Use scripted extension points to integrate customizations without altering the core components in the application code. When customizing a base application, you implement the scripted extension points by creating the custom script includes and registering them against the scripted extension points.

Extension points for event types

Extension point name	Description
sn_skill_cfg_page.ManageSkillsExtnPt	Implement this extension point to customize the logic of creating users by groups for the Manage IT skills page.

Important:
You can configure additional groups using the `sn_skill_cfg_page.ManageSkillsConstants` script include. For information on script includes see, Script includes.

Exploring Omnichannel Callback

Learn more about Omnichannel Callback and review its benefits.

Omnichannel Callback overview

The Omnichannel Callback app is a ServiceNow AI Platform® capability that offers enhanced user experience by providing an option for agents to call users back rather than waiting in the queue for an available agent. For example, you can use the callback functionality to call users back when the agent wait time is long or when there are no agents available.

Callbacks are a well-received addition to any interactive voice response (IVR). You can invoke callbacks on any supported conversational integration channels.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Omnichannel Callback workflow

In this workflow:

1. Users seeking help from a live agent request for a callback when the live agent is either unavailable or the wait time to get to a live agent is long.
2. Omnichannel Callback determines the availability of agents via ServiceNow® Advanced Work Assignment (AWA) and places a callback work item for an available agent.
3. AWA picks up the callback task and places it in the callback queue.
4. The agent receives a **Callback** accept card. If the agent decides to close the interaction or requeue the callback manually, the agent can do so from the workspace.

Omnichannel Callback benefits

Benefit	Feature	Users
Omnichannel Callback creates callback work items for available agents via AWA. Callback requests are placed in the AWA queue immediately upon submission. If the customer does not answer the initial callback, the agent has the option to manually initiate a retry. In such cases, the callback is re-queued according to the retry mechanism defined in the system.	Recurring Callback	Agents
Users requesting a callback can schedule by date and time based on the available time slots. Omnichannel Callback provides the framework for the scheduled callback. Consumer use cases for scheduled callback are currently supported via Customer Service Management (CSM) application only.	Scheduled callback	Customers
The user can request for a video callback at an appointed time. Currently, video callback is supported only via the Zoom service and requires the Zoom extension for Omnichannel Callback Store app. For more information, see Zoom extension for Omnichannel Callback.	Video callback	Customers

Configuring Omnichannel Callback

Configure the Omnichannel Callback features and components that you need to support agents with callback requests.

Configuration overview

Admins can enable the callback feature and configure one or more callback channels by navigating to **Conversational Interfaces** > **Settings** > **General** > **Omnichannel Callback** and clicking **Manage**. The callback behavior per channel can be set by configuring the following callback parameters: Topic, Maximum callback attempts, and the callback timeout threshold. For more information on how to configure the callback behavior, see Configure callback behavior for a channel.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Omnichannel Callback app includes the default Callback-Phone and Callback-General topics. The Callback-Phone and Callback-General topics are triggered when agents are not available or the agent wait time is longer than the callback threshold time, which is the average of the most recent AWA queue time. You can customize the default callback topics as per your requirements. For more information on how to customize the callback topics, see Customize a default callback topic.

1. Get started with Omnichannel Callback

   Review this information before you start setting up Omnichannel Callback.

2. Install Omnichannel Callback

   You can install Omnichannel Callback if you have the admin role.

3. Configure callback behavior for a channel

   Configure callback behavior for a channel using the callback parameters.

4. Customize a default callback topic

   Customize the default callback topic as per your requirements.

Get started with Omnichannel Callback

Review the following information before you start setting up Omnichannel Callback.

Checklist

Setup task	Description
Verify that the ServiceNow core applications or plugins that are required to support Omnichannel Callback are installed and activated.	Verify that the following applications or plugins are installed and activated from the ServiceNow Store. When you activate the first plugin, its dependant plugins are activated automatically. If not installed, install and activate one application at a time in the following order to ensure a smooth implementation. • com.glide.cs • com.glide.interaction.awa • com.glide.cs.custom.adapter • com.snc.appointment_booking For more information, see Install Omnichannel Callback.
Verify that you have assigned the required ServiceNow AI Platform roles.	The following roles are used across the Omnichannel Callback features: • The administrator (admin) installs the application from the ServiceNow Store and assigns the roles. • sn_omni_callback.callback_api role

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Install Omnichannel Callback

You can install the Omnichannel Callback application (sn_omni_callback) if you have the admin role.The application includes demo data and installs related ServiceNow® Store applications and plugins if they are not already installed.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the Omnichannel Callback application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Role required: admin

About this task

The following items are installed with Omnichannel Callback:

- Roles
- Scheduled jobs
- Tables

For more information, see Components installed with Omnichannel Callback.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Omnichannel Callback application (sn_omni_callback) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

   In the list next to the **Install** button, the versions that are available to you are displayed.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.
4. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data are sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.
5. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
6. Select **Install**.

Configure callback behavior for a channel

Configure callback behavior for a channel using the callback parameters. You can create a separate callback configuration for each supported conversational integration channel.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Conversational Interfaces** > **Settings** > **General**.
2. On the Callback configuration form, swipe the **Activate** toggle switch to the right, enter the wait time threshold, and select **Save**.

   Note:
   Ensure that the application scope of your ServiceNow instance is set to global before editing the Callback configuration form.

3. Select a channel that you want to configure callback for from the Channel drop-down list.
4. Select a callback topic from the Callback Topic drop-down list.
   Select **Callback-Phone** for voice channels and **Callback-General** for messaging or chat channels. These default callback topics are triggered when there are no agents available to take the call or when the average wait time in the queue is over the predefined threshold. You can also use a custom callback topic based on your requirements. For more information on how to customize a callback topic, see Customize a default callback topic.
5. Provide the **Max callback attempts**.
   After the maximum number of callback attempts is reached, the callback task is closed and no further callback attempts are made.
6. Provide the **Callback timeout (threshold (in hours)**.
   When the callback timeout is reached, no further callback attempts are made and the callback task is closed.

Customize a default callback topic

Customize the default callback topics as per your requirements.

Before you begin
Role required: admin

About this task
You can customize one of the following default callback topics: Callback-Phone for voice channels and Callback-General for messaging or chat channels. The following procedure explains how to customize the Callback-Phone topic.

Procedure

1. Duplicate the Callback-Phone topic from the Virtual Agent Designer.
   For more information on how to duplicate a topic, see Duplicate a Virtual Agent topic.
2. In the Advanced properties section of the **Properties** tab, select the voice channel that you want to associate with the custom callback topic.
3. On the **Flow** tab, modify the default callback flow and set the following properties in the Script action utility, if required.

   a. Set Global Callback Executed (vaVars.global_callback_executed) to **true**.

   b. Set No Agent Available (vaVars.global_show_no_agent_available_msg) to **false**.

   c. Set the following properties in the Create Callback Task node.
      - Set Global Callback Executed (vaVars.global_callback_executed) to **true**.
      - Set No Agent Available (vaVars.global_show_no_agent_available_msg) to **false**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Callback Number (callback_number): Required field to be populated with the number on which the user requested a callback. This number may be the number that the user is calling from or the dialed number.
- Short description (short_description): User issue description.
- Initial Interaction (initial_interaction): Interaction detail from which the callback task has been initiated.
- Max Retry Attempts (max_retry_Attempts): Maximum retry attempts after which the callback task is closed.
- Expire Time (expire_time): Callback timeout after which the callback task is closed.
- Messaging Channel (messaging_channel): Messaging channels configured for use. If not provided, the default callback channel is used.
- Scheduled (scheduled): Set to **true** to make the callback task eligible for auto callback.

4. Save and publish your custom callback topic by clicking **Save** and **Publish**.
5. Map the custom callback topic to the voice service provider.
   a. Fetch the sys_id of your custom callback topic from the Topics [sys_cs_topic] table.
   b. Select your voice service provider from the Provider Channel Identities [sys_cs_provider_application] table.
   c. On the **Provider Identity Properties** tab, update the value of the **callback_topic_id** property with the sys_id of your custom callback topic and click **Update**.

Working on callback records

Use Workspace to work on callback records originating from Omnichannel Callback.

Agents can work on the records for the following callback scenarios.

- Recurring callback: When a user requests recurring callback, the callback request is added to the AWA queue. AWA routes the callback work item to an available agent based on the predefined callback attempt interval. The agent then receives a **Callback** work item. When the agent accepts the callback work item, auto-dial initiates a call to the user. Based on the resolution, the agent can either close the interaction or re-queue the callback.
- Scheduled voice callback: When a user requests a voice callback at their preferred date and time, an interaction record with callback details is created a minute before the scheduled call time and an agent receives the callback work item. When the agent accepts the callback work item, auto-dial initiates a call to the user. Based on the

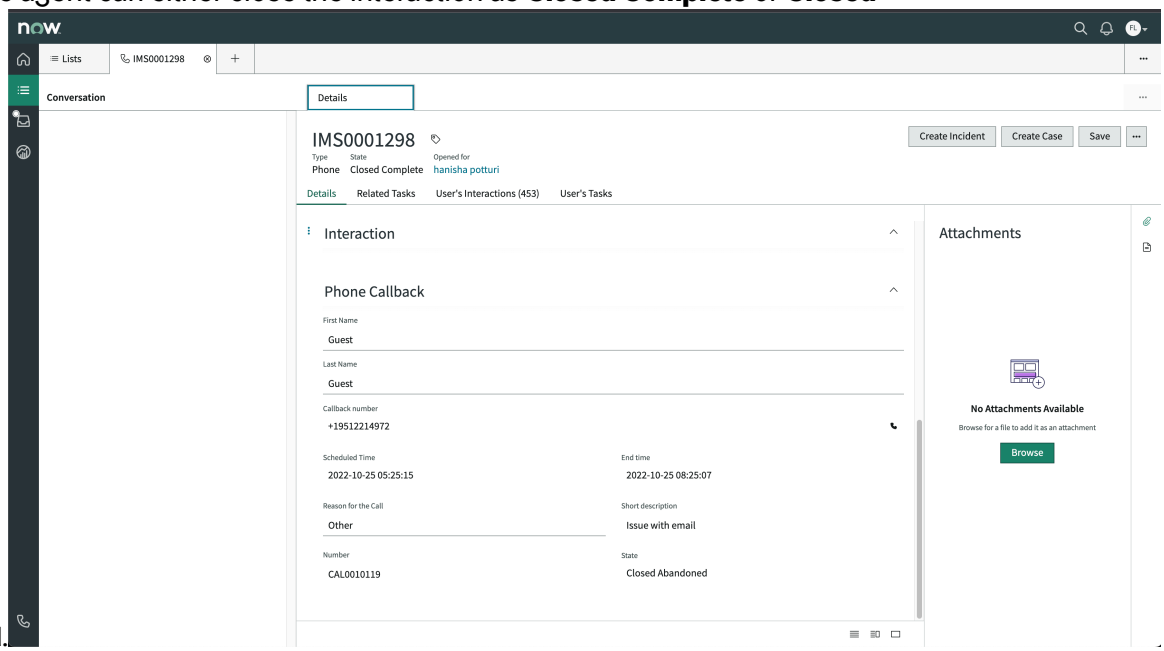
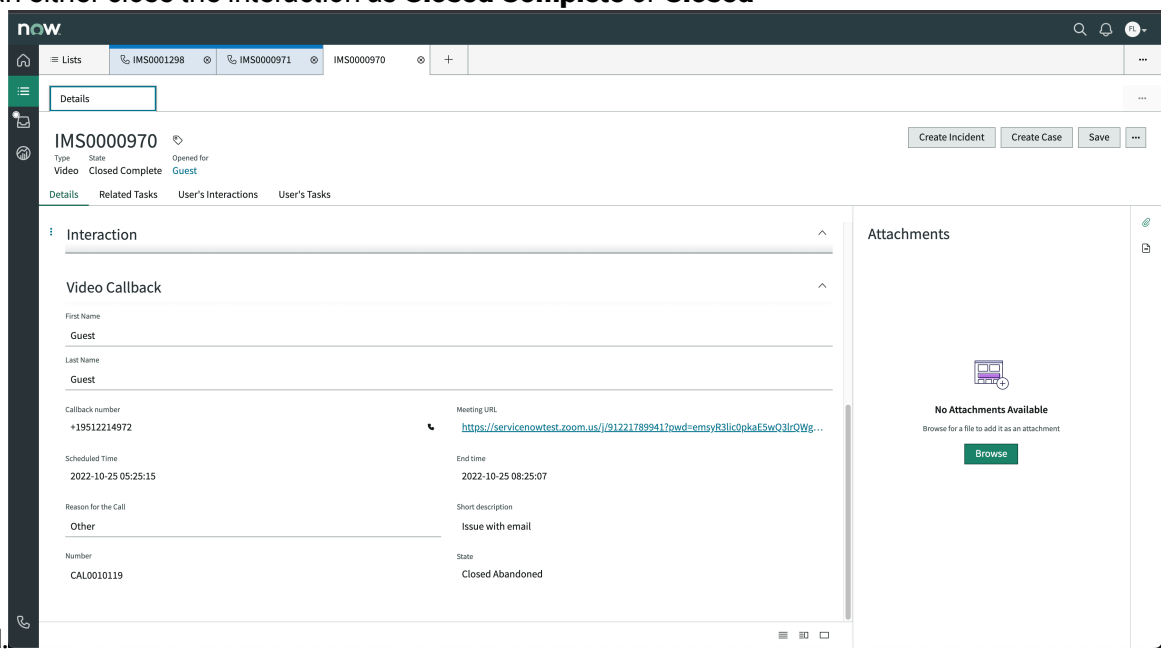
outcome, the agent can either close the interaction as **Closed Complete** or **Closed Abandoned**.



- Scheduled video callback: When a user requests a video callback at their preferred date and time, an interaction record with callback details is created which includes a URL to initiate the video call. Based on the outcome, the agent can either close the interaction as **Closed Complete** or **Closed Abandoned**.



Omnichannel Callback reference

Reference topics provide additional information that you can use to configure and administer Omnichannel Callback.

Components installed with Omnichannel Callback

Several types of components are installed with activation of the Omnichannel Callback plugin, including user roles, scheduled jobs, and tables.

Scheduled jobs installed

Scheduled job	Description
Callback Scheduler - Scheduled	Executes the callback task of type Scheduled a minute before the scheduled start time.
Callback Scheduler - Recurring	Executes the callback task of type Recurring after creation of the callback task or at the next retry attempt.
Omnichannel Callback Close expired tasks	Marks the callback tasks as Closed Abandoned in the following scenarios. • Recurring callback: If the current time is past the expiry time or the number of callback attempts exceeds the maximum retry attempts. • Scheduled callback: When the callback task is not closed one hour after the scheduled end time.

Tables installed

Table	Description
Callback Properties [sn_omni_callback_st_callback_properties]	Lists the callback properties that determine the callback behavior.
Callback [sys_cs_callback]	Lists the callback tasks of type Scheduled and Recurring.

Roles installed

Special considerations

None.

Domain separation and Omnichannel Callback

Domain separation is supported for Omnichannel Callback. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Standard

- Includes all aspects of **Basic** level support.
- Application properties are domain-aware as needed.
- Business logic: The service provider (SP) creates or modifies processes per customer. The use cases reflect proper use of the application by multiple SP customers in a single instance.
- The instance owner must configure the minimum viable product (MVP) business logic and data parameters per tenant as expected for the specific application.

Sample use case: An admin must be able to make comments required when a record closes for one tenant, but not for another.

For more information on support levels, see Application support for domain separation.

Overview

Domain separation enables you to partition your organization's data and administrative control into separate domains. This lets you isolate data and control access to it, which is particularly important in environments where multiple tenants share a common platform.

How domain separation works in Omnichannel Callback

Domain separation in Omnichannel Callback works by routing callback requests to domain-specific available agents.

When using domain separation for Omnichannel Callback, keep the following points in mind.

- Domain separation applies to both the agent and the customer requesting for a callback. This means that agents will only be able to access interactions records that are created under the domain of the user requesting the callback.
- The agent should be in the same domain as the user to receive a callback request in the workspace.
- No configuration is required for domain separation for Omnichannel Callback.

Domain separated tables

The sys_cs_callback table is domain separated.

Use cases

When domain separation is used, a callback request from guest users is routed to the agent with the same domain as the guest user. For custom chat channels, the domain of the provider application is used as a reference to route the callback to the domain-specific agent.

Zoom extension for Omnichannel Callback

The ServiceNow® Zoom extension for Omnichannel Callback application enables other ServiceNow® applications to display a Zoom callback option to users. The Zoom extension for Omnichannel Callback application is available through the ServiceNow® Store.

Overview

The Zoom extension for Omnichannel Callback app is a ServiceNow AI Platform® capability that enables users to request a callback over Zoom when the agent wait time is long, or agents are unavailable. Agents and users can collaborate over a Zoom meeting at a date and time requested by users.

Features

Zoom extension for Omnichannel Callback offers the following capabilities:

- Allows users to request a video callback from omnichannels such as Virtual Agent, Engagement Messenger, portals, and chats.
- Enables agents and users to collaborate to resolve an issue.
- Enables agents to join a Zoom meeting from an interaction record.
- Imports the Zoom meeting transcript to the interaction record. The inserted transcripts are not sentiment analyzed.
- Imports the Zoom meeting recording URL to the interaction record.
- Displays the names of participants who attended the meeting.
- Marks the interaction Close complete when the following conditions are met:
  - Both the participants joined the meeting.
  - The Zoom meeting has ended.

Install Zoom extension for Omnichannel Callback

You can install the Zoom extension for Omnichannel Callback application (com.sn.zoom.callback) if you have the admin role.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the Zoom Extension for Omnichannel Callback application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Role required: admin

About this task

The following items are installed with Zoom extension for Omnichannel Callback:

- Script includes
- Business rules

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information, see Components installed with Zoom extension for Omnichannel Callback.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Zoom extension for Omnichannel Callback application (com.sn.zoom.callback) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

   In the list next to the **Install** button, the versions that are available to you are displayed.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.
4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data are sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.
6. Select **Install**.

Components installed with Zoom extension for Omnichannel Callback

Several types of components are installed with the Zoom extension for Omnichannel Callback application.

Script includes

Zoom extension for Omnichannel Callback script includes

Script include	Description
ZoomCallDatabase	Contains database-related functions.
ZoomCallDriver	Implements extension point for sn_omni_callback.VideoCallDriver.
ZoomCallEventHandler	Overrides the functions of ZoomCallEventHandlerSNC.
ZoomCallEventHandlerSNC	Contains utility functions for handling the transcript completed events.
ZoomCallTranscriptProcessor	Contains utility functions to process the Zoom transcript.
ZoomCallUtils	Overrides the functions of ZoomCallUtilsSNC.
ZoomCallUtilsSNC	Contains the utility functions for Zoom callback.

Business rules

Zoom extension for Omnichannel Callback business rules

Close interaction (Zoom Callback)	Notify Conference Call [notify_conference_call]	Closes the interaction after the Zoom meetings ends. Both the agent and the requester must join the call to close the interaction.
Create Notify Conference call record	Callback [sys_cs_callback]	Creates a notify conference call record when the Zoom callback is created.
Recording Completed (Zoom Callback)	Notify Recording [notify_recording]	Stores the recording URL in the interaction when the recording is completed.
Update Zoom Host when agent is assigned	Interaction [interaction]	Makes the agent the host when the interaction is accepted by the agent.

Setting up Zoom extension for Omnichannel Callback

Enable your users to request a callback over Zoom by integrating your#Zoom account with the ServiceNow instance. You can also enable the account to authenticate requests from your instance by creating a custom OAuth application in the account.

The configuration process consists of the tasks listed in the following table.

Task	Description
Setting up the Zoom spoke for Zoom extension for Omnichannel Callback	Integrate your organization's Zoom account with your ServiceNow instance using the Zoom spoke to create Zoom meetings.
Setting up Notify Zoom connector for Zoom extension for Omnichannel Callback	Set up the Notify Zoom connector in Zoom to receive the event information from Zoom.
Configure a Zoom webhook for Zoom extension for Omnichannel Callback	Configure a Zoom webhook in ServiceNow to notify the Zoom Extension app when certain events occur in Zoom.
Configure the Zoom channel for callbacks over Zoom	Enable the Zoom callback channel and specify the host email address for a callback over Zoom.

Setting up the Zoom spoke for Zoom extension for Omnichannel Callback

Enable the Zoom spoke to perform various actions such as creating meetings, rescheduling meetings, deleting a meeting, or fetching the participant details from your Zoom account by integrating your Zoom account with your ServiceNow instance.

Create a connected app in Zoom

Create a connected app in your Zoom account to enable OAuth 2.0 authentication with the Zoom spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Ensure that you have an Integration Hub subscription.
- Ensure that Omnichannel Callback is installed on your instance.
- Ensure that the Zoom spoke is activated. For more information, see Zoom spoke

Role required: Zoom admin

Procedure

1. Log in to Zoom marketplace.
2. In the **Develop** drop-down list, select **Build App**.
3. Choose the **OAuth** card from the available cards.
4. Disable the **Would you like to publish this app on Zoom App Marketplace?** option.
5. Select **Create.**
6. Provide a name for the app in the **Name** field.
7. Set the app type to **Account-level app**.

   Note:
   Account-level apps must be installed by a Zoom admin, who manage the app for all account users in the account.

8. Configure the redirect URLs for authentication.

   a. In the App credentials section, enter the ServiceNow instance redirect URL in the **Redirect URL for OAuth** field in the following format:
   `https://<instance name>.com/oauth_redirect.do`

   b. In the OAuth allow list section, add the ServiceNow instance redirect URL in the following format:
   `https://<instance name>.com/oauth_redirect.do`

   c. Record the values of the **Client ID** and **Client Secret** fields to use them for the application registry.

9. In the left panel, select **Scopes**.
10. In the Add Scopes section, select **Add Scopes**.
11. On the **Add Scopes** dialog box, select the scope type.
12. Select the **Meeting** scope type.
13. Select the following scopes:
    - View all user meetings
    - View and manage all user meetings
14. Select the **Recording** scope type.
15. Select the following scopes:
    - View all user recordings
    - View and manage all user recordings
16. Select the **User** scope type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

17. Select the **View all user information** scope.
18. Select **Done**.

Result
The actions under the selected scopes become available to the Zoom spoke.

Configure a Zoom connection in ServiceNow instance

Use the information generated during Zoom account configuration to register the Zoom spoke as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Before you begin
Role required: admin

Procedure
1. From your ServiceNow instance, navigate to **Process Automation** > **Flow Designer**.
2. In the Flow Designer, select the **Connections** tab.
3. Search for the Zoom connection and select **View Details**.
4. On the Zoom connection card, select **Edit**.
5. On the form, fill in the fields.

Field	Description
Connection Name	Name to identify the connection record.
Connection URL	Base URL to connect to your Zoom instance: `https://api.zoom.us`.
OAuth Entity Name	Name to identify the application registry record.
OAuth Client ID	Client ID created during application registration.
OAuth Client Secret	Client secret created during application registration.
OAuth Redirect URL	OAuth callback endpoint: `https://instance name.service-now.com/oauth_redirect.do`.

6. Select **Edit and Get OAuth Token**.
   A confirmation message is displayed that the token is available.

Setting up Notify Zoom connector for Zoom extension for Omnichannel Callback

Setting up the Notify Zoom connector in Zoom and then in your ServiceNow instance enables your instance to receive the event information from Zoom. An event is usually any action that is related to a meeting.

Note:
Currently, only the Zoom recording URL without passcode is stored in the interaction. You can configure the Zoom account to disable the passcode option.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure the Notify Zoom connector in Zoom

Configure the Notify Zoom connector in Zoom to receive event information in your ServiceNow instance from Zoom.

Before you begin

- Ensure that Notify Zoom Connector and Omnichannel Callback are installed on your instance.
- Ensure that you have the Zoom spoke installed on your instance.
- Make sure you have the required credentials for and connections to Zoom on your instance.
- The Notify Zoom connector must have been configured with the same Zoom account with which you created the OAuth app for the Zoom spoke.

Role required: admin, Zoom admin

Procedure

1. On your Zoom OAuth app, navigate to **Feature** > **Add Feature** > **Event Subscription**.
2. Enable the event subscription feature.
3. Select **Add Event Subscription** to add the first event subscription.
4. Enter the URL to be used to post information about events in Zoom to your instance: `https://<instance name>.com/api/sn_notify_zoom/notify_zoom/ZoomEvent`
5. Select the **Add Events** button.
6. Select **Meeting** and then select the following meetings from the list:
   - Start Meeting
   - End Meeting
   - Participant/Host joined meeting
   - Participant/Host left meeting
7. Select **Recording** and then select **All Recordings have completed** from the list.
8. Select **Done**.
9. On the Add feature screen, select **Save** to save the event subscription configuration.
10. Select **Add Event Subscription** to add a second event subscription.
11. In the form, enter the URL used to post information about events in Zoom to your instance: `https://<instance name>.com/api/sn_zoom_spoke/zoom_webhook_endpoint/webhook`
12. Select the **Add Events** button.
13. Select **Recording** and then select **Recording Transcript files have completed** from the list.
14. Select **Done**.
15. In the Add feature section, select **Save** to save the event subscription configuration.
16. In the Token section, select **Copy** to record the verification token to be used during configuration of the Notify Zoom connector.

Configure the Notify Zoom connector in ServiceNow

Configure Notify in your ServiceNow instance to receive event information from Zoom.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

You must have copied the verification token displayed during the configuration of the Notify Zoom connector in Zoom.

Role required: admin

Procedure

1. Navigate to **All** > **Notify** > **Zoom** > **Configuration**.
2. Paste the verification token in the **Webhook validation token** field.
3. Select **Update**.

What to do next

Configure a Zoom webhook for Zoom extension for Omnichannel Callback

Configure a Zoom webhook for Zoom extension for Omnichannel Callback

Configure a Zoom webhook in ServiceNow to notify the Zoom extension for Omnichannel Callback app when certain events occur in Zoom.

Before you begin

You must have copied the verification token displayed during the configuration of the Notify Zoom connector in Zoom.

Role required: admin

Procedure

1. Navigate to **All** > **Zoom Spoke** > **Zoom Webhook Registries**.
2. Select **Zoom Callback Transcript completed** from the list.
3. Paste the verification token for validating event notifications in the **Token** field.
4. Select **Update**.

Configure the Zoom channel for callbacks over Zoom

Allow agents to call users back over Zoom by enabling the Zoom callback channel and specifying the host email address.

Before you begin

Role required: admin

Procedure

1. Navigate to **All**, and then enter `sys_cs_channel.list` in the navigation filter.
2. On the Messaging Channels form, select the **Zoom** channel.
3. If you are prompted in a message at the top of the form to switch applications to be able to edit the record, select the word **here**.
4. In the Channel Properties section, configure the channel properties.
   - Set the *enabled* property to true.
   - In the *host_email* property, enter the email with which the meetings should be created.
5. Select **Update**.

Proactive Triggers

Proactive Triggers supports end users by providing helpful platform actions, using real-time data. Admin users can customize rules and actions to present rich text pop-up messages to specific users.

Exploring Proactive Triggers

Proactive Triggers is a ServiceNow® Store application that is available to all Virtual Agent chat widget and Agent Chat customers by default. Proactive Triggers can increase adoption of Virtual Agent by proactively sending context-specific messages to end users.

Proactive Triggers overview

The Proactive Triggers rich text pop-up messages provide users with actions according to real-time Proactive Triggers data. When end users engage with the Proactive Triggers message, the Virtual Agent opens. If there's a Virtual Agent topic, associated with the action, the topic runs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If buttons are presented to end users (a maximum of three), they can select the most relevant button to run the associated Virtual Agent topic. Proactive Triggers can be used with LLM topics if Now Assist in Virtual Agent is set up. Proactive Triggers can also be used with Agent Chat to connect customers to a live agent in configurations without Virtual Agent. For more information about the Proactive Triggers process, see How Proactive Triggers work.

Proactive Triggers admins use Proactive Triggers rules to define when, where, and how to engage with customers. Proactive Triggers actions define what the rule does, using several key fields. Admins customize these rules and actions based on when and how their customers are most likely in need of help. For example, customers may need help when ordering equipment, opening an incident/case, or viewing information in a Knowledge Base article. Proactive Triggers rules can be applied to any defined URL, including any portal URL, catalog item, or external site. Proactive Triggers rules can be applied to the Proactive Triggers API after the **Proactive Trigger on Search** business rule and related trigger type, rule, and action are enabled. For additional information and an example of the Proactive Triggers API script, see ProactiveTriggerAPI - Scoped.

Proactive Triggers examples

The Proactive Triggers feature uses rules and related actions based on those rules to present messages to end users. These rules and actions are context-specific and are based on real-time data gathered as end users navigate across portal pages or through the Proactive Triggers API call.

By default, the Proactive Triggers feature includes these sample rules: Virtual Agent greeting and Chat welcome message when a live agent is available.

See the following table for information about action type examples. The images in the Example column are all of standard chat, but this feature works the same in enhanced chat.

Note:
Depending on the plugins installed, you may only see one of these rules or you may see other rules as well.

Default sample rules

Default sample rules	Description	Example
Virtual Agent greeting	This rule gives a sample welcome message to end users on a portal page. This message introduces the Virtual Agent to both internal and external end users.	Chat welcome message when a live agent is available	This rule gives a sample welcome message to end users when the chat widget is configured for Live Agent only. This message introduces Agent Chat to end users.	
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Default sample rules (continued)

Default sample rules	Description	Example
	Note: This message appears only if you have the Advanced Work Assignment (AWA) plugin (agent chat) installed.	

After a rule is created, the admin creates one or more actions that are triggered by the rule. Actions define the messages that end users see based on the rule and the next steps available for the end users to take. These messages are displayed differently depending on the selected action type.

See the following table for information about action type examples. The images in the Example column are all of standard chat, but this feature works the same in enhanced chat.

Action types

Action type	Description	Example
Message only	End users see an HTML pop-up message.	Message that launches a virtual agent topic	End users see an HTML pop-up message that directs them to an available Virtual Agent topic.	
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action types (continued)

Action type	Description	Example
Message that launches a selection of virtual agent topics	End users see an HTML pop-up message with up to three suggested action buttons that direct them to a relevant Virtual Agent topic.	
You can customize the appearance of the Proactive Triggers message. For example, you can change the side bar color of the message. For more information about customization, see Configure Agent Chat in a portal.

How Proactive Triggers work

Explore example use cases and how information flows through the Proactive Triggers process.

Proactive Triggers use cases

Proactive Triggers are useful in various scenarios. Explore the following example use cases to determine how to use Proactive Triggers effectively for your organization.

- An admin creates a Proactive Triggers rule that runs when a user views a Knowledge article containing the keyword “VPN” (or any other keyword that has a matching Virtual Agent topic). The admin configures the rule to run the VPN Connectivity Virtual Agent conversation, which proactively helps the user resolve the VPN issues.
- An admin creates a Proactive Triggers rule that runs when a user views any catalog item with a short description that includes a specific keyword, such as “laptop.” The admin configures the rule to connect the user to a live agent, using the Live Agent Support topic, which proactively helps the user get assistance in ordering a laptop.

You can also use Proactive Triggers to engage with customers in more complex scenarios. Admin users can create multiple rules using different delay times and different user criteria to create a customized user experience. For more information about configuring more complex scenarios, see Multiple Proactive Triggers rules and actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Proactive Triggers process

1. Whenever an end user navigates to a Proactive Triggers enabled page, Proactive Triggers reads the page URL or called API to determine if any Proactive Triggers rules should run.
2. During this analysis, Proactive Triggers determines the Trigger Type source.

Web browsing (client side)	Trigger type
Knowledge Base pages	Knowledge
Service Catalog pages	Catalog Item
Portal home pages	Portal Home
All other portal pages	URL

System API (server side)	Trigger type
Search event on portal pages	Search Event

3. Next, Proactive Triggers evaluates all the Proactive Triggers rules for that Trigger Type one by one until a matching rule is found.

   Note:
   Rules are created with the required fields **Delay Time** and **Order**. During the rule matching process, rules are analyzed in ascending Order, according to the order number assigned. If the Delay Time is reached before the order number, the Delay Time takes precedent.

4. After a Proactive rule has been matched, the rule's actions are evaluated one by one. This evaluation proceeds in ascending order, according to the **Order** field in the associated Proactive actions. As part of this process, the **Applies To** field is compared with the user visiting the page to determine if the action applies to this user.
5. After Proactive Triggers identifies at least one rule and action that apply to the visiting user and the Delay Time has been met, a pop-up message appears directly on the web page. The contents of this message are configured by the admin for the matched action.
6. If the user selects the pop-up message, the chat widget opens. If the matched action is of the type *`Virtual Agent Topic`*, the chat widget also runs the topic configured in that action.

Installing Proactive Triggers

Enable Proactive Triggers so that you can begin working with the feature.

Before you begin

The Proactive Triggers feature [sn_pt] is available as an app and must be installed from the ServiceNow Store. This feature is only available after you've installed and updated the Omni-Experience Standard Feature Set to the latest version through the ServiceNow Store.

Role required: admin

About this task

The following steps provide a high-level overview of how to enable Proactive Triggers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Conversational Interfaces** > **Settings** > **General**.
2. Under Proactive triggers, select the Enable Proactive Triggers field toggle switch to enable the feature.
3. Set the com.glide.cs.advanced-chat-popover system property to **true** in the System Properties [sys_properties] table .

   This system property is only applicable to the requester persona.

Enable Proactive Triggers

Use Proactive Triggers to create and view context-specific messages and use relevant actions on the chat widget.

Before you begin

Note:
The Proactive Triggers feature [sn_pt] is available as an app and must be installed from the ServiceNow Store. This feature is only available after you've installed and updated the Omni-Experience Standard Feature Set to the latest version through the ServiceNow Store. Subsequent updates are also available there. Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

For conceptual information about Proactive Triggers, see Exploring Proactive Triggers.

The Proactive Triggers feature can be used with Domain Separation. For more information about Domain Separation, see Domain separation explained.

Role required: admin

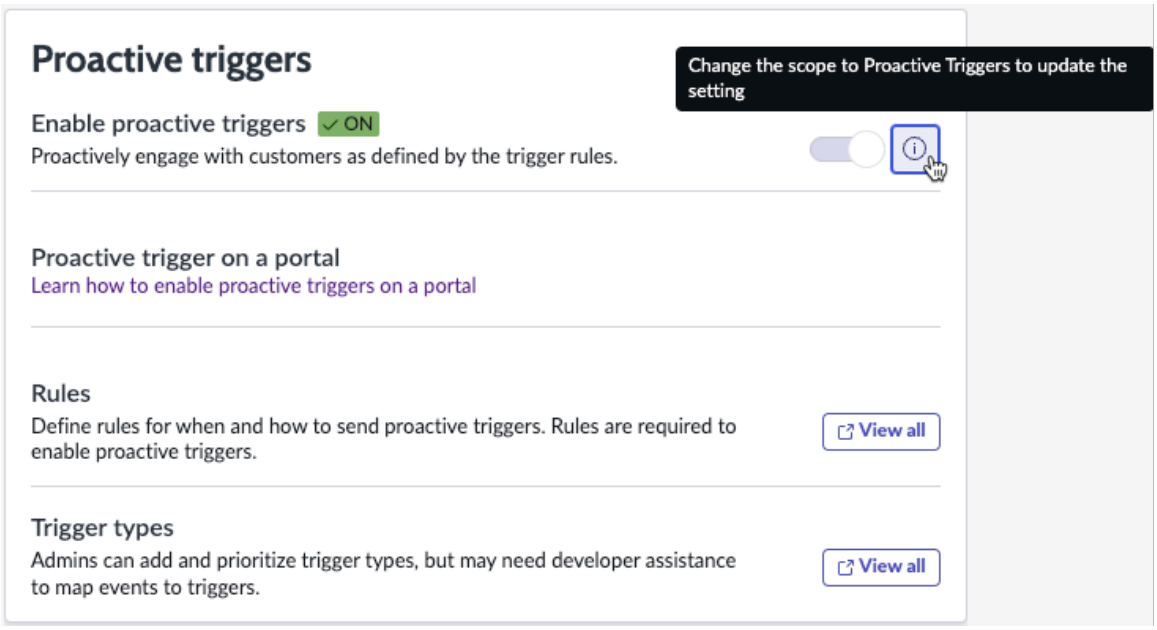
About this task

An admin first enables and then creates rules and actions as separate tasks.

Procedure

1. In the navigation filter, enter `sys_properties.list`.
   The entire list of properties in the System Properties [sys_properties] table appears.
2. Search for the `com.glide.cs.advanced-chat-popover` system property, and then change the value from **false** (default) to **true**.
   This system property enables the smart chat component on the Service Portal. This system property is only applicable to the requester persona.
3. Navigate to **Conversational Interfaces** > **Settings**.
   You must be in the Proactive Triggers scope to enable this feature.
4. Under Proactive triggers, select the more info icon (ⓘ) next to the **Enable proactive triggers** field toggle switch to view the Proactive Triggers scope reminder.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

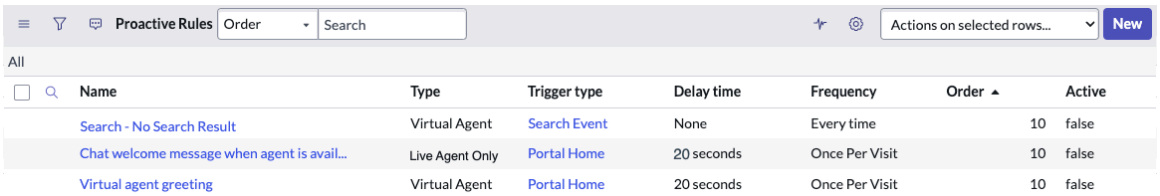


For more information about scopes and how to change them, see Application scopes.

5. Under **Proactive triggers**, select the **Enable proactive triggers** field toggle switch to enable the feature.

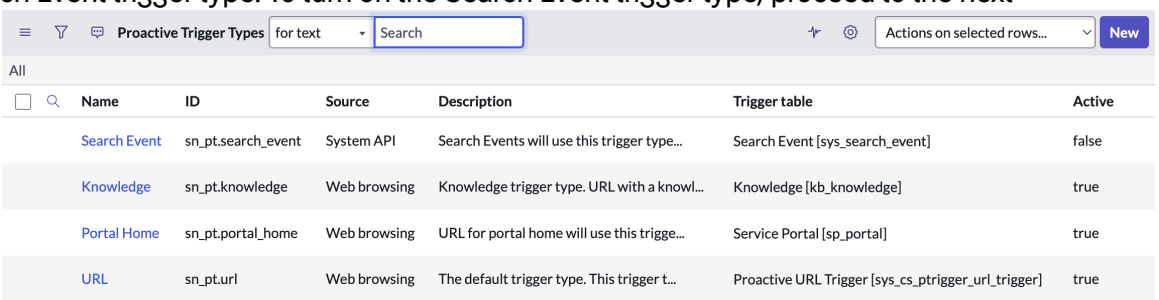
   By default, the Proactive Triggers feature is inactive.

6. Next to **Rules**, select **View all**.
   The default sample rules included with Proactive Triggers appear.



Name	Type	Trigger type	Delay time	Frequency	Order	Active
Search - No Search Result	Virtual Agent	Search Event	None	Every time	10	false
Chat welcome message when agent is avail...	Live Agent Only	Portal Home	20 seconds	Once Per Visit	10	false
Virtual agent greeting	Virtual Agent	Portal Home	20 seconds	Once Per Visit	10	false

7. Navigate back to the **Conversational Interfaces** > **Settings** page and next to **Trigger types**, select **View all**.
   The default trigger types appear. All trigger types default to **Active is true** except the Search Event trigger type. To turn on the Search Event trigger type, proceed to the next step.



Name	ID	Source	Description	Trigger table	Active
Search Event	sn_pt.search_event	System API	Search Events will use this trigger type...	Search Event [sys_search_event]	false
Knowledge	sn_pt.knowledge	Web browsing	Knowledge trigger type. URL with a knowl...	Knowledge [kb_knowledge]	true
Portal Home	sn_pt.portal_home	Web browsing	URL for portal home will use this trigge...	Service Portal [sp_portal]	true
URL	sn_pt.url	Web browsing	The default trigger type. This trigger t...	Proactive URL Trigger [sys_cs_ptrigger_url_trigger]	true
Catalog Item	sn_pt.catalog_item	Web browsing	Catalog item trigger type. URL with a ca...	Catalog Item [sc_cat_item]	true

8. **Optional:** Turn on the Search Event trigger.

   (Optional) The Search Event triggers a pop-up message on the Service Portal Default Search Profile whenever a search result yields no result. The Search Event trigger is an inactive default trigger type that uses the System API source rather than the web browsing source. Because

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

this trigger type defaults to inactive, an admin must turn on the related business rule, trigger type, Proactive Triggers rule, and action prior to using this trigger.

a. Navigate to **System Definition** > **Business rules**.

b. Search for `Proactive Trigger on Search` in the **Business Rules** field, and then select the business rule.

c. Select the **Active** option to turn on the business rule.

d. **Optional:** Adjust any settings, as needed.

> **Note:**
> Your organization may want to update the **Filter Conditions** on the **When to Run** related tab. For example, if your organization doesn't use the Service Portal, update the default values in the Filter Conditions section to reflect your organization's preferred portal or site. Your organization may also want to adjust the Proactive Triggers API script in the **Advanced** related tab. For additional information on the Proactive Triggers API script, see ProactiveTriggerAPI - Scoped.

e. Select **Update**.

f. Navigate to **Conversational Interfaces** > **Settings** and under **Proactive Triggers**, select **View All** next to **Trigger Types**.

g. Select **Search Event**.

h. In the Proactive Trigger Type form for Search Event, select the **Active** option to turn on the trigger type and adjust any settings, as needed.

i. Select **Update**.

j. Select **Search - No Search Result** from the Proactive Rules related list.

k. In the Proactive Rule form for Search - No Search Result, select the **Active** option to turn on the rule and adjust any settings, as needed.

l. Select **Update**.

m. Select **No Search Result Message** from the Proactive Actions related list.

n. In the Proactive Action form for No Search Result Message, select the **Active** option to turn on the action and adjust any settings, as needed.

o. Select **Submit**.

The Search Event trigger type is turned on.

Result

The Proactive Triggers feature is enabled and you know where to create rules, actions, and custom trigger types.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

Create rules and actions for Proactive Triggers. For more information, see Create rules and actions for Proactive Triggers.

Create custom trigger types. For more information, see Create custom trigger types.

Related topics

Enable message preview on the chat widget

Application scopes

To upload and distribute custom applications on the ServiceNow Store, you need to create a private scope for your applications.

All applications have an application scope that determines which of its resources are available to other parts of the system. Application scoping ensures that one application does not impact another application. You specify what parts of an application other applications can access by setting application access controls.

For example, if you create a conference room booking application in its own application scope, by default, the application can access and change its own tables and business logic, but other applications such as Incident Management cannot make changes to it without explicit permission.

An application scope ensures that:

- The conference room booking application does not interrupt core business services.
- Other applications do not interfere with its normal functioning.

Application scope is available for new and upgraded instances starting with the Fuji release.

Configuring Proactive Triggers

Plan, configure, and review your Proactive Triggers.

Before you begin

Activate the Proactive Triggers feature.

Note:
For new customers onboarding from Vancouver onward, the chat widget is only accessible to authenticated users by default. To allow unauthenticated users to access the chat widget, you must enable the $sn-va-web-client-app and sn_va_web_client_app_embed pages for public access. For more information, see Make UI pages public or private.

Role required: admin

About this task

The following steps provide a high-level overview of the Proactive Triggers configuration process.

Procedure

1. Navigate to **Conversational Interfaces** > **Settings** > **General**, and then select the **View All** button next to Proactive Triggers's **Rules**.
2. Select **New** to create rules and define actions that are triggered by those rules.
3. **Optional:** Navigate to **Conversational Interfaces** > **Settings** > **General**, and then select the **View All** button next to Proactive Triggers's **Trigger types**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. **Optional:** Select **New** to create custom trigger types.
5. **Optional:** Create multiple rules related to the same trigger type, if needed.

What to do next

Review execution logging tables and explore common issues and their resolutions to ensure that your Proactive Triggers feature is working as expected.

Create rules and actions for Proactive Triggers

Create rules and related actions for Proactive Triggers. These rules and their related actions determine the messages that end users see on the ServiceNow portal.

Before you begin

Enable the Proactive Triggers feature, and review the list of default rules included with Proactive Triggers.

Role required: sn_pt.proactive_admin or admin

About this task

Select a default rule in the Proactive Triggers rules list to see how the default rule is defined. Admins or proactive admins can use these rules, change them, or create rules. After a rule is created, the admin creates one or more actions that are triggered by the rule. Actions define the messages that end users see based on the rule and the next steps available for the end users to take. For examples of default rules and action types, see Exploring Proactive Triggers.

Procedure

1. Navigate to **Conversational Interfaces** > **Settings** > **General**, and then select **View All** next to Proactive Triggers **Rules**.
   The list of default rules included with Proactive Triggers is displayed.
2. Select **New** to display the Proactive Rule form.
3. On the Proactive Rule form, fill in the fields.
   For a description of the field values, see Proactive Rule form.
4. Select **Submit**.
   The rule is created and is displayed in the list of available rules.
5. Select the newly created rule, and then go to the Proactive Actions related list.
6. Select **New** and, when prompted, choose the action type for the rule.

Action types

Action type	Description
Message only	End users see an HTML pop-up message.
Message that launches a virtual agent topic	End users see an HTML pop-up message that directs them to an available Virtual Agent topic.
Message that launches a selection of virtual agent topics	End users see an HTML pop-up message with up to three suggested action buttons that direct them to a relevant Virtual Agent topic.

Note:
If you've created Live Agent rules, you can only select Message action types for those rules.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. On the Proactive Action form, fill in the fields.
   For a description of the field values, see Proactive Action form.
8. **Optional:** If you select the **Message that launches a selection of virtual agent topics** action type, work with the following default list columns on the Proactive Action Virtual Agent Topic Controls related list to determine the button display order:

Proactive Action Virtual Agent Topic Controls related list

Column	Description
Label	The button label that appears to end users. Double-click (or use the keyboard shortcut) the value to enter a button label up to a maximum of 40 characters. Leave this value empty if you want to have the label auto-populate with the topic title.
Topic	The Virtual Agent topic that end users interact with after they've selected the button. Double-click (or use the keyboard shortcut) the value to enter or search for a Virtual Agent topic.
Active	The active status of the rule action. A rule needs at least one active action for the rule to be triggered. Double-click (or use the keyboard shortcut) to select either **true** or **false**. Leave this value empty to auto-populate this value to **true**.
Order	The button order that is displayed on end users' screens. Double-click (or use the keyboard shortcut) to enter the button preference order. Leave this value empty if you want to auto-populate with the next available order number that increments by one.

Note:
Up to three buttons can appear in the proactive message.

9. Select **Submit**.
   The Proactive action is created.

   You can create additional rules and actions as needed. For information about using multiple rules and actions, see Multiple Proactive Triggers rules and actions.

   You can localize the language for end users by making entries to the Translated Text table. For more information about making entries to the Translated Text table, see Translating text fields.

Result
The triggering rules and actions are ready for you to validate and test.

Create custom trigger types

Create your own trigger type during the rule creation process that is specific to your organization for improved Proactive Triggers usage.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_pt.proactive_admin or admin

About this task
For a more advanced configuration, create your own custom trigger types. You can create custom trigger types through two different paths.

1. Through the **View All** button next to the **Trigger types** field in **Conversational Interfaces** > **Settings** > **General** > **Proactive triggers**.
2. Through the rule creation process.

Procedure
1. Navigate to **Conversational Interfaces** > **Settings** > **General**, and then select **View All** next to the **Rules** field in Proactive Triggers.
2. Select **New** to display the Proactive Rule form.
3. Next to the **Trigger type** field, select the create new trigger type icon ( ).
4. On the form, fill in the fields.

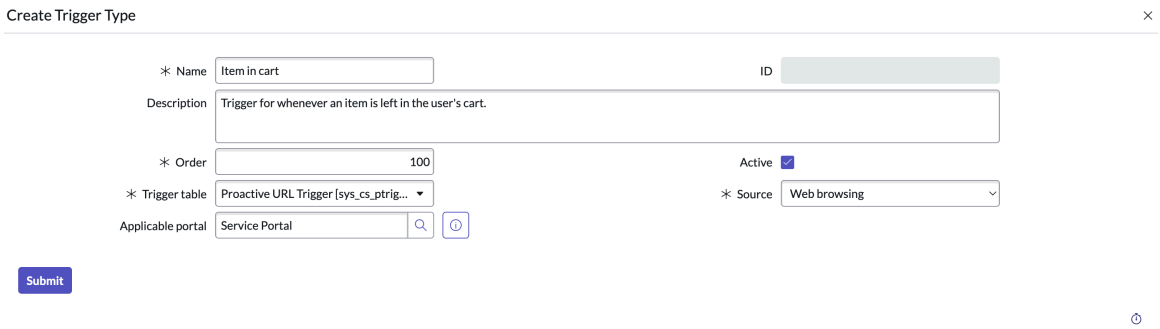
Proactive Triggers Create Trigger Type form

Field	Description
Name	Name of the custom trigger type.
ID	System-generated, read-only ID required for API calls. This ID is only displayed after you've submitted the new trigger type and you view the trigger record.
Description	Trigger type description.
Order	Trigger run order whenever two rules conflict in the same time frame. The lowest number is evaluated first when multiple triggers are running at the same time.
Active	Option to activate the trigger type so that it's available as a trigger type when creating a rule.
Trigger table	The table referenced in the rule condition builder. Only one trigger type can exist for the same referenced table. For example, if you try to create a trigger type referencing the Knowledge [kb_knowledge] table with a Web browsing source, an error appears when saving the trigger type. This error appears because the default Knowledge trigger already uses this same table and source.
Source	The trigger initiation is either **System API** or **Web browsing**. ○ **System API**: Calls the Proactive Triggers API. For example, a business rule on the trigger table calls the API that initiates the trigger.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: Trigger types with the **System API** source only work for internal ServiceNow sites and not external sites. ○ **Web browsing**: Calls to a URL. The default active trigger types are associated with the web browsing source.
Applicable portal	The trigger type is only applicable to select pages on a particular portal.

Example of a custom trigger type



5. Select **Submit**.
   The new, custom trigger type appears as the **Trigger Type** field value.

What to do next

After creating the custom trigger type, the **Create new trigger type** button updates to the **Preview this record** button ( ). Select **Preview this record** to preview the new trigger type that you created and view the system-generated ID. To make edits to this trigger type, select **Open Record** to manage the parameters of the custom trigger type.

Also, you can make edits to this new trigger type by selecting **View All** next to the **Trigger types** field in **Conversational Interfaces** > **Settings** > **General** > **Proactive triggers**.

Multiple Proactive Triggers rules and actions

The Proactive Triggers feature uses rules and actions to trigger context-specific Virtual Agent conversations with end users on the web client.

An admin enables the Proactive Triggers feature.

An admin then creates rules and defines actions that are triggered by those rules. Admins can create multiple rules and actions. They also specify the end user that the rules and actions apply to.

Multiple rules can be defined with the same trigger type references (for example, catalog item, knowledge, portal home, URL) as long as the **Order** and **Delay time** settings are different. Multiple rules defined on the same trigger type references let you layer messages based on how long the end user is on the page.

A rule can include more than one action, but ensure that you apply the action to different users in the **Applies to** fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you have errors when you create a rule, check the following fields to see if there's a conflict:

Tip:
The error message that appears includes a link that you can select to help you identify the conflicts.

Error message example

- **Trigger type**
- **Delay time**
- **Order**

It may be necessary to clear the rule's history for the rule to function as anticipated. When you set your rule's **Frequency** field to **Once per user** and you want to run the rule again, you must clear the history. Clearing the history lets you apply the rule again for that user. To clear the rule's history, select **Clear History** on the rule's Proactive Rule form. After the history clears, an admin must reactivate the rule.

Clear History example

Manage Proactive Triggers

Manage Proactive Triggers

After admins have installed Proactive Triggers and created related actions and rules, admins can check that the Proactive Triggers feature is performing as expected. For example, admins can view the Proactive Execution History table and the Proactive Daily Report table.

This topic includes information admins can use to see if the Proactive Triggers feature is performing as expected. For example, admins can review the Proactive Triggers history tables to make sure that the rules and actions are working as intended.

This topic also includes common issues that admins may encounter when they're creating rules and actions, along with the proposed solutions.

View Proactive Triggers history and report tables

To see if the Proactive Triggers feature is running as intended, admins can review these two tables' data:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Proactive Execution History#(sys_cs_ptrigger_execution) table
  - Real-time execution history of Proactive Triggers events.

    Tip:
    The Notes column provides a brief rule execution status. For additional information about why Proactive Triggers didn't run successfully, select the execution event from the Created column, and then view the **Details** field under the **Others** section.

  - The data from this table is removed every seven days.
- Proactive Daily Report (sys_cs_ptrigger_report_daily) table
  - Aggregated execution data by user, rule, and action per day.
  - Execution data is processed every hour and updates this table.
  - The data from this table is removed every 35 days.

Common issues and resolutions

The following table lists issues that you may encounter when you're creating rules and actions, and the suggested resolutions.

Issue	Resolution
If a trigger type is defined as a URL in the rule, when the page is actually a catalog item, knowledge, or portal, the rule won't run.	Admin must fix the rule to match the page type.
The **Frequency** is set to run once per user but the rules don't run.	Clear the rule history at the rule level. For details on clearing the rule history, see Multiple Proactive Triggers rules and actions.
Rule doesn't run for some end users, and the **action** type selected is **virtual agent topic**.	End users may not have access to the Virtual Agent topic defined on the action. Check the access to the topic in Virtual Agent Designer.
The Proactive Triggers rule doesn't run.	Close any active conversations in the Virtual Agent chat widget.

Proactive Triggers reference

The following section details the installed components for Proactive Triggers.

Components installed with the Proactive Triggers feature

When the Proactive Triggers feature is installed, the feature includes required components, such as specific roles and tables. Admins can review these roles and tables to make sure that the feature has been installed correctly.

Note:
The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application Find components installed with an application.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles installed with the Proactive Triggers feature

Role title [name]	Description	Contains roles
Proactive_admin [sn_pt.proactive_admin]	Allows users to create proactive rules and have access to related tables and related records	• user_criteria_admin • sp_admin

Tables installed with the Proactive Triggers feature

Table	Description
Proactive Custom Trigger Types [sys_cs_ptrigger_trigger_type_list]	Create and view custom trigger types
Proactive Rules [sys_cs_ptrigger_rule]	Stores all Proactive Triggers rules
Proactive Actions [sys_cs_ptrigger_action]	Parent action table
Proactive Virtual Agent Topic Action[sys_cs_ptrigger_va_topic_action]	Extended table from action for Virtual Agent action
Proactive Execution History #[sys_cs_ptrigger_execution]	Execution history for the last 7 days
Proactive Daily Report [sys_cs_ptrigger_report_daily]	Aggregated execution data by user, rule, or action per day

Proactive Triggers roles

Proactive Triggers adds the Proactive Triggers admin role.

To learn more about managing subscriptions, see Managing per-user subscriptions in Subscription Management and contact your account representative.

Installed roles

Role title [name]	Description	Contains Roles	Groups	Elevated	Considerations
Proactive Triggers admin [sn-pt.proactive_admin]	Users who create proactive rules and have access to related tables and related records.	• User Criteria Administrator [user_critera_admin] • Service Portal administrator [sp_admin]	None.	No	Users assigned this role can access any related tables and records including potentially protected information, as well as proactive rules.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

Simplify user administration by creating groups that contain all the roles necessary for specific personas rather than to individual users. You can then assign individual users to those groups. When users transition to new roles, you can then re-assign their group memberships, and avoid scenarios where users retain unexpected roles.

For details on the administration of users, groups, and roles, see User Administration.

Proactive Triggers admin [sn-pt.proactive_admin]

Users who create proactive rules and have access to related tables and related records.

Contains Roles

List of roles contained within the role.

- User Criteria Administrator [user_critera_admin]
- Service Portal administrator [sp_admin]

Groups

List of groups this role is assigned to by default.

None.

Special considerations

Important:
Avoid granting an admin role when more specialized roles are available.

Domain separation and Proactive Triggers

Domain separation is supported for Proactive Triggers. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Overview

The Proactive Triggers rich text pop-up messages provide users with actions according to real-time Proactive Triggers data. Domain separation is enabled and supported at the basic level.

How domain separation works in Proactive Triggers

Each domain has its own set of rules and trigger types that are evaluated independently of other domains.

Domain separation for service providers

Proactive Rule form

When creating a Proactive Triggers rule, the Proactive Rule form includes the following fields.

Proactive Rule form

Field	Description
Name	Name of the new rule that you want to create.
Type	Proactive Triggers conversation type for end users. Choices are: • Virtual Agent Rules are triggered when the Virtual Agent is available. • Live Agent only Rules are triggered when the web client is configured to live agent only. You can configure the web client to live agent only from the Service Portal. For instructions, see Configure Agent Chat in a portal.
Description	Rule description.
Order	Order of when a Proactive Triggers rule is to be applied. If there's more than one rule, the rules with lower numbers for a particular delay time are applied first.
Active	Option to activate the rule.
When to run the trigger	
Frequency	How often the rule should be applied. Choices are: • Every time: Every time an end user visits the page. • Once per visit: Every time an end user visits a page per user log in.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Proactive Rule form (continued)

Field	Description
	• Once per user: Applies the rule only the first time that an end user visits the page. With this frequency setting, you must clear the rule's history if you want to run this rule again for a user. For more information about clearing the rule history, see Multiple Proactive Triggers rules and actions.
Delay time	Time to wait before the rule is applied. Choices are: • None • 10 seconds • 20 seconds • 30 seconds • 1 minute • 3 minutes
What initiates the trigger	
Trigger type	System API or web browsing URL for the type of trigger. Select the lookup list icon ( ) to view your default choices. If enabled, your default system API choice is **Search Event**. This trigger type triggers an action when no search results are found on the Service Portal or Employee Service Center. **Tip:** Ensure that your Proactive Trigger business rule (**Proactive Trigger on Search**), trigger type (**Search Event**), rule (**Search - No Search Result**), and action (**No Search Result Message**) have the **Active** option turned on so that this rule runs effectively. These parameters default to inactive. Your default web browsing URL choices are: • **Catalog item**: Triggers an action based on the catalog item's reference fields. • **Knowledge**: Triggers an action based on the knowledge article's reference fields. • **Portal home**: Triggers an action based on the portal home page's reference fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Proactive Rule form (continued)

Field	Description
	• **URL**: Triggers an action based on the defined URL. Define the URL components as shown in this example. **Important:** ○ If you're using the Virtual Agent web client outside of the ServiceNow instance (for example, as part of a third-party website), use the URL trigger type. Don't use any of the other trigger types. ○ The URL trigger type applies only if no other available trigger types match the URL. If you don't see the trigger type that you need using the lookup list icon ( ), you can create your own custom trigger type. For more information about custom trigger types, see Create custom trigger types.
Conditions	Conditions that must be met for the trigger type to run as defined by the admin. Conditions vary by trigger type. Specify the Proactive Triggers conditions that you want to use. For more information about using conditions, see Condition builder . **Note:** Rule conditions are case-sensitive and must match. For example, if you want to use the name of a catalog item, such as the iPhone condition, entering "iphone" doesn't give you the results that you want. 
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Proactive Rule form (continued)

Field	Description
	Note: When specifying the conditions that must be met for a trigger type, be careful not to specify conflicting trigger types and conditions. Conflicting URL trigger types and conditions can cause errors. For more information, see Manage Proactive Triggers.
Advanced conditions	Option for using scripts to define the condition. Find available agent	Option to check for any available live agents.

Proactive Action form

When creating a Proactive Triggers rule, the Proactive Action form includes the following fields.

Proactive Action form

Field	Description
Name	Name of the action that you want to associate with a rule.
Description	Description of the action to be applied.
Applies to	The set of end users to which this action applies. For example, you can apply an action to any **Any Users** or **Guest Users** user criteria. Use the lookup using list icon ( ) to select the user. The **Applies to** settings must be unique for the actions for each rule. To create a user criteria record, see Create a user criteria record for Service Portal . **Note:** If you don't specify a user, this rule is applied to all users.
Model Type	Topic type, either an **LLM** or **NLU/Keyword** value, that is associated with the Proactive Triggers action. This field is only applicable if Now Assist is installed and enabled.
Topic	List of Virtual Agent topics available. The selected topic runs when end users open the Proactive Triggers message.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Proactive Action form (continued)

Field	Description
	Note: Only the topics that are active and published appear in the list. System topics aren't included in the topics list. (For **Message that launches a virtual agent topic** actions only.)
Active	Option to activate the action.
Order	Order of when a Proactive Triggers action is to be applied. If there's more than one action, the actions with lower numbers are applied first.
Rule	Rule to which this action applies.
Select variables from	Option for choosing from a list of variables to use in the message. Choices are: • Trigger Type: References the trigger type table selected for the rule. • User: References the user table. Uses the attributes in the user table for the Proactive Triggers message.
Message	Text that the end users see when the action is applied. To enter the text, you can: • Use the tools and options of the HTML editor. **Note:** Support for using the link button may be included in future releases. • Use variables (Trigger Type or User).
Tagline	Text that the end users see above the buttons that you've created. The default tagline text is `Suggested for you`. (For **Message that launches a selection of virtual agent topics** actions only.)

Interaction Management

Interactions provide a centralized location for all communication channels in the platform. Each interaction represents a request for assistance through a given channel, for example, a call or a chat. The purpose of Interaction Management is to help get insights into the channel's effectiveness.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Overview of Interaction Management

The ServiceNow AI Platform offers several forms of queuing and communication management, but each system is tightly coupled to the specific area. Interactions offer an alternative, flexible, and more extensible option so that each product area can use the same framework.

Get started

Activate

Activate Interaction Management.

Configure

Configure interaction components, determine which actions occur depending on the state of the interaction, and configure States determine the behavior for interactions. For each state of the interaction life cycle, you determine which routine actions to perform.

Use

Manually create interactions or associate records with an interaction.

Reference

Learn about the components installed with Interaction Management.

Troubleshoot and get help

- Virtual Agent interaction records
- ServiceNow Community forums
- Search the Known Error Portal for known error articles
- Contact Customer Service and Support

Activating the Interaction Management system

An administrator can activate the Interaction Logging, Routing, and Queueing plugin (com.glide.interaction) to access the functionality.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the **Interactions Management** plugin (com.glide.interaction) using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Configuring Interaction Management

You can configure the behavior of an interaction and the types of information that is stored with the record. You can also use interaction wrap up to provide agents with a brief wrap-up period at the end of customer conversations.

Interaction states

Configure the behavior of an interaction by determining the routine behavior for each state that the interaction goes through during the life cycle.

Interaction framework

Configure each of the following interaction components to determine the behavior and life cycle.

- Lists: Configure the interaction list view. You can also extend the interaction table. For more information about configuring lists, see Configuring lists on the ServiceNow AI Platform®.
- Forms: Configure the form view to tailor interactions for each application. For more information about configuring forms, see Configuring forms on the ServiceNow AI Platform®.

Interaction states

States determine the behavior for interactions. For each state of the interaction life cycle, you determine which routine actions to perform. For example, the *`On Created`* state would have a script that creates an interaction and then adds the end user as the 'opened for'. The script then sends a message to the end user to let them know that the interaction has been opened.

Interaction states

State	Description
New	An interaction is inserted into the interaction table.
On Hold	The interaction is waiting for assignment.
Work In Progress	An agent accepts an unassigned interaction.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Interaction states (continued)

State	Description
Wrap Up	This state indicates that the agent has completed a conversation with a customer and is wrapping up the interaction. This state is available if an interaction wrap up configuration has been created for the specific type of interaction and that configuration is active. For more information, see Interaction wrap up.
Closed Complete	The interaction timed out or the agent or consumer intentionally closed the interaction.
Closed Abandoned	The interaction is closed because the consumer disconnects or is unresponsive.

Interaction context and channel metadata

Context and channel metadata are document ID fields included as part of interactions. Both types of records store information about the interaction.

Context

Context for an interaction tracks the information for an interaction, such as the initial question, asset tagging, or device location. Context records are stored on the interaction_json_blob table by default, however you can use any table to store a context record.

Channel metadata

Channel metadata contains the information needed to interact with the channel on which communication is happening on, for example, the chat or phone channels. Channel metadata can be free-form JSON or a reference to another record.

Interaction wrap up

Interaction wrap up provides agents with a brief wrap-up period at the end of customer conversations. Agents can use this time to complete their work before moving on to assist other customers.

Interaction wrap up is a feature available for all types of interactions. When enabled, an interaction record moves from the Work In Progress to the Wrap Up state at the end of a customer conversation. This brief, configurable period enables agents to complete tasks such as posting work notes and updating record information before moving on to other work items.

While in the Wrap Up state, an agent's capacity is not reduced until the state of the interaction moves to Closed Complete.

Note:
The interaction wrap up feature works with multiple types of communication channels. This feature supports a chat and messaging interactions base system.

Configuring interaction wrap up

Users with the system administrator role create an interaction wrap up configuration for the desired communication channel. Creating a configuration automatically enables the feature and the Wrap Up state for interactions that match the configuration settings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The interaction wrap up configuration includes the following information:

- The selected communication channel.
- Additional conditions that apply to the interaction records included in the configuration.
- Whether wrap up is automatically ended by the system and, if automatically ended the duration of the wrap up period.
- Whether a countdown timer that displays the wrap up duration is shown to agents in CSM Configurable Workspace.

The interaction wrap up configuration adds the Wrap Up state to the **State** field on the Interaction record. For more information about the wrap up state, see Interaction states.

Starting wrap up

The wrap up period begins when either the agent or the customer ends a conversation. The system then does the following:

- Moves the state of the interaction from Work in Progress to Wrap Up.
- Starts a countdown timer for the wrap up duration period.

Manually ending wrap up

Ending the wrap up period can be performed manually by the agent or automatically by the system.

Agents can end the wrap up by clicking **End Wrap Up** on the Interaction record, which moves the interaction from Wrap Up to Closed Complete.

Agents can also end the wrap up period by closing the interaction record tab.

- If the interaction is in the Wrap Up state, closing the tab ends the wrap up period and moves the interaction to Closed Complete. The system displays a message to the user about ending the wrap up period.
- If the interaction is in the Work in Progress state, closing the tab skips the wrap up period and moves the interaction to Closed Complete.

Automatically ending wrap up

If an agent has not already ended wrap up, the system can automatically end the wrap up period after a set period of time. Automatic wrap up must be enabled in the interaction wrap up configuration.

- The system starts the wrap up duration timer when the wrap up period starts.
- When the wrap up duration timer reaches zero, the system ends wrap up and changes the state from Wrap Up to Closed Complete.
- The system sets the **System wrap up** field on the Interaction record to True.

Note:
Agents can manually end the wrap up period even if automatic wrap up is enabled.

Interaction form

The Interaction form displays information about a customer interaction.

The interaction form includes the following fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Number	The automatically assigned interaction number.
Type	The type of customer interaction, such as a chat or phone call.
Account	The name of the customer contact's company. This field is filled in automatically if the information is available in the contact record.
Contact	The name of the customer contact.
Consumer	The name of the consumer.
State	The current state of the interaction. For more information, see Interaction states.
Assigned to	The name of the assigned user.
Short description	A brief description of the customer issue.
Work notes	Records information about the interaction and the work being done to resolve the customer issue.
Wrap up duration	If using the Interaction wrap up feature, the system administrator can configure the Interaction form and add the **Wrap up duration** field. This field records the length of time that the Interaction record spends in the Wrap Up state. This is a read-only field. If a duration is not calculated, this field is set to 0. Duration is calculated as the time an interaction is in the Wrap Up state before moving to either Closed Complete or Closed Abandoned. **Note:** If an agent closes the tab and ends the interaction, the wrap up duration is recorded as 0 seconds.
System wrap up	If using the Interaction wrap up feature, the system administrator can configure the Interaction form and add the **System wrap up** field. The system determines if the interaction wrap up was performed manually by an agent (by clicking **End Wrap Up**) or automatically by the system and sets this field accordingly. • Set to **True** when automatic wrap up is enabled and the system moves an interaction from the Wrap Up state to either

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Closed Complete or Closed Abandoned at the end of the wrap up duration. • Set to **False** when an agent manually wraps up an interaction. The default value for this field is false.

Interaction wrap up timer

The interaction wrap up timer displays a countdown of the wrap up duration period in CSM Configurable Workspace.

The system administrator can configure the display of the wrap up timer by enabling the **Show duration to agent** field on the Interaction Wrap Up Configuration form.

The read-only timer appears in an interaction record's secondary values. Depending on the configuration of the secondary values, these values can be displayed either in the form header or in the contextual side panel.

Note:
The interaction wrap up timer works in both CSM Configurable Workspace and CSM Agent Workspace but the timer display is only available in CSM Configurable Workspace.

The timer counts down the amount of time specified in the **Duration in seconds** field on the Interaction Wrap Up Configuration form. The background color of the timer changes as it counts down the duration.

Timer color	Description
Green	Time remaining is between 100% to 50% of duration.
Yellow	Time remaining is between 50% and 25% of duration.
Orange	Time remaining is between 25% and 0% of duration.
Red	When the timer reaches 0.00, the display turns red and then disappears. The system updates the state of the interaction record to Closed Complete.

Interaction wrap up scheduled job

The interaction wrap up feature includes a scheduled job to close any interactions in the Wrap Up state that were not closed either manually by an agent or automatically by the system.

Ending the wrap up period is typically performed in the following ways:

- Manually by the agent.
- Automatically by the system, if the **Enforce wrap up duration** setting is enabled in the interaction wrap up configuration.
- By closing the workspace tab.

While most interaction records are automatically closed when the configured wrap up period ends, the interaction wrap up feature also includes a scheduled job to close any remaining records. For example, if the **Enforce wrap up duration** setting is not enabled in the configuration and agents close interactions by closing the browser, these interactions can remain in the Wrap Up state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **Fallback Timeout for Interactions in Wrap Up** scheduled job functions as a fail-safe method for closing interaction records that remain in the Wrap Up state. This scheduled job:

- Evaluates interaction records in the Wrap Up state.
- Closes those records that have been in the Wrap Up state longer than the time specified in the Max Wrap Up system property.

The Max Wrap Up system property (**com.glide.interaction.max_wrapup_duration**) defines the length of time that an interaction record can be in the Wrap Up state. The default value for this property is 15 minutes.

The time value set in the Max Wrap Up system property must be greater than the time value set in the **Enforce wrap up duration** field on the Interaction Wrap Up Configuration form.

The default run interval for this scheduled job is five minutes. The system administrator can configure this time interval.

Note:
This scheduled job is inactive by default.

Create an interaction wrap-up configuration

Create a configuration for each type of interaction that uses the interaction wrap up feature.

Before you begin
Role required: admin

About this task
Creating a configuration automatically enables the interaction wrap up feature and adds the Wrap Up state for interactions that match the configuration settings.

Navigate to **All** > **Interactions** > **Wrap Up Configuration** to display the list of wrap up configuration records. These configurations are stored in the Interaction Wrap Up Configuration (interaction_wrap_up_configuration) table.

Procedure

1. Navigate to **All** > **Interactions** > **Wrap Up Configuration**.
2. Click **New**.
3. Fill in the fields on the Interaction Wrap Up Configuration form.

Field	Description
Name	The name of the interaction wrap up configuration.
Table	Read only. The table that stores the interaction records to which this configuration applies.
Application	The application that contains this record. The default is CSM and FSM Configurable Workspace Foundation.
Active	Indicates whether the configuration is active. The default value is true.
Order	The order of the configuration, which is used in evaluation processing of wrap up

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	configuration records. If there are multiple records, the lower order number takes precedence over higher numbers. The default value is 100.
Conditions	Use the condition builder to select the conditions that apply to the interaction records included in this configuration. For example, create a condition for chat interactions: **[Type]** [is] **[Chat]**.
Enforce wrap up duration	Enables the system to automatically end the wrap up period. The default value is false. If enabled, the system automatically ends the wrap up period at the end of the wrap up duration (set in the **Duration in seconds** field) and moves the state of the interaction record from Wrap Up to Closed Complete.
Duration in seconds	The duration of the wrap up period. ○ The default value is 60 seconds. ○ The value must be greater than 0. The system displays this field when you enable the **Enforce wrap up duration** field.
Show duration to agent	Enables a duration countdown timer for the agent. The default value is false. The system displays this field when you enable the **Enforce wrap up duration** field. The interaction wrap up timer display is available in CSM Configurable Workspace.
Enable wrap up codes	Enables wrap up codes in CSM Configurable Workspace. When wrapping up an interaction, agents can select from the configured wrap up codes.
Allowed wrap up codes	The list of wrap up codes that agents can select from when wrapping up an interaction.
Default wrap up code	The default wrap up code that is used if an agent does not select a code before the wrap up duration ends.

4. Click **Submit**.

Create interaction wrap-up codes

Wrap-up codes enable agents to quickly wrap up and close interactions. Agents can select wrap-up codes from the interaction wrap-up modeless dialog.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
Users with the system administrator role can create wrap-up codes for agents to use during the wrap-up period. When interaction wrap-up codes are enabled, agents can select wrap-up codes from the interaction wrap-up modeless dialog.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **Interaction** > **Wrap Up Codes**.
2. Select **New**.
3. Fill in the fields on the Interaction Wrap Up Code form.

Field	Description
Code	The name of the wrap up code.
Application	The application that contains this record. The default is CSM and FSM Configurable Workspace Foundation.
Active	Indicates whether the interaction wrap-up configuration is active. The default value is true.
Description	A brief description of the wrap-up code.

4. Select **Submit**.

What to do next
After creating wrap-up codes, system administrators can enable wrap-up codes in the interaction wrap-up configuration record and select the wrap-up codes that are available to agents. For more information, see Create an interaction wrap-up configuration.

Enable interaction wrap-up codes

Enable interaction wrap-up codes and select the wrap-up codes that are available to agents in the interaction wrap-up modeless dialog.

About this task
Users with the system administrator role can enable wrap-up codes for agents to use during the wrap-up period. When enabled, agents can select wrap-up codes from the configured list in the interaction wrap-up modeless dialog.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **Interaction** > **Wrap Up Configuration**.
2. Select a configuration record.
3. In the Duration related list, enable the following fields.
   - **Enforce wrap up duration**
   - **Show duration to agent**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Enter a value in the **Duration in seconds** field.
5. In the Codes related list, enable the **Enable wrap up codes** field.
6. In the **Allowed wrap up codes** field, select the desired codes and move them from the Available column to the Selected column.
7. Select a **Default wrap up code**.
8. Select **Update**.

Using Interaction Management

Most interaction creation takes place in other applications, to control channels. When needed, you can create an interaction from the Interaction application.

For more information about how interaction are created in other applications, see:

- Interaction Management in Service Operations Workspace
- Interaction Management in Source-to-Pay Workspace
- Interaction Management in Supplier Lifecycle Operations
- Interaction management in Accounts Payable Operations
- CSM Interaction record page

Create an interaction

An interaction is a record of a conversation between a requester and a fulfiller (real or virtual). Though most interaction creation takes place in other applications, if needed, you can create an interaction directly from Interaction Management.

Before you begin

Role required: interaction_agent

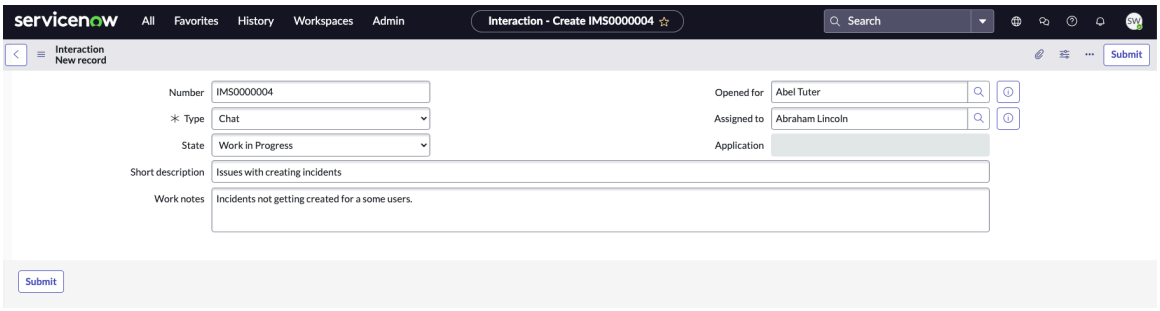
Procedure

1. Navigate to **All** > **Interaction** > **All**.
2. Select **New**.
3. In the Interaction form, fill in the fields:

Field	Description
Type	Select the type of interaction. For example, chat, phone, and so on.
Opened for	Select the user who started the interaction.
Assigned to	Select the user to whom the interaction is assigned.
State	Select the current state of the interaction.
Short description	Enter the basic details of the interaction.
Work notes	Enter relevant additional information.

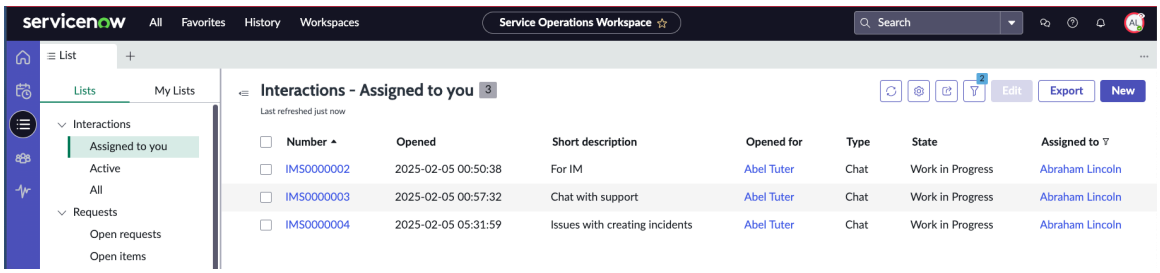
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select **Submit**.



Result

The interaction is created and assigned to the selected user.



Associate a record with an interaction

As an agent, you might need to create a record on another table to work on an interaction. You can associate the record with the interaction.

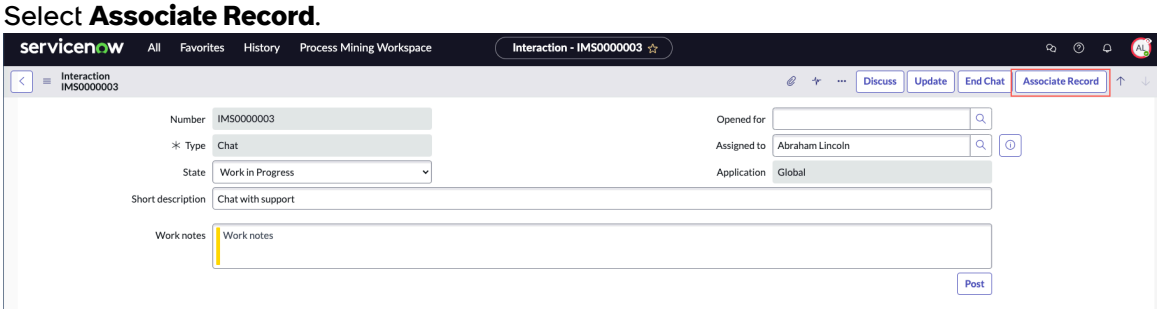
Before you begin

Role required: interaction_agent

Note:
You must also have the roles required to access the records that you want to associate with the interaction.

Procedure

1. Navigate to **All** > **Interaction** > **Assigned to me**.
2. Open the interaction you want to associate with another record.
3. Select **Associate Record**.



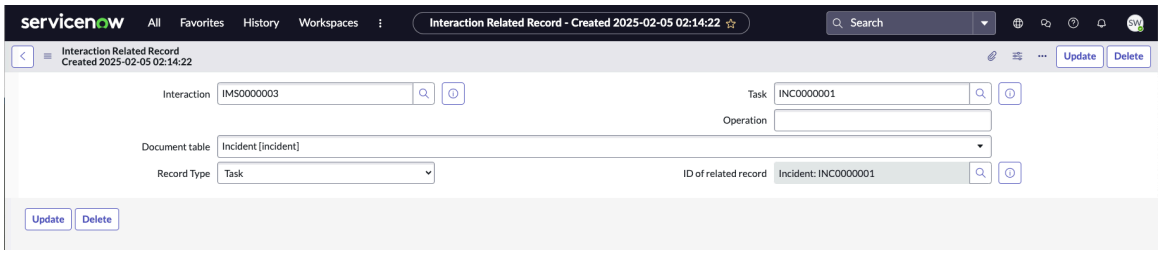
4. In the Interaction Related Record form, fill in the fields:

Field	Description
Document table	Select the table where the association is saved.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Record Type	Select the type of record that you are associating with the interaction. Record type can be **Task** or **Knowledge**.
Task	Select the task you want to associate with the incident. Task field becomes available when the record type is selected as Task.
Knowledge article	Select the knowledge article you want to associate with the incident. Knowledge article field becomes available when the record type is selected as Knowledge.
ID of related record	Automatically updated with the task or knowledge number.

5. Save the form.



Result

Task type records associated will appear in the Related Tasks related list for the interaction.

Components installed with Interaction Management

Several types of components are installed with activation of the Interaction Logging, Routing, and Queueing plugin, including tables and user roles.

Note:
The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Roles installed

Role title [name]	Description	Contains roles
Interaction Administrator [interaction_admin]	Configure interactions for users.	interaction_agent
Interaction Agent [interaction_agent]	Create and edit interactions. Transfer interactions to different agents or queues.	None

Tables installed

Table	Description
Interaction [interaction]	Table for all interaction records.
Interaction JSON blob [interaction_json_blob]	List of records that store context information for each interaction.
Interaction related record [interaction_related_record]	List of related records that have been associated with an interaction.

Live Feed Core UI

Live Feed is a social IT application that provides a place to post and share content in a ServiceNow® instance.

Important:

Core UI is required to use Live Feed. Live Feed is not supported in Next Experience. If you turn on Next Experience, Live Feed is automatically disabled and will no longer work. See Next Experience UI for more information.

While Live Feed has been discontinued, we are always exploring new ways to enhance our services. Stay tuned for future updates and improvements.

© 2026 ServiceNow, Inc. All rights reserved.

Exploring Live Feed Core UI

Live Feed content forms a searchable knowledge source for sharing information within an organization.

Live Feed overview

Important:

Core UI is required to use Live Feed. Live Feed is not supported in Next Experience. If you turn on Next Experience, Live Feed is automatically disabled and will no longer work. See Next Experience UI for more information.

While Live Feed has been discontinued, we are always exploring new ways to enhance our services. Stay tuned for future updates and improvements.

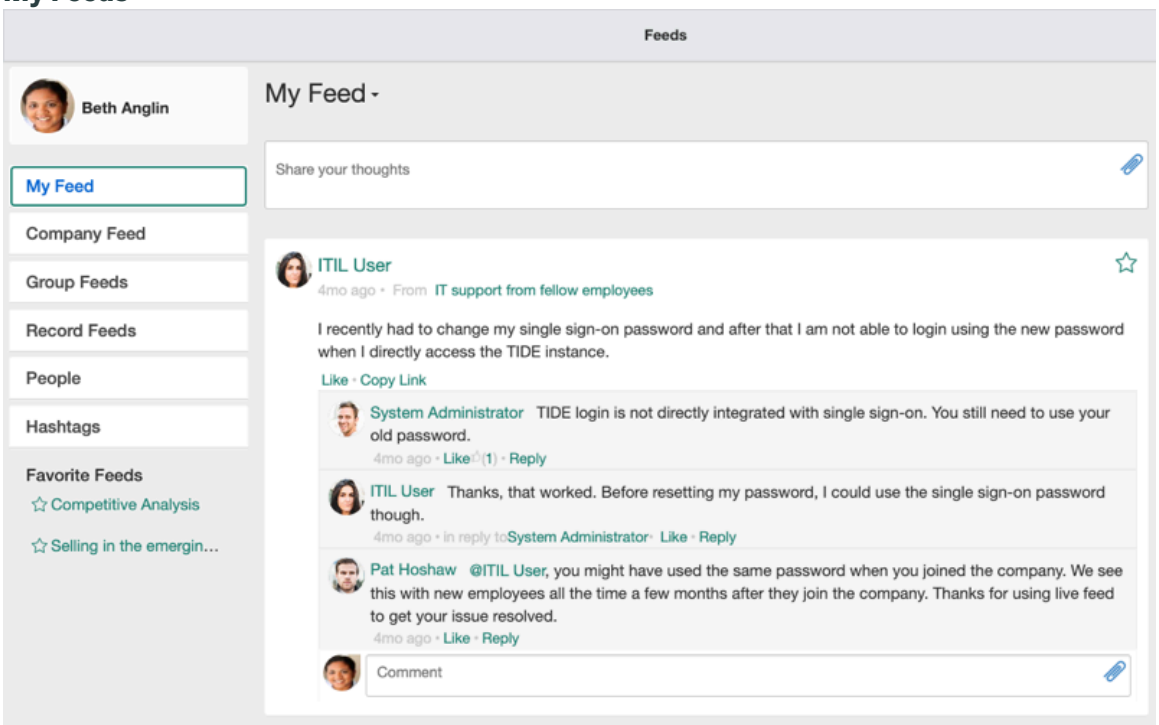
Live Feed content forms a searchable knowledge source for sharing information within an organization. Main features include the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Users can post, reply to, and rate messages, including links and images.
- Administrators can set up automatic messages that are generated when specific records are updated throughout the system.
- Users can subscribe to receive email notifications when new messages are posted.
- Users who take advantage of the accessibility options in the platform can tab through a Live Feed to navigate.

Live Feed includes different types of feeds, including company feeds, group feeds, individual feeds, and record feeds.

My Feeds



Note:
Live Feed v2 is active for all new instances by default. If you are upgrading from an earlier version of ServiceNow®, you need to activate Live Feed v2 to use these features.

Live feed can be domain separated at the data level only. For more information on Live Feed and domain separation, see Domain separation in Live Feed.

Live Feed users

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Live Feed browser support

The Live Feed v2 plugin does not support Internet Explorer 7 through 9.

Important:

Core UI is required to use Live Feed. Live Feed is not supported in Next Experience. If you turn on Next Experience, Live Feed is automatically disabled and will no longer work. See Next Experience UI for more information.

While Live Feed has been discontinued, we are always exploring new ways to enhance our services. Stay tuned for future updates and improvements.

Users who access the instance from those browser versions can use Live Feed v1 functionality. Users who access the instance from browsers that are compatible with HTML5 can use Live Feed v2 functionality.

Activating Live Feed

Live Feed is active for all instances. An administrator can activate the Live Feed plugin if it is not already active.

Before you begin

Role required: admin

Important:

Core UI is required to use Live Feed. Live Feed is not supported in Next Experience. If you turn on Next Experience, Live Feed is automatically disabled and will no longer work. See Next Experience UI for more information.

While Live Feed has been discontinued, we are always exploring new ways to enhance our services. Stay tuned for future updates and improvements.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Administering Live Feed

Administrators and users with the live_feed_admin role can configure Live Feed security and provide access to Live Feed from content management pages. Administrators can also set up Live Feed table notifications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

Core UI is required to use Live Feed. Live Feed is not supported in Next Experience. If you turn on Next Experience, Live Feed is automatically disabled and will no longer work. See Next Experience UI for more information.

While Live Feed has been discontinued, we are always exploring new ways to enhance our services. Stay tuned for future updates and improvements.

Document feeds

A document feed is a Live Feed group that is associated with a record, such as an incident or change.

Document feeds allow users to work on tasks and other records through the Live Feed interface. Users can post messages in Live Feed that are automatically maintained as comments or work notes on the record, if the record has these journal fields.

The benefits of using document feeds include the following.

- Improving communication between users working on the same record.
- Improving visibility into progress for end users.
- Providing a single place to see updates on multiple records.
- Saving conversation history in the record so that knowledge is not lost in an email chain.

To use document feeds, activate the Live Feed Document plugin, which is active by default in new instances. See Use Live Feed to work on records to learn how to use this feature.

The system automatically creates a document group for the feed when a user follows or shows a record on Live Feed. The system also creates a document group when a user creates a new record on a table that has Live Feed enabled.

The following list describes features of the document feed group.

- Is unlisted; it does not appear when users view all groups on Live Feed.
- Automatically approves membership for every user who can access the record.
- Uses the record number as the group name.
- Uses the record short description as a group description.
- Maintains all messages posted to Live Feed on the record, if the record has a journal field for comments. If the record has a standard text field for comments, each live post overwrites the field value.
- Maintains all messages posted on the record in Live Feed if the record has a journal field for comments. When the group is created, existing messages are added to the document feed.

A user who participates in Live Feed becomes a member of the group.

Activate a plugin

Add a Live Feed UI action on a table

You can add UI actions on a table to allow users to follow records in live feed.

Before you begin

Role required: ui_action_admin or admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **System Definition** > **UI Actions**.
2. Open one of the Live Feed UI actions, for example, the *Follow on Live Feed* list UI action.
3. In the *Table* field, select the table name.
4. Right-click the header and select **Insert** to create a copy of the UI action for the desired table.
5. Repeat steps 1 – 4 for all Live Feed UI actions.

Configure document feeds

You can configure a table to support document feeds.

Before you begin
Role required: personalize_dictionary or admin

Procedure

1. Add Live Feed to a form header.
2. Add *Follow on Live Feed* and *Show Live Feed* as list and form UI actions.

Security configuration for document feeds

Document feeds honor the access control rules (ACLs) for the associated record. Users can only view messages on the document feed if they have access to the same information on the record.

Consider the following examples:

- If an ACL allows a user to read and create comments on an incident, then the user can view and add messages posted as comments on the incident feed.
- If an ACL restricts a user from reading work notes, then the user cannot view messages posted as work notes on the incident feed.

Note:
Access control rules are only checked when a user first accesses the document feed. After users view the feed, an administrator must remove them manually to change their access.

Disable a record feed

You can disable Live Feed functionality from the form of any table.

Before you begin
Role required: personalize_dictionary or admin

Procedure

1. Navigate to **System Definition** > **Dictionary**.
2. Open the dictionary entry for the table.
3. Add `live_feed=false` in the **Attributes** field.
4. Click **Update**.

Note:

If the Collaboration feature is activated, you can remove the show Live Feed icon ( ) from all form headers. Set the *glide.live_feed.task_header_button* property to **collaboration**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Disable a document feed

You can disable a document feed from the form of any table.

Before you begin

Role required: personalize_dictionary or admin

Procedure

1. Navigate to **System Definition** > **Tables**.
2. Open the table record.
3. Clear the **Live feed** check box.
4. Click **Update**.

Business rule installed with Live Feed Document

This business rule is installed with Live Feed Document. There are no tables, roles, or notifications installed with it.

Business rule	Description
Live Feed integration	Writes journal comments to the Live Feed if there is a group for this record.

Record feeds

A record feed is a Live Feed group that is associated with a record, such as an incident or change.

Record feeds allow users to work on tasks and other records through the Live Feed interface. Users can post messages in Live Feed that are automatically maintained as comments or work notes on the record if the record has these journal fields.

You can use record feeds to do the following:

- Improve communication between users working on the same record.
- Improve visibility into progress for end users.
- Provide a single place to see updates on multiple records.
- Save feed history in the record so that knowledge is not lost in an email chain.

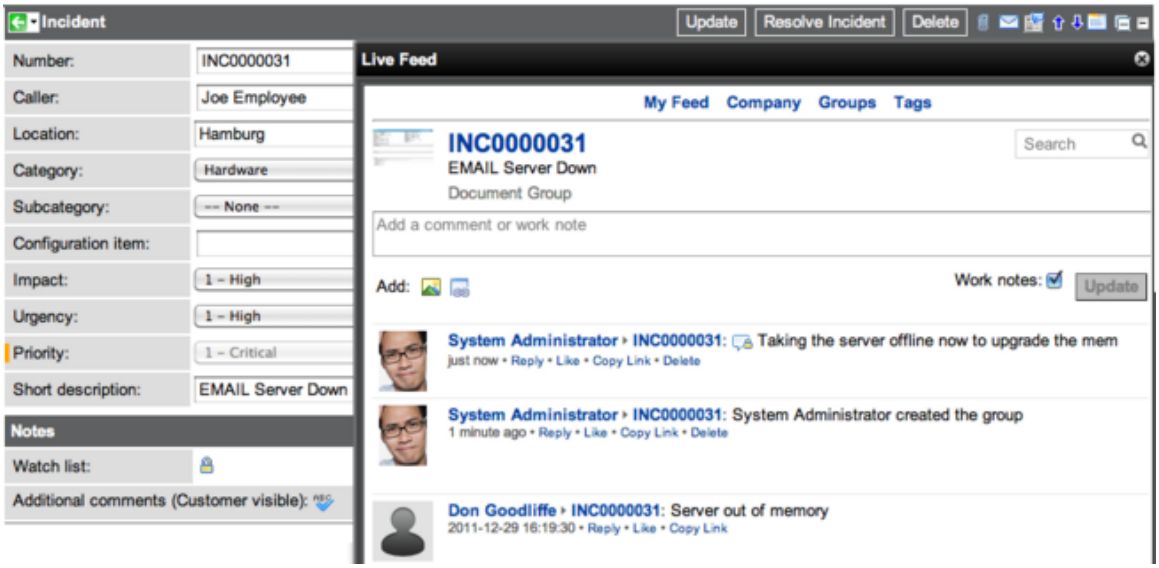
Live Feed document



Note:
Many of these features are part of Live Feed v2.

Activate the Live Feed Document plugin

The Live Feed Document plugin is active by default.

Before you begin
Role required: admin

About this task
Administrators can enable record feeds in an instance by activating the Live Feed Document plugin, which activates the Live Feed plugin if it is not active. For upgrades, administrators must activate the plugin.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Configure record feeds

Configure a table to support record feeds. You can add the Show Live Feed button in the form header and add the UI actions Follow on Live Feed and Show Live Feed as List and Form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

By default, the Show Live Feed icon appears on the form header for all tables that extend task, including the Incident, Change Request, and Problem tables, and in the list and form context menus for all task tables.

Add Live Feed to a form header

Add the **Live Feed** button in the form header for a table.

Before you begin
Role required: admin

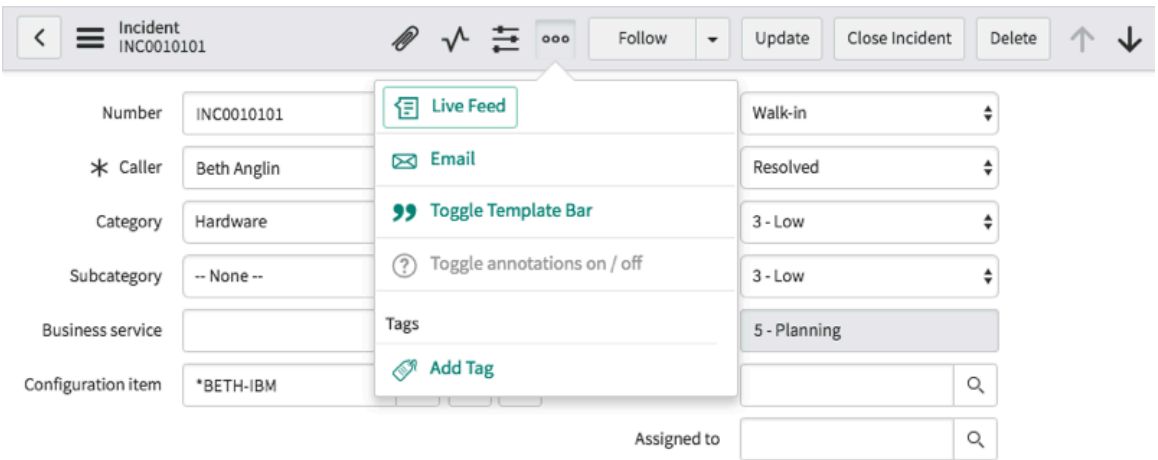
Procedure

1. Type `sys_properties.list` in the Application Navigator.
2. Open the record for *`glide.live_feed.task_header_button`*.
3. In the **Value** field, change the value to `both`.

> **Note:**
> By default, the value is `collaboration` so that the property is supported in the Collaboration (com.glide.collaboration) plugin. Changing the value to `both` allows the system property to be supported in Collaboration and Live Feed.

4. Click **Update**.
5. Navigate to **System Definition** > **Tables**.
6. Open the table record.
7. If the **Live feed** check box does not appear on the form, configure the form layout to add the **Live feed** field.
8. On the form, select the **Live feed** check box.
9. Click **Update**.
   Alternatively, you can add **live_feed=true** to the **Attributes** field in the dictionary entry for the table.

Result
The **Live Feed** button appears on the overflow menu of the form header.



Add Live Feed to a context menu

Add Live Feed UI actions on a table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

Procedure

1. Navigate to **System Definition** > **UI Actions**.
2. Open one of the Live Feed UI action, for example, **Follow on Live Feed**.
3. In the **Table** field, select the table name.
4. Right-click the header and select **Insert** to create a copy of the UI action for the desired table.
5. Repeat steps 1 – 4 for all Live Feed UI actions.

Disable a record feed

You can disable Live Feed functionality from the form of any table.

Before you begin
Role required: personalize_dictionary or admin

Procedure

1. Navigate to **System Definition** > **Dictionary**.
2. Open the dictionary entry for the table.
3. Add `live_feed=false` in the **Attributes** field.
4. Click **Update**.

Note:
If the Collaboration feature is activated, you can remove the show Live Feed icon ( ) from all form headers. Set the *glide.live_feed.task_header_button* property to **collaboration**.

Configure security

Record feeds honor the access control rules (ACLs) for the associated record.

Users can only view messages on the record feed if they have access to the same information on the record. For example:

- If an ACL allows a user to read and create comments on an incident, then the user can view and add messages posted as comments on the incident feed.
- If an ACL restricts a user from reading work notes, then the user cannot view messages posted as work notes on the incident feed.

Note:
Access control rules are only checked when a user first accesses the record feed. After users view the feed, an administrator must remove them manually to change their access.

Live Feed table notifications

Live feed table notifications generate automatic Live Feed messages. The Live Feed plugin must be activated to use table notifications.

When a record is inserted or updated on a specific task table and the notification conditions are met, a message is generated and posted to the specified group or to the company feed. Table notifications are supported for all task tables and all task types by default.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Administrators and users with the live_feed_admin or chat_admin roles can set up table notifications for any table in an instance.

Set up table notifications for task tables

You can set up a table notification for a task table to enable automatic Live Feed messages.

Before you begin

Role required: live_feed_admin or chat_admin

Procedure

1. Navigate to **Live Feed** > **Feed Administration** > **Table Notifications**.
2. Click **New** or select a notification to open it.
3. Complete the form.

Live Table Notification fields

Field	Description
Table	Select the table for which notifications are generated. **Note:** The list shows only tables and database views that are in the same scope as the table notification.
Post to chat rooms	Select the check box to generate the notification in chat rooms that are associated with the record, This applies to task records only and requires that the Chat plugin is active.
Post to Live Feed	Select the check box to generate the notification on Live Feed. If record feeds are not set up and the **Feed group** field is blank, the notification is posted to the company feed.
Record Feeds	Select the fields to post for record feeds. This field is available only if **Post to live feed** is selected.
Application	Select the application that contains this record.
Active	Select the check box to enable the notification.
Insert	Select the check box to generate the notification when a record is inserted into the database.
Update	Select the check box to generate the notification when a record is updated.
Feed	Select the Live Feed team to which you want to post messages. This field is available only if **Post to Live Feed** is selected. Clear the field to post notifications on the company feed.
Conditions	Create the condition that must be met to generate the notification. If you add a condition statement, the system evaluates the condition first and parses the **Before script** field only if the condition is met. You may choose to leave this field blank and include conditions in the script.
Description	Enter a description of the table notification.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description

Message	Construct the automatic message you want to generate. You can include field values as variables and a link to the record.
	
	To add a variable, position the cursor in the text and then click the field name in the **Select variables** field. To add a link to the record, enter `${URI}` in the message text as shown in the following example.
	
	`High priority incident opened: ${URI}`
	`Short description: ${short_description}`
	
	Note:
	For security reasons, any HTML code is automatically stripped out of a message before it is posted.

Before script	Create a script that runs before a notification is generated. The script runs only if the condition evaluates to true or is empty. The following variables are available in the script. ○ *`current`*: the GlideRecord object that triggered the notification. ○ *`changedFields`*: an ArrayList of fields changed on submit. Use changedFields.contains('fieldname') to check for change. ○ *`answer`*: set answer to false to cancel the notification. ○ *`profileSource`*: set to a valid GlideRecord object to define the profile that is posting the message. ○ *`profileID`*: set to a live_profile sys_id to define the profile that is posting the message; by default it is the current record. Overrides profileSource if both are specified. Any custom variable created in the script is also exposed to the message in the form of *`${myVariableName}`*.

4. Click **Submit** or **Update**.

Set up table notifications for non-task tables

Table notifications are supported for all task tables by default, and you can set up a table notification for any other table.

Before you begin
Role required: live_feed_admin or chat_admin

Procedure

1. Navigate to **System Definition** > **Business Rules**.
2. Open the *`Live Feed events`* business rule.
3. In the Advanced section,select and copy the text in the **Script** field.
4. Click the back arrow on the top, left to exit the record and return to the Business Rules list.
5. Click **New**.
6. Enter the following values at the top of the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Name**: Enter a name, such as `Live Feed events for my table`.
- **Table**: Select the table for which you are setting up a notification.
- **Active** and **Advanced**: Select these check boxes.

7. In the **When to run** section, enter the following values.
   - **When**: Select **before**.
   - **Insert**, **Update**, and **Delete**: Select the check boxes.
8. In the **Advanced** section, paste the script from the *`Live Feed events`* business rule into the script box.
9. Click **Submit**.
   The *`Live Feed events`* business rule runs on the non-task table. It fires the *`live_feed.update`* event, which is associated with the *`Live Feed Update`* script action. The script action sets up variables and processes the table notifications.

What to do next

After saving the business rule, create a Live Feed table notification record for the new table as you would for a task table.

Live Feed table notification examples

The following examples demonstrate how to set up different types of table notifications that are useful for Live Feed.

Workaround posted

This example demonstrates a table notification that generates an automatic message on Live Feed whenever a workaround is added to an open problem.

- **Table**: Problem [problem]
- **Active**: Select the check box.
- **Update**: Select the check box.
- **Post to Live Feed**: Select the check box.
- **Conditions**: [State] [is] [Open]
- **Description**: `Workaround Posted`
- **Message**:

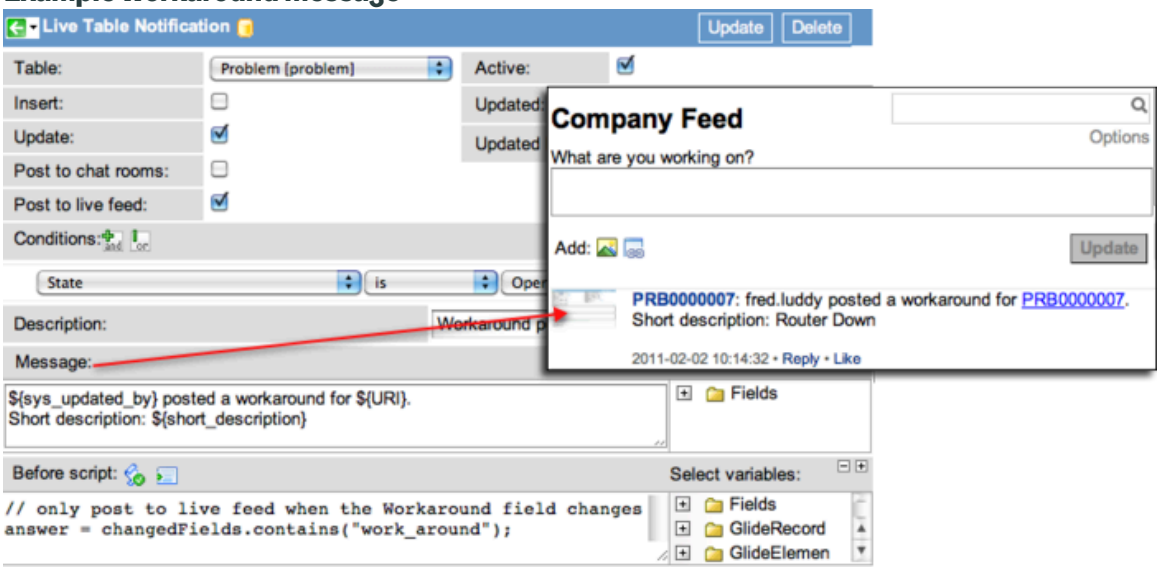
```
${sys_updated_by} posted a workaround for ${URI}.
Short description: ${short_description}
```

- **Before script**:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// only post to Live Feed when the Workaround field changes
answer  = changedFields. contains ( "work_around" ) ;
```

Example workaround message



Related topics

Live Feed table notifications

Problem resolved (advanced)

This advanced example demonstrates a table notification that generates an automatic message on Live Feed whenever a problem is closed.

It also adds a message about the assigned user and posts the message from the assignment group profile instead of the problem record.

- **Table**: Problem [problem]
- **Active**: Select the check box.
- **Update**: Select the check box.
- **Post to Live Feed**: Select the check box.
- **Conditions**: [Problem State] [is] [Closed/Resolved]
- **Description**: `Problem Resolved`
- **Message**:

```
Problem ${number} - ${short_description} has been resolved.
 ${fixedByMsg}
```

- **Before script**:

```
//cancel if we didn't just change the problem state if
 ( !changedFields. contains ( "problem_state" ) )
answer  = false ;

 //if we have an assigned_to value add a comment about who it
 was //create a new variable fixedByMsg that we can access from
 the message
fixedByMsg  = "" ; if ( !current. assigned_to. nil ( ) )
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
fixedByMsg  = " Thank you " + current. assigned_to.
 getDisplayValue ( ) ;

 //make the message appear to come from the assignment group if
 we have one if ( !current. assignment_group. nil ( ) )
profileSource  = current. assignment_group. getRefRecord
 ( ) ; //need GlideRecord object
```

Example problem resolved message

Live Feed table notifications

Opportunity won (non-task)

This example demonstrates a table notification on a non-task table. It generates an automatic message on Live Feed whenever a sales opportunity is won, if you have activated the Sales Force Automation plugin.

Create a business rule on the Opportunity [sales_opportunity] table that matches the **Live Feed events** business rule on the task table.

Create a table notification with the following values:

- **Table**: Opportunity [sales_opportunity]
- **Active**: Select the check box.
- **Update**: Select the check box.
- **Post to Live Feed**: Select the check box.
- **Conditions**: [State] [is] [Closed Won]
- **Description**: `Opportunity won`
- **Message**:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
${owner} closed a sale with ${account}!
```

- **Before script**:

```
//make the message appear to come from the assigned salesperson
 if there is one if ( !current. owner. nil ( ) )
profileSource  = current. owner. getRefRecord ( ) ; //need
 GlideRecord object
```

Example opportunity won message

Live Feed table notifications

Related feeds table notification

This example demonstrates table notifications to be sent out to related feeds.

For this example, whenever the status of a story changes to **Complete**, a table notification message is sent to the related sprint, release, or epic. Messages are posted only if the related feed already exists; this notification does not create a new feed.

- **Table**: Story [rm_story]
- **Active**: Select the check box.
- **Update**: Select the check box.
- **Post to Live Feed**: Select the check box.
- **Record feeds**: Move **Sprint**, **Release**, and **Epic** to the **Selected** column.
- **Conditions**: [State] [changes to] [Complete]
- **Description**: `Story is done; message to Epic, Release, and Sprint`
- **Message**:

```
${URI} status changed to ${state}
```

Live Feed security and table access

By default, administrators and users with the live_feed_admin role can configure live feed security and view all Live Feed tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can also modify the following Live Feed tables:

- Live Table Notification [live_table_notification]: Set up automatic messages that are generated when specific records are updated throughout the system.
- Live Feed Message [live_message]: Modify only if necessary, such as to delete an inappropriate message or restore a message that a user accidentally deleted. This table is typically managed by system functionality.

Extending or modifying data in any Live Feed chat table is not recommended.

Limit Live Feed access by role

All active users in the instance have access to Live Feed by default.

Before you begin

Role required: live_feed_admin and admin

Procedure

1. Complete the following steps to define the roles that allow users to see the Live Feed module.
   a. Perform the appropriate action for your version of the UI:
      - Core UI: Navigate to **System Definition** > **Application Menus**, and then select **Live Feed**.
      - UI15: Right-click the icon beside the Live Feed module and select **Edit Module**.
   b. Enter the roles that have access in the **Roles** field.
   c. Click **Update**.
2. Complete the following steps to define the roles that allow users to see live feed from a mobile device.
   a. Navigate to **System Definition** > **Applications (Mobile)**.
   b. Click **Live Feed**.
   c. Enter the roles that have access in the **Roles** field.
   d. Click **Update**.
3. Use the following settings in the Access Control form to create access control rules to limit who can view the live_feed pages.
   - **Type**: ui page
   - **Operation**: read
   - **Name**: create one access control rule record for each of the following pages
     - live_feed
     - live_feed_small
     - $live_feed
     - $live_feed_small
   - **Requires role**: in this related list, add roles to define who can access the Live Feed pages. Users who do not have these roles cannot access Live Feed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Manage Live Feed message content

Users can remove their own messages from feeds. If necessary, administrators can remove inappropriate messages that are posted by any user.

Before you begin
Role required: live_feed_admin and admin

About this task
For security reasons, any HTML code is automatically stripped out of a message before it is posted. This measure ensures that users cannot modify any page settings by posting a message.

Procedure

1. Navigate to **Live Feed** > **Feed Administration** > **Messages**.
2. Open the message to be removed.
3. In the **State** field, select **deleted**.
   You may need to configure the form to add this field.
4. Click **Update**.

Live Feed team security

You can restrict who can create teams by modifying an access control rule.

Modify the following access control rule:

- **Table**: Live Group Profile [live_group_profile]
- **Operation**: create

Restrict hashtag renaming

You can restrict who can rename hashtags.

You restrict hashtag rename by modifying the following access control rule:

- **Table**: Live Tag [live_tag]
- **Operation**: write

Provide access to Live Feed from CMS pages

You can provide access to Live Feed from pages built in the Content Management System (CMS). For example, allow an end user to access your company feed via the ESS portal.

Before you begin
Role required: content_admin or admin

About this task
The ESS Portal template includes the **Portal - Live page** and **Live Feed** dynamic blocks. To provide access to Live Feed from CMS pages, add the Live Feed dynamic block to a CMS page or include **Portal - Live page** in a site.

Procedure

1. Navigate to **Content Management** > **iFrames**.
2. Click **New**.
3. Enter the iFrame block details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

iFrame block fields

Field	Description
Name	Enter a unique name such as **Live Frame**.
Frame Name	Enter a frame name, such as **live_frame**.
URL	https://INSTANCE/live_feed.do?sysparm_doctype=true where INSTANCE is your instance URL (example, [instance name] .service-now.com)
Application	Displays scoping information.
Sizing	Select **Fixed Size** and enter height and width pixel dimensions according to the page where you plan to display the feed (for example, width of 1024 and height of 768).

4. Click **Submit**.
5. Add the block to a page.

Administering Live Feed

Content Management System

Using Live Feed

Live Feed provides many methods you can use to share content with others in your organization.

Important:

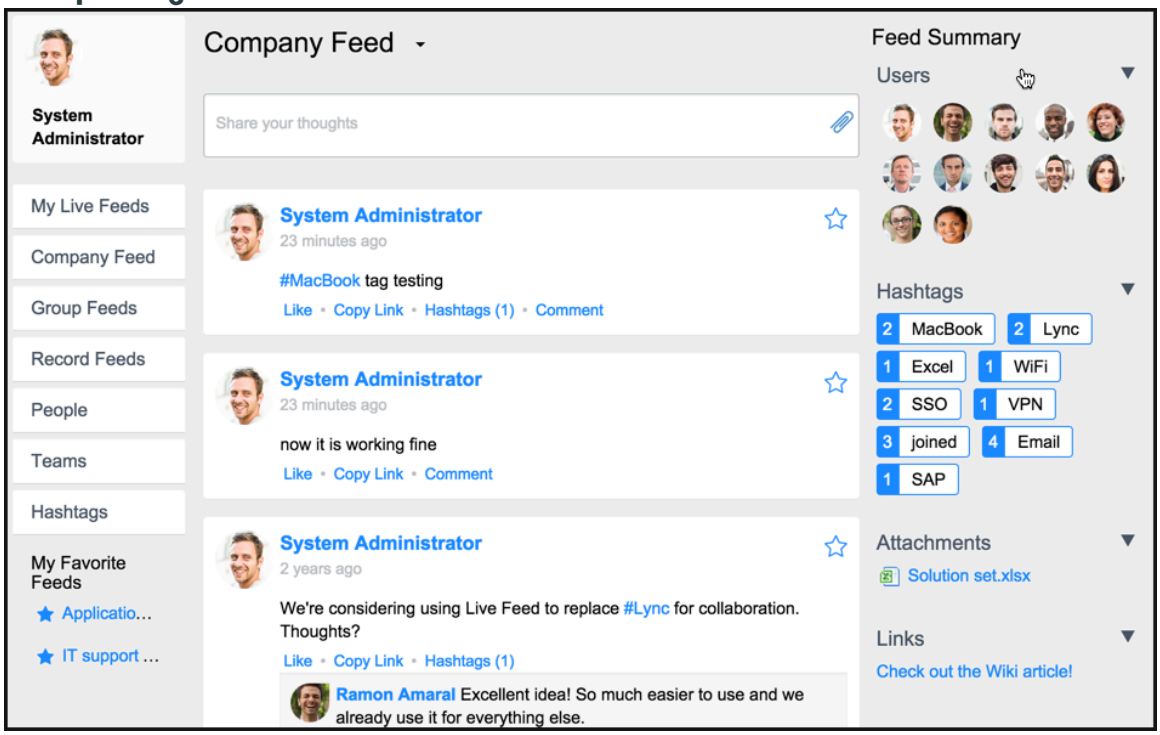
Core UI is required to use Live Feed. Live Feed is not supported in Next Experience. If you turn on Next Experience, Live Feed is automatically disabled and will no longer work. See Next Experience UI for more information.

While Live Feed has been discontinued, we are always exploring new ways to enhance our services. Stay tuned for future updates and improvements.

Depending on your role, there are several different types of feeds you can access, teams you can join and share information with, and hashtags you can use for categorizing messages.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example image



Note:
Live Feed v2 is active for all new instances by default. If you are upgrading from an earlier version of ServiceNow, you need to activate Live Feed v2 to use these features.

Use hashtags in Live Feed

Hashtags are words marked with a hash symbol (#) in messages. Hashtags are a way to categorize messages by keyword or topic for improved search results.

For example, to identify messages associated with VPN questions, add the hashtag #VPN in the message text.

Note:
Many of these features are part of Live Feed v2. If you are using Live Feed v1, or have not activated Live Feed v2, see Legacy Live Feed.

Tag messages

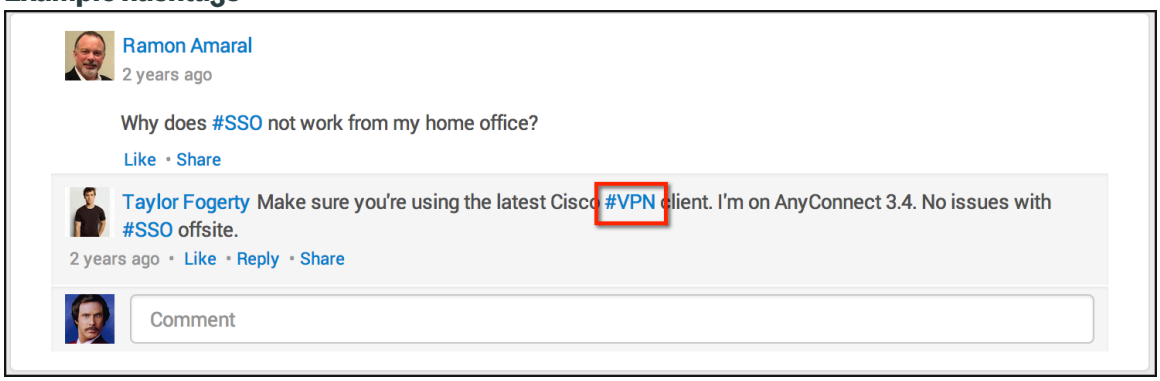
To tag a keyword or topic in a message, enter a # symbol before the word. A link to the hashtag is added beneath the message and all feed users can search and filter by the hashtag to find the message.

Follow these tips for using hashtags effectively:

- Limit the number of hashtags per message (no more than 3 is a good guideline).
- Use hashtags only in messages that are relevant to the tagged topic.
- Write a message first, and then add hashtags only if they add value. Answer the question, "What are you working on?", rather than "What hashtags apply to what you are working on?"
- Use camel case to create a hashtag that is more than one word long. For camel case, remove the space and use an uppercase letter to start each word. For example, to create a topic about the service desk, use #ServiceDesk.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example hashtags



View an available hashtag

View a hashtag from any feed.

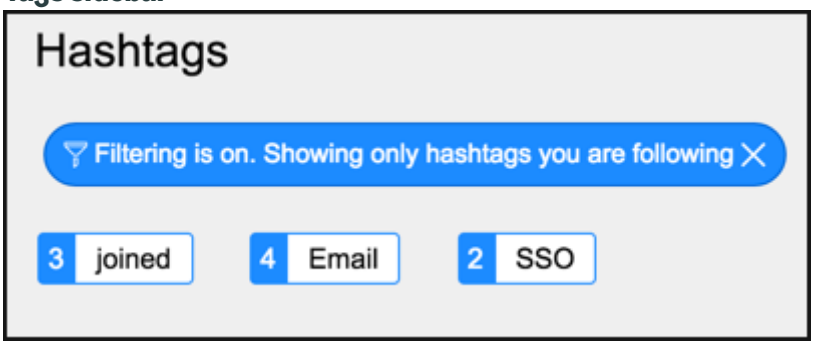
Before you begin

Role required: none

Procedure

1. Navigate to **Live Feed** > **Live Feed**.
2. Click **Hashtags** in the sidebar.
   Any hashtags already defined are displayed. Up to 36 hashtags can be displayed, and options are available for searching and sorting the hashtags. When searching, you do not need to include the hash symbol (#).

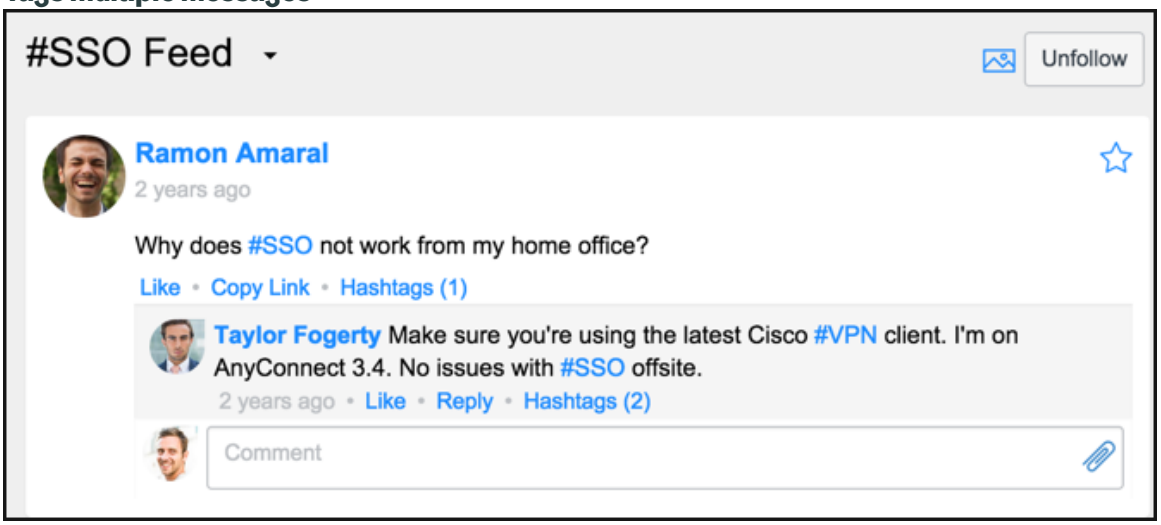
Tags sidebar



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Click a hashtag to view all messages containing that hashtag.

Tags multiple messages



Change a hashtag name and merge a hashtag

Over time, users may create many hashtags with similar names, such as competitive, competitor, and competition. To combine hashtags for better searching and filtering, change the names of similar hashtags to a standard name.

Before you begin

Role required: admin

About this task

Administrators can restrict who can rename hashtags.

Procedure

1. Navigate to **Live Feed** > **Live Feed**.
2. Click **Hashtags** in the sidebar to reveal the currently defined hashtags.
3. Turn off the filter to show all hashtags.
4. Point to the hashtag you want to change.

   If you have the rights to edit hashtags, an edit tag ( ) appears.
5. Click the edit tag icon.

Edit tag

6. Enter a new hashtag name.
7. Press **Enter**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If the new name is different than the other hashtags, the new hashtag name replaces the old hashtag name on the list and in the text of any messages that include the hashtag.
- If the name is the same as one of the existing hashtags, the hashtags will be merged. For example, if you have two hashtags called **Competitive** and **Competitors**, and you change the name of **Competitors** to **Competitive**, all of the messages previously tagged **Competitors** are changed to **Competitive** and the **Competitors** hashtag is removed.

Note:
If a hashtag is removed from the message, renaming that hashtag does not change the message text.

Add an image to a hashtag

You can add an image at the domain level of already defined hashtags if you have the admin role.

Before you begin
Role required: admin

Procedure

1. Click **Hashtags** in the sidebar.
2. Select the appropriate hashtag.

   Tag with image icon

3. Do one of the following:
   - Locate the image in your file system, and then drag-and-drop the image onto the add an image icon ( ).
   - Click the add an image icon ( ), select the image file, and click **Open**.
4. To change the image, simply drag-and-drop a new image onto the old one, or click on the existing one and select a new image.

   When you view a message that contains a hashtag with an image, that image appears in the hashtag heading bar.

   Message with tag icon

Follow and unfollow a hashtag

You can view all postings assigned a specific hashtag by following the hashtag. You can also unfollow the hashtag if you no longer want to view those postings.

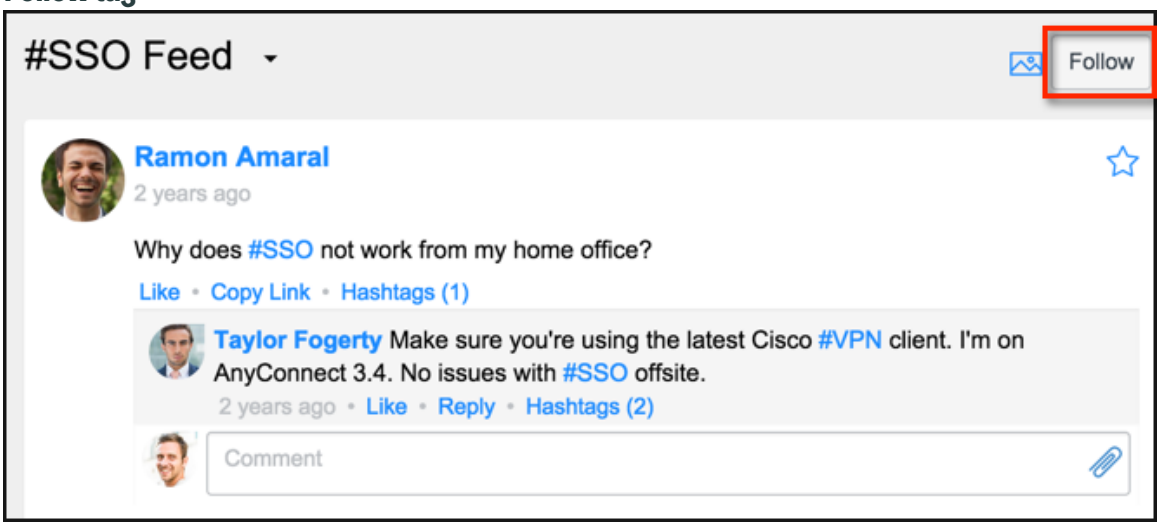
Before you begin
Role required: admin

Procedure

1. Navigate to **Live Feed** > **Live Feed**.
2. Click **Hashtags** in the sidebar.
3. Select the hashtag you want to follow.
4. Click **Follow**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Follow tag



A confirmation message appears.

5. Click **X** to dismiss the message.
   To unfollow a hashtag, repeat the same steps and click **Unfollow**.

Remove a hashtag from a posted message

As a participant in a conversation, you can remove hashtags from messages that have already been posted.

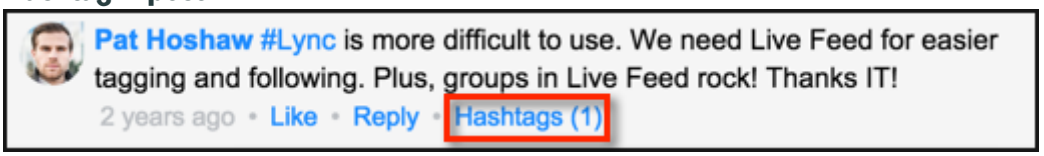
Before you begin

Role required: admin

Procedure

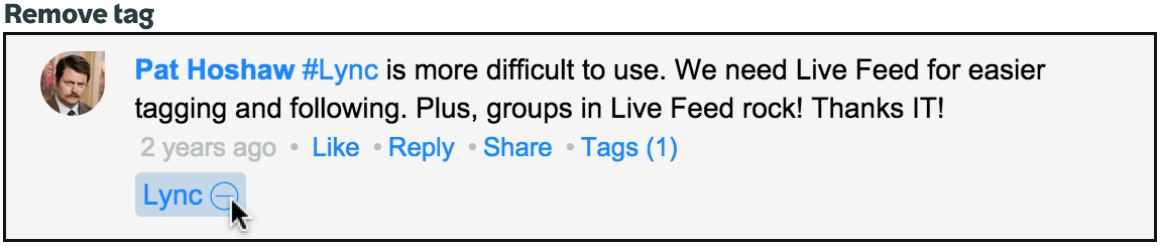
1. Navigate to the posted message.
2. Click **Hashtags** in the message posting.

Hashtag in post



The hashtags associated with the message are displayed, along with the removal icon.

Remove tag



3. Click the removal icon.

Use teams in Live Feed

Users can be combined into teams for the purpose of subscribing to specifically-focused feeds.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Teams can be created based on any criteria that makes sense for your organization. For example, you can create a team called IT Developers and subscribe the team to feeds such as Coding Standards, AngularJS Development, and ServiceNow Customization Best Practices. When a new developer is added to the IT Developers team, that user automatically has rights to participate in all of the feeds followed by the team.

Automatic team creation

If you create a record on a table that has Live Feed enabled, such as the Incident table, and click Follow/Show Live Feed for the record, a record feed is created for the record.

The record feed name is based on the table name.

Reply to email notifications using email

After receiving an email about a posted message or a reply, you can post your reply to Live Feed by responding to the email.

The body of the email reply is posted as a response to the Live Feed message. Any attachments that you include in your reply email are also posted in the Live Feed reply.

Create a Live Feed team

When you create a team, you become the team administrator.

Before you begin
Role required: admin

About this task
As team administrator, you can do the following:

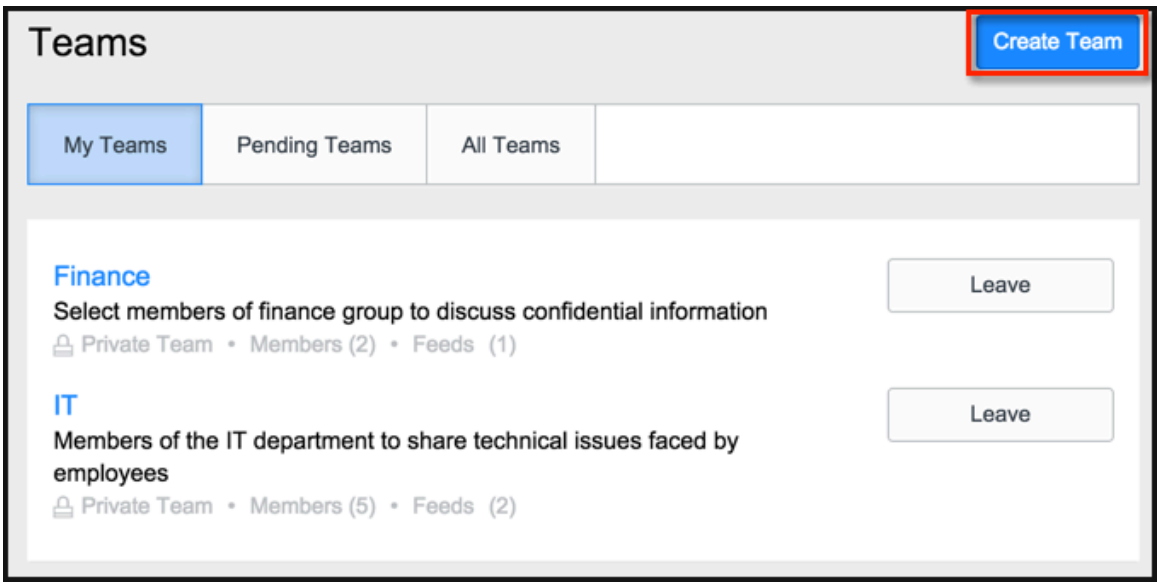
- Modify team properties
- Accept or reject membership requests
- Remove members from the team
- Delete the team

Procedure

1. Navigate to **Live Feed** > **Teams**.
2. In the sidebar, click your profile picture, then select the **Teams** tab.
3. Click **Create Team**.

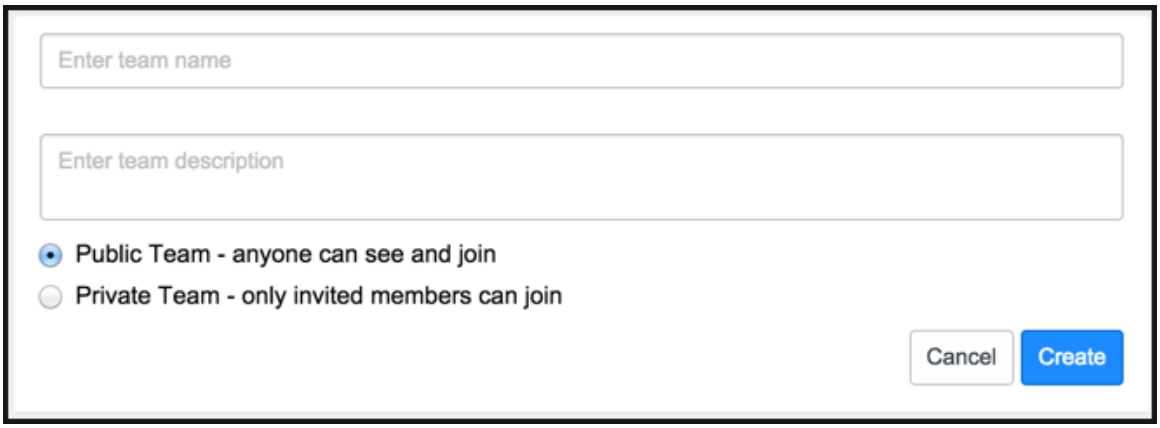
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Teams tab



4. Enter a **Name** to appear at the top of the feed and in messages posted to the team.

Create Team form

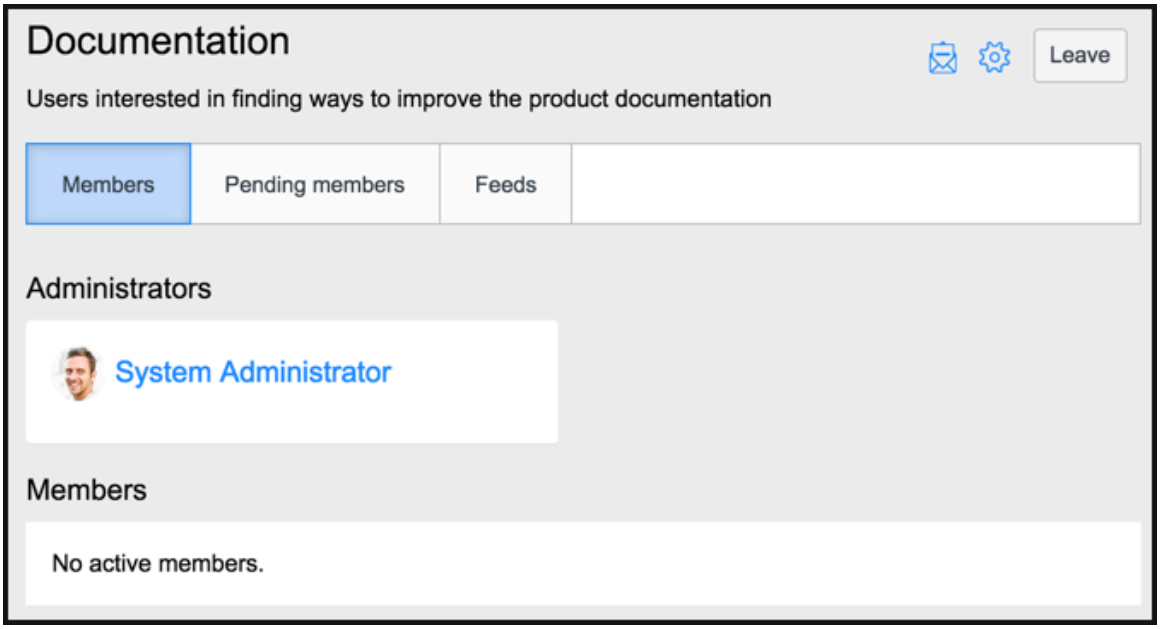


This name links to the team feed.

5. Enter a **Description** to appear at the top of the feed and under the team name in the list of all teams.
6. Select the access level for the team:
   - **Public Team**: In the list of all teams, any user can see the name of this team. Any user can also see the feed and join the team. Messages in a public team appear in the Company Feed with a link to the team feed.
   - **Private Team**: In the list of all teams, any user can see the name of this team, but not the feed. Messages in private teams do not appear on the Company Feed.

     When **Private Team** is selected, the **Show this team for anyone to find and request to join** check box is displayed. Select this check box to allow any user to search for this team and request to join it. Clear the check box to allow only invited users to see the feed and join the team.
7. Click **Create**.
   The team is created with you as the team administrator.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note:
A team administrator can create one or more group feeds specifically for the members of this team by clicking the **Group Feeds** tab and **Create Group Feed**. Additionally, the team can be invited to join a feed. Having multiple feeds for the team facilitates focused discussions on topics of interest to the team and allows the team to selectively invite other teams and members to collaborate on specific feeds.

Join a team

You can join a public team, accept an invitation, or request access to a team.

Before you begin

Role required: admin

About this task

As a team member, you can:

- View messages posted to the team (team feed). Non-members can also view the feed for a public team.
- View a list of team members.
- Invite another team to join the team.
- Subscribe to team email notifications.
- Leave the team.

Procedure

1. Navigate to **Live Feed** > **Live Feed**.
2. Click **Teams** and click **All Teams**.
   - If you received an invitation, click **Accept**. You can **Decline** the invitation if you do not want to join the team.
   - If the team is public, click **Join**.
   - If the team is private, click **Request**. The team administrator receives an email notification and must accept your request before you can join the team.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

View a team feed

View a team feed to see messages belonging to that team.

Before you begin
Role required: admin

Procedure

1. Navigate to **Live Feed** > **Live Feed**.
2. In the sidebar, click your profile picture, then select the **Teams** tab.
   - To view a team you belong to, select the team name.
   - To view a public team you do not belong to, select **All Teams** and then click the team name.

     You must be a member to view the feed for a private team.

View a team member

View a list of members belonging to a Live Feed team.

Before you begin
Role required: admin

Procedure

1. Navigate to **Live Feed** > **Live Feed**.
2. In the sidebar, click your profile picture, then select the **Teams** tab.
3. From the team list, select the team name.
   You must be a member of the team to view the members.
4. Click **Members**.
   The list of team members appears, organized by team administrators and team members.

Invite a new member

You can invite another user to join a team.

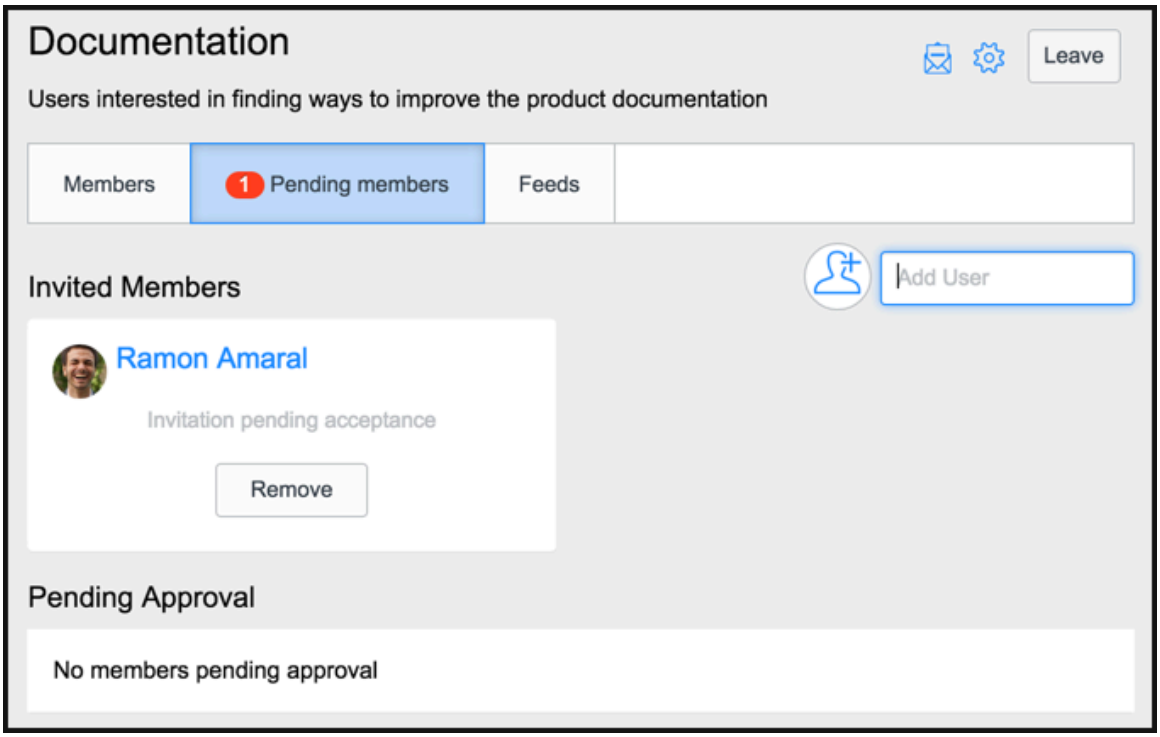
Before you begin
Role required: admin

Procedure

1. Navigate to **Live Feed** > **Live Feed**.
2. In the sidebar, click your profile picture, then select the **Teams** tab.
3. From the team list, select the team name.
4. Click the **Pending members** tab.
5. In the **Add User** field, enter the name of the user you want to invite.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The invited member's picture appears.



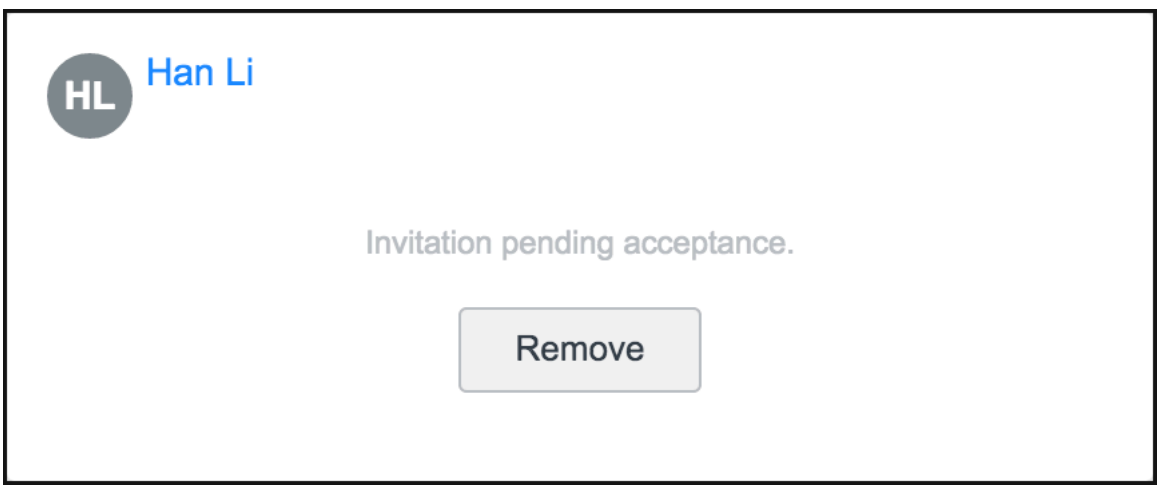
Remove a member

If you are team administrator, you can remove any member from the team.

Before you begin
Role required: admin

Procedure

1. Navigate to **Live Feed** > **Live Feed**.
2. In the sidebar, click your profile picture, then select the **Teams** tab.
3. From the team list, select the team name.
4. Click the **Members** tab.



5. Click **Remove** below the member name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Click **Remove** again in the confirmation box that opens.

Note:
You can remove members regardless of their current state. That is, you can remove members who have already joined the team or whose membership is pending.

Subscribe to team and email notification

Users can subscribe and unsubscribe to receive email notifications generated by feeds the team participates in.

Before you begin
Role required: none

About this task
Email notifications are generated whenever actions such as posting messages, replies, likes, polls, and @mentions are performed.

All notifications related to a top-level message, such as replies, mentions, and likes, are sent out with the same subject. The subject line defaults to **Live Feed** followed by the beginning of the subject line from the top-level message. For example, if the subject of the feed is **IT Support**, the email notification's subject will be **Live Feed IT Support**.

Procedure

1. Navigate to **Live Feed** > **Live Feed**.
2. Click **Teams** and select the team name.
3. Click the subscribe icon ( ).
   You can click the unsubscribe icon ( ) to stop receiving email notifications.

Subscribe a team to feed notification

A team administrator can subscribe a team to specific feeds so the members of the team receive email notifications.

Before you begin
Role required: none

Procedure

1. Navigate to **Live Feed** > **Live Feed**.
2. Click **Teams** and select the team name.
   You can use the advanced search to locate team of which you are the administrator.
3. Click **Feeds**.
4. Click the subscribe icon ( ) beside the feed name.
   You can click the unsubscribe icon ( ) to stop receiving email notifications.

Leave a team

You can give up membership to a team by leaving that team.

Before you begin
Role required: none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Live Feed** > **Live Feed**.
2. In the sidebar, click your profile picture, then select the **Teams** tab.
3. Click **Leave** beside the team name.

Modify a team

If you are team administrator, you can modify an existing team.

Before you begin
Role required: admin

Procedure

1. Navigate to **Live Feed** > **Live Feed**.
2. In the sidebar, click your profile picture, then select the **Teams** tab.
3. From the team list, select the team name.
4. Click the edit icon ( ).
5. Modify the team properties as needed.
6. Click **Save**.

Manage a membership request

When a user requests membership to a private team, the team administrator receives an email.

Before you begin
Role required: admin

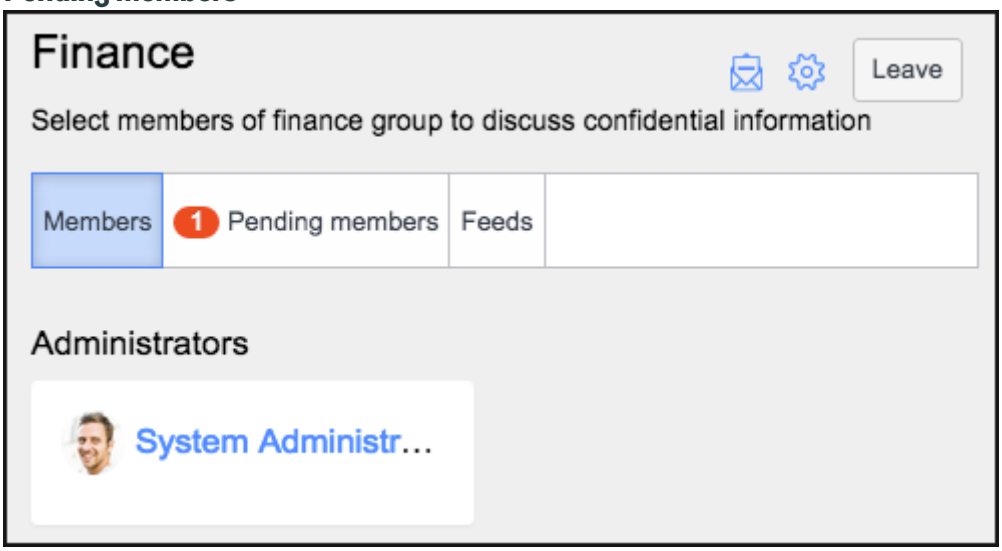
About this task
If you are the team administrator, you can manage membership requests.

Procedure

1. Navigate to **Live Feed** > **Live Feed**.
2. Click **Teams** and select the team name.
   If one or more users have been invited to the team, the **Pending members** tab shows the number of invitations sent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

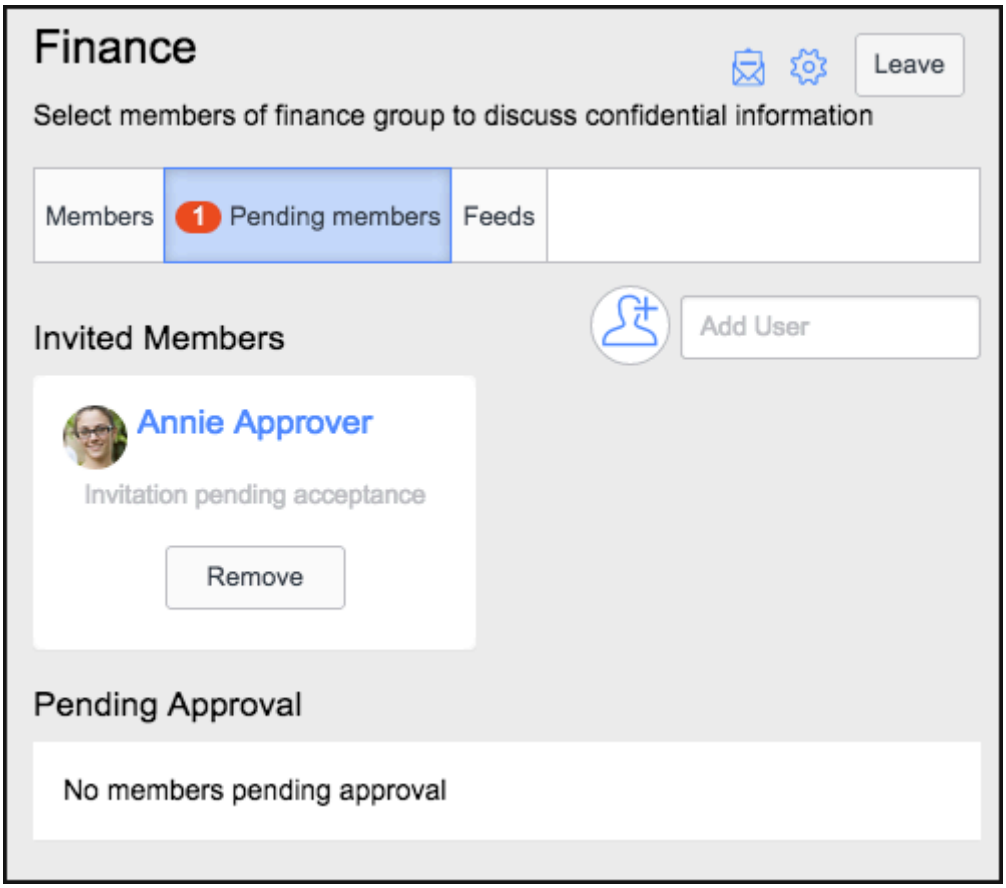
Pending members



3. Click **Pending members**.

   This shows the users who have received invitations, but who have not yet accepted.

Invited members



4. You can cancel a user's invitation by clicking **Remove**.
5. You can invite another user to the team by entering their name in the **Add user** field and clicking the Invite member ( ) button.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Delete a team

If you are the team administrator, you can delete a team.

Before you begin
Role required: admin

Procedure

1. Navigate to **Live Feed** > **Live Feed**.
2. In the sidebar, click your profile picture, then select the **Teams** tab.
3. From the team list, select the team name.
4. Click the edit icon ( ).
5. Click **Delete**.
6. Click **Yes** to confirm deletion.
   The team is deleted from Live Feed. Messages posted to a private team are deleted; messages posted to a public team remain on the company feed without a team link.

   If you delete a team that is associated with an active record, such as an incident that has not yet been closed, the team becomes active again when any user modifies that record or follows the record on Live Feed. The first user who modifies the record becomes the team administrator. The previous messages that existed as part of the record feed are not deleted.

Use Live Feed to work on records

A record feed is associated with a record, such as an incident or change.

Record feeds help users collaborate on records by providing a place for anyone who can access the record to share messages and post attachments specific to that record.

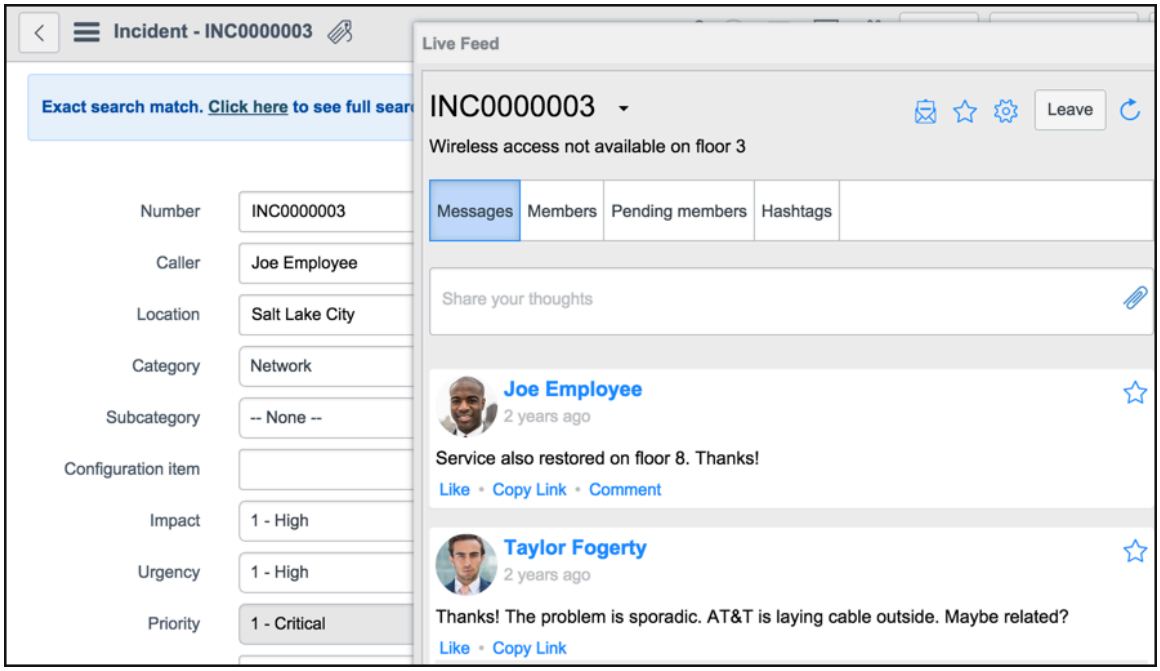
With record feeds, users can:

- Follow record feeds and post messages in Live Feed. These messages can also be automatically maintained in the comments or work notes journal fields on records.
- View Live Feed from records.
- Work on multiple records from **My Feed**.
- Access Live Feed team functions, such as sending invitations and subscribing to email notifications.

Any users with access to the record can also use the record feed. By default, record feeds are available on the incident, change, and problem tables. Administrators can configure record feeds for additional tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Live Feed Document



How Document Feeds Work

The Live Feed application creates a document group for each document feed. The document group:

- Automatically approves membership for every user who can access the record.
- Uses the record number as the group name.
- Uses the record short description as a group description.
- Maintains all messages posted on the record in Live Feed (if the record has a journal field for comments). When the group is created, existing messages are added to the document feed.
- Lists the group when users select **View all groups** on their Live Feed interface, unless the record associated with the document feed has been closed. When the state of the record is closed, the Live Feed group becomes inactive and unlisted.
- Automatically adds users to the document group when they view the record.

Document Group Creation

When a user follows or shows a record on Live Feed, a Live Feed group is automatically created and associated to the record (if one does not already exist). The user becomes a member of the group and can use Live Feed to work on the record. If the user can access work notes on the record, the user also becomes a group administrator.

A Live Feed group is also automatically created when a user creates a record on a table that uses document feeds, such as the Incident table. The user who creates the record becomes the administrator of the group, and any other user who modifies the same record automatically joins the group.

Add Live Feed to a homepage

Add Live Feed to a homepage so it is the first thing you see when you log in.

Before you begin
Role required: admin

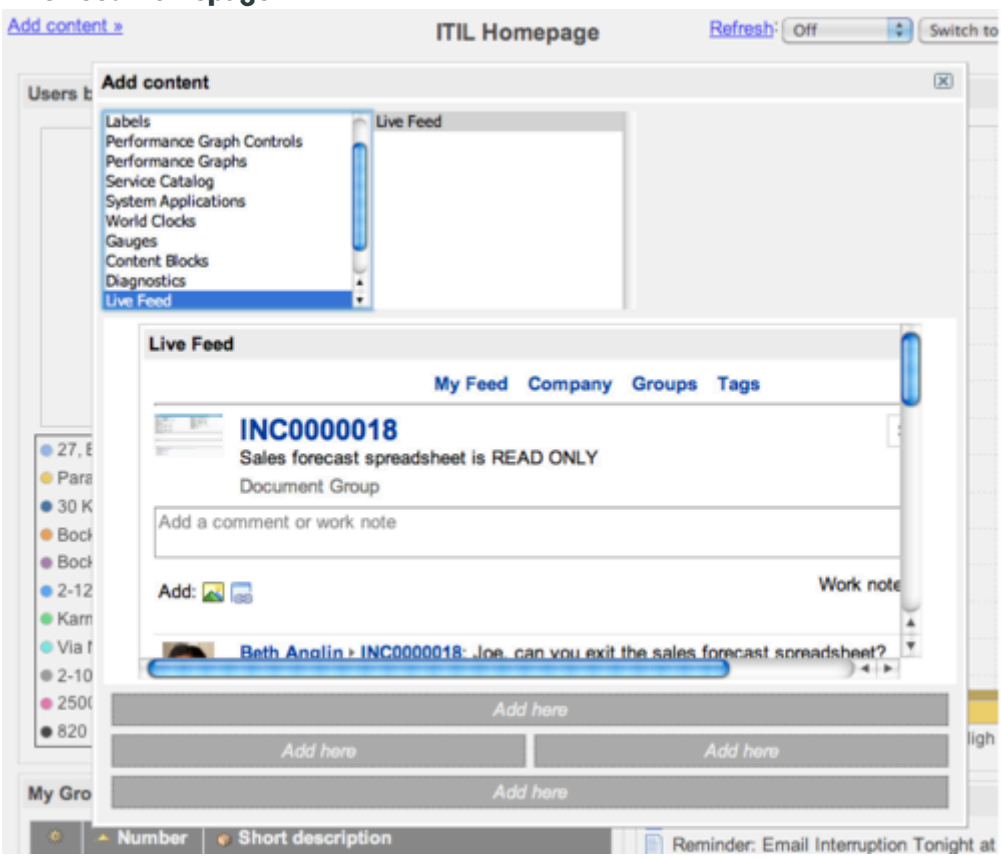
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Click **Add** content at the top of the homepage.
2. Select **Live Feed** in the left panel.
3. On the bottom of the window, click **Add here** in the appropriate layout position, then close the window.

> **Note:**
> Administrators can add Live Feed to a global homepage to make it available for all homepage users by default. By default, users with any role can add Live Feed to their homepage. Administrators can restrict this ability.

Live Feed Homepage



Modifying and deleting document feeds

The user who creates a record feed becomes the group administrator, which allows the user to modify the following record feed properties.

- **Name**: Default value is the record number.
- **Description**: Default value is the record short description.
- **Picture**: Default value is a thumbnail image of the record.

Feed administrators can also delete the feed. When deleted, the feed is removed from Live Feed but messages remain in the journal field of the associated record.

Viewing Live Feed from records

Interact with the record feed in any form that has Live Feed enabled.

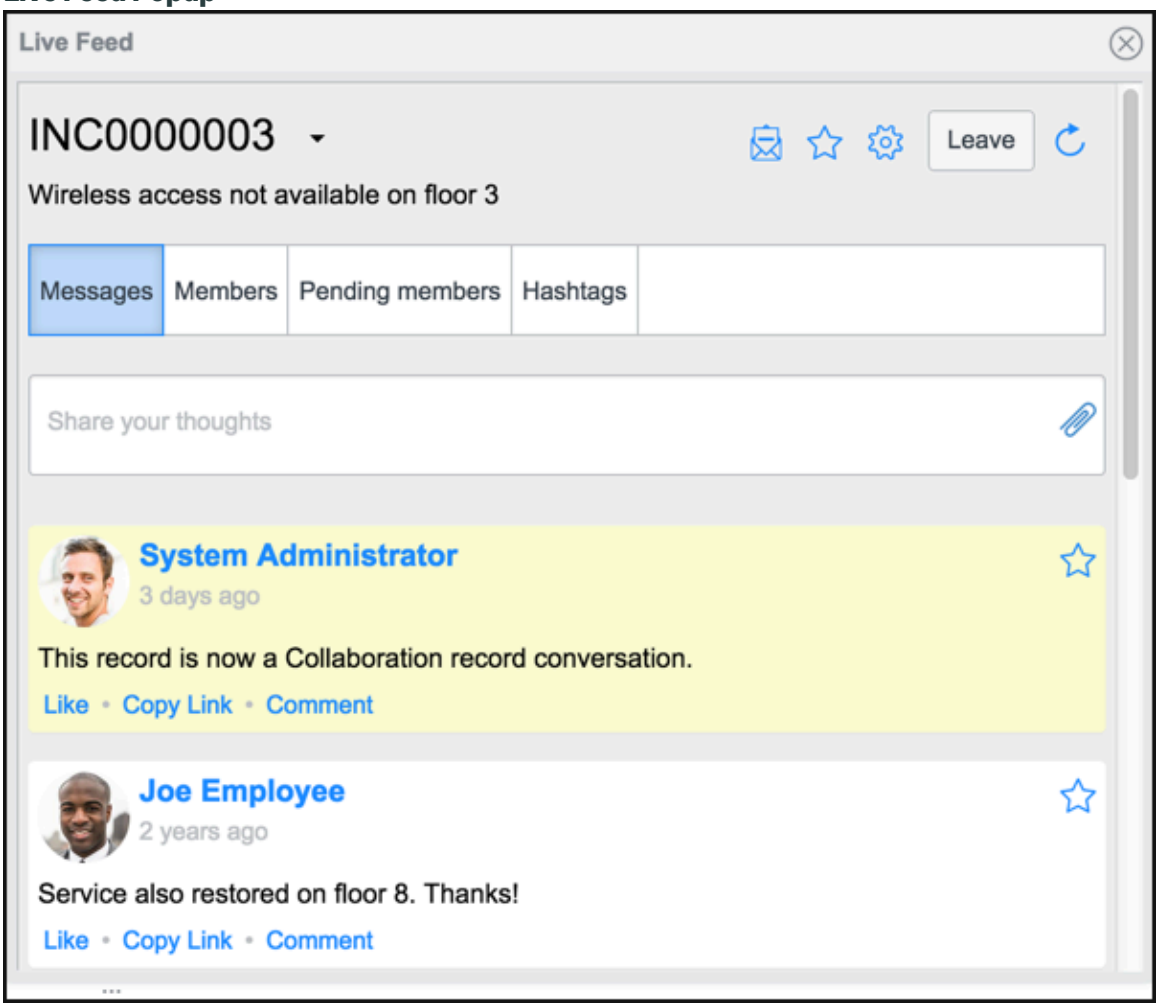
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The record feed appears in a pop-up window. The record feed also appears on the record form's activity formatter if the administrator enables the record feed system property (`glide.ui.show_live_feed_activity`).

To access a record feed from the form, do one of the following:

- Click the **Show Live Feed** button in the form header. This displays the Live Feed pop-up.
- Right-click the form header and select **Show Live Feed**. This also displays the Live Feed pop-up.
- Scroll down to the activity formatter area on the form. Click one of the following tabs:
  - **Live Feed**: click to show a text box to type in the feed.
  - **Activity**: click to show the activity summary. The activity filter determines the content in the activity summary.

Live Feed Popup



If the activity formatter or the **Live Feed** and **Activity** tabs are not visible, administrators can do the following:

- Configure the form layout and add **Activities (filtered)** to the form. This adds the activity formatter.
- Personalize the form layout and add **Activities (filtered)** to the form. This adds the activity formatter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Go to **System Definition** > **Tables**, access the table associated with the record, and verify that the live_feed dictionary attribute is set to true on the form. This adds Live Feed to the activity formatter.
- Go to **Live Feed** > **Feed Administration** > **Properties** and enable the following property:**Toggle the display of the Live Feed tab in the activity formatter**

Working with record feeds

When a user follows a record, the user becomes a member of a private group for the record.

Team members can do the following:

- View the record feed from Live Feed.
- View a list of group members (other users who are following the record).
- Invite another user to join the group. Only users who have access to the record have access to the record feed.
- Subscribe to email notifications.
- Leave the team to stop following the record.

Follow a record feed from a form

You can follow records that have a record feed associated with them from within the record form.

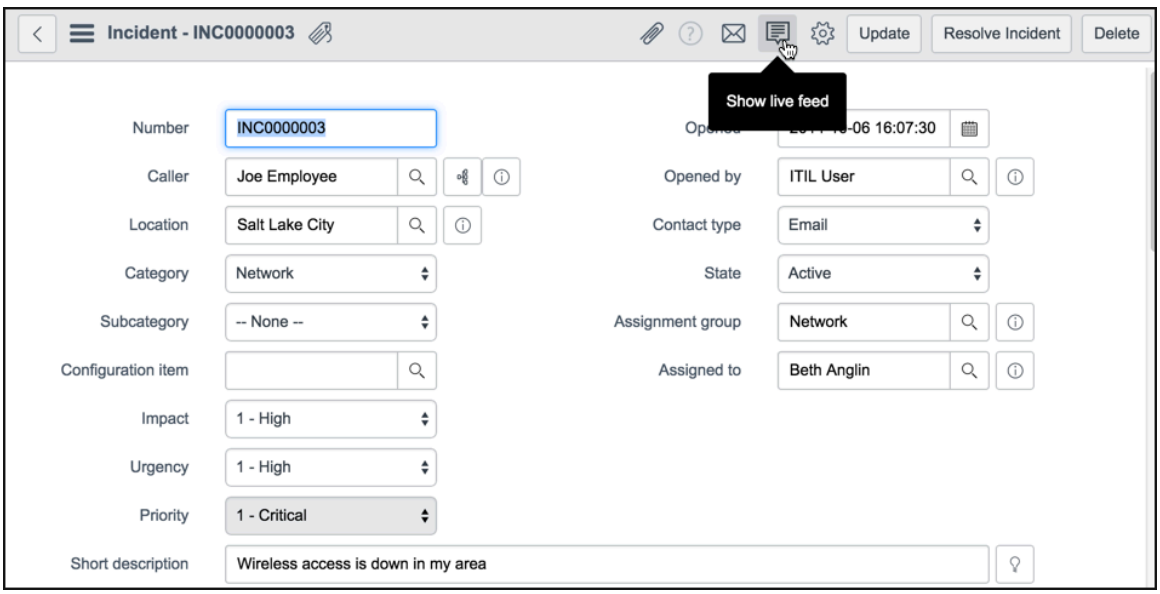
Before you begin

Role required: none

Procedure

1. Navigate to the record in a list or form.
2. Click the **Show on Live Feed** icon in the header.

Follow Task



Follow a record feed from a list

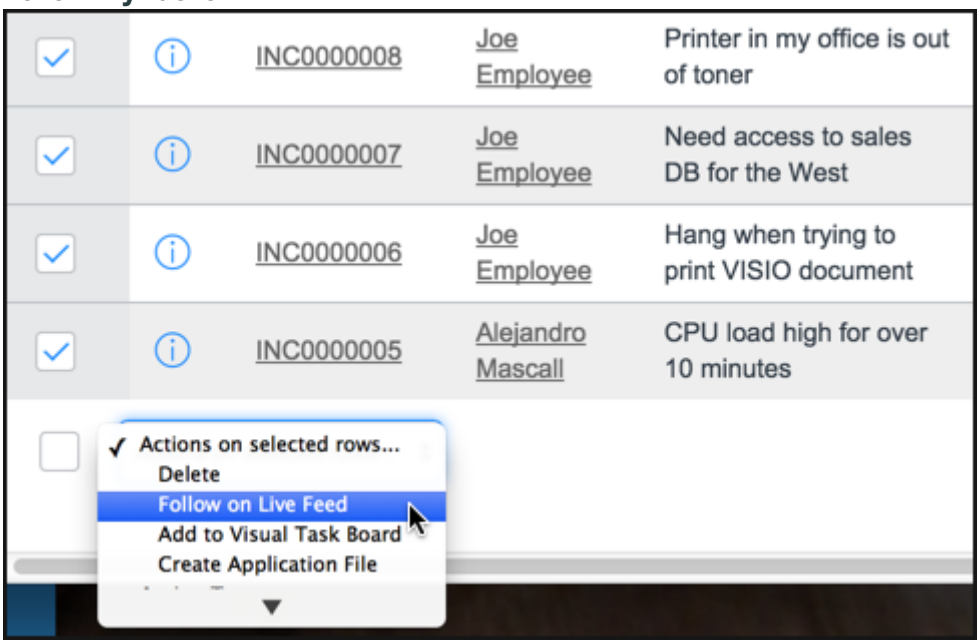
You can follow records that have a record feed associated with them when viewing a list of records. This method allows you to select multiple records to follow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: none

Procedure
1. Navigate to a list of records (for example, **Assigned to me**).
2. Select the **Action** check box beside each record to follow.
3. In the **Actions** choice list, select **Follow on Live Feed**.

Follow My Tasks



Post a message to a record feed

Use Live Feed to post a message to a record feed.

Before you begin
Role required: none

Procedure
1. Open the record feed in one of the following ways:
   - From your homepage (must already be following the record)
   - As a team in Live Feed (must already be following the record)
   - From My Live Feed (must already be following the record)
   - From the **Live Feed** pop-up window
   - From the **Live Feed** tab on the activity formatter
   - Click the **Show Live Feed** button ( ) in the form header.
2. Compose the message and add images and links.
3. In the To list, select the record where you want to post the message.

Note:
Applies to Live Feed only.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. **Optional:** Select the **Work Notes** check box to post the message as a work note.
   Only users with access to work notes on the record can post and see work notes. This option is only available for records that have a journal field.
5. Click **Post**.

> **Note:**
> If the record has journal fields for comments or work notes, your message is automatically added to the appropriate field on the record. If the record has a standard text field for comments on the activity formatter, each live post overwrites the field value. Comments added through Live Feed start with #LiveFeed on the activity formatter.

Use feeds in Live Feed

Feeds allow users to create focused discussions in Live Feed.

Live feed includes different types of feeds. The user who creates a group or record feed becomes the feed administrator. This user configures the access level for the feed:

- **Public**: any user can see the name on the list of all feeds, view the feed, and join it. Messages appear on the company feed with a link to the public feed.
- **Private**: any user can see the name on the list of all feeds, but only invited members can view the feed and join. Messages do not appear on the company feed.

> **Note:**
> The concept of groups changed in Live Feed v2.

Create a group feed

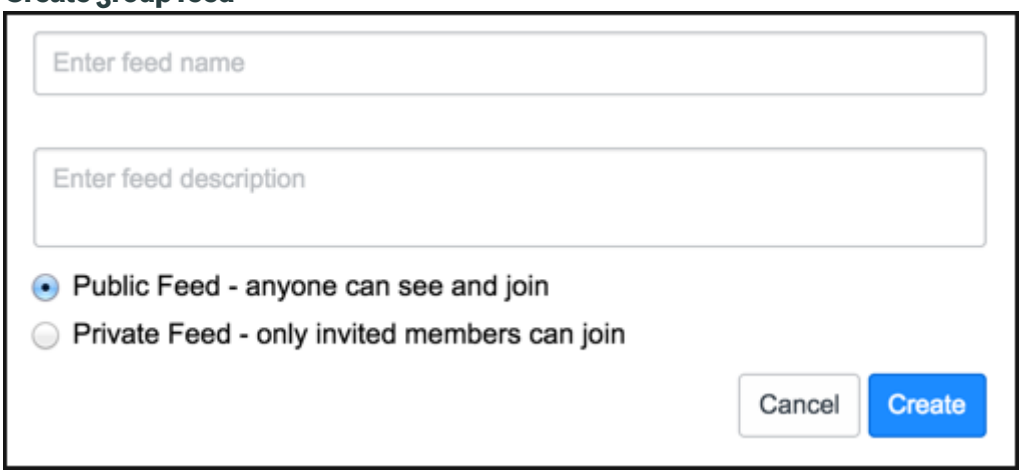
Group feeds are created by users so that members with similar interests can find that information in one place. Individual users or teams can join group feeds.

Before you begin
Role required: admin

Procedure

1. Navigate to **Live Feed** > **Live Feed**.
2. Click **Group Feeds** and click **All Feeds**.
3. Click **Create Group Feed**.

Create group feed



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Enter the feed name and description.
   These will appear in the list of group feeds.
5. Indicate how members can join the feed:
   - **Public Feed**: Select this to allow anyone to view and join the group feed.
   - **Private Feed**: Select this to restrict membership to only members invited by the administrator.

     When **Private Feed** is selected, the **Show this feed for anyone to find and request to join** check box is displayed. If it is selected, any user can search for this group feed and join it. If the check box is not selected, only users who are invited can see the feed and join the group feed.
6. Click **Create**.

Create record feeds

When a user views a record on a table that has Live Feed enabled, such as the **Incident** `[incident]` table, the user can click the **Show Live Feed** button at the top of the form to automatically create a record feed.

When a user who has write access to a record's **work_notes** journal field clicks the **Show Live Feed** button, that user becomes the record feed administrator. If, for example, a customer calls technical support to report an incident and the customer clicks **Show Live Feed** on a record, a record feed is created, but the customer is not the record feed administrator. When a support representative later opens the incident and participates in the record feed, the user becomes the feed administrator.

Record feeds are, by default, private unlisted. That is, only invited members can see the name of the record feed in the list of feeds, and join it. Record feed administrators, however, have the ability to change the access level at any time. This can be helpful if, for example, a user is working on a sales opportunity and wants customers to be able to participate in a record feed without granting them access to the records.

Control how Live Feed is enabled for records

A property called *`glide.ui.show_live-feed_activity`* controls whether Live Feed is automatically enabled for all records.

This glide record is disabled by default. If the property is enabled, a record feed is automatically created whenever a record is viewed, and you become a member of that feed.

A second property, *`glide.live-feed.auto_join_document_group`*, enables automatic membership to a record feed whenever the associated document is visited and the user clicks **Show Live Feed**.

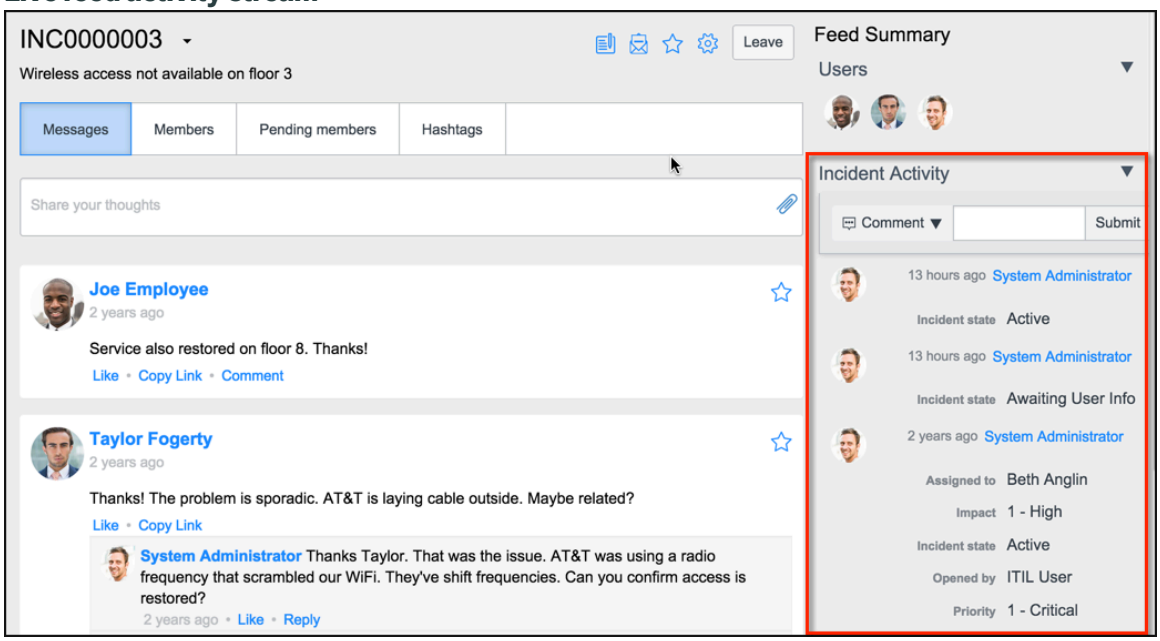
View the activity stream in record feeds

When you view record feeds, Live Feed displays the activity stream for the document.

For example, for an incident feed, the screen displays recent activity for the incident. The activity stream is updated whenever anything is changed in the associated record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Live feed activity stream



Note:
The information in the activity stream is subject to the same ACL rules as those for viewing the underlying document.

Participate in a feed

When you join a feed, you become a feed member.

Before you begin

Role required: none

About this task

Feed members can do the following:

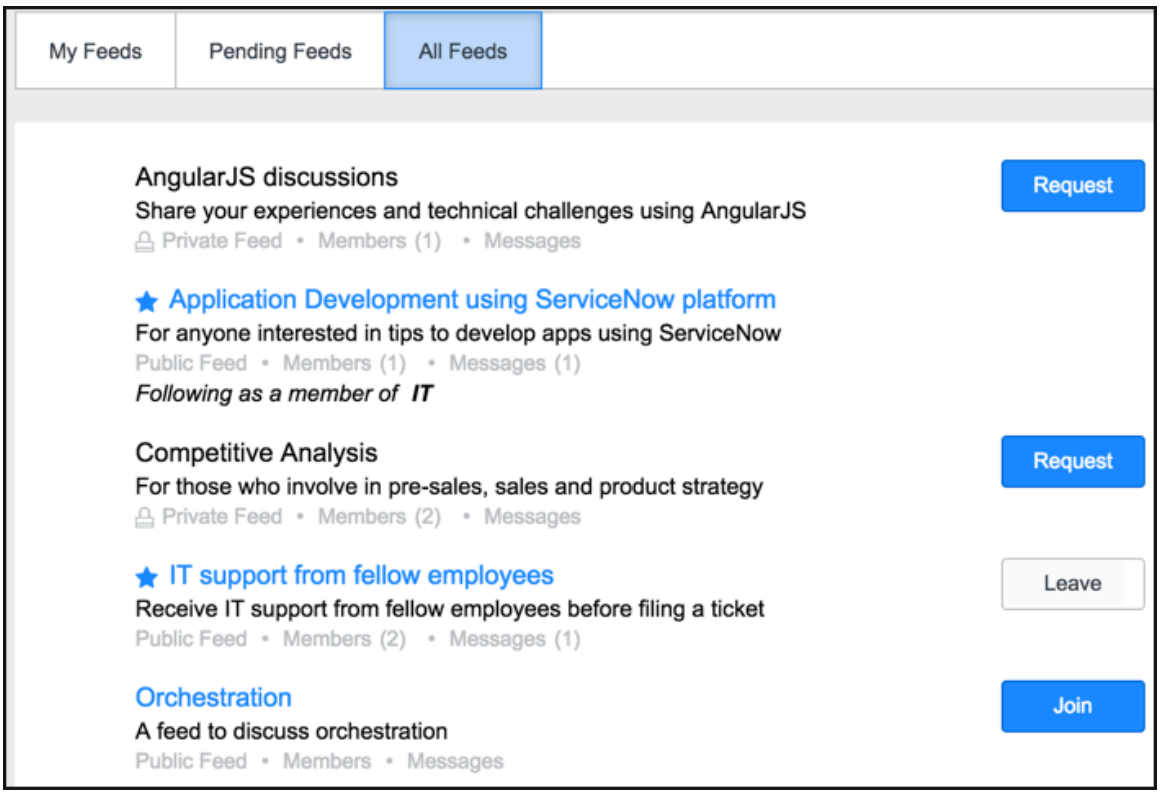
- View messages posted to the feed. Non-members can also view the messages for a public feed.
- View a list of feed members.
- Invite another user to join the feed.
- Subscribe to feed email notifications.
- Leave the feed.

Procedure

1. Navigate to **Live Feed** > **Live Feed**.
2. Click either **Group Feeds** or **Record Feeds**, and then click **All Feeds**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

All feeds



- If you received an invitation, click **Accept**. You can **Decline** the invitation if you do not want to join the feed.
- If the feed is public, click **Join**.
- If the feed is private, click **Request**. The feed administrator receives an email notification and must accept your request before you can join the feed.

Mark a feed as a favorite

Top-level messages in feeds can be marked as favorites on a per user basis only.

Before you begin

Role required: none

About this task

You can also search for messages marked as favorites, and remove the favorite designation as needed.

Procedure

1. Navigate to **Live Feed** > **Live Feed**.
2. Click either **Group Feeds** or **Record Feeds**, and then click **All Feeds**.
3. In the list of feeds, click the star icon ( ) adjacent to the feed name you want to mark as a favorite.

   To unfavorite a message, click the star icon ( ) of a message that is already a favorite.

View a feed

You have several options for viewing a feed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: none

Procedure

1. Navigate to **Live Feed** > **Live Feed**.
2. Click either **Group Feeds** or **Record Feeds**.
   This displays a list of feeds you belong to and an option to view all feeds.
   - To view a feed you belong to, select the feed name.
   - To view a public feed you do not belong to, select **Show All** and then click the feed name. You must be a member to view the feed for a private feed.

Note:
If you navigate away from the Live Feed application and then back again, the system displays the feed you last visited if you are a member of it.

View a feed member

View a specific member of a group feed.

Before you begin
Role required: none

Procedure

1. Navigate to **Live Feed** > **Live Feed**.
2. Click either **Group Feeds** or **Record Feeds**.
   This displays a list of feeds you belong to and an option to view all feeds.
3. Click the feed name.
   The list of feed members appears, organized by feed administrators and members.

Invite a new member to a group feed

The feed administrator can invite another user or a group to join a feed.

Before you begin
Role required: none

About this task
When a team is added to a feed, all members of the team also indirectly become members of the feed. Only users, and not teams, can be the feed administrators. A team member who is following a feed can become administrator by directly inviting another user to the feed.

Procedure

1. Navigate to **Live Feed** > **Live Feed**.
2. Click either **Group Feeds** or **Record Feeds**, and then select the feed name.
3. Click the **Pending members** tab.
4. In the **Add user or team** field, begin entering a user or team name and select a user or team from the suggestion list.
   The invited user or team members receive an email notification.

Invite a new member to a record feed

The feed administrator can invite another user or a team to join a record feed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: none

About this task
When a team is added, each of the individual members of the team become members of the feed. That is, if Team ABC is added to a feed, the feed does not show that Team ABC is a member. Instead, the feed shows each of the individual members of Team ABC as members of the feed.

When users are invited, their membership state is initially **Invited**. When they accept the invitation, the system checks their access to the **work_notes** journal field. If they have write access, they become administrator members; otherwise, they become active members.

Procedure
1. Navigate to **Live Feed** > **Live Feed**.
2. Click **Record Feeds** and select the record feed name.
3. Click the **Pending members** tab.
4. In the **Add user or team** field, begin entering a user or team name and select a user or team from the suggestion list.

   If you invite a team, the individual members of the team are invited.

   The invited users receive an email notification.

Remove a member from a feed

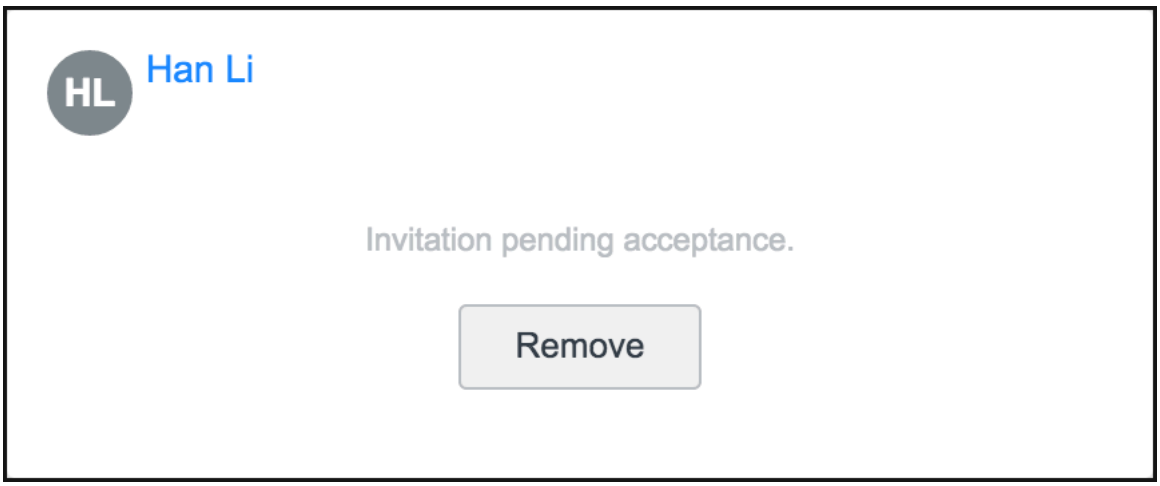
The feed administrator can remove any member from the feed.

Before you begin
Role required: none

Procedure
1. Navigate to **Live Feed** > **Live Feed**.
2. Click either **Group Feeds** or **Record Feeds**, and then select the feed name.
3. Click the **Members** tab.
4. Locate the member you want to remove and click **Remove**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Remove member



Note:
You can remove members regardless of their current state. That is, you can remove members who have already joined the feed or whose membership is pending.

Subscribe to a feed

Direct members of a feed can subscribe and unsubscribe to the feed in order to receive email notifications whenever any activity in the feed occurs, such as new messages being posted, replies, likes, polls, and @mentions.

Before you begin
Role required: none

About this task
Individual indirect members—that is, members of a team that is participating in a feed—cannot subscribe or unsubscribe from a feed directly. If the team administrator subscribes the team to a feed, the individual members receive an email notification for activities in the feed such as new messages being posted, replies, likes, polls and @mentions.

All notifications related to a top-level message, such as replies, mentions, and likes, are sent out with the same subject. The subject line defaults to **Live Feed** followed by the beginning of the subject line from the top-level message. For example, if the subject of the feed is **IT Support**, the email notification's subject will be **Live Feed IT Support**.

Procedure

1. Navigate to **Live Feed** > **Live Feed**.
2. Click either **Group Feeds** or **Record Feeds**, and then select the feed name.
3. Click the subscribe icon ( ).

   You can click the unsubscribe icon ( ) to stop receiving email notifications.

Note:
If a team is subscribed to receive email notifications for a feed, but a member of the team did not subscribe to the team, that member does not receive the email notifications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Navigate between Live Feed and other modules

If you are participating in a feed and navigate to another module, when you return to Live Feed it displays the feed you were previously viewing if it is public or if it is a private feed that you are a member of.

For example, assume you are viewing a public feed and then navigate to a particular incident record. Upon returning to Live Feed, the feed you were previously viewing opens. If you were last viewing a private feed that you are not a member of, returning to Live Feed opens the Company Feed.

Leave a feed

Members can choose to leave a group feed.

Before you begin

Role required: none

Procedure

1. Navigate to **Live Feed** > **Live Feed**.
2. Click either **Group Feeds** or **Record Feeds**, and then select the feed name.
3. Click **Leave**.

> **Note:**
> If you leave a feed associated with a record, such as an incident, you automatically rejoin that feed if you modify the associated record again.

Delete a feed

If you are a feed administrator, you can delete the feed.

Before you begin

Role required: none

Procedure

1. Navigate to **Live Feed** > **Live Feed**.
2. Click either **Group Feeds** or **Record Feeds**, and then select the feed name.
3. Click **Delete**.
4. Click **Yes** to confirm deletion.
   The feed is deleted from Live Feed. Messages posted to a private feed are deleted. Messages posted to a public feed remain on the Company Feed without a feed link.

Live Feed UI overview

The Live Feed user interface provides many methods you can use to share content with others in your organization.

> **Important:**
>
> Core UI is required to use Live Feed. Live Feed is not supported in Next Experience. If you turn on Next Experience, Live Feed is automatically disabled and will no longer work. See Next Experience UI for more information.
>
> While Live Feed has been discontinued, we are always exploring new ways to enhance our services. Stay tuned for future updates and improvements.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Update your Live Feed profile

Your profile information includes a photo or image, and tabs for different types of information including messages, feeds, teams, followers, and those who are following you. You can update your profile information and picture at any time.

Before you begin

Important:

Core UI is required to use Live Feed. Live Feed is not supported in Next Experience. If you turn on Next Experience, Live Feed is automatically disabled and will no longer work. See Next Experience UI for more information.

While Live Feed has been discontinued, we are always exploring new ways to enhance our services. Stay tuned for future updates and improvements.

Role required: none

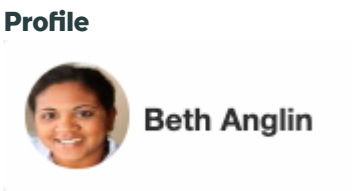
About this task

You can provide details about yourself, such as your role in your organization. You can also update your profile picture. However, only admins can delete a profile picture.

Note:
The functionality described here applies to HTML5-compliant browsers, such as Chrome, Firefox, Safari, and IE10 and above.

Procedure

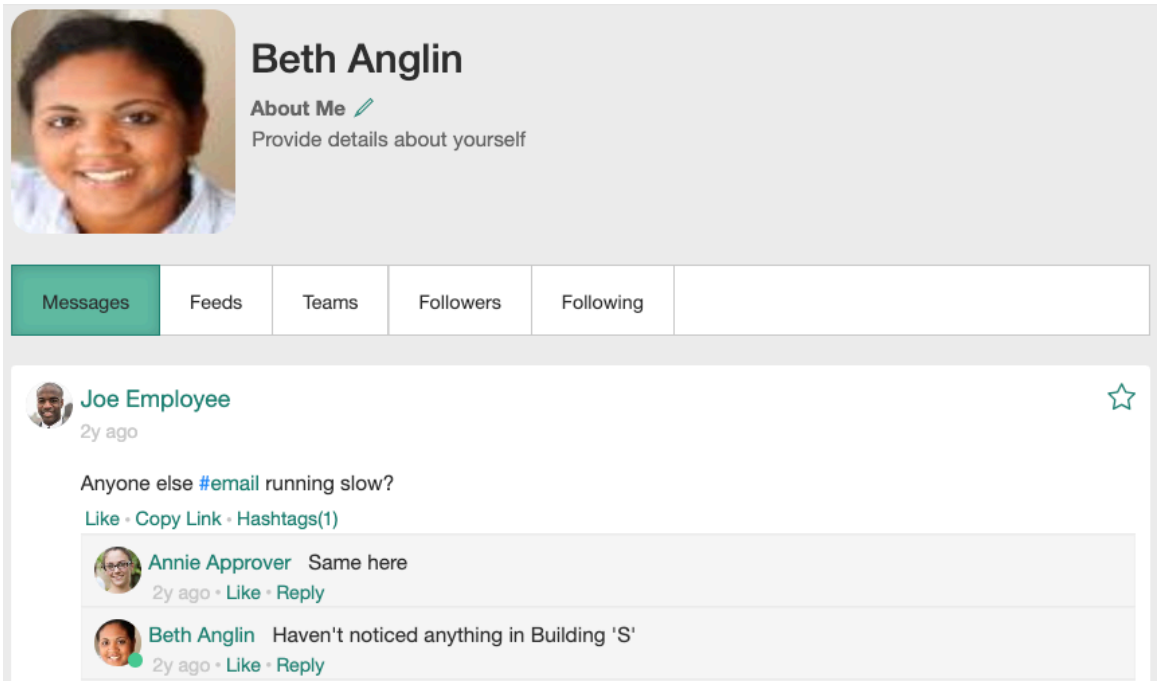
1. Navigate to **Live Feed** > **Live Feed**.
2. Click your name or title displayed with your picture.



The profile record opens.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Profile record



3. Click the pencil icon next to **About Me** and type a short description about yourself that you want to share with others who view your profile.
   This is text that you might not necessarily want to change on a regular basis.
4. You can change your profile photo using either of the following two methods:
   - Hover over the existing picture (or tap the photo in the case of the smartphone or tablet interface) to display the **Upload a picture** link. Select the link, navigate to the location of the photo you want to use, and then select **Open**.
   - Locate the photo file you want to use on your computer, and then drag-and-drop it over the existing photo.

Upload a picture link

Note:
Your profile picture is used by the Connect and legacy chat features as well, if they are activated.

Work with Live Feed messages

This portion of the UI gives the user access to various types of messages and tools for grouping and categorizing messages. Also included are methods for identifying which user feeds you are following and which users are following you.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tools for working with Live Feed messages

Menu section	Description
	• *My Live Feeds*: These are custom feeds that allow you to customize Live Feed to view the content that is most important to you. • *Company Feed*: This feed displays all posts, except those posted to private or unlisted groups. • *Group Feeds*: These feeds are created by users. Record Feeds: These feeds are associated with a record, such as an incident or change. • *Record feeds*: These feeds help users collaborate on records by providing a place for anyone who can access the record to share messages and post attachments specific to that record. • *People*: This option displays people who are following the current user and people the current user is following. • *Teams*: This option is used to combine users into groups for the purpose of subscribing to specifically-focused conversations. • *Hashtags*: Hashtags are words marked with a hash (#) symbol in messages. Hashtags are used to categorize messages by keyword or topic for improved search results messages filtered from all conversations that include specific hashtags.

View another Live Feed user

When a requester user, one that has no ServiceNow role, is viewing a feed and points to another user's picture, information for the user appears from the Business Card view of the User [sys_user] table.

Before you begin

Role required: none

About this task

Admins can change the amount of information that is displayed for users with different roles.

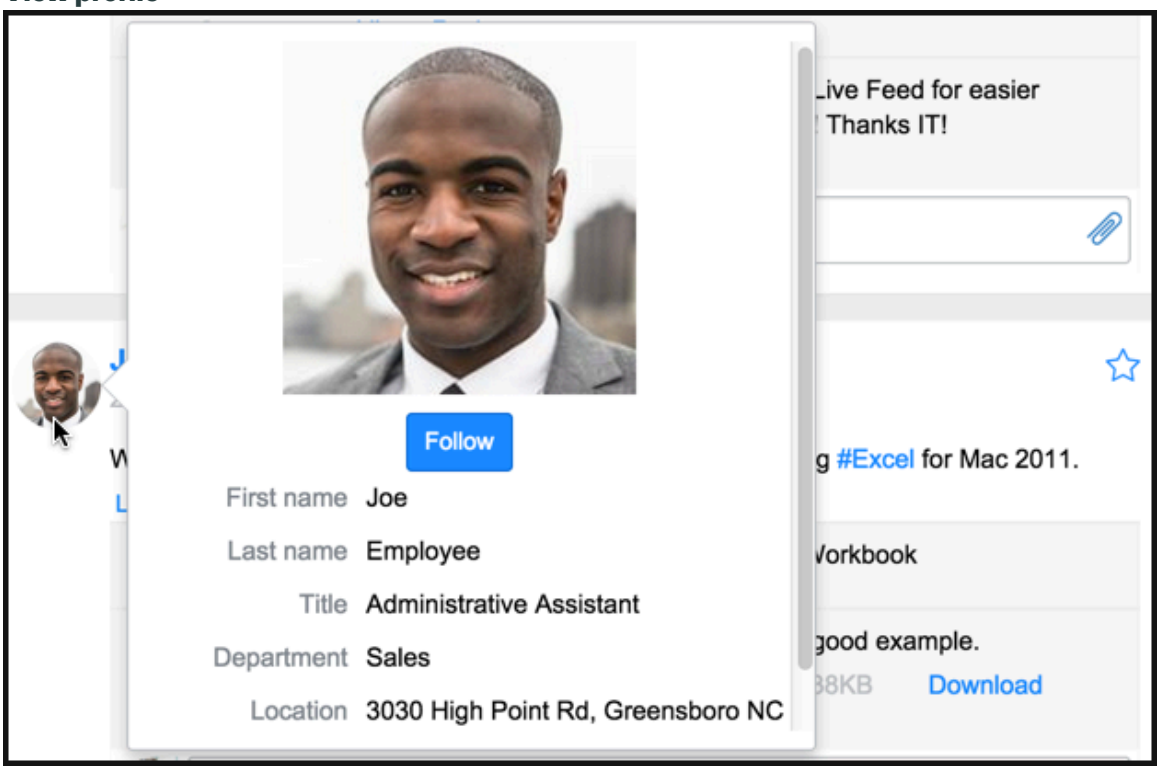
Procedure

1. Select a profile picture in your feed.

A user summary appears.

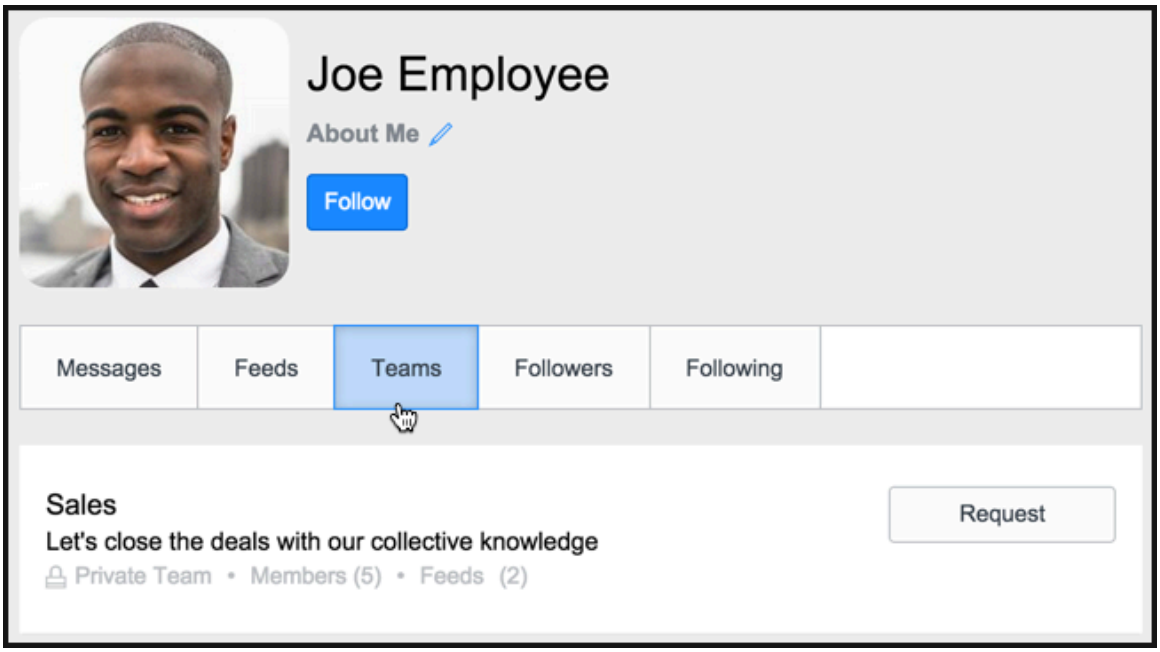
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

View profile



2. Select the profile picture to view the full profile.
   Use the tabs to view different types of information about the user.

Profile tabs



Follow other Live Feed users

As you use Live Feed, you can follow the message threads of other users.

Before you begin

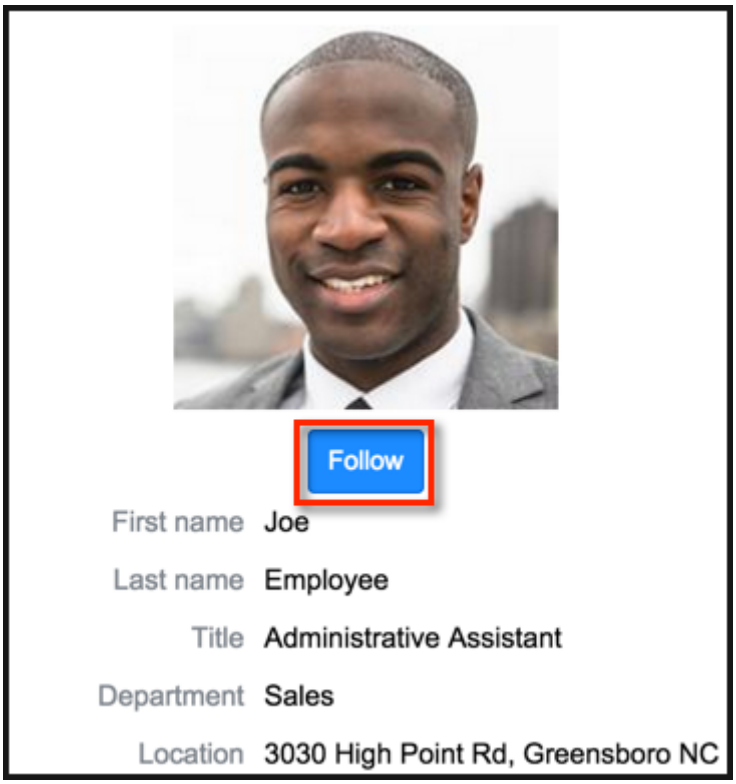
Role required: none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

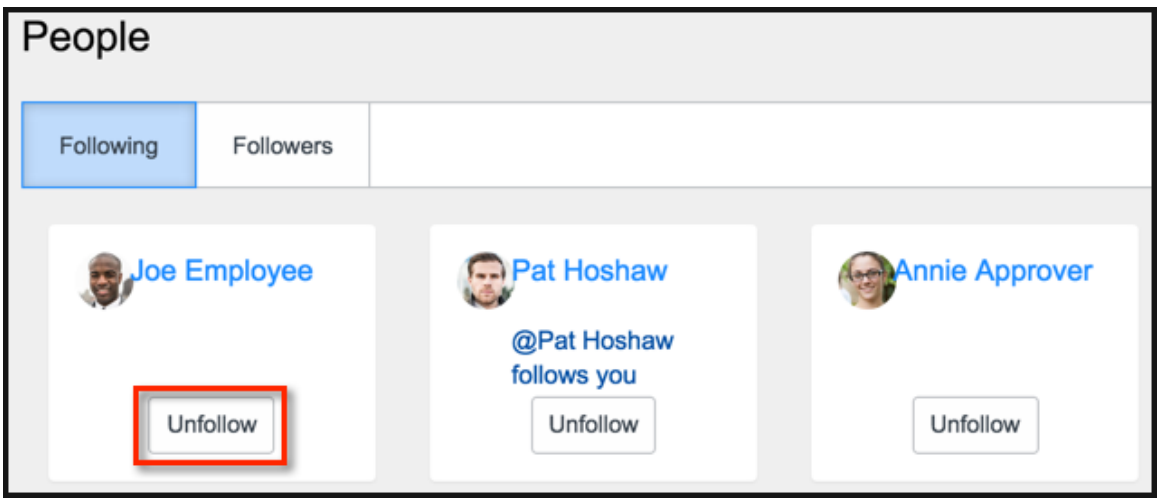
1. Navigate to a thread that the user you want to follow is engaged in.
2. Click that user's name or point to the user's picture.
   A **Follow** link appears in the user's profile.

Profile with Follow link



3. Click **Follow**.
4. To stop following the user, navigate to **People** > **Following**.

Unfollow



5. Click **Unfollow**.
6. To view people who are following you, navigate to **People** > **Followers**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Select feeds

A feed is a stream of related messages. You can use the feed selector to switch between feed types and to view specific group feeds and record feeds.

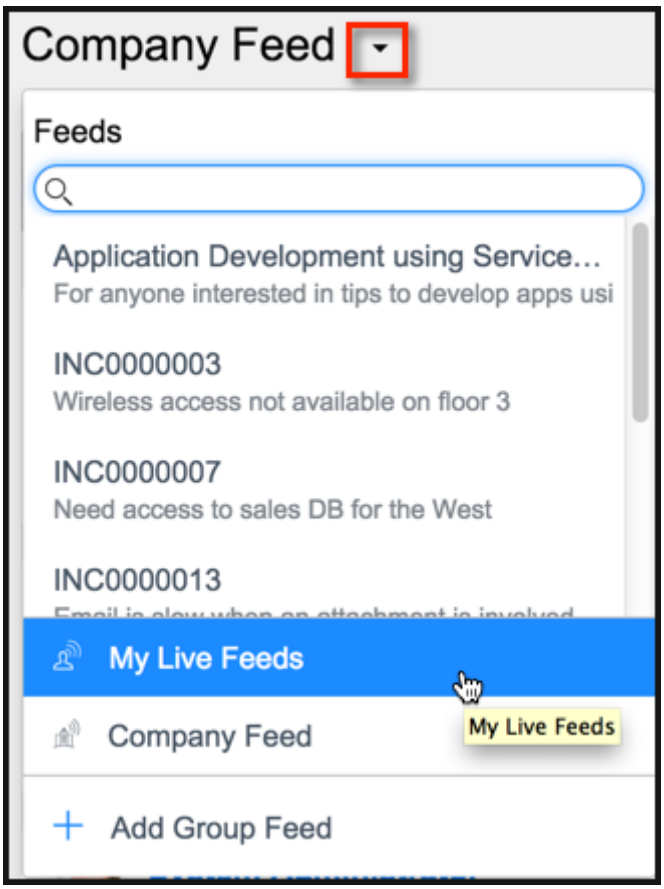
Before you begin

Role required: none

Procedure

1. Use the **Search** field to locate any type of feed.
   As you type in the **Search** field, the results are dynamically displayed. For example, if you type *INC*, records that are incidents are forced to the top of the results list.

Feed selector



2. You can also select the following types of feed information.

Feeds types

Feed	Description
My Live Feeds	Displays the following posts: ○ messages from users you follow ○ messages with hashtags you follow
Company Feed	Displays all posts, except those posted to private or unlisted groups.
Add Group Feed	Allows you to add a group feed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Follow feeds

You can view users who are following you or other users you are following.

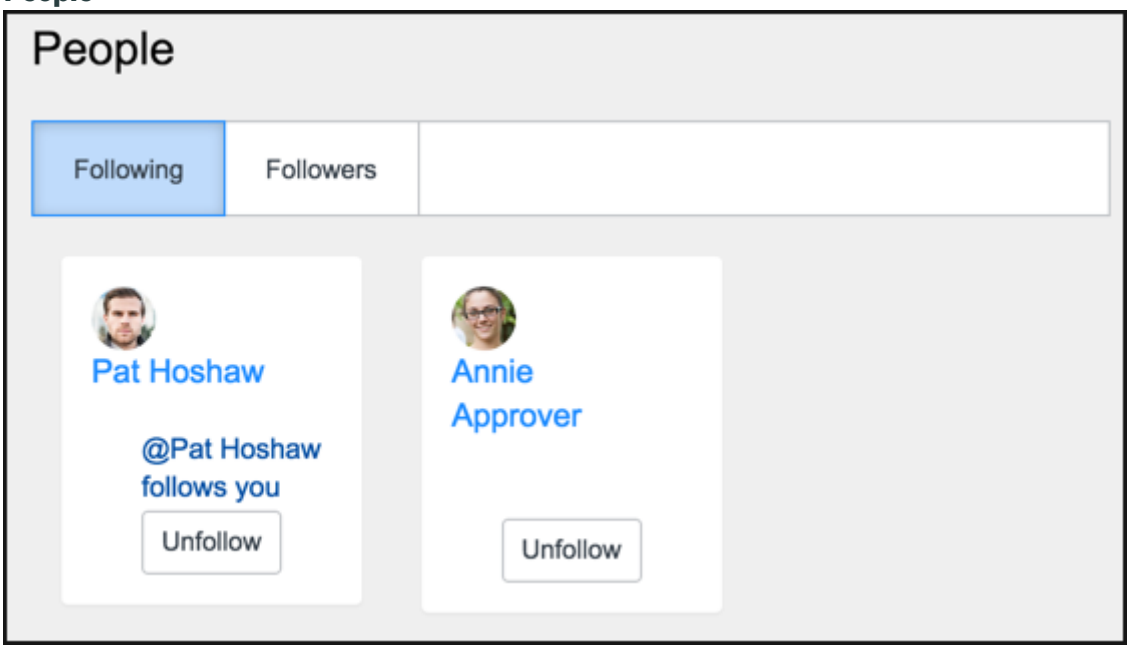
Before you begin
Role required: none

Procedure

1. Click **People** in the sidebar.

   The system shows 10 most recent followers or users you are following.

People



2. Click the Show More link if either list contains more than 10 users.

Note:
If you are following a particular user whose profile changes, that user moves to the front of the Following list. This alerts you to changes in the profile of a user you are following.

Bookmark feeds and hashtags

The Live Feed interface uses the standard bookmarking functionality for feeds and hashtags.

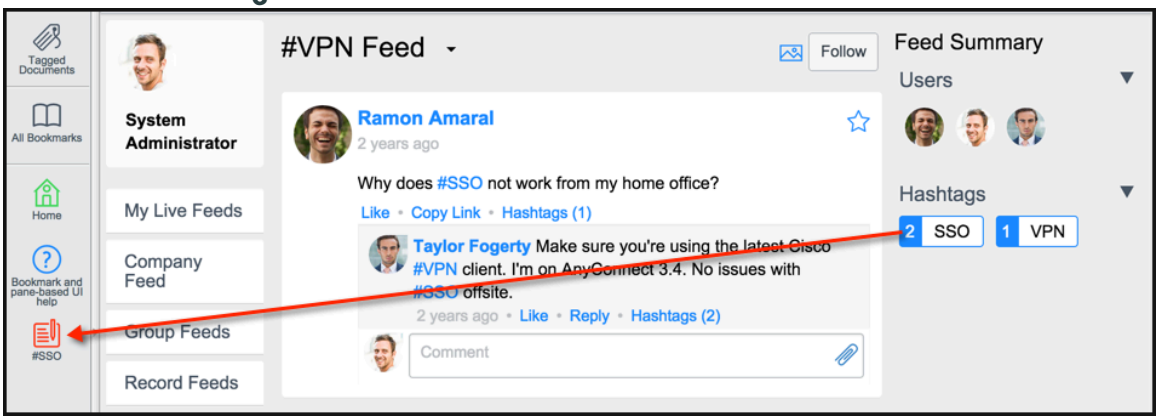
Before you begin
Role required: none

Procedure

Drag-and-drop group feeds and hashtags from the Feed Summary section to the Edge for quick access.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Bookmark a hashtag



Add Live Feed to your homepage

You can add Live Feed to your own homepage or to a global homepage.

Before you begin

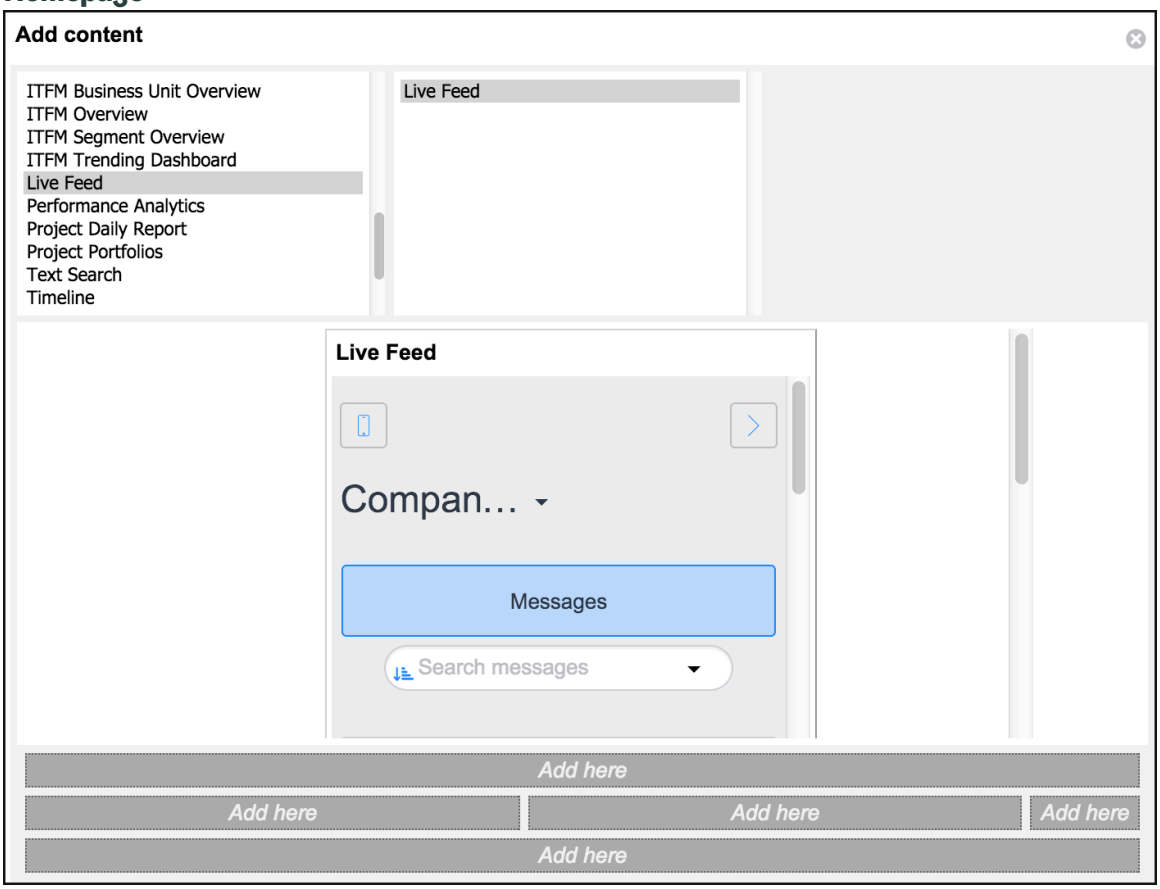
Role required: none

Procedure

1. Navigate to a homepage.
2. Click the add content icon (+) in top left corner of the homepage.
3. Select Live Feed in the left panel.
4. On the bottom of the window, click **Add here** in the appropriate layout position, then close the window.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Homepage



Note:
Administrators can add Live Feed to a global homepage to make it available for all homepage users by default. Users with any role can add Live Feed to their homepage; however, administrators can restrict this ability.

Post content in Live Feed

In Live Feed, you can post new messages and replies to existing messages for all users in the feed. You can also send a reply message to a team or record.

Important:

Core UI is required to use Live Feed. Live Feed is not supported in Next Experience. If you turn on Next Experience, Live Feed is automatically disabled and will no longer work. See Next Experience UI for more information.

While Live Feed has been discontinued, we are always exploring new ways to enhance our services. Stay tuned for future updates and improvements.

Attachments in feeds

In addition to entering text, you can attach files, such as images, documents, and spreadsheet files in any ServiceNow supported file type to Live Feed messages.

Administrators can manage attachment file settings, such as supported file types and maximum attachment file size, by editing system properties.

You can also include links to user-defined URLs and knowledge articles contained in your instance's knowledge base.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The functionality described here applies to HTML5-compliant browsers, such as Chrome, Firefox, Safari, and Internet Explorer 10 and above. Significant differences while using different browsers are highlighted.

Post a Live Feed message

You can post a message to open a new feed.

Before you begin
Role required: none

Procedure

1. Navigate to **Live Feed** > **Live Feed**.
2. Click the feed to which you want to post your message, for example My Live Feed, Company Feed, and so on.
3. Enter a message in the **Share your thoughts** field.
   Use hashtags, if you want.
4. As needed, click , , or to add a poll, attachment, or screenshot image, respectively.
5. Click **Post**.

Reply to a Live Feed message

To participate in an existing thread of a feed, you can compose and submit a reply message. By default, the message is visible to all members of the feed.

Before you begin
Role required: none

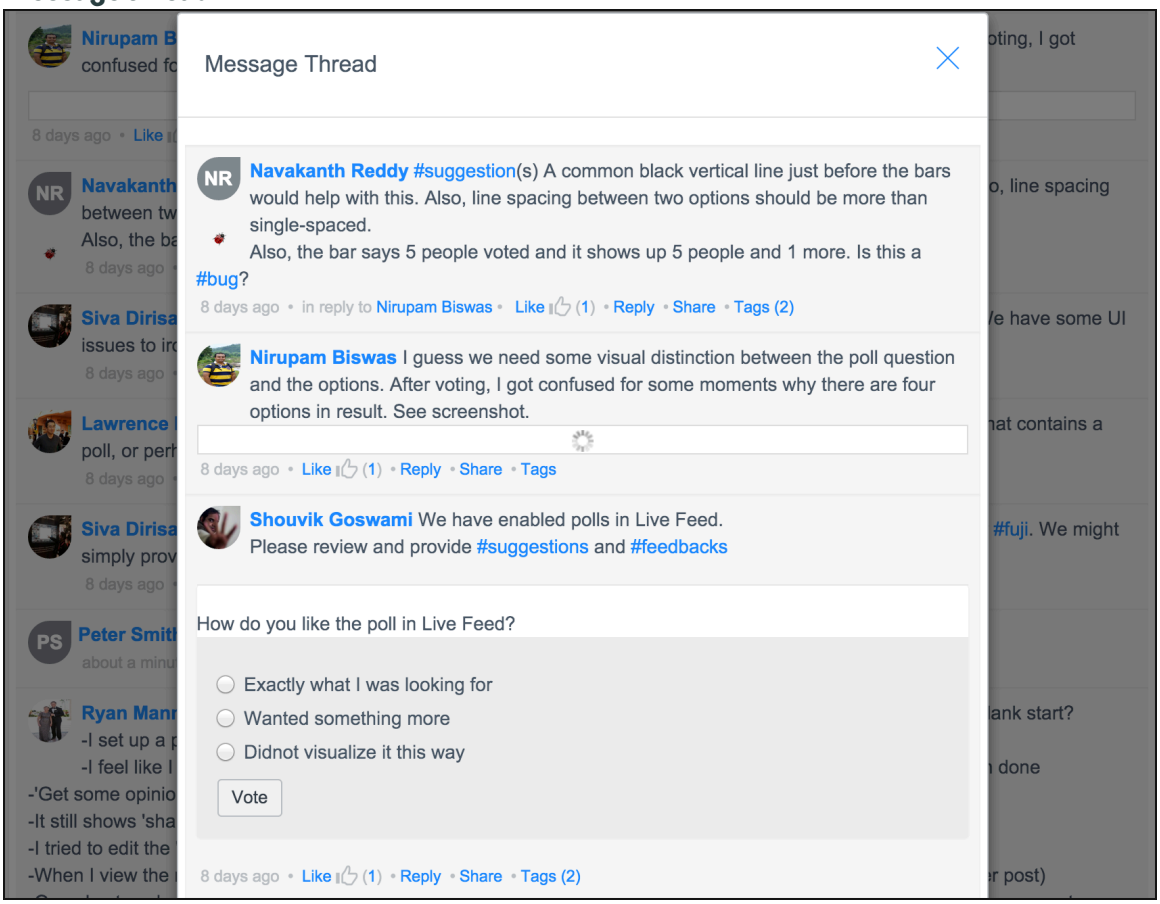
Procedure

1. Navigate to **Live Feed** > **Live Feed**.
2. Locate the message you want to reply to.
3. Type your reply in the message box and click **Reply**.
   As needed, you can add hashtags, attachments, links, or knowledge base articles.
4. To limit who can view the reply to a single individual, select a user from the **To** choice list.
5. Click **Reply**.
6. To view additional replies, click **Show all replies**.
   By default, 7 replies are visible for each message. Any reply to a reply includes a **Threads** link.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Click **Threads** to view all of the replies within the selected reply in reverse chronological order within the **Message Thread** pop-up window, similar to an email thread.

Message thread



Attach a file to a post or reply

You can attach files to a post by dragging a file into a post or pasting an image from the clipboard.

Before you begin

Role required: none

About this task

Use the paperclip icon ( ) to drag files into a post. Additionally, you can paste images into a post or reply from the clipboard.

Procedure

1. Do one of the following:

   - While composing a post or reply (see Reply to a Message), locate one or more images or other supported types of files, and drag them into the message box.

   - Click the paperclip icon ( ) in the message box, navigate to the location of the files you want to attach, select them, and click **Open**.

2. To add more files, drag-and-drop additional files into the text box below the displayed files or images, or click the plus sign.

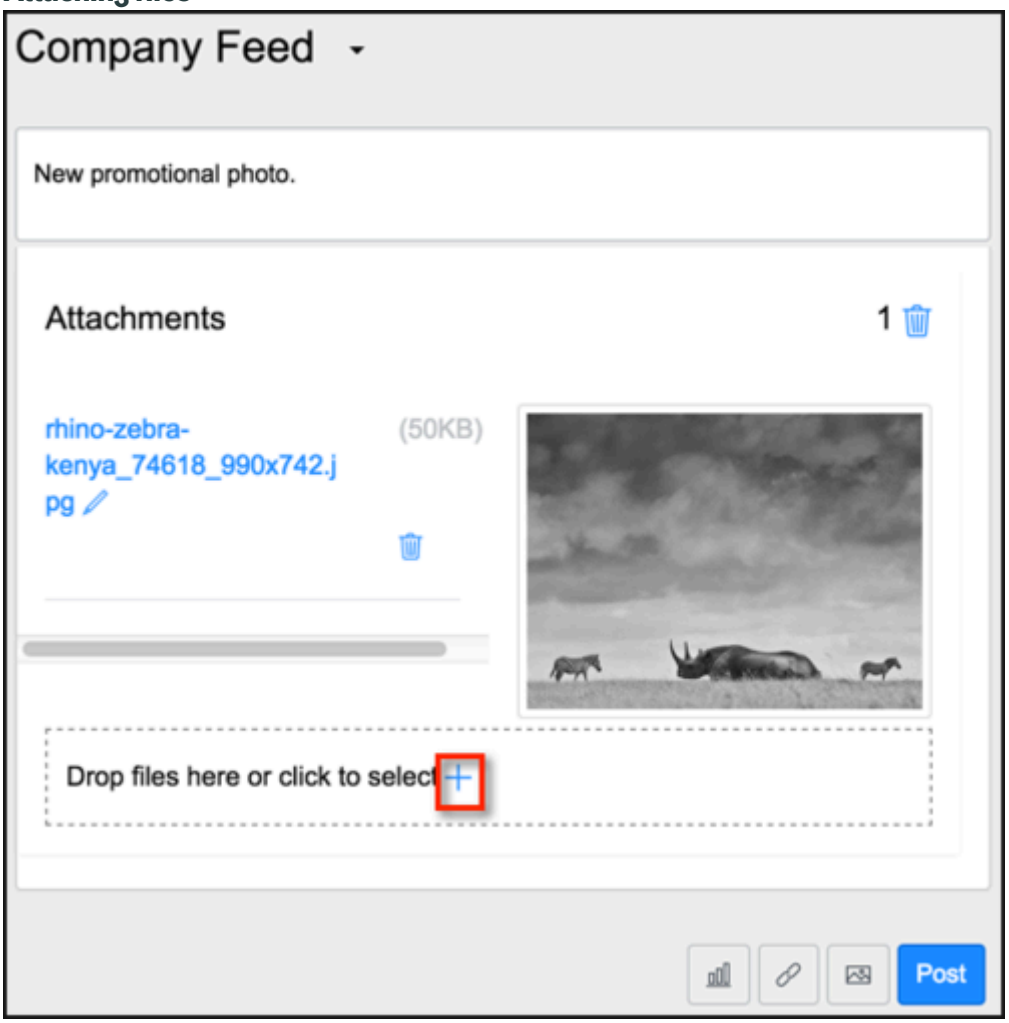
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Attaching files



3. If you want to delete an attachment before posting the message, click the trashcan icon adjacent to the attachment.
4. Enter a comment to share your thoughts about the image.

> **Note:**
> The **Post** button is enabled only after you add the comment.

5. Click **Post** or **Reply**.
6. If you added files that do not contain previews and then posted the message, they will be listed in the message box with a **Download** link.
7. Click the link to download the files.

Copy an image from the clipboard

In addition to adding files to a message, you can also copy images to the clipboard and paste them into a message or reply.

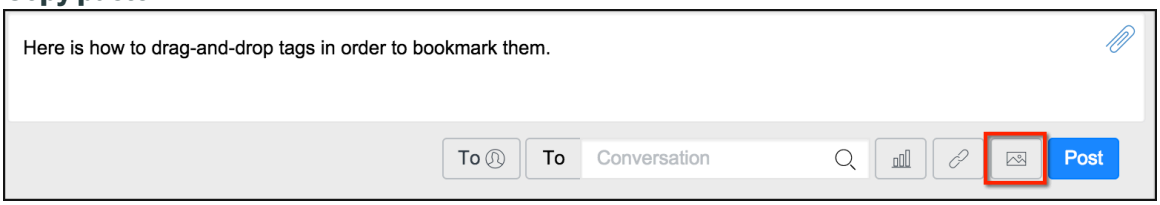
Before you begin
Role required: none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

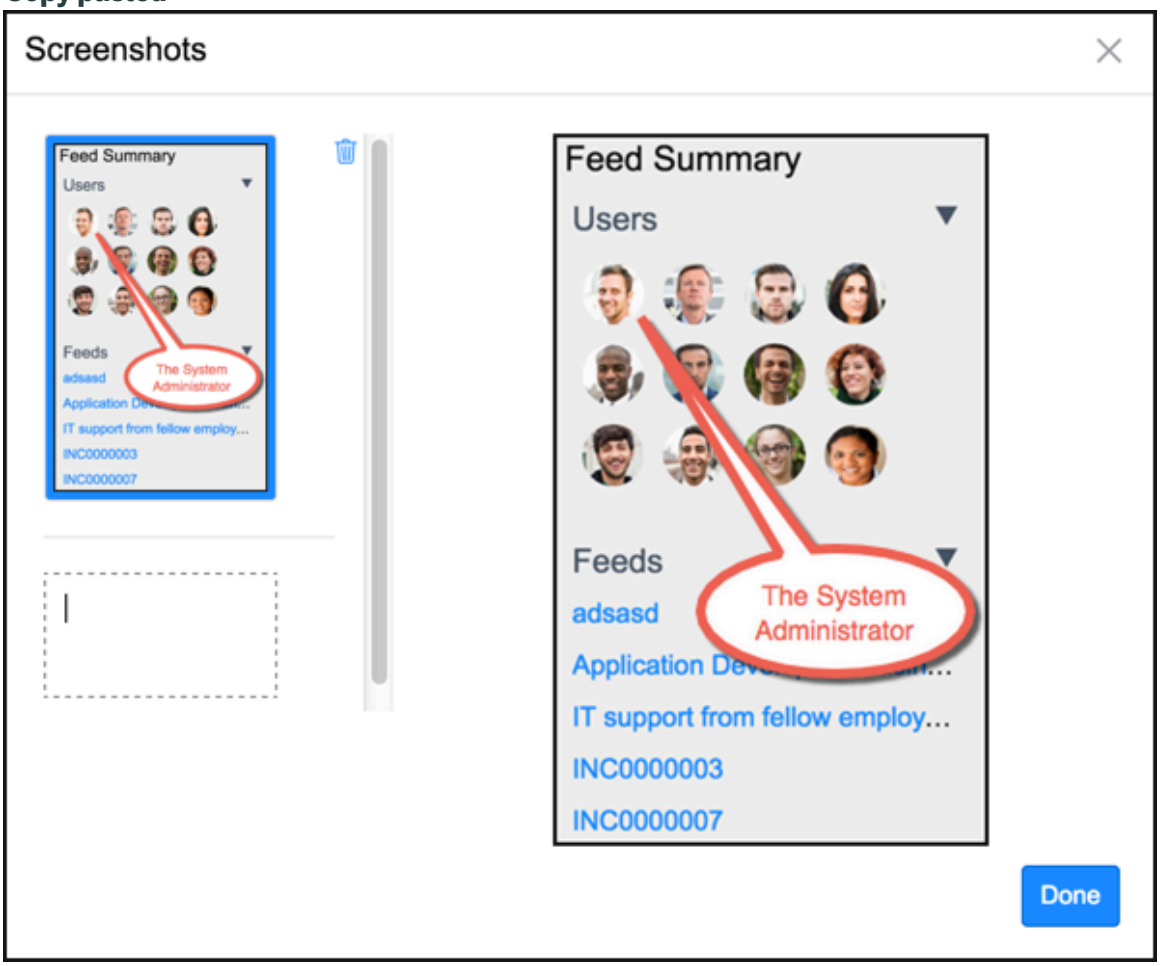
1. Click into the **Comment** box and add a comment.

Copy paste



2. Click the **Add an image** button.
   The **Screenshots** dialog box opens.
3. Right-click the **Paste an image here** box and select **Paste** to paste the image from the clipboard.

Copy pasted



4. To add another image, repeat the previous steps.
5. When you finish pasting images into the message, click **Done**.
6. To change the link text, click **Pasted Image** and enter a new label.
7. When you finish, click **Post** or **Reply**.
8. To remove an image, click the trash can icon adjacent to the link.

9. To make changes to an existing image, click the edit icon ( ).

Note:
The copy/paste functionality is supported in Chrome, Firefox, and Internet Explorer 11.

Add a link to a post or reply

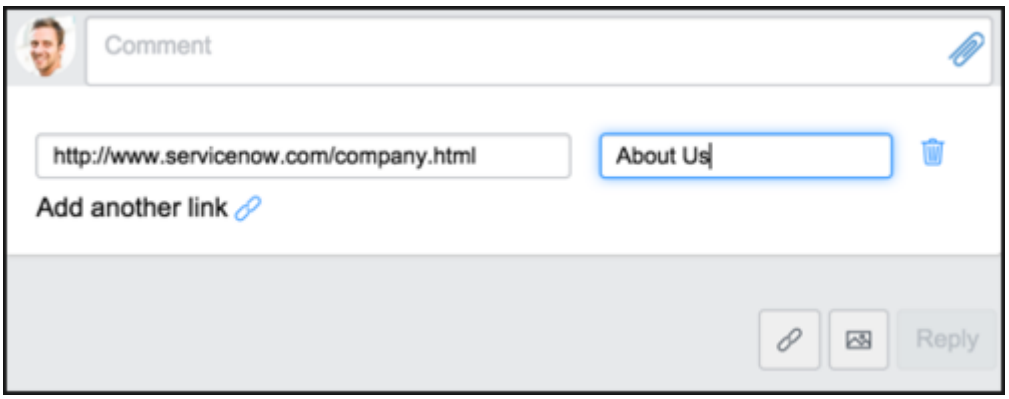
Add or modify a link to a Live Feed post.

Before you begin
Role required: none

Procedure

1. Click into the **Comment** box.
   The **Add a link** button appears.
2. Click the **Add a link** button.
   The **URL** and **Link text** fields appear.

Add a URL



3. Enter the URL and the text you want to appear as the link.
4. To add another link, click the link icon under the **URL** field.
5. When you have finished entering your message, click **Post** or **Reply**.

URL Saved

To remove a link, click the trash can icon adjacent to the link. To make changes to an existing link, click the edit ( ) icon.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add a knowledge article link to a post or reply

Use the ID of a knowledge article to post it as a reply to a Live Feed conversation.

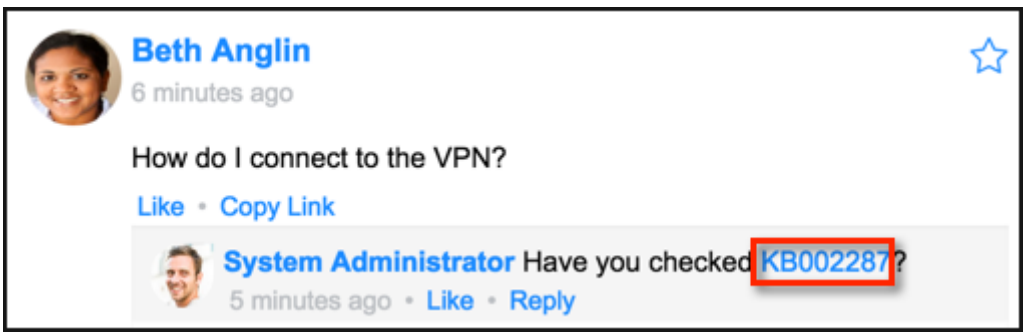
Before you begin

Role required: none

Procedure

1. While composing a post or reply, type the ID of the knowledge article you want to link to. You do not need to identify the knowledge article ID as a hyperlink. Live feed recognizes it as such and automatically converts it into a link when the message is posted.
2. When you are finished entering your message, click **Post** or **Reply**.

KB link



Add a poll to a message

When you are posting a message, you have the option of creating a poll in order to record your viewers' opinions. As users take the poll, their feedback statistics are displayed within the feed.

Before you begin

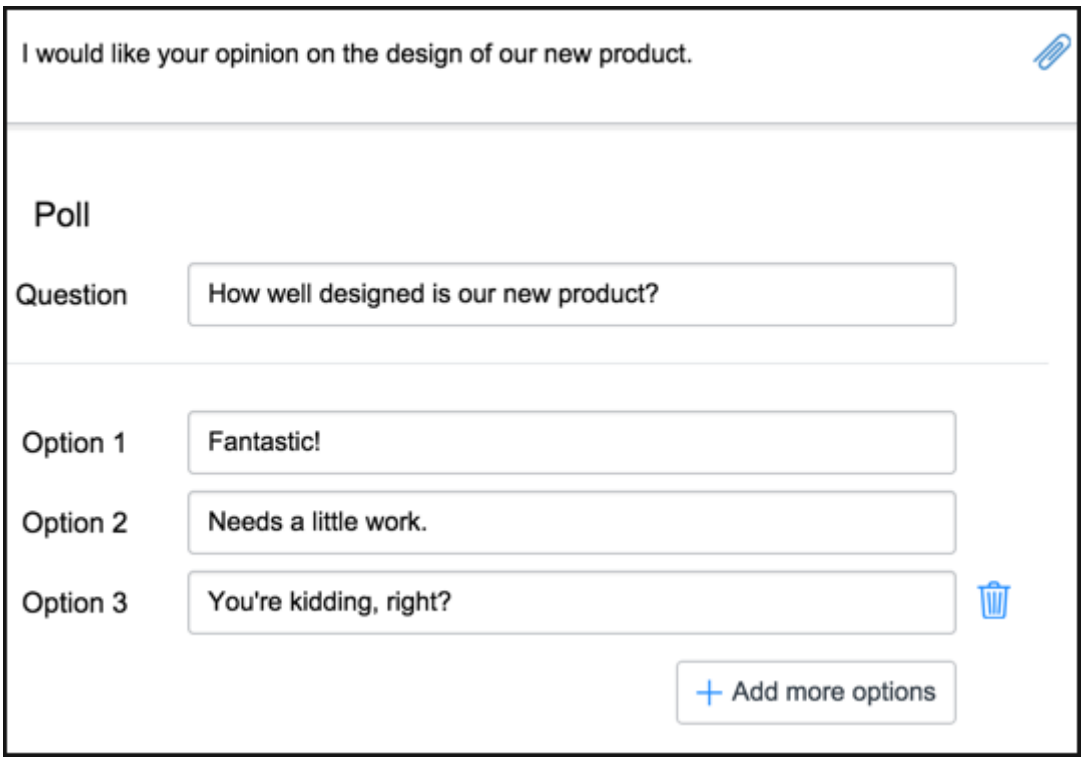
Role required: admin

Procedure

1. Open the feed where you want to create a message with a poll.
2. Enter the message with an invitation to take the poll in the **Share your thoughts** box.
3. Click the poll ( ) icon.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Poll



4. In the **Question** field, enter the question on which you are soliciting opinions.
5. In the **Option** fields, enter possible responses to the query.
6. To add more response options, click **Add more options**.
7. Click **Post**.
   After the poll is posted, users who view the message can vote. After they vote, their pictures appear next to their response, with others who have voted for the same option.

   An email notification with the poll result is sent to all participants of the poll informing them that the poll is closed.

Add mentions to a message

An @mention is any posted update that contains @username anywhere in the body of the message.

Before you begin

Role required: none

About this task

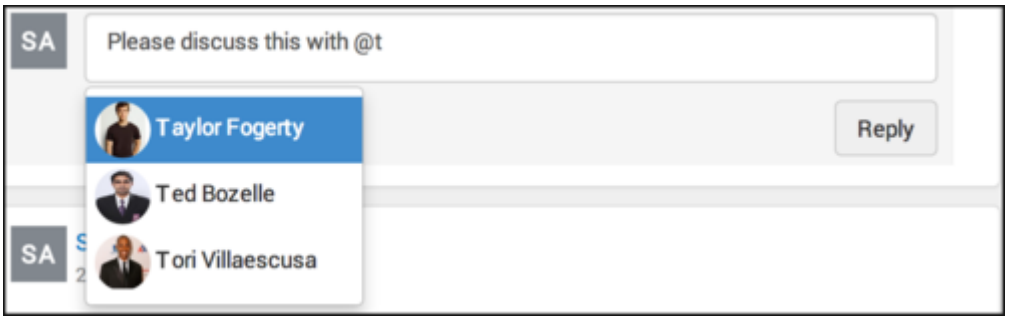
The user's name, with a link to that user's feed, is inserted into the message. Additionally, the mentioned user receives an email notification about the mention. This is a great way of bringing attention to other members in a conversation. All @mentions are included in the logged-in user's My Feed.

Note:
If an @mention is used by a member of a team, only members of that team appear in the auto-suggest list.

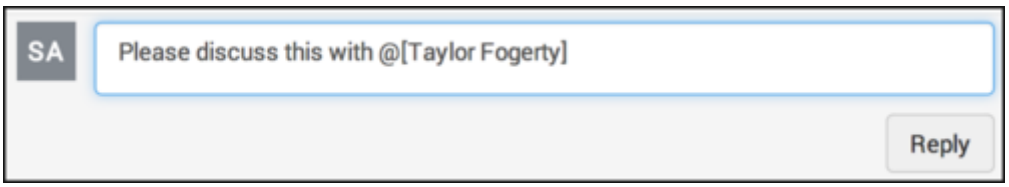
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. While entering a message or reply in a conversation, type `@username` anywhere in the message.
   As you type, an auto-suggest list appears with names and pictures of users that match your entries. For example, if you type `@t`, the auto-suggest list shows the pictures and names of all users with names that start with T.



2. Click the user you want to add.
   That user's name is inserted into the @mention in the body of the message.



Note:
My Feed displays @mentions of you and the teams you are a member of. Profile feeds for another user display only @mentions of that user.

Like a message

Like a message to provide feedback to the author.

Before you begin
Role required: none

Procedure

1. Navigate to **All** > **Live Feed** > **Live Feed**.
2. Click **Feeds**.
3. Locate the feed that contains the message you want to like.
4. Under the message title, click **Like**.
   If the message has previously been liked, the number of likes for a message displays next to the Like link.

   For a top-level message, the profile pictures of the first 5 users who liked a message are displayed. Any additional users who liked the message can be viewed by hovering over the **# more** link. If the logged-in user has liked the message, that user's image will appear first, followed by the image of the user who last liked the message.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For a reply, you must hover your mouse pointer over the **count** link to view the users who liked the message.

Note:
After a message has been liked, it cannot be unliked.

Delete a message

Users can delete any of their own posts or replies. A conversation administrator can also delete messages.

Before you begin
Role required: none

Procedure

1. Hover over the message you want to delete.
2. Click the trash can icon in the upper-right-hand corner of the message box.
3. Click **Delete** in the confirmation box.
   The message disappears from the feed.

Live Feed reference

Topics in this section describe domain separation in Live Feed, as well as the various components that are installed with it.

Important:

Core UI is required to use Live Feed. Live Feed is not supported in Next Experience. If you turn on Next Experience, Live Feed is automatically disabled and will no longer work. See Next Experience UI for more information.

While Live Feed has been discontinued, we are always exploring new ways to enhance our services. Stay tuned for future updates and improvements.

Domain separation in Live Feed

This is an overview of domain separation and Live Feed. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Overview

Support: Level 2

Parent and child domains define the Live Feed content that can be viewed and shared with other users.

- A user in a parent domain can see users and content within their domain and within all child domains that are lower in the domain hierarchy.
- A user in a child domain can see users and content within their domain but cannot see the parent domain or other child domains at the same level in the domain hierarchy.

Enable domain separation for Live Feed

Domain separation for the Live Feed application is available starting with the Eureka release. For users upgrading to Eureka, a sys_domain column is added to existing live feed-related database

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

tables. For existing database records, the value of the sys_domain field is set to empty (global). This allows the domain separation feature to work with existing Live Feed records.

Show or hide the Live Feed application for a domain

The administrator can Live Feed visibility for a domain. This includes:

- Displaying Live Feed in the application navigator.
- Following a document feed for a record.
- Viewing Live Feed from a record.

Use Live Feed with domain separation

All of the Live Feed features are available to users within a domain and work the same way, with some exceptions to visibility.

- *Posting and sharing content*
  - Users in a child domain can interact with other users in the same domain. This includes posting and replying to messages, deleting messages, attaching files and links, and rating content.
  - Users in a parent domain can interact with other users in the same domain and with users in any child domains. Messages that are added to child threads by parent users are given the visibility of the child domain, not the parent domain.
- *Viewing content*
  - Users in a child domain can view content that resides within their domain. This includes filtering by feed, sorting, searching, and viewing older messages.
  - Users in a parent domain can view content that resides within their domain and within any child domains.
  - My Feed shows messages, teams, and hashtags based on the user's domain. Showing another user's feed only shows posts visible in the current user's domain.
- *Using hashtags*
  - Hashtags are separated by domain. Users in a child domain can use all of the hashtag functions within their domain. This includes tagging messages, viewing available hashtags, changing hashtag names, and searching and filtering by hashtag.
  - Users in a parent domain can use all of the hashtag functions within their domain and can see hashtags in any child domains.
- *Using teams*
  - Teams are separated across domains. Users in a child domain can join and follow teams within their domain, and can invite other users within their domain to join teams.
  - Users in a parent domain can join and follow teams that belong to their domain or to any child domains.
- *Exceptions to teams*
  - New teams are created in the user's domain. However, if the team has a record associated with it, the team is created in record's domain.
  - New threads in an existing team are created in the domain of the existing team.
  - When a user is creating a new team from a document, if the document domain is not empty or global, the team domain needs to be changed to be the document's domain.
  - For a document-generated team, when the domain of the document changes, the domain of all related Live Feed records changes as well.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- *Subscribing to email notifications*

  Users can subscribe to email notifications from users and teams within their domain only.

Components installed with Live Feed

Several types of components are installed with Live Feed.

Demo data is available with Live Feed.

Tables installed with Live Feed

The Live Feed plugin includes the following tables.

Table	Description
Link attachments [live_link]	Stores links and attachments that are added to messages.
Live Favorite [live_favorite]	Stores the favorite conversations, user groups, and messages.
Live Feed Searches [live_feed_search]	Stores Live Feed text searches. Access at **Live Feed** > **Feed Administration** > **Search Log**.
Live Follows [live_follow]	Maintains users' follow preferences for user feeds.
Live Group Profile [live_group_profile]	Stores conversation properties, including name, description, and public status. Also stored are user group properties, such as name, description, and public status.
Live Group Member [live_group_member]	Maintains the member lists for conversation and user group.
Live Mention [live_mention]	Stores the profiles mentioned in a message. References sys_user table.
Live Message Tag [live_message_tag]	Stores messages associated with user-created tags. Appears as a related list on Live Tag records.
Live Messages	Stores messages. References sys_user table. Access at **Live Feed** > **Feed Administration** > **Messages**.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
[live_message]	
Live Poll [live_poll]	Stores a poll question.
Live Poll Cast [live_poll_cast]	Stores profiles of users who voted for a particular option in a poll.
Live Poll Options [live_poll_option]	Stores poll options.
Live Profiles [live_profile]	Stores user Live Feed profiles. References sys_user table. Access at **Live Feed** > **Feed Administration** > **Profiles**.
Live Table Notification [live_table_notification]	Generates automatic table notifications, such as when a user reads Live Feed for the first time and when a high priority incident is opened. Access at **Live Feed** > **Feed Administration** > **Table Notifications**.
Live Tag [live_tag]	Maintains user-created tags. Access at **Live Feed** > **Feed Administration** > **Tags**.
Live Tag Follows [live_tag_follow]	Maintains users' follow preferences for tags.
Messages Liked by [live_message_like]	Maintains like ratings for posts. Access at **Live Feed** > **Feed Administration** > **Likes**.

User roles installed with Live Feed

The Live Feed plugin includes the following user roles.

To learn more about managing subscriptions, see Managing per-user subscriptions in Subscription Management and contact your account representative.

live_feed_admin

Can manage Live Feed functions. Users with the live_feed_admin role can set up table notifications for non-task tables, limit Live Feed access by role, and manage Live Feed message content.

Contains Roles

List of roles contained within the role.

None.

Groups

List of groups this role is assigned to by default.

None.

List of groups this role is assigned to by default.

None.

Special considerations

Note:
Avoid granting an admin role when more specialized roles are available.

Script includes installed with Live Feed

The Live Feed plugin installs the following script includes.

Name	Description
LiveMsgUtil	Provides helper functions for working with live_message records.
LiveFeedFilter	Queries filters for working with live_feed records.
LiveFeedUtil	Provides helper functions for working with live_feed records.

Business rules installed with Live Feed

The Live Feed plugin includes the following business rules.

Business rule	Table	Description
Feed Group Creator Becomes Admin	Live Group Profile [live_group_profile]	Designates the group creator as the group administrator.
Live Feed events	Task [task]	Runs on task insert, update, and delete. Triggers event associated with the Live Feed Update Script action that processes Live Table Notifications to auto-generate Live Feed messages.
Live feed member update events	Live Group Member [live_group_member]	Generates a notification event when member state changes (invited, accepted, declined, left, rejected, request, request_accepted).

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Business rule	Table	Description
Live feed integration	Journal Entry [sys_journal_field]	Writes journal comments to the Live Feed if there is a group for this record.
Live feed new member events	Live Group Member [live_group_member]	Generates a notification event when new members are added.
Live Feed profile events	Live Profile [live_profile]	Runs on live_profile insert/update/delete, triggers event associated with the Live Feed Update script action that processes Live Table Notifications to auto-generate Live Feed messages.
Live Feed message events	Live Feed Message [live_message]	Runs on live_message, notification event trigger for new live messages.
Live message like events	Message Liked by [live_message_like]	Runs on live_message_like, notification event trigger for new like records.
LiveFeed Group Member Visibility 2.0	Live Group Member [live_group_member]	Ensures users can only see the members list for public groups and groups they belong to.
LiveFeed Group Profile Validation	Live Group Profile [live_group_profile]	Ensures that a public group is visible.
LiveFeed Group Profile Visibility 2.0	Live Group Profile [live_group_profile]	Ensures that the list of all groups only displays public groups, private groups that are visible, and groups the user belongs to.
LiveFeed Membership Changes	Live Group Member [live_group_member]	Enforces that only the group administrator and users with live_feed_admin role can manage membership for a group.
LiveFeed Single Group Membership	Live Group Member [live_group_member]	Ensures that a user is not added multiple times to the same group.
Live Message Likes	Live Message Like [live_message_like]	Updates the number of likes for a message.
LiveFeed Join Group Check	Live Group Member [live_group_member]	Ensures that users can not automatically join private visible groups.
Update Follow/ Follower Counts	Live Follow [live_follow]	Updates the following/followers counts.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Business rule	Table	Description
Live Feed Group	Assessable Record [asmt_assessable_record]	Creates/Deletes a Live Feed group for an assessable record
Live Feed Message Visibility	Live Feed Message [live_message]	Ensures user's access to Live Feed messages

Email notifications installed with Live Feed

The Live Feed plugin includes the following email notifications.

Email notification	Description
Live Feed Feed Member Accepted	Sends an email to the administrator when a user has accepted to join the feed.
Live Feed Feed Member Declined	Sends an email to the administrator when a user has declined to join the feed.
Live Feed Feed Member Invited	Sends an email to a user when they have been invited to join a feed.
Live Feed Feed Member Left	Sends an email to the administrators when a user has left the feed.
Live Feed Feed Member Removed	Sends an email to user when they have been removed from the feed.
Live Feed Feed Member Request	Sends an email to administrators when an user requests to join a feed.
Live Feed Feed Member Request Accepted	Sends an email to the user when their request to join a feed is accepted.
Live Feed Feed Request Rejected	Sends an email to the user when their request to join a feed has been rejected by an administrator.
Live Feed MsgReply Subscription	Sends an email when a reply or reply_to_reply message is inserted into the thread of a message in a feed.
Live Feed Team Member Accepted	Sends an email to administrators when a user accepts an invitation to join a team.
Live Feed Team Member Declined	Sends an email to administrators when a user declines an invitation to join a team.
Live Feed Team Member Invited	Sends an email when a user is invited to join a team.
Live Feed Team Member Left	Sends an email when a user leaves a team.
Live Feed Team Member Removed	Sends an email when an administrator has removed a user from a team
Live Feed Team Member Request	Sends an email when a user requests to join a team.
Live Feed Team Member Request Accepted	Sends an email when a user's request to join a team is accepted.

Email notification	Description
Live Team Member Request Rejected	Sends an email when a user's request to join a team is rejected.
Live Message All Subscription	Sends an email to subscribed users when any message (new or reply) is posted.
Live Message Feed Subscription	Sends an email when a new message is inserted into a feed.
Live Message Liked	Sends an email to the creator of a message when another user likes the message.
Live Message Mention	Sends an email to a user when that user is mentioned in a message.
Live Message New Posts Subscription	Sends an email to subscribed users when a new (not reply) message is posted.
Live Message Reply	Sends an email to all users in a feed thread when a user posts a reply (live_message.replied event).

E-signature

Sign electronic documents from any desktop or mobile device with e-signature. E-signature is a scoped application that enables users to sign managed documents or knowledge articles with their typed or drawn e-signature, credentials, or as an acknowledgment.

Get started

Activate	Use	Reference
Activate e-signature.	Create or modify e-signature templates.	Learn about the components installed with e-signature.

Troubleshoot and get help

- ServiceNow Community forums
- Search the Known Error Portal for known error articles
- Contact Customer Service and Support

Activating e-signature

You can activate the e-signature plugin (com.snc.esign) if you have the admin role. This plugin includes demo data and activates related plugins if they are not already active.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

E-signature activates these related plugins if they are not already active.

Plugins for E-signature

Plugin	Description
ServiceNow document viewer [com.snc.documentviewer]	Document viewer is a platform feature that will enable users to view enterprise class documents inline within the platform attachment instead of downloading it to the local device and then opening the documents with a locally installed viewer.
Managed documents [com.snc.document_management]	Managed Documents application. To enable the ability to publish to the knowledge base, activate the knowledge document plugin.
Signature pad [com.snc.signaturepad]	Provides a tool to allow a digital signature in a .pdf document. The Human Resources application uses this with various documents.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Using e-signature

Users with the assigned e-signature roles can create templates for documents that require an electronic signature.

Role assignment

Before you begin using e-signature, you must assign the e-signature roles to the appropriate roles, groups, or users in your application. See Components installed with e-signature for more information.

How to use e-signature templates

Users with the e-signature administrator [sn_esign.admin] or manager [sn_esign.config_manager] role can create e-signature templates. Each e-signature template pairs a document type to sign (managed document or knowledge article) with a signature type (signature, credential, or acknowledgment). For example, you could create an e-signature

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

template for a non-disclosure agreement that requires a typed or drawn signature. For more information, see Create or modify an e-signature template.

You can then use the e-signature template in task forms to request electronic signatures from users. In the HR Service Delivery application, for example, you can add HR tasks to HR cases or configure HR task templates to request electronic signatures per the selected e-signature template. See E-signature for HR for HR-specific examples.

Create or modify an e-signature template

Create or modify an e-signature template to define an electronic document and signature configuration for use in task forms.

Before you begin

Role required: sn_esign.admin or sn_esign.config_manager

Each template is associated with a document type such as a managed document or knowledge article, and you can configure the template so that the signatory is required to sign the document with their typed or drawn signature, credentials, or as an acknowledgment.

Procedure

1. Navigate to **All** > **E-signature** > **E-signature template**.
2. Click **New** or open a record.
3. Fill in the fields on the form.

E-signature template form

Field	Description
Name	Name of the e-signature template.
Task table	Task table that the e-signature template is associated with.
Document type	Document type of the e-signature template. Select one of the following: ○ **HR document template**: Make sure that the **Task table** field is set to HR Task [sn_hr_core_task]. The HR document template that the signatory will sign is selected on the HR case form. See Select an HR document template for an e-signature task for more information. ○ **Knowledge article**: In the **Knowledge article** field, select the knowledge article that the signatory will sign. ○ **Managed document**: In the **Managed document** field, select the managed document that the signatory will sign.
Signature type	Signature type of the e-signature template. Select one of the following: ○ **Acknowledgment**: The signatory acknowledges the document by accepting and completing the task. **Note:** This option is not available for HR document templates. ○ **Credential**: The signatory signs the document with their credentials.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: This option is not available for HR document templates. ○ **Signature**: The signatory signs the document with their typed or drawn signature.
Acknowledgment text	Adds a check box with accompanying acknowledgment text that the user must select before the signing is completed. This option can be used with any signature type. **Note:** Acknowledgment text is limited to 1,000 characters.

4. Click **Submit** or **Update**.

What to do next

You can use the e-signature template in task forms to request electronic signatures from users.

E-signature reference

Activating the e-signature plugin installs additional roles and tables.

Components installed with e-signature

Several types of components are installed with activation of e-signature, including tables and user roles.

Note:
The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Demo data is available for this feature.

Roles installed

Role title [name]	Description	Contains roles
E-signature administrator [sn_esign.admin]	Can manage the e-signature module.	sn_esign.config_manager
E-signature manager [sn_esign.config_manager]	Can manage the e-signature configurations.	None

You can assign these roles to the appropriate roles, groups, or users in your application.

- To assign a role to another role, see Add a role to an existing role.
- To assign a role to a group, see Assign a role to a group.
- To assign a role to a user, see Assign a role to a user.

Voice API on the ServiceNow® Developer Site

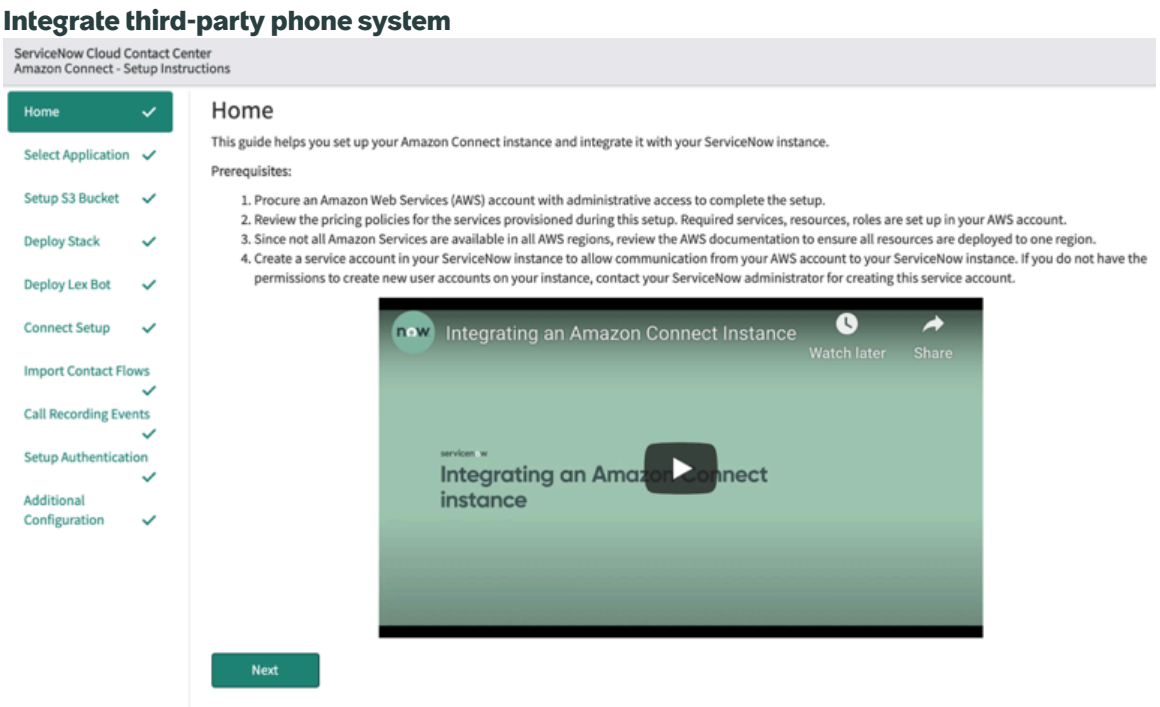
Exploring ServiceNow Voice

Use ServiceNow Voice to facilitate inbound and outbound telephone calls by integrating your ServiceNow instance with a third-party phone system such as Amazon Connect.

Key features

Integrate a third-party phone system with Voice in the ServiceNow instance

Provide a seamless inbound and outbound voice call experience for your callers and agents using third-party systems. See the ServiceNow Store for a full list of integrations.

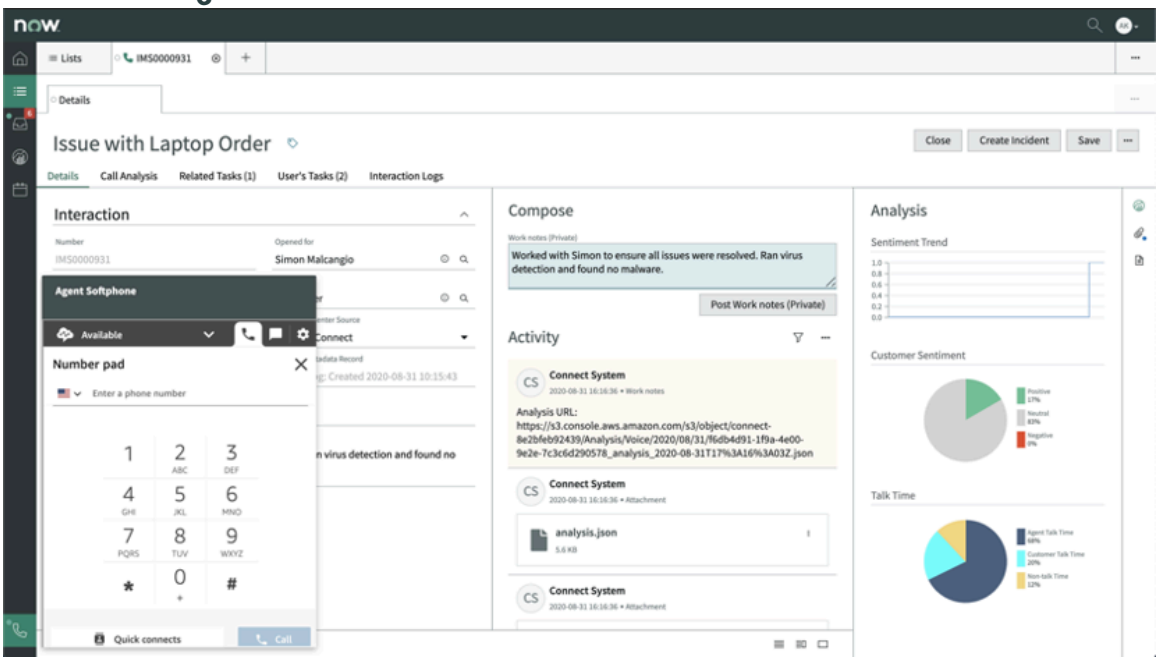


Display relevant data for an agent at the right time

Display relevant data in an interaction for an agent to help a customer during a call.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

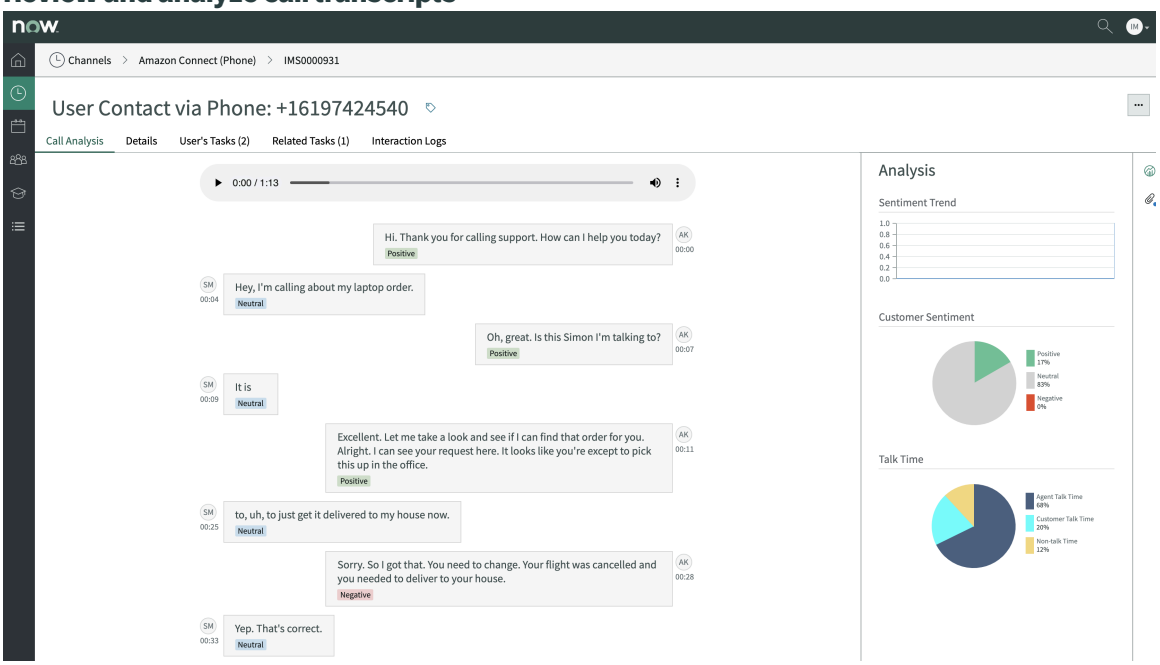
Route calls to agents



Analyze recording and call metrics of interactions

Within your ServiceNow instance, access recordings, call metrics, and call transcripts of agents to analyze interactions.

Review and analyze call transcripts



As an admin, you can:

- Use pre-built instructions and templates to integrate your ServiceNow instance with a third-party phone system such as Amazon Connect.
- Use pre-built operation handlers that invoke interactions to fulfill requests between a third-party phone system and Voice.

As a manager, you can:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- View the call transcript and recording for coaching.
- View call metrics (for example, agent call time) for reporting.
- Analyze agent conversations and provide feedback for quality assurance.

As an agent, you can:

- Get calls routed to your assigned queues and accept or reject the calls via the integrated softphone from within the ServiceNow instance.
- Transfer a call to another agent or to a queue using **Quick connect**.
- Get the context of caller information before accepting a call.
- View real-time transcripts of calls while interacting with a customer. For more information about real-time transcripts, see
- Collaborate with managers who can analyze your conversations and provide feedback for quality assurance.
- Manage presence states within the ServiceNow instance. For information about the presence states of an agent, see Agent Inbox controls.
- Access and use your softphone directly from within the ServiceNow interface using the OpenFrame integration. For information about OpenFrame, see OpenFrame overview.

As a caller, you can:

- Create a task using voice-based interactions. For example, create an incident or a case, or unlock your account.
- Get your requests fulfilled within the integrated ServiceNow instance through bot interactions using the voice or dual-tone multi-frequency (DTMF) inputs. These bot interactions are defined in contact flows in the third-party phone system.
- Speak to an agent who can help fulfill a request.

Inbound call workflow for the integration of Voice with Amazon Connect

When a caller contacts the call center, using the voice or dual-tone multi-frequency (DTMF) inputs from a caller, a contact flow is invoked in the Amazon Connect instance based on the caller context such as language. An interaction record is created for this call.

- The caller request will invoke an operation handler in the ServiceNow instance.
- The request can be resolved by an automated interaction with a bot. If the caller request is not resolved by an automated interaction with bot, then the call is queued for the next available agent. An agent then receives the call and interaction, and resolves the request.

Here is an example workflow.

Setting up ServiceNow Voice

Enable ServiceNow Voice and integrate it with a third-party phone system such as Amazon Connect.

When you set up a third-party phone system and integrate it with the ServiceNow instance, an agent can accept an incoming call or make an outbound call from the ServiceNow instance using the integrated softphone. This experience is based on the configurations made within the third-party phone system.

Get started with Voice

1. Procure a license for a ServiceNow application, such as ITSM or CSM, which includes ServiceNow Voice.
2. Install the ServiceNow Voice applications in ServiceNow® Store. For information about this installation, see Install ServiceNow Voice applications.
3. Sign up and create an account with a third-party phone system. By default, Amazon Connect is supported. For information about creating an Amazon Web Services (AWS) account, see the Amazon documentation.
4. Configure the framework for the third-party phone system within the ServiceNow instance. By default, the framework is supported for Amazon Connect. For information about this configuration, see Integrate ServiceNow Voice with Amazon Connect.

Install ServiceNow Voice applications

You can install the ServiceNow Voice applications if you have the admin role. The application includes demo data and installs related ServiceNow® Store applications and plugins if they are not already installed.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Your organization must have purchased a license for a ServiceNow application, such as ITSM or CSM, which includes the ServiceNow Voice SKU.
- You should install at least one content pack, for example, CSM or ITSM.

Role required: admin

About this task

The following ServiceNow Voice applications should be installed.

ServiceNow Voice applications

Application	Description	Components installed
ServiceNow Voice [sn_cti_core]	Provides the framework that supports the integration with your third-party phone system.	For information about the components installed with this application, see Components installed with ServiceNow Voice Core.
ServiceNow Voice with Amazon Connect	Integrates Amazon Connect with ServiceNow Voice Core.	For information about the components installed with this application, see

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ServiceNow Voice applications (continued)

Application	Description	Components installed
[sn_cti_amzn_cct]		Components installed with Amazon Connect Integration with ServiceNow Voice.
ServiceNow Voice UI Components [sn_cti_ux]	Enables call recording, transcription, and sentiment analysis for ServiceNow Voice with Workspace experience.	None
ServiceNow Real Time Transcription [sn_cti_amzn_cct] (Available for ServiceNow Voice for Customer Service Management only.)	Enables real-time call transcription so that the agent can see the call transcript while on a call with the customer.	[sn_cti_csm_cnt.enable_ims_update]

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find these applications using the filter criteria and search bar.
   - ServiceNow Voice (sn_cti_core)
   - ServiceNow Voice with Amazon Connect (sn_cti_amzn_cct)
   - ServiceNow Voice UI Components (sn_cti_ux)

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

   Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.
3. In the Application installation dialog box, review the application dependencies.

   Dependent plugins and applications are listed if they will be installed, are currently installed, or need to be installed. If any plugins or applications need to be installed, you must install them before you can install the Voice applications.
   - ServiceNow Voice (sn_cti_core)
   - ServiceNow Voice with Amazon Connect (sn_cti_amzn_cct)
   - ServiceNow Voice UI Components (sn_cti_ux)

   For the complete Voice experience, install ServiceNow Voice for ITSM or ServiceNow Voice for CSM applications. For information about these installations, see Install ServiceNow Voice for ITSM and Install ServiceNow Voice for CSM.
4. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data are sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.
5. Select **Install**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Domain separation and ServiceNow Voice

Domain separation is supported for ServiceNow Voice. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

Domain-separated tables

- CTI Instance [sn_cti_instance]
- CTI Component Logging Configuration [sn_cti_log_cfg]
- Operation Handler [sn_cti_operation_handler]
- Provider Component [sn_cti_provider_component]
- Provider Configuration [sn_cti_provider_config]
- Provider Message Transformer [sn_cti_provider_msg_transformer]
- CTI user [sn_cti_user]
- AWS Resource [sn_cti_aws_resource]
- Amazon Connect Instance [sn_cti_connect_instance]

Domain separation for service providers

Configuring a phone PIN

You can set up or reset a phone PIN that can be used for caller authentication during a call with an agent.

If the **Require authentication** field is set to **true** for an operation handler, the corresponding operation is invoked only after the caller enters the PIN.

Important:
It is applicable for both ServiceNow Voice for ITSM and ServiceNow Voice for CSM applications.

Reset the phone PIN for a caller

Reset the phone PIN for a caller if the caller's account is locked.

Before you begin

Role required: sn_cti_core.user_manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Procedure

1. Navigate to **All** > **ServiceNow Voice - Core** > **User Pin Reset**.
2. For the required CTI user, Click the preview icon and open the record to reset the PIN.
   a. In the **PIN** field, enter the new PIN.
   b. Clear the **Disabled** check box.
   c. Click **Update**.

Set or reset the phone PIN

Set up or reset your phone PIN that can be used for caller authentication when you call an agent.

Before you begin
Role required: none

Procedure

1. Navigate to **All** > **ServiceNow Voice - Core** > **My Phone PIN**.
2. On the Request Phone PIN form, enter the PIN and re-enter it.
3. Click **Submit**.

Configure the E.164 format for a consumer phone number

Ensure that all the necessary information for a phone number is included and properly formatted to successfully route an international call over a territory's public telephone network. Provide the E.164-compliant formatting and validation for phone number.

Before you begin
Role required: admin

About this task
An E.164 phone number field displays the following field types:

- A list for the phone number territory
- An input box for entering phone numbers

The E.164 format that does not contain any dashes or spaces and must include the + sign. For example, +14152223456.

Procedure

1. Navigate to **All** > **Customer Service** > **Consumers**.
2. Select the required consumer record.
3. On the Consumer form, right-click any phone field and select **Configure Dictionary**.
4. On the Dictionary Entry form, for the **Type** field, select **Phone Number (E164)**.
5. Click **Update**.

Result
After this configuration, when entering the consumer phone number in the phone field, select the territory and enter the corresponding phone number. The same format is reflected in Agent Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuring CTI component logging

Configure CTI component logging to enable component logging to the system logs.

Before you begin

Role required: admin

About this task

You can create logs for the following components:

- Operation handler
- Provider component
- Provider configuration
- Provider message transformer

Note:
Do not leave the log configurations on in a production instance, since this can impact performance.

Procedure

1. Navigate to **All** > **ServiceNow Voice Core** > **Log Configuration** > **New**.
2. Select the component, component table, and log level you want to configure.
3. Choose the log level option.
   Options include the following:
   - Off
   - Error
   - Warn
   - Info
   - Debug
4. Click **Submit**.
5. Create a separate record for each type of component table you want to log.
   If there are multiple logging configurations, the final log level is the selected component's log level, based on the following prioritization:
   a. Operation handler
   b. Provider message transformer
   c. Provider component
   d. Provider configuration
6. To view the logs, navigate to **All** > **System Logs** > **System Log** > **All**.
   You can see the logs from the invoked *sn_cti* modules, including the date created, log level, log message, and source. In the system logs, the message log level is always **info**. For basic logs from *sn_cti_core* without any logging configuration, the log level varies.

Example:

For an entry on *sn_cti_log_cfg.list* for an operation handler with **warn** log level logger located in the operation handler, the code is as follows:

```
var log= ctx.getLogger();
log.warn("CTX Logger Demo from Operation Handler");
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample output:

```
cti_core::
 P:c4bae70xxxxf6a9a|C:bxxxx44|T:793cxxxx7b|O:6fb1xxxx4006dabb45v
c::CTX Logger Demo from Operation Handler
```

- P: Provider
- C: Component
- T: Transformer
- O: Operation handler

Configure Real Time Transcription for ServiceNow Voice Customer Service Management

Configure settings in your Amazon Connect instance, and in your ServiceNow instance to allow agents to see a real time transcription of voice calls with customers.

Before you begin

- An Amazon Connect instance set up using the guided setup.
- Real Time Transcription is only available for ServiceNow Voice for Customer Service Management
- Role required: admin

About this task

For new deployments, the Real-Time Transcription feature is enabled during the guided setup for Voice for Customer Service Management.

If you have already deployed Voice for CSM and are upgrading, go through all of the steps for Setting up ServiceNow Voice, and Set up Real-Time Transcription for ServiceNow Voice before completing the setup on Amazon Connect.

Procedure

1. Go to your Amazon Connect instance.
2. Enable Contact Lens in the Amazon Connect instance.
   See the Amazon documentation for full instructions. Also refer to the Contact Lens documentation for more information about Contact Lens for Amazon Connect.
   a. On the "Set recording and analytics behavior block", enable Contact Lens.
   b. Enable speech analytics with real-time and post-call analytics.
3. Go to the **Setup Guide** for Amazon Connect.
4. Complete the instructions in the Real Time Transcription section.

Set up Real-Time Transcription for ServiceNow Voice

Set up the properties in the Amazon Connect integration in order to enable Real-Time Transcription.

Before you begin

Role required: admin

About this task

For new deployments, the Real-Time Transcription feature is enabled during the guided setup for ServiceNow Voice.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you have already deployed ServiceNow Voice and are upgrading, go through all of the steps for Setting up ServiceNow Voice, and the steps in this procedure, before completing the setup on Amazon Connect.

Procedure

1. Add the system property `sn_cti_csm_cnt.enable_ims_update` and set it to **true**.
   For more information on adding a new system property, see Add a system property.
2. Navigate to **All** > **Amazon Connect integration** > **View instances**.
3. Choose your instance, and click on the **Setup guide** related link.
4. Select the checkbox at the top of the setup guide to enable Real Time Transcription setup.
   Once you select the Real Time Transcription checkbox, agents can see the conversation panel in their workpace.
5. Proceed through the setup guide.
   Even if you have already set up your Amazon Connect integration, you must complete the setup tasks again, due to changes in the Lambda Cloudformation Template and contact flow.
6. In the **Setup Authentication** step, create a user with "Web Service Only access".
   This user is intended only for communication between ServiceNow and Amazon Connect.
   a. Go to the **Roles** related list.
   b. Edit the user, and add the role `interaction_integration_user`.
   c. Click **OK**.

What to do next

Proceed with the setup tasks on your Amazon Connect instance detailed in the setup guide.

Configure Real Time Transcription for ServiceNow Voice for IT Service Management

Configure settings in your Amazon Connect instance, and in your ServiceNow instance to allow agents to see a real time transcription of voice calls with customers.

Before you begin

- An Amazon Connect instance set up using the guided setup.
- Real Time Transcription is only available for ServiceNow Voice for Customer Service Management
- Role required: admin

About this task

For new deployments, the Real-Time Transcription feature is enabled during the guided setup for Voice for IT Service Management.

If you have already deployed Voice for IT Service Management and are upgrading, go through all of the steps for Setting up ServiceNow Voice, and Set up Real-Time Transcription for ServiceNow Voice before completing the setup on Amazon Connect.

Procedure

1. Go to your Amazon Connect instance.
2. Enable Contact Lens in the Amazon Connect instance.
   See the Amazon documentation for full instructions. Also refer to the Contact Lens documentation for more information about Contact Lens for Amazon Connect.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. On the "Set recording and analytics behavior block", enable Contact Lens.

b. Enable speech analytics with real-time and post-call analytics.

3. Go to the **Setup Guide** for Amazon Connect.
4. Complete the instructions in the Real Time Transcription section.

Set up Real-Time Transcription for ServiceNow Voice for IT Service Management

Set up the properties in the Amazon Connect integration in order to enable Real-Time Transcription for IT Service Management.

Before you begin

Role required: admin

About this task

For new deployments, the Real-Time Transcription feature is enabled during the guided setup for ServiceNow Voice.

If you have already deployed ServiceNow Voice and are upgrading, go through all of the steps for Setting up ServiceNow Voice, and the steps in this procedure, before completing the setup on Amazon Connect.

Procedure

1. Add the system property `sn_cti_itsm_cnt.enable_ims_update` and set it to **true**.
   For more information on adding a new system property, see Add a system property.
2. Navigate to **All** > **Amazon Connect integration** > **View instances**.
3. Choose your instance, and click on the **Setup guide** related link.
4. Select the checkbox at the top of the setup guide to enable Real Time Transcription setup.
   Once you select the Real Time Transcription checkbox, agents can see the conversation panel in their workpace.
5. Proceed through the setup guide.
   Even if you have already set up your Amazon Connect integration, you must complete the setup tasks again, due to changes in the Lambda Cloudformation Template and contact flow.
6. In the **Setup Authentication** step, create a user with "Web Service Only access".
   This user is intended only for communication between ServiceNow and Amazon Connect.
   a. Go to the **Roles** related list.
   b. Edit the user, and add the role `interaction_integration_user`.
   c. Click **OK**.

What to do next

Proceed with the setup tasks on your Amazon Connect instance detailed in the setup guide.

Scripting for operation handlers

You can use the APIs in the ServiceNow Voice framework to create a seamless voice call experience for your callers and agents.

The *`CTIOperationRequest`* API provides methods to set and get data on the current CTIOperationRequest object. For information on this API, see CTIOperationRequest - Scoped, Global.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The *CTIOperationResponse* API provides methods to set and get data on the current CTIOperationResponse object. For information on this API, see CTIOperationResponse - Scoped, Global.

The *CTI API* provides REST resources that enable Computer Telephony Integration (CTI) providers to interact with the Voice framework. For information about this API, see CTI API.

Provider configuration in Voice

For both inbound and outbound calls, a provider configuration contains settings about the involved components and message transformers for a specific third-party phone system provider. Any request from that phone system provider is handled within ServiceNow based on these settings.

To view the available provider configurations, navigate to **ServiceNow Voice - Core** > **Provider Configurations**.

Any request from a third-party phone system is passed into a ServiceNow instance through the *CTI Operation* endpoint of the *CTI API*. For information about this API, see CTI API. Based on the provider and the component specified in the endpoint, the corresponding message transformers are invoked to perform the following:

- Transform the request from the third-party phone system before passing the request to an operation handler.
- Transform the response from the operation handler before passing it on to the third-party phone system.

Provider component

For each component or node available in the third-party phone system, a provider configuration contains a provider component. It contains a mapping between the component and a message transformer.

To view the available provider components, navigate to **ServiceNow Voice - Core** > **Provider Components**.

Message transformer

A message transformer defines how a request and response can be transformed between a third-party phone system and the ServiceNow instance.

- The **Input Transformer** field has a script that defines how a request from a third-party phone system should be transformed within the ServiceNow instance before passing the request to an operation handler.
- The **Output Transformer** field has a script that defines how the response from the operation handler should be transformed before passing it on to the third-party phone system.

To view the available message transformers, navigate to **ServiceNow Voice - Core** > **Provider Message Transformers**.

Provider configuration for the integration of Voice with Amazon Connect

For the ServiceNow Voice integration with the ServiceNow Voice with Amazon Connect application, the *AWS Connect Default Handler* provider component is available by default.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The ServiceNow Voice with Amazon Connect integration with ServiceNow application [sn_cti_amzn_cct] must be installed from the ServiceNow® Store. For information on installing this application, see Install ServiceNow Voice applications.

For each node that can be used an integration point between Amazon services and the ServiceNow instance, the following provider components and the corresponding message transformers are available.

Provider components and message transformers

Node	Provider component	Message transformer
Get Customer Input	sn_aws_connect_lex_intent_processor_component	AWS - Lex - Intent - Message Transformer (SN Proxy)
Invoke AWS Lambda Function	sn_aws_connect_lambda_proxy_component	AWS - Connect - Lambda - Message Transformer

When a customer dials using a phone number, a call is placed through the Amazon Connect 's phone system. Using one of its components, Amazon Connect provides the request to the ServiceNow instance through the *CTI Operation* endpoint of the *CTI API*. For information about this API, see CTI API. Based on the provider and the component specified here, the corresponding message transformers are invoked to perform the following:

- Transform the request from Amazon Connect before passing the request to an operation handler.
- Transform the response from the operation handler before passing it on to Amazon Connect.

Extension points in Voice

Using extension points, you can call the custom scripts to extend the functionality of ServiceNow Voice. While integrating a third-party phone system with ServiceNow Voice, you can invoke extension points using the *CTI API* to handle events in ServiceNow Voice.

By using extension points, you can easily integrate customizations without having to alter the base code. You can extend standard base functionality using customized scripts. For more information, see Using extension points to extend application functionality.

To view the extension points that are available by default, navigate to **System Extension Points** > **Scripted Extension Points** and group by the ServiceNow Voice application.

Note:
You should install the ServiceNow Voice, ServiceNow Voice for ITSM, ServiceNow Voice for CSM, and ServiceNow Voice with Amazon Connect applications from the ServiceNow® Store. For information about these installations, see Install ServiceNow Voice applications, Install ServiceNow Voice for ITSM, and Install ServiceNow Voice for CSM.

Extension points in Voice

Extension point	Description
sn_cti_core.clickToCallContextMap	Enables the copying of application-specific field values to interaction records for ServiceNow Voice outbound calls.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Extension points in Voice (continued)

Extension point	Description
sn_cti_core.CTICallAnalysisExtractor	Defines how the transcription and the recording data is retrieved for an interaction based on the third-party phone system integrated with ServiceNow Voice.
sn_cti_core.SoftPhoneEventSink	Defines if the third-party phone system can handle an event. Maps events from the Softphone interface to back-end events.

Using Voice

Agents can use ServiceNow Voice to receive inbound calls and make outbound calls with a seamless voice call experience. Managers can use this application to monitor and analyze calls.

Receiving inbound calls in ServiceNow Voice

An agent can receive inbound calls using the Agent Softphone interface to handle a caller's request.

As an agent, you should have any of the following roles to receive an inbound call:

- sn_openframe.user and interaction_agent
- If the Advanced Work Assignment plugin (com.glide.awa) is installed, awa_agent & awa_integration_user.

After a customer dials in, the corresponding contact flow is invoked in Amazon Connect. Through the configured nodes, the request is forwarded to an operation handler in the ServiceNow instance.

If an agent is available, the agent can receive the call and handle the request using Agent Softphone interface. For information about the presence states of an agent, see Agent Inbox controls.

Interaction record states

If	Then the interaction
The interaction has just been created, is currently in a call tree being deflected by an IVR flow, or has not yet been routed and assigned to an agent	Is in **New** state.
The Lex Bot deflects the call or the user disconnects the call any time before the call enters the queue	Moves to **Closed Complete** state.
The interaction gets assigned to an agent	Moves to **Work in Progress** state.
The user disconnects the call while waiting in the queue	Moves to **Closed Abandoned** state.

Initiating outbound calls with ServiceNow Voice

Improve your productivity as an agent by initiating outbound calls to connect with customers using the click-to-call feature in the ServiceNow Voice application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

As an agent, you can initiate outbound calls using the click-to-call feature when accessing the phone number of a user. The phone number of a user, if available, is displayed on the ServiceNow application UIs. Example application UIs include the contact details on a Case form, the user record on an Incident form, the Consumer form, the Contact form, and other application UIs.

Note:

- If not available, you can add the **Caller** field to an incident form.
- The phone number of a user should be in the E.164 format. For information about configuring a phone number in this format, see Configure the E.164 format for a consumer phone number.

You should have any of the following roles to initiate an outbound call:

- sn_openframe.user and interaction_agent
- If the Advanced Work Assignment plugin (com.glide.awa) is installed, awa_agent & awa_integration_user.

You can click the link to the user's phone number displayed on the application UI. The user record must have the mobile phone, business phone, or both. The Agent Softphone pop-up window is displayed letting you know that the call will be recorded, and then the user's number is connected. An interaction record of type Phone is created for the call and is in the **Work in Progress** state.

For ServiceNow Voice Core, if the `createConversation` flag is set to true, a conversation record is created for an outgoing call.

For ServiceNow Voice with Customer Service Management, if the `sn_cti_csm_cnt.enable_ims_update` flag is set to true, a conversation record is created for an outgoing call.

For ServiceNow Voice with IT Service Management, if the `sn_cti_itsm_cnt.enable_ims_update` flag is set to true, a conversation record is created for an outgoing call.

The following agent presence states are configured by default for the Voice application and are displayed in your Agent Workspace Inbox.

Agent Workspace Inbox statuses

Status	Description
CallingCustomer	Indicates that you are in the process of connecting with a customer. After the call is connected, the status appears as **Busy**.
Busy	Indicates that you are on the call.
AfterCallWork	Indicates that you ended the call and right now working on updating the task such as case details. The status is displayed after you click **End call** in the Agent Softphone pop-up window.
Available	Indicates that you are available to accept another task such as a case.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent Workspace Inbox statuses (continued)

Status	Description
	The status is displayed after you click **Clear contact** in the Agent Softphone pop-up window.
FailedConnectAgent	Indicates that you were unable to connect with the customer. After the call doesn't go through, the status appears as **Available**.

Note:
The Agent Workspace Inbox statuses are synchronized with your Advanced Work Assignment (AWA) activity.

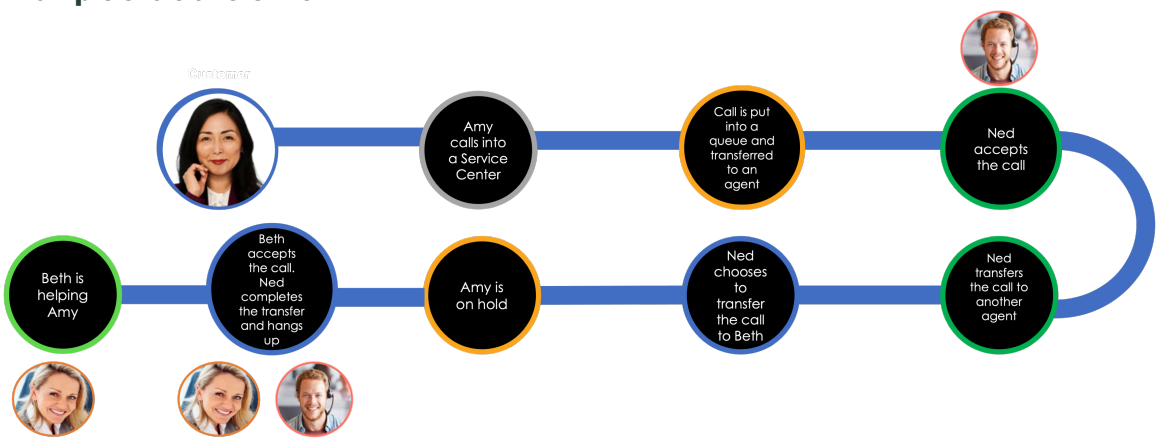
The activity stream of the associated interaction record is populated with your status details, the URL to the call recording, contact trace record, and call transcript.

Transferring a call to an agent or queue

When on a call with a customer, an agent can transfer the call to another agent or to a queue to get more assistance for the customer.

This feature is available for ServiceNow Voice for Customer Service Management. See Integrating ServiceNow Voice with CSM for more information.

Example of a transfer flow



1. Navigate to **All** > **Workspace Experience** > **CSM/FSM Configurable Workspace**.
2. Ned uses the Agent Softphone to accept an incoming call from a customer.
3. To transfer the call, Ned clicks **Quick connects** and choose either another agent or a queue (for example "Billing queue"). The transfer begins, and **INTERNAL-TRANSFER** displays on the softphone. The customer is placed on hold until the next agent accepts the call.
4. Once the next agent (Beth) selects **Join**, and joins the call, the first agent (Ned) can either remain on the call or leave the call.
5. When the Ned leaves the call, the call is reassigned to the Beth on the interaction record.

Integrating Voice with other applications

You can extend the capabilities of ServiceNow Voice for inbound and outbound calls by integrating with other applications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integrate ServiceNow Voice with Amazon Connect

Connect ServiceNow Voice of your ServiceNow instance with the Amazon Connect instance to provide a seamless inbound and outbound voice call experience for your callers and agents.

Before you begin

- Procure an Amazon Web Services (AWS) account with the administrative access to complete the integration setup between Amazon Connect and ServiceNow. For information about creating the AWS account, see the Amazon documentation.
- Review the pricing policies for the services provisioned during this setup. Required services, resources, roles are set up in your AWS account.
- Create a service account in your ServiceNow instance to allow communication from your AWS account to your ServiceNow instance. If you do not have the permissions to create service accounts on your instance, contact your ServiceNow administrator for creating this service account.

Role required: sn_cti_amzn_cct.admin

Note:
ServiceNow Voice with Amazon Connect integration is not supported for AWS GovCloud.

Procedure

1. Log in to your Amazon Web Services (AWS) account and setup an Amazon Connect instance. For instructions on setting up this instance, see the Amazon Connect documentation.
2. Integrate the Amazon Connect with your ServiceNow instance.

   a. Log in to your ServiceNow instance.

   b. Navigate to **Amazon Connect Integration** > **Setup Instance**.

   c. On the form, fill in the fields.

Amazon Connect Instance form

Field	Description
Name	Name of the Amazon Connect instance.
AWS ARN	Amazon resource name of the Amazon Connect instance. For information on AWS ARN, see the Amazon Connect documentation.
Active	Option that indicates if the record is active.
Override Params	Option to edit the domain for Amazon Connect instance parameters. You should select this option only when you want to integrate the ServiceNow instance with an Amazon Connect instance created before introducing the new domain for the Amazon Connect console. For information about this new domain, see the Amazon Connect documentation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description

Instance Params	Auto-generated parameters based on the name of the Amazon Connect instance.
	
	For example, here are the Amazon Connect instance parameters before and after introducing the new domain for the Amazon Connect console.
	
	▪ Before introducing the new domain
	
	`{"ccpHost":"acmesupport.awsapps.com","ccpUrl":"https://acmesupport.awsapps.com/connect/ccp-v2","audioRecordingUrlPrefix":"https://acmesupport.awsapps.com/connect/get-recording?format=wav&callLegId="}`
	
	▪ After introducing the new domain
	
	`{"ccpHost":"acmesupport.my.connect.aws","ccpUrl":"https://acmesupport.my.connect.aws/ccp-v2","audioRecordingUrlPrefix":"https://acmesupport.my.connect.aws/get-recording?format=wav&callLegId="}`

3. Configure the Amazon Connect components in your ServiceNow instance.

   a. Navigate to **Amazon Connect Integration** > **View Instances**.

   b. Select the instance you want to configure.

   c. Click the **Setup Guide** related link.

   d. Work through the guided setup steps in the order displayed, and complete the instructions for components specified in each section.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Steps to configure Amazon Connect components

Guided setup step	Description
Select Application	Select an application for which you want to configure the Amazon Connect components.
Setup S3 Bucket	Host content that can be deployed by Amazon CloudFormation. For more information on creating an S3 bucket, see the Amazon documentation
Deploy Stack	Set up a collection of the required Amazon Web Services (AWS) resources. For more information on stacks, see the Amazon documentation. You can deploy the AWS stack using AWS CloudFormation templates. ▪ Use AWS Cloud Formation template to describe AWS resources and properties ▪ Use AWS Cloud Formation stack to provision the resources described in the template **Note:** If you are upgrading from a previous release, point your existing deployment of Lambda function running on Node.js 10.x to point it to Node.js 14.x. For more information, see the Amazon documentation.
Deploy Lex Bot	Build voice-based conversational interfaces for your users. For more information on Lex Bot, see the Amazon documentation
Connect Setup	Integrate with your ServiceNow instance with AWS services

Import Contact Flows	▪ To enable Advanced Work Assignment (AWA) Voice Routing, check the checkbox under the **AWA Voice Routing** heading. Complete the steps specified in the setup guide:
	  ▪ Complete AWS Lambda and Oauth credential setup.
	  ▪ Download the recommended hold music using the link in the setup guide (you can choose your own hold music, but it cannot be longer than 5 seconds).
	  ▪ Upload the hold music. See the AWS documentation.
	▪ Define a call tree for inbound and outbound calls between Amazon Connect and your ServiceNow instance. For more information on contact flows, see the Amazon documentation.
	▪ Based on your subscription, you have default inbound and outbound contact flows. For example, for the integration of ServiceNow Voice with ITSM applications, see Components installed with ServiceNow Voice for ITSM.
	▪ For an inbound contact flow, create queues to route contacts from AWS queues to ServiceNow queues. For information on creating queues in AWS, see the Amazon documentation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Guided setup step	Description
	▪ Set up call transfer flows through Amazon Connect using Transfer to Agent Flow and Transfer to Queue Flow. The transfer flows are reusable and can also be applied to ServiceNow Voice for ITSM. ▪ Amazon Connect (Phone) is a placeholder phone channel for Amazon Connect integration. For queues that you implement in your Amazon Connect instance, you can use this channel to create corresponding Advanced Work Assignment queues. For an example implementation, see Associate Amazon Connect queues for ITSM to a ServiceNow instance or Associate Amazon Connect queues for CSM to a ServiceNow instance.
Setup Real Time Transcription	Set up the properties in the Amazon Connect integration in order to enable Real-Time Transcription. Refer to Configure Real Time Transcription for ServiceNow Voice Customer Service Management for configuration instructions.
Call Recording Events	Send recording events to the ServiceNow instance by enabling call recording on your Amazon Connect instance. For more information on recording behavior, see the Amazon documentation
Setup Authentication	Integrate your Amazon Connect instance with your ServiceNow account by creating a service account
Additional Configuration	Launch the Amazon Connect softphone interface within ServiceNow UI by configuring Openframe. The Openframe configuration created in your ServiceNow instance enables agents to launch the softphone from within the ServiceNow interface. You can also configure user groups to restrict this configuration to specific agent user groups. **Note:** Agents should log in to the softphone interface in a separate browser tab using the Amazon Connect credentials or SSO credentials (if configured). Once logged in, the softphone can be launched and used within the ServiceNow interface.

Configure a contact flow for an automated caller interaction

Invoke an automated caller interaction with bots to fulfill the caller's request within the ServiceNow instance.

Before you begin

Role required: sn_cti_core.admin

About this task

When a caller contacts the call center, using the voice or dual-tone multi frequency (DTMF) inputs from caller, a contact flow is invoked in the Amazon Connect instance based on the caller context. The contact flow contains nodes that act as integration points between Amazon services and the ServiceNow instance. Based on the nodes defined in the contact flow, the corresponding operation handlers are triggered in the ServiceNow instance. The caller then gets

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

the response that is defined in the operation handler. For information about contact flows, see the Amazon documentation.

In the ServiceNow base system, a few operation handlers are available by default. For information on operation handlers, see ServiceNow Voice reference.

Procedure

1. **Optional:** If you do not want to use a default operation handler, create and configure an operation handler in the ServiceNow instance.

   a. Navigate to **ServiceNow Voice - Core** > **Operation Handlers**.

   b. Click **New**.

   c. On the form, fill in the fields.

Operation Handler form

Field	Description
Operation Name	Name of the operation that you want to automate.
Type	Type that specifies how the operation is implemented. ▪ Script: Implementation is included in a script. ▪ Forward to Handler: Request is forwarded to an operation handler, which is invoked by lookup on the sys_id of that handler. This scenario is possible when you have different intents for similar operations, for example, Create an HR incident and Create incident. ▪ Forward to Operation: Request is forwarded to an operation handler, which is invoked by lookup on the name of the handler and then name resolution to find the handler. ▪ Integration Hub - Action: Calls an Integration Hub action. ▪ Integration Hub - Subflow: Calls an Integration Hub flow or subflow.
Application	Application associated with the operation handler.
Domain	Domain associated with the operation handler.
Active	Option to activate the operation handler.
Require Authentication	Option to enable authentication for the operation handler. **Note:** If this option is selected, the corresponding operation is invoked only when a valid authentication token is passed in the request. It is supported by an authentication operation handler that supports pin-based authentication, which can be leveraged in your contact flows. For information about configuring the PIN, see Configuring a phone PIN.
Description	Summary about the operation handler.
Script	Script that contains the operation implementation and the response for the caller. This field appears when **Script** is selected for **Type**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Forward To	Operation handler to which you want to forward the request. This field appears when **Forward to Handler** or **Forward to Operation** is selected for **Type**.
Integration Hub - Action	(Optional) Integration Hub action that you want to call to complete the request. This field appears when **Integration Hub - Action** is selected for **Type**.
Integration Hub - Flow/ SubFlow	(Optional) Integration Hub flow or subflow that you want to call to complete the request. This field appears when **Integration Hub - Subflow** is selected for **Type**.

d. Click **Submit**.

2. Create a contact flow in Amazon Connect to define an end-to-end customer experience.

For information about creating a contact flow, see the Amazon documentation.

When building a contact flow within Amazon Connect, use any of these nodes to trigger operation handlers defined in the ServiceNow instance. These nodes act as integration points between Amazon services and the ServiceNow instance.

Nodes in contact flows

Node	Description	Configuration
Get Customer Input	Invokes a Lex Bot. The operation handler that is triggered is based on the name of the intent associated with the Lex Bot. For information about this node, see the Amazon documentation. **Note:** This node can be used when the integration is between Amazon Lex and the ServiceNow instance.	**a.** Create an intent for the required Lex Bot in your Amazon Connect instance. For information about creating an intent, see the Amazon documentation. **b.** Specify the following information in the intent. ▪ Intent name: Name of the intent. **Note:** This intent name should match an operation handler in the ServiceNow instance with the same name, or name + '_<suffix>' where suffix can contain any five uppercase alpha characters. ▪ Sample utterances: Caller utterances that trigger the operation handler. ▪ Lambda initialization and validation: If the operation handler being invoked requires authentication, select the **Initialization and validation code hook** check box and select the deployed AWS Lambda function. ▪ Lambda function: Deployed AWS Lambda function that is invoked. **c.** Save, build, and publish the intent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Node	Description	Configuration
		d. Open the required contact flow in the contact flow designer in your Amazon Connect instance. **e.** Click the Get Customer Input node and specify the Lex Bot details in the **Amazon Lex** section. **f.** Click **Save**.
Invoke AWS Lambda Function	Invokes an AWS Lambda function. The operation handler that is triggered is based on the *sn_operation* parameter set on the node in the contact flow. For information about this node, see the Amazon documentation. **Note:** This node can be used to for data dips (for example, authorizing a caller) where the integration is between the call center and the ServiceNow instance. The data dip configuration allows a caller to enter information, such as an account number, to route calls to a particular queue. Using this number, you can look up the first name of the caller and create an interaction record after the call is initiated. Also, you can customize the greeting with the caller name later in the flow.	**a.** Open the required contact flow in the contact flow designer in your Amazon Connect instance. **b.** Click the Invoke AWS Lambda Function node and specify the following input parameters. ▪ Destination key: sn_component, Value: Component from where the Lambda function is invoked. For example, sn_aws_connect_lambda_proxy_component. ▪ Destination key: sn_operation, Value: Name of the operation handler that you want to invoke. For example, interactionEvent. ▪ (optional) Destination key: queueName, Value: Name of the queue that you want to transfer the flow to. **Note:** This parameter is used to invoke the workItemEvent operation handler. ▪ (optional) Destination key: queueId, Value: ARN of the queue that you want to transfer the flow to. **Note:** This parameter is used to invoke the workItemEvent operation handler. ▪ (optional) Destination key: authToken, Value: AuthToken received via authentication call. This parameter is required for invoking an operation handler that requires authentication. ▪ (optional) Destination key: interactionId, Value: Interaction ID received via interactionEvent call. **c.** Click **Save**.

3. Ensure that a caller's phone number is associated with the contact flow after it is created and published.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This process ensures that each time the caller calls, the corresponding contact flow is invoked. For information about associating a phone number with a contact flow, see the Amazon documentation.

Note:
For a sample implementation of invoking operation handlers in a contact flow, you can refer to the default contact flows. For information on default contact flows, see Components installed with ServiceNow Voice for ITSM and Components installed with ServiceNow Voice for CSM.

Integrating ServiceNow Voice with ITSM

Route calls coming through the ServiceNow Voice to specific phone queues based on user preference, utterances, or any other ServiceNow data to optimize incident resolution.

Sample ITSM contact flow

Use the inbound **(ServiceNow ITSM Inbound Demo Flow)** and outbound **(ServiceNow ITSM Outbound Demo Flow)** Amazon Connect ITSM sample contact flows that come with the Voice integration to get you up and running quickly. The sample flow allows you to deflect voice calls or route them based on the caller context to different queues. When a call comes through the ServiceNow Voice, the Amazon Connect application uses data dips to identify the caller and then deflect the call or route it to the right agent. For more information on integrating ServiceNow Voice with Amazon Connect see, Integrate ServiceNow Voice with Amazon Connect.

Callers can access status updates or make updates to their records when they are authenticated.

PIN-based authentication

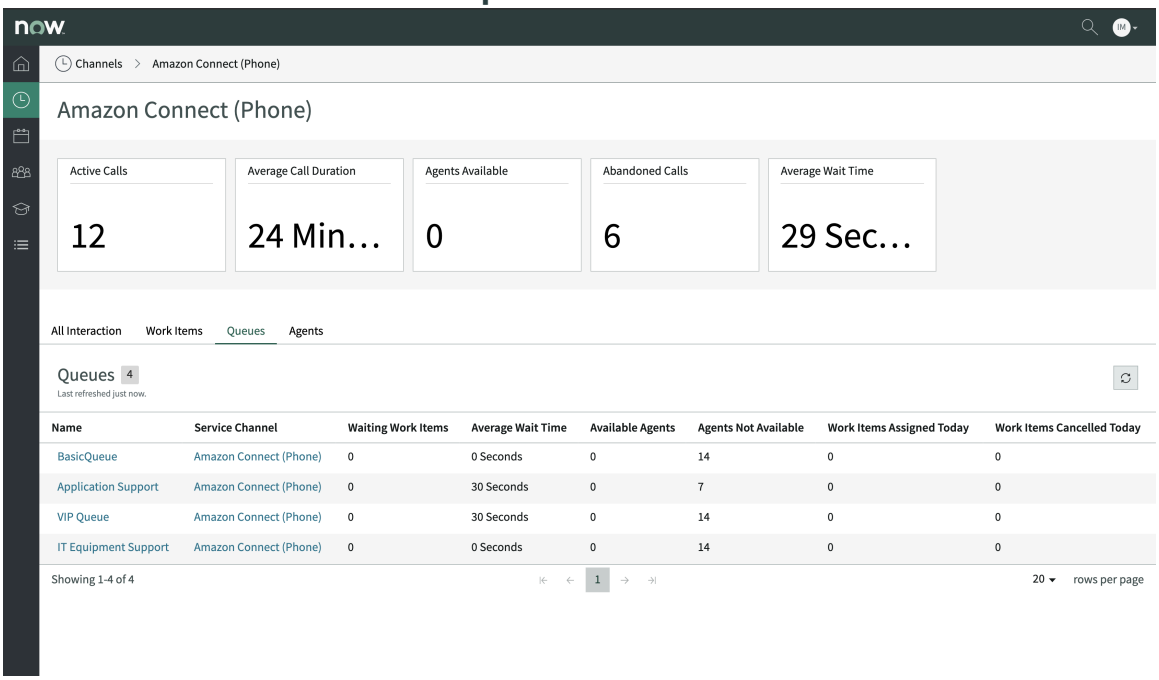
Callers can use PIN-based authentication to access the phone channel. Managers can set or reset the PIN for the users who can also set or reset their phone PIN. For more information, see Configure a phone PIN.

Workforce Optimization for ITSM

Integrate Voice with Workforce Optimization for ITSM to visualize call metrics from Amazon Connect. The Voice uses Advanced Work Assignment to display the call metrics and active calls along with all other Channel metrics in the Manager Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Amazon Connect Phone Workforce Optimization for ITSM



Install ServiceNow Voice for ITSM

You can install the ServiceNow Voice for ITSM application (sn_cti_itsm_cnt) if you have the admin role. This plugin installs the ITSM content for integration between ServiceNow Voice and a third-party phone system.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Your organization must have purchased ITSM Pro subscription, which includes the ServiceNow Voice SKU.
- ServiceNow Voice for ITSM requires the following ServiceNow Store application. Ensure that this application is installed before you install ServiceNow Voice for ITSM.

  Required ServiceNow Store applications

  Amazon Connect Integration with ServiceNow Voice (sn_cti_amzn_cct)

  Integrates the ServiceNow instance with the Amazon Connect server.

Role required: admin

About this task

The following items are installed with ServiceNow Voice for ITSM application (sn_cti_itsm_cnt):

- Contact flows
- Operation handlers

For more information, see Components installed with ServiceNow Voice for ITSM.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the ServiceNow Voice for ITSM application (sn_cti_itsm_cnt) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

   Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.
3. In the Application installation dialog box, review the application dependencies.

   Dependent plugins and applications are listed if they will be installed, are currently installed, or need to be installed. If any plugins or applications need to be installed, you must install them before you can install ServiceNow Voice for ITSM application (sn_cti_itsm_cnt).
4. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data are sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.
5. Select **Install**.

Real time transcriptions for ServiceNow Voice for IT Service Management

Agents can see a transcript of voice calls while interacting with customers. Real time transcription enable agents to better understand caller issues, and managers to gain insights into caller trends and agent training gaps.

Inbound call example flow for customers and agents

The below examples illustrate common scenarios for using real-time transcriptions for inbound calls. The caller calls in and requests to speak to an agent. As soon as the call begins, the agent can see the transcript of the call in chat panel as they work with the caller. The real time transcript is not visible to the caller, however, the transcript can help the agent better understand the caller issue and refer back to the conversation for clarification.

Personas:

- Agent
- Caller

Example Caller flow for inbound calls.

1. Customer dials an Amazon Connect customer service number.
2. Confirm the approval for recording (press 1#).
3. Give instruction: “Speak to a live agent”.
4. Provide a subject for the customer service agent: “Router Issue”.
5. Confirm the subject and wait for the agent to pick up the call.

Example Agent flow for inbound calls.

1. Log in to your ServiceNow instance and open the Configurable Workspace
2. Log in to Amazon Connect.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Set status to **Online**.
4. Wait for a call alert and answer the call.
5. A new interaction with the subject and chat panel opens with the real time transcript.

Outbound call example flow for agents

The below example illustrates a common scenario for using real-time transcriptions in outbound calls. The agent contacts the caller, and as soon as the call starts, the agent can see the transcript of the call in chat panel as they work with the caller. The real time transcript is not visible to the caller, however, the transcript can help the agent better understand the caller issue and refer back to the conversation for clarification.

Persona: Agent.

1. Log in and open the Configurable Workspace.
2. Log in to Amazon Connect.
3. Set status to **Online**.

An interaction is created with the subject "outbound call to `<customer name>`", and a chat panel opens with the transcript.

Enable native voice control in Service Operations Workspace

Enable the native voice control to allow the agents to manage the calls using the Interaction Controls Component and the Customer History tab component.

Before you begin

Role required: admin

About this task

This page variant is available to users when:

- The Interaction Controls Component plugin (com.app_interaction_control) is installed.
- Interaction controls in the OpenFrame configuration are enabled.

When the following conditions are met, the agent sees the SOW voice interaction record page with the Interaction Controls Component and the Customer History tab component.

- The interaction is of type phone.
- The **Enable interaction controls** field on the OpenFrame Configuration record is enabled.
- The agent belongs to the **User Group** selected on the OpenFrame Configuration record.

The agent can switch between phone interactions and chat interactions. If an interaction is of type chat, the agent sees the CSM default record page.

Procedure

1. Navigate to **All** > **OpenFrame** > **Configurations**.
2. Select a configuration record.
   For example, select **CTI**.
3. Select the **Enable interaction controls** check box to enable interaction controls for OpenFrame.
4. Select a group from the available **User Group** column and move it to the **Selected** column.
   This is the group of users to whom the OpenFrame configuration applies.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Unlock the URL field, and add a third-party URL.
   You can get this URL from your contact center provider admin.
6. Select **Update**.

Integrating ServiceNow Voice with CSM

Access the CSM -specific contact flows and operation handlers when you integrate the ServiceNow Voice application with the Customer Service Management application.

The ServiceNow Voice for CSM application provides seamless interactive voice response (IVR) and calling experiences for your customers and agents by integrating a cloud contact center provider with the robust capabilities of the Customer Service Management application.

Overview

The ServiceNow Voice for CSM application provides the following Customer Service capabilities for the integration with a cloud call center provider such as the Amazon Connect service:

- A bot building framework to automate interactions with consumers and customer contacts.
- An inbound contact flow to define the customer experience in an IVR.
- An outbound contact flow to connect with consumers and customer contacts from the phone number field displayed in any of the ServiceNow application UIs.
- Operation handlers to configure automated interactions for customer service cases.
- A phone PIN setup option for consumers and customer contacts.
- Amazon Connect phone queues for the Workforce Optimization for Customer Service application.

To get started with the ServiceNow Voice for CSM application, see Install ServiceNow Voice for CSM.

Key features

Customer experience

Engage via voice-based interactions using a natural language process to do the following:

- Create a case
- Update and check case status
- Speak with an agent
- Request a call back from an agent

Agent experience

- Preview caller information displayed in Agent Workspace before accepting an inbound call.
- Indicate your presence in the Agent Workspace Inbox with voice as a service channel when the Agent Workspace Inbox is integrated with the Agent softphone.
- View real-time transcripts of calls while interacting with a customer. For more information about real-time transcripts, see Real time transcriptions for ServiceNow Voice for Customer Service Management

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Transfer calls to another agent or to a queue, and include transcripts and interaction history with the transfer.
- Make outbound calls to connect with a customer and automatically capture interaction details to simplify data entry.

Manager experience

- Review call transcripts, sentiments, and recordings to explore coaching opportunities for agents.
- Use call metrics, such as the agent call time, to report on agents.
- Monitor real-time phone metrics captured in a unified dashboard by using the Workforce Optimization for Customer Service application.

> **Note:**
> This feature is available when the Workforce Optimization for Customer Service application is enabled for the Customer Service Management application.

ServiceNow Voice for CSM user roles

The users with the roles listed in the following table can use the ServiceNow Voice for CSM application.

Roles required for ServiceNow Voice for CSM

Roles	Tasks
agent_workspace_user	Initiate or accept voice calls to understand customer issues and resolve issues.
sn_customerservice_manager	View details of voice calls using the interaction record of the Phone type.
sn_customerservice.consumer, sn_customerservice.customer	Initiate or accept voice calls to create and track one's own customer service cases.

Example workflow

The following example workflow shows the use of the ServiceNow Voice for CSM application in resolving a customer issue:

1. A customer is in an IVR call using the ServiceNow Voice for CSM application.
2. The ServiceNow Voice for CSM application identifies the customer and starts an interaction.
3. A welcome message is read out to the customer including announcements, if any.
4. Based on customer identification, the Cloud Call Center for CSM application addresses the call.
   - If the caller is identified as an existing customer who has a customer contact or consumer record with the phone number details available in the Customer Service Management application, a personal greeting is read to the caller and the automated interactions are made available.
   - If the caller is not identified, the call is routed to a live agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. The ServiceNow Voice for CSM application identifies the customer intent using automated interactions, and then based on the interaction responses, either creates or updates a case.

Note:
This step in the flow applies only when the caller is an existing customer.

Workforce Optimization for Customer Service

Integrate Voice with Workforce Optimization for Customer Service to visualize call metrics from the Amazon Connect service. Voice uses the Advanced Work Assignment feature to display the call metrics and active calls along with all other Channel metrics in the Manager Workspace. For more information, see Using Voice with Workforce Optimization for Customer Service.

Installs the Customer Service Management application.

Amazon Connect Integration with ServiceNow Voice (sn_cti_amzn_cct)

Integrates the ServiceNow instance with the Amazon Connect server.

Role required: admin

About this task

The following items are installed with ServiceNow Voice for CSM:

- Contact flows
- Operation handlers

For more information, see Components installed with ServiceNow Voice for CSM.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the ServiceNow Voice for CSM application (sn_cti_csm_cnt) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you may have to request it from the ServiceNow Store.

   Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.
3. In the Application installation dialog box, review the application dependencies.

   Dependent plugins and applications are listed if they will be installed, are currently installed, or need to be installed. If there are any plugins or applications that need to be installed, you must install them before you can install ServiceNow Voice for CSM.
4. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data are sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.
5. Select **Install**.

What to do next

To set up Voice for CSM, see Setting up ServiceNow Voice

Configuring the phone PIN settings for ServiceNow Voice

Use a#PIN-based authentication mechanism for enabling a customer contact or consumer to connect with the ServiceNow Voice for CSM #application.

An authentication mechanism for inbound#dialing#enables protecting the details of#customer contacts and consumers from unauthorized users. When using the#ServiceNow Voice for CSM application, you as an administrator can configure the PIN-based authentication mechanism available within the#ServiceNow Voice for CSM application or set up a custom authentication mechanism.

The PIN-based authentication mechanism available within the#ServiceNow Voice for CSM application enables #customer contacts#and#consumers#to use a custom phone PIN for accessing details related to their customer service cases during inbound#dialing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

By default, the **My Phone PIN** link in the Additional Configuration section of the setup guide for configuring the Amazon Connect components enables the PIN-based authentication mechanism. For more information about the setup guide, see Integrate ServiceNow Voice with Amazon Connect.

Note:
The **My Phone PIN** link for customer contacts and consumers is available only with the sample CSM -specific contact flows.

To enable a PIN-based authentication mechanism, the **My Phone PIN** link in the setup guide uses the predefined Setup PIN record producer that is configured by default for consumers and customer contacts. As an administrator, you can edit the Setup PIN record producer to add any additional ServiceNow roles, include the record producer in a service catalog, and display the service catalog as a module on a customer-facing portal. Customers can then use the module to configure and reset their phone PIN. For more information, see Record Producer and Set up a service catalog.

Real time transcriptions for ServiceNow Voice for Customer Service Management

Agents can see a transcript of voice calls while interacting with customers. Real time transcription allows agents to better understand customer issues, and allows managers to gain insights into customer trends and agent training gaps.

Inbound call example flow for customers and agents

The below examples illustrate common scenarios for using real-time transcriptions for inbound calls. The customer calls in and requests to speak to an agent. As soon as the call begins, the agent can see the transcript of the call in chat panel as they work with the customer. The real time transcript is not visible to the customer, however, the transcript can help the agent better understand the customer issue and refer back to the conversation for clarification.

Personas:

- Customer Service Agent
- Customer

Example Customer Flow for inbound calls.

1. Customer dials an Amazon Connect customer service number.
2. Confirm the approval for recording (press 1).
3. Give instruction: “Speak to a live agent”.
4. Provide a subject for the customer service agent: “Router Issue”.
5. Confirm the subject and wait for the agent to pick up the call.

Example Agent Flow for inbound calls.

1. Log in to your ServiceNow instance and open the Configurable Workspace
2. Log in to Amazon Connect.
3. Set status to **Online**.
4. Wait for a call alert and answer the call.
5. A new interaction with the subject and chat panel opens with the real time transcript.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Outbound call example flow for agents

The below example illustrates a common scenario for using real-time transcriptions in outbound calls. The agent contacts the customer, and as soon as the call starts, the agent can see the transcript of the call in chat panel as they work with the customer. The real time transcript is not visible to the customer, however, the transcript can help the agent better understand the customer issue and refer back to the conversation for clarification.

Persona: Customer Service Agent.

1. Log in and open the Configurable Workspace.
2. Log in to Amazon Connect.
3. Set status to **Online**.
4. Open a contact record and click the phone icon next to the customer's phone number.

> **Note:**
> The real time transcription only works when you place the call using the "click to call" button.

An interaction is created with the subject "outbound call to `<customer name>`", and a chat panel opens with the transcript.

Integrating ServiceNow® Voice with Virtual Agent

ServiceNow® Voice with Virtual Agent allows you to use the ServiceNow Virtual Agent conversation as an IVR (Interactive Voice Response) in phone and to use the existing ServiceNow Advanced Work Assignment to find an agent in case of an escalation and allows agents to work in ServiceNow Workspace to manage the incoming cases on the queue.

The ServiceNow Voice for Virtual Agent application provides seamless interactive voice response (IVR) and calling experiences for your customers and agents when integrated with a Contact Center In Yokohama release, we have Amazon Connect, a pre-built adapter integrating the ServiceNow Voice with Virtual Agent to provide the robust capabilities of the Virtual Agent application.

To use our pre-built adapter connector with ServiceNow Voice with Virtual Agent, install the Virtual Agent API (sn_va_as_service) plugin.

Key features

User experience

- Have Virtual Agent answer calls and interact with end users for automated deflection on the phone channel.
- Complete workflow including case lookup, interaction, and task management using Virtual Agent.
- Enable agents to interact with users on the phone on workspace in case of any escalations.
- Receive calls in inbox that are routed via the Advanced Work Assignment rules.

Calling and routing

- Make outbound calls via click to call or via auto-connecting the Omnichannel Callback feature.

  For more information, see Configure Conversational IVR with Amazon Connect.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Transfer to external phone number using the Amazon Connect Softphone.
- Skills-based call assignment using the Advanced Work Assignment.

Artificial intelligence

- Match intent and entity using ServiceNow Virtual Agent.
- Analyze sentiments of the utterances.
- Real-time transcription and storage of the recording.

User benefits

- Account log in using voice to receive enterprise service.
- Callback options.

Example workflow

The following example workflow shows the use of ServiceNow Voice for Virtual Agent application in resolving a customer issue.

- A customer is in an IVR call using the ServiceNow Voice for Virtual Agent application.
- The ServiceNow Voice for Virtual Agent application identifies the customer and starts an interaction.
- A welcome message is read out to the customer including announcements if any.
- Based on customer identification, the ServiceNow Voice for Virtual Agent application addresses the call.
  - If the caller is identified as an existing customer who has a customer contact or consumer record with the phone number details available in the ServiceNow Voice for Virtual Agent application, a personal greeting is read to the caller and the automated interactions with Virtual Agent conversations are made available.
  - If the caller is not identified, the caller is presented with the guest topics and the live agent topic. The caller can select the live agent topic to route themselves to a live agent.
- The ServiceNow Voice for Virtual Agent application identifies the customer intent using automated interactions, and the Virtual Agent conversations guide customers to complete the workflow, including changing records, passwords or hearing about a case status.

Note:
This step in the flow applies only when the caller is an existing customer.

Integrating Virtual Agent with Conversational IVR

Integrate Advanced Work Assignment AWA Voice routing

Provide customers the ability to use AWA as the routing engine for ServiceNow Voice on Amazon Connect.

Before you begin

ServiceNow Voice for Amazon Connect offers two call routing options:

- Amazon Connect native Voice routing
- Advanced Work Assignment AWA Voice routing

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When using the AWA Voice routing, calls are held in the Amazon Connect queue until the AWA queue settings determine their routing. This allows flexible call management using either the built-in Amazon Connect routing or the more advanced AWA routing capabilities.

Role required: sn_cti_amzn_cct.admin

Procedure

1. Navigate to **Amazon Connect Integration** > **View Instances**.
2. Select the instance you want to configure.
3. Click the **Setup Guide** related link.
4. Go to the **Import Contact Flows** section of the setup guide.
5. To enable Advanced Work Assignment (AWA) Voice routing, check the checkbox under the **AWA Voice Routing** heading.
   Complete the steps specified in the setup guide:
   a. Complete AWS Lambda and OAuth credential setup.
   b. Download the recommended hold music using the link in the setup guide (you can choose your own hold music, but it cannot be longer than 5 seconds).
   c. See the AWS documentation to upload the hold music.
6. Set up AWA queue to route Amazon Connect phone calls.
   To setup AWA, see Get started with Advanced Work Assignment

What to do next

For more information about integrating ServiceNow® Voice with Amazon Connect, see Integrate ServiceNow Voice with Amazon Connect.

Integrating ServiceNow Voice for HR

The ServiceNow Voice for HR Agent Workspace provides seamless interactive voice response (IVR) and calling experiences for your employees and agents by integrating a cloud contact center provider with the robust capabilities of the Agent Workspace for HR Case Management.

The ServiceNow Voice for HR provides the following capabilities:

- An inbound contact flow to define the employee experience in an IVR.
- An outbound contact flow to connect with employee contacts from the phone number field displayed in any of the ServiceNow application interfaces.
- Operation handlers to configure automated interactions for employee service cases.

Employee experience with ServiceNow Voice for HR

The following example provides an overview of how an employee uses ServiceNow Voice for HR to resolve their HR requests and issues.

An employee calls the general HR phone number with a request. The employee provides information via the interactive voice response (IVR). Using the provided information, ServiceNow Voice for HR tries to identify the caller.

If the caller is identified as an existing employee in HR Agent Workspace, Voice reads a personal greeting to the employee and offers automated interactions to enable the employee to independently address their request. If the employee cannot resolve their request using the IVR, the system routes the call to a live agent.

If the caller is not identified, the call is routed to a live agent.

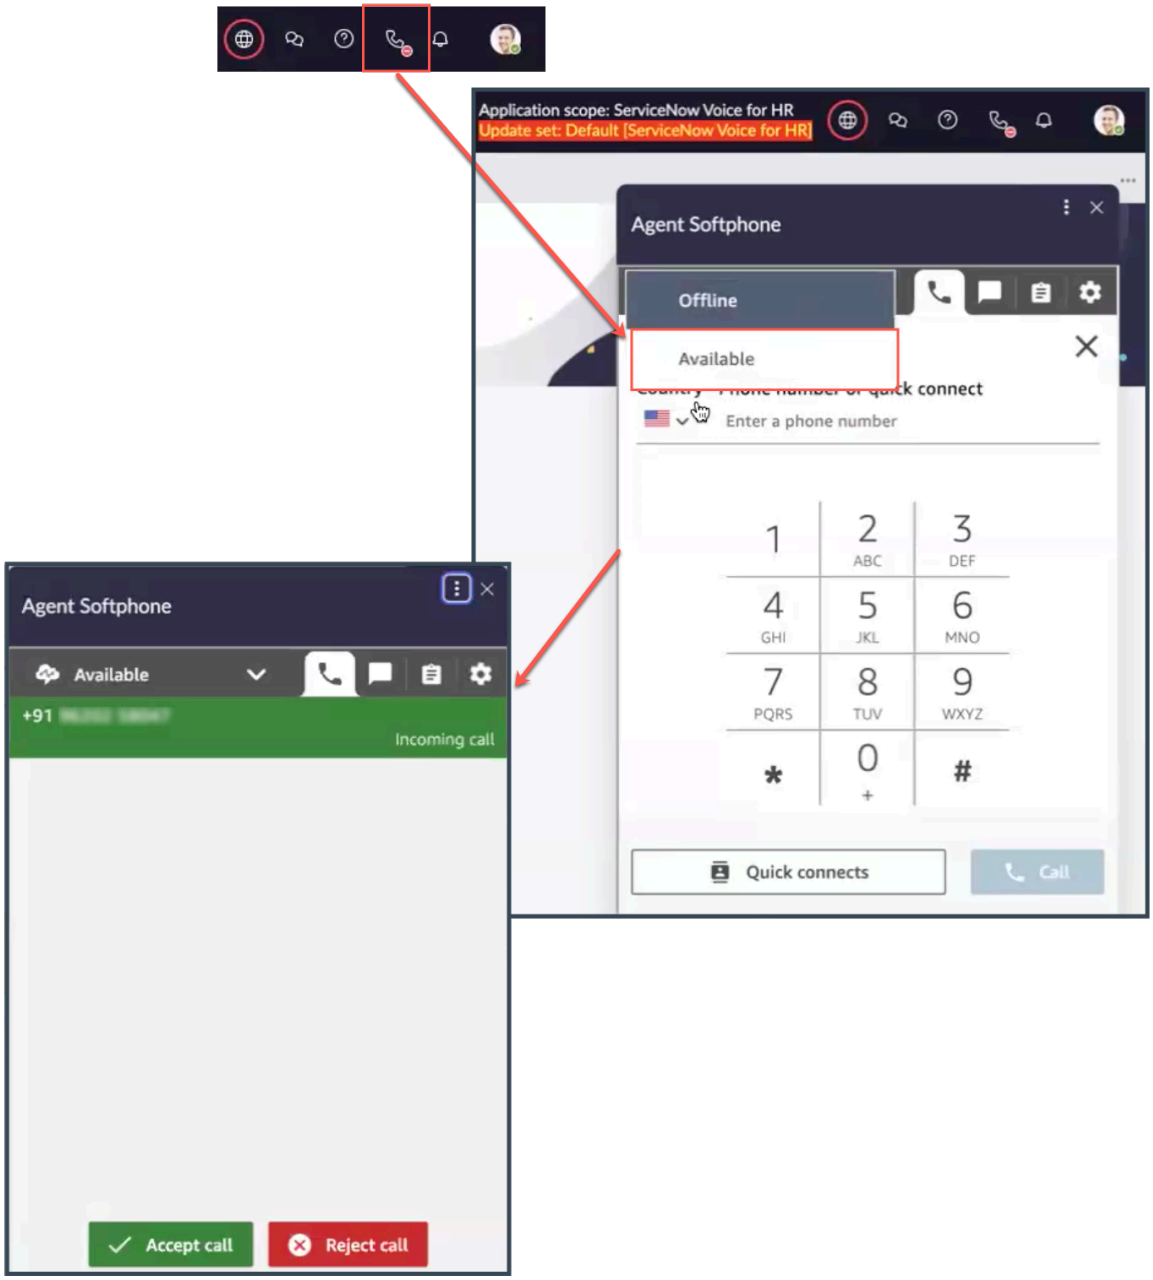
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent experience with ServiceNow Voice for HR

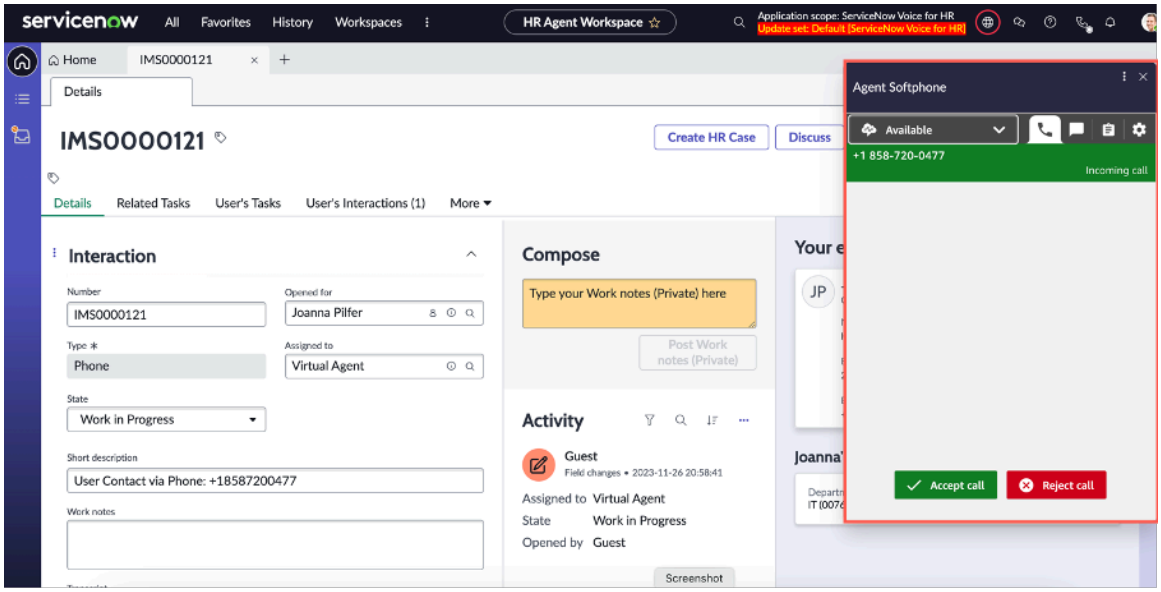
Once installed, ServiceNow Voice appears as a pop-up in the HR Agent Workspace where agents can do the following:

- Indicate availability to receive calls on the agent softphone

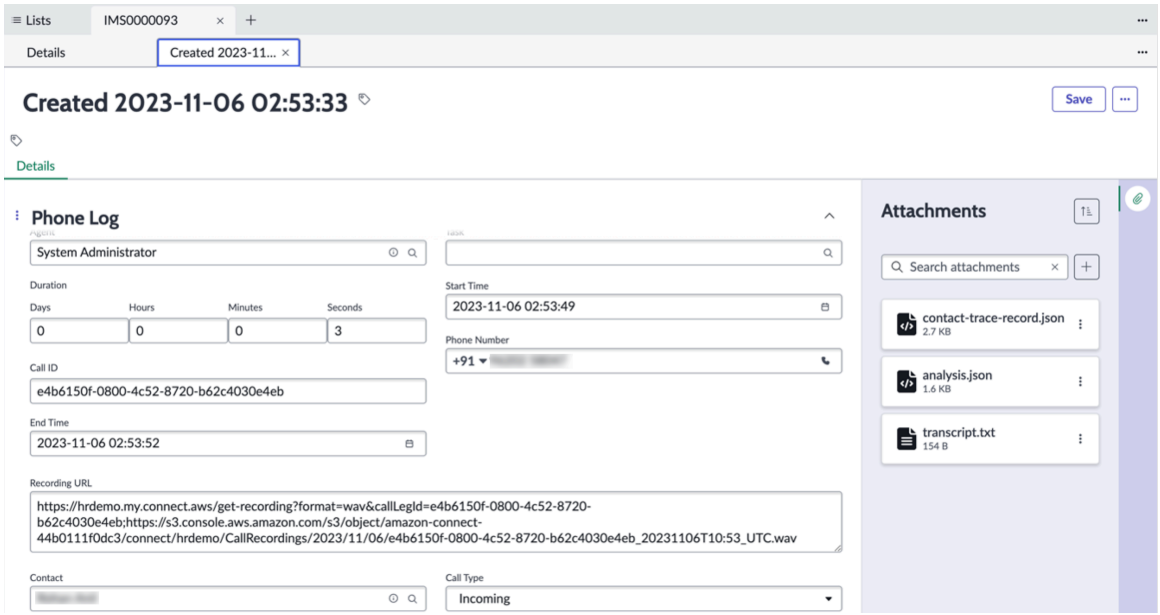


- Preview caller information before accepting an inbound call.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



- View the call transcript, hear the recording, and review the call analysis in the interaction related list.



- Make outbound calls to connect with a employee and automatically capture interaction details to simplify data entry

Configuration

ServiceNow Voice for HR (sn_cti_hr_cnt) is activated from the store and requires the following dependency applications:

Application	Description
ServiceNow Voice with Amazon Connect [sn_cti_amzn_cct]	Integrates the ServiceNow instance with the Amazon Connect server. For information about the components installed with this application,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Application	Description
	see Components installed with Amazon Connect Integration with ServiceNow Voice
Agent Workspace for HR Case Management [sn_hr_agent_ws]	Enables call recording, transcription, and sentiment analysis for ServiceNow Voice with Workspace experience.
ServiceNow Voice for HR Agent Workspace [sn_cti_hr_cnt]	Provides the framework that supports the integration with your third-party phone system.

You must install the dependency applications first, then install ServiceNow Voice for HR. For more information, see Install ServiceNow Voice for HR.

ServiceNow Voice for HR creates an interaction record for every call between an employee and an HR agent with the IMS prefix. These records contain related lists of details relating to the employee and interaction. To maximize the full feature capability, add the Interaction record to the HR Agent workspace. For more information, see Add Interaction Related Records to HR Agent workspace.

Install ServiceNow Voice for HR

You can install ServiceNow Voice for HR if you have the admin role. The application includes demo data and installs related ServiceNow® Store applications and plugins if they are not already installed.

Before you begin

- Ensure that the application and all of its associated ServiceNow® Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Your organization must have purchased the Agent Workspace for HR Case Management (sn_hr_agent_ws) subscription.
- Ensure that Amazon Connect Integration with ServiceNow Voice (sn_cti_amzn_cct) is installed. For more information, see Install ServiceNow Voice applications.

Role required: admin

About this task

Follow the steps below to install these applications to use ServiceNow Voice for HR.

The following items are installed with ServiceNow Voice for HR:

- Contact flows
- Operation handlers

For more information, see Components installed with ServiceNow Voice for HR Agent Workspace.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the ServiceNow Voice for HR Agent Workspace (sn_cti_hr_cnt) using the filter criteria and search bar.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can search for the application by its name or ID. If you cannot find the application, you may have to request it from the ServiceNow Store.

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

3. In the Application installation dialog box, review the application dependencies.

   Dependent plugins and applications are listed if they will be installed, are currently installed, or need to be installed.

4. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data are sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.
5. Select **Install**.

What to do next

Follow these steps to Integrate ServiceNow Voice with Amazon Connect.

Add Interaction Related Records to HR Agent workspace

ServiceNow Voice for HR creates an interaction record for every call between an employee and an HR agent, which contain related lists of details relating to the employee and interaction. To maximize the full feature capability, add the Interaction record to the HR Agent workspace.

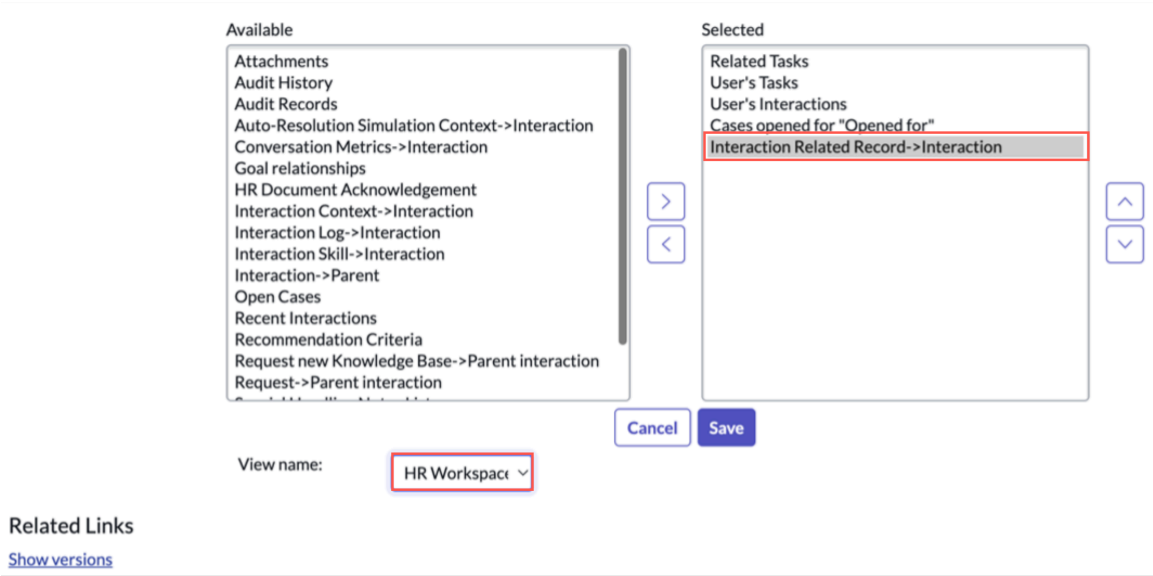
Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Interaction** > **All**.
2. Open any IMS record.
   If there are no records, create a dummy record.
3. Click **Additional actions** > **Configure** > **Related lists**.
4. Select the **HR Workspace** view.
5. Locate the **Interaction Related Record -> Interaction** option and add it to the **Selected** list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Click **Save**.

ServiceNow Voice reference

Reference topics provide additional information about components installed with ServiceNow Voice.

Components installed with ServiceNow Voice Core

Several types of components are installed with activation of the ServiceNow Voice Core application (sn_cti_core), including user roles, plugins, and operation handlers.

Note:
The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Roles installed

Role title [name]	Description	Contains roles
CTI service account [sn_cti_core.service]	Allows communication between the third-party phone system instance and the ServiceNow instance.	sn_openframe_api_user
CTI admin [sn_cti_core.admin]	Creates the framework for integration with a third-party phone system.	None
CTI user manager [sn_cti_core.user_manager]	• Can access the Call Analysis tab and interaction to analyze transcripts, recordings, and sentiments. • Can manage the CTI-enabled user PIN.	None

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Plugins installed

Plugin	Description
Interaction Management (com.glide.interaction)	Enables interaction logging, routing, and queueing
Openframe (com.sn_openframe)	Provides an interface to integrate a communication frame to place and receive calls.

Operation handlers installed

Operation handlers are defined in the ServiceNow instance to run a script based on the intent of the caller and provide response to the caller.

Plugin	Description
$transcript	Saves the call transcript
$query2ssml	Securely queries tables and returns the response as ssml
workItemEvent	If the Advanced Work Assignment plugin (com.glide.awa) is installed, creates a work item on Advanced Work Assignment table before routing the call to agent, and associates an interaction with the work item. **Note:** In a contact flow, invoke this operation handler in the Invoke AWS Lambda Function node just before transferring the flow to a queue
interactionEvent	Defines the life cycle of the an Amazon Web Services (AWS) interaction event, such as initiating an interaction and associating an agent and caller to the interaction
authenticate	Authenticates a user based on the PIN. For information on PIN configuration, see Configuring a phone PIN.
fetchVoiceInteraction	Fetches interaction and processes createConversation flag for creating conversation.

Components installed with Amazon Connect Integration with ServiceNow Voice

Several types of components are installed with installation of the Amazon Connect Integration with Voice application (sn_cti_amzn_cct), including user roles, plugins, and operation handlers.

Note:
The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Roles installed

Role title [name]	Description	Contains roles
Amazon Connect administrator	Configures the integration with the Amazon Connect instance.	sn_cti_core.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role title [name]	Description	Contains roles
[sn_cti_amzn_cct.admin]		

Plugins installed

Plugin	Description
ServiceNow Voice - Core (sn_cti_core)	Provides the framework that supports the integration with your third-party phone system.
Openframe (com.sn_openframe)	Provides an interface to integrate a communication frame to place and receive calls.

Operation handlers installed

Operation handlers are defined in the ServiceNow instance to run a script based on the intent of the caller and provide response to the caller.

Plugin	Description
$connect.kinesis.event	Receives and processes the call trace record that is created by Amazon Connect in the Amazon Kinesis stream.
$connect.s3.event	Receives and processes JSON events from the S3 buckets where the call recording, transcript and analysis data is created and stored. Associates this information with an interaction and Openframe call log records.
createPhoneLog	Creates a PhoneLog for each call transfer and links the Phone Log to the Interaction Related Record

Components installed with ServiceNow Voice for ITSM

Several contact flows and operation handlers are installed with activation of the ServiceNow Voice for ITSM application (sn_cti_itsm_cnt).

Contact flows installed

Contact flow	Description
ServiceNow ITSM Inbound Demo Flow	Contains the call tree for inbound calls. When a caller contacts the call center, using the voice or dual-tone multi frequency (DTMF) inputs from caller, the contact flow is invoked in the Amazon Connect instance based on the caller context. This contact flow contains nodes that act as integration points between Amazon services and the ServiceNow instance. Based on the nodes defined in the contact flow, the corresponding operation handlers are triggered in the ServiceNow instance. The caller then gets the response that is defined in the operation handler.
ServiceNow ITSM Outbound Demo Flow	Contains the call tree for outbound calls. It specifies the whisper message that a caller hears before getting connecting to an agent.
include rtt

Contact flow	Description
awa routing	

Operation handlers installed

Operation handler	Description
sn_FallbackIntent	Captures the user input
manageIncident	Manages an existing incident
unlockAccount	Unlocks a user account
announcements	Makes announcement for a caller
manageIncident.DialogCodeHook	Initializes the Amazon Connect instance and validates incoming calls
createIncident	Creates an incident
createITSMInteraction	Creates an interaction
fetchITSMInteraction	Fetches the details of an interaction

Components installed with ServiceNow Voice for CSM

Several contact flows and operation handlers are installed with Cloud Call Center for CSM application (sn_cti_csm_cnt).

Contact flows installed

Contact flow	Description
ServiceNow CSM Inbound Demo Flow	Contains the call tree for inbound calls. When a caller contacts the call center, using the voice or dual-tone multi frequency (DTMF) inputs from caller, the contact flow is invoked in the Amazon Connect instance based on the caller context. This contact flow contains nodes that act as integration points between Amazon services and the ServiceNow instance. Based on the nodes defined in the contact flow, the corresponding operation handlers are triggered in the ServiceNow instance. The caller then gets the response that is defined in the operation handler.
ServiceNow CSM Outbound Demo Flow	Contains the call tree for outbound calls. It specifies the whisper message that a caller hears before getting connecting to an agent.
ServiceNow CSM Transfer to Agent Flow	The call is relocated to another persona using call transfer functionality. A new PhoneLog is created with each transfer. The PhoneLog also includes any attachments associated with the interaction. Call transfers can be done with either incoming and outgoing calls.
ServiceNow CSM Transfer to Queue Flow	The inbound call is relocated to a queue using call transfer functionality. A new PhoneLog is created with each transfer. The PhoneLog also includes any attachments associated with the interaction. Call transfers can be done with either incoming and outgoing calls.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Operation handlers installed

Operation handler	Description
$csm.connect.s3.event	Receives and processes events from S3 buckets where connect audio, transcript and analysis data is created and stored and tries to associate with interaction and openframe call log records. This is CSM operation handler for the new data model with conversation as metadata
$csm.connect.kinesis.event	Handler to process CTR events from Kinesis stream for CSM integration with VA Conversations
speakToCSMAgent	Enables customer contacts and consumers to speak with a live agent.
createCSMCase	Enables customer contacts and consumers to create a customer service case.
manageCSMCase	Enables customer contacts and consumers to update an existing case.
csmAnnouncements	Makes announcements for a caller.
createCSMInteraction	Creates an interaction record in the ServiceNow instance for the incoming calls.
updateCSMInteraction	Updates an existing interaction record in the ServiceNow instance for the incoming calls.
fetchCSMInteraction	Fetches interaction and processes sn_cti_csm_cnt.enable_ims_update sys property for creating conversation.

Components installed with ServiceNow Voice for HR Agent Workspace

Several contact flows and operation handlers are installed with ServiceNow Voice for HR Agent Workspace.

Contact flows installed

Contact flow	Description
ServiceNow HR Inbound Demo Flow	Contains the call tree for inbound calls. When a caller contacts the call center, using the voice or dual-tone multi frequency (DTMF) inputs from caller, the contact flow is invoked in the Amazon Connect instance based on the caller context. This contact flow contains nodes that act as integration points between Amazon services and the ServiceNow instance. Based on the nodes defined in the contact flow, the corresponding operation handlers are triggered in the ServiceNow instance. The caller then gets the response that is defined in the operation handler.
ServiceNow HR Outbound Demo Flow	Contains the call tree for outbound calls. It specifies the whisper message that a caller hears before getting connecting to an agent.

Operation handlers installed

Operation handlers are reusable code components that get executed on the ServiceNow instance. They work on the request/response message exchange pattern.

Operation handler	Description
createHRInteraction	Creates an interaction record in the ServiceNow instance for the incoming calls.
fetchHRInteraction	Fetches interaction and processes sn_cti_hr_cnt.enable_ims_update sys property for creating conversation.

ServiceNow AI Platform Additional Capabilities

Explore additional ServiceNow ServiceNow AI Platform capabilities features.

Connect

Connect to your coworkers and participate in conversations while you work.

Orchestration

Extend automation capabilities to external services.

Task Communications Management

Create communications plans for any event.

Connect

ServiceNow Connect is a real-time messaging platform that connects you to your coworkers, bypassing email and static documents. Connect integrates with other features within the system, such as Visual Task Boards, Human Resources Management, and Customer Service Management. The Connect interface overlays the standard interface, which allows users to participate in conversations while they work.

Orchestration

Take the power of ServiceNow beyond the ServiceNow AI Platform. Orchestration extends the platform's automation capabilities to external instances, with activity packs to automate IT and business processes. Create more activities and packs using Activity Designer and Scoped Applications, and track data flow through your external activities with Databus.

Task Communications Management

Define and implement communications plans based on any event you choose. The Task Communications Management app assists event-based communication through Slack, SMS, and email. Define plans, connect plans with task tables, and ensure easy collaboration and issue resolution.

Connect

ServiceNow® Connect is a real-time messaging platform that connects you to your coworkers, bypassing email and static documents.

Connect integrates with other features within the system, such as Visual Task Boards, Human Resources Management, and Customer Service Management. The Connect interface overlays the standard interface, which allows users to participate in conversations while they work.

Connect contains the following features:

- Connect Chat: Enables users to chat with individuals and groups, quickly share files, and collaborate on any record by connecting with the right people instantly.
- Connect Support: Enables support agents to provide real-time assistance to end users, using queues. Requires the Connect Support plugin.

Core UI is required to use Connect.

Important:
Connect is not supported in Next Experience. If you turn on Next Experience, Connect functionality will no longer work. See Next Experience.

Note:
Connect does not replace legacy chat but offers some of the same functionality. Do not use these features concurrently

- Microsoft Edge version 90

Activate Connect

Connect is active by default on new instances. For upgraded instances, you can activate the Connect plugin (com.glide.connect) if you have the admin role.

Before you begin

Role required: admin

About this task

If you used Collaboration in the Fuji release, the Connect plugin is activated automatically.

Important:

Connect is not supported in Next Experience. If you turn on Next Experience, Connect functionality will no longer work. See Next Experience.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

List of plugins

Properties installed with Connect

Properties are added with activation of Connect.

Note:
To open the System Property [sys_properties] table, enter `sys_properties.list` in the navigation filter.

Name	Description
collaboration.email_interval	Sets the number of minutes the system waits before sending a Connect notification email to an inactive user. • **Type**: integer • Default value: 3 • Location: **Collaborate** > **Administration** > **Properties** • Learn more: Configure the email notification interval
collaboration.frameset	Determines whether the Connect overlay is visible (enabled). This property also impacts Connect Support. • **Type**: true | false • Default value: true • Location: **Collaborate** > **Administration** > **Properties** • Learn more: Disable the Connect overlay
collaboration.polling_interval	Sets the number of seconds the system waits between polling for new Connect messages. This property also impacts Connect Support. • **Type**: integer • Default value: 10 • Location: System Property [sys_properties] table
connect.notification.audio_alert	Specifies the audio file to play to notify users of new messages, support conversation transfers, and @mentions in Connect. This property's value must point to the **Name** field of a record in the Audio File

Name	Description
	[db_audio] table. This property also impacts Connect Support. • **Type**: string • Default value: connect_alert.mp3 • Location: **Collaborate** > **Administration** > **Properties** • Learn more: Customize the Connect audio notification sound
connect.retrieve_external_link_content	Enables Connect to render URLs for external sites as links. When this property is disabled, URLs that point anywhere outside the instance appear as plain text. This property also impacts Connect Support. • **Type**: true | false • Default value: true • Location: **Collaborate** > **Administration** > **Properties**
connect.roles	Determines which user roles are required to access Connect. When the value is blank, no role is required. This property also impacts Connect Support. **Note:** If you choose to restrict Connect access to specific roles, consider updating the role requirements for Connect modules and other access points. • **Type** : string • Default value: <empty> • Location: **Collaborate** > **Administration** > **Properties**
glide.connect.enabled	Hides the **Create or Join Chat Room** related link, which appears on the Incident form when legacy chat is enabled. Legacy chat and Connect Chat should not be used concurrently and this property should not be modified. • **Type**: true | false • Default value: true • Location: **Collaborate** > **Administration** > **Properties**
glide.connect.chat.disabled	Disables and hides all UI elements related to Connect. • **Type**: true | false • Default value: false • Location: System Property [sys_properties] table

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

glide.live_feed.task_header_button	Determines whether the show Live Feed icon ( ) and **Follow** button are available in the form header of tables that have the *live_feed=true* dictionary attribute.
	• **Type**: choice list
	• Default value: collaboration
	• Other possible values:
	  ○ **both**: enables both the show Live Feed icon and the **Follow** button.
	  ○ **live_feed**: enables the show Live Feed icon.
	  ○ **none**: disables both the show Live Feed icon and the **Follow** button.
	• Location: **Collaborate** > **Administration** > **Properties**
	• Learn more: Configure record conversations

Activate Connect Support

The Connect Support plugin (com.glide.connect.support) is no longer available.

Before you begin

Important:

This plugin is no longer available. In Paris and future releases, Connect Support no longer receives enhancements or non-priority bug fixes. Consider migrating to ServiceNow® Advanced Work Assignment and Agent Chat in workspace to automatically assign chat requests and other work items to agents. For details, see Migrate from Connect Support to Advanced Work Assignment and Agent Chat.

If you are currently using the legacy chat feature to provide help desk support, close any open help desk chats before activating Connect Support. Legacy chat and Connect Support should not be used concurrently. When you activate Connect Support, the system automatically sets the state of all Chat Queue Entry [chat_queue_entry] records to **Closed Complete**. This ends any open help desk chats. For more information, see Migrate from legacy chat to Connect Support.

Role required: admin

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Properties installed with Connect Support

Properties are added with activation of Connect Support.

Name	Description
connect.support.conversation_limit	Determines how many support conversations an individual agent can have at one time. When the value is set to **-1**, an agent can participate in an unlimited number of conversations. • **Type**: integer • Default value: -1 • Location: **Collaborate** > **Support Administration** > **Properties**
connect.support.idle.delay	Determines how many seconds a user must be inactive in a support conversation before an idle countdown timer appears. • **Type**: integer • Default value: 120 • Location: **Collaborate** > **Support Administration** > **Properties**
connect.support.idle.count_down	Determines how many seconds the idle countdown timer remains open after it appears. If the idle user does not dismiss the timer before the countdown completes, the system closes the support session. • **Type**: integer • Default value: 60 • Location: **Collaborate** > **Support Administration** > **Properties**
connect.support.show_agent_avatar	Determines whether an agent's avatar is shown in a support conversation (enabled). When the property is disabled, users see the agent's name only.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• **Type**: true | false • Default value: true • Location: **Collaborate** > **Support Administration** > **Properties**
connect.support.user.closed.conversation_limit	Determines how many closed conversations appear in a user's support conversation history. When the value is set to **0**, all previous conversations appear in the history. • **Type**: integer • Default value: 0 • Location: **Collaborate** > **Support Administration** > **Properties**
glide.connect.support.enabled	Disables or enables Connect Support. When the property is enabled, the **Service Desk Chat** button in the Employee Self-Service portal opens the conversation in Connect Support, rather than legacy chat. Additionally, the Support tab appears in the Connect sidebar. • **Type**: true | false • Default value: true • Location: **Collaborate** > **Support Administration** > **Properties**
glide.connect.support.reflect_system_messages	Controls whether Connect Support reflects system messages in records created from a support chat, for example, transfer notices, automated queue messages, etc. • **Type**: true | false • **Default value**: false • Location: System Property [sys_properties] table

Additional plugins for Connect Support

Additional plugins are available for Connect Support. These plugins integrate Connect Support with other features and provide capabilities to track performance metrics.

You must have the admin role to activate these additional plugins. For details, see Activate a plugin .

Additional plugins for Connect Support

Plugin	Description
Connect Support and Service Portal Integration [com.glide.connect.support.service-portal]	Adds Connect Support components for use in the Service Portal.
Connect Support Manager's Dashboard [com.glide.connect.managers_dashboard]	Provides a homepage for Connect Support, and all required configuration records. Though the plugin name contains the term dashboard, the plugin does not provide functionality related to Performance Analytics dashboards. Homepages are similar to dashboards, but do not require Performance Analytics roles to view. **Note:** The Connect Support Manager's Dashboard plugin does not activate Connect Support automatically. You must activate Connect Support to collect data for the homepage.
Human Resources Application: HR Connect [com.snc.hr.hr_connect]	Sets up a human resources (HR) chat queue and makes it available on the HR Service Portal. **Note:** This plugin does not appear in the **System Definition>Plugins** list. Contact ServiceNow personnel to activate it. If not already active, the Human Resources Application: HR Connect plugin activates the Human Resources Application: Core [com.snc.hr.core] plugin that provides basic HR features.
Performance Analytics - Content Pack - Service Desk Chat [com.snc.pa.chat]	Provides the **Service Desk Chat Monitor** dashboard, which analyzes key Connect Support metrics and indicators. The Performance Analytics - Content Pack - Service Desk Chat plugin activates the Connect Support Manager's Dashboard [com.glide.connect.managers_dashboard].
Performance Analytics - Context Sensitive Analytics for Chat [com.snc.pa.chat.context_sensitive_analytics]	Provides in-form analytics for Connect Support. These analytics are available as a related link on the Chat Queue Entry [chat_queue_entry] form, and also as the **Context Sensitive Analytics - Chat** dashboard. The Performance Analytics - Context Sensitive Analytics for Chat plugin activates the Performance Analytics - Content Pack - Service

Additional plugins for Connect Support (continued)

Plugin	Description
	Desk Chat [com.snc.pa.chat] plugin if it is not already active.

Connect interface

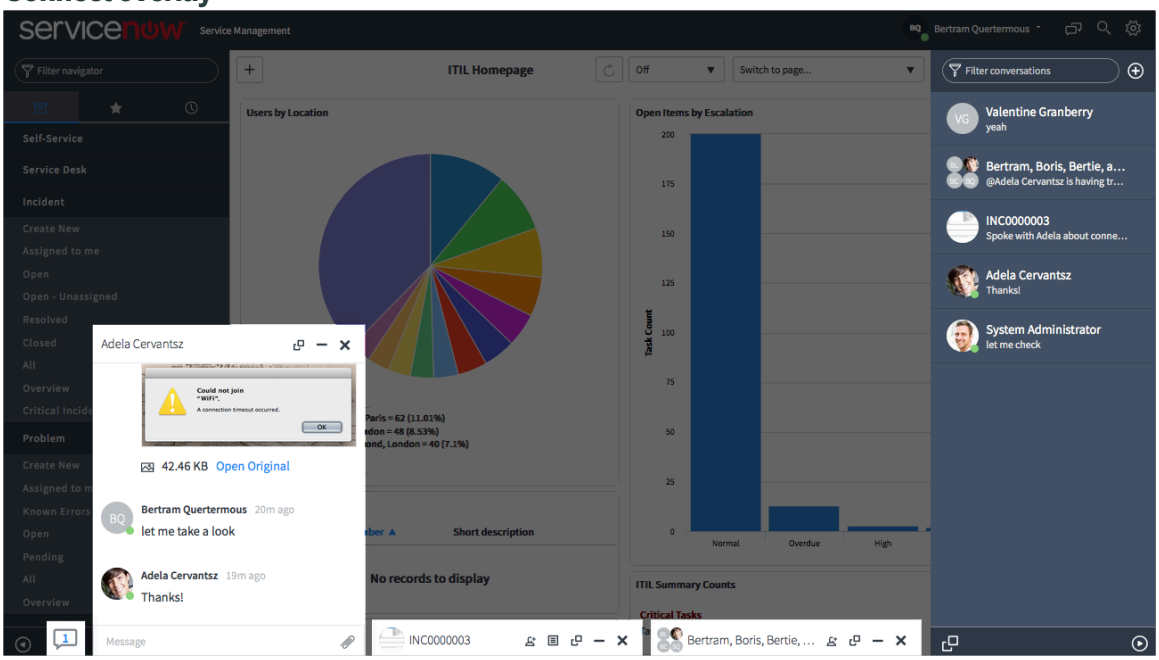
Users can work in a compact view of Connect, which overlays the standard user interface, or in a full-screen workspace.

Connect Chat and Connect Support share the same interface, so support agents can keep track of all their conversations in one place.

Connect overlay

The Connect overlay appears over the standard user interface. It consists of the Connect sidebar, which is the primary interface for Connect Chat and Connect Support, and any Connect mini windows that are open. Each mini window contains a header, a conversation area, and a message field.

Connect overlay



Note:
An administrator can disable the Connect overlay so users can only use the Connect workspace, a full-screen interface with additional Connect tools.

Connect sidebar

The Connect sidebar is the primary interface for Connect Chat and Connect Support. It lists your conversations and provides access to create conversations.

The sidebar is collapsed by default. Click the toggle Connect sidebar icon ( ) in the banner frame to expand or collapse the sidebar, which appears on the right edge of the interface.

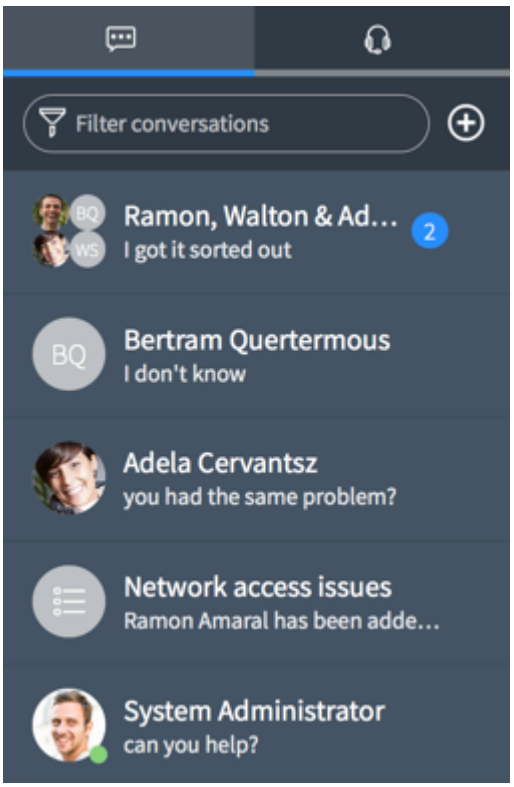
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connect Chat

The chat view of the sidebar is available to all users. If Connect Support is enabled, users must click the chat tab of the sidebar, which is represented by a speech bubble icon. If Connect Support is not enabled, there are no tabs in the sidebar and the chat view displays by default.

The chat view of the sidebar lists all your current Connect Chat conversations. It also contains a filter tool and a button to create conversations.

Chat view of the Connect sidebar



If you have unread messages in a conversation, a number appears by the conversation in the sidebar. Point to a conversation and click the **x** icon to remove the conversation from the sidebar.

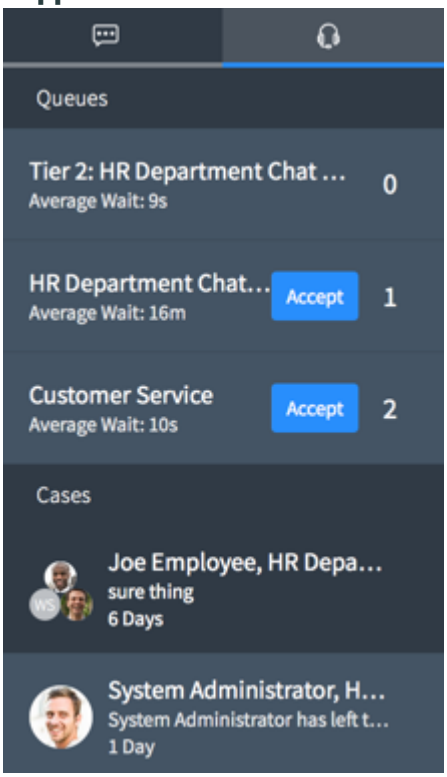
Connect Support

The support view of the sidebar is available when Connect Support is activated. The support view is visible only to users who are agents for at least one support queue. Users must click the support tab of the sidebar, which is represented by a headset icon.

The support view displays **Queues** to which you belong. It also displays your open support conversations under **Cases**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Support view of the Connect sidebar



If you have unread messages in a conversation, a number appears by the conversation in the sidebar.

Connect mini windows

When you open a Connect Chat or Connect Support conversation in the Connect overlay, it opens in a Connect mini window. Each mini window contains a header, a conversation area, and a message field.

Several icons appear in the mini window header and by the message field.

Note:
The icons you see for each conversation depend on the conversation type and other conditions.

Chat mini window icons

Icon	Name	Description
	Add user	Add a user to the conversation. This icon is visible for group and record conversations only. Administrators can enable this icon for Connect Support conversations.
	View document	View the record associated with the conversation. This icon is visible for record and support conversations only.
	New window	Open the conversation in the Connect workspace, a full-screen window with additional Connect tools.
	Collapse/ Expand conversation	Hide or show the conversation. Alternatively, click anywhere in the mini window header to the left of the icons.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Chat mini window icons (continued)

Icon	Name	Description
	Close window	Close the mini window. The conversation remains in the Connect sidebar and the history is preserved when you reopen the conversation. You can also close a mini window by pressing the Escape key.
	Connect actions	Open the Connect actions menu, which contains options like **Transfer** and **Create Incident**. This icon is visible only when Connect actions are available for the conversation. By default, this icon is visible for support conversations only. Administrators can add options to this menu by creating Connect actions.
	Message type	Choose whether messages are added to the associated record as comments or work notes. This icon is visible only for record and support conversations.
	Attach file	Attach and send a file. Select one or more files and click Open. You can also add an attachment by dragging and dropping it directly in the conversation.

Connect workspace

The Connect workspace is a full-screen view of all your Connect Chat and Connect Support conversations in one place. It contains the conversation pane, which displays the conversation header and an expanded version of the mini window, and the conversation tools area.

To open the Connect workspace, navigate to **Collaborate** > **Connect Chat** or click the new window icon ( ) in a Connect mini window. If you do not have any recent conversations, a screen appears with helpful information about Connect.

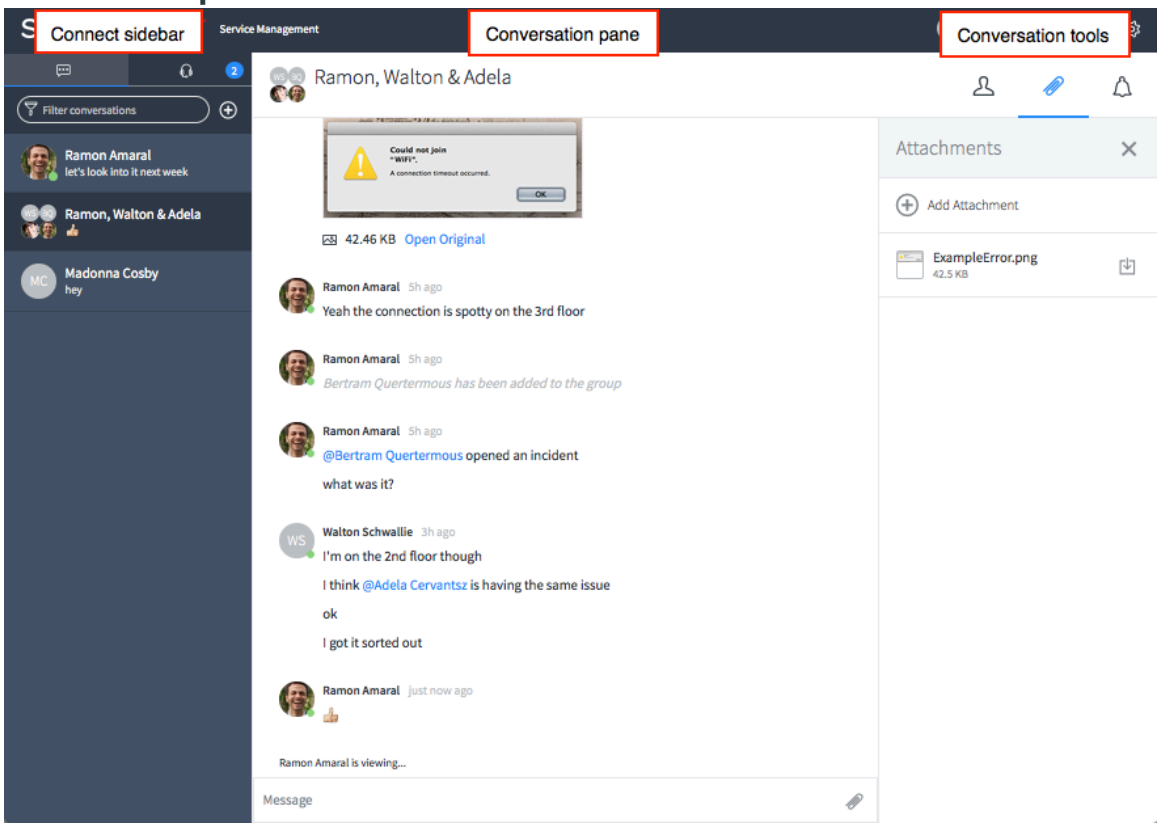
The Connect workspace is composed of the following elements.

Connect workspace elements

Element	Description
Sidebar	Provides access to conversations. The Connect sidebar behaves the same way in the workspace as it does in the Connect overlay. The only difference is that the sidebar appears on the left edge of the Connect workspace. For more information about using the sidebar, see Connect sidebar.
Conversation pane	Displays the currently selected conversation.
Conversation tools	Provides quick access to key information, conversation members, attachments, and notification preferences for the currently selected conversation. Some of the conversation tools vary depending on the type of conversation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connect workspace



Conversation pane

The conversation pane of the Connect workspace displays the conversation header and an expanded version of the mini window.

The header displays basic conversation details like the avatar and name. You can edit these details for group or record conversations.

Below the header, messages appear in chronological order. You can enter messages in the text entry field at the bottom of the window.

Connect conversation tools

The conversation tools area in the Connect workspace contains several tabs, each represented by an icon.

Click an icon to open the tab. Click the same icon again to hide the tab. The tabs you see for each conversation depend on the conversation type and other conditions.

Conversation tool tabs

Tab icon	Tab name	Description
ⓘ	Info	Contains the following sections, each of which appears only if it contains information. • **Record**: Lists details about the record the current conversation follows, such as record number, state, assignee, and short description. The fields displayed in this section vary by the type of record. This section is available only for record conversations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Conversation tool tabs (continued)

Tab icon	Tab name	Description
		• **Related Records**: Lists Visual Task Boards and task records that have been referenced in the conversation, such as incidents, problems, or changes. When you send a record number as a message or drag a record in a conversation, it appears as a link. The list displays the short description for each task. Click a task to open the record in a new browser tab. Only conversation members who have rights to view the tasks can access them. • **Links**: Lists URLs that have been referenced in the conversation. Click a link to open the destination page in a new browser tab. This tab is not available for support conversations.
	Record	Displays a compact form view of a record created from the current conversation, such as an incident. If more than one record has been created from the conversation, there is a separate record tab for each one. These tabs are available only for support conversations.
	Knowledge Base	Displays a compact view of the knowledge homepage. For more information, see Share knowledge in a Connect Support conversation.
	Members	Lists all members of the current conversation. You can add or remove conversation members for group and record conversations.
	Attachments	Lists all attachments in the conversation. Click an attachment to open it. Click **Add Attachment** to upload an attachment.
	Notification preferences	Contains settings to control which notifications you receive for the current conversation. For more information, see Edit which notifications you receive for a conversation.

Enable or disable Connect notifications globally

You can edit your Connect notification settings globally to enable or disable mobile, desktop, email, or audio notifications for all your Connect Chat and Connect Support conversations.

Before you begin

Role required: none

About this task

By default, Connect mobile, email, and audio notifications are enabled globally. You must enable desktop notifications.

An administrator can customize the sound used for audio notifications.

Note:
You receive mobile notifications only if you have installed the ServiceNow mobile app.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the banner frame, click the gear icon ( ) to open the system settings.
2. In the system settings window, click the **Notifications** tab.
3. In Notifications by Category, navigate to **Connect**.
4. Enable or disable Connect mobile, desktop, email, or audio notifications.
5. **Optional:** Configure the following system notifications.
   For more information on how to configure system notifications, see Apply notification conditions.

Notification	Description
Activity Stream @Mention Email	Sends an email alert to a user anytime they get @mentioned in an activity stream
Collaboration Offline Group Message(s)	Sends email to offline users who are members of a group conversation after a certain number of minutes determined by the *collaboration.email_interval* property to limit spam. **Note:** It takes 90 seconds after a user logs out for the system to register that the user is offline. If a message is sent to the user within 90 seconds of them logging out, then the user does not receive the notification.
Collaboration Offline Message Bundle	Sends email to offline users after a certain number of minutes determined by the *collaboration.email_interval* property to limit spam. **Note:** It takes 90 seconds after a user logs out for the system to register that the user is offline. If a message is sent to the user within 90 seconds of them logging out, then the user does not receive the notification.
ConnectMessagePushNotification	Uses a push notification to inform users when there are new messages in a conversation
ConnectNotificationPushNotification	Uses a push notification to inform a user when they have been @Mentioned in a record

What to do next

Edit which notifications you receive for a specific conversation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connect notification browser support

The following browsers support Connect chat notifications.

Connect chat browser support

Browser	Enable notification steps
Chrome	1. From a Chrome window, click the Chrome menu in the upper right corner. 2. Go to **Settings** > **Show advanced settings...** > **Privacy** > **Content settings**. 3. In the Content settings window, from the notifications section, select your notification settings.
Mozilla Firefox (starting with version 44)	Manage browser notification settings using the information icon next to the URL.
Safari (starting with OS X Mavericks)	1. From a Safari window, open **Preferences**. 2. Select the notifications tab. 3. Select **Allow** or **Deny** to control which websites have access to notifications.
Microsoft Edge	Notifications are enabled by default on Windows 10 PCs and tablets starting with EdgeHTML 14. For more information, see https://blogs.windows.com/msedgedev/2016/05/16/web-notifications-microsoft-edge/#pVkwubg7uvROayyl.97.

Note:
Internet Explorer does not support Connect notifications out of box.

Edit which notifications you receive for a conversation

You can control which types of Connect notifications you receive for each conversation and when you receive them.

Before you begin

Role required: none

About this task

Connect can send mobile, desktop, email, and audio notifications to inform you of messages and other activity, when you are not actively viewing Connect. You can edit your notification preferences in each conversation to control which notifications you receive for the conversation and under what circumstances. For example, if you are a member of a large group conversation, you might want to receive mobile, desktop, and email notifications for all activity, and audio notifications only when someone mentions you. You might also want to disable a certain type of notification entirely for a conversation.

By default, you receive mobile, email, and audio notifications for all activity in every conversation you belong to. You must enable desktop notifications manually. Not all browsers allow desktop notifications. For more information, see Enable or disable Connect notifications globally.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

An administrator can customize the sound used for audio notifications.

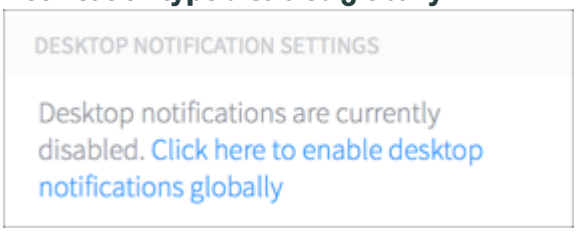
Note:
You receive mobile notifications only if you have installed the ServiceNow mobile app.

Procedure

1. Open a conversation in the Connect workspace.
2. In the conversation tools to the right of the conversation, click the notification settings tab ( ).
3. Edit the following settings according to your preferences.

Note:
If a notification type is disabled globally, a link to enable that type appears. You must click the link before you can edit conversation-specific notification settings.

Notification type disabled globally



Mobile Notification Settings	Choose to receive push notifications: ○ For all activity ○ Only when @ mentioned (this option is not available for direct conversations) ○ Never
Desktop Notification Settings	Choose to receive desktop notifications: ○ For all activity ○ Only when @ mentioned (this option is not available for direct conversations) ○ Never
Email Settings	Choose to receive email notifications: ○ For all activity ○ Only when @ mentioned (this option is not available for direct conversations) ○ Never
Audio Notification Settings	Choose to receive audio notifications: ○ For all activity ○ Only when @ mentioned (this option is not available for direct conversations) ○ Never
System Message Notifications	Enable or disable system message notifications, which are automatically

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

	generated by events like conversation membership changes and Visual Task Board updates. This option is not available for direct conversations.

Upload a profile picture

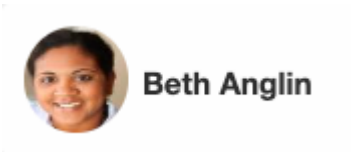
You can upload a profile picture in your Live Feed profile to use as an avatar in Connect Chat and Connect Support conversations.

Before you begin
Role required: none

About this task
Users who do not have profile pictures are represented by an avatar with their initials. Administrators can upload a profile picture in a user record which displays if there is no Live Feed photo.

Procedure

1. Navigate to **All** > **Collaborate** > **Live Feed**.
2. Click the tile with your picture or initials and title.



3. Use one of the following actions to add your photo.
   - Locate the photo file you want to use and drag it over the existing photo.
   - Point to the existing picture (or tap the photo in the smartphone or tablet interface) to display the **Upload a picture** link. Click the link, navigate to the location of the photo you want to use, and click **Open**.

Related topics

Update your Live Feed profile

Drag a file into a Connect conversation

Drag and drop functionality in Connect Chat and Connect Support provides an easy way to share external attachments and links or items from within your instance.

Before you begin
Role required: none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
You can drag several things from within an instance, including items from the application navigator, records or breadcrumbs from lists, and Visual Task Boards from the My Task Boards page.

Procedure

Drag an item in a Connect mini window.

To drag a record from a list, drag the reference icon ( ), the record number, or a reference column value.

Connect accepts the same file extensions as the platform. For more information, see Add and manage attachments.

Share a Visual Task Board in a Connect conversation

You can share a Visual Task Board in a Connect Chat or Connect Support conversation.

Before you begin
Role required: none

Procedure

1. Navigate to **All** > **Self-Service** > **Visual Task Boards**.
2. Drag a task board to a Connect mini window.
   A link to the task board appears in the conversation. The task board is also listed in the conversation tools, which are visible in the Connect workspace. Only conversation members who are members of the board can access it. If you share a task board in a Follow a record in Connect, it appears as a URL in the record activity stream.

Visual Task Boards

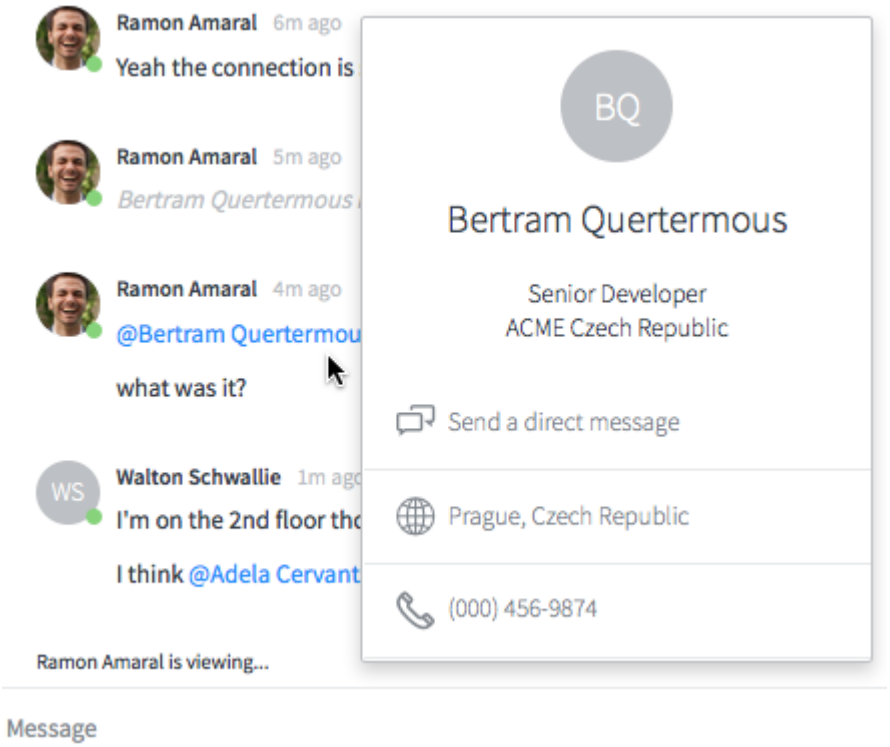
Mention a user in a Connect conversation

You can get someone's attention in a group conversation by mentioning them.

Before you begin
Role required: none

About this task
Users can set their notification preferences so they receive notifications only when they are mentioned. Mentioning a user creates a shortcut to view their basic information and send them a direct message.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Procedure

1. Open a Connect group conversation.
2. In the message field, type the @ character.
   A suggestion menu appears with the names of the conversation members.
3. Select the person you want to mention and send the message.

Connect administration

Administrators can configure various performance settings and features that impact both Connect Chat and Connect Support.

Note:
There are also administrative options specifically for Connect Chat or Connect Support. For more information, see Connect Chat administration and Connect Support administration.

Properties for Connect

The Connect Properties page provides several configuration options for Connect.

Important:

Core UI is required to use Connect Chat. Connect Chat is not supported in Next Experience. If you turn on Next Experience, Connect Chat will no longer work. See Next Experience UI for more information.

Users with the admin role can access these properties by navigating to **Connect** > **Administration** > **Properties**.

Note:
Many of the properties also impact Connect Support.

Properties for Connect

Property	Description
Disable Presence glide.ui.presence.disabled	Turns off user presence globally when enabled. Enabling this property turns off user presence throughout the platform, not just in Connect. • **Type**: true | false • Default value: false • Location: **Connect** > **Administration** > **Properties** • Learn more: User presence
Enable Connect in the frameset collaboration.frameset	Determines whether the Connect overlay is visible (enabled). This property also impacts Connect Support. • **Type**: true | false • Default value: true • Location: **Collaborate** > **Administration** > **Properties** • Learn more: Disable the Connect overlay
Enable Connect to retrieve external link metadata in order to render richer content in messages with links to YouTube, news articles, images, etc. glide.ui.url.external, glide.ui.url.external.content	Enables Connect to render URLs for external sites as links. When this property is disabled, URLs that point anywhere outside the instance appear as plain text. This property also impacts Connect Support. • **Type**: true | false • Default value: true • Location: **Collaborate** > **Administration** > **Properties**
Number of minutes to wait before collecting unread messages and sending an email to offline users. collaboration.email_interval	Sets the number of minutes the system waits before sending a Connect notification email to an inactive user. • **Type**: integer • Default value: 3 • Location: **Collaborate** > **Administration** > **Properties** • Learn more: Configure the email notification interval
Maximum number of latest conversations to show during search. (Default = 50)	Sets the number of results that appear when you search conversations in Connect. In the System Properties [sys_properties] table, this property appears as *connect.search.conversation_limit*.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties for Connect (continued)

Property	Description
	• Type: integer • Default value: 50
Audio file to play to notify users of new messages, support conversation transfers and @mentions in Connect. This property's value should point to the 'name' field of an audio file in the db_audio table. connect.notification.audio_alert	Specifies the audio file to play to notify users of new messages, support conversation transfers, and @mentions in Connect. This property's value must point to the **Name** field of a record in the Audio File [db_audio] table. This property also impacts Connect Support. • **Type**: string • Default value: connect_alert.mp3 • Location: **Collaborate** > **Administration** > **Properties** • Learn more: Customize the Connect audio notification sound
Comma separated allow list of roles able to access Connect. Empty allows all roles. connect.roles	Determines which user roles are required to access Connect. When the value is blank, no role is required. This property also impacts Connect Support. **Note:** If you choose to restrict Connect access to specific roles, consider updating the role requirements for Connect modules and other access points. • **Type** : string • Default value: <empty> • Location: **Collaborate** > **Administration** > **Properties**
Determine whether or not a button is shown in task forms to view the Collaboration document conversation or Live Feed Record Feed related to the task. Note: The Collaboration button will only be enabled if the frameset view is also enabled with collaboration.frameset = true glide.live_feed.task_header_button	Determines whether the show Live Feed icon ( ) and **Follow** button are available in the form header of tables that have the *live_feed=true* dictionary attribute. • **Type**: choice list • Default value: collaboration • Other possible values: ○ **both**: enables both the show Live Feed icon and the **Follow** button. ○ **live_feed**: enables the show Live Feed icon. ○ **none**: disables both the show Live Feed icon and the **Follow** button.

Properties for Connect (continued)

Property	Description
	• Location: **Collaborate** > **Administration** > **Properties** • Learn more: Configure record conversations
Disable the legacy chat "Create or Join Chat Room" link on the Incident form (Must have Chat plugin enabled to see link) glide.connect.enabled	Hides the **Create or Join Chat Room** related link, which appears on the Incident form when legacy chat is enabled. Legacy chat and Connect Chat should not be used concurrently and this property should not be modified. • **Type**: true | false • Default value: true • Location: **Collaborate** > **Administration** > **Properties**

Configure the polling interval

The polling interval determines how frequently the system polls for new Connect messages.

Before you begin

Role required: admin

About this task

The default interval is 10 seconds. You can change this value. The shorter the polling interval, the more frequently the system checks for new messages and the greater the impact on performance.

Note:
This setting impacts Connect Chat and Connect Support.

Procedure

1. Navigate to **sys_properties.list**.
2. Locate the *collaboration.polling_interval* property.
3. Set the **Value** to a different number of seconds.
   Setting the polling interval to a value smaller than 2 is likely to tax the system too heavily, while a value greater than 10 is likely to result in a poor user experience.

Disable the Connect overlay

The Connect overlay is enabled by default and is integrated with the standard user interface. You can disable the Connect overlay.

Before you begin

Role required: admin

About this task

To disable the Connect overlay and remove the toggle Connect sidebar icon from the banner frame, set the *collaboration.frameset* property to **false**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Connect** > **Administration** > **Properties**.
2. Locate the property called **Enable Connect in the frameset** (*collaboration.frameset*) and clear the check box.
3. Click **Save**.

Result

When the frameset is disabled, any Connect chats open in the Connect workspace. For more information on completely disabling Connect Chat, see Disable Connect Chat.

Customize the Connect audio notification sound

You can replace the default Connect audio notification sound with an audio file of your choice.

Before you begin

Role required: admin

Upload the audio file you want to use as the notification sound.

Role required: admin

About this task

The audio notification sound is used for all Connect conversation types, including Connect Support conversations.

Procedure

1. Navigate to **All** > **System UI** > **Audio Files**.
2. Locate the audio file you want to use as the notification sound and copy the **Name** value.
3. Navigate to **Connect** > **Administration** > **Properties**.
4. Locate the property called **Audio file to play to notify users of new messages, support conversation transfers and @mentions in Connect** (*connect.notification.audio_alert*) and replace the default value with the name of the audio file.
5. Click **Save**.

Result

End users receive audio notifications when sending and receiving support chats. Support agents only receive audio notifications for inbound chats when the chat window is not in focus.

Administer Connect actions

You can create or modify Connect actions to provide custom functionality in Connect Chat or Connect Support conversations.

Before you begin

Important:

Core UI is required to use Connect Chat. Connect Chat is not supported in Next Experience. If you turn on Next Experience, Connect Chat will no longer work. See Next Experience UI for more information.

If you want to customize the icon for a Connect action, navigate to **Collaborate** > **Administration** > **Action Icons** to view the available icons and their class names. Note the class name of the icon you want to use.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: admin

About this task

The Connect action menu appears by the message entry field when one or more Connect actions are available for a conversation, based on defined conditions. When a user selects a Connect action, the system runs the script defined for that action.

Procedure

1. Navigate to **Connect** > **Administration** > **Actions**.
2. Click **New** or open an existing record to edit a table.
3. On the form, fill in the fields.

Connect Action form

Field	Description
Condition	JavaScript condition statement that must return true for the action to be available in a conversation. For example, to show the action in Connect Support conversations only, enter `conversation.type === "support"` or `conversation.table === 'chat_queue_entry'`. For information about the *`conversation`* object, see the GlideConversation API reference documentation.
Hint	This field is not used.
Icon Class Name	Class name of the icon to use. To view all available icons and their class names, navigate to **Collaborate** > **Administration** > **Action Icons**.
Order	Order of the action relative to other items in the Connect action menu.
Script	Script to execute when the action is run. For example, to create a new incident that is based on the conversation, enter the following code: `response.newRecord("incident",{ short_description: conversation.document.short_description ||"", caller_id: conversation.document.opened_by });` For information about the *`response`* object, see the ConnectActionResponse API reference documentation. **Note:** You can only create a Connect action that is based on a task table.
Shortcut	Text that triggers the action when entered after the "/" character in a conversation.
Title	Text that appears in the Connect action menu. The title for each Connect action should be unique.

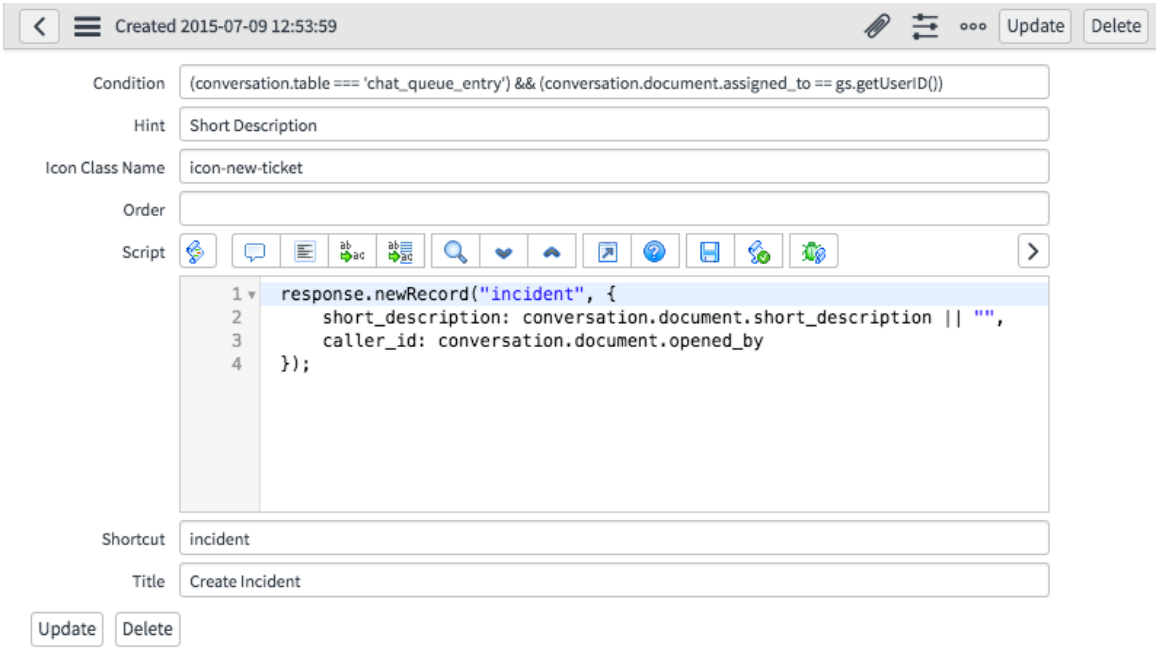
Result

Connect Actions form



Configure the fields on a record card in Connect

When a record is either linked to or created from a Connect Chat conversation, the details of the record display as a card in the chat window.

Before you begin

Role required: admin

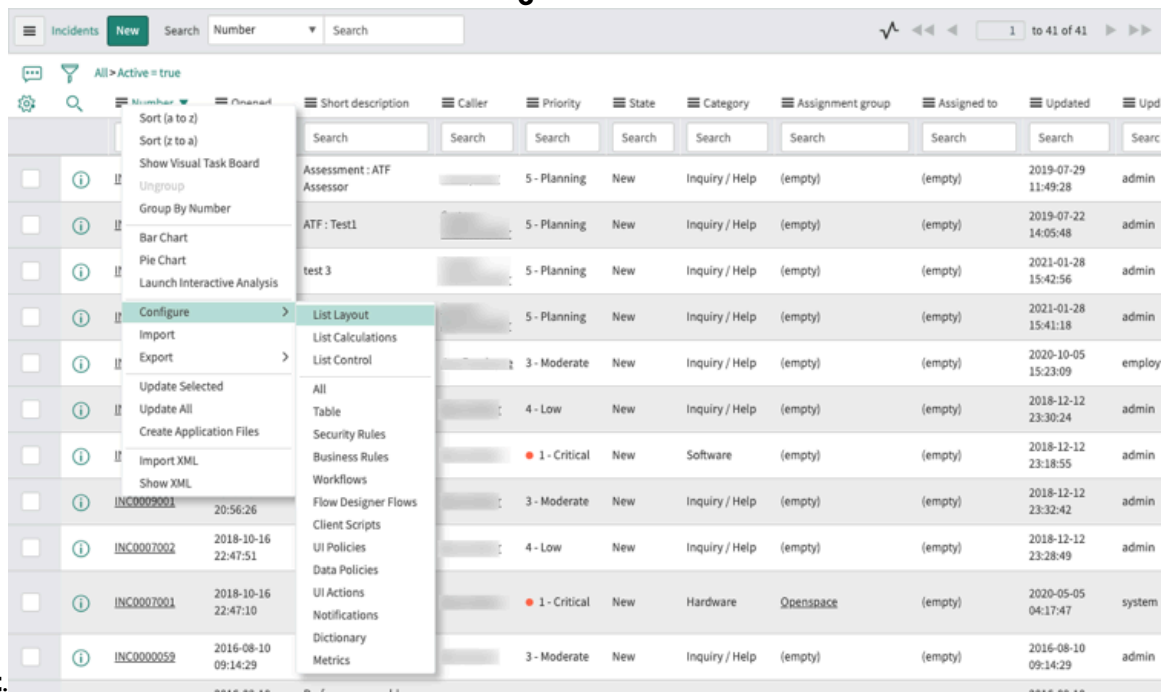
About this task

The card view only applies to the full Connect Chat page and the end-user view of Connect Support conversations.

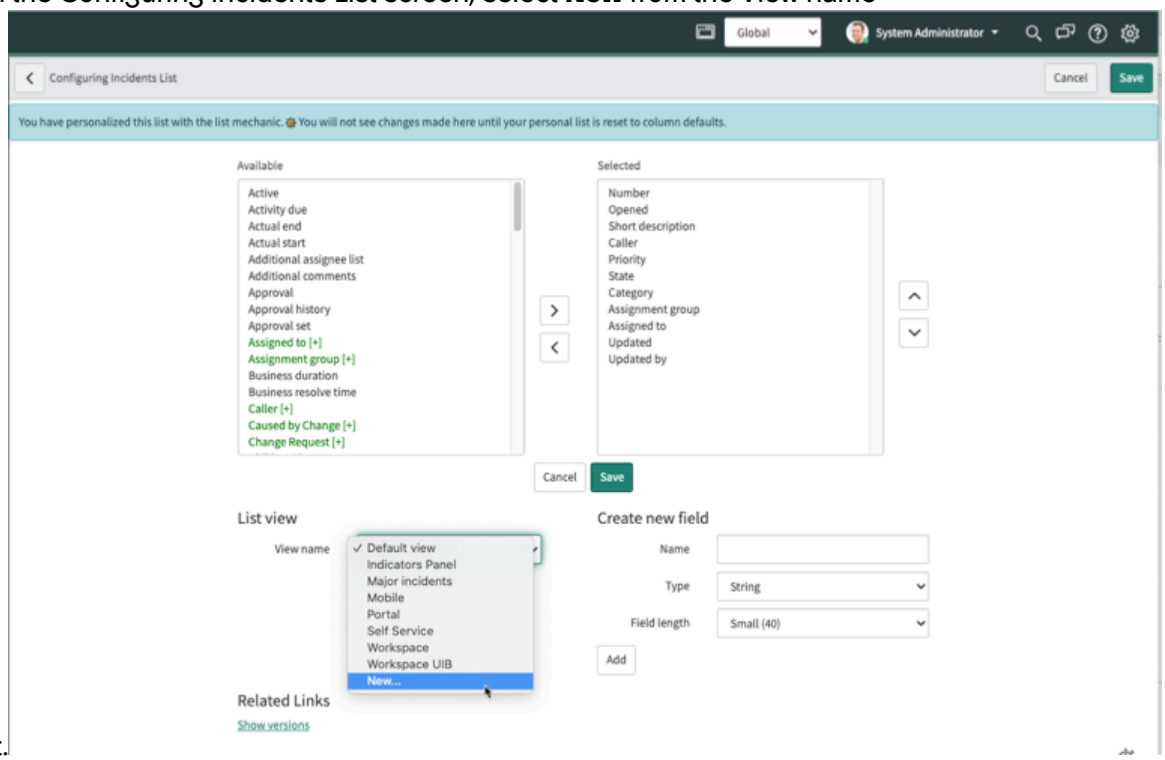
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

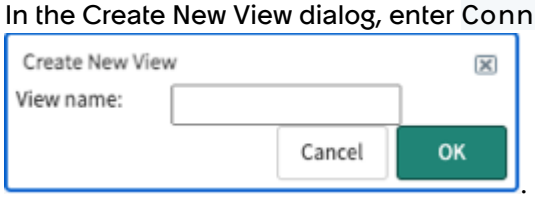
1. Select the menu icon (☰) on any of the column names of the incident list view.
2. Right-click on the column name and select **Configure** > **List Layout**.



3. On the Configuring Incidents List screen, select **New** from the View name list.



4. In the Create New View dialog, enter `Connect` in the View name field.

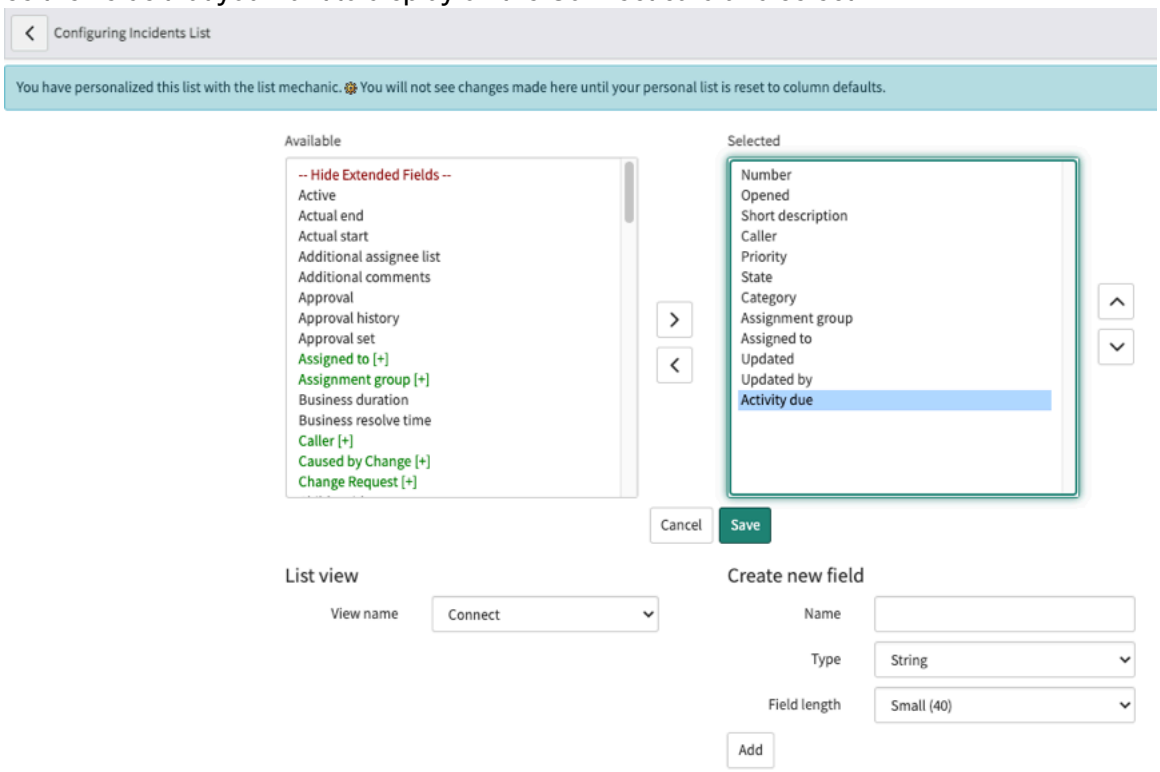


For more information on creating a form view, see Create and delete views .

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You cannot remove the Author or the Updated fields from the card regardless of whether they are on the view or not. The card always shows the Short Description field in the top even if it is in a different order in the list.

5. Choose the fields that you want to display on the Connect card and select



Save.

6. Validate that the card displays the fields in a Connect Chat conversation.

Disable specific URLs for Connect

Prevent users from accessing certain websites by disabling linking to specific Top-Level Domains (TLDs).

Before you begin

Role required: admin

Procedure

1. In the navigation filter, type `sys_properties.list`.
2. Search for the *`glide.ui.url.external.top_level_domains`* system property.
3. In the value field, remove any TLDs that you do not want your users to have access to.
   For example, remove any TLDs that are commonly used for restricted websites, such as `xxx` or `adult`.

   The list of TLDs is based on the top 200 most common domains.

Result

Any TLD not included in the value field becomes unclickable in Connect.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connect Chat

Connect Chat is a real-time messaging tool that enables users to chat with individuals and groups, quickly share files, and collaborate on any record by connecting with the right people instantly.

Important:

Connect Chat is not available in Next Experience. Starting with Yokohama, certain Connect Chat functions are available in Next Experience by using Sidebar. See KB1123615 – Moving from Connect Chat to Sidebar or Next Experience for more information about the differences between Connect Chat and Sidebar.

Connect Chat animates communication around records, Visual Task Boards, topics of interest, or groups of people.

Features include:

- Direct conversations between two users.
- Group conversations between three or more users.
- Conversations linked to records. Comments and work notes appear in conversations in real time and users can update the record directly from the conversation.
- Drag-and-drop sharing of links, files, and records.

Core UI is required to use Connect Chat.

This video demonstrates how to use Connect Chat.

How to use Connect Chat

This video demonstrates how to use Connect Support.

How to use Connect Support

Note:
Connect Chat does not replace legacy chat but offers some of the same functionality. The features should not be used concurrently.

Connect Chat use

All users have access to Connect Chat, a convenient way to stay updated on all the people and documents you work with in a familiar chat interface.

You can start using Connect Chat right away with virtually no setup. Connect Chat supports a few different types of conversations so you can use it as a social tool or a quick way to follow specific records.

Start a direct or group conversation

You can start a conversation with one or more users in Connect Chat.

Before you begin

Important:

Core UI is required to use Connect Chat. Connect Chat is not supported in Next Experience. If you turn on Next Experience, Connect Chat will no longer work. See Next Experience UI for more information.

Role required: none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

A conversation between two users is called a direct conversation. A conversation between three or more users is called a group conversation.

Procedure

1. In the chat view of the Connect sidebar, click the plus icon (**+**) by the filter.
   A Connect mini window appears.
2. In the **To** field, enter the name of the user you want to chat with.
   Suggestions appear as you type.
3. **Optional:** Enter additional names to create a group conversation.
   You can add or remove group conversation members later. You cannot add members to a direct conversation after you create it.
4. Press the Enter key to shift focus to the message field.
5. Send a message to create the conversation.
   The conversation is added to the Connect sidebar for quick access.

Follow a record in Connect

You can follow a record in Connect Chat to track activity as it happens, in a familiar chat interface. When you follow a record, you become a member of a record conversation.

Before you begin

Important:

Core UI is required to use Connect Chat. Connect Chat is not supported in Next Experience. If you turn on Next Experience, Connect Chat will no longer work. See Next Experience UI for more information.

Role required: whichever role is required to access the record you want to follow in Connect

About this task

You must first activate the Connect (com.glide.connect) plugin to complete this task.

Any record conversation you create in Connect becomes a record feed in Live Feed, and vice versa. Unlike direct or group conversations, all messages in record conversations are comments or work notes.

Note:
By default, record conversations are enabled for all tables that extend Task [task]. Administrators can enable record conversations for additional tables or disable them if desired.

Procedure

1. Navigate to a task record.
2. Do one of the following actions.

Option	Description
Follow the record	In the form header, click **Follow**. The system adds you as a member of the record conversation, but does not open the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	conversation. You can open the conversation from the Connect sidebar.
Follow the record and open a chat mini win dow	**a.** In the form header, click the down arrow in the **Follow** button. **b.** Select **Open Connect Mini**. The system adds you as a member of the record conversation and opens it in a Con nect mini window.
Follow the record and open the Connect workspace	**a.** In the form header, click the down arrow in the **Follow** button. **b.** Select **Open Connect Full**. The system adds you as a member of the record conversation and opens it in the Con nect workspace, the full-screen view.

The **Follow** button is relabeled **Following**.

3. Add comments or work notes to the record directly from Connect.
   Any comments or work notes added to the record appear in the record conversation. Likewise, comments and work notes you add to the conversation appear on the record.
   a. In the record conversation, by the text entry field, click the message type icon ( ).
   b. Select **Comment** or **Work Note**.
   c. Enter a message.
   By default, record conversation messages are added as work notes.

Note:
If you add an attachment to a record conversation, it is attached to the underlying record as well.

What to do next
Edit your notification settings for the record conversation.

Live Feed Core UI

Edit basic conversation details

In Connect Chat, you can customize the avatar, name, and description for a group or record conversation.

Before you begin
Role required: none

About this task
These details are not editable for direct conversations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The name and description for a record conversation default to the record name and short description. However, editing the name or description for a record conversation does not change anything on the underlying record.

Procedure

1. Open the a group or record conversation in the Connect workspace.
2. Click anywhere in the conversation header to the left of the icons.
   A pop-up appears to edit conversation details.
3. Edit the conversation image, name, and description as needed.
4. Click **Save**.

Add or remove conversation members

In Connect Chat, any member of a group or record conversation can add or remove other conversation members. In a direct conversation with only two people, you cannot add members to the conversation after you create it.

Before you begin
Role required: none

Procedure

1. Open a group or record conversation in the Connect workspace.
2. In the conversation tools to the right of the conversation pane, click the member list tab ( ).
3. Do one of the following actions.

Option	Description
Add a member	**a.** Click **Add Member to Group**. **b.** Use the search field to find and select a user.
Remove a member	**a.** Point to a member name. **b.** Click the minus icon (**-**).

Create a Connect conversation from a Visual Task Board

Create a Connect Chat conversation from a Visual Task Board to collaborate with board members and keep track of activity as it happens.

Before you begin
Role required: none

About this task
When you create a conversation from a task board, all the board members become members of the conversation. The members are synchronized between the task board and the conversation. For example, if you remove a user from the conversation, the system automatically removes the user from the board as well.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Self-Service** > **Visual Task Boards**.
2. Open a task board.
3. In the board header, click the connect with board members icon ( ).
   The system automatically opens a record conversation for the board. Each board member becomes a member of the conversation.

Connect Chat administration

Administrators can configure various performance settings and features of Connect Chat.

Note:
There are also settings that apply to both Connect Chat and Connect Support. For more information, see Connect administration.

Configure the email notification interval

The email notification interval determines how long the system waits before sending a Connect Chat email notification to an inactive user.

Before you begin
Role required: admin

About this task
The default interval is 3 minutes. You can change this value.

Procedure

1. Navigate to **All** > **Connect** > **Administration** > **Properties**.
2. Locate the property called **Number of minutes to wait before collecting unread messages and sending an email to offline users.** (*collaboration.email_interval*) and set the value to a different number of minutes.
3. Click **Save**.

Result
When an offline user is sent a Connect message, the collaboration.new_offline_message event fires. The system waits the amount of time provided in the collaboration.email_interval property, then triggers the collaboration.notify_offline_user and collaboration.notify_offline_user.group events (depending on if the conversation was peer to peer or a group conversation).The sysevent_email_action record listens for collaboration.notify_offline_user(.group) then builds an email notification containing all the messages from the last collaboration.email_interval minutes that the user has received in that conversation.

Enable record conversations for a table

Record conversations are enabled for all tables that extend Task [task] by default. You can configure record conversations for additional tables that extend Task.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

To create record conversations, users must have access to the **Follow** button in the form header. To show the button and thus enable record conversations for a table, the following conditions must be true.

- The *live_feed* dictionary attribute must be set to **true** for the table. By default, *live_feed=true* for all tables that extend Task [task].
- The *glide.live_feed.task_header_button* property must be set to **both** or **collaboration**. By default, *glide.live_feed.task_header_button* is set to **collaboration**.

Procedure

1. Navigate to the list view of a table for which you want to enable record conversations.
2. Perform the appropriate action for the list version.
   The list of dictionary entries for the table appears.
3. Open the dictionary entry that has **Type** set to **Collection**.
   The Dictionary Entry form appears.
4. In the **Attributes** related list, click **New**.
   The Dictionary Attribute form appears.
5. In the **Attribute** field, enter `Live feed`.
6. In the **Value** field, enter `true`.
7. Click **Submit**.
8. Navigate to **Collaborate** > **Administration** > **Properties**.
9. Locate the property called **Determine whether or not a button is shown in task forms to view the Collaboration document conversation or Live Feed Record Feed related to the task** (*glide.live_feed.task_header_button*).
10. Ensure the property is set to **both** or **collaboration**.
    The *glide.live_feed.task_header_button* property also controls whether the show Live Feed icon ( ) appears. If the property is set to **collaboration**, the show Live Feed icon does not appear on form headers.

Prevent users from following records in Connect for all tables

Users can follow records in Connect for any table that extends Task [task] by default. You can disable this functionality for all tables.

Before you begin

Role required: admin

About this task

To disable record conversations for all tables, prevent the **Follow** button from appearing in all form headers by editing the *glide.live_feed.task_header_button* property.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **sys_properties.list**.
2. Locate the *glide.live_feed.task_header_button* property.
3. Set the **Value** to **live_feed**.

Prevent users from following records in Connect for a specific table

Users can follow records in Connect for any table that extends Task [task] by default. You can disable this functionality for a specific table.

Before you begin
Role required: admin

About this task
To disable record conversations for a specific table, prevent the **Follow** button from appearing in form headers for the table. To do so, set the *live_feed* dictionary attribute to **false** for the table.

Procedure

1. Navigate to the list view of a table for which you want to disable record conversations.
2. Perform the appropriate action for the list version.
   The list of dictionary entries for the table appears.
3. Open the dictionary entry that has **Type** set to **Collection**.
   The Dictionary Entry form appears.
4. In the **Attributes** related list, locate the **Live feed** dictionary attribute.
5. Set the **Value** to **false**.

   Setting the dictionary attribute to **false** also removes the show Live Feed icon ( ) for the table.

Disable Connect Chat

You can disable Connect Chat to prevent users from being able to chat within the platform.

Before you begin
Role required: admin

About this task
Disabling Connect Chat hides the Connect Chat sidebar icon. Users who try to access Connect Chat from the navigation pane receive a message that says Connect has been disabled.

Procedure

1. In the navigation filter, type `sys_properties.list` and press Enter.
2. Search for the *glide.connect.chat.disabled* property.
3. Set the property value to **true**.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connect Support

Connect Support is a real-time messaging tool that enables support agents to easily track their support cases, find solutions, and resolve problems quickly.

Important:

Starting in Utah, Connect Support has been deprecated and is no longer supported or available for new activation. For similar capabilities, please move to Advanced Work Assignment and Agent Chat. For details, see Move from Connect Support to Advanced Work Assignment and Agent Chat.

Connect Support builds on the messaging platform provided with Connect. For general information about the Connect interface, setup, and administration, see Connect. When Connect Support is enabled, users designated as support agents can access the support tab of the Connect sidebar.

Using Connect Support:

- Administrators can create chat queues and enable users to access live support.
- Support agents can monitor the queues to provide instant support.
- Users can share links, files, and records using drag-and-drop.

Core UI is required to use Connect Support.

Note:
Connect Support does not replace legacy chat but offers some of the same functionality. Do not use the features concurrently.

Monitor incoming Connect Support conversations

In the support tab of the Connect sidebar, you can monitor the queues for which you are an agent and accept incoming conversations.

Before you begin
Role required: none

About this task

Note:
The support tab is visible only if you are an agent for one or more queues.

Procedure

1. Navigate to **All** > **Connect** > **Connect Support**.
   The Connect workspace opens in a new tab.
2. Click the support tab of the Connect sidebar, indicated by a headset icon ( ).
   The support tab displays **Queues** to which you belong. It also displays your open support conversations under **Cases**. When a user starts a support conversation or an agent transfers a conversation to a queue, any agent who belongs to the associated queue can accept the conversation. An agent can also request to transfer a conversation directly to you.

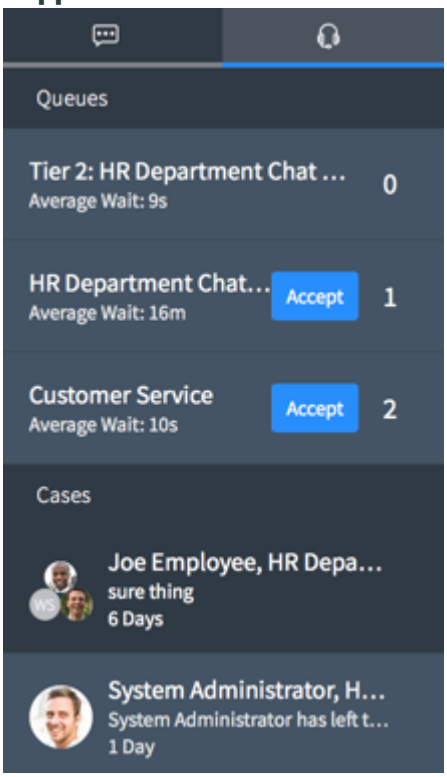
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Support tab of Connect sidebar



3. Accept a conversation in one of the following ways.

Option	Description
Accept a conversation from a queue	Under **Queues**, click **Accept** by the queue. The conversation opens in the conversation pane and an entry appears in the **Cases** section of the sidebar.
Accept a transfer request	Under **Cases**, click **Accept** by a transfer request. **Transfer request**  The conversation opens in the conversation pane. The agent who transferred the conversation can stay in the conversation.

4. Respond to the user and help resolve the issue.
   By default, your messages are added to the conversation record as comments and are visible to the user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. **Optional:** Initiate a Zoom meeting to help resolve customer issues faster.
   For more information, see Initiate Zoom meetings from chats.

Share knowledge in a Connect Support conversation

The support view of the Connect workspace has a built-in knowledge tool that makes it easy to search for knowledge articles and share them in a conversation.

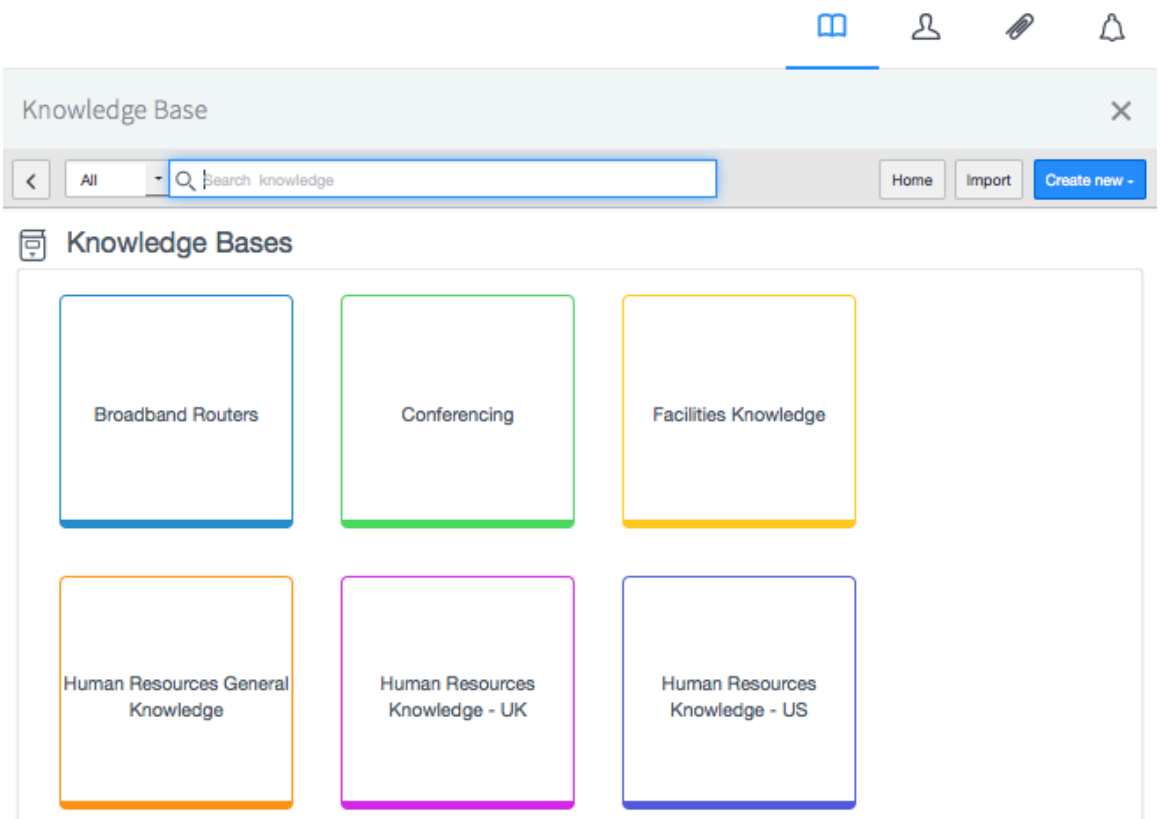
Before you begin
Role required: none

About this task
Use the knowledge tool to research user questions and provide solutions quickly and easily.

Procedure

1. Open a support conversation in the Connect workspace.
   The knowledge tool is not available in Connect mini windows.
2. In the conversation tools area to the right of the conversation pane, click the knowledge base tab, which is represented by an open book icon.

   The knowledge homepage appears in the conversation tools pane.



3. Search for articles related to the user's issue.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information about finding knowledge, see Search using Knowledge Management v3.

4. To share an article in the conversation, drag a knowledge article link to the conversation pane and drop it anywhere in the drop zone that appears.

Transfer a Connect Support conversation to a different agent or queue

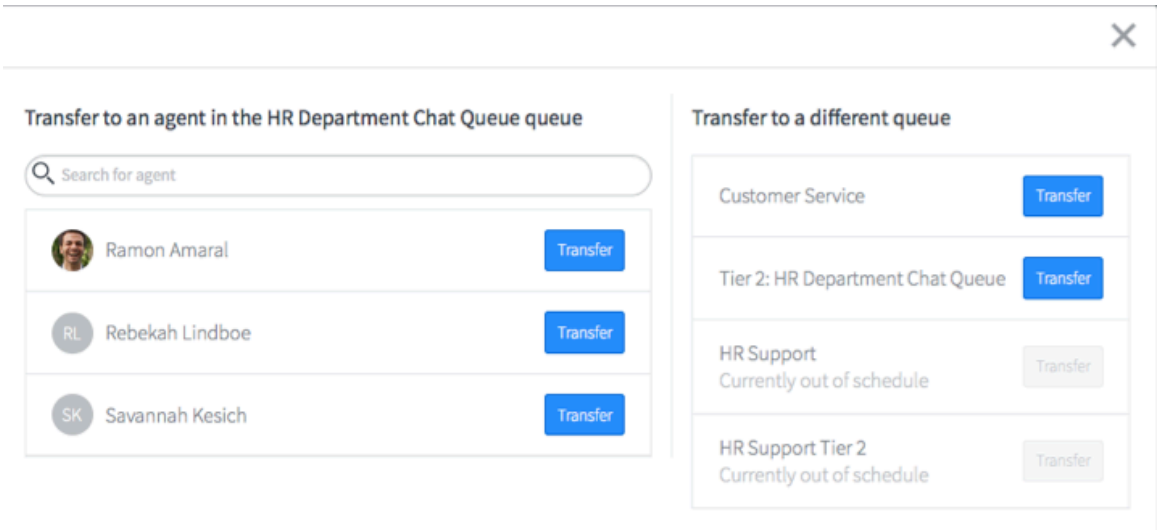
You can transfer a Connect Support conversation to a different agent in the queue or to a different queue.

Before you begin

Role required: none

Procedure

1. Open a Connect Support conversation.
2. At the bottom of the conversation, click the menu icon ( ) to open the Connect actions menu.
3. In the Connect actions menu, select **Transfer**.
   A transfer dialog box opens.



4. Do one of the following actions.

Option	Description
Transfer the conversation to an agent	**a.** To start the transfer request, click **Transfer** by an agent's name. Be sure to choose an agent who is online. A green dot on their avatar indicates that a user is online. You can cancel the transfer any time before it is accepted.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	 **b.** When the transfer is accepted, select one of the following options in the dialog box that appears. ▪ Stay: Remain in the conversation, which is also known as a warm transfer. This option is ideal if you want to provide the new agent with background information or introduce the user to the new agent. ▪ Leave: Exit the conversation, which is al so known as a cold transfer.
Transfer the conversation to a queue	Click **Transfer** by a queue. The system automatically removes you from the conversation and the conversation enters the queue you selected.

Add a user to a Connect Support conversation

You can add additional users to a Connect Support conversation.

Before you begin

An administrator must enable the *glide.connect.support.add_members* property before users can be added to conversations.

Role required: none

Procedure

1. Open a group or record conversation in the Connect workspace.
2. In the conversation tools to the right of the conversation pane, click the member list tab ( ).
3. Do one of the following actions.

Option	Description
Add a member	**a.** Click **Add Member to Group**. **b.** Use the search field to find and select a user.
Remove a member	**a.** Point to a member name. **b.** Click the minus icon (**-**).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	The assigned support agent cannot be re moved from a Connect Support conversation.

Note:
Only the assigned support agent can create an incident from the Connect Support conversation.

Escalate a Connect Support conversation

If an escalation path is defined for a Connect Support conversation, you can use a shortcut to escalate a Connect Support conversation to a different queue.

Before you begin

Define an escalation path for the queue, using the **Escalate to** field on the Chat Queue [chat_queue] table. For more information, see Administer Connect Support queues.

Procedure

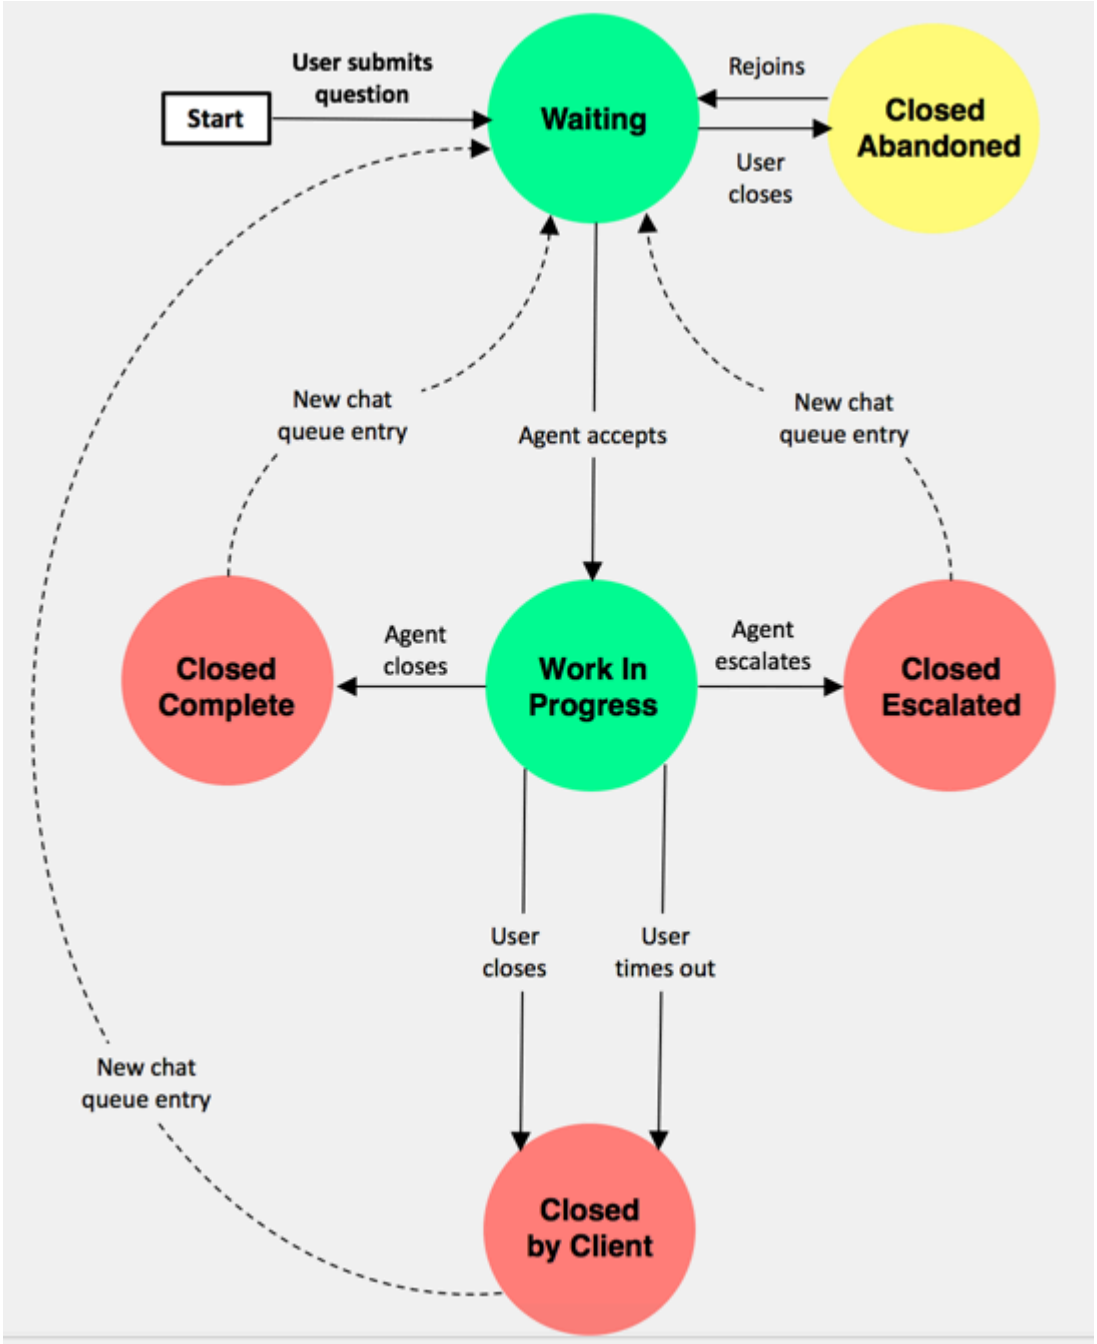
1. Open a Connect Support conversation.
2. At the bottom of the conversation, click the menu icon ( ) to open the Connect actions menu.
3. In the Connect actions menu, select **Escalate**.
   A confirmation dialog box appears.
4. In the dialog box, click **Escalate**.
   The system automatically removes you from the conversation and the conversation enters the escalated queue.

Connect Support chat states

Connect Support chats move through specific states.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connect Support states diagram



Connect Support chat states

Composite state	State	Definition
Active	Waiting	• Requester/end user enters a queue by sending a message. Agent has not yet accepted it. • Requester/end user rejoins a session that is in a Reopenable state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connect Support chat states (continued)

Composite state	State	Definition
	Work in Progress	• Agent accepts a chat from a queue. Both requester and agent engage in a chat session. • Requester/end user temporarily leaves an ongoing conversation; requester or agent does not end the session; requester rejoins session.
Reopenable	Closed Abandoned	Requester/end user clicks **End Chat** button before agent accepts the request.
Permanently closed	Closed by Client	• Requester/end user clicks **End Chat** button after agent accepts the request. • Requester/end user times out.
	Closed Escalated	Agent escalates an ongoing conversation by performing the Escalate action from the menu icon.
	Closed Complete	• Agent ends the session. • During a chat, if an agent creates an incident or case and closes it, the chat session closes automatically.

Connect Support administration

Administrators can configure various performance settings and features of Connect Support.

Note:
There are also settings that apply to both Connect Chat and Connect Support. For more information, see Connect administration.

Migrate from legacy chat to Connect Support

Connect Support is an extension of Connect. Users designated as support agents have access to the support tab of the connect sidebar. Do not use Connect Support concurrently with legacy chat.

Before you begin

Role required: admin

Before you activate Connect Support, inform your support agents to close out any existing chats.

Legacy chat uses a different field to determine which state a help desk chat is in. A fix script is included in the Connect Support plugin that circumvents this issue by closing out any existing help desk chat sessions. Manually closing out any existing chats before allowing this script to run helps prevent any loss of chat information.

If you do not close out existing help desk chats, your metrics and chat queue will not work accurately.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Activate the Connect Support plugin.
   When you activate the Connect Support plugin, the *glide.connect.support.enabled* property redirects the legacy chat URL to Connect Support.

   For more information, see Activate Connect Support.

2. Hide the Social IT application.
   Activating Connect Support does not completely eliminate the legacy chat module. To prevent users from using the legacy chat, hide the Social IT application menu. For more information, see Enable or disable an application menu or module .

Properties for Connect Support

The Connect Support Properties page provides several configuration options specifically for Connect Support.

Important:

Starting with Utah, Connect Support has been deprecated. For similar capabilities, please move to Advanced Work Assignment and Agent Chat. For details, see Move from Connect Support to Advanced Work Assignment and Agent Chat.

These properties are available for Connect Support.

Properties for Connect Support

Users with the admin role can access these properties by navigating to Connect > Support Administration > Properties.

Note:
The Connect Properties page contains many general Connect properties that impact Connect Support.

Property	Description
Should Connect be used for handling chat queue entries glide.connect.support.enabled	Disables or enables Connect Support. When the property is enabled, the **Service Desk Chat** button in the Employee Self-Service portal opens the conversation in Connect Support, rather than legacy chat. Additionally, the Support tab appears in the Connect sidebar. • **Type**: true | false • Default value: true • Location: **Collaborate** > **Support Administration** > **Properties**
Number of support conversations an individual agent can have at one time (-1 is unlimited) connect.support.conversation_limit	Determines how many support conversations an individual agent can have at one time. When the value is set to **-1**, an agent can

(continued)

Property	Description
	participate in an unlimited number of conversations. • **Type**: integer • Default value: -1 • Location: **Collaborate** > **Support Administration** > **Properties**
Show agent avatar in Connect Support conversations. connect.support.show_agent_avatar	Determines whether an agent's avatar is shown in a support conversation (enabled). When the property is disabled, users see the agent's name only. • **Type**: true | false • Default value: true • Location: **Collaborate** > **Support Administration** > **Properties**
Number of seconds to wait (without user interaction), before presenting end users with an idle countdown timer connect.support.idle.delay	Determines how many seconds a user must be inactive in a support conversation before an idle countdown timer appears. • **Type**: integer • Default value: 120 • Location: **Collaborate** > **Support Administration** > **Properties**
Number of seconds to count down from before marking end user as having left their support session connect.support.idle.count_down	Determines how many seconds the idle countdown timer remains open after it appears. If the idle user does not dismiss the timer before the countdown completes, the system closes the support session. • **Type**: integer • Default value: 60 • Location: **Collaborate** > **Support Administration** > **Properties**

Users with the admin role can access these properties by navigating to Connect > Support Administration > Properties.

Note:
The Connect Properties page contains many general Connect properties that impact Connect Support.

(continued)

Property	Description
Limits the number of closed conversations that the support user can see. (0 = unlimited) connect.support.user.closed.conversation_limit	Determines how many closed conversations appear in a user's support conversation history. When the value is set to **0**, all previous conversations appear in the history. • **Type**: integer • Default value: 0 • Location: **Collaborate** > **Support Administration** > **Properties**

Administer Connect Support queues

You can define the support agents, default messages, schedule, and escalation path for each Connect Support queue.

Before you begin
Role required: admin

About this task

Note:
Both Connect Support queues and legacy chat queues are stored on the Chat Queue [chat_queue] table. Do not use Connect and legacy chat concurrently.

Procedure

1. Navigate to **All** > **Connect** > **Queues**.
2. Click **New** or open an existing queue from the list.
3. Complete the Chat Queue form, as appropriate.

Chat Queue form

Field	Description
Name	Name of the queue.
Active	Not used in Connect.
Assignment group	User group that contains the support staff for the queue. Any user in the group can view the queue in the Connect sidebar and accept chats. No other users can access the queue. This field must be populated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Average wait time	Average time it takes for an agent to accept a chat in the queue. This value is automatically calculated. Do not manually edit.
Confirm problem	Not used in Connect.
Escalate to	Different queue to which an agent can escalate a chat. For example, there is a queue for high priority support chats. When a queue is defined in this field, agents can access the **Escalate** option in conversations.
Initial agent response	Message that users see when an agent accepts their chat. For example, **Thank you for contacting support. We are looking into your question now and will be with you shortly.**
Not available	Message that users see when they attempt to start a chat outside the defined queue **Schedule**. You can use HTML to format the message and include links or media.
Question	Initial phrase that users see when they start a new chat in the queue. For example, **How can I help you?**
Schedule	Schedule that defines when the queue is available. Leave the field blank to make the queue available all the time. Users cannot start a new conversation in the queue outside the schedule hours.

4. Manage the HR chat queue

Make a Connect Support queue accessible to end users

To make a Connect Support queue accessible to end users, use the accepted URL format.

Before you begin

Create a queue. Create agents for the queue by assigning users to the assignment group associated with the queue.
Role required: admin

About this task

For example, you might create a module or add a link to a portal. The accepted URL format is `https://<instancename>.service-now.com/$chat_support.do?queueID=<sys_id>`.

Procedure

1. Navigate to **All** > **Connect** > **Administration** > **Queues**.
2. Right-click the name of the queue to which you want to link.
3. In the context menu, select **Copy sys_id**.
4. Follow browser instructions to copy the sys_id if browser security measures restrict this function.
5. Preview the support queue by navigating to `https://<instancename>.service-now.com/$chat_support.do?queueID=<sys_id>`.
6. Create a module or other link to the queue using the URL.

© 2026 ServiceNow, Inc. All rights reserved.

Add a scripted extension point for Connect Support chats

Implement the `ConversationServerInteractionService` extension point, which enables you to create custom scripts that use context variables from pre-chat surveys presented to requesters in the Agent Chat client.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Extension Points** > **Scripted Extension Points** and select the `ConversationServerInteractionService` scripted extension point.
2. Click the **Create implementation** related link to create a new custom script include.
3. In the Script Include form, create the code that uses the pre-chat context variables to route chats to the appropriate Connect Support queue.
4. Click **Update**.

Result

The custom script is created and registered against the `ConversationServerInteractionService` scripted extension point.

Connect Support metrics

Optional plugins provide a homepage and Performance Analytics dashboards, which contain helpful Connect Support metrics.

The reporting homepage is ideal for support managers who want a simple solution to track the recent performance of the support organization. The Performance Analytics dashboards provide a more full-featured solution for support managers who want to analyze trends over time.

Users with the admin role can activate the following plugins to use these features.

Connect Support homepage and dashboard plugins

Plugin	Description
Connect Support Manager's Dashboard [com.glide.connect.managers_dashboard]	Provides a homepage for Connect Support, and all required configuration records. Though the plugin name contains the term dashboard, the plugin does not provide functionality related to Performance Analytics dashboards. Homepages are similar to dashboards, but do not require Performance Analytics roles to view.
Performance Analytics - Content Pack - Service Desk Chat [com.snc.pa.chat]	Provides the **Service Desk Chat Monitor** dashboard, which analyzes key Connect Support metrics and indicators.
Performance Analytics - Context Sensitive Analytics for Chat [com.snc.pa.chat.context_sensitive_analytics]	Provides in-form analytics for Connect Support. These analytics are available as a related link on the Chat Queue Entry [chat_queue_entry] form, and also as the **Context Sensitive Analytics - Chat** dashboard.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
For more information about these plugins, including which other plugins they activate, see Additional plugins for Connect Support.

Related topics

Performance Analytics concepts

Use the Connect Support homepage

Use the Connect Support homepage to view key indicators and metrics related to support conversations, queues, and agents.

Before you begin
Activate the Connect Support Manager's Dashboard plugin (com.glide.connect.managers_dashboard) to view this homepage.
Role required: chat_admin

About this task
The homepage is called **Service Desk - Chat**.

Procedure

1. Navigate to **All** > **Connect** > **Support Administration** > **Reporting Dashboard**.

   Note:
   Though the module name contains the term dashboard, the module does not provide functionality related to Performance Analytics dashboards. Homepages are similar to dashboards, but do not require Performance Analytics roles to view.

   The Connect Support homepage, which is called **Service Desk - Chat**, opens.
2. Click a widget to drill down into its data.

Use the Connect Support dashboards

Use the Connect Support dashboards in Performance Analytics to understand trends in your support organization's performance over time.

Before you begin
Activate one or both of the following plugins, according to your analytics needs:

- Performance Analytics - Content Pack - Service Desk Chat (com.snc.pa.chat)
- Performance Analytics - Context Sensitive Analytics for Chat (com.snc.pa.chat.context_sensitive_analytics)

Role required: both chat_admin and pa_viewer

About this task
The Performance Analytics - Content Pack - Service Desk Chat plugin (com.snc.pa.chat) includes the **Service Desk Chat Monitor** dashboard, which contains the following tabs:

- **Chat Monitor By State**: Contains metrics related to closed support conversations.
- **Overview**: Contains several metrics related to support conversations, queues, and agents.
- **KPI Process**: Contains metrics that are key performance indicators (KPIs) of the Connect Support process, including the average queue response time, the average duration of support conversations, and the number of new support conversations per day.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Performance Analytics - Context Sensitive Analytics for Chat plugin (com.snc.pa.chat.context_sensitive_analytics) includes the **Context Sensitive Analytics - Chat** dashboard. The dashboard contains additional metrics related to support queues, including the number of support conversations closed.

Note:
You must license Performance Analytics to collect scores for the indicators on the dashboards. Without Performance Analytics premium, the dashboards display the indicators with no data.

Procedure

1. Navigate to **All** > **Performance Analytics** > **Dashboards**.
   The last dashboard you viewed opens.
2. In the dashboard picker, under the **Connect Chat** group, select the dashboard you want to view.
3. View the indicators.

Configure the add support users property

To enable support agents to add users to a Connect Support conversation, add the *glide.connect.support.add_members* property.

Before you begin
Role required: admin

Warning:
Enabling the *glide.connect.support.add_members* property can negatively impact instance performance if there are large numbers of users logged in to the instance.

About this task
When the *glide.connect.support.add_members* property is added and enabled, support agents can add users to a support conversation. Any added user can also add other users. Only the assigned agent can create an incident from the chat. When non-support agents are added to a chat, the chat appears in their chat tab.

Note:
Make sure you are in the Global scope when adding this property.

Procedure

1. Enter `sys_properties.list` in the navigation filter.
   The entire list of properties in the System Properties [sys_properties] table appears.
2. Verify that the property does not exist by searching for the property name.
   If the property does exist, update the property with the information in the following table.
3. Select **New**.
4. Complete the form.

Service Desk Chat Platform Analytics Solutions

Platform Analytics Solutions contain preconfigured dashboards. These dashboards contain actionable data visualizations that help you improve your business processes and practices.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Platform Analytics data visualizations use Performance Analytics indicator data to show you data over time, helping you analyze your business processes and identify areas of improvement. With Platform Analytics Solutions, you can get value from Performance Analytics for your application with minimal setup. You can always create your own objects as well.

To enable the solution for Service Desk Chat, an admin can navigate to **Performance Analytics** > **Guided Setup**. Click **Get Started** then scroll to the section for Service Desk Chat. The guided setup takes you through the entire setup and configuration process.

Connect Support and Service Portal

Use Connect Support in your portal to allow your users to ask questions or submit requests to support agents. You configure the instance options to control the appearance of your widget and how it functions.

The Connect Support and Service Portal integration creates a Connect Support widget that you can add to a page in the Service Portal.

Configure Connect Support widget instance options

You can control the appearance of your widget and how it functions by configuring the instance options.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Service Portal** > **Service Portal Configuration** and open the Service Portal Designer.
2. From the Service Portal Designer, select the page you added the Connect Support widget to. If you have not yet added the widget to a page, see Create and edit a page using the Service Portal Designer for more information.
3. Click the edit icon in the corner of the widget to open the instance options menu.
4. Complete the fields using the following table.
   Depending on the functionality you want to add, you may not need to add all these fields.

Connect Support widget instance options

Field	Description
Bootstrap color	Select a color for your widget from a list of common bootstrap colors. Themes control the overall color of a widget, but if you want your widget to be a specific color, you can select it from the list.
Queue URL	The URL for the Connect Support chat queue that you want questions to be directed to. For example, htts://<instancename.service-now.com/$chat_support.do?queueID=<sys_id>
Queue Name	The name of the queue you want the questions to be directed to. You can find a list of queue names in **Collaborate** > **Connect Support** > **Queues**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Queue ID	The sys_id of the queue you want questions to be directed to. You can find this ID by going to the support queue and either copying the queue ID from the support link, or by selecting **Copy sys_id** from the context menu.
Message	The text for the button in the Connect Support widget
Window	Use this option to open the chat in another tab rather than in a new window.
Title	The name in the widget header

Classic Orchestration

ServiceNow® Orchestration extends the workflow engine to manage processes and to automate things outside of a ServiceNow instance.

Orchestration is available as a separate subscription from the rest of the ServiceNow platform. See Activate Orchestration for details.

Introduction to Orchestration

Orchestration automates simple or complex multi-system tasks on remote services, servers, applications, and hardware.

An Orchestration process can cross all management disciplines and interact with hosted services and all types of infrastructure elements. These capabilities provide a powerful system for managing IT and Business processes quickly and reliably.

Orchestrated solutions aide collaboration among teams by providing reusable data and versioning for both the workflows and the activities within them. Subject matter experts can

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

create activities that are reusable to numerous workflow developers. When an activity requires a change, developers can see the downstream implication of the change immediately by knowing which workflows use the activity. Well-designed orchestrations never fail and apply human tasks to address errors as they arise.

Orchestration tools

Orchestration can make calls outside of a ServiceNow instance, directly to web services or through a MID Server to systems within corporate firewall. Orchestration also enables the creation reusable activities that wrapper Java Script functions for manipulating things inside the platform. Orchestration extends the Workflow editor by providing these features:

- Activity packs containing ready-to-use activities.
- Activity Designer, which enables developers to create custom activities without an over dependence to create scripts to orchestrate to third-party systems.
- Ability to create activity packs using Scoped Applications.
- A Databus for following the flow of data across orchestration activities.

Orchestration Core provides entitlements to use specific applications:

Client Software Distribution

An application that automates software delivery from the Service Catalog. Provides OOB support for SCCM. Partner solutions support Macs using JAMF. Other third-party solutions provide support through the extension framework.

Configuring Password Reset

An application for users to reset their password in Active Directory. It can expand to communicate with other third-party systems.

Orchestration ROI

Enables users to evaluate estimated costs and actual costs for tasks, automate these tasks, and track the ROI of these tasks.

Systems that Orchestration can automate

Orchestration can automate tasks such as employee onboarding, user access rights, server management, managed file transfers, and security operations orchestration activities. For example, you might use the Active Directory and Exchange activities provided in the base Orchestration system to set up network accounts and mailboxes for new employees.

If Orchestration does not provide the activities you need for an integration, create the necessary activities using the templates in the Orchestration Activity Designer. The external systems that Orchestration can automate for:

- Any system exposing web services (SOAP, REST)
- Any system accessible from the command line (such as a UNIX system accessible through SSH, a Windows system enabled for PowerShell remoting or WMI)
- Numerous proprietary services: Windows Active Directory, Microsoft Exchange mail servers, InfoBlox, and F5 Networks.

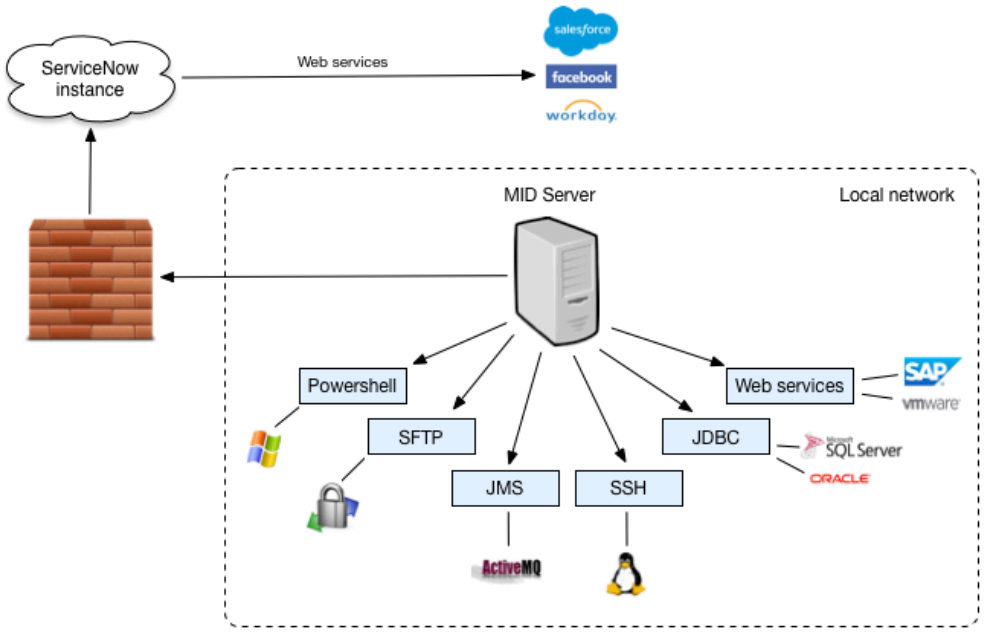
> **Note:**
> For a full list of Activity Pack service offerings, see Orchestration Core Activity Packs.

- Any filesystem accessible by SFTP

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Any database with a compliant JDBC driver
- Additional Activity Packs are also available with other ServiceNow products, such as Security Operations

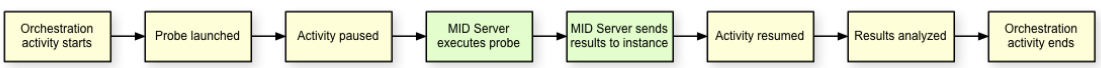
Orchestration capabilities



Orchestration workflow

When an Orchestration activity starts within a workflow, Orchestration launches a Discovery probes and sensors and writes a probe record to the ECC Queue. The workflow pauses as the MID Server picks up the request and executes the probe. When the probe reports back, the workflow resumes as the results are analyzed. The workflow can exit or continue at this point.

Orchestration workflow



Domain separation and Orchestration

Domain separation is supported in Orchestration. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

© 2026 ServiceNow, Inc. All rights reserved.

Support level: Standard*

- Includes **Basic** level
- Business logic: Processes can be created or modified per customer by the service provider. The use cases reflect proper use of the application by multiple service provider customers in a single instance.
- The owner of the instance needs to be able to configure MVP business logic and data parameters per tenant as expected for the specific application.

Use case: As an admin, I need the ability to make comments mandatory on close of a record for one tenant, but not for another.

Domain separation for service providers

Activate Orchestration

The Orchestration (com.snc.runbook_automation) plugin is available within a separate subscription from the rest of the ServiceNow platform.

Before you begin

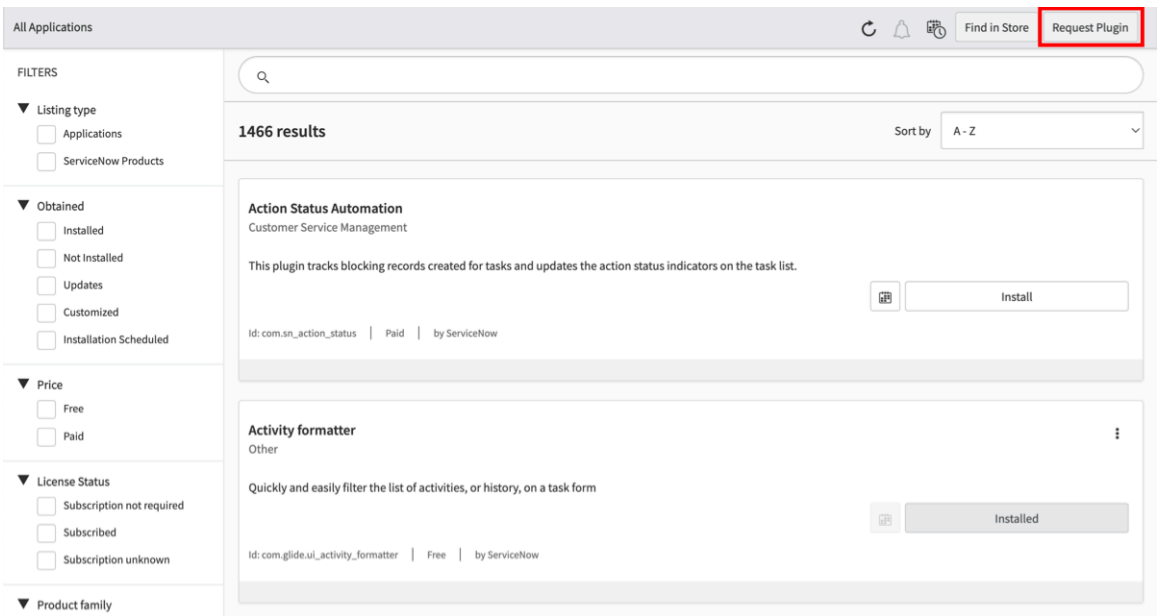
To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization's production and subproduction instances, generally within a few days.

If you don't have an account manager, decide to delay activation after purchase, or want to evaluate the product on a subproduction instance without charge, follow these steps.

Role required: none

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Select **Request plugin** to open the **Activate Plugin** form on Now Support.



3. On the **Activate Plugin** form, provide the following information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

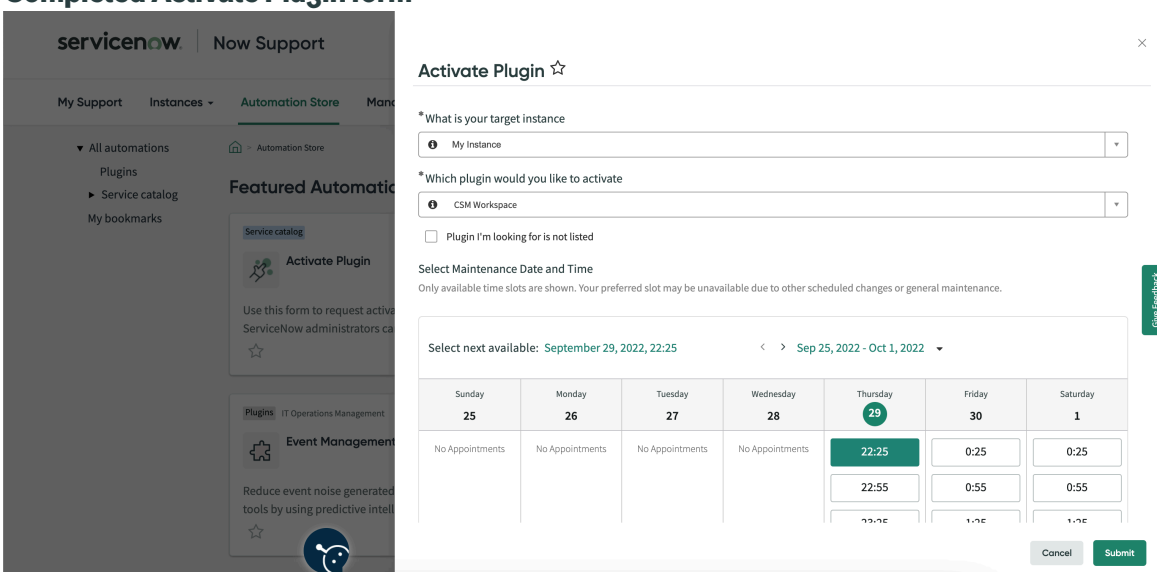
Activate Plugin form

Field	Description
What is your target instance	Select the instance that you want to activate the plugin on.
Which plugin would you like to activate	Select the name of the plugin to activate. **Note:** If the system doesn't list the plugin you want or if you're activating the plugin on an OEM or on-premise instance, select the **Plugin I'm looking for is not listed** check box and then enter the name of the plugin.
Select Maintenance Date and Time	Select the date and time to activate the plugin.

Example

For example, see the following form to activate the Event Management plugin on an instance named SNC Instance.

Completed Activate Plugin form



4. Select **Submit**.
   After the maintenance window, the system installs the plugin on your instance. To confirm the installation, go to the Installed tab in the Application Manager.

List of Orchestration plugins

This table lists all plugins available for Orchestration and their dependencies.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

These Orchestration plugins are available for purchase or can be requested as part of your Orchestration subscription. Contact your account representative for details.

Name	Description	Dependencies
Orchestration [com.snc.runbook_automation]	Main plugin for the Orchestration feature. This plugin extends Workflow to automate operations with external systems. Use this plugin to orchestrate business services, applications, and infrastructure.This plugin automates operations such as deployments, configurations, and information gathering. Orchestration can automate Web Services and uses MID Servers to execute commands on devices inside an enterprise's network.	• Orchestration - ROI • Orchestration - Runtime
Orchestration - Active Directory [com.snc.orchestration.ad]	Installs the Active Directory activity pack. These activities create, delete, and manage objects in Windows Active Directory.	Orchestration
Orchestration - Asset Lease Management [com.snc.orchestration.asset_lease_management]	Provides the software lease functionality for Client Software Distribution. Allows users to select the start and end dates of software leases and to request an extension of a lease. **Note:** This plugin is not automatically enabled when Orchestration is active.	None
Orchestration - Azure Active Directory [com.snc.orchestration.azure.ad]	Installs the Azure AD activity pack. These activities automate employee onboarding and offboarding functions on Azure Active Directory and manage Office 365 licensing.	Orchestration
Orchestration - Client Software Distribution [com.snc.orchestration.client_sf_distribution]	Allows the distribution of software from the service catalog using third party management systems, such as Microsoft System Center Configuration Manager (SCCM) **Note:** This plugin is not automatically enabled when Orchestration is active.	• Orchestration - System Center Configuration Manager • Orchestration - Asset Lease Management • Service Catalog Scoped API • Software Asset Management

Name	Description	Dependencies
	directories on an SFTP server and move files from one SFTP server to another.	
Orchestration - SSH [com.snc.orchestration.ssh]	Installs the SSH activity pack. These activities read, write, and copy files, and reset user passwords on Linux computers.	Orchestration
Orchestration - System Center Configuration Manager [com.snc.orchestration.sccm_mgmt]	Installs the System Center Configuration Manager (SCCM) activity pack. These activities manage software deployments and collections on an SCCM server.	Orchestration

Orchestration Runtime plugin

The Orchestration – Runtime plugin enables other applications on the ServiceNow® platform to automate tasks, without requiring an Orchestration subscription.

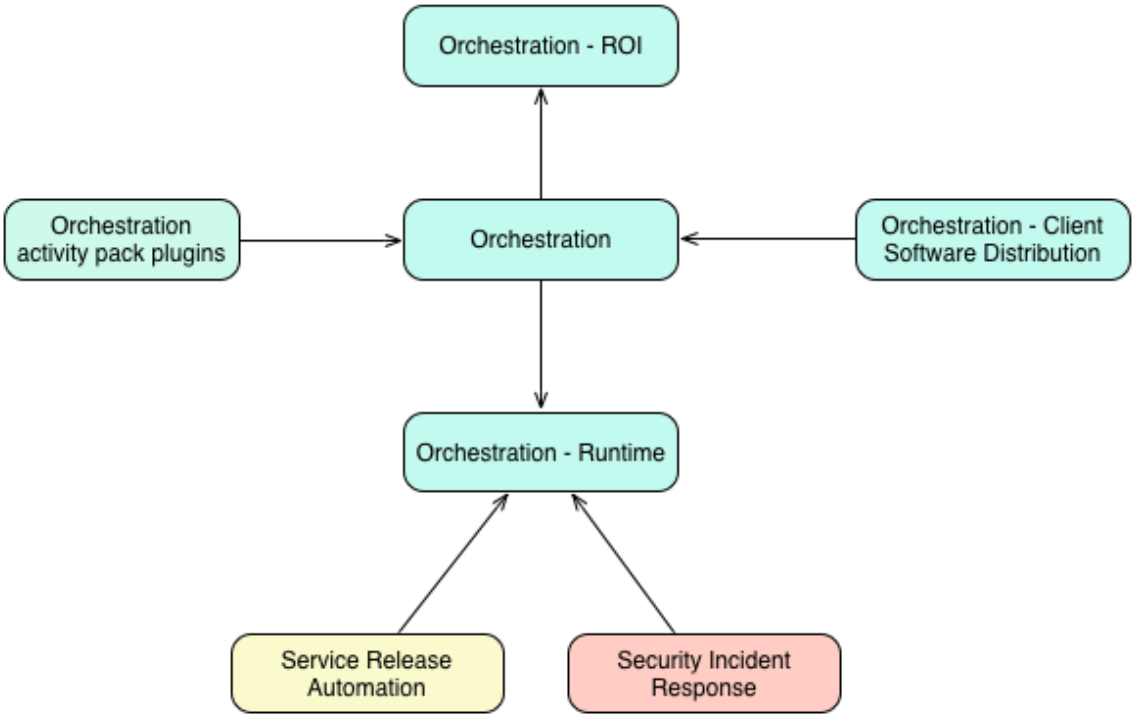
The Orchestration – Runtime plugin can be activated as part of another plugin or application. It is used by strategic technology partners and ServiceNow applications to distribute activity packs to customers who may not own Orchestration. For example, the Security Incident Response Management (SIRM) application provides orchestration content, which includes activities that are available from the **Packs** tab in the Workflow Editor. Customers who purchase SIRM can consume and modify the activities that SIRM ships without having to purchase an Orchestration license.

Included with the plugin

The Orchestration – Runtime plugin provides access to the **Packs** and **Data** tabs in the Workflow Editor. This plugin gives users access to custom activities for their applications and enables them to reuse data from the Databus. This plugin does not provide access to custom Orchestration activity packs or to the activity designer. The **Custom** tab in the Workflow Editor is not available without an Orchestration subscription.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Orchestration plugin relationships



Dependencies

The Orchestration – Runtime plugin activates these application plugins:

- Security Incident Response Orchestration
- Service Release Automation

.

Access to activities

Custom activities shipped with ServiceNow® applications are available in the **Packs** tab of the Workflow Editor for use in workflows. To edit these activities, navigate to **Orchestration** > **Activity Designer Activities** and select the activity you want to modify. For information about the provider templates used to create these activities, see Orchestration custom activity templates.

List of Orchestration activities

Use Orchestration activities in a Workflow to integrate with third-party systems.

Several Orchestration activities have been rewritten as Application scope activities using the activity designer and grouped into activity packs. Other non-scoped activities are deprecated and may or may not appear in the Workflow Editor. However, all deprecated activities still function in existing workflows that use them.

Global activities

These activities run in the global scope only. Any activities you create in the global scope are organized in the Global category in the **Packs** and **Custom** tabs in the Workflow Editor.

Activity	Description
Test Server Alive	Runs a command (including shell scripts) on a Linux or UNIX computer via SSH to validate whether the target system is alive.

Active Directory (AD) activities

All AD Orchestration activities were rewritten in the Geneva release as scoped activities and are available in the Active Directory activity pack. All previous version AD activities that were built on activity definitions are deprecated and are unavailable for use in new workflows.

Activity	Description
Create AD Object	Creates a user account in Windows Active Directory when a user account is created in a ServiceNow instance.
Disable AD User Account	Marks a Windows Active Directory user account disabled, making it inactive.
Enable AD User Account	Enables a Windows Active Directory user account, making it active.
Query AD	Retrieves entries from the Windows Active Directory based on a search filter.
Remove AD Object	Deletes a user account from Windows Active Directory.
Reset AD User Password	Resets the password of a user account in Windows Active Directory.
Change AD User Password	Changes the password of a user account in Windows Active Directory.
Update AD Object	Updates a user account in Windows Active Directory.
Is AD Account Locked	Determines if an Active Directory user account is locked.
Unlock AD Account	Unlocks a locked Active Directory user account.

Azure AD

All these activities are scoped and part of the Azure AD activity pack. They do not have legacy versions.

Activity	Description
Add User to Group	Adds a user to an existing security group in Azure Active Directory.
Assign User License	Assigns an extra Office 365 software license to the named user.
Create User	Creates a user for the Azure Active Directory tenant.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activity	Description
Delete User	Deletes the named user's account from the Azure Active Directory tenant.
Get User Info	Returns the named user's information from the Azure Active Directory.
Remove User from Group	Removes an existing user from a security group in Azure Active Directory.
Remove User License	Revokes the specified Office 365 software license for the named user.
Reset User Password	Changes the named user's Azure Active Directory password.

F5 Network Management activities

All these activities are scoped and part of the F5 Network Management activity pack. They do not have legacy versions.

Activity	Description
Add F5 Pool	Creates the load balancer pool.
Check F5 Pool	Checks the status of a pool to validate whether it is available to accept traffic.
Delete F5 Pool	Deletes an F5 pool.
Add F5 Pool Member	Adds a member to an F5 pool.
Get F5 Pool Member	Returns the pool members and verifies the pool status.
Delete F5 Pool Member	Deletes an F5 pool member.
Add F5 Virtual Server	Adds a virtual server.
Modify F5 Virtual Server	Configures a virtual server assigned to an F5 pool with irules and a vlan.
Delete F5 Virtual Server	Deletes a virtual server from an F5 pool.
Add F5 Profile to Virtual Server	Adds a profile to a virtual server assigned to an F5 pool.

Infoblox activities

All these activities are scoped and part of the Infoblox DDI activity pack. They do not have legacy versions.

Activity	Description
DHCP Reserve IP v4 Address Range	Reserves an IP address range for DHCP use.
DHCP Delete IP Reservation	Deletes IP reservations in DHCP using either an IPv4 or IPv6 address range.
DHCP List IP Reservations	Generates a list of all the DHCP range reservations on a specific Infoblox server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activity	Description
List DNS C-records	Retrieves all canonical (CNAME) records from a specified Infoblox server.
Register DNS A-record	Creates a DNS A record on a specified Infoblox server.
Register DNS C-Record	Creates a DNS canonical (CNAME) record on a specified Infoblox server.
List DNS Record	Generates a list of all the DNS entries on a specific Infoblox server.
DNS Delete	Deletes DNS records of any type from in Infoblox server, such as C and A records.
IPAM Register IP Address	Registers an IP address in a network using Infoblox IPAM.
IPAM Reserve IP Address	Reserves an IP address in a network using Infoblox IPAM.
IPAM List IP Reservations	Returns an array of all IP Address within the named Infoblox Server.
IPAM Delete	Deletes an IP Address within a named Infoblox server.
Create Network	Creates networks on a specified Infoblox server.
Get Network Details	Retrieves the information about a specific network on an Infoblox server.
Delete Network	Deletes a network from an Infoblox server.
List Registered Networks	Retrieves all the networks associated with an Infoblox server.

Microsoft Exchange activities

All Exchange Orchestration activities were rewritten in the Geneva release as scoped activities and are available in the Exchange activity pack. All previous version Exchange activities that were built on activity definitions are deprecated and are unavailable for use in new workflows.

Activity	Description
Create Address List	Creates an address list that acts as an alias for emailing all users in the group. This alias cannot be used to manage user permissions.
Delete Address List	Removes an existing address list from an Exchange server.
Get Address List	Retrieves all attributes from the specified Exchange address list.
Move Address List	Moves an Exchange address list to another location in the address hierarchy.
Set Address List	Modifies an Exchange address list.
Update Address List	Adds or removes users from the specified address list and immediately applies any cached address list changes to the server.
Create Mailbox	If a user does not exist, creates a new Active Directory user and associated Exchange mailbox.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activity	Description
Delete Mailbox	Deletes the Exchange mailbox of an Active Directory user.
Disable Mailbox	Disables the mailbox associated with a specified Active Directory account.
Enable Mailbox	Creates a mailbox for an existing Active Directory user.
Get Mailbox	Gets the mailbox for the specified user or all mailboxes on an Exchange server.
Set Mailbox	Modifies the settings of an existing Exchange mailbox.

PowerShell activities

These PowerShell activities were rewritten as scoped activities and are available in the PowerShell activity pack. All previous version PowerShell activities that were built on activity definitions are deprecated and are unavailable for use in new workflows.

Activity	Description
Install Windows App	Installs an application on a Windows target machine.
Join Domain	Joins a Windows machine to a domain.
Restart Windows Server	Restarts a Windows server using PowerShell.
Uninstall Windows App	Uninstalls an application from a Windows target machine.
Change Service State	Starts or stops a Windows service on a remote system.

Probe activities

These probe activities were rewritten as scoped activities and are available in the Probe activity pack. All previous versions of these activities that were built on activity definitions are deprecated and are unavailable for use in new workflows.

Activity	Description
Resolve DNS Name	Resolves an IP address or a fully qualified domain name (FQDN) into one or more IP addresses.
SNMP Query	Queries an SNMP device.

SCCM activities

All these activities are scoped and part of the SCCM activity pack. They do not have legacy versions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activity	Description
Add to Device Collection	Adds a device to a Microsoft System Center Configuration Manager (SCCM) device collection.
Add to User Collection	Adds a user to a Microsoft System Center Configuration Manager (SCCM) user collection.
Get Applications	Returns a list of all the applications available on a Microsoft System Center Configuration Manager (SCCM) server.
Get Deployments	Returns the list of deployments performed by Orchestration using a Microsoft System Center Configuration Manager (SCCM) server.
Get Device Collections	Returns the list of available device collections on a Microsoft System Center Configuration Manager (SCCM) host.
Get User Collections	Returns the list of available user collections on a Microsoft System Center Configuration Manager (SCCM) host.
Remove from Device Collection	Removes a device from a Microsoft System Center Configuration Manager (SCCM) device collection.
Remove from User Collection	Removes a user from a Microsoft System Center Configuration Manager (SCCM) user collection.

SSH activities

These SSH activities were rewritten as scoped activities and are available in the SSH activity pack. The SSH activities not converted to scoped activities were moved to the Orchestration - Deprecated category, but are still available for all workflows.

Activity	Description
File Copy	Copies a file on a Linux or Unix computer, via SSH.
File Read	Reads a file on a Linux or Unix computer, via SSH.
File Write	Writes a file on a Linux or UNIX computer.
File Replace String	Finds and replaces a string in a file on a Linux or UNIX computer.
Files Compare	Compares two files on a Linux or Unix computer, via SSH.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activity	Description
Reset Linux User Password	Resets the password for a given user on a Linux computer.
Secure Copy	Copies a file from one host to another, without storing the copied file on the MID Server.

SFTP activities

All these activities are scoped and part of the SFTP File Transfer activity pack. They do not have legacy versions.

Activity	Description
Copy File	Copies a file from an SFTP server (source host) to another SFTP server (target host).
Create Directory	Creates a directory on an SFTP server.
Get File List	Returns a list of files from a given directory and its subdirectories on an SFTP server (source host).
Remove File or Directory	Removes a file or a directory on an SFTP server, including subdirectories, when configured.
Rename File or Directory	Renames a file or directory to a new name on an SFTP server.
Set File Attributes	Sets common file attributes, such as timestamps, size, permissions, and UID/GID, for a file or directory on an SFTP server.

Deprecated activities

These activities have been removed from the Workflow Editor and are not available for new workflows, but continue to work normally in existing workflows. You can reactivate the deprecated activity or duplicate the functionality of a deprecated activity as a scoped activity by recreating it using the activity designer.

Activity	Description
Run Probe	Launches a MID Server probe on behalf of a document.
SOAP Request	Executes a SOAP request on a target server. The SOAP Message activity replaces this activity.
Run Command	Runs a command (including shell scripts) on a Linux or UNIX computer.
Run SCP	Uses Secure Copy Protocol (SCP) to copy a file from one computer to another, including the directory in which the file resides. The Secure Copy activity replaces the Run SCP activity.
Run Powershell	Executes Windows PowerShell commands on a MID Server.

Available activity packs

Activity packs are available with your subscription to Orchestration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: admin

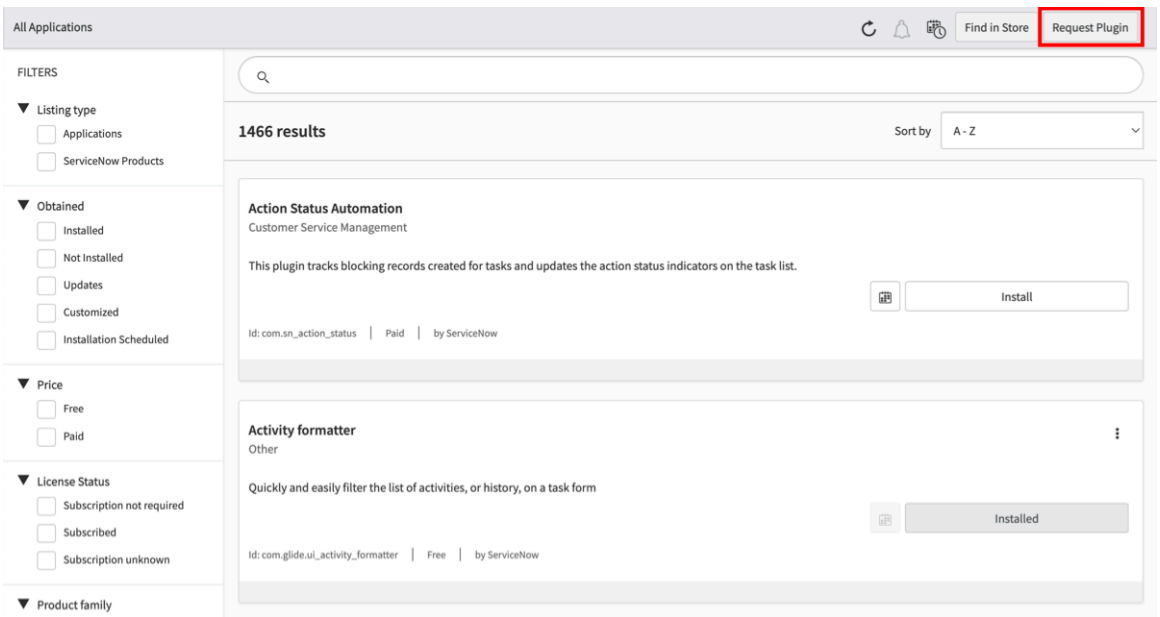
About this task

The following activity packs are available and active with your Orchestration subscription:

- Orchestration - Active Directory (com.snc.orchestration.ad)
- Orchestration - Azure Active Directory (com.snc.orchestration.azure.ad)
- Orchestration - Exchange (com.snc.orchestration.exchange)
- Orchestration - SFTP (com.snc.orchestration.sftp)
- Orchestration - Infoblox DDI Activity Pack (com.snc.orchestration.infoblox)
- F5 Network Management activity pack (com.snc.orchestration.f5)
- Orchestration - SSH (com.snc.orchestration.ssh)
- Orchestration - PowerShell (com.snc.orchestration.powershell)
- Orchestration - System Center Configuration Manager (com.snc.orchestration.sccm_mgnt)

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Select **Request plugin** to open the **Activate Plugin** form on Now Support.



3. On the **Activate Plugin** form, provide the following information.

Activate Plugin form

Field	Description
What is your target instance	Select the instance that you want to activate the plugin on.
Which plugin would you like to activate	Select the name of the plugin to activate.

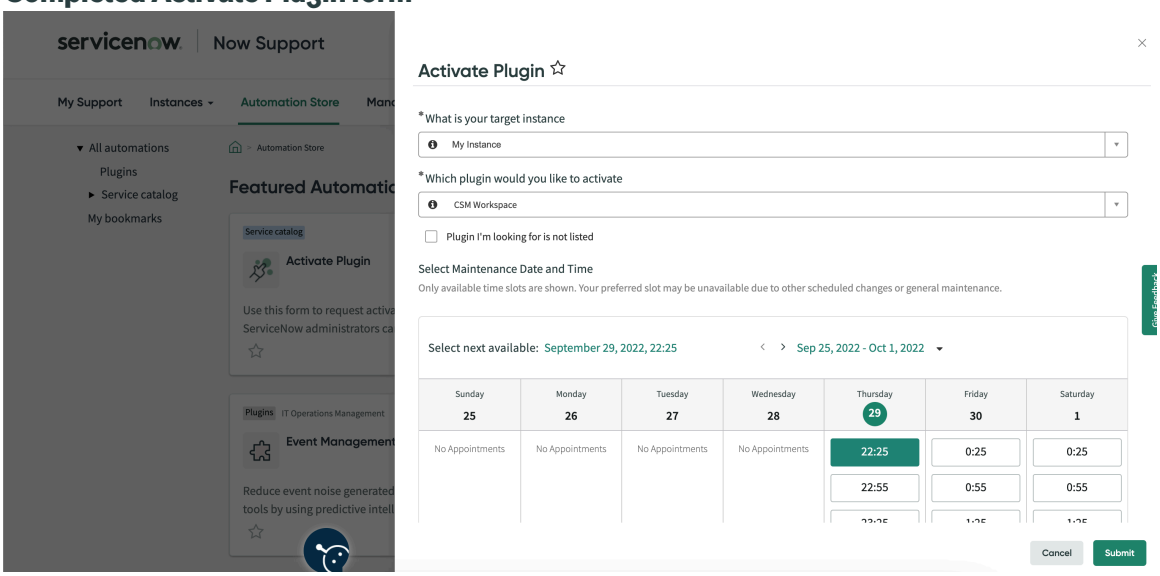
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: If the system doesn't list the plugin you want or if you're activating the plugin on an OEM or on-premise instance, select the **Plugin I'm looking for is not listed** check box and then enter the name of the plugin.
Select Maintenance Date and Time	Select the date and time to activate the plugin.

Example

For example, see the following form to activate the Event Management plugin on an instance named SNC Instance.

Completed Activate Plugin form



4. Select **Submit**.
   After the maintenance window, the system installs the plugin on your instance. To confirm the installation, go to the Installed tab in the Application Manager.

Deprecated Orchestration activities

These Orchestration activities have been deprecated.

Run Probe

The Run Probe activity launches a MID Server probe on behalf of a document. All Orchestration activities that launch a probe on a target machine are based on the Run Probe activity. Your ServiceNow instance must have access to a MID Server configured to use SSH to run this activity.

Important:
This activity is deprecated and is unavailable for new workflows. To replace the functionality of this probe, use the Probe activity template to create a custom activity. Workflows from a previous release that use the Run Probe activity can continue to do so.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Run Probe input variables

Field	Description
Probe	Select a MID Server probe from the list. This is the name of the probe as it appears in the *discovery_probes* table.
Source for probe	Enter the IP address of the host system against which the probe runs (the probe's target).
Sensor script	The script to run using the results of the probe. The output from the probe is contained in a variable called *output*. Any error from the probe is contained in a variable called *error*.

SOAP Request

The SOAP Request activity executes a SOAP request on a target server.

Important:
This activity is deprecated and is replaced by the SOAP Message workflow activity activity. Workflows from a previous release that use the SOAP Request activity can continue to do so. However, this activity is not available for new workflows.

SOAP Request input variables

Field	Description
SOAP URL	The SOAP endpoint.
Username	User name for basic authentication credentials.
Password	Password for basic authentication credentials.
Envelope Script	Script for setting up parameters for the web service.
Sensor Script	The script to execute after the request has been made and a response has been received.

Reactivate a deprecated activity

Orchestration activities that were converted to activity packs are deprecated for upgraded and new instances but can be reactivated for use in new workflows.

Before you begin

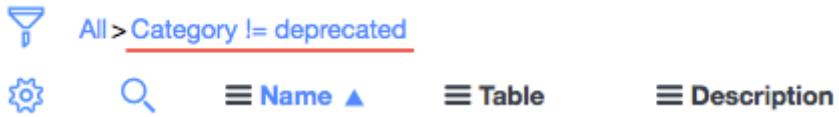
Role required: workflow_admin, admin

Note:
Reactivation of deprecated activities for use in new workflows is discouraged. Legacy activities cannot use the unique features of the scoped applications, such as reuse of data from the databus and input variable testing.

Procedure

1. Navigate to **All** > **Workflow** > **Administration** > **Activity Definitions**.
2. In the list of activities, clear the condition **Category !=deprecated** from the filter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Open the definition record for the activity you want to reactivate.
4. Select the **What to Display** tab.
5. In the **Category** field, replace the value **deprecated** with another category.
   This can be an arbitrary string.
6. Click **Update**.
   The system creates a new category using the value provided and reactivates the activity, which becomes available in the **Core** tab of the Workflow Editor.

SOAP Message workflow activity

The **SOAP Message** activity uses SOAP messages defined in the System Web Services plugin and can call the messages using a MID Server.

Your instance must have access to a MID Server configured to use SOAP.

Input variables

SOAP Message activity input variables

Field	Parameter	Description
SOAP Message	soap_message	The SOAP Message defined under the System Web Services plugin's Outbound SOAP Message [sys_soap_message] table. (**System Web Services** > **Outbound** > **SOAP Message**)
SOAP Message Function	soap_message_function	The function to call that is defined in the SOAP Message. Functions are listed in the **SOAP Message Functions** related list in each SOAP Message record.
SOAP Endpoint	soap_endpoint	Endpoint to use instead of the **SOAP endpoint** value in the SOAP Message Function record. Leave this field blank to use the defined endpoint in the SOAP Message Function record.
Variables	variables	Variables to substitute into the SOAP **Envelope** defined in the SOAP Message Function record. Use this format for the string: `name1=value1, name2=value2, . . .` If either the name or value contains a comma or equal sign, escape these characters with a backslash.
Use MID Server	use_midserver	Check box for using a MID Server to send the SOAP message. A MID Server might be necessary to reach an endpoint within a firewall or a sub-network that is not visible from the instance. If this check box is selected (true), but no MID Server is defined in the **MID Server** field, workflow automatically attempts to find a MID Server.
MID Server	midserver	Name of the MID Server to use. This field appears when you select the **Use MID Server** check box. The

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SOAP Message activity input variables (continued)

Field	Parameter	Description
		workflow ignores this parameter if the *use_midserver* parameter is disabled. **Note:** You can only select a specific MID Server in the legacy SOAP message activity and REST messages. These legacy activities do not use the MID Server selection available starting with the Istanbul release.
Sensor Script	sensor_script	The script to execute after the request has been made and a response has been received. You can access the full XML response body from the *activity.output* object.

Probes used by Orchestration

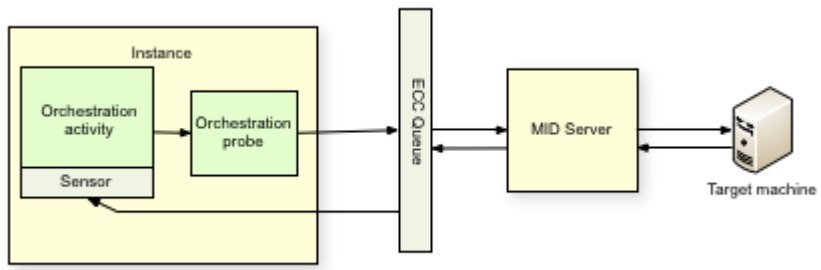
Certain probes, controlled by MID Servers, perform Orchestration tasks on remote computers, such as restarting a server or creating virtual machines from templates.

How Orchestration probes work

When a Workflow executes an Orchestration activity, that activity launches a probe, which writes an *output* record to the ECC Queue. The MID Server selected for the activity checks the ECC Queue for assignments, and then executes the appropriate probe to do the work on the target machine. The information about the activity (machine restarted, files copied, etc.) that is returned from the target machine by the probe is written to the ECC Queue as an *input* record. This information is then sent from the ECC Queue to a sensor that is built into the Workflow activity. The Workflow is updated, and the next activity is executed.

Note:
The probe parameters are set by the activities that launch the probe.

How Orchestration uses probes



Probe List

The base system includes the following Orchestration probes (**Orchestration** > **Definition** > **Probes**).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Probe List

Probe Name	ECC Queue Topic	ECC Queue Name	Description
Command	Command		A probe that runs a local command on the MID server.
DNS Name Resolver	DNSNameResolver		A probe that resolves a fully qualified domain name (FQDN) into an IP address. The probe executes MID Server queries in parallel. It utilizes DNS lookup by the MID Server host OS to make use of the OS maintained DNS cache. It also leverages the hosts file on the OS.
SCPCommand	SCPCommand		A probe that copies files securely from one machine to another. The copy function is performed using the MID Server as a tunnel.
Shazzam	Shazzam		A probe that identifies active devices.
SNMPProbe	SNMP	SNMP Query	This is a generic SNMP probe.
SOAPProbe	SOAPProbe		A probe that sends a SOAP request to target machine.
SSHCommand	SSHCommand		A probe that executes shell scripts from a command line after logging in to a target machine via SSH.
SSHCommandLong	SSHCommandLong		A probe that executes long running shell scripts from a command line after logging in to a target machine via SSH.
VMWare	VMWareProbe		A generic VMware probe that executes the MID Server script include in the *ECC queue name* that is set by a VMware Orchestration activity. This probe can run any MID Server script include.
Windows - PowerShell	PowerShell	Windows - PowerShell	A probe that runs a Windows PowerShell script on the MID Server. The PowerShell script is provided as the value of a parameter with name ending in `.ps1`. Two variables are available to the script: • `$computer`: The computer pointed to as the source for this probe • `$cred`: A PowerShell credential, using a user name and password from the Credentials table, that logs into `$computer` successfully.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

PowerShell activities

PowerShell is built on the Windows .NET Framework and is designed to control and automate the administration of Windows machines and applications.

PowerShell must be installed on any MID Server that uses these activities. MID Servers using PowerShell must be installed on a supported Windows operating system. ServiceNow supports PowerShell 3.0 to 5.1.

The ServiceNow Orchestration plugin adds these basic PowerShell activities to workflows. For instructions on using activities from the PowerShell activity pack, see PowerShell activity pack

Legacy Run PowerShell activity

The Run PowerShell activity executes Windows PowerShell commands on a MID Server.

Important:
This activity is deprecated and is unavailable for new workflows. To replace the functionality of this activity, use the Powershell activity template to create a custom, scoped activity. Workflows from a previous release that use the Run PowerShell activity can continue to do so.

Result Values

The workflow designer can assign a result value using activity.result from within a script field of the activity. By default, the success or failure of the PowerShell commands used determines the result value of the Run PowerShell activity. Possible result values are:

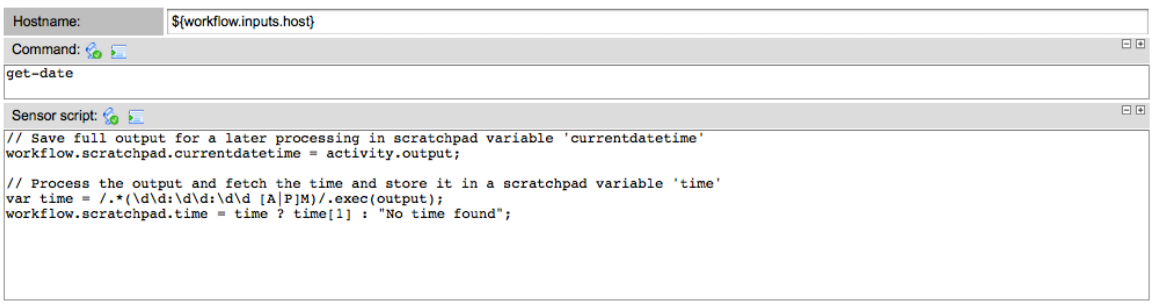
- Success
- Failure

Scratchpad Entries

Information written to `stdout` by the executing script is captured and returned to the activity in the `activity.output` variable. This information can be parsed, processed, or saved (to a scratchpad variable, for example) for future processing in the activity's sensor script.

An example would be to run the get-date command to get the MID Server's current time. This sensor script saves the full output received, but we can process it to return and save only the time.

PowerShell activity



Note:
This is an over-simplified example. In most cases, the script operates against some remote Windows computer. However, the principal is the same – whatever is written to `stdout` is returned in `activity.output` and available to process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Input Variables

Input Variables

Field	Description
Hostname	IP address of the target Windows machine. This value is mapped to the *$computer* variable for use in commands (see the example in the **Command** field). A PowerShell credential variable called *$cred* that is based on information in the ServiceNow Credentials table will authenticate on the computer pointed to by **Hostname**.
Command	Enter the PowerShell command to run. For example, to execute a simple WMI query against a remote machine pointed to by the *hostname* variable, the command is: `get-wmiobject <class> -computer $computer -credential $cred` If no credentials authenticate on the computer, the command runs in the context of the MID Server user. You cannot run both a command and a script file. Specifying a command hides the *Script file* variable.
Sensor script	The script to run using the results of the probe. The output from the probe is contained in a variable called *output*. Any error from the probe is contained in a variable called *error*.
Script file	The Enable script file synchronization for Windows enhanced security. You cannot run both a script file and a command. Selecting a script file hides the *Command* variable.
PowerShell script variables	Additional parameters, in JSON format, used by the specified script file.

States

The activity state tells the workflow engine what to do with the activity.

States

State	Description
Executing	The workflow engine knows to start the onExecute function of the activity.
Finished	The activity finished running. See the result value for the outcome of the activity.
Cancelled	This activity, or the workflow that contains this activty, was cancelled.

Add workflow variables for the command line using the normal workflow variable syntax. In the example above, if the <class> was in a workflow input variable called *myclass*, the command would look like:

```
get-wmiobject $ {workflow. inputs. myclass } -computer $computer
 -credential $cred
Similarly  if the variable  is a scratchpad variable named
 myclass , the command would look like :
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
get -wmiobject $ {workflow. scratchpad. myclass } -computer
 $computer –credential $cred
```

HResult codes

When a PowerShell script encounters an error, the Windows machine may return an HResult code as part of the error message.

PowerShell activities can read and interpret this code. Not all PowerShell errors include an HResult code. In the event of a failed PowerShell script, you can use the HResult code to move the workflow through a specific condition.

For example, when resetting an Active Directory password to a password that does not meet policy requirements, such as minimum length or complexity, the PowerShell script returns the HResult code -2146022651. To use this code, create an activity condition with the **Condition** value of *`activity.hresult = -2146022651`*. If the PowerShell script returns this code when the activity runs, the workflow transitions through this new condition.

SSH activities

SSH activities allow workflows to perform operations on Linux and Unix computers.

Your ServiceNow instance must have access to a MID Server configured to use SSH to run these Orchestration activities.

Run Command activity

The *Run Command* activity runs a command (including shell scripts) on a Linux or UNIX computer.

Important:
The Run Command activity is deprecated in this release. If you have a workflow created in a previous version that uses this activity, your workflow will continue to work normally after upgrading to Helsinki. However, to use this functionality in a new workflow, you must create a custom activity using the SSH activity template in the ServiceNow® activity designer.

Input variables

Run command input variables

Field	Description
Long running	Select this check box to disable the SSH connection timeout if you think the command will take longer to run than the default 60 seconds. Orchestration periodically checks the running process to determine its status until it is finished.
Hostname	Hostname or IP address of destination server for SSH activity.
Directory	Name of the working directory.
Command	The command to run from this activity.
Sudo	Select this check box to use sudo to run the command on the host machine.
Sensor script	The script to run using the results of the probe. The output from the probe is contained in a variable called *`output`*. Any error from the probe is contained in a variable called *`error`*.

Run SCP activity

The Run SCP activity uses Secure Copy Protocol (SCP) to copy a file from one computer to another, including the directory in which the file resides.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
This activity is deprecated in the Geneva release and is not available for use in new workflows. If you have a workflow created in a previous version that uses this activity, your workflow will continue to work normally after upgrading. The custom Secure Copy activity replaces the Run SCP activity in the Geneva release.

Input variables

Run SCP input variables

Field	Description
From Host	Hostname or IP address of the source computer.
From File	Absolute path to the file to copy. This value can be a directory.
To Host	Hostname or IP address of the target computer.
To File	Path to the target file. This path can be absolute or relative to the logged in user's home directory. The specified directory must already exist on the target computer.
Copy Directory	Check box to copy a directory defined in the **From File** variable and all files contained in that directory.

Orchestration applications

Orchestration provides several applications with your subscription.

Orchestration ROI

The Orchestration ROI application allows you to estimate and compute cost savings for tasks in your system that could be automated with Orchestration.

After you automate the tasks, you can track cost savings by associating Orchestration workflows with corresponding task areas. Configuration in the application allows you to select the hourly rate for performing the task manually, the rules the system uses to select tasks for evaluation, and the time period of the evaluation. Orchestration ROI estimates your savings by multiplying the cost of performing repetitive tasks manually by the estimated number of times the system performs those tasks automatically during a specific date/time range. The system also calculates the actual savings of your automations. Orchestration ROI is included with the base Orchestration subscription.

Orchestration ROI reports offer a number of views of the comparative data and allow you to access the associated records directly from the reports. The standard reports included with the Orchestration - ROI plugin provide summaries, estimated costs, and calculated costs for automated processes. The ROI premium dashboard uses Performance Analytics to provide detailed reports on calculated savings over time. Performance Analytics requires a different plugin and subscription.

Note:
When Orchestration ROI is activated as a dependent plugin of Orchestration, demo data is not installed. If you want to use demo data as a template for your own ROI evaluation, submit a request to ServiceNow® technical support for an Orchestration ROI plugin upgrade with demo data selected.

To set up Orchestration ROI, complete the configuration tasks in the order shown here.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create Orchestration ROI labor rate cards

Before calculating your Orchestration ROI, you must create labor rate cards for the manual work that would be required to complete the tasks correlated to the ROI calculations.

Before you begin

Role required: orchestration_manager

About this task

The hourly rates defined in the rate cards are used to determine the savings from your orchestrated tasks.

Procedure

1. Navigate to **All** > **Orchestration** > **ROI** > **Labor Rate Cards**.
2. Complete the fields in the form using the descriptions in Manage a labor rate card.
3. Click **Submit**.
4. Create additional rate cards as needed.

Create an Orchestration ROI automation entry record

The ROI automation entry record couples the cost of performing a task with the specific workflow that automates the task, for the purpose of calculating the resulting savings.

Before you begin

Role required: orchestration_manager
Before starting this procedure, verify that the appropriate labor rate cards were created.

About this task

Use this record to apply a manual hourly rate to a task that is performed automatically by your instance. To determine the savings realized from orchestrating a task, the system can evaluate whether those savings were estimated or calculated.

- **Estimated savings**: Uses the labor rate, the time estimates for completion of the task, and the number of automations that have been run to determine savings.
- **Calculated savings**: Uses the labor rate, the time calculated for completion of the task, based on the configured evaluation period, and the number of automations that have been run to determine savings.

Procedure

1. Navigate to **All** > **Orchestration** > **ROI** > **Automation Entry Form**.
2. Fill in the fields on the form, as appropriate.

Automation Entry Form

Field	Description
Category	Category of the selected workflow automation. The following categories are provided in the base Orchestration - ROI system: ○ **Access & Identity Management** ○ **Datacenter Automation** ○ **IT Service Management** ○ **Other**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: To create a category, open the dictionary record for the Automation Entry Form [automation_entry_form] table and add an option to the choice list.
Item	Unique name for the specific task within the category. This value represents the work to which the labor rate card applies, such as **Password Reset**.
Resource	Labor rate card to apply to this automation entry. You must have IT Cost Management active on the instance for this field to appear.
Associated Workflows	Workflow automations created to automate this manual task. The system uses this field to identify the number of automations that have been run.
Estimated Duration (min) per Task	Estimated time to perform this task manually.
Estimated Volume per Month	Estimated number of times needed to perform this task manually per month.
Read-only fields	
Start time	Start time for the evaluation period. Configure this value in the Time Range for Calculated Averages module.
End time	End time of the evaluation period. Configure this value in the Time Range for Calculated Averages module.
Calculated average duration per task (min)	Actual time required to perform this task manually.
Calculated average volume per month	Actual average number of times this task is performed manually per month.

3. Select one of these submission options:
   - **Submit**: Saves the record to the table without running any calculations.
   - **Submit and process now**: Saves the record and calculates the savings based on the hourly rate and the number of workflow contexts for this automation entry.

Create an Orchestration ROI correlated task rule

The correlated task rule applies configurable conditions to fields in a selected table that tell the instance which manual tasks correspond to an automation entry record.

Before you begin

Role required: orchestration_manager

Before starting this procedure, make sure you have created labor rate cards and the appropriate automation entry records for the automated tasks you want to evaluate.

About this task

Create conditions that the system can use to correlate manual tasks to the automation entry. For example, a rule on the Incident [incident] table uses these conditions to correlate the employee on-boarding task to values configured in the Employee OnBoarding automation entry record:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **[Subcategory] [is] [Employee OnBoarding]**
- **[Sort description] [contains] [new employee]**

When a new employee opens an incident to request services or assets which are typically handled manually, Orchestration applies the usual labor rate for the manual work to the potential automated solution, and then computes the actual savings.

Procedure

1. Navigate to **All** > **Orchestration** > **ROI Task Correlation** > **Correlated Tasks Rules**.
2. Click **New**.
3. Fill in the fields on the form, as appropriate.

Automation entry form

Field	Description
Automation entry	Automation entry record that correlates to the manual task defined by these conditions. The entry record names the workflow used to automate the task and defines the labor rate used to calculate the cost of the task.
Table	Table to filter, using these conditions. The rule selects records from this table that match the conditions. Information from these records is used to calculate the actual time to perform a manual task and the actual volume for that manual task.
Condition	Condition builder to use to filter records for this table. Use these conditions to identify all manual tasks correlated to this automation entry.
Read-only fields	
Processed on	Date and time that the system performs the matching records lookup. The system automatically searches for new manual tasks matching these conditions.

4. Select one of these submission options:
   - **Submit**: Saves the record to the table without running any calculations.
   - **Submit and process now**: Saves the record, looks up all matching tasks, and saves matching record information to the Correlated Tasks [manual_mapping_records] table.
5. To view a rule, select the link in the **Table** column of the **Correlated Tasks Rules** related list for the automation entry you want to see.
6. To view the list of tasks that match all correlated rules in the system, navigate to **Orchestration** > **ROI Task Correlation** > **Correlated Tasks**.
7. To view the list of tasks that match this rule in the system, click **Correlated Tasks** under **Related Links** in this form

Configure the time range for Orchestration ROI calculations

Select a date range to calculate the average number of tasks and the duration per month for the correlated tasks.

Before you begin

Role required: orchestration_manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

By default, the system creates a range ending at the current date and time and extending back over the previous month. You can change this range at any time and recalculate the ROI instantly.

Procedure

1. Navigate to **All** > **Orchestration** > **ROI Task Correlation** > **Time Range for Calculated Averages**.
2. Enter a new start or end date and time or click the icon to select a date using the calendar.
3. Click **Calculate** to recalculate the ROI based on the new time range and to save your settings.

Installed with Orchestration ROI

Several types of components are installed with the Orchestration - ROI plugin (com.snc.runbook_automation.roi).

Tables installed with Orchestration ROI

Tables are added with activation of Orchestration ROI.

Table	Description
Expense and Savings [run_rate_predicted_savings]	Contains the data for the reports in **Orchestration** > **ROI Reports** > **Predicted Savings**.
Savings Report [savings_report]	Contains the number of automations that have been run before the date specified in the **Processed On** column, based on: • Each automation entry's associated workflows • Estimated savings based on the estimated duration per task. • Calculated savings based on calculated duration.
Detailed Savings Report [detailed_savings_report]	Contains a detailed list for the Savings Report [savings_report] table. This list contains each automation's run date and savings for that automation.
Automation Entries [automation_entry_form]	Contains automation entries that couple labor resources to specific manual tasks. You can specify the estimated duration to perform a task manually and the estimated number of times that a task is performed per month. If this automation entry already has workflow automations implemented, you can specify the associated workflows. The system calculates the savings, based on the labor rate card and the number of workflow automations that have been performed.
Roadmap Planning [roadmap_planning]	Contains roadmap planning for each automation entry to be implemented. You can provide estimated hours to implement a workflow automation, the automation percentage anticipated by the end of the year, and the starting month to implement the workflow.
Correlated Tasks [manual_mapping_records]	Contains all matching manual tasks for each automation entry. Each tasks's information is stored in this table for the system to use to calculate the actual duration and volume for each manual task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
Correlated Tasks Rules [manual_mapping_conditions]	Contains the correlated task rules the system uses to look up manual tasks corresponding to each automation entry.

Plugins installed with Orchestration ROI

Plugins are installed with activation of Orchestration ROI, if they are not already active.

Plugin	Description
Cost Management [com.snc.cost_management]	Provides the labor rate cards Orchestration ROI uses to determine the savings for each automated task. See Cost Management for more information.

Roles installed with Orchestration ROI

Roles are added with activation of Orchestration ROI.

Role title [name]	Description	Contains Roles
Orchestration manager [orchestration_manager]	Manages all activities in the Orchestration ROI module.	• pa_admin • report_admin

UI actions installed with Orchestration ROI

UI actions are added with activation of Orchestration ROI.

UI actions for Orchestration - ROI

UI action	Table	Description
Savings Report	Automation Entry Form [automation_entry_form]	Displays the savings report specific to this automation entry, if the associated workflows are not empty.
Estimated and Projected Savings	Automation Entry Form [automation_entry_form]	Displays the estimated savings, based on the estimated duration of the task, and calculated savings, based on the calculated duration of the task.
Show Workflow Context	Detailed Savings Report [detailed_savings_report]	Shows the related workflow context.
Submit AND process now	Automation Entry Form [automation_entry_form]	Processes this new entry
Correlated Tasks	Correlated Tasks Rules [manual_mapping_conditions]	Displays all matching tasks from the Correlated Tasks [manual_mapping_records] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

UI actions for Orchestration - ROI (continued)

UI action	Table	Description
Detailed Savings Report	Automation Entry Form [automation_entry_form]	Displays the list of automations that have been run, based on associated workflows.
Task	Correlated Tasks [manual_mapping_records]	Displays the task record.
Submit AND process now	Correlated Tasks Rules [manual_mapping_conditions]	Processes a correlated task rule. This action performs matching on the specified table and the filter conditions.

Script includes installed with Orchestration ROI

Script includes are added with activation of Orchestration ROI.

Script include	Description
OrchestrationROIAjax	Script that calculates the actual duration and volume of a task.
OrchestrationROI	Script that calculates the number of workflow contexts, looks up all matching tasks, calculates savings, and other functions used in the UI actions.
ROIDemoDataUtil	Script that updates demo data timestamps.

Client scripts installed with Orchestration ROI

Client scripts are added with activation of Orchestration ROI.

Client script	Table	Description
Display info for processing rules	Correlated Tasks Rules [manual_mapping_conditions]	Displays annotation on the Correlated Task Rule form advising that new task rules are not evaluated until the time specified in the ROI schedule.

Business rules installed with Orchestration ROI

Business rules are added with activation of Orchestration ROI.

Business rule	Table	Description
Delete corresponding records	Automation Entry Form [automation_entry_form]	When a record is deleted from the Automation Entry Form [automation_entry_form] table, this business rule deletes all records in other ROI tables that reference this entry.
Insert into Run Rate & Savings	Automation Entry Form [automation_entry_form]	When a new automation entry is provided, this business rule calculates the estimated savings, based on the estimated duration of a task and its associated labor rate card.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Business rule	Table	Description
Insert into Savings Reports	Automation Entry Form [automation_entry_form]	When a new automation entry is provided, this business rule inserts a new record into the Savings Report [savings_report] table with the**automations_run** field set to **0**.

Orchestration ROI reports

Orchestration ROI provides a collection of standard and premium reports to help you calculate savings from automating services in your organization.

The ROI standard reports are included with Orchestration ROI. The premium reports provide enhanced views generated with Performance Analytics and require the Orchestration - ROI Premium plugin.

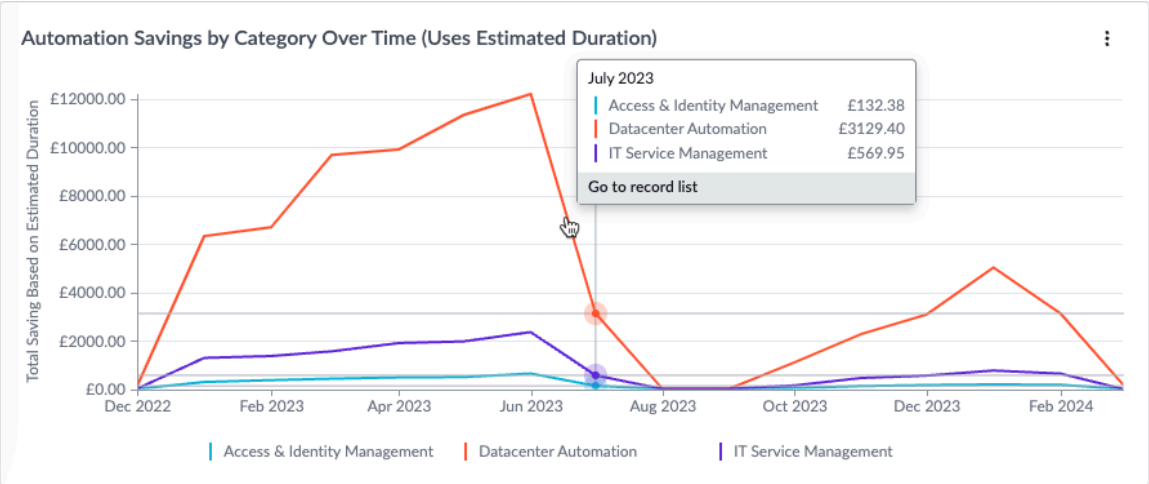
Orchestration ROI standard reports

The dashboard of standard ROI reports provides summaries, estimated costs, and calculated costs for automated processes. To access the ROI standard dashboard, navigate to **Orchestration** > **ROI Reports** > **Dashboard**.

Summary tab

The Summary tab contains four reports on automation categories.

ROI summary report sample



Standard ROI summaries by category

Report	Description
Manual Tasks by Category Over Time	Trend of manual tasks by category over time. For example, if you use automations to perform a portion of the necessary tasks, the report shows the number of tasks still executed manually, decreasing over time. • **Type**: Line chart • **Table**: Detailed Savings Report [detailed_savings_report]
Automations by Category Over Time	Trend of automated tasks by category over time. For example, this chart can show the increase in the number of automated tasks as a workflow automation rolls out slowly over time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

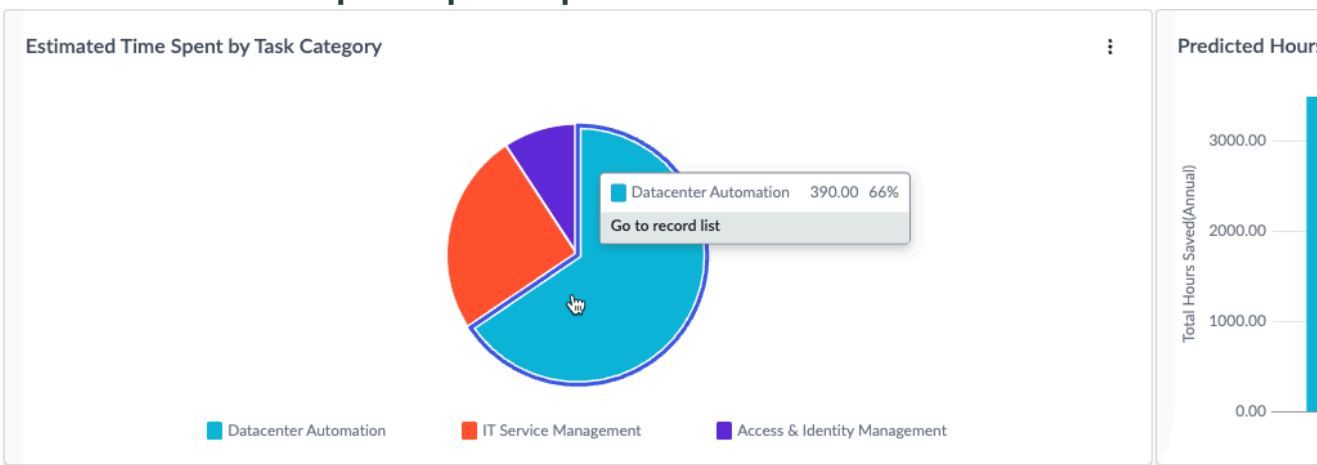
Standard ROI summaries by category (continued)

Report	Description
	• **Type**: Line chart • **Table**: Detailed Savings Report [detailed_savings_report]
Automation Savings by Category Over Time (Uses Estimated Duration)	Amount of savings from automated tasks over time, based on the estimated duration of the task, the number of automations performed, and the cost from the labor rate card. • **Type**: Line chart • **Table**: Detailed Savings Report [detailed_savings_report]
Automation Savings by Category Over Time (Uses Calculated Duration)	Amount of savings from automated tasks over time, based on the calculated duration of the task, the number of automations performed, and the cost from the labor rate card. • **Type**: Line chart • **Table**: Detailed Savings Report [detailed_savings_report]

Estimated Costs tab

The Estimated Costs tab contains eight reports on estimated time and expense for automations.

ROI estimated time and expense report samples



Standard ROI time and expense estimates

Report	Description
Estimated Time Spent by Task Category	Total estimated time spent, in minutes, on all tasks by task category. • **Type**: Pie chart • **Table**: Automation Entry Form [automation_entry_form]
Estimated Volume of Manual Tasks per Month by Category	Total estimated volume of all tasks per month by task category.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Standard ROI time and expense estimates (continued)

Report	Description
	• **Type**: Pie chart • **Table**: Automation Entry Form [automation_entry_form]
Predicted Hours Spent Monthly by Category (Uses Estimated Duration & Volume)	Total predicted hours spent monthly on all manual tasks by category, using the estimated duration of each task and the estimated volume of each task per month. • **Type**: Bar chart • **Table**: Expense and Savings [run_rate_predicted_savings]
Predicted Monthly Expense by Category (Uses Estimated Duration & Volume)	Total predicted monthly expense for all manual tasks by category, using the estimated duration of each task, estimated volume of each task per month, and the cost from the labor rate card. **Note:** This report uses negative numbers to express an expense. • **Type**: Bar chart • **Table**: Expense and Savings [run_rate_predicted_savings]
Predicted Hours Spent Quarterly by Category (Uses Estimated Duration & Volume)	Total predicted hours spent quarterly on all manual tasks by category, using the estimated duration of each task and the estimated volume of each task per month. • **Type**: Bar chart • **Table**: Expense and Savings [run_rate_predicted_savings]
Predicted Quarterly Expense by Category (Uses Estimated Duration & Volume)	Total predicted quarterly expense for all manual tasks by category, using the estimated duration of each task, estimated volume of each task per month, and the cost from the labor rate card. **Note:** This report uses negative numbers to express an expense. • **Type**: Bar chart • **Table**: Expense and Savings [run_rate_predicted_savings]
Predicted Hours Spent Annually by Category (Uses Estimated Duration & Volume)	Total predicted hours spent annually on all manual tasks by category, using the estimated duration of each task and the estimated volume of each task per month. • **Type**: Bar chart • **Table**: Expense and Savings [run_rate_predicted_savings]
Predicted Annual Expense by Category (Uses Estimated Duration & Volume)	Total predicted annual expense for all manual tasks by category, using the estimated duration of each task, estimated volume of each task per month, and the cost from the labor rate card.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

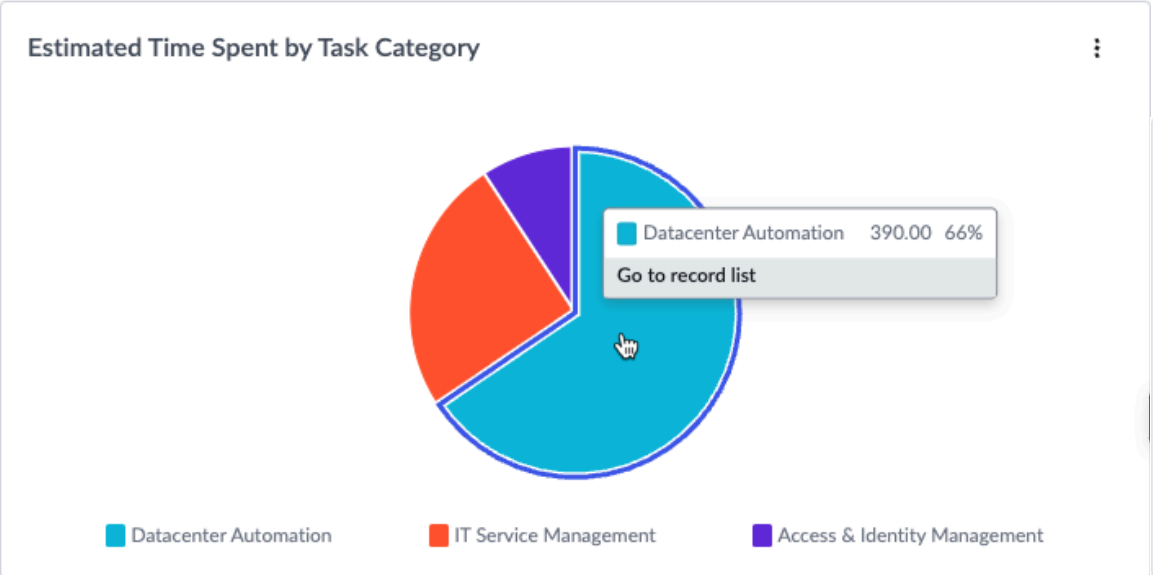
Standard ROI time and expense estimates (continued)

Report	Description
	Note: This report uses negative numbers to express an expense. • **Type**: Bar chart • **Table**: Expense and Savings [run_rate_predicted_savings]

Costs from Correlated Tasks tab

The Costs from Correlated Tasks tab contains eight reports on time and expense for automations based on actual calculations.

ROI calculated time and expense report samples



Standard ROI calculated time and expense of automations

Report	Description
Time Spent by Task Category	Total actual time spent, in minutes, on all tasks by task category. • **Type**: Pie chart • **Table**: Automation Entry Form [automation_entry_form]
Volume of Manual Tasks per Month by Category	Total actual volume of all tasks per month by task category. • **Type**: Pie chart • **Table**: Automation Entry Form [automation_entry_form]
Projected Hours Spent Monthly by Category (Uses Calculated Duration & Volume)	Total projected hours spent monthly on all manual tasks by category, using the calculated duration of each task and the calculated volume of each task per month.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Standard ROI calculated time and expense of automations (continued)

Report	Description
	• **Type**: Bar chart • **Table**: Expense and Savings [run_rate_predicted_savings]
Projected Monthly Expense by Category (Uses Calculated Duration & Volume)	Total projected monthly expense for all manual tasks by category using the calculated duration of each task, the calculated volume of each task per month, and the cost from the labor rate card. **Note:** This report uses negative numbers to express an expense. • **Type**: Bar chart • **Table**: Expense and Savings [run_rate_predicted_savings]
Projected Hours Spent Quarterly by Category (Uses Calculated Duration & Volume)	Total projected hours spent quarterly on all manual tasks by category, using the calculated duration of each task and the calculated volume of each task per month. • **Type**: Bar chart • **Table**: Expense and Savings [run_rate_predicted_savings]
Projected Quarterly Expense by Category (Uses Calculated Duration & Volume)	Total projected quarterly expense for all manual tasks by category using the calculated duration of each task, the calculated volume of each task per month, and the cost from the labor rate card. **Note:** This report uses negative numbers to express an expense. • **Type**: Bar chart • **Table**: Expense and Savings [run_rate_predicted_savings]
Projected Hours Spent Annually by Category (Uses Calculated Duration & Volume)	Total projected hours spent annually on all manual tasks by category, using the calculated duration of each task and the calculated volume of each task per month. • **Type**: Bar chart • **Table**: Expense and Savings [run_rate_predicted_savings]
Projected Annual Expense by Category (Uses Calculated Duration & Volume)	Total projected annual expense for all manual tasks by category using the calculated duration of each task, the calculated volume of each task per month, and the cost from the labor rate card. **Note:** This report uses negative numbers to express an expense. • **Type**: Bar chart • **Table**: Expense and Savings [run_rate_predicted_savings]

Schedule Orchestration ROI calculations for standard reports

The scheduled job that calculates Orchestration ROI standard reports is active by default and controlled by system properties.

Before you begin

Role required: orchestration_manager, admin

About this task

The system provides a default scheduled job called Processing ROI Schedule that allows you to configure when Orchestration calculates the ROI for standard reports. This schedule allows scripting for advanced conditions. To modify the schedule or write a script to run, open Processing ROI Schedule from **System Scheduler** > **Scheduled Jobs** > **Scheduled Jobs** and click **Configure Job Definition**. To execute the schedule directly from the job definition, click **Execute Now**

To control the running of the schedule job with the Orchestration properties.

Procedure

1. Navigate to **Orchestration ROI** > **Properties**.
2. Configure the following properties:

ROI schedule properties

Property	Description
roi.processing.active	Activate scheduled job for ROI processing. This property activates the Processing ROI Schedule scheduled job. ○ **Type**: true | false ○ **Default**: true
roi.processing.interval	Scheduled ROI processing interval (hours). This property sets the repeat interval for the scheduled job that processes savings reports and correlated tasks. ○ **Type**: integer ○ **Default**: 24

3. Click **Save** to save your changes.

Orchestration ROI premium reports

The premium dashboard provides detailed reports on calculated savings over time.

The ROI premium reports require the Orchestration - ROI Premium plugin and are built using Performance Analytics. The Orchestration - ROI Premium plugin is dependent on the Performance Analytics - Premium plugin which requires a separate subscription.

Important:
You must activate the Performance Analytics scheduled collection job before Orchestration ROI premium can display data.

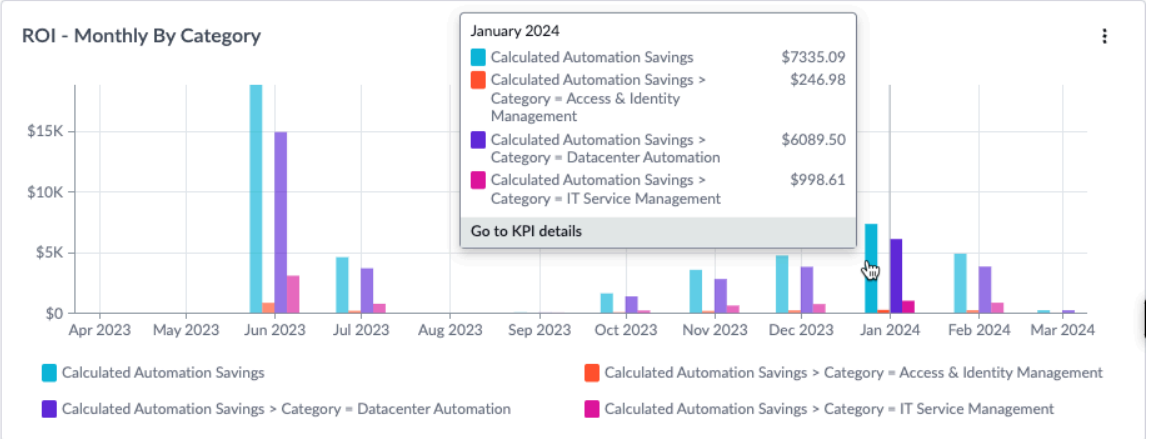
To access the ROI premium dashboard, navigate to **Orchestration** > **ROI Reports** > **Premium Dashboard**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ROI By Category tab

The ROI By Category tab contains three reports showing the calculated savings over time by category.

Calculated savings monthly by category



Premium reports for calculated savings over time by category

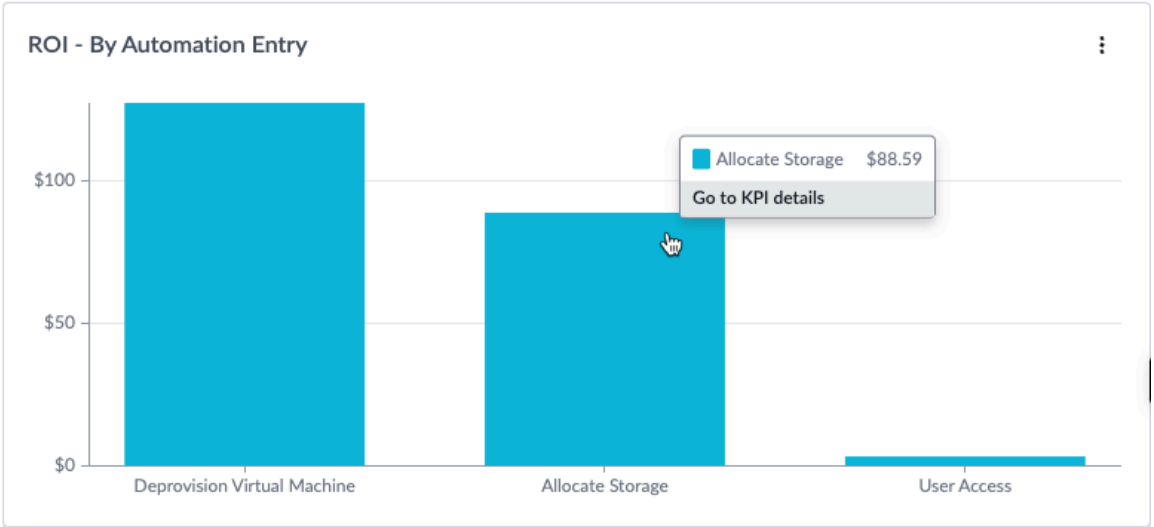
Report	Description
ROI - Monthly By Category	Shows the calculated savings each month by category. The chart displays the total calculated savings against the calculated savings for each category. • **Type**: Column chart • **Table**: Detailed Savings Report [detailed_savings_report]
ROI - By Category	Shows the trend of calculated savings by category. • **Type**: Spline chart • **Table**: Detailed Savings Report [detailed_savings_report]
ROI - Running Sum 12 month period	Shows the running sum of calculated savings for all categories in the last 12 months. • **Type**: Area chart • **Table**: Detailed Savings Report [detailed_savings_report]

ROI By Automation Entry

The ROI By Automation Entry tab contains two reports showing the calculated savings over time by automation entry.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Calculated savings for the current month by automation entry



Calculated savings over time by automation entry

Report	Description
ROI By Automation Entry	Shows the current month's calculated savings for each automation entry. • **Type**: Column • **Table**: Detailed Savings Report [detailed_savings_report]
ROI - By Automation Entry Top 10 List	Shows the top 10 automation entries that have the most calculated savings in the current month. • **Type**: Scorecard • **Table**: Detailed Savings Report [detailed_savings_report]

Request Orchestration ROI premium reports

To view the Orchestration ROI premium reports, you must request activation of the Orchestration - ROI Premium (com.snc.runbook_automation.roi_premium) plugin. The Orchestration - ROI Premium plugin is included with an Orchestration subscription, but must be activated by request.

Before you begin

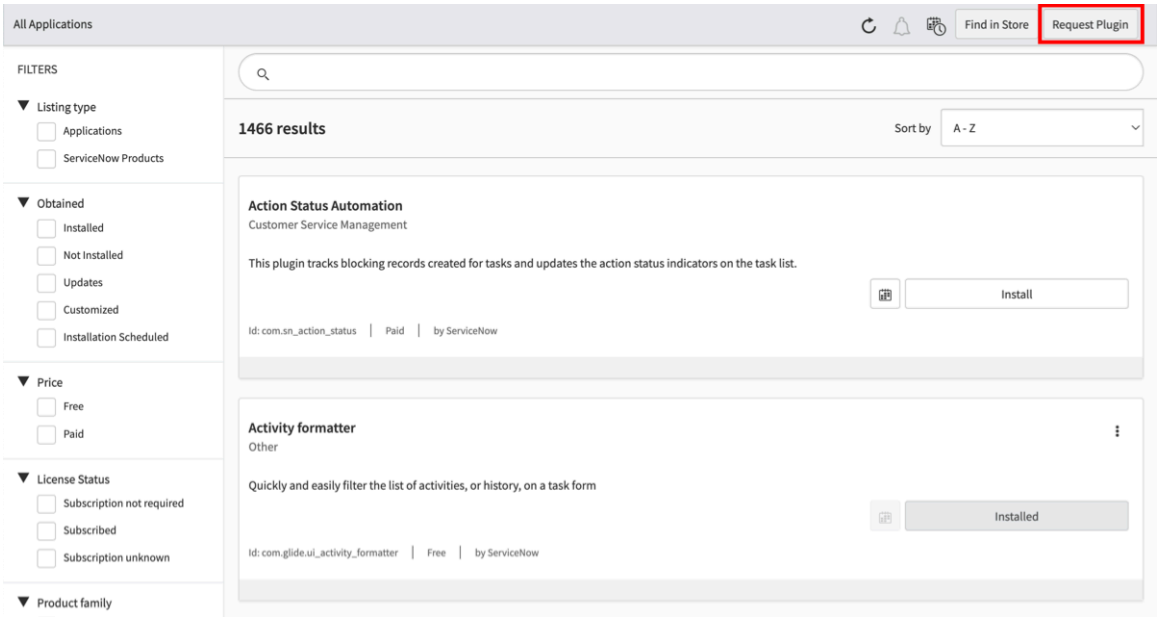
The Orchestration - ROI Premium plugin requires the Performance Analytics - Premium plugin, which must be purchased separately.

Role required: admin

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Select **Request plugin** to open the **Activate Plugin** form on Now Support.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. On the **Activate Plugin** form, provide the following information.

Activate Plugin form

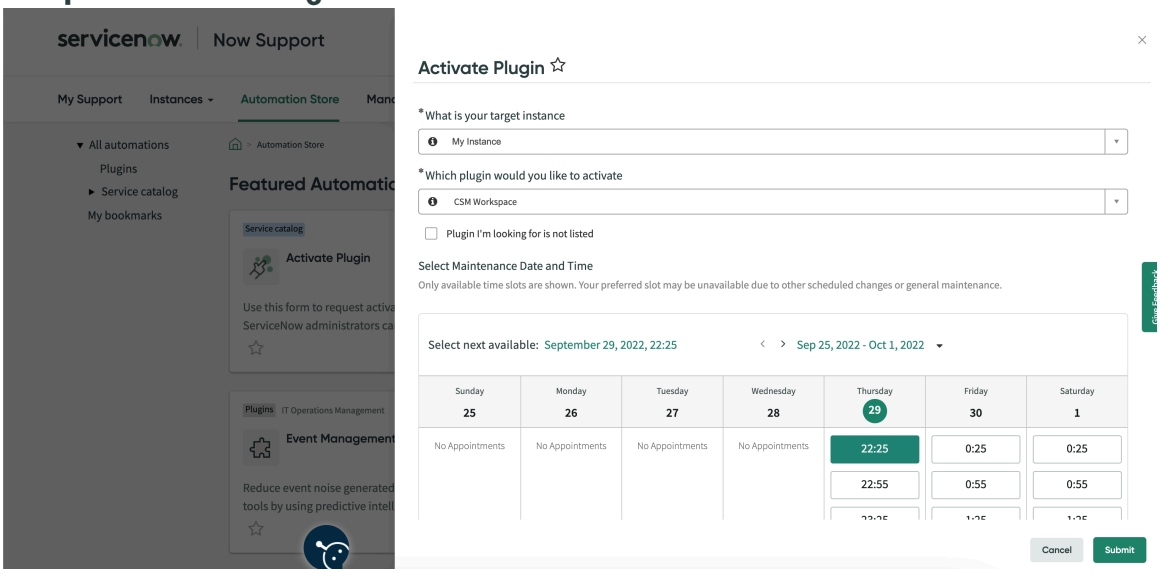
Field	Description
What is your target instance	Select the instance that you want to activate the plugin on.
Which plugin would you like to activate	Select the name of the plugin to activate. **Note:** If the system doesn't list the plugin you want or if you're activating the plugin on an OEM or on-premise instance, select the **Plugin I'm looking for is not listed** check box and then enter the name of the plugin.
Select Maintenance Date and Time	Select the date and time to activate the plugin.

Example

For example, see the following form to activate the Event Management plugin on an instance named SNC Instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Completed Activate Plugin form



4. Select **Submit**.
   After the maintenance window, the system installs the plugin on your instance. To confirm the installation, go to the Installed tab in the Application Manager.

Schedule Orchestration ROI calculations for premium reports

Orchestration ROI premium reports use a Performance Analytics job that must be activated before premium reports can be generated.

Before you begin

Role required: orchestration_manager, admin

About this task

The scheduled job required to calculate premium ROI reports is called [PA ROI] Historic Data Collection and is installed with the Orchestration - ROI Premium [com.snc.runbook_automation.roi_premium] plugin. This job is not active by default.

Procedure

1. Navigate to **All** > **Performance Analytics** > **Data Collector** > **Jobs**.
2. Search for the [PA ROI] Historic Data Collection job.
3. Select the **Active** check box.
4. The scheduling options appear for the value selected in the **Run** field.
   For instructions on creating a schedule, see Create or schedule a data collection job.
5. To execute the schedule directly from the job definition, click **Execute Now**.
6. Click **Update**.

Client Software Distribution

The Client Software Distribution (CSD) application allows administrators to distribute software from the service catalog using third-party management systems.

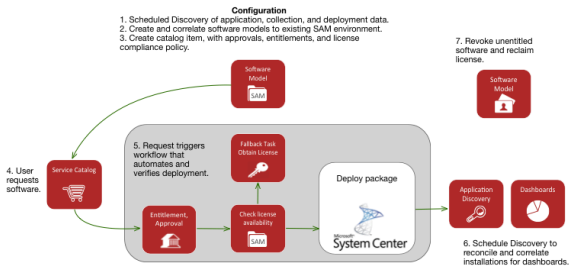
CSD allows an administrator to create all the records necessary to deploy software from service catalog requests, including software models and catalog items. You can use the CSD application to automate the deployment and revocation of software from an SCCM host using the custom SCCM activity pack. You can define lease periods for software distributed from the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Catalog and allow lease extensions in some cases, pending approvals. Deployment is accomplished using Orchestration activities and workflows.

CSD also integrates with Software Asset Management to manage license counts for deployed software.

CSD process flow using SCCM



Request client software distribution

Client software distribution requires the Orchestration - Client Software Distribution plugin (com.snc.orchestration.client_sf_distribution), which is available by request with a subscription to Orchestration.

Before you begin

Role required: admin

About this task

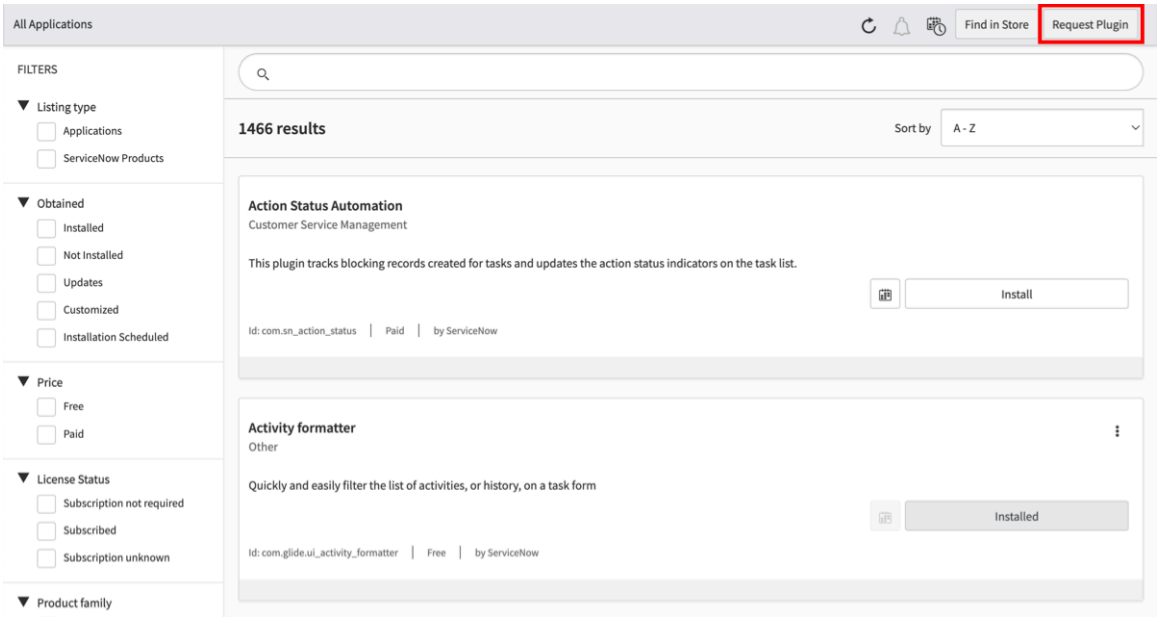
The Orchestration - Client Software Distribution plugin activates the Orchestration - System Center Configuration Manager plugin that contains the custom SCCM activities used to deploy or revoke software using an SCCM server. For additional plugin dependencies, see Plugins installed with client software distribution.

Note:
The Orchestration - Client Software Distribution plugin runs in its own application scope.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Select **Request plugin** to open the **Activate Plugin** form on Now Support.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. On the **Activate Plugin** form, provide the following information.

Activate Plugin form

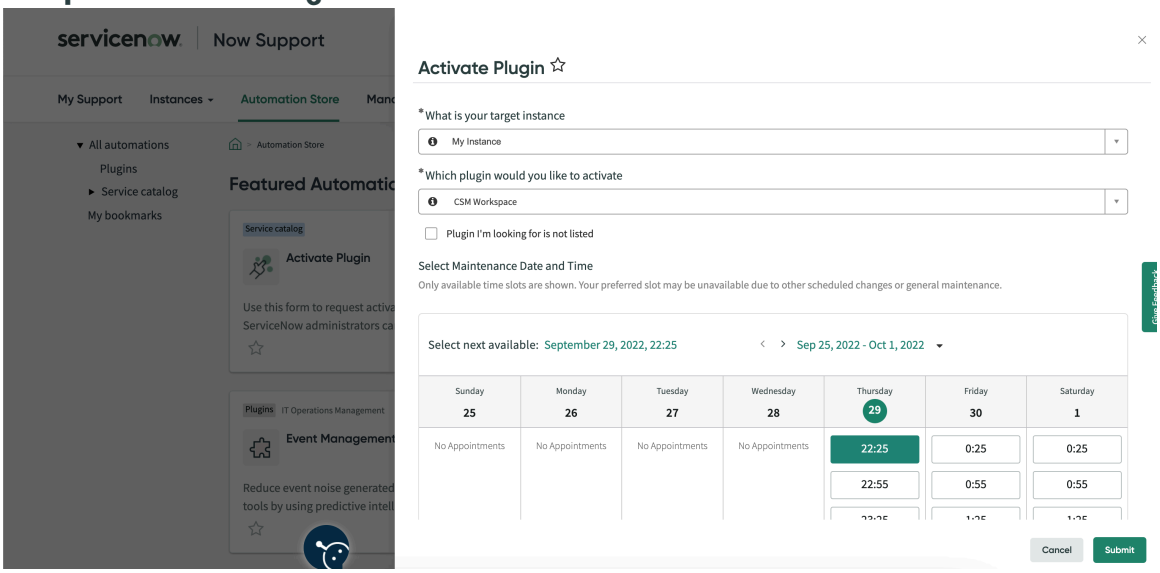
Field	Description
What is your target instance	Select the instance that you want to activate the plugin on.
Which plugin would you like to activate	Select the name of the plugin to activate. **Note:** If the system doesn't list the plugin you want or if you're activating the plugin on an OEM or on-premise instance, select the **Plugin I'm looking for is not listed** check box and then enter the name of the plugin.
Select Maintenance Date and Time	Select the date and time to activate the plugin.

Example

For example, see the following form to activate the Event Management plugin on an instance named SNC Instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Completed Activate Plugin form



4. Select **Submit**.
   After the maintenance window, the system installs the plugin on your instance. To confirm the installation, go to the Installed tab in the Application Manager.

Installed with client software distribution

Several types of components are installed with client software distribution (CSD).

Tables installed with client software distribution

These tables are installed with the Orchestration - Client Software Distribution plugin (com.snc.orchestration.client_sf_distribution).

Client software distribution tables

Table	Description
Client Software Distribution Catalog Item [sn_client_sf_dist_cat_item]	Contains all catalog items created for client software distribution. This table extends the Catalog Item [sc_cat_item] table.
Client Software Distribution Software Request [sn_client_sf_dist_req_software]	Contains all requested software, and their statuses.
Client Software Distribution Application [sn_client_sf_dist_application]	Contains all discovered CSD applications.
Client Software Distribution Provider [sn_client_sf_dist_provider]	Contains all software distribution providers.
Client Software Distribution Extension Key [sn_client_sf_dist_extension_key]	Contains the predefined CSD extension keys.
Client Software Distribution Extension Point [sn_client_sf_dist_extension_point]	Contains the customization script for the extension keys.
Client Software Distribution Software Configuration [sn_client_sf_dist_software_config]	Base table for all software provider configurations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Client software distribution tables (continued)

Table	Description
SCCM Server Instance [sn_client_sf_dist_cmdb_ci_sccm_server]	Contains all SCCM server instances. This table extends the Configuration Item [cmdb_ci] table.
SCCM Application [sn_client_sf_dist_sccm_application]	Contains all discovered SCCM applications. This table extends the Client Software Distribution Application [sn_client_sf_dist_application] table.
SCCM Application Catalog Item [sn_client_sf_dist_sccm_app_cat_item]	Contains all catalog items created for SCCM applications. This table extends the Client Software Distribution Catalog Item [sn_client_sf_dist_cat_item] table.
SCCM Collection [sn_client_sf_dist_sccm_collection]	Contains all discovered SCCM collections. Contains all discovered SCCM collections.
SCCM Deployment [sn_client_sf_dist_sccm_deployment]	Contains all discovered SCCM deployments. Contains all discovered SCCM deployments.
SCCM Configuration [sn_client_sf_dist_sccm_sf_config]	Contains the SCCM application, install and uninstall collections, and Discovery model. This table extends the Client Software Distribution Software Configuration [sn_client_sf_dist_software_config]

Plugins installed with client software distribution

These plugins are installed with the Orchestration - Client Software Distribution plugin, if they are not already active.

For instructions on requesting activation of Client Software Distribution (CSD) see Request client software distribution.

Plugins for Orchestration - Client Software Distribution

Plugin	Description
Orchestration - System Center Configuration Manager [com.snc.orchestration.sccm_mgnt]	Installs the custom SCCM Orchestration activities that do work on the SCCM target host.
Orchestration - Asset Lease Management [com.snc.orchestration.asset_lease_management]	Installs the lease functionality for software distributed through the Service Catalog. This includes starting, stopping, and extending leases.
Service Catalog Scoped API [com.glideapp.servicecatalog.scoped.api]	Installs the API to support application creation in the Service Catalog.
Software Asset Management [com.snc.software_asset_management]	Provides the ability to manage software assets, including the reconciliation of entitlements to licenses for named users, workstation, and enterprise software agreements.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles installed with client software distribution

These roles are installed with the Orchestration - Client Software Distribution plugin.

Roles for Orchestration - Client Software Distribution

Role title [name]	Description	Contains Roles
Client software distribution admin [sn_client_sf_dist.csd_admin]	Administrator role for managing client software distribution application.	• sam • agent_admin • report_admin • catalog_admin • itil • workflow_admin

Script includes installed with client software distribution

These script includes are installed with the Orchestration - Client Software Distribution plugin

Script includes for Orchestration - Client Software Distribution

Script include	Description
CSDExtensionPoint	Execute the CSD provider's specific code
CSDUtil	Utility functions for the CSD application.
RefQualsCSD	Reference qualifier filter. This script provides the filter functrions for the CSD providers, devices, SCCM application, install collections, and uninstall collections.
SCCMCatItemHandler	Sets the field values of specific SCCM catalog items. These values are the SCCM catalog item table name, catalog item name, SCCM provider, and SCCM software configuration.
SoftwareCatItemCreator	Creates software catalog items
CSDCatItemHandler	Base class for CSD catalog item creation. This script is used by the Create Catalog Item UI action to create and application catalog.
CSDDemoDataUtil	Populates demo data.
CSDDemoDataUtilAjax	Populates demo data.

Properties installed with client software distribution

Properties for client software distribution (CSD) manage the installation status of requested software deployments and configure scheduled Discoveries.

To access CSD properties, navigate to **Client Software Distribution** > **Properties**. The following properties are available:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Client software distribution properties

Property	Name	Description
Status check expiration interval (days)	sn_client_sf_dist.softwareInstallExpDays	Controls how many days the system waits before ignoring the software installation status. The default time limit for installing software is 30 days before the system stops checking the installation status of a deployment. Installation statuses are: • **Not installed**: User has not installed requested software prior to the expiration of the configured time limit. • **Installed**: Software was installed within the configured time limit. • **Status check expired**: Time limit has expired for the user to install the requested software. The system no longer checks the status of this deployment. • **Revoked**: Software was revoked by the administrator. • **Type**: integer • **Default value**: 30
Reconcile software installation status interval (hours)	sn_client_sf_dist.softwareInstallIntervalHour	Determines when the scheduled job runs that determines the installation status. By default, the system checks the installation status every hour. • **Type**: integer • **Default value**: 24
Set scheduled application Discovery interval (days).	sn_client_sf_dist.discoveryExeDay	Sets the repeat interval for the scheduled job that runs application Discovery. By default, Discovery runs at midnight on the day set with this value. • **Type**: integer • **Default value**: 5
Set lease execution schedule job interval (minutes)	sn_client_sf_dist.lease_execution_interval	Interval in which the CSD Lease Schedule scheduled job checks for requested software leases to start, stop, or extend.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Client software distribution properties (continued)

Property	Name	Description
		• **Type**: integer • **Default value**: 1
Set time prior to lease end to notify requester (days)	sn_client_sf_dist.lease_end_notification	Determines how many days prior to the end of a software lease to notify the requester. If lease extensions are allowed, ensure that this period provides enough time for the approval process to complete before the lease expires. • **Type**: integer • **Default value**: 5

Workflows installed with client software distribution

These workflows are installed with the Orchestration - Client Software Distribution plugin

Workflows installed with client software distribution

Workflow	Description
Discover SCCM	Retrieves lists of applications, collections, and deployments from SCCM servers using custom CSD orchestration activities. An administrator runs this workflow from a UI action in a SCCM Server Instance record.
Order Client Software	Runs automatically when a user orders software from the service catalog.
Deploy SCCM Application	Triggered by the Order Client Software workflow to deploy software through SCCM server. This workflow adds either the user or the device into the SCCM collection.
Revoke Client Software	Begins the software revocation process for software deployed by an external provider. Administrators run this workflow from a UI action on the Requested Software record and the Installed Software Not Entitled record. This workflow triggers the appropriate provider workflow that performs the actual recovation. For example, this workflow triggers the Revoke SCCM Application workflow for applications in SCCM uninstall collections.
Revoke SCCM Application	Revokes SCCM applications that are members of an uninstall collection. The Revoke Client Software workflow triggers this workflow to revoke software deployed by an SCCM server. This workflow moves either the user or the device from the SCCM collection into the appropriate uninstall collection.

Create licenses and counters for distributed software

Licenses and software counters are associated with the software model and must be created if you want to track the license for software deployed by client software distribution (CSD).

Before you begin

Role required: sam or admin

You can create software licenses and counters in Software Asset Management for software items deployed from the service catalog by CSD. CSD depends on the software counter result to determine if the license is available for the requested software. If the license **Valuation** is greater than 0, and the license type is **Not allocated**, CSD assumes that the license is available for the software.

Procedure

1. Navigate to **All** > **Software Asset** > **Software Licenses**.
2. Add a new software license for the software model you used in CSD.
3. Navigate to **Software Asset** > **Reconciliation** > **Software Counters**.
4. Create a software counter for the software model you created.
5. Run the counter to retrieve the software license information.

Client software distribution ordering process

Software deployed by Client Software Distribution (CSD) can be ordered from the service catalog by individual users or by approved users on behalf of others.

Client Software Distribution catalog items have different options, depending on how ordering is configured.

Lease start and end dates

All software deployed by CSD requires users to specify the beginning date for the lease. This is enforced by the Orchestration - Asset Lease Management plugin that is activated automatically with CSD. The system prepopulates the **Lease start** field with the current date and time.

If the catalog item is configured for revocation (uninstall), the form displays the **Lease end** field, which allows the requester to define an end date and time for the lease. The system validates user input in these fields to ensure that the dates selected define a future window. The **Lease end** field is not mandatory and can be left blank to order software with no end date.

Note:
For systems deploying software from Microsoft System Center Configuration Management (SCCM), the **Lease end** field is only available if the SCCM configuration specifies an uninstall collection.

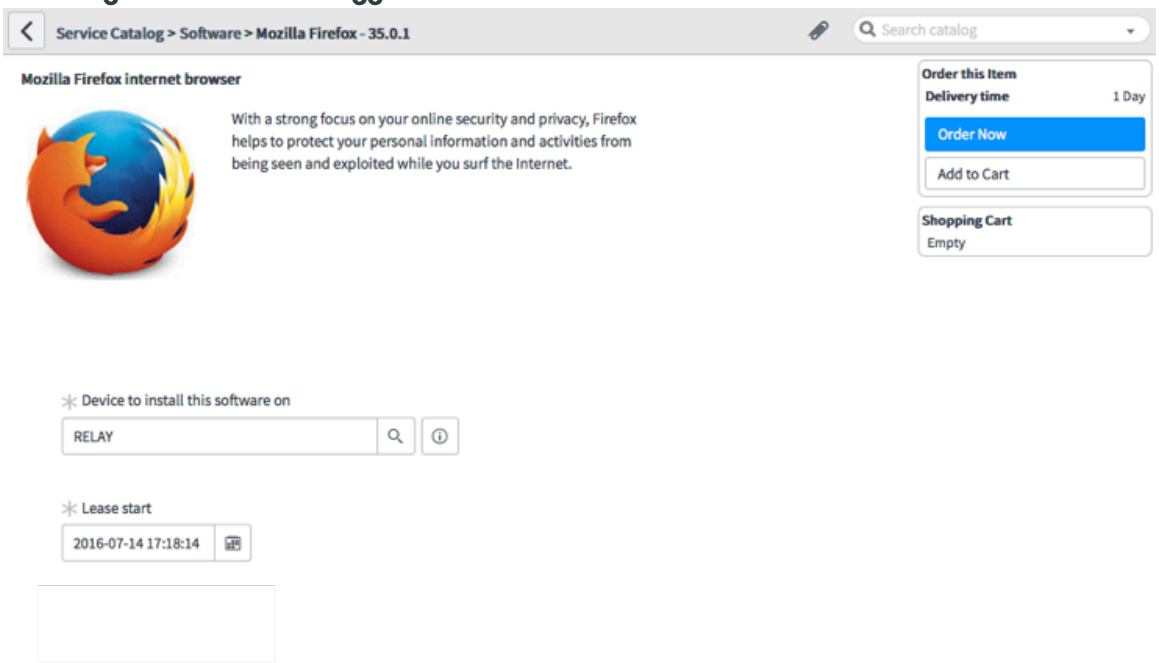
Software offered only to the logged in user

If the software catalog item is configured with the **Order on behalf of** check box cleared, the **User** field does not appear on the order form. The logged in user selects the device on which to deploy the software from the **Device to install this software on** field. Only those devices assigned to the logged in user appear in the list.

In this example, a user has logged into the service catalog to order Firefox for a computer that is assigned to the user. User selects the machine from a list of owned devices and selects the date and time the lease should begin. This software is deployed through Microsoft System Center Configuration Management (SCCM), but does not have an uninstall collection configured and cannot be revoked automatically by the system. As a result, the **Lease end** field is not available.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Ordering software as the logged in user



Software ordered on behalf of another user

If the software catalog item is configured with the **Order on behalf of** check box selected, the **User** field appears on the form. The logged in user can select any user from this field. The **Device to install this software on** field only lists the devices assigned to the user selected in the **User** field. If an approval is required for software ordered on behalf of another user, the system automatically sends an approval request to the manager of the user receiving the software. The approval is skipped if the requester is the named user's manager.

In this example, a manager is ordering Google Chrome for a contractor. The manager selects the contractor from the **User** field and then chooses a computer from the list of devices assigned to the contractor. This software has an SCCM uninstall collection configured, which allows the manager to select an end date for the lease that coincides with the end of the user's contract. When the lease expires, SCCM automatically uninstalls the software from the device.

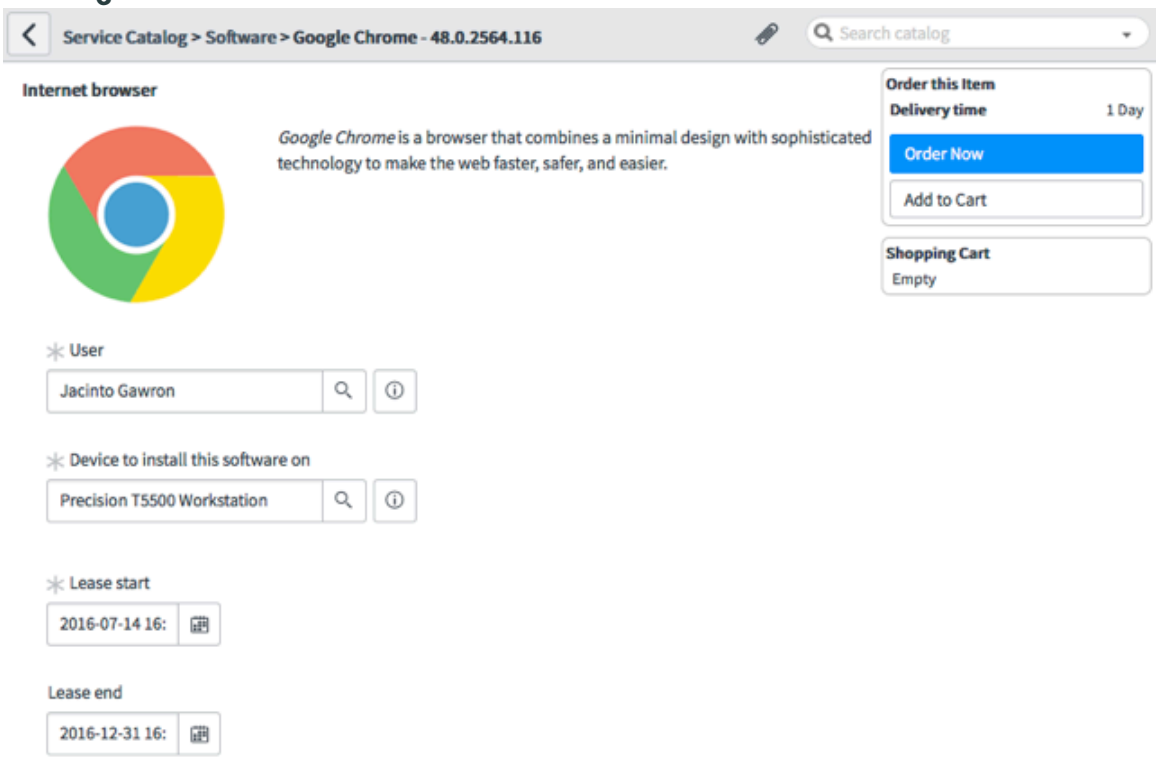
Defining software lease window



Extend a software lease

Users of software deployed by Client Software Distribution (CSD) can request the extension of a lease window, if the software is revocable by a software distribution system.

Before you begin

Role required: Any system user

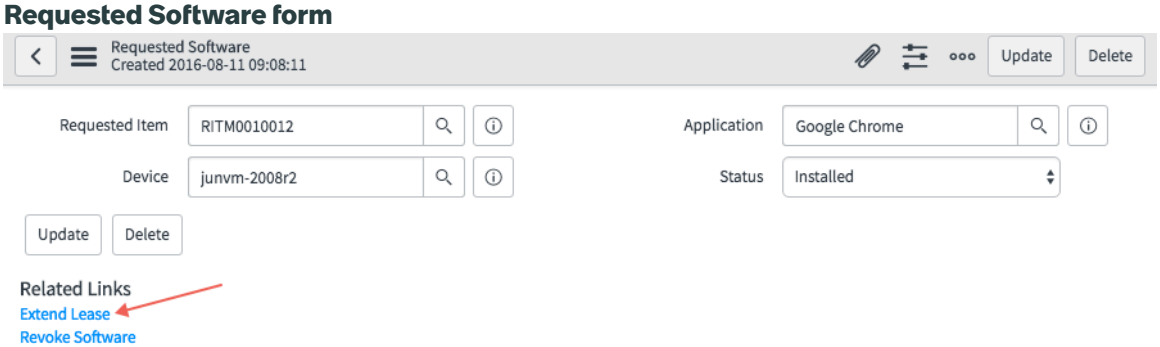
About this task

If your software has a lease end date defined, and the software status is **Installed**, you can request an extension of the lease, pending any approvals your organization requires.

Procedure

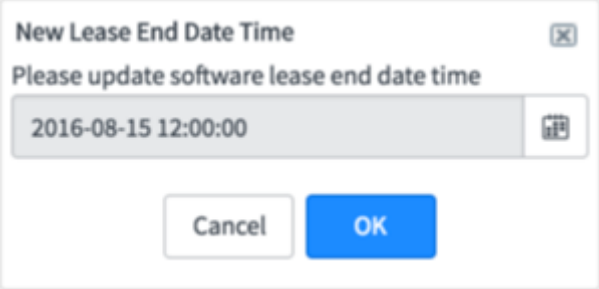
1. Navigate to **All** > **Service Catalog** > **My Requested Software**.
   The list shows only the software you have requested from the service catalog.
2. Select the record for the installed software whose lease you want to extend.
3. Under **Related Links** click **Extend Lease**.

Requested Software form



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the dialog box that appears, select a new lease end date in the calendar and click **OK**. You must select a date later than the current date.



If the lease extension is subject to manager approval, you are notified of the decision. If the request is approved, a notification shows the new lease end date. If the new end date is within 5 days (the default notification period) of the date when you made the request, CSD sends an immediate end-of-lease notification.

Important:
If lease extensions in your organization require approval, make sure the approver is available and has enough time to process your extension request. If the extension cannot be approved before the original end date expires, the software is revoked.

Client software distribution from SCCM

You can use Client Software Distribution (CSD) to deploy and revoke software deployments from Microsoft System Center Configuration Management (SCCM) and manage distributions on SCCM hosts.

The SCCM activity pack contains Orchestration activities that CSD uses to deploy software from a service catalog request and manage user and device collections on SCCM servers. In addition, CSD can manage license counts for deployed software using ServiceNow Software Asset Management, revoke software deployed by SCCM without user interaction, and manage lease periods.

Configuring SCCM

Follow the SCCM configuration procedures in the order shown.

Configure the Application Administrator role on the SCCM server

To deploy software using ServiceNow® Client Software Distribution (CSD), ensure that an SCCM administrative user has the correct permissions to deploy software and that PowerShell is properly configured.

Before you begin
SCCM role required: Application Administrator

About this task
These instructions are for Microsoft 2012 R2 Server.

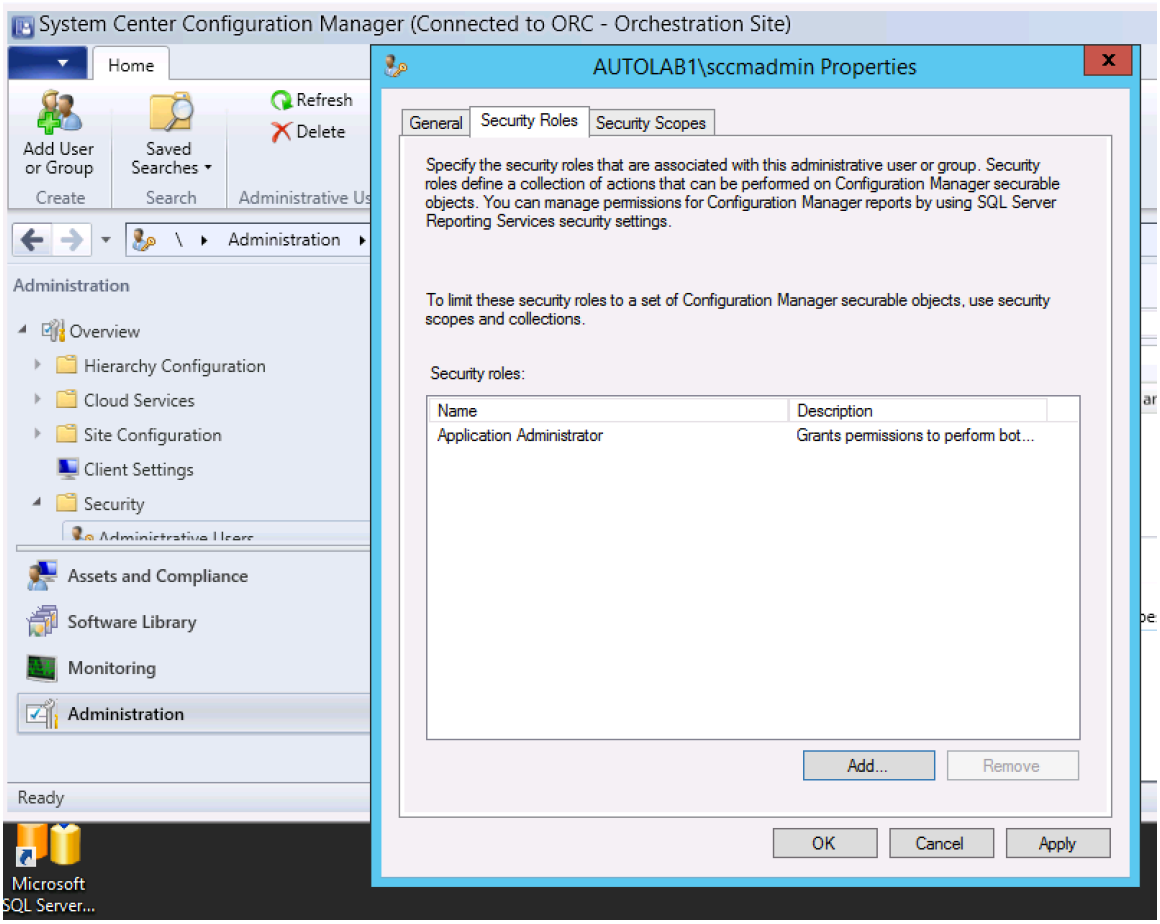
Procedure

1. In the System Center Configuration Manager console, navigate to **Administration** > **Security** > **Administrative Users**.
2. Right-click the user to whom you want to grant the Application Administrator role.
3. Select **Properties** from the drop-down menu.
4. In the Properties dialog box, select the **Security Roles** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Ensure that the user has the Application Administrator role.
6. If the user does not already have this role, click **Add**, select this role from the list, and click **OK**.

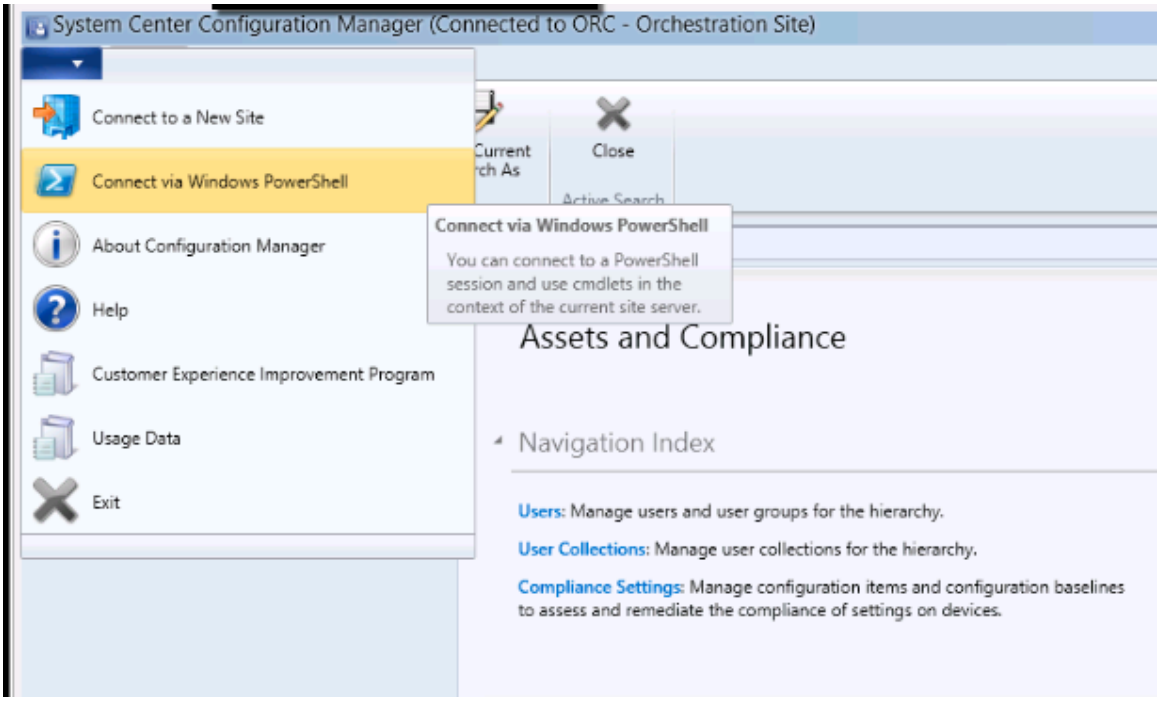
Granting the Application Administrator role on the SCCM server



7. Log into SCCM as the user with the Application Administrator role.
8. Open the menu from the upper left corner of the console and select **Connect via Windows PowerShell**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connect to PowerShell



9. Ensure that the user can access the CM console.
   This action establishes the environment path to PowerShell for the logged in Application Administrator user.

Update the SCCM cmdlet libraries

Ensure that the System Center Configuration Manager SCCM Cmdlet Library is up-to-date.

Before you begin

Role required: Either current user or system administrator, depending on settings.

About this task

The System Center Configuration Manager SCCM Cmdlet Library installs and updates the Windows PowerShell module for SCCM. SCCM checks for library updates on a daily basis. Out-of-date libraries can cause Discovery of the SCCM server to fail, because the system cannot parse the SCCM activity output. This warning message appears in the ECC queue input records for the SCCM GET activities:

```
WARNING: An update to the System Center 2012 Configuration
 Manager Cmdlet
Library is available. Please go to
'http://go.microsoft.com/fwlink/?LinkId=528947' to download the
 latest version.
Running cmdlet version: 5.0.8231.1004 Latest cmdlet version:
 5.0.8328.1155
```

Download the latest version of the cmdlet library from Microsoft. For installation instructions, see https://learn.microsoft.com/en-us/fabric/enterprise/powerbi/service-admin-reference.

If you elect to use an earlier version library, use this procedure to disable the CM update check, which allows Discovery to prodeed without issues.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Log into the SCCM console as an adminstrator.
2. Open the menu from the upper left corner of the console.
3. Select **Connect via Windows PowerShell**.
4. Run one of these commands to disable the update check:
   - **Per-user**: `Set-CMCmdletUpdateCheck -CurrentUser -IsUpdateCheckEnabled 0`
   - **Per-system**: `Set-CMCmdletUpdateCheck -System -IsUpdateCheckEnabled 0`

   Important:
   The per-system cmdlet must run in an elevated Windows PowerShell session.
5. Run the `Get-CMCmdletUpdateCheck` command to refresh the console and check the settings.
6. Ensure that the value of the `IsEnabled` configuration variable has changed to **False**. This indicates that the warning for an out of date cmdlet library is disabled for the users specified.
7. To re-enable the update check, run the `-IsUpdateCheckEnabled 1` command for either the current user or for the system.

Configure the MID Server for SCCM activities

To use a MID Server with Microsoft System Center Configuration Management (SCCM) activities, configure it to communicate with the SCCM server.

Before you begin

Role required: admin

Procedure

1. In the navigation filter, enter **cmdb_ci_dns_name.list**.
2. Click **New**.
3. Enter the fully-qualified domain name (FQDN) of the SCCM server in the **Name** field.
4. Right-click in the form header and select **Save**.
5. In the **IP Address** related list, click **New**.
6. In the **IP Address** field, enter the IP address of the SCCM server.
7. In the **Nic** field, select **eth0** or your preferred network interface controller.
8. Leave the **Netmask** field blank.
9. Click **Submit**.

Create Windows credentials for SCCM deployments

Microsoft System Center Configuration Manager (SCCM) requires the appropriate credentials to deploy applications using the Client Software Distribution application.

Before you begin

Role required: sn_client_sf_dist.csd_admin or admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
Client software distribution requires Windows credentials that have administrative rights on the SCCM server.

Procedure
1. Navigate to **All** > **Orchestration** > **Credentials**.
2. Click **New**.
3. In the list of credential types, select **Windows Credentials**.
4. Provide a user name and password with administrative rights on the SCCM server.

> **Important:**
> Ensure the following:
> - This user must have the Application Administrator role on the SCCM server.
> - Use the credentials to log into the SCCM Server and connect via Windows PowerShell from the System Center Configuration Manager console at least once to set the path variable for that credential.

5. Fill in the other fields on the form, as appropriate.

   For details, see Windows credentials.
6. Click **Submit**.

Retrieve SCCM data for client software distribution

Retrieve the collections and the list of applications available for deployment from your SCCM servers.

Before you begin
Role required: sn_client_sf_dist.csd_admin or admin

Before starting this procedure:

- Set up your Microsoft System Center Configuration Manager (SCCM) server, create the applications and collections, and configure the deployments you need. For information, see your SCCM documentation.
- Configure a user with the Application Deployment Manager role on the SCCM server.
- Set up the MID Server to communicate with the SCCM server.
- Add Powershell credentials to the ServiceNow Credentials [discovery_credentials] table for the SCCM user who has the Application Deployment Manager role.

About this task
To populate the Client Software Distribution application with SCCM data:

Procedure
1. Navigate to **All** > **Client Software Distribution** > **SCCM** > **SCCM Server Instance**.
2. Click **New**.
3. In the SCCM Server Instance form, identify the server by name and provide the fully qualified domain name.
4. Click **Submit**.

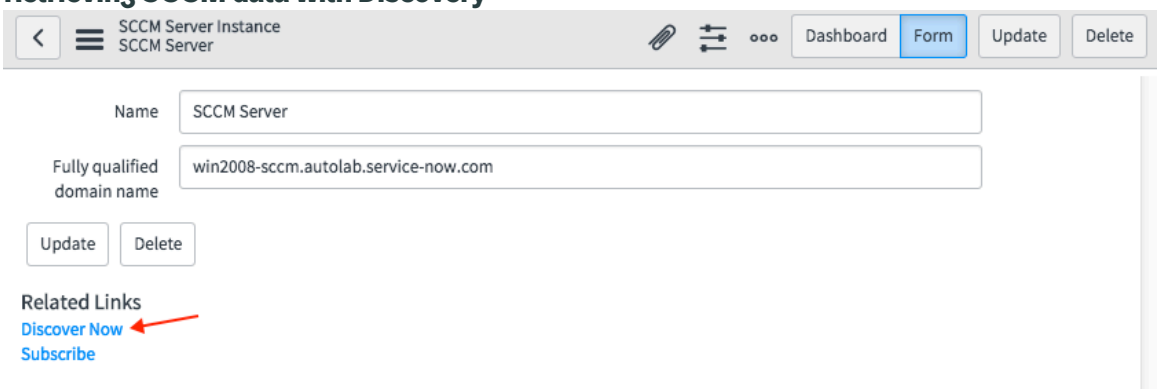
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The new SCCM server appears in the list.

5. Open the new SCCM record and click **Discover now** under **Related links**.

   The system runs the Discover SCCM workflow that retrieves the application, collection, and deployment data from the SCCM server.

Retrieving SCCM data with Discovery



SCCM server Discovery for client software distribution

A Discovery workflow populates ServiceNow tables with collection, application, and deployment data retrieved from SCCM servers.

Users run the **Discover SCCM** workflow from an SCCM Server Instance record to populate the following ServiceNow tables:

SCCM data populated in ServiceNow tables

Table	Fields
SCCM Application [sn_client_sf_dist_sccm_application]	• name • publisher • version • model • sccm_server
SCCM Collection [sn_client_sf_dist_sccm_collection]	• name • type • sccm_server
SCCM Deployment [sn_client_sf_dist_sccm_deployment]	• application • collection • type

Note:
For details about the custom activities used in this workflow to extract data from an SCCM server, see Orchestration SCCM activity pack.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up a software model for an SCCM application

Using the applications discovered on the SCCM server, set up a software model used by the Software Asset Management application to manage licenses.

Before you begin

Role required: sn_client_sf_dist.csd_admin or admin

Before creating software models, you must discover the applications available for deployment on the SCCM server. See Retrieve SCCM data for client software distribution for details.

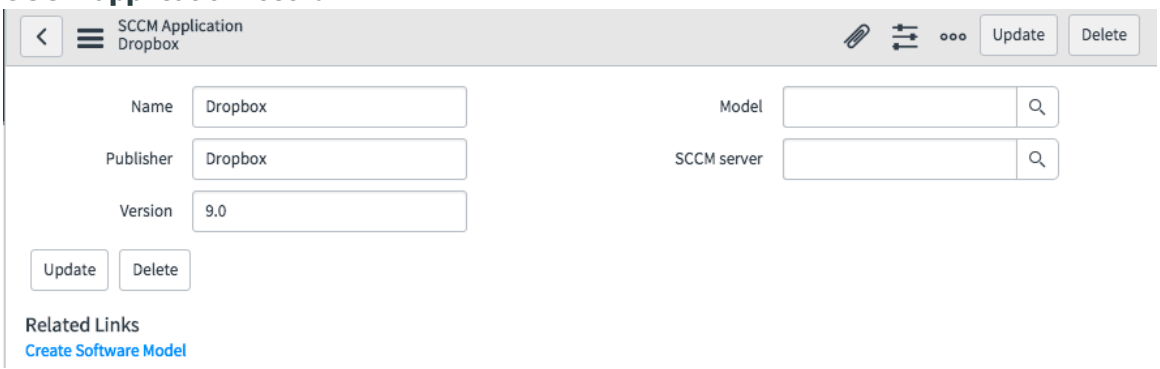
About this task

You can link an SCCM application to an existing software model or create a new model.

Procedure

1. Navigate to **All** > **Client Software Distribution** > **SCCM** > **SCCM Applications**.
   A list of applications discovered on the SCCM server appears.
2. Open an SCCM application record.
3. To link to an existing model, click the magnifying glass icon in the **Model** field and select a model from the list.

SCCM application record



4. To create a model, click **Create Software Model** under **Related Links**.

   a. Complete the software model fields.
   See for details.

   b. Click **Submit**.
   The view returns to the SCCM Applications form.

Define an SCCM configuration

To create catalog items for SCCM software deployment or to configure your instance to revoke software through SCCM, you must first associate that software with a collection through an SCCM configuration.

Before you begin

Before you create an SCCM configuration record, make sure you have discovered the SCCM applications, collections, and deployments and set up the necessary software models.

Role required: sn_client_sf_dist.csd_admin or admin

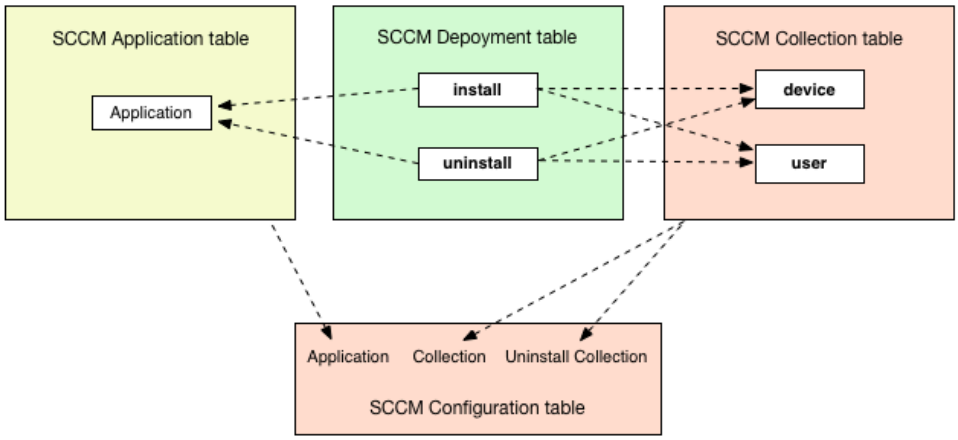
About this task

The SCCM configuration process associates software with SCCM collections. To deploy software from an SCCM server, the user or device must be a member of an SCCM collection associated

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

with an **install** deployment. Client Software Distribution (CSD) allows you to revoke unentitled software using an SCCM server when that software can be removed using an **uninstall** collection. Users requesting revokable software from the Service Catalog also have the ability to define lease start and stop dates and request lease extensions.

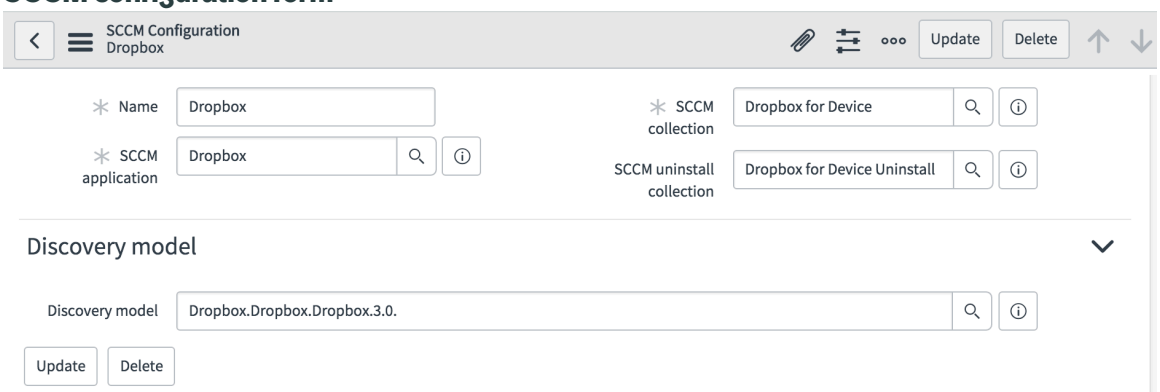
SCCM table references



Procedure

1. Navigate to **All** > **Client Software Distribution** > **SCCM** > **SCCM Applications**.
2. Open an application that has a configured software model.
3. Under **Related Links**, click **Create Software Configuration**.
4. Complete the form, using the fields in the table.

SCCM configuration form



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SCCM configuration fields

Field	Description
Name	Recognizable name for this SCCM software configuration.
SCCM application	Name of an application hosted on the SCCM server.
SCCM collection	Name of the collection associated with the **install** deployment for the selected application on the SCCM server. Only those collections associated with the application are available for selection.
SCCM uninstall collection	Name of the collection associated with the **uninstall** deployment for the selected application on the SCCM server. You must specify an uninstall collection to: ○ Define a lease end date for deployed software. ○ Allow lease extensions. ○ Revoke software from a user's machine.
Discovery model	Discovery model that links the unentitled software installation with the SCCM configuration. From the SCCM configuration record, Client Software Distribution can determine which collection to use to revoke the software. Unentitled software is software found on the user's machine that the user is not entitled to use.

Create a catalog item for an SCCM application

Using the applications discovered on the SCCM server, create a catalog item for an application you want to offer for distribution from the service catalog.

Before you begin

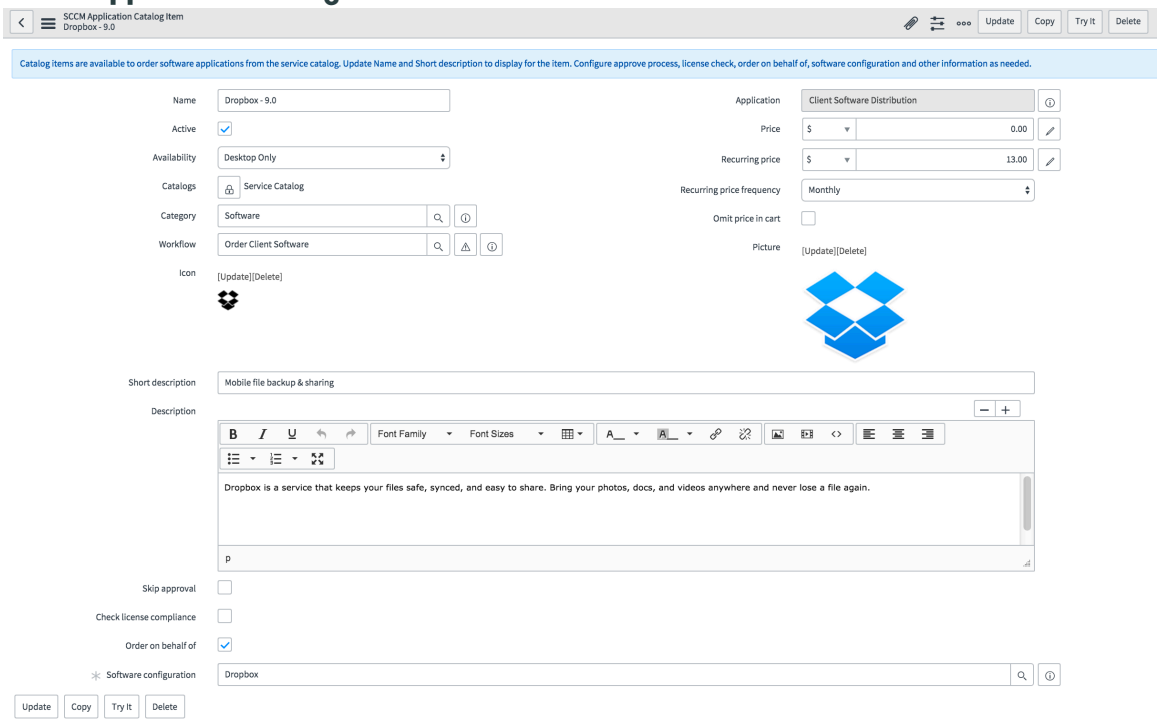
Role required: sn_client_sf_dist.csd_admin or admin
Before creating a catalog item, you must link the application to a software model and create at least one software configuration.

Procedure

1. Navigate to **All** > **Client Software Distribution** > **SCCM** > **SCCM Applications**.
   A list of applications discovered on the SCCM server appears.
2. Open a record for an SCCM application.
3. Under **Related Links**, click **Create Catalog Item**.
   A new SCCM Application Catalog Item record appears with preconfigured information. .

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SCCM application catalog item



4. Add price information and complete the following fields added to the Client Software Distribution Catalog Item [sn_client_sf_dist_cat_item] table by the Orchestration - Client Software Distribution plugin:

SCCM fields in the catalog item form

Field	Description
Skip approval (skip_approval)	Check box that allows skipping approval for this item by the requester's manager when a user orders it from the service catalog. Use this field in conjunction with the **Order on behalf of** field to ensure that software ordered by a logged in user on behalf of another user is subject to approval. By default, this check box is cleared, requiring manager approval for all new catalog items. **Note:** There are two levels of approval possible. By default, all category items require group approval for items in excess of $1000. If that approval is given or skipped, the system evaluates the **Skip approval** check box to determine if the software item requires approval by the requester's manager.
Check license compliance (check_license_compliance)	Check box that forces the system to determine if deploying this item is allowed under the current license.
Order on behalf of	Check box that allows the logged-in user to order this software from the service catalog for another user. This permits service desk personnel to order SCCM deployments for other users in the system. By default, this feature is enabled. To prevent unauthorized users from ordering software, ensure that

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	approvals are required for this type of deployment by clearing the **Skip approval** check box. If an approval is required for software ordered on behalf of a user, the system automatically sends an approval request to the manager of the user receiving the software. The approval is skipped if the requestor is the named user's manager. Software items requested from the service catalog on behalf of a different user require the following information: ○ **User**: User selected for deployment. This field is automatically populated with the name of the logged in user. You can select another user from the list. ○ **Device to install this sofware on**: Device belonging to the selected user on which to deploy the software. Only devices belonging to that user appear in the choice list. ○ **Lease start**: Date and time to deploy the software. This is the start time for the lease. A lease can be open-ended or have a lease end time.
SCCM configuration	Name of the SCCM configuration record for this application. This record defines the collection and uninstall collection for this application. This configuration is required for all deployments, revocations, and leases performed by the SCCM server.

5. If the catalog item requires approval because of cost, be sure to configure an approval group in the**Approved By Group** related list.
   By default, the Service Catalog Request workflow runs when an item costing more than $1000 is ordered and looks for an appropriate approval group. If no approval group is configured for the item, this workflow skips approval altogether and ends. The system then runs the Order Client Software workflow, which evaluates the **Skip approval** check box to determine if approval by the requester's manager is required.
6. Click **Update**.
   The view returns to the SCCM Applications list.
7. To see all client software distribution (CSD) catalog items, navigate to **Client Software Distribution** > **Maintain Items** > **Software Items**.

SCCM deployment

Ordering an SCCM application from a client software distribution (CSD) catalog item in the service catalog triggers the Order Client Software workflow.

This process deploys an SCCM application to a user or device through a service catalog order:

1. If the **Skip approval** check box is cleared in the software catalog item, the Order Client Software workflow sends the catalog request to the requesting user's manager for approval.
2. If the **Check license compliance** check box is selected in the software catalog item, the workflow performs a software license check. If there is no license available, the workflow creates a catalog task to procure more licenses and assigns the task to the Client Software Distribution Administrators group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. The Order Client Software workflow triggers the Deploy SCCM Application workflow as a subflow. This workflow adds either the user or the device to the SCCM collection using the Add to User Collection or Add to Device Collection SCCM activity.
4. If the software configuration specifies SCCM uninstall collection in the software catalog item, the Deploy SCCM Application workflow checks if the user or device exists in the uninstall collection. The workflow uses the Is Device in Collection or Is User in Collection SCCM activity. If the user or device exists in the uninstall collection, the workflow removes the device or user. The workflow uses the Remove from Device Collection or Remove from User Collection SCCM activity before adding it to the SCCM install collection.

Client software distribution validation process

After SCCM deploys software to a target computer, client software distribution (CSD) detects the installation and validates its status.

Client software distribution uses the following methods for detecting software installed on the target machine:

- **Discovery**: CSD is configured to leverage Discovery to detect software installations. You can run Discovery manually at any time, or by a scheduled job.
- **Microsoft SCCM Integration**: You can import SCCM data into the CMDB using the features in the Integration - Microsoft SCCM plugin if Discovery is not active on the instance.

The instance uses the data gathered by Discovery or the SCCM integration plugin to populate the Software Installation [cmdb_sam_sw_install] table. To validate installations using this data, CSD runs a scheduled job called Reconcile Requested Software that uses Properties installed settings. This process reconciles the software installation data accumulated in the CMDB and makes these status updates:

- **Not installed** to **Installed**: The user has installed the requested software within the time limit configured in the *sn_client_sf_dist.softwareInstallExpDays* property.
- **Not installed** to **Status check expired**: The time limit has expired for the user to install the requested software. The system stops checking for installation when the time limit expires.

SCCM software revocation

An administrator can revoke software without any user interaction using Microsoft System Center Configuration Manager (SCCM) if the software configuration specifies an SCCM uninstall collection, even if the software was installed by some other process or user.

Revoke software deployed through the service catalog

Software deployed by SCCM can be revoked, but only when the software's status is **Installed** and the application associated with the software configuration has an uninstall collection configured.

Before you begin

- Create an SCCM configuration record for the application that names an appropriate uninstall collection.
- Associate the CSD catalog item for the application with the SCCM configuration that specifies the uninstall collection.

Role required: sn_client_sf_dist.csd_admin or admin

A workflow called Revoke SCCM Application moves either the user or the device from its respective collection and adds it to the appropriate uninstall collection. When SCCM performs

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

an internal policy check and finds the user or device in the uninstall collection, SCCM removes the related software package from the client computer.

Procedure

1. Navigate to **All** > **Client Software Distribution** > **Reports** > **Requested Software**.
2. Open the record for the SCCM software package you want to revoke.
   The package must have a **Status** of **Installed** to be revocable.
3. Under **Related Links**, click **Revoke software**.

   This action runs the Revoke Client Software workflow, which triggers the Revoke SCCM Application subflow that moves the user or device from the install collection to the uninstall collection. When SCCM performs an internal policy check and finds the user or device in the uninstall collection, SCCM removes the related software package from the client computer.

Revoke unentitled software

An administrator can revoke software using Microsoft System Center Configuration Manager (SCCM) that a user is not entitled to use even if the software was installed by some other process or user.

Before you begin

To revoke software using SCCM, you must create an SCCM configuration record for the application, in which the appropriate software Discovery model is defined. See Software discovery models.

Role required: sn_client_sf_dist.csd_admin or admin

Client Software Distribution (CSD) uses Software Asset Management to identify unentitled software installations. Discovery detects the software on the user's machine, and SAM determines if the user or device is entitled to use that software. This might include software that was not installed through a catalog request or software that the user installed without approval. If the software installation's Discovery model is associated with an SCCM software configuration that has an uninstall collection defined, then an administrator can use CSD to revoke that software from the user's machine without involving the user.

Procedure

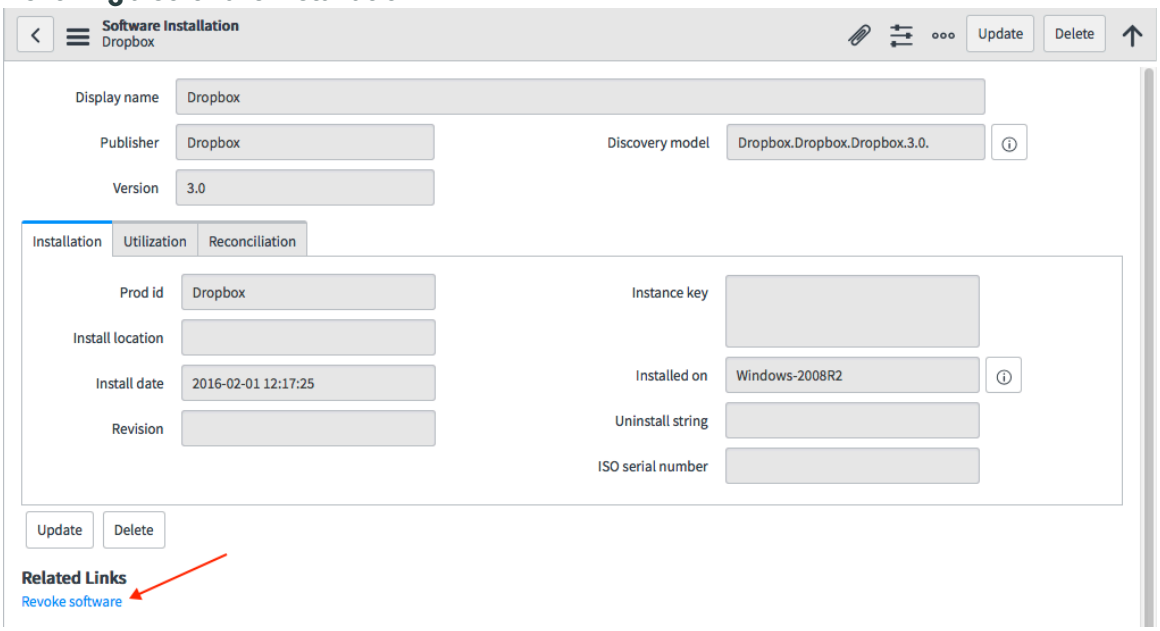
1. Navigate to **All** > **Client Software Distribution** > **Reports** > **Installed Software Not Entitled**.
2. Select the record for the installation that has unentitled users.
3. Under **Related Links**, click **Revoke software**.

   This action runs the Revoke Client Software workflow, which triggers the Revoke SCCM Application subflow that moves the user or device from the install collection to the uninstall

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

collection. When SCCM performs an internal policy check and finds the user or device in the uninstall collection, SCCM removes the related software package from the client computer.

Revoking a software installation



SCCM software revocation workflow

The Revoke SCCM Application workflow moves a user or device from an install collection to an uninstall collection to revoke software installed from Microsoft System Center Configuration Manager (SCCM).

For the revocation workflow to run, the software package must have a status of **Installed** and must be pre-configured for an appropriate uninstall collection. See Revoke software deployed through the service catalog for configuration instructions. When an administrator initiates the revocation process, the system launches the Revoke SCCM Application workflow to move the user or device collection associated with installation to the appropriate SCCM uninstall collection. When the SCCM server performs a policy check, it finds the additions to the user or device uninstall collection and revokes the software package associated with that collection.

The workflow employs two custom activities, Remove from User Collection and Remove from Device Collection, to remove either the user or the device from its original collection. The workflow then adds the user or device to the appropriate uninstall collection on the SCCM server with the Add to User Collection or Add to Device Collection activity.

Note:
This workflow is triggered by the Revoke Client Software workflow as a subflow.

Client software distribution dashboard

The CSD dashboard provides a collection of visual reports for the Client Software Distribution application.

CSD dashboard

To access the CSD dashboard, navigate to **Client Software Distribution** > **Requested Software** > **Dashboard**.

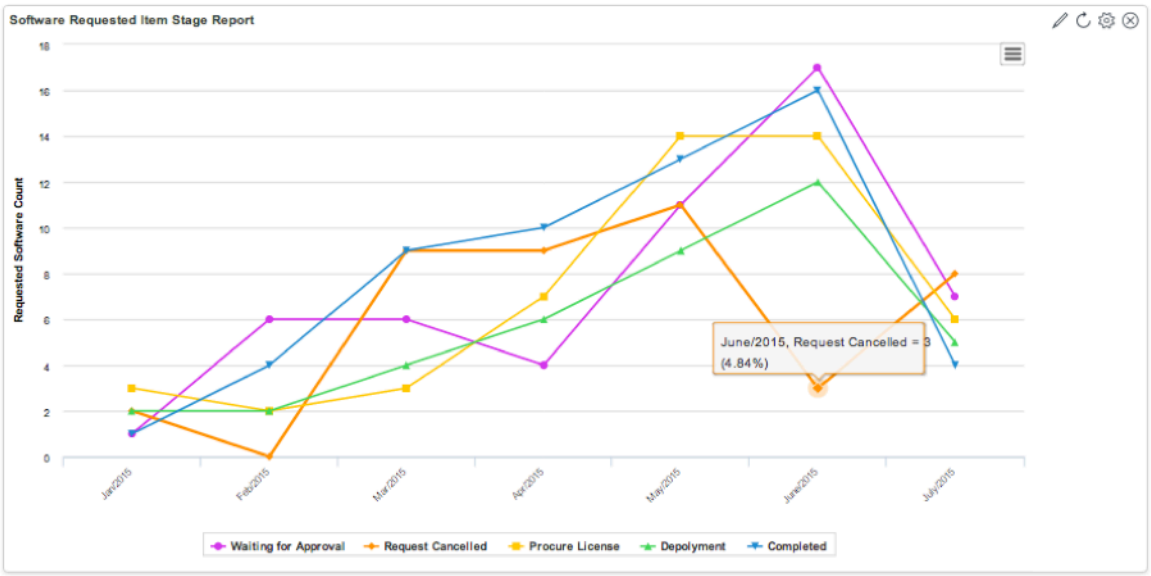
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample report from CSD dashboard



Client software distribution reports

Report	Description
Open Tasks	Displays all open tasks grouped by the requested item's stage value. • *Type*: Create a basic list report • *Table:* Catalog Task [sc_task]
Top 10 Applications Installed	Displays the top 10 applications installed by request count. • **Type**: Create a bar report • **Table**: Requested Software [sn_client_sf_dist_req_software]
Total Software Request Item Over Time	Displays the total software items requested each month. • **Type**: Line reports • **Table**: Requested Software [sn_client_sf_dist_req_software]
Requests Completed Report	Displays the total of software requests completed each month. • **Type**: Line reports • **Table**: Requested Software [sn_client_sf_dist_req_software]
Installed Software Not Entitled	Displays installed software that users or devices are not entitled to use. This can be software deployed through CSD or by another process that does not comply with licensing. This report is on a Software Asset Management table. • **Type**: Create a basic list report • **Table**: Software Installation [cmdb_sam_sw_install]
Software Installation Status	Displays the count of requested software, grouped by installation status, for each month.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Client software distribution reports (continued)

Report	Description
	• **Type**: Line reports • **Table**: Requested Software [sn_client_sf_dist_req_software]
Software Requested Item Stage Report	Displays the sum of all requested items, grouped by the requested item's stage, for each month. • **Type**: Line reports • **Table**: Requested Software [sn_client_sf_dist_req_software]
License Counts Available	Displays the license counts for all available applications. • **Type**: Create a basic list report • **Table**: SCCM Application Catalog Item [sn_client_sf_dist_sccm_app_cat_item]

Usage Overview dashboard

Navigate to **Client Software Distribution** > **Usage Overview** to view the current transaction count for your instance.

Client software distribution extension framework

Client software distribution (CSD) provides built-in extension points for integrating a ServiceNow instance with client software distribution providers, such as Casper, Altiris, or LANDesk.

Important:
The use of CSD extension points is an advanced procedure intended for use by experienced ServiceNow AI Platform developers only. Instructions for customizing your instance to deploy and revoke software from a software distribution provider can be found in the CSD Extension Implementation Guide.

Configure client software distribution providers

Identify the provider and specify the workflows and extension points for a customized software distribution process.

Before you begin

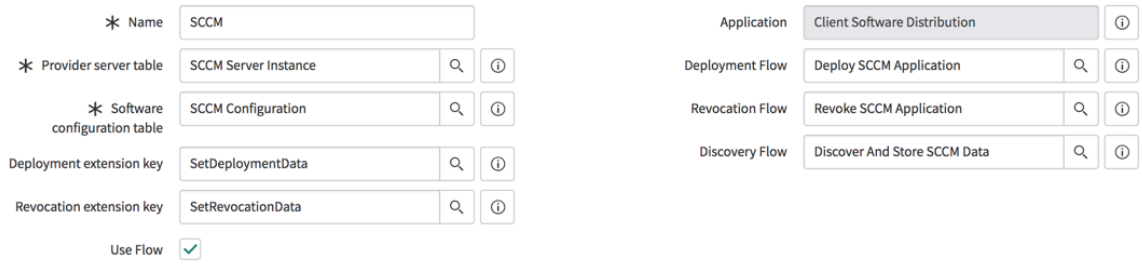
Perform the development tasks described in the CSD Extension Implementation Guide before attempting this procedure.

Role required: sn_client_sf_dist.csd_admin, admin

Procedure

1. Navigate to **All** > **Client Software Distribution** > **Extensions** > **Providers**.
2. Click **New**.
3. Complete the form using the fields in the table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Client software distribution provider fields

Field	Description
Name	Descriptive name of the provider.
Provider server table	Table name of the provider server. You must create this table as an extension of the Configuration Item [cmdb_ci] table. For example, you might call your table Casper Server Instance [cmdb_ci_casper_server_instance].
Discovery flow	Flow that discovers the provider server and returns the data from that server back to the instance. This is the flow you create with custom activities that query the provider server.
Software configuration table	Table name of the software configuration for this provider. You create this table as an extension of the Client Software Distribution Software Configuration [sn_client_sf_dist_software_config] table. For example, you might create a table called Casper Software Configuration [sn_client_sf_dist_casper_sf_config].
Deployment extension key	The **SetDeploymentData** key provided with CSD. This key sets up the data for the software ordering and deployment workflow.
Deployment flow	Flow that deploys software from the provider server. This is the flow you created with custom activities that tells the provider where to deploy an application requested from the service catalog.
Revocation extension key	The **SetRevocationData** key provided with CSD. This key sets up the data for installation revocation.
Revocation flow	Flow that revokes an installation from a provider server. This is the flow you created with custom activities that tells the provider which application to remove from a device.
Use Flow	Option to use Integration Hub flows for client software distribution. When this option isn't

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	selected, Orchestration workflows are used for client software distribution. **Note:**

Client software distribution extension keys

Client software distribution (CSD) extension keys allow you to customize the deployment and revocation of software from distribution providers.

These pre-defined keys allow you to generate input variables for workflows that deploy and revoke software from external distribution providers:

- **SetDeploymentData**: Sets the software order information and generates the input variables for the deployment workflow.
- **SetRevocationData**: Generates the input variables for the revocation workflow.
- **CheckRevocable**: Specifies the conditions that determine if an installation can be revoked. If the software configuration associated with the installed software allows uninstallation, the installed software can be revoked.

Client software distribution extension points

The client software distribution (CSD) extension points create the customization code for the specific provider and the extension keys.

The purpose of the extension points is to associate extension keys with a specific provider, and then create a script that sets input variables for your custom deployment and revocation workflows. Another extension point script tells CSD if the provider has the capability to revoke software. If this is the case, CSD enables the UI action that triggers revocation from the provider.

SetDeploymentData

The script associated with this extension key must set the *csdExtensionResult* object with these attributes:

- *deploymentWorkflowInputs*: Object that specifies the deployment workflow input variables.
- *softwareModel*: Software model sys_id.
- *deploymentType*: An integer. Use **1** for deployment to a user and **2** for deployment to a device.
- *softwareApplication*: Software application sys_id.

CheckRevocable

The script associated with this extension key gets the input parameter *csdExtensionInputs.softwareConfiguration*, which is a Client Software Distribution record in the Software Configuration [sn_client_sf_dist_software_config] table. All providers' software configurations are extended from this table, but may have different attributes.

This script must set the *csdExtensionResult* object to **true** or **false**, depending on whether the software configuration specifies uninstallation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SetRevocationData

The script associated with this extension key gets the input parameter *csdExtensionInputs.softwareConfiguration*, which is a Client Software Distribution record in the Software Configuration [sn_client_sf_dist_software_config] table. All providers' software configurations are extended from this table, but may have different attributes.

The script must set the *csdExtensionResult* object with these attributes:

- *revocationWorkflowInput*: Object that specifies the revocation workflow input variables.
- *softwareModel*: Software model sys_id.
- *deploymentType*: An integer. Use **1** for deployment to a user and **2** for deployment to a device.

Using client extension points in client-side UI scripting

Orchestration examples

These examples demonstrate how Orchestration can be used to automate common tasks.

Active Directory automation example

A set of six Orchestration Active Directory activities enables organizations to automate their on-boarding/off-boarding processes with auditable, self-documenting workflows that save time and eliminate mistakes.

The activities in the Active Directory activity pack are designed to manage user accounts and reset user passwords. The following activities cover the most common use cases administrators encounter when managing Active Directory user accounts:

- Create AD User Account
- Update AD User Account
- Remove AD User Account
- Disable AD User Account
- Query AD
- Reset AD User Password.

These activities share a common design, have complementary functionality, and share a common set of parameters. They can be used singly or together to create consistent workflows for provisioning and de-provisioning user accounts.

Update Active Directory with Orchestration

An organization plans to make their ServiceNow instance the single system of record for user account data and wants to update Active Directory with the latest changes.

About this task

The solution is to create an Orchestration workflow that pushes changes from the ServiceNow user record down to the Active Directory to create a new user record or update an existing

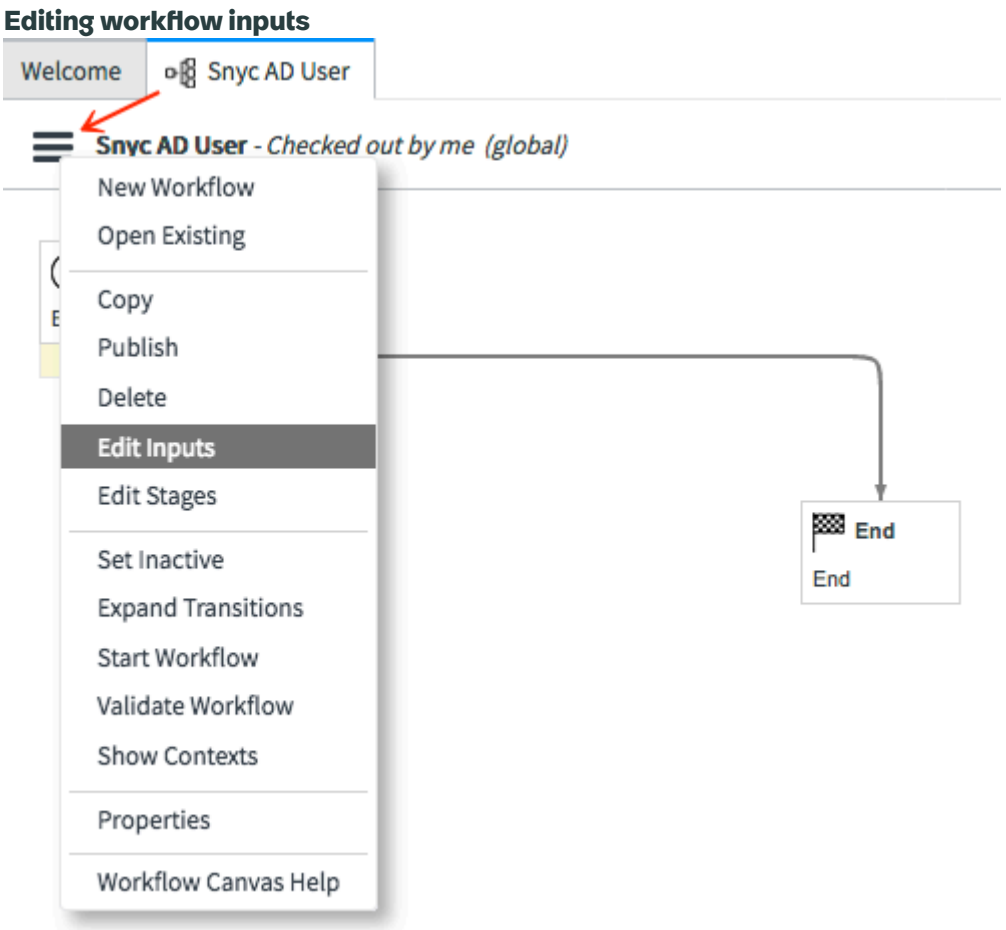
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

record. This is accomplished by creating an Orchestration workflow that can create and update records in Active Directory based on the data in the ServiceNow User [sys_user] table.

Note:
This example workflow assumes that ServiceNow is configured for LDAP and an LDAP server is configured to accept the new user accounts. The Active Directory user management activities are not dependent on LDAP, but the presence of LDAP makes this example workflow much easier. You must provide the domain controller's IP address to the workflow, either by hardcoding it, adding another workflow input, or using a script to look it up from the CMDB.

Procedure

1. Navigate to **All** > **Workflow** > **Workflow Editor**.
2. In the **Workflow** tab, click the **+** icon to create a new workflow using these variables:
   - *Name*: Sync AD User
   - *Table*: Global [global]
3. Click **Submit**.
   A basic workflow with a Begin and End point appears on the canvas.
4. Click the menu icon in the upper left corner of the canvas and select **Edit Inputs** from the context menu.



5. In the Workflow Inputs form, click **New** in the **Variables** record list, and create a new variable, using the fields in the table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

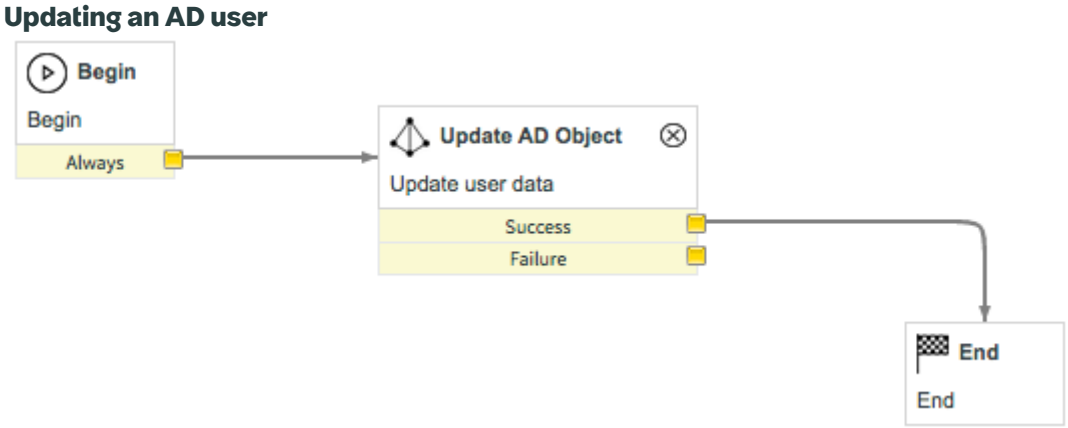
Field	Value
Type	Reference
Label	User
Column name	u_user
Reference Specification > Reference	User (sys_user)

6. Click **Submit**.
7. In the **Custom** tab, expand **Custom Activities** > **Active Directory**.
8. Drag and drop the Update AD Object activity onto the transition line between the Begin and End points of the new workflow.
   This action automatically links the activity with the end point and opens the Workflow Activity property form.
9. Complete the form using the fields in the table.

Field	Value
Name	Enter a logical name such as **Update user data**.
Domain controller	The ServiceNow LDAP integration adds a reference to the LDAP server to which the user's account is linked. To identify the LDAP server, enter the following statement: `${workflow.inputs.u_user.ldap_server.server_url}`
Type	Type of AD object. In this case, the type is **User**, which is the default.
Object name	This example assumes that the ServiceNow user name matches the Active Directory sAMAccountName. Enter the following: `${workflow.inputs.u_user.user_name}`
Object data	Updates the user's account in Active Directory, if the user exists. In this example, the user's title is updated: `{"title" : "QA"}`

10. Click **Submit**.
    The workflow looks like this:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



11. Attach both activity outcomes (Success and Failure) to the end point.
At this point, the workflow takes a ServiceNow user record as input and updates the First Name, Last Name, and Title of the corresponding Active Directory account. If the account does not exist in Active Directory, the workflow fails.

> **Note:**
> In a normal workflow, some type of alternate action is desirable upon failure. For example, you might send an Email and SMS notifications if the workflow failed to update the record.

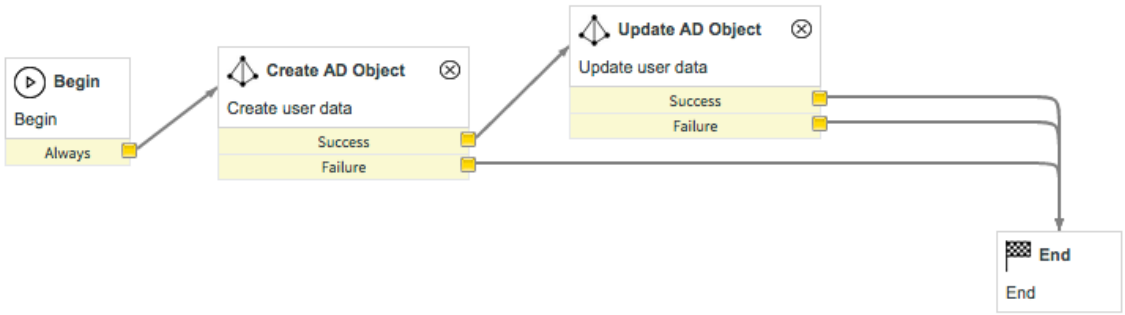
12. To prevent the workflow from failing, add a Create AD Object activity to the transition lines between Begin and the Update AD Object activity.
13. Complete the Workflow Activity property form using the fields in the table.

Field	Value
Name	Enter a logical name such as **Create user data**.
Domain controller	Same as for the update activity. `${workflow.inputs.u_user.ldap_server.server_url}`
Ou	The organizational unit to which this object belongs. For the purpose of this example, you can enter **OU=HQ,OU=Managed Objects**
Object name	Same as for the update activity. `${workflow.inputs.u_user.user_name}`
Object data	Creates an account with only the user name in it. For the purpose of this example, you can enter `{"givenName" : "${workflow.inputs.u_user.first_name}", "SN" : "${workflow.inputs.u_user.last_name}" }`

14. Click **Submit**.
15. Connect the Failure outcome of the Create AD Object activity to End.
For this example, we are ignoring errors. The workflow now looks like this:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Creating an AD user



This procedure builds a simple workflow that creates a bare-bones Active Directory account consisting of a user name only. The workflow then updates that account with additional information provided by the ServiceNow User [sys_user] table. However, we do not want to execute the Create AD Object activity if the user account already exists. The workflow needs to query Active Directory for matching user records and then branch the workflow based on the results of the query. If an account already exists, then the workflow should update the account. If the account does not exist, then the workflow should create the account in Active Directory.

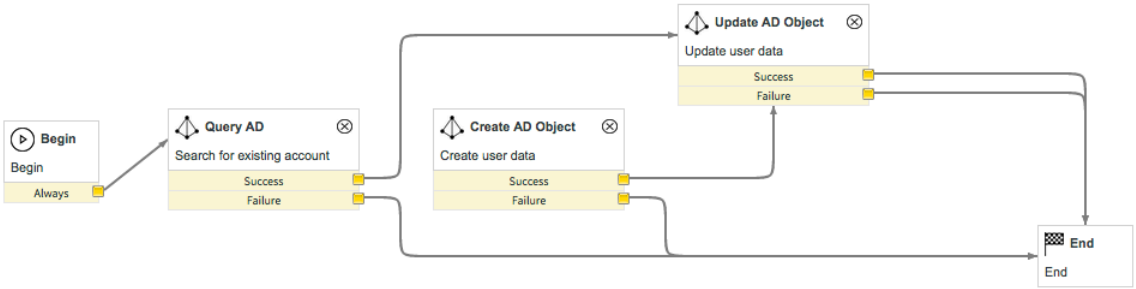
16. Drag and drop the Query AD activity onto the transition between Begin and Create AD Object.
17. Complete the Workflow Activity property form using the fields in the table.

Field	Definition
Name	Enter a logical name such as **Search for existing account**.
Domain controller	`${workflow.inputs.u_user.ldap_server.server_url}`
Properties	A comma-separated list of Active Directory properties to return. For example, givenName, SN, title. If the parameter field is blank, then all properties are returned. In this workflow, we leave the field blank.
Search filter	An LDAP filter string that defines the search parameters. Use any valid LDAP filtering criteria. To find user accounts matching the input record, we use: `(samaccountname=${workflow.inputs.u_user.user_name})`

18. Click **Submit**.
19. Connect the Failure outcome for the query activity to the End point.
Remember that we are ignoring errors in this workflow.
20. Connect the Success outcome of the query activity to the Update AD Object activity.
The workflow now looks like this:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Querying AD for user accounts



The Query AD activity returns its results as a JSON string in the workflow data bus. This JSON string is always an array of objects. Each object corresponds to an Active Directory entry that matched the query. Our workflow should branch, whether that array is empty or not.

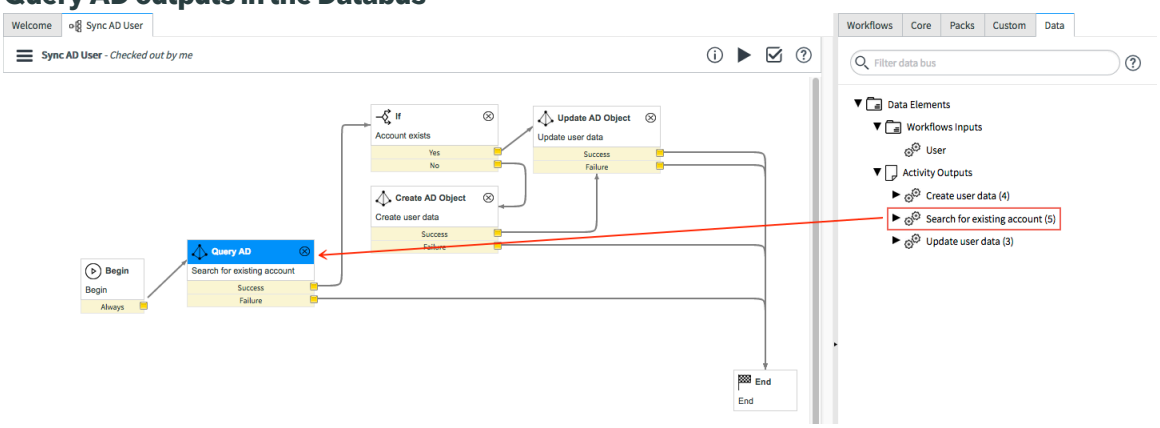
21. Drag a standard *If* activity from the *Conditions* folder in the **Core** tab and drop it onto the transition between Query AD and Update AD Object.
22. Complete the Workflow Activity properties form using the fields in the table.

Field	Value
Name	Enter a logical name such as **Account exists**.
Advanced	Select this check box to open the *Script* field.

Script	For the If activity to work correctly, we must return a **yes** or **no** in the answer variable (var) which corresponds to the Yes and No outcomes of the query activity. Line 1 converts the Query AD results from a JSON string into a Javascript array called queryResults. Line 2 checks the length of that array. If the array is more than 0, a match to the account was found, and we set our answer to yes. Otherwise, the answer is no.
	`var queryResults=new JSON().decode(data.get(5).output);`
	`answer = ( queryResults.length>0 ? 'yes' : 'no' );`

Note:
The expression `data.get(5)` in this script identifies the Query AD output in the Databus by order number, since it was the fifth activity added to the workflow.

Query AD outputs in the Databus

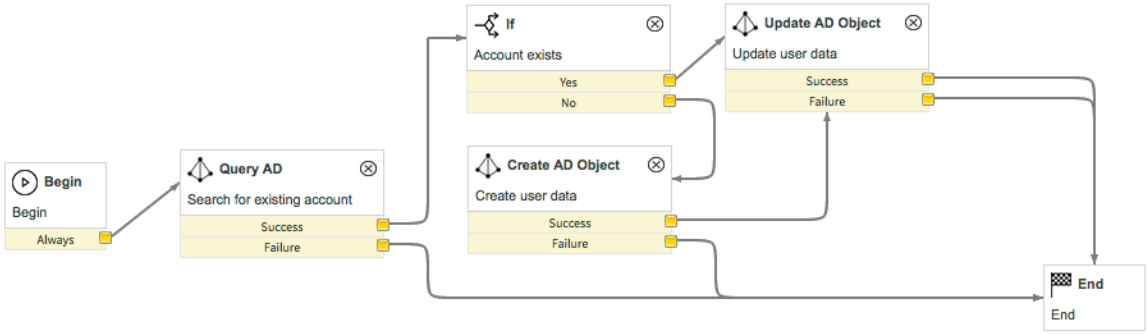


23. Click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

24. In the canvas, create a transition from the Yes outcome of the If activity to the Update AD Object activity.
25. Create a transition from the No outcome of the If activity to the Create AD Object activity. This is the final step. This workflow will query Active Directory to determine if an account already exists. If an account exists, the workflow updates that account. If an account does not exist, the workflow creates the account and then updates the Active Directory with the configured user data set.

Creating the conditional paths



Orchestration activity packs

The base Orchestration system includes packs of custom activities you can use to automate typical IT and business processes in your network.

Activity packs allow you to automate several common business processes, such as managing Active Directory accounts and Exchange server mailboxes. Activity packs can also automate IT functions such as starting and stopping Windows servers, joining domains, assigning IP addresses, and configuring load balancers.

Use an activity pack

The **Packs** tab of the Workflow Editor contains any activity packs downloaded from the ServiceNow Store and any activity packs that you create.

Before you begin

Roles required: admin, activity_admin, activity_creator

About this task

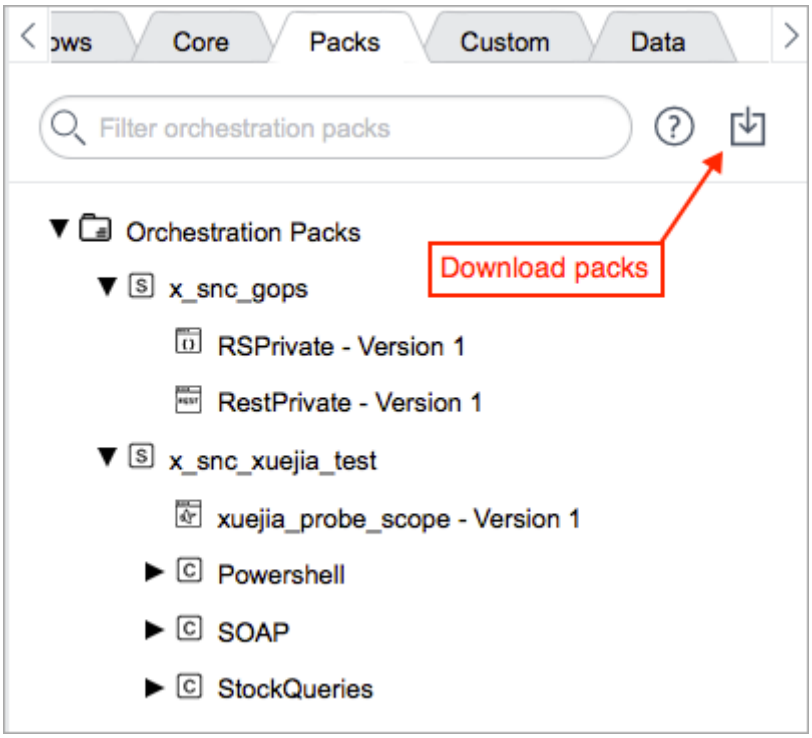
You can organize custom activities into packs and upload them to the ServiceNow Store. Your custom packs do not appear in the tree until at least one activity in the pack is published. Activities added to an existing pack are not displayed until they are published. Activity packs from any Application scope can appear in the **Packs** tab, regardless of the current scope setting for the instance.

Procedure

1. In the Workflow Editor palette, select the **Packs** tab.
2. Click the download icon.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The hierarchy in the tab organizes packs by vendor, scope, category, and activity.



Active Directory activity pack

The Active Directory (AD) activity pack enables an administrator to create, delete, and manage objects in Windows Active Directory, such as users, groups, and computers, using a ServiceNow Orchestration workflow.

Activities in this pack can reset a password automatically from a user request or manage any user account in Active Directory, whether or not it was created by a Orchestration workflow.

Domain controllers are identified by the IP address of the host machine. To use the hostname of the domain controller, add the Resolve DNS Name activity to resolve the hostname into an IP, and then pass the IP into the Active Directory activity.

Your instance must have access to a MID Server configured to use PowerShell to run these activities.

Note:
All Active Directory activities pass through error messages returned from Active Directory. To view these error messages, point to the failed activity in the workflow canvas or select the **Workflow Log** tab in a Workflow Context record.

Custom Active Directory activities

Orchestration provides custom Active Directory activities that were created with the Orchestration Create a PowerShell activity, starting with the Geneva release. These activities perform the same functions as AD activities by the same name from previous releases and replace those activities for all new workflows. Existing workflows from earlier versions that were created with legacy AD activities continue to function normally after an upgrade to Istanbul. However, all new workflows must use these custom AD activities. The Powershell activity template gives workflow administrators the ability to store input and output variables from the Query AD activity in the Databus.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
To use the Active Directory custom activities, you must request activation of the Orchestration - Active Directory plugin.

Active Directory credentials with LDAP

If you are using an LDAP Server with MID Servers, note that Orchestration and Active Directory activities do not use the user name and password configured on LDAP Servers. You must create a Windows type orchestration credential record Windows credentials. The username and password in the credentials record is used for LDAP queries that Orchestration and workflow activities perform.

Connection port used by AD Orchestration activities

All Active Directory activities use port 389 for LDAP access. If you are using AD activities with Oracle Virtual Directory (OVD) as a proxy, set up pass-through on port 389 only.

Add User to Group AD activity

The Add User to Group activity adds a user to a group in Windows Active Directory.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Active Directory**.

Input variables

Add User to Group input variables

Variable	Description
DomainController	IP address of the domain controller machine.
UserName	Name of the user to add to the group.
GroupName	Name of the group to which this user is added.

Output variables

Add User to Group output variables

Variable	Description
result	Either **success** or **failure**.
errorMessage	The *executionResult.errorMessages* from the Activity designer parsing sources.

Conditions

Add User to Group conditions

Condition	Description
Success	User was successfully added to group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add User to Group conditions (continued)

Condition	Description
Failure	An error occurred while attempting to add the user to the group. Additional details may be available in the workflow log.

Change AD User Password activity

The Change AD User Password activity changes the password for an Active Directory user account.

This activity requires the user's current password to run, unlike the **Reset AD User Password** activity. If the new password violates any Active Directory password requirements, such as length or character combinations, the activity fails and returns the appropriate error message. This error message appears in the ECC queue and in hint text when a user points to the activity in the Workflow Editor.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Active Directory**.

Note:
This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer.

Input variables

Change AD User Password input variables

Variable	Description
DomainController	IP address of the domain controller machine.
User	The sAMAccountName of the Active Directory user account.
New_password	The new password to assign this user.
Old_password	The user's current password.

Output variables

Change AD User Password output variables

Variable	Description
result	One of the following outcomes: • **failure** • **success** • **Policy Failure** • **Incorrect old password**
errorMessage	The *executionResult.errorMessages* from the Activity designer parsing sources.

© 2026 ServiceNow, Inc. All rights reserved.

Change AD User Password output variables (continued)

Variable	Description
hresult	Powershell command result.

Conditions

The activity provides the following conditions:

Change AD User Password conditions

Condition	Description
Success	Password successfully reset.
Policy Failure	Password does not comply with the organization's Active Directory requirements.
Incorrect old password	Password being changed was not entered correctly.
Failure	An error occurred while attempting to change the password. Additional details may be available in the workflow log.

Active Directory credentials with LDAP

If you are using an LDAP Server with MID Servers, note that Orchestration and Active Directory activities do not use the user name and password configured on LDAP Servers. You must create a Windows type orchestration credential record Windows credentials. The username and password in the credentials record is used for LDAP queries that Orchestration and workflow activities perform.

Create AD Object activity

The Create AD Object activity creates an object in Windows Active Directory.

This activity fails if it finds an existing object with matching input variables.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Active Directory**.

Note:
This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer.

Input variables

Create AD Object input variables

Variable	Description
DomainController	IP address of the domain controller machine.
Type	The object type to create: user, group, or computer.
OU	The organizational unit to which this object belongs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create AD Object input variables (continued)

Variable	Description
ObjectName	The sAMAccountName of the Active Directory object. **Object name** is also used for the **name** attribute in Active Directory. This behavior is available in **ActiveDirectory.psm1**. Whatever is passed as the **Object name** becomes both the **samAccountName** and the **name** of the new user in Active Directory.
ObjectData	A JSON object containing Active Directory property names and their corresponding values. For example: `{ "givenName" : "John", "SN" : "Doe", "title" : "Sr. Account Specialist", "allowLogin" : true }` This example sets the first name (givenName), last name (SN), and title on the Active Directory user account and allows that user to log in (allowLogin). This field allows expression evaluation via the ${} variable substitution syntax.

Output variables

Create AD Object output variables

Variable	Description
result	Either **success** or **failure**.
errorMessage	The *executionResult.errorMessages* from the Activity designer parsing sources.

Conditions

Create AD Object conditions

Condition	Description
Success	A Windows Active Directory object was created successfully.
Failure	An error occurred while attempting to create the AD object. Additional details may be available in the workflow log.

Disable AD User Account activity

The Disable AD User Account activity disables a Windows Active Directory user account, making it inactive.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Active Directory**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer.

Input variables

Disable AD User Account input variables

Variable	Description
DomainController	IP address of the domain controller machine.
User	The sAMAccountName of the Active Directory user account.

Output variables

Disable AD User Account output variables

Variable	Description
result	Either **success** or **failure**.
errorMessage	The *`executionResult.errorMessages`* from the Activity designer parsing sources.

Conditions

Disable AD User Account conditions

Condition	Description
Success	AD user account was successfully disabled.
Failure	An error occurred while attempting to disable the account. Additional details may be available in the workflow log.

Enable AD User Account activity

The Enable AD User Account activity enables a Windows Active Directory user account, making it active.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Active Directory**.

Note:
This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Input variables

Enable AD User Account input variables

Variable	Description
User	The sAMAccountName of the Active Directory user account.
DomainController	IP address of the domain controller machine.

Output variables

Enable AD User Account output variables

Variable	Description
result	Either **success** or **failure**.
errorMessage	The *executionResult.errorMessages* from the Activity designer parsing sources.

Conditions

Enable AD User Account conditions

Condition	Description
Success	AD user account was successfully enabled.
Failure	An error occurred while attempting to enable the AD user account. Additional details may be available in the workflow log.

Is AD Account Locked activity

The Is AD Account Locked activity determines whether an Active Directory user account is locked.

An account may be locked automatically if a user enters an incorrect password more times than allowed by the Active Directory security policy. You can unlock an account using the Unlock AD User Account activity.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Active Directory**.

Note:
This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer.

Input variables

Is AD Account Locked input variables

Variable	Description
DomainController	IP address of the domain controller machine.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Is AD Account Locked input variables (continued)

Variable	Description
User	The sAMAccountName of the Active Directory user account.

Output variables

Is AD Account Locked output variables

Variable	Description
result	Either **success** or **failure**.
errorMessage	The *executionResult.errorMessages* from the Activity designer parsing sources.
output	The query result.

Conditions

Is AD Account Locked conditions

Condition	Description
Locked	The AD account is locked.
Unlocked	The AD account is unlocked.
Failure	An error occurred while processing the query. Additional details may be available in the workflow log.

Query AD activity

The Query AD activity retrieves entries from the Windows Active Directory based on an LDAP search filter and stores the results as a JSON string that can be used in the data bus.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Active Directory** > **.**

Note:
This activity replaces an AD activity by the same name available in releases prior to Geneva. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul and will continue to save query results to the scratchpad. However, all new workflows must use the custom version of this activity. This activity was built with the Create a PowerShell activity, which stores input and output variables in the databus instead of the scratchpad.

Input variables

Query AD input variables

Variable	Description
DomainController	IP address of the domain controller machine.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query AD input variables (continued)

Variable	Description
Properties	A comma-separated list of Active Directory properties to return. For example, *`givenName,SN,title`*. If this field is blank, then all properties are returned.
SearchFilter	An LDAP filter string that defines the search parameters. Use any valid LDAP filtering criteria. For example, to find user accounts matching the ServiceNow input record, use: `(samaccountname=${workflow.inputs.u_user.user_name})`

Output variables

Query AD output variables

Variable	Description
result	Either **success** or **failure**.
errorMessage	The *`executionResult.errorMessages`* from the Activity designer parsing sources.
output	The query result.

Conditions

Query AD conditions

Condition	Description
Success	The query completed as expected.
Failure	An error occurred while processing the query. Additional details may be available in the workflow log.

Remove AD Object activity

The Remove AD Object activity deletes an object from Windows Active Directory.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Active Directory**.

Note:
This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Input variables

Remove AD Object input variables

Variable	Description
DomainController	IP address of the domain controller machine.
ObjectName	The sAMAccountName of the Active Directory object.
Type	The object type to remove: • **user** • **group** • **computer**

Output variables

Remove AD Object output variables

Variable	Description
result	Either **success** or **failure**.
errorMessage	The *executionResult.errorMessages* from the Activity designer parsing sources.

Conditions

Remove AD Object conditions

Condition	Description
Success	AD object was successfully removed.
Failure	An error occurred while attempting to remove the AD object. Additional details may be available in the workflow log.

Remove User from Group AD activity

The Remove User from Group activity removes a user from a group in Windows Active Directory.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Active Directory**.

Input variables

Remove User from Group input variables

Variable	Description
DomainController	IP address of the domain controller machine.
UserName	Name of the user to remove from the group.
GroupName	Name of the group from which this user is removed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output variables

Remove User from Group output variables

Variable	Description
result	Either **success** or **failure**.
errorMessage	The *executionResult.errorMessages* from the Activity designer parsing sources.

Conditions

Remove User from Group conditions

Condition	Description
Success	User was successfully removed from the group.
Failure	An error occurred while attempting to remove the user from the group. Additional details may be available in the workflow log.

Reset AD User Password activity

The Reset AD User Password activity resets the password of a user account in Windows Active Directory.

If the new password violates any Active Directory password requirements, such as length or character combinations, the reset activity fails and returns the appropriate error message. This error appears in the ECC Queue and when you point to the activity in the Workflow Editor.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Active Directory**.

Note:
This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer.

Input variables

Reset AD User Password input variables

Variable	Description
DomainController	IP address of the domain controller machine.
User	The sAMAccountName of the Active Directory user account.
Password	The new password for the user. This password must comply with the organization's Active Directory requirements.
ForceChange	Makes this password temporary by forcing the user to change it at the next login.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Reset AD User Password input variables (continued)

Variable	Description
Unlock	Unlock the account if the account is locked.

Output variables

Reset AD User Password output variables

Variable	Description
result	One of the following outcomes: • **failure** • **success** • **Policy Failure**
errorMessage	The *executionResult.errorMessages* from the Activity designer parsing sources.
hresult	Powershell command result.

Conditions

Reset AD User Password conditions

Condition	Description
Success	Password was successfully reset.
Policy Failure	New password does not comply with the organization's Active Directory requirements.
Failure	An error occurred while attempting to reset the password. Additional details may be available in the workflow log.

Unlock AD Account activity

The Unlock AD Account activity unlocks a locked Active Directory user account.

You can use the Is AD Account Locked activity activity to determine if an account is locked.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Active Directory**.

Note:
This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Input variables

Unlock AD Account input variables

Variable	Description
DomainController	IP address of the domain controller machine.
User	The sAMAccountName of the Active Directory user account.

Output variables

Unlock AD Account output variables

Variable	Description
result	Either **success** or **failure**.
errorMessage	The *executionResult.errorMessages* from the Activity designer parsing sources.

Conditions

Unlock AD Account conditions

Condition	Description
Success	The account was successfully unlocked.
Failure	An error occurred while attempting to unlock the account. Additional details may be available in the workflow log.

Update AD Object activity

The Update AD Object activity updates an object in Windows Active Directory.

This activity only replaces existing values with new values. It cannot add new values to AD records such as adding a new group member to an AD group. For complex AD operations, use the Run PowerShell activity instead. The activity fails if it cannot find an existing account with matching object name and data.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Active Directory**.

Note:
This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer.

Input variables

Update AD Object input variables

Variable	Description
DomainController	IP address of the domain controller machine.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Update AD Object input variables (continued)

Variable	Description
ObjectName	The sAMAccountName of the Active Directory object.
ObjectData	A JSON object containing Active Directory properties and their values. For example, to set the first name, last name, and title of a user, clear the user's manager, and set the VIP flag to true, the Object Data specifies: `{ "givenName" : "John", "SN" : "Doe", "title" : "Sr. Account Specialist", "manager" : null, "msTSAllowLogon" : false }`
Type	The object type to update: user, group, or computer.

Output variables

Update AD Object output variables

Variable	Description
result	Either **success** or **failure**.
errorMessage	The *executionResult.errorMessages* from the Activity designer parsing sources.

Conditions

Update AD Object conditions

Condition	Description
Success	AD object was successfully updated.
Failure	An error occurred while attempting to update an AD object. Additional details may be available in the workflow log.

Azure AD activity pack

The Azure AD activity pack enables an administrator to automate employee onboarding and offboarding functions on Azure AD and manage Office 365 licensing.

Use the Azure AD activities to add and remove users to Azure Active Directory, manage security group membership, and assign or remove Office 365 licenses for individual users.

The Azure AD activities were created with the Orchestration REST Web Service activity template.

Add User to Group Azure AD activity

The Add User to Group activity adds a user to an existing security group in Azure Active Directory.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Azure AD**. This activity was built with the REST web service activity template.

Important:
The REST message used for this activity must be configured to use OAuth 2.0.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Input variables

Add User to Group input variables

Variable	Description
user_id	Object ID (GUID) of the member to be added.
group_id	Object ID (GUID) of the target group.

Output variables

Add User to Group output variables

Variable	Description
error	Returns the error string from the REST message. If there are no errors, this variable returns a null value.
body	Contains a string value representing the output from the REST message.
status_code	Contains the status code returned from the Web service.

Conditions

Add User to Group conditions

Condition	Description
Success	Activity successfully added the object ID to the security group.
Failure	Activity failed to update the group's membership, or the activity failed to connect to Azure AD.

Assign User License Azure AD activity

The Assign User License activity assigns an additional Office 365 software license to the named user.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Azure AD**. This activity was built with the REST web service activity template.

Important:
The REST message used for this activity must be configured to use OAuth 2.0.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Input variables

Assign User License input variables

Variable	Description
user_id	The object ID (GUID) or the user principal name of the target user. An example of a user principal name is **someuser@a830edad9050849NDA1.onmicrosoft.com**.
sku_id	Subscription SKU ID associated with the tenant's enterprise agreement.

Output variables

Assign User License output variables

Variable	Description
error	Returns the error string from the REST message. If there are no errors, this variable returns a null value.
body	Contains a string value representing the output from the REST message.
status_code	Contains the status code returned from the Web service.

Conditions

Assign User License conditions

Condition	Description
Success	Activity successfully assigned an Office 365 license to a user.
Failure	Activity failed to assigned an Office 365 license to a user, or the activity failed to connect to Azure AD.

Create User Azure AD activity

The Create User activity creates a user for the Azure Active Directory tenant.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Azure AD**. This activity was built with the REST web service activity template.

Important:
The REST message used for this activity must be configured to use OAuth 2.0.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Input variables

Create User input variables

Variable	Description
display_name	Name of the Azure AD user in the accepted display format, such as **jacinto.gawron**.
user_principal_name	User principal name (UPN) in an email format. For example, you might enter **jacinto.gawron@khitomer.com**.
mail_nickname	User's email alias that redirects to the user's full address.
password	User's Azure AD password. This password must be passed as a workflow input with a type of **Password (2 Way Encrypted)** and must meet the password policy set in Azure AD.
change_password	Control that requires the user to change their password at the next login, if set to true.
account_enabled	Control that sets the user's account is enabled, if set to true.
given_name	First name of the user.
surname	Last name of the user.
other_mails	List of additional email addresses for the user. For example, you might enter `["jac@home.com", "jgawron@fabrikam.com"]`.
country	The country or region in which the user is located. For example, you might enter **US** or **UK**. The default value is set to**US**.
city	City in which the user is located.
department	Name of the department in which the user works.
mobile	User's primary cell phone number.
job_title	User's job title.
physical_delivery_office_name	Office location in the user place of business.
postal_code	Postal code of the user's address.
preferred_language	Language in which the user prefers to communicate. This value must follow the ISO 639-1 Code. For example, you might enter **en-US**. The default value is set to **en-US**.
state	State or province for the user's address.
street_address	Street address of the user's place of business.
telephone_number	Primary telephone number of the user's place of business.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create User input variables (continued)

Variable	Description
usage_location	Two letter country code that is required for users who are assigned Office 365 licenses. The default value is **US**.

Output variables

Create User output variables

Variable	Description
error	Returns the error string from the REST message. If there are no errors, this variable returns a null value.
status_code	Contains the status code returned from the Web service.
user_exists	Output variable mapped to the JSON message that contains the `User already exists` error.
user_info	The *`user_info`* array contains attributes that can be leveraged by other activities as inputs. For example, the user *`objectid`* output (GUID) can be passed to the Add User to Group activity as the *`user_id`* input. • *`objectid`*: User's Azure AD identifier. • *`accountEnabled`*: Boolean variable indicating whether the user's account is active or inactive. • *`displayName`*: Users display name, such as **jacinto.gawron**. • *`userPrincipalName`*: User's name in email format, such as **jacinto.gawron@wammo.com**. • *`mailNickname`*: User's email alias.

Conditions

Create User conditions

Conditions	Description
Created user	Activity successfully created the user.
User already exists	User already exists in the tenant domain.
Failure	Activity failed to connect to Azure AD, or an input value was invalid.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Delete User Azure AD activity

The Delete User activity deletes the named user's account from the Azure Active Directory tenant.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Azure AD**. This activity was built with the REST web service activity template.

Important:
The REST message used for this activity must be configured to use OAuth 2.0.

Input variables

Delete User input variables

Variable	Description
user_id	The object ID (GUID) or the user principal name of the target user. An example of a user principal name is **someuser@a830edad9050849NDA1.onmicrosoft.com**.

Output variables

Delete User output variables

Variables	Description
error	Returns the error string from the REST message. If there are no errors, this variable returns a null value.
body	Contains a string value representing the output from the REST message.
status_code	Contains the status code returned from the Web service.

Conditions

Delete User conditions

Condition	Description
Deleted user	Activity deleted the specified user.
User does not exist	Specified user does not have an account in the tenant domain.
Failure	Activity failed to connect to Azure AD.

Get User Info Azure AD activity

The Get User Info activity returns the named user's information from the Azure Active Directory.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Azure AD**. This activity was built with the REST web service activity template.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:
The REST message used for this activity must be configured to use OAuth 2.0.

Input variables

Check If User Exists input variables

Variable	Description
user_id	The object ID (GUID) or the user principal name of the target user. An example of a user principal name is **someuser@a830edad9050849NDA1.onmicrosoft.com** **Note:** Version 2 of this activity enforces input validation. If empty, the following message appears: "Mandatory input 'user_id' is empty" .

Output variables

Check If User Exists output variables

Variable	Description
error	Returns the error string from the REST message. If there are no errors, this variable returns a null value.
body	Contains a string value representing the output from the REST message.
status_code	Contains the status code returned from the Web service.
user_info	The *user_info* array contains attributes that can be leveraged by other activities as inputs. For example, the user *objectid* output (GUID) can be passed to the Add User to Group activity as the *user_id* input. • *objectid*: User's Azure AD identifier. • *accountEnabled*: Boolean variable indicating whether the user's account is active or inactive. • *displayName*: Users display name, such as **jacinto.gawron**. • *userPrincipalName*: User's name in email format, such as **jacinto.gawron@wammo.com**. • *mailNickname*: User's email alias.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Conditions

Check If User Exists conditions

Condition	Description
User exists	Activity found the named user.
User does not exist	Activity was unable to find the named user in the customer tenant domain.
Failure	Activity failed to connect to Azure AD.

Remove User from Group Azure AD activity

The Remove User from Group activity removes an existing user from a security group in Azure Active Directory.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Azure AD**. This activity was built with the REST web service activity template.

Important:
The REST message used for this activity must be configured to use OAuth 2.0.

Input variables

Remove User from Group input variables

Variable	Description
user_id	Object ID (GUID) of the user to be removed.
group_id	Object ID (GUID) of the target group.

Output variables

Remove User from Group output variables

Variable	Description
error	Returns the error string from the REST message. If there are no errors, this variable returns a null value.
body	Contains a string value representing the output from the REST message.
status_code	Contains the status code returned from the Web service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Conditions

Remove User from Group conditions

Variable	Description
Success	Activity removed the object ID from the security group.
Failure	Activity failed to update the group's membership, or the activity failed to connect to Azure AD.

Remove User License Azure AD activity

The Remove User License activity revokes the specified Office 365 software license for the named user.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Azure AD**. This activity was built with the REST web service activity template.

Important:
The REST message used for this activity must be configured to use OAuth 2.0.

Input variables

Remove User License input variables

Variable	Description
user_id	The object ID (GUID) or the user principal name of the target user. An example of a user principal name is **someuser@a830edad9050849NDA1.onmicrosoft.com**.
sku_id	Subscription SKU ID associated with the tenant's enterprise agreement.

Output variables

Remove User License output variables

Variable	Description
error	Returns the error string from the REST message. If there are no errors, this variable returns a null value.
body	Contains a string value representing the output from the REST message.
status_code	Contains the status code returned from the Web service.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Conditions

Remove User License conditions

Condition	Description
Success	Activity removed an Office 365 license from the named user.
Failure	Activity failed to remove an Office 365 from a user, or the activity failed to connect to Azure AD.

Reset User Password Azure AD activity

The Reset User Password activity changes the named user's Azure Active Directory password.

The Azure password policy imposes constraints on the complexity, length, and re-use of a password.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Azure AD**. This activity was built with the REST web service activity template.

Important:
The REST message used for this activity must be configured to use OAuth 2.0.

Input variables

Reset User Password input variables

Variable	Description
user_id	The object ID (GUID) or the user principal name of the target user. An example of a user principal name is **someuser@a830edad9050849NDA1.onmicrosoft.com**.
password	User's Azure AD password. This password must be passed as a workflow input with a type of **Password (2 Way Encrypted)** and must meet the password policy set in Azure AD.
change_password	Control that requires the user to change their password at the next login, if set to true.

Output variables

Reset User Password output variables

Variable	Description
error	Returns the error string from the REST message. If there are no errors, this variable returns a null value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Reset User Password output variables (continued)

Variable	Description
body	Contains a string value representing the output from the REST message.
status_code	Contains the status code returned from the Web service.

Conditions

Reset User Password conditions

Condition	Description
Success	Activity reset the named user's password.
Failure	Activity failed to reset the named user's password, or the activity failed to connect to Azure AD.

Exchange activity pack

The Exchange activity pack allows workflows to manage Microsoft Exchange mail systems.

The use of Orchestration Exchange activities requires the following:

- Microsoft Exchange 2010, 2013, or 2016.
- A MID Server configured to run Powershell 2.0
- A target Exchange server in the same Active Directory domain as the instance.
- Powershell Remoting enabled on the target Exchange server.

Note:
These activities cannot be used to interact with Microsoft Exchange Online.

Orchestration provides custom Exchange activities that were created with the Orchestration activity designer template. These activities perform the same functions as Exchange activities by the same name from previous releases and replace those activities for all new workflows. The custom Exchange activities were built with a Powershell activity template, which gives workflow administrators the ability to store input and output variables in the databus.

Note:
Existing workflows from earlier versions that were created with legacy Exchange activities continue to function normally after an upgrade to Geneva. However, all new workflows must use these custom Exchange activities.

To use the Microsoft Exchange custom activities, you must request activation of the Orchestration - Exchange plugin. The custom Exchange activities are available in the Workflow Editor on the **Custom** tab. Expand the **Custom Activities** tree and select the **Exchange** category for the activity you want to use.

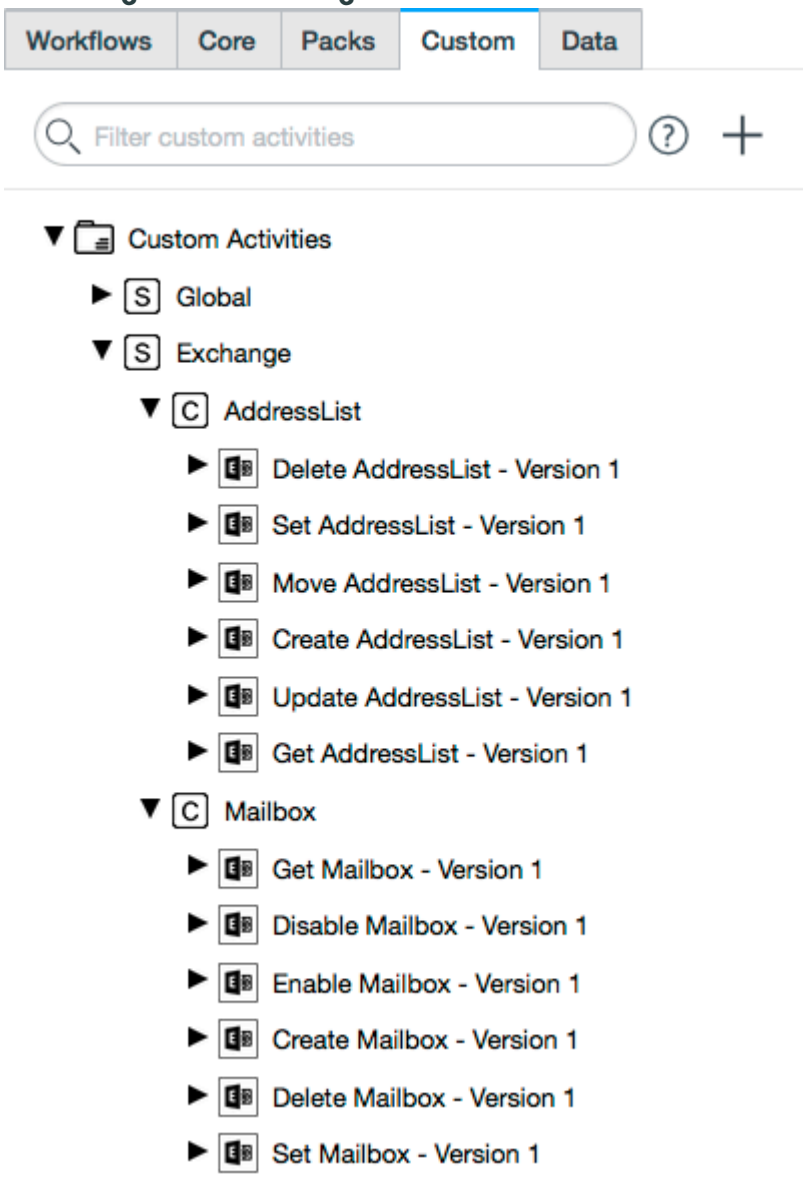
Accessing custom Exchange activities



Configure MID Server for Exchange

Configure a MID Server with defined IP ranges to use Exchange.

Before you begin

Role required: admin

About this task

If the MID Server manages resources within defined IP ranges, instead of all computers on your network, you must perform additional configuration steps to run Exchange activities. You do not need to perform these steps if your MID Server uses the default configuration.

Procedure

1. In the navigation filter, enter `cmdb_ci_dns_name.list`.
2. Click **New**.
3. Enter the fully-qualified domain name (FQDN) of your Exchange server in the **Name** field.
4. Right-click the form header and select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. In the **IP Address** related list, click **New**.
6. In the **IP Address** field, enter the IP address of your Exchange server.
7. In the **Nic** field, select **eth0** or your preferred network interface controller.
8. Leave the **Netmask** field blank.
9. Click **Submit**.

Pass multivalued properties with an Exchange activity

To set a multivalued property using an Exchange activity, you must use a specific parameter format.

About this task

The Optional parameters shared input variable allows you to set multivalued properties.

Procedure

- To set a multivalued property, replacing any existing values, use this format: "`PropertyName`":"(`value1`, `value2`, `value3`)"
- To add values, use this format: "PropertyName":"+(`value1`, `value2`, `value3`);"
- To remove values, use this format: "PropertyName":"-(`value1`, `value2`, `value3`);"
- To both add and remove values, use this format: "PropertyName":"-(`value1`, `value2`, `value3`);+(`value1`, `value2`, `value3`);"

Create Address List activity

The Create Address List activity creates a new address list that acts as an alias for emailing all users in the group.

This alias cannot be used to manage user permissions. This activity implements the Microsoft Exchange New-AddressList command.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Exchange** > **Address List**.

Note:
This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

Create Address List input variables

Variable	Description
hostname	The hostname of the Exchange server with which the activity interacts. Do not enter an IP address in this variable.
domain	The name of the Exchange server's assigned domain.
name	Name of the new address list to create.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create Address List input variables (continued)

Variable	Description
parameters	Optional parameters to pass to the Exchange server written in JavaScript Object Notation (JSON). Exchange activities cannot pass parameters that reference an object, such as a PSCredential object. Plain text is automatically converted to SecureString objects for parameters that require that data type. Attempting to save an activity that specifies duplicate parameters, including parameters from activity variables, or incorrectly formatted JSON causes a warning message to appear. **Note:** When passing a switch parameter, such as ForceUpgrade, you must use the format *`"parameter":"true"`*.

Output variables

Create Address List output variables

Variable	Description
result	Either **success** or **failure**.
error	Error message if the operation fails.
output	Raw XML payload from the Exchange server. This data includes all Exchange attributes.

Conditions

Create Address List conditions

Condition	Description
Success	The activity succeeded in creating a new address list.
Failure	The activity failed to create a new address list.

Delete Address List activity

The Delete Address List activity removes an existing address list from an Exchange server.

This activity implements the Microsoft Exchange Remove-AddressList command.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Exchange** > **Address List**.

Note:
This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Input variables

Delete Address List input variables

Variable	Description
hostname	The hostname of the Exchange server with which the activity interacts. Do not enter an IP address in this variable.
domain	The name of the Exchange server's assigned domain.
identity	Name of the address list to remove.
domainController	Fully-qualified domain name (FQDN) of the domain controller that writes to Active Directory.
recursive	Check box that indicates if the activity should delete Active Directory elements that are children of the specified address list.
whatif	Check box that indicates if the activity should stage the changes without applying them. Use this variable to test your activity settings before using the activity in a live workflow. When this variable is selected, the Exchange server does not make any changes but indicates if the command would succeed or fail. You can review any messages from the Exchange server using the ECC queue.

Output variables

Delete Address List output variables

Variable	Description
result	Either **success** or **failure**.
error	Error message if the operation fails.

Conditions

Delete Address List conditions

Condition	Description
Success	The activity succeeded in removing the address list from the Exchange server.
Failure	The activity failed to remove the address list from the Exchange server.

Get Address List activity

The Get AddressList activity retrieves all attributes from the specified Exchange address list.

This activity implements the Microsoft Exchange Get-AddressList command.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Exchange** > **Address List**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Note:
This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

Get Address List input variables

Variables	Description
hostname	The hostname of the Exchange server with which the activity interacts. Do not enter an IP address in this variable.
domain	The name of the Exchange server's assigned domain.
domainController	Fully-qualified domain name (FQDN) of the domain controller that writes to Active Directory.
identity	Name of the address list to get attributes from. If you enter a value in this variable, leave the **container** and **searchText** variables blank.
organization	Organization to which the specified address list belongs.
searchText	Filter text that causes the activity to return only results that contain this text. This variable can only be used with Exchange 2013 servers. If you enter a value in this variable, leave the **container** and **identity** variables blank.
container	Parent address list of the address list from which you want to retrieve attributes. If you enter a value in this variable, leave the **identity** and **searchText** variables blank

Output variables

Get Address List output variables

Variables	Descriptions
result	Either **success** or **failure**.
error	Error message if the operation fails.
output	Raw XML payload from the Exchange server. This data includes all Exchange attributes.

Conditions

Get Address List conditions

Condition	Description
Success	The activity succeeded in retrieving the attributes from the address list.
Failure	The activity failed to retrieve the attributes from the address list.

Move Address List activity

The Move Address List activity moves a Microsoft Exchange address list to another location in the address hierarchy.

This activity implements the Microsoft Exchange Move-AddressList command.

The Exchange server caches the changes from this activity but does not immediately apply them. Use the Update Address List activity after this activity to apply the changes or wait for the Exchange server to automatically apply cached changes.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Exchange** > **Address List**.

Note:
This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

Move Address List input variables

Variables	Description
hostname	The hostname of the Exchange server with which the activity interacts. Do not enter an IP address in this variable.
domain	The name of the Exchange server's assigned domain.
identity	Name of the address list to move.
target	Path to the address list's new location.
domainController	Fully-qualified domain name (FQDN) of the domain controller that writes to Active Directory.
whatif	Check box that indicates if the activity should stage the changes without applying them. Use this variable to test your activity settings before using the activity in a live workflow. When this variable is selected, the Exchange server does not make any changes but indicates if the command would succeed or fail. You can review any messages from the Exchange server using the ECC queue.

Output variables

Move Address List output variables

Variable	Description
result	Either **success** or **failure**.
error	Error message if the operation fails.

Conditions

Move Address List conditions

Condition	Description
Success	The activity succeeded in moving the address list to another location.
Failure	The activity failed to move the address list to another location.

Set Address List activity

The Set Address List activity modifies a Microsoft Exchange address list.

Use the Optional parameters variable to pass specific values to the Microsoft Exchange server. This activity implements the Microsoft Exchange Set-AddressList command.

The Exchange server caches the changes from this activity but does not immediately apply them. Use the Update Address List after this activity to apply the changes or wait for the Exchange server to automatically apply cached changes.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Exchange** > **Address List**.

Note:
This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

Set Address List input variables

Variables	Description
hostname	The hostname of the Exchange server with which the activity interacts. Do not enter an IP address in this variable.
domain	The name of the Exchange server's assigned domain.
identity	Name of the address list to modify.
parameters	Optional parameters to pass to the Exchange server written in JavaScript Object Notation (JSON). Exchange activities cannot pass parameters that reference an object, such as a PSCredential object. Plain text is automatically converted to SecureString objects for parameters that require that data type. Attempting to save an activity that specifies duplicate parameters, including parameters from activity variables, or incorrectly formatted JSON causes a warning message to appear. **Note:** When passing a switch parameter, such as ForceUpgrade, you must use the format `"parameter":"true"`.

Variable	Description
result	Either **success** or **failure**.
error	Error message if the operation fails.

Conditions

Set Address List conditions

Variable	Description
Success	The activity succeeded in modifying the specified address list.
Failure	The activity failed to modify the specified address list.

Update Address List activity

The Update Address List activity adds or removes users from the specified address list and immediately applies any cached address list changes to the server.

Use the optional parameters variable to specify which users to add or remove. This activity implements the Microsoft Exchange Update-AddressList command.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Exchange** > **Address List**.

Note:
This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

Update Address List input variables

Variable	Description
hostname	The hostname of the Exchange server with which the activity interacts. Do not enter an IP address in this variable.
domain	The name of the Exchange server's assigned domain.
identity	Name of the address list to update.
domainController	Fully-qualified domain name (FQDN) of the domain controller that writes to Active Directory.
whatif	A check box that indicates if the activity should stage the changes without applying them. Use this variable to test your activity settings before using the activity in a live workflow. When this variable is selected, the Exchange server does not make any changes but indicates if the command would

Variable	Description
result	Either **Success** or **Failure**.
error	Error message if the operation fails.

Conditions

Update Address List conditions

Condition	Description
Success	The activity succeeded in adding or removing users from the specified address list.
Failure	The activity failed to add or remove users from the specified address list.

Create Mailbox activity

The Create Mailbox activity creates a new Active Directory user, if that user does not already exist, and a Microsoft Exchange mailbox for that user.

This activity implements the Microsoft Exchange New-Mailbox command.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Exchange** > **Mailbox**.

Note:
This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

Create Mailbox input variables

Variable	Description
hostname	The hostname of the Exchange server with which the activity interacts. Do not enter an IP address in this variable.
domain	The name of the Exchange server's assigned domain.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create Mailbox input variables (continued)

Variable	Description
	Important: The MID Server must be in the same domain as the Exchange server.
first_name	First name of the user.
middle_initial	Middle initial of the user.
last_name	Last name of the user.
alias	The display name for the mailbox address, the part of the email address to the left of the @ symbol. If no alias is specified, the activity uses First name.Last name as the alias. The alias is also used as the user's principal name (UPN) if none is specified in the optional parameters.
password	Password to use for the new mailbox. The password is encrypted when it is sent to the target host.
parameters	Optional parameters to pass to the Exchange server written in JavaScript Object Notation (JSON). Exchange activities cannot pass parameters that reference an object, such as a PSCredential object. Plain text is automatically converted to SecureString objects for parameters that require that data type. Attempting to save an activity that specifies duplicate parameters, including parameters from activity variables, or incorrectly formatted JSON causes a warning message to appear. **Note:** When passing a switch parameter, such as ForceUpgrade, you must use the format *`"parameter":"true"`*.

Output variables

Create Mailbox output variables

Variable	Description
result	Either **success** or **failure**.
error	Error message if the operation fails.
output	Raw XML payload from the Exchange server. This data includes all Exchange attributes.

Conditions

Create Mailbox conditions

Condition	Description
Success	The activity succeeded in creating a new mailbox for the specified user. If no Active Diectory account existed for that user, this activity succeeded in creating a new account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Create Mailbox conditions (continued)

Condition	Description
Failure	The activity failed to create a new mailbox or an Active Directory account for the specified user.

Delete Mailbox activity

The Delete Mailbox activity deletes the Microsoft Exchange mailbox of an Active Directory user.

Optional parameters determine how the Exchange server handles the mailbox after deleting the user. This activity implements the Microsoft Exchange Remove-Mailbox command.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Exchange** > **Mailbox**.

Note:
This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

Delete Mailbox input variables

Variable	Description
hostname	The hostname of the Exchange server with which the activity interacts. Do not enter an IP address in this variable.
domain	The name of the Exchange server's assigned domain.
user	Active Directory user to delete. The activity passes this value to Exchange as the Identity Exchange variable.
parameters	Optional parameters to pass to the Exchange server written in JavaScript Object Notation (JSON). Exchange activities cannot pass parameters that reference an object, such as a PSCredential object. Plain text is automatically converted to SecureString objects for parameters that require that data type. Attempting to save an activity that specifies duplicate parameters, including parameters from activity variables, or incorrectly formatted JSON causes a warning message to appear. **Note:** When passing a switch parameter, such as ForceUpgrade, you must use the format `"parameter":"true"`.

Output variables

Delete Mailbox output variables

Variable	Description
result	Either **success** or **failure**.
error	Error message if the operation fails.

Conditions

Delete Mailbox conditions

Condition	Description
Success	The activity succeeded in deleting the specified user's mailbox.
Failure	The activity failed to delete the specified user's mailbox.

Disable Mailbox activity

The Disable Mailbox activity disables the mailbox associated with a specified Active Directory account.

This activity implements the Microsoft Exchange Disable-Mailbox command.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Exchange** > **Mailbox**.

Note:
This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

Disable Mailbox input variables

Variable	Description
hostname	The hostname of the Exchange server with which the activity interacts. Do not enter an IP address in this variable.
domain	The name of the Exchange server's assigned domain.
user	Active Directory user who's mailbox should be disabled. The activity passes this value to Exchange as the Identity Exchange variable.
parameters	Optional parameters to pass to the Exchange server written in JavaScript Object Notation (JSON). Exchange activities cannot pass parameters that reference an object, such as a PSCredential object. Plain text is automatically converted to SecureString objects for parameters that require that data type.

Disable Mailbox input variables (continued)

Variable	Description
	Attempting to save an activity that specifies duplicate parameters, including parameters from activity variables, or incorrectly formatted JSON causes a warning message to appear. **Note:** When passing a switch parameter, such as ForceUpgrade, you must use the format *`"parameter":"true"`*.

Output variables

Disable Mailbox output variables

Variable	Description
result	Either **success** or **failure**.
error	Error message if the operation fails.

Conditions

Disable Mailbox conditions

Condition	Description
Success	The activity succeeded in disabling the specified mailbox.
Failure	The activity failed to disable the specified mailbox.

Enable Mailbox activity

The Enable Mailbox activity creates a new mailbox for an existing Active Directory user.

This activity implements the Microsoft Exchange Enable-Mailbox command.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Exchange** > **Mailbox**.

Note:
This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

Enable Mailbox input variables

Variable	Description

Enable Mailbox input variables (continued)

Variable	Description
domain	The name of the Exchange server's assigned domain.
user	Active Directory user who's mailbox should be enabled. The activity passes this value to Exchange as the Identity Exchange variable.
parameters	Optional parameters to pass to the Exchange server written in JavaScript Object Notation (JSON). Exchange activities cannot pass parameters that reference an object, such as a PSCredential object. Plain text is automatically converted to SecureString objects for parameters that require that data type. Attempting to save an activity that specifies duplicate parameters, including parameters from activity variables, or incorrectly formatted JSON causes a warning message to appear. **Note:** When passing a switch parameter, such as ForceUpgrade, you must use the format `"parameter":"true"`.

Output variables

Enable Mailbox output variables

Variable	Description
result	Either **success** or **failure**.
error	Error message if the operation fails.

Conditions

Enable Mailbox conditions

Condition	Description
Success	The activity succeeded in creating a new mailbox for the specified user.
Failure	The activity failed to create a new mailbox for the specified user.

Get Mailbox activity

The Get Mailbox activity gets the mailbox for the specified user or all mailboxes on a Microsoft Exchange server.

This activity implements the Microsoft Exchange Get-Mailbox command.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Exchange** > **Mailbox**.

Note:
This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

Get Mailbox input variables

Variable	Description
hostname	The hostname of the Exchange server with which the activity interacts. Do not enter an IP address in this variable.
domain	The name of the Exchange server's assigned domain.
user	User whose mailbox this activity should retrieve. If no user is specified, the activity gets all mailboxes on the Exchange server. The activity passes this value to Exchange as the Identity Exchange variable.
parameters	Optional parameters to pass to the Exchange server written in JavaScript Object Notation (JSON). Exchange activities cannot pass parameters that reference an object, such as a PSCredential object. Plain text is automatically converted to SecureString objects for parameters that require that data type. Attempting to save an activity that specifies duplicate parameters, including parameters from activity variables, or incorrectly formatted JSON causes a warning message to appear. **Note:** When passing a switch parameter, such as ForceUpgrade, you must use the format `"parameter":"true"`.

Output variables

Get Mailbox output variables

Variable	Description
result	Either **success** or **failure**.
error	Error message if the operation fails.
output	Raw XML payload from the Exchange server. This data includes all Exchange attributes.

Conditions

Get Mailbox conditions

Condition	Description
Success	The activity succeeded in retrieving the attributes of the specified mailbox.
Failure	The activity failed to retrieve the attributes of the specified mailbox.

Set Mailbox activity

The Set Mailbox activity modifies the settings of an existing Microsoft Exchange mailbox.

Use the optional parameters variable to pass specific values to the Exchange server. This activity implements the Microsoft Exchange Set-Mailbox command.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Exchange** > **Mailbox**.

Note:
This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

Set Mailbox input variables

Variable	Description
hostname	The hostname of the Exchange server with which the activity interacts. Do not enter an IP address in this variable.
domain	The name of the Exchange server's assigned domain.
user	Active Directory user whose mailbox you want to modify. The activity passes this value to Exchange as the Identity Exchange variable.
parameters	Optional parameters to pass to the Exchange server written in JavaScript Object Notation (JSON). Exchange activities cannot pass parameters that reference an object, such as a PSCredential object. Plain text is automatically converted to SecureString objects for parameters that require that data type. Attempting to save an activity that specifies duplicate parameters, including parameters from activity variables, or incorrectly formatted JSON causes a warning message to appear. **Note:** When passing a switch parameter, such as ForceUpgrade, you must use the format *`"parameter":"true"`*.

Output variables

Set Mailbox output variables

Variable	Description
result	Either **success** or **failure**.
error	Error message if the operation fails.

Conditions

Set Mailbox conditions

Conditions	Description
Success	The activity succeeded in modifying the settings of the specified mailbox.
Failure	The activity failed to modify the settings of the specified mailbox.

F5 Network Management activity pack

Orchestration provides custom activities for configuring elements of an F5 load balancer, including pools, pool members, and the virtual servers contained in the pool.

All F5 custom activities are in the F5 Network Management Application Application scope and are activated by the Orchestration - F5 network management plugin, which must be activated by request.

ServiceNow provides custom F5 activities, built from the REST web service activity template, that you can use to perform the following tasks:

- Add, delete, or verify pools.
- Add, delete, or identify pool members.
- Add or delete virtual servers.
- Add a profile to a virtual server.
- Configure the virtual server for vlans, irules, pool, and persistence.

Add F5 Pool Member activity

The Add F5 Pool Member activity adds a member to an F5 load balancer pool.

This activity was built using the REST web service activity template. To access the activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Active Directory**.

REST settings

- **REST message**: F5 POOL Membership Management
- **REST function**: post

Input variables

Add F5 Pool Member input variables

Variable	Description
PoolName	Name of this pool, such as `testPool`.
F5IPAddress	IP address of the F5 console.
MemberName	Pool member IP address and port, such as 192.168.2.19:80.

Output variables

Add F5 Pool Member output variables

Variable	Description
result	Success or failure.
status_code	The HTTP status code.
error	The REST error.
output	The REST output.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Conditions

Add F5 Pool Member conditions

Condition	Description
Success	Activity successfully added an F5 load balancer pool member.
Failure	Activity failed to add an F5 load balancer pool member.

Get F5 Pool Member activity

The Get F5 Pool Member activity returns the pool members and verifies the pool's status.

Use this activity to verify that a pool member was created properly.

This activity was built using the REST web service activity template. To access the activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Active Directory**.

REST settings

- **REST message**: F5 POOL Membership Management
- **REST function**: get

Input variables

Get F5 Pool Member input variables

Variable	Description
PoolName	Name of this pool, such as `testPool`.
F5IPAddress	IP address of the F5 console.

Output variables

Get F5 Pool Member output variables

Variable	Description
MembersArray	Array for the returned pool member IP address and port, such as 192.168.2.19:80.
status_code	The HTTP status code.
error	The REST error.
result	Success or failure.
output	The REST output.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Conditions

Get F5 Pool Member conditions

Condition	Description
Success	Activity successfully returned the F5 load balancer pool members.
Failure	Activity failed to return the F5 load balancer pool members

Delete F5 Virtual Server activity

The Delete F5 Virtual Server activity deletes a virtual server from an F5 load balancer pool.

This activity was built using the REST web service activity template. To access the activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Active Directory**.

REST settings

- **REST message**: F5 VIP Management
- **REST function**: delete

Input variables

Delete F5 Virtual Server input variables

Variable	Description
F5IPAddress	IP address of the F5 console.
name	The virtual server's name, such as `testVIP`.

Output variables

Delete F5 Virtual Server output variables

Variable	Description
result	Success or failure.
status_code	The HTTP status code.

Conditions

Delete F5 Virtual Server conditions

Condition	Description
Success	Activity successfully deleted the virtual server from the F5 load balancer pool.
Failure	Activity failed to delete the virtual server from the F5 load balancer pool.

Check F5 Pool activity

The Check F5 Pool activity checks the status of a pool to determine if it is available to accept traffic.

Use this activity to determine if a pool you just created is up and running with the proper configuration.

This activity was built using the REST web service activity template. To access the activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Active Directory**.

REST settings

- **REST message**: F5 POOL Management
- **REST function**: get

Input variables

Check F5 Pool input variables

Variable	Description
F5IPAddress	IP address of the F5 console.
PoolName	Name of this pool, such as `testPool`.

Output variables

Check F5 Pool output variables

Variable	Description
result	Success or failure.
status_code	The HTTP status code.
error	The REST error.

Conditions

Check F5 Pool conditions

Condition	Description
Success	Activity successfully returned the status of the F5 load balancer pool.
Failure	Activity failed to return the status of the F5 load balancer pool.

Add F5 Profile to Virtual Server activity

The Add F5 Profile to Virtual Server activity adds a profile to a virtual server assigned to an F5 load balancer pool.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This activity was built using the REST web service activity template. To access the activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Active Directory**.

REST settings

- **REST message**: F5 VIP Profile Management
- **REST function**: post

Input variables

Add F5 Profile to Virtual Server input variables

Variable	Description
name	The virtual server's name, such as `testVIP`
F5IPAddress	IP address of the F5 console.
VirtualServerName	Name of the virtual server, such as `testVIP`.

Output variables

Add F5 Profile to Virtual Server output variables

Variable	Description
result	Success or failure.
output	The REST output.
status_code	The HTTP status code.

Condtions

Add F5 Profile to Virtual Server conditions

Condition	Description
Success	Activity successfully added the F5 load balancer profile to the virtual server.
Failure	Activity failed to add the F5 load balancer profile to the virtual server.

Modify F5 Virtual Server activity

The Modify F5 Virtual Server activity configures a virtual server assigned to an F5 load balancer pool with irules and a vlan.

This activity was built using the REST web service activity template. To access the activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Active Directory**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

REST settings

- **REST message**: F5 VIP Management
- **REST function**: put

Input variables

Modify F5 Virtual Server input variables

Variable	Description
name	The virtual server's name, such as `testVIP`.
F5IPAddress	IP address of the F5 console.
irules	The irules for the virtual server, such as `_sys_https_redirect`. • **pool**: Name of the pool for the virtual server, such as `testPool`. • **persistent**: Persistent profile for the virtual server, such as `cookie`.
vlans	Vlans for the virtual server, such as `internal`.

Output variables

Modify F5 Virtual Server output variables

Variable	Description
result	Success or failure.
status_code	The HTTP status code.
output	The REST output.

Conditions

Modify F5 Virtual Server conditions

Condition	Description
Success	Activity successfully configured a virtual server assigned to an F5 load balancer pool.
Failure	Activity failed to configure a virtual server assigned to an F5 load balancer pool.

Add F5 Virtual Server activity

The Add F5 Virtual Server activity adds a virtual server.

This activity was built using the REST web service activity template. To access the activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Active Directory**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

REST settings

- **REST message**: F5 POOL Membership Management
- **REST function**: post

Input variables

Add F5 Virtual Server input variables

Variable	Description
name	The virtual server's name, such as `testVIP`.
description	Description of this virtual server.
ipProtocol	Protocol used for this virtual server, such as `tcp`.
destination	Virtual server IP address and port number, such as 192.168.4.20:80.
mask	Subnet mask for this virtual server, such as 255.255.255.255.
F5IPAddress	IP address of the F5 console.
sourceAddressTranslation	Source address translation mode.

Output variables

Add F5 Virtual Server output variables

Variable	Description
result	Success or failure.
status_code	The HTTP status code.
error	The REST error.
output	The REST output.

Conditions

Add F5 Virtual Server conditions

Condition	Decription
Success	Acitivty successfully added a virtual server.
Failure	Activity failed to add a virtual server.

Delete F5 Pool Member activity

The Delete F5 Pool Member activity deletes an F5 load balancer pool member.

This activity was built using the REST web service activity template. To access the activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Active Directory**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

REST settings

- **REST message**: F5 POOL Membership Management
- **REST function**: delete

Input variables

Delete F5 Pool Member input variables

Variable	Description
PoolName	Name of this pool, such as `testPool`.
F5IPAddress	IP address of the F5 console.
MemberName	Pool member IP address and port, such as 192.168.2.19:80.

Output variables

Delete F5 Pool Member output variables

Variable	Description
result	Success or failure.
status_code	The HTTP status code.
error	The REST error.

Conditions

Delete F5 Pool Member output variables

Condition	Description
Success	Acivity succeeded in deleting an F5 load balancer pool member.
Failure	Acivity failed to delete an F5 load balancer pool member.

Delete F5 Pool activity

The Delete F5 Pool activity deletes an F5 load balancer pool.

This activity was built using the REST web service activity template. To access the activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Active Directory**.

REST settings

- **REST message**: F5 POOL Management
- **REST function**: delete

Input variables

Delete F5 Pool input variables

Variable	Description
F5IPAddress	IP address of the F5 console.
PoolName	Name of this pool, such as `testPool`.

Output variables

Delete F5 Pool output variables

Variable	Description
result	Success or failure.
error	The REST error.
status_code	The HTTP status code.

Conditions

Delete F5 Pool conditions

Condition	Description
Success	Activity successfully deleted the F5 load balancer pool.
Failure	Activity failed to delete the F5 load balancer pool.

Add F5 Pool activity

The Add F5 Pool activity creates the F5 load balancer pool.

Use this activity to verify that a pool member was created properly.

This activity was built using the REST web service activity template. To access the activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Active Directory**.

REST settings

- **REST message**: F5 POOL Management
- **REST function**: post

Input variables

Add F5 Pool input variables

Variable	Description
PoolName	Name of this pool, such as `testPool`.

Add F5 Pool input variables (continued)

Variable	Description
F5IPAddress	IP address of the F5 console.
MemberName	Pool member IP address and port, such as 192.168.2.19:80.

Output variables

Add F5 Pool output variables

Variable	Description
result	Success or failure.
status_code	The HTTP status code.
error	The REST error.
output	The REST output.

Conditions

Add F5 Pool conditions

Condition	Description
Success	Activity succeeded in creating the F5 load balancer pool.
Failure	Activity failed to create the F5 load balancer pool.

Infoblox DDI activity pack

This activity pack supports Infoblox DDI management through ServiceNow Orchestration.

The Infoblox DDI activity pack manages the IP addresses used in a network by integrating DNS and DHCP. Custom Orchestration activities use Infoblox Web API (WAPI) REST web services to access the Infoblox GRID server.

Important:
Managing IP addresses through the Infoblox server requires a fully functional MID Server.

Starting with the Jakarta release, the Infoblox activity pack updates to version 2. This update supports Infoblox network views, which can restrict the visibility of network data. The view parameter can be passed as a query parameter or payload content, to do operations in a specific view. Version 2 also supports specifying the version of WAPI to use in integration endpoints.

Supported for Infoblox:

- WAPI version 2.0 for REST messages
- NIOS appliance version 7.0

Note:
To use the Infoblox DDI activities and workflow, you must request activation of the Orchestration - Infoblox DDI Activty Pack plugin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a REST credential for Infoblox activities

All Infoblox activities require a REST credential to manage IP addresses from the Infoblox DDI server.

Before you begin

Before starting this procedure, make sure you have the following:

- A properly configured and running Infoblox DDI Grid Server.
- REST credentials defined on the Infoblox DDI server.

Role required: admin

About this task

You must create a REST credential record on the ServiceNow instance that each Infoblox activity can use to access management features on the Infoblox server.

Procedure

1. Navigate to **All** > **Orchestration** > **Credentials** and click **New**.
2. In the list of credential types, select **Basic Auth Credentials**.
3. Create the credential record with a logical name, such as **InfobloxCred**.
4. Right-click in the header bar of your new credential record and select **Copy sys_id** from the context menu.
   Follow browser instructions to copy the sys_id if browser security measures restrict this function.
5. Paste the sys_id into the **restCredentials** input field of each activity you use.

Infoblox workflows

The Infobox DDI activity pack includes two default workflows, one that reserves and registers IP addresses and another that releases IP addresses.

To access these workflows, navigate to **Workflow** > **Workflow Editor** and select the **Workflows** tab. Click on a workflow to open it, and then click the information icon in the workflow header to display the properties dialog box.

Infoblox Reserve/Register IP in IPAM

Use this workflow to register IPv4 addresses or request the next available IP address on IPAM. Optionally, you can use it to register IP addresses on DNS. The custom Infoblox activities used in this workflow are:

- IPAM Register IP Address
- IPAM Reserve IP Address
- Register DNS A-Record
- Get Network Details

Infoblox Reserve/Register IP input variables

Field	Description
Infoblox Server	IP address of the Infoblox DDI server.
Network	Network containing the target IP address.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Infoblox Reserve/Register IP input variables (continued)

Field	Description
Zone	The DNS zone for the IP address being registered.
Rest Credentials	The sys_id of the REST credentials from the ServiceNow instance.
DNS Host Name	Name of the DNS server machine on which the IP address is being registered.
IPv4 Address	IP address being reserved or registered.

Infoblox Release IPAM Reservations

Use this workflow to release (delete) all the IPAM reservations associated with an IPv4 address. The custom Infoblox activities used in this workflow are:

- IPAM List IP Reservations
- List DNS Record
- DNS Delete
- IPAM Delete

Infoblox Release IPAM Reservations input variables

Field	Description
Rest Credentials	The sys_id of the REST credentials from the ServiceNowinstance.
IP to Delete	IP address to release.
Infoblox Server	IP address of the Infoblox DDI server.

Infoblox roles and permissions

Define the roles and permissions that the Infoblox activities need to access the various resources on the Infoblox server.

Admin groups

There are three types of admin groups on an Infoblox server:

- Superuser
- Default
- Limited Access

To perform specific operations on the Infoblox server, the Limited Access user must have a minimum set of privileges for the desired resources, using either the user interface or an API. These privileges are based on read and read/write access. For more information, refer to the "About Admin Groups" section in the Infoblox NIOS Administrator Guide.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Permission hierarchy

1. **User**: A user can be part of multiple groups.
2. **Group**: A group can have many roles.
3. **Role**: Each role consistes of specific resource permissions.

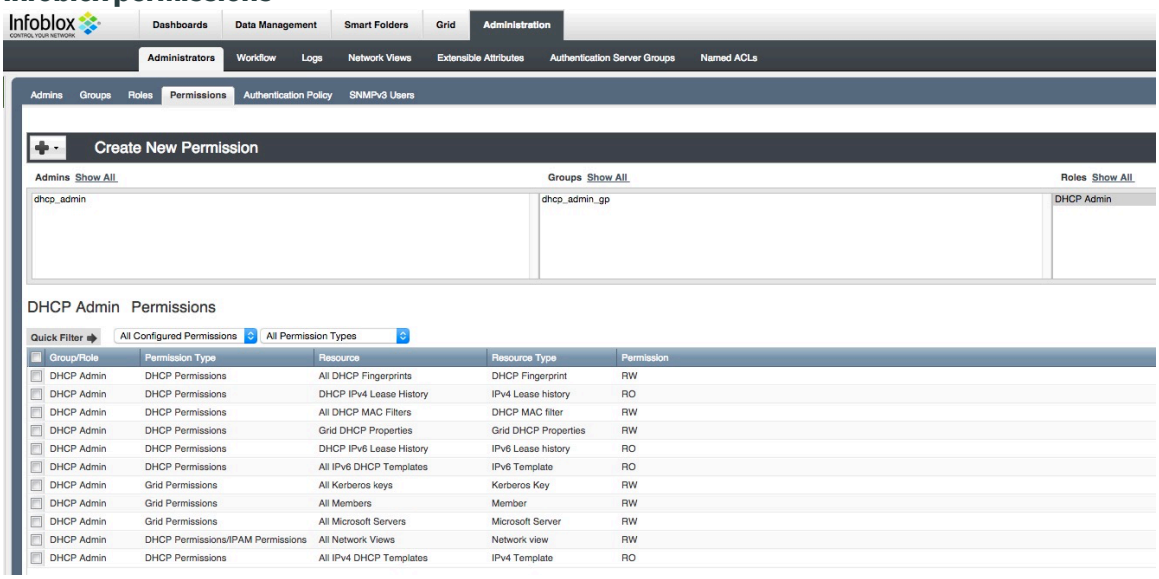
Required permissions

The ServiceNow Infoblox activity pack requires appropriate read and read/write privileges for these resources:

- Network
- DHCP
- DNS
- IPAM

This example shows a default DHCP admin role, its resources, and the related permissions for each.

Infoblox permissions



Infoblox DHCP activities

The Infoblox DHCP activities manage the IP addresses reserved for DHCP in your network.

Use these activities to reserve, list, or delete IP addresses that are used for DHCP assignment in your network.

DHCP Reserve IP v4 Address Range activity

The DHCP Reserve IP v4 Address Range activity reserves an IP address range for DHCP use.

The DHCP activities use the REST web service activity template to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Infoblox DDI** > **DHCP**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Input variables

DHCP Reserve IP v4 Address Range input variables

Variable	Description
InfobloxServer	Name of the Infoblox DDI Grid Server.
startIpAddress	Beginning IPv4 address of the range to reserve.
endIpAddress	Ending IPv4 address of the range to reserve.
restCredentials	The sys_id of the REST credentials from the ServiceNow instance.
api_version	Defines the version of WAPI to use for the integration endpoints. The default value is **2.0**. **Note:** This field is mandatory. If the field is empty, the orchestration activity will fail.
view	Name of the Infoblox network view. The default value is **default**. **Note:** If the field is empty, the operation is treated as happening in the default view.

Output variables

DHCP Reserve IP v4 Address Range output variables

Variable	Description
DHCPIpAddressRange	Range of reserved IPv4 addresses.
error	Displays the message for any REST error encountered.

Conditions

DHCP Reserve IP v4 Address Range conditions

Variable	Description
Success	Activity successfully reserved the specified IPv4 address range.
Failure	Activity failed to reserve the specified IPv4 address range.

DHCP Delete IP Reservation activity

The DHCP Delete IP Reservation activity deletes IP reservations in DHCP using either an IPv4 or IPv6 address range.

An automation can obtain an Infoblox DHCP object to delete from either of these activities:

- DHCP List IP Reservations
- DHCP Reserve IPv4 Address Range

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The DHCP activities use the REST web service activity template to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Infoblox DDI** > **DHCP**.

Input variables

DHCP Delete IP Reservation input variables

Variable	Description
InfobloxServer	Name of the Infoblox DDI Grid Server.
ipToDelete	IP address range to delete, in the form: `range/<encrypted code>:<start range>/<end range>/default`
restCredentials	The sys_id of the REST credentials from the ServiceNow instance.
api_version	Defines the version of WAPI to use for the integration endpoints. The default value is **2.0**. **Note:** This field is mandatory. If the field is empty, the orchestration activity will fail.

Output variables

DHCP Delete IP Reservation output variables

Variable	Description
DHCPDeletedIpRange	Range of deleted IP addresses.
error	Displays the message for any REST error encountered.

Conditions

DHCP Delete IP Reservation conditions

Variable	Description
Success	Activity successfully deleted the specified IP address range.
Failure	Activity failed to delete the specified IP address range.

DHCP List IP Reservations activity

The DHCP List IP Reservations activity generates a list of all the DHCP range reservations on a specific InfoBlox server.

The DHCP activities use the REST web service activity template to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Infoblox DDI** > **DHCP**.

Input variables

DHCP List IP Reservations input variables

Variable	Description
InfobloxServer	Name of the Infoblox DDI Grid Server.
restCredentials	The sys_id of the REST credentials from the ServiceNow instance.
api_version	Defines the version of WAPI to use for the integration endpoints. The default value is **2.0**. **Note:** This field is mandatory. If field is empty, the orchestration activity will fail.
view	Name of the Infoblox network view. The default value is **default**. **Note:** If the field is empty, the operation is treated as happening with no view and returns the values with data from all views.

Output variables

DHCP List IP Reservations output variables

Variable	Description
reference	Reference value for an array of DHCP address ranges in this format: `range/<encrypted code>:<start range>/<end range>/default`
network	Address of the network containing the IP address range.
network_view	Routing doman associated with the network returned.

Conditions

DHCP List IP Reservations conditions

Variables	Description
Success	Activity successfully returned an array of DHCP IP address ranges.
Failure	Activity failed to return an array of DHCP IP address ranges.

Infoblox DNS activities

The Infoblox DNS activities manage DNS records in your network using an Infoblox DDI Grid Server.

Use these activities to register, list, or delete DNS records managed on an Infoblox server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

List DNS C-records activity

The List DNS C-records activity retrieves all canonical (CNAME) records from a specified Infoblox server.

The DNS activities use the REST web service activity template to manage DNS records using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Infoblox DDI** > **DNS**.

Input variables

List DNS C-records input variables

Variable	Description
InfobloxServer	Name of the Infoblox DDI Grid Server.
restCredentials	The sys_id of the REST credentials from the ServiceNow instance.
api_version	Defines the version of WAPI to use for the integration endpoints. The default value is **2.0**. **Note:** This field is mandatory. If field is empty, the orchestration activity will fail.
view	Name of the Infoblox network view. The default value is **default**. **Note:** If the field is empty, the operation is treated as happening with no view and returns the values with data from all views.

Output variables

List DNS C-records output variables

Variable	Description
error	Displays the message for any REST error encountered.
reference	Reference value for a DNS CNAME record, such as: `record:cname/ZG5zLmJpbmRfY25hbWUkL19kZWZhdWx0LmNvbS50ZXN0LmNuYW1l:cname.test default`
cannonicalName	CNAME record.
name	Name of the network option returned, such as *`domain-name-server`*.
view	The assigned view of the DNS data. A given zone can have multiple views, which are accesse depending on the IP address of the source of the query. The **default** view of DNS data for this activity is the network view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Conditions

List DNS C-records conditions

Variable	Description
Success	Activity successfully listed the DNS C records.
Failure	Activity failed to list the DNS C records.

Register DNS A-record activity

The Register DNS A-record activity creates a DNS A record on a specified Infoblox server.

The DNS activities use the REST web service activity template to manage DNS records using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Infoblox DDI** > **DNS**.

Input variables

Register DNS A-record input variables

Variable	Description
InfobloxServer	Name of the Infoblox DDI Grid Server.
network	Address of the network containing the IP address to register in the record.
hostName	Name of the actual server machine associate with the IP address in this record.
zone	The DNS zone associated with the record being created.
ipAddress	Specific IP address registered in this record.
restCredentials	The sys_id of the REST credentials from the ServiceNow instance.
api_version	Defines the version of WAPI to use for the integration endpoints. The default value is **2.0**. **Note:** This field is mandatory. If the field is empty, the orchestration activity will fail.
view	Name of the Infoblox network view. The default value is **default**. **Note:** If the field is empty, the operation is treated as happening in the default view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output variables

Register DNS A-record output variables

Variable	Description
error	Displays the message for any REST error encountered.
DNSARecord	Name of the record registered, expressed in the format: *record:host/<encrypted code>:<network name>/default*.

Conditions

Register DNS A-record conditions

Variable	Description
Success	Activity successfully created the DNS A record.
Failure	Activity failed to create the DNS A record.

Register DNS C-Record activity

The Register DNS C-Record activity creates a DNS canonical (CNAME) record on a specified Infoblox server.

The DNS activities use the REST web service activity template to manage DNS records using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Infoblox DDI** > **DNS**.

Input variables

Register DNS C-Record input variables

Variable	Description
InfobloxServer	Name of the Infoblox DDI Grid Server.
cname	The DNS cannonical record to create, as expressed by the *c_name* value.
recordName	Name of the record to create.
zone	The DNS zone containing the cannonical record to create.
restCredentials	The sys_id of the REST credentials from the ServiceNow instance.
api_version	Defines the version of WAPI to use for the integration endpoints. The default value is **2.0**. **Note:** This field is mandatory. If the field is empty, the orchestration activity will fail.
view	Name of the Infoblox network view. The default value is **default**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Register DNS C-Record input variables (continued)

Variable	Description
	Note: If the field is empty, the operation is treated as happening in the default view.

Output variables

Register DNS C-Record output variables

Variable	Desctiption
error	Displays the message for any REST error encountered.
DNSCRecord	Name of the CNAME record registered, expressed in the format: *record:cname/<encrypted code>:<network name>/default*.

Conditions

Register DNS C-Record conditions

Variable	Description
Success	Activity successfully created the cannonical DNS record.
Failure	Activity failed to create the cannonical DNS record.

List DNS Record activity

The List DNS Record activity generates a list of all the DNS entries on a specific InfoBlox server.

The DNS activities use the REST web service activity template to manage DNS records using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Infoblox DDI** > **DNS**.

Input variables

List DNS Record input variables

Variable	Description
InfobloxServer	Name of the Infoblox DDI Grid Server.
restCredentials	The sys_id of the REST credentials from the ServiceNow instance.
api_version	Defines the version of WAPI to use for the integration endpoints. The default value is **2.0**. **Note:** This field is mandatory. If field is empty, the orchestration activity will fail.
view	Name of the Infoblox network view. The default value is **default**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

List DNS Record input variables (continued)

Variable	Description
	Note: If the field is empty, the operation is treated as happening with no view and returns the values with data from all views.

Output variables

List DNS Record output variables

Variable	Description
reference	Reference value for a DNS record, such as: `record:cname/ZG5zLmJpbmRfY25hbWUkL19kZWZhdWx0LmNvbS50ZXN0LmNuYW1l:cname.tes default`
configure_for_dhcp	Returns the status of a DHCP fixed address object.
host	Host machine with which the DNS record is associated.
ipv4addr	The reserved IPv4 address associated with a DNS record.
name	Name of the network option returned. For example, the name of the DNS record object from **reference** example is *cname.test.com*.
view	The assigned view of the DNS data. A given zone can have multiple views, which are acces depending on the IP address of the source of the query. The **default** view of DNS data for th activity is the network view.
error	Displays the message for any REST error encountered.

Conditions

List DNS Record conditions

Variable	Description
Success	Activity successfully listed all the available DNS record.
Failure	Activity failed to list the available DNS record.

DNS Delete activity

The DNS Delete activity deletes DNS records of any type from in Infoblox server, such as C and A records.

The DNS activities use the REST web service activity template to manage DNS records using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Infoblox DDI** > **DNS**.

Note:
It is faster to create a new record than recover one that has been deleted.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Input variables

DNS Delete input variables

Variable	Description
InfobloxServer	Name of the Infoblox DDI Grid Server.
RecordToDelete	Name of the DNS record to delete. The record is expressed in this format: *record:cname/ZG5zLmJpbmRfY25hbWUkL19kZWZhdWx0LmNvbS50ZXN0LmNuYW11:cname.test.default*
restCredentials	The sys_id of the REST credentials from the ServiceNow instance.
api_version	Defines the version of WAPI to use for the integration endpoints. The default value is **2.0**. **Note:** This field is mandatory. If the field is empty, the orchestration activity will fail.

Output variables

DNS Delete output variables

Variable	Description
DeletedRecord	Name of the deleted DNS record.
error	Displays the message for any REST error encountered.

Conditions

DNS Delete conditions

Variable	Description
Success	Activity successfully deleted the specified DNS record.
Failure	Activity failed to delete the specified DNS record.

Infoblox IPAM activities

The Infoblox IPAM activities manage IP addresses in your network using an Infoblox DDI Grid Server.

Use these activities to register, reserve, list, or delete IP addresses.

IPAM Register IP Address activity

The IPAM Register IP Address activity registers an IP address in a network using Infoblox IPAM.

The output of this activity produces an InfoBlox IP address record that can be used for other IPAM functions in the format `fixedaddress/<encrypted key>:<reserved ip address>/<view>`.

The IPAM activities use the REST web service activity template to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Infoblox DDI** > **IPAM**.

Input variables

IPAM Register IP Address input variables

Variable	Description
InfobloxServer	Name of the Infoblox DDI Grid Server.
macAddress	Mac address of the computer for which this IP address is registered.
ipAddress	Specific IP address to register.
network	Address of the network containing the registered IP address.
restCredentials	The sys_id of the REST credentials from the ServiceNow instance.
api_version	Defines the version of WAPI to use for the integration endpoints. The default value is **2.0**. **Note:** This field is mandatory. If the field is empty, the orchestration activity will fail.
view	Name of the Infoblox network view. The default value is **default**. **Note:** If the field is empty, the operation is treated as happening in the default view.

Output variables

IPAM Register IP Address output variables

Variable	Description
error	Displays the message for any REST error encountered.
IPAddressRecord	IPAM record of the registered IP address.

Conditions

IPAM Register IP Address conditions

Variable	Description
Success	Activity successfully registered the specified IP address.
Failure	Activity failed to register the specified IP address.

IPAM Reserve IP Address activity

The IPAM Reserve IP Address activity reserves an IP address in a network using Infoblox IPAM.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The output of this activity produces an InfoBlox IP address record that can be used for other IPAM functions in the format `fixedaddress/<encrypted key>:<reserved ip address>/<view>`.

The IPAM activities use the REST web service activity template to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Infoblox DDI** > **IPAM**.

Input variables

IPAM Reserve IP Address input variables

Variable	Description
InfobloxServer	Name of the Infoblox DDI Grid Server.
macAddress	Mac address of the computer for which this IP address is reserved.
network	Address of the network containing the reserved IP address. The Infoblox server reserves the next available IP address from this network.
restCredentials	The sys_id of the REST credentials from the ServiceNow instance.
api_version	Defines the version of WAPI to use for the integration endpoints. The default value is **2.0**. **Note:** This field is mandatory. If the field is empty, the orchestration activity will fail.
view	Name of the Infoblox network view. The default value is **default**. **Note:** If the field is empty, the operation is treated as happening in the default view.

Output variables

IPAM Reserve IP Address output variables

Variable	Description
error	Displays the message for any REST error encountered.
IPAddressRecord	IPAM record of the reserved IP address.
IPAddress	Selected IP address to reserve.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Conditions

IPAM Reserve IP Address conditions

Variable	Description
Success	Activity successfully reserved the specified IP address.
Failure	Activity failed to reserve the specified IP address.

IPAM List IP Reservations activity

The IPAM List IP Reservations activity returns an array of all IP Address within the named InfoBlox Server.

The IPAM activities use the REST web service activity template to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Infoblox DDI** > **IPAM**.

Input variables

IPAM List IP Reservations input variables

Variable	Description
InfobloxServer	Name of the Infoblox DDI Grid Server.
restCredentials	The sys_id of the REST credentials from the ServiceNow instance.
api_version	Defines the version of WAPI to use for the integration endpoints. The default value is **2.0**. **Note:** This field is mandatory. If field is empty, the orchestration activity will fail.
view	Name of the Infoblox network view. The default value is **default**. **Note:** If the field is empty, the operation is treated as happening with no view and returns the values with data from all views.

Output variables

The output of this activity produces an array of reserved IP addresses in the format `fixedaddress/<encrypted key>:<reserved ip address>/<view>`.

IPAM List IP Reservations output variables

Variable	Description
reference	Reference value of a reserved IP address contained in an array of addresses, such as `fixedaddress/ZG5zLmZpeGVkX2FkZHJlc3MkMTAuMC4xMDMuMTEuMC4u:0.0.0.11/default" ipv4addr: "0.0.0.11"`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

IPAM List IP Reservations output variables (continued)

Variable	Description
ipv4addr	The reserved IPv4 address.
network_view	Routing domain associated with the network returned.
error	Displays the message for any REST error encountered.

Conditions

IPAM List IP Reservations conditions

Variable	Description
Success	Activity successfully retrieved the list of reserved IP addresses from the Infoblox server.
Failure	Activity failed to retrieve the list of reserved IP addresses from the Infoblox server.

IPAM Delete activity

The IPAM Delete activity deletes an IP Address within a named InfoBlox server.

The IPAM activities use the REST web service activity template to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Infoblox DDI** > **IPAM**.

Input variables

IPAM Delete input variables

Variable	Description
InfobloxServer	Name of the Infoblox DDI Grid Server.
itemToDelete	The IP address to delete, in the format `fixedaddress/<encrypted key>:<reserved ip address>/<view>`.
restCredentials	The sys_id of the REST credentials from the ServiceNow instance.
api_version	Defines the version of WAPI to use for the integration endpoints. The default value is **2.0**. **Note:** This field is mandatory. If the field is empty, the orchestration activity will fail.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output variables

IPAM Delete output variables

Variable	Description
DeletedRecord	IPAM record of the deleted IP address.
error	Displays the message for any REST error encountered.

Conditions

IPAM Delete conditions

Variable	Description
Success	Activity successfully deleted the specified IP address.
Failure	Activity failed to delete the specified IP address.

Infoblox network activities

The Infoblox network activities manage networks using an Infoblox DDI Grid Server.

Use these activities to create, list, or delete networks on an Infoblox server.

Create Network activity

The Create Network activity creates new networks on a specified Infoblox server.

The network activities use the REST web service activity template to manage network addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Infoblox DDI** > **Network**.

Input variables

Create Network input variables

Variable	Description
InfobloxServer	Name of the Infoblox DDI Grid Server.
network	Address of the network to create.
restCredentials	The sys_id of the REST credentials from the ServiceNow instance.
api_version	Defines the version of WAPI to use for the integration endpoints. The default value is **2.0**. **Note:** This field is mandatory. If the field is empty, the orchestration activity will fail.
view	Name of the Infoblox network view. The default value is **default**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create Network input variables (continued)

Variable	Description
	Note: If the field is empty, the operation is treated as happening in the default view.

Output variables

Create Network output variables

Variable	Description
NetworkCreated	Address of the network created.
error	Displays the message for any REST error encountered.

Conditions

Create Network conditions

Variable	Description
Success	Activity successfully created the network.
Failure	Activity failed to create the network.

Get Network Details activity

The Get Network Details activity retrieves the information about a specific network on an Infoblox server.

The network activities use the REST web service activity template to manage network addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Infoblox DDI** > **Network**.

Input variables

Get Network Details input variables

Variable	Description
InfobloxServer	Name of the Infoblox DDI Grid Server.
network	Address of the network whose details you want to see.
restCredentials	The sys_id of the REST credentials from the ServiceNow instance.
api_version	Defines the version of WAPI to use for the integration endpoints. The default value is **2.0**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Get Network Details input variables (continued)

Variable	Description
	Note: This field is mandatory. If the field is empty, the orchestration activity will fail.
view	Name of the Infoblox network view. The default value is **default**. **Note:** If the field is empty, the operation is treated as happening in the default view.

Output variables

The output variables from this activity are objects on the Infoblox server used to identify network details. For more information, refer to the Infoblox documentation.

Get Network Details output variables

Variable	Description
error	Displays the message for any REST error encountered.
NetworkOptions	The *NetworkOptions* array contains these attributes: • *reference*: Reference value for the network requested. This value is in the form of `network/ZG5zLm5ldHdvcmskMTAuMS4wLjAvMTYvMA:10.1.0.0%2F1` • *options*: The *options* array contains these attributes: ◦ *name*: Name of the network option returned, such as *domain-name-server*. ◦ *num*: Index number of the option. For example, the index for *domain-name-server* is *6*. ◦ *use_option*: Indicates whether a DHCP option is used at that level in the network heirarchy. Set this value to **True** to override the Grid Level DHCP option with this option at the network level. ◦ *value*: Value to use for this option. For example, the value for the *domain-name-server* option is the IP address of the server machine. ◦ *vendor_class*: The class of the network object. The options are **DHCP**, **DNS**, or **IPAM**.

Conditions

Get Network Details conditions

Variable	Description
Success	Activity successfully retrieved network details from the Infoblox server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Get Network Details conditions (continued)

Variable	Description
Failure	Activity failed to retrieve network details from the Infoblox server.

Delete Network activity

The Delete Network activity deletes a network from an Infoblox server.

The network activities use the REST web service activity template to manage network addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Infoblox DDI** > **Network**.

Input variables

Delete Network input variables

Variable	Description
InfobloxServer	Name of the Infoblox DDI Grid Server.
networkToDelete	Reference number of the network to delete from the Infoblox server. You can obtain this value either by using the List Registered Networks activity or when creating a network with the Create Network activity. An example of the network reference value is: *`network/ZG5zLm51dHdvcmskMTUuMC40NS4wLzI0LzA:15.0.45.0/24/default`*.
restCredentials	The sys_id of the REST credentials from the ServiceNow instance.
api_version	Defines the version of WAPI to use for the integration endpoints. The default value is **2.0**. **Note:** This field is mandatory. If the field is empty, the orchestration activity will fail.

Output variables

Delete Network output variables

Variable	Description
DeletedNetwork	Reference number of the deleted network from the Infoblox server.
error	Displays the message for any REST error encountered.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Conditions

Delete Network conditions

Variable	Description
Success	Activity successfully deleted the network.
Failure	Activity failed to delete the network.

List Registered Networks activity

The List Registered Networks activity retrieves all the networks associated with an Infoblox server.

The network activities use the REST web service activity template to manage network addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Infoblox DDI** > **Network**.

Input variables

Activity input variables

Variable	Description
InfobloxServer	Name of the Infoblox DDI Grid Server.
restCredentials	The sys_id of the REST credentials from the ServiceNow instance.
api_version	Defines the version of WAPI to use for the integration endpoints. The default value is **2.0**. **Note:** This field is mandatory. If field is empty, the orchestration activity will fail.
view	Name of the Infoblox network view. The default value is **default**. **Note:** If the field is empty, the operation is treated as happening with no view and returns the values with data from all views.

Output variables

Activity output variables

Variable	Description
reference	Reference value of a registered network.
network	Network address.
network_view	Routing doman associated with the network returned.
error	Displays the message for any REST error encountered.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Conditions

Activity conditions

Variable	Description
Success	Activity successfully retrieved the list of registered networks available on the Infoblox server.
Failure	Activity failed to retrieve the list of registered networks available on the Infoblox server.

PowerShell activity pack

PowerShell is built on the Windows .NET Framework and is designed to control and automate the administration of Windows machines and applications.

Orchestration provides custom PowerShell activities that were created with the PowerShell activity designer template. These activities perform the same functions as PowerShell activities by the same name from previous releases and replace those activities for all new workflows. These custom activities give workflow administrators the ability to store input and output variables in the databus.

Note:
Existing workflows from earlier versions that were created with legacy PowerShell activities continue to function normally after an upgrade to Geneva. However, all new workflows must use these custom PowerShell activities.

Starting with the Yokohama release, there are the following updates to the PowerShell activity pack:

- A new PowerShell probe (V2), which takes advantage of Integration Hub functionality
- The ability to insert debug statements in the PowerShell scripts and produce the resulting messages at runtime

To use the PowerShell custom activities, you must request activation of the Orchestration - PowerShell plugin. These activities are available in the Workflow Editor on the **Custom** tab. Expand the **Custom Activities** tree and select the PowerShell category for the activity you want to use.

ServiceNow supports PowerShell 3.0 to 5.1.

PowerShell activity designer

PowerShell activities are configured to return data to a workflow from a host using Microsoft PowerShell.

You must purchase Classic Orchestration to use this template. For specific information about using the tools in the activity designer, refer to these resources:

- Orchestration activity designer
- Create input variables
- Create a parsing rule

ServiceNow supports PowerShell 3.0 to 5.1.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

PowerShell protocols and troubleshooting

PowerShell uses the Windows Management Instrumentation (WMI) and Windows Remote Management (WinRM) protocols to enable Orchestration activities to run commands on remote Windows hosts.

Windows Management Instrumentation (WMI)

WMI provides a uniform interface for any local or remote applications or scripts that obtain management data from a computer system, a network, or an enterprise. WMI contains these components:

- **Managed objects and WMI providers**: A WMI provider is a COM object that monitors one or more managed objects for WMI. A managed object is a logical or physical enterprise component, such as a hard disk drive, network adapter, database system, operating system, process, or service.
- **WMI infrastructure**: The WMI infrastructure is a Microsoft Windows operating system component know as the WMI service (winmgmt). The WMI infrastructure is composed of the WMI Core and the WMI repository. The WMI repository is organized by WMI namespaces. The WMI service creates namespaces, such as `root\default`, `root\cimv2`, and `root\subscription`, at system startup and preinstalls a default set of class definitions, including the Win32 Classes, the WMI System Classes, and others. The remaining namespaces found on your system are created by providers for other parts of the operating system or products.
- **WMI consumers**: A WMI consumer is a management application or script that interacts with the WMI infrastructure. A management application can query, enumerate data, run provider methods, or subscribe to events by calling either the COM API or the Scripting API for WMI.

WMI installation and configuration

For the MID Server to successfully make a remote connection to the target host, TCP port 135 must be open. The Windows firewall automatically creates an inbound rule for WMI connectivity called Windows Management Instrumentation (DCOM-In).

Windows Remote Management (WinRM)

WinRM is the Microsoft implementation of WS-Management Protocol, a standard Simple Object Access Protocol (SOAP) protocol that allows hardware and operating systems from different vendors to interoperate.

WinRM contains these components:

- **WinRM Scripting API**: This scripting API enables Orchestration to obtain data from remote computers, using scripts that perform WS-Management protocol operations.
- **WMI Service**: The WMI service continues to run side-by-side with WinRM and provides requested data or control through the WMI plug-in. You can continue to obtain data from standard WMI classes, such as as Win32_Process.

WinRM configuration

WinRM is automatically installed on Windows 2008 R2 and above operating systems, but must be configured before use.

1. In a command prompt, enter **winrm quickconfig**. This command is not case sensitive.
2. When the console displays **Make these changes [y/n]?**, enter **y**.

   The `winrm quickconfig` command performs the following operations:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Starts the WinRM service, and sets the service startup type to **auto start**.
- Configures a listener for the ports that send and receive WS-Management protocol, using either HTTP or HTTPS on any IP address.
- Creates a firewall exception for the current user profile.

MID Server PowerShell files

PowerShell functions are stored in script files (*.ps1) that use a PowerShell Script module (*.psm1) file name extension.

The PowerShell functions are used by the PowerShell MID Server script files included in these activity packs:

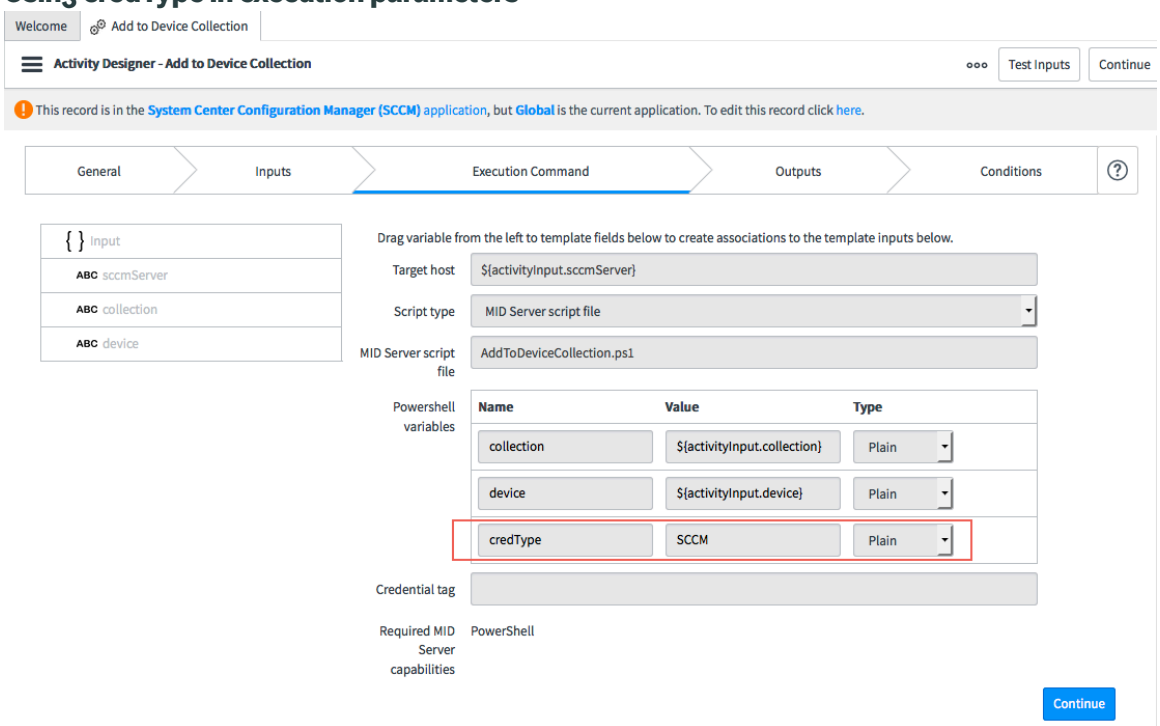
- Active Directory
- Exchange
- SCCM
- PowerShell

PSScript.ps1

This script performs a few tasks, such as credential testing, password encryption, and the execution of scripts configured in the Orchestration Activity Designer or in MID Script Files. However, this document focuses on how PSScript.ps1 uses the `credential.psm1` module for testing access to remote hosts.

The PowerShell variables are generally used directly in the PowerShell execution command or as arguments in the MID Server script file you specify. There are special variables that are passed to PSScript.ps1, such as *`credType`*.

Using credType in execution parameters



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

PowerShell credTypes

The PowerShell credential types:

Type	Description
WMI	testCredentialWMI
Exchange	testCredentilExchange
AD	testCredentilAD
SCCM	testCredentilSCCM

If no credential type is passed to the PSScrip.ps1 script, the MID Server defaults to the WMI test function to test access to the target host. If there is a credential type used, the MID Server runs the corresponding test function for that credential type.

Exit codes

These exit codes are returned from the PSScript.ps1 script and logged in the MID Server log file.

PSScript.ps1 exit codes

Type	Test function
0	PowerShell command/script ran successfully.
1	Test finished successfully, but the command/script failed to execute.
2	Incorrect syntax passed to script.
3	All credentials including MID Server service account failed to execute the command/script.
4	Passed test and executed the activity, but an error was returned. Example user cannot be found.

DiagnosticsUtil.psm1

The MID Server uses this module file to perform PowerShell logging that assists debugging any Orchestration activity using PowerShell scripting. You can also add debugging statements directly to custom scripts.

PowerShell diagnostic utilities

Utility	Description
SNCLog-DebugInfo	Log a debug message for a PowerShell script or PowerShell Orchestration activity. Examples: • `SNCLog-DebugInfo -message "My debug message..."` • `SNCLog-DebugInfo "My debug message"`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

PowerShell diagnostic utilities (continued)

Utility	Description
SNCLog-ParameterInfo	Log a function parameter value. For `"function getHostName{ param( [String] $target )"`, the first value to the PowerShell hashtable is a string to indicate which function executes, and the values for each of the function parameters. Examples: • Function with single parameter: `SNCLog-ParameterInfo @("Running getHostName", $target)` **Note:** The debug message shows, 'Running getHostName $target: [actual value of $target]'. • Function with multiple parameters: `SNCLog-ParameterInfo @("Running functionName", $param1, $param2, $param3)`
SNCObfuscate-Value	Use this utility to encrypt values for security purposes. The function displays `"$variableName":***`, where *** is the obfuscated value. Example: `SNCObfuscate-Value $password` **Note:** The debug message reads: `"$password : ***"`.

Credentials.psm1

The MID Server uses this module file to test access to a target host. The MID Server loops through all Windows credentials stored in its credentials table using the following access type functions, unless the PowerShell activity has a credential type (**credType**) defined. All ServiceNow® authored PowerShell activities are hard-coded to use a specific credential type. As a result, the MID Server only tests credential access against the designated function.

PowerShell test functions

Function	Description
testCredentialWMI	Tests the given user and password on the target host using the *`Get-WMI`* object.
testCredentilAD	Tests the given user and password on the target host using the built-in *`DirectoryEntry`* object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

PowerShell test functions (continued)

Function	Description
testCredentialExchange	Tests the given user and password to create a session on an Exchange host. This test uses the built-in PowerShell remoting feature on a remote host. WinRM is configured on Exchange servers by default.
testCredentialSCCM	Tests the given user and password to create a session on an SCCM server. This test uses the built-in PowerShell remoting feature on a remote host. This test requires WinRM to be configured.
testNoCredentialAccessWMI	Tests the given user and password on the target host, using the *Get-WMI* object. This test is used when no **credType** is used.

Note:
If the test passes using one of these functions, that credential is used to run the PowerShell script/command. If the tests fail to access the target host using these functions, the MID Server runs the PowerShell script/command under the account of the MID Server service.

This diagram illustrates the dependency of the credential selection behavior on the host being targeted by the PowerShell activity. If the target host is the IP address or host name of the MID Server, the MID Server bypasses all credentials in the Credentials table and uses the account of the MID Server service. If the target host is not the MID Server, then all Windows credentials are used first. If all credentials in the Credentials table are unsuccessful in running the PowerShell activity, then the MID Server uses the MID Server service account.

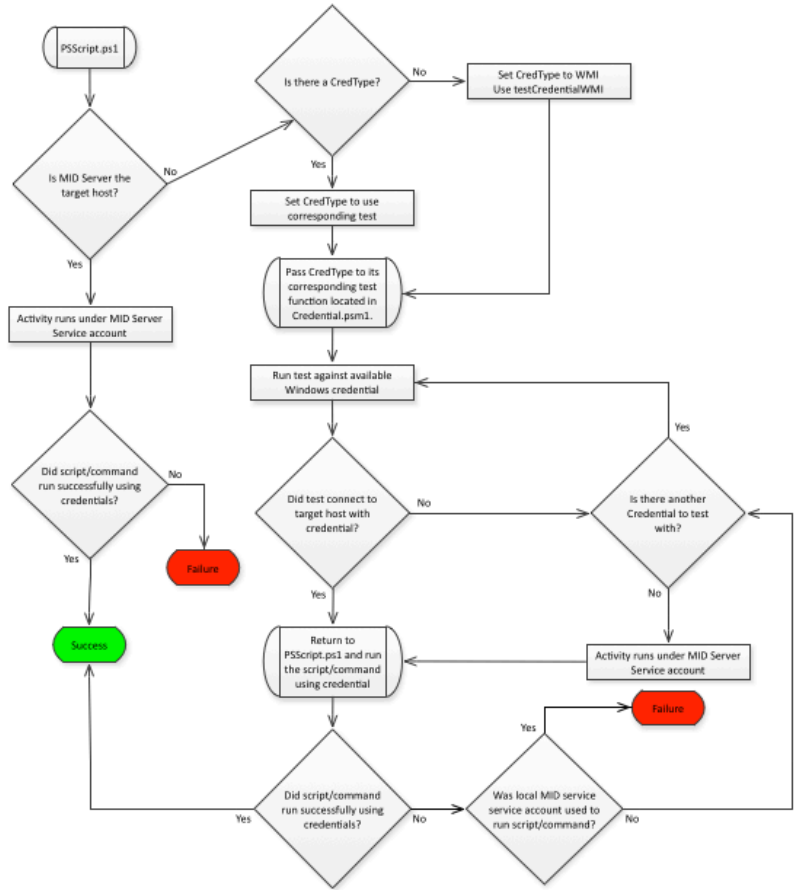
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

PowerShell credential selection criteria



ActiveDirectory.psm1

This module file stores the functions used by the PowerShell scripts shipped with the Active Directory activity pack.

Exchange.psm1

This module file stores the functions used by the PowerShell scripts shipped with the Exchange activity pack.

SCCM.psm1

This module file stores the functions used by the PowerShell scripts shipped with the SCCM activity pack.

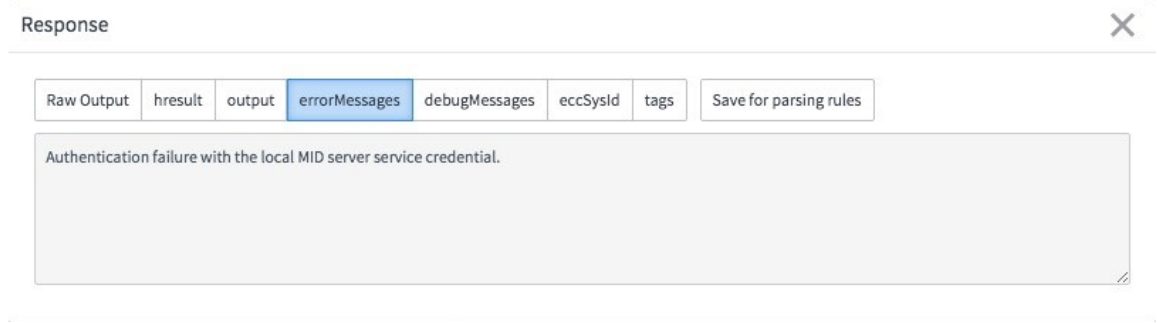
PowerShell troubleshooting

Authentication and access denied errors can prevent PowerShell activities from running a command on a target host.

Use these procedures for troubleshooting authentication failures with Orchestration PowerShell activities and when the Remote Procedure Call (RPC) server is unavailable or when access is denied. The authentication failure error displays when all credentials, including those of the local MID Server service account, do not have the correct permissions to run the Powershell script/command. The same error displays when the target host is unreachable.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Authentication error message



Authentication failure in an Active Directory activity

This example uses the Create AD Object activity to illustrate troubleshooting authentication failure in PowerShell.

Before you begin

Role required: Permissions to access and create accounts on Active Directory

About this task

Validate that the account you are using has the proper permissions to run the activity.

Procedure

1. Log on to the target machine using the account under which you want to run the activity. Active Directory tools must be installed on this machine.
2. Launch the Active Directory Users and Computers application.
3. Navigate to the OU under which you want to create the Active Directory object.
4. Attempt to create the object.

   If this procedure is successful under the specified user, the following might be the cause of the authentication failure:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- User name is invalid.
- Password entered incorrectly.
- Domain controller is unreachable.

Note:
The majority of the return codes listed in the MID Server log for this error are **1**s and **3**s. This is because the Active Directory activities use the ADSI provider and not WMI or WinRM. An error code of **1** means the account was able to connect with the test account, but running the script failed.

```
Attempting to use credential with username 'service-now\joel.zamallo
Running command:-> C:\Windows\System32\WindowsPowerShell\v1.0\powers
rShell\PSScript.ps1' -computer '10.11.144.230'   -script 'C:\Users\j
useCred $true -isDiscovery $false -debug $true; exit $LASTEXITCODE}"
Thread name is Powershell is executing...
The exit value from waitFor() is 1
The status code returned from running the command is 1
```

An error code of **3** means that the MID Server attempted to run the PowerShell activity under the MID Server service account but failed.

```
worker-Standard:PowershellProbe DEBUG: Thread name is Powershell is executing...
Gobbling stdout: Powershell is executing... Gobbled: <powershell>
Gobbling stdout: Powershell is executing... Gobbled: <output>
Gobbling stdout: Powershell is executing... Gobbled: </output>
Gobbling stdout: Powershell is executing... Gobbled: </powershell>
worker-Standard:PowershellProbe DEBUG: The exit value from waitFor() is 3
worker-Standard:PowershellProbe DEBUG: The status code returned from running the command is 3
worker-Standard:PowershellProbe DEBUG: Queuing Powershell Windows - Powershell (nodes: 3)
worker-Standard:PowershellProbe Sending to queue: Powershell,Windows - Powershell (nodes: 3),1
worker-Standard:PowershellProbe Document: <?xml version="1.0" encoding="UTF-8"?><results probe
<error>Authentication failure with the local MID server service credential.</error>
```

Authentication failure in an Exchange activity

This example uses the Create Mailbox activity to illustrate troubleshooting authentication failure in PowerShell.

Before you begin

Role required: Permissions to access and create mailboxes on the Exchange server

Procedure

1. Validate that the account you are using has the proper permissions to run the PowerShell activity.
2. Log on to a machine that has the Exchange Management Shell (EMS) installed.
3. Create a user using the `New-mailbox` Exchange commandlet.

Creating a new user in Exchange

```
[PS] C:\Windows\system32>
[PS] C:\Windows\system32>
[PS] C:\Windows\system32>
[PS] C:\Windows\system32>
[PS] C:\Windows\system32>New-Mailbox -Name 'Test P. Smith' -Alias 'test.smith' -OrganizationalUnit 'discolab2.service-no
w.com/Managed Objects/Users/San Diego' -UserPrincipalName 'test.smith@discolab2.service-now.com' -SamAccountName 'test.s
mith' -FirstName 'Test' -Initials 'P' -LastName 'Smith' -Password 'System.Security.SecureString' -ResetPasswordOnNextLog
on $false_
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If this procedure is successful under the specified credential, the following is the likely cause of the failure:

- User name is invalid.
- Password entered incorrectly.
- Exchange server is unreachable.

4. If the Exchange server is unreachable, examine the MID Server logs.
   Because the Exchange activities use WinRM to access the Exchange server, the logs can provide more troubleshooting information.

> **Note:**
> Ensure that the error is NOT **WinRM cannot process the request**.

Remote Procedure Call (RPC) server unavailable or access denied

Typically, this error is logged when running a PowerShell script/command that uses WinRM or WMI.

Possible causes of error

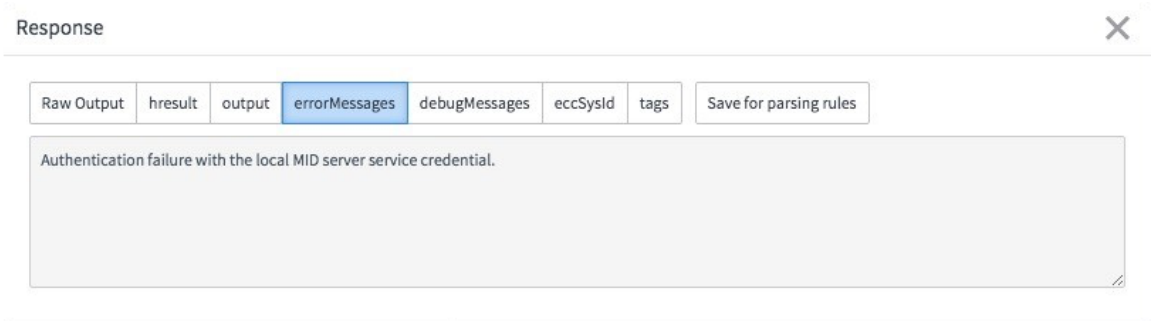
The target host might have one of these issues:

- WinRM isn't configured.
- Firewall is blocking access to the host over TCP port 135 (WMI) or HTTP/HTTPs and TCP port 5985 (WinRM).
- Kerberos issue, caused by hopping to multiple hosts using WMI.

Example WinRM error

The Create Mailbox activity from the Exchange activity pack has generated an error in the ECC queue involving authentication using the MID Server service credential. This occurred because the MID Server credential is the last to be used if the targeted host is not the MID Server.

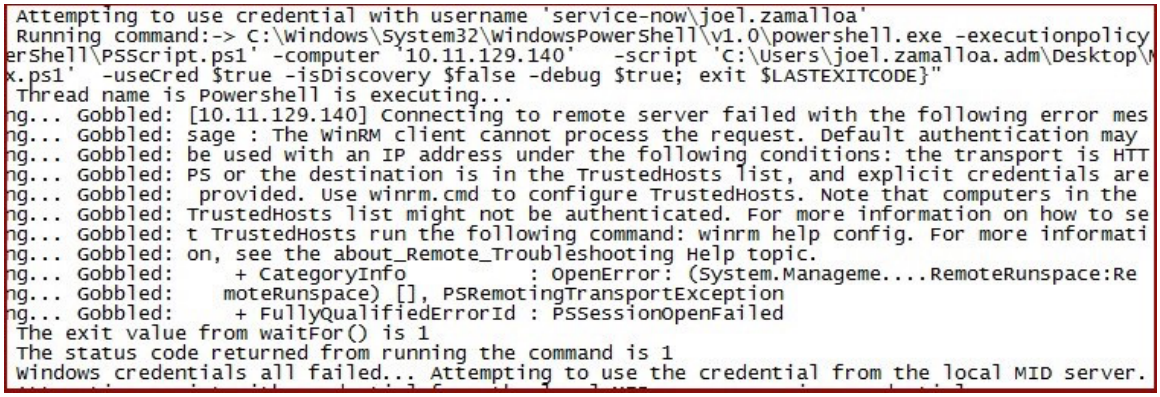
Authentication failure error message



The MID Server log shows that the MID Server tried to run the activity under specific credentials, but wasn't successful and received an exit code of 1.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MID Server error code



Join Domain activity

The Join Domain activity joins a Windows computer to a domain.

If the computer is already a member of a domain, this activity completes without modifying the computer. Joining a domain requires a username and password. This user must have domain administration privileges or privileges to join a computer to the domain.

Note:
This activity replaces a Powershell activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

Join Domain input variables

Variables	Description
Hostname	Hostname or IP address of the Windows server that is joining the domain.
Domain	Name of the domain to join.
Domain_user	The name of a user who has domain administration privileges or privileges to join a computer to the domain.
Domain_user_password	The password for the user who has domain administration privileges or privileges to join a computer to the domain.

Output variables

Join Domain output variables

Variables	Description
result	Either **success** or **failure**.
errorMessage	The *executionResult.errorMessages* from the Activity designer parsing sources. If this variable is not null, the operation has failed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Conditions

Join Domain conditions

Condition	Description
Success	The activity succeeded in joining the computer to the domain.
Failure	The activity failed to join the computer to the domain.

Install Windows App activity

The Install Windows App activity installs an application from an MSI package on a Windows target machine.

Note:
This activity replaces a Powershell activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

Install Windows App input variables

Variable	Description
hostname	Hostname or IP address of the target Windows machine on which the service is installed. Use the Resolve DNS MID Server capabilities to resolve hostnames into IP addresses.
installerpath	Path to the installer. The installer can be on any machine that is visible to both the MID Server and the target machine (local drive, UNC path, mapped drive, etc.).
installer	Name of the installer file, such as `winzip150.msi`. The installer must be an MSI package.
arguments	The parameter that contains the command line arguments to the MSI package. These are name=value pairs, separated by a space. For example, the argument might appear as: `INSTALLDIR=c:\myinstallfolder` ADDDESKTOPICON=0. These arguments are dependent on the what the actual MSI being installed defines. If there are no arguments, leave the field empty.

Output variables

Install Windows App output variables

Variable	Description
result	Either **success** or **failure**.
errorMessage	The *`executionResult.errorMessages`* from the Activity designer parsing sources.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Conditions

The activity state tells the workflow engine what to do with the activity.

Install Windows App conditions

Name	Description
Success	The Windows application was successfully installed on the target machine.
Failure	The Windows application failed to install on the target machine

Enable WMI Windows Installer provider

To install software on Windows machines using the Install Windows App activity, enable WMI Windows Installer provider on all target machines.

Before you begin

- It is recommended that the MID Server, the target machine, and the installer source machine be on the same Active Directory domain. However, if these computers are on separate domains, those domains must have a trust relationship established between them.
- If the installer path is a UNC file sharing machine, the Active Directory account of the target computer must be trusted for delegation. For instructions on this configuration, see the posting on the community for installing and uninstalling Windows applications.

About this task

Note:
See WMI Providers for a list of Windows operating systems that provide this tool by default.

Procedure

1. Open the Control Panel.
2. Go to **Add or Remove Programs**.
3. Select **Add/Remove Windows Components**.
4. Double-click **Management and Monitoring Tools**.

   This action opens a secondary window displaying additional selections.
5. Select **WMI Windows Installer Provider** check box.
6. Click **OK** to return to the Windows Components Wizard window.
7. Click **Next**.
   You might be asked for the Windows installation CD to complete this process.

Change Service State activity

The Change Service State activity starts or stops a Windows service on a remote system.

This activity replaces a Powershell activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the Powershell activity template, which gives workflow administrators the ability to store input and output variables in the databus.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Input Variables

Change Service State input variables

Variable	Description
hostname	Hostname or IP address of the target Windows machine on which the service is installed. Use the Resolve DNS activity to resolve hostnames into IP addresses.
service	Name of the Windows service to start or stop. The *service* parameter is the service name, not the display name of the service affected.
state	There are two actions to select for a service state change: **StartService** or **StopService**.

Output variables

Change Service State output variables

Variable	Description
errorMessage	The *executionResult.errorMessages* from the Activity designer parsing sources. If there is no error, this value is null.

Conditions

Change Service State conditions

Condition	Description
Success	The target service was successfully started or stopped.
Failure	The update to the target service was unsuccessful, or the service was not found on the target system.

Restart Windows Server activity

The Restart Windows Server activity stops and then restarts a Windows server using Powershell.

Note:
This activity replaces a Powershell activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the Powershell activity template, which gives workflow administrators the ability to store input and output variables in the databus.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Input variables

Restart Windows Server input variables

Variable	Description
Hostname	Hostname or IP address of the Windows server to restart.

Output variables

Restart Windows Server output variables

Variable	Description
result	Either **success** or **failure**.
errorMessage	The *executionResult.errorMessages* from the Activity designer parsing sources. If this variable is not null, the operation has failed.

Conditions

Restart Windows Server conditions

Condition	Description
Success	The activity succeeded in restarting the Windows server.
Failure	The activity failed to restart the Windows server.

Uninstall Windows App activity

The Uninstall Windows App activity uninstalls an application from a Windows target machine.

The only applications that can be uninstalled using this activity are those that were installed by a Windows Installer.

Note:
This activity replaces a Powershell activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the Powershell activity template, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

Uninstall Windows App input variables

Variable	Description
hostname	Hostname or IP address of the Windows target machine on which to uninstall an application.
product	The name of the application to uninstall exactly as it appears in the Windows Add/Remove Programs list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output variables

Uninstall Windows App output variables

Variable	Description
result	Either **success** or **failure**.
errorMessage	The *executionResult.errorMessages* from the Activity designer parsing sources. If this variable is not null, the operation has failed.

Conditions

Uninstall Windows App conditions

Condition	Description
Success	The activity succeeded in unistalling the application from the Windows server.
Failure	The activity failed to uninstall the application from the Windows server.

Probe activity pack

Orchestration provides an activity pack customized using the ServiceNow activity designer that runs probes on target hosts to return specific information.

These custom activities were built with the Create a probe activity, which gives workflow administrators the ability to store input and output variables in the databus.

To use the custom probe activities, you must request activation of the Orchestration - Probe plugin.

Resolve DNS Name activity

The Resolve DNS Name activity takes an IP address or a fully qualified domain name (FQDN), which it resolves into one or more IP addresses.

The domain name is sent through the MID Server to the domain name system (DNS) to resolve the name. If a single IP address is returned, it is stored in two variables: *resolved_ip* and *resolved_ips*. If multiple IP addresses are returned, the first IP address is stored in the *resolved_ip* variable, and all the addresses are stored in the *resolved_ips* variable. If an IP address is provided instead of an FQDN, this address is output directly to both variables. Your ServiceNow instance must have access to a MID Server configured to use Resolve DNS to run this activity.

This activity replaces an activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the Probe activity template, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

Resolve DNS Name input variables

Variable	Description
FQDN	The fully qualified domain name to resolve or an IP address.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output variables

Resolve DNS Name output variables

Variable	Desctiption
ip	The first IP address of the resolved DNS name.
ips	Comma separated list of resolved IP addresses.
result	One of the following: • **resolved**: Able to resolve the sprcified DNS name. • **unresolved**: Unable to resolve the specified DNS name.

Conditions

Resolve DNS Name conditions

Condition	Description
Success	Activity successfully resolved the DNS name.
Failure	Activity failed to resolve the DNS name.

SNMP Query activity

The SNMP Query activity queries an SNMP device.

Your ServiceNow instance must have access to a MID Server configured to use SNMP to run this activity.

This activity replaces an activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the Probe activity template, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

SNMP Query input variables

Variable	Description
hostname	Hostname or IP address of the SNMP device being queried.
oids	A list of unique object identifiers used to identify SNMP devices.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output variables

SNMP Query output variables

Variable	Description
description	Description of the SNMP object.
timeout	Boolean value indicating whether or not the query timed out.
error	Indicates any error that occurred. If no error occurred, this value is null.
oid_data	An array of data objects for all unique object identifiers.

Conditions

SNMP Query conditions

Condition	Description
Success	Activity successfully ran the query on the target device.
Failure	Activity failed to run the query on the target device. Failure could be caused by invalid credentials or a device that is not accessible.

SCCM activity pack

The Microsoft System Center Configuration Management (SCCM) activity pack provides Orchestration activities you can use to manage software deployments and collections on an SCCM server.

You can use SCCM Orchestration activities to deploy and revoke software from an SCCM server or manage user and device collections. The system manages software on an SCCM server using Orchestration activities and workflows.

Client software distribution requires:

- SCCM 2012 R2 and later.
- Powershell 3.x.
- Powershell Remoting enabled.
- The Windows PowerShell x86 execution policy must be set to unrestricted mode.
- Latest version of the SCCM *cmdlet* library installed on the SCCM server.
- Use the credentials to log onto the SCCM Server and connect via Windows PowerShell from the System Center Configuration Manager console at least once to set the path variable for that credential.

Request SCCM activities

The Orchestration - System Center Configuration Manager plugin installs the SCCM activity pack that deploys software from an SCCM host and manages user and device collections.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

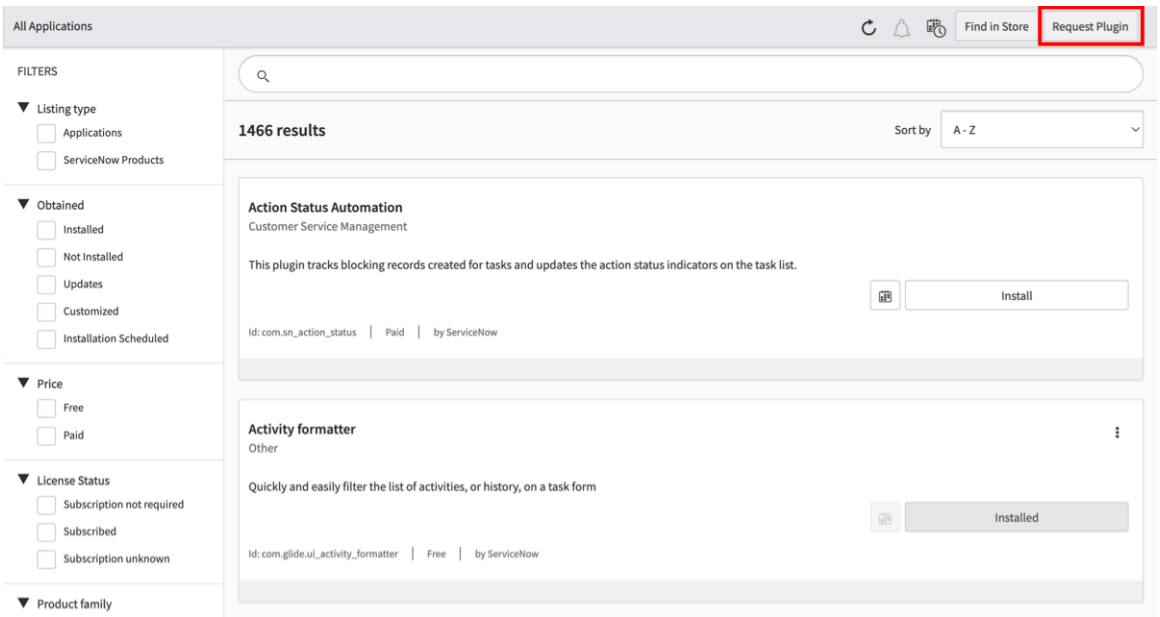
About this task

The SCCM plugin is activated automatically when the Orchestration - Client Software Distribution [com.snc.orchestration.sccm_mgnt] plugin is activated, but can be activated separately.

Note:
The activities in the SCCM plugin run in the System Center Configuration Manager scope.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Select **Request plugin** to open the **Activate Plugin** form on Now Support.



3. On the **Activate Plugin** form, provide the following information.

Activate Plugin form

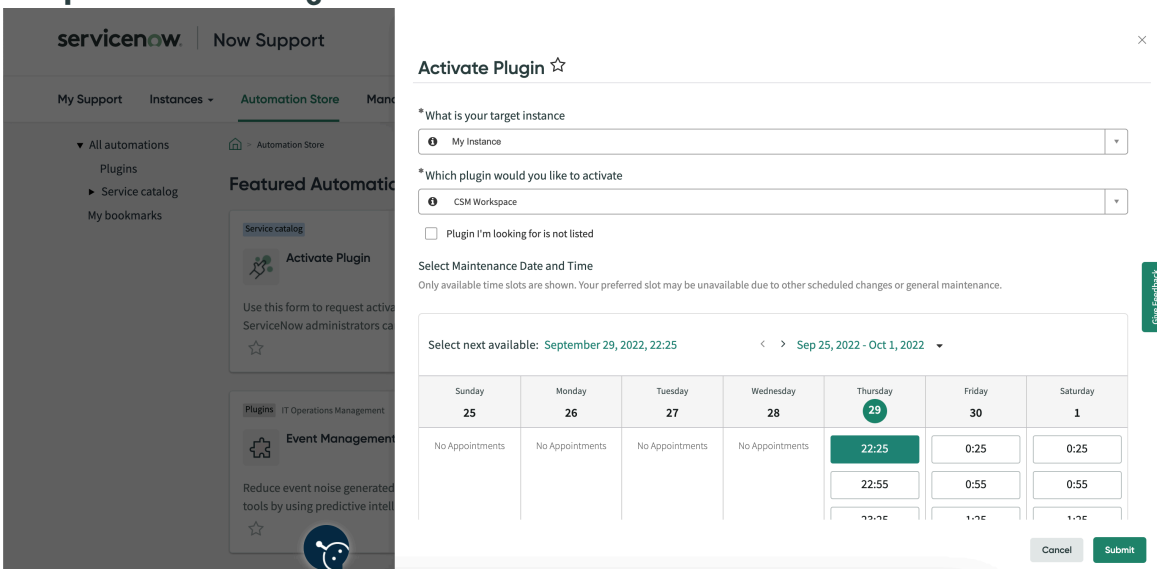
Field	Description
What is your target instance	Select the instance that you want to activate the plugin on.
Which plugin would you like to activate	Select the name of the plugin to activate. **Note:** If the system doesn't list the plugin you want or if you're activating the plugin on an OEM or on-premise instance, select the **Plugin I'm looking for is not listed** check box and then enter the name of the plugin.
Select Maintenance Date and Time	Select the date and time to activate the plugin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example

For example, see the following form to activate the Event Management plugin on an instance named SNC Instance.

Completed Activate Plugin form



4. Select **Submit**.
   After the maintenance window, the system installs the plugin on your instance. To confirm the installation, go to the Installed tab in the Application Manager.

Configure the MID Server for SCCM activities

To use a MID Server with Microsoft System Center Configuration Management (SCCM) activities, configure it to communicate with the SCCM server.

Before you begin

Role required: admin

Procedure

1. In the navigation filter, enter **cmdb_ci_dns_name.list**.
2. Click **New**.
3. Enter the fully-qualified domain name (FQDN) of the SCCM server in the **Name** field.
4. Right-click in the form header and select **Save**.
5. In the **IP Address** related list, click **New**.
6. In the **IP Address** field, enter the IP address of the SCCM server.
7. In the **Nic** field, select **eth0** or your preferred network interface controller.
8. Leave the **Netmask** field blank.
9. Click **Submit**.

Add to Device Collection activity

The Add to Device Collection activity adds the specified device into a Microsoft System Center Configuration Manager (SCCM) device collection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Add to Device Collection activity uses the Powershell activity template to add a specified device to an SCCM device collection. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called `AddToDeviceCollection.ps1` to edit the collection.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **System Center Configuration Manager (SCCM)**.

Note:
The Add to Device Collection activity does not use pre-processing or post-processing scripts.

Input variables

Add to Device Collection input variables

Variable	Description
sccmServer	The fully qualified domain name (FQDN) of the SCCM server.
collection	Name of the device collection.
device	Name of the device to add to the collection.

Output variables

Add to Device Collection output variables

Variable	Description
output	Variable that contains a value that is passed to other activities in the workflow.
error	Variable that contains the activity output error message.

Conditions

Add to Device Collection conditions

Condition	Description
Success	Activity successfully added the device to the SCCM device collection.
Failure	Activity failed to add the device to the SCCM device collection.

Add to User Collection activity

The Add to User Collection activity adds a user to a Microsoft System Center Configuration Manager (SCCM) user collection.

The Add to User Collection activity uses the Powershell activity template to access the SCCM server. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called `AddToUserCollection.ps1` to edit the collection.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **System Center Configuration Manager (SCCM)**.

Note:
The Add to User Collection activity does not use pre-processing or post processing scripts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Input variables

Add to User Collection input variables

Variable	Description
sccmServer	The fully qualified domain name (FQDN) of the SCCM server.
collection	Name of the user collection.
user	Name of the user to add to the collection.

Output variable

Add to User Collection output variables

Variable	Description
output	Variable that contains a value that is passed to other activities in the workflow.
error	Variable that contains the activity output error message.

Conditions

Add to User Collection conditions

Success	Activity successfully added a user to the SCCM user collection.
Failure	Activity failed to add a user to the SCCM user collection.

Get Applications activity

The Get Applications activity returns a list of all the applications available on a Microsoft System Center Configuration Manager (SCCM) server.

The Get Applications activity uses the Powershell activity template to access the applications on the SCCM server. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called `GetApplications.ps1`. This script filters the results of the GET, so that only specific attributes are returned for the applications on the SCCM server. Filtering the results in this manner controls the size of the payload, while providing the most desirable application data. The list of available applications is returned as an array in a JSON object.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **System Center Configuration Manager (SCCM)**.

Note:
The Get Applications activity does not use a pre-processing script.

Input variables

Get Applications input variables

Variable	Description
sccmServer	The fully qualified domain name (FQDN) of the SCCM server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output variables

The output variables for the Get Applications activity contain an array of objects called *applications* and an error message. Each object in the array contains the attributes in this table.

Get Applications output variables

Variables	Description
applications	The *applications* array contains these attributes: • *id*: Primary key of the SCCM application. • *ciUniqueId*: Unique ID of the SCCM application. • *name*: Name of the application. • *manufacturer*: Manufacturer of the application. • *version*: Version of the application. • *isDeployable*: True/false value indicating if this application is deployable. • *isDeployed*: True/false value indicating if this application is already deployed. • *numberOfUsersWithApp*: Count of users with this application installed. • *numberOfDevicesWithApp*: Count of devices on which this application is installed. • *application*: Object containing the data set listed above for this application. Use the script to parse additional data from this set that you might need.
error	Variable that contains the activity output error message.

Conditions

Get Applications conditions

Variables	Description
Success	Activity successfully retrieved the list of applications available on the SCCM host.
Failure	Activity failed to retrieve the list of applications available on the SCCM host.

Get Deployments activity

The Get Deployments activity returns the list of deployments performed by Orchestration using a Microsoft System Center Configuration Manager (SCCM) server.

The Get Deployments activity uses the Powershell activity template to access the deployments on the SCCM server. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called *GetDeployments.ps1* that returns the deployments on the host. This script filters the results of the GET, so that only specific attributes are returned for the deployments on the SCCM server. Filtering the results in this manner controls the size of the payload, while providing the most desirable deployment data. The list of available deployments is returned as an array in a JSON object.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **System Center Configuration Manager (SCCM)**.

Note:
The Get Deployments activity does not use pre-processing scripts.

Input variables

Get Deployments input variables

Variable	Description
sccmServer	The fully qualified domain name (FQDN) of the SCCM server.

Output variables

Get Deployments output variables

Variable	Description
deployments	The *deployments* array contains these attributes: • *id*: Primary key of the SCCM application. • *applicationId*: Primary key of the SCCM application. • *softwareName*: Name of the software that will be deployed. • *collectionId*: Primary key of the SCCM collection. • *collectionName*: Name of the SCCM collection. • *desiredConfigType*: Possible values are: *Install* (1) and *Uninstall* (2). • *deploymentIntent*: Intended purpose of the deployment. Possible values are: **Available** (1) and **Required** (2) . • *numberSuccess*: Number of clients that successfully installed the deployment. • *numberErrors*: Number of clients with an error when installing the deployment. • *deployment*: Object containing the data set of attributes listed here for this deployment. Use the post-processing script to parse additional data from this set that you might need..
error	Variable that contains the activity output error message.

Conditions

Get Deployments conditions

Condition	Description
Success	Activity successfully retrieved the list of deployments performed by Orchestration using an SCCM host.
Failure	Activity failed to retrieve the list of deployments performed by Orchestration using an SCCM host.

Get Device Collections activity

The Get Device Collections activity returns the list of available device collections on a Microsoft System Center Configuration Manager (SCCM) host.

The Get Device Collections activity uses the Powershell activity template to access the collections on the SCCM server. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called `GetDeviceCollections.ps1` that returns the device collections on the server. This script filters the results of the GET, so that only specific attributes are returned for the device collections on the SCCM server. Filtering the results in this manner controls the size of the payload, while providing the most desirable device collection data. The list of available collections is returned as an array in a JSON object.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **System Center Configuration Manager (SCCM)**.

Note:
The Get Device Collections activity does not use pre-processing scripts.

Input variables

Get Device Collections input variables

Variable	Description
sccmServer	The fully qualified domain name (FQDN) of the SCCM server..

Output variables

Get Device Collections output variables

Variable	Description
deviceCollections	The *deviceCollections* array contains these attributes: • *id*: Primary key of the SCCM device collection. • *name*: Name of the SCCM device collection. • *collectionType*: Type of SCCM collection. In this case, the value is **device**. • *localMemberCount*: Count of device collection members visible at the local SCCM site. • *memberCount*: Count of all device collection members. • *deviceCollection*: Object containing the data set of attributes listed here for this device collection. Use the post-processing script to parse additional data from this set to use.
error	Variable that contains the activity output error message.

Conditions

Get Device Collections conditions

Condition	Description
Success	Activity successfully retrieved a list of device collections available on the SCCM host.
Failure	Activity failed to retrieve a list of device collections available on the SCCM host.

Get User Collections activity

The Get User Collections activity returns the list of available user collections on a Microsoft System Center Configuration Manager (SCCM) server.

The Get User Collections activity uses the Powershell activity template to access the user collections on the SCCM server. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called `GetUserCollections.ps1` that returns the user collections on the host. This script filters the results of the GET, so that only specific attributes are returned for the user collections on the SCCM server. Filtering the results in this manner controls the size of the payload, while providing the most desirable user collection data. The list of available collections is returned as an array in a JSON object.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **System Center Configuration Manager (SCCM)**.

Note:
The Get User Collections activity does not use pre-processing scripts.

Input variables

Get User Collections input variables

Variable	Description
sccmServer	The fully qualified domain name (FQDN) of the SCCM server.

Output variables

Get User Collections output variables

Variable	Description
userCollections	The `userCollections` array contains these attributes: • `id`: Primary key of the SCCM user collection. • `name`: Name of the SCCM user collection. • `collectionType`: Type of SCCM collection. In this case, the value is **user**. • `localMemberCount`: Count of user collection members visible at the local SCCM site.

Get User Collections output variables (continued)

Variable	Description
	• *memberCount*: Count of all user collection members. • *userCollection*: Object containing the data set of attributes listed here for this user collection. Use the post-processing script to parse additional data from this set to use.
error	Variable that contains the activity output error message.

Conditions

Get User Collections conditions

Condition	Description
Success	Activity successfully retrieved the list of available user collections on an SCCM host.
Failure	Activity failed to retrieve the list of available user collections on an SCCM host.

Is Device in Collection activity

This activity verifies if a device exists in an SCCM device collection.

The Is Device in Collection activity uses the PowerShell activity template to verify if a specific device exists in an SCCM device collection. The activity is configured to use a MID Server with PowerShell capabilities and to run a MID Server script called *IsDeviceInCollection.ps1* to perform the test.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **System Center Configuration Manager (SCCM)**.

Input variables

Is Device in Collection input variables

Variable	Description
sccmServer	The fully qualified domain name (FQDN) of the SCCM server.
collection	Name of the device collection.
device	Name of the device to verify is in the collection.

Output variables

Is Device in Collection output variables

Variable	Description
output	Variable that contains the test result: True/False
errorMessage	Variable that contains the activity output error message.

Conditions

Is Device in Collection conditions

Condition	Description
Exist	The device exists in the collection.
Not exist	The device does not exist in the collection.
Failure	Activity failed.

Is User in Collection activity

This activity verifies if a user exists in an SCCM user collection.

The Is User in Collection activity uses the PowerShell activity template to verify if a specific user exists in an SCCM user collection. The activity is configured to use a MID Server with PowerShell capabilities and to run a MID Server script called `IsUserInCollection.ps1` to perform the test.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **System Center Configuration Manager (SCCM)**.

Input variables

Is User in Collection input variables

Variable	Description
sccmServer	The fully qualified domain name (FQDN) of the SCCM server.
collection	Name of the user collection.
user	Name of the user to verify is in the collection.

Output variables

Is User in Collection output variables

Variable	Description
output	Variable that contains the test result: True/False
errorMessage	Variable that contains the activity output error message.

Conditions

Is User in Collection conditions

Condition	Description
Exist	The user exists in the collection.
Not exist	The user does not exist in the collection.
Failure	Activity failed.

Remove from Device Collection activity

The Remove from Device Collection activity removes a device from a Microsoft System Center Configuration Manager (SCCM) device collection.

The Remove from Device Collection activity uses the Powershell activity template to remove a device from a device collection on a Microsoft SCCM server. The activity is configured to use a MID Server with Powershell capabilites and to run a MID Server script called *`RemoveFromUserCollection.ps1`* to edit the collection.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **System Center Configuration Manager (SCCM)**.

Input variables

Remove from Device Collection input variables

Variable	Description
sccmServer	The fully qualified domain name (FQDN) of the SCCM server.
collection	Name of the device collection.
device	Name of the device to add to the collection.

Output variables

Remove from Device Collection output variables

Variable	Description
output	Variable that contains a value that is passed to other activities in the workflow
error	Variable that contains the activity output error message.

Conditions

Remove from Device Collection conditions

Condition	Description
Success	Activity successfully removed the device from the SCCM device collection.
Failure	Activity failed to remove the device from the SCCM device collection.

Remove from User Collection activity

The Remove from User Collection activity removes a user from a Microsoft System Center Configuration Manager (SCCM) user collection.

The Remove from User Collection activity uses the Powershell activity designer template to access a user collection on a Microsoft SCCM target host. The activity is configured to use a MID Server with Powershell capabilites and to run a MID Server script called `RemoveFromUserCollection.ps1` to edit the collection.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **System Center Configuration Manager (SCCM)**.

Input variables

Remove from User Collection input variables

Variable	Description
sccmServer	The fully qualified domain name (FQDN) of the SCCM server.
collection	Name of the user collection.
user	Name of the user to add to the collection.

Output variables

Remove from User Collection output variables

Variable	Description
output	Variable that contains a value that is passed to other activities in the workflow.
error	Variable that contains the activity output error message.

Conditions

Remove from User Collection conditions

Condition	Description
Success	Activity successfully removed the user from the SCCM user collection.
Failure	Activity failed to remove the user from the SCCM user collection.

SFTP File Transfer activity pack

Use the SFTP File Transfer activities to manage files and directories on an SFTP server and to move files from one SFTP server to another.

The SFTP activity pack includes scoped activities for common file transfer tasks and a ready-to-use workflow that includes these activities. Use the SFTP workflow to control which files are going to be moved, what conditions the files need to meet, the order in which the files are moved, and which overwrite options are executed.

Note:
To use the SFTP File Transfer activities and workflow, you must request activation of the Orchestration - SFTP plugin.

SFTP File Transfer workflow

The SFTP File Transfer activity pack includes a scoped workflow that uses multiple activities to manage files on SFTP servers.

The maximum activity count for the SFTP File Transfer workflow is set to 10,000. This allows the workflow to move up to 1000 files from one server to another.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Accessing the workflow

- Navigate to **Workflow** > **Workflow Editor** and select the **Workflows** tab.
- Click on the SFTP File Transfer workflow to open it.
- Click the information icon in the workflow header to display the properties dialog box.

Input variables

SFTP File Transfer workflow input variables

Variable	Description	Default value
Source host	Name or IP address of the server containing the files you want to move.	
Source port	Port number to use to communicate with the source server.	22
Source directory	Full path to the directory where the source files are located.	
Source files	Names of specific source files to move. Separate the file names in this list with semi-colons. This field supports the use of wild cards. For information about how the values in this field are affected by options in other fields, see the section below the table.	
Excluded files	Names of specific source files to exclude from the move. The system moves all other files found in the source directory or subfolders. Separate the file names in this list with semi-colons. This field supports the use of wild cards. For information about how the values in this field are affected by options in other fields, see the section below the table.	
Target host	Name or IP address of the server to which the files are being moved.	
Target port	Port number to use to communicate with the target host.	22
Datetime format	Timestamp format to apply when the `$[DateTime]` variable is used in the **Target directory** or **Target files** field. The system uses the current time from the instance to create timestamp values.	yyyy-MM-dd
Target directory	Path to the directory in the target host where the files are being moved. You can specify a target directory whose name includes the timestamp by adding the `$[DateTime]` variable to the directory name. For example, you might enter this path to a target directory: `/user/jacinto.gawron/documents/projects_$[DateTime]`. This produces the `projects_20150505` directory. When the timestamp variable is used, the system uses the format specified in the **Datetime format** field.	
Target file	Format to use for target file names when a timestamp is added. You can configure the system to add the timestamp as a prefix to the file name or insert the timestamp into the name, using these variables: • `$[DateTime]`: Current timestamp, using the format defined in the **Datetime format** field. • `$[SourceFile]`: Complete file name.

SFTP File Transfer workflow input variables (continued)

Variable	Description	Default value
	• `$[SourceFile:Base]`: Base file name without the extension. • `$[SourceFile:Ext]`: File extension only. A target file name with the timestamp added as a prefix is expressed as: `$[DateTime]_$[SourceFile]`. This produces a file name that looks like this: `20150505_file1.txt` A target file name with the timestamp inserted into the name is expressed as: `$[SourceFile:Base]_$[DateTime]$[SourceFile:Ext]`. This produces a file name that looks like this: `file1_20150505.txt`	
Apply move conditions	Check box to apply conditions to the file transfer. If this check box is selected, additional fields appear for setting conditions.	false
Minimum file size, in bytes	Condition that defines a target file's minimum size requirement. This setting can help determine if the file is valid. This field appears when the **Apply move conditions** check box is selected.	0
Maximum file size, in bytes	Condition that defines a target file's maximum size requirement. This field appears when the **Apply move conditions** check box is selected.	-1
File is not older than	Condition that sets the earliest acceptable date for this file's age range. The range starts at 00:00 (midnight) on the date specified. This field appears when the **Apply move conditions** check box is selected.	
File is not newer than	Condition that sets the latest acceptable date for this file's age range. The range ends at 23:59 on the date specified. This field appears when the **Apply move conditions** check box is selected.	
Include subfolders	Check box to move the files from subfolders in the source directory. For information about how your selection affects other fields in the form, see the section below the table.	
Move order	Order in which the files are moved from the source to the target. The possible options are: • **None** (same order as files in the source directory) • **By timestamp** • **By file name** • **By file size**	
Sort order	Order in which the files are sorted in the target directory, using the option selected in the **Move order** field. Sorting options are **Ascending** and **Descending**.	desc
Maximum number of retries	Number of attempts the activity can make to connect to the target host or to move a file before timing out. When the retry limit to move a file or to connect to the host is exceeded, the system logs a failure. If the	2

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SFTP File Transfer workflow input variables (continued)

Variable	Description	Default value
	maximum number of failures is not exceeded, the system attempts to connect again or to move the next file named.	
Time between retries, in seconds	Time, in seconds, between repeat attempts to connect to the target or to begin moving a file.	10
Maximum number of failures	Acceptable number of times the system can fail to connect to the target host or to move a file before it quits trying. A failure occurs when the number of configured retries is exceeded. Using the default settings, failure occurs when the system cannot connect to the target or move a file after two retries.	0
Duplicate file action	Action to take if a file being moved already exists in the target directory. The choices are: • **Overwrite if file exists** (default) • **Rename with index** • **Do not move**	overwrite
Preserve file attributes	Check box to use the time stamp and mode information from the source files for the copied files. If this check box is cleared, the copied files have a current time stamp and mode. **Note:** This timestamp is a file attribute and is not appended to the file name.	false
Upon success, remove files from source	Check box to delete original files from the source directory when they are copied to the new location. Clear this check box to keep the source files in their current location in the source host.	false
Upon failure, keep moved files on target	Check box to keep any files on the target that were moved successfully, even if the entire file transfer operation ended in failure. If this check box is cleared, the system removes all successfully transfered files from the target when general failure occurs.	true
Credential tag for source	Specific Credential aliases for Orchestration activities this activity must use to run SSH commands on the source host.	
Credential tag for target	Specific credential tag this activity must use to run SSH commands on the target host.	

File selection logic

When selecting the files to move from the source host, the system uses this logic:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If the **Source files** and **Excluded files** fields are empty, the system moves all the files in the source directory.
- When the **Include subfolders** check box is selected, the following dependencies exist:
  - If no files are specified in the **Source files** and **Exclude files** fields, the system moves all files in the source directory and all files in all subfolders of the source directory.
  - If the **Source files** field contains file names, the system moves those files from their location on either the source directory or any of its subfolders.
  - If the **Exclude files** field contains file names, the system moves all the files from the source directory and its subfolders except those excluded files.
- When the **Include subfolders** check box is cleared, the system looks only in the source directory for files to move or exclude.

Copy File activity

The Copy File activity copies a file from an SFTP server (source host) to another SFTP server (target host).

Input variables

Copy File input variables

Variable	Description
sourceHost	Name or IP address of the server containing the files you want to transfer.
sourcePort	Port number to use to communicate with the source server. The default port number is **22**.
sourceFilePath	Full path to the file to copy from the source host.
targetHost	Name or IP address of the server to which you want to move the files.
targetPort	Port number to use to communicate with the target server. The default port number is **22**.
targetFilePath	Full path to the copied file on the target host.
tempFileSuffix	Temporary suffix to use when moving a file. If this field contains a value, the activity deletes the duplicate target file, if it exists, and then copies the source file to a temporary file using *`targetFilePath + tempFileSuffix`* as the name. Upon completion, the activity renames the file to the actual target file name. If this field is blank, the activity copies the source file directly to the target file and overwrites it, if it already exists.
sourceCredentialTag	Specific Credential aliases for Orchestration activities this activity must use to run SSH commands on the source host.
targetCredentialTag	Specific credential tag this activity must use to run SSH commands on the target host.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output variables

Copy File output variables

Variable	Description
errorMessages	The *executionResult.errorMessages* from the Activity designer parsing sources. If this variable is not null, the operation has failed.
result	Text message advising that the command was executed successfully.

Conditions

Copy File conditions

Condition	Description
Success	The activity succeeded in copying the file.
Failure	The activity failed to copy the file.

Create Directory activity

The Create Directory activity creates a new directory on an SFTP server.

Input variables

Create Directory input variables

Variable	Description
sourceHost	Name or IP address of the server containing the files you want to move.
sourcePort	Port number to use to communicate with the source server. The default port number is **22**.
sourceDirectory	Path to the target directory to create.
sourceCredentialTag	Specific Credential aliases for Orchestration activities this activity must use to run SSH commands on the host.

Output variables

Create Directory output variables

Variable	Description
errorMessage	The *executionResult.errorMessages* from the Activity designer parsing sources. If this variable is not null, the operation has failed.
result	Text message advising that the command was executed successfully.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Conditions

Create Directory conditions

Variable	Description
Success	The activity succeeded in creating the directory.
Failure	The activity failed to create the directory.

Get File List activity

The Get File List activity returns a list of files from a given directory and its subdirectories on an SFTP server (source host).

Input variables

Get File List input variables

Variable	Description
sourceHost	Name or IP address of the server containing the files you want to list.
sourcePort	Port number to use to communicate with the target server. The default port number is **22**.
sourceDirectory	Path to the target directory containing the files to list.
sourceFiles	List of target files to return. This is a comma separated list that accepts wildcards, such as ***.txt**.
excludedFiles	List of target files to exclude. This is a comma separated list that accepts wildcards, such as ***.txt**.
includeSubfolders	True/false variable that determines if files from subfolders are included in the list. The default value for this variable is **false**.
sourceCredentialTag	Specific Credential aliases for Orchestration activities this activity must use to run SSH commands on the host.

Output variables

Get File List output variables

Variable	Description
errorMessage	The *executionResult.errorMessages* from the Activity designer parsing sources. If this variable is not null, the operation has failed. An activity can examine the error message to customize a condition. For example, if the error message contains *NO_SUCH_FILE*, the activity can be considered successful, depending on circumstances.
result	List of requested files, returned as a JSON string.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Conditions

Get File List conditions

Condition	Description
Success	The activity succeeded in listing the requested files.
Failure	The activity failed to list the requested files.

Remove File or Directory activity

The Remove File or Directory activity removes a file or a directory on an SFTP server, including subdirectories, when configured.

Input variables

Remove File or Directory input variables

Variable	Description
sourceHost	Name or IP address of the server containing the files you want to remove.
sourcePort	Port number to use to communicate with the target server. The default port number is **22**.
sourceFilePath	Full path to the file or directory to remove. To remove multiple files or directories using a single activity, enter a semicolon-separated list of paths in this field.
isDirectory	True/false variable that determines if the specified file path is a directory. The default value for this variable is **false**.
includeSubfolders	True/false variable that determines if the given directory and all of its subfolders should be removed. The default value for this variable is **false**. If the value for this field is **false**, then the activity can only remove an empty directory. This field appears when the **isDirectory** checkbox is selected.
sourceCredentialTag	Specific Credential aliases for Orchestration activities this activity must use to run SSH commands on the host.

Output variables

Remove File or Directory output variables

Variable	Description
errorMessage	The *executionResult.errorMessages* from the Activity designer parsing sources. If this variable is not null, the operation has failed.
result	Either **success** or **failure**.
deletionResults	The *deletionResults* array contains these attributes: • *fullPath*: Full path to the file or directory targeted. • *status*: Either **succeeded** or **failed**. • *reason*: Text message describing the cause of a failure.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Conditions

Remove File or Directory conditions

Condition	Description
Success	The activity succeeded in removing the file or directory specified.
Failure	The activity failed to remove the file or directory specified.

Rename File or Directory activity

The Rename File or Directory activity renames a file or directory to a new name on an SFTP server.

Input variables

Rename File or Directory input variables

Variable	Description
sourceHost	Name or IP address of the server containing the file or directory you want to rename.
sourcePort	Port number to use to communicate with the target server. The default port number is **22**.
sourceFilePath	Full path to the file or directory to rename.
targetFilePath	Full path to the renamed file or directory.
sourceCredentialTag	Specific Credential aliases for Orchestration activities this activity must use to run SSH commands on the host.

Output variables

Rename File or Directory output variables

Variable	Description
errorMessages	The *executionResult.errorMessages* from the Activity designer parsing sources. If this variable is not null, the operation has failed.
result	A message saying that the operation has been successful. For example, you might see: `Rename /tmp/sftp_test/subdir1 to /tmp/sftp_test/subdir2 complete`.

Conditions

Rename File or Directory conditions

Condition	Description
Success	The activity succeeded in renaming the file or directory.
Failure	The activity failed to rename the file or directory.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set File Attributes activity

The Set File Attributes activity sets common file attributes, such as timestamps, size, permissions, and UID/GID, for a file or directory on an SFTP server.

A good practice is to use the Get File List activity to return a list of files and their attributes first. Then, when you moved a file from a source host to a target host, use the Set File Attributes activity to set the source file attributes on the target file. This is demonstrated in the SFTP File Transferworkflow.

Input variables

Set File Attributes input variables

Variable	Description
sourceHost	Name or IP address of the server containing the file or directory whose attributes you want to change.
sourcePort	Port number to use to communicate with the target server. The default port number is **22**.
sourceFilePath	Full path to the file or directory whose attributes you want to change.
userID	User ID attribute to apply to the file or directory. The UID and GUID variables must be set together as a pair.
groupID	Group ID attribute to apply to the file or directory. The UID and GUID variables must be set together as a pair.
permissions	File or directory permissions to set for the user and group specified. This value must be expressed as an integer, such as **16877**, which defines these permissions: *rwxr-xr-x*. **Note:** The permissions number is an internal value returned by the Get File List activity.
accessTimestamp	Override the timestamp when the file or directory was last accessed. The access and modification timestamps must be set together as a pair.
modificationTimestamp	Override the timestamp when the file or directory was last modified. The access and modification timestamps must be set together as a pair.
sizeInBytes	Size of the file or directory, expressed in bytes.
sourceCredentialTag	Specific Credential aliases for Orchestration activities this activity must use to run SSH commands on the host.

Output variables

Set File Attributes output variables

Variable	Description
errorMessage	The *executionResult.errorMessages* from the Activity designer parsing sources. If this variable is not null, the operation has failed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set File Attributes output variables (continued)

Variable	Description
result	Text message advising that the command was executed successfully.

Conditions

Set File Attributes conditions

Condition	Description
Success	The activity succeeded in changing the attributes of the specified file or directory.
Failure	The activity failed to change the attributes of the specified file or directory.

SSH activity pack

Orchestration provides an activity pack of SSH activities that were customized using the ServiceNow activity designer.

These activities perform the same functions as SSH activities by the same name from previous releases and replace those activities for all new workflows. The custom SSH activities were built with the Create an SSH activity, which gives workflow administrators the ability to store input and output variables in the databus.

Note:
Existing workflows from earlier versions that were created with legacy SSH activities continue to function normally after an upgrade to Geneva. However, all new workflows must use these custom SSH activities.

To use the SSH custom activities, you must request activation of the Orchestration - SSH plugin.

Secure Copy activity

The Secure Copy activity copies a file from one host to another, without storing the copied file on the MID Server.

This activity replaces an SSH activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the SSH activity designer template, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

Secure Copy input variables

Input variable	Description
from_host	Host name or IP address of the source machine.
from_scp_file	Name of the file to copy, including the absolute path.
to_host	Host name or IP address of the target machine.
to_scp_file	Path to the target file. This path can be absolute or relative to the logged in user's home directory.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Secure Copy input variables (continued)

Input variable	Description
debug_mid	Check box that enables debug logging when selected.
debug_ssh	Check box that enables J2SSH debug logging when selected.

Output variables

Secure Copy output variables

Output variable	Description
payload	The *executionResult.payload* from the Activity designer parsing sources.
output	The *executionResult.output* from the parsing sources.

Conditions

Secure Copy conditions

Condition	Description
Success	Activity successfully copied the file from one host to another.
Failure	Activity failed to copy the file from one host to another.

Files Compare activity

The Files Compare activity compares two files on a Linux or UNIX computer.

This activity replaces an SSH activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the SSH activity designer template, which gives workflow administrators the ability to store input and output variables in the databus.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Global** > **Orchestration - SSH**.

Input variables

Files Compare input variables

Input variable	Description
Hostname	Hostname or IP address of the destination server for SSH activity.
Directory	Name of the working directory.
OldFile	Name of the first file to compare.
NewFile	Name of the second file to compare.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output variables

Files Compare output variables

Output variable	Description
contents	File comparison result. This is the difference of the two compared files.
result	Either **success** or **failure**.
return-code	Either **0**, if the two files are the same, or **1**, if the two files are different.
errorMessage	The *executionResult.errorMessages* from the Activity designer parsing sources.

Conditions

Files Compare conditions

Condition	Description
Success	Activity successfully compared the specified files.
Failure	Activity could not complare the specified files.

File Read activity

The File Read activity reads a file on a Linux or UNIX computer.

This activity replaces an SSH activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the SSH activity designer template, which gives workflow administrators the ability to store input and output variables in the databus.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Global** > **Orchestration - SSH**.

Input variables

File read input variables

Input variable	Description
Hostname	Hostname or IP address of the destination server for SSH activity.
Directory	Name of the working directory.
File	The name of the file to read.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output variables

File read output variables

Output variable	Description
contents	Content of the file to read.
result	Either **success** or **failure**.
errorMessage	The *executionResult.errorMessages* from the Activity designer parsing sources.

Conditions

File Read conditions

Condition	Description
Success	Activity successfully read the contents of the specified file.
Failure	Activity could not read the contents of the specified file.

File Write activity

The File Write activity writes a file on a Linux or UNIX computer.

The source file can be an absolute or relative path from the Directory. If an absolute path is used, then no value is required in the *Directory* field.

This activity replaces an SSH activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the SSH activity template, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

File Write input variables

Field	Description
hostname	Hostname or IP address of destination server for SSH activity.
directory	Name of the working (target) directory.
file	Name of the file to be written.
behavior	Select one of the following: • **overwrite**: Creates the file if it does not exist and overwrites the file if it does exist. • **append**: Creates the file if it does not exist and appends the new content to an existing file. • **create only**: Creates the file if it does not exist and fails if the file does exist.
contents	What to write or append (depending on the behavior) to the file

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output variables

File Write output variables

Variable	Description
return_code	Indicates whether or not the file write operation was successful.
error_message	Message that indicates if an error has occurred. Any value other than **0** indicates a failure.

Conditions

File Write conditions

Condition	Description
Success	The activity wrote a file in the target directory.
Failure	The activity failed to write a file in the target directory.

File Copy activity

The custom File Copy activity copies a file on a Linux or UNIX computer.

This activity replaces an SSH activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the SSH activity designer template, which gives workflow administrators the ability to store input and output variables in the databus.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities** > **Global** > **Orchestration - SSH**.

Input variables

File Copy input variables

Input variable	Description
hostname	Hostname or IP address of destination server for SSH activity.
directory	Name of the working directory.
src_file	Name of the source file.
dst_file	The name of the destination file.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output variables

File Copy output variables

Output variable	Description
result	Either **success** or **failure**.

Conditions

File Copy conditions

Condition	Description
Success	Activity successfully copied the file on the specified host.
Failure	Activity failed to copy the file on the specified host.

File Replace String activity

The File Replace String activity finds and replaces a string in a file on a Linux or UNIX computer.

This activity replaces an SSH activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the SSH activity template, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

File Replace String input variables

Variable	Description
hostname	Hostname or IP address of destination server for SSH activity.
directory	Name of the working (target) directory.
file	Name of the file in which the string is to be replaced.
find_pattern	A regular expression of the text to replace.
replace_string	The replacement string for the text found by the expression in the *find_pattern* variable.
options	Replacement options: • **first**: Replaces the first occurence of the pattern. • **all**: Replaces all occurrences of the pattern.

Output variables

File Replace String output variables

Variable	Description
return_code	Indicates whether or not the string was replaced successfully in the target file.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

File Replace String output variables (continued)

Variable	Description
error_message	Message that indicates if an error has occurred. Any value other than **0** indicates a failure.

Conditions

File Replace String conditions

Condition	Description
Success	The activity has successfully replaced the string in the file.
Failure	The activity has failed to replaced the string in the file.

Reset Linux User Password activity

The *Reset Linux User Password* activity resets the password for a given user on a Linux computer.

This activity requires that the user executing the command be able to run the **chpasswd** command and, if expiring the password immediately, to run **chage** with MID Server privileged commands.

This activity replaces an SSH activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the SSH activity template, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

Reset Linux User Password input variables

Variable	Description
hostname	IP address of the target Linux machine.
user	Name of the user whose password is being reset.
password	New password set for this user. The password is a workflow variable that is encrypted either as a **password2** field or by calling the encryption method of a *`Packages.com.glide.util.Encrypter`* object.
force_change	Indicates if this password is temporary and to force the named user to change the password at login.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output variables

Reset Linux User Password output variables

Variable	Description
return_code	Indicates whether or not the user password reset action was successful.
error_message	Describes any error that occurred during password reset. If no error occurred, this value is null.

Conditions

Reset Linux User Password conditions

Variable	Description
Success	Activity successfully changed specified user's password
Failure	Activity failed to change specified user's password.

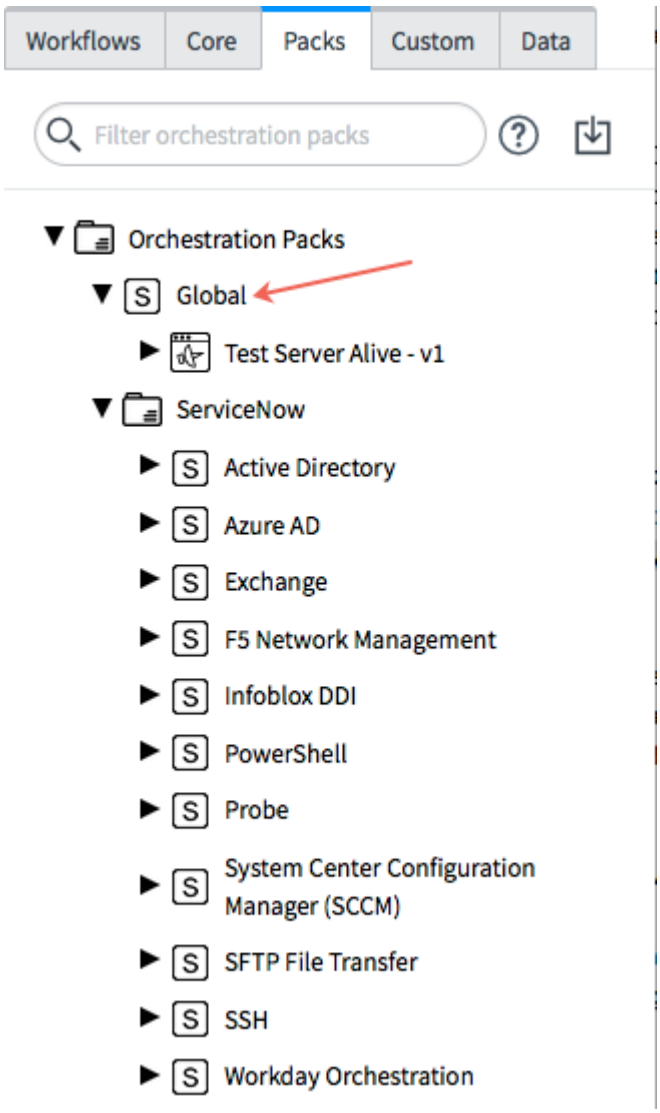
Global activities

Global activities are Orchestration activities created in the global scope.

Any activities you create in the global scope are listed in the Global category in the **Packs** and **Custom** tabs of the Workflow Editor.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Global activities



Test Server Alive activity

The Test Server Alive activity determines if a target system is alive by its response to a particular protocol.

This activity replaces an activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the Probe activity template, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

Test Server Alive input variables

Variable	Description
port_probes	A comma separated list of protocols to use to check for signs of activity on the target machine (example: *wmi,wins,https,ssh,http,https,snmp,dns*)
hostname	Hostname or IP address of the target system to check.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output variables

Test Server Alive output variables

Variable	Description
alive	Code that indicates whether or not the server is alive. If any value but **'1'** is returned, the server is not alive.

Conditions

Test Server Alive conditions

Condition	Description
Success	Activity determined that the device is running.
Failure	Activity failed to determine if the target device is running. Failure could be caused by a missing protocol or a device that is not accessible.

Orchestration activity designer

The Orchestration activity designer enables a user with either the workflow_admin or activity_creator and workflow_creator roles to construct reusable activities that suit an organization's business needs.

Activities created by the activity designer offer the following advantages over core activities offered in previous releases:

- Reuse custom activities in multiple workflows.
- Upload and download custom activities from the ServiceNow Store.
- Parse data from standard input formats.
- Test input variables against a target host or endpoint and inspect the payload.
- Automatically map values from a test payload to an activity's output variables.
- Share data between activities.
- View previous versions of an activity.

Access to the activity designer requires activation of ServiceNow Orchestration. For instructions about managing transitions and conditions for all activities, see Workflow activities.

Orchestration provides numerous pre-defined activities, which are reusable components that can be used in numerous workflows without having to understand the complexities of the underlying system. These activities are grouped into activity packs, which address specific business needs, such as: Active Directory, Azure AD, Exchange, Infoblox DDI, and PowerShell. There are other ServiceNow applications which provide and maintain their own separate activity packs, such as Security Incident Response, Cloud Management, or Release Automation.

Customers can also build their own activities and activity packs. You can construct custom activities with a specified template through the Orchestration Activity Designer. Custom-built activities built with the Activity Designer are referred to as activity elements. Activity elements provide optimal operations, enable code reuse, and minimize the need to write code. They also

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

enable you to follow the flow of data within a given workflow across orchestration activities. Incorporating activity elements limits the dependency on the scratchpad which reduces problems in complex workflows. Limit the use of core activities, like 'Run Script', unless you need direct access the scratchpad, for example, for a counter. Activity elements do not have direct access to the scratchpad. You can, however, pass scratchpad variables as inputs into your activities.

Orchestration activities created by the activity designer:

- Can be uploaded and shared in the ServiceNow App Store
- Use the databus, which allows the activity to have well-defined inputs and outputs
- Share data across activities within a workflow
- Use versioning
- Provide a consistent approach for activity development regardless protocol

Note:
Prior to the Fujirelease, activities were built with Activity Definitions. In Fuji, a new architecture was introduced using the Activity Designer. Orchestration Core activities, built originally as Activity Definitions, have been converted to use the new template format (Activity Elements) and the databus offered with the activity designer. Workflows in upgraded instances that use legacy activities continue to work normally.

For instructions on using activities to construct a workflow, see Add an activity to a workflow.

Introduction to credentials, connections, and aliases for Orchestration

All application integrations in Orchestration require connection information, credentials, and connection and credential aliases to their respective applications to access resources.

Before you can execute an application integration in Orchestration, you must create and configure the corresponding connection information and credentials. The Connections pertains to an integration with a system, such as an IP address or endpoint with protocols. It contains specific details, such as database particulars, when integrating with a database. The associated Credentials are the authentication data required to make the connection.

Connection information and credentials can vary between QA/Development/Production environments for the same integration. The tight coupling between this data and application metadata, such as workflow or job scheduling, make application metadata obsolete when you change environments. To alleviate this problem, the concept of an alias is introduced, for connections and credentials, to decouple this data from application metadata. These aliases allow customers to design their application metadata to couple to an alias, which during runtime resolves to connection and credential data.

There are two types of aliases, a connection and credential alias and a credential alias. There are business rules that enforce certain constraints on these aliases. Names should contain alphabets, numbers, and underscores but cannot have special characters. The alias must be unique in a scope. If you choose to have multiple active connections, you can have more than one active connection in the same domain. If you do not choose this option, you can have only one active connection in per domain.

Note:
If you enable multiple active connections, when the connection records resolve, your application picks one connection based on an established order. The order of the connections depends on the API you use to retrieve connection data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can add additional connection attributes to an alias, which are available in connection data during run time. Variables overridden by connection administration during run time should not affect the alias.

The credential alias resolves only credential data. Along with alias data model, you can use a scriptable API which can get connection and credential data during runtime.

Using Connection and Credential Alias with Orchestration

Define an alias to label a credential or connection record.

The Credential and Connection Alias defines an alias that labels a credential or connection record. It is extended from the sys_metadata table. It requires the admin role. The credential_admin and connection_admin have read access to sys_alias. A connection alias contains:

Name

Name of the alias.

ID

This field is based on the format "scope name.alias name" Unique index on ID to ensure unique record based on scope name + name. If the scope is global, the ID is the alias name.

Type

You can select either 'Credential' or 'Connection and Credential'. The default is Connection and Credential.

Connection type

This field is applicable when the alias type is set to Connection and Credential. There are three connection types: HTTP, JDBC, JMS. The default is HTTP.

If you create a workday alias in global scope, the ID is set to workday

If you create a workday alias in hr app scope, the ID is set to x_hr_app.workday

- Name can only contain alphabets, numbers and underscore.
- During the upgrade, the tag in credential record will be migrated to connection alias. If the tag in previous release's credential record contains special characters other than alphabets, numbers and underscore, the tag data will be preserved during the upgrade. The user still can use these connection alias, but the user cannot update these alias, unless he removes these special characters when do the update.

Using credentials with Orchestration

Orchestration requires credentials to access resources.

Credential table

The credential table (discovery_credential) defines credentials that can be used for integration. In the previous release, the Credential table contains a string-type tag field, which labels a credential and the tag is used in Orchestration activities. In the Madrid release, the credential alias is renamed from tag, and the type is changed from string to GlideList, which is a reference to the connection alias table.

Credential types

The following credential types are provided:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Credential type	Description	Supports Test Credential option
Applicative credentials	The credentials to explore the applications on a device or computer. Discovery patterns used by ITOM Visibility often need applicative credentials.	No
Amazon Web Service credentials	The Amazon Web Services (AWS) main account, access key ID, and secret access key. **Note:** You cannot test AWS credentials through the Test	No
Azure Service Principal and Enterprise Agreement credentials	The Azure service principals required for an Azure subscription.	No
Basic authentication credentials	A user name and password.	No
CIM credentials	The user name and password required to access a CIMOM - Common Information Model Object Manager (CIM) server, which obtains information about VMware ESX servers.	No
Cloud credentials	Credentials that Orchestration uses to access cloud resources.	No
JDBC credentials	A user name and password to access a Java Database Connectivity (JDBC) connection.	Yes
JMS credentials	A user name and password to access to a Java Message Service (JMS).	Yes
OAuth 2.0 credentials	OAuth 2.0 credentials enable ServiceNow® to obtain access to user accounts on an HTTP service.	
SNMP community credentials	The community string to access devices via SNMP.	Yes
SNMPv3 credentials	The user name and keys required to access devices on your SNMP v3 network.	Yes
SSH credentials	The user name and password to access Linux and UNIX devices.	Yes
SSH credentials	The private key credentials to access Linux and UNIX devices. **Note:** For better security, SSH private key credentials are suggested over SSH password credentials.	Yes
VMware credentials	Credentials to access vCenter resources. These credentials are required for any work that is performed on vCenter, such as cloning a virtual machine.	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Credential type	Description	Supports Test Credential option
Windows credentials	The user name and password required to access Windows computers. Several Windows credentials must be met to use Windows credentials.	Yes

How MID Servers use credentials

By default, Windows MID Servers use the login credentials of the MID Server service on the host machine to discover Windows devices in the network. You should Configure Windows MID Server service credentials so that they have domain or local administrator privileges. For Linux and UNIX machines and network devices, the MID Server uses the SSH and SNMP credentials configured in the instance in **Discovery** > **Credentials**.

MID Servers that Orchestration uses must have access to the necessary credentials to execute commands on computers in the network as specified by the Workflow activities. Orchestration can use the same SSH and SNMP credentials as Discovery, but has two additional credentials designed for specific workflow activities: Windows (for PowerShell) and VMware.

Encryption and decryption

The platform stores credentials in an encrypted field on the Credentials [discovery_credentials] table. Once they are entered, they cannot be viewed.

When credentials are requested by the MID Server, the platform decrypts the credentials using the following process:

1. The credentials are decrypted on the instance with the password2 fixed key.
2. The credentials are re-encrypted on the instance with the MID Server's public key.
3. The credentials are encrypted on the load balancer with SSL.
4. The credentials are decrypted on the MID Server with SSL.
5. The credentials are decrypted on the MID Server with the MID Server's private key.

Note:
The platform does not have separate encryption keys for multi-tenant instances.

Credential order

Credentials can be assigned an order value in the Credentials form, which forces the application to try all the credentials at their disposal in a certain sequence. If you do not specify an order value, the application tries the credentials in the Credentials [discovery_credential] table randomly, until it finds one that works, such as when Orchestration attempts to run a command on an SSH server (such as a Linux or UNIX machine), or when Discovery attempts to query an SNMP device (such as a printer, router, or UPS).

After identifying the credentials for a device, Discovery and Orchestration create an affinity between the credentials and the device using the Credential Affinity `[dscy_credentials_affinity]` table. All subsequent discoveries or Orchestration activities attempt to match the credentials in this table with a device for which an affinity exists. If credentials for a device change, Discovery and Orchestration try all available credentials again until they create a new affinity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If Orchestration and Discovery are installed, and credential alias is enabled, multiple affinities can exist. In this case, the platform looks up credentials for each affinity and inserts the credential for the affinity with the lowest order into the probe.

Ordering credentials is useful in the following situations:

- The credentials table contains many credentials, with some used more frequently than others. For example, if the table contains 150 SSH credentials, and 5 of those are used to log in to 90% of the devices, it is good practice to configure those five with low-order numbers, which places them at the top of the execution list. Discovery and Orchestration will work faster if they try these common credentials first. After the first successful connection, the system knows which credentials to use the next time for each device.
- The system has aggressive login security. For example, if the Solaris database servers in the network only allow three failed login attempts before they lock out the MID Server, configure the database credentials with a low-order value.

Credential alias

Credential alias enables flow and workflow creators to:

- Assign individual credentials to any activity in an Orchestration workflow.
- Assign individual credentials to any action in Workflow Studio.
- Assign different credentials to each occurrence of the same activity type in an Orchestration workflow.
- Assign different credentials to each occurrence of the same action in designer flow.

Credential alias also works with credential affinities.

External credential stores

If you do not want credentials stored in your instance, you can use external credential repositories. External credential stores save the credentials in an external site that your instance can access. Only CyberArk is supported.

Connections with Orchestration

Use the connections table to setup a JMS, JDBC, or HTTP(s) connection to a target host.

Connection Table

The Connection table (sys_connection) is the base table for all connection tables. You can setup connections for the following protocols:

- JDBC
- JMS
- HTTP(s)

The connection table references the connection alias table, which couples the connection alias to connection information. Every connection records the following information:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Base connection properties

Field	Description
Name	Name of the connection. This field must be unique on the table.
Credential	Specify the credential to use with this connection. This is optional.
Connection alias	The connection alias resolves your connection and credentials at run time. Only one connection is active per Connection alias at any one time.
Active	Check to make the current connection active.
Domain	Domain to which the connection belongs.

Credential is unique across active connections, if not empty.

Upgrading connection information

The JDBC connection (jdbc_connection) and JMS connection (orch_jms_ds) tables are existing Orchestration connection tables. In madrid, we re-parent them to extend from Connection (sys_connection) table. They move from Orchestration run time plugins to Credentials & Connections plugins. They are originally extended from sys_metadata. The sys_metadata related data will be removed. JDBC field name changes:

- JDBC server is renamed to host
- Database port is renamed to port

Create custom activities using custom activity designer templates

You can create and update different types of custom activities in the Workflow Editor using a custom template.

Before you begin

Roles required: workflow_admin or activity_creator

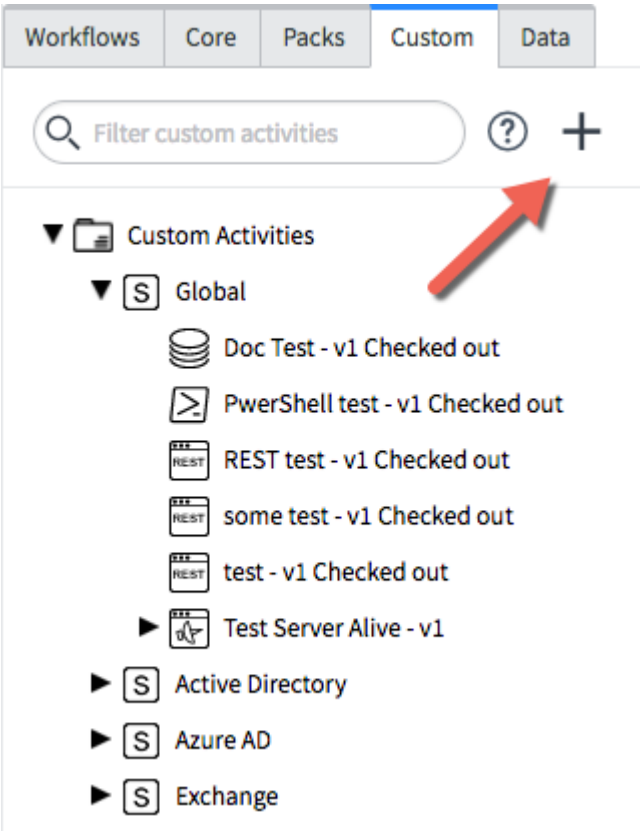
About this task

The Activity Designer contains common steps which are applicable to all the activities that you create. This procedure guides you through the common steps and the order they should be set up. You specify an activity template before you create a custom activity.

Procedure

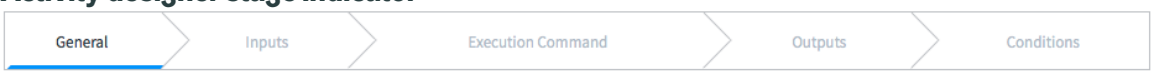
1. Navigate to **All** > **Orchestration** > **Workflow Editor**.
   The **Welcome** tab of the Workflow Editor opens.
2. On the **Custom** tab in the palette, click **+** to create a new activity select the appropriate template from the list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The Activity Designer form appears, with a stage indicator at the top. All new activities start at the **General** stage. The current stage shows with a blue underscore.

Activity designer stage indicator



3. Add the general properties.
   This information is standard for each custom activity, include a name, description, and other related information.
4. Create the template Create input variables for the template.
   Create the variables to pass into the activity in the Inputs form of the activity designer.
5. **Optional:** Add a pre-processing script.
   For input validation or transforming input data, you might need a pre-processing script.

   Note:
   This step is not included in the Run Script activity.

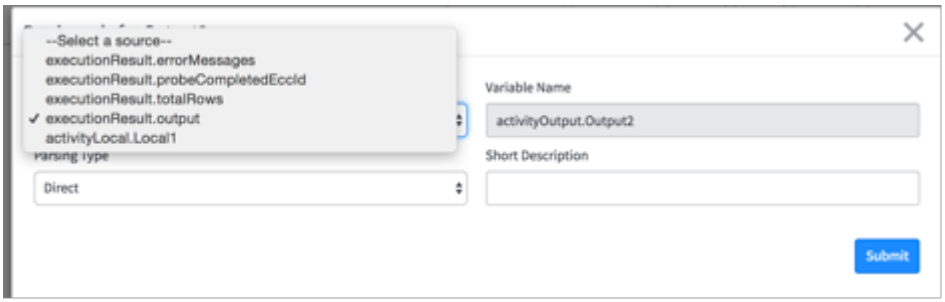
6. Click **Continue** to open the Execution Command form, then fill out the **Execution Command** step based on the corresponding execution templates:
   - Create a SOAP web service activity
   - Create a JDBC activity
   - Create a JavaScript Probe activity
   - Create a PowerShell activity
   - Create a REST web service activity
   - Create a Probe activity
   - Create an SFTP activity

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Create a Run Script activity
- Create an SSH activity
- Create a JMS activity

7. **Optional:** Test your inputs.
8. **Optional:** In the Outputs form, define local and/or output variables.
   Local variables can be used for temporary storage when cascading parsing rules. For example, you might extract an XML payload from within a JSON payload. A local variable can access the XML document and use that as a source for another parsing rule. The graphic shows a *Local1* variable source to parse data for *Output2*.

Define local variable



9. Use one of the options to assign values to Outputs.

Option	Description
Parsing rule	You can create a parsing rule and map them to the output fields by dragging and dropping the variables into the parsing rules structure. The REST, SOAP, and JDBC templates pro vide auto-mapping to create the parsing rules automatically. If available from the test inputs form, auto-mapping should be used when possible.
Post-processing	Post-processing scripts allow you to code your own output data validation, output pars ing code, and related tasks. Post-process ing executes after the execution command results have been returned and before the parsing rules and conditions are run. Click **Go to Post-Processing (Advanced)** to create a post-processing script. **Note:** If you create a script, this step reflects as a stage in the indicator.

10. Click **Continue** to open the Conditions form to create exit condition rules for your activity and then click **Save**.

General properties for activity designer templates

The following General Property fields are common to all activity designer templates.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

General Property fields common to all activity designer templates

Fields	Description
Name	Descriptive name of the activity. Select a unique name that makes the activity easily identifiable in the palette. If you do not name the activity, it is identified in the **Data** tab of the Workflow Editor with an index number when it is added to a workflow. This index reflects the order in which the custom activity was added to the workflow. Only custom activities and their output variables appear in the **Data** tab.
Short description	Brief description of what the activity does.
Image	Icon that identifies an activity of this type in the workflow palette.
Execution template	Predefined template selected for this activity.
Application	Current Application scope set on the instance. To view the scope, click the gear icon on the right side of the title bar in any record or list and look at the value in the **Application** field. The activity runs in this scope within a workflow. You cannot view or change the scope for the instance in the Workflow Editor.
Accessible from	Accessibility setting for this activity, by scope. The following options are available: • **All application scopes**: This activity is available to all application scopes. • **This application scope only**: Use of this activity is restricted to the scope named in the **Application** field.
Category	Category for this activity in the **Custom** and **Packs** tabs. All categories are listed under their scope in the collapsible hierarchy.
Description	Detailed description of the activity.

Create input variables

Create the variables to pass into the activity in the **Inputs** form of the activity designer.

Before you begin

You must name your activity in the **General** form before you can advance to the **Inputs** stage.

Roles required: workflow_admin or activity_creator

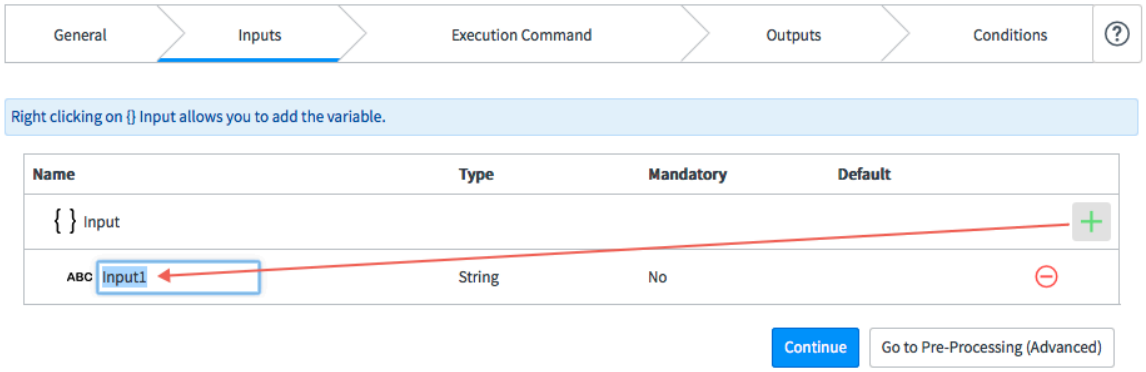
Note:
Variable strings in the **Inputs** form have a 255 character limit.

Procedure

1. Click the **+** icon to create a new input variable.

   The designer creates a default variable called **Input1**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



2. Type your new variable name in the field.
3. To change the name of a variable or any of its attributes, double-click the value and then select or enter a new value in the field that appears.
4. Configure your variable using these fields:

Variable configuration

Field	Description
Type	Data type for this variable. Double-click on the field to display the choice list. In addition to the usual data types, you can create input arrays and encrypt individual variables that contain sensitive data. Encrypted variables are passed to the ECC Queue and then decrypted by the MID Server when they run on the target host. Sensitive data returned from running these variables on the host can then be passed to another activity through encrypted output variables.
Mandatory	Marks an input variable as mandatory. Variables marked as mandatory are required fields in the properties form for the activity in the workflow. The input testing feature allows you to filter on mandatory variables.
Default	Default value for this input variable. Default values are prepopulated for variables in the properties form for the activity in the workflow. You can override this value when you test the variables.

5. To reorder the variable list, select a row and then drag the row to its new location.

   When you select a row to move it, the pointer icon changes to an up/down arrow icon ( ).
6. To delete a variable, click the delete icon ( ) in the row.
7. Click **Continue** to advance to the **Execution Command** stage or click **Go to Pre-Processing (Advanced)** to create a script that runs before the activity executes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Map an input variable

After you create the input variables, map them to the fields in the Execution Command form.

Before you begin

Role required: activity_admin, activity_creator

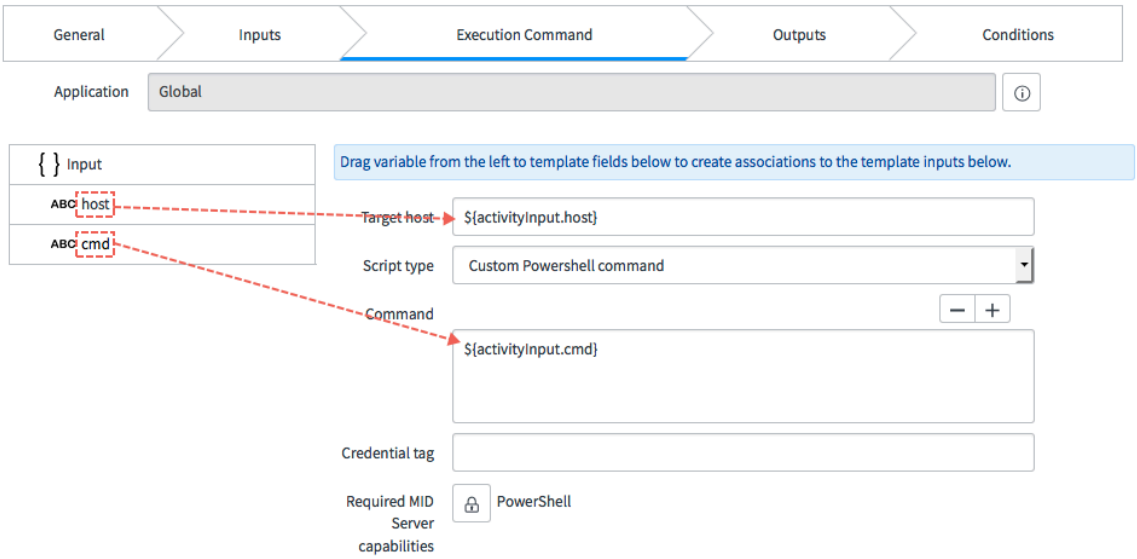
About this task

These fields contain values required by the target host or endpoint to authenticate and query for data. Included in this example are fields for a command to run on the target and the MID Server to use, if one is required.

Procedure

To map a variable, drag it into the appropriate field.

The designer automatically expresses the variable in the syntax the system requires.



Configure the PowerShell execution command

Use the input variables you created to configure the command that Orchestration executes on the Windows target machine.

Before you begin

Create the input variables you need in the **Inputs** form before you can advance to the **Execution Command** stage.

Role required: activity_creator, admin

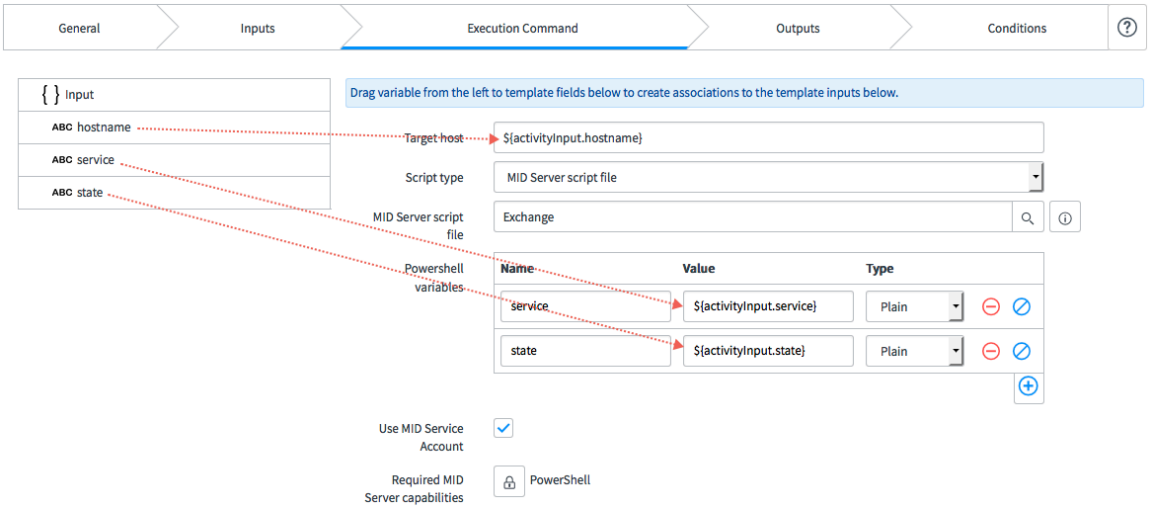
> **Note:**
> You can test the PowerShell connection between the MID Server and the target computer without having to run the acvitity in a workflow context. For details, see test template outputs.

Procedure

1. Drag variables from the list of inputs and drop them into command fields.
   The system formats the variable in the proper syntax for the command.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

PowerShell execution command



2. Complete the fields shown in the table.

Powershell command fields

Field	Description
Input	Input variable builder. Create variables to map to available fields.
Target host	Host name or IP address of the target server for this PowerShell activity.
Script type	Type of script to run on the PowerShell host. Available options are: ○ Custom Powershell command ○ MID Server script file
MID Server script file	MID Server script file to run. This field is available when the **Script type** selected is *MID Server script file*.
Command	Command that this activity runs on the target host. This field is available when the **Script type** selected is *Custom Powershell command*. You can drag and drop input variables from the variable builder into this field to create your command.
Powershell variables	Name-value pairs to pass to the host with Powershell. You can create these variables manually, or drag input variables into the **Value** field. Encrypted input variables retain their encryption, regardless of the data type settings in this field. If you type in a value and select the **Encrypted** data type, your value appears in plain text in this field and is only encrypted when it passes to the ECC Queue.
Use MID service account	Forces this activity to authenticate on the target host using the credentials of the MID Server service account only, without trying any other credentials. When this check box is selected, the **Credential tag** field is not available.
Credential tag	Specific Credential aliases for Orchestration activities this activity must use to run Powershell commands on the host. If this field is left blank, the MID Server tries all the available credentials until it finds a valid one, ending with the MID Server service account. If a credential alias is defined, the MID Server tries the credentials for that alias only and does not try the MID Server service account. This field is not available when the **Use MID service account** check box is selected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Required MID Server capabilities	MID Server to use for querying Powershell, by capabilities. By default, the system selects a Powershell MID Server.

3. Click **Save**.
4. Click **Continue** to advance to the **Outputs** stage.

Test activity template inputs

You can test the input parameters of a custom activity during its development without having to run the activity in a workflow context.

Before you begin

Create input variables and map them to fields in the **Execution Command** form or provide actual values for these fields.

Role required: web_service_admin, activity_admin, activity_creator

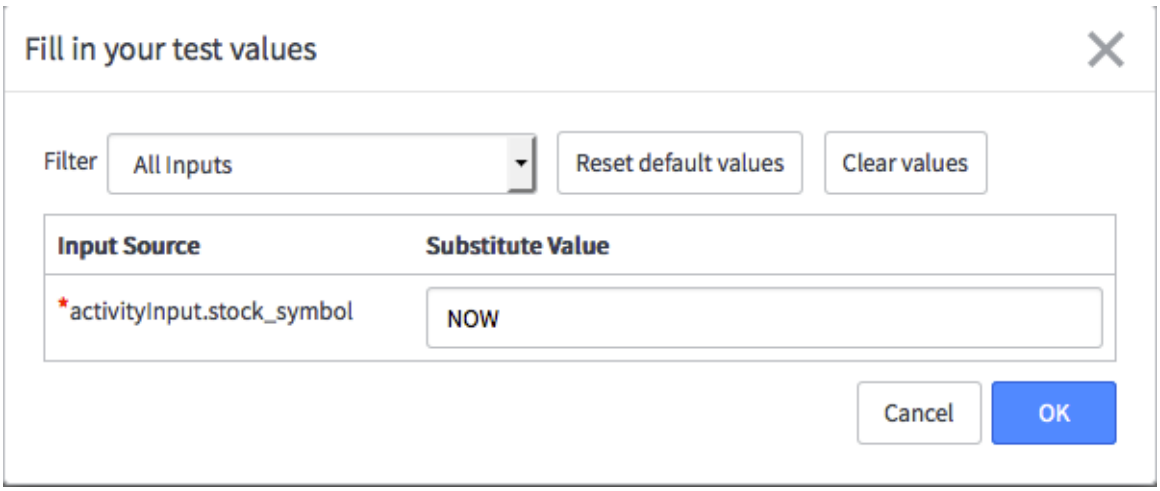
About this task

An input test executes only the input parameters against an endpoint and not the pre-processing or post-processing scripts. You need to use a workflow to test a pre-processing or post-processing scritp. You do not need to check out the activity to test it, and you can test input variables from any stage in the activity designer, if your activity is properly configured. Typically, the **Execution Command** stage is the point at which your inputs are ready for testing.

Note:
If you intend to use auto-mapping, you must test your input variables.

Procedure

1. Click **Test Inputs**.
   The list of input source variables appears. If you added default values for these variables, those values appear in the **Substitute Value** column. Mandatory variables are marked with a red star. In this example, a SOAP endpoint returns a value for a stock quote variable.



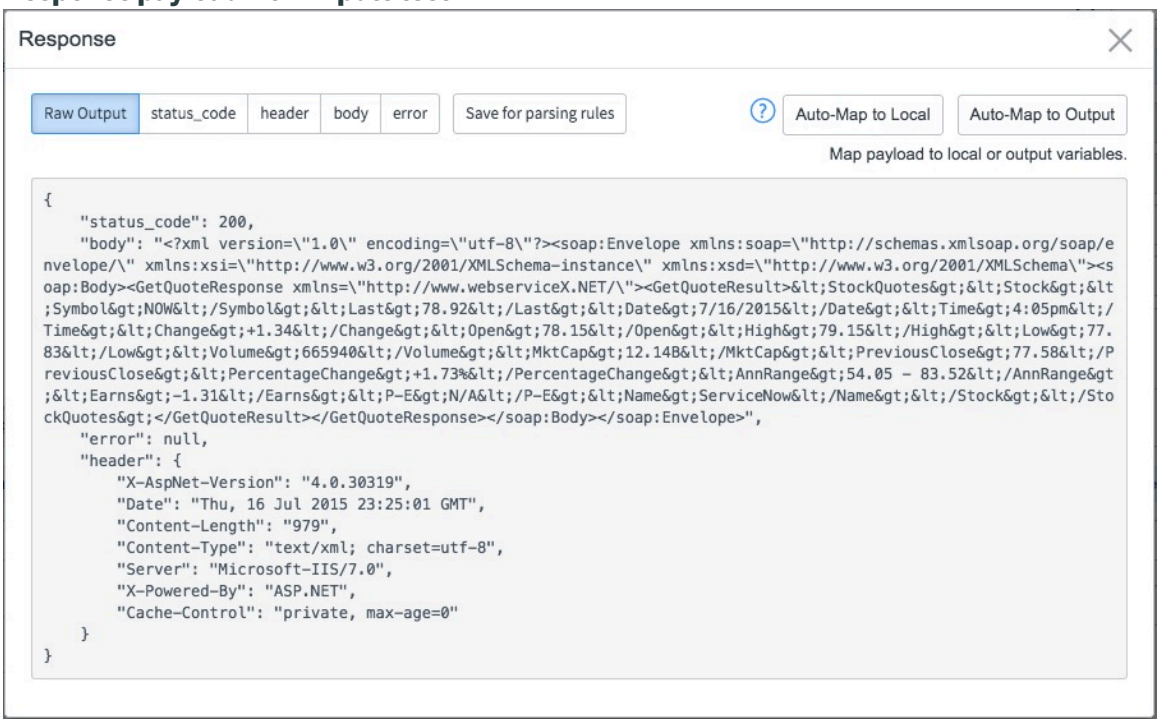
2. Filter the variable list with these controls:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **All Inputs**: Displays all input variables. This is the default view.
- **Mandatory Inputs**: Displays only mandatory input variables.
- **Inputs Without Defaults**: Shows input variables that do not have assigned default values.

3. Reset values as needed.
   - **Reset default values**: Replaces any test values set in this form with the default values, if they are present.
   - **Clear values**: Clears all values in the input variable list, even if default values exist.
4. When your test values are configured correctly, click **OK**.
   The system runs the values for all the inputs configured against the specified target and returns the resulting payload. The buttons in the Response form display different views of the payload. The entire payload appears in the **Raw Output** window.

Response payload from inputs test



5. To map appropriate parameter values in the payload to variables in the **Outputs** stage automatically, select an auto-mapping option.
6. Alternately, you can click **Save for parsing rules** to copy the entire payload to the parsing rules. This allows you to manually select values for the output variables directly from the payload. This action completely overwrites any previous payload that existed in the parsing rules.
7. Click the **X** in the upper right corner of the window to close it.

Data encryption for activity variables

You can protect sensitive data passed from Orchestration activities by encrypting input and output variables.

The system never stores encrypted variables as clear text. If the MID Server is used to fulfill the activity, the corresponding ECC Queue's input payload is encrypted if an encrypted output variable is defined in the template. Output variables passed to a downstream activity as input variables maintain their encryption throughout processing.

Inputs that require data encryption come from one of these sources:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Workflows: These inputs are provided through the Workflow Editor and must be in the password2 format for two-way encryption.
- Service catalog requests: These input values are provided to an activity as encrypted variables from a service catalog item.
- GlideRecord: These are variables attached to any ServiceNow table. The source column in the table must be a password2 type variable.
- Activity outputs: These are variables passed as outputs from one activity to a downstream activity as inputs, through the data bus.
- Empty string: The system allows you to define encrypted input variables but never pass a value into the variable.

Activity designer template pre-processing fields

Use the **Pre Processing** form of the activity designer to define a script to run before the activity executes.

Pre-processing fields

Field	Description
Input process script	Script to run before the activity executes.
Variables	Input variables that are available to use as building blocks in the input process script. Click the arrow above the field to open the variables list. Click an item in the tree to add it to your script in the appropriate syntax. The list displays execution parameters and input variables you passed into the activity on the **Inputs** form. All activity variables added in the **Inputs** form are read-only and are expressed in the pre-processing script with this syntax: `activityInput.variable`. Before the activity executes and makes a call to the service or host, you can override the effective execution value of this variable by assigning values to the `executionParam.variable_name` execution parameter. Refer to the specific execution parameters for your template.

Logging

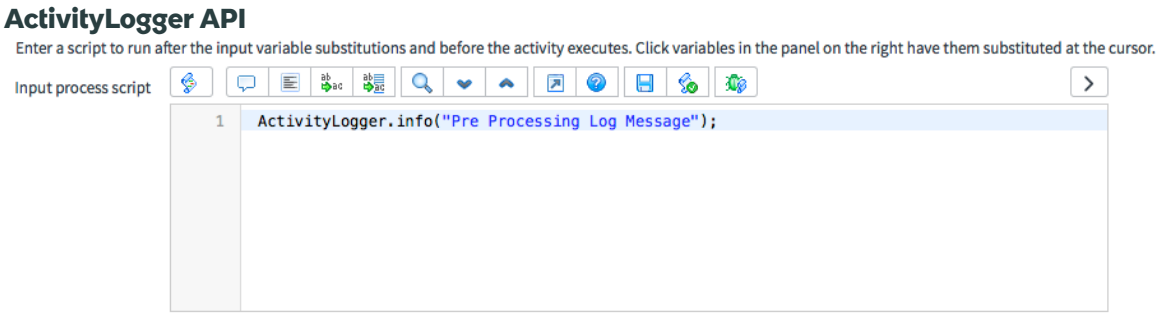
Activity designers can add logging to the pre-processing using the *`ActivityLogger`* API, which works for scoped or global applications. Logged data from the script appears in the **Workflow Log** related list in the context records for any workflow that uses the activity. The **Source** for these messages in the workflow log is **ACTIVITY**.

Important:
To display the debug messages in the workflow log, set the *`glide.workflow.log.debug`* property to **true**.

The supported messages are:

- `ActivityLogger.debug("Pre Processing Log Message");`
- `ActivityLogger.info ("Pre Processing Log Message");`
- `ActivityLogger.warn ("Pre Processing Log Message");`
- `ActivityLogger.error("Pre Processing Log Message");`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Template post-processing fields

From the **Post Processing** form in the activity designer you can define a script to run after the activity executes.

Post-processing fields

To use the results returned by the activity, append the `executionResult.` prefix to these parameters.

Field	Description
Output process script	Script to run after the activity executes.
Variables	Input variables that are available to use as building blocks in the output process script. Click the arrow above the field to open the variables list. Click an item in the tree to add it to your script in the appropriate syntax. The list displays execution results and the variables you passed into the activity on the **Inputs** form. All activity variables added in the **Inputs** form are read-only and are expressed in the post-processing script with this syntax: `activityInput.variable`. For parameter descriptions, refer to the table in the post-processing parameters topic for this activity.

Logging

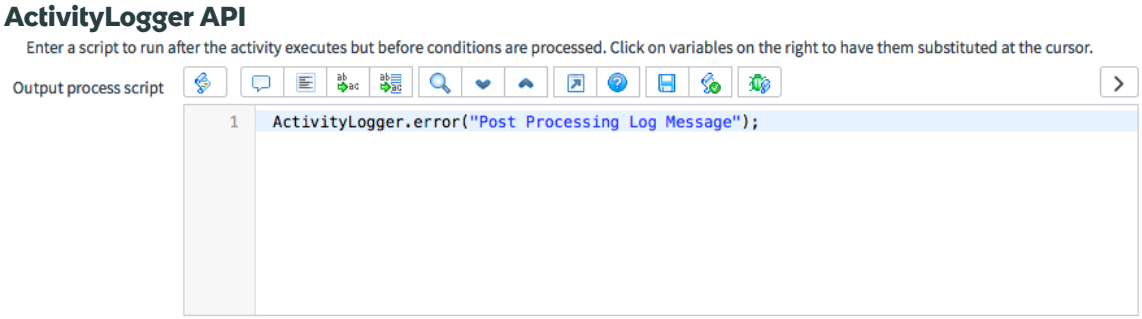
Activity designers can add logging to the post-processing script using the *`ActivityLogger`* API, which works for scoped or global applications. Logged data from the script appears in the **Workflow Log** related list in the context records for any workflow that uses the activity. The **Source** for these messages in the workflow log is **ACTIVITY**.

Important:
To display the debug messages in the workflow log, set the *`glide.workflow.log.debug`* property to **true**.

The supported messages are:

- `ActivityLogger.debug("Post Processing Log Message");`
- `ActivityLogger.info ("Post Processing Log Message");`
- `ActivityLogger.warn ("Post Processing Log Message");`
- `ActivityLogger.error("Post Processing Log Message");`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Auto-map activity output variables

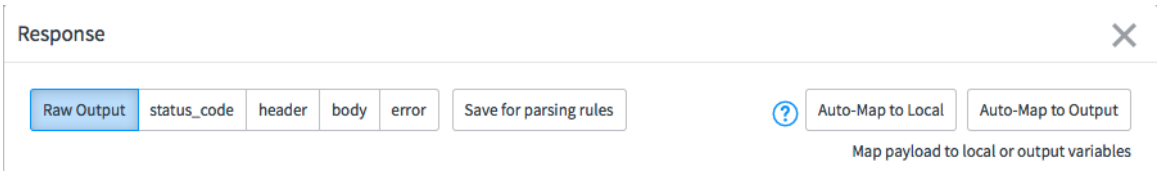
You can map parameter values in a test payload to variables in the **Outputs** tab automatically.

Before you begin

Role required: admin

Procedure

1. From the Execution Command in the template, select the **Inputs** tab.
2. Click **Test Inputs** to test the input parameters.
   If you added actual values for the parameters and fields, the system runs those values against the specified target and returns the resulting payload. If you mapped input variables to fields and parameters, the system displays a dialog box for assigning test values to those variables.
3. Provide test values, if requested, and click **OK** to display the payload.
   The entire payload appears in the **Raw Output** tab of the Response form.



4. Select an auto-mapping option.

Option	Description
Auto-Map to Local	Translates the entire payload into a JSON object and places it in the data bus. This allows for post-processing manipulation in JavaScript. This selection causes the entire data field on the right to disappear and the inputs structure to be auto-populated with these default variables: ○ output ○ totalRows ○ errorMessage ○ eccSysId

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
Auto-Map to Output	Automatically populates the output variables in the activity with the same default variables used as inputs for the local variable.

Note:
No parsing rules are available with auto-mapping selections.

Create an output variable

The **Outputs** form in the designer contains a variable builder for creating data structures of objects and arrays.

Before you begin
Roles required: activity_admin, activity_creator

About this task
Elements in this structure are mapped with Create a parsing rule to specific data contained in payloads returned from an endpoint or host. These variables and their values are then made available locally or for reuse in other activities.

Procedure

1. Click the **+** icon in the **Outputs** column to create a local or output variable.

   Local variables are only available within an activity and are not visible in the data structures displayed in the **Custom** tab. Output variables are available for reuse in other activities, either individually or as an entire data structure. When you create a new variable of either type, the designer provides a default name of **Local1** or **Output1**.

2. Type your new variable name in the field and select a data type.

   Variable names must be unique within an array or an object. You can assign a data type of **Encrypted** to output variables that contain sensitive data. Data protected by encryption is passed to other activities or processes encrypted and is never displayed in plain text.

3. To change the name of a variable or any of its attributes, double-click the value, type a new value in the editing field, and then press **Enter**.

   The icon to the left of the name reflects the data type of the variable.

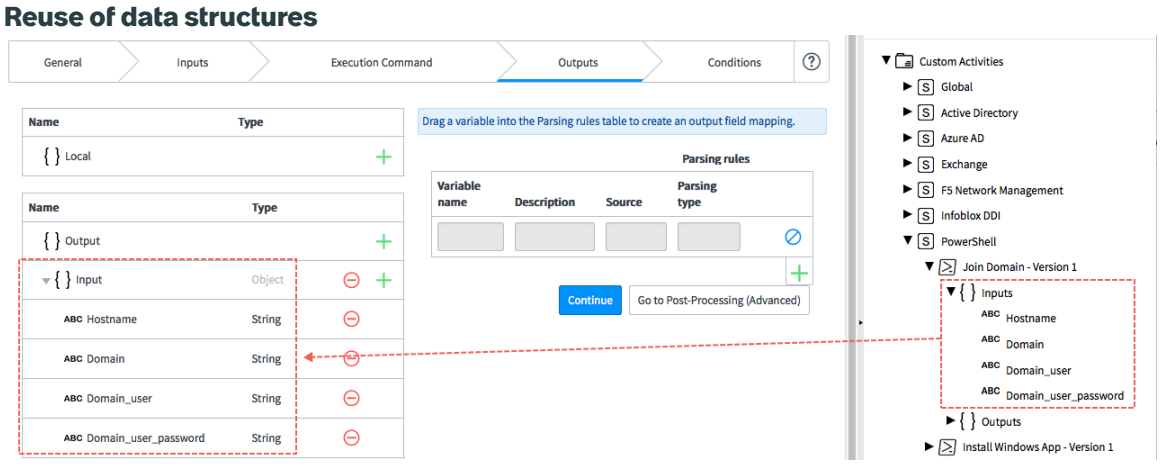
4. To reorder the variable list, select a row and then drag the row to its new location.

   When you select a row to move it, the pointer icon changes to an up/down arrow icon ( ).

5. Drag the row into another location.
6. Choose from the following options.
   - To reuse a variable from another activity, drag it from the **Custom** tab in the palette to the **Local** or **Output** heading at the top of the variable list.
   - To copy an entire data structure, drag the parent object or array into the variable list header.

   The designer duplicates the copied data structure in the outputs variable builder.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



7. To delete a variable, click the delete icon ( ) in the row.

Activity designer template outputs

Output variables contain messages returned from a destination that are available to other activities in a workflow or internally to the activity.

Activity designer output fields

Field	Description
Variable name	Name of a variable, either **Local** or **Output**, that this activity passes.
Local	Variable that contains a value used within an activity. For example, use a local variable to identify metadata that is processed within an activity before the final value is exported to an output variable.
Output	Variable that contains a value that is passed to other activities in the workflow.

Map an output field

Mapping is configured with parsing rules that allow you to build expressions in the appropriate data format for the selected payload.

Before you begin

Role required: activity_admin, activity_creator

About this task

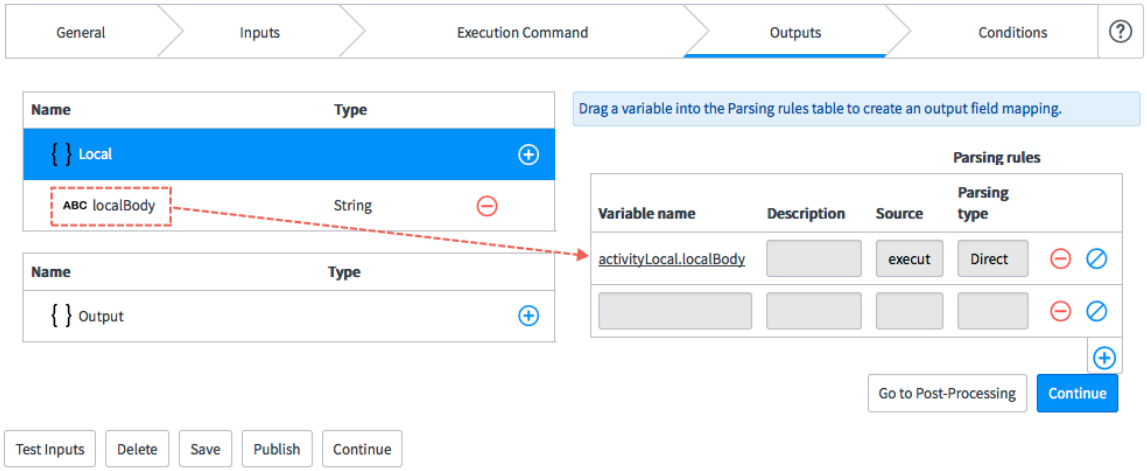
When you are finished creating the output data structure, map each variable to the specific data you want to extract from the target host.

Procedure

To map a variable, drag it from the **Outputs** variable builder and drop it into an empty **Variable name** field in the Parsing rules section.

See create a parsing rule for instructions on configuring parsing for output variables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Create a parsing rule

Populate output variables defined in a custom activity with payload data returned from an inputs test on an external host or endpoint.

Before you begin

Roles required: activity_admin, activity_creator

About this task

Procedure

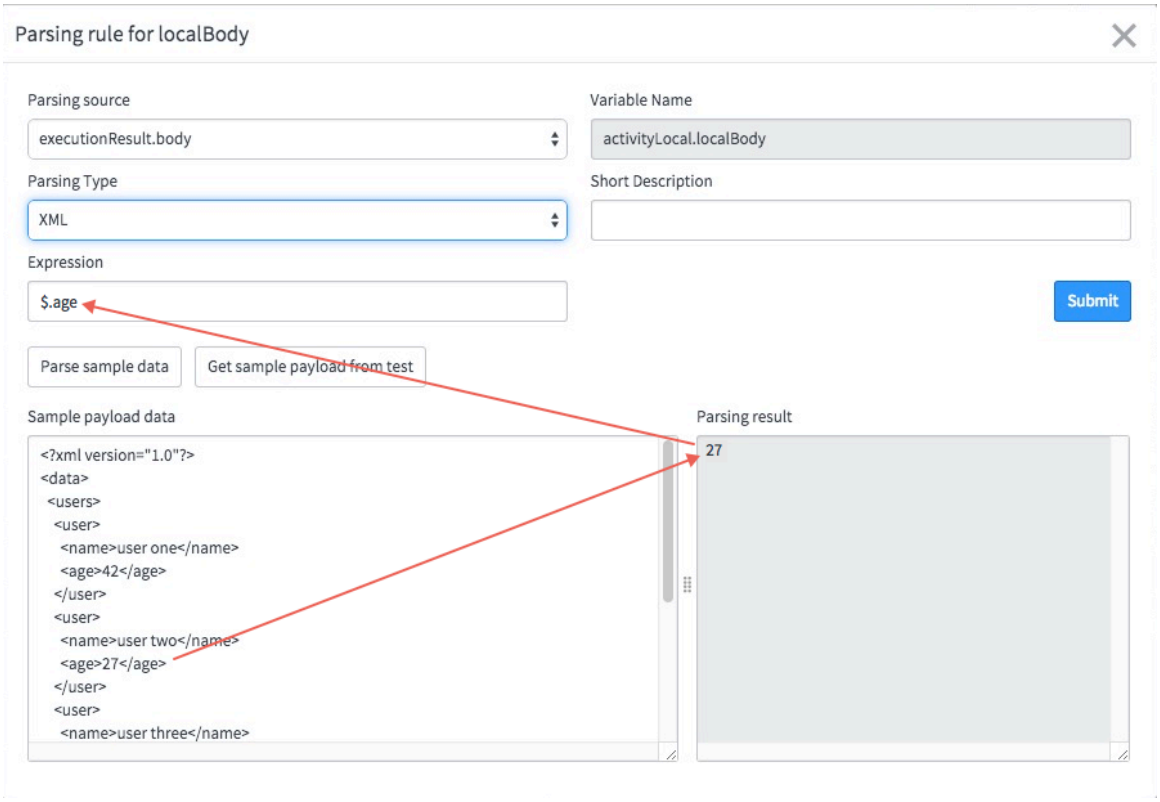
1. Navigate to **All** > **Workflow** > **Workflow Editor**.
2. From the **Custom** tab in the palette, open a custom activity.
3. In the Activity Designer form, advance to the **Output** stage.
4. Drag an output variable from the data structure builder into the **Variable name** field in the **Parsing rules** builder.

Mapping variables to parsing rules

   The parsing rules form appears for the selected variable. By default, the parsing type is set to **Direct**, which populates the variable with all the data from the selected payload, without parsing the contents. Each template has a specific default parsing source.

5. Complete the form using the fields in the table.
   In this example, the parsing type selected is **XML**, which allows you to select specific parameters from the payload to parse.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Parsing rules fields

Field	Description
Parsing source	Source of the data returned from the target host or endpoint. Each template opens to a specific, default payload. Available choices depend on the execution template selected for the activity. You can also use local variables as a parsing source if a parsing rule has previously been defined for them. For a list of the available payloads for each template, see Activity designer parsing sources.
Expression	Expression used to extract specific data from the selected parsing source. This expression is created from clickable data in the sample payload and appears in the format selected in the **Parsing type** field. When testing, the expression can return multiple results. Discern which choice gives reliable or predictable results before choosing your expression. **Note:** The system cannot generate clickable **RegEx** expressions from sample data. You must write all regular expressions manually.
Variable name	Revised variable name as it is used in the final output expression. The system adds the **activityOutput** or **activityLocal** prefix to the variable you specify.
Parsing type	The language to use for querying the target host's payload. The selections are: ○ **Direct**: Maps to the entire content of the payload selected in the **Parsing source** field, without any parsing. This is the default parsing type. ○ **XML**: XPath query used for selecting nodes from an XML payload.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **JSON**: JSONPath query for selecting parts of a JSON payload. ○ **RegEx**: Parsing method that uses a regular expression to extract data from a payload. The RegEx parsing type does not support multi-line parsing and is not case sensitive.
Short description	Brief description of this parsing rule.
Sample payload data	Sample data from the source containing the data requested. This field is not available for **Direct** parsing types. After you click **Parse sample data**, the data in this field cannot be edited, but becomes clickable for the purpose of creating expressions. Click **Edit sample data** to make the field editable again.
Parsing results	Displays the data returned from the source by the selected expression. This field is not available for **Direct** parsing types.

6. To retest the inputs, click **Get sample payload from test**.
   This action reopens the test form, allowing you to substitute different test values and create a different payload.
7. Click **Save** to have the parsing rules overwrite the previous payload with the one you just created.
8. To create an expression for the parsing rule, click the specific parameter you want to see in the sample payload.
   The value for that parameter appears in the **Parsing result** field, and the system creates the appropriate expression in the **Expression** field.
9. Click **Submit** to save the parsing rule for that variable.

Activity designer parsing sources

This table lists the parsing sources available with each execution template.

Parsing sources

Template	Source
SOAP Web Service	• executionResult.body (Default) • executionResult.status_code • executionResult.header • executionResult.error
JDBC	• executionResult.output (Default) • executionResult.errorMessages • executionResult.probeCompletedEccId • executionResult.totalRows
JavaScript Probe	• executionResult.payload (Default) • executionResult.output

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parsing sources (continued)

Template	Source
	• executionResult.eccSysId • executionResult.errorMessages
Powershell	• executionResult.output (Default) • executionResult.tags • executionResult.hresult • executionResult.eccSysId • executionResult.errorMessages
REST Web Service	• executionResult.body (Default) • executionResult.status_code • executionResult.header • executionResult.error
SFTP	• executionResult.output (Default) • executionResult.eccSysId • executionResult.errorMessages • executionResult.tags
Probe	• executionResult.output (Default) • executionResult.payload • executionResult.eccSysId
SSH	• executionResult.output (Default) • executionResult.eccSysId • executionResult.errorMessages • executionResult.tags
JMS	• executionResult.status • executionResult.standardHeaders • executionResult.customHeaders • executionResult.messagePayload • executionResult.eccSysId • executionResult.errorMessages

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activity designer parsing rule example

In this example, the parsing rule is configured to populate the *activityOutput.ipv4* variable with the value for the IP address from a domain server, using PowerShell.

Before you begin

Role required: activity_creator, activity_admin

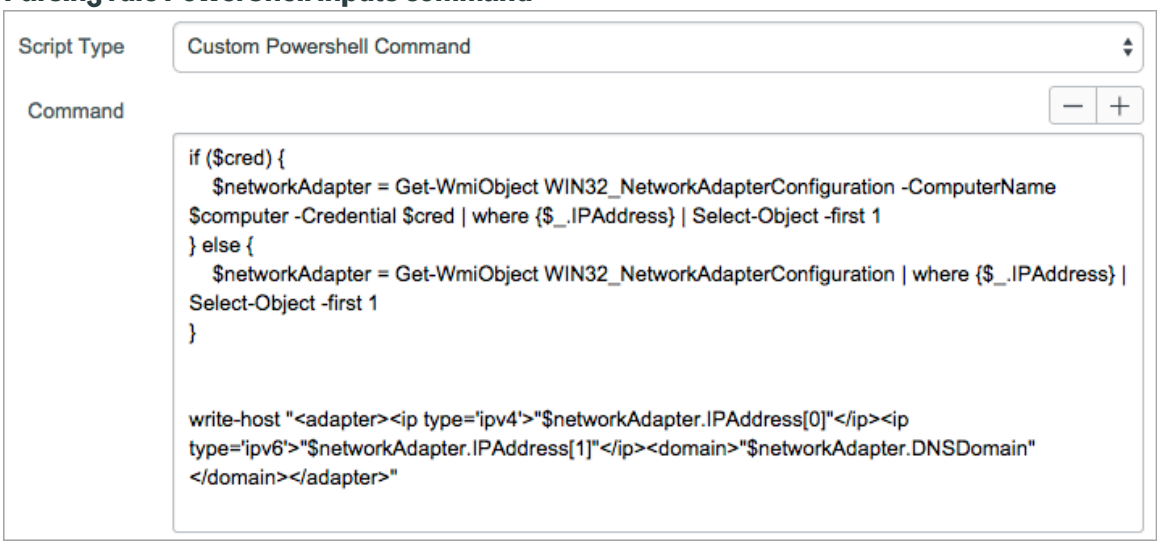
About this task

To generate the sample data, the administrator must actually run the command on the host and then paste the data returned into the **Sample payload data** field when creating the parsing rule. The administrator can then create an expression that returns IP addresses from that sample in two formats: `ipv4` and `ipv6`. In this example, the system produces two expressions to use for the parsing rule.

Procedure

1. Navigate to **All** > **Workflow** > **Workflow Editor** and open the activity that runs on the host.
2. Click the **Inputs** tab, and note the **Command**.

Parsing rule PowerShell inputs command



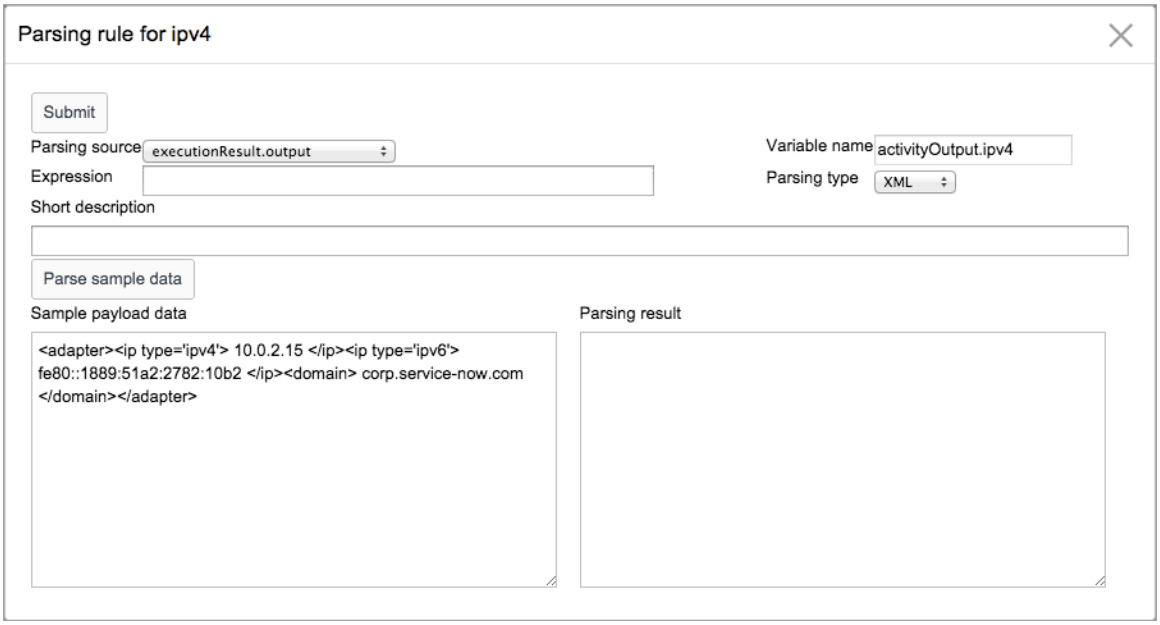
3. In a PowerShell console, run the **Command** on the host to extract the XML sample that contains the values you need.
4. Copy the data that is returned to the clipboard.
5. In the activity designer, click the **Outputs** tab and paste the returned data into the **Sample payload data** field.

   In this example, the data includes IP addresses in two different formats and the domain name.

6. Select the parsing type for the source.

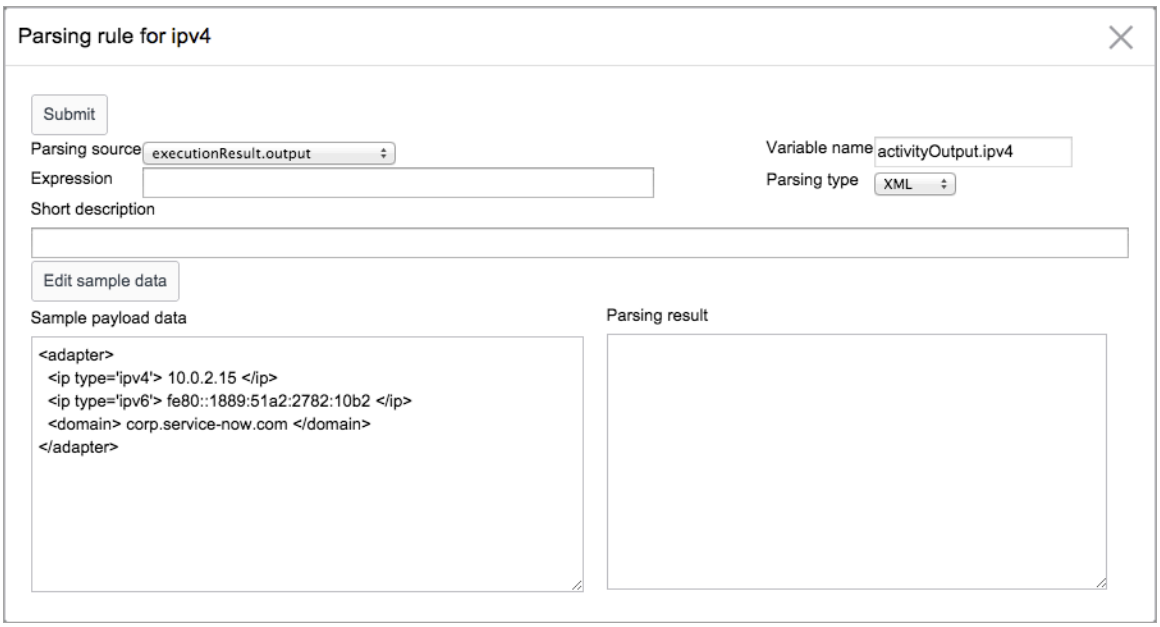
   Example
   In the following example, you would select **XML**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



7. Click **Parse sample data**.

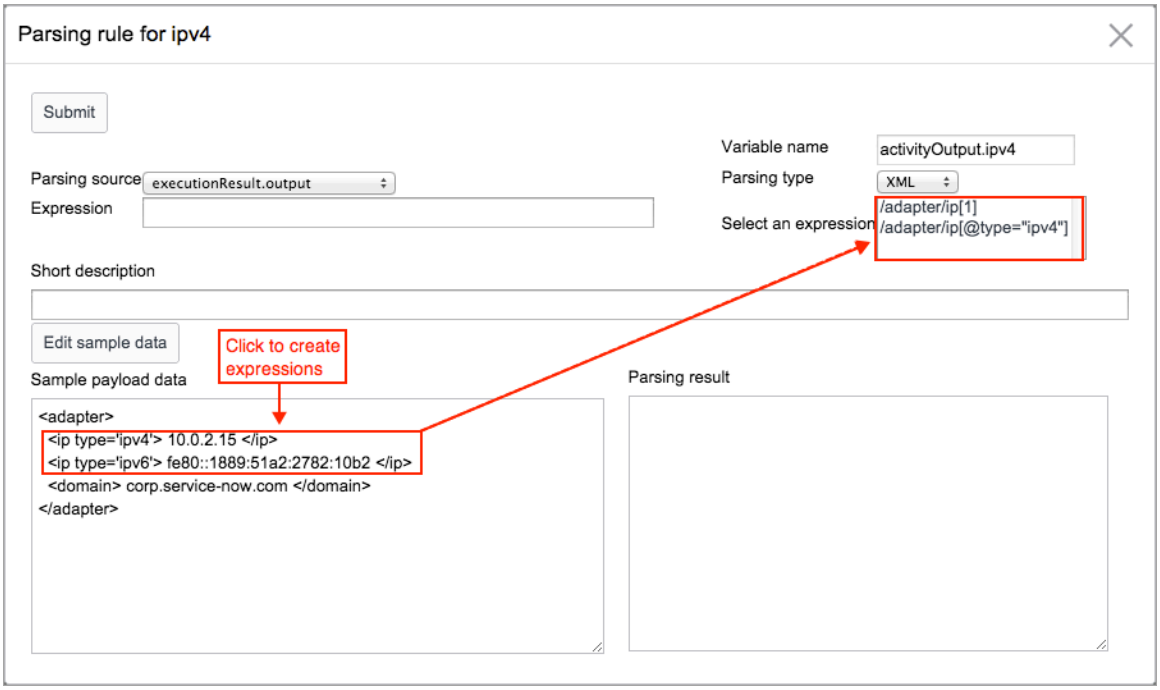
   The system displays the XML in the proper format, and it becomes clickable. In this view, the system can translate clicked data from the sample into an expression.



8. To create the expression, click the elements in the data sample you want to map to the variable.

   Based on the sample data you clicked, the system creates two expressions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



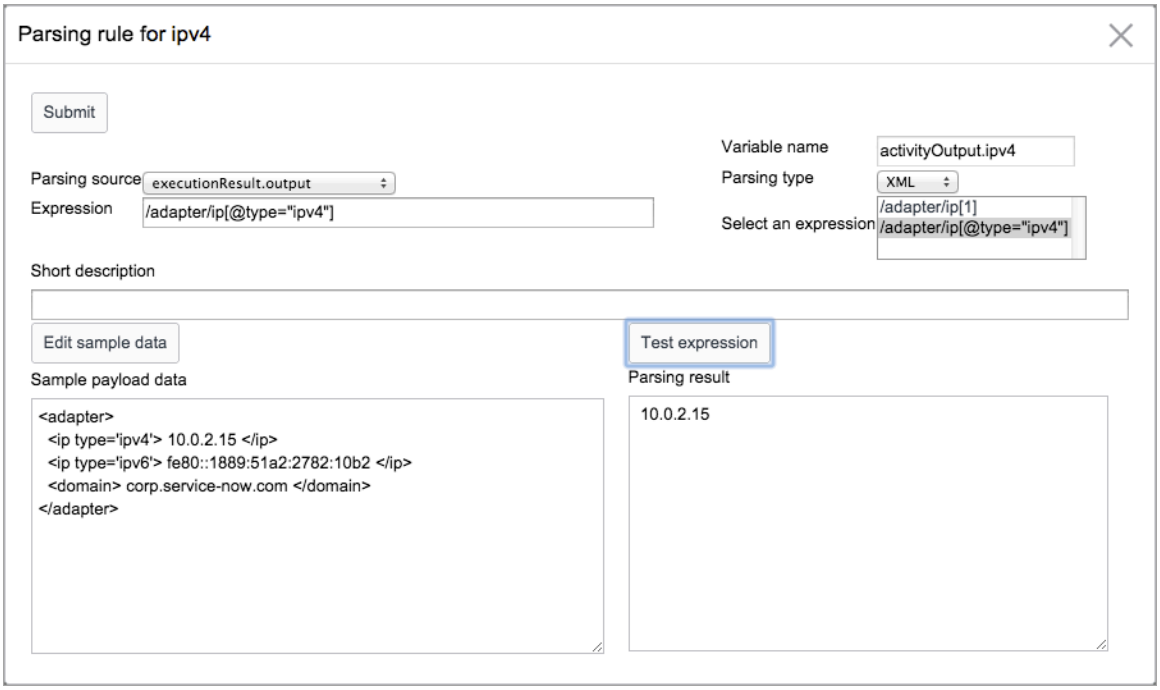
9. Select an expression from the list.

The desired result is the IP address that has a **type** attribute of **ipv4**. The system populates the **Expression** field with this choice.

10. Click **Test expression**.

The system parses the payload using the selected expression and returns the requested data in the **Parsing result** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



11. Click **Submit**.

The view returns to the **Outputs** tab of the activity designer. The new parsing rule is listed, and a blank row is available for another rule.

Activity conditions

Create the exit conditions for your activity in the **Condition** column and set the order for each..

The system evaluates the condition with the lowest order number first and stops when it finds the first true condition. The system delays evaluation of conditions with an **Else** value set to **true** until all conditions with an **Else** value set to **false** are evaluated. If the system does not find a true condition, it looks for a default condition in which the value for **Else** is **true** and takes this exit. You must have at least one default exit condition, or the activity hangs when the workflow runs.

The following are possible conditions you might create for an activity:

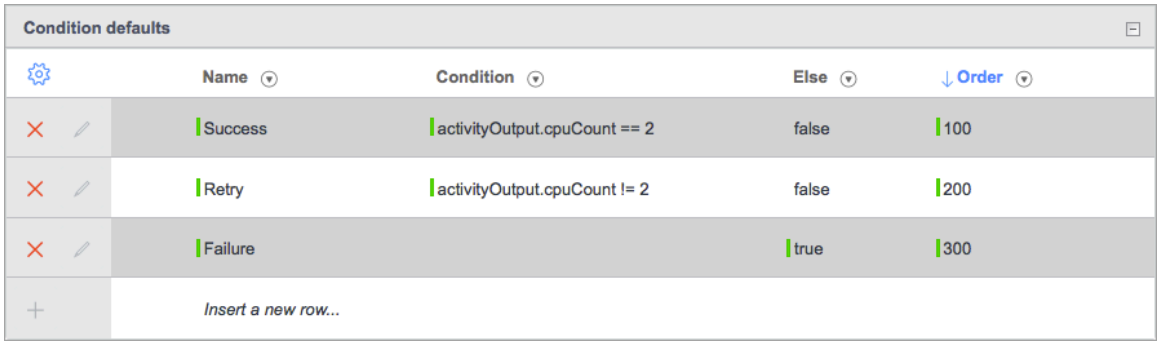
Sample activity conditions

Condition	Evaluation
Success	Tests for a success condition. **Else** is set to **false** and the **Order** is set to **100**. If this condition is true, the activity takes the **Success** exit. If this condition is false, the system evaluates the next condition in order.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample activity conditions (continued)

Condition	Evaluation
Retry	Tests for a condition that runs the activity again. **Else** is set to **false**. If this condition is true, the activity runs again. If this condition is false, the system takes the default **Failure** exit.
Failure	Default condition that allows the workflow to continue if the other conditions in the activity are false. **Else** is set to **true**.



Orchestration custom activity templates

Orchestration provides customizable activity templates to create and manage custom activities in the Workflow Editor.

You create and update different types of Orchestration activities with the Activity Designer using activity templates for SSH, PowerShell, REST, SOAP, JMS, SFTP, JDBC, JavaScript Probes, and Probes.

Hundreds of workflows can share these activities simultaneously. Before you change an activity, you should check the workflows that they are part of by clicking the form menu icon ( ) and selecting **Used In**. Any central change to a versioned activity automatically updates across workflows unless you have pinned that activity .

All the Orchestration Core activities are built using the Activity Designer in scoped applications. Custom activities can be developed in the global scope or their own application scope even if that scope is different from the scope of the workflow. Use Activity scoping when build your own activity packs.

Create a JDBC activity

Create a custom JDBC activity to automate SQL commands and stored procedure calls to relational databases from workflow.

Before you begin

Role required: activity_admin, activity_creator

About this task

The JDBC activity template allows you to execute ANSI SQL statements or stored procedures on a target database. Support for stored procedures with IN, OUT, and INOUT parameters are available in Yokohama. To learn how to set up these parameters, see JDBC stored procedure parameters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If you are transferring bulk data into a ServiceNow instance from an external data source, use Import sets key concepts. The JDBC activities allow you to transfer data between external data sources and ServiceNow within a workflow. It is not intended to replace the bulk import features of data sources.

Procedure

1. Create or verify your JDBC credential.
   Your JDBC credentials must have permission for the target database and proper configuration for the corresponding JDBC connection. Credentials must be set up before you can create a JDBC activity.
2. Create or verify your JDBC connection.
   Your JDBC connection must be configured with valid JDBC credentials set up before you can create a JDBC activity.
3. Create a custom activity.
   This action creates a custom activity using a template.
4. After setting up general properties and creating input variables, configure the JDBC Execution Command.

Option	Description
JDBC Connection	Configure or reference the appropriate JDBC Connection for the database. The connection selected provides the activity with the following information: ○ Target database information (server and database names) ○ Connection URL ○ Target database port (if different from standard port number) ○ Database instance name
Credential	JDBC credential to use for your JDBC connection.
SQL statement	Input the ANSI SQL to execute on the JDBC target database. **Note:** This field is hidden when the Stored Procedure check box is selected. You can map the input variables you created to configure the SQL statements. By default, you can run the following SQL statements. ○ select ○ insert ○ update ○ delete ○ show

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	○ create ○ describe For added security measure, a MID Server property controls the operations that this JDBCOrchestrationProbe executes, which restricts the SQL commands used. This property protects against potentially destructive commands, such as drop database. The mid.property.jdbc_operations contains the MID Server property controls. **Note:** You cannot run multiple statements of different types. For example, you cannot run a select statement and an update statement together, but you can run two insert statements. However, you cannot run multiple select statements in this activity.
Maximum rows	Maximum number of records to retrieve from database. The default is 1000.
Maximum payload size (KB)	You can set a limit on the maximum payload size of data retrieved from the database. The default is 64 kilobytes.
Connection timeout	How long the activity waits to make the connection. This field is populated automatically from the data source, but can be changed for this activity.
Query timeout	Elapsed time to wait after running the query until the data is returned. This field is populated automatically from the data source, but can be changed for this activity.
Required MID Server capabilities	MID Server to use for querying JDBC, by capabilities. By default, the system selects a MID Server that has JDBC capability.
Use stored procedure	If checked, you can run a stored procedure on MySQL, Oracle, or SQL Server databases by entering the procedure name and parameters. See JDBC stored procedure parameters.

Note:
You can map parameter values in a test payload to variables in the **Outputs** tab automatically. See automap output variables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

- Test JDBC activity inputs
- Use auto-mapping to generate outputs and parsing rules (recommended for JDBC)
- If you do not use auto-mapping, you can manually create output variables and create parsing rules

Related topics

Create custom activities using custom activity designer templates

Create a JDBC connection for an Orchestration activity

The JDBC Connection [jdbc_connection] table provides the information custom JDBC Orchestration activities use to connect to various target databases.

Before you begin

You must have an appropriate JAR file, whether it is supplied with the instance or a custom JAR file.

Note:
The ServiceNow instance supplies `mysql-connector-java-5.1.21.jar`, `sql-server-jdbc-4.0.jar`, and `ojdbc6.jar` files as part of the current release, which supports MySQL, SQLServer, and Oracle databases. Other databases, such as Sybase or DB2 Universal, must use a custom JAR file that must be uploaded to the instance before setting the JDBC connection.

Role required: activity_admin, activity_creator

About this task

JDBC credentials JDBC credentials are retrieved separately by the activity designer template and support external credential storage, such as CyberArk.

Procedure

1. Navigate to **All** > **Orchestration** > **Credentials & Connections** > **JDBC Connections** and click **New**.
2. Complete the form using the fields in the table.
   The database selection in the **Format** field determines which fields are available.

JDBC connection fields

Field	Database Format	Description
Name	All	Unique name of this JDBC connection. For example, you might enter **JDBC MySQLProd**.
Query timeout	All	Maximum elapsed time the JDBC query is allowed to run without a response.
Connection timeout	All	Maximum elapsed time for the JDBC activity to wait while attempting to connect to the target database.
Application	All	Scope for this table. By default, the JDBC Connection [jdbc_connection] table runs in the **Global** scope.
Domain	All	Domain for this table. By default, the JDBC Connection [jdbc_connection] table runs in the **global** domain.
Format	All	Database type for this connection. The default choices are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Database Format	Description
		○ **MySQL** ○ **Oracle** ○ **SQLServer** ○ **None** You can add **Sybase** or **DB2 Universal** to the choice list by uploading the appropriate JDBC driver JAR file to the instance. Orchestration automatically recognizes these drivers when they are loaded into the system and adds them to this list.
Server	Oracle, MySQL, SQLServer	Host name or IP address of the database server.
Oracle sid	Oracle	The Oracle database site identifier. The default value is **orcl**.
Oracle port	Oracle	Port that the Oracle database is using. The default value is **1521**.
Database name	MySQL, SQLServer	Name of the database.
Database port	My SQL, SQLServer	Port that the selected database is using.
Instance name	SQLServer	Instance name for the selected SQLServer
Connection URL	All	URL that the MID Server uses to connect to the specified database. The URL is created automatically when you save the form, and is read-only for the default databases. **Note:** If the format selected is not one of the default databases, you must create the connection URL manually so that the MID Server knows how to create the connection.
JDBC driver	None, DB2 Universal, Sybase	The JDBC driver to use for this connection when it is not a default database. **Note:** If you add a Sybase or DB2 Universal database, you must enter the driver name in this field and upload the driver JAR file to the instance.

JDBC credentials

Auto-map JDBC activity output variables

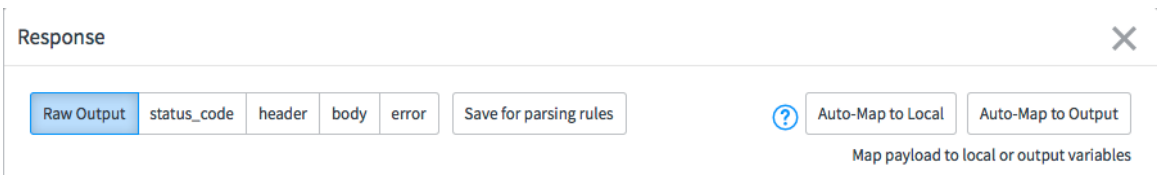
The ServiceNow activity designer allows you to map parameter values in a JDBC test payload to variables in the **Outputs** tab automatically.

Before you begin

Role required: admin

Procedure

1. In the JDBC provider template form, select the **Inputs** tab.
2. Click **Test Activity** to test the input parameters.
   If you added actual values for the parameters and fields, the system runs those values against the specified target and returns the resulting payload. If you mapped input variables to fields and parameters, the system displays a dialog box for assigning test values to those variables.
3. Provide test values, if requested, and click **OK** to display the payload.
   The entire payload appears in the **Raw Output** tab of the Response form.



4. Select one of these auto-mapping options.
   - **Auto-Map to Local**: Directly maps values to a local variable for use within the activity.
   - **Auto-Map to Output**: Directly maps values to the output variable to pass to other activities in the workflow. Auto-mapping to an output variable creates an array of objects, each of which contains the column names from the query result.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

JDBC stored procedure parameters

You can use Orchestration to run a stored procedure on MySQL, Oracle DB, and MS-SQL databases.

There is support of multiple data types, with the following limitations:

- Only one result-set is returned.
- The order of input and output data types in the stored procedure parameters must match the activity definition.
- Binary, Blob, Varbinary, and LongBinary should be base64 encoded.
- Date, Time, and Timestamp have a specific format:

  Date format: yyyy-mm-dd

  yyyy-mm-dd is the supported format.

  Time format: hh:mm:ss[.sss]

  hh:mm:ss[.sss] is the supported format. Precision is in milliseconds only, microseconds or nanoseconds cannot be handled.

  Note:
  `10:30:59` and `10:30:59.999000` are correct, but `10:30:59.` is incorrect.

  Timestamp format: yyyy-mm-dd hh:mm:ss[.ffffff]

  yyyy-mm-dd hh:mm:ss[.ffffff] is the supported format. Precision is to microseconds.

- ResultSet is the first result set coming back from database server.
- MS-SQL does not support INOUT parameters. If you use INOUT parameters, the Activity Template transparently maps them to OUT parameters.

Note:
If you do not want to do a validation of data types in stored procedure parameters, like the legacy behavior, you set the glide.stored_proc.data_type.validation as false. See MID Server properties for more information.

Stored procedure parameters

Field	Description
Mode	Type of stored procedure parameter. Supported parameters: • IN • OUT • INOUT
Sql Type	A SQL data type. Supported data types: • ARRAY • BIGINT • BINARY • BIT

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Stored procedure parameters (continued)

Field	Description
	• BLOB • CHAR • CLOB • DATE • DECIMAL • DISTINCT • DOUBLE • FLOAT • INT • INTEGER • JAVA_OBJECT • LONGVARBINARY • LONGVARCHAR • NULL • NUMERIC • OTHER • REAL • REF • REF_CURSOR • SMALLINT • STRUCT • TIME • TIMESTAMP • TINYINT • VARBINARY • VARCHAR
Name/Value	Name-value pairs to pass to the host. You can create these parameters manually, or drag and drop input variables into the parameter fields and assign a value.

Note:
Not all database providers support the entire realm of JDBC data types. Reference your database reference manual to understand the supported datatypes for your installation.

Test JDBC activity template inputs

You can test the input parameters of a custom JDBC activity during its development without having to run the activity in a workflow context.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Create input variables and map them to fields in the Execution Command form or provide actual values for these fields. Role required: web_service_admin, activity_admin, activity_creator

About this task

This test executes only the input parameters against an endpoint and not the pre-processing or post-processing scripts. It is not necessary to check out the activity to test it.

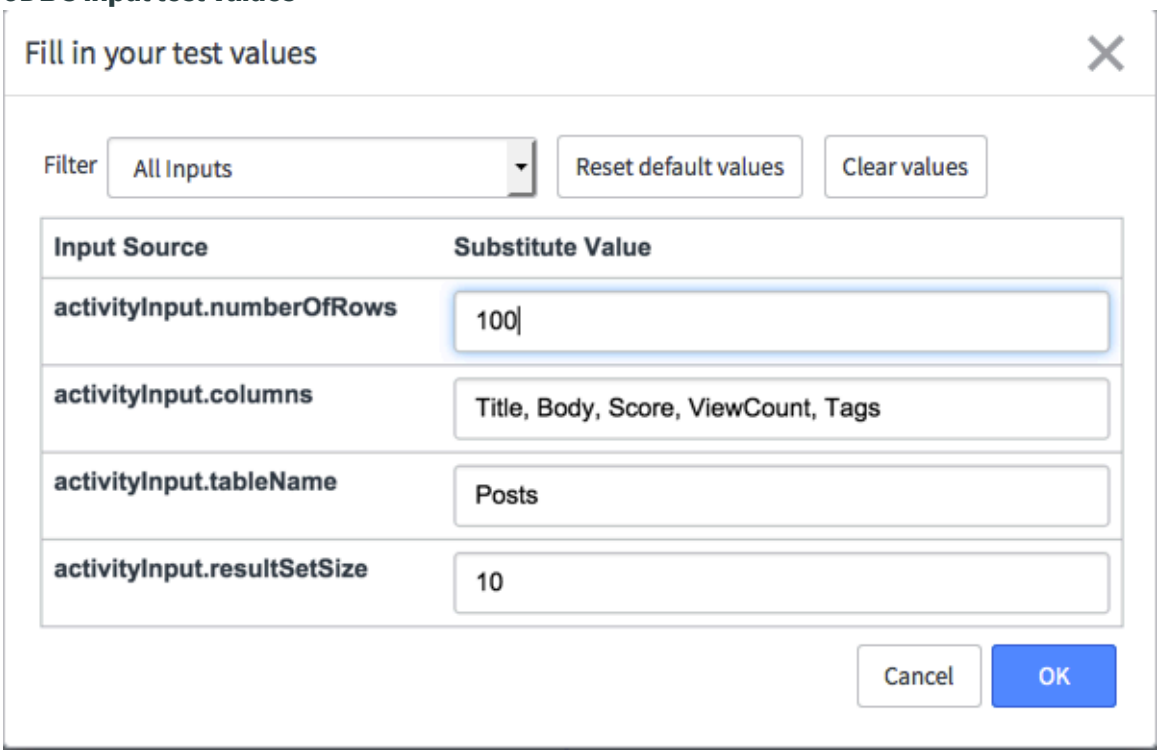
Note:
If you provide enough information for Orchestration to contact the endpoint or host and return data, you can test the input variables. You can test from any stage in the activity designer. Typically, the Execution Command stage is the point at which your inputs are ready for testing.

Procedure

1. From the JDBC Execution Command, click **Test Inputs**.
   The list of input source variables appears. If you added default values for these variables, those values appear in the **Substitute Value** column. Mandatory variables are marked with a red star.

   Note:
   The test fails if the MID Server cannot be found or if it cannot connect to the target.

   JDBC input test values

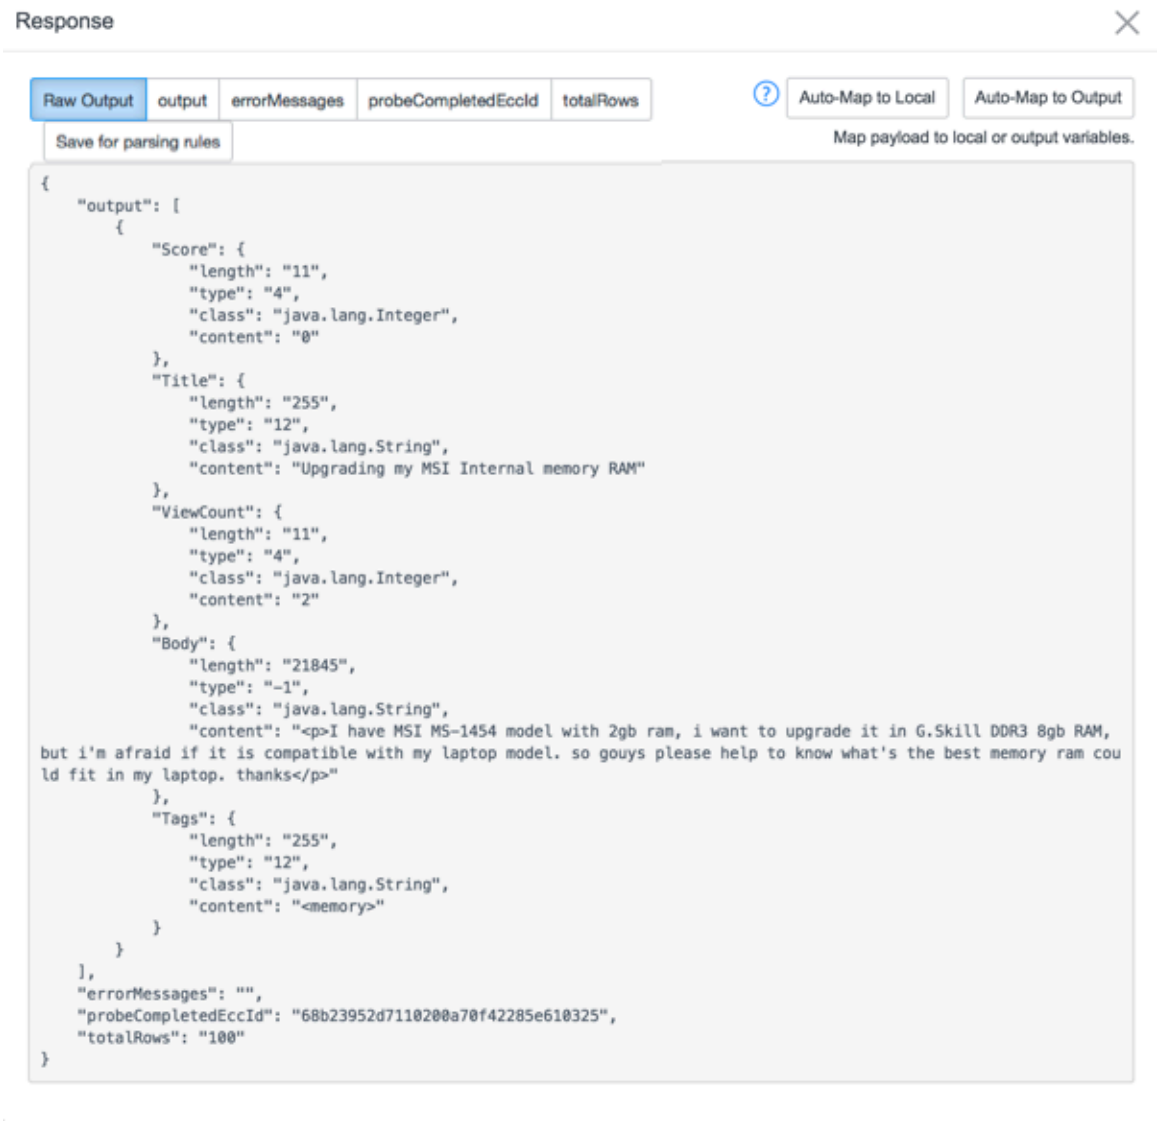
2. Filter the variable list with these controls:
   - **All Inputs**: Displays all input variables. This control is the default view.
   - **Mandatory Inputs**: Displays only mandatory variables.
   - **Inputs Without Defaults**: Shows input variables that do not have assigned default values.
3. Reset values as needed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Reset default values**: If values are present, this control replaces any test values set in this form with the default values.
- **Clear values**: Clears all values in the input variable list, even if default values exist.

4. When your test values are configured correctly, click **OK**.
   The system runs the values for all the inputs configured against the specified target and returns the resulting payload. The buttons in the Response form display different views of the payload. The entire payload appears in the **Raw Output** window.

Response payload from inputs test



5. To map appropriate parameter values in the payload to variables in the **Outputs** stage automatically, select an auto-mapping option.
6. Click the **X** in the upper right corner of the window to close it.

Create a SOAP web service activity

Use this template to create a custom SOAP activity.

Before you begin

Role required: web_service_admin, activity_admin, activity_creator

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

For instructions on using the activity template process flow, see create custom activities.

Procedure

1. Create a custom activity.
   This action creates a custom activity using a template.
2. After setting up general properties and creating input variables, configure the SOAP web service Execution Command.

Option	Description
Map the input variables	Use the variables you created to configure the command that Orchestration executes on the SOAP web service.
Web service message	Specify the SOAP web service message to use for this activity. If you need information on SOAP web services messages, see SOAP
Web service message function	Specify the SOAP message function available in conjunction with the SOAP web service.
Endpoint	If you enter an endpoint in this field, it over rides the endpoint URL configured in the SOAP message web service. Click the lock icon to open the input field and add the end point.
SOAP message parameters	Name-value pairs to pass to the SOAP end point. You can create these parameters man ually, or drag input variables into the parame ter fields and then assign a value. Parameters defined in the SOAP message that use ${} can be assigned data from this activity tem plate. Use the **Additional attribute** column to configure the system to not escape the text. By default, text sent to the SOAP message is escaped. The **Name** column is auto-populat ed if the users have provided variables using Variable substitution in outbound REST mes in the SOAP message.
Use MID Server	Check box that determines if a MID Server must be used to invoke the SOAP web ser vice. If the SOAP web service message func tion defines a MID Server, that MID Server is used instead of the one selected here.
Required MID Server capabilities	MID Server with the appropriate MID Server capabilities for connecting to the SOAP end point. By default, the system selects a MID Server with SOAP capabilities. This field is available when the **Use MID Server** check box is selected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
Timeout	Allowed duration of the SOAP web service request before it times out, in seconds. The default is **10**.
Authentication	Determines what type of authentication is required for the endpoint. The options are: ○ **Use existing credentials in SOAP message**: Uses credential definitions from the SOAP message definition. ○ **Override with Basic Authentication credentials:** Uses |Enable basic authentication credentials. Overrides the credentials in the SOAP message definition. Basic authentication credentials must be provisioned before they are available for selection. ○ **Override with Certificate Authentication credentials**: Overrides the credentials in the SOAP message definition with certificate authentication credentials. ○ **Override with Both Basic and Certificate Authentication credentials**: Overrides the credentials in the SOAP message definition with both basic authentication or certificate authentication credentials. ○ **Override with WS-Security Username profile**: Overrides the credentials in the SOAP message definition with credentials defined in WS-Security.
Credentials	Required REST endpoint basic authentication credentials. This field is available when **Override with Basic Authentication credentials** is selected in the **Authentication** field. Only basic authentication credentials appear in the selection list, which includes credentials stored on the instance and credential IDs from an external storage system. If you are using credentials stored in a CyberArk safe, you can override the default safe defined in the MID Server configuration file by adding the name of a different safe as a prefix to the credential ID, separated by a colon. For example, *newsafe:orch-test-f5*. See Configure for details.
Protocol Profile	Outbound web services mutual authentication to use for authentication. This field is available when the authentication type is either **Override with Certificate Authentica**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	tion credentials or **Override with Both Basic and Certificate Authentication credentials**.

Note:
You can map parameter values in a test payload to variables in the **Outputs** tab automatically. See automap output variables.

What to do next

- Use auto-mapping to generate outputs and parsing rules (recommended for JDBC)
- If you do not use auto-mapping, you can manually create output variables and create parsing rules

Auto-map SOAP activity output variables

The ServiceNow activity designer allows you to map parameter values in a SOAP test payload to variables in the **Outputs** stage automatically.

Before you begin

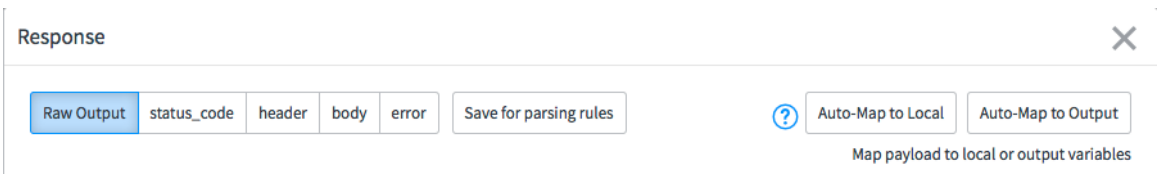
Role required: web_service_admin, activity_admin, activity_creator

About this task

Note:
You can test input variables from any stage in the activity designer if you have provided enough information for Orchestration to contact the endpoint and return data. Typically, the **Execution Command** stage is the point at which your inputs are ready for testing.

Procedure

1. In the activity designer, proceed to the **Execution Command** stage.
2. Define an appropriate MID Server, if requested.
   The test fails if the MID Server cannot be found or if it cannot connect to the target.
3. Click **Test Activity** to test the input parameters.
   If you added actual values for the parameters and fields, the system runs those values against the specified target and returns the resulting payload. If you mapped input variables to fields and parameters, the system displays a dialog box for assigning test values to those variables.
4. Provide test values, if requested, and click **OK** to display the payload.
   The entire payload appears in the **Raw Output** tab of the Response form.



5. Select one of these auto-mapping options.
   - **Auto-Map to Local**: Directly maps values to a local variable for use within the activity.
   - **Auto-Map to Output**: Directly maps values to the output variable to pass to other activities in the workflow. Auto-mapping to an output variable creates an array of objects, each of which contains the column names from the query result.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide credentials to access a SOAP message WSDL

If the SOAP WSDL you are requesting in a test payload requires authentication, you must provide basic auth credentials in either the SOAP message or the SOAP activity.

Before you begin

Role required: web_service_admin, activity_admin, activity_creator

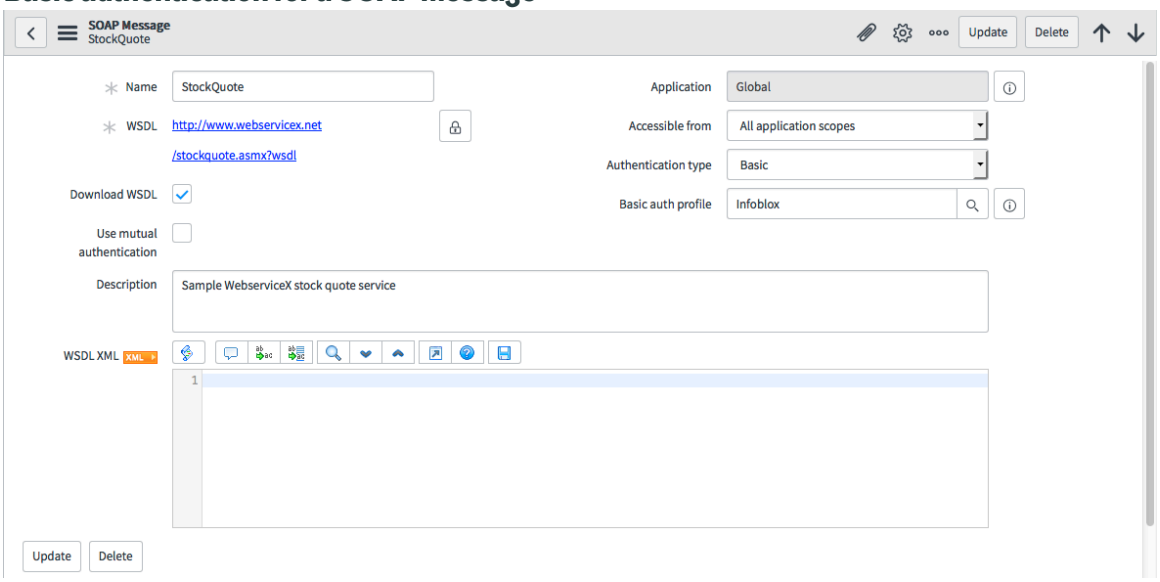
The ServiceNow instance only supports basic auth credentials for accessing a WSDL. If the SOAP function or the SOAP message does not provide these credentials, you must configure them in the SOAP activity template. Orchestration uses these priorities for deciding which basic authentication credentials to use:

- SOAP message: Credentials for a SOAP message are used if no other credentials are defined.
- SOAP function: Credentials for a SOAP function override the credentials configured for the SOAP message.
- SOAP activity template: Credentials for a SOAP activity template override both the SOAP function and SOAP message credentials.

Procedure

1. Navigate to **All** > **System Web Services** > **Outbound** > **SOAP Message**.
2. Select the SOAP message you want the activity to use.
3. In the SOAP Message record, select the **Download WSDL** check box.
4. In the **Authentication type** field, select **Basic**.
   The **Basic auth profile** field appears.
5. Select the basic auth profile to use with this SOAP message.

Basic authentication for a SOAP message



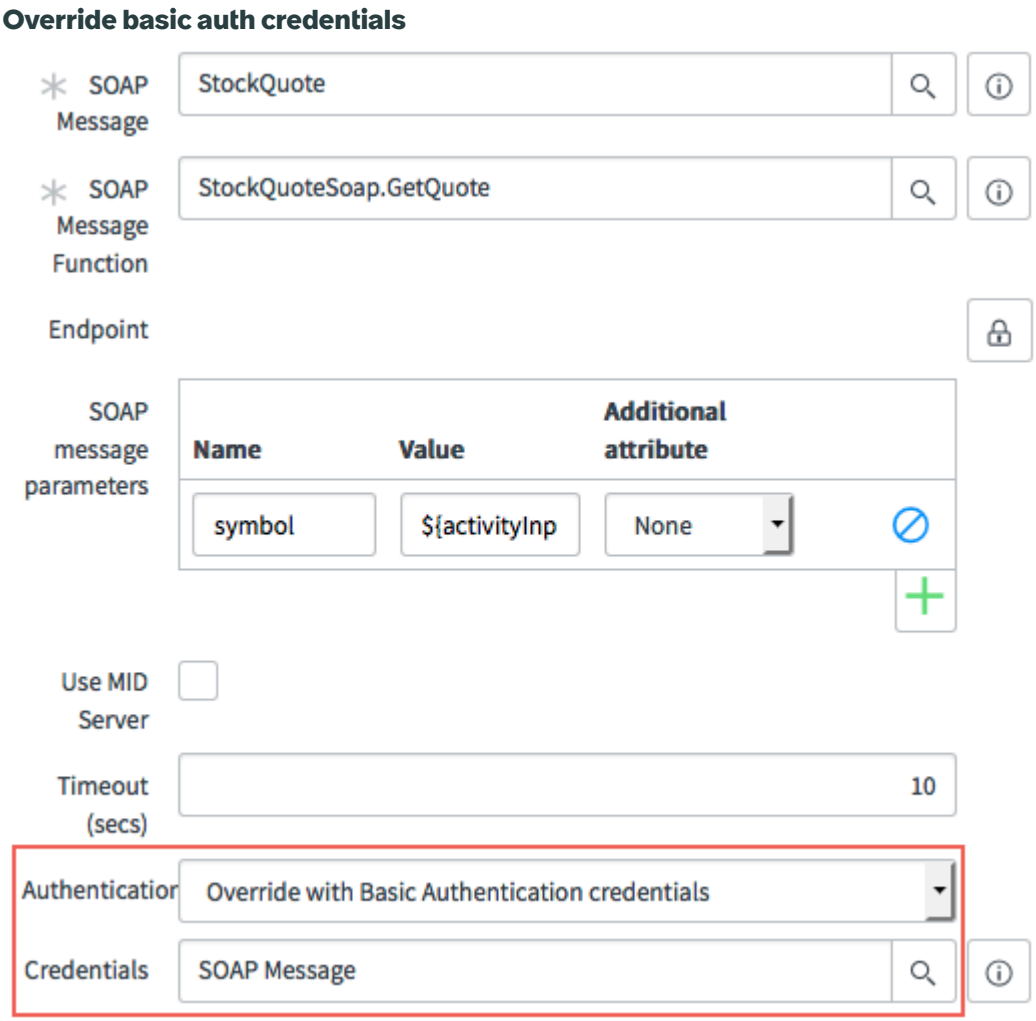
6. Alternately, you can configure basic authentication credentials in Configure the SOAP execution command.

   a. In the **Authentication** field, select **Override with Basic Authentication credentials**.
      The **Credentials** field appears.

   b. Select the basic auth credentials to use to access the WSDL.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This setting overrides any credentials configured in the SOAP message.



Configure the SOAP execution command

Use the input variables you created to configure the command that Orchestration executes on the SOAP endpoint.

Before you begin

Create the input variables you need in the **Inputs** form before you can advance to the **Execution Command** stage.

Role required: web_service_admin, activity_admin, activity_creator

Note:
You can test the SOAP connection between the MID Server and the endpoint without having to run the acvitity in a workflow context. For details, see test template outputs.

Procedure

1. Drag variables from the list of inputs and drop them into command fields.
   The system formats the variable in the proper syntax for the command.

© 2026 ServiceNow, Inc. All rights reserved.

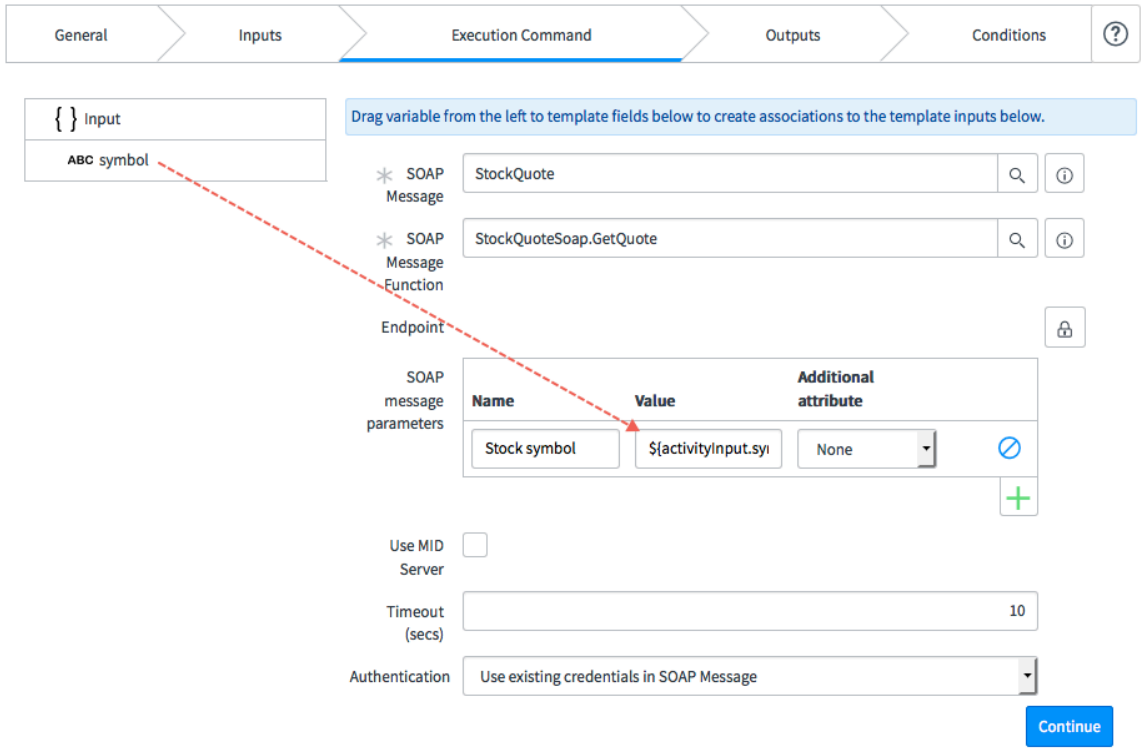
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SOAP execution command



2. Complete the fields shown in the table.

SOAP template execution command fields

Field	Description
Input	Input variable builder. Create input variables to map to available fields.
Web service message	SOAP message to use for this activity. Users must have the web_service_admin role to configure this field.
Web service message function	SOAP message SOAP message functions to use for this activity. Users must have the web_service_admin role to configure this field.
Endpoint	Endpoint URL for the SOAP web service this activity uses. Enter an endpoint in this field to override the endpoint configured in the SOAP message. Click the lock icon to open the input field.
SOAP message parameters	Name-value pairs to pass to the SOAP endpoint. You can create these parameters manually, or drag input variables into the parameter fields and then assign a value. Parameters defined in the SOAP message that use ${} can be assigned data from this activity template. Use the **Additional attribute** column to configure the system to not escape the text. By default, text sent to the SOAP message is escaped. The **Name** column is auto-populated if the users have provided variables using Variable substitution in outbound REST messages in the SOAP message.
Use MID Server	Check box that determines if a MID Server must be used to invoke the SOAP web service. **Note:**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	If the SOAP web service message function defines a MID Server, that MID Server is used instead of the one selected here.
Required MID Server capabilities	MID Server with the appropriate MID Server capabilities for connecting to the SOAP endpoint. By default, the system selects a MID Server with SOAP capabilities. This field is available when the **Use MID Server** check box is selected.
Timeout	Allowed duration of the SOAP web service request before it times out, in seconds. The default is **10**.
Authentication	Determines what type of authentication is required for the endpoint. The options are: ○ **Use existing credentials in SOAP message**: Uses credential definitions from the SOAP message definition. ○ **Override with Basic Authentication credentials:** Uses |Enable basic authentication for outbound SOAP credentials. Overrides the credentials in the SOAP message definition. Basic authentication credentials must be provisioned before they are available for selection. ○ **Override with Certificate Authentication credentials**: Overrides the credentials in the SOAP message definition with certificate authentication credentials. ○ **Override with Both Basic and Certificate Authentication credentials**: Overrides the credentials in the SOAP message definition with both basic authentication or certificate authentication credentials. ○ **Override with WS-Security Username profile**: Overrides the credentials in the SOAP message definition with credentials defined in WS-Security.
Credentials	Required REST endpoint basic authentication credentials. This field is available when **Override with Basic Authentication credentials** is selected in the **Authentication** field. Only basic authentication credentials appear in the selection list, which includes credentials stored on the instance and credential IDs from an external storage system. If you are using credentials stored in a CyberArk safe, you can override the Configure the MID Server for CyberArk defined in the MID Server configuration file by adding the name of a different safe as a prefix to the credential ID, separated by a colon. For example, *`newsafe:orch-test-f5`*.
Protocol Profile	Outbound web services mutual authentication to use for authentication. This field is available when the authentication type is either **Override with Certificate Authentication credentials** or **Override with Both Basic and Certificate Authentication credentials**.

3. Click **Save**.
4. Click **Continue** to advance to the **Outputs** stage.

SOAP template execution parameters

You use execution parameters to create the input process script in the **Pre processing** form of the activity designer.

For descriptions of the SOAP web service command fields, see the table in Configure the SOAP execution command.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
You must use the `executionParam.` prefix with all variables in this table.

SOAP execution parameters

Name	Variable	Type	Usage
Web service message	web_service_message	Reference	The sys_id of the corresponding SOAP message.
Web service message function	web-service_message_function	Reference	The sys_id of the SOAP message function.
Web service endpoint	web_service_endpoint	String	URL of the SOAP endpoint.
Parameters	parameters	Array of JavaScript objects	Array of JavaScript objects, expressed with the `executionParam.` prefix. For instructions on creating arrays using this parameter, see Create a JavaScript array in a SOAP template.
Use mid server	use_mid_server	Boolean	When true, indicates that a MID Server is used.
MidCapabilities	midCapabilities	String (comma separated)	List of references to required MID Server capabilities.
Time out	time_out	String	Allowed duration of the SOAP web service request before it times out, in seconds. The default is **10**.

ValueCapabilities	valueCapabilities	Array of hashmap	Capability values used to select the MID Server. For more information, see MID Server capabilities. Use this example to customize the MID Server selection if there are additional capabilities that are assigned by value:
			`var valueCapability = {'NEW_MID_CAPABIILTY':'NEW_MID_CAPABILITY_VALUE'};`
			`executionParam.valueCapabilities.push(valueCapability);`

Auth Type	auth_type	Boolean	Type of credentials to use. The choices are: • basic_auth_pick_credentials • use_existing_credentials
Credentials	credentials	Reference	Credentials to use for this SOAP message when the `auth_type` is `basic_auth_pick_credentials`.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a JavaScript array in a SOAP template

These are instructions for creating JavaScript arrays using SOAP execution parameters.

Before you begin

Role required: web_service_admin, activity_admin, activity_creator

About this task

To add more name-value pairs to the parameter's array, append the values to the existing array.

Procedure

1. Create a JavaScript object with the following syntax, and add it to the `executionParam.parameter` array:

```
var newParameter =
 {"name":"parameterName","value":"parameterValue","additional_a
ttribute":"none"};
executionParam.parameters.push(newParameter);
```

   By adding the new parameter JavaScript object to the array, you ensure that any elements already available in the array are not impacted.

2. Make sure to set the value in the **Additional attribute** column in the **SOAP message parameters** input field to **Do not escape text**.

   In this case, the system does not escape the value specified for the **value** attribute. An example of this is:

```
var newParameter =
 {"name":"parameterName","value":"parameterValue","additional_a
ttribute":"do_not_escape_text"};
executionParam.parameters.push(newParameter);
```

   Note:
   If the value for the **additional_attribute** field is **None**, then the system escapes the value specified by the **value** attribute. In the first example, `parameterValue` is escaped.

SOAP template post-processing parameters

Use these parameters to create a post-processing script.

Activity designer post-processing parameters

Name	Variable	Type	Usage
Status code	status_code	Integer	Contains the status code returned from the web service.
Header	header	Hashmap of JavaScript object	Contains the key value paired hashmap associated with the header values passed into the web service. You can access each value with `executionResult.header[keyName]`.
Body	body	String	Contains a string value representing the output from the SOAP message
Error	error	String	Returns the error string from the SOAP web service, unless there are no errors, in which case it returns**null**.

Create a JavaScript Probe activity

Create a JavaScript Probe activity to instruct a MID server to execute server-side javascript.

Before you begin

Role required: activity_creator or workflow_admin

About this task

The JavascriptProbe activity has the same functionality as making 'Packages' calls into standard Java libraries. It allows you to have more control over the Java libraries on the MID Server. You can load your own JAR files on the MID Server and have the JavascriptProbe make Package calls into those java files.

Procedure

1. Create a custom activity.
   This action creates a custom activity using a template.
2. After setting up general properties and creating input variables, configure the JavaScript probe activity Execution Command.

Option	Description
Map the input variables	Use the variables you created to configure the command that Orchestration executes on the MID server.
Script type	Select the type of script to include. Available options are: ○ Custom JavaScript ○ MID Server script include
Script	Custom JavaScript to run with this probe. **Note:** This field is available when the **Script type** selected is **Custom JavaScript**.
MID Server script include	Script for the MID Server to run with this probe. **Note:** This field is available when the **Script type** selected is **MID Server script include**.
Select MID Server by host	MID Server on which the probe runs.
Required MID Server capabilities	MID Server to use, by capabilities.
Parameters	Name-value pairs to pass to the host with this probe. You can create these parameters manually, or drag input variables into the **Parameters** fields and assign a value.

Note: You can map parameter values in a test payload to variables in the **Outputs** tab automatically. See automap output variables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

Finish creating your JavaScript probe activity by creating output variables, creating a parsing rule, or Conditions. Refer to the create custom activities topic to know your template options.

JavaScript probe template execution parameters

You use execution parameters to create the input process script in the **Preprocessing** form of the activity designer.

For descriptions of the JavaScript Probe command fields, see the table in Configure the JavaScript Probe execution command.

Note:
You must use the `executionParam.` prefix with all variables in this table.

JavaScript template execution parameters

Name	Variable	Type	Usage
Script Type	script_type	Enumerated	Type of script to run. The possible types are: • custom_javascript_typ • mid_script_include_type
Script	script	String	Script that runs custom JavaScript when the **script_type** is **custom_javascript_type**.
Mid script include	mid_script_include	Reference	The sys_id reference associated with the MID Server script include to call, when the **script_type** is **mid_script_include_type**.
Source	source	String	Target host on which to run the script.
MidCapabilities	midCapabilities	String (comma separated)	List of required MID Server capabilities.
Parameters	parameters	Array of JavaScript object	Array of JavaScript objects, expressed with the `executionParam.` prefix. To add more name-value pairs to the **parameters** array, append them to the existing array. Create a JavaScript object with the following syntax, and add it to the `executionParam.parameter` array. This assigns additional parameters to the message: `var newParameter = {"name":"parameterName","value":"parameterValue"}; executionParam.parameters.push(newParameter);`
ValueCapabilities	valueCapabilities	Array of hashmap	Capability values used to select the MID Server. For more information, see MID Server capabilities. If there are additional

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

JavaScript template execution parameters (continued)

Name	Variable	Type	Usage
			capabilities that are assigned by value, use this example to customize the MID Server selection: `var valueCapability = {'NEW_MID_CAPABIILTY':'NEW_MID_CAPABILITY_VALUE'}; executionParam.valueCapabilities.push(valueCapability);`

JavaScript probe template post-processing parameters

Use these parameters to create a post-processing script.

JavaScript probe post-processing parameters

Name	Variable	Type	Usage
Payload	payload	String	Contains raw payload returned from the JavaScript Probe.
Output	output	String	Contains output data returned from the JavaScript Probe.
EccSysId	eccSysId	String	Contains the reference ID associated with the ECC Queue input message.
Error Messages	errorMessages	String	Contains the error messages returned from the JavaScript probe. If no error messages are returned, this value is null.

Configure the JavaScript Probe execution command

Use the input variables you created to configure the command that Orchestration executes on the JavaScript Probe target host.

Before you begin

Create the input variables you need in the **Inputs** form before you can advance to the **Execution Command** stage.

Role required: activity_creator, admin

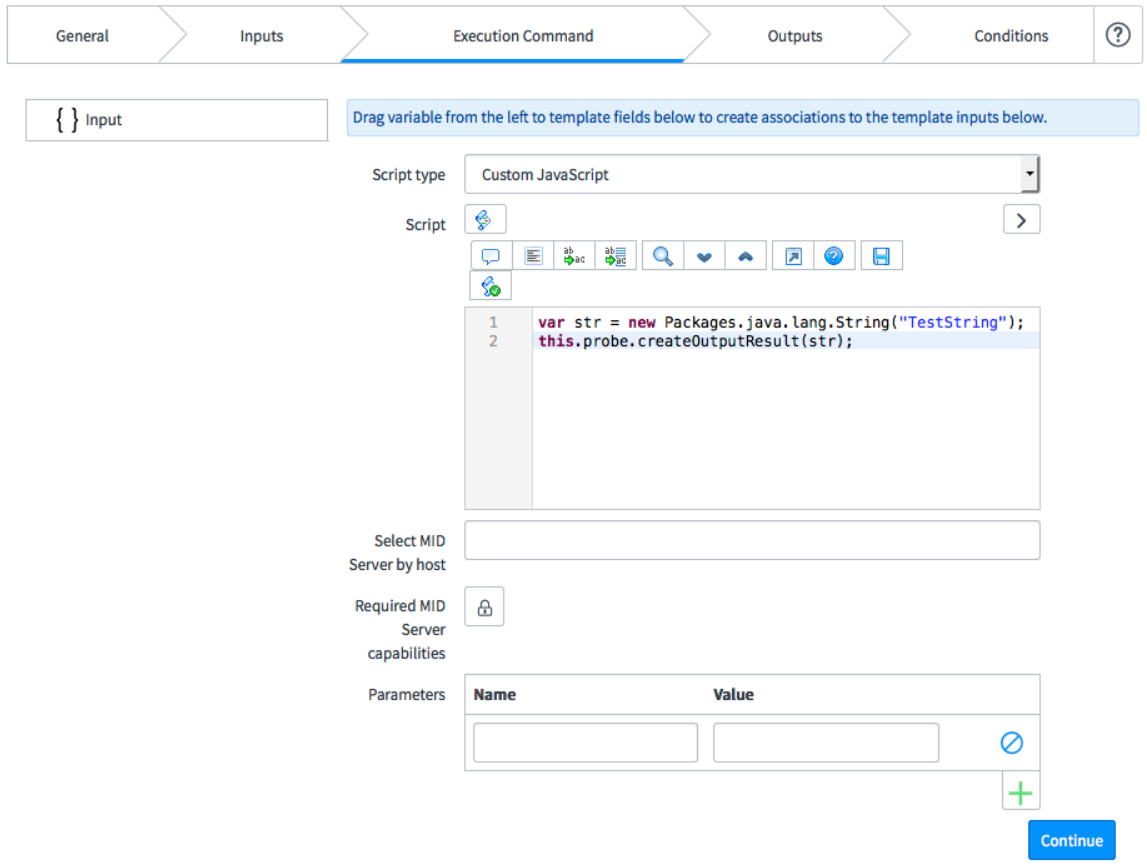
Note:
You can test the JavaScript Probe connection between the MID Server and the target without having to run the acvitity in a workflow context. For details, see test template outputs.

Procedure

1. Drag variables from the list of inputs and drop them into command fields.
   The system formats the variable in the proper syntax for the command.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

JavaScript Probe execution command



2. Complete the fields shown in the table.

JavaScript Probe execution command fields

Field	Description
Input	Input variable builder. Create input variables to map to available fields.
Script type	Select the type of script to include. Available options are: ○ Custom JavaScript ○ MID Server script include
Script	Custom JavaScript to run with this probe. This field is available when the **Script type** selected is **Custom JavaScript**.
MID Server script include	Script for the MID Server to run with this probe. This field is available when the **Script type** selected is **MID Server script include**.
Select MID Server by host	MID Server on which the probe runs.
Required MID Server capabilities	MID Server to use, by capabilities.
Parameters	Name-value pairs to pass to the host with this probe. You can create these parameters manually, or drag input variables into the **Parameters** fields and assign a value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Click **Save**.
4. Click **Continue** to advance to the **Outputs** stage.

Create a PowerShell activity

Create a custom PowerShell activity return data to a workflow from a host using Microsoft PowerShell.

Before you begin

Role required: activity_creator or workflow_admin

About this task

ServiceNow supports PowerShell 3.0 to 5.1.

Procedure

1. Create a custom activity.
   This action creates a custom activity using a template.
2. After setting up general properties and creating input variables, configure the PowerShell Execution Command.

Option	Description
Map the input variables	Use the variables you created to configure the command that Orchestration executes on the MID Server.
Target host	Host name or IP address of the target server for this PowerShell activity.
Script type	Type of PowerShell script to run on the Power Shell host. Available options are: ○ Custom PowerShell command ○ MID Server script file
MID Server script file	The MID Server script file contains the Power Shell scripts. This field is available when the **Script type** selected is MID Server script file.
Command	PowerShell command the activity executes. This field is available when the **Script type** se lected is *Custom PowerShell command*. You can create your commands by dragging and dropping input variables from the variable builder into this field.
PowerShell variables	Name-value pairs to pass to the host with Pow erShell. You can create these variables man ually, or drag input variables into the **Value** field. Encrypted input variables retain their en cryption, regardless of the data type settings in this field. If you type in a value and select the **Encrypted** data type, your value appears in plain text. It is only encrypted when it pass es to the ECC Queue.
Use MID Service Account	If checked, this activity authenticates on the target host using the credentials of the MID

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	Server service account only, without trying any other credentials. **Note:** The **Credential tag** field is not available.
Credential tag	Credential tag this activity must use to run PowerShell commands on the host. If this field is left blank, the MID Server tries all the available credentials until it finds a valid one, ending with the MID Server service account. If a credential tag is defined, the MID Server tries the credentials with that tag specified on ly and does not try the MID Server service ac count. **Note:** This field is not available when the **Use MID service account** check box is se lected.
Required MID Server capabilities	MID Server to use for querying PowerShell, by capabilities. By default, the system selects a PowerShell MID Server.

Note:
You can map parameter values in a test payload to variables in the **Outputs** tab automatically. See automap output variables.

What to do next

Finish creating your PowerShell activity by creating output variables, creating a parsing rule, or Conditions. Refer to the create custom activities topic to know your template options.

PowerShell template execution parameters

You use execution parameters to create the input process script in the **Pre Processing** form of the activity designer.

For descriptions of the Powershell command fields, see the table in Configure the PowerShell execution command.

Note:
You must use the `executionParam.` prefix with all variables in this table.

Powershell execution parameters

Name	Variable	Type	Usage
Source	source	String	Target host on which to execute the command.
Script type	script_type	Enumeration	Type of script to run. The possible types are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Powershell execution parameters (continued)

Name	Variable	Type	Usage
			• **command:** Custom PowerShell command. • **file:** Identifies the MID Server script file to run.
Command	command	String	Command sent to the MID Server for it to run on the target host.
MidScriptFile	midScriptFile	Reference	Reference sys_id of the MID Server script file to execute, when the **script_type** is **file**.
PowershellVariables	powershellVariables	Array of hashmap	Hashmap of JavaScript objects with **name**, **value**, and **type** for each object. The **type** of each object can be one of **plain**, **encrypted**, **boolean**, or **null**, corresponding to the PowerShell variable **type** selected in the inputs tab. For example, you might enter: `var newParameter = {"name":"parameterName","value":"parameterValue", "type": "plain" }; executionParam.powershellVariables.push(newParameter);`
Credential tag	credential_tag	String	Specific credential tag this activity must use to run PowerShell commands on the host.
MidCapabilities	midCapabilities	String (comma separated)	List of required MID Server capabilities.
ValueCapabilities	valueCapabilities	Array of hashmap	Capability values used to select the MID Server. For more information, see MID Server capabilities. If there are additional capabilities that are assigned by value, use this example to customize the MID Server selection: `var valueCapability = {'NEW_MID_CAPABIILTY': 'NEW_MID_CAPABILITY_VALUE'}; executionParam.valueCapabilities.push(valueCapability);`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Powershell post-processing parameters and payload parsing

Use these parameters to create a post-processing script, payload parsing, and tagging.

Powershell post-processing parameters

Name	Variable	Type	Usage

Tags	tags	Hashmap of tag values to return from the PowerShell command.	Contains the tags used to extract output using the PowerShell commands. The tag output is delimited by double percentage signs, as in **%%tagname%% ... %%**. Set up the command using the format in this example:
			`Write-Host %%tagname1%%`
			`output1 line 1`
			`output1 line 2`
			`…`
			`Write-Host%%`
			
			`Write-Host %%tagname2%%`
			`output2 line 1`
			`output2 line 2`
			`…`
			`Write-Host%%`
			
			The tags returned are JavaScript hashmap objects in which each key is prefixed with **tag** appended with the **tagname**.
			`{"__text__": "",`
			`"tagtagname1":"output1`
			`line1\noutput1 line2\n",`
			`"tagtagname2":"output2`
			`line1\noutput2 line2\n"}`

Hresult	hresult	String	Contains any **hresult** returned from the PowerShell command. If no **hresult** is returned, this parameter is **null**.
Output	output	String	Contains the raw output from the PowerShell command.
EccSysID	eccSysID	String	Contains the reference ID associated with the ECC Queue input message returned by the activity.
ErrorMessages	errorMessages	String	Contains any error messages retrieved from the PowerShell command. This value is **null** if there are no error messages.

Create a REST web service activity

Use this procedure to create a custom REST web service Orchestration activity.

Before you begin

Role required: web_service_admin, activity_admin, activity_creator

About this task

To create and use a REST web service workflow activity:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Create a Create a REST message if an appropriate one is not already configured.
- Assign the web_service_admin role to any user who must create or edit a custom REST activity.
- Determine an application, or Application scope, for this activity.
- Determine the Create a REST message to use for the activity. Use this value to override the endpoint configured in the REST message.
- Optionally, create basic authentication credentials. Use this value to override the credentials configured in the SOAP message.

Procedure

1. Create a custom activity.
   This action creates a custom activity using a template.
2. After setting up general properties and creating input variables, configure the REST web service Execution Command.

Option	Description
Map the input variables	Use the variables you created to configure the command that Orchestration executes.
REST message	Name of an existing REST message to use in this activity.
REST message function	REST message function to use for this activity.
Endpoint	Endpoint URL for the REST web service this activity uses. Enter an endpoint in this field to override the endpoint configured in the REST message. Click the lock to open the in put field.
Variable substitutions	Name-value pairs to pass to the REST end point. You can create these parameters manu ally, or drag input variables into the parameter fields, and then assign a value. Parameters defined in the REST message that use **${}** can be assigned data from this activity template. Use the **Additional attribute** column to config ure the system to not escape the text. By de fault the text sent to the REST message is es caped. If the users have provided variables using Variable substitution in outbound REST in the REST message, then the **Name** column is automatically populated.
Additional Headers	Additional HTTP header parameters for the REST message selected. You can also use these values to override parameters inherited from the REST message.
Additional Query Parameters	Additional query parameters for the REST message selected. You can also use these val ues to override parameters inherited from the REST message.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
Use MID Server	Check box that determines if a MID Server should be used to invoke the REST web service. **Note:** If the REST web service message function defines a MID Server, that MID Server is used instead of the one selected here.
Required MID Server capabilities	MID Server with the appropriate MID Server capabilities for connecting to the REST endpoint. By default, the system selects a MID Server with REST capabilities. This field is available when the **Use MID Server** check box is selected.
Timeout	Allowed duration of the REST web service request before it times out, in seconds. The default is **10**.
Authentication	Determines what type of authentication is required for the endpoint. The options are: ○ **Use existing credentials in REST message**: Uses credential definitions from the REST message definition. ○ **Override with Basic Authentication credentials**: Uses Enable basic authentication credentials to override the credentials in the REST message definition. Basic authentication credentials must be provisioned before they are available for selection. ○ **Override with Certificate Authentication credentials**: Uses a certificate, such as a private key, to override the credentials in the REST message definition. ○ **Override with Both Basic and Certificate Authentication credentials**: Uses both basic authentication and certificate authentication to override the credentials in the REST message definition. ○ **Override with OAuth Authentication credentials**: Uses OAuth 2.0 credentials to override the credentials in the REST message definition. The REST message selected for this activity must have its OAuth set to **OAuth 2.0** and its OAuth profiles and configured appropriately.
Credentials	Required REST endpoint basic authentication credentials. This field is available when

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	Override with Basic Authentication credentials is selected in the **Authentication** field. Only basic authentication credentials appear in the selection list, which includes credentials stored on the instance and credential IDs from an external storage system. If you are using credentials stored in a CyberArk safe, you can override the default safe defined in the MID Server configuration file. See Configure for details. Add the name of a different safe as a prefix to the credential ID, separated by a colon. For example, *newsafe:orch-test-f5*.
Protocol Profile	Certificate authentication to use. This field is available when the selections in the **Authentication** are either **Override with Certificate Authentication credentials** or **Override with Both Basic and Certificate Authentication credentials**.
OAuth profile	Profile for the OAuth provider for this REST message. See for more information.

Note:
You can map parameter values in a test payload to variables in the **Outputs** tab automatically. See automap output variables.

What to do next
Finish creating your Rest web service activity by creating output variables, creating a parsing rule, or Conditions. Refer to the create custom activities topic to know your template options.

Auto-map REST activity output variables

The ServiceNow activity designer allows you to map parameter values in a REST test payload to variables in the **Outputs** stage automatically.

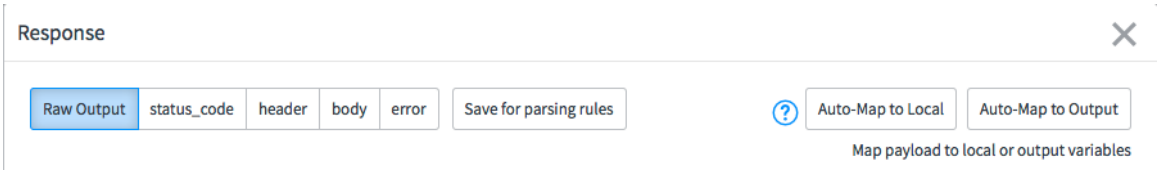
Before you begin
Role required: web_service_admin, activity_admin, activity_creator

About this task
Note:
You can test input variables from any stage in the activity designer if you have provided enough information for Orchestration to contact the endpoint and return data. Typically, the **Execution Command** stage is the point at which your inputs are ready for testing.

Procedure
1. In the activity designer, proceed to the **Execution Command** stage.
2. Define an appropriate MID Server, if requested.
   The test fails if the MID Server cannot be found or if it cannot connect to the target.
3. Click **Test Activity** to test the input parameters.
   If you added actual values for the parameters and fields, the system runs those values against the specified target and returns the resulting payload. If you mapped input variables to fields and parameters, the system displays a dialog box for assigning test values to those variables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Provide test values, if requested, and click **OK** to display the payload.
   The entire payload appears in the **Raw Output** tab of the Response form.



5. Select one of these auto-mapping options.
   - **Auto-Map to Local**: Directly maps values to a local variable for use within the activity.
   - **Auto-Map to Output**: Directly maps values to the output variable to pass to other activities in the workflow. Auto-mapping to an output variable creates an array of objects, each of which contains the column names from the query result.

REST template execution parameters

You use execution parameters to create the input process script in the **Pre Processing** form of the activity designer.

For descriptions of the REST web service command fields, see Configure the REST execution command.

Note:
You must use the `executionParam.` prefix with all variables in this table.

REST template execution parameters

Name	Variable	Type	Usage
Web service message	web_service_message	Reference	The sys_id of the corresponding web service message.
Web service message function	web_service_message_function	Reference	The sys_id of the REST message function.
Web service endpoint	web_service_endpoint	String	URL of the REST endpoint.
Parameters	parameters	Array of JavaScript objects	Array of JavaScript objects, expressed with the `executionParam.` prefix. For instructions on creating arrays using this parameter see Create a JavaScript array in a REST template.
Use mid server	use_mid_server	Boolean	Selects whether or not to use the MID Server. A value of **true** uses the MID Server, and a value of **false** does not use the MID Server.
MidCapabilities	midCapabilities	String (comma separated)	List of references to required MID Server capabilities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

REST template execution parameters (continued)

Name	Variable	Type	Usage
Time out	time-out	String	Allowable time out duration, expressed in seconds.
ValueCapabilities	valueCapabilities	Array of hashmap	Capability values used to select the MID Server. For more information, see MID Server capabilities. Use this example to customize the MID Server selection if there are additional capabilities that are assigned by value: `var valueCapability = {'NEW_MID_CAPABIILTY':'NEW_MID_CAPABILITY_VALUE'}; executionParam.valueCapabilities.push(valueCapability);`
Auth Type	auth-type	Boolean	Type of credentials to use. The choices are: • basic_auth_pick_credentials • use_existing_credentials
Credentials	credentials	Reference	Contains the credentials to use for this REST message when the **auth_type** selected is **basic_auth_pick_credentials**.

Create a JavaScript array in a REST template

These are instructions for creating JavaScript arrays using REST execution parameters.

Before you begin

Role required: web_service_admin, activity_admin, activity_creator

About this task

To add more name-value pairs to the parameter's array, append the values to the existing array.

Procedure

1. Create a JavaScript object with the following syntax, and add it to the `executionParam.parameter` array:

```
var newParameter =
 {"name":"parameterName","value":"parameterValue","additional_attribute":"none"};
executionParam.parameters.push(newParameter);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

By adding the new parameter JavaScript object to the array, you ensure that any elements already available in the array are not impacted.

2. Make sure to set the value in the **Additional attribute** column in the **REST message parameters** input field to **Do not escape text**.

   In this case, the system does not escape the value specified for the **value** attribute. An example of this is:

```
var newParameter =
 {"name":"parameterName","value":"parameterValue","additional_a
ttribute":"do_not_escape_text"};
executionParam.parameters.push(newParameter);
```

Note:
If the value for the **additional_attribute** field is **None**, then the system escapes the value specified by the **value** attribute. In the first example, `parameterValue` is escaped.

REST template post-processing parameters

Use these parameters to create a post-processing script.

Activity designer post-processing parameters

Name	Variable	Type	Usage
Status code	status_code	Integer	Contains the status code returned from the REST web service.
Header	header	Hashmap of JavaScript object	Hashmap of key value pairs associated with the header values passed into the web service. You can access each value with `executionResult.header[keyName]`.
Body	body	String	Contains a string value representing the output from the REST message
Error	error	String	Returns the error string from the REST web service, unless there are no errors, in which case it returns**null**.

Configure the REST execution command

Use the input variables you created to configure the command that Orchestration executes on the REST endpoint.

Before you begin

Create the input variables you need in the **Inputs** form before you can advance to the **Execution Command** stage.

Role required: web_service_admin, activity_admin, activity_creator

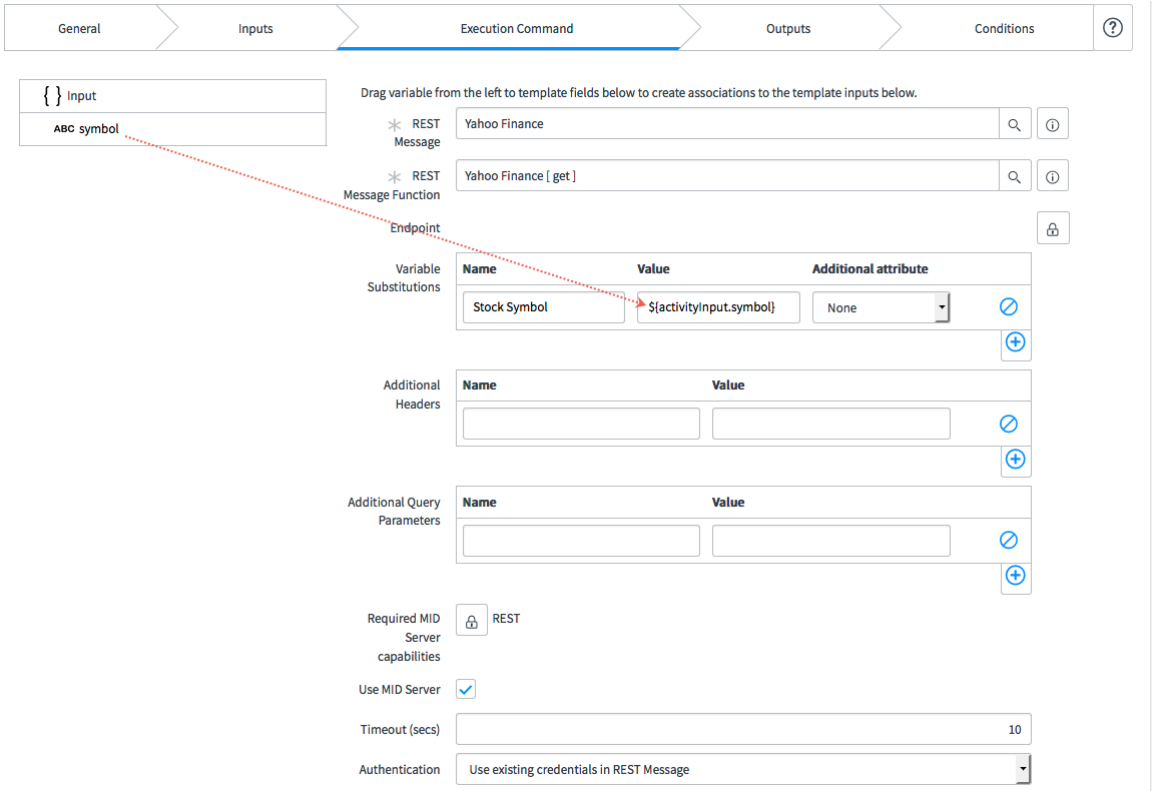
Note:
You can test the REST connection between the MID Server and the endpoint without having to run the acvitity in a workflow context. For details, see test template outputs.

Procedure

1. Drag variables from the list of inputs and drop them into command fields.
   The system formats the variable in the proper syntax for the command.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

REST execution command



2. Complete the fields shown in the table.

REST execution command fields

Field	Description
Input	Input variable builder. Create input variables to map to available fields.
REST message	Name of an existing REST message to use in this activity. Users must have the web_service_admin role to configure this field.
REST message function	REST message function to use for this activity. Users must have the web_service_admin role to configure this field.
Endpoint	Endpoint URL for the REST web service this activity uses. Enter an endpoint in this field to override the endpoint configured in the REST message. Click the lock to open the input field.
Variable substitutions	Name-value pairs to pass to the REST endpoint. You can create these parameters manually, or drag and drop input variables into the parameter fields, and then assign a value. Parameters defined in the REST message that use **${}** can be assigned data from this activity template. Use the **Additional attribute** column to configure the system to not escape the text. By default the text sent to the REST message is escaped. The **Name** column is automatically populated if the users have provided variables using Variable substitution in outbound REST messages in the REST message.
Additional Headers	Additional HTTP header parameters for the REST message selected. You can also use these values to override parameters inherited from the REST message.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Additional Query Parameters	Additional query parameters for the REST message selected. You can also use these values to override parameters inherited from the REST message.
Use MID Server	Check box that determines if a MID Server should be used to invoke the REST web service. **Note:** If the REST web service message function defines a MID Server, that MID Server is used instead of the one selected here.
Required MID Server capabilities	MID Server with the appropriate MID Server capabilities for connecting to the REST endpoint. By default, the system selects a MID Server with REST capabilities. This field is available when the **Use MID Server** check box is selected.
Timeout	Allowed duration of the REST web service request before it times out, in seconds. The default is **10**.
Authentication	Determines what type of authentication is required for the endpoint. The options are: ○ **Use existing credentials in REST message**: Uses credential definitions from the REST message definition. ○ **Override with Basic Authentication credentials**: Uses Enable basic authentication for outbound SOAP credentials to override the credentials in the REST message definition. Basic authentication credentials must be provisioned before they are available for selection. ○ **Override with Certificate Authentication credentials**: Uses a certificate, such as a private key, to override the credentials in the REST message definition. ○ **Override with Both Basic and Certificate Authentication credentials**: Uses both basic authentication and certificate authentication to override the credentials in the REST message definition. ○ **Override with OAuth Authentication credentials**: Uses OAuth 2.0 credentials to override the credentials in the REST message definition. The REST message selected for this activity must have its OAuth 2.0 tutorial - create a REST message set to **OAuth 2.0** and its OAuth profiles and scopes configured appropriately.
Credentials	Required REST endpoint basic authentication credentials. This field is available when **Override with Basic Authentication credentials** is selected in the **Authentication** field. Only basic authentication credentials appear in the selection list, which includes credentials stored on the instance and credential IDs from an external storage system. If you are using credentials stored in a CyberArk safe, you can override the Configure the MID Server for CyberArk defined in the MID Server configuration file by adding the name of a different safe as a prefix to the credential ID, separated by a colon. For example, *`newsafe:orch-test-f5`*.
Protocol Profile	Certificate authentication to use. This field is available when the selections in the **Authentication** field is either **Override with Certificate Authentication credentials** or **Override with Both Basic and Certificate Authentication credentials**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
OAuth profile	Profile for the OAuth provider for this REST message. See Specify an OAuth profile for more information.

3. Click **Save**.
4. Click **Continue** to advance to the **Outputs** stage.

Create an SFTP activity

Create an activity that executes basic SFTP commands on a remote server.

Before you begin

Roles required: activity_creator or workflow_admin

About this task

You can create a custom activity that manages files and directories on a target host or copies a file from one SFTP server to another. The file content is streamed through a MID Server, which avoids having to store the data on the hard drive of the MID Server host machine.

Note:
This activity requires the credentials of a user who can execute SFTP commands on the source host. The Copy File activity, provided in the activity pack, requires separate credentials to access the target host.

Procedure

1. Create a custom activity.
   This action creates a custom activity using a template.
2. After setting up general properties and creating input variables, configure the SFTP Execution Command.

Option	Description
Command	Type of activity to create. The choices are: ○ Copy file ○ Create directory ○ Get file list ○ Remove file or directory ○ Rename file or directory ○ Set file attributes **Note:** The fields that display on the form de pend on the command you select.
Source host	Name or IP address of the server containing the files targeted by the activity.
Source port	Port number to use to communicate with the source server. The default port number is **22**.
Source file path	Full path to a file (`/temp/test_data_file.txt`) or directory (`/temp/test_dir`) on a source host depending on the se

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	lected command. Field available on following commands: ○ Copy file ○ Remove file or directory ○ Set file attributes
Source directory	Path to the directory where the source files are located. Field available on following com mands: ○ Create directory ○ Get file list
Source files	Names of specific source files to include in the file transfer. Separate the file names with semi-colons. This field supports a semi-colon separated list of wild-card patterns. For ex ample: `*.txt; a?cd.pdf`. If this field is blank, all files are included. Field available on following command: Get file list **Note:** For information about how the values in this field affect options in other fields, see the logic explanation which follows.
Is a directory	If checked, specifies the file path is a directo ry. Field available on following command: Re move file or directory
Credential tag for source	Specific credential tag this activity must use to run SFTP commands on the source host.
Credential tag for target	Specific credential tag this activity must use to run SFTP commands on the target host. Field available on following command: Copy file
Excluded files	Names of specific source files to exclude from the file transfer. The activity acts on all other files found in the source directory or subfold ers. Separate the file names with commas. This field supports comma-separated list of wild-card patterns. For example: `*.txt, a?cd.pdf`. Field available on following com mand: Get file list **Note:** For information about how the values in this field affect options in other fields, see the logic explanation which follows.
Include subfolders	If checked, includes the files from subfolders in the source directory. Field available on fol lowing command: Get file list

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	Note: For information about how your selec tion affects other fields in the form, see the logic explanation which follows.
Target host	Name or IP address of the server to which the files are being transferred. Field available on following command: Copy file
Target port	Port number to use to communicate with the target host. The default port number is **22**. Field available on following command: Copy file
Target file path	Full path to a file on a target host. Field avail able on following commands: ○ Copy file ○ Rename file or directory
Suffix for temporary file	If a file exists on a target host, this command enables a temporary suffix to use for a file name. If this field contains a value, the activity first copies the source file to a temporary file on the target host using *`targetFilePath + tempFileSuffix`* as the name. Up on completion, the activity renames the file to the actual target file name. If this field is blank, the activity copies the source file direct ly to the target file and overwrites it, if it exists. Field available on following command: Copy file
UID	User ID attribute to apply to a file or directory. The UID and GID values must be set together as a pair or they are ignored. The UID and GID numbers are internal values returned by the Get File List activity. Typically, you first use the Get File List activity to return a list of files and their attributes. Then you can move a file from a source host to a target host and set the source file attributes on the target file. This flow is demonstrated in the SFTP File Trans fer workflow. Field available on following com mand: Set file attributes
GID	Group ID attribute to apply to a file or direc tory. The UID and GID values must be set to gether as a pair or they are ignored. The UID and GID numbers are internal values returned by the Get File List activity. Typically, you first use the Get File List activity to return a list of files and their attributes. Then you can move a file from a source host to a target host and set the source file attributes on the target file. This flow is demonstrated in the SFTP File

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	Transfer workflow. Field available on following command: Set file attributes
Permissions	File or directory permissions to set for the user and group specified. This value must be expressed as an integer, such as **16877**, which defines these permissions: *rwxr-xr-x*. The permissions numbers are internal val ues returned by the Get File List activity. Typ ically, you first use the Get File List activity to return a list of files and their attributes. Then you can move a file from a source host to a tar get host and set the source file attributes on the target file. This flow is demonstrated in the SFTP File Transfer workflow. Field available on following command: Set file attributes
Access timestamp	Override the timestamp when the file or direc tory was last accessed. The access and mod ification timestamps must be set together as a pair. Field available on following command: Set file attributes
Modification timestamp	Override the timestamp when the file or direc tory was last modified. The access and modi fication timestamps must be set together as a pair. Field available on following command: Set file attributes
Size in bytes	Size of a file, expressed in bytes. Field avail able on following command: Set file attributes
Required MID Server capabilities	MID Server with the appropriate MID Server capabilities for connecting to the source and target servers.

The system uses this logic to determine which files to move from the source host:

- If the Source files field is empty, the system selects all the files in the source directory. Otherwise, it only selects those files whose names match one of the file name patterns given in the field.
- If the Excluded files field is empty, the system excludes nothing. Otherwise, it excludes those files whose names match one of the file name patterns given in the field.
- The exclude rule has a higher preference than the include rule. If a file name matches one of the file name patterns in the Excluded files field, it does not get into the selection regardless of the include rule.
- When the Include subfolders check box is cleared, the system looks only in the source directory for files to include or exclude. Otherwise, it looks in the source directory and any of its subfolders for files to include or exclude.

Note:
You can map parameter values in a test payload to variables in the **Outputs** tab automatically. See automap output variables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

- Use auto-mapping to generate outputs and parsing rules (recommended for JDBC)
- If you do not use auto-mapping, you can manually create output variables and create parsing rules

SFTP template execution parameters

You use execution parameters to create the input process script in the **Preprocessing** form.

For descriptions of the command fields, see Configure the SFTP execution command.

Note:
You must use the `executionParam.` prefix with all variables in this table.

SFTP execution parameters

Name	Variable	Type	Usage
Command	command	String	Identifies the function of this activity. The possible commands are: • Copy file • Create directory • Get file list • Remove file or directory • Rename file or directory • Set file attributes
Source	source	String	Identifies the source host.
Source port	source_port	Integer	Identifies the port used to communicate with the source host.
Source directory	source_directory	String	Path to the source directory of the files to be moved.
Source files	source_files	String	Names of the files on the source to be moved.
Excluded files	excluded_files	String	Lists the files excluded from the operation.
Source file path	source_file_path	String	Path to the source files to be moved.
Target host	target_host	String	Identifies the target host.
Target port	target_port	Integer	Identifies the port used to communicate with the target host.
Target directory	target_directory	String	Full path to the target directory on the target host.
Target file path	target_file_path	String	Full path to a file or directory on the source host or on the target host. For example, this value is used in the Rename File or Directory activity in the activity pack.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SFTP execution parameters (continued)

Name	Variable	Type	Usage
Temp file postfix	temp_file_postfix	String	Temporary file name extension used by the Copy File activity when moving a file. If this field contains an extension, the source file is copied to a temporary file using *target file name + temp_file_postfix*, before being renamed to the actual target file. If this field is blank, the source file is copied directly to the target file.
Is directory	is_directory	Boolean	Indicates whether the given file path is a directory.
Include subfolders	include_subfolders	Boolean	Indicates whether the system looks into subfolders of the source directory for files to include and exclude.
File attribute uid	file_attribute_uid	Integer	User ID associated with a file or directory.
File attribute gid	file_attribute_gid	Integer	Group ID associated with a file or directory.
File attribute permissions	file_attribute_permissions	Integer	File or directory permissions for the user and group specified.
File attribute atime	file_attribute_atime	Integer	Access time stamp from the file attributes.
File attribute mtime	file_attribute_mtime	Integer	Modification time stamp from the file attributes.
File attribute size	file_attribute_size	Integer	Size of the file, in bytes.
Source credential tag	source_credential_tag	String	Credential aliases for Orchestration activities used to run the command on the source host.
Target credential tag	target_credential_tag	String	Credential tag used to run the command on the target host.
MidCapabilities	midCapabilities	String (comma separated)	List of required MID Server capabilities.

SFTP post-processing parameters and payload parsing

Use these parameters to create a post-processing script, payload parsing, and tagging.

SFTP post-processing parameters

Name	Variable	Type	Usage
Output	output	String	Contains output data returned by the query.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SFTP post-processing parameters (continued)

Name	Variable	Type	Usage
EccSysId	eccSysId	String	Contains the Reference ID associated with the ECC Queue input message.
ErrorMessages	errorMessages	String	Contains the error messages returned from the query. If no error messages are returned, this value is null.

Tags	tags	Hashmap of tag values returned from the SSH command	Contains the tags used to extract output using the SSH commands. The tag output is delimited by double percentage signs, as in `%%tagname %% ... %%`. Set up the command using the following format:
			`%%tagname1%%`
			`output1 line 1`
			`output1 line 2`
			`...`
			`%%`
			
			`%%tagname2%%`
			`output2 line 1`
			`output2 line 2`
			`...`
			`%%`
			The tags returned are JavaScript hashmap objects in which each key is prefixed with `tag` appended with the tagname.
			`{"__text__": "",`
			`"tagtagname1":"output1`
			`line1\noutput1 line2\n",`
			`"tagtagname2":"output2`
			`line1\noutput2 line2\n"}`

Configure the SFTP execution command

Use the input variables you created to configure the command that Orchestration executes on the SFTP target.

Before you begin

Create the input variables you need in the **Inputs** form before you can advance to the **Execution Command** stage.

Role required: activity_creator, admin

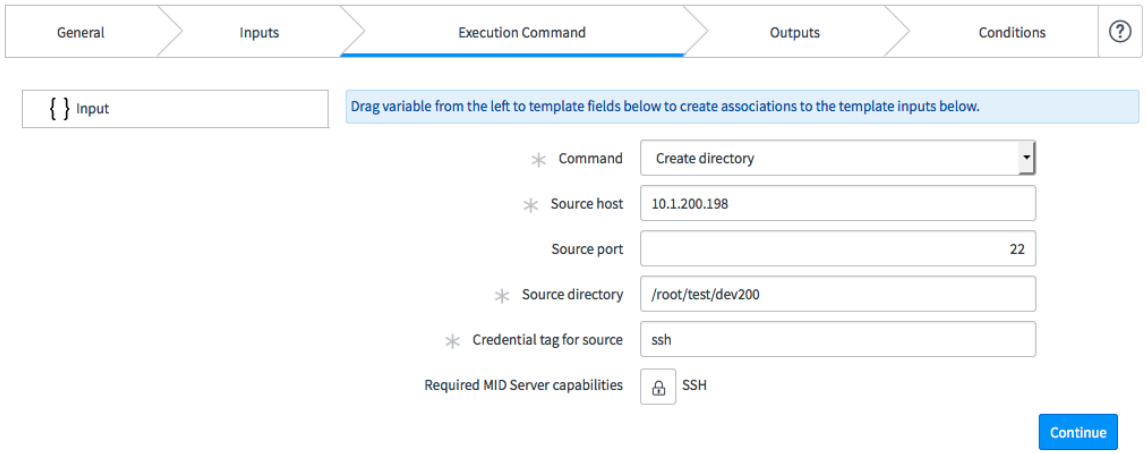
Note:
You can test the JDBC connection between the MID Server and the target without having to run the activity in a workflow context. For details, see test template outputs.

Procedure

1. Drag variables from the list of inputs and drop them into command fields.
   The system formats the variable in the proper syntax for the command.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SFTP execution command



2. Complete the fields shown in the table.

SFTP command fields

Field	Description	Command
Command	Type of activity to create. The choices are: ○ Copy file ○ Create directory ○ Get file list ○ Remove file or directory ○ Rename file or directory ○ Set file attributes **Note:** The fields displayed on the form depend on the command selected.	All
Source host	Name or IP address of the server containing the files targeted by the activity.	All
Source port	Port number to use to communicate with the source server. The default port number is **22**.	All
Source file path	Full path to a file on a source host.	○ Copy file ○ Remove file or directory ○ Set file attributes
Source directory	Path to the directory where the source files are located.	○ Create directory ○ Get file list

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description	Command
Source files	Names of specific source files to include in the management action. Separate the file names in this list with semi-colons. This field supports the use of wild cards. If this field is blank, all files are included. For information about how the values in this field are affected by options in other fields, see the section below the table.	Get file list
Is a directory	Check box that determines if the specified file path is a directory.	Remove file or directory
Credential tag for source	Specific Credential aliases for Orchestration activities this activity must use to run SFTP commands on the source host.	All
Credential tag for target	Specific credential tag this activity must use to run SFTP commands on the target host.	Copy file
Excluded files	Names of specific source files to exclude from the management action. The activity acts on all other files found in the source directory or subfolders. Separate the file names in this list with semi-colons. This field supports the use of wild cards. For information about how the values in this field are affected by options in other fields, see the section below the table.	Get file list
Include subfolders	Check box to manage the files from subfolders in the source directory. For information about how your selection affects other fields in the form, see the section below the table.	Get file list
Target host	Name or IP address of the server to which the files are being transferred.	Copy file
Target port	Port number to use to communicate with the target host. The default port number is **22**.	Copy file
Target file path	Full path to a file on a target host.	○ Copy file ○ Rename file or directory
Suffix for temporary file	Temporary suffix to use for a file name if the file already exists on a target host. If this field contains a value, the activity deletes the duplicate target file if it exists, and then copies the source file to a temporary file using *`targetFilePath + tempFileSuffix`* as the name. Upon completion, the activity renames the file to the actual target file name. If this field is blank, the activity copies the source file directly to the target file and overwrites it, if it already exists.	Copy file
UID	User ID attribute to apply to a file or directory. The UID and GID values must be set together as a pair or they are ignored.	Set file attributes
GID	Group ID attribute to apply to a file or directory. The UID and GID values must be set together as a pair or they are ignored.	Set file attributes
Permissions	File or directory permissions to set for the user and group specified. This value must be expressed as an integer, such as **16877**, which defines these permissions: *`rwxr-xr-x`*. The permissions number is an internal value returned by the Get	Set file attributes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description	Command
	File List activity. Typically, you first use the Get File List activity to return a list of files and their attributes. Then you can move a file from a source host to a target host and set the source file attributes on the target file. This is demonstrated in the SFTP File Transfer workflow.	
Access timestamp	Override the timestamp when the file or directory was last accessed. The access and modification timestamps must be set together as a pair.	Set file attributes
Modification timestamp	Override the timestamp when the file or directory was last modified. The access and modification timestamps must be set together as a pair.	Set file attributes
Size in bytes	Size of a file, expressed in bytes.	Set file attributes
Required MID Server capabilities	MID Server with the appropriate MID Server capabilities for connecting to the source and target servers. By default, the system selects an SSH MID Server.	All

The system uses this logic to determine which files to move from the source host:

- If the **Source files** field is empty, the system select all the files in the source directory. Otherwise, it only selects those files whose names match one of the file name patterns given in the field.
- If the **Excluded files** field is empty, the system excludes nothing. Otherwise, it excludes those files whose names match one of the file name patterns given in the field.
- The exclude rule has a higher preference than the include rule. A file whose name matches one of the file name patterns in the **Excluded files** field does not get into the selection, even though it would be selected by the include rule.
- When the **Include subfolders** check box is cleared, the system looks only in the source directory for files to include or exclude. Otherwise, it looks in the source directory and any of its subfolders for files to include or exclude.

3. Click **Save**.
4. Click **Continue** to advance to the **Outputs** stage.

Create a probe activity

Create an activity that runs a probe on the target host that is configured to return specific information..

Before you begin

Role required: activity_creator or workflow_admin

About this task

For instructions on using the activity template process flow, see create custom activities.

Procedure

1. Create a custom activity.
   This action creates a custom activity using a template.
2. After setting up general properties and creating input variables, configure the Probe Execution Command.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
Map the input variables	Use the variables you created to configure the command that Orchestration executes.
Probe	Probe to run with this activity, from the list of probes in the system
Target host	Host name or IP address of the target server for this activity.
Parameters	MID Server to use, by capabilities.
Required MID Server capabilities	Name-value pairs to pass to the host with this probe. You can create these parameters man ually, or drag and drop input variables into the parameter fields and assign a value.

Note:
You can map parameter values in a test payload to variables in the **Outputs** tab automatically. See automap output variables.

What to do next

- Use auto-mapping to generate outputs and parsing rules
- If you do not use auto-mapping, you can manually create output variables and create parsing rules

Probe template execution parameters

You use execution parameters to create the input process script in the **Pre Processing** form.

For descriptions of the command fields, see Configure the Probe execution command.

Note:
You must use the `executionParam.` prefix with all variables in this table.

Probe activity execution parameters

Name	Variable	Type	Usage
Probe	probe	Reference	The sys_id of the MID Server probe.
Source	source	String	Intended target host
Parameters	parameters	Array of JS object	Array of JavaScript objects, expressed with the `executionParam.` prefix. To add more name-value pairs to the **parameters** array, append them to the existing array. Create a JavaScript object with the following syntax, and add it to the `executionParam.parameter` array. This assigns additional parameters to the message: `var newParameter = {"name":"parameterName","value":"parameterValue"};`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Probe activity execution parameters (continued)

Name	Variable	Type	Usage
			`executionParam.parameters.push(newParameter);`
MidCapabilities	midCapabilities	String (comma separated)	List of required MID server capabilities.

ValueCapabilities	valueCapabilities	Array of hashmap	Capability values used to select the MID Server. For more information, see MID Server capabilities. If there are additional capabilities that are assigned by value, use this example to customize the MID Server selection:
			`var valueCapability = {'NEW_MID_CAPABIILTY':'NEW_MID_CAPABILITY_VALUE'};`
			`executionParam.valueCapabilities.push(valueCapability);`

Probe template post-processing parameters

Use these parameters to create a post-processing script.

Probe post-processing parameters

Name	Variable	Type	Usage
Payload	payload	String	Contains raw payload returned from the probe.
Output	output	String	Contains output data returned from the probe.
EccSysId	eccSysId	String	Contains the reference ID associated with the ECC Queue input message.

Configure the Probe execution command

Use the input variables you created to configure the command that Orchestration executes on the target.

Before you begin

Create the input variables you need in the **Inputs** form before you can advance to the **Execution Command** stage.

Role required: activity_creator, admin

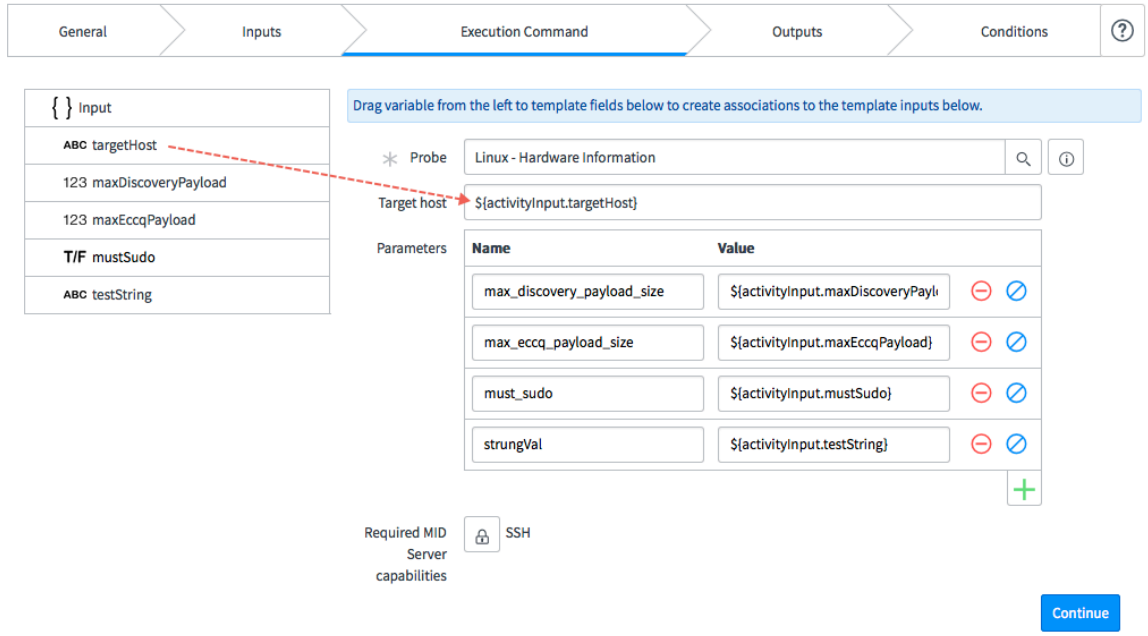
Note:
You can test the activity connection between the MID Server and the target without having to run the acvitity in a workflow context. For details, see test template outputs.

Procedure

1. Drag variables from the list of inputs and drop them into command fields.
   The system formats the variable in the proper syntax for the command.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Probe execution command



2. Complete the fields shown in the table.

Probe execution command fields

Field	Description
Input	Input variable builder. Create input variables to map to available fields.
Probe	Probe to run with this activity, from the list of probes in the system.
Target host	Host name or IP address of the target server for this activity.
Required MID Server capabilities	MID Server to use, by capabilities.
Parameters	Name-value pairs to pass to the host with this probe. You can create these parameters manually, or drag and drop input variables into the parameter fields and assign a value.

3. Click **Save**.
4. Click **Continue** to advance to the **Outputs** stage.

Create an SSH activity

Create an activity that extracts data from a target host that uses the SSH network protocol.

Before you begin

Role required: activity_creator or workflow_admin

About this task

For instructions on using the activity template process flow, see create custom activities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Create a custom activity.
   This action creates a custom activity using a template.
2. After setting up general properties and creating input variables, configure the SSH Execution Command.

Option	Description
Map the input variables	Use the variables you created to configure the command that Orchestration executes.
Target host	Host name or IP address of the target server for this activity.
Command	Command this activity runs on the target host. You can invoke a MID Server script from this field using any script type that the SSH command line supports. For more information, see **Advanced SSH script options** below the table.
Directory	Directory on the target host where the command is run.
Credential tag	The Orchestration credential tag to use when running the command.
Required MID Server capabilities	MID Server with the appropriate capabilities for connecting to the host. By default, the system selects a MID Server with SSH capabilities.
Long running	If checked, disables the SSH connection timeout for commands that might take longer to run than the default 60 seconds. Orchestration periodically checks the running process to determine its status until it is finished.
Must Sudo	If checked, enables the use of [illegible] to run commands.

Note:
You can map parameter values in a test payload to variables in the **Outputs** tab automatically. See automap output variables.

Example: Advanced SSH script options

To run a MID Server script on the target host, specify the script type and pass the name of the script into the `${syncFile()}` parameter. The system uses this parameter to locate the named script in the MID Server Script File [ecc_agent_script_file] table and run it on the target host. For example, a bash script can be expressed as:

```
bash ${syncFile("<MID script name>")} argument1 argument2
 argument3
```

A base script (`main_script.bash`) can reference another script (`my_include.bash`) as well as a separate file (`.my_profile`) located on the target host. Both scripts and the file referenced must be synced to the MID Server, using the `${syncFile()}` parameter, to execute properly.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
source ${syncFile(".my_profile")}
cp ${syncFile("my_include.bash")} /usr/ssmith/my_include.bash
bash ${syncFile("main_script.bash")} one two three four five six
rm /usr/ssmith/my_include.bash
```

A Python example with inline comments might look like this:

```
set $LIB_DIR=/usr/bin;.
# Sync a file that is referenced inside myF5CreateLBPool.py
cp ${syncFile("specialFunctions.py")} ~/specialFunctions.py
# set up environment variables
source ${syncFile(".python_profile")}
# call script that sets up dependencies on the box from remote
 package repos
python ${syncFile("setupPythonDependencies.py")} pycontrol
# call a script that requires functions from the package as well
 as a function from myIncludedFile
python ${syncFile("myF5CreateLBPool.py")} snow_pool
 myActualValue
# user is responsible for their own cleanup
rm ~/specialFunctions.py
```

What to do next

- Use auto-mapping to generate outputs and parsing rules
- If you do not use auto-mapping, you can manually create output variables and create parsing rules

SSH template execution parameters

Use execution parameters to create the input process script in the **Pre Processing** form of the activity designer.

For descriptions of the command fields, see Configure the SSH execution command.

Note:
You must use the `executionParam.` prefix with all variables in this table.

SSH execution parameters

Name	Variable	Type	Usage
Source	source	String	Intended target or host.
Command	command	String	Comment to run on the host.
Directory	directory	String	Directory on the host in which to run the command.
Credential tag	credential_tag	String	Orchestration credential tag to use when running the command.
MidCapabilities	midCapabilities	String (comma separated)	List of required MID Server capabilities.
ValueCapabilities	valueCapabilities	Array of hashmap	Capability values used to select the MID Server. For more information, see MID Server capabilities. If there are additional capabilities that are assigned by value, use

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SSH execution parameters (continued)

Name	Variable	Type	Usage
			this example to customize the MID Server selection: `var valueCapability = {'NEW_MID_CAPABIILTY':'NEW_MID_CAPABILITY_VALUE'}; executionParam.valueCapabilities.push(valueCapability);`
Long running	long_running	Boolean	Indicates whether or not the command is long running. A value of true indicates that the command is long running.
Must sudo	must_sudo	Boolean	Indicates whether or not this activity must use sudo to run root commands. A value of true indicates that sudo SSH credentials must be used.

SSH post-processing parameters and payload parsing

Use these parameters to create a post-processing script, payload parsing, and tagging.

SSH post-processing parameters

Name	Variable	Type	Usage
Output	output	String	Contains the output returned from the SSH command.
EccSysID	eccSysID	String	Contains the reference ID associated with the ECC Queue input message returned by the activity.
ErrorMessages	errorMessages	String	Contains the error messages retrieved from the SSH command. This value is **null** if there are no error messages.

Tags	tags	Hashmap of tag values returned from the SSH command	Contains the tags used to extract output using the SSH commands. The tag output is delimited by double percentage signs, as in `%%tagname%% ... %%`. Set up the command using the following format:
			`%%tagname1%%`
			`output1 line 1`
			`output1 line 2`
			`...`
			`%%`
			
			`%%tagname2%%`
			`output2 line 1`
			`output2 line 2`
			`...`
			`%%`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SSH post-processing parameters (continued)

Name	Variable	Type	Usage
			The tags returned are JavaScript hashmap objects in which each key is prefixed with `tag` appended with the tagname. `{"__text__": "", "tagtagname1":"output1 line1\noutput1 line2\n", "tagtagname2":"output2 line1\noutput2 line2\n"}`

Configure the SSH execution command

Use the input variables you created to configure the command that Orchestration executes on the host target.

Before you begin

Create the input variables you need in the **Inputs** form before you advance to the **Execution Command** stage.

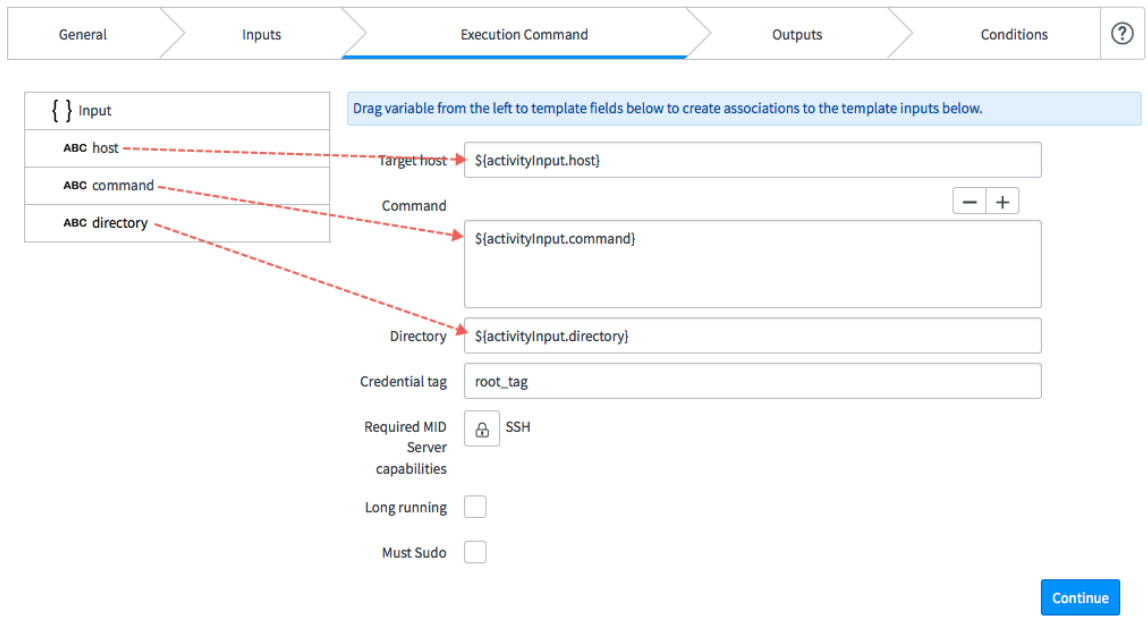
Role required: activity_creator, admin

Note:
You can test the SSH connection between the MID Server and the target without having to run the acvitity in a workflow context. For details, see test template outputs.

Procedure

1. Drag variables from the list of inputs and drop them into command fields.
   The system formats the variable in the proper syntax for the command.

SSH execution command



2. Complete the fields shown in the table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SSH activity inputs

Field	Description
Input	Input variable builder. Create input variables to map to available fields.
Target host	Host name or IP address of the target server for this activity.
Command	Command this activity runs on the target host. You can invoke a MID Server script from this field using any script type that is supported by the SSH command line. For more information, see **Advanced SSH script options** below the table.
Directory	Directory on the target host where the command is run.
Credential tag	The Credential aliases for Orchestration activities to use when running the command.
Select MID Server by capabilities	MID Server with the appropriate capabilities for connecting to the host. By default, the system selects a MID Server with SSH capabilities
Long running	Check box to disable the SSH connection timeout for commands that might take longer to run than the default 60 seconds. Orchestration periodically checks the running process to determine its status until it is finished.
Must Sudo	Check box to allow the use of SSH credentials to run commands.

3. Click **Save**.
4. Click **Continue** to advance to the **Outputs** stage.

Create a run script activity

Create an activity that runs any script.

Before you begin

Role required: activity_creator or workflow_admin

Procedure

1. Create a custom activity.
   This action creates a custom activity using a template.
2. After setting up general properties and creating input variables, configure the Run Script Execution Command:
   Create a script for this activity to execute.

> **Note:**
> You can map parameter values in a test payload to variables in the **Outputs** tab automatically. See automap output variables.

What to do next

- Use auto-mapping to generate outputs and parsing rules
- If you do not use auto-mapping, you can manually create output variables and create parsing rules

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Run Script template processing script

Use the Run Script custom template Script form to enter a script to call and use with other activities.

Run Script processing script

Field	Description
Processing script	Script that the activity runs.
Variables	Input variables that are available to use as building blocks in the input process script. Click the arrow above the field to open the variables list. Click an item in the tree to add it to your script in the appropriate syntax. The list displays input variables you passed into the activity on the **Inputs** form. All activity variables added in the **Inputs** form are read-only and are expressed in the processing script with this syntax: `activityInput.variable`.

Create a JMS activity

Create a custom JMS activity to retrieve or send messages to external systems using the Java Messaging Service.

Before you begin

Role required: activity_creator or workflow_admin

About this task

The JMS activity supports third party JMS providers whose JMS client application is written with a typical Java EE pattern and can support these operations:

- Using JNDI to find a ConnectionFactory object.
- Using JNDI to find one or more destination objects.
- Using the ConnectionFactory to create a JMS connection object.
- Using the JMS connection to create one or more JMS session objects.
- Using a JMS session and the destinations to create the MessageProducer and MessageConsumer objects.
- Starting the JMS connection to enable delivery or consumption of messages.

Note:
The JMS activity designer has been tested with the JMS providers ActiveMQ and Tibco EMS. When connecting to a JMS provider, refer to your third party user documentation.

Procedure

1. Create or verify your JMS credential .
   Your JMS credentials must have permission for the target database and proper configuration for the corresponding JMS connection. Credentials must be set up before you can create a JMS activity.
2. Create or verify your JMS connection .
   Your JMS connection must be configured with valid JMS credentials set up before you can create a JMS activity.
3. Create a custom activity .
   This action creates a custom activity using a template.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. After setting up general properties and creating input variables, configure the JMS Execution Command.

Option	Description
Configure your credential	Fill in the fields necessary for your database connection.
Connection Factory	Name of the JMS Connection Factory. You should create or verify your JMS connection. This configuration links the name of the Ini tial Context Factory with the URL of the JMS provider.
Destination Type	Type of destination used for this message: ○ **Queue**: Message is queued for point-to-point communications. **Note:** The **GET** operation is only supported for the Queue destination type. ○ **Topic**: Message is used for publish and sub scribe communication.
Destination Name	Name of the queue or topic destination that is configured on the JMS provider.
Message Type	The JMS message type value. Only the **Text Message** type is supported. The queue or top ic destination must be configured to receive or send only Text Message. Other message types are dropped, since the JMS Activity can not process them.
Operation	The programmatic operation to perform on the destination. The choices are **PUT** or **GET**.
Timeout (Secs)	Allowed time to wait for a message in the mes sage queue before it times out, in seconds. The default is **30**.
Custom message headers	The custom header values in a name/value pair format, that is available on the JMS desti nation. **Note:** This is only supported for a **PUT** opera tion.
Message payload	Actual message content or payload that is sent to the JMS destination. **Note:** This is only supported for a **PUT** opera tion.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
Credential tag	A tag for an individual credential for a JMS activity in an Orchestration workflow.
Required MID Server capabilities	MID Server to use, by capabilities.

What to do next

- Use auto-mapping to generate outputs and parsing rules
- If you do not use auto-mapping, you can manually create output variables and create parsing rules

Create a JMS connection for an Orchestration activity

Configure your system to use Java Messaging Service (JMS) with a custom Orchestration JMS activity.

Before you begin

Role required: admin

About this task

The MID Server must have the correct JMS connection factories for your organization. Configure those values in the *mid.property.jms.command.allowed_factory_names* property, found in **MID Server** > **Properties**. The default values for this property can be changed to any value or comma-separated list of values that the third-party JMS provider advertises.

Procedure

1. Navigate to **MID Server** > **JAR Files**.
2. Click **New** and add.

Option	Description
Name	A unique and descriptive name for identifying the file in the instance.
Version	A version number for the file, if one is available.
Source	Location of the JAR file for reference purposes. Source information is not used by the system.
Description	Short description of the JAR file and its purpose in the instance.

3. Click the paper clip icon in the banner and attach the JMS driver jar file.
   The JMS driver jar file should be available as part of JMS provider installation. Few JMS vendors make them available as a separate product. Refer to the JMS provider documentation to determine which JMS client driver jar files require the client applications to connect to the JMS provider. For example, if you are trying to connect to ActiveMQ V5.10 (JMS provider), you need the `activemq-all-5.10.1.jar` file.
4. Navigate to **Orchestration** > **Credentials & Connections** > **JMS Connection Factory**.
5. Click **New**, add the following, and click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
Name	Unique name of this connection factory.
Initial Context Factory	Name of the JNDI class that is used to create the InitialContext. **Note:** For example, to connect to Active MQ V5.10 (JMS Provider), the value is `org.apache.activemq.jndi.ActiveMQInitialContextFactory`.
Provider URL	Location of the running JMS provider installation. **Note:** For example, to connect to ActiveMQ V5.1: `tcp://ipAddressOrHostName:61616`.

6. Navigate to **Orchestration** > **Credentials**.
7. Click **New**, select **JMS Credentials**, and provide the user name and password the MID should use to communicate with the JMS provider.
   For more information, see JMS credentials JMS credentials.
8. Click **Submit**.
   You are ready to create a custom JMS activity.

JMS template execution parameters

You use execution parameters to create the input process script in the **Preprocessing** form.

You must use the `executionParam.` prefix with all variables in this table.

JDBC execution parameters

Name	Variable	Type	Usage
Jms ds	jms_ds	Reference	Selected JMS data source.
Destination type	destination_type	Enumerated	
Destination name	destination_name	String	
Message type	message_type	Enumerated	
Operation	operation	Enumerated	
Time out	time_out	Integer	Length of time to wait for the query to return results.
Custom headers	custom_headers	Array of JavaScript objects	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

JDBC execution parameters (continued)

Name	Variable	Type	Usage
Message payload	message_payload	String	
Credential tag	credential_tag	String	List of required MID Server capabilities.
MidCapabilities	midCapabilities	String (comma separated)	
ValueCapabilities	valueCapabilities	Array of hashmap	Capability values used to select the MID Server. For more information, see MID Server capabilities. If there are additional capabilities that are assigned by value, use this example to customize the MID Server selection: `var valueCapability = {'NEW_MID_CAPABIILTY':'NEW_MID_CAPABILITY_VALUE'}; executionParam.valueCapabilities.push(valueCapability);`

JMS template post-processing parameters

Use these parameters to create a post-processing script.

JMS post-processing parameters

Name	Variable	Type	Usage
Status	status	String	Status of the operation (Put or Get) on the JMS destination.
StandardHeaders	standardHeaders	String	All the standard headers, as specified by JMS, that are obtained as part of the JMS message during a Get operation. This field is applicable only for Get operations.
CustomHeaders	customHeaders	String	All custom headers added by a producer or publisher application that are obtained as part of the JMS message during a Get operation. This field is applicable only for Get operations.
MessagePayload	messagePayload	String	Message payload that is obtained as part of the JMS message during a Get operation. This field is applicable only for Get operations.
EccSysID	eccSysID	String	Contains the reference ID associated with the ECC Queue input message returned by the activity.
ErrorMessages	errorMessages	String	Contains any error messages retrieved from the JMS command. This value is **null** if there are no error messages.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activity scoping

Custom activities run in their own scope, even if it is different from that of the workflow.

Any script that runs inside a custom activity with a scope can only access outside artifacts that are within the scope of that activity or artifacts that are configured to run in any scope. Conversely, an outside artifact can only access the script inside that private activity if the outside artifact is running in the same scope. Activities with public scopes can interact with outside artifacts in any application scope.

You can use private activities as part of a workflow that has a public application scope. These activities are protected from reaching outside of the workflow or from being reached from outside the workflow. For details about setting application scoping for custom activities, see the field description table for the appropriate activity template.

Note:
Custom activities uploaded to the ServiceNow Store must be configured as accessible to all application scopes.

Publish a custom activity

When a user creates a custom activity and saves or submits it, that activity appears in the **Custom** and **Packs** tabs of the designer palette, but is visible only to the user who created it.

Before you begin

Roles required: admin, activity_admin, activity_creator

Procedure

1. When you finish configuring the activity, click **Publish**.

   This makes the activity accessible to other users on the instance with the workflow_admin or activity_creator role. Published activities are available for upload to the ServiceNow Store, can be added to workflows, and can be edited by any user with the proper roles.

2. To edit a published activity, click **Checkout**.

   When an activity is checked out by a user, only that user can modify it. The fields of a checked out activity are read-only for all other users.

3. When you are finished editing the checked out activity, publish it again.

   The system adds a new version of this activity to the **Custom** tab in the Workflow Editor palette.

   Note:
   Activities you create and publish are visible in the **Packs** tab only if they were created in the current application scope.

Return a locked activity to a published state

Problems can arise if an activity version is checked out by a user and not checked back in. An activity in this state cannot be checked out for update.

Before you begin

Role required: admin, activity_admin, activity_creator

About this task

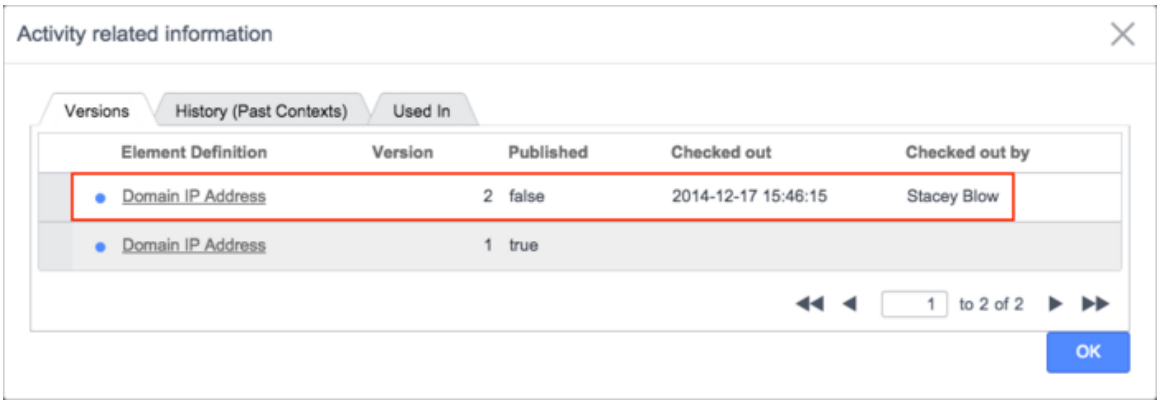
An administrator can return a locked activity to a published state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Open the Workflow Editor.
2. From the **Custom** tab, open the activity that is locked.
3. Click the menu icon in the title bar and select **Versions** from the context menu.

   A list of all the versions of that activity appears. The locked version displays the user who checked it out.



4. Select the checked out version.

   The system opens the record in the activity designer.

5. Click the menu icon again and select **Force Checkout** from the context menu.

   The activity fields become editable.

6. Click **Publish**.

   The activity becomes available to users with the appropriate roles.

Copy a custom activity

You can copy activities for reuse from the **Custom** tab in the global scope.

Before you begin

Role required: admin, activity_admin, activity_creator

About this task

Note:
You cannot copy an activity in a private scope.

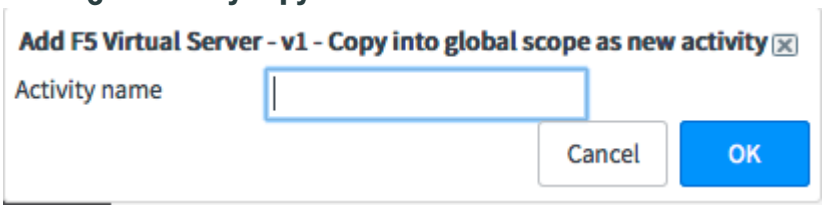
Procedure

1. To reuse an activity in the global scope, expand the parent category to display the activities.
2. Right-click the activity you want to copy and select one of these options:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

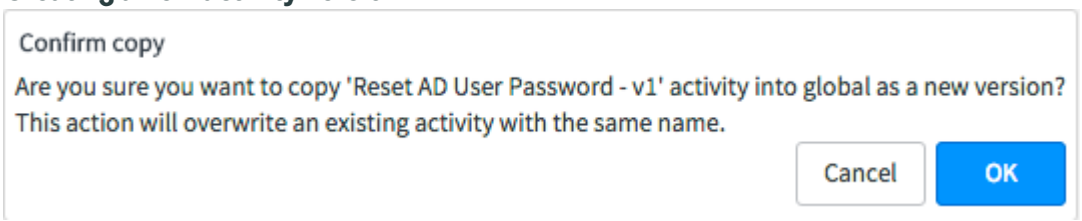
- *Copy into global scope as new activity*: Copies the activity with the new name you provide, uses the same version number as the original activity, and moves it to the global scope in the **Custom** tab.

Naming an activity copy



- *Copy into global scope as new version*: Copies the activity using the same name, increments the version number, and moves it to the global scope in the **Custom** tab. The system automatically adds the parent category to the **Custom** tab if it does not already exist. This action will overwrite another activity with the same name and version number.

Creating a new activity version



Note:
If the activity is in any other scope but global, the system displays this message: `Cannot copy privately scoped activity.`

Orchestration databus

The databus allows workflow designers to track the flow of data through an Orchestration workflow and provides access to output data that can be consumed by other custom activities.

Data is made available in a workflow when you use activities created with the Orchestration activity designer. The activity designer provides the ability to specify well defined inputs and outputs for your activities. When you use those activities on the workflow canvas, the outputs appear in the **Data** tab and are available for use as inputs in subsequent activities.

Note:
Orchestration does not filter the data you are given for reuse in the **Data** tab. You must make sure an activity in the workflow canvas has executed before you consume its output data.

When you drop a custom activity onto the workflow canvas, the system assigns it an index. If you delete an activity from the canvas and add a new one, the indexes are not reused. This ensures that you don't accidentally start subscribing to data you did not intend to use. If you update an activity in the activity designer, the system automatically updates the activity on the canvas to ensure the data you are subscribing to downstream is not affected.

Reuse data in the activity designer

The **Data** tab in the Workflow Editor lists all custom activities used in the current workflow that produce data and displays that data for reuse in other custom activities.

Before you begin
Roles required: workflow_creator

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

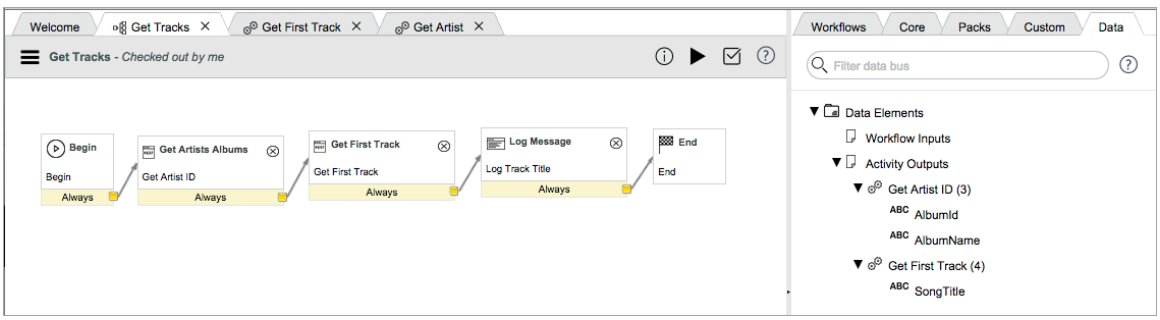
About this task

Activities are categorized by application in this tab and are available for use as data sources for other activities. The **Data** tab is a graphical representation of the workflow Databus, which manages all the temporary data used by the current workflow.

Procedure

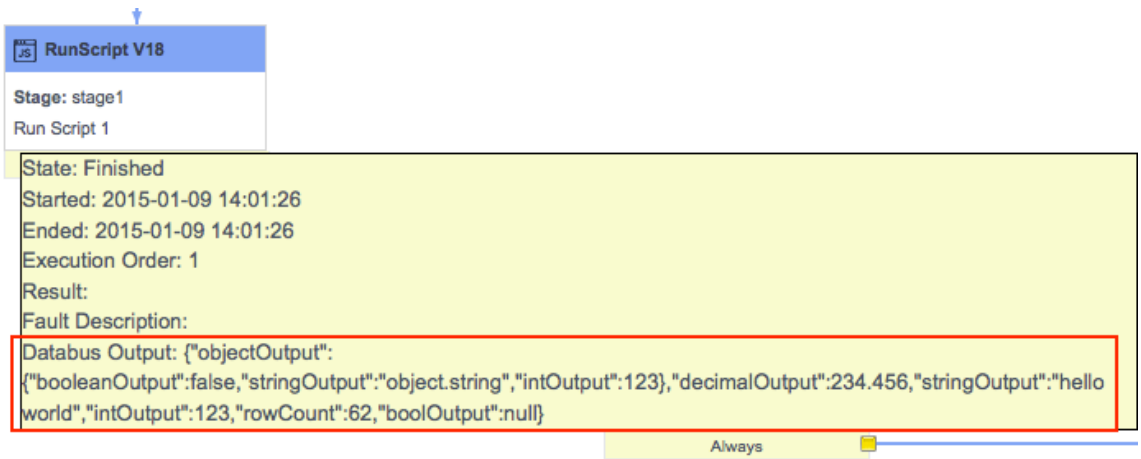
1. Drag output variables from an activity in this tab into the inputs of another activity on the workflow canvas to link the activities together.

   You can use any of the outputs in the structure, regardless of the application to which they belong. An index number in parenthesis after the activity name provides a unique identifier for the parameters that you use as input data in other activities. If you do not name a custom activity, the only identifier for that activity in the **Data** tab is the index number. Index numbers indicate the sequence in which custom activities were added to the workflow and are not reused. When you drag a custom activity onto the workflow canvas, the system adds that activity and its output data to the structure. Conversely, if you remove a custom activity from the canvas, that activity and its outputs disappear from the data list.



2. Point to an activity to display information about it in a pop-up window.

   Any output data reused by the activity is listed in the **Databus Output** field of the pop-up window.



MID Servers for Orchestration

Orchestration automatically selects an appropriate MID Server based on the capabilities that you configure in activities, the IP addresses of target devices, and the application that the MID Server is allowed to use.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To allow a MID Server to work with Orchestration, it must have the **Orchestration** application or the **ALL** application assigned to it. See Configure a default MID Server for each application for instructions.

You can have MID Servers focus on different capabilities and separate sections of your network. See:

- MID Server capabilities
- Map an IP address to a DNS name

You can also specify a default MID Server to use if no MID Servers meet the capability and IP range criteria for an activity. See Select the default MID Server for Orchestration.

Related topics

MID Server capabilities

MID Server capabilities

MID Server capabilities define the specific functions of a MID Server within an IP address range.

Nmap capability

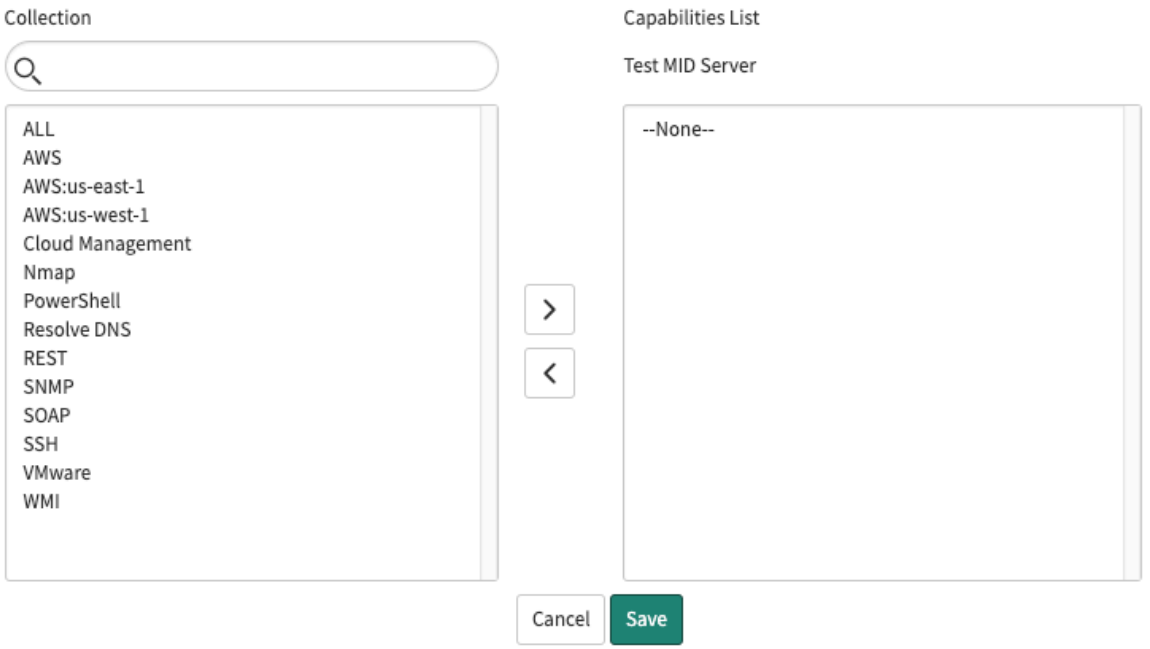
The **Nmap** capability is only assigned to MID Servers for which the Network Mapper (Nmap) scanner has been installed for credential-less Discovery. This capability cannot be added to or removed from any MID Server manually. For instructions on installing or uninstalling Nmap, see Install and uninstall Nmap on a MID Server

MID Server capability values

Capabilities provided in the base system do not have a defined value string. The capability value can be blank, a single value, or a * (wildcard). A MID Server configured to use a capability that has no value can locate any device using that capability's protocol. If a capability has a defined value, the MID Server using that capability finds only those devices using that protocol that match the value string exactly. The exception to this is the Resolve DNS capability, which is configured to resolve any DNS name into an IP address using a partial string match. The * (wildcard) will match a request capability specifying any non-blank value.

Starting with the Madrid release, the **[capability name]:[value]** combination appears in the slushbucket when you add a capability to a MID Server. This combination allows you to see all the capabilities that have different values, even if the capability name is the same. For example, if you are using the Cloud Management capability, and you use the value field to specify the us-west logical datacenter on one of the capability records, you can see the combination in the **Collection** list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



MID Server selection

The MID Server is selected using an algorithm based on the capabilities available. The selector produces a list of suitable MIDs using filters in the following order: **server status** > **applications** > **IP range** > **capabilities**. The algorithm searches the capabilities in the following sequence and, if a step finds at least one MID server, the remaining steps are skipped:

1. **Exact value match:** Find each MID Server containing capabilities with name/value pairs with an exact match to all requested capability name/value pairs. Blank is a valid value. * (wildcard) values are ignored.
2. **Wildcard value match:** The same as an exact value match, but also allows a non-blank request value to match MID server capability records containing value *.
3. **Special capability name ALL:** Find each MID Server containing the special capability name ALL, ignoring capability's value field.

Note:
If the requested capability name does not exist in the ecc_agent_capability table, **BadArgumentException** is thrown rather than falling back to the ALL capability.

Scripted MID Server capability value matching

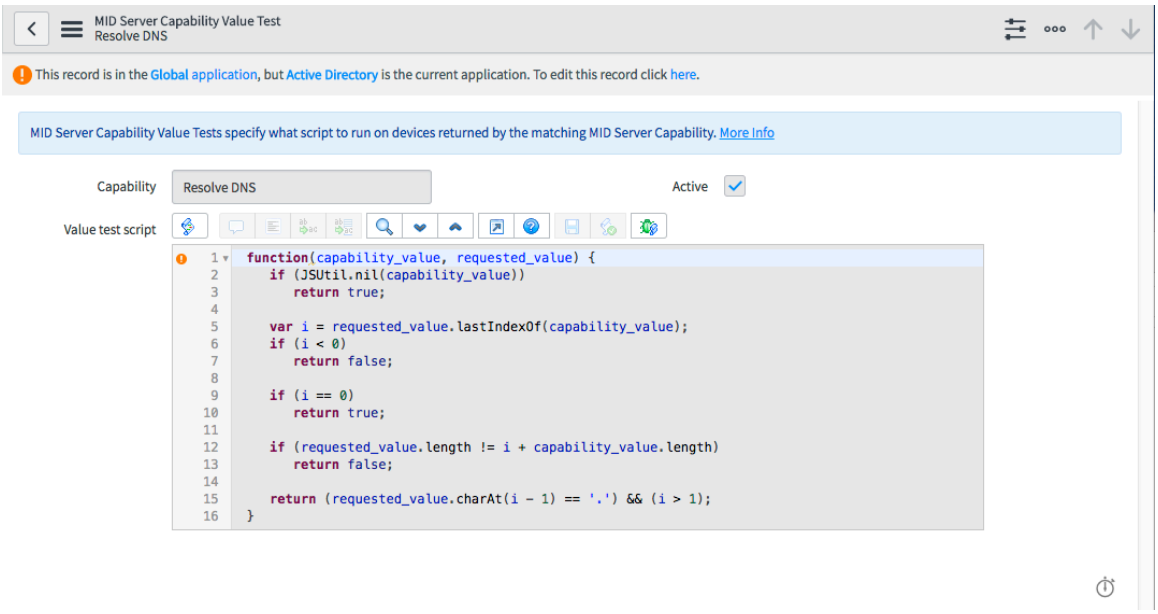
You can use value tests to create capabilities that find devices using values without requiring exact string matching. Action on these values is controlled by a user-defined script.

The Resolve DNS capability is provided in the base system and is configured to resolve DNS names into IP addresses for devices whose names end with a specified domain name. The capability **Value** entered is automatically prefaced with a dot during processing to match domain syntax. This value can contain one or more sub-domains, but must include the end of the domain string. Matching devices must end with the identical syntax. The script for the Resolve DNS capability determines if a device name matches the criteria defined by **Value**. If a match exists, the platform performs the address resolution automatically. For example, if the value for the Resolve DNS capability is `service-now.com`, the MID Server with this capability finds `lnxlab01.sandiego.service-now.com` and `dbsrv101.sanjose.service-now.com`. If the value is changed to `sandiego.service-now.com`, then the MID Server finds only `lnxlab01`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If **Value** in the Resolve DNS capability is blank, then all domains match.

To view the script for evaluating this capability, navigate to **MID Server** > **Capability Value Tests** and select **Resolve DNS** from the list.



Configure MID Server capabilities

MID Server capabilities define the specific functions of a MID Server within an IP address range, allowing an application to select the most appropriate MID Server. Configure capabilities on MID Servers for applications like Orchestration, Cloud Management, and Service Mapping.

Before you begin

Role required: admin or sm_admin

About this task

Several applications use capabilities, IP ranges, and MID Server selection to narrow the pool of MID Servers the applications need.

Note:
At least one capability is required for each MID Server used by Orchestration. See MID Servers for Orchestration for more information.

The following capabilities are available by default with Discovery:

All	IBM	Resolve DNS
Ansible	JDBC	REST
AWS	NetApp	SNMP
Azure	Nmap	SOAP
Chef	OpenStack	SSH
Cloud Management	PowerShell	VMware
Google	RCA	WMI

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **MID Server** > **Capabilities**.
2. Select an existing capability or select **ALL** to include all capabilities.

   Note:
   Ensure that each IP address range has MID Servers with the necessary capabilities to complete the Orchestration activities on that network segment.

3. Create a new capability:

   a. Select **New**.

   b. Configure the value for a custom capability.

   Example
   An example is a capability for **DOMAIN**, with a value of **service-now**.

   c. Select **Submit**.

4. Select **Edit** in the MID Servers related list to add MID Servers to the capability.
5. Select one or more MID Servers for this capability from the **Available** list.
6. Select **Save**.

   The capability defined here also appears in the primary record for this MID Server.

Select the default MID Server for Orchestration

Orchestration uses the default MID Server if it cannot find a MID Server with the correct IP range and capability.

Specify the default MID Server in either of these locations:

- The **Default MID Server** field on the Orchestration application record. See Configure a default MID Server for each application for instructions.
- The **Default MID Server to use for Orchestration Activities** property. Navigate to **Orchestration** > **MID Server Properties** to set this value.

These two values are automatically kept in synch. You can change the default MID Server in either location.

PowerShell probe version 2 system property

View detailed PowerShell credential information and view extended logging information.

Starting with the madrid release, there is a new system property for the PowerShell probe which enables the version 2 of the probe. This new version enables you to view detailed credential information on why PowerShell credentials fail or succeed. You can also view logging information for an ECC Queue payload and Workflow Context log.

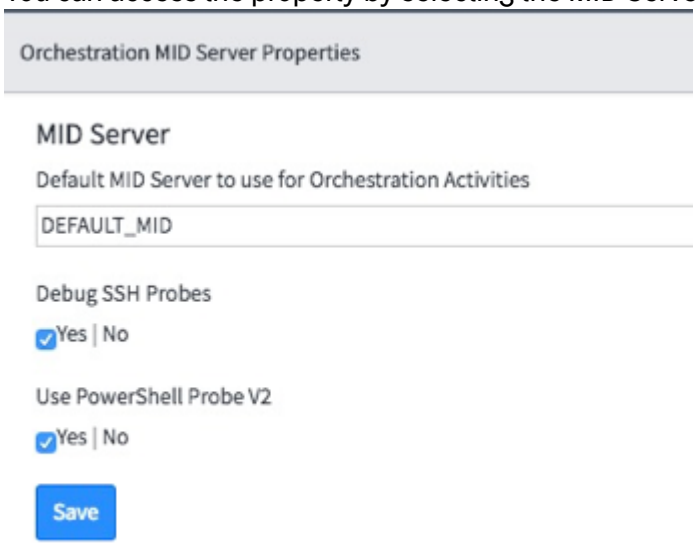
mid.server.rba_powershell_v2

Enables the PowerShell probe version 2 for use with all PowerShell activities. The default value is true. If you choose false, the legacy PowerShell probe is used. Unless there are issues, use version 2, as the legacy version is going to be deprecated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
This property only applies to Orchestration activities. Discovery probes are not affected.

You can access the property by selecting the MID Server Properties link in the navigation pane:



PowerShell log property

Enable debug messages to display from PowerShell.

This property enables control of when and where to display debug messages generated by debug statements embedded in the PowerShell scripts.

mid.property.powershell.log_info

The new MID Server PowerShell log property:

- Displays logging information.

  Note:
  Once logging is enabled, OOB PowerShell scripts log information.

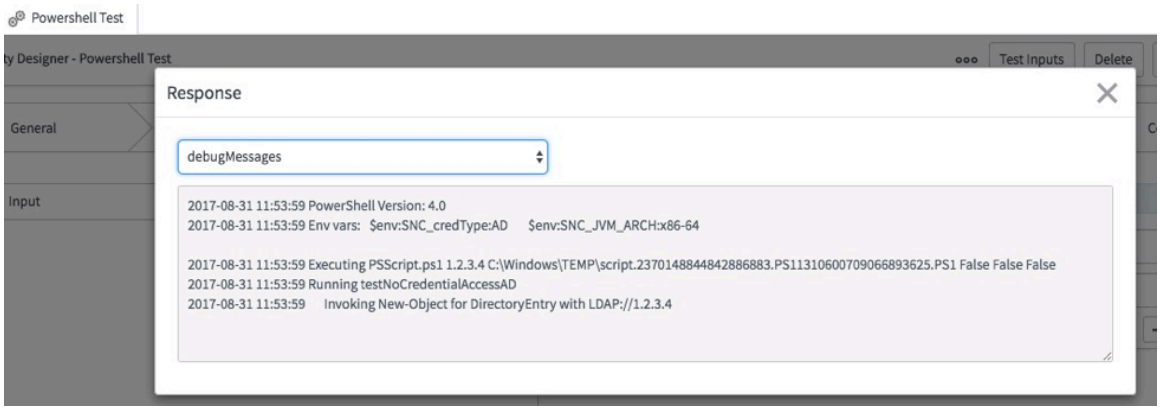
- Adds logging information to your developed PowerShell scripts and PowerShell activities.

  Note:
  Logging information is only available when property is enabled.

- Logging is not enabled by default.

If the property is set to true, debug messages display from the workflow context or from the Response popup after you test inputs. The ecc_queue entry payload for each of the PowerShell activities is going to show all the debug messages that were logged.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Enable the PowerShell log property for each MID Server. If the MID Server field is empty, the property applies to all MID Servers. There are separate credential debug messages that always come back regardless of this setting. The credential debug messages show which credentials have been used and other related information.

Note:
All the debug messages that come back to the instance are also saved to the MID Server log file. The log file might have additional debug messages generated from Java code, which might help the debug process.

Use the Orchestration Usage dashboard

This dashboard shows an overview of Orchestration usage metrics to show customers how their organization uses Orchestration and to support license compliance.

Before you begin

Role required: orchestration_manager

Procedure

1. To view the dashboard, navigate to **Orchestration** > **Operations & Troubleshooting** > **Orchestration Usage Dashboard**.
   The Orchestration Usage dashboard is displayed. The tabs on the dashboard include Licensable Usage and Orchestration Usage. Reports on these tabs include:

Orchestration Usage Metrics

Metric	Description
Transaction Summary Last 12 months	A running transaction count of all Orchestration transactions over the last 12 months. Includes: ○ The count of orchestration transactions associated with the HR Application ○ The count of Orchestration transactions associated with the Security Operations Application
Transaction Summary YTD	Cumulative count of all transactions since the time the Orchestration plugin was activated or the customer upgraded to Geneva.
365 day Running Average of Server	The running average over the last 365 days for cmdb_ci_computer - cmdb_ci_server. This

Metric	Description
	includes all physical and virtual client nodes and excludes server nodes from the count.
365 day Running Average of Client	The running average over the last 365 days for cmdb_ci_server. This includes all physical and virtual server nodes.
Orchestration Transactions by Month for Last 12 Months	
Average Client Nodes Orchestrated Last 365 Days	
Average Server Nodes Orchestrated Last 365 Days	
Number of Orchestration Activities Developed Last 365 Days	The aggregate number of activity definitions you have developed and OOB activity definitions you have modified. This number includes activity elements (Activities build with the Activity Designer) you have developed and OOB activity definitions you have modified. **Note:** his number excludes activity elements that are shipped with ServiceNow Applications that use the Orchestration Runtime e.g. ServiceNow Security Operations and Human Resources Apps.
Cumulative Client Nodes Orchestrated by Month	
Cumulative Server Nodes Orchestrated by Month	
Usage by Provider Last 12 Months	Breaks down emphasis by provider, such as PowerShell, JDBC, SSH, etc.
Top 10 Orchestration Activities	

2. **Optional:** You can add more widgets to the dashboard by clicking the **Add Content** icon ( ) in the upper right corner of the dashboard.

Note:
You should not modify the first tab in this Dashboard. If you want a different dashboard experience, add a tab and customize that with your usage reports.

Task Communications Management

Task Communications Management (TCM) provides a framework for defining and managing a communication process for any entity that extends the task table.

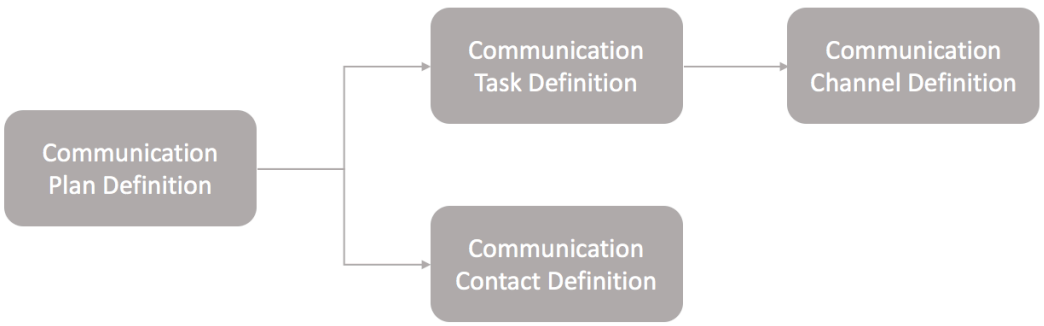
Task Communications Management process

Task Communications Management helps you to streamline the process by creating designated communication plans for effective communication during an event. The communication plan, with its defined tasks, helps you to focus on resolving the current issue instead of deciding when to send a communication, what information to share, and whom to inform.

Task Communications Management basic components



How Task Communications Management works

With Task Communications Management, you can predefine a communication plan for an event such as major incident, planned maintenance, and release. Each plan generally involves a series of tasks that define different communication and collaboration activities along with frequency and method of communication. For each task, you must specify the communication channel for contacting the stakeholders. You can also define templates for email and SMS messages.

After defining the task and channel for communication, you can define the contacts or the target audience to be contacted for each task.

After a communication plan is defined, the plan gets associated with the appropriate task table based on the conditions defined. Thereafter, the tasks defined in the plan get executed sequentially and stakeholders are contacted as defined in the plan. The communication plan

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

makes communication and collaboration process smoother and brings a quicker resolution of the issue.

Example: Task Communications Management flow in major incident management

Assume that you want an incident communication plan generated for a high-priority major incident.

- As the major incident manager, you can predefine a communication plan and the conditions that drive its attachment. In this case, the conditions are: Priority = High and Major Incident state = Accepted. Consider that the target audience is the technical stakeholders of the incident and the communication plan definition is named Technical Communications.
- The plan definition can have multiple communication task definitions such as:
  - Initiate Technical Communications
  - Technical Status Update
- Each communication task definition also specifies the channel of communication and the communication frequency (one time or recurring).
  - Initiate Technical Communications uses email as a channel of communication and communication frequency is one time.
  - Technical Status Update uses email and SMS as channel of communication and the communication frequency is recurring.
- The target audience for in the communications is defined as communication contact definitions on the plan definition. In this case, consider Service owners of the affected configuration items (CIs) related to the incident as technical stakeholders.
- When an incident meets these conditions, an incident communication plan together with its tasks gets attached to the incident record.
- As the major incident manager, you can effectively carry out the communication without any delay in the resolution of the major incident.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Task Communications Management plugins

The Task Communications Management plugins is activated in the base system. The plugin includes demo data.

Activate Task Communications Management

The Task Communications Management plugin (com.snc.task_communication_management) is activated when you activate the Incident Communications Management plugin (com.snc.iam) or the Incident Management - Major Incident Management plugin (com.snc.incident.mim). This plugin includes demo data and activates related plugins if they are not already active.

Before you begin

Role required: admin

About this task

Task Communications Management activates these related plugins if they are not already active.

© 2026 ServiceNow, Inc. All rights reserved.

Plugins for Task Communications Management

Plugin	Description
Contact Management [com.snc.contact_management]	The Contact Management plugin manages the connections between users or groups and other resources in the system.
Targeted Communications [com.sn_publications]	The Targeted Communications plugin provides a way to publish and send out newsletter like articles to targeted internal or external customers.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

None.

Special considerations

None.

Communication Plan Manager [sn_comm_management.comm_plan_manager]

This role has create and edit access to Task Communications Management instance tables such as Communication Plans, Communication Tasks. Users with this role can send impromptu communications.

Contains Roles

The Communication Plan Manager [sn_comm_management.comm_plan_manager] role contains the *Communication Plan Viewer [sn_comm_management.comm_plan_viewer]* role.

Groups

List of groups this role is assigned to by default.

None.

Special considerations

None.

Install Collaboration Services for Task Communications Management

Install the Collaboration Services for Task Communications Management plugin (sn_tcm_collab_hook) from ServiceNow Store to get the Slack functionality.

Before you begin
Role required: admin

About this task

Procedure

1. Navigate to ServiceNow Store.
2. Find the Collaboration Services for Task Communications Management store application.
3. Click the Collaboration Services for Task Communications Management store application and then click **Request App**.

Working with Task Communications Management

The section covers topics that help you with a variety of technical concepts related to Task Communications Management such as creating communication plan definition, task definition, channel definition, and contact definition.

Define a communication plan

Define a communication plan for a task record to specify communication task and contact definitions. When specified conditions for the plan definition are met, the communication plan and its associated records are automatically attached to the task record, eliminating manual effort.

Before you begin
Role required: sn_comm_management.comm_plan_admin or admin

Procedure

1. Navigate to **All** > **Task Communications Management** > **Plan Definitions**, and click **New**.
2. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Communication Plan Definition form

Field	Description
Name	Unique name for the communication plan.
Table	Table that the plan is attached to when the conditions are met.
Type	Type of communication plan such as Technical, Internal, External, Customer.
Order	Order in which the communication plans must be associated to the table.
Condition based	Option to define whether the plan is attached to a table based on the conditions. For example, if you want to attach a communication plan to an incident of priority = 2, you can mention the condition in the **Condition** field.
Active	Option to define whether the plan definition is active.
Description	Detailed description of the plan definition.
Condition	Condition under which a communication plan gets attached to a table.

3. Click **Submit**.
   The communication plan is submitted. The following related lists appear in the communication plan definition:
   - Communication Task Definitions
   - Communication Contact Definitions

What to do next
Define a communication task for the plan.

Define a communication task

Define a communication task for a communication plan. When a plan gets attached to a table, the tasks related to the plan need to be executed to resolve the issue. You can associate multiple tasks with a communication plan.

Before you begin
Role required: sn_comm_management.comm_plan_admin or admin

You have defined a communication plan.

Procedure

1. Navigate to **All** > **Task Communications Management** > **Plan Definitions**.
2. Click the communication plan for which you want to define a communication task.
3. Click the Communication Task Definitions related list and then click **New**.
4. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Communication Task Definition form

Field	Description
Communication plan definition	Unique name of the communication plan definition that you are defining the task for.
Name	Unique name for the communication task definition.
Type	Type of task, such as internal communication, that is applicable globally or to a particular table. **Note:** The value in the **Type** field helps you to filter a task by its type. The value also helps to generate a report of a particular task type or to create SLAs on any communication task.
Application	Application scope of the task definition. The task definition is available for all applications or for scoped applications.
Order	Order that the communication tasks appear in the plan. This field indicates which communication task to execute first.
Active	Option to define whether the task is active or not.
Description	Detailed description of the task definition.
Communication frequency	Frequency of the communication task execution. You can send the notification once or the notification can be repeated.
Duration	Time by which you want to send a notification. For example, if the communication frequency is **One time** and the **Duration** is 15 minutes, then the notification is sent only once in 15 minutes. If the communication frequency is **Recurring**, then the notification is sent every 15 minutes.

5. Click **Update**.
   The communication task is defined for the communication plan.

What to do next
Define communication channel for the task.

Define a communication channel

Define a communication channel for each communication task to determine which mode of communication to use for the task when a plan is attached to a table.

Before you begin
Role required: sn_comm_management.comm_plan_admin or admin

You have defined a communication plan and its related tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

- The modes of communication available are: email, SMS, conference, and Slack.
- For the incident table, the functionality for SMS and conference appears only if you activate the Notify plugin (com.snc.notify) and the *com.snc.iam.notify_number* property value is set to the registered notify number. The notify number is registered while configuring the Twilio account.
- For the incident table, the functionality for Slack appears only if you activate the Collaboration Services for Task Communications Management plugin (sn_tcm_collab_hook). To activate the Collaboration Services for Task Communications Management plugin, navigate to ServiceNow Store and install the Collaboration Services for Task Communications Management application. For more information, refer Collaboration services for Task Communications Management.

  Note:
  For information on how to configure Slack, refer to Configure Slack workspace .

- **Add Channel – Conference** is mutually exclusive to **Add Channel – SMS** and **Add Channel – Email**. If you select **Add Channel – Conference**, you cannot select **Add Channel – Email** or **Add Channel – SMS**.

Procedure

1. Navigate to **All** > **Task Communications Management** > **Plan Definitions**.
2. Click a communication plan.
3. Click the Communication Task Definitions related list and then click the task for which you want to define the communication channel.
4. On the Communication Task Definition form, click any one of the following related links based on your requirement:
   - **Add channel - DEX Desktop Assistant**
   - **Add Channel – Conference**
   - **Add Channel – Email**
   - **Add Channel – SMS**
   - **Add Channel – Slack**
5. On the form, fill in the fields.

Communication Channel Definition form

Field	Description
Add Channel – Conference	
Communication task definition	Communication task definition that the channel definition is associated with.
Notify provider selector	Lookup icon ( ) to select the selector from the Provider Selector [notify_group_selector] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: The selector can be associated with notify number group or conference provider. Each notify number group can have one or more Notify numbers that can be used to make conference calls.
Add Channel – Email	
Communication task definition	Communication task definition that this channel definition is associated with.
Email client template	Lookup icon ( ) to select the email client template used to send emails to the targeted audience. **Note:** This email template must be defined in the Communication task table.
Recipient field	List to select where you want the recipients list to be populated. Options include **To**, **CC**, and **BCC**. The default value is populated based on what you define in the **Default recipient location of emails for Communication Tasks** property (*sn_comm_management.default_email_recipient_fie*
Add Channel – SMS	
Communication task definition	Communication task definition this channel definition is associated with.
Notify SMS template	Lookup icon to select the notify SMS template used to send an SMS to the targeted audience. **Note:** This SMS template must be defined in the Communication task table.
Notify provider selector	Lookup icon ( ) to select the selector from the Provider Selector [notify_group_selector] table. **Note:** The selector can be associated with notify number group or conference provider. Each notify number group can have one or more Notify numbers that can be used to send SMS.
Add Channel – Slack	
Communication task definition	Communication task definition this channel definition is associated with.
Channel Type	Channel type is Slack.
Add Channel – Desktop Assistant	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Communication task definition	Communication task definition this channel definition is associated with.
Channel Type	Channel type is Desktop Assistant.
Notification template	Template applied when composing the notification message.

6. Click **Submit**.
   A communication channel is defined for the communication task.

What to do next
After creating communication tasks and communication channels for those tasks, define contacts for the communication plan.

Define a communication contact

Define the recipients of a particular plan to determine the target audience involved in each communication task and the responsibilities the recipients are expected to handle. A notification for a task is sent to all individuals specified for that task.

Before you begin
Role required: sn_comm_management.communication_plan_admin or admin

You have defined a communication plan.

About this task
You can add or remove any particular communication contact manually.

Procedure
1. Navigate to **All** > **Task Communications Management** > **Plan Definitions**.
2. Click the communication plan that you want to define the contacts for.
3. Click the **Communication Contact Definitions** related list and then click **New**.
4. On the form, fill in the fields.

Communication Contact Definition form

Field	Description
Type	Type of contact such as user, group, or recipient list that you want to involve in the plan. The contact type is assigned dynamically at the time of the table execution. For information on recipient lists, refer Define a recipient list for communication contact.
Responsibility	Responsibility that the user, group, or individuals in the recipient list are expected to handle.
User	Name of the user, group, or recipient list to be added to the contact list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: You can use the recipient list to specify dynamic criteria for fetching the list of users for a particular communication plan.

5. Click **Submit**.
   A communication contact is defined for the communication plan.

Define a recipient list for communication contact

A recipient list lets you specify a filter to fetch a list of users. Use the recipient list as the contact for a particular communication plan.

Before you begin
Role required: sn_comm_management.comm_plan_admin or admin

About this task
Sometimes, the contacts that you want to include in a plan can only be known dynamically. For example, you might want the support group associated with a particular business service in an incident to be involved in the communication plan. The support group might change depending on the business service that you select. In such a case, a recipient list provides the flexibility to add recipients dynamically.

Procedure
1. Navigate to **All** > **Task Communications Management** > **Administration** > **Recipients Lists**.
2. Click **New** to create a new recipient list.
3. On the form, fill in the fields.

Recipients Lists form

Field	Description
Name	Name of the recipient list.
Type	Type of recipient.
State	[Read only] The state of the recipient list.
Setup	
Method	The method used to generate the recipient list. ○ Upload File: Upload an Excel file with the recipient information to create a recipient list. This list is static. ○ Dynamic Condition: Use scripts or conditions to receive recipient information.

4. Click **Submit**.
   A recipient list is defined for the contact.

What to do next
Define a communication contact for the task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a plan type

Create the communication plan type and specify whether the plan type is applicable globally or to a particular table. When you create the communication plan type, it is referenced in the communication plan definition. The type of the communication plan helps you to filter the plan by its type, generate a report of a particular plan type, or create SLAs for any communication plan.

Before you begin

Role required: sn_comm_management.comm_plan_admin or admin

Procedure

1. Navigate to **All** > **Task Communication Management** > **Administration** > **Plan Types**, and click **New**.
2. On the form, fill in the fields.

Communication Plan Type Lookup form

Field	Description
Name	Unique name of the communication plan type.
Global	Option to determine whether the plan type is available for all tables or for a specific table. If the check box is not selected, the **Table** field appears where you can select the table for which the plan type appears.
Application	Application scope of the plan type. The plan type is available for all applications or for scoped applications.
Active	Option to define whether the plan type is active.
Description	Detailed description of the plan type.

3. Click **Submit**.
   A communication plan type is created.

What to do next

Define a communication plan.

Create a task type

Create the communication task type and specify whether the task is applicable to a particular table or is globally applicable. The communication task type helps you to filter a task by its type, generate a report of a particular task type, or create SLAs for any communication task.

Before you begin

Role required: sn_comm_management.comm_plan_admin

Procedure

1. Navigate to **All** > **Task Communication Management** > **Administration** > **Task Types**, and click **New**.
2. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Communication Task Type Lookup form

Field	Description
Name	Unique name of the communication task type.
Global	Option to determine whether the task type is available for all tables or for a specific table. If the check box is not selected, the **Table** field appears where you can select the table the task type appears for.
Application	Application scope of the task type. The task type is available for all applications or for scoped applications.
Active	Option to define whether the task type is active or not.
Description	Detailed description regarding the type of the task.

3. Click **Submit**.
   A communication task type is created.

What to do next
Define a communication task.

Define contact responsibilities

Define the different contacts or target audience involved in the communication process and their responsibility to understand the expectations from those contacts throughout the process.

Before you begin
Role required: sn_comm_management.comm_plan_admin or admin

Procedure

1. Navigate to **All** > **Task Communication Management** > **Administration** > **Contact Responsibilities**, and click **New**.
2. On the form, fill in the fields.

Contact Responsibility form

Field	Description
Global	Option to determine whether the contact responsibility is available for all tables or for a specific table. If the check box is not selected, the **Table** field appears where you can select the table that you are defining the contact responsibility for.
Name	Unique name of the contact, such as Business Director or Communication Manager, involved in the communication process.
Type	Type of contact such as user, group, or recipient list.
Table	Table that the contact is activated on when a communication plan is attached.

3. Click **Submit**.
   Contact responsibilities are defined.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next
Define a communication contact for the task.

View communication channel configuration

View the configuration of different communication channels that are used to contact the target audience in the communication process. By default, the communication channels available are email, SMS, Slack, and conference.

Before you begin
Role required: sn_comm_management.comm_plan_admin or admin

Procedure

1. Navigate to **All** > **Task Communication Management** > **Administration** > **Channel Configuration**.
2. Open any communication channel record.
3. On the form, view the fields.

Communication Channel Configuration form

Field	Description
Type	[Read only] Mode of channel.
Configuration script	[Read only] Lookup icon ( ) to select the script that defines the channel configuration.
Active	[Read only] Option to define whether the communication channel is active or not.
Classification	[Read only] Internally used to group the channels between conference or major incident management workbench.

Configure Slack for a communication task

Configure Slack as a mode of communication for a communication task to send direct message to the users.

Before you begin
Role required: sn_comm_management.comm_plan_admin or admin

Install the Collaboration Services for Task Communications Management plugin (sn_tcm_collab_hook) from ServiceNow Store.

Procedure

1. Navigate to **All** > **Incident** > **Communication Plan Definitions**.
2. Open the communication plan where you want to add Slack as a communication channel for a communication task.
3. Open the communication task definition for which you want to add Slack as the mode of communication.
4. Click the **Add Channel – Slack** related links.
5. Click **Submit**.
   Slack gets added as a communication channel for the communication task.

© 2026 ServiceNow, Inc. All rights reserved.

Classic Workflow

Workflow provides a drag-and-drop interface for automating multi-step processes across the platform. Each workflow consists of a sequence of activities, such as generating records, notifying users of pending approvals, or running scripts. The graphical Workflow Editor represents workflows visually as a type of flowchart. It shows activities as boxes labeled with information about that activity and transitions from one activity to the next as lines connecting the boxes.

Note:
As of the New York release, Workflow is a legacy product. Use Flow Designer for any new process automation. As many organizations have workflows in production, use this Workflow documentation to learn how to work with existing workflows.

Getting started with workflows

The graphical Workflow Editor provides a drag-and-drop interface for automating multi-step processes across the platform.

Parts of a workflow

Workflows consist of these parts.

Properties

Specify configuration settings such as the workflow name, the table whose records the workflow acts on, and the conditions under which to run it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activities

Specify the sequence of operations the workflow performs such as generating records, notifying users of pending approvals, or running scripts.

Transitions

Specify the conditions under which to run an activity.

Exit conditions

Specify the conditions under which to run a transition.

Contexts

Store historical runtime information about a specific workflow run in a Workflow Context record.

Versions

Store historical design information about a specific workflow in a Workflow version record.

Workflow life cycle

A workflow starts when a triggering event occurs. Common triggers include a record being inserted into a specific table, or a particular field in a table being set to a specified value. For example, you might create a workflow that runs whenever a user requests approval for an item they want to order from the catalog. You can also schedule workflows to run periodically or call them from scripts such as business rules.

When an activity completes, the workflow transitions to the next activity. An activity might have several different possible transitions to various activities, depending on the outcome of the activity. Continuing the example above, if the user's request is approved, the activity might transition to an activity that notifies someone to order the item. If the user's request is denied, the activity might transition to notifying the user that their request has been denied.

The graphical Workflow Editor represents workflows visually as a type of flowchart. It shows activities as boxes labelled with information about that activity and transitions from one activity to the next as lines connecting the boxes.

At each step in a workflow:

1. An activity is processed and an action defined by that activity occurs.
2. At the completion of an action by an activity, the workflow checks the activity's conditions.
3. For each matching condition, the workflow follows the transition to the next activity.

When the workflow runs out of activities, the workflow is complete. The Workflow Context stores the execution history of the activities and transitions run. The Workflow Version stores the design history of the activities, transitions, and exit conditions available to run.

Workflow properties

The workflow properties specify when to run a workflow and what records it acts on. For more information about workflow properties, see Workflow properties.

Workflow activities

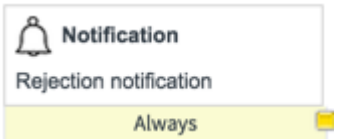
A workflow activity contains instructions that are processed by the workflow.

Activities can include running scripts, manipulating records, waiting for a set period of time, or logging an event. Workflow conditions determine whether or not the activity is performed. Activities can be added, removed, or rearranged. Transitions can be drawn between activities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This is an activity that triggers a notification:

Sample activity



Workflow runs activities as the user session that starts them. Workflows started from record operations will run activities as the user session that performed the record operation. Workflows started from schedules or restarted from timers run activities as the System user. Workflows started from script calls run activities as the user session that started the script.

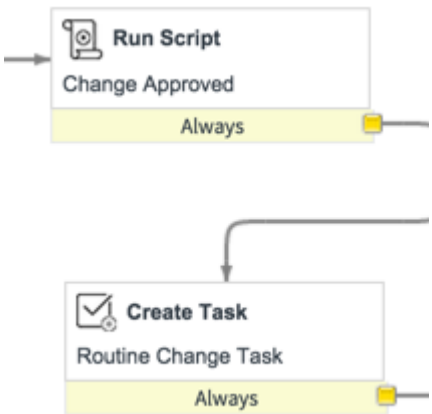
For more information on available activities and their behaviors, see Workflow activities.

Transitions

After the workflow condition is evaluated, the workflow transition determines which activity is performed when the workflow condition is met.

This is a transition that always leads from the *Change Approved* script to the **Change Task** activity:

Sample transition



Exit conditions

After a workflow activity is performed, the workflow condition is evaluated to determine which transition is activated.

The condition determines behavior based on a change being approved or rejected:

Sample exit conditions

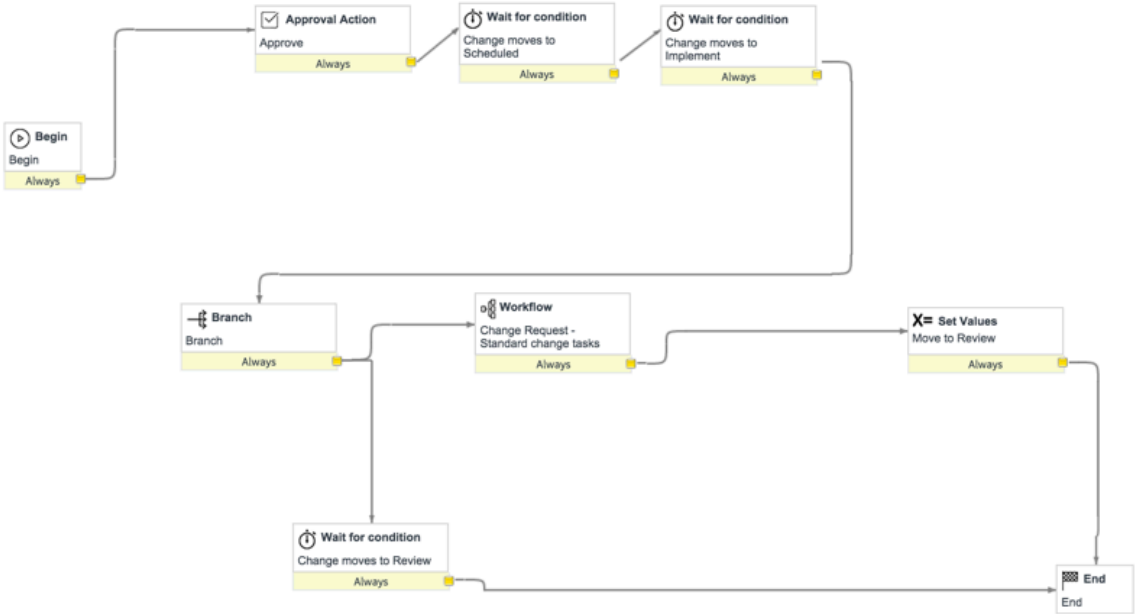
Workflow example

During workflow editing or while an unpublished workflow is running, only the person who checked out the workflow can view the changes.

After a workflow is published, it is available to other users. The workflow moves through the process as defined in the Workflow Editor. The entire workflow is represented in one screen. For example, this is the Standard Change workflow:

Sample change workflow



Workflow editor

The Workflow Editor is an interface for creating and modifying workflows by arranging and connecting activities to drive processes.

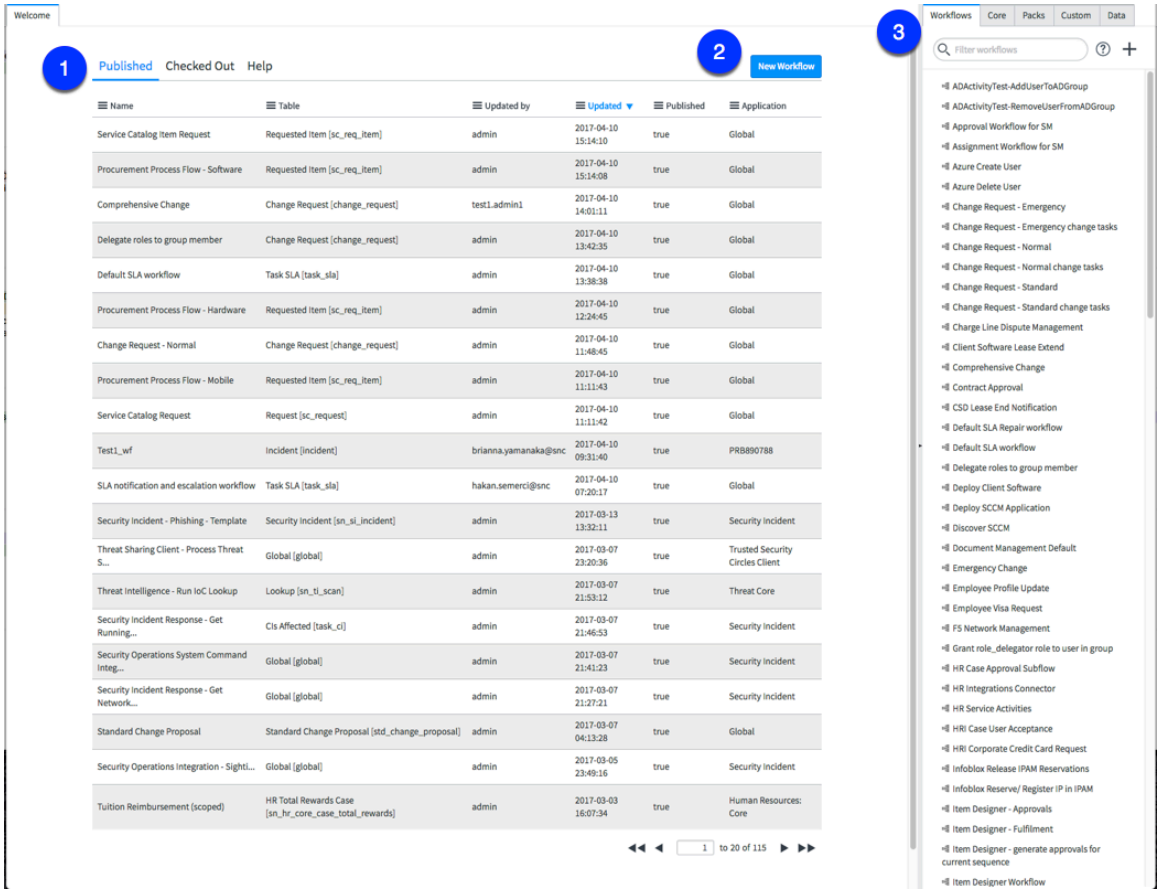
You can manage multiple workflows in the same screen, create custom workflow activities, and use existing activities as data sources. Users with the workflow_creator role can create workflows. Users with the workflow_admin role can create, modify, delete, and publish workflows.

To open the Workflow Editor, navigate to **Workflow** > **Workflow Editor**. For information about using the editor, see Create a workflow.

Welcome screen

The editor opens with the **Welcome** page, which displays a list of active, published workflows. From this tab, you can open existing workflows, create new workflows, and open help resources related to workflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



1 List display filters

Published: Click to view list of published workflows

Checked Out: Click to view list of workflows checked out to current user

Help: Click to view links to help resources for workflow

2 New Workflow button

Click to create a new workflow

3 Palette tabs

Workflows: Workflow activities and workflows you can use as subflows.

Core: Available workflow activities appropriate for the selected workflow. Contents can include activities provided by the base system and those purchased with orchestration.

Packs: Orchestration activity packs downloaded from the ServiceNow® App Store, organized by vendor and scope. Custom activities and workflows that you scope also appear as packs. Only visible if the orchestration plugin is installed.

Custom: Orchestration custom activities available. Only visible if the orchestration plugin is installed.

Data: Activities in the current workflow that output data. You can use these activities as data sources for other activities. Only visible if the orchestration plugin is installed.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If your workflow welcome page does not look like this example, you may have customized the workflow welcome page before upgrading to Yokohama. You can update the workflow welcome page to the latest version by editing the UI pages .

Navigate to **System UI** > **UI Pages** > **Workflow Editor welcome**. In the UI page record for workflow_editor_welcome, scroll to the **Versions** related list. Select the row for the version corresponding to the upgrade to Yokohama, right-click and select **Revert to this version**.

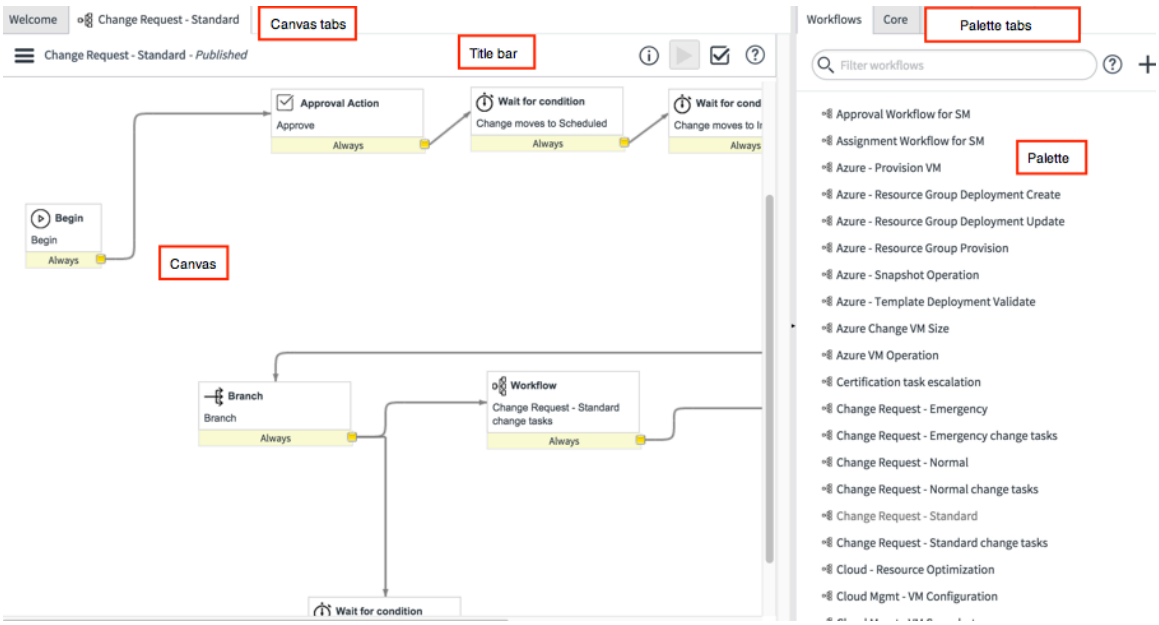
Workflow canvas

After you open or create a new workflow, the system displays the workflow canvas. On the canvas you interact with the Workflow Editor through several different elements: the canvas itself, the canvas tabs, the title bar, the palette, and the palette tabs.

The drawing canvas is where you add activities and configure transitions for checked out workflows. Add an activity by dragging it from the palette to the workflow in the canvas. For more information, see Create a workflow.

- **Canvas tabs**: Contains tabs for accessing workflows being edited or created.
- **Title bar:** Displays the workflow name and status. Provides a menu and controls for configuring, testing, and validating workflows.
- **Canvas**: Provides the working surface for creating new workflows or editing existing ones.
- **Palette tabs**: Contains tabs for accessing activities being edited or created.
- **Palette**: Contains all available workflow activities and existing workflows you can use as subflows. Drag activities and subflows to the canvas to create new workflows or edit existing ones.

Workflow user interface



Workflow palette

The default workflow palette contains workflow activities and existing workflows you can use as subflows.

The basic workflow palette contains these tabs:

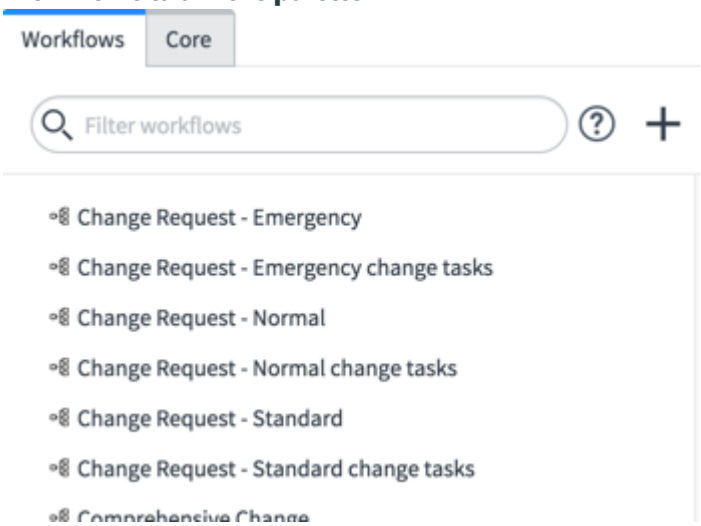
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Workflows**: Displays existing workflows and provides controls for creating new ones.
- **Core**: Displays baseline workflow activities available to all systems and Orchestration activities (when Orchestration is activated).

Workflows tab

The **Workflows** tab lists existing workflows that you can edit or use as subflows in other workflows. Double-click a workflow to open it in the canvas. To add a workflow as a subflow, drag it to another workflow in the canvas. Click the **+** icon to create a new workflow.

Workflows tab in the palette

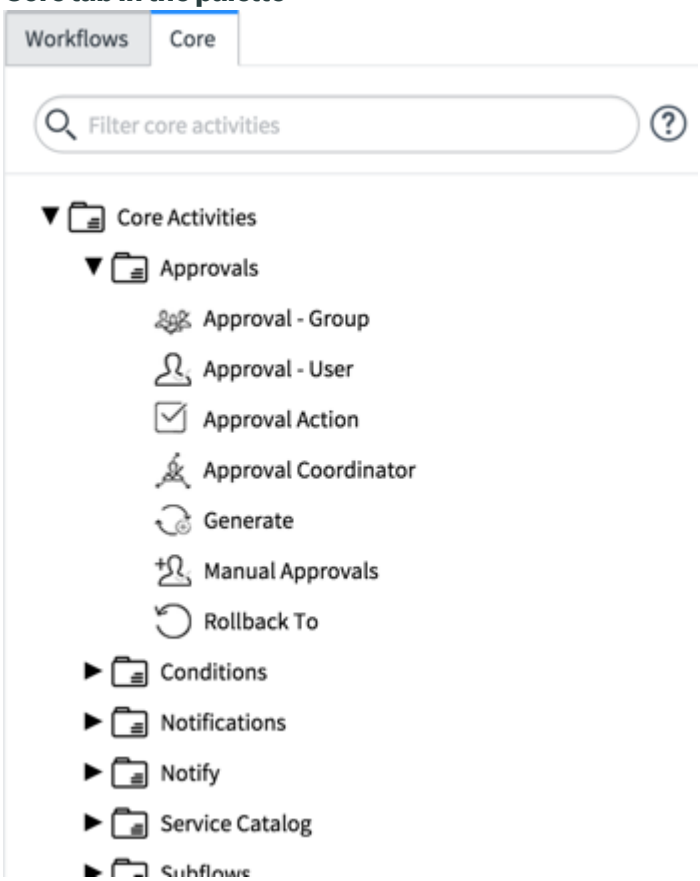


Core tab

The **Core** tab contains the standard activities available by default to all workflows and any activities purchased with Orchestration, organized by category. Click the arrow icons to expand or collapse the activity lists under each category. To add an activity to a workflow, drag it to the canvas. For more information, see Add an activity to a workflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

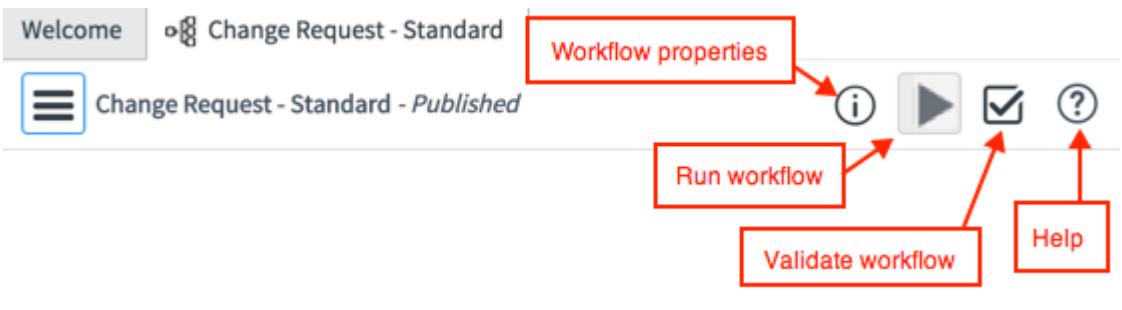
Core tab in the palette



Workflow editor title bar

When a workflow is opened in the canvas, the title bar displays the workflow title and the workflow status in italics. Possible states are **Checked out by <name>** and **Published**.

Workflow editor title bar



Controls on the right side of the title bar manage the workflow.

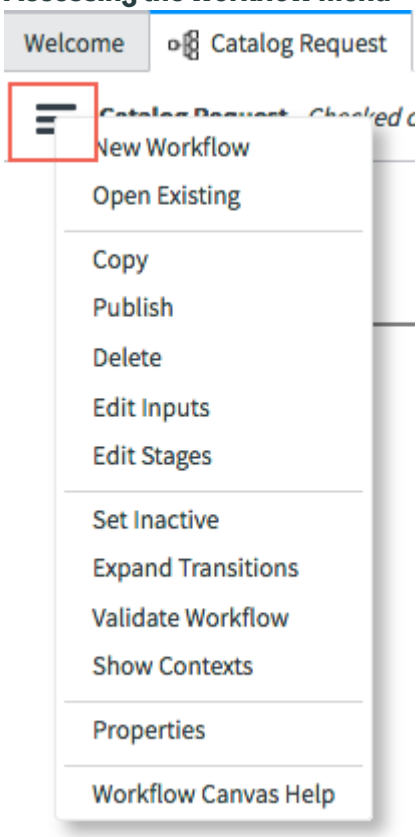
- **Workflow Properties** ⓘ: Opens the current workflow's properties form.
- **Start** ▶: Runs the workflow. This control is only available for workflows running on the Global table that are accessible from all application scopes. To test workflows that are on other tables, insert a record into that table that meets the condition of the workflow.
- **Validate** ☑: Tests the workflow prior to publication. Validation detects potential problems that can prevent the workflow from publishing or cause the workflow to fail. For more information, see Workflow Validation.
- **Help** ?: Opens documentation to help you create the workflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow menu

Click the menu icon in the title bar for additional options to configure the workflow.

Accessing the workflow menu



These menu options are available:

Workflow menu options

Option	Description
New Workflow	Creates a new workflow.
Open Existing	Opens another existing workflow.
Copy	Creates a duplicate of the workflow. Give the copy a different name.
Publish	Makes the personal workflow version public, overwriting the current published workflow version. This option is only available for checked out workflows.
Checkout	Creates a personal version of the workflow for you, which you can edit. This option is only available for published workflows.
Delete	Deletes the workflow. You cannot delete workflows that have contexts associated with them.
Set Inactive	Inactivates the workflow so that it cannot be used.
Expand Transitions	Redraws the transitions so that they do not overlap when they leave the activity condition.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow menu options (continued)

Option	Description
Start Workflow	Starts a test run of the current workflow.
Validate Workflow	Runs validation tests on your workflow prior to publication. Use this validation to detect potential problems that can prevent the workflow from publishing or cause the workflow to fail. For more information, see Work on workflows.
Collapse Transitions	Redraws the transitions so they overlap when they leave the activity condition.
Show Contexts	Displays all the contexts for the current workflow. You can use this option to troubleshoot a workflow.
Properties	Opens the Workflow Properties form, which defines the workflow's attributes.
Edit Inputs	Opens the Workflow Inputs list of variables that the workflow can accept when used as a subflow. For more information, see Pass a variable from a workflow to a subflow.
Edit Stages	Opens the Workflow Stages list. For more information, see Workflow stages. For tables with a column of Type = Workflow.

Workflow editor keyboard navigation

The platform includes accessibility features that makes the interface accessible to users with disabilities.

These features improve the user experience when accessing platform functions with Using accessibility features. In general, you use the following set of standard keyboard navigation functions:

- Press **Tab** to navigate major groupings in a pre-defined sequence. This usually includes moving between standard interface controls (fields and lists) in a module, or between records within a tab.

  Press **Shift Tab** to move backwards in a pre-defined sequence.

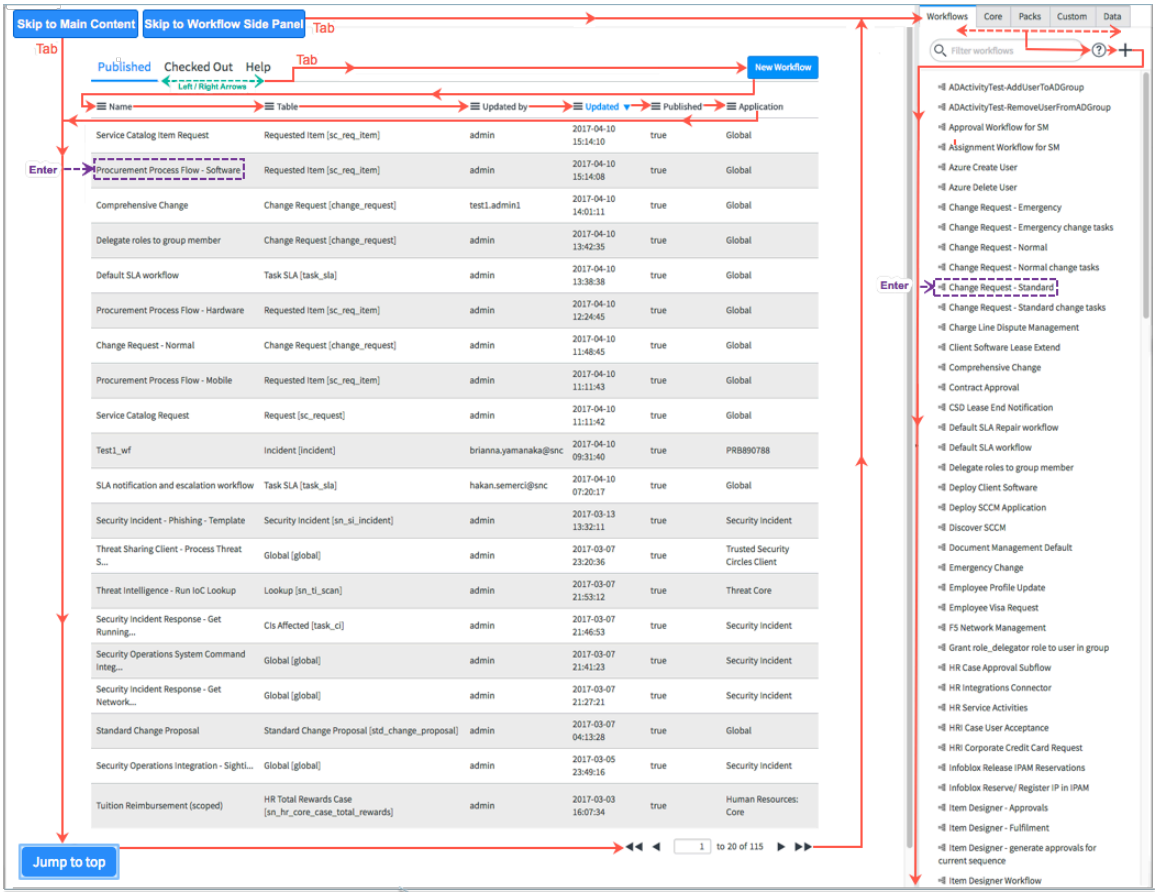
- Use arrow keys (left, right, up, down) to navigate between individual elements within a group. This usually includes moving between tabs, or between available selections within a specific control (for example, within a list).
- Press **Enter** to select a control or tab, or enter text within a control.

The Workflow Editor is constructed in a unique manner. It includes a series of main (left) panel tabs, a series of side (right) panel tabs, and a drawing canvas for workflow creation or editing. As such, it has its own unique set of keyboard accessibility functions and commands.

Welcome page keyboard commands

Use keyboard commands to navigate and operate the Workflow Editor Welcome page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Task or Action	Keyboard Commands
Navigate to main content (left) panel, and select a workflow	**1.** After accessing the Workflow Editor from a menu, press **Tab**. Skip to Main Content appears in the upper left corner. **2.** Press **Enter** to position the cursor in the first record displayed in the **Published** tab. **3.** Press **Tab** to navigate down the listing of workflow records. Press **Enter** to select and open a workflow record in the Workflow drawing canvas.
Select a checked out workflow or a help function in main content panel	**1.** After accessing the Workflow Editor from a menu, press **Tab** until the **Published** tab is highlighted. **Note:** Do not select Skip to Main Content or Skip to Workflow Side Panel.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Task or Action	Keyboard Commands
	2. Press the right or left arrow keys to navigate between the **Published**, **Checked Out**, or **Help** tabs. **3.** Press **Tab** to navigate across the columns and down the listing of checked out workflow records or help selections. Press **Enter** to select and open a checked out workflow record in the Workflow drawing canvas, or open a help selection (work or orchestration videos, documentation, community discussions, knowledge base, or Live Feed).
Create a workflow	**1.** After accessing the Workflow Editor from a menu, press **Tab** until is highlighted. **2.** Press **Enter** to open New Workflow
Jump to Top	After tabbing through the displayed records in a tab in the main panel (for example, within the **Published** tab),  appears at the bottom of the listing. Press **Enter** to return to the Welcome tab at the top of the Workflow Editor.
Navigate to page selection controls 	**1.** After tabbing through the displayed records in a tab in the main panel (for example, within the **Published** tab), including  , press **Tab** to access the page selection controls. Continue to press **Tab** until you access the desired one. **2.** Press **Enter** to operate the selected page control.
Navigate directly to side (right) panel to open help, create a new workflow, or open an existing one	**1.** After accessing the Workflow Editor from a menu, press **Tab** two times. Do not select  appears in the upper left corner. **2.** Press **Enter** to position the cursor in the **Workflows** tab in the side panel. **3.** To open help, press **Tab** to navigate to . Press **Enter** to open help, or press **Tab** to skip.

© 2026 ServiceNow, Inc. All rights reserved.

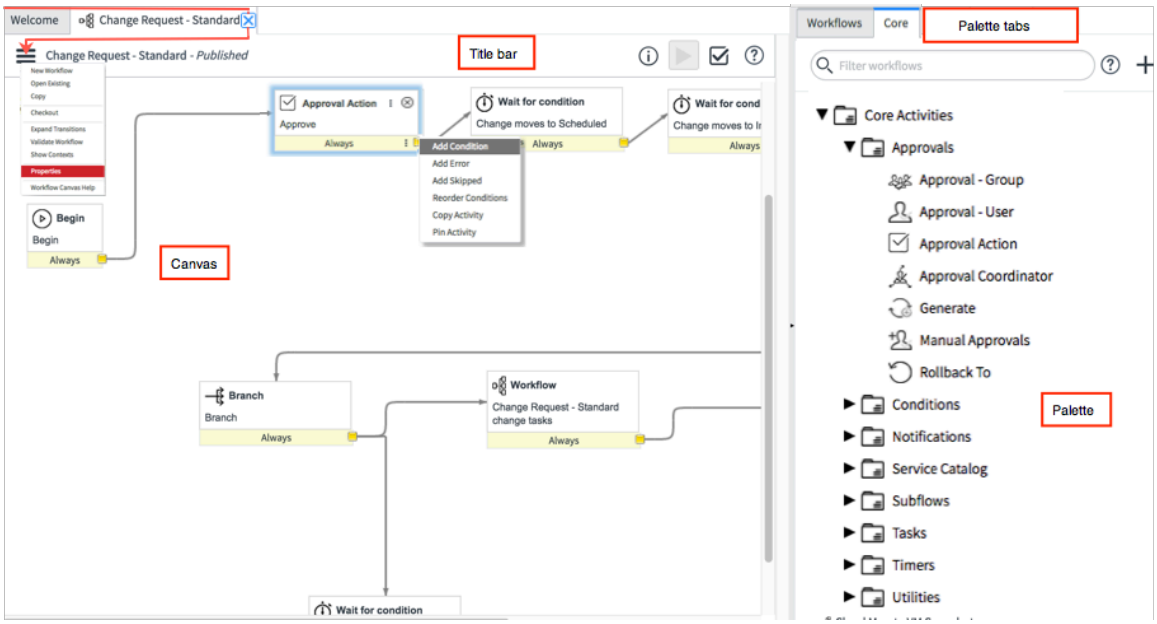
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Task or Action	Keyboard Commands
	4. To create a new workflow, press **Tab** to navigate to +. Press **Enter** to open New Workflow, or press **Tab** to skip. **5.** To open an existing workflow: ○ As needed, stop at the filter field to filter workflows. ○ Press **Tab** to navigate down the workflow list. ○ Press **Enter** to select and open a workflow record in the Workflow drawing canvas,
Add a core activity to a checked out workflow in the Workflow drawing canvas	If a checked out workflow is open in the Workflow drawing canvas, core activity records display in the **Core** tab. To select a core activity and place it in the checked out workflow: **Note:** Core activity records only display when a checked out workflow is open in the Workflow drawing canvas. Other tabs display in the side panel only if Orchestration functions are enabled. **1.** In the Workflow drawing canvas, press **Shift Tab** until Skip to Workflow Side Panel appears in the upper left corner. **2.** Press **Enter** to position the cursor in the **Workflows** tab in the side panel. **3.** Press the right arrow key to navigate to the **Core** tab. **4.** Press **Tab** or the down arrow key to navigate down the listing of core activities. ○ To open a core activities folder (for example, Approvals), press the right arrow key. ○ To navigate up the list, press the left or up arrow keys. **5.** Press **Tab** to select a core activity and open the New Activity dialog to specify properties for it. **6.** After creating the activity, remember to link it to another activity in the workflow. See Create a connection from a condition on one activity to the next activity that follows in Workflow drawing canvas keyboard commands.

Workflow drawing canvas keyboard commands

Use keyboard commands to navigate and operate the Workflow Editor canvas.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Task or Action	Keyboard Commands
Select Workflow Actions menu command (for example, **Validate Workflow** or **Publish Workflow**)	**1.** Press **Tab** until the context menu (☰) is highlighted. **2.** Press **Enter** to open the context menu. **3.** Use the down arrow key to move to the command, then press **Enter** to select it.
Set general workflow properties	**1.** Press **Tab** until ⓘ is highlighted. **2.** Press **Enter** to open Workflow Properties.
Navigate from activity box to activity box.	Simply press **Tab** or use the arrow keys (right, left, up and down) to navigate from activity to activity within the workflow. **Note:** Depending on the complexity and number of activity boxes in the workflow, the sequence of navigation is not always predictable. Depending on how you are navigating within the workflow, the navigation sequence is generally (but not always) row-by-row, and focus is usually placed on the nearest activity box.
Modify a selected activity.	**1.** Navigate to the activity box, then press **Enter** to select it and place it in Edit mode. When you select an activity box, it appears as highlighted. **2.** Once in Edit mode, use **Tab** to move around within the activity box to change or access elements such as: ○ Activity Properties (☑) ○ Title ○ Node context menu ○ Delete Node (⊗)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Task or Action	Keyboard Commands
	○ Condition Properties (Always) ○ Node conditional context menu (⋮) ○ Node conditional port options ( ) **Note:** All elements in a selected activity are only accessible when working with a checked out workflow. When working with a published workflow, you can only access its activity properties and title, **3.** Press **Enter** to select an element, or press **Esc** to escape an element without making changes.
Add a condition to an activity.	**1.** Within an activity box, select ... to access **Condition Properties**. **2.** In **Condition Properties**, specify the conditions for the activity.
Create a connection from a condition on one activity to the next activity that follows	**1.** Within an activity box, select **Node conditional context menu** (⋮). **2.** Select **Link to...** to create a connection to the next activity box that follows, or select **Delete** to delete an existing connection.
Add a core or custom activity	**1.** Within an activity box, select **Node conditional port options** ( ). **2.** Select **Add Core Activity** to access Workflow Activity Definitions to add a new core activity, or select **Add Custom Activity** to add a custom activity to the workflow.
Move an activity box	**1.** Press **Tab** to navigate to the activity box, enter press **Enter** to select it. **2.** Use the arrow keys to move the activity box. To move the activity box one pixel at a time, press **Shift** while using the arrow keys.
Validate a workflow	**1.** Press **Tab** until ☑ is highlighted. **2.** Press **Enter** to validate the workflow. You can also select **Validate** from the Workflow Actions menu.
Run a workflow	**1.** Press **Tab** until ▶ is highlighted. **2.** Press **Enter** to run the workflow. **Note:** If the workflow is tied to a database table, this function is disabled. The workflow runs when the proper table conditions are activated (for example, insertion of a new record into the table).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Task or Action	Keyboard Commands
Close workflow drawing canvas	1. Press **Tab** until (on the right side of the tab that contains the name of the workflow) appears. 2. Press **Enter** to close the canvas.
Publish a workflow	1. Press **Tab** until the context menu ( ) is highlighted. 2. Press **Enter** to open the context menu. 3. Use the down arrow key to move to the **Publish** command, then press **Enter** to select it.
Jump to Top	After tabbing through the entire workflow,  appears at the bottom of the listing. Press **Enter** to jump to the top of the Workflow drawing canvas.

Workflow management

Create, edit, validate, and publish workflows to automate multi-step processes across the platform. Understand workflow activities and variables and how to use them effectively. Take a deeper look at how workflows are constructed, validated, and used.

Create a workflow

Automate a multi-step process by creating a workflow with the Workflow Editor.

Before you begin

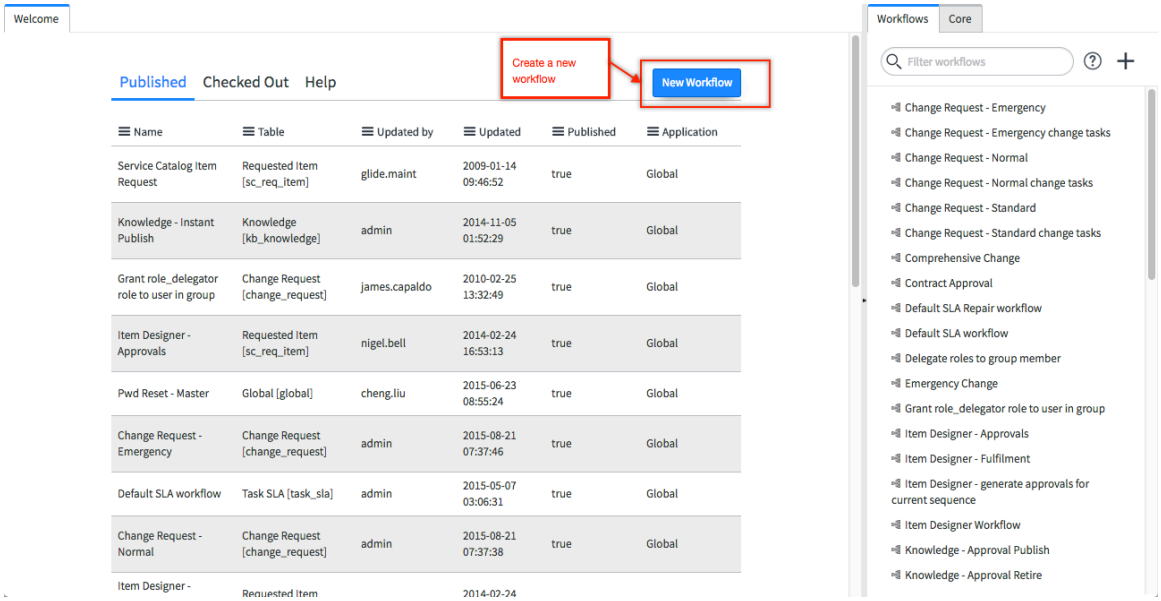
Role required:

- You must have the workflow_admin or workflow_creator role to use the Workflow Editor.
- If you are designing the workflow as part of an update set process, see Workflow movement with update sets before creating the workflow.

Procedure

1. Navigate to **All** > **Workflow** > **Workflow Editor**.
   The **Welcome** tab of the Workflow Editor opens.
2. On the **Workflows** tab in the palette, click **New Workflow**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



A simplified version of the New Workflow form opens.

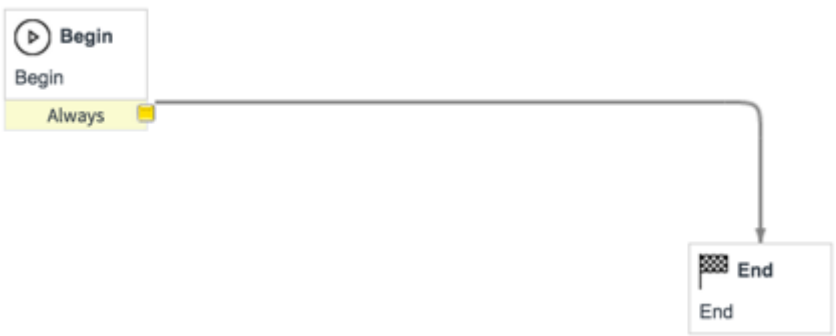
3. Fill in the **Name** and **Table** fields
4. **Optional:** Add a **Description**.
5. **Optional:** Do one of the following:

   a. If the **Conditions** UI section is displayed, specify a **Condition** if needed and edit the fields.
   The **Conditions** UI section shows only if the selected table supports conditions for launching workflows. For example, if you select the sc_req_item table, conditions are not applicable and the **Conditions** UI section is not displayed.

   b. If the **Stages** UI section is displayed, check that the **State rendering** and **Stage order** fields contain the correct information.
   The **Stages** UI section shows only if the selected table supports stages. For example, if you select the sc_req_item table, the **Stages** UI section is displayed.

6. Click **Submit**.

   The new workflow is created with the **Begin** and **End**activities connected by a single transition.



7. Finish creating the workflow by adding activities, validating, and publishing so the workflow is available to other users.
   For more information, see Work on workflows.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. To change advanced settings for the workflow, click the **Properties** icon ⓘ.
9. If you make changes, click **Update**.

Workflow properties

In the properties of a workflow, you can configure settings such as its application scope, start conditions, schedule, inputs, stages, and run time metrics. You can also view information such as the workflow author, version, and history.

When you create a new workflow, the following fields are available in the dialog box:

- **Name**
- **Table**
- **Description**
- **If condition matches**
- **Condition**

If you click **Diagrammer view**, in **Related Lists**, the following UI sections are available in the dialog box:

- General
- Conditions
- Inputs
- Activities
- Application
- Schedule
- Stages
- Estimated Runtime

General

Field	Description
Name	A name to identify the workflow.
Table	The table for the workflow to run on. Workflows that run on specific tables can still interact with other tables. Select **Global [global]** to run the workflow on all tables. **Note:** The list shows only tables and database views that are in the same scope as the workflow. Also, all users who edit the workflow must have access to the necessary tables and domains.
Checked out	[Read-only] When the workflow was checked out. Automatically set by the **Checkout** action in the workflow menu.
Checked out by	[Read-only] The user who has this workflow checked out. This value is automatically set by the **Checkout** action in the workflow menu.
Published	[Read-only] Check box to indicate whether the workflow has been published. Automatically set by the **Publish** action in the workflow menu.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Description	The purpose of the workflow.

Conditions

Create conditions to trigger the workflow. The Conditions section does not appear if you select a table, such as sc_req_item, that does not require a condition.

Field	Description
If condition matches	When the condition evaluates to true, the workflow launches an active context: • **None**: The workflow is not automatically started by the workflow engine. To run this workflow, write a script to start the workflow. • **Run the Workflow**: The default value. The workflow engine starts the workflow if the information in the **Condition** field matches a record that is inserting into the table. • **Run if no other workflows match yet (deprecated)**: The workflow only runs if no other workflows are running on the execution thread that started this workflow. Avoid using. • **Run if no other workflows matched**: The workflow only runs if no other workflows are running on a specific record. For example, there are four workflows inserted into the Incident table, which have a condition such as **short_desc** contains **test**. A new workflow, which has **If condition matches** is set to **Run if no other workflows match yet**, only runs if none of the four workflows have started running on the Incident record.
Condition	A condition builder for specifying workflow conditions that trigger the behavior selected from the If condition matches list.
Order	Numeric value that determines the order of the workflow, relative to other workflows. Workflows are evaluated in order from the lowest order number to the highest. A workflow runs if it is the first to match conditions.

Inputs

The Inputs section lists all the activities in the current workflow that input data, the data type, and the default value. The Inputs section is only available after a workflow has been created. To create a variable, click **New**.

Field	Description
Label	Displayed column label. Localized depending on user locale.
Reference	Input field from another table.
Type	Data type. For example, integer or string.
Default value	Value used if you do not provide a value.

Activities

The Activities section enables you to set activity pinning and maximum activity count.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Activity pinning	List of options that control updates to custom activities at the workflow level. Pinning protects custom activities from being updated automatically when downloaded from the ServiceNow Store. For more information, see Workflow activity pinning. The possible options are: • **Set by activity**: Allows all activities in the workflow to use their own pinning settings. This is the default pinning option. • **Pin all activities**: Pins all activities in the workflow to their current version. • **Unpin all activities**: Allows all activities in the workflow to be updated.
Max activity count	The maximum number of activities performed by the workflow. This value is used to prevent infinite loops and is set to **100** by default. When the stated maximum count is reached, the workflow is canceled. If this field is blank, the maximum count is set to **-1**, and the workflow is canceled.

Application

The Application section enables you to see application scope and scope restrictions.

Field	Description
Application	[Read-only] Scope of this activity. For more information, see Application Scope.
Accessible from	Scope restrictions for this workflow. Possible settings are: • **All application scopes**: Workflow is accessible to all application scopes. • **This application scope only**: Workflow access is limited to the scope named in the **Application** field. For more information see Workflow scope.

Schedule

Use the Schedule section to create a schedule for this workflow using the schedule builder.

Field	Description
Delivery based on	The schedule type for this workflow. Possible types are: • **User-specified duration**: Duration based on a user-specified value. This is the default schedule type. • **Relative duration**: Duration calculated from a preconfigured schedule, such as **8-5 weekdays**.
Expected time	User-defined interval. This field is visible when the schedule type is **User-specified duration**.
Schedule	Preconfigured schedule that determines when this workflow runs.
Timezone	Time zone for this instance.

Stages

The Stages section appears if you select a table with **Type** = **Workflow**.

Field	Description
Stage	Displays the workflow stage progress on the selected table. Optionally, select **Stage rendering** and **Stage order** schemes to customize the appearance of the stage field. The default values cover typical scenarios.
Stage rendering	The renderer to use when displaying stage icons on a form or list view. For more information about renderers, see Workflow stage renderers.
Stage order	The order of workflow stages when you view a workflow field in a list. Select **Computed** to let the workflow engine compute the stage order from the order of execution in the workflow. Select **User Specified** to use the **Order** field from that Workflow stages.
Name	The name of the stage as it appears in workflow fields..
Duration	Time allocated for the specific stage.
Order	The order of workflow stages when you view a workflow field in a list. Select **Computed** to let the workflow engine compute the stage order from the order of execution in the workflow. Select **User Specified** to use the **Order** field from that Workflow stages.
Value	The value of the stage when it is referenced from elsewhere in the system, such as in a script.

Estimated Runtime

The **Estimated Runtime** section opens the controls for configuring the **ERT** for the workflow. Core workflows included in the base system are not configured for estimated run time by default. All new workflows are configured with default ERT values automatically. You can edit existing run time estimates or configure new ones for any existing workflow. For details about how estimated run times are configured and calculated, see Workflow run time metrics.

Field	Description
Requires ERT	Check box to indicate that this workflow requires an estimated runtime configuration. You can use the ERT calculations to determine if workflows are running longer or shorter than expected and to identify errors in workflow processing. By default, new workflows require an ERT.
Estimated Run Time	The initial estimate for the workflow's run time.
Number of data points	[Read only] The number of times the system has compared the estimated run time to an actual run time result.
Outlier Percentage Threshold for ERT	[Required] The percentage deviation from the estimated run time that identifies an outlier workflow run time. The system uses a default value of 20. For more information, see Outlying workflow run times.

Create a workflow from a table

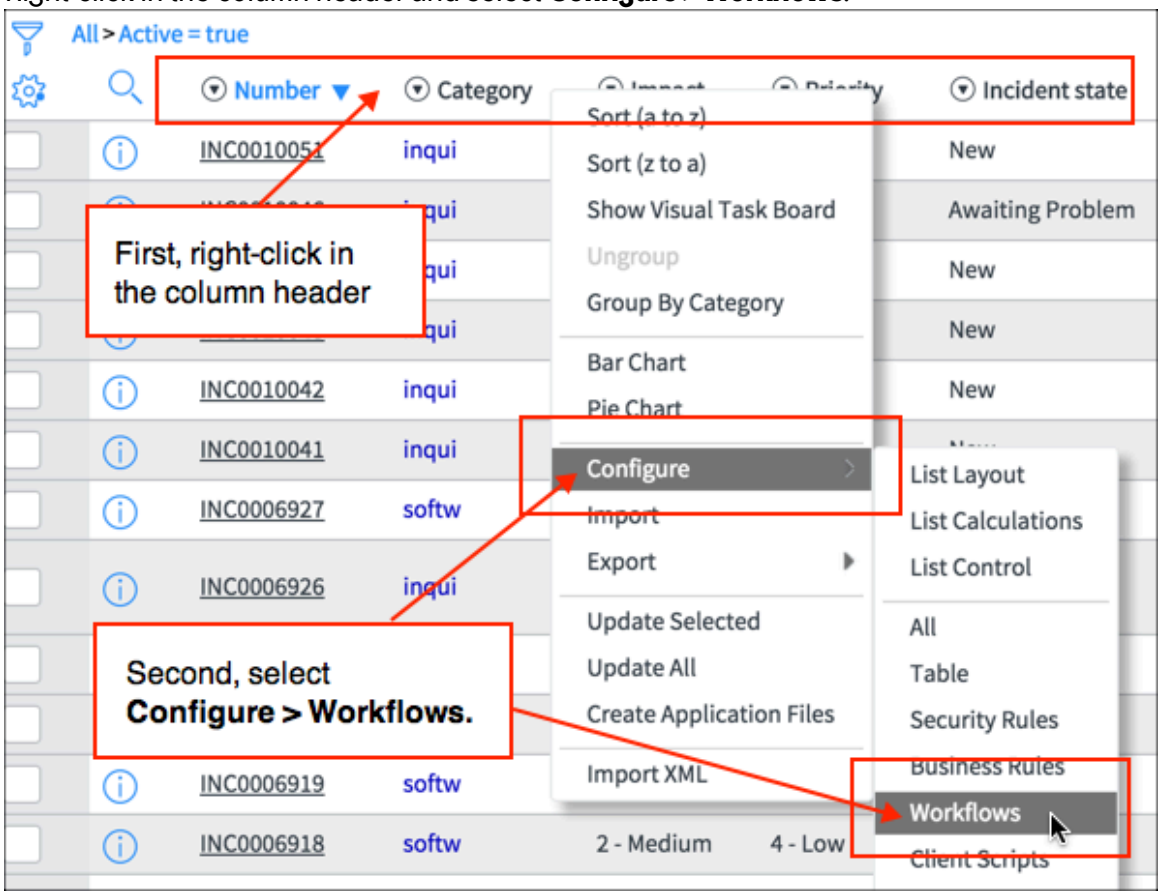
Automate a multi-step process by creating a workflow from the list view of any table that supports workflows.

Before you begin

- If you are designing the workflow as part of an update set process, see Workflow movement with update sets before creating the workflow.

Procedure

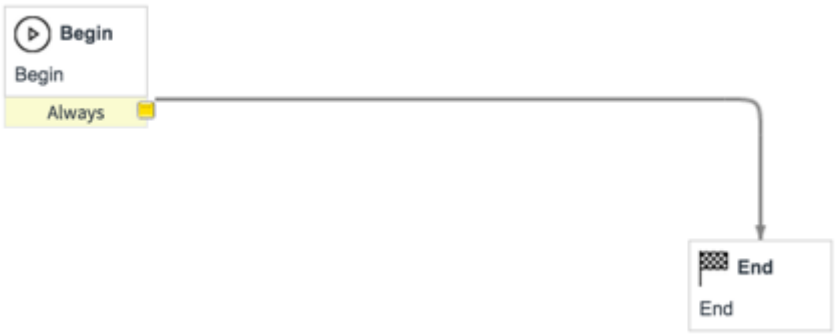
1. Open a table, such as Incident or Problem, in list view. For example, navigate to **Incident > Open**.
2. Right-click in the column header and select **Configure > Workflows**.



The **Workflow Versions** on that table appear in a list.

3. Click**New**.
   The **Workflow Version** opens in **New Workflow** view. The **Table** field is filled in with the table you selected in step 1 and is read-only.
4. Enter **Name**.
5. **Optional:** Enter **Description**.
6. **Optional:** Edit conditions fields as necessary.
7. Click **Submit**.
   The new workflow is added to the **Workflow Versions** list.
8. Click the workflow **Name**.
   The new workflow is created with the **Begin** and **End**activities connected by a single transition.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



9. Finish creating the workflow by adding activities, validating, and publishing so the workflow is available to other users.
   For more information, see Work on workflows.
10. **Optional:** To change advanced settings for the workflow, click the **Properties** icon . If you make changes, click **Update**.

Create a workflow for a new service catalog item

When you create a new service catalog item, you can create a new corresponding workflow at the same time.

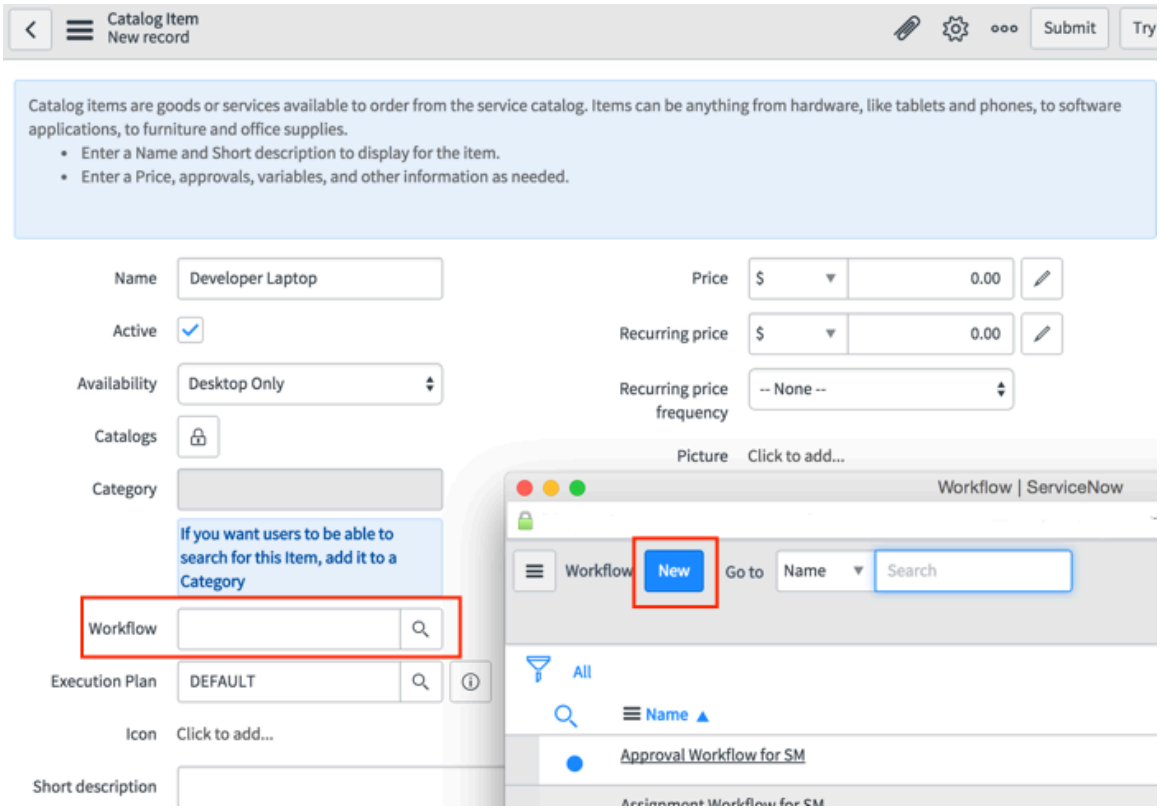
Before you begin

- If you are designing the workflow as part of an update set process, see Workflow movement with update sets before creating the workflow.

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Definitions** > **Maintain Items**.
2. At the top of the form, next to **Catalog Items**, click **New** .
   The Catalog Item form opens.
3. Add a **Name**.
4. Select the **Process Engine** tab.
5. Next to the **Workflow** field, click the lookup icon .
6. Next to Workflow at the top, click **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The Workflow version dialog opens in the New Workflow View. The **Table** field is set to **Requested Item (sc_req_item)** and is read-only.

7. Add a **Name**.
8. **Optional:** Add a **Description**.
9. **Optional:** Change the stage information as necessary.
10. Click **Submit**.
    The new workflow is created with the **Begin** and **End**activities connected by a single transition.

11. Finish creating the workflow by adding activities, validating, and publishing so the workflow is available to other users.
    For more information, see Work on workflows.
12. To change advanced settings for the workflow, click the **Properties** icon.
13. Click **Update**.
    If you close the Workflow Editor, you can see the Catalog Item record. Note that the workflow is added to the Workflow field. The Show Workflow and Information icons appear next to the **Workflow** field. Hover over the information icon to view a read-only summary of the workflow.

Create a workflow for an SLA Definition

Automate a multi-step process by creating a workflow from an SLA definition.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- If you're designing the workflow as part of an update set process, see Workflow movement with update sets before creating the workflow.

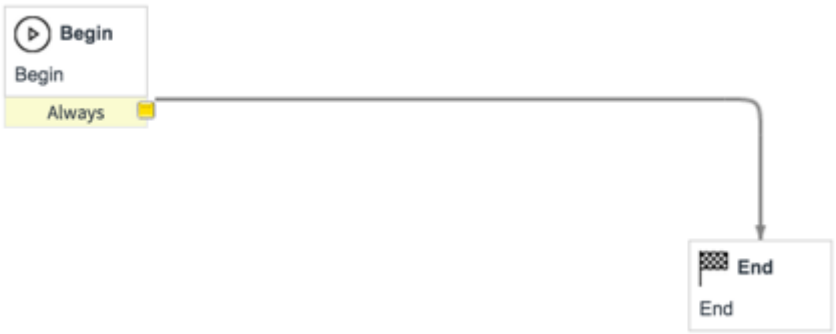
Procedure

1. Open a list of SLA definitions.
   For example **Facilities > SLA Definitions** or **Service Level Management > SLA Definitions**.
2. At the top of the form, next to **SLA Definitions**, click the new icon (New).
3. Select **Contract SLA** or **Service Offering SLA**.
4. Next to the **Workflow** field, click the lookup icon.
5. Next to **Workflow** at the top, click **New**.

   The Workflow Version dialog shows in the New Workflow view. The **Table** field is set to **SLA Definition (contract_sla)** or **Service Offering SLA (service_offering_sla)** and is read-only.

6. Enter a **Name**.
7. **Optional:** Enter a **Description**.
8. **Optional:** Edit the conditions fields as necessary.
9. Click **Submit**.
   The new workflow is created with the **Begin** and **End** activities connected by a single transition.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



10. Finish creating the workflow by adding activities, validating, and publishing so the workflow is available to other users.
    For more information, see Work on workflows.

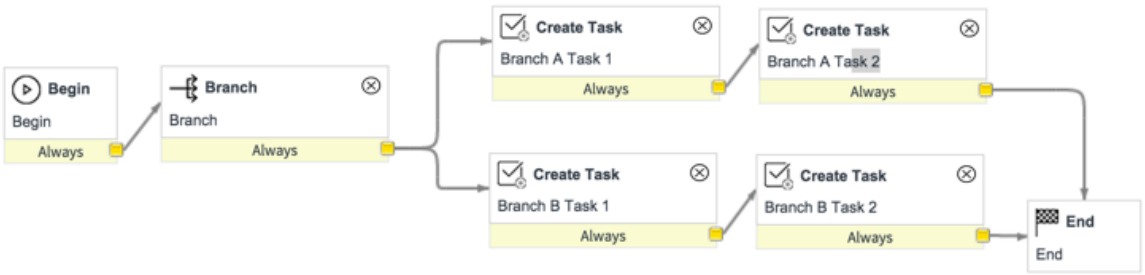
11. **Optional:** Change the advanced settings for the workflow by clicking the properties icon ( ). If you make changes, click **Update**.

Ending workflows with multiple branches

A workflow is complete when it reaches the **End** activity, even if there are still active branches of the workflow in progress. To ensure that both branches are completed, add a **Join** activity to resolve the branches.

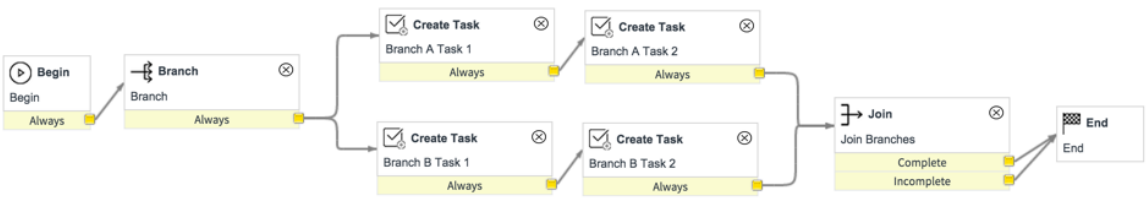
For example, the following figure shows a workflow with two branches that execute independently. When Task 1 and Task 2 of Branch B are completed, the workflow is marked complete even if the Branch A tasks are not completed.

Workflow with uncompleted branch



For both branches to complete, add a **Join** activity to resolve the branches. When one branch reaches the join, the workflow waits for the other branch. When both branches are complete, the workflow reaches the end. The **Incomplete** condition of the a **Join** activity is met only if one of the branches cannot be completed.

Workflow with completed branches



Work on workflows

To complete a workflow, you add workflow activities, validate the workflow, and publish it.

Before you begin
Role required: None.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add a workflow activity

Activities determine the functionality of the workflow.

Before you begin
Role required: workflow_admin, workflow_creator, or admin

About this task
When they are created, all workflows contain **Start** and **End** activities.

For more information, see Workflow activities.

Procedure
1. Open a workflow.
2. Check out the workflow.
3. Drag a workflow activity from the Activities menu into the workflow body.
4. Populate the Workflow Activity form that appears.

Validate a workflow

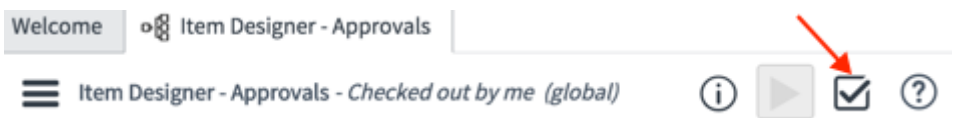
You can manually validate a workflow from the Workflow Editor. You can generate a workflow validation report from the Workflow Version form.

Before you begin
Role required: workflow_admin, workflow_creator, workflow_publisher, or admin

About this task
Running a workflow on a new node automatically attempts to validate the workflow. If validation is successful, the system updates the workflow version record to indicate the workflow has been validated and marks the record as updated by the user who ran the workflow.

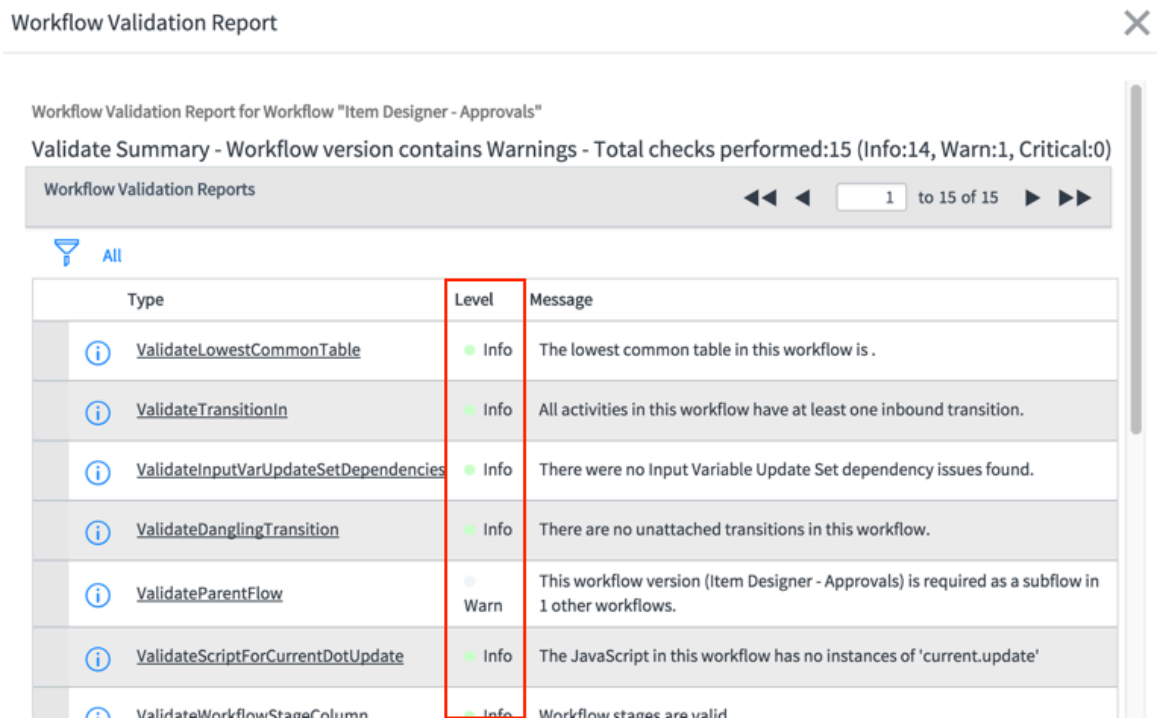
Procedure
1. Open the workflow to validate in the Workflow Editor.

   When the workflow is loaded, the workflow validator icon appears in the toolbar.



2. Click the validator icon to run a series of validation tests on the current workflow version and generate a report.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Complete the following steps to generate a workflow validation report from the Workflow Version form
   a. Navigate to **Workflow** > **Administration** > **Workflow Versions**, and select a workflow to validate.
   b. Under **Related Links**, click **Validate Workflow**.

Publish a workflow

When a workflow is complete, publish the workflow so that it is available to all users.

Before you begin

Before you publish a workflow, validate it to test it for issues that might cause it to fail, such as missing subflows or disconnected transitions. For more information, see Workflow validation.

Role required: workflow_admin, workflow_creator, workflow_publisher, or admin

About this task

To publish a workflow:

Procedure

1. Navigate to **All** > **Workflow** > **Workflow Editor**.
2. Open the workflow that you want to publish.
3. In the title bar, click the menu icon and select **Publish**.

Result

If you published a new version of workflow, the changes are not applied to running workflow contexts. Any currently running workflow context continues using the workflow version that was available when the workflow started. The next time the workflow runs, it uses the new version.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Determine whether a workflow can run

A workflow can run only if a checked out version is available to the user who has it checked out, and a valid, published version is available for all users with permission to run it.

Before you begin

Role required: workflow_admin, workflow_creator, or admin

Procedure

1. In the navigation filter, enter `wf_workflow.list`, and then open one of the workflows.
2. In the **Versions** related list, check for all of the following conditions:

   a. There is only one workflow version in a state of **Checked out** and **Checked out by**.

   b. There is only one version and it is not checked out. This version must be both **Active** and **Published**.
   You may need to personalize the list and add the **Active** column.

   c. If there are multiple versions, only one is **Published**.

   These checks determine the only two conditions under which a workflow can run:

   - A checked out version of a workflow is available for the user who has it checked out.
   - A valid, published version of a workflow is available for all users who have permission to run the workflow.

   Main flows containing subflows that do not meet one of these two conditions are not permitted to execute against a current record transaction. Instead, a critical log entry detailing the subflow state is added to the Workflow Context record. To enable the workflow to execute on the next appropriate transaction, remove the subflow from the main flow or modify the published and active states of the subflow.

Edit a published workflow

You can edit a published workflow after you check it out.

Before you begin

Role required: workflow_admin, workflow_creator, workflow_publisher, or admin

About this task

Note:
You cannot check out or delete workflows that are associated with a read-only application file.

To check out a workflow:

Procedure

1. Navigate to **All** > **Workflow** > **Workflow Editor**.
2. Open the workflow that you want to edit.
3. In the title bar, click the menu icon and select **Checkout**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A new version of the workflow is created and assigned to you.

If you are in a different domain than the published workflow, the new workflow version is created in your domain.

What to do next

After you finish editing the workflow, validate and publish the workflow to make the new version available to other users.

Copy a workflow between two application scopes

Application scoping protects applications by identifying and restricting access to application files and data. You can copy a workflow created in one application scope (for example, Test) to another (Production) as needed.

Before you begin

Role required: admin

Procedure

1. On the Home page, click , located next to the logged in user name.
2. In the **Developer** tab, in the **Application** field, select the application scope (for example, Test) in which you want to operate the ServiceNow platform.
3. Close the System Settings page.
4. Navigate to **Workflow** > **Workflow Editor**.
5. Create a workflow in the Workflow Editor. For more details, see Create a workflow.
6. In the Workflow Editor, click .
7. In the **Application** tab, **Application** is set to the current application scope selected in System Settings.
8. In **Accessible from**, select **All application scopes** if the workflow is available to all application scopes, or select **This application scope only** if it is only available to, and accessible in the current application scope only.
   Only those workflows that are accessible from all application scopes can be copied to another application scope.
9. Go back to the Homepage, click .
10. In the **Developer** tab, in the **Application** field, select the application scope (for example, Production) to which you want to copy the workflow.
11. Navigate to **Workflow** > **Workflow Editor**.
12. Refresh the page, then open the same workflow you created.
    An **Out of scope workflow, workflow belongs to <scope name> scope** message appears, where <scope name> is the application scope in which the workflow was originally created.
13. In the Workflow Editor, click .
14. Select **Copy**.
    The **Workflow Name** dialog appears:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

   a. In **Workflow Name**, type the new name for the copied workflow.
   b. Click **OK**. The system creates a workflow in the current application scope.

15. In the Workflow Editor, click ⓘ.
16. In the **Application** tab, **Application** is set to the current application scope.
17. In **Accessible from**, select **This application scope only** if to make the newly copied workflow a private one that cannot be accessed from outside current scope.
18. Click **Update**.

Result

A new workflow record is created in the selected application scope and marked as private if designated as one in the Workflow Editor.

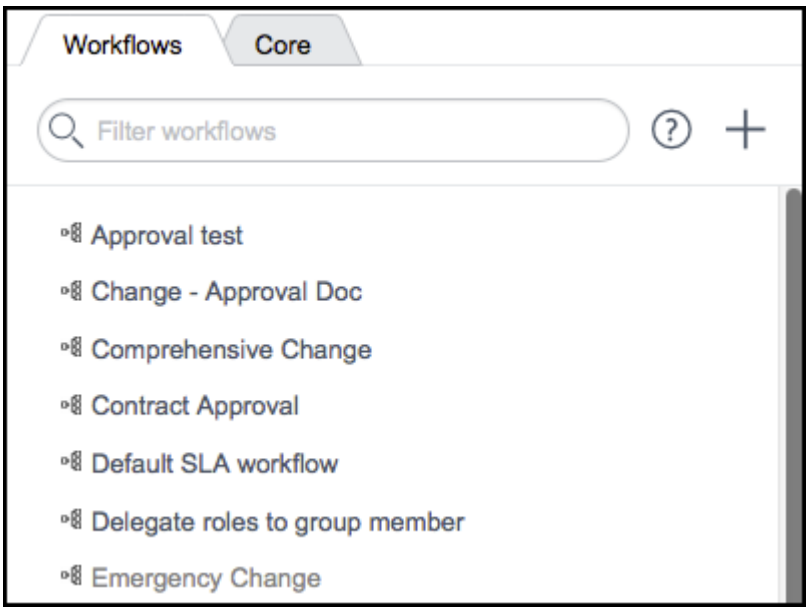
Workflows used as subflows

A workflow can launch another workflow as an activity.

The parent workflow triggers the subflow and then waits for the subflow to complete before continuing. Run the workflow validation tool prior to publishing to detect missing subflows and other dependency problems, such as those involving update sets.

The **Workflows** tab in the Workflow Editor contains a list of the workflows available for use as subflows.

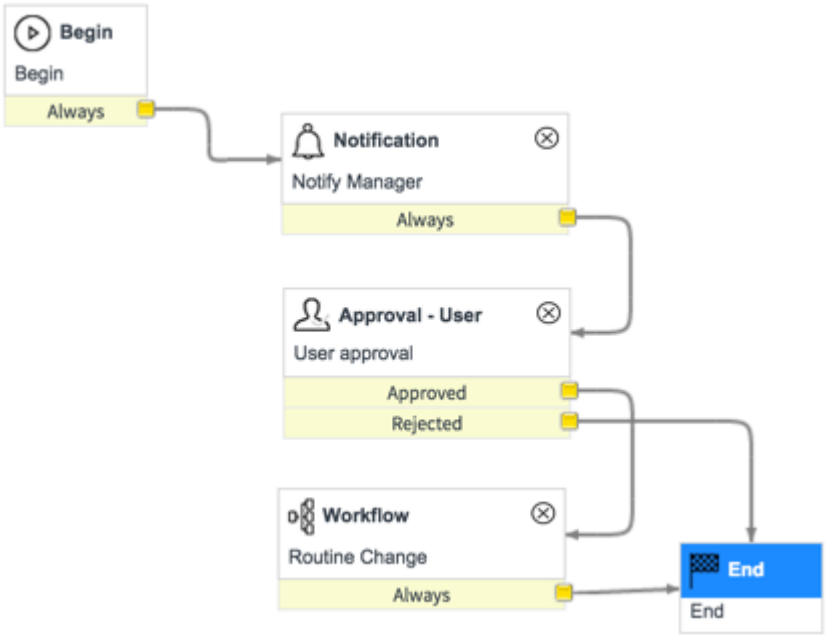
Workflows available to use as subflows



Make sure that the selected subflow is active. If the subflow is inactive, the main workflow will hang with a **Loading** message. If you place an inactive subflow into a workflow, the subflow appears with a red banner, indicating that it cannot run. An active subflow is highlighted in blue when selected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow with active subflows



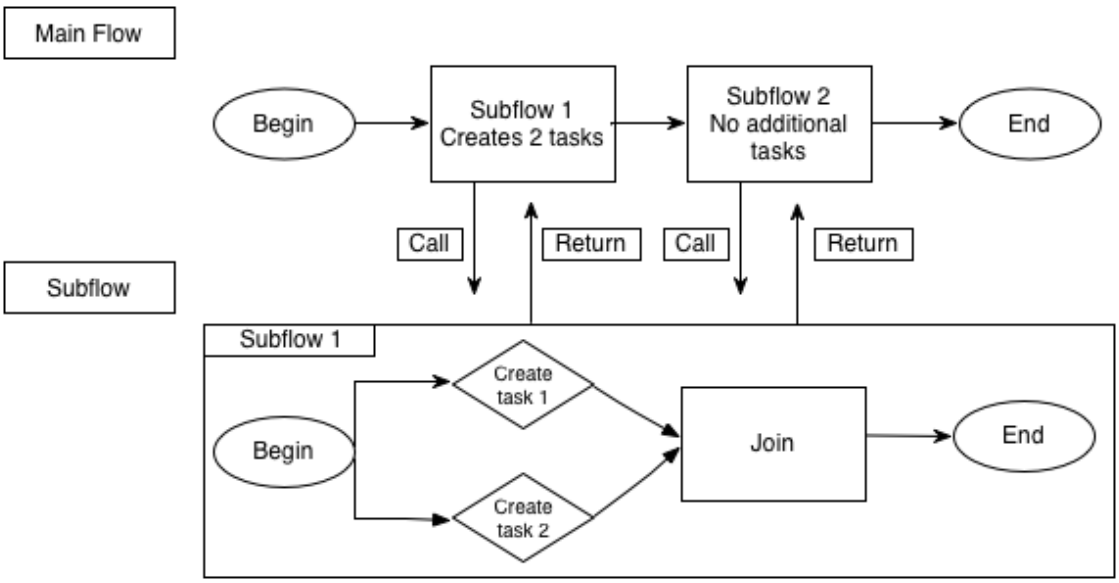
Subflows and the Create Task activity

If a workflow contains a **Create Task** activity that has executed on the current record, additional task activities in the workflow might not execute as expected.

This can happen when the same subflow containing a Create Task activity runs more than once in a parent flow. When the subflow reruns and attempts to execute the **Create Task** activity again, the system reopens the first task activity instead and does not create an additional task.

Note:
An alternative to creating duplicate subflows that use the **Create Task** activity is to add a **Run Script** activity to the workflow that creates a task with a script.

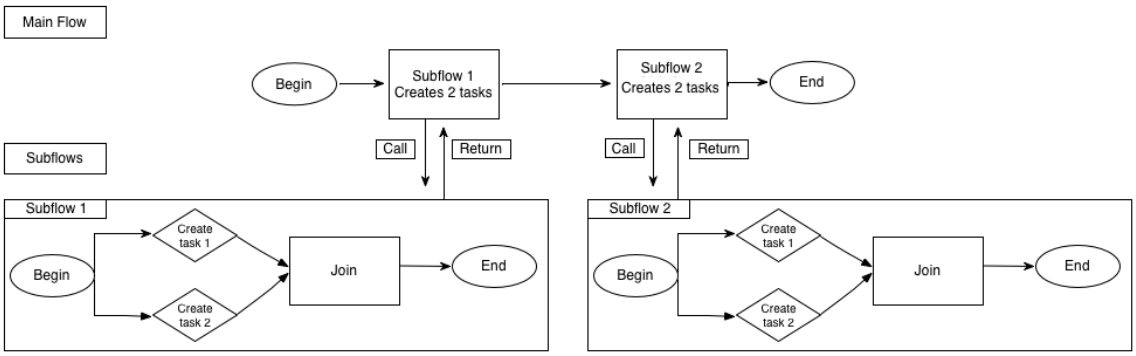
The same create task activity runs twice in a workflow



In this configuration, the workflow does not run the same subflow containing a **Create Task** activity more than once. This allows the workflow to create additional tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Running different subflows containing the Create Task activity



Pass a variable from a workflow to a subflow

Use this process to pass variables from a parent workflow to a subflow.

Before you begin

Role required: workflow_admin, workflow_creator, or admin

About this task

Note:
You can also use the **Return Value** activity in the subflow to return values to the parent workflow. Make sure to have a **Return Value** on every ending transition path.

Procedure

1. Prepare the subflow to accept variables from the parent workflow by defining the inputs.
2. Include the subflow in the parent workflow and connect the inputs to the parent workflow variables.

Note:
You cannot pass variables to a subflow that runs on the Requested Item [sc_req_item] table.

Define inputs for a subflow

Define the input variables for a workflow to request from parent workflows when it is launched as a subflow.

About this task

All inputs are stored in the Variables [var_dictionary] table.

Procedure

1. In the editor, open and check out the workflow.
2. In the title bar, click the menu icon and select **Edit Inputs**.
3. In the Workflow Inputs window, click **New**.
4. Populate the record with the definition of the variable, including the column name, the label that is displayed to the user, and the type of field.
5. Click **Submit**.

Invoke a subflow in a workflow

Use this procedure to add a subflow to a workflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the Workflow Editor, open and check out the parent workflow.
2. Drag the subflow from the **Workflows** tab to the parent workflow.
3. In the New Activity dialog box, define the variables defined by the subflow's **Inputs**.

   These fields can accept both static values or variables in the following format:

   `${variable_name}`
4. Click **Submit**.

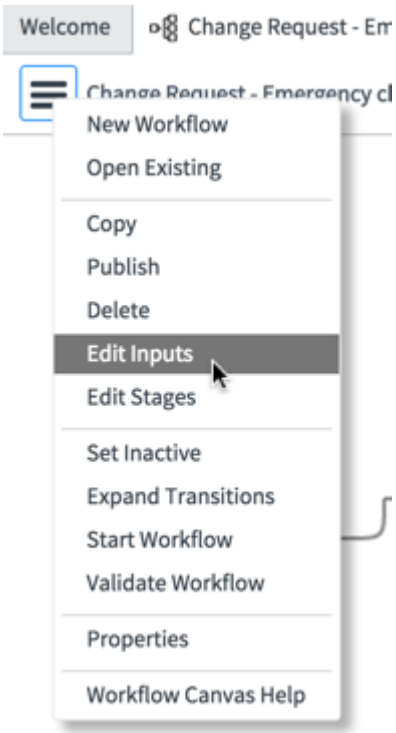
   The workflow triggers the subflow at the appropriate time and passes the variables as indicated by the **Inputs** definition.

Prepare a subflow

Review the process of preparing a subflow for use in a parent workflow, and for preparing the parent workflow to use a subflow.

Procedure

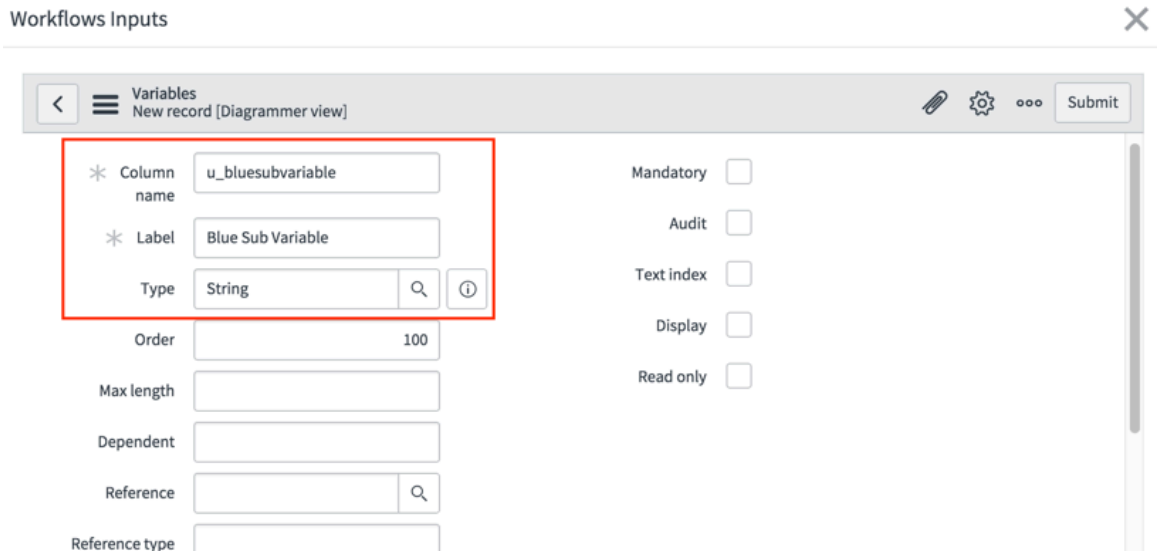
1. In the editor, open and check out the workflow that you want to use as a subflow.
2. In the title bar, click the menu icon and select **Edit Inputs**.



3. In the Workflow Inputs window, click **New** in the **Variables** list.
4. Add a new variable depending on the type of values that it is going to store.

   The following example sets up a string value.

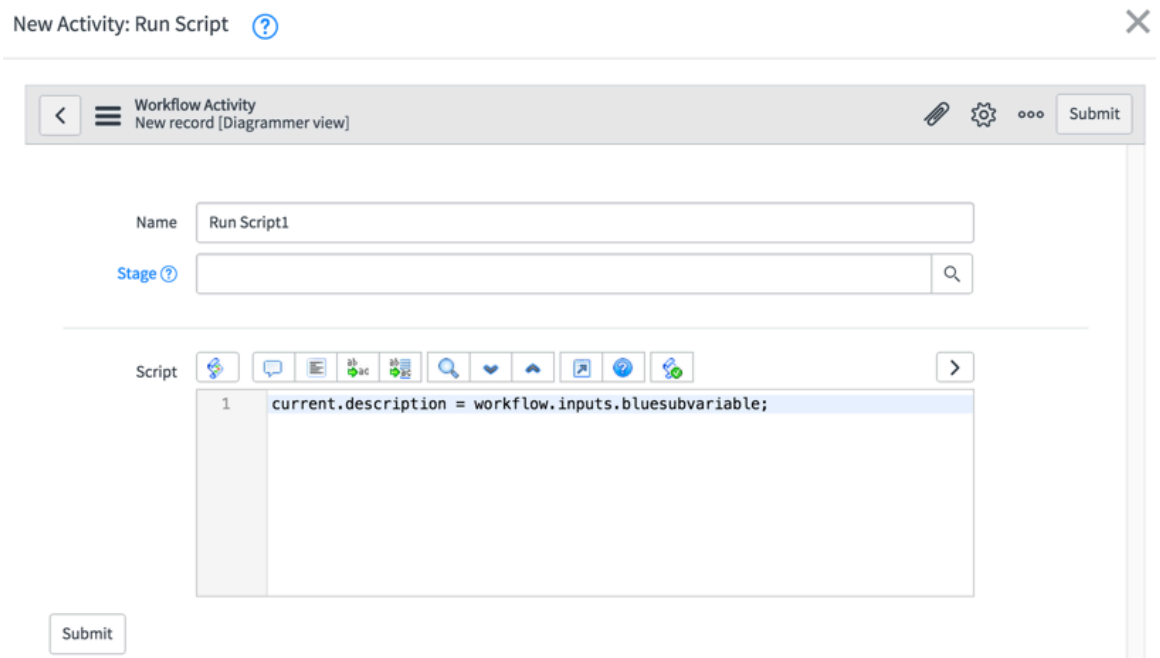
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Click **Submit**.
6. Close the **Workflows Inputs** dialog.
7. Create a **Run Script** activity on the subflow.
   - Set the value from the parameter to a field on the current form. This is important because the **Notification** activity can only pull values from the current variable and not from the newly added variable. The following example sets the value in the **Description** field.

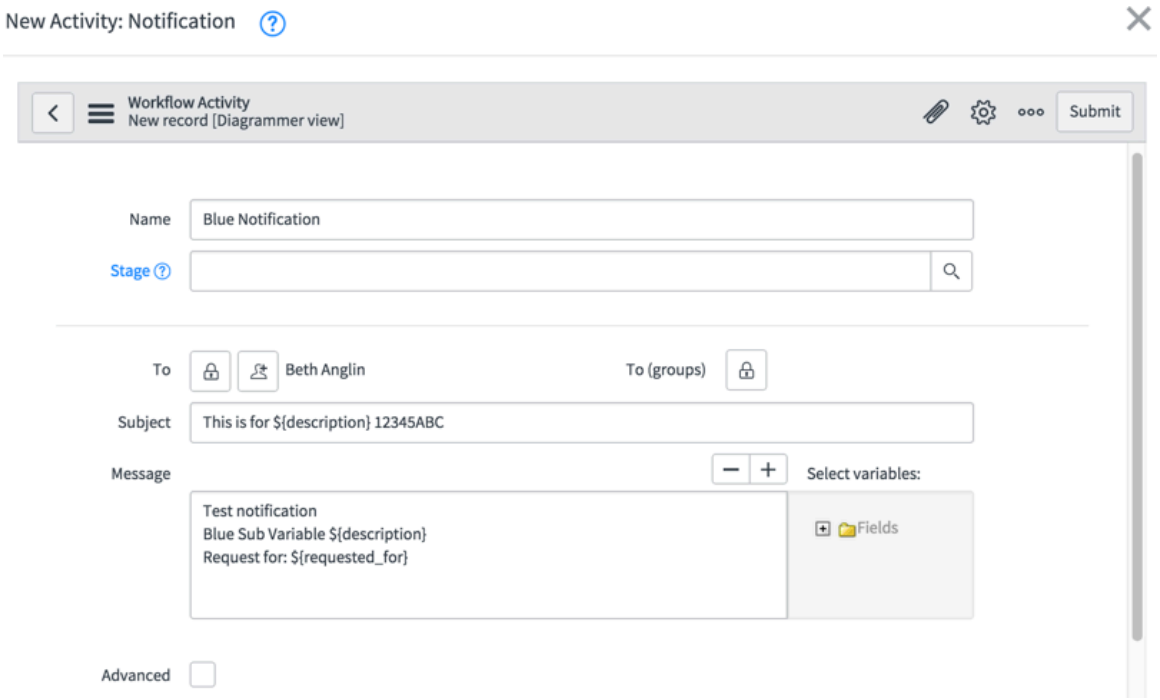
     ```
     current.description = workflow.inputs.bluesubvariable;
     ```

   - Create a new field on the request form but do not display the field. This serves as temporary storage.

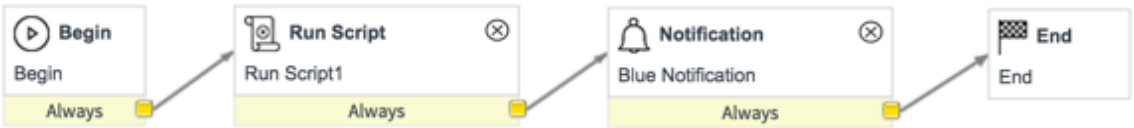


8. Create a **Notification** activity on the subflow and use `${description}` in the subject to return the value from the field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



This is what the subflow would look like:



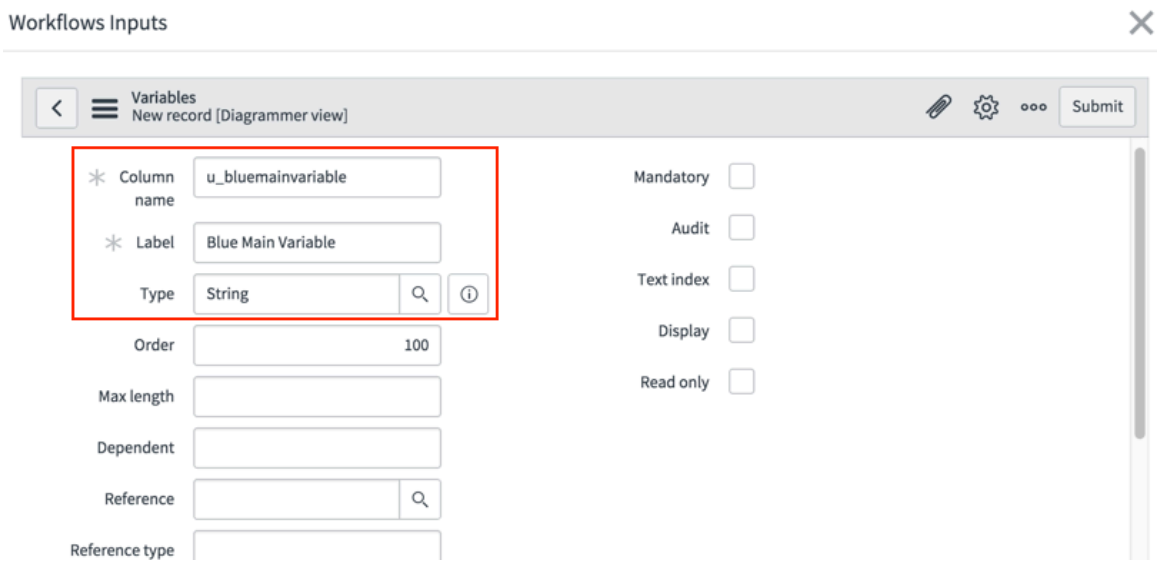
Prepare a workflow to use a subflow

After you create a subflow, use this procedure to prepare the parent workflow.

Procedure

1. On the parent workflow, create a variable similar to what you did on the subflow, but name it something different.

   In the following example, the variable is named **Blue Main Variable**.

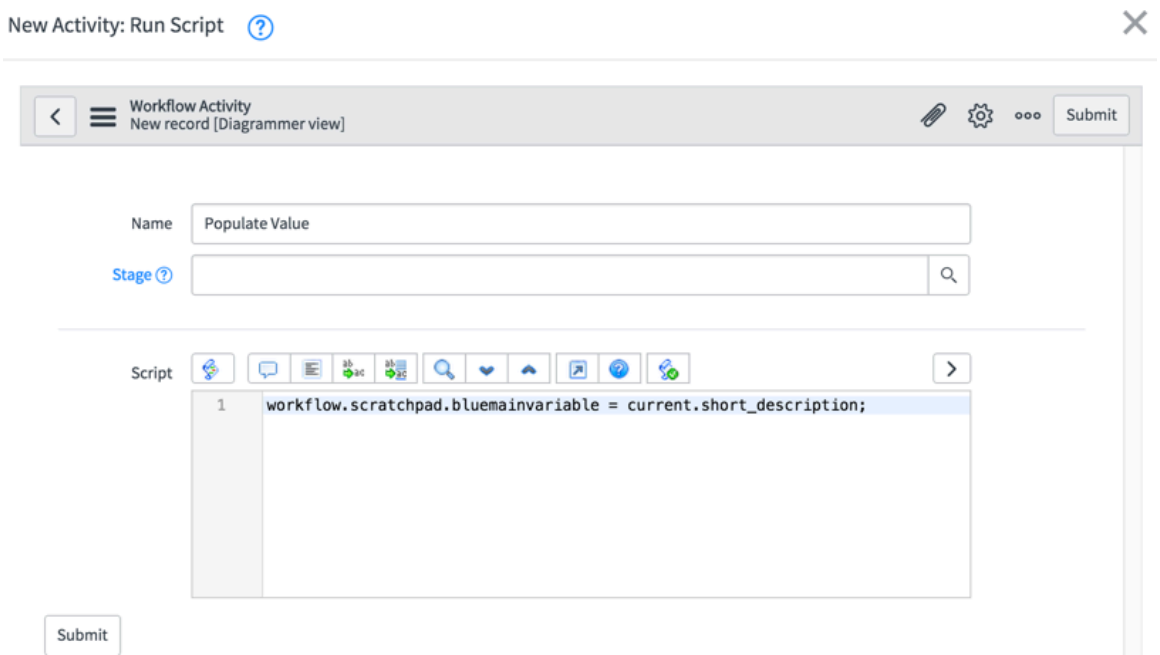


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Click **Submit**.
3. Insert a **Run Script** activity to return the value from a field to the newly created variable.

   In this example, the value of the **Short Description** field is returned and given to the newly created variable.

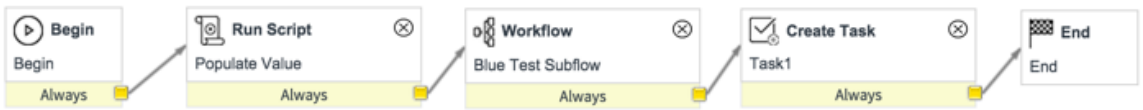
   ```
   workflow.scratchpad.bluemainvariable =
   current.short_description;
   ```



4. Click **Submit**.
5. In the subflow activity, set the **Blue Sub Variable** to pass the `bluemainvariable` to the `bluesubvariable`.

   ```
   ${workflow.scratchpad.bluemainvariable}
   ```

   This is what the main workflow looks like:



Using variables in a workflow

Within workflow there are several different types of variables that are available.

Some variables define, describe, or compose the pieces of the workflow (such as workflow activities). Some variables are available specifically to facilitate the execution of a workflow (such as scratchpad variables). Some variables define, describe, or compose the data records being manipulated by the workflow process (for example, the elements of a Glide Record that are defined in a dictionary.xml file describing a record, such as an incident).

Activity variables

Activity variables are properties specifically associated with a workflow activity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

About this task
These are the inputs that appear on the activity definition when a specific activity is dragged onto the workflow canvas. These variables are properties that define, compose or describe the workflow activity, or the work it is designed to perform.

Activity variables are declared in a related list within the Workflow Activity Definition.

To add, view, or modify a variable:

Procedure
1. Navigate to **All** > **Workflow** > **Activity Definitions**.
2. Select a workflow activity, such as **Approval - User**.
3. In the **Activity Variables** section or tab, add, view, or modify the variables. Activity variables are defined using the same fields as System dictionary.

Note:
If defining a new activity variable that is dependent on another activity variable, put the prefix "vars." before the name of the parent activity variable. For example, if the child field is dependent on a field named **parent**, put the value `vars.parent` in the **Dependent** field.

To control the visibility of an activity variable on the workflow canvas after the activity has been dragged to the canvas, use a UI policy on the wf_activity table.

To access the variables or assign values to these variables within the workflow activity, use the *vars* variable of the workflow activity.

```
activity.vars.variable_name = new_variable_value
```

Workflow input variables

Workflow variables are external values that are passed into and referenced by a workflow during its execution.

Before you begin
Role required: admin

About this task
Workflow variables can be declared externally in a script and passed into a main workflow or they can be declared within a main workflow and passed as inputs to a subflow.

Note:
There is a specific kind of input variable for any workflow that is declared against the table Requested Item [sc_request_item]. To understand the use of these variables, see Workflow catalog variables.

Workflow variables are declared in a form available from the Workflow Editor gear menu.

Procedure
1. Navigate to **All** > **Workflow** > **Workflow Editor**.
2. Edit and check out a workflow.
3. Select the Workflow Activities menu and select **Edit Inputs**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select an existing variable or select **New**.

   Note the **Column name** field. Use this value when accessing the variable from a script.

   Workflow variables do not appear on the workflow canvas, they are only available for view from the Workflow Activity menu.

   The input variables are available to use in scripts. To access an input variable from a script:

```
var input  = workflow. variables. variableName //get the workflow variable identified by column name .
```

Assigning values to variables from outside of workflow

After being declared in a workflow, values can be assigned to the variables from where the workflow is kicked off.

The following example demonstrates how a workflow variable's value can be set in a script include, business rule, or UI action:

```
//Declare an instance  of workflow.js
var wf  = new Workflow ( ) //Get the workflow id
var  wfId  = wf. getWorkflowFromName ( "Workflow Name" ) ;
//Start workflow, passing along name : value pair(s) for mapping to variable
//where input_var_name is the name of the variable declared in gear menu
//and input_var_value is whatever that value should be for this execution of
//workflow
wf. startFlow (wfId , null , "Workflow Name" , {input_var_name : input_var_value } ) ;
```

Another example that demonstrates a more readable way of passing multiple variables involves declaring an object, adding the names/values to the object, and passing it:

```
//Declare an instance  of workflow.js
var wf  = new Workflow ( )
//Get the workflow id
var  wfId  = wf. getWorkflowFromName ( "Workflow Name" ) ;
//Start workflow, passing along object containing name/value pairs mapping to inputs expected by the workflow
var vars  = { } ;
vars. input_var_name1 = input_var_value1 ;
vars. input_var_name2 = input_var_value2 ;
// add as many variables as your workflow is expecting, then pass the object
wf. startFlow (wfId , null , "Workflow Name" , vars ) ;
```

Assigning Values for Subflow Inputs from inside of a Main Workflow

If a workflow that accepts inputs is called from within another workflow, those input values can be set from the workflow canvas within the UI of the workflow activity. Each input variable declared for a subflow will have a text box input area displayed on the activity. Within these text boxes, the variables can be set with any value either from the scratchpad or from within the current record.

For more information, see Workflows used as subflows.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Reading the Value of a Workflow Input Variable

The value of a Workflow input variable is accessible anywhere within the workflow that accepts javascript by dot walking the current workflow object:

```
var readValue = workflow.inputs.variable_name;
```

Workflow scratchpad variables

Store and share string-based variables as name-value pairs between workflow activities.

The scratchpad is global to the instance of the running workflow and as such, is available equally to all activities.

Declaration

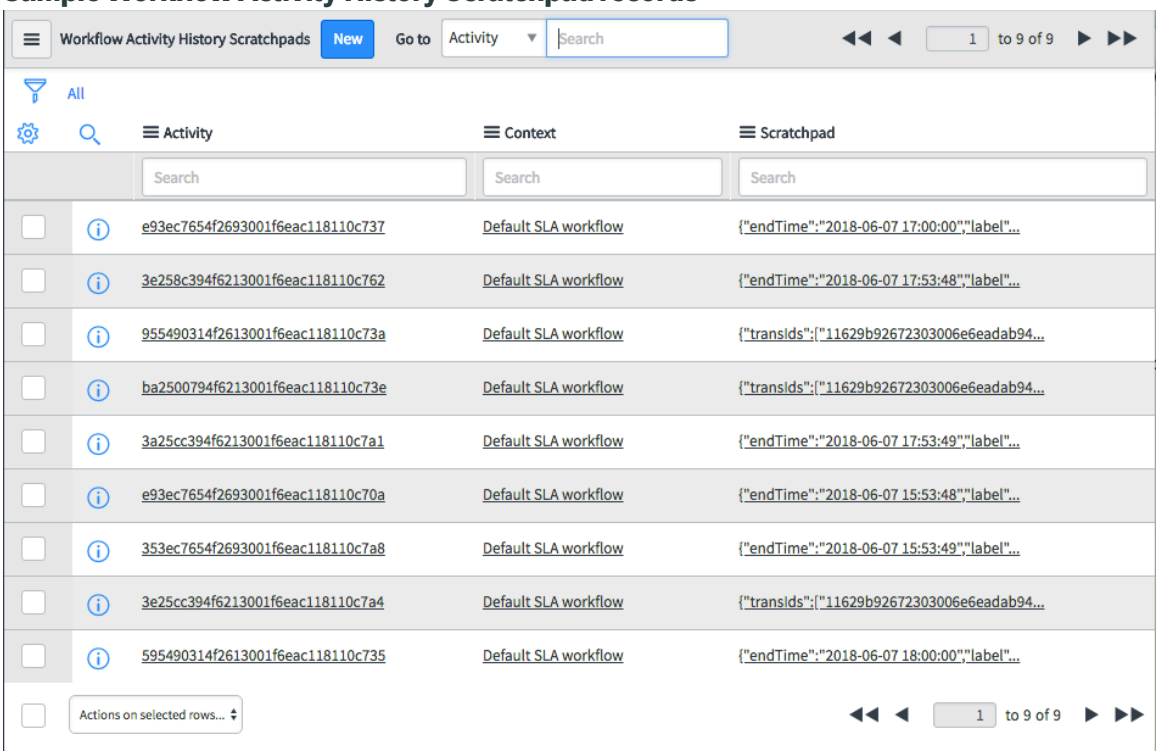
The scratchpad itself is automatically available to an executing workflow and requires no specific declaration. Variables are declared and stored in the scratchpad simultaneously by referencing it. For example:

```
workflow.scratchpad.variableName = variableValue;
```

Display

View activity scratchpad values from the Workflow Activity History Scratchpad [wf_history_scratchpad] table. Workflow Activity History Scratchpad is also an embedded list in Worfklow Activity History records.

Sample Workflow Activity History Scratchpad records



Access and Assignment

Use standard JavaScript object notation to access or assign scratchpad values. For example, use this format to assign a particular scratchpad variable value.

```
workflow.scratchpad.variableName = variableValue;
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use this format to assign a JavaScript variable to a scratchpad variable.

```
var myValue = workflow.scratchpad.variableName;
```

Current variables

Current is the database GlideRecord that kicked off the workflow, either by association to the table in the Workflow properties table or by being associated with a catalog item.

Declaration

Variables in current are the columns that are defined in the `dictionary.xml` file that support the database record. There is no way at runtime to add variables to the current record.

Display

Variables of a current record are displayed on the Glide Forms and Lists throughout the applications that use them.

Access and Assignment

To access the variables or assign values to the variables within the workflow activity, get the value from the current record by referencing the Glide Element.

```
var myVarValue = current.getElement(nameOfTheField);
```

or

```
var myVarValue = current.fieldName;
```

or

```
current.variableName.setValue( "A Variable Value");
```

Workflow catalog variables

Workflows that are associated with the Requested Item [sc_req_item] table have a specific type of workflow input.

The inputs into this workflow are essentially question:answer pairings that, when associated with a specific catalog task, become options on the task form. These options are generated by that catalog task activity within a workflow.

Scope

For the purposes of Service Catalog and workflow, a variable's scope determines its availability to a catalog task activity within a workflow. You can define variables as global or catalog item-specific. When a variable is associated to a catalog item and the workflow generating the catalog task is associated to the catalog item, the variable scope determines which variables are available for mapping within the catalog task activity in a workflow. If a workflow is associated with Requested Item [sc_request_item], and is not specifically associated with a catalog item, any catalog variable with a blank Cat Item field value is available to all catalog task activities within the workflow.

Declaration

You can declare requested item catalog variables at the catalog item level or at a global level.

About this task

You can declare global catalog variables using the Workflow Editor context menu.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Also see, Global variable declaration option 2.

Procedure

1. Navigate to **All** > **Workflow** > **Workflow Editor**.
2. Open and check out a workflow that runs against the Requested Item [sc_req_item] table.
3. Click the menu icon and select **Edit Catalog Variables**.
4. Click **New** to create a new variable or select an existing variable.
5. Select the **Global** check box.
6. Click **Submit**.

Global variable declaration option 2

You can declare global catalog variables using the Service Catalog.

Procedure

1. Navigate to **All** > **Service Catalog** > **Item Variables**.
2. The list of variables that appears in the workspace has a default filter of **Cat Item != <blank>**.
   Change the filter to **Cat Item = <blank>** and run the query.

   The catalog variables that appear are available to any catalog task that is initiated from within a workflow.
3. Click **New** to create a new variable.
4. Leave the **Cat Item** field blank.
5. Select the **Global** check box.
6. Click **Submit**.
   Also see, Global variable declaration option 1.

Catalog item specific variable declaration option 1

You can declare a catalog item-specific variable.

About this task

These variables are only available to the catalog item referenced in the **Cat Item** field on the variable record.

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Variables** > **Item Variables**.
   Note the list of variables that appears in the workspace has a default filter of **Cat Item != <blank>**.
2. Enter or select a catalog item in the **Cat Item** reference field.
   Selecting a **Cat Item** restricts the scope and availability of the catalog variable to that specific catalog item.
3. Click **Submit**.
   Also see, Catalog item specific variable declaration option 2.

Catalog item specific variable declaration option 2

You can declare a catalog item-specific variable directly from a catalog item record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Creating a catalog variable in this way automatically sets the **Cat Item** reference to the catalog item selected.

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Definitions** > **Maintain Items**.
2. Select or create an a catalog item.
   Note the **Variables** related list. All variables declared using this related list have a **Cat Item** reference value of the current catalog item.
3. From the **Variables** related list, click **New**.
4. Ensure that the **Cat Item** field correctly references the catalog item previously selected or created.
5. Go to or open the **Question** section or tab.
6. Add a **Question**.
7. Add a **Name**.
   Variable names should not include white space and cannot begin with a number.
8. Click **Submit**.
   Also see, Catalog item specific variable declaration option 1.

Display

Catalog specific item variables are visible in several places depending on where in the process the variable is viewed.

Declaration can happen and variables can be seen from within the menu, inside both the **Maintain Items** module and in the **Item Variable** modules of the Service Catalog.

Within a workflow, the Catalog Specific Item variables are available to the **Catalog Task** activity in the form of a slushbucket at the bottom of the **Catalog Task** activity. Item variables that are selected, are the question and answer pairs that will appear on the task that is generated by that instance of **Catalog Task** when executing that workflow.

If a workflow is associated with a specific catalog item, the association acts as a filter for item variables that appear in the slushbucket of the **Catalog Task** activity.

The last place the variables are seen is in the task form that is generated by the Catalog Task Item. The variables selected in the slushbucket are the question and answer pairs that appear to the user on the task form.

Access and assignment

The Catalog Item Variables are available and assigned to a specific **Catalog Task** activity (thereby to a specific task) using the slushbucket entry of a catalog task.

The user working the task enters the values of the variables.

To access the values of a Catalog Item Variable inside a script:

```
var now_GR  = current ; // or create and query a new GlideRecord
var itemVariable  = now_GR. variables [ variableName
  ] ; //access the service catalog variable identified by the
 variable name.
var itemVariableValue  = itemVariable. getValue ( ) ;
var itemVariableName  = itemVariable. getName ( ) ;
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var itemQuestion  = itemVariable. getQuestion ( ); //All
 GlideappQuestion API are accessible on itemQuestion
```

Workflow events

The system employs two types of events: registered platform events and workflow events.

Registered platform events

Registered events are created in business rules and are used for such tasks as sending email notifications when records are inserted into the database. Workflow events are registered within workflows only and are not used anywhere else in the platform. Registered platform events can be triggered by a workflow for external use, but cannot be used within a workflow.

Workflow events

Workflow events follow different rules than platform events that are registered using the event registry. Platform events are entered into the Event Registration [sysevent_register] table and are available for platform processes to use. Workflow events are triggered exclusively for the workflow engine and are used only to direct the work of executing workflow contexts. When an event is registered in a workflow, it is attached to a currently executing activity in the **registered_events** column of the Workflow Executing Activity [wf_executing] table.

Workflow events also can be broadcast to a workflow from any scripting source that has access to the workflow context, such as a script include or a **Run Script** activity. In this case, the event, such as **cancel**, is passed to all records in the Workflow Executing [wf_executing] table for a specific context.

Whether by registry or by broadcast, an event is handled by the activity definition associated with the currently executing activity. Each activity definition comes with a set of handlers. For example, most activities come with `onExecute`, `onCancel`, and `onUpdate` event handlers. As an example of a more specific event, the **Approval - User** activity also comes with `onDetermineApprovalState`, which is specific to the work of the approval activity.

Multiple parallel events

A single workflow can have multiple event threads running concurrently, such as when a workflow has timers that overlap on separate workflow branches. If any additional thread completes before the first thread, the system stores event information from the additional thread on the Workflow Queued Commands [wf_command] table. After the first thread completes, the system retrieves the information stored by the additional thread and proceeds through the workflow with the event information from each thread.

Workflow events in the base system

Several workflow events are available in the base system.

Workflow events in the base system

Event	Description	Purpose	To use
activityComplete	String value used by activity definitions to respond to the `onActivityComplete` event handler.	Informs records in the Workflow Executing Activity [wf_executing] table about the completion of other activities in	If the activity is allowed to set the boolean value for `wf_executing.notify_ter` then set the value to `true` `(activity.notify_termin` `true)` during the `onExecute` e

© 2026 ServiceNow, Inc. All rights reserved.

Workflow events in the base system (continued)

Event	Description	Purpose	To use
		the same workflow context.	
otherEvent	String value used by the **Join** activity to respond to an otherEvent.	Informs records in the Workflow Executing Activity [wf_executing] table about an otherEvent that has completed.	The **Join** activity transitions from **r** preceding activities. These preced all create a wf_executing record, w a check to see if the record alread **Join** already exists, then the **Join** the executing transition sets the w record for deletion.
timer	String value used by workflow activities to respond to a **Timer** activity that has expired.	Allows wf_executing records to be informed about a timer activity that has completed and has fired the timer event.	The **Timer** activity schedules a job script. The script calls fireEvent (w timer).
execute	String value used by workflow activities to respond to a **Timer** activity that has expired.	Informs a record in the wf_executing table with the initial state of **Executing** to proceed with its primary work.	The workflow engine, for each tran executed, creates an executing re state of **Executing**. Once created, record is put in a queue for proces each item in the queue, the Rhino established, the activity definition the executing record is instantiate `run()` function is called. When th record is **Executing**, this function a `onExecute`.
execute (specific to **Lock**)	String value used by the **Lock** activity to respond to a waiting lock that is ready to make another attempt to obtain a specific lock. This execute is different than the previous execute because it is called on a separate thread, at specified intervals, and is treated as an outside event.	Informs a wf_executing record waiting to execute that the specified wait interval has passed and that it should attempt to get the lock again.	**Lock** activity schedules a job with that uses the workflow script inclu `fireEvent(wf_executing, 'execute')` method.
determineApprovalState	String value used by approval activities to respond to a change in the overall approval status of the current record.	Informs wf_executing records for approval activities about an approval that completed and triggered the timer event.	**Approval Coordinator** both regist the event and triggers the event. T approvals have listeners that dete approval state.
cancel (from within activity definitions)	String value used by workflow activities to	Informs all wf_executing records	The **End** activity uses the global `workflow.broadcastEvent`

Workflow events in the base system (continued)

Event	Description	Purpose	To use
	respond to a request for cancellation.	in a context that the workflow is being canceled.	to interrupt the currently running w records. This changes the state of to **Cancelled**.
cancel (outside current context)	String value used by workflow activities to respond to a request for cancellation.	This event is the same as the cancel event above and handled the same. However, the management of this event is subtly different. This event informs all wf_executing records in a context that the workflow is being canceled. The event is managed via the *onCancel* event handler of each executing activity definition, but the event is called differently. In particular, the call to cancel from outside an activity definition is blocked by the current mutex. This is a significant difference in that the event does not interrupt a currently executing activity that is still operating within the parameters of the current mutex.	Any script can call cancel on a kno context via the workflow script incl example, `var w = new Work w.cancel(context); //wh` is a GlideRecord of the context to
stop (see **End** activity)	The **End** activity checks for this event.	If the stop event is the current event, then the cancel operation of the **End** activity is bypassed.	Only in the **End** activity.
listener	String value that the workflow (subflow) activity triggers as an event.	When a main workflow calls a subflow, the workflow keeps the ID of the subflow's context	The listener event is passed to the context on completion of a subflow managed by the onListener action workflow activity.

Workflow events in the base system (continued)

Event	Description	Purpose	To use
		in the scratchpad. When the subflow is complete, it triggers the listener event via a business rule.	
probe_complete	String value triggered in the workflow by an Orchestration activity indicating that the MID Server has completed a task.	The probe_complete event is triggered from Orchestration sensor processors via the workflow helper function `handleEventById`.	The `onProbe_complete` event the `WebServiceActivityHa` used by most Orchestration activi
pause	String value sent to a workflow from an SLA to pause the **Timer** activity.	When an SLA is paused, the SLA workflows must be paused if there is a timer running.	Use is exclusive to the SLA timer
resume	String value used by the **Timer** activity to resume a paused timer (see pause).	When an SLA is resumed, the SLA workflows must be resumed as well.	Use is exclusive to the SLA timer.

Glide events relative to workflows

Workflow uses several Glide events.

Workflow Glide events

Event	Description	Purpose	To Use	Source	Thread	Listeners
Insert	Global event set upon the insert of a GlideRecord that causes the script engine, and through that the workflow engine, to wake up.	Starts workflows that are associated with the current GlideRecord either by reference, as in request items and SLA timers, or by conditions associated with the GlideRecord's table.	There is no explicit customer-facing use for this in a workflow. It is part of the Glide engine, and with this event, the only thing workflows can do is start. Workflows can also be started manually using a script.	Workflow Engine, RunEngine	Current thread, current mutex	User action of insert
Update	Global event set upon the	Looks to the Workflow Context	There is no explicit customer-facing use for this in	Workflow Engine, RunEngine	Current thread,	User action of

Workflow Glide events (continued)

Event	Description	Purpose	To Use	Source	Thread	Listeners
	update of a GlideRecord that causes the script engine, and through that the workflow engine, to wake up.	[wf_context] table to find running workflows that are associated with the current GlideRecord by document ID.	a workflow. It is part of the Glide engine, and with this event, the only thing workflows can do is advance through the next set of transitions.		current mutex	update of a GlideRecord
Delete	Global event set upon the delete of a GlideRecord that causes the script engine, and through that the workflow engine, to wake up.	Looks to the Workflow Context [wf_context] table to find running workflows that are associated with the current GlideRecord by document ID.	There is no explicit customer-facing use for this in a workflow. It is part of the Glide engine, and with this event, the only thing workflows can do is advance through the next set of transitions.	Workflow Engine, RunEngine	Current thread, current mutex	User action of delete of a GlideRecord
Query	Global event set upon the query of the Glide database that causes the script engine, and through that the workflow engine, to wake up.	Looks to the Workflow Context [wf_context] table to find running workflows that are associated with the current GlideRecord by document ID.	There is no explicit customer-facing use for this in a workflow. It is part of the Glide engine, and with this event, the only thing workflows can do is advance through the next set of transitions.	Workflow Engine, RunEngine	Current thread, current mutex	User action of query of a GlideRecord

Workflow event-specific functions

There are several functions that relate specifically to workflow events.

Workflow event-specific functions

Function	Description	Purpose
registerForEvent (eventName)	Function in the workflow environment that writes events represented as strings to the `wf_executing.registered_events` field.	The workflow events are just strings. When an activity that has registered for an event executes, a comma delimited set of events is stored with the Workflow Executing Activity [wf_executing] record. When the event is triggered in the workflow

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow event-specific functions (continued)

Function	Description	Purpose
		context, the wf_executing table looks for all executing records that contain the string that represents the event in the `wf_executing.registered_event` field
unRegisterForEvent (eventName)	Function in the workflow environment that removes a string value representing an event that has been written to the `wf_executing.registered_events` field.	The workflow events are just strings that are written to the `wf_executing.registered_event` field. When an activity unRegisters for an event, the comma delimited set of events stored with the Workflow Executing Activity [wf_executing] record is searched, and if that string is found, it is removed.
fireEvent (eventName)	Function in the workflow environment that examines the contents of the `wf_executing.registered_events` field, comparing its contents to the `eventName` passed in.	The workflow events are just strings that are written to the `wf_executing.registered_event` field. When *`fireEvent(eventName)`* is called by a workflow activity, the workflow engine queues up any executing records that contain the string in the registered field.
fireEvent (eventRecord, eventName)	Function in the workflow environment that sends an event to a specific Workflow Executing Activity [wf_executing] record. The `eventRecord` is a GlideRecord of the type wf_executing.	This event call expects an *`onMyEvent`* event handler in the activity represented in the event record (Workflow Executing Activity [wf_executing] table). When *`fireEvent(eventRecord, eventName)`* is called by a workflow activity, the workflow engine queues up the specific executing record with that event and passes the event into the activity definition for the on<eventName> handler to manage. This event is queued up in its own mutex, so the current queue complete before this event is processed.
fireEvent (eventRecordSysId, eventName)	Function in the workflow environment that sends an event to a specific Workflow Executing Activity [wf_executing] record. The `eventRecordSysId` is the sys_id of a GlideRecord of the type wf_executing.	This is the same as the *`fireEvent`* above except that it accepts an ID and returns the Workflow Executing Activity [wf_executing] record.
fireEvent (eventRecordSysId, eventName, optionalJSONObject)	Function in the workflow environment that sends an event to a specific Workflow Executing Activity [wf_executing] record. The `eventRecordSysId` is the sys_id of a GlideRecord of the type wf_executing.	This is the same as the *`fireEvent`* above except that it accepts a JSON object as a third parameter. This object can specify any data expressible as JSON. You can also specify additional functionality when creating a workflow activity.
broadcastEvent (contextId, eventName)	Function in the workflow environment that sends an event to all currently running Workflow Executing Activity [wf_executing]	This is the same as the *`fireEvent`* above except that it accepts an ID and returns the Workflow Executing Activity [wf_executing] record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow event-specific functions (continued)

Function	Description	Purpose
	records in a specified context, regardless of their state.	
broadcastEvent (eventName)	Function in the workflow environment that sends an event to all currently running Workflow Executing Activity [wf_executing] records in the current context, regardless of their state.	This should not be confused with `broadcastEvent` above. This event is only available to current Workflow Executin Activity [wf_executing] records.

Event-specific workflow activities

The following workflow activities trigger events.

Event-specific workflow activities

Activity Name	Description	Purpose	To Use	Source	Thread	Listeners
Create Event	Requires an event from the event registry rather than a workflow event. This activity is located in the **Notification** category of the workflow tree.	Fires the notification event specified in the Workflow Activity [wf_activity] table.	1. Navigate to **System Policy** > **Events** > **Registry** 2. Create an event. 3. Navigate to **System Policy** > **Templates** and create an Email templates. 4. Navigate to **System Policy** > **Email** > **Notifications**. 5. Create an email notification that is triggered by the event you created and sends the template you created. 6. On the workflow canvas, drag the **Create Event** activity onto the canvas and associate it with the newly registered event.	Event Registry	Triggered in the current thread and handled on the worker thread in notifications. Never processed by a workflow	On the notificati thread, outside c workflow

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Event-specific workflow activities (continued)

Activity Name	Description	Purpose	To Use	Source	Thread	Listeners
			When the workflow executes, the event is created and the email associated with the event is sent.			
Wait for WF Event	Listens for workflow events, as described in the Workflow Events in the Base System table, and only within the current context. This activity is located in the **Conditions** category of the workflow tree.	Waits for another transition branch of the current context to trigger an event.	Takes an event name as input. When the activity is executed, the specified event name is added to a string array stored in the **registered_events** column. The values in this column are in a list of all events the activity waits for when it is executing.	The **Wait for WF Event** activity has a generic `onUnhandledEvent` that tests the current event against the value that was passed to the variable. If they match, the **Wait for WF Event** moves the workflow forward.	Triggered in the current thread or from a script include	The `onUnhandled` of the **Wait for W Event** activity

Workflow stages

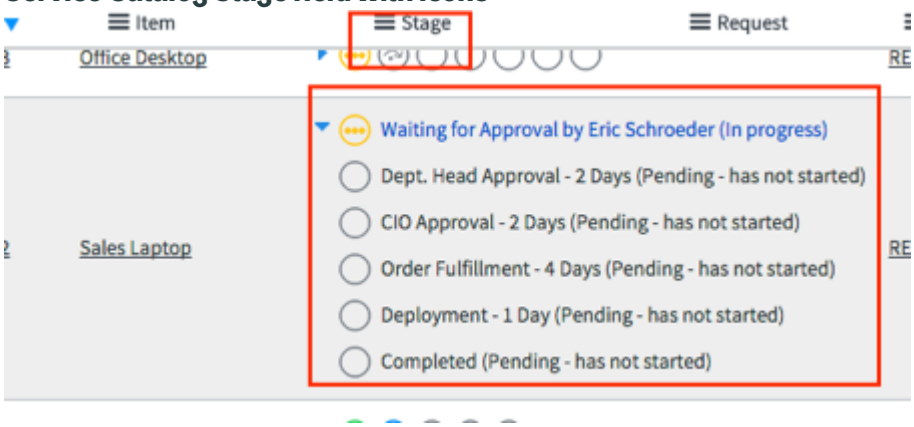
Workflows can indicate workflow progress by updating any field designated as a stage field.

For example, the Incident [incident] table has an **Incident state** field that indicates progress, but the service catalog uses the **Stage** field.

To indicate the workflow's progress through the possible stage values, the interface updates the **Stage field** selected in the workflow properties. Available fields depend on the table used by the workflow. If the field provides a choice list, then the choices are available as stage values for the workflow. If the field is a workflow field, it displays an icon to indicate the workflow's progress, as with the Service Catalog's **Stage** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Catalog Stage field with icons



After stages are added to the workflow, they can be assigned to each workflow activity. If an activity with an assigned stage is encountered when the workflow runs, the workflow engine assigns the stage to the record associated with the workflow context.

For workflows that use the Requested Item [sc_req_item] table, the stage field is automatically set to the **Stage** field of the table and cannot be changed. The stage state displayed for a workflow running on the Requested Item table is based on the state of the workflow activities.

- If an activity is active, then the stage is shown with the state of **In progress**.
- If an activity is in the **Pending** or **Completed** state, the stage reflects this state.
- If an activity is canceled, **Request Cancelled** appears in the **Stage** field. The "Cancelled" label set in the wf_stage table is a reserved word, and does not display in the **Stage** field.

How stage values are derived

Stage values are derived from various sources in the interface.

Note:
An updated method for managing workflow stages as a set is also available. For information about grouping and reusing stages, see Workflow stage sets.

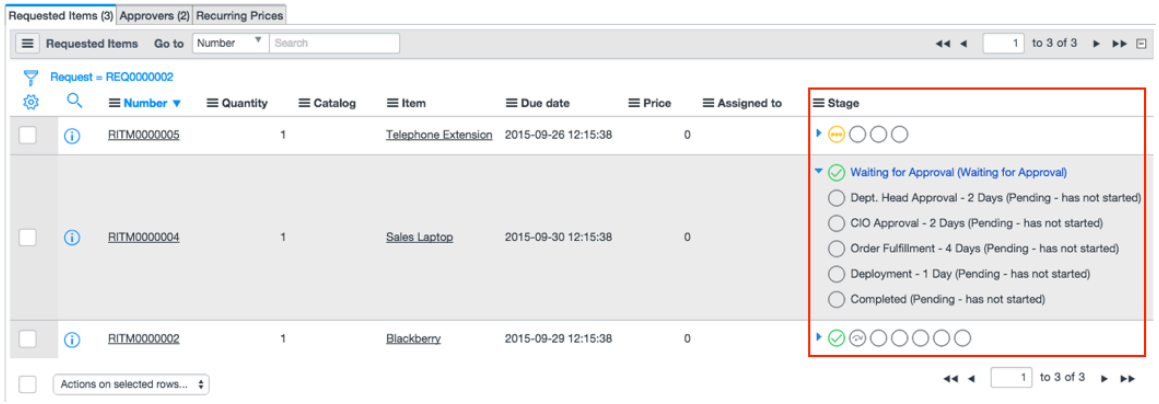
Stage values are derived from the following sources:

- **Choices for Stage column**: Choices defined for the column selected as the **Stage** column for the workflow.
- **Default stages for table**: Stages defined in the Stage Default [wf_stage_default] table for the table selected.
- **Workflow-specific stages**: Applied only to the workflow for which they were defined in the Workflow Stage [wf_stage] table.
- **Stage values in existing records**: Values from the designated **Stage** column in the table assigned to the workflow are inherited from existing records.

If the stage field for a workflow is the table column named **Stage**, then the progress of the workflow appears in any list view containing the **Stage** column.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Stages in a list



Stage values shown in the list views are accompanied by the state, based on the workflow activities being executed. If an activity has a stage specified for it, and the activity is currently active in the workflow, then the stage is shown with a state of **In progress**. Similarly, if the activity is in the **Pending** or **Completed** state, the stage reflects this state.

Example

If the workflow table is Request Item [sc_req_item], then the stage field is automatically set to the **Stage** column of that table and cannot be changed. The following stage values for the request item are displayed in a choice list from the Dictionary Entry [sys_dictionary] table:

- Waiting for Approval
- Fulfillment
- Delivery

In addition, the Request Item table has the following default stages:

- Request Cancelled
- Completed

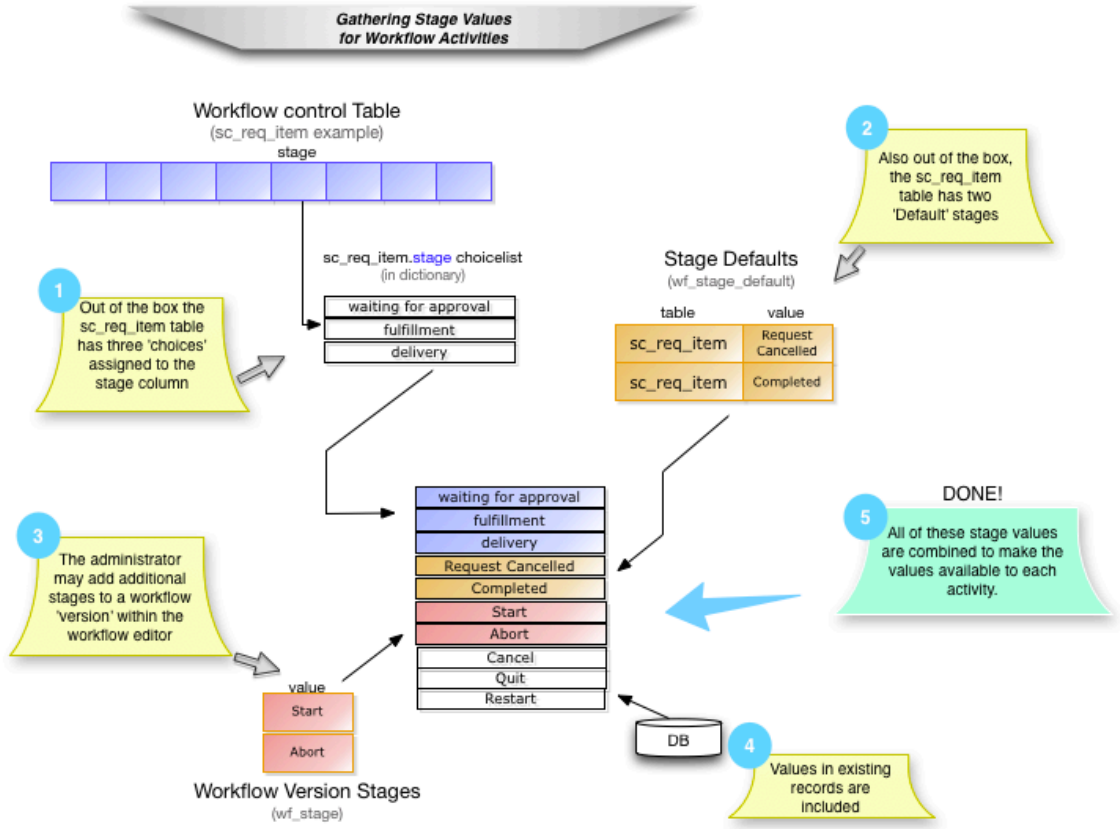
Note:
If an activity is cancelled, Request Cancelled appears in the **Stage** field. The "Cancelled" label set in the wf_stage table is a reserved word, and does not display in the **Stage** field.

When you edit available activity stages in the Workflow Editor, the list displays the following stage values:

- Waiting for Approval
- Fulfillment
- Delivery
- Request Cancelled
- Completed

The following diagram depicts the process used to gather stage values from the Request Item table to populate the **Stages** list in workflow activities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note:
If you are creating a workflow with a table other than Request Item [sc_req_item], you must select a **Stage field** in the workflow properties for the workflow to have stages.

Use workflow stages

You can add or modify workflow stages.

Before you begin

Role required: workflow_admin, workflow_creator, or admin

Procedure

1. Navigate to **All** > **Workflow** > **Workflow Editor**.
2. Create a new workflow by clicking **New** or open an existing workflow.
3. In the Workflow Properties form, if the table is not the Requested Item [sc_req_item] table, select a field to display stages in the **Stage** field property.

   Available fields depend on the table selected for the workflow.
4. After assigning a list of stages to the workflow, you can set a stage value in any of the workflow activities that provide a **Stage** field in their dialog box.

   Setting a stage value in a workflow activity tells the workflow engine to assign that stage to the record associated with the workflow context when the activity is encountered during a run.

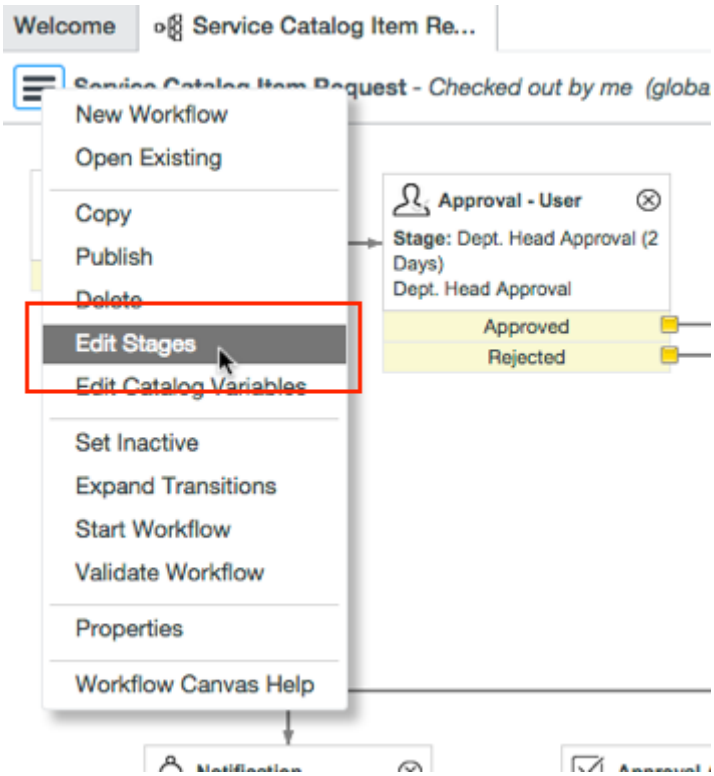
   When an activity starts with a specified stage, the platform updates the **Stage** field with the current value. In workflows run against the Requested Item [sc_req_item] table, the `sc_req_item.stage` field is defined as a workflow type field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When displaying the stages for a workflow on the Requested Item [sc_req_item] table, the stage state is based on the state of the workflow activities. If an activity has a stage specified for it, and the activity is currently active in the workflow, then the stage is shown with an **In progress** state. Similarly, if the activity is in the **Pending** or **Completed** state, the stage reflects this state.

5. To edit the workflow-specific stages for an existing workflow, click the gear icon in the header bar and select **Edit Stages**.

   Again, these stage values are combined with the choices, defaults, and existing values.



Example: Workflow stages

To optimize the use of stages, you can assign a stage to multiple activities in a workflow. For example, if your workflow uses the following activities to create tasks:

1. Get approval
2. Order equipment
3. Receive equipment
4. Add equipment to CMDB
5. Set up equipment
6. Install software
7. Configure software
8. Deliver to user

The following stages might be used:

- Approval
- Order

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Configure
- Deliver

A good practice is to assign stages to the activities as follows:

Examples of stages added to workflow activities

Activity	Assigned stage
Get approval	Approval
Order equipment	Order
Receive equipment	Order
Add equipment to CMDB	Order
Set up equipment	Configure
Install software	Configure
Configure software	Configure
Deliver to user	Deliver

When the **Order equipment**, **Receive equipment**, or **Add equipment to CMDB** activity is active, the **Stage** display shows that the **Order** stage is **In progress**.

Add and translate stages

You can add default stages to use for a table, and stages to existing workflow

Add default stages for a table

You can assign a stage set as a default set to any number of tables.

About this task

The stages in the assigned stage set pre-fill the workflow version stages when you create a new workflow for the associated table.

Procedure

1. Navigate to **All** > **Workflow** > **Default Stages (by table)**.
2. Click **New**.
3. Select a stage **Set**.
   You can create a new set by clicking **New**, typing a name, and clicking **Submit**.
4. Select a corresponding **Table**.
5. Click **Submit**.

   The stages in the selected stage set are automatically added to any new workflows that use the corresponding table.

Add a stage to an existing workflow

If a stage required for a workflow has not been imported or is not in the stage set assigned to the workflow table, you can add it to the workflow manually.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Workflow** > **Workflow Editor**.
2. Open and check out the workflow.
3. In the title bar, click the menu icon and select **Edit Stages**.
4. In the Workflow Stages list, click **New**.
5. On the Workflow Stage form, fill in the fields as appropriate.

   Do not use a **Name** or **Value** field value that already exists in the base system.

   #### Workflow stage fields

Field	Description
Name	The name of the stage as it appears in workflow fields.
Value	The value of the stage when it is referenced from elsewhere in the system, such as in a script.
Duration	The default duration for the stage. Currently not used.

6. Click **Submit**.
7. Publish the workflow.

Add a stage to a workflow activity

After stages are added to a workflow, you can assign them to the workflow activities.

Procedure

1. Navigate to **All** > **Workflow** > **Workflow Editor**.
2. Open and check out the workflow.
3. Double-click the activity.
4. In the **Stage** field on the Activity Properties form, find and select the stage to display when the workflow reaches the activity.
5. Click **Update**.

Translate workflow stages

You can provide translations for workflow stage names so the names appear in the language selected for the instance.

Before you begin

The instance must already have language internationalization plugins installed. For more information, see Activate a language.

About this task

Language-specific text appears in Field types displayed in a list, workflow stage sets, and the Workflow Editor for users with that language selected. Language-specific text does not automatically appear when displaying stages on a form. To translate stages on a form, add translated text to the workflow field choices.

You can add translated text for any language enabled on the instance. For example, to translate workflow stages into French:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Set the interface language to **French**.
2. Navigate to **Workflow** > **Workflow Editor**.
3. Open and check out a workflow.
4. In the title bar, click the menu icon and select **Edit Stages**.
5. Edit the **Name** field for each stage and enter the text to display to French users.

   Do not change the **Value** field.
6. Confirm that the workflow stages display the French text.

Result

Alternatively, to translate stages for multiple workflows at once, you can directly edit the Workflow Stages [wf_stage] table. For example, to translate workflow stages from multiple workflows into French:

1. Set the interface language to **French**.
2. In the application navigation filter, enter `wf_stage.list`.
3. Edit the **Name** field for each stage and enter the text to display to French users. Do not change the **Value** field.

Workflow stage sets

Stage sets are named groups of workflow stages commonly used together. Create a stage set and assign it as a default set to any number of tables. You can import the choice list values of a workflow field as stages for a workflow, and export a stage set to create a new one.

A single stage set usually represents a process, such as the stages required to display the progress of a service catalog request. You can also assign a stage set as the default set for workflows on specific tables.

In an active context, workflow stages provide summary-level feedback about the progress of a workflow. Stage icons display the status of each activity as it is being driven by a workflow. The system updates a **Stage** field, defined in the workflow properties, to indicate the progress of the workflow through the possible stage values.

Updates to workflow stage values

During an upgrade, the system makes changes to the **Value** field of records in the Workflow Stage [wf_stage] table.

- All entries are made lowercase.
- All spaces and special characters are replaced with underscores.

These changes support System Localization and enable workflows to display translated text in the **Stage** field.

Create a new stage set

You can create a new stage set by creating a stage set record and adding stage set entries manually.

About this task

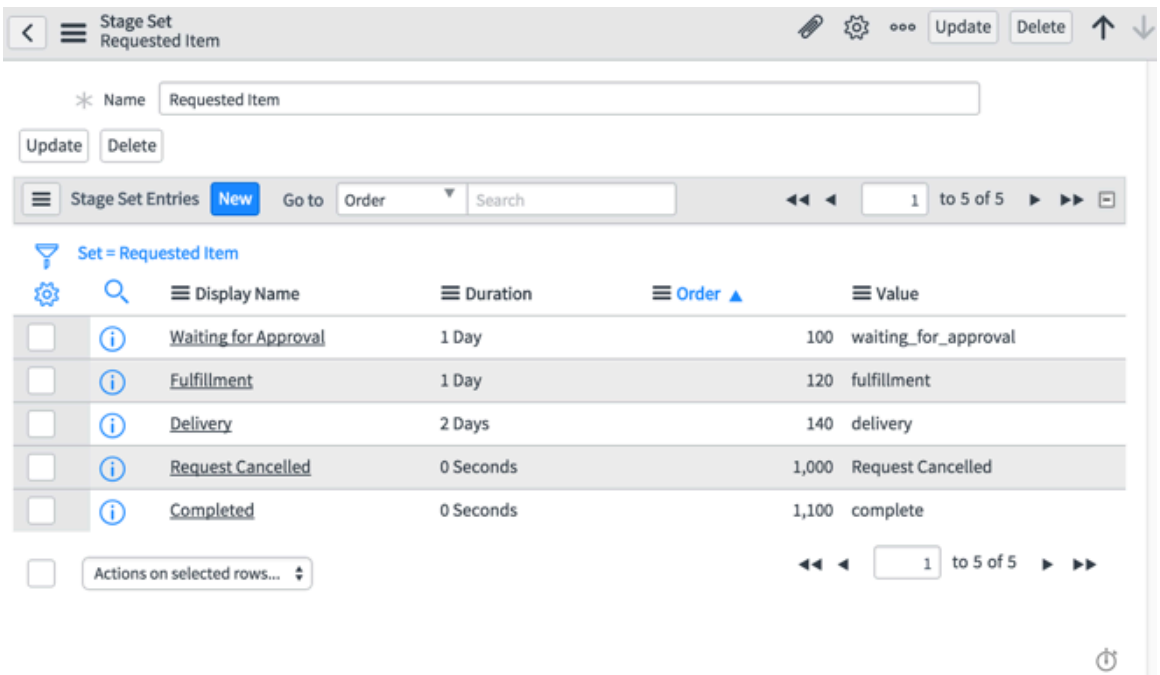
Create a stage set record only when you want additional stages that are not available on the table by default.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Workflow** > **Stage Sets**.
2. Click **New**.
3. Enter a **Name** that indicates the purpose of the stage set.

   Example
   For example, you can create a Requested Item stage set to hold the stages commonly used by inventory tracking workflows or service catalog fulfillment workflows.
4. Click **Submit**.
5. Open the new stage set record.
6. In the **Stage Set Entries** related list, click **New**.
   Each stage set entry can be used as the **Stage** for an activity in a workflow that uses this stage set.
7. Enter a **Name** that indicates the stage name to appear in workflow fields.
8. Enter a **Value** to use when referencing the entry, such as in a script.
9. Click **Submit**.
10. In the **Stage Set Entries** related list, ensure that each entry has a unique **Order** value.
    Enter a low value for stages that should appear early in the workflow and a higher value for later stages.



What to do next

The stage set can be added to a workflow or assigned as the default stage set for workflows that are created for a specific table.

Use a default stage set

You can assign a stage set as a default set to any number of tables.

About this task

The stages in the assigned stage set pre-fill the workflow version stages when you create a new workflow for the associated table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Workflow** > **Default Stages (by table)**.
2. Click **New**.
3. Select a **Table**.
4. Select the **Set** you want to assign to the selected table.
5. Click **Submit**.

Import stages from a choice list

You can import the choice list values of a workflow field as stages for a workflow.

Before you begin

Create a choice list as follows:

- Add a custom field of Type **Workflow** to the table.
- Configure the custom field to use a choice list.
- If you are creating a new field, set the **Choice List type** to **Display without --None--** and create the choices for the newly created field.

For more information, see Create a workflow stage field.

Procedure

1. Navigate to **All** > **Workflow** > **Workflow Editor**.
2. Open and check out the workflow.
3. In the title bar, click the menu icon and select **Properties**
4. In the Workflow Properties dialog box, click the **Stages** tab.
5. From the **Stage field** list, verify that the correct workflow field is selected.
6. In the Related Links section, click **Import Stages from Choice List**.
7. In the dialog box asking you to confirm that you want to import the choice list, click **OK**.
8. Click **Update**.

What to do next

The stage set can be added to a workflow or assigned as the default set for workflows that are created for a specific table.

Export a stage set from a workflow

You can create a new stage set by exporting the stages from an existing workflow as a set, instead of manually adding stage set entries to a stage set record.

Procedure

1. Navigate to **All** > **Workflow** > **Workflow Editor**.
2. Open and check out the workflow containing stages that you want to export as a new stage set.
3. In the title bar, click the menu icon and select **Edit Stages** to open the Workflow Stages dialog box.
4. In the Related Links section, click **Export to Stage Set**.
5. Enter a unique **Name** for the new stage set.
6. Click **OK**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next
The stage set can be added to a workflow or assigned as the default set for workflows that are created for a specific table.

Add a stage set to a workflow

You can add any number of stage sets to an existing workflow.

About this task
When multiple stage sets have stage set entries with the same **Value**, the stage appears on the workflow only once.

Procedure
1. Navigate to **All** > **Workflow** > **Workflow Editor**.
2. Open and check out the workflow.
3. In the title bar, click the menu icon and select **Edit Stages** to open the Workflow Stages dialog box.
4. In the Related Links section, click **Import from Stage Set**.
5. Select the stage set.
6. Click **Ok**.
7. Import additional stage sets as needed for the workflow.

What to do next
After you add all necessary stage sets to the workflow, you can add them to the workflow activities. For more information, see Add a stage to a workflow activity.

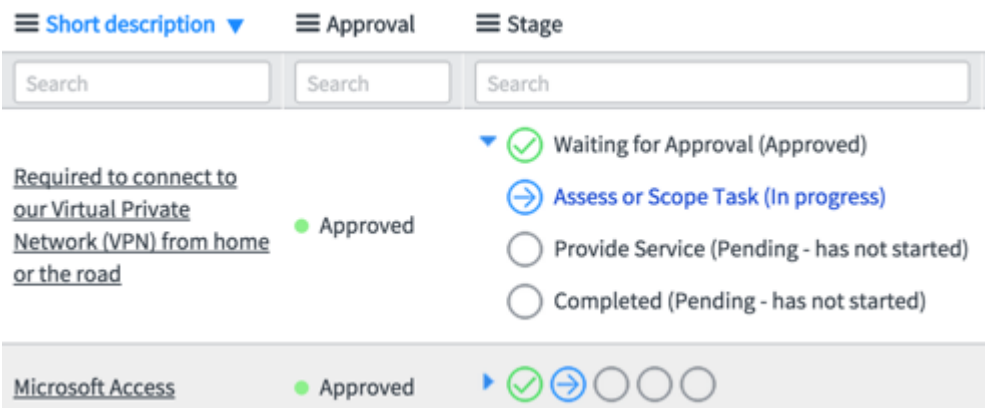
Create a workflow stage field

Workflows can provide a summary of workflow progress by updating any field of the **Workflow** type. If the field is a workflow field, it displays an icon to indicate the workflow stage progress.

Before you begin
Role required: admin

About this task
In a form, the workflow field displays the current stage as a choice list value.

In a list, the workflow field displays stage icons that represent the series of states, stages, phases, or tasks within a workflow. The stage icons are populated using the activity stages from the associated workflow. For more information, see Workflow stages.



To create a workflow stage field:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Workflow** > **Default Stages (by table)**.
2. Right-click near a column header and select **Configure** > **List Layout**.
3. Create a new field in lower right.
4. On the form view of the table used by the workflow, create a field with the **Type** set to **Workflow**.
   For detailed steps, see Add and customize a field in a table.
5. Click **Save**.
6. Right-click the field label and select **Configure Dictionary**.
7. Open a dictionary entry.
8. In the Choice List Specification section of the Dictionary Entries form, select **Dropdown with --None--** from the **Choice** list.
9. Click **Update**.
10. To ensure that the workflow field properly displays stages on the form, define a choice for each workflow stage.
    - To create workflow stages using a choice list that already has choices, you can import the stages from the choice list. A stage is created for each choice defined for the **Stage field** selected in the workflow properties. For detailed steps about importing a choice list, see Import stages from a choice list.
    - The **Value** of each choice must match the **Value** of the corresponding workflow stage.
    - Do not use spaces in the **Value** field for either choices or stages. Use underscores in place of spaces.
    - Make the choice list read-only. If a user changes the stage value for a record from the choice list rather than allowing the workflow to control the value, the workflow-driven, legacy, and linear renders may not work as intended. You can also use business rules or events to ensure the workflow progresses accordingly.

    For detailed steps on defining choice lists, see Define an option for a choice list.
11. To see workflow stages as icons, add the field to the list layout of the workflow table.
    For detailed steps, see Configure the list layout.

What to do next

After you create or update the workflow field:

- Unless the workflow uses the Requested Item [sc_req_item] table, ensure that the workflow field is selected from the **Stage field** list in the workflow properties. For detailed steps, see Select a stage field. If a workflow uses the Requested Item table, the stage field is automatically set to the **Stage** field of the table and cannot be changed.
- Work through the workflow. Any other updates made to the workflow field, such as updates from business rules or other scripts, can interfere with displaying workflow stages.

Select a stage field

A **Stage field** allows the workflow context to show additional workflow information, such as the stage name and the estimated completion time for an activity.

Before you begin

Ensure that the workflow field you want to use as the stage field is configured to properly display stages. For detailed steps, see Create a workflow stage field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Unless the workflow uses the Requested Item [sc_req_item] table, you can specify which field from the workflow table is the stage field. For workflows that use the Requested Item [sc_req_item] table, the stage field is automatically set to the **Stage** field of the table and cannot be changed.

To add or edit a workflow stage field:

Procedure

1. Navigate to **Workflow > Workflow Editor**.
2. Create or check out the workflow.
3. In the title bar, click the menu icon and select **Properties**.
4. In the Workflow Properties dialog box, click the **General** tab.
5. In the **Table** list, verify that the table containing the workflow field is selected.
6. Click the **Stages** tab.
7. From the **Stage field** list, select the workflow field.
8. Click **Update**.

Display approvers in workflow stage fields

Enable workflow stage fields to display approvers, change the number of approvers to display, or disable displaying approvers.

Before you begin

Role required: admin

About this task

By default, only workflow stage fields that use the Workflow-driven renderer can display a list of approvers. Only these workflow stage renderer types support displaying approvers.

- Linear renderer
- Main flow renderer
- Workflow-driven renderer

Procedure

1. Navigate to **All** > **Workflow** > **Administration** > **Properties**.
   The system displays the Workflow Properties page.
2. Set the following properties.

Property	Description
Number of approvers to show if approvers are displayed for workflow stages. Only valid for supported list v2 renderers. glide.workflow.renderer.show_approver_limit	Sets the maximum number of approvers to display within a workflow stage field. The system displays an ellipsis character when there are more approvers than the display limit allows. ○ Type: integer ○ Default value: 5
Show approvers when displaying workflow stages with the Linear renderer.	Enables (true) or disables (false) the Linear renderer to display approvers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
glide.workflow.renderer.linear.show_approver	○ Type: true | false ○ Default value: false
Show approvers when displaying workflow stages with the Main flow renderer. glide.workflow.renderer.mainflow.show_approver	Enables (true) or disables (false) the Main flow renderer to display approvers. ○ Type: true | false ○ Default value: false
Show approvers when displaying workflow stages with the Workflow-driven renderer. glide.workflow.renderer.workflowdriven.show_approver	Enables (true) or disables (false) the Workflow-driven renderer to display approvers. ○ Type: true | false ○ Default value: true

3. Click **Save**.
4. Add stages to workflows that have associated workflow stage fields.

   Note:
   If you add stages to a subflow, the parent workflow must also have stages.

5. For each approval activity you want to display approvers, select a **Stage** value.

   Example
   For example, the sample workflow **Service Catalog Item Request** has two approval activities. The first **Approval - User** activity has a **Stage** value of `Dept. Head Approval`. The second **Approval - User** activity has a **Stage** value of `CIO Approval`.

Result
The workflow stage field renderers you enabled display approvers up to the approver display limit. For example, a Workflow-driven stage field displays up to five approvers when the workflow reaches an approval stage.

Workflow stage field icons and tooltips

A workflow stage field displays icons to indicate the workflow stage.

Based on the stage renderer selected for the workflow, these icons may display a tooltip with additional information.

Workflow field icons

Icon	Workflow stage
	Current active step
	Approval pending
	Approval rejected
	Complete
	Late (Change/Request) or Canceled (Catalog)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow field icons (continued)

Icon	Workflow stage
	Skipped (Catalog only)

Stage tooltips

Based on the stage renderer selected for a workflow, workflow stage icons may display tooltips with detailed information about a stage.

Stage renderers and tooltip behavior

Renderer	Tooltip behavior
Legacy	When a user points to a stage, the tooltip displays the name of the stage. In the expanded view, the activity status appears in parentheses next to the stage. Other renderers	When a user points to a stage, the tooltip displays the name of the stage. If the stage is a gated approval, the tooltip also shows the name of the approver. In the expanded view, the activity status appears in parentheses next to the stage. 
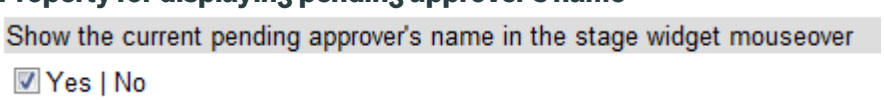
If you do not want the approver's name included in the tooltip, navigate to **System Properties** > **Service Catalog** and clear the **Show the current pending approver's name in the stage widget mouseover** check box.

Property for displaying pending approver's name



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow stage renderers

Workflow stage renderers determine how a workflow displays stages in a workflow field.

There are multiple renderers available.

Note:
Most workflows should use the workflow-driven renderer. This renderer is used by default for all workflows. Use a different stage renderer only after careful consideration and to satisfy specific requirements for how the stages appear.

Workflow-driven

Use the workflow-driven renderer as much as possible. This renderer displays icons for stages using the stage state controlled by the workflow. Icons are displayed in a way that is meaningful for many situations. This renderer can display stages from a main workflow and subflows. The order of the icons is determined by the expected path of the executing workflow. As the workflow progresses, stages on paths that the workflow did not take are removed from the display. Stages from paths other than the expected path are not included unless the workflow follows that path.

The **Stage order** field on the **Stages** tab has two options:

- **Computed** uses the actual workflow path in order
- **User-specified** uses the order specified in the **Order** column on the Workflow Stages record

Note:
If the workflow context for a request item has been deleted, the stages for that request item can no longer be rendered. This stage history is stored on the workflow context.

Main flow

The main flow renderer displays icons for stages defined in the main workflow only. Use this renderer when you do not want to expose the details of the subflows. For example, a single main workflow may run several subflows to handle implementation details. The stages in these subflows do not provide useful information for the user who starts the workflow, but are useful when editing the subflow. In this scenario, using the main flow renderer leads to the best user experience. The stage field displays the high-level process of the workflow without exposing unnecessary details.

The **Stage order** field on the **Stages** tab has two options:

- **Computed** uses the actual workflow path in order
- **User-specified** uses the order specified in the **Order** column on the Workflow Stages record

Linear

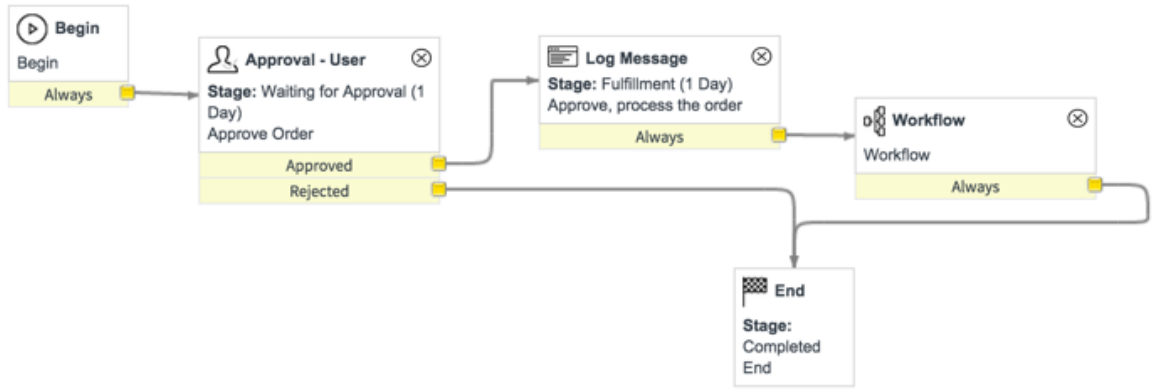
Linear rendering displays all stage icons from the main workflow and all subflows within a single workflow field on a list or form. It displays icons in a linear sequence regardless of the paths the workflow follows as it executes. This renderer uses stages defined in both the main workflow and any subflows that the main flow launches. The icons appear in the user-specified order. Skipped stages do not appear.

Use this renderer when the workflow stages must display in a consistent order and the actual details of how the workflow runs are less important. For example, a workflow may revisit or revert to previous stages based on one or more Condition Workflow activities. Displaying these loops in the stage field does not provide useful information to the user. In this scenario, using the linear renderer leads to the best user experience. The stage field displays the predefined process, including stages from subflows, in a consistent order.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, you can create a service catalog workflow that uses a subflow to complete delivery of the requested item. The following images illustrate the main flow and subflow for ordering corporate-branded supplies.

Linear main flow



Linear subflow

The linear renderer displays all these stages in one workflow field. The parent workflow specifies the **Waiting for approval**, **Fulfillment**, and **Completed** stages. The subflow specifies the **Delivery** and **Waiting for Task**, and **Delivery OK** stages.

Progress bar

The progress bar renderer displays a single progress bar instead of a sequence of stage icons. This renderer is particularly useful when you want to display the general progress of the workflow as a percent. Each stage in the workflow controls an equal percentage of the progress bar. For example, if a workflow has 10 stages, reaching each stage causes the workflow field to display an additional 10% of the progress bar. Stage names do not appear in the progress bar.

The progress bar renderer provides a way to display the status of a workflow that has a large number of stages. Other rendering options may provide a better user experience when rendering fewer than four stages in a single workflow.

The **Stage order** field on the **Stages** tab has two options:

- **Computed** uses the actual workflow path in order
- **User-specified** uses the order specified in the **Order** column on the Workflow Stages record

Workflow field progress bar

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Legacy

The legacy renderer displays stages in the same way as releases prior to Dublin. When an instance is upgraded from a release prior to Dublin, all existing workflows are set to use the legacy renderer. Whenever possible, use a different stage renderer instead. If you want your workflow to maintain pre-Dublin behavior, use the Legacy option. The legacy renderer sometimes assigns incorrect data to and/or reports incorrect data from the workflow stage field. If possible, we recommend all workflows use the Workflow-driven renderer.

With the legacy renderer, you can create and reference a custom workflow field icon set by setting the icons attribute to a new script include. For example, to use the *WorkflowIconsSCR* script include to define which icons to use, add the attribute *icons=WorkflowIconsSCR* to the **Attributes** field of the dictionary entry for the workflow field. To use the default icon display behavior, use the attribute *icons=WorkflowIconsStages*.

The legacy renderer works with all tables except the Requested item [sc_req_item] table. In this case, use the requested item renderer instead.

Requested item

The requested item renderer functions the same way as the legacy renderer, but is for use with the Requested item [sc_req_item] table.

Only in Now Mobile, default stage renderer is used.

Select a stage renderer

In most cases, the default workflow-driven renderer should be used. If you have specific requirements for displaying stages, you can select a different stage renderer.

Before you begin

Consider the following when selecting a stage renderer:

- Use the workflow-driven renderer if possible. This is the default renderer that should be used in most cases.
- Use the legacy renderer only if your instance was upgraded from a release prior to Dublin and you want your workflow to maintain pre-Dublin behavior.

To use linear, main flow, or progress bar rendering, satisfy the following requirements.

Linear and progress bar renderer requirements

Renderer	Requirements
Linear	• The parent workflow and all subflows must modify the same current record. • In the properties for all subflows, the **Stage field** value for all subflows must match that of the parent workflow. • The parent flow and all subflows must contain the same stages. Use a stage set to ensure the parent flow and all subflows have the same stages. • On the workflow canvas, each workflow needs only the stages used directly by that workflow. It is not necessary to add stages from subflows to activities on the parent flow, or stages from the parent flow to activities on the subflows.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Linear and progress bar renderer requirements (continued)

Renderer	Requirements
Main flow	• The workflow contains subflows. • You do not want or need to reveal the details about the subflows.
Progress bar	• The workflow properties must have a **Stage ordering** value of **User-defined** • There must be workflow stages within the workflow. • Because stage names do not appear in a workflow field when using the progress bar renderer, you can simplify stage names to represent a percentage of the workflow. For example, if a process has four main steps, name the workflow stages as 25%, 50%, 75%, and 100%. Enter the numerical value of each stage, such as 25, in the **Value** and **Order** fields.

About this task

To select a stage renderer:

Procedure

1. Navigate to **All** > **Workflow** > **Workflow Editor**.
2. Open and check out the workflow.
3. In the title bar, click the menu icon and select **Properties**.
4. In the Workflow Properties dialog box, click the **Stages** tab.
5. From the **Stage rendering** list, select a stage renderer.
   - If you are using two workflows to update two unique workflow fields on a single record, both workflows must use a non-legacy renderer. You can select a different stage renderer for each workflow but do not select **Legacy** for either one.
   - If you want to use the linear renderer, make sure you select **Linear** in the properties for the parent workflow and all subflows.
6. Click **Update**.

Workflow fields with deleted records

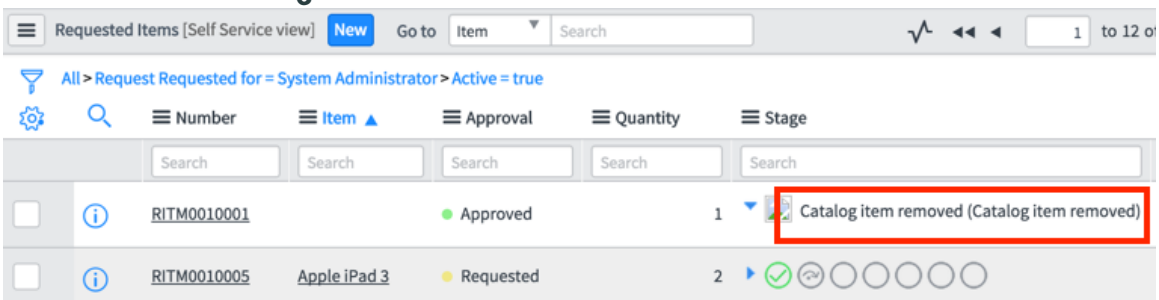
Workflow fields may indicate when a record required by the workflow is deleted.

After a referenced record is deleted, the reference in the primary record is no longer valid. If the stage renderer detects a reference that is no longer valid, the stage field displays a message about the deleted record.

Administrators can restore deleted records. For more information, see Use the Deleted Records module to restore a deleted record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflows with missing records



The image shows a list with two workflows. The top request does not have an associated request item. The bottom request has an associated request item, but the item does not have an associated workflow context.

Workflow validation

Workflow validation examines different characteristics of a workflow to locate issues that might prevent the workflow from being published or cause it to fail. The validation report summarizes the results of each separate workflow validation.

Validation prevents workflows with critical flaws from executing and resulting in an unstable or incomplete state. There are a number of validators in the base system that notify workflow designers of potential problems. For example, multiple **End** activities, disconnected transitions, incorrect table references, missing subflows, and dependencies affected by update sets. A workflow validation report displays the results from each validator, including a message explaining what was found. The system automatically validates a workflow when you publish it. You can also run validation on a workflow directly from controls in the Workflow Editor.

Highlighting critical errors

The graphical Workflow Editor highlights critical errors when a workflow is loaded. In this example, a subflow is missing and is not available to the parent workflow for the current user. The graphical Workflow Editor indicates the error when the parent workflow loads by highlighting (in red) the activity that calls the subflow. To correct the error in the parent workflow, click the validate icon in the header bar and inspect the error description in the validation report.

Validate missing subflow

Validations at publishing

If you attempt to publish an invalid workflow or a workflow with potential problems, the system displays an error message and blocks the operation, if necessary. When validation error messages appear, click the validate icon in the graphical Workflow Editor to see the error report.

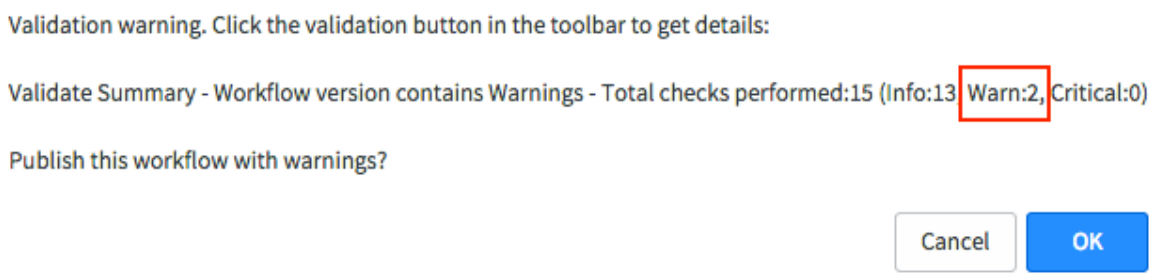
Validation warning

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A validation warning notifies you that a potential problem exists in a workflow but permits you to publish the workflow. Validation warnings appear when:

- You edit and then attempt to publish a workflow that is included as a subflow in another workflow. The system cannot determine how your changes will affect the parent workflow and alerts you of the relationship.
- A workflow activity uses a different table than the table assigned to the workflow. The system alerts you of the potential conflict.

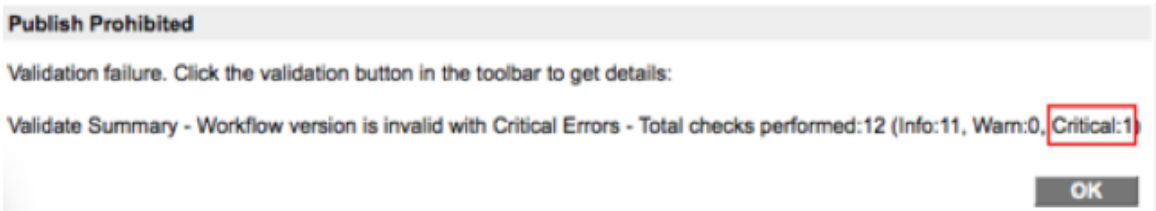
Validation warning



Validation failure

A validation failure notifies you that a critical error has occurred in the workflow that prevents you from publishing the workflow. An example of a critical error is a missing subflow.

Validation failure



Workflow validation report

Validators display three notification levels: CRITICAL, WARN, and INFO. The designer can publish a workflow that returns WARN or INFO level validation, but not a workflow that returns an overall validation level of CRITICAL.

© 2026 ServiceNow, Inc. All rights reserved.

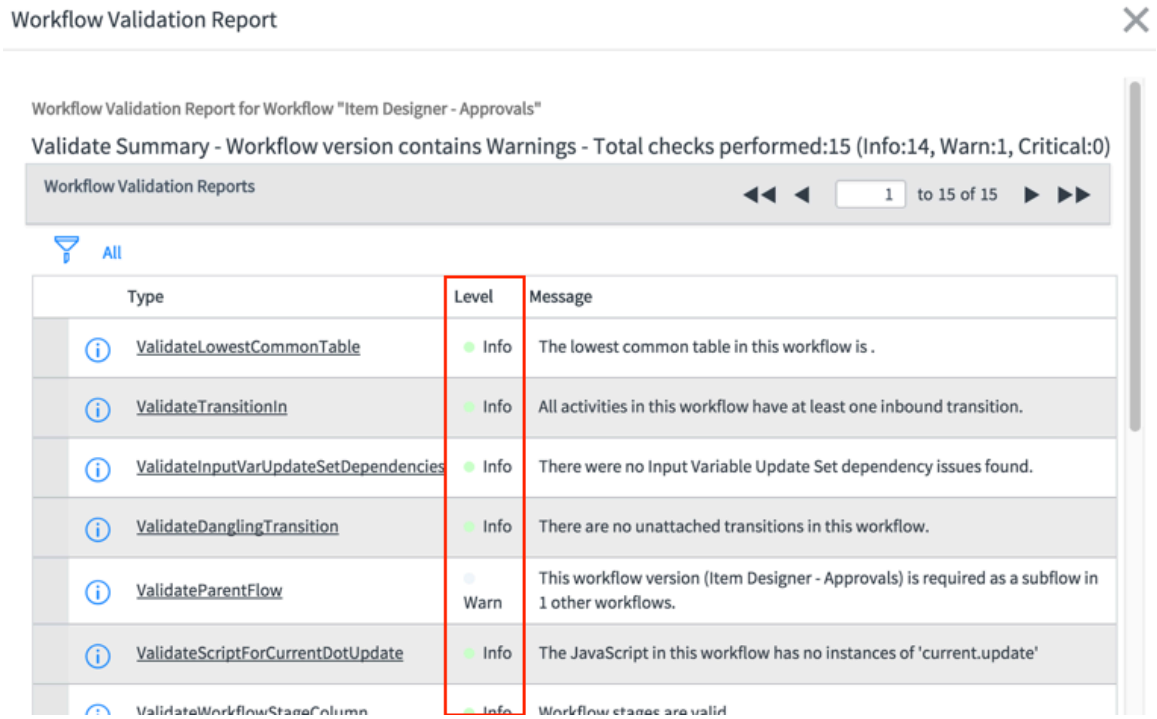
Workflow validation report



Header summary

The header of the validation report summarizes the entire validation run against the specified workflow.

- **Validate Summary:** The overall score reflects the most severe notification level encountered during the validation.
- **Total checks performed:** The total number of validations run is also broken down to show the number at each notification level.

Report columns

The body of the report displays the results of each individual validation check that was performed. The columns are **Type**, **Level**, and **Message**. You can sort and filter these columns as you would any list.

Workflow termination and external dependencies levels

Name	Implication
Info	Provides information about the current workflow version. An example of an information level message is one that names the lowest common table in the workflow. Workflows at this validation level are considered valid and publishable.
Warning	Alerts the user that the validator detected anomalies in the workflow that might compromise its ability to execute. An example of a warning level message is one that alerts you to a missing activity input transition. Workflows at this validation level are considered valid and publishable.
Critical	Names a workflow element containing a critical error that prevents the workflow from executing successfully. Examples of this are missing or invalid subflows and missing transitions. Workflows at this validation level cannot be published or run in production.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Message

The validation message provides a detailed description of the results, including table names, update sets, and other specifics.

For the procedure to validate a workflow and generate a validation report, see Validate a workflow

Workflow validator

ServiceNow offers several workflow validators for workflow designers to test their workflows.

This page lists all available workflow validators. See Workflow validation for information on using workflow validators and the workflow validation report to see the type of information that is returned.

Hanging workflows and update sets

Hanging Workflows	Update Sets
Identify workflow design decisions that can result in a hanging workflow	Identify related artifacts being moved in different update sets
ValidateTransitionOut	ValidateUpdateSetDependencies
ValidateTransitionIn	ValidateUpdateSetParentDependencies
ValidateDanglingTransition	ValidateInputVarUpdateSetDependencies
ValidateSubflows	
ValidateScriptForCurrentDotUpdate	

Workflow termination and external dependencies

Unexpected Workflow Termination	External Dependencies
Identify workflows that can end unexpectedly	Identify external artifacts that have potential workflow dependencies
ValidateSingleEnd	ValidateParentFlow

Workflow conflicts

Workflow Properties Conflicts
Identify workflow design decisions that conflict with workflow properties
ValidateLowestCommonTable
ValidateTableChange

ValidateTransitionOut

The **ValidateTransitionOut** validator finds activity conditions with no exit transitions.

Validation summary

- Risk: Activity conditions might not transition to the next activity, which could cause the workflow to hang.
- Severity Level: Warning
- Valid Result: Valid

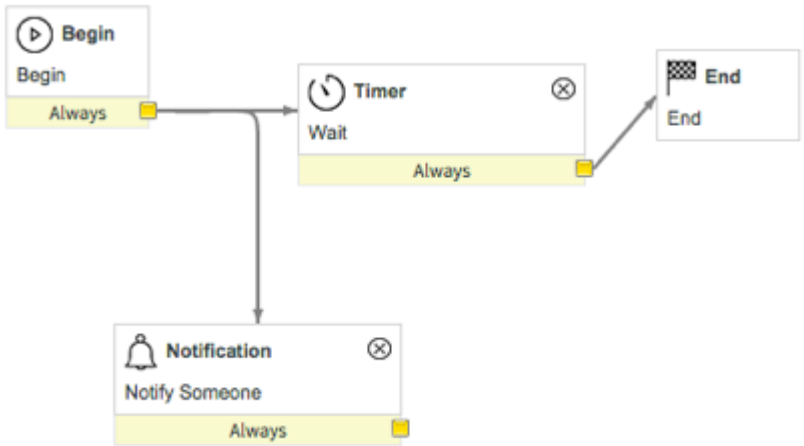
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Valid Message: All conditions have transitions.
- Invalid Result: Invalid
- Invalid Message: This workflow contains <condition count> activity conditions without an output transition.
- Suggested Action: If this is a conscious design decision, there is no corrective action. Otherwise, find the condition cited in the validator and add an appropriate transition to the next activity.
- Publishable: Yes
- Runnable: Yes
- Related Information: None

Troubleshooting

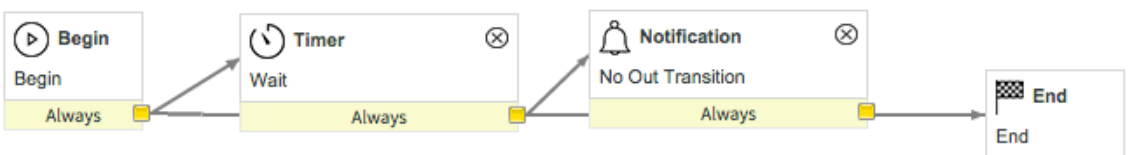
Design choices made when creating a workflow on the canvas might legitimately use an activity without an exit condition. In the first example, the **Notification** and **Timer** activities both execute at the start of the workflow. The **Timer** is the entity that decides when the workflow ends. In this situation, executing the **Notification**, but not transitioning away, keeps the design simple and adds no risk. The validator finds and reports the missing transition from the **Notification** activity as a **Warning** that the designer can ignore.

Condition with no valid transition



In the second example, the **Notification** activity has no exit transition. The designer missed this because of the layout. The transition from the **Timer** activity passes behind the **Notification** activity and appears to connect the exit from the **Notification** activity to the **End**. In workflows with more than 10 or 15 activities, it might be difficult to see all the transitions clearly. This workflow's designer intended for the **Notification** activity to transition to the **End**.

No condition out



This validator directs the designer to the specific activity and condition that does not have an exit transition. The designer then makes the decision whether or not to respond to the warning.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ValidateTransitionIn

The **ValidateTransitionIn** validator finds activities that do not have inbound transitions and cannot execute in the workflow.

Validation summary

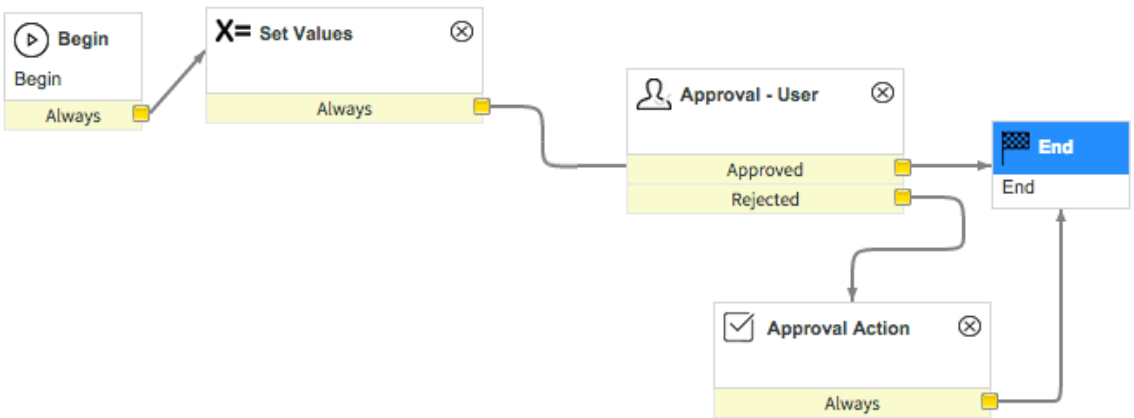
- **Risk:**Activities that do not have inbound transitions have no means of being executed in the workflow. If other logic builds from these activities, the workflow could hang, with no means of moving forward.
- **Purpose:** Find activities that do not have inbound transitions.
- **Severity Level:** Warning.
- **Valid Result:**Valid.
- **Valid Message:** All activities in this workflow have at least one inbound transition.
- **Invalid Result:** Invalid.
- **Invalid Message:**This workflow contains <activity count> activity conditions without an input transition.
- **Suggested Action:**Either remove the activities to reduce confusion and make the workflow easier to understand or provide the appropriate inbound transition.
- **Publishable:**Yes
- **Runnable:**Yes
- **Related Information:**None

Troubleshooting

Although the activities detected in this validator do no harm to the execution of the workflow, the designer needs to know that there are activities on the canvas that cannot execute and serve no purpose, particularly in a production system. This error is typically caused by a visual misinterpretation of the drawing.

This example workflow appears to be perfectly valid. Under closer inspection, however, we see that the transition from **Set Values** does not stop at **Approval - User** (there is no arrow end). Instead, that transition goes directly to **End**. As a result, **Approval - User** cannot execute. Because there is an activity in the workflow based on the approval's condition routing, it appears that the designer intended for the approval to execute and that a correction is needed.

TransitionIn invalid



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This validator directs the designer to the specific activity and condition that has no inbound transition. The designer should establish a transition or remove the activity.

ValidateDanglingTransition

The **ValidateDanglingTransition** validator finds and reports any transitions that do not terminate on an activity.

Note:
These transitions are not drawn on the workflow canvas, but are still present in the database.

Warning:
This is a critical error that prevents a workflow from running.

Validation summary

- Risk: A workflow with dangling transitions will silently hang a workflow with no recovery options.
- Severity Level: Critical
- Valid Result: Valid
- Valid Message: Valid
- Invalid Result: Invalid
- Invalid Message: Invalid
- Suggested Action: Remove or connect the offending transition. Get the source activity name from the validation report details and resolve the issue. Then, run the validation again to test your changes.
- Publishable: No
- Runnable: No
- Related Information: None

Troubleshooting

On rare occasions, the destination of a workflow transition becomes null. The workflow canvas shows no evidence of the transition, but at run time, the workflow hangs when it encounters one of these dangling transitions. If the **ValidateDanglingTransition** validator reports this condition at publishing time, it blocks the publication action until the issue is resolved. If this condition is detected on a runtime check, the workflow is not allowed to execute against a current record's transaction. Instead, the system adds a critical log entry detailing the activity with the faulted transition to the current record's workflow context. To enable the workflow to execute on the next appropriate transaction, remove the faulted transition from the workflow model.

To find and remove the faulted transition:

1. Make note of the workflow version and activity that contains the faulted transition as indicated in the validator details.
2. Navigate to **Workflow** > **Administration** > **Workflow Version**.
3. In the list of workflow versions, select the workflow that has the faulted transition.
4. On Workflow Version form, add the workflow activities related list. Click the menu icon, select **Configure > Related Lists**, move **Workflow Activity-->Workflow Version** from the **Available** list to the **Selected** list, and click **Save**.
5. In the **Workflow Activities** related list, select the activity cited in the validator.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. In the Workflow Activity form, view the **Workflow Transitions** section or tab and identify the transition in that list that has no value or a null value in the **To** column.
7. Delete this transition.
8. Return to the workflow version and re-run the validation check.

The **Critical** warning should disappear. The workflow should execute as expected on the next appropriate transaction.

ValidateSubflows

The **ValidateSubflows** validator detects any workflows included as subflows that are either inactive, deleted, or not available as a published workflow for the current user.

Any of these conditions cause the workflow to hang when the workflow activity in the main flow is encountered.

> ⚠ **Warning:**
> This is a critical error that prevents a workflow from running.

Validation summary

- Risk: A parent workflow that transitions to a deleted subflow hangs indefinitely, with no recovery options.
- Severity Level: Critical
- Valid Result: Valid
- Valid Message: This workflow contains <count> valid subflows.
- Invalid Result: Invalid
- Invalid Message: This workflow contains <invalid count> invalid subflow(s) of <total subflow count> total subflows.
- Suggested Action: Remove the link in the parent workflow to the questionable subflow, examine the subflow to ensure that it is valid and published, or that it is checked out to the current user. After making the correction to the state of the subflow, run the validation again to test your changes.
- Publishable: No
- Runnable: No
- Related Information: Workflows used as subflows

Troubleshooting

When a workflow runs, regardless of whether it is a subflow or a main flow, the script engine determines which version of a workflow should execute, given the current user and workflow conditions. When a workflow is checked out by the same user who is running the workflow, the checked out version is the version that executes. If the user is not the same person who has the workflow checked out, the published version of the workflow executes. If there is no published workflow, no workflow runs.

One scenario addressed by the **ValidateSubflows** validator is when a workflow:

- Is checked out to User A.
- Is a subflow in a parent workflow being run by User B.
- Has no published alternative to the subflow being run by User B.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When this occurs, the parent workflow runs to the execution of the unpublished subflow and then hangs at that activity, with no means to transition forward. Main flows that encounter this condition in a subflow are not permitted to execute against a current record's transaction. Instead, a critical log entry detailing the subflow's state is added to the current workflow's Workflow Context record. To correct the problem, remove the subflow from the main flow, or publish the subflow so it is available to User B. This allows the workflow to execute on the next appropriate transaction.

Another scenario addressed by the **ValidateSubflow** validator is when a workflow:

- Is a subflow in a parent workflow being run by any user.
- Has no published alternative to the subflow, because the workflow has been deleted or all versions of the workflow are unpublished or inactive.

Note:
You cannot delete a from a list or form workflow that is a subflow. However, you can create one of these unstable conditions with advanced scripting, SQL options, or incomplete update sets that contain main flows, but not the referenced subflows. When troubleshooting a workflow that triggered this validator, consider the history of the subflow while assessing the error condition.

ValidateScriptForCurrentDotUpdate

The **ValidateScriptForCurrentDotUpdate** validator finds workflow activities with scripts that use the `current.update()` function.

Calling `current.update()` causes significant performance delays in transaction processing and might cause an instance to hang.

Validation summary

- *Risk*: At best, a workflow that uses `current.update()` in scripts experiences degraded performance. In the worst case, the workflow enters an infinite, recursive loop that crashes the server.
- *Severity Level*: Warning
- *Valid Result*: Valid
- *Valid Message*: The JavaScript in this workflow has no instances of 'current.update()'.
- *Invalid Result*: Invalid
- *Invalid Message*: This workflow uses 'current.update()' in <count of current.update references> JavaScript statements.
- *Suggested Action*: Remove `current.update()` from the activity scripts cited by this validator. Workflows execute within a transaction, and current is updated, or possibly inserted, at the end of the transaction, as appropriate. There is no need to explicitly update the record during the transaction.
- *Publishable*: Yes
- *Runnable*: Yes

Problems with current.update() in workflow scripts

A workflow initiates execution in one of these ways:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- *Script Engine*: If a workflow is assigned to a specific table, and given a run condition, the workflow runs on INSERT.
- *Script*: Any business rule, script include, background script, or client script can initiate a workflow using the workflow script include and calling `startFlow()`.

The workflow engine initiates a workflow based on the matched criteria of the current record being inserted. The transaction for current is managed by the script engine and not the workflow. Workflows that progress on the `update()` of the current record are not invoked via the workflow engine, but as a call from either a client script or business rule. In either case, the script engine is invoked, and the current record is put in memory. Edits and modifications to any current fields are made and are available to other activities and scripts that are executed in the same transaction.

When appropriate, other engines that run in sequence with the workflow engine, such as the business rule engine or field normalization, are invoked against the same current record transaction. Any changes made to current through these scripts and activities modify the record in memory. These changing values are available for reference in any other transactions called from activities and scripts in the same INSERT transaction. When all expected changes are executed, the current record is inserted.

When one of these scripts calls `current.update()` on a record that has yet to be inserted, the action forces an unnecessary and error-prone database transaction. If a record is not yet in the database, it cannot be updated. Business rules that trigger on `update()` on a record that is in the process of being inserted can cause a very unstable and potentially infinite looping condition.

Troubleshooting

This validator detects the use of `current.update()` in any of the editable script fields. Do not call `current.update()` from within a workflow script. In the event of an INSERT or UPDATE of current, the changes made to current are available to all scripts executing in the same transaction, and the script engine stores all changes in the database. Leave the update of current to the engine. Use the scripts only for setting and referencing the current field values.

ValidateLowestCommonTable

The **ValidateLowestCommonTable** validator reports the lowest table in the Glide hierarchy that the workflow uses.

For example, the Requested Item [sc_req_item] table is the lowest table in a workflow containing a **Catalog Task** activity. This information is significant to a designer who wants to change the table against which an existing workflow runs after adding activities to the canvas.

Note:
This validator provides information only. It does not indicate an error or warning condition.

Validation summary

- Risk: This validator informs only and has no risk associated with it.
- Severity Level: Data/Information
- Valid Result: Valid
- Valid Message: The lowest common table in this workflow is <<table_name>.
- Invalid Result: N/A (informational only)
- Invalid Message: N/A (informational only)
- Suggested Action: None

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Publishable: Yes
- Runnable: Yes
- Related Information: Workflow activities

ValidateTableChange

The **ValidateTableChange** validator reports any activities in the workflow that are invalid given the table associated with the workflow version.

For example, a workflow version that is associated with the Change Request [change_request] table but has a **Catalog Request** activity on the canvas is invalid, since the activity is not compatible with the selected table.

Validation summary

- Risk: If the current record at runtime does not originate from the table specified by the lowest common table, the activities for the lowest common table cannot set specific values.
- Severity Level: Warning if the table that is associated with a workflow is higher in the table hierarchy than the lowest common table required for the workflow activities.
- Valid Result: Valid
- Valid Message: All activities are valid for the newly selected table
- Invalid Result: Invalid Activity
- Invalid Message: This workflow contains <count of invalid activities> invalid activities for the newly selected table.
- Suggested Action: Make one of these changes:
  - Change the workflow to not require the activities associated with the lowest table reported.
  - Modify the workflow to use a table that contains the lowest common table in its hierarchy.
  - Ensure that the current record meets the requirements of the at-risk activities.
- Publishable: Yes
- Runnable: Yes
- Related Information: Workflow activities

Troubleshooting

Navigate to **Workflow** > **Administration** > **Activity Definitions**. Note the **Table** column in the list. Each activity that is not global is associated with a table.

When you select a table in the Workflow Properties form, the activity menu presents only activities that are compatible with the selected table. Associating a table with a workflow activity enables the system to make certain decisions about the activity that affect value comparison, condition routing, or the setting and getting of field values in the current record.

When a workflow is set to the Global [global] table, it is possible that the process executing the workflow ensures that the current record meets the requirements of the activities identified by this validator. In that case, the activity still works as expected. If that assurance cannot be guaranteed by the user process, do not use the activity identified by the validator without assigning a table that meets the requirements of all the activities on the canvas.

This validation check ensures that the table specified by all the activities in a particular workflow is included in the hierarchy of the table selected for the workflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ValidateParentFlow

The **ValidateParentFlow** validator reports any workflows that use the workflow as a subflow.

Validation summary

- **Risk:** There is no risk in a workflow being a subflow. This is only a warning that other workflows are at risk from dramatic changes to a subflow.
- **Severity Level:**Warning
- **Valid Result:** Valid
- **Valid Message:** Currently <workflow version name> is not a subflow.
- **Invalid Result:** None
- **Warning Message:**This workflow version (<workflow version name>) is required as a subflow in <workflow version count> other workflows.
- **Suggested Action:** Exercise caution when modifying things like input parameters and return values to assure that parent workflows are not adversely affected.
- **Publishable:** Yes
- **Runnable:**Yes
- **Related Information:** Workflows used as subflows

Troubleshooting

The system warns the workflow designer at publishing time and during validation that a workflow is a subflow. This warning reminds the designer that changes to the current workflow have the potential to affect workflows cited in the validation report or other workflows already running in production. Regardless of how simple the change to a workflow that is a subflow, thoroughly test all parent flows cited in this validation report before publication.

When a workflow is a subflow, changes that can cause it to become invalid include:

- Changing the data types of input variables. Verify that all parent workflows cited in this validation report can pass the correct value type.
- Adding input variables. Verify that all parent workflows cited in this validation report are able to pass all variable values into the subflow.
- Changing or removing the return value of a workflow. Verify that any changes to the return value of a workflow are compatible with the requirements of all the parent flows.
- Changing the table on which the workflow runs. Verify that the table selection is compatible with all parent flows.

Note:
To delete a workflow that is a subflow, first remove the dependency by removing the subflow from all parent flows cited in this validation report. After the dependencies are cleared, a user with the proper role can delete the subflow.

ValidateSingleEnd

The **ValidateSingleEnd** validator finds and identifies multiple **End** activities in a single workflow.

Multiple **End** activities in a workflow might be intentional and have no affect on the workflow, or might be a mistake that the designer needs to correct.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Validation summary

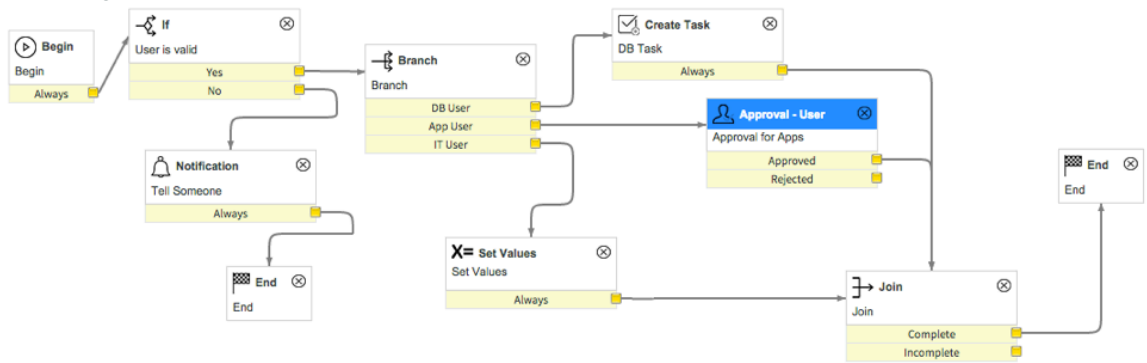
- Risk: If the execution paths to the **End** activities are not mutually exclusive, then the first **End** encountered completes the workflow and cancels all other executing activities.
- Severity Level: Warning
- Valid Result: Valid
- Valid Message: This workflow contains 1 End activity.
- Invalid Result: Invalid Activity
- Invalid Message: This workflow contains <count of ends> End activities.
- Suggested Action: Remove extraneous **End** activities that are not intended as part of the design.
- Publishable: Yes
- Runnable: Yes
- Related Information: None

Troubleshooting

As soon as an **End** activity is encountered in the workflow, the workflow completes even if there are other viable execution paths leading to a second **End** activity that is still executing. Those executing activities are canceled as part of the **End** activity's clean up actions. Therefore, the results of designing workflows with multiple **Ends** must be carefully considered.

In the case of large workflows, it is often more intuitive to read the workflow when there are multiple **End** activities. In the following example, the paths to the two **Ends** are mutually exclusive execution paths. If this was a large workflow, with many activities between **Branch** and the second **End**, the value of the multiple ends becomes apparent. Tracing a **No** response from **User is invalid** to a single **End** behind 33 other activities would be significantly more difficult. There is no risk in this workflow design because there is no reason for other activities to execute if the **End** after the **Notification** activity terminates the workflow.

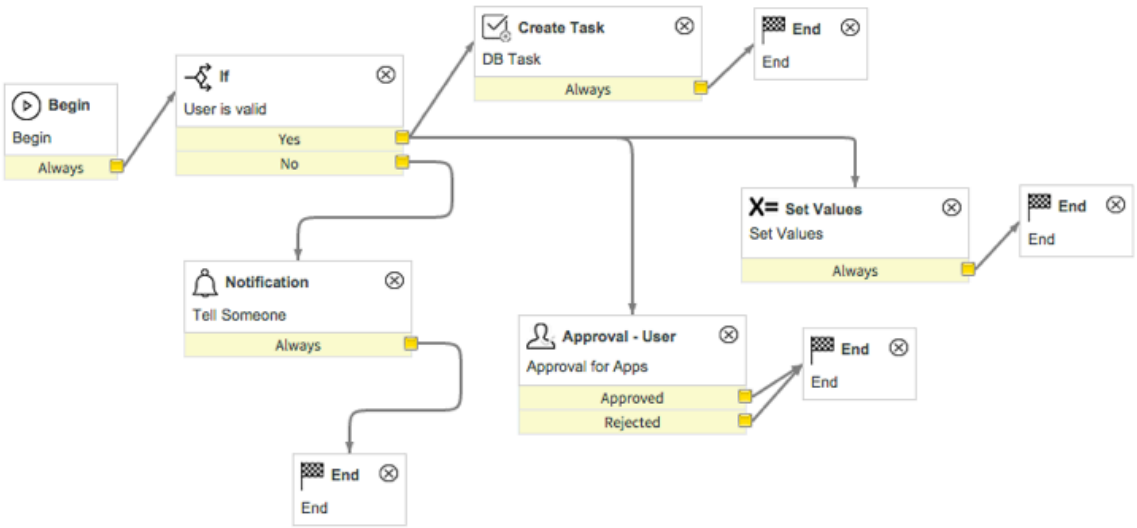
Mutually exclusive execution paths



The next example has multiple **End** activities in execution paths that are not mutually exclusive. A **Yes** response from **User is valid** causes the **Set Values** activity to finish immediately. By reaching its **End** activity first, this execution path cancels the **Approval for Apps** and the **DB Task** activities, which might not be the desired outcome. If the paths are all expected to complete before **End**, the activities should come to a **Join** (as in the previous example) that transitions to a single **End**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Mutually inexclusive execution paths



Note:
To add the second **End**, right-click to copy the original **End** activity and paste it onto the canvas. In most cases, a single **End** is the best and most reliable way to ensure that all activities expected to execute prior to workflow completion, do so successfully.

ValidateUpdateSetDependencies

The **ValidateUpdateSetDependencies** validator identifies all the subflows called in the current workflow and determines if any of those subflows are being edited in a different (in progress) update set.

This warning informs the user that this workflow and one or more of its dependencies are being actively modified in a way that will not deploy concurrently to another instance without additional effort.

For information about update sets, see Create and select an update set.

Validation summary

- Risk: If a parent workflow is edited in one update set and its dependent subflow is edited in another, the two workflows might not be compatible when moved to a different instance. Making independent changes, such as to common or expected values, can make the two workflows incompatible.
- Severity Level: Warning
- Valid Result: Valid
- Valid Message: There were no Update Set dependency issues found.
- Invalid Result: Invalid
- Invalid Message: This workflow has dependent workflows that are in a different update set.
- Suggested Action: Modify and deploy both workflows in the same update set. If you must modify dependencies in separate update sets, use one of these methods:
  - Ensure that all update sets migrate concurrently.
  - Prior to deploying the main flow update set, merge the dependencies into one update set before completing that update set.
- Publishable: Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Runnable: Yes
- Related Information: Workflow movement with update sets

Troubleshooting

A workflow is added to an update set only when the workflow is published. This validator issues a warning when either of the following conditions exist:

- A published subflow is in a different update set than the parent workflow and that update set is In progress.
- A subflow is checked out by another user, who is working in a different update set than the current user.

Note:
This validator does not look for update sets that have been closed. It looks only at update sets that are In progress or at the update sets of all subflows being used by the current workflow that are checked out to users who are working in a different update set.

Example

Following is an example of an at-risk development scenario in which two users create dependencies between workflows in different update sets.

User A:

1. Sets Update Set A to the current update set.
2. Checks out Workflow A.
3. Changes the return value of the **String** type in Workflow A to a **Reference/User** type.
4. Publishes Workflow A, causing an entry into Update Set A.

User B:

1. Sets Update Set B to the current update set.
2. Checks out Workflow B.
3. Includes Workflow A as a subflow.
4. Uses the user reference return value from Workflow A as an approval assignment.
5. Publishes Workflow B, causing an entry into Update Set B.

Risks

- User B moves Update Set B to a different instance that has an older version of Workflow A. The return value is not a user reference, which causes the outcome of Workflow B to be different than it was when tested in development.
- User B moves Update Set B to a new instance that does not have a version of Workflow A. Workflow B experiences a validation failure at runtime and cannot execute. A log entry is added to the workflow log of the current record.

Possible solutions

Solution 1

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Migrate the parent workflow and all dependent workflows to a new instance together using the same update set.

1. Set the update set to the one you want to migrate to new instances.
2. Check out and republish the workflows that need to be included, this action forces an entry into the current update set.
3. Complete the update set with all dependencies.
4. Follow standard procedures for migrating update sets to local instances.

Solution 2

Move dependent workflows between update sets.

1. Identify the update set containing the main workflow to be migrated.
2. Navigate to **System Update Sets > Local Update Sets**.
3. Find and select the update set that contains the dependencies to the main workflow.
4. In the **Customer Updates** related list, select the workflow version of the subflow you want to move.
5. Select the update set containing the parent workflow in the **Update set** field. If this field is not on the Customer Update form, configure the form and add the field.
6. Click **Update** and the base system moves the dependent subflow to the update set selected.
7. Repeat steps 4-6 to add additional dependent subflows to the parent flow update set.

ValidateUpdateSetParentDependencies

The **ValidateUpdateSetParentDependencies** validator identifies all the workflows that call the current workflow as a subflow and determines if any of those parent workflows are being edited in a different update set that is in progress.

This warning informs the user that this workflow and one or more workflows that depend on this workflow are being actively modified in a way that will not deploy concurrently to another instance without additional effort.

Validation summary

- Risk: If a parent workflow is edited in one update set and its dependent subflow is edited in another, the two workflows might not be compatible when moved to a different instance. Making independent changes, such as editing common or expected values, can make the two workflows incompatible.
- Severity Level: Warning
- Valid Result: Valid
- Valid Message: There were no Update Set dependency issues found.
- Invalid Result: Invalid
- Invalid Message: This workflow has dependent workflows that are in a different update set.
- Suggested Action: Modify and deploy both workflows in the same update set. If you must modify dependencies in separate update sets, use one of these methods:
  - Ensure that all update sets migrate concurrently.
  - Prior to deploying the main flow update set, merge the dependencies into one update set before setting that update set to complete.
- Publishable: Yes

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Runnable: Yes
- Related Information: Workflow movement with update sets

Troubleshooting

A workflow is added to an update set only when the workflow is published. This validator issues a warning when either of the following conditions exist:

- A published subflow is in a different update set than the parent workflow and that update set is In progress.
- A subflow is checked out by another user, who is working in a different update set than the current user.

Note:
This validator does not look for update sets that have been closed. It looks only at update sets that are In progress or at the update sets of all parent workflows that call the current workflow and are checked out to users who are working in a different update set.

Example

Following is an example of an at-risk development scenario in which two users create dependencies between workflows in different update sets.

User A:

1. Sets Update Set A to the current update set.
2. Checks out Workflow A.
3. Changes the return value of the **String** type in Workflow A to a **Reference/User** type.
4. Publishes Workflow A, causing an entry into Update Set A.

User B:

1. Sets Update Set B to the current update set.
2. Checks out Workflow B.
3. Includes Workflow A as a subflow.
4. Uses the user reference return value from Workflow A as an approval assignment.
5. Publishes Workflow B, causing an entry into Update Set B.

Risks

- User B moves Update Set B to a different instance that has an older version of Workflow A. The return value is not a user reference, which causes the outcome of Workflow B to be different than it was when tested in development.
- User B moves Update Set B to a new instance that does not have a version of Workflow A. Workflow B experiences a validation failure at runtime and cannot execute. A log entry is added to the workflow log of the current record.

Possible solutions

Solution 1

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Migrate the parent workflow and all dependent workflows to a new instance together using the same update set.

1. Set the update set to the one you want to migrate to new instances.
2. Check out and republish the workflows that need to be included.

   Note:
   This action forces an entry into the current update set.

3. Complete the update set with all dependencies.
4. Follow standard procedures for migrating update sets to local instances. For information about update sets, see System update sets.

Solution 2

Move dependent workflows between update sets.

1. Identify the update set containing the main workflow to be migrated.
2. Navigate to **System Update Sets** > **Local Update Sets**.
3. Find and select the update set that contains the dependencies to the main workflow.
4. In the **Customer Updates** related list, select the workflow version of the subflow you want to move.
5. Select the update set containing the parent workflow in the **Update set** field. If this field is not on the Customer Update form, configure the form and add the field.
6. Click **Update**. The base system moves the dependent subflow to the update set selected.
7. Repeat steps 4-6 to add additional dependent subflows to the parent flow update set.

ValidateInputVarUpdateSetDependencies

The **ValidateInputVarUpdateSetDependencies** validator examines update sets to ensure that workflow input variables for a given workflow have not been deleted in different update sets than those currently **In progress**.

Validation summary

- Risk: Workflows and their input variables are not moved together in a single update set. The deletion of input variables is captured in a different update entry. If these two entries are not in the same update set, the workflow execution can be unstable.
- Purpose: Determine whether input variables that belonged to this workflow were deleted in a different update set.
- Severity Level: Warning
- Valid Result: Valid
- Valid Message: There were no Input Variable Update Set dependency issues found.
- Invalid Result: Invalid
- Invalid Message: There are input variables that have been deleted and logged in a different update set.
- Suggested Action: If the deletion is not intended to be separate from the workflow, ensure that both update sets are committed concurrently to the new instance, or merge both payloads into a single update set.
- Publishable: Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Runnable: Yes
- Related Information: Workflow movement with update sets

Troubleshooting

Workflow input variables get individual entries in the **Customer Update** related list in the current user's update set. This validator reports to the user when workflow input deletions have happened in an update set other than the current user's update set.

Follow the instructions for Input variable removal when the validator issues this warning.

ValidateWorkflowEndStages

The **ValidateWorkflowEndStages** validator checks that in workflows with stages, the end activity of the workflow has a stage named Complete or Completed.

If the workflow has stages associated with it, but does not have the completed stage on the end activity, then the stage indicator will not show that the workflow completed.

Validation summary

- Risk: The stage indicator will not show the workflow is completed.
- Severity Level: Warning
- Valid Result: Valid
- Valid Message: Workflow end stages are valid.
- Invalid Result: invalid
- Invalid Message: End activity A found with invalid stage "S."
- Suggested Action: If this is not by design, make the appropriate changes.
- Publishable: Yes
- Runnable: Yes
- Related Information: Workflow activities

Troubleshooting

Check the workflow for an end activity. Ensure that this activity assigns a stage named Complete or Completed.

ValidateWorkflowStageColumn

The **ValidateWorkflowStageColumn** validator detects and reports when the stage field (stage column) for a workflow is not correct or is unusable.

Validation summary

- Risk: The stage indicators may not display appropriate information.
- Severity Level: Warning
- Valid Result: Valid
- Valid Message:Workflow stage values are valid.
- Invalid Result: Warning
- Info Summary: Stage warnings found.
- Invalid Messages:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Table T does not have a column named C.
- Workflow for table T has stages, but no stage column.
- Table T has a stage column "C," but no stages are set by activities.
- Workflow on table T has stage column "C" that is not type=workflow.

- Suggested Action: If this is not by design, make the appropriate changes.
- Publishable: Yes
- Runnable: Yes
- Related Information: Workflow activities, Workflow stages

Troubleshooting

To check the stage column:

1. Open and check out a workflow.
2. Open the workflow version properties dialog by clicking the menu icon and selecting **Properties**.
3. View the **Stages** tab or section.
4. Check that the assigned stage column is actually a column in the table to which the workflow is associated.
5. Check that the column is type=workflow.

Tip: Stage columns should not be choice lists. If they are, the list appears read-only in form views, since changing that column value outside the workflow engine does not ensure safe tracking of stage states.

ValidateWorkflowStateValues

The **ValidateWorkflowStateValues** validator checks a number of stage aspects in workflow activities for correctness.

This validator has multiple possible error messages.

Validation summary

- Risk: The stage indicators may not display appropriate information.
- Severity Level: Warning.
- Valid Result: Valid.
- Valid Message: Workflow stage values are valid.
- Invalid Result: invalid.
- Warning summary: Stage warnings found.
- Invalid Messages:
  - Stage with empty name is not allowed.
  - Stage with empty value is not allowed.
  - Cannot have more than one stage with the same name: x.
  - Cannot have more than one stage with the same value: y
- Suggested Action: If this is not by design, make the appropriate changes.
- Publishable: Yes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Runnable: Yes
- Related Information: Workflow activities.

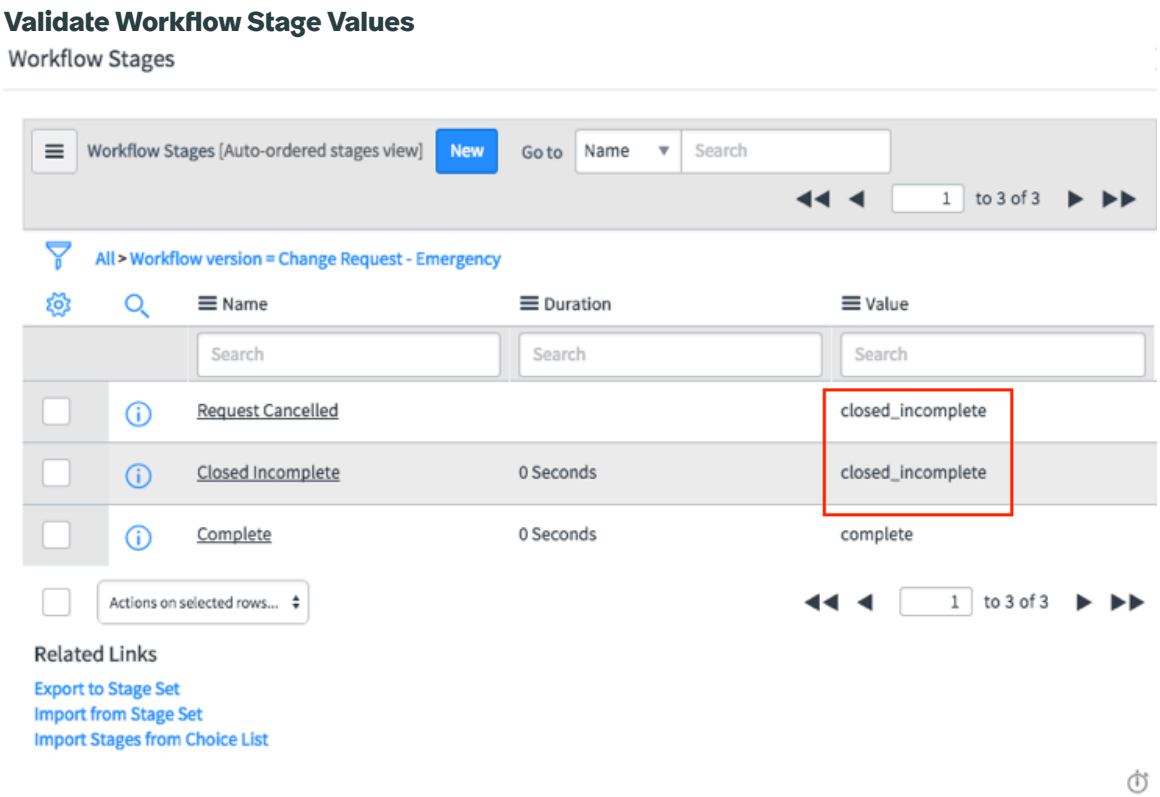
Troubleshooting

Use the following procedure to troubleshoot this validator:

1. Open and check out a workflow.
2. Open the list of stages for the workflow by selecting the menu icon and selecting **Edit Stages**.
3. Check the names and values.

   Ensure that the names and values are unique and are not empty.

4. If the same stage name or value apprears more than once, remove one of the rows. It is then very important to go through the workflow and reassign stages in the activities that used the removed stage.



Tip: Make a list of which activities assign which stages.

Workflow concepts

You can do many things using the Workflow Editor.

- Modify core activities and exit conditions.
- Create custom activities and reuse the data for other workflows.

  See Orchestration activity designer.

- Download activity packs from the ServiceNow Store and create packs for upload.
- Edit workflows graphically.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Define transitions between workflow activities.
- For the table that corresponds to the workflow, customize business rules.
- Summarize workflow progress through stages.
- Validate workflows to identify potential problems.
- Publish workflows for other users.
- Edit multiple tables without needing to directly modify them.

Workflow versions

To prevent users from making changes to a workflow that affect other users of the system, workflows must be checked out before they can be edited.

Only one user can check out a workflow at a time. When a workflow is checked out, changes apply only to the user who has the workflow checked out. Other users can continue to use the published workflow. After the changes are complete, the workflow can be published so that it is available to all users.

Note:
Because each workflow has a unique sys_id, different workflows can have the same name. This is typically expected in a domain-separated environment where users in different companies cannot see each other's workflows because they are in different domains. However, this can lead to confusion in other environments. In general, give each workflow a unique name to prevent workflow designers from making changes to the wrong workflow.

When a new version of an existing workflow is published, the changes are not applied to running workflow contexts. Any currently running workflow context continues using the workflow version that was available when the workflow started. The next time the workflow runs, it uses the updated, published version.

Workflow scope

Workflow application scope determines the access that an application has to the information in a workflow, specifically to the data contained in the activities in that workflow.

When a workflow is created, it inherits the application scope from the gear menu for the logged in user. This scope cannot be changed in the Workflow Editor. When the workflow executes, it runs in this scope and can only be called from a different application if the workflow's accessibility setting permits access to all scopes (public). Otherwise, the workflow's application scope is private to the application.

Note:
Any script that is created in the Workflow Editor, such as an advanced script in an *If* activity, runs in the scope of the workflow. All core activities provided in the base system or for Orchestration run in the scope of the workflow.

Custom activities run in their own scope, even if it is different from that of the workflow. The scope of a custom activity can be private or public. Any script that runs inside a custom activity with a scope can only access outside artifacts that are within the scope of that activity or artifacts that are configured to run in any scope. Conversely, an outside artifact can only access the script inside that private activity if the outside artifact is running in the same scope. Activities with public scopes can interact with outside artifacts in any application scope.

You can use private activities as part of a workflow that has a public application scope. These activities are protected from reaching outside of the workflow or from being reached from outside the workflow. For details about setting application scoping for custom activities, see the field description table for the appropriate activity template.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Custom activities uploaded to the ServiceNow Store must be configured as accessible to all application scopes.

Workflow scope restrictions

There are some restrictions to public and private application scopes.

During runtime, publicly scoped workflows can access other application resources, as long as these resources are set to be accessible to all application scopes. Privately scoped workflows in a private application scope can only access resources private to its scope. Due to scope access boundaries, any privately scoped workflows that make calls out to other scoped resources fail with either an exception or a hung activity while waiting for returned results. This occurs when making calls to these common global resources:

- ECC queues
- Tasks
- Approvals
- Events
- SLA timers
- Timers
- Script includes
- Business rules
- Workflow APIs

As you design workflows, validate the visibility and accessibility of all resources prior to deployment.

See Application scope.

For information on how to configure the scope for a workflow, see Workflow properties.

Domain separation and Workflow

Domain separation is supported in the Workflow application. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Standard*

- Includes **Basic** level
- Business logic: Processes can be created or modified per customer by the service provider. The use cases reflect proper use of the application by multiple service provider customers in a single instance.
- The owner of the instance needs to be able to configure MVP business logic and data parameters per tenant as expected for the specific application.

Use case: As an admin, I need the ability to make comments mandatory on close of a record for one tenant, but not for another.

Overview

When domain separation is enabled, workflows and workflow activities inherit the domain of the user who publishes or creates them.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

How domain separation works in the Workflow application

While workflows are managed by multiple tables, only the following tables are used for domain separation features:

- **Workflow [wf_workflow]** and **Workflow Version [wf_workflow_version]**: used for Process administration or process separation.
- **Workflow Context [wf_context]**: used for Understanding domain separation.

Note:
The Workflow Version table [wf_workflow_version] table does not contain a domain field; Workflow Version records inherit their domain from the parent Workflow record.

The Workflow Editor displays a workflow's domain in the title bar after the workflow name.

Workflow editor domain

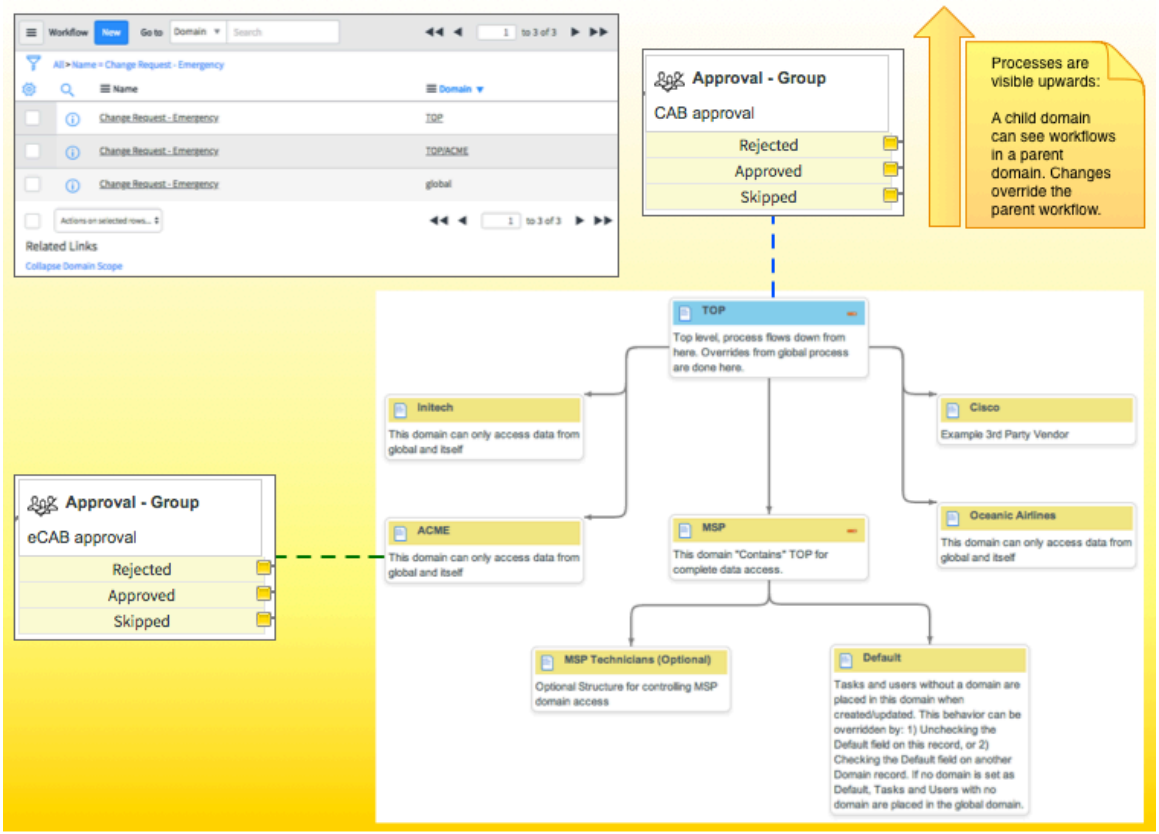
Domain separation for service providers

Workflows and delegated administration

Delegated administration allows child domains to inherit workflows from higher up the domain hierarchy and to override them with domain-specific versions if necessary.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow and delegated administration



Workflow records in the Workflow [wf_workflow] and Workflow Version [wf_workflow_version] tables are considered processes. A user in a child domain may check out but not copy a workflow from a parent domain. When a user in a child domain checks out a workflow from a parent domain, the system creates a version of the workflow in that user's domain. This new version is a unique record in the Workflow [wf_workflow] table. After the user publishes this new workflow, other users in the child domain use the new workflow, which overrides the workflow from the parent domain. The original workflow in the parent domain is no longer visible to users in the child domain.

For example, a managed service provider (MSP) hosts ITSM services for several companies, including ACME and Initech, on a single instance. As administrators, the MSP creates a Change Request - Emergency workflow that applies to all domains because it was created in the TOP domain, which is the highest domain in the domain hierarchy. This workflow overrides the global Change Request - Emergency workflow and specifies that emergency change requests require approval from the CAB approval group. Because of delegated administration, every domain in the hierarchy sees and uses this workflow. Now suppose the ACME domain requires a different approval policy where emergency change requests require approval from the emergency CAB approval group. The MSP creates another version of the Change Request - Emergency workflow in the ACME domain. This workflow overrides the version in the TOP domain and only applies to users in the ACME domain.

Workflow permissions

When a user starts a new workflow, the workflow runs with that user's domain and credentials.

The workflow preserves a user's domain and credentials until an activity causes the workflow to wait, such as an approval activity waiting for approval or rejection. When the stopped workflow resumes, such as when a user approves a request, the workflow uses the credentials of the approving user, but continues to run within the domain of the original user.

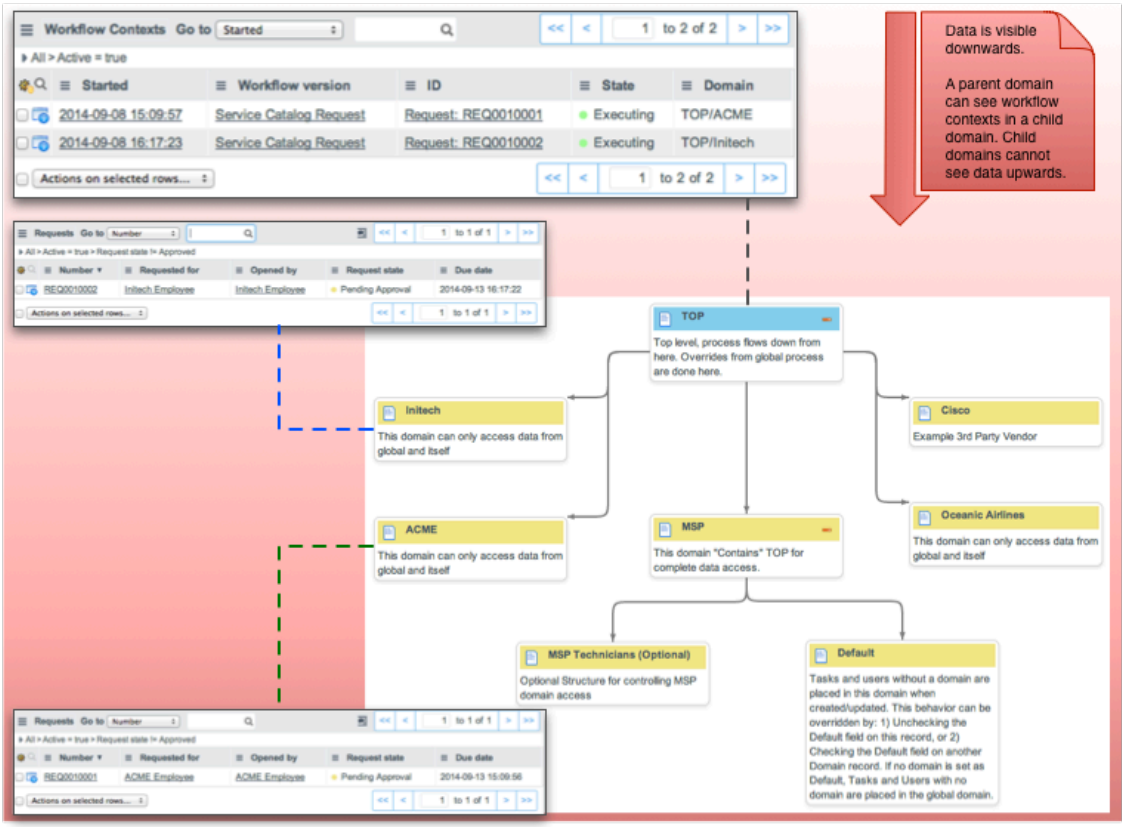
Workflows and data separation

Data separation restricts workflow contexts to users who are either in the same domain of the workflow or are members of a parent domain.

Workflow and data separation



Workflow records in the Workflow Contexts [wf_contexts] table are considered data. Data separation restricts workflow contexts to users who are either in the same domain of the workflow or are members of a parent domain. While a user in a parent domain can see running workflows in a child domain, a user in a child domain cannot see running workflows in a parent domain. If necessary, administrators can use visibility or contains domains to expand who can see domain-specific data.

For example, when an ACME user requests something from the service catalog, a Service Catalog Request workflow context is created in the ACME domain. Similarly, a service catalog request from an Initech user creates a workflow context in the Initech domain. An MSP user in the TOP domain can see both workflow contexts because it is the parent domain for both the ACME and Initech domains. However when an ACME or Initech user logs in, data separation prevents them from seeing each other's service catalog requests. This is expected behavior because each workflow context contains data specific to that domain, such as the item requested and the request's approval history.

Workflow engine operation order

The workflow engine runs in a predefined order relative to business rules and database operations. It caches commonly-used published workflows to improve performance.

The **Run after bus. rules run** workflow property defines if a workflow is **Default** or **Deferred**.

The diagram below shows the workflow engine order of operations and when Default and Deferred flows are executed. For a more general overview of engine operation order, see Execution order of scripts and engines.

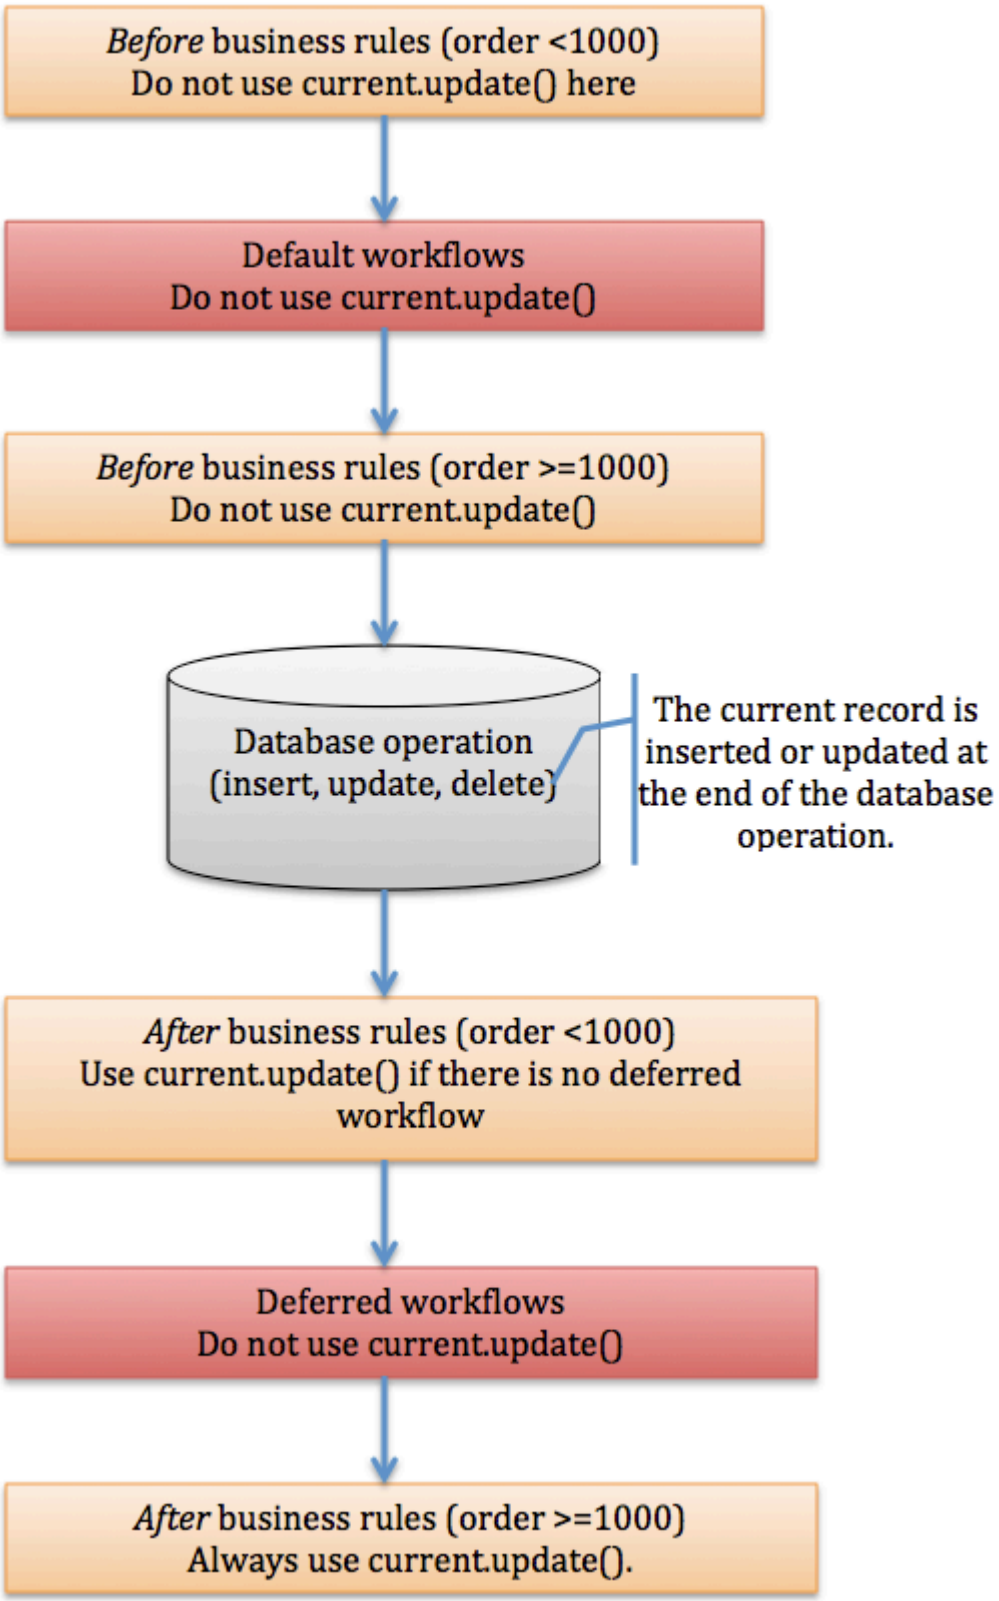
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow engine order diagram



Workflow caching

The workflow engine caches commonly-used published workflows to improve performance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Caching significantly reduces the number of database queries per workflow. By default, the engine caches up to 300 unique workflow versions. Caching very large workflows may reduce this number as the cache size cannot exceed the Java Virtual Machine (JVM) heap size.

To change the maximum number of cached workflow versions, navigate to **Workflow** > **Administration** > **Properties** and modify the value of the **The max number of models that will be concurrently held in the LRU cache** (*glide.workflow.model.cache.max*) property. You must restart the instance to apply this change.

Workflow tables

For full flexibility, workflows store information over a number of different tables.

Usually tables containing workflow information are not edited one-by-one. Instead, use the Workflow Editor to edit workflows. The following lists are provided for reference purposes.

Workflow tables

Table	Description
Workflows	
Column Renderer [column_renderer]	A renderer widget for a stage column. Stage renderers are written in Jelly as a UI Macro. The default is Workflow-Driven; it covers most workflow related stage scenarios.
Version [wf_versionable]	Tracks different versions of element definitions [wf_element_activity].
Workflow [wf_workflow]	The primary records of workflows.
Workflow Binding [wf_workflow_binding]	History of workflows run and the triggering record. Workflow Binding records prevent the system from running workflows again when the associated Workflow Context record has been deleted.
Workflow Context [wf_context]	Individual instances of a workflow being used.
Workflow Execution [wf_workflow_execution]	Synthetic "current" records for workflows that run on Global.
Workflow Instance [wf_workflow_instance]	Connections of workflows to subflows.
Workflow Version [wf_workflow_version]	Particular versions of a workflow, either published versions or versions that have been checked out.
Activities	
Activity Designer [wf_element_activity]	Custom activity definitions.
Activity Variables [wf_activity_variable]	Variables for activities.
Workflow Activity [wf_activity]	Activities as they are being used in workflows.
Workflow Activity Definition [wf_activity_definition]	Definitions of activities that can be used in a workflow.
Workflow Executing Activity [wf_executing]	Individual instances of activities being performed in active contexts.
Workflow components	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow tables (continued)

Table	Description
Element Provider [wf_element_provider]	Template definitions for custom activities.
Group approval [sysapproval_group]	Group-level approvals.
Variable [item_option_new]	
Workflow Condition [wf_condition]	All of the defined conditions in workflows.
Workflow Element Definition [wf_element_definition]	Parent table for activity definitions.
Workflow Estimated Runtime Configuration [wf_estimated_runtime_config]	Runtime performance data for completed workflows.
Workflow Queued Command [wf_command]	Temporary internal storage for workflows that are currently executing.
Workflow SC Variable [wf_variable]	The Service Catalog variables for a workflow.
Workflow Schedule [wf_workflow_schedule]	Definitions of the times to run specific workflows.
Workflow Timing [wf_workflow_timing]	Timing performance data for workflows.
Workflow Transition [wf_transition]	All of the defined transitions in workflows.
History	
Workflow Activity History [wf_history]	The history of executed activities.
Workflow Log Entry [wf_log]	All of the events and history of the workflow.
Workflow Transition History [wf_transition_history]	The history of executed transitions.
Stages	
Stage Default [wf_stage_default]	Definitions of default stage fields for tables to use.
Stage Set [stage_set]	A named set of stages that can be used to populate workflow stages for multiple workflows.
Stage Set Entry [stage_set_entry]	The stages that belong to a named stage set.
Stage Set for Table [stage_set_table]	Defines a relationship of a stage set to a table so that the stage set can be used as the default stages when a new workflow is created for the table. This replaces the wf_default_stage table and is the view that shows when you click **Default Stages (by table)** in the menu.
Workflow Stage [wf_stage]	Definitions of stages used by workflows.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow administration

Tailor workflows exactly the way you want them.

Workflow roles

Certain roles are required to use workflows.

To learn more about managing subscriptions, see Managing per-user subscriptions in Subscription Management and contact your account representative.

Workflow roles

Role title [name]	Description
Activity creator [activity_creator]	Creates and edits custom workflow activities, reuses custom activity data, and manages activity packs downloaded from the ServiceNow Store.
Web service administrator [web_service_admin]	Accesses and uses REST and SOAP messages in the Orchestration activity designer. Creates and edits custom activities that use the REST web service and SOAP web service templates.
Workflow administrator [workflow_admin]	Checks out, creates, edits, publishes, and deletes graphical workflows. **Warning:** Granting this role to a user is equivalent to giving the user the admin role, because workflow Script activities bypass access controls and grant access to all tables and database operations. Script activities do not bypass application scope settings.
Workflow creator [workflow_creator]	Checks out, creates, edits, and deletes graphical workflows. **Warning:** Granting this role to a user is equivalent to giving the user the admin role, because workflow Script activities bypass access controls and grant access to all tables and database operations. Script activities do not bypass application scope settings.
Workflow publisher [workflow_publisher]	Checks out with force checkout option, validates, publishes, and deletes graphical workflows.

Administering workflow contexts

The workflow context performs the activities and transitions defined in the workflow with the new record as current.

Workflow in ServiceNow names a running workflow a Workflow Context. The Workflow Context maintains the state of the overall process in the Workflow Context record. The Workflow Context maintains the state of the individual activities as they execute in a series of related lists. These lists maintain the state of currently executing activities, the result of finished activities, and the execution path the workflow took through the process model.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Workflow Context canvas provides a visual representation of the execution path the workflow took through the process model. The state of each activity (finished, executing, cancelled, error) is represented using the color palette. The executed paths are represented in the color blue; the non-executed paths are represented in grey. Active and historic workflow contexts, as well as the activities within them, can be viewed using the Live Workflows section of the Workflow application menu.

Viewing a workflow context

Workflow contexts can be found in two places:

- From the **Workflow Context** related link on the form of the task being powered by the workflow.
- By navigating to **Workflow** > **All Contexts** and selecting an active context.

Displaying workflow progress

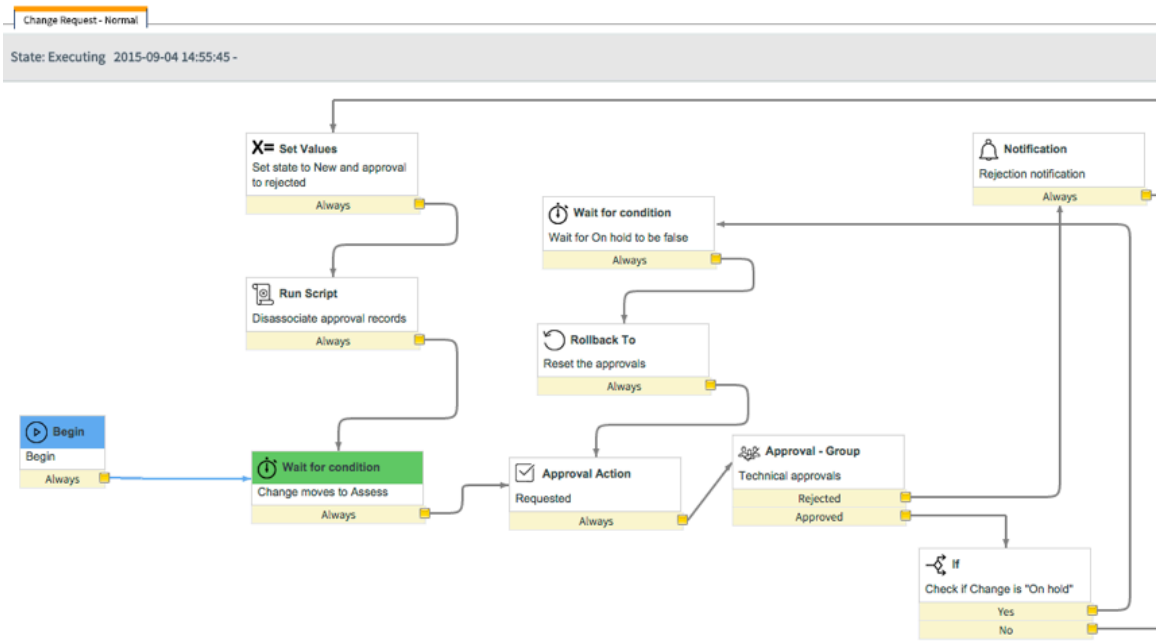
Two related links on the Workflow Context form allow you to view the progress of a workflow in different formats.

- **Show Timeline** displays the workflow context as a timeline.
- **Show Workflow** displays the workflow context in the graphical Workflow Editor.

Graphical interface

To view the workflow context in the graphical Workflow Editor interface, click the **Show Workflow** link from either the workflow context record or the current record.

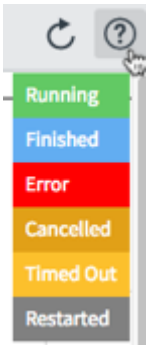
Show workflow



In the top right hand corner are two controls:

	Refreshes the workflow context.
	Displays a key of the colors used in the workflow to denote the state of activities and transitions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

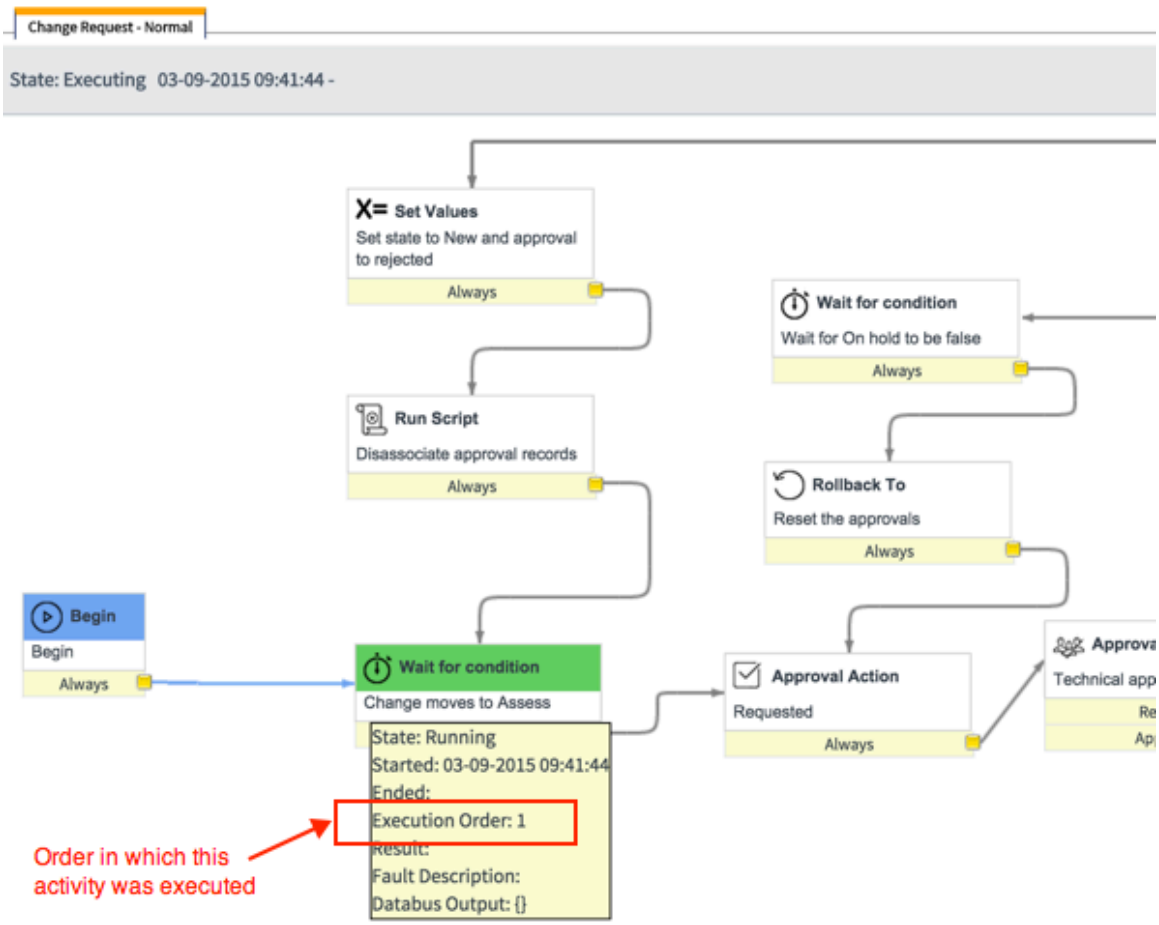


Execution order

View tooltip text in the workflow context graphical view to see the execution order of individual activities.

In **Workflow** > **Live Workflows** > **Active Contexts** or **All Contexts**, Open the context you want to examine. Click **Show Workflow**, and point to a finished or executing activity. The tooltip shows error data, execution time, and the order in which the activity executed in the workflow. Use this data to help troubleshoot activities in an error state.

Execution order workflow



Cancel a workflow

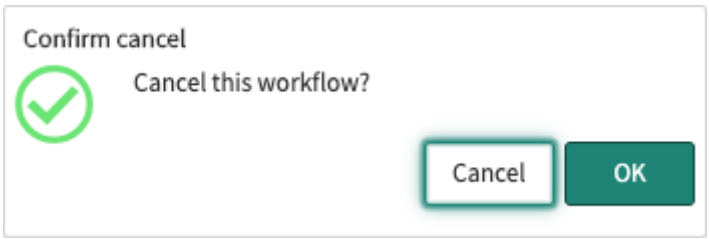
Canceling a workflow stops the workflow from executing and sets the workflow context **State** to **Canceled**. To cancel an executing workflow, you can use the `cancelContext(context)` script. You can define an onCancel script to clean up unresolved workflow activities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

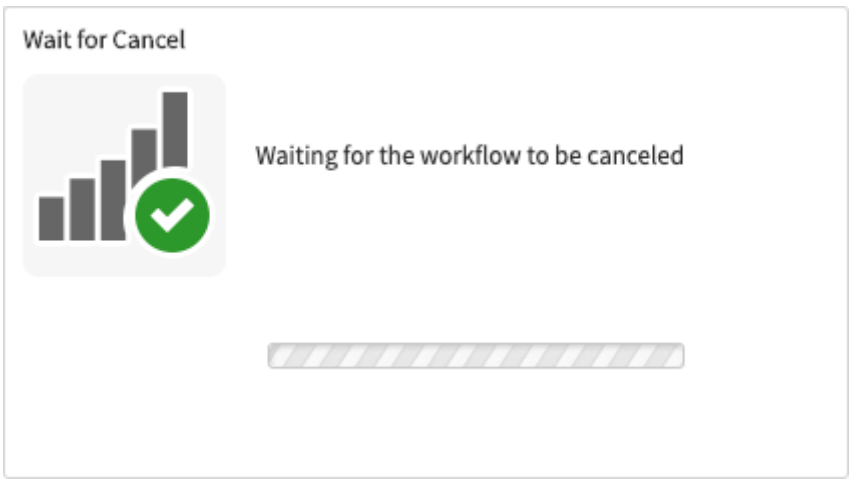
Before you begin
Role required: admin or workflow_admin

About this task
Canceling a workflow attempts to stop the workflow gracefully by injecting a cancel command into the workflow engine.

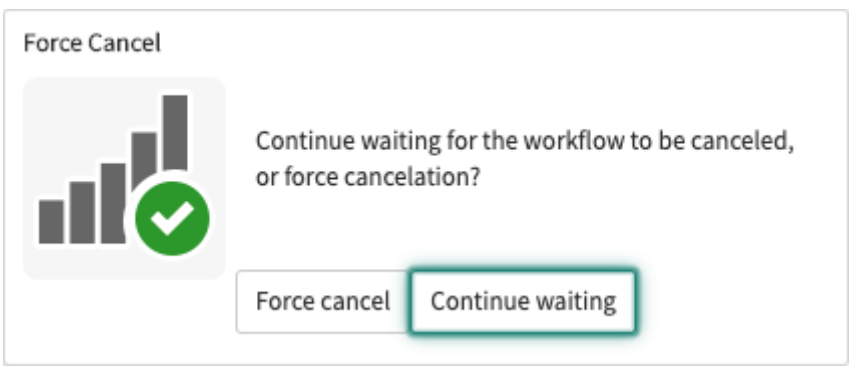
Procedure
1. Navigate to **All** > **Workflow** > **Active Contexts**.
2. Select a workflow context record.
3. Configure form layout to add **On-cancel script** field to form.
   For detailed information about configuring form layout, see Configuring the form layout.
4. Select the **Cancel** related link.
   A confirmation appears.



5. Click **OK**.
   The workflow engine attempts to cancel the workflow gracefully.



If the workflow does not respond to the cancel command, the Force Cancel option appears.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Click **Force cancel** to interrupt the thread the workflow is actively executing or click **Continue waiting** to continue waiting for the workflow to cancel gracefully.

> **Warning:**
> Whenever possible, allow a workflow to cancel gracefully. Forcing a workflow to cancel can leave related workflows and scripts in an unresolved state. You can use an on-cancel script to clean up unresolved artifacts from a cancelled workflow.

Cancel a workflow with the cancelContext(context) script

To cancel an executing workflow, you can use the *cancelContext(context)* script. This script can be useful in cases where a workflow must be canceled in response to an event or where a user must manually cancel a workflow.

Before you begin
Role required: admin

About this task
For more information, see the Workflow - cancelContext(GlideRecord context).

Define an on-cancel script

Canceling a workflow can leave records or scripts in an unresolved state. For example, canceling a service catalog workflow may leave catalog items in the requesting user's cart. An administrator can specify an On-cancel script that runs when the workflow transitions to the Canceled state. This script can notify users, log information, or resolve the state of any scripts run within a workflow activity. The sys_id of the workflow context is available in this script using the context_sys_id variable.

About this task
On-cancel scripts run asynchronously from the global scope. Your instance workload determines when the system schedules and runs the on-cancel script.

> **Important:**
> Since the system runs on-cancel scripts from the global scope, they cannot call or run scoped script includes.

Procedure

1. Navigate to **All** > **Workflow** > **Workflow Versions**.
2. Select a workflow version that you have checked out.
   Workflow versions that are not checked out are not editable.
3. Edit the **On-cancel script** field.
   You may need to configure the form to add this field.
4. Click **Update**.

Example:
This example script adds a comment to a Requested Item [sc_req_item] record indicating the workflow for that request has been canceled.

```
var grContext = new GlideRecord("wf_context");
grContext.get(context_sys_id);
var grReq = new GlideRecord("sc_req_item");

// The current record may not exist, make sure it exists before
 modifying it.
if (grReq.get(grContext.id)) {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    grReq.comments = "The workflow processing this item was
 Canceled. Contact your system administrator for further
 information.";
    grReq.update();
}
```

Scheduling a workflow

In addition to being run based on conditions, workflows can also be scheduled to perform at a particular time, similar to a scheduled job.

Scheduled workflows do not have a defined current record and do not run on specific records within a table. Due to this behavior, certain activities that depend on a current record, such as **Create Task** or **Catalog Task** are unavailable on scheduled workflows. If your workflow requires one of these activities, consider using a scheduled job that inserts a record to start the workflow instead of using a scheduled workflow.

To schedule a workflow, navigate to **Workflow** > **Scheduled Workflows** and click **New**. Populate the following fields:

Field	Description
Name	A unique name for the scheduled workflow.
Workflow	Select an existing published workflow to be triggered at the specified date, time, or interval.
Active	If selected, the scheduled workflow will be triggered at the appropriate time.
Application	Specifies the type of application, such as Global.
Run	A choice list to determine when the workflow should be triggered. Options are: • **Daily:** At a particular hour every day. • **Weekly:** On a particular day of the week. • **Monthly:** On a particular day of the month • **Periodically:** After every set duration. • **Once:** At one specific date and time.
Time	For daily/weekly/monthly scheduled workflows, the time of day to run the workflow.
Day	For weekly scheduled workflow, the day of the week to run the workflow. For monthly scheduled workflows, the day of the month to run the workflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Repeat Interval	For periodical workflows, the interval between workflows, beginning from the **Starting** date and time.
Starting	For periodical workflows, the first date and time to run the workflow. For scheduled workflows run once, the date and time to run the workflow.

Related topics

Create a scheduled job

Workflow movement with update sets

The system tracks workflows in update sets differently than other records because workflow information is stored across multiple tables.

Changes made to a workflow version are not added to the update set until the workflow is published, at which point the entire workflow is added into the update set. Update sets store workflows as a single Workflow [wf_workflow] record and only retain the latest version with the update type of Workflow.

For information about update sets, see System update sets.

Workflow update set migration use case - simple

Create a new workflow with no dependencies and then migrate the workflow in an update set.

1. User A selects Update Set A.
2. User A creates a new workflow called Workflow A.
3. User A publishes Workflow A.

   A customer update set record is added to Update Set A containing an XML payload, including the published Workflow A and all activity dependencies. The XML payload also contains the workflow input variables associated with the workflow.
4. User A completes Update Set A and migrates it to the production instance.
5. Update Set A commits successfully.
6. Workflow A works as expected.

Workflow update set migration use case - subflow dependency (success)

Successfully edit and migrate an existing workflow and its dependent subflow.

1. User A selects Update Set B.
2. User A checks out Workflow A.
3. User A adds a subflow called Workflow B to Workflow A.

   Assume that Workflow B was previously published and migrated to the production instance.
4. User A publishes Workflow A.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A customer update set record is added to Update Set B containing an XML payload, including the published Workflow A and all activity dependencies. The XML payload also contains the workflow input variables associated with the workflow.

5. User A completes Update Set B and migrates it to the production instance.
6. Update Set B commits successfully.
7. Workflow A works as expected with Workflow B as a subflow.

Workflow update set migration use case - subflow dependency (failure)

Edit and migrate an existing workflow from a test instance to a production instance that fails to run on the production instance because of a missing dependent subflow.

1. User A selects Update Set C.
2. User A checks out Workflow A.
3. User A adds a subflow called Workflow B to Workflow A.

   Assume that Workflow B was previously published, but has not been migrated to the production instance.

4. User A publishes Workflow A.

   A customer update set record is added to Update Set C containing an XML payload, including the published Workflow A and all activity dependencies. The XML payload also contains the workflow input variables associated with the workflow.

   Notably absent from Update Set C is the subflow called Workflow B. Workflow B was published before User A selected Update Set C.

5. User A completes Update Set C and migrates it to the production instance.
6. Update Set C commits with warnings.
7. Workflow A is invoked on the production instance with the following results:

   Workflow A fails the runtime validation check and is prevented from running on the production system. The system adds to the workflow context a workflow log entry detailing the cause of the failure, notably the absence of a dependent workflow.

   To learn more about the validation checks on workflow dependencies and update sets see ValidateUpdateSetDependencies.

Workflow update set migration use case - subflow dependency (risk)

Multiple users migrate a workflow from a test instance to a production instance without proper coordination. This use case can succeed, but only when each user understands the dependencies and properly migrates the dependent parts of the workflow to the new instance.

This example does not represent an update set failure, although update sets are most often blamed in this use case. Validation increases the visibility of workflow dependencies across multiple update sets and provides designers with better information. In most cases, the warnings do not prevent an action, but only identify risk. The designer is responsible for taking action on advice given in the validation checks.

1. User A selects Update Set C.
2. User A checks out Workflow A.
3. User A adds a subflow called Workflow B that returns a **User ID**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Assume that Workflow B was previously published and migrated to the production instance.

4. User A uses the return value of Workflow B to generate approvals.
5. User B selects Update Set D.
6. User B checks out Workflow B (the subflow in Workflow A).
7. User B modifies the return value of the workflow by changing it from a **User ID** to a **String Message**.
8. User A publishes Workflow A.

Note:
A dialog box displays warnings associated with Workflow A and encourages User A to validate the workflow before publishing.

9. User A cancels publishing and validates Workflow A.
10. User A is warned that Workflow B was modified by a user in a different update set.
11. User A ignores this warning and publishes Workflow A.

Note:
A customer update set record is added to Update Set C containing an XML payload, including the published Workflow A and all activity dependencies.The XML payload also contains the workflow input variables associated with the workflow.

12. User A completes Update Set C and migrates it to the production instance.
13. Workflow A is invoked on the production instance and runs successfully using the older version of Workflow B already on the system.
14. User B publishes Workflow B.

Note:
User B is not warned of the Update Set C dependency, because the update set is no longer In progress. However, User B is informed via a dialog box that there are warnings associated with the workflow version and is instructed to validate Workflow B. If User B cancels publication and validates the workflow, User B is warned that there are workflows that use Workflow B as a subflow. Knowing the return value was changed, User B should test those workflows as well. See ValidateUpdateSetDependencies to understand the parameters of update set warnings.

15. User B finally publishes Workflow B.

Note:
A customer update set record is added to Update Set D containing an XML payload, including the published Workflow B and all activity dependencies.

16. User B completes Update Set D and migrates it to the production instance.
17. Update Set D commits without warnings.
18. Workflow A is invoked on the production instance and fails to run successfully, because the return value of Workflow B no longer generates a User ID.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Input variable movement

You can add input variables to existing workflows and add them to update sets.

When you submit the new variables, an entry is made into the current update set that reflects the addition of a variable to the Variables [var_dictionary] table. Unlike the workflow version that only writes to the update set when the workflow is published, the variables write individual update entries into the currently selected update set immediately upon submission.

Input variable movement use case - two input variables

An existing workflow already contains two input variables.

1. User A checks out the workflow.
2. User A adds two input variables.

   ServiceNow adds to the current update set one customer update record for each new variable.

   The current workflow now has 4 input variables: the two that were present prior to check out and the two new ones.
3. User A publishes the workflow.

   There are now three related customer update records: two for new variables, and one for the published workflow. The XML payload of the new workflow version now includes all input variable database entries. So while the two original input variables do not have individual customer update records, all four variables are migrated to the local instance with the payload of the newly published workflow version.
4. Verify variables included in a specific workflow.
5. User A completes the update set.
6. Adding Input Variables - Success

   User A migrates and commits the update set to a local instance where the original workflow version had previously been committed.
   - The two existing input variables are already present because of the earlier version.
   - The system adds the two new input variables when the user commits the update set.
   - The system preserves the two legacy input variables on the instance receiving the update set. The update set does not overwrite these variables.
   - The new published workflow version uses all four variables.
   - The user tests the new workflow version and it runs as expected.

Verify variables included in a specific workflow

You can verify the variables that are included in a specific workflow.

Procedure

1. Navigate to **All** > **System Update Sets** > **Local Update Sets**.
2. Select the active update set.
3. Select the customer update entry for the workflow.
4. View the **XML Payload**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Search for the name of one of the columns or search for var_dictionary.

   There is one var_dictionary entry for each input variable.

Input variable removal

Deleting workflow input variables, like insert and update actions, creates a customer update record in a user's current update set.

These deletions migrate to a new instance with the update set, regardless of whether the workflow that owns the input variables is published in the same update set. Plan carefully and use caution when editing a workflow and selecting update sets.

Input variable removal risk

An existing workflow already contains two input variables.

1. The workflow was migrated to a production instance with the two variables.
2. On a development instance, User A selects Update Set A and checks out the workflow.
3. User A removes one input variable and all references to it in the workflow.

   The system enters into Update Set A one customer update record reflecting the deletion of the input variable. No record is added for the new workflow version which no longer depends on the input. This does not happen until the workflow is published.

4. User A continues working on other features in Update Set A that need to be moved to production.
5. User A completes Update Set A and migrates it to the production instance without publishing the workflow.

   The update set entry that deletes the workflow input variable now applies to the production instance. The prior version of the workflow is running on this instance and still references the missing variable.

Input variable removal solution

When editing workflows, particularly when deleting input variables, be sure to use a single update set for all variable editing and workflow publishing.

If necessary, merge the update set into a more general set targeted for deployment after the workflow is published. For information about update sets, see System update sets.

Note:
If a workflow version is already running on a production system and input variables are deleted from a newer version, those deletions could affect transactions already running against the earlier version. Use extreme caution when deleting workflow input variables and plan the migration carefully.

Input variable removal prevention

Prior to publishing a workflow version, the system validates the workflow model to assist the designer in planning for deployment.

This validation warns of critical errors that can prevent a workflow from running successfully, but also warns of dependencies and conflicts in update sets. See ValidateUpdateSetDependencies for more details.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Avoiding duplicate workflows

Update sets manage the published state of all versions of a workflow prior to committing the workflow version on a local instance.

The last version of a workflow committed as an Insert or Update using an update set becomes the currently published version, regardless of the publishing sequence for the workflow versions.

Commit a workflow in an update set

Follow the steps in this page to commit a workflow in an update set.

Procedure

1. Workflow A - Version 1 is created and published in Update Set A.
2. Update Set A is completed and migrated to a local instance.
3. When the update set is committed, the system sets all prior versions of Workflow A to published = false.

   In the first migration, there are no prior versions.
4. Workflow A - Version 1 becomes the only published version of the workflow.

Update set migration example

It is not possible to have multiple published versions as a result of update set commits. However, this does not eliminate risk, and care should be taken when migrating update sets.

Consider this example:

1. Workflow A - Version 1 is migrated and committed to the production instance.
2. Update Set B is created.
3. Update Set C is created.
4. Workflow A - Version 2 is published in Update Set B.

   A customer update record is added to Update Set B with the Version 2 payload.

   A customer update record is added to Update Set B with the Version 1 workflow left unpublished.
5. Update Set B is completed.
6. Workflow A - Version 3 is published in Update Set C.

   A customer update record is added to Update Set C with the Version 3 payload.

   A customer update record is added to Update Set C with the Version 2 workflow left unpublished.
7. Update Set C is completed.
8. Update Set C is migrated and committed to the production instance.

   Workflow A - Version 1 is set to unpublished.

   Workflow A - Version 2 update is skipped since Update Set B, which contains Version 2, was never migrated.

   Workflow A - Version 3 is committed and becomes the only published version of the workflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Update set migration risk

Update Set B is migrated and committed to the production instance.

1. Workflow A - Version 3 is set to unpublished.
2. Workflow A - Version 1 remains unpublished.
3. Workflow A - Version 2 is committed and becomes the only published version of the workflow.

   The workflow has gone back a version, perhaps unintentionally. The regressed version becomes the currently published version.

Workflow timelines

The system provides a timeline view of history activities associated with a workflow context.

Timelines display a linear calendar of activities, such as tasks and approvals, defined by their start and end dates. Each activity on the timeline is represented by a span, which is displayed as a horizontal, colored bar. Each span has a label and a tooltip that contains additional information about the activity. The left pane displays all the activities in the context (or contexts) in an expandable hierarchy. You can change the timeline's perspective for a more granular view of the data.

Note:
Workflow timelines reflect context history only and are not real-time gauges of workflow activity.

Use a timeline

By default, the timeline displays all activities and transitions requested when first opened.

About this task

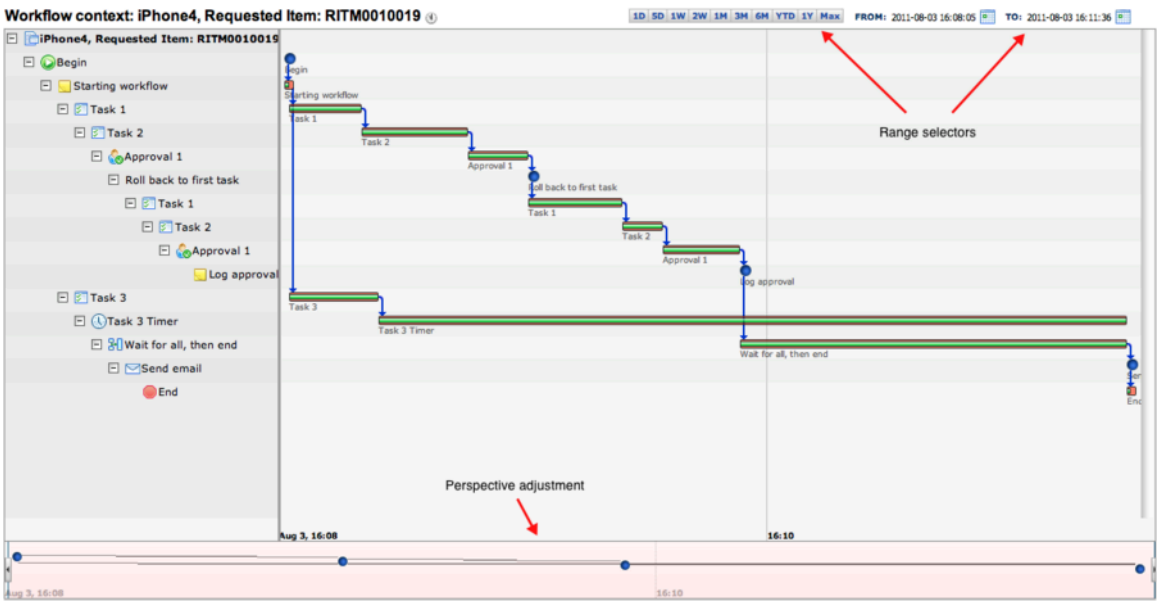
Collapse any part of the hierarchy in the activity pane and the timeline adjusts automatically. Date/time and duration controls enable you to scale the timeline to view all the elements at once. To display a timeline, click a UI action within a Workflow Context record.

Procedure

1. Navigate to**All** > **Workflow** > **Live Workflows** > **Active Contexts**.
2. Select a context.
3. In **Related Links**, click **Show Timeline** to display the timeline for the entire context.

   The timeline opens with all activities expanded and the view set to **Max**, which displays the entire timeline at the width of the pane. The title of the timeline is in the form Workflow context: <context name>, Requested Item: <requested item number>.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Use the Range Selectors at the top of the timeline to change the perspective.

The increments go from one day to one year. To limit the timeline to an increment between the start date of the first span and the end date of the last span, click **Max**.

5. Use the starting and ending calendar fields to select the timeline perspective.

These fields control the same perspective as the slider at the bottom of the timeline.

6. Use the pink slider at the bottom of the timeline to change the perspective.

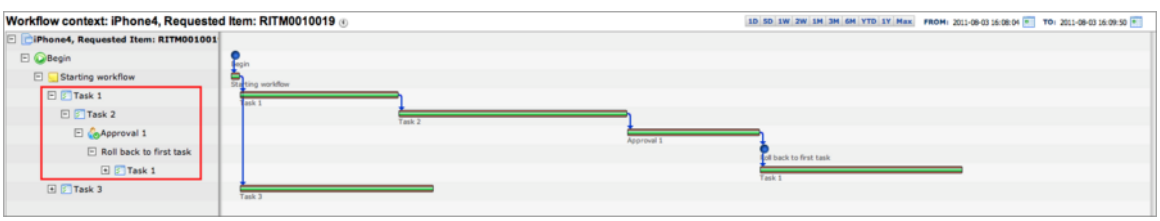
a. Move the slider from right to left to view all the spans on a long timeline.

b. Adjust the end points of the slider to make arbitrary changes to the magnification.

A narrow slider zooms in on the spans and provides a more detailed view of complex timelines. A wide slider pulls the view out and makes more of the timeline visible on the screen.

7. To focus the timeline view on selected activities, expand or collapse the activity tree.

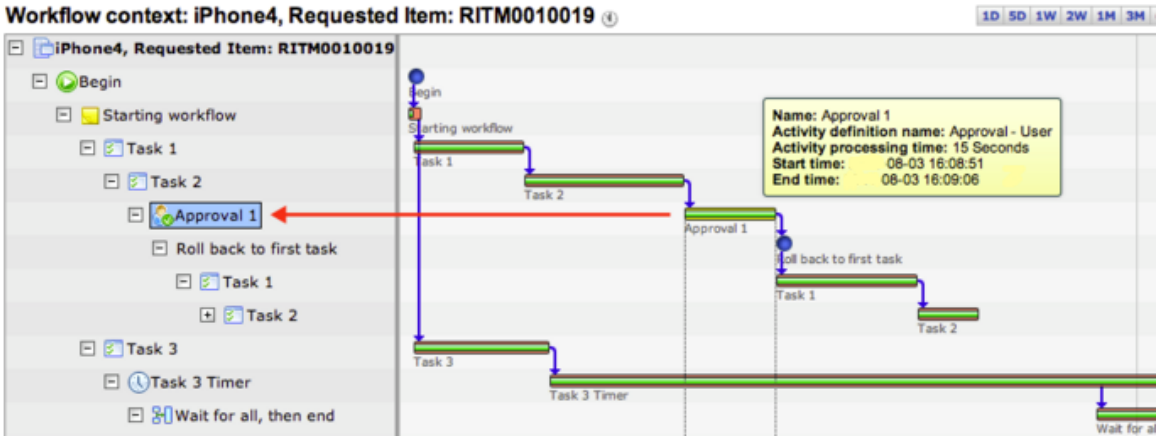
Spans not visible in the activity tree are not shown in the timeline pane.



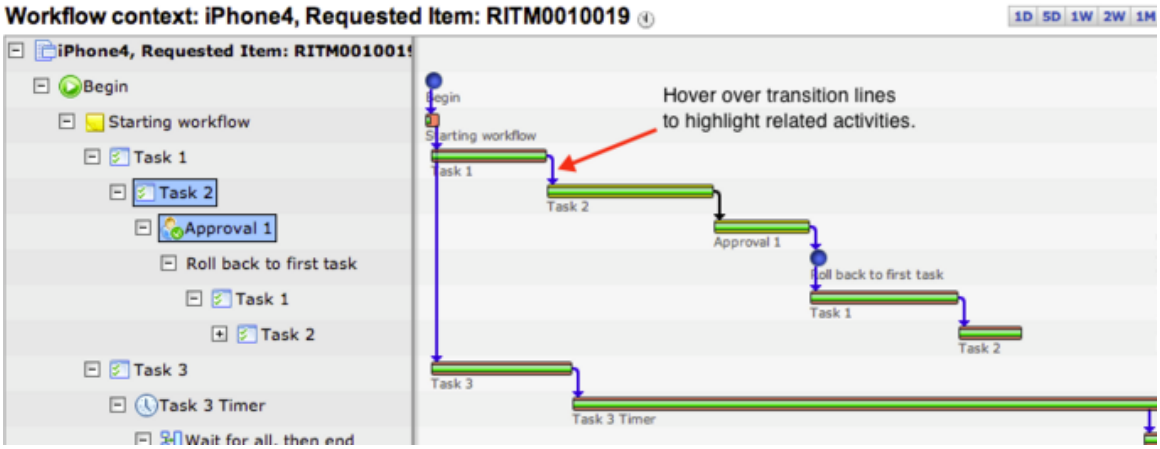
8. Hover over an activity span to display a tooltip with information about the activity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This action highlights the activity in the activity pane.

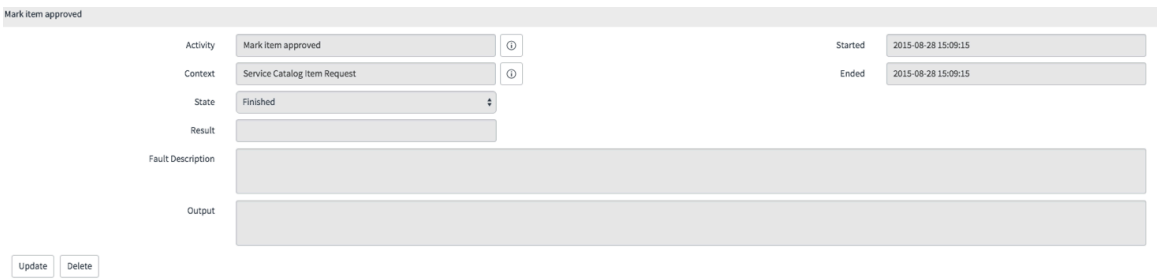


9. Hover over the transition between two activities to highlight the activity and the predecessor activity in the activity pane.



10. Double-click a span to display a history record for that activity.

History records shows information such as the **State** and the starting and ending times.



Timeline for a selected activity

You can display a partial workflow timeline.

Procedure

1. Navigate to**All** > **Workflow** > **Live Workflows** > **Active Contexts**.
2. Open a Workflow Context record.
3. On the **Workflow Activity History** related list, select one or more individual activities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Click **Show Timeline** from the action menu.

   The resulting view is a snapshot of the timeline, showing only the selected activities and their transitions, if any.

5. Collapse the tree to confine the view even further.

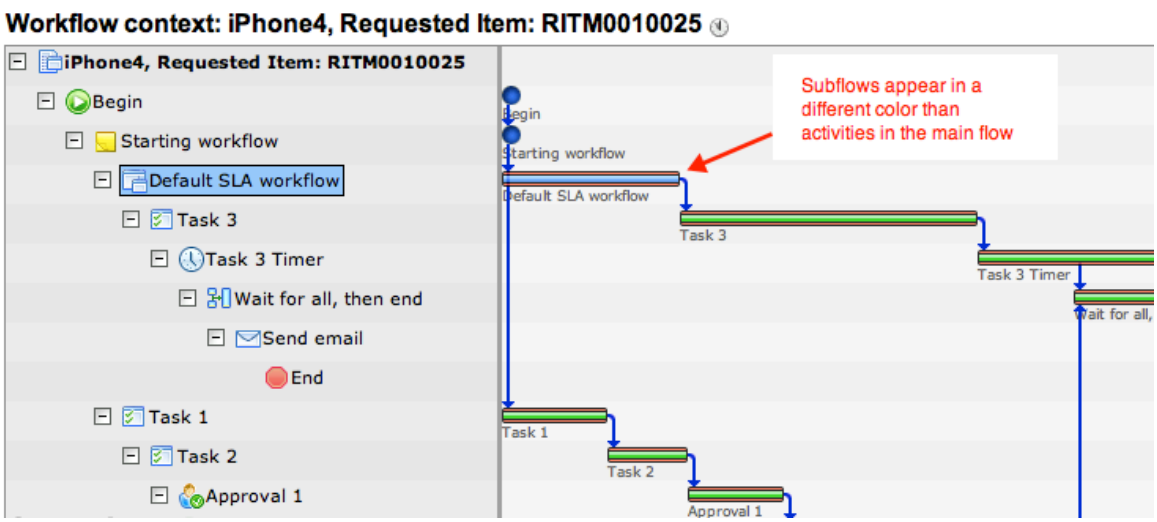
6. To view a timeline displaying activities from different contexts:
   You might use this feature to display a subflow's context with the parent workflow context.
   a. Navigate to **Workflow** > **Live Workflows** > **History**.
   b. Select individual history items from the list.
   c. Select the **Show Timeline** option from the actions menu.

      History items are arranged in a hierarchy in the activities pane under their contexts. The timeline title is **Multiple Contexts**. The timeline draws only the activities and relationships of the history items selected.

View subflows in a workflow timeline

In a workflow timeline, subflow spans appear as a different color than the activities of the main workflow.

Workflow timeline subflow



Workflow error handling

The personalized JavaScript that users create in workflow activity variables is vulnerable to run-time syntax errors. Available error information is available in a tooltip when you point to a workflow activity in an error state.

In the base system, workflow activities do not provide condition routing on the error state. As a result, the workflow progresses based on the state of the current record. For example, a workflow contains an **Approval - User** activity that uses an advanced script to add additional approvers. A syntax error in the script results in no approvers being added. Because a state of **no approvers**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

is a valid return, even without the syntax error, the approval activity is skipped and the workflow progresses along a positive path. However, this might not be a valid response for the workflow designer who does not want the workflow to progress along the positive path without approvers.

Workflow error handling detects and logs syntax errors and provides a state that the workflow designer can use to add error conditions to the workflow. Use error handling to locate syntax errors in advanced script fields for these workflow activities:

- Approval - User
- Approval - Group
- Catalog Task
- Create Task
- If
- Run Script
- Notification

Available error information

This table shows which activities support error exits.

Available error information

Activity	Workflow log	Red error indicator	Activity state	Activity result	Fault description	Reroute on error
Approval - User Approval - Group	Yes	Yes	Error	Skipped	Yes	Yes
Catalog Task Create Task	Yes	No	Finished	none	No	No
If	Yes	Yes	Error	none	Yes	Yes
Run Script	No	Yes	Error	error	Yes	Yes
Notification	Yes	Yes	Error	error	Yes	Yes

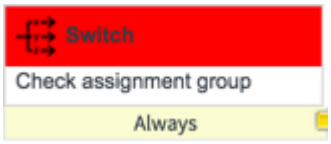
Workflow error tracking features

Error handling provides visual cues within the workflow, such as error descriptions for activities in pop-ups, and detailed log records.

Banners

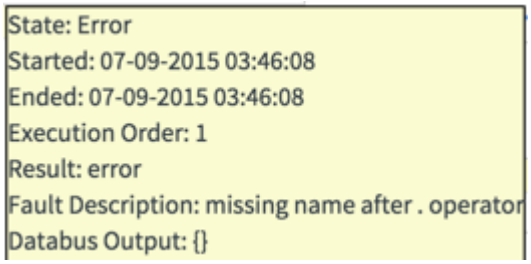
Look for an activity with a red banner, indicating that a syntax error has occurred in a script field. All activities that provide error handling, with the exception of **Catalog Task** and **Create Task**, display a red banner for this error.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Tooltips

Point to the activity displaying a red banner to view information about the error. A tooltip shows the **State** and **Result** of the activity and provides a brief **Fault Description** (except for task activities). Note that this approval continued as skipped despite the error given in the fault description. See Workflow error handling for the information available to each activity.



Execution order

Tooltip text in the Workflow Context graphical view displays the execution order of individual activities, which assists in troubleshooting.

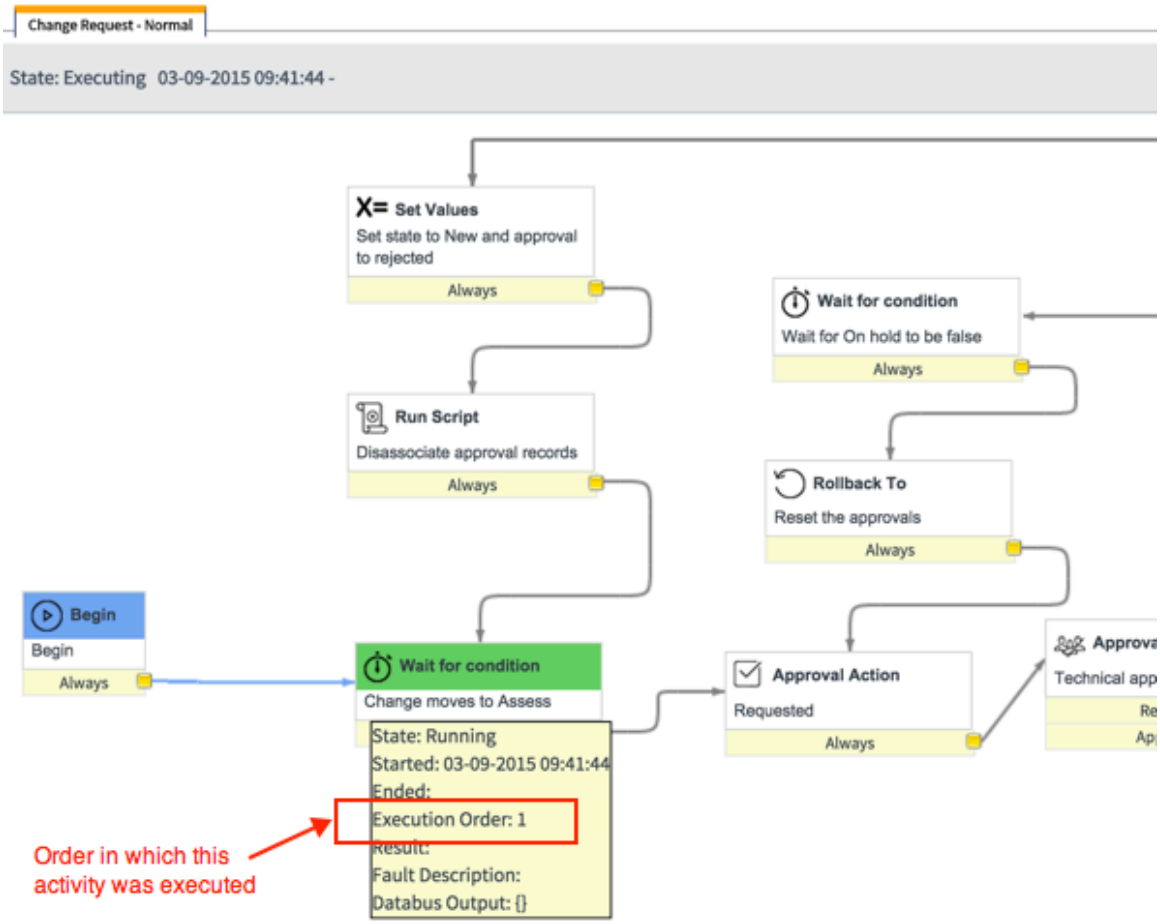
To view the order in which a workflow activity was executed:

1. Navigate to **Workflow** > **Live Workflows** > **Active Contexts** or **All Contexts**.
2. Open the context you want to examine.
3. Click **Show Workflow**.
4. Hover the cursor over a finished or executing activity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A tooltip appears showing error data, execution time, and the order in which that activity executed in the workflow. You can use this data to help troubleshoot activities in an error state.

Activity execution order



Workflow log

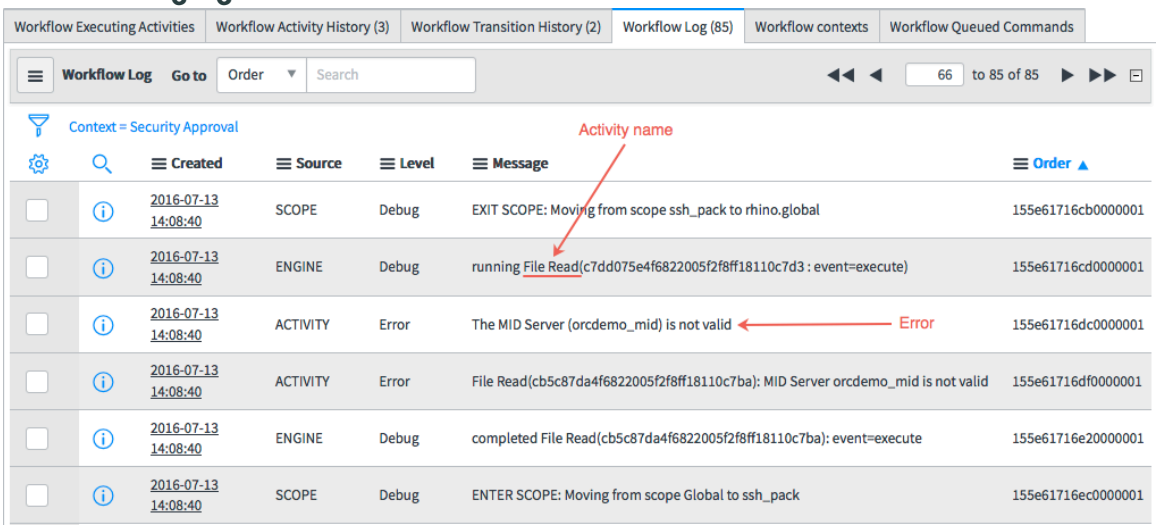
View the log in the Workflow Context form for more information about the syntax error in the activity. Since task activities do not display a red banner when a syntax error has occurred, you must view the log if you suspect the workflow has not run properly. Examine the error description in the log, and then inspect the script in the activity named in the log.

To view the activity by name, navigate to **Workflow** > **Administration** > **Properties** and enable the **Log workflow debug messages** property.

In this example, an SSH activity named File Read specifies an invalid MID Server.

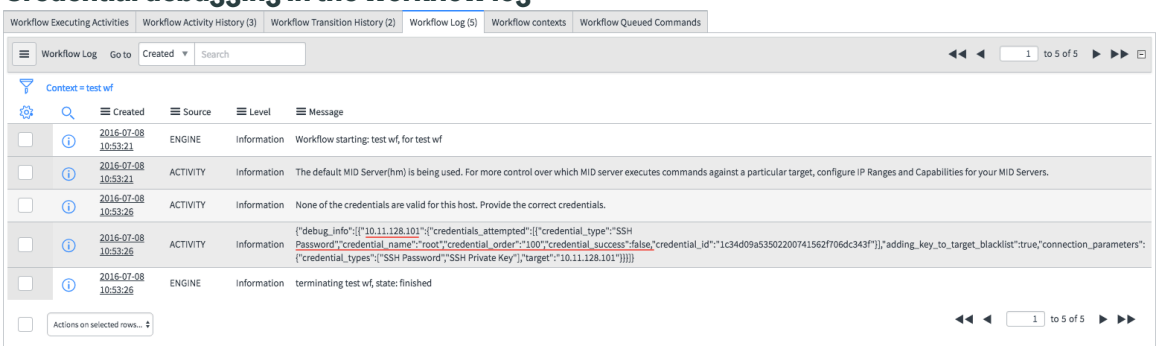
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Error handling log



If the credentials used by an activity in the workflow fail, and the activity cannot authenticate on the target, a message describing the failure appears in the **Workflow Log** related list. The message displays the target IP address and the credential details.

Credential debugging in the workflow log



Create an error condition exit

An administrator can reroute the workflow when a script error occurs by creating an error condition exit for specific activities within the workflow. This allows the workflow to process script errors in a predictable way and not create undesirable results.

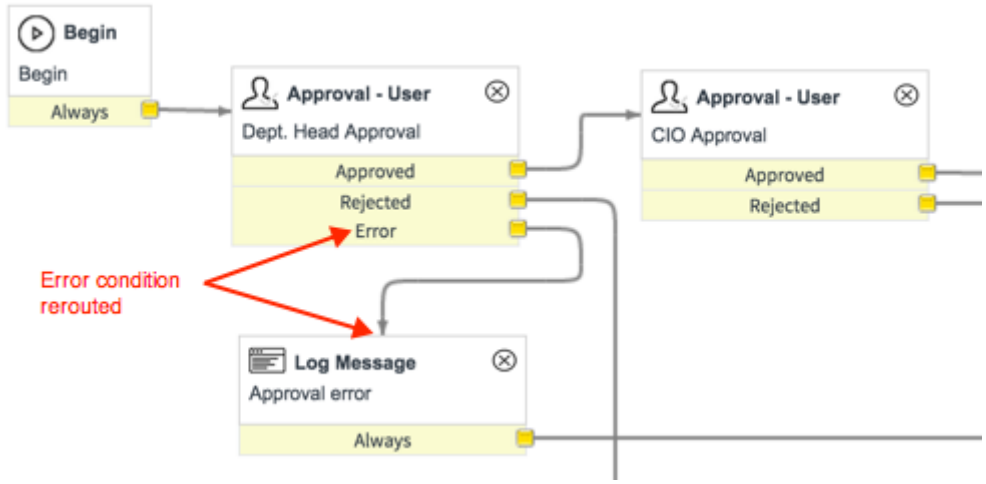
Procedure

1. Open and check out a workflow.
2. Right-click in the top portion of the activity for which you want to create an error exit.
3. Select **Add condition** from the context menu.
4. Add a condition exit with the following values:
   - Name: `Error`
   - Condition: `activity.state=='faulted'`
5. Click **Submit**.

   The **Error** exit appears on the activity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Connect the **Error** exit to another activity for handling the error state, such as **Notification** or **Log Message**.



Reconfigure an approval condition

Approval activities react differently to script errors than the other activities.

About this task

Approval activity script errors can prevent an approval from being processed successfully. This, in turn, can cause the approval to complete as **Skipped**, which can appear to be an **Approved** state. To prevent this from happening, reconfigure the **Approved** exit as follows:

Procedure

1. Open an approval workflow and make sure it is checked out.
2. On an approval activity, double-click the **Approved** exit.
3. Add the following script to the **Condition** field:

   ```
   && activity.state != 'faulted'
   ```

   This prevents the activity from continuing down the normal path in an error state and ensures that **Skipped** or **Approved** is the desired state.
4. Click **Update**.

Workflow run time metrics

You can enable the collection of workflow run time metrics to determine whether workflows are performing as expected or consuming additional resources.

Outlying run times for a workflow are identified by comparing actual run times to an outlier range calculated with the outlier threshold and estimated run time defined in the workflow properties.

You can monitor the results of these metrics on the Workflow Operations Dashboard and custom homepages with workflow gauges.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

The functionality found in homepages, arranging information from your instance to tell a story about your data, is found in dashboards on new instances. On upgraded instances with Next Experience enabled, users can view existing homepages if they have a direct URL, but they can't create or edit them. Responsive dashboards and Analytics Center dashboards take over homepage functionality.

Use the Homepage deprecation help tool to convert the homepages on your instance to responsive dashboards.

For more information, see:

- Dashboards in the Analytics Center.
- Working with responsive dashboards.

Enable workflow run time metrics

Provide an estimated run time that can be compared to actual workflow run times.

About this task

For baseline workflows, you must also manually enable the collection of run time metrics. The system automatically enables the collection of run time metrics for new workflows.

Procedure

1. Navigate to **All** > **Workflow** > **Workflow Editor**.
2. Open and check out the workflow.
3. In the title bar, click the menu icon and select **Properties**.
4. In the Workflow Properties dialog box, click the **Estimated Runtime** tab.
5. To enable the collection of run time metrics, check that the **Requires ERT** option is selected.
6. Open a configuration from the **Estimated Run Time** column.
7. In **Estimated Run Time**, enter an initial estimate for the workflow's run time.
   The system compares this initial estimate to actual run time results to create outlier reports. The system can automatically update this field in certain circumstances. Workflow designers can also manually update this field.
8. In the **Outlier Percentage Threshold for ERT** field, enter the percentage deviation from the estimated run time that identifies an outlier workflow run time.
   The system uses a default value of **20**.
9. Click **Update**.

Outlying workflow run times

Workflow run times are identified as outliers when they are longer or shorter than the outlier range that is computed for the workflow.

The outlier range is automatically computed with the **Estimated Run Time** and **Outlier Percentage Threshold for ERT** values in the workflow properties. These values are used in the following formulas.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Formulas for computing workflow outlier ranges

Value computed	Computation used	Example
Outlier Value	**Estimated Run Time** * (**Outlier Percentage Threshold for ERT** / 100)	10 seconds * (20 / 100) 10 seconds * 0.2 = 2 seconds
Outlier Range	(**Estimated Run Time** - *`Outlier Value`*) to (**Estimated Run Time** + *`Outlier Value`*)	(10 seconds - 2 seconds) to (10 seconds + 2 seconds) = 8 to 12 seconds

When a workflow runs within the outlier range, its estimated run time is automatically updated.

If a workflow has an outlying run time, it appears in any outlier workflow gauges on the Workflow Operations Dashboard and custom home pages.

Workflow estimated run time updates

When a workflow runs within the outlier range, its estimated run time is automatically updated.

The estimated run time is updated with the cumulative moving average of the latest run time value in relation to previous run times. The computed value is rounded to the nearest second and stored as a GlideDateTime.

For example:

Data point	Latest value	Cumulative running average (CRA)	CRA after rounding to the nearest second
1	10 seconds	10 seconds	10 seconds
2	12 seconds	11 seconds	11 seconds
3	9 seconds	10.333 seconds	10 seconds

Note:
Because the system rounds to the nearest second, the calculation is less precise with short durations.

You can also manually update the estimated run time in the workflow properties.

Workflow pause utility

Workflow Pause Utility provides functionality you can use to pause or resume all workflow contexts, a subset of qualified workflow contexts, or individual workflow contexts. You designate the data and time of day at which the paused workflows should resume, and can manually resume individual workflows as needed.

Once activated, the Workflow Pause Utility plugin (com.glideapp.workflow.pause) updates several tables when you pause or resume workflows. Each table stores specific data related to each paused or resumed workflow.

wf_pause_request

Records every workflow pause request. The system automatically updates and inserts records in this table whenever you pause workflow contexts. It tracks user-

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

specified resume time, whether the pause request is still active, and the total number of workflow activities that paused or resumed.

wf_pause_status

Records the status of each workflow context you pause. When you pause workflow contexts, the plugin waits until the current executing activity finishes, and pauses it before the next activity starts. It tracks the specific activity on which the workflow context was paused and whether it has resumed. If the workflow is paused, it tracks the time at which it is scheduled to resume.

wf_pause_group_request

Pauses the specific set of workflow contexts you designate using filtering in Group Pause Requests. You can manually pause all currently active workflows by clicking the **Pause All** check box.

wf_pause_snapshot

Before pausing and after resuming a workflow, the table records a snapshot of the current state of the workflow context. The table also records the state of the currently executing activity on the paused workflow context.

Use examples

When you take down an instance for maintenance, you can pause all or selected active workflow contexts, and then resume them after you complete the maintenance.

You have an integration workflow context that hits an internal service that is down for maintenance. You can pause all instances of that workflow context from progressing to the next activity, allowing time for the internal service to be restored. Then, the paused workflow contexts can be resumed.

Request workflow pause utility

You can request the Workflow Pause Utility plugin (com.glideapp.workflow.pause) if you have the admin role. This plugin may include demo data and activates related plugins if they are not already active.

Before you begin

Role required: admin

About this task

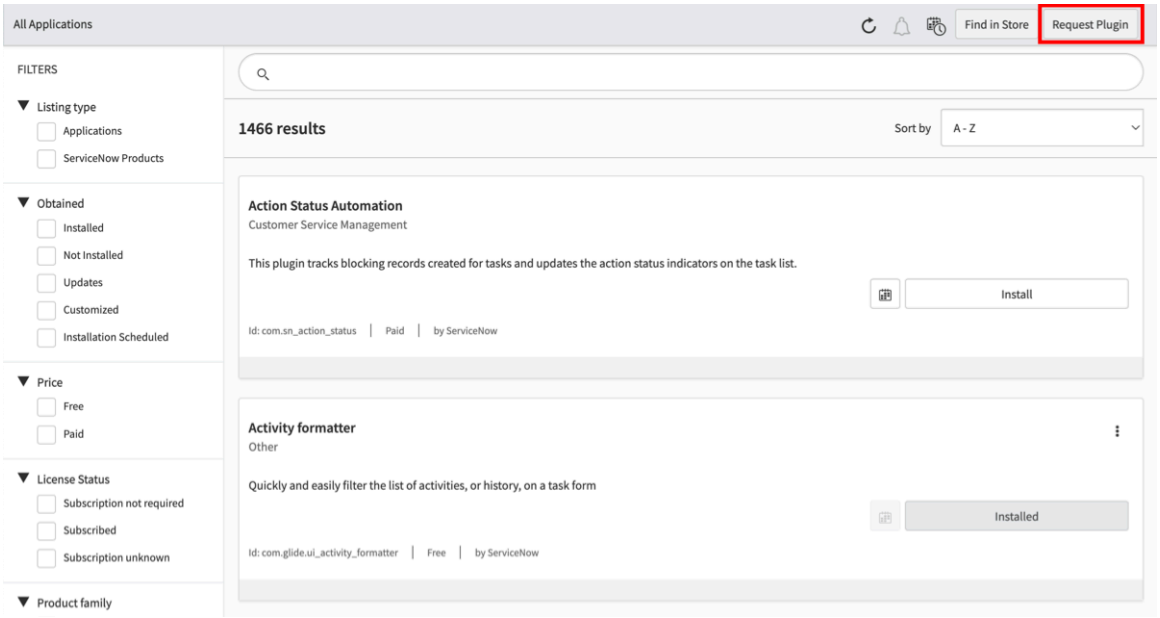
There are two ways to request a plugin:

- Access the Now Support Service Catalog directly by selecting **Automation Store** > **Service Catalog** > **Activate Plugin** on Now Support.
- Access the Now Support Service Catalog through the All Applications page on your instance by following these steps.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Select **Request plugin** to open the **Activate Plugin** form on Now Support.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. On the **Activate Plugin** form, provide the following information.

Activate Plugin form

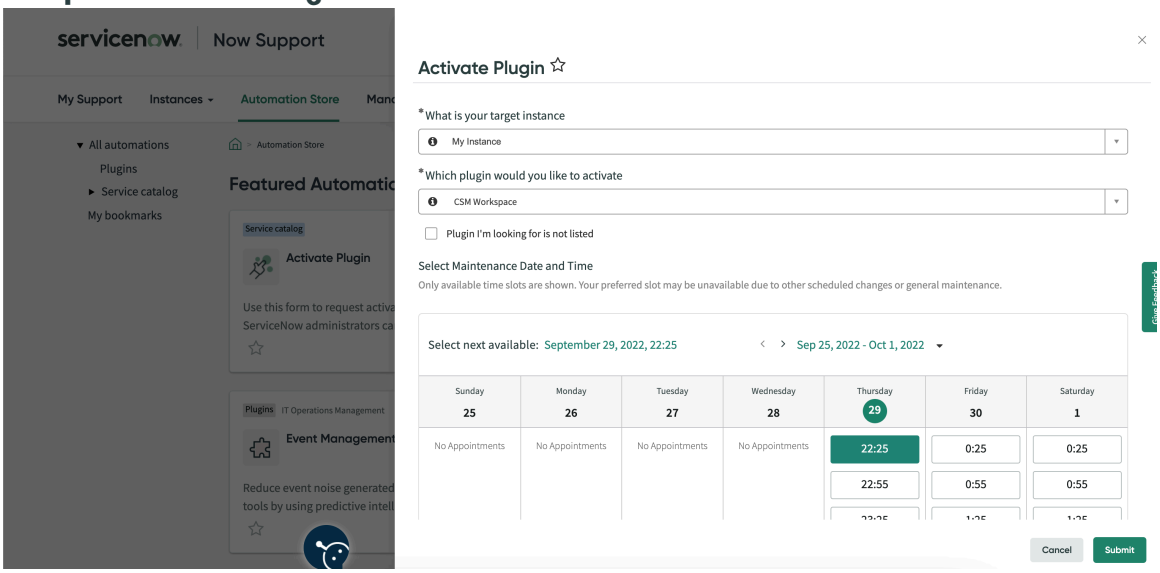
Field	Description
What is your target instance	Select the instance that you want to activate the plugin on.
Which plugin would you like to activate	Select the name of the plugin to activate. **Note:** If the system doesn't list the plugin you want or if you're activating the plugin on an OEM or on-premise instance, select the **Plugin I'm looking for is not listed** check box and then enter the name of the plugin.
Select Maintenance Date and Time	Select the date and time to activate the plugin.

Example

For example, see the following form to activate the Event Management plugin on an instance named SNC Instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Completed Activate Plugin form



4. Select **Submit**.
   After the maintenance window, the system installs the plugin on your instance. To confirm the installation, go to the Installed tab in the Application Manager.

Pause and resume individual workflows

Pause individual workflow contexts. Specify the date and time of day at which the workflow context should resume.

Before you begin

Install and activate the Workflow Pause Utility plugin.

Role required: Workflow_admin or workflow_publisher, workflow_creator

About this task

When a workflow context is paused, the system saves basic information about the pause request, such as the resume date and time, in the wf_pause_request table. A workflow context automatically resumes at a specified date and time of day, but the paused workflow context can be manually resumed as needed.

Procedure

1. Navigate to **All** > **Workflow** > **Live Workflows** > **Active Contexts**.
2. Select the individual workflow context that you are pausing.
   Workflow Context appears.
3. In **Related Links**, click **Pause**.
   A **Workflow Pause Inputs** dialog appears.
4. In the **Workflow Pause Inputs** dialog:

   a. Click the calendar icon ( ) to select the date, and enter the time of day (in hours, minutes, and seconds) at which the workflow should resume.
   You can select the current date or future date, but you must enter a time of day in the future. For example, to pause the workflow context at 13:30:00 (1:30 pm), select the date from the calendar, and then enter `13`, `30`, and `00` into the respective **Time:** fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. Click the green check mark icon ( ) when finished.
The selected date and time of day appear in the **Resume At** field.

c. Click **OK** to return to Workflow Contexts.
The selected workflow is now paused. Use Workflow pause request to monitor its status.

5. Manually resume a currently paused workflow context:
Paused workflows resume on the date and time of day specified in the **Resume At** field.

a. Navigate to **Workflow** > **Live Workflows** > **Active Contexts**.

b. Select the individual workflow context that you are pausing.
Workflow Context appears.

c. In **Related Links**, click **Resume**.

Pause and resume all or multiple workflows

Use Workflow Pause Group Requests to pause, or resume, groups of workflows, or all active workflows. If pausing a group of workflows, use filtering functions to select the workflows. If pausing all active workflows, select the Pause All check box to indicate that all currently active workflows should be paused.

Before you begin

Role required: Workflow_admin or workflow_publisher, workflow_creator
Install and activate the Workflow Pause Utility plugin.

Procedure

1. Navigate to **All** > **Workflow** > **Operations** > **Group Pause Requests**.
Workflow Pause Group Requests appears and displays existing workflow pause group requests.
2. Click **New**.
Workflow Pause Group Request appears, and assigns a workflow pause group request ID.
3. To pause all active workflows, select **Pause All**, then click **Update**. To pause a filtered group of active workflow contexts, skip this step.
All currently active workflow contexts in the instance are paused until you resume them. Use Workflow pause request to monitor their status.
4. To pause a filtered group of active workflow contexts, use the **Filter** field, specify the conditions for the search, then click **Update**.
Workflow Pause Group Requests appears, and displays the results of the workflow group search. It assigns a workflow pause group request ID and indicates if the group is active (true = paused) or inactive (not yet paused).
5. To update, resume or delete a specific workflow pause group request, select it.
Workflow Pause Group Request appears, and displays the selected workflow pause group request.
6. If the selected workflow pause group request is active (paused), and you do not want to pause it, click **Do Not Pause Incoming Workflows**. If the selected workflow pause group request is inactive (not yet paused), click **Pause** to pause it.
7. For the paused workflow group request, use the **Resume At** field to specify the date and time of day at which the paused workflow contexts should resume.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Click to select the date, and enter the time of day (in hours, minutes, and seconds) at which the workflow contexts should resume. You can select the current date or future date, but you must enter a time of day in the future.
For example, to pause the workflow context group at 13:30:00 (1:30 pm), select the date from the calendar, and then enter 13, 30, and 00 into the respective **Time:** fields.

b. Click when finished.

c. The selected date and time of day appear in the **Resume At** field.

d. Click **OK** to return to Workflow Pause Group Request.

8. Click **Submit**.
9. Paused workflow contexts automatically resume on the date and time of day specified in the **Resume At** field. To manually resume currently paused workflow contexts:

   a. Navigate to **Workflow Pause Group Requests**.

   b. Select the workflow pause group request to resume.
   Workflow Pause Group Request appears.

   c. Click **Resume**, and then click **Update**.

10. Workflow Group Pause Request also contains the following information fields.

Workflow group pause request form

Field	Description
Active	Indicates if workflow group is paused.
Completed Resume Activity Count	Number of resumed workflow context activities that are completed.
Filter	Standard filtering fields used to specify the conditions for selection of a group of workflow contexts.
Log	Activity work notes generated by the group pause request.
Not Transitioned Workflow Count	Number of workflow contexts that were not transitioned when the group pause request was placed. When a group pause request is placed, the affected workflow contexts are paused before start of the next activity.
Resume Act Count	Number of workflow context activities resumed after the group pause completed.
Pause Act Count	Number of paused workflow context activities.
Requester Name	Name of the person requesting the workflow context pause.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Pause percentage	Total percentage of workflow contexts that are paused.
Resume Percentage	Total percentage of workflow contexts that have resumed.
Total Workflow Count	Total number of workflows matching the specified filter conditions that are being paused.
Paused Workflow Count	Number of current paused workflow contexts.

Monitor workflow pause requests

You can monitor the status of workflow pause requests using Workflow Pause Request.

Before you begin

Role required: Workflow_admin or workflow_publisher, workflow_creator
You must install and activate the Workflow Pause Utility plugin.

Procedure

1. Navigate to **All** > **Workflow** > **Operations** > **Pause Requests**.
   Workflow Pause Requests appears and displays existing workflow pause requests.
2. Select the workflow pause request.
   Workflow Pause Request appears, and displays the selected workflow pause request.

Workflow pause request fields

Field	Description
Req Number	Unique assigned pause request number.
Completed Resume Activity Count	Number of workflow context activities resumed after the pause completed.
Pause Active	Selected indicates the workflow context is currently paused. Cleared indicates it is not.
Transitioned During Pause	Number of workflow contexts that transitioned when the pause request was placed. When a pause request is placed, the affected workflow contexts are paused before start of the next activity.
Workflow Context	Reference number for the paused workflow context.
Log	Activity work notes generated by the group pause request.
Paused Act Count	Date and time of day (h:m:s) at which the paused workflow context is resuming.
Requester Name	Name of the person who requested the workflow pause.
Resume Act Count	Number of workflow context activities resumed after the pause completed.
Resume At	Date and time of day (h:ms:s) at which the workflow contents are scheduled to resume.
Table	Related record table name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Application	Application in which the workflow context is executing.
Exec Act Count	Number of activities executing when the workflow context was paused.
Group Pause Request	Reference number for the associated group pause request, if any. Appears only if pause request was the result of a group pause request.
Is Workflow Complete	Selected indicates the workflow context is complete. Cleared indicates it is not.
Is Workflow Stuck	Selected indicates the workflow context is stuck. Cleared indicates it is not.
State	Current state of the workflow context - Paused or Resumed.
Stuck Activities Count	The number of workflow context activities that are stuck.
Stuck Act Count To be subtracted for Pause Percentage	Writer to whom the documentation request is assigned.

Encrypted workflow scratchpad

The Encrypted Workflow Scratchpad plugin (com.snc.encrypted.scratchpad) provides encrypted scratchpad support for workflow context and workflow executing activities.

The platform supports encryption on most fields, and workflows can execute on tables with encrypted fields. Encrypted data is typically stored in the workflow scratch pad for workflows that execute using encrypted fields and must access this data after processing an approval, timer, or create task activity.

Data in the workflow scratchpad is not encrypted by default. The Workflow engine supports scratchpad encryption and executing activity records only when the Encrypted Workflow Scratchpad plugin is activated. Once activated, data stored in the wf_context and wf_executing scratchpads is protected by a private workflow engine encryption module, and is prevented from being stored in plain text.

Incompatibility with domain separation

The Encrypted Workflow Scratchpad plugin is incompatible with domain separation. Activating the Encrypted Workflow Scratchpad plugin on a domain separated instance can produce encryption errors when running some workflows. Consider using a Workflow Studio flow instead.

Request encrypted workflow scratchpad activation

Request activation of the Encrypted Workflow Scratchpad plugin (com.snc.encrypted.scratchpad) from ServiceNow personnel

Before you begin

Role required: admin

The Encrypted Workflow Scratchpad plugin must be activated via a Customer Service and Support request. You should activate and thoroughly test the plugin in a non-production instance. Only after you satisfied with the results should you request activation in a production instance.

When requesting activation in a production instance, you should schedule a low transactional volume time to do so. Prior to its activation, first activate the Workflow Pause Utility (com.glideapp.workflow.pause), and then pause all active workflows. Refer to Workflow pause

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

utility. After activation of the Encrypted Workflow Scratchpad plugin, resume all paused workflows.

About this task

There are two ways to request a plugin:

- Access the Now Support Service Catalog directly by selecting **Automation Store** > **Service Catalog** > **Activate Plugin** on Now Support.
- Access the Now Support Service Catalog through the All Applications page on your instance by following these steps.

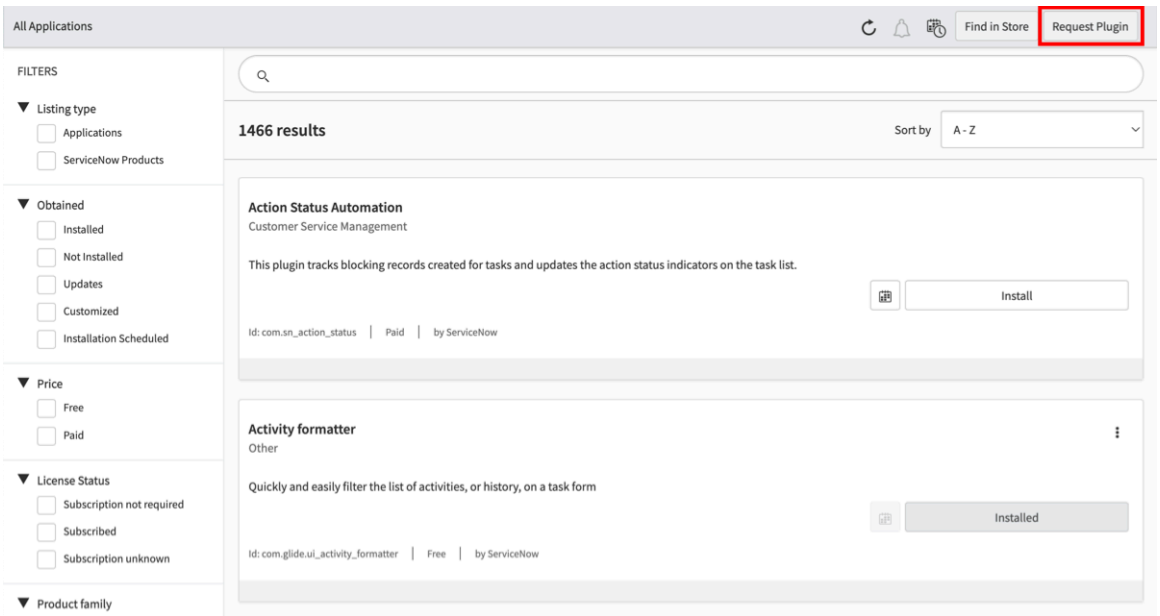
Encrypted Workflow Scratchpad activates these related plugins if they are not already active.

Plugins for Encrypted Workflow Scratchpad

Plugin	Description
Encryption Support [com.glide.encryption]	Allows text fields and attached files to be encrypted.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Select **Request plugin** to open the **Activate Plugin** form on Now Support.



3. On the **Activate Plugin** form, provide the following information.

Activate Plugin form

Field	Description
What is your target instance	Select the instance that you want to activate the plugin on.

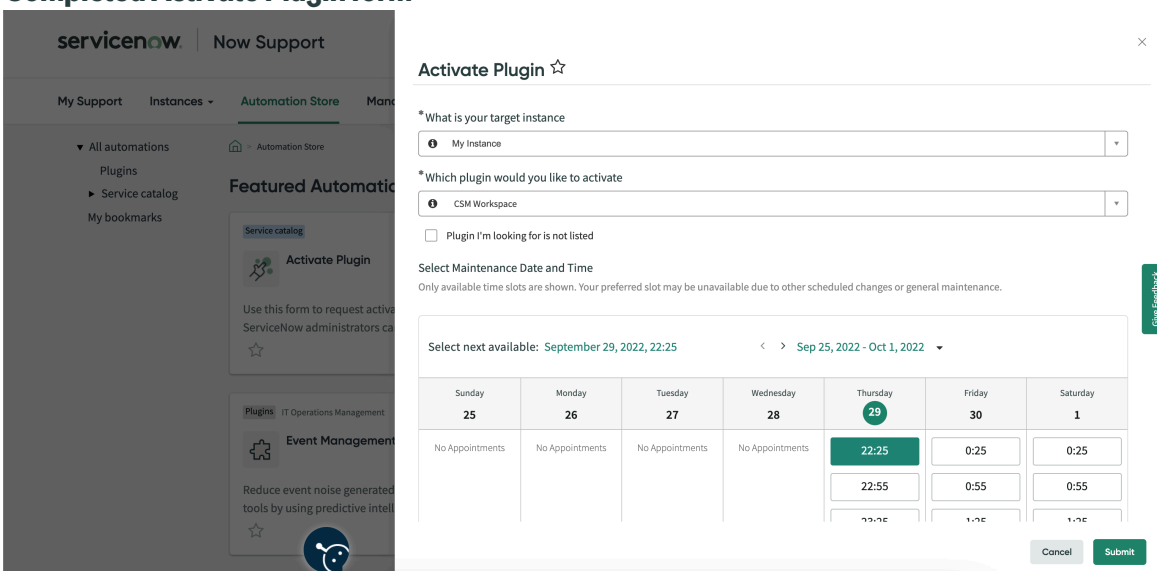
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Which plugin would you like to activate	Select the name of the plugin to activate. **Note:** If the system doesn't list the plugin you want or if you're activating the plugin on an OEM or on-premise instance, select the **Plugin I'm looking for is not listed** check box and then enter the name of the plugin.
Select Maintenance Date and Time	Select the date and time to activate the plugin.

Example

For example, see the following form to activate the Event Management plugin on an instance named SNC Instance.

Completed Activate Plugin form



4. Select **Submit**.
   After the maintenance window, the system installs the plugin on your instance. To confirm the installation, go to the Installed tab in the Application Manager.

What to do next

After plugin activation, resume all paused workflows. Refer to Pause and resume all or multiple workflows.

Related topics

List of plugins

Troubleshoot workflows

Troubleshooting tools for workflows enable administrators to isolate execution paths, compare contexts, and track incomplete activities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

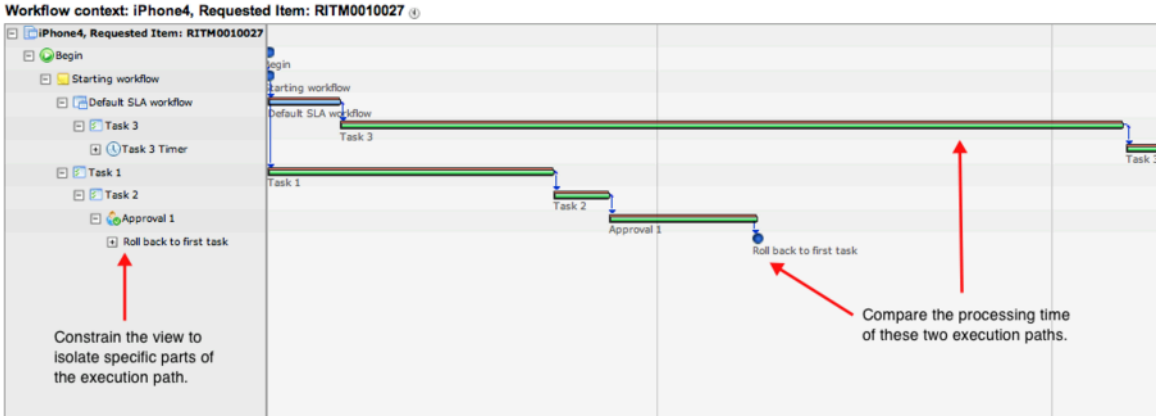
The workflow timeline provides a visual representation of the workflow, including transitions and the elapsed time for each activity. A troubleshooting tool for highlighting execution paths helps users perform forensics on a workflow. The highlighting feature can group multiple execution paths in various colors and can isolate rollback processing. Use the workflow highlighter to isolate incomplete tasks and approvals. You can also enable a workflow performance timing feature to troubleshoot slow workflows.

Execution path troubleshooting in timelines

Use the controls in a workflow timeline to isolate specific execution paths or compare multiple execution paths over time.

Timelines show how the activities in the workflow progressed in relation to one another over time. Isolate execution paths and follow transition lines between subflows and the main flow. Processing times provide a view of the workflow that you cannot get from the workflow diagram. Tooltips give precise information about each activity, such as duration.

Workflow timeline troubleshooting



Execution history table

Highlight execution paths and rollbacks to locate activities that may have been left in an unresolved state.

About this task

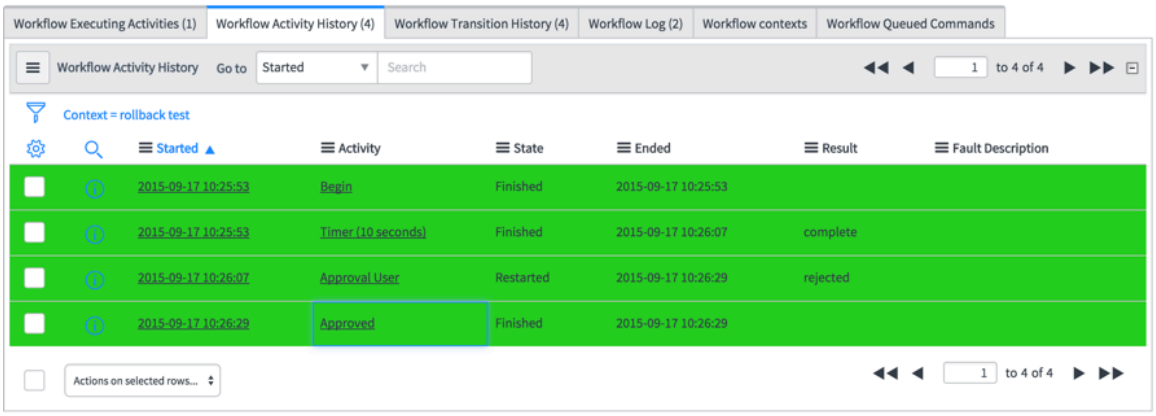
Rollbacks, cancels, and deletions during the execution of a workflow can prevent some activities from fully completing. Use highlighting in the execution history table to determine which activities in the workflow were left in an unresolved state.

Procedure

1. Run the workflow.
2. Navigate to **Workflow** > **All Contexts**.
3. Select a context to troubleshoot.
4. In the Workflow Context form, select the **Workflow Activity History** related list.
5. Right-click an activity and select **Workflow Debug** > **Toggle Execution Path Highlighting** from the context menu.

   All activities in that execution path are highlighted in a color selected by the platform. The debug path shows all activities that completed successfully during the workflow.

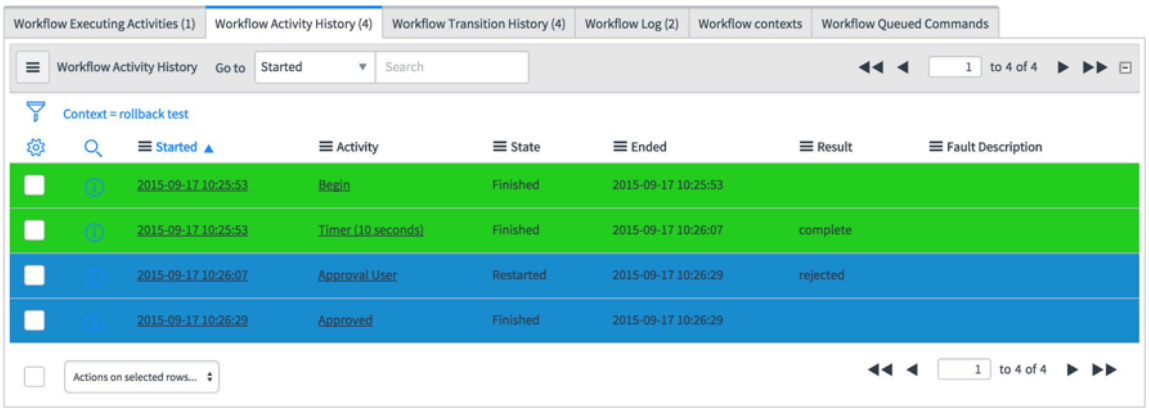
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Right-click a rollback activity and select **Workflow Debug** > **Toggle Rollback Highlighting** from the context menu.

   The platform highlights the rollback path (restarted activities) in a different color. Each color represents a group of activities that were part of the same rollback execution. The highlighting includes the activity that initiated the rollback. If you right-click an activity that was not part of a rollback, no rows are highlighted.

   Note:
   The rollback activity itself appears in both execution path and rollback highlighting.



7. To remove highlighting, right-click in the list and select an option to clear execution path or rollback highlighting.

   You can clear individual rollback paths or all rollback highlighting.

Use the Workflow Operations Dashboard

On the Workflow Operations Dashboard, view and add widgets to help you monitor workflows. Review the performance of workflows and determine which workflows must be improved.

Before you begin

Role required: workflow_admin
The different levels of access are:

- **View**: View the dashboard and refresh report widgets.
- **Customize**: Refresh, add, delete, and rearrange widgets.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

On the Workflow Operations Dashboard, you can click widget elements to view the records they represent. You can also add new report widgets that are not displayed by default.

Procedure

1. View the Workflow Operations Dashboard by navigating to **Workflow** > **Operations** > **Workflow Operations Dashboard**.

   The default reports on the dashboard include:

   - Workflow contexts providing run time metrics
   - Active workflows started during a specified time period
   - Workflows run between yesterday and today
   - Workflows by state for the current month
   - Aged workflow contexts for the past month

2. Find and add more widgets by selecting the add content icon ( ) in the corner of the dashboard.

What to do next

If a workflow consistently appears as an outlier and there is no error causing the run time values, you can use its historical run time values to calculate a new estimated run time value. Then update the estimated run time in the workflow properties.

Workflow gauges

Multiple gauges are available to help you review the performance of workflows. You can add these gauges to the Workflow Operations Dashboard or custom homepages.

Important:

The functionality found in homepages, arranging information from your instance to tell a story about your data, is found in dashboards on new instances. On upgraded instances with Next Experience enabled, users can view existing homepages if they have a direct URL, but they can't create or edit them. Responsive dashboards and Analytics Center dashboards take over homepage functionality.

Use the Homepage deprecation help tool to convert the homepages on your instance to responsive dashboards.

For more information, see:

- Dashboards in the Analytics Center.
- Working with responsive dashboards.

Workflow gauges

Content	Description
ERT Dashboard Controls >	
Outlier Finished Workflows for ERT (Percentage Outlier)	Identifies workflows that finished, but did not finish within estimated runtime (ERT) values. Enter an outlier percentage to see workflows that ran outside the specified runtime range.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow gauges (continued)

Content	Description
Outlier Long Running Workflows for ERT (Percentage Outlier)	Displays workflows running longer than the configured runtime threshold.
Workflow Dashboard >	
Workflows Without Current Record	Displays workflow contexts that do not have an associated current record.
Gauges > **Workflow Context**	
Number of Active Workflows Started Hourly Over Time (Yesterday)	Displays the total number of running workflows per hour over a given time period. By default, it displays the number of workflows that ran per hour over the previous day (yesterday).
Outlier Finished Workflows Not Cumulated to ERT	Displays workflow contexts that are finished outside the estimated runtime outlier value and not cumulated to estimated run time value.
Running Workflow Contexts	Displays the total number of running workflows.
Successfully Finished Workflows Cumulated to ERT	Displays the total number of successfully completed workflows whose running duration is cumulated to the estimated run time value.
Workflows by State (This Month)	Displays the total number of workflows run in a month grouped by the current state.
Aged Workflow Contexts (Running Since Last Month)	Displays the total number of workflow contexts running for a given period of time by workflow name. By default, it displays the total number of workflow contexts running over the last month.
Workflows Run Between Yesterday and Today (by Table)	Displays workflows that have run in the last day grouped by table name.

Workflow performance timing

The workflow engine can generate detailed performance timing data that is useful for troubleshooting slow workflows.

An administrator must enable this functionality.

When workflow performance timing is enabled, the workflow engine tracks key performance data, including various execution speed metrics. The Workflow Timing [wf_workflow_timing] table stores the data, with a record for each workflow context. The workflow timing record is updated when the workflow engine completes the workflow, waits for an activity to complete, or otherwise exits the workflow execution.

Workflow estimated run time properties

Administrators can enable the collection of workflow run time metrics by setting Estimated Run Time (ERT) properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Administrators can use ERT metrics to determine if workflows are running longer or shorter than expected and to identify errors in workflow processing. The system displays run time metrics on the Workflow Operations Dashboard.

Enable workflow performance timing

Workflow performance timing is disabled by default. You can create a system property to enable it.

Before you begin
Role required: admin

Procedure

Add a system property with the following specifications.

Field	Value
Name	glide.workflow.show_timing
Type	true | false
Value	true

Workflow activities

Workflow activity properties reference

Each activity performs a different task, such as running a script, sending notifications, or requesting approvals. Activities can succeed or fail, which can result in actions performed by other activities.

For information about configuring different types of activities, click an activity name in the list below or see Workflow activities reference.

Core activities provided in the base system

- Approval and rollback workflow activities
- Condition Workflow activities
- Notification workflow activity
- Notify workflow activities
- Workflows used as subflows
- Task workflow activities
- Timer workflow activities
- Utility workflow activities

Activities provided with Orchestration

The following activities are included with Orchestration.

- Active Directory activity pack
- Orchestration activities

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- PowerShell activities
- Puppet activities

Templates provided for creating custom activities

If Orchestration is active on your system, users with the proper roles can create custom activities using the ServiceNow Orchestration activity designer. For information about the templates Orchestration provides for creating custom activities that you can upload to the ServiceNow Store, see Activity designer components.

Workflow activities reference

Workflow activity reference, organized by category.

Each activity performs a different task, such as running a script, sending notifications, or requesting approvals.

Workflow runs activities as the user session that starts or advances them. Workflows started from record operations will run activities as the user session that performed the record operation. Workflows started from schedules or restarted from timers run activities as the System user. Workflows started from script calls run activities as the user session that started the script.

Approval and rollback activities

Approval and rollback activities generate and manage approvals. Not all workflows can include approval activities. For more information, read Approval and rollback workflow activities.

Note:
Approval activities run as the user whose actions match the approve or reject conditions the workflow was waiting for and advances the workflow.

Approval and rollback activities

Activity	Description
Approval Action workflow activity	The **Approval Action** activity performs an approval action on the current task.
Approval Coordinator workflow activity	The **Approval Coordinator** activity creates an approval whose outcome depends on the outcome of one or more child activities, including one or more **Approval - User**, **Approval - Group**, and/or **Manual Approval** activities.
Approval - Group workflow activity	The **Approval - Group** activity creates approval records for each member of a specified group.
Approval - User workflow activity	The **Approval - User** activity creates one or more individual user approvals.
Generate workflow activity	The **Generate** activity immediately creates task or approval records from any task or approval activities placed after the **Generate** activity in the workflow path. These pre-generated tasks and approvals start when the task and approval activities are reached during flow execution. This allows a task to have a set of associated pre-generated sequential tasks or approvals, but still require them to be completed in order.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Approval and rollback activities (continued)

Activity	Description
Manual Approvals workflow activity	The **Manual Approvals** activity watches and manages any approvals that users add manually outside of the workflow process. This activity only selects approvals that are in the Not requested state.
Rollback To workflow activity	The **Rollback To** activity transitions directly to the activity specified by the outgoing transition line arrow.

Condition activities

Condition activities provide conditional branching and logical operation functionality for workflows.

Note:
Condition activities run as the user whose actions match the conditions the workflow was waiting for and advances the workflow.

Condition activities

Activity	Description
If workflow activity	The **If** activity checks a condition or script to determine if a **Yes** or **No** transition should be taken.
Switch workflow activity	The **Switch** activity checks if the value of a passed field or variable is equivalent to one of several case values.
Wait for condition workflow activity	The **Wait for condition** activity causes the workflow to wait at this activity until the current record matches the specified condition.
Wait for WF Event workflow activity	The **Wait for WF Event** activity causes the workflow to wait at this activity until the specified event is fired.

Notify activities

Notify workflow activities manage calls and SMS messages in Notify.

Notify activities

Activity	Description
Forward call workflow activity	The **Forward Call** activity forwards a Notify call to an E.164-compliant phone number.
Input workflow activity	The **Input** activity creates a phone menu by presenting a list of options on a Notify call.
Hangup workflow activity	The **Hangup** activity disconnects an active Notify phone call.
Play workflow activity	The **Play** activity plays a sound file on a Notify call.
Record workflow activity	The **Record** workflow activity records audio from a user on a Notify call.
Reject workflow	The **Reject** workflow activity rejects an incoming Notify call.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Notify activities (continued)

Activity	Description
Say workflow activity	The **say** workflow activity allows you to play a message, using text to speech, on a Notify call.
Forward to notify client workflow activity	The **forward to notify client** workflow activity connects a phone call to a Notify WebRTC client.
Call workflow activity	The **Call** activity makes outbound phone calls using a Notify workflow. This workflow activity can be added to any table.
Join conference call workflow activity	The **Join Conference Call** activity connects an incoming or outgoing call to a Notify conference call.
Send SMS workflow activity	The **send SMS** workflow activity to send short text messages using Notify to users' phones. This workflow activity can be added to any table.
Queue workflow activity	The **Queue** activity places an active Notify call in a queue.

Notification activities

Notification workflow activities notify users of events that occur during the workflow.

Notification activities

Activity	Description
Create Event workflow activity	The **Create Event** activity adds an event to the event queue, but does not immediately fire the event.
Notification workflow activity	The **Notification** activity sends an email or SMS message to specified users or groups.

Subflow activities

Subflow activities run and manage workflows from a parent workflow.

Subflow activities

Activity	Description
Parallel Flow Launcher workflow activity	The **Parallel Flow Launcher** activity launches multiple subflows in parallel.

Task activities

Task activities create and modify workflow tasks.

Note:
Task activities run as the user whose actions complete the task the workflow was waiting for and advances the workflow.

Task activities

Activity	Description
Add Worknote workflow activity	The **Add Worknote** activity adds text to the *Worknotes* field of the current incident record.
Attachment Note workflow activity	The **Attachment Note** activity adds an attachment to the current record.
Catalog Task workflow activity	The **Catalog Task** activity creates a service catalog task record.
Create Task workflow activity	The **Create Task** activity generates a record on any of the tables that extend Task [task].

Timer activities

Timer activities pause workflows for set periods of time.

Note:
Timer activities run as the System user because the system scheduler advances the workflow.

Timer activities

Activity	Description
SLA Percentage Timer workflow activity	The **SLA Percentage Timer** activity pauses the workflow for a duration equal to a percentage of an SLA.
Timer workflow activity	The **Timer** activity pauses the workflow for a specified period of time.

Utility activities

Utility activities provide controls over the path of the workflow, and other useful tools.

Utility activities

Activity	Description
Branch workflow activity	The **Branch** activity splits the workflow into multiple transition paths from a single activity.
Join workflow activity	The **Join** activity unites multiple execution paths into one transition.
Lock workflow activity	The **Lock** activity prevents other instances of this workflow from continuing past this activity until the lock is released.
Log Message workflow activity	The **Log Message** activity writes a message to the workflow log.
Log Trace Message workflow activity	The **Log Trace Message** activity writes a trace message to the workflow log.
REST Message legacy workflow activity	The legacy **REST Message** activity enables an administrator to override the REST endpoint or supply the variables configured in the REST Message module.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Utility activities (continued)

Activity	Description
Return Value workflow activity	The **Return Value** activity returns a value to a parent workflow, when run from a subflow.
Run Script workflow activity	The **Run Script** activity runs the specified script in the scope of the workflow version.
Set Values workflow activity	The **Set Values** activity sets values on the current record when the workflow quiesces or ends.
SOAP Message legacy workflow activity	The legacy **SOAP Message** activity uses SOAP messages defined in the System Web Services plugin and can call the messages using a MID Server.
Turnstile workflow activity	The **Turnstile** activity limits how many times a workflow can pass through the same point.
Unlock workflow activity	The **Unlock** activity releases a lock that was previously placed by the **Lock** activity.

Activities provided with Orchestration

The following activities are included with Orchestration.

- Active Directory activity pack
- Orchestration activities
- PowerShell activities
- Puppet activities

Templates provided for creating custom activities

If Orchestration is active on your system, users with the proper roles can create custom activities using the ServiceNow Orchestration activity designer. For information about the templates Orchestration provides for creating custom activities that you can upload to the ServiceNow Store, see Orchestration custom activity templates.

Approval and rollback workflow activities

Approval and rollback activities generate and manage approvals.

Approval and rollback activities are not available in some workflows.

- With two exceptions, approval and rollback activities are only available when the workflow runs on a table that extends Task. The exceptions are the **Approval - User** and **Approval Action** activities, which are available globally.
- Approval and rollback activities are available only if approval engines are turned off for the table on which the workflow runs. If approval engines are enabled for the table, approval activities appear greyed out and cannot be selected. To learn more about how workflow and approval engines interact, read Approval workflow activities and approval engines.

Approval Action workflow activity

The **Approval Action** activity performs an approval action on the current task.

Use this activity to mark the current task record as approved or rejected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
When an **Approval Action** activity is used to mark a task approved, the activity marks all pending approvals as **No Longer Required**. This activity behaves differently from **Set Values** or **Run Script** when used to set the **Approval** field's value.

Results

The result value of the activity is the final approval disposition selected by the approver. The result value can be **Approved** or **Rejected**. A workflow designer can assign a result value using the `activity.result` variable from within a script field of the activity.

Input variables

Input variables determine the initial behavior of the activity.

Approval Action activity input variables

Field	Description
Action	The action to perform on the task. Options are: • Mark task approved • Mark task rejected • Mark task requested • Disregard pending approvals: the system sets approval records to **no longer required** and marks the activity as **approved**.

Conditions

The conditions determine which transition runs after this activity.

Note:
Approval activities run as the user whose actions match the approve or reject conditions the workflow was waiting for and advances the workflow.

Approval Action activity conditions

Condition	Description
Always	The event or condition that causes the approval to move to the next workflow step.
Error	The event or condition that generates an error.
Skipped	The event or condition that allows a skipped approval.

States

The activity state tells the workflow engine what to do with the activity.

Approval Action activity states

State	Description
Executing	The workflow engine starts the `execute` function of the activity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Approval Action activity states (continued)

State	Description
Waiting	The workflow engine ignores the activity until a specific event to restart the activity is fired.
Finished	The activity finished running. See the result value for the outcome of the activity.
Cancelled	This activity, or the workflow that contains this activity, was canceled.
Error	A JavaScript error occurred. Review the logs for error details.

Approval Coordinator workflow activity

The **Approval Coordinator** activity creates an approval whose outcome depends on the outcome of one or more child activities, including one or more **Approval - User**, **Approval - Group**, and/or **Manual Approval** activities.

Note:
This activity is only available when the workflow runs on a table that extends Task.

To create an **Approval Coordinator** activity, first drag the activity onto the workflow canvas, causing the activity form to display. On the activity form, fill in the appropriate fields, then click **Submit**.

After you click **Submit**, the activity appears on the workflow canvas. From there, specify the child activities by clicking the links that appear on the body of the activity.

When the **Approval Coordinator** activity completes, all pending approvals that were created by any of the **Approval Coordinator** approval activities are immediately set to **No Longer Required**. If a single user is called as an approver twice by the same workflow, such as when a single user is both a product approver and an executive approver, any approvals for that user after the first are skipped.

Results

The result value of the **Approval Coordinator** activity depends on the approval actions taken by the approvers and the approval conditions specified in the **Wait for** field. Possible result values are:

- Approved
- Rejected
- Deleted
- Cancelled

Input variables

Input variables determine the initial behavior of the activity.

Approval Coordinator activity input variables

Field	Description
Wait for	Indicate what to wait for to indicate that the approval activity is approved or rejected. Options are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Approval Coordinator activity input variables (continued)

Field	Description
	• **Any child activity to be approved:** Any child activity (User, Group, or Manual Approval) that completes with a result of **approved** causes the **Approval Coordinator** activity to complete with a result of **approved**. • **All child activities to be approved:** All child activities of the **Approval Coordinator** activity must complete with a a result of **approved** to cause the **Approval Coordinator** activity to complete with a result of **approved**. • **The first approval or rejection from any child activity:** The first child activity that completes with a result of **approved** or **rejected** causes the **Approval Coordinator** activity to complete with the same result. • **Condition based on script:**Call a script to determine how to manage an approval or rejection.
When a rejection occurs Only appears if **Wait for** is set to **All child activities to be approved** or **Any child activity to be approved**.	Specify what the coordinator should do when it sees a rejection from any one of the child activities. Options are: • **Reject the approval:** Immediately complete the **Approval Coordinator** activity with a result of **rejected**. • **Wait for other responses before deciding:** Wait until we get other responses from other child activities before making an approval or rejection decision. This allows users to change their minds until a decision is made. In addition, if **Wait for** is set to **Any child activity to approve** then a single child activity completion with a result of **approved** will cause the **Approval Coordinator** activity to complete with a result of **approved** even if other child activities have completed with a result of **rejected**.

Approval script
 	
Only appears if **Wait for** is set to **Condition based on script**.
	If the **Wait for** variable is set to **Condition based on script** this script is called to determine how to handle an approval or rejection. The script needs to set the variable *answer* to , approved or rejected to indicate the overall approval status for this approval. When called, the following variable is available to the script:
	`counts.total = total number of child approval activities that are part of this approval`
	`counts.approved = # of child approval activities that approved so far`
	`counts.rejected = # of child approval activities that rejected so far`
	`counts.requested = # of child approval activities that are pending approval`

Conditions

The conditions determine which transition runs after this activity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Approval activities run as the user whose actions match the approve or reject conditions the workflow was waiting for and advances the workflow.

Approval Coordinator activity conditions

Condition	Description
Approved	The users from the groups have approved the request based on the **Wait for** rules.
Rejected	The users from the groups have rejected the request based on the **Wait for** rules.

States

The activity state tells the workflow engine what to do with the activity.

Approval Coordinator activity states

State	Description
Executing	The workflow engine starts the *execute* function of the activity.
Waiting	The workflow engine ignores the activity until a specific event to restart the activity is fired.
Finished	The activity finished running. See the result value for the outcome of the activity.
Cancelled	This activity, or the workflow that contains this activity, was canceled.
Error	A JavaScript error occurred. Review the logs for error details.

Approval - Group workflow activity

The **Approval - Group** activity creates approval records for each member of a specified group.

Note:
This activity is only available when the workflow runs on a table that extends Task.

The group approval is approved or rejected based on the user approvals, according to the logic specified in the **Wait For** field.

Results

The workflow designer can assign a result value using activity.result from within a script field of the activity. By default, the result value is the final approval disposition. This disposition depends on the approval actions take by the approvers and the approval conditions specified in the **Wait for** or **When Anyone Rejects** fields. Possible result values are:

- Approved
- Rejected
- Deleted
- Cancelled

Input variables

Input variables determine the initial behavior of the activity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Approval - Group activity input variables

Field	Description
Approval - Group When Specify when this activity generates a group approval record.	
Condition	Conditions which, if met, cause the group approval to be generated. If the conditions are not met, the approval is skipped.
Approval - Group Approvers Specify the groups whose approval will be requested.	
Groups	The groups whose approval will be requested. To edit this field, click the lock icon. To select specific groups by name, use the lookup list. To select groups from field values on the current record at runtime, click the tree icon. Each member of the group will be assigned an individual approval record. If no group is selected, the activity automatically sets the approval to **Approved**.
Approval - Group Condition Specify how the activity decides to approve or reject the group approval, based on the responses from individual members of the group.	
Wait for	A choice between different approval logics to determine which individual approvals or rejections result in approval or rejection of the activity's approval. Options are: • **An approval from each group:** Any user from each group can approve and the first approval from each group causes the activity to complete with a result of **approved** (see below for how a rejection is handled). • **An approval from any group:** Any user from any group can approve and the first approval from any group causes the activity to complete with a result of **approved**. • **An approval from everyone from all groups:** All users from all groups must approve to cause the activity to complete with a result of **approved** (see below for how a rejection is handled). • **First response from each group:** The first approval or rejection from any user in each group is used to indicate the state of the group approval (see below for how a rejection is handled). Indicate what happens when any user rejects their approval request. Options are: • **Reject the approval:** Immediately complete the activity with a result of **rejected**.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Approval - Group activity input variables (continued)

Field	Description
	• **First response from any group:** The first approval or rejection from any user in any group causes the activity to complete with a result of **approved** or **rejected**. • **Condition based on script:** Each time a user approves or rejects, the **Approval script** is called to determine if the activity should complete.

Approval script
 	
Only appears when **Wait for** is set to `Condition based on script`.
	If the **Wait for** variable is set to **Condition based on script** this script is called to determine how to handle an approval or rejection. The script needs to set the variable *answer* to approved or rejected to indicate the overall status for this approval.
	
	This script is responsible for setting the approval state for each group that is part of this approval activity before returning the overall approval state for all of the groups.
	
	When called, the following variables are available to the script for all the groups that are part of this approval activity:
	
	`counts.total = total number of groups that are part of this approval`
	`counts.approved = # of groups that approved so far`
	`counts.rejected = # of groups that rejected so far`
	`counts.requested = # of groups that are pending approval`
	`counts.not_requested = # of groups that are not pending approval`
	`counts.not_required = # of groups that approval is not required`
	
	And for each group:
	
	`groups[group_id].total = total number of users that are part of this group's approval`
	`groups[group_id].approved = # of users that approved so far`
	`groups[group_id].rejected = # of users that rejected so far`
	`groups[group_id].requested = # of users that are pending approval`
	
	`groups[group_id].not_requested = # of users that are not pending approval`
	
	`groups[group_id].not_required = # of users that approval is not required`
	
	`groups[group_id].approvalIDs[state] = array of user ids that are at the specified approval state`
	
	Note: Iterate the groups using:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Approval - Group activity input variables (continued)

Field	Description

	`for (var id in groups) { var group = groups[id]; ... group.total ... }`
	
	Note: Get group object using the following code (to get things like the group name being iterated on):
	
	`var objGroup = fncGetGroupObj(id); var strGroupName = objGroup.name;`
	
	`function fncGetGroupObj(sidGroupApproval) { var objGroupApproval = new GlideRecord('sysapproval_group'); objGroupApproval.get(sidGroupApproval); var objGroup = new GlideRecord('sys_user_group'); objGroup.get(objGroupApproval.assignment_group.sys_id); return objGroup; }`
	
	Approval scripts also allow computations. For example, if only half of the approvals are required:
	
	`if (counts.approved/counts.total > .49) { answer = 'approved'; } else if (counts.rejected/counts.total > .50) { answer = 'rejected'; }`

When anyone rejects	A choice between different approval logics to determine which individual rejections result in rejection of the activity's approval. Options are: • **Reject the approval:** Immediately complete the activity with a result of **rejected**. • **Wait for other responses before deciding:** Wait until we get other responses before making an approval or rejection decision. This allows users to change their mind until a decision is made.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Approval - Group activity input variables (continued)

Field	Description
	Note: If **Wait for** is set to **Anyone to approve**, then a single approval causes the activity to complete with a result of **approved**, even if one or more users reject.
Approval - Group Schedule Specify how workflow calculates the approval record's expected start date and due date. Once you've made a selection for 'Due date based on', and 'Schedule based on', the appropriate fields will display.	
Due date based on	Select how workflow determines the task's duration, due date, and schedule. • **A user specified duration:** The duration is based on a user specified value. • **A relative duration:** The duration is calculated from a relative duration (such as End of Next Business Day). • **A date/time or duration field:** The duration is based on the value of a field on the current record. • **Script:** The duration is returned by a script.
Duration Only appears when **Due date based on** is set to `A user specified duration`	The specific number of days and hours.
Relative duration Only appears when **Due date based on** is set to `A relative duration`	The general number and length of business days.
Due date field Only appears when **Due date based on** is set to `A date/time or duration field`	The date/time or duration field.
Due date script Only appears when **Due date based on** is set to `Script`	The script that sets 'answer' to the number of seconds for the duration.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Approval - Group activity input variables (continued)

Field	Description
Schedule based on	The basic schedule the timer uses to count working hours. If a schedule is specified, the duration will only be considered for times that are specified on the schedule. For example, if the duration is 2 hours and the workflow begins at 4:00pm on a schedule that is 8am - 5pm, then it ends at 9:00am the next day. The options are: • **This workflow's schedule:** The schedule uses workflow context date, time, and an optional **Time zone based on** value. • **A specific schedule:** The schedule uses a pre-defined **Schedule** and an optional **Time zone based on** value. • **A schedule field:** The schedule uses a value from a table and an optional **Time zone based on** value.
Schedule Only appears when **Schedule based on** is set to `A specific schedule`	The predefined **Schedule** from a list.
Schedule field Only appears when **Schedule based on** is set to `A schedule field`.	A date and time or duration field for the schedule, that is associated with the table. Valid fields appear in blue on the Select the element from a tree dialog.
Time zone based on	The time zone for calculating the duration. The time zone may be based on: • **No time zone:** Default. Workflow uses the GMT time zone. • **A specific time zone:** A specific **Time zone** that you choose from a choice list. • **A time zone field:** A **Time zone field** to track time duration from a field on the form.
Time zone Only appears when **Time zone based on** is set to `A specific time zone` .	Select the time zone you want from the choice list.
Time zone field Only appears when **Time zone based on** is set to	A date and time or duration field for the schedule, that is associated with the table. Valid fields appear in blue on the Select the element from a tree dialog.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Approval - Group activity input variables (continued)

Field	Description
`A time zone field.`	
Approval - Advanced If desired, write a script for determining additional users to request approvals from.	
Advanced	Select this check box to write a script for determining additional users to request approvals from. Use the **Additional groups script** to customize group approvals.

Additional groups script	If the **Advanced** check box is selected, this script is called to determine any additional group approvals to be created. The script needs to set the variable *`answer`* to a comma-separated list of group ids or an array of group ids to add as approver groups. For example:
	`answer = [];`
	`answer.push('id1');`
	`answer.push('id2');`

Conditions

The following conditions determine which transition runs after this activity.

Note:
Approval activities run as the user whose actions match the approve or reject conditions the workflow was waiting for and advances the workflow.

Approval - Group activity conditions

Condition	Description
Approved	The users from the groups have approved the request based on the **Wait for** rules.
Rejected	The users from the groups have rejected the request based on the **Wait for** rules.
Error	The event or condition that generates an error.
Skipped	The event or condition that allows a skipped approval.

States

The activity state tells the workflow engine what to do with the activity.

Approval - Group activity states

State	Description
Executing	The workflow engine starts the *`execute`* function of the activity.
Waiting	The workflow engine ignores the activity until a specific event to restart the activity is fired.
Finished	The activity finished running. See the result value for the outcome of the activity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Approval - Group activity states (continued)

State	Description
Cancelled	This activity, or the workflow that contains this activity, was canceled.
Error	A JavaScript error occurred. Review the logs for error details.

Approval - User workflow activity

The **Approval - User** activity creates one or more individual user approvals.

Results

The result value is the final approval disposition. This disposition depends on the approval actions take by the approvers and the approval conditions specified in the **Wait for** or **When Anyone Rejects** fields. Possible result values are:

- Approved
- Rejected
- Deleted
- Cancelled

Input variables

Approval - User activity input variables

Field	Description
Approval - User When Specify when this activity generates a user approval record.	
Condition	Conditions which, if met, cause the individual approval to be generated. If the conditions are not met, the approval is skipped.
Approval - User Approvers Specify the users whose approval will be requested.	
Users	The users for the approval. Use the tree icon to select user reference fields from the current record to create approvals, such as `${assigned_to}`. If no user is selected, the activity automatically sets the approval to **Approved**. **Note:** Workflow only manages approval records generated by the Approval User activity. After starting the workflow, newly added approvals do not affect the workflow context.
Groups	Groups whose members should also receive approvals. Note that this is different than the **Approval - Group** activity, which creates a group approval in addition to the individual approvals. The tree icon can be used to select group reference fields from the current record to create approvals, such as `${assignment_group}`.
Approval - User Condition	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Approval - User activity input variables (continued)

Field	Description
Specify how the activity decides to approve or reject the approval, based on the responses from individual approvers.	
Wait for	A choice between different approval logics to determine which individual approvals result in approval of the activity's approval. Options are: • **Anyone to approve:** Any user can approve and the first approval causes the activity to complete with a result of **approved**. • **Everyone to approve:** All users must approve (see below for how a rejection is handled). • **First response from anyone:** The first approval or rejection from any user causes the activity to complete. • **Condition based on script:** Each time a user approves or rejects, the **Approval script** is called to determine if the activity should complete.
When anyone rejects	A choice between different approval logics to determine which individual rejections result in rejection of the activity's approval. Options are: • **Reject the approval:** Immediately complete the activity with a result of **rejected**. • **Wait for other responses before deciding:** Wait until we get other responses before making an approval or rejection decision. This allows users to change their mind until a decision is made. **Note:** Note that if **Wait for** is set to **Anyone to approve** then a single approval will cause the activity to complete with a result of **approved** even if one or more users reject.
Approval Column	A string field for the name of the approval field on the table the workflow is running on. The default value is **approval**, which is the field on the Task table. **Note:** Use the field's name, not its label. If using any custom approval column fields and approval column journals, use Set Value activities in the workflow to set the custom Approval column fields.
Approval Journal Column	
Approval Script	If the **Wait for** variable is set to **Condition based on script** this script is called to determine how to handle an approval or rejection. The script needs to set the variable *answer* to approved or rejected to indicate the approval status for this approval. When called, the following information is available:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Approval - User activity input variables (continued)

Field	Description

	`counts.total = total number of users that are part of this approval`
	`counts.approved = # of users that approved so far`
	`counts.rejected = # of users that rejected so far`
	`counts.requested = # of users that are pending approval`
	`counts.not_requested = # of users that are not pending approval`
	`counts.not_required = # of users that approval is not required`

Approval - User Schedule Specify how workflow calculates the approval record's expected start date and due date. Once you've made a selection for 'Due date based on', and 'Schedule based on', the appropriate fields will display.	
Due date based on	Select how workflow determines the task's duration, due date, and schedule. • **A user specified duration:** The duration is based on a user specified value. • **A relative duration:** The duration is calculated from a relative duration (such as End of Next Business Day). • **A date/time or duration field:** The duration is based on the value of a field on the current record. • **Script:** The duration is returned by a script.
Duration Only appears when **Due date based on** is set to `A user specified duration`	The specific number of days and hours.
Relative duration Only appears when **Due date based on** is set to `A relative duration`	The general number and length of business days.
Due date field Only appears when **Due date based on** is set to `A date/time`	The date/time or duration field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Approval - User activity input variables (continued)

Field	Description
`or duration field`	
Due date script Only appears when **Due date based on** is set to `Script`	The script that sets 'answer' to the number of seconds for the duration.
Schedule based on	The basic schedule the timer uses to count working hours. If a schedule is specified, the duration will only be considered for times that are specified on the schedule. For example, if the duration is 2 hours and the workflow begins at 4:00pm on a schedule that is 8am - 5pm, then it ends at 9:00am the next day. The options are: • **This workflow's schedule:** The schedule uses workflow context date, time, and an optional **Time zone based on** value. • **A specific schedule:** The schedule uses a pre-defined **Schedule** and an optional **Time zone based on** value. • **A schedule field:** The schedule uses a value from a table and an optional **Time zone based on** value.
Schedule Only appears when **Schedule based on** is set to `A specific schedule`	The predefined **Schedule** from a list.
Schedule field Only appears when **Schedule based on** is set to `A schedule field`.	A date and time or duration field for the schedule, that is associated with the table. Valid fields appear in blue on the Select the element from a tree dialog.
Time zone based on	The time zone for calculating the duration. The time zone may be based on: • **No time zone:** Default. Workflow uses the GMT time zone. • **A specific time zone:** A specific **Time zone** that you choose from a choice list. • **A time zone field:** A **Time zone field** to track time duration from a field on the form.
Time zone Only appears when **Time zone based on** is set to `A`	Select the time zone you want from the choice list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Approval - User activity input variables (continued)

Field	Description
`specific time zone` .	
Time zone field Only appears when **Time zone based on** is set to `A time zone field.`	A date and time or duration field for the schedule, that is associated with the table. Valid fields appear in blue on the Select the element from a tree dialog.
Approval - Advanced If desired, write a script for determining additional users to request approvals from.	
Advanced	Select this check box to write a script for determining additional users to request approvals from.

Additional approvers script	If the **Advanced** check box is selected, this script is called to determine any additional user approvals to be created. The script needs to set the variable *`answer`* to a comma-separated list of user ids and group ids or an array of user and group ids to add as approvers. For example:
	`answer = [];`
	`answer.push('id1');`
	`answer.push('id2');`

Conditions

The following conditions determine which transition runs after this activity.

Note:
Approval activities run as the user whose actions match the approve or reject conditions the workflow was waiting for and advances the workflow.

Approval - User activity conditions

Condition	Description
Approved	The users approved the request based on the **Wait for** rules.
Rejected	The users rejected the request based on the **Wait for** rules.
Error	The event or condition that generates an error.
Skipped	The event or condition that allows a skipped approval.

States

The activity state tells the workflow engine what to do with the activity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Approval - User activity states

State	Description
Executing	The workflow engine starts the `execute` function of the activity.
Waiting	The workflow engine ignores the activity until a specific event to restart the activity is fired.
Finished	The activity finished running. See the result value for the outcome of the activity.
Cancelled	This activity, or the workflow that contains this activity, was canceled.
Error	A JavaScript error occurred. Review the logs for error details.

Generate workflow activity

The **Generate** activity immediately creates task or approval records from any task or approval activities placed after the **Generate** activity in the workflow path. These pre-generated tasks and approvals start when the task and approval activities are reached during flow execution. This allows a task to have a set of associated pre-generated sequential tasks or approvals, but still require them to be completed in order.

Note:
This activity is only available when the workflow runs on a table that extends Task.

By default, the workflow does not create any tasks or approvals until it reaches them in the workflow.

The **Generate** activity follows all transitions through the workflow to each activity. For each activity:

- If it is a task activity, creates the task and sets:
  - The **State** to **Pending**
  - The **Expected Start Date**
  - The **Due Date**

  Note:
  Task activities run as the user whose actions complete the task the workflow was waiting for and advances the workflow.

- If it is an approval activity, creates the approvals and sets:
  - The approval **State** to **Not Requested**
  - The **Expected Start Date**
  - The **Due Date**

  Note:
  Approval activities run as the user whose actions match the approve or reject conditions the workflow was waiting for and advances the workflow.

Expected start dates and due dates are calculated based on the **Expected Duration** of all of the tasks and approvals between the **Generate** activity and the activity being updated. In the case of a branched path (between a **Branch** and **Join** activity), the longer duration will be used for any post-branch activities.

The **Generate** activity can be used more than once, and any tasks or approvals will be refreshed with updated information. This is useful in situations where the list of approvers or other

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

important information is still editable while the workflow is in process and it may be necessary to update or correct the generated approvals or tasks.

To exclude a set of activities from the **Generate** activity, select the **Skip during generate** check box on any condition and its transitions will not be followed during the generate process. By default, the following conditions have the **Skip during generate** check box selected:

- **Rejected** (for any of the approval activities)
- **No** condition of **If** activity
- **Continue** condition of **Turnstile** activity
- **Incomplete** condition of **Join** activity

Input variables

Input variables determine the initial behavior of the activity.

Generate activity input variables

Field	Description
Generate approvals	If selected, approvals are created when running the **Generate** activity. If cleared, the approvals are used to compute their estimated duration, but no approvals are created.
Generate tasks	If selected, tasks are created when running the **Generate** activity. If cleared, the tasks are used to compute their estimated duration, but no tasks are created.

States

The activity state tells the workflow engine what to do with the activity.

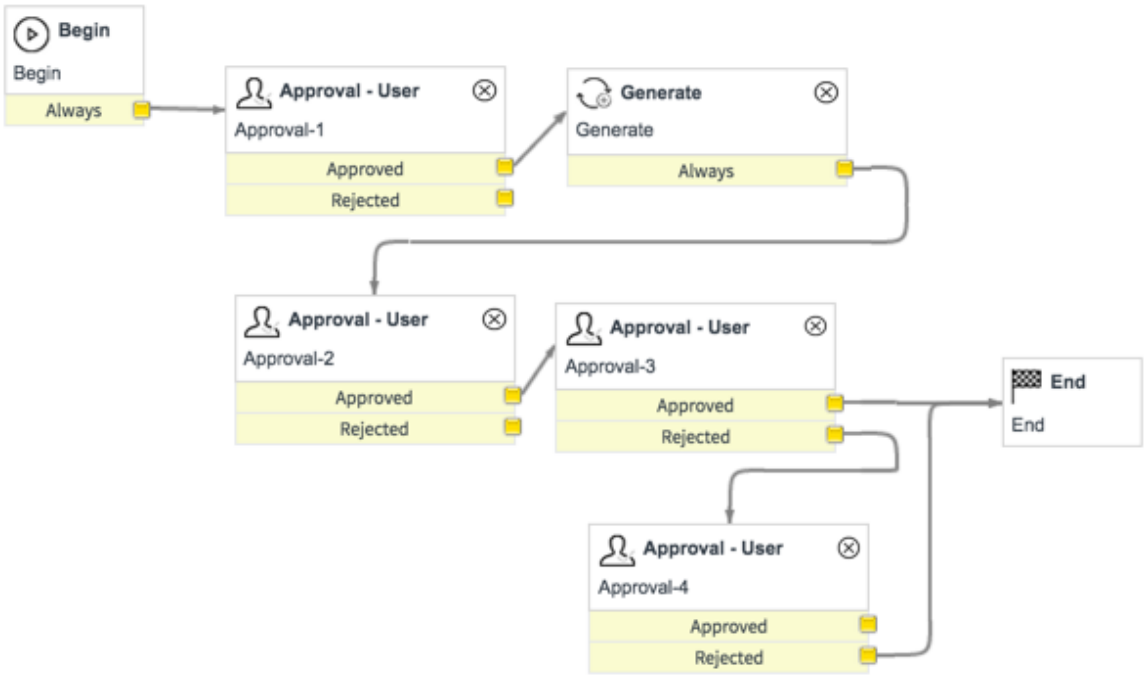
Generate activity states

State	Description
Executing	The activity is executing.
Finished	The activity finished running. See the result value for the outcome of the activity.
Cancelled	This activity, or the workflow that contains this activity, was canceled.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example

Generate workflow



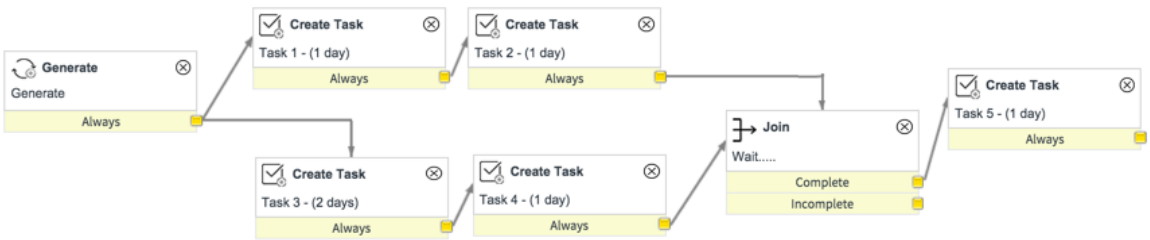
In this example, the following approvals are generated:

- Approval-2
- Approval-3

Approval-4 is skipped since the **Rejected** condition of Approval-3 has **Skip during generate** selected.

Here is an example of using the **Generate** activity that describes the expected start and due dates:

Generate workflow start and due date



In this example, if the **Generate** activity is run on Jan 1, 2016, the following expected start dates and due dates would be set for the generated tasks.

Task	Expected Start Date	Reason	Due Date
Task 1 (1 day)	Jan. 1, 2016		Jan. 2, 2016
Task 2 (1 day)	Jan. 2, 2016	Task 1 is 1 day	Jan. 3, 2016
Task 3 (2 days)	Jan. 1, 2016		Jan. 3, 2016
Task 4 (1 day)	Jan. 3, 2016	Task 3 is 2 days	Jan. 4, 2016

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Task	Expected Start Date	Reason	Due Date
Task 5 (1 day)	Jan. 4, 2016	Task 4 ends the latest before the Join	Jan. 5, 2016

Notice that Task 5 starts on Jan. 4, 2016 since the longest path (based on due dates) to the **Join** is Task 3/Task 4.

Manual Approvals workflow activity

The **Manual Approvals** activity watches and manages any approvals that users add manually outside of the workflow process. This activity only selects approvals that are in the Not requested state.

Note:
This activity is only available when the workflow runs on a table that extends Task.

If there are no pending manual approvals when this activity executes, the activity immediately completes with a result of **approved**. This activity does not create approval records. Use this activity to pause the workflow when a user adds a manual approval to a record with an associated workflow, and it is in the Not requested state. The workflow waits for the approval to be closed before proceeding.

Results

The workflow designer can assign a result value using `activity.result` from within a script field of the activity. By default, the result value of the activity is the final approval disposition determined by the approval actions take by the approvers. Possible result values are:

- Approved
- Rejected
- Deleted
- Cancelled
- Error

Input variables

Input variables determine the initial behavior of the activity.

Manual Approvals activity input variables

Field	Description
Wait for	Indicate what to wait for to indicate that the approval activity is approved or rejected. Options are: • **Any manual user or group approval:** Any user can approve and the first approval causes the activity to complete with a result of **approved**. • **All manual user or group approvals:** All users must approve (see below for how a rejection is handled). • **The first response from any manual approval:** The first approval or rejection from any user causes the activity to complete.
When anyone rejects	Indicate what happens when any user rejects their approval request. Options are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Manual Approvals activity input variables (continued)

Field	Description
	• **Reject the approval:** Immediately complete the activity with a result of **rejected**. • **Wait for other responses before deciding:** Wait until we get other responses before making an approval or rejection decision. This allows users to change their mind until a decision is made. In addition, if **Wait for** is set to **Anyone to approve** then a single approval will cause the activity to complete with a result of **approved** even if one or more users reject.

Conditions

The conditions determine which transition runs after this activity.

Note:
Approval activities run as the user whose actions match the approve or reject conditions the workflow was waiting for and advances the workflow.

Manual Approvals activity conditions

Condition	Description
Approved	The users from the groups have approved the request based on the **Wait for** rules.
Rejected	The users from the groups have rejected the request based on the **Wait for** rules.

States

The activity state tells the workflow engine what to do with the activity.

Manual Approvals activity states

State	Description
Executing	The workflow engine starts the `execute` function of the activity.
Waiting	The workflow engine ignores the activity until a specific event to restart the activity is fired.
Finished	The activity finished running. See the result value for the outcome of the activity.
Cancelled	This activity, or the workflow that contains this activity, was canceled.
Error	A JavaScript error occurred. Review the logs for error details.

Rollback To workflow activity

The **Rollback To** activity transitions directly to the activity specified by the outgoing transition line arrow.

Note:
This activity is only available when the workflow runs on a table that extends Task.

Rollback To determines which activities to reset based on the actual workflow sequence (transition line attachments) of activities between itself and the transitioned to activity, not the execution order. **Rollback To** then marks all the approvals that have transitioned between the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

rollback and the transitioned to activity as **Not Yet Requested** and the tasks as either **Open** or **Pending**.

Use the **Rollback To** activity for all workflows in which multiple rollbacks are required. **Rollback To** has no variables.

Conditions

The conditions determine which transition runs after this activity.

Rollback To activity conditions

Condition	Description
Always	The event or condition that causes the approval to revert to the previous workflow step.
Error	The event or condition that generates an error.
Skipped	The event or condition that allows a skipped approval.

States

The activity state tells the workflow engine what to do with the activity.

Rollback To activity states

State	Description
Executing	The workflow engine starts the `execute` function of the activity.
Waiting	The workflow engine ignores the activity until a specific event to restart the activity is fired.
Finished	The activity finished running. See the result value for the outcome of the activity.
Cancelled	This activity, or the workflow that contains this activity, was canceled.
Error	A JavaScript error occurred. Review the logs for error details.

Rollback To behavior

The **Rollback To** activity transitions directly to the activity specified by the transition line arrow.

Use the **Rollback To** activity for all workflows that use multiple or nested rollbacks. **Rollback To** resets the targeted task (the direct transition) to **Open**. All tasks that have executed between the **Rollback To** activity and the targeted task (rolled back task) are set to **Pending**.

(0) Begin

Rollback To activity

When conditions in a workflow trigger a **Rollback To** activity, the workflow moves processing backward to a specified activity in the workflow and resets certain activities that have already executed back to their original state. This is useful when handling an unexpected failure or as part of a programmed logical flow.

When an activity is reset during a workflow rollback, the following happens:

- Approvals are reset to **Not Requested**.
- Tasks are reset to either **Open** or **Pending**. A rollback workflow path cannot create new tasks.

Activities that perform external system operations, such as deleting a file or sending an email, are not rolled back. Only approval and task activity states are reset.

A workflow can contain a single rollback, multiple rollbacks, or nested rollbacks in more complex workflows. The **Rollback To** activity resets activities based on the actual workflow sequence (transition line attachments) of activities between itself and the transitioned to activity, rather than using the execution order to determine where processing should restart.

Condition Workflow activities

Condition activities provide conditional branching and logical operation functionality for workflows.

If workflow activity

The **If** activity checks a condition or script to determine if a **Yes** or **No** transition should be taken.

If the workflow creator specifies both the **Condition** and the **Advanced** script, both must evaluate successfully for activity to take the **Yes** transition.

Results

The workflow designer can assign a result value using activity.result from within the **Script** field on the activity record. By default, the result value of the activity is the final result of the condition or script specified. Possible result values are:

- Yes
- No

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Input variables

The following variables determine the behavior of the activity.

Note:
Condition activities run as the user whose actions match the conditions the workflow was waiting for and advances the workflow.

If activity input variables

Field	Description
Condition	If specified and the current record matches the condition, the **Yes** transition is taken.
Advanced and Script	To specify a script, select the **Advanced** check box. You may then enter a script that is evaluated. If your script sets the variable answer to `yes`, then the **Yes** transition is taken. Otherwise, the **No** transition is taken.

Conditions

The following conditions determine which transition comes after the activity.

If activity conditions

Condition	
Yes	Taken when the condition, if specified, matches and the **Advanced** script, if specified, returns yes.
No	Taken when either the condition does not match or the **Advanced** script, if specified, returns no.

States

The activity state tells the workflow engine what to do with the activity.

If activity states

State	Description
Executing	The workflow engine knows to start the *`onExecute`* function of the activity.
Waiting	The workflow engine ignores the activity until a specific event to restart the activity is fired.
Finished	The activity finished running. See the result value for the outcome of the activity.
Cancelled	This activity, or the workflow that contains this activty, was canceled.
Error	A JavaScript error occurred. Review the logs for error details.

Switch workflow activity

The **Switch** activity checks if the value of a passed field or variable is equivalent to one of several case values.

The switch activity behavior is similar to a switch statement in Java.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When creating a switch activity, select a **Variable** or **Field** to check against activity conditions for a matching field value. When the value passed in this variable or field matches the value defined in the **Condition** field of the activity condition, the workflow progresses through that activity condition.

Note:
Condition activities run as the user whose actions match the conditions the workflow was waiting for and advances the workflow.

Results

The variable or field selected in the **Variable** or **Field** activity variable determines the possible result values.

Input variables

The following variables determine the behavior of the activity.

Switch activity input variables

Field	Description
Type	Select **Variable** or **Field** as the type of value to check against available conditions. This selection sets the label and available options for the other field.
Variable or Field	Select the source of the value compared against the switch activity conditions. The field label and available options depend on the **Type** selection. • **Variable:** select any service catalog variable. • **Field:** select any field from the **Table** defined in the workflow properties.

States

The activity state tells the workflow engine what to do with the activity.

Switch activity states

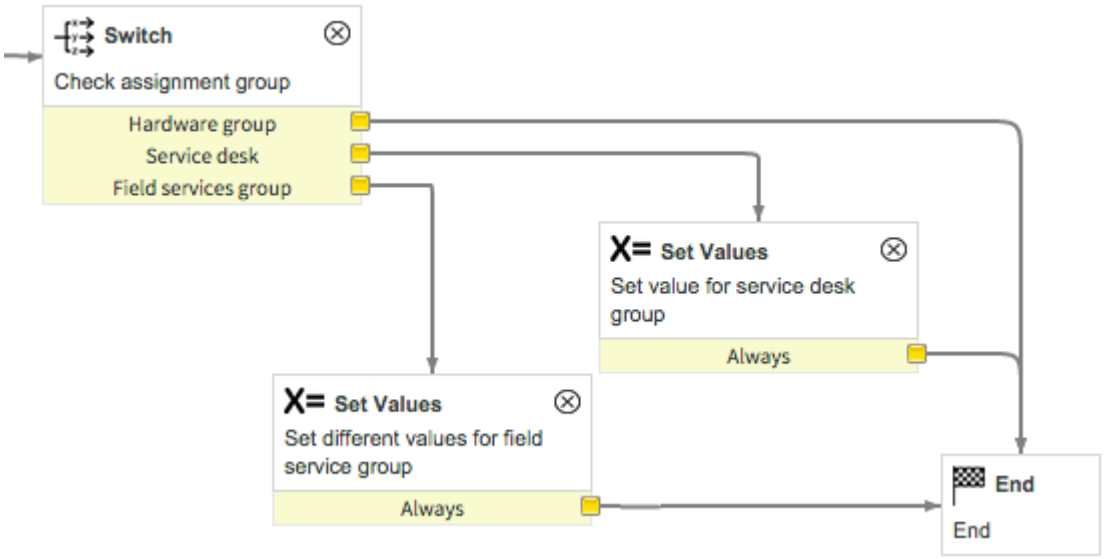
State	Description
Executing	The workflow engine knows to start the `onExecute` function of the activity.
Waiting	The workflow engine ignores the activity until a specific event to restart the activity is fired.
Finished	The activity finished running. See the result value for the outcome of the activity.
Cancelled	This activity, or the workflow that contains this activity, was canceled.
Error	A JavaScript error occurred. Review the logs for error details.

Example

You can create a switch activity that sets different field values on an incident based on the Assignment group of the incident record.

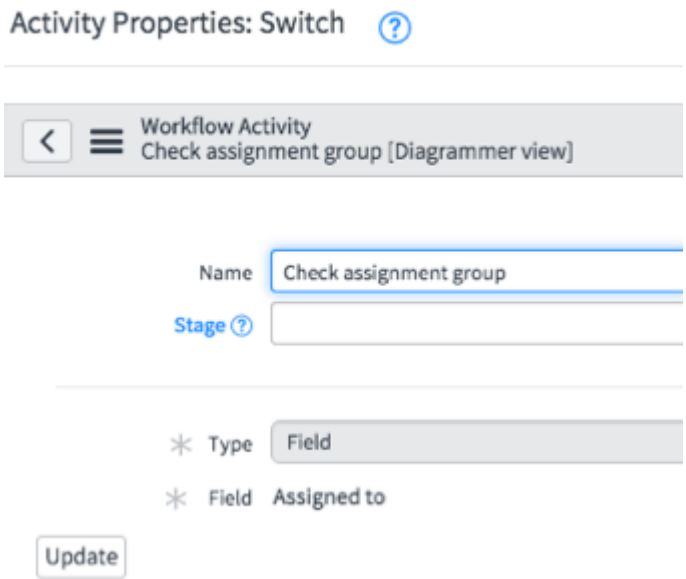
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Switch activity example



The **Field** selected is the incident **Assigned to** field.

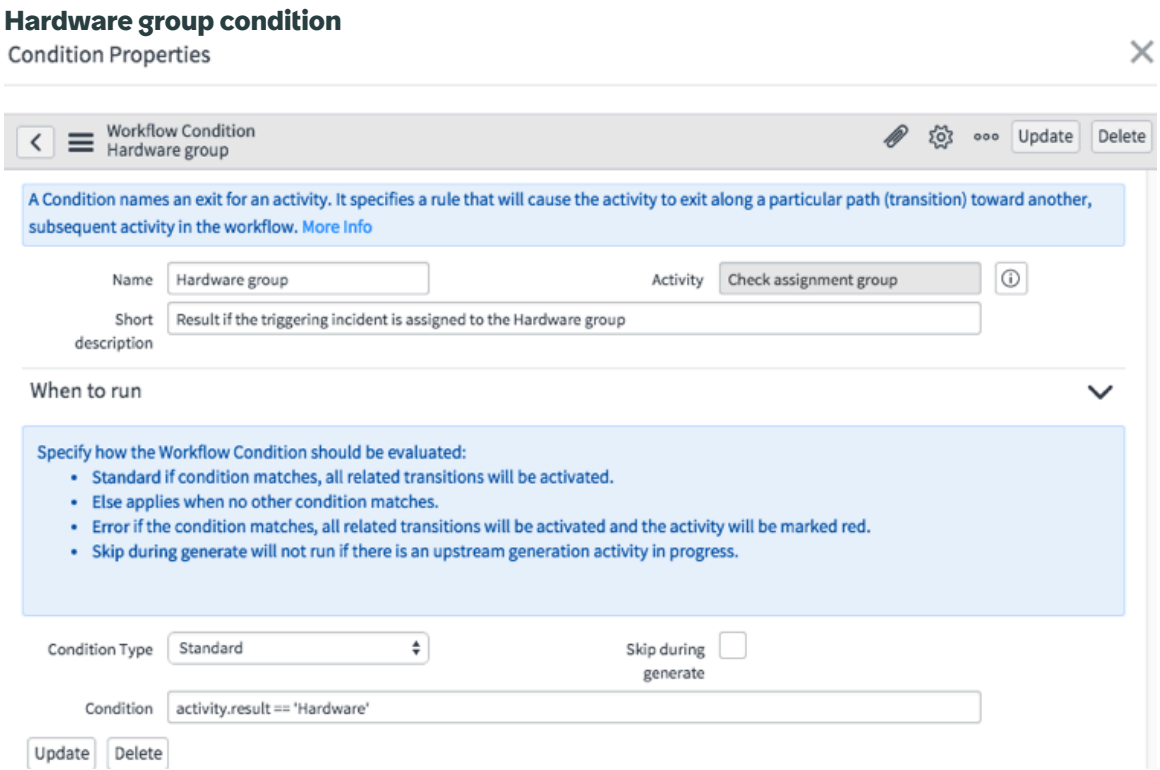
Switch activity Field



If the value of the **Assigned to** field of the workflow-triggering incident is **Service Desk** or **Field Services**, the workflow populates values on the incident record before continuing. If the **Assigned to** value is **Hardware**, the workflow continues without populating any field values.

Condition type (Standard, Else, or Error) is used. For more information, see Manage workflow activity conditions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Wait for condition workflow activity

The **Wait for condition** activity causes the workflow to wait at this activity until the current record matches the specified condition.

The workflow evaluates the **Wait for condition** activity each time the current record is updated. Use this activity to pause a workflow indefinitely until a particular criteria is met by a record update. To pause a workflow for a timed duration see Timer workflow activities.

For workflow to consider the condition met, all conditions specified – whether in the builder or in a script – must be true.

Note:
A **Wait for condition activity** should only be used to wait for an external event such as a record update, and not one from a workflow setting a value. If you have a workflow setting a value and want to wait for that same field to be seen as 'changed,' try inserting a one-second timer.

Results

The workflow designer can assign a result value using `activity.result` from within a script field of the activity. The activity transitions when the result value is true.

Input variables

The following variables determine the behavior of the activity.

Note:
Condition activities run as the user whose actions match the conditions the workflow was waiting for and advances the workflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Wait for condition activity input variables

Field	Description
Condition	The workflow is paused at this activity until this condition matches the current record.
Condition script	If specified, the workflow is paused at this activity until this script sets the *answer* variable to true.
Enable Timeout	Option to limit the amount of time that the workflow waits for the activity to be completed before continuing. **Note:** Use the **Enable timeout** option to prevent this activity from continuing to run. If the condition to continue is never met, a timeout value specifies when the system skips the Wait for Condition activity and goes to the next item in the workflow. You must set a Duration value to enable a timeout. You can also select a Schedule if you want to compute the duration end date based on a specific work schedule.
Duration	Amount of time that the workflow waits before continuing when the **Enable timeout** option is selected. Enter the time to wait in hours, minutes, and seconds. If you leave this field empty, the workflow does not wait.

States

The activity state tells the workflow engine what to do with the activity.

Wait for condition activity states

State	Description
Executing	The workflow engine knows to start the *onExecute* function of the activity.
Waiting	The workflow engine ignores the activity until a specific event to restart the activity is fired.
Finished	The activity finished running. See the result value for the outcome of the activity.
Cancelled	This activity, or the workflow that contains this activty, was canceled.
Error	A JavaScript error occurred. Review the logs for error details.

Wait for WF Event workflow activity

The **Wait for WF Event** activity causes the workflow to wait at this activity until the specified event is fired.

Use this activity to wait for another activity to fire an event. Events from other activities are fired in a script using the workflow.fireEvent('eventName') API call.

Results

The workflow designer can assign a result value using `activity.result` from within a script field of the activity. This activity transitions when the specified event fires.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Input variables

The following variables determine the behavior of the activity.

Note:
Condition activities run as the user whose actions match the conditions the workflow was waiting for and advances the workflow.

Wait For WF Event activity input variables

Field	Description
Wait for Event	An event name to trigger the workflow.

States

The activity state tells the workflow engine what to do with the activity.

Wait For WF Event activity states

State	Description
Executing	The workflow engine knows to start the `onExecute` function of the activity.
Waiting	The workflow engine ignores the activity until a specific event to restart the activity is fired.
Finished	The activity finished running. See the result value for the outcome of the activity.
Cancelled	This activity, or the workflow that contains this activity, was canceled.
Error	A JavaScript error occurred. Review the logs for error details.

Workflow notification activities

Notification workflow activities notify users of events that occur during the workflow.

Create Event workflow activity

The **Create Event** activity adds an event to the event queue, but does not immediately fire the event.

The event processor typically processes the event within one minute. This activity triggers any business rules or email notifications that would normally be triggered by the event.

For more information about creating and using system events, see System Events.

Results

Finished: the activity added the event to the event queue.

Input variables

Create Event activity input variables

Field	Description
Event name	The name of the event to create. From the Event Name lookup list, select the event to add to the queue. If the event requires parameters, specify them in the Parameter script field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create Event activity input variables (continued)

Field	Description
Parameter 1	The first parameter of the event. **Note:** If this parameter is a string value, it must be within quotes (" ").
Parameter 2	The second event parameter. **Note:** If this parameter is a string value, it must be within quotes (" ").

Notification workflow activity

The **Notification** activity sends an email or SMS message to specified users or groups.

Input variables

Update the recipients list or delete the activity from the flow if you want to stop the notifications.

Notification activity input variables

Field	Description
Addressees	
To	The users who will be recipients of the email.
To (groups)	The members of the groups that will be recipients of the email.
Advanced	If selected, the script in the **To (script)** field is called to specify additional recipients of the email.
To (script)	If **Advanced** is selected, this script is called and should set the variable *answer* to a comma-separated list of user or group sys_ids that you want to add as recipients of the email.
Message	
Subject	The subject line of the email.
Message	The email body that is sent. To include the value of a field in the message body, place the cursor at the point in the text where you want the field's value inserted. Then click the + icon next to **Fields** and select the field you want.

States

The activity state tells the workflow engine what to do with the activity.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Notification activity states

Field	Description
Executing	The workflow engine knows to start the `run` function of the activity.
Finished	The activity finished running. See the result value for the outcome of the activity.
Cancelled	This activity, or the workflow that contains this activity, was canceled.

Timer workflow activities

Timer activities pause workflows for set periods of time.

Related topics

Use multiple timer activities in one workflow

SLA Percentage Timer workflow activity

The **SLA Percentage Timer** activity pauses the workflow for a duration equal to a percentage of an SLA.

A workflow must run on the Task SLA table to use this activity.

Note:
Timer activities run as the System user because the system scheduler advances the workflow.

Results

SLA Percentage Timer activity results

Result	Description
Complete	The activity successfully reached the specified duration
Cancelled	The activity or workflow was canceled before the timer reached the specified duration

Input variables

Input variables determine the initial behavior of the activity.

SLA Percentage Timer activity input variables

Field	Description
Percentage	The duration to pause the workflow for, as a percentage of the current SLA

States

The activity state tells the workflow engine what to do with the activity.

SLA Percentage Timer states

State	Description
Executing	The activity is in this state very briefly while initializing, after which it immediately changes to **Waiting**.
Waiting	The workflow engine waits until the SLA reaches the specified percentage. The engine then transitions the workflow to the next activity.
Finished	The activity finished running. See the result value for the outcome of the activity.
Cancelled	This activity, or the workflow that contains this activity, was canceled.
Error	A JavaScript error occurred. Review the logs for error details.

Timer workflow activity

The **Timer** activity pauses the workflow for a specified period of time.

This duration can be an absolute time value or a relative value based on a defined Creating and using schedules. It is best to adjust the **Duration** so the workflow can progress in a timely manner. To pause a workflow indefinitely until a condition is met, see wait for condition.

Note:
Timer activities run as the System user because the system scheduler advances the workflow.

Results

Timer activity results

Result	Description
Complete	The activity successfully reached the specified duration.
Cancelled	The activity or workflow was canceled before the timer reached the specified duration.

Input variables

Input variables determine the initial behavior of the activity.

Timer activity input variables

Field	Description
Timer Information	
Timer based on	How the timer duration is computed. The options are: • **A user specified duration:** The duration is based on the **Duration** fields, such as days and hours. • **A relative duration:** The duration is based on the **Relative duration** (such as End of Next Business Day) and **Wait** fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Timer activity input variables (continued)

Field	Description
	• **A date/time or duration field:** The duration is based on the **Field** value and the **Wait** field. • **Script:** The duration is based on a script that returns the number of seconds.
Duration Appears only when **Timer based on** is **A user specified duration**.	The specific number of days and hours to wait before proceeding to the next activity in the workflow.
Relative duration Appears only when **Timer based on** is **A relative duration**	The general number and length of business days to wait before progressing to the next workflow activity. .
Wait Appears only when **Timer based on** is **A relative duration** or **A date/time or duration field**.	An additional timer adjustment when **Timer based on** is **A relative duration** or **A date/time or duration field**. The options are: • **The full duration:** No modification of the calculated duration. • **A % of the duration:** The duration is adjusted by multiplying the number of seconds by the (**Percentage** / 100). • **Some time before:** The duration is shortened by the **Time before** days and hours. • **Some time after:** The duration is lengthened by the **Time after** days and hours.
Percentage Appears only when **Timer based on** is **A relative duration** or **A date/time or duration field**.	The **Wait** percentage value when **Timer based on** is **A relative duration** or **A date/time or duration field**.
Time before Appears only when **Timer based on** is **A relative duration** or **A date/time or duration field** and **Wait** is **Some time before**.	The modifier time value when **Wait** is **Some time before**.
Time after Appears only when **Timer based on** is **A relative duration** or **A date/time or duration**	The modifier time value when **Wait** is **Some time after**.

Timer activity input variables (continued)

Field	Description
field and **Wait** is **Some time after**.	
Field Appears only when **Timer based on** is **A date/time or duration field**.	The date/time or duration field that contains the elapsed wait-time before moving to the next workflow activity.
Script Appears only when **Timer based on** is **Script**	The script that sets 'answer' to the number of seconds for the duration.
Timer Schedule	
Schedule based on	The basic schedule the timer uses to count working hours. If a schedule is specified, the duration will only be considered for times that are specified on the schedule. For example, if the duration is 2 hours and the workflow begins at 4:00pm on a schedule that is 8am - 5pm, then it ends at 9:00am the next day. The options are: • **This workflow's schedule:** The schedule uses workflow context date, time, and an optional **Time zone based on** value. • **A specific schedule:** The schedule uses a pre-defined **Schedule** and an optional **Time zone based on** value. • **A schedule field:** The schedule uses a value from a table and an optional **Time zone based on** value.
Schedule Appears only when **Schedule based on** is **A specific schedule**.	The pre-defined **Schedule** from a list.
Schedule field Appears only when **Schedule based on** is **A schedule field**.	A date and time or duration field for the schedule, that is associated with the table. Valid fields appear in blue on the Select the element from a tree dialog.
Timer Time Zone	
Time zone based on	The time zone for calculating the duration. The time zone may be based on: • **No time zone:** Default. Workflow uses the GMT time zone. • **A specific time zone:** A predefined **Time zone**. • **A time zone field:** A **Time zone field** to track time duration from a field on the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Timer activity input variables (continued)

Field	Description
Time zone Appears only when **Time zone based on** is **A specific time zone**.	The predefined time zone.
Time zone field Appears only when **Time zone based on** is **A time zone field**.	A date and time or duration field for the schedule, that is associated with the table. Valid fields appear in blue on the Select the element from a tree dialog.

States

The activity state tells the workflow engine what to do with the activity.

Timer activity states

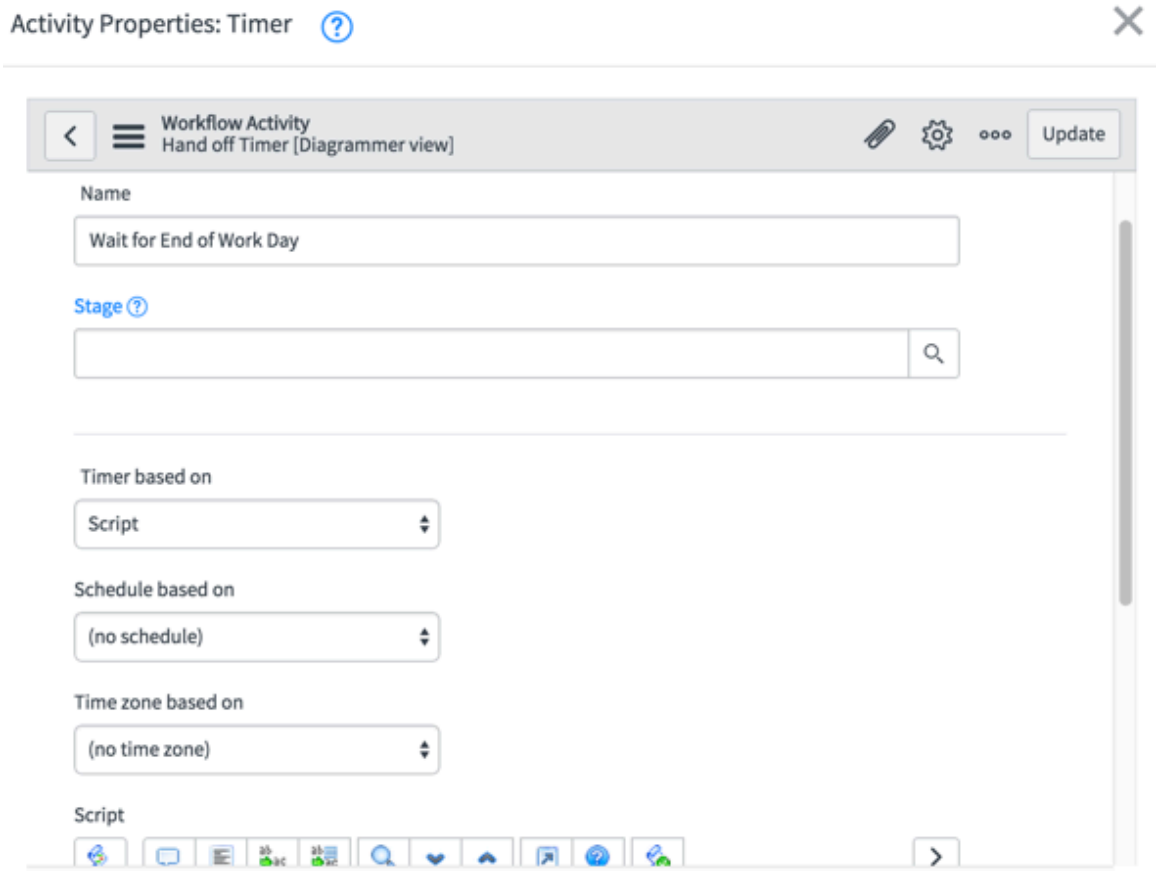
State	Description
Executing	The **Timer** activity is in this state very briefly while initializing, after which it immediately changes to **Waiting**.
Waiting	The workflow engine waits until the timer reaches the specified duration. The engine then transitions the workflow to the next activity.
Finished	The activity finished running. See the result value for the outcome of the activity.
Cancelled	This activity, or the workflow that contains this activity, was canceled.
Error	A JavaScript error occurred. Review the logs for error details.

Example

You can use a **Timer** activity to pause the workflow until the end of the business day.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Timer example



In this example, the script evaluates the time between the *now* variable and the *eod* variable. The *eod* variable is defined, in 24 hour time, as 4:00 PM. The script then sets the *answer* variable to the difference between these variables, in seconds, and logs a message.

```
// get now and calc end of day (4:00pm)

var now =new Date();

var eod =new Date();
eod.setHours(16);
eod.setMinutes(0);
eod.setSeconds(0);

answer =(eod.getTime()- now.getTime())/1000;

workflow.debug('Timer will fire @: '+ eod +'  '+(answer/60)+'
 minutes from now');
```

Task workflow activities

Task activities create and modify workflow tasks.

Task activities are only available when the workflow runs on a table that extends Task.

Add Worknote workflow activity

The **Add Worknote** activity adds text to the *Worknotes* field of the current incident record.

A workflow must run on the Incident table to use this activity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Task activities run as the user whose actions complete the task the workflow was waiting for and advances the workflow.

Input variables

Add Worknote activity input variables

Field	Description
Work Note	The text to add to the incident record.

Attachment Note workflow activity

The **Attachment Note** activity adds an attachment to the current record.

Note:
This activity is only available when the workflow runs on a table that extends Task.

This activity allows the use of irregular HTML tags to reference attachments, specifically the `[code]` tag. Entries in a journal field that use irregular HTML do not work if the *`glide.ui.allow_deep_html_validation`* property is true. This property is set to false by default.

Note:
Task activities run as the user whose actions complete the task the workflow was waiting for and advances the workflow.

Results

Finished: the activity added the attachment to the record.

Input variables

The following variables determine the behavior of the activity.

Attachment Note activity input variables

Field	Description
General	
Field	When this activity runs, it makes a note on the current record that a file has been attached. Specify the field on the current record in which you want this note to appear. The options are: • **none** (defaults to Work Notes) • **Additional Comments** • **Work notes**
Attachment note information	
Attachment Name	When this activity runs, it creates a .txt file with the name you specify in this field.
Attachment Data	The content of the .txt file attachment. It can be in plain text or use variables to extract specific data from a table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Catalog Task workflow activity

The **Catalog Task** activity creates a service catalog task record.

Note:
This activity is only available when the workflow runs on a table that extends Task.

A user must complete the catalog task. This activity is available only for workflows running on the Catalog Request Item [sc_req_item] table.

Note:
Task activities run as the user whose actions complete the task the workflow was waiting for and advances the workflow.

Results

You can assign a result value using `activity.result` from within a script field of the activity. The final **State** value of the catalog task record determines the result value for the **Create Task** activity. Possible result values are:

- Closed complete
- Closed incomplete
- Closed skipped
- Deleted
- Cancelled

Input fields

The values you enter in the following fields determine the behavior of the activity.

Catalog task activity information

Field	Description
Catalog Task Activity Settings The following fields specify the behavior of the Catalog Task Activity.	
Task Table	The table on which this activity runs. In most cases, leave set to the default value: [sc_req_item].
Priority	The value you want assigned to the **Priority** field for the new task.
Wait for completion	If selected, the workflow activity waits for the task to complete before continuing. If cleared, the task is created but the workflow proceeds.
Catalog Task Record Settings The following fields specify the field values that this activity sets for the catalog task it creates.	
Task value from	Specify how you want to populate fields on the new task. • **Fields:** a predefined set of fields including **Fulfillment group**, **Assigned to**, **Short description** and **Instructions**. • **Template:** an existing template for the selected task table. • **Values:** values that you specify using a Set Values widget.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Catalog task activity information (continued)

Field	Description
	After you select a value for **Task value from**, additional fields specific to that value appear on the form.
Fulfillment group Only appears when **Task value from** is set to `Fields`	The group that is responsible for completing the task. Populates the **Assignment group** field on the new task.
Assigned to Only appears when **Task value from** is set to `Fields`	The user who is responsible for completing the task. Populates the **Assignment to** field on the new task.
Short description Only appears when **Task value from** is set to `Fields`	A short description for the task. Populates the **Short description** field on the new task.
Instructions Only appears when **Task value from** is set to `Fields`	The task instructions for the user to complete prior to closing the task. Populates the **Description** field on the new task.
Template Only appears when **Task value from** is set to `Template`.	The values in the task will be populated from the values in the template you select.
SetValues Only appears when **Task value from** is set to `Values`.	Select any field on the task record to a value you specify here.
Advanced	Check **Advanced** if you want to use a script to assign values on the catalog task. When you check **Advanced,** a text box appears where you can enter your script.
Advanced Script Only appears when the **Advanced** field is checked.	Set additional values for the task in this script. This script is run after the task values are set using the **Fields**, **Template** or **Values** you have specified. Use the variable *`task`* when setting additional values, for example: `task.short_description = current.short_description;`
Catalog Task Variables	
Variables on Task Form	Specify optional catalog variables to include on the Catalog task form. The variables you select here will be displayed in a field called **Variable**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Catalog task activity information (continued)

Field	Description
	Editor. If you select no variables here, the **Variable Editor** field in the Catalog Task form will not be visible.
Catalog Task Schedule	
Due date based on	Select how workflow determines the task's duration, due date, and schedule. • **A user specified duration:** The duration is based on a user specified value. • **A relative duration:** The duration is calculated from a relative duration (such as End of Next Business Day). • **A date/time or duration field:** The duration is based on the value of a field on the current record. • **Script:** The duration is returned by a script.
Duration Only appears when **Due date based on** is set to `A user specified duration`	The specific number of days and hours.
Relative duration Only appears when **Due date based on** is set to `A relative duration`	The general number and length of business days.
Due date field Only appears when **Due date based on** is set to `A date/time or duration field`	The date/time or duration field.
Due date script Only appears when **Due date based on** is set to `Script`	The script that sets 'answer' to the number of seconds for the duration.
Schedule based on	The basic schedule the timer uses to count working hours. If a schedule is specified, the duration will only be considered for times that are specified on the schedule. For example, if the duration is 2 hours and the workflow begins at 4:00pm on a schedule that is 8am - 5pm, then it ends at 9:00am the next day. The options are:

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Catalog task activity information (continued)

Field	Description
	• **This workflow's schedule:** The schedule uses workflow context date, time, and an optional **Time zone based on** value. • **A specific schedule:** The schedule uses a pre-defined **Schedule** and an optional **Time zone based on** value. • **A schedule field:** The schedule uses a value from a table and an optional **Time zone based on** value.
Schedule Only appears when **Schedule based on** is set to `A specific schedule`	The predefined **Schedule** from a list.
Schedule field Only appears when **Schedule based on** is set to `A schedule field`.	A date and time or duration field for the schedule, that is associated with the table. Valid fields appear in blue on the Select the element from a tree dialog.
Time zone based on	The time zone for calculating the duration. The time zone may be based on: • **No time zone:** Default. Workflow uses the GMT time zone. • **A specific time zone:** A specific **Time zone** that you choose from a choice list. • **A time zone field:** A **Time zone field** to track time duration from a field on the form.
Time zone Only appears when **Time zone based on** is set to `A specific time zone` .	Select the time zone you want from the choice list.
Time zone field Only appears when **Time zone based on** is set to `A time zone field`.	A date and time or duration field for the schedule, that is associated with the table. Valid fields appear in blue on the Select the element from a tree dialog.

States

The activity state tells the workflow engine what to do with the activity.

Catalog Task activity states

State	Description
Executing	The workflow engine knows to start the `onExecute` function of the activity.
Waiting	The workflow engine ignores the activity until a specific event to restart the activity is fired.
Finished	The activity finished running. See the result value for the outcome of the activity.
Cancelled	This activity, or the workflow that contains this activity, was canceled.
Error	A JavaScript error occurred. Review the logs for error details.

Create Task workflow activity

The **Create Task** activity generates a record on any of the tables that extend Task [task].

Note:
This activity is only available when the workflow runs on a table that extends Task.

If the **Wait for completion** check box is selected, the workflow context waits for a user action on the task, such as Complete or Incomplete, and then progresses based on the user action.

Note:
Task activities run as the user whose actions complete the task the workflow was waiting for and advances the workflow.

Results

You can assign a result value using `activity.result` from within a script field of the activity. By default, the final **State** value of the task record determines the result value for the **Create Task** activity. Possible result values are:

- Closed complete
- Closed incomplete
- Closed skipped
- Deleted
- Cancelled

Input variables

The following variables determine the behavior of the activity.

Create Task activity input variables

Field	Description
Create Task Activity Settings The following fields specify the behavior of the Create Task Activity.	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create Task activity input variables (continued)

Field	Description
Task type	The type of task to create. Select from the corresponding task table for the workflow.
Priority	The default priority assigned to the task. If you also set the Task priority in the **Task values from** section, the Task value overrides the default priority.
Wait for completion	If selected, the workflow activity waits for the task to complete before continuing. If cleared, the task is created but the workflow proceeds.
Create Task Record Settings The following fields specify the field values that this activity sets for the task it creates.	
Task values from	The values used to create the task may either come from: • **Fields:** a predefined set of fields including **Fulfillment group**, **Assigned to**, **Short description** and **Instructions**. • **Template:** an existing template for the selected task table. • **Values:** values that you specify using a Set Values widget. **Note:** Any Task priority you set here overrides the default priority set by the **Priority** field.
Fulfillment group Only appears when **Task value from** is set to `Fields`	The group that is responsible for completing the task. Populates the **Assignment group** field on the new task.
Assigned to Only appears when **Task value from** is set to `Fields`	The user who is responsible for completing the task. Populates the **Assignment to** field on the new task.
Short description Only appears when **Task value from** is set to `Fields`	A short description for the task. Populates the **Short description** field on the new task.
Instructions Only appears when **Task value from** is set to `Fields`	The task instructions for the user to complete prior to closing the task. Populates the **Description** field on the new task.
Task template Only appears when **Task values from** is set to **Template**.	A template that is used to fill in values for the task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create Task activity input variables (continued)

Field	Description
Set values Only appears when **Task values from** is set to **Values**.	A widget that is used to specify values for any fields of the task.
Advanced	
Advanced	Check **Advanced** if you want to use a script to assign values on the catalog task. When you check **Advanced,** a text box appears where you can enter your script.
Advanced Script Only appears when the **Advanced** field is checked.	Set additional values for the task in this script. This script is run after the task values are set using the **Fields**, **Template** or **Values** you have specified. Use the variable *task* when setting additional values, for example: `task.short_description = current.short_description;`
Task Schedule	
Due date based on	Select how workflow determines the task's duration, due date, and schedule. • **A user specified duration:** The duration is based on a user specified value. • **A relative duration:** The duration is calculated from a relative duration (such as End of Next Business Day). • **A date/time or duration field:** The duration is based on the value of a field on the current record. • **Script:** The duration is returned by a script.
Duration Only appears when **Due date based on** is set to `A user specified duration`	The specific number of days and hours.
Relative duration Only appears when **Due date based on** is set to `A relative duration`	The general number and length of business days.
Due date field Only appears when **Due date**	The date/time or duration field.

© 2026 ServiceNow, Inc. All rights reserved.

Create Task activity input variables (continued)

Field	Description
Only appears when **Time zone based on** is set to `A specific time zone` .	
Time zone field Only appears when **Time zone based on** is set to `A time zone field.`	A date and time or duration field for the schedule, that is associated with the table. Valid fields appear in blue on the Select the element from a tree dialog.

States

The activity state tells the workflow engine what to do with the activity.

Create Task activity states

State	Description
Executing	The workflow engine knows to start the `onExecute` function of the activity.
Waiting	The workflow engine ignores the activity until a specific event to restart the activity is fired.
Finished	The activity finished running. See the result value for the outcome of the activity.
Cancelled	This activity, or the workflow that contains this activity, was canceled.
Error	A JavaScript error occurred. Review the logs for error details.

Utility workflow activities

Utility activities provide controls over the path of the workflow, and other useful tools.

Branch workflow activity

The **Branch** activity splits the workflow into multiple transition paths from a single activity.

To add a transition path, drag the **Branch** activity onto the canvas. When the Branch activity properties form displays, click **Submit** to add the activity to the canvas. Once the activity is on the canvas, right click in the activity body, then click **Add Condition**.

All transitions from this activity execute concurrently. This activity provides a single **Always** condition. You can draw any number of transitions from this condition. Using this activity is equivalent to drawing multiple transitions from a single condition of another activity.

Branching can affect the behavior of rollback activities. See Rollback To activity for more information.

Join workflow activity

The **Join** activity unites multiple execution paths into one transition.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use this activity to cause a workflow to wait for all activities in multiple paths to finish before continuing. If multiple concurrent workflow paths meet without a **Join** activity, any subsequent activities execute twice.

To add Join to the canvas, click **Submit**. On the canvas, connect incoming transitions from each activity you want to act as a predecessor to the Join activity. Then connect outgoing transitions to the two exit conditions: Complete and Incomplete.

Results

Provide an Incomplete transition out of a **Join** whenever it is possible for any predecessor activities to follow a transition path that does not lead to the **Join** activity.

Join activity results

Result	Description
Complete	**Join** exits along the Complete path when the system has determined that all predecessor activities have completed and transitioned to the **Join**.
Incomplete	**Join** exits along the Incomplete path when the system determines that at least one predecessor activity completed but transitioned along a path that bypassed the **Join** activity.

Lock workflow activity

The **Lock** activity prevents other instances of this workflow from continuing past this activity until the lock is released.

Several instances of the same workflow may run concurrently. For example, if a workflow triggers when a record is added to a particular table. That workflow triggers multiple times if multiple records are added one after the other, once by each record insertion. You can use the lock activity to ensure that this instance of the workflow has finished one or more activities before any other instance of the workflow can proceed.

A workflow can explicitly release a lock with the **Unlock** activity. The lock may also be released when the **Max duration** is reached.

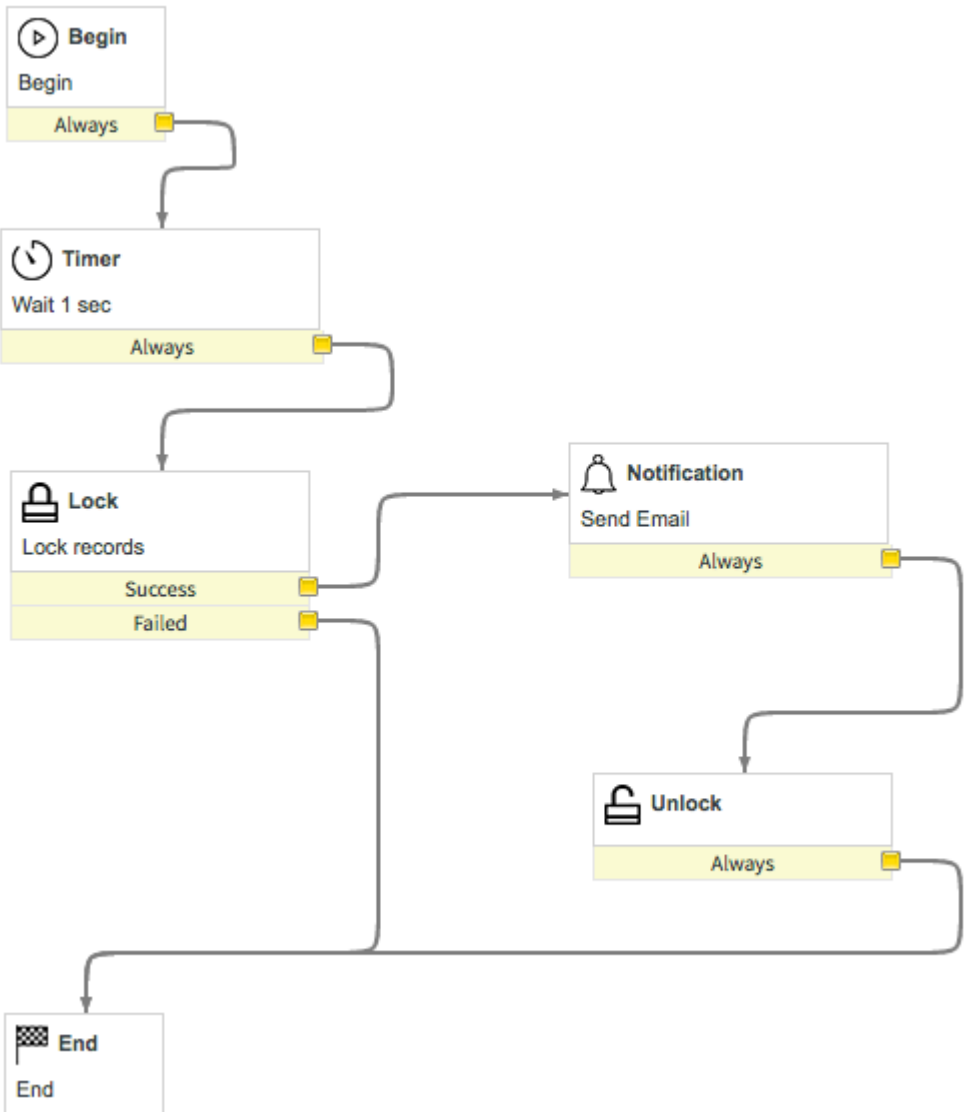
When an instance of the workflow reaches the **Lock** activity, it attempts to obtain a lock using the key specified in the lock activity. If another instance has already obtained the lock and has not yet released it, this lock attempt fails. The instance continues trying to obtain the lock until **Max attempts** has been reached.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

We recommend placing a one-second timer activity before the lock activity. This helps prevent a rare condition in which the lock activity may not be able to distinguish one workflow instance from another. This condition can occur because the entity owning the lock is not the specific workflow instance, but rather the code-execution thread in which that instance is running. In most cases, each workflow instance runs on a different thread. Adding a timer activity ensures that this is the case.

Example of Lock Activity Preceded by Timer Activity



Since a **Lock** activity can only temporarily prevent processing of other workflow instances, do not add activities that cause the workflow to wait between a **Lock** and **Unlock** activity block. This may cause the **Unlock** activity to be unable to acquire the lock to release it and instead take 60 seconds to complete. Restricted wait activities include:

- Approval activities
- Task activities
- Timer activities
- Wait for condition activity

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Wait for WF Event activity
- MID server activities such as a PowerShell script

Results

Lock activity results

Result	Description
Success	The activity successfully obtained a lock. This instance of the workflow can proceed past this point, but other instances cannot proceed until the lock is released.
Failure	After attempting to obtain the lock **Max attempts** times, the activity could not obtain the lock.

Input variables

Input variables determine the initial behavior of the activity.

Lock activity input variables

Field	Description
Key	A unique mutex key. The Unlock activity activity uses this key to release the lock.
Duration	
Max. duration	The maximum time the lock persists. The lock is released after it reaches this duration. Releasing a lock this way is equivalent to running the **Unlock** activity.
Lock attempts Specify how the activity behaves if the lock attempt is denied. If the final lock attempt fails, the activity state is set to 'timeout' and the activity result is set to 'failed'.	
Max. attempts	Specify the maximum number of times the activity may attempt to obtain the lock.
Delay between attempts	The amount of time required after a failed lock attempt before another lock attempt is allowed.

States

The activity state tells the workflow engine what to do with the activity.

Lock activity states

State	Description
Waiting	The workflow engine is waiting to obtain a lock.
Finished	The activity successfully obtained the lock.
Timeout	The activity could not obtain a lock within the number of attempts specified by the **Max. attempts** input variable.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Log Message workflow activity

The **Log Message** activity writes a message to the workflow log.

Use this activity to add entries to the workflow's log for debugging or tracing purposes.

Input variables

Input variables determine the initial behavior of the activity.

Log Message activity input variables

Field	Description
Message	The message to log. This variable can be a string or a JavaScript expression that evaluates to a string.

Log Trace Message workflow activity

The **Log Trace Message** activity writes a trace message to the workflow log.

The trace message includes the activity name, the event that invoked the workflow, and the table of the current record. There are no variables or conditions. To log other data, use the Log Message workflow activity activity.

REST Message legacy workflow activity

The legacy **REST Message** activity enables an administrator to override the REST endpoint or supply the variables configured in the REST Message module.

This activity is deprecated in the Yokohama release and no longer shows up in the Workflow canvas for new workflow development. New workflows should use the Orchestration REST Activity templates instead.

Existing workflows using it will continue to work as designed. To edit this activity in an existing workflow, you must re-activate the activity.

The **REST Message** activity executes a dead link REST function (POST, PUT, GET, or DELETE) on an endpoint using values defined in the function record.

Note:
If you want to use a MID Server to send the REST message, the MID Server must be accessible by the instance and configured to use SSH.

Input variables

REST Message activity input variables

Field	Description
Rest Message	
REST Message	Name of the Create a REST message to run. This is a reference field to the REST Message [sys_rest_message] table (**System Web Services** > **Outbound** > **REST Message**).
REST Message Function	Function to call that is defined in a REST message function. This is a reference field to the HTTP Method [sys_rest_message_fn] table (**System Web Services** > **Outbound** > **REST Message**).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

REST Message activity input variables (continued)

Field	Description
	Available functions are **put**, **post**, **get**, or **delete**. You can edit functions in the **HTTP Methods** related list in each REST Message record.
REST Endpoint	REST endpoint to use instead of the **Endpoint** defined in the HTTP Method record. Leave this field blank to use the defined endpoint in the REST Message Function record.
Rest Message Variables	
Variables	Values to use for Variable substitution in outbound REST messages defined in the HTTP Method record. Use the following format for the string: `name1=value1, name2=value2, . . .` For example, use `name=${nameValue}, id=${idValue}` where *name* and *id* are function variables. If either the variable name or value contains a comma or equal sign, escape those characters with a backslash.
Rest Message MID Server	
Use MID Server	Check this box if you want to use a MID Server to send the REST message. A MID Server might be necessary to reach an endpoint within a firewall or a subnetwork that is not visible from the instance. If this check box is selected, but no MID Server is defined in the **MID Server** field, the workflow automatically attempts to find a MID Server based on IP range and the REST capability.
MID Server	Name of the MID Server to use. This field is available when **Use MID Server** is selected. The workflow ignores this parameter if the *use_midserver* parameter is disabled.
Rest Message Script	
Sensor Script	The script to execute after the request has been made and a response has been received. You can access the full response body from the *activity.output* variable.

Return Value workflow activity

The **Return Value** activity returns a value to a parent workflow, when run from a subflow.

This activity has no variables or conditions. For more information, see Workflows used as subflows.

Use this activity within a subflow to store data that the parent flow can access. The **Return Value** activity adds the data from the subflow's *value* variable to the parent workflow's scratchpad.

Scratchpad entries

The activity uses the workflow scratchpad to read and write persistent values.

Return Value activity scratchpad entries

Variable	Description
value	The activity writes the value from the subflow *value* variable to the parent scratchpad. The parent workflow activity that runs the subflow includes a *Map*

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Return Value activity scratchpad entries (continued)

Variable	Description
	return value to variable that defines where the parent workflow stores the returned data. This data can be scalar, a stringifiable JavaScript object, or an expression that evaluates to a stringifiable JavaScript object.

Related topics

Workflow scratchpad variables

Using variables in a workflow

Run Script workflow activity

The **Run Script** activity runs the specified script in the scope of the workflow version.

Note:
All changes to `current` are automatically updated. There is no need to call `current.update()`

Input variables

Input variables determine the initial behavior of the activity.

Run Script activity input variables

Field	Description
Script	Script to execute.

Set Values workflow activity

The **Set Values** activity sets values on the current record when the workflow quiesces or ends.

Input Fields

The values you enter in the following fields determine the behavior of the activity.

Set Values Activity Input Fields

Field	Description
Set these values	From the list on the left, select the field on the current record whose value you want to set when the workflow quiesces or ends. In the user-input field to the right, select or enter the value to which you want that field set. **Note:** Avoid setting the same fields from different **Set Value** activities. The workflow only sets the value specified by the last **Set Values** activity run before quiescing or ending.

Note:
Using the **Set Values** activity to set the **Approval** field on a task does not cancel pending approvals. To approve a task in a workflow, use the **Approval Action** activity instead.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SOAP Message legacy workflow activity

The legacy **SOAP Message** activity uses SOAP messages defined in the System Web Services plugin and can call the messages using a MID Server.

This activity is deprecated in the Yokohama release and no longer shows up in the Workflow canvas for new workflow development. New workflows should use the Orchestration SOAP Activity templates instead.

Existing workflows using it will continue to work as designed. To edit this activity in an existing workflow, you must re-activate the activity.

Input variables

SOAP Message activity input variables

Field	Parameter	Description
SOAP Message	soap_message	The SOAP Message defined under the System Web Services plugin's Outbound SOAP Message [sys_soap_message] table. (**System Web Services** > **Outbound** > **SOAP Message**)
SOAP Message Function	soap_message_function	The function to call that is defined in the SOAP Message. Functions are listed in the **SOAP Message Functions** related list in each SOAP Message record.
SOAP Endpoint	soap_endpoint	Endpoint to use instead of the **SOAP endpoint** value in the SOAP Message Function record. Leave this field blank to use the defined endpoint in the SOAP Message Function record.
Variables	variables	Variables to substitute into the SOAP **Envelope** defined in the SOAP Message Function record. Use this format for the string: `name1=value1, name2=value2, . . .` If either the name or value contains a comma or equal sign, escape these characters with a backslash.
Use MID Server	use_midserver	Check box for using a MID Server to send the SOAP message. A MID Server might be necessary to reach an endpoint within a firewall or a sub-network that is not visible from the instance. If this check box is selected (true), but no MID Server is defined in the **MID Server** field, Workflow automatically attempts to find a MID Server.
MID Server	midserver	Name of the MID Server to use. This field appears when you select the **Use MID Server** check box. The workflow ignores this parameter if the *`use_midserver`* parameter is disabled.
Sensor Script	sensor_script	The script to execute after the request has been made and a response has been received. You can access the full XML response body from the *`activity.output`* object.

Turnstile workflow activity

The **Turnstile** activity limits how many times a workflow can pass through the same point.

Use this activity to prevent infinite loops. This activity is useful alongside the Rollback To workflow activity activity.

Results

You can assign a result value using the `activity.result` variable from within a script field of the activity. By default, the activity script evaluates if the activity should continue to iterate or stop.

Turnstile activity results

Result	Description
Continue	The **Allowed iterations** value is greater than the number of times the workflow accessed this activity.
Cancel	The workflow accessed this activity more times than the **Allowed iterations** value.

Input variables

Input variables determine the initial behavior of the activity.

Turnstile activity input variables

Field	Description
Allowed iterations	Number of times the workflow can pass through this activity before the turnstile ends the loop.

Conditions

The conditions determine which transition comes after this activity.

Turnstile activity conditions

Field	Description
Continue	If the workflow has returned to this point an amount of times less than the allowed iteration.
Cancel	If the workflow has returned to this point an amount of times more than the allowed iteration.

States

The activity state tells the workflow engine what to do with the activity.

Turnstile activity states

State	Description
Executing	The workflow engine knows to start the `onExecute` function of the activity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Turnstile activity states (continued)

State	Description
Waiting	The workflow engine ignores the activity until a specific event to restart the activity is triggered.
Finished	The activity finished running. See the result value for the outcome of the activity.
Cancelled	This activity, or the workflow that contains this activity, was canceled.
Error	A JavaScript error occurred. Review the logs for error details.

Unlock workflow activity

The **Unlock** activity releases a lock that was previously placed by the **Lock** activity.

To release a lock, specify the same lock key that was specified in the **Lock** activity. If the **Lock** activity had a **Duration** specified, and that duration has already passed, the lock will already be released.

Input variables

Input variables determine the initial behavior of the activity.

Unlock activity input variables

Field	Description
Lock key	The Mutex key that releases the lock. This key must match the key specified by a **Lock** activity. For more information, see Lock activity.

States

The activity state tells the workflow engine what to do with the activity.

Unlock activity states

State	Description
Finished	The activity successfully released the lock.

Subflow activities in workflow

Subflow activities run and manage workflows from a parent workflow.

The Parallel Flow Launchersubflow activity is available.

Parallel Flow Launcher workflow activity

The **Parallel Flow Launcher** activity launches multiple subflows in parallel.

Workflows running in parallel execute simultaneously and may complete in any order. The activity can launch a single subflow or multiple subflows as needed. You can manage the input values and values returned for each subflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The Parallel Flow Launcher activity waits until all subflows are completed before proceeding. If any subflow does not finish, the activity waits indefinitely.

Do not launch a large number of subflows with the Parallel Flow Launcher activity. If overused, this activity can overburden the instance. For launching very large numbers of subflows, consider putting the Parallel Flow Launcher inside a loop controlled by a turnstile or other conditional activity and having it do batches.

Activity variables

Activity variables determine the initial behavior of the activity.

Parallel Flow Launcher activity input variables

Field	Description
Parallel Flow Launcher configuration	
Name	A unique name for the activity.
Stage	The stage to display when the workflow reaches the activity.
Inputs	Inputs to the subflows to run. Specify an array of name: value pairs for each input defined in the workflow being launched. The name and data type of each input variable entered must match those used by the subflow that this activity launches. For a detailed example, see Parallel Flow Launcher Example.
Parallel Flow Launcher selection	
Workflow	The workflow to run.
Advanced	Check **Advanced**, to enter a script that uses a WorkflowCoordinator object to manage the subflows. When you check Advanced, a text box appears where you can enter a script that specifies a unique workflow for each set of input variables. See WorkflowCoordinator object for more information.
Parallel Flow Launcher iteration Specify parameters to tune the performance of batched workflows.	
Count	If not specified by an input set, **Count** determines the number of subflows executed in parallel from this activity. If the **Advanced** option is not selected, ensure that this field is populated with a valid number.
Max flows	The maximum number of workflows this activity can launch. If this value is a positive integer, it overrides the max parameter used in the WorkflowCoordinator constructor.
Max simultaneous	The maximum number of parallel workflows this activity can run at one time. If this value is a positive integer, it overrides the poolsize parameter used in the WorkflowCoordinator constructor.
Parallel Flow Launcher Process	
Process flow complete	To specify a script that runs after each subflow completes, check **Process flow complete**. If you check this field, a text box labelled **Flow complete** appears, where you can enter the script to run.
Flow complete	The script that runs each time a subflow finishes. This field is available when the **Process flow complete** option is selected.

Parallel Flow Launcher activity input variables (continued)

Field	Description
	The same script functions and variables available in other workflow scripts, such as those in the Run Script activity, are available here. For more information, see Completed subflow values in scripts. The variable "flow" is available to this script. It is an object that contains the following information about the flow that is finishing: **flow.output (String)**: The value that the subflow returns to the parent if it executed a Return Value activity before ending. **flow.index (Number)**: The zero-relative index of the subflow that finished. **flow.contextId (String)**: The sys_id of the workflow context for the completed subflow. **flow.inputs (Object)**: The inputs that were passed to the subflow when its context was created and started. **flow.status (String)**: The final state of the context. This corresponds to the **state** column in the subflow context record, which has possible values of **executing**, **finished**, **cancelled**, or **faulted**. (Since the flow is completed, it cannot be **executing** at this point.)
Parallel Flow Launcher Split	

Process finished	To specify a script that runs after all subflows have finished, check **Process finished**. If you check this field, a text box labelled **Finished Script**appears where you can enter the script to run. The 'coordinator' variable is made available to this script and is an object that allows access to any of the finished subflows using the getFlow(index) method. For example:
	
	`for (var i = 0; i < coordinator.getNumFlows(); i++)`
	`writeFlowResultsToTable( i, coordinator.getFlow(i) );`

Finished script	The script that runs after all subflows launched by the activity are complete. You can use variables that contain completed flow information in this script.
	
	The 'coordinator' variable is made available to this script and is an object that allows access to any of the finished subflows using the getFlow(index) method. For example:
	
	`for (var i = 0; i < coordinator.getNumFlows(); i++)`
	`writeFlowResultsToTable( i, coordinator.getFlow(i) );`
	
	This field is available when **Process finished** is selected.

States

The activity state tells the workflow engine what to do with the activity. To view an activity's state, point to the activity. A pop-up window shows the **State** and **Result** of the activity. If the activity is in an error state, the pop-up window provides a brief **Fault Description**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parallel Flow Launcher activity states

State	Description
Waiting	The activity is waiting for all subflows to finish. All subflows have started and some may have finished.
Finished	The activity successfully completed all of the subflows.
Error	The activity encountered an error.

WorkflowCoordinator object

A WorkflowCoordinator object specifies which subflows to run and the input variables to pass to those subflows.

When using a WorkflowCoordinator object, you can create a **Parallel Flow Launcher** activity that launches multiple subflows. When using the activity without a WorkflowCoordinator object, you can only launch a single subflow multiple times. Use one of the following methods to specify a WorkflowCoordinator object for the activity when the **Advanced** activity input variable is selected.

- Reference a workflow scratchpad variable that contains an existing WorkflowCoordinator object. To save a WorkflowCoordinator object to the scratchpad, call the *`save(variableName)`* function on the WorkflowCoordinator object. You can reference the object using the value passed in the *`variableName`* parameter. For example, you can create a WorkflowCoordinator object in a **Run Script** activity, save the object using `<object>.save('coord')`, and then call this object by entering `coord` in the **Workflow** activity variable of a subsequent **Parallel Flow Launcher** activity.
- Define the WorkflowCoordinator within the **Workflow** activity variable. Add the `javascript:` identifier at the beginning of the script. The Parallel Flow Launcher example shows how to use a WorkflowCoordinator object in this way.
- Create a factory class to define the WorkflowCoordinator object. The system does not provide a factory class for WorkflowCoordinator by default.

Completed subflow values in scripts

The **Parallel Flow Launcher** activity exposes additional variables you can use in scripts.

Additional variables

Variable	Description
coordinator	The WorkflowCoordinator used when running the subflows. You can use this variable in the **Finished script** to perform any final operations. Additionally, you can use the WorkflowCoordinator in a later workflow activity by passing the activity name or sys_id to the *`WorkflowCoordinator.load('<Activity>')`* function. For example, to load the WorkflowCoordinator object from a **Parallel Flow Launcher** activity called **Launch Subflows**, enter `var coord = WorkflowCoordinator.load('Launch Subflows');` in a later activity.
flow	The subflow launched by the activity that completed most recently. You can use this variable in the **Flow complete** script to perform any post-processing operations on each subflow. To get a complete subflow from a coordinator object, use `var flow = coord.getFlow(I);` where I is the numeric index of the subflow based on the order it was launched. These values are available from the completed subflow:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Additional variables (continued)

Variable	Description
	• index: the numerical index of this subflow based on the order it was launched • workflow: the sys_id or name, depending on which you passed to the WorkflowCoordinator constructor, of the workflow used for this subflow • inputs: any input values provided to the launched subflow • status: status of the subflow context • output: the value returned by the subflow • contextId: the sys_id of the workflow context for the subflow

Parallel Flow Launcher example

This example shows how to use the **Parallel Flow Launcher**activity with an array of input values and with a WorkflowCoordinator object.

Sample workflow

This example shows a SQL-based web server with four application nodes. A single subflow runs to provision the database, and multiple parallel subflows each configure an application node. Finally, a separate set of parallel subflows configures the nodes to use a load balancer and sets up the server DNS.

Parallel flow launcher business case

Provision the application nodes

The first **Parallel Flow Launcher**activity launches the **Provision Node** subflow four times. The activity passes a unique IP address to each subflow from an array in the **Inputs** variable. The scripts defined in the **Flow complete** and **Finished script** variables write log messages regarding the status of the subflows.

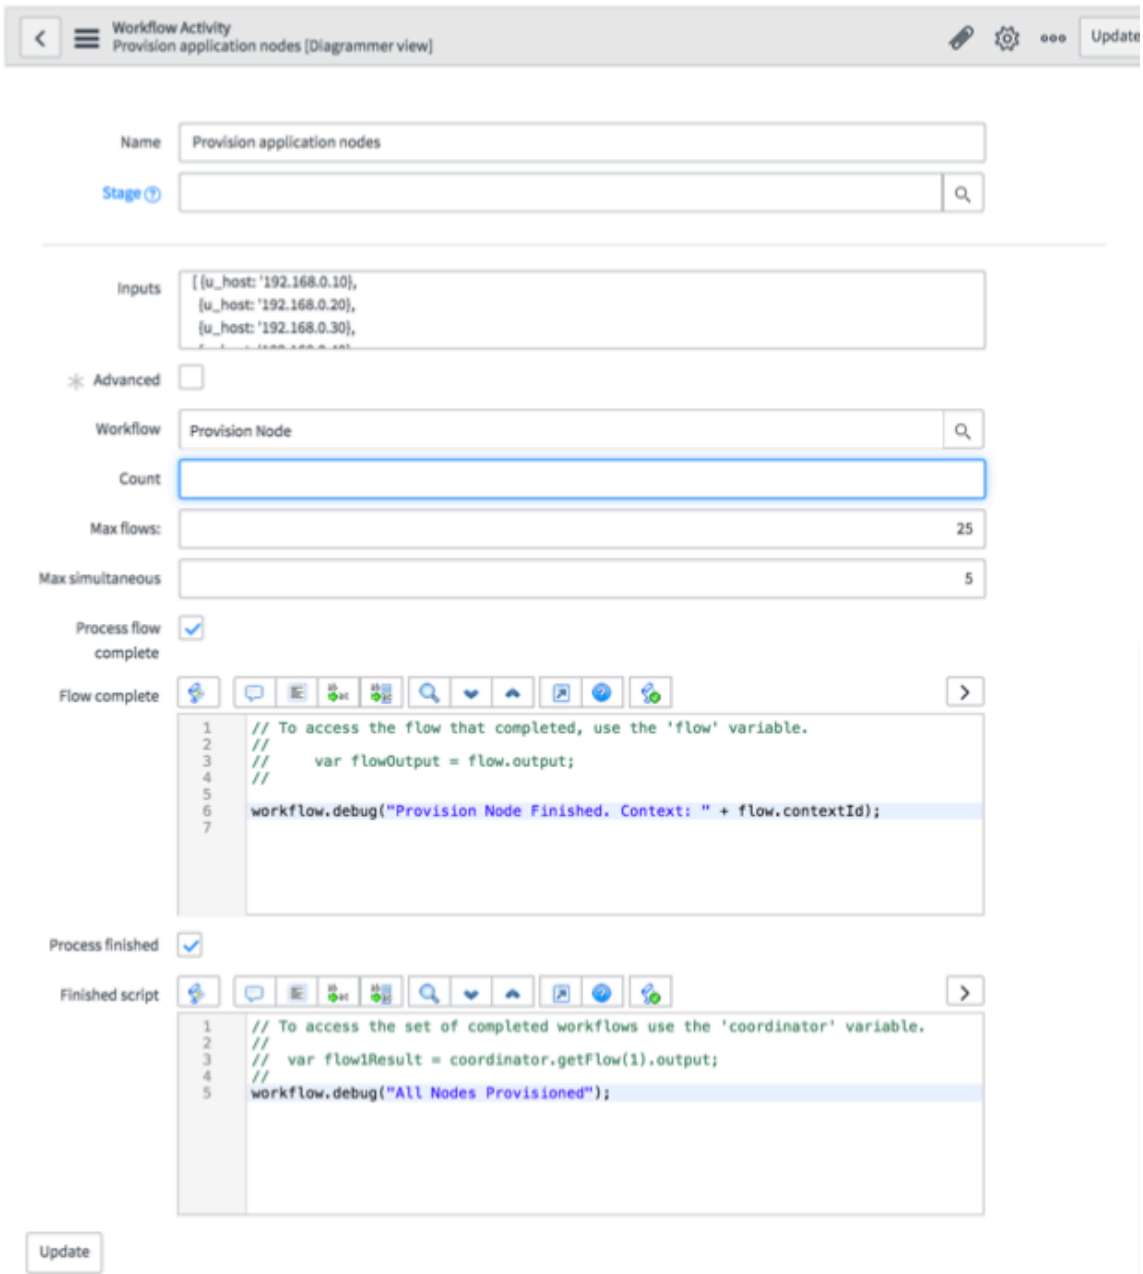
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parallel flow launcher activity properties
Activity Properties: Parallel Flow Launcher



Add nodes to the load balancer

The second **Parallel Flow Launcher** activity uses WorkflowCoordinator objects to specify which subflows to run. The `coordinator` variable stores the completed flow information from the previous **Provision Nodes** activity. The script then retrieves the IP address and port for each node that was provisioned. The `coord2` WorkflowCoordinator object runs the Add Node to Load Balancer subflow once for each node, using the retrieved IP address and port information as input variables. Finally, the `coord2` WorkflowCoordinator object runs the **SetupDNS** subflow once to configure the load balancer.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Specifying which subflows to run

```
javascript:
var coordinator = WorkflowCoordinator.load('Provision Nodes');
var coord2 = new WorkflowCoordinator({
    workflow: 'Add Node to Load Balancer'
});

for (var i = 0; i < coordinator.getNumFlows(); i++) {
    var ip = coordinator.getInput(i).ip;
    var port = coordinator.getOutput(i);
    coord2.add( {
        ip: ip,
        port: port
    } );
}
var loadBalancerIP = '10.0.20.10';
coord2.add( {ip: loadBalancerIP, hostname:'www.snow1.net'}, 'SetupDNS');

coord2;
```

View workflow activity descriptions

Tooltips are available for workflow activities to help you understand how to use each activity.

Before you begin

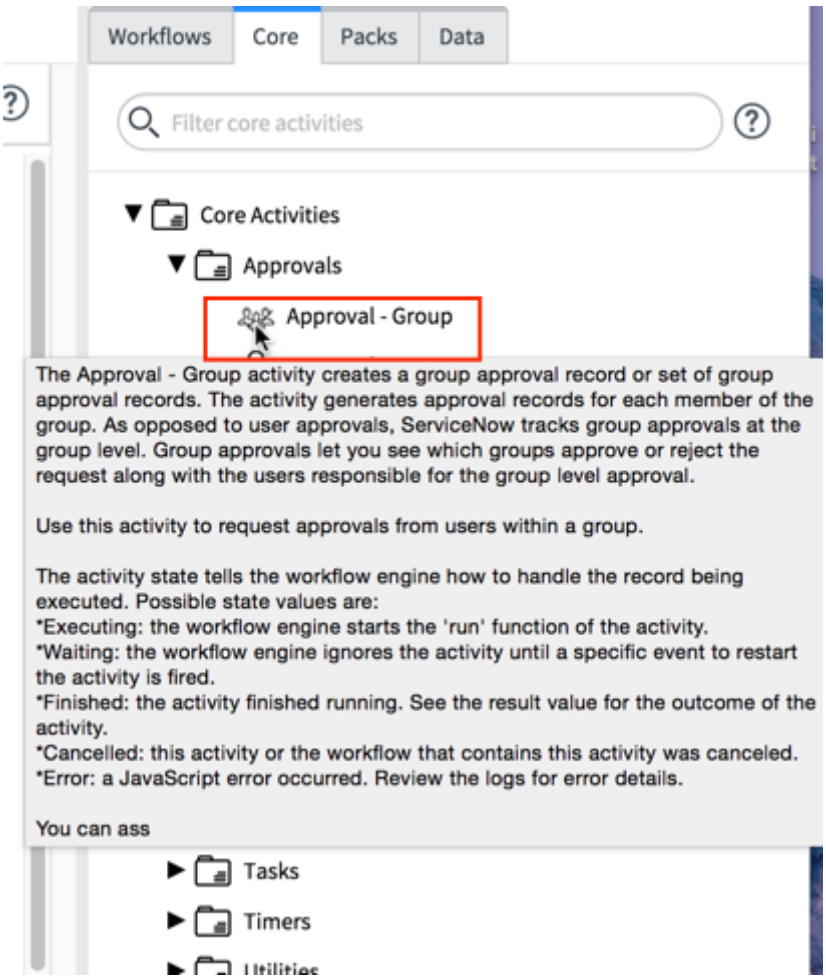
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Procedure

1. To view an activity description in the Workflow Editor, point to the icon for the activity in the palette.



2. To modify activity descriptions, navigate to **Workflow** > **Administration** > **Activity Definitions** and edit the **Description** field.

> **Note:**
> To view more information about an activity, double-click the activity on the canvas and then click the help icon in the title bar of the Activity Properties window.

Elements in workflow activity definitions

Each activity can specify a number of elements that control the behavior of the activity or are controlled by the activity.

Not all activities specify all possible elements. See Workflow activities for links to the activities provided by default. Each activity description includes a detailed explanation of the specific elements offered by that activity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow activity elements

Element	Description
Results	The possible **activity.results** value. The activity result usually determines which condition the activity transitions through.
Scratchpad entries	Scratchpad variables the activity depends on to run, or variables the activity writes to the scratchpad.
Input variables	Values that control the behavior of the activity. Fields to set these values appear on the Activity Properties form when a new activity is added to a workflow. See Activity variables for more information.
Conditions	Determines which transition the activity follows after completing. See Manage workflow activity conditions for more information.
States	Determines how the workflow handles the record being executed.

Add an activity to a workflow

Available activities are displayed in the **Core**, **Packs**, and **Custom** tabs in the Workflow Editor palette.

Before you begin

Role required: admin

Procedure

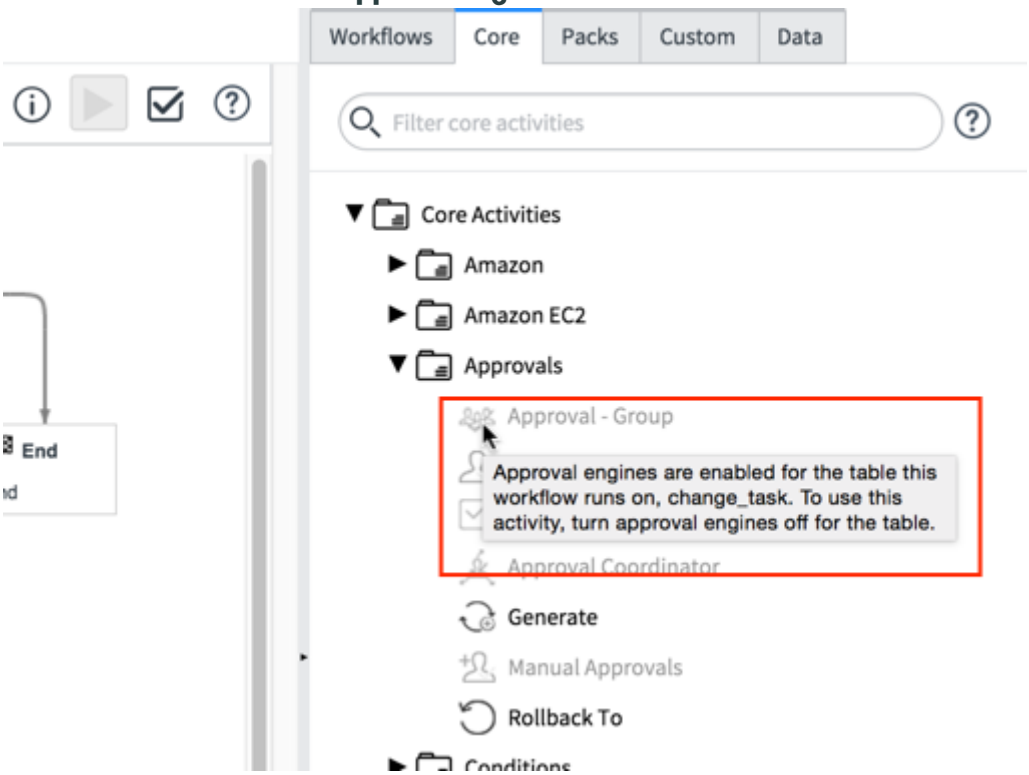
1. In the Workflow Editor, check out a workflow.
2. To add a workflow activity, drag it from the **Core**, **Packs**, or **Custom** tab to the canvas and drop it on a transition line in the workflow body.

   The transition turns blue when it is connected to the new activity. The designer adds the activity to the flow at that point and displays the property form for the new activity.

   If an activity is greyed out, approval engines are enabled for the table on which the workflow runs. To use the activity, turn approval engines off for the table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Unavailable activities and approval engines

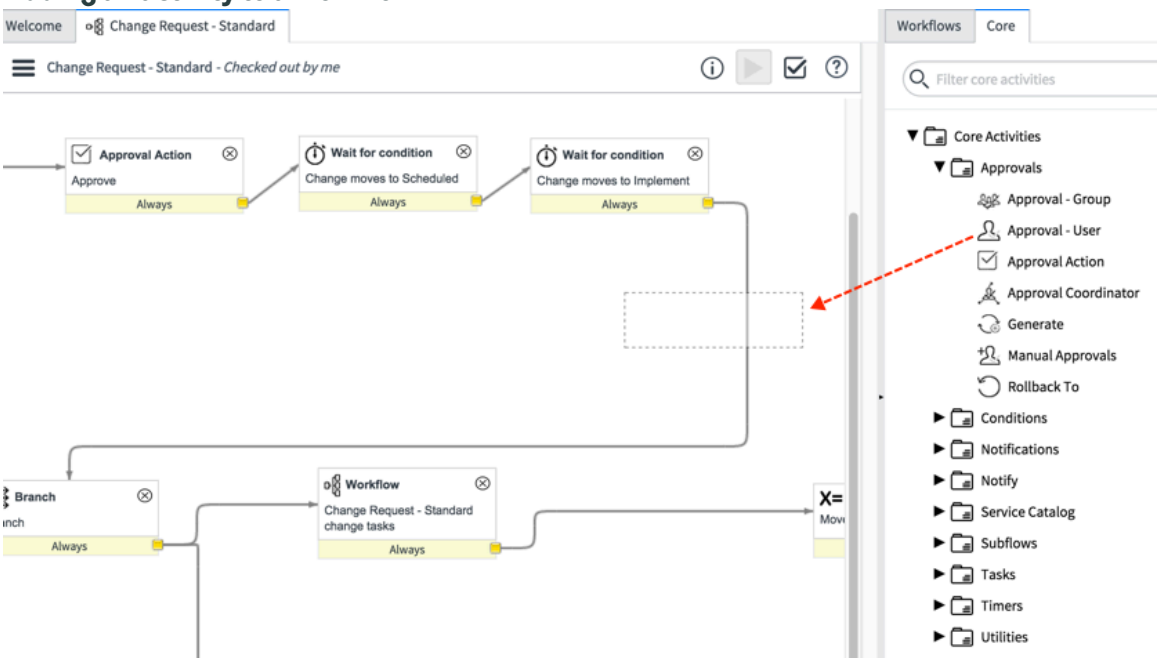


3. Create any additional conditions needed for the activity and ensure that all exits are connected.
4. Run the workflow validation tool prior to publishing to detect missing or disconnected transitions that can cause a workflow to hang.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
All activity descriptions have a **Table** value. If this value is **Global**, the activity is available for use with any workflow regardless of the table selected in the workflow properties. Activities that identify a specific table appear in the palette only if the table configured for the workflow matches or extends the table identified in the activity.

Adding an activity to a workflow



Duplicate a workflow activity

You can duplicate an activity used in a workflow, including all the configured properties.

Procedure

1. Right-click the activity and select **Copy Activity** from the context menu.

   The system automatically duplicates the activity, but does not create transitions.
2. Double-click the copy and configure the properties appropriately.
3. Drag the activity to a location in the workflow.
4. Add transitions.

Manage transitions between workflow activities

Transitions define the processing path of the workflow, depending on conditions defined in each activity.

Before you begin
Role required: admin

About this task
All conditions in an activity must have a transition and all transitions must have a connection to another activity or to the **End** activity.

Note:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

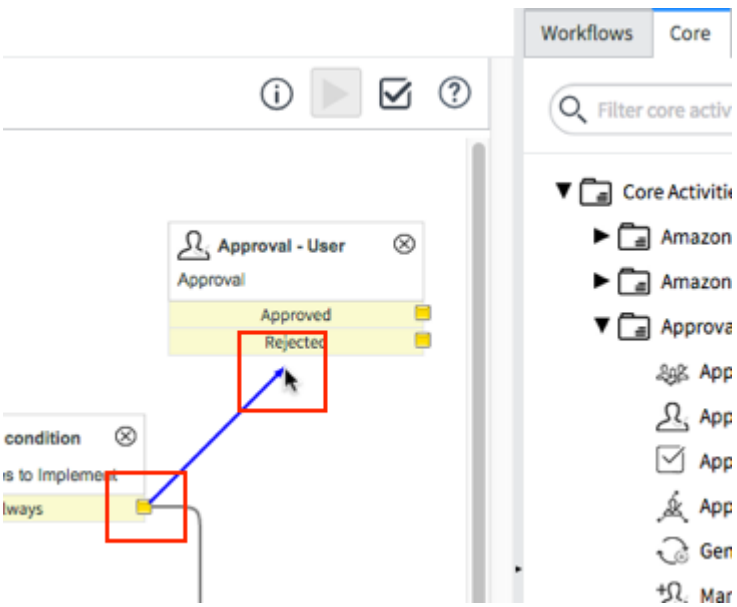
Run the workflow validation tool prior to publishing to detect missing or disconnected transitions that could cause a workflow to hang.

Procedure

1. Add transitions to the workflow using either of these methods:

   - Drag and drop an activity directly onto a transition line to connect it to the adjacent activities. The transition line turns blue when the connection is made. The system updates the transitions automatically to reflect the new sequence.

   - Drag the activity to an open area in the canvas and create the transitions manually. Click the yellow square on the right side of the activity condition and drag a connector to the next task.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. You can draw multiple transitions from the same activity condition if the activity executes concurrently.
3. To remove a transition, click to highlight it, and then press **Delete**.

Custom activity transitions

Controls on the **Approval - User** activity enable an administrator to add additional workflow transitions to the activity other than the default transitions of **Approved** or **Rejected**.

Transitions defined using this method do not become a permanent feature of the **Approval - User** activity. After a new transition is configured, that transition must be applied manually to subsequent instances of the activity, where desired.

Manage workflow activity conditions

Activities contain default conditions that determine which transitions are followed.

Before you begin

Role required: admin

About this task

For example, the **Approval - User** activity has two conditions, **Approved** and **Rejected**.

Example of activity conditions

You can use a JavaScript condition check to create custom conditions on Core workflow activities. Custom activities do not support this feature.

Procedure

1. Right-click the activity and select **Add Condition** from the context menu.
2. In the New Workflow Condition dialog box, fill in the fields as appropriate (see table).

New Workflow Conditions form

Field	Description
Name	The label that is displayed on the workflow.
Activity	Name of the activity for which this condition is submitted. This value is populated automatically by the system.
Short description	Brief description of this condition.
Condition	A JavaScript condition check. The following variables are available: ○ **current**: Current record that the workflow is running against. ○ **activity.result**: Result value set by the activity upon completion.

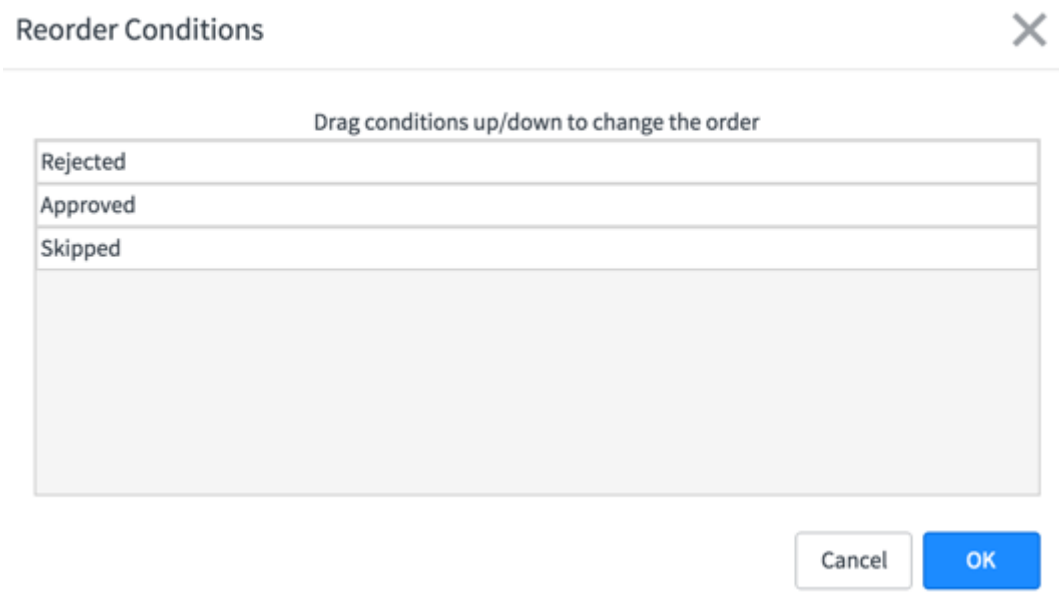
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **activity**: Workflow Executing Activity (wf_executing) record. Used for advanced condition checks. ○ **activity.vars**: Variables associated with the Workflow Executing Activity record. Used for advanced condition checks.
Skip during generate	If selected, the **Generate** activity does not follow this transition to generate approvals or tasks.

3. Click **Submit**.
4. To change the order in which conditions appear on the workflow activity, right-click the activity and select **Reorder Conditions**.

   A dialog box appears, with a list of the available conditions.

List of conditions in the current activity



5. Drag the conditions to a new position in the list.
6. Click **OK**.

Activity result value

The `result` value specified by an activity controls the condition through which the activity transitions.

Use the `result` value as part of the **Condition** field in the activity. For example, if the **Condition** field of an **Approval - User** activity contains `activity.result == 'rejected'`, the activity transitions through that condition when a rejection is received from the approver. Result values are set in the **Script** field of the activity definition.

Edit the workflow activity properties form

Customize which workflow variables appear on an activity properties form and how the variables are arranged on the form.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workflow** > **Administration** > **Activity Definitions**.
2. Scroll to the activity that you want to work with and click the activity name.
3. On the Workflow Activity Definition form, click the **Edit Variables Layout** related link.
4. On the Form Design page for the Activity Properties form, add and remove activity variables. The activity variables appear as separate items that you can rearrange on the form.

   For more details on using the form design interface, see Using the form designer.

Using workflow approval activities and rolling back workflows

When you work with approvals, you need to understand how approval activities interact with approval engines, how to correct a skipped approval workflow activity, and how rollbacks work.

Related topics

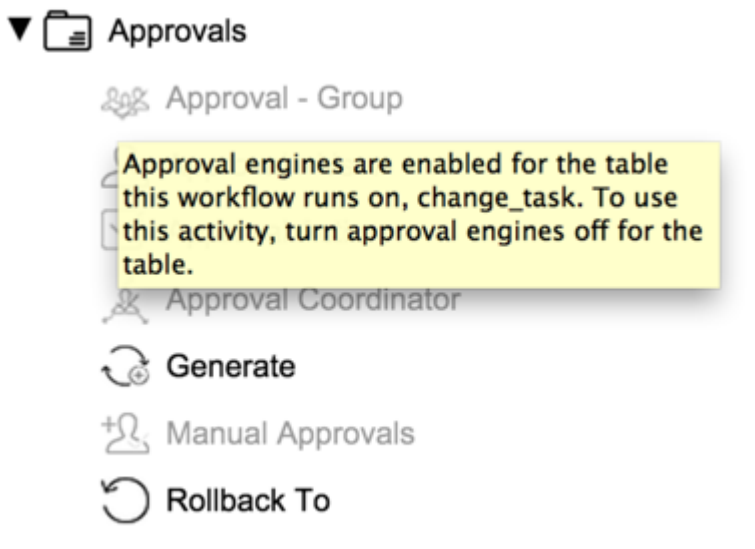
Rollback To workflow activity

Approval workflow activities and approval engines

Approvals can be managed by approval activities or approval engines, but not both. Approval activities can be used if approval engines are not turned on for the table associated with the workflow.

Approvals can be managed by approval activities or approval engines, but not both. Trying to use both can cause a range of issues. Approval activites are not available (greyed out) in the palette if approval engines are used on the specified table. If you hover over a greyed out approval activity in the palette, a comment with more information is provided. For more information about approvals and approval engines, see Classic approvals.

Unavailable approval activities



To turn approval engines off for the table, navigate to the **System Properties > Approval Engines** and change the setting for the table to **Turn engines off.**

Approval and rollback workflow activities

Classic approvals

Correct a skipped workflow approval activity

While a workflow is in an active context, an approval activity can skip to the next activity.

Before you begin

Role required: admin

About this task

An approval activity might skip for the following reasons:

- The approval user or group is missing or invalid (for example, sys_id).
- The approval user or group became inactive after the approval record was created.
- The activity is a Dot-walking to data in related tables field, such as `current.opened_by.department.manager`, and it has a missing or invalid approval user or group.
- The business rule on the table that is associated with the workflow is invalid.

To correct a missed approval activity:

Procedure

1. Navigate to **All** > **Workflow** > **Live Workflows** > **All Contexts**.
2. Click the date and time in the **Started** column for the workflow that is incorrectly processing approval activities.
3. In **Related Links**, click **Show Workflow**.
4. Review the portion of the workflow that executed, and then do one or more of the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Verify that after approval, the workflow progressed to the next activity. If a workflow failed to progress, check the business rules. For more information, see Debugging business rules.
- Point to each processed approval activity to find activities where the **State** is **Finished** and **Result** is **Skipped**.

5. Navigate to **Workflow** > **Workflow Editor** and open the workflow.
6. Double-click the skipped approval activity.
7. Click **Users** or **Groups**.
8. Assign an active user or group for the approval activity. For more information, see Workflow error handling.

Using variables in Notify workflow activities

Certain Notify workflow activities support variable substitution for reading text to callers.

Certain Notify workflow activities allow you to use variables, such as those from the workflow scratchpad, to determine the activity behavior. Each activity supports a maximum of 20 variables. The following activities allow variable substitution:

Activity	Notes
Say	Supports variable substition in the **Text** field only.
Input	Supports variable substition in the **Text** field only.
Play	Supports variable substitution in the **URL** field only.
Forward call	Supports variable substitution in the **Phone number** field only.

Scratchpad variables

You can call variables from the workflow scratchpad or the activity scratchpad using the syntax ${variable_name}. You do not need to include either workflow.scratchpad or activity.scratchpad before the variable name. For example, to use the variable `activity.scratchpad.langCode = 'en-US'`, call ${langCode} within the activity. If the scratchpad does not contain the specified variable, the variable evaluates to an empty value.

You can get values from objects on the scratchpad using the format ${object.value}. For example, you can get the name of a user object, such as `workflow.scratchpad.user = {name:'john.smith'}` by calling ${user.name}.

The digit variable

The **Input** activity exposes the ${digit} variable. Use this variable in each condition presented by the activity. The number read to the user is determined automatically by each condition. The caller can press that number to cause the activity to transition through that condition.

Use multiple timer activities in one workflow

Workflow timer activities store data independently of each other in an activity-specific scratchpad.

Previously, all timer activities in a workflow accessed a single, shared scratchpad, which could lead to conflicts when adding multiple timer activities to one workflow.

Timer scratchpads entries hold these values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- workflow.scratchpad.endTime
- workflow.scratchpad.realStartTime
- workflow.scratchpad.retroactiveSecsLeft

Related topics

Timer workflow activities

Publish a custom workflow activity

When a user creates a custom activity and saves or submits it, that activity appears in the **Custom** and **Packs** tabs of the designer palette, but is only visible to the user who created it.

When configuration is complete, the user clicks **Publish**, which makes the activity accessible to other users on the instance with the workflow_admin or activity_creator role. Published activities are available for upload to the ServiceNow Store, can be added to workflows, and can be edited by any user with the proper roles.

To edit a published activity, click **Checkout**. When an activity is checked out by a user, only that user can modify it. The fields of a checked out activity are read-only for all other users. When the checked out activity has been modified successfully, the user publishes it again. The system adds a new version of this activity to the Custom tab in the Workflow Editor palette.

Note:
Activities you create and publish are only visible in the *Packs* tab if they were created in the current application scope.

Locked versions

Problems can arise if an activity version is checked out by a user and not checked back in, for example, when the user is sick or leaves the company. An activity in this state cannot be checked out for update.

A user with the admin role can return a locked activity to a published state. The administrator opens the locked activity from the **Custom** tab of the Workflow Editor, selects the checked-out version, and selects **Force Checkout**, and then **Publish**.

Workflow activity pinning

Workflow administrators can pin a custom activity to prevent the system from automatically updating that activity when a new version is downloaded from the ServiceNow Store.

You can pin or unpin individual activities or set pinning within workflow properties that controls the versions used for all the activities in that workflow. This can result in two workflows using different versions of the same activity.

Note:
Activity pinning and unpinning applies to the custom activities downloaded from the ServiceNow Store only, and does not apply to newly published activity definitions made locally on your instance. To make use of these locally updated custom activities, you must check out your workflow and manually add the activities.

RaptorDB

RaptorDB, the new ServiceNow database, optimizes ServiceNow AI Platform workloads, enabling your organization to support more users, workflows, and data on a single platform.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

https://player.vimeo.com/video/1075474494?h=8fecf1b432&badge=0&autopause=0&player_id=0&app_id=58479

RaptorDB will underpin ServiceNow AI Platform core services, applications, and data.

Note:
The roll-out of RaptorDB is not tied to your organization's upgrade to Yokohama. Please speak with your account team for more information.

Benefits

With RaptorDB, your organization gets the benefits of database features owned and maintained by ServiceNow, as well as optimized for ServiceNow applications and workloads. This enables your organization to confidently grow your use of the ServiceNow AI Platform over time.

RaptorDB Professional unlocks additional functionality and higher performance, allowing your organization to do even more with ServiceNow.

RaptorDB Standard and RaptorDB Professional

RaptorDB Standard is the target state default primary database, built to provide improved scale and performance capabilities for ServiceNow AI Platform workloads and queries.

If your organization is looking to drive ultra-scale and high performance to support ServiceNow AI Platform generative AI and machine-scale data use cases, user growth, applications, workloads, and analytics, you may wish to leverage RaptorDB Professional. RaptorDB Professional is a licensed database; for more information, contact your account team.

RaptorDB Standard and RaptorDB Professional feature comparison

Feature	RaptorDB Standard	RaptorDB Professional
Optimized for ServiceNow workloads	Yes	Yes
Improved response time	Yes	Yes
Ultra-scale performance and scalability	No	Yes
Enhanced analytics with built-in column store	No	Yes
Advanced instance topology support	No	Yes

ATF Test Generator and Cloud Runner

ATF Test Generator and Cloud Runner is a tool that enables you to leverage ServiceNow's ability to intelligently generate regression tests for a specific instance.

ATF Test Generator and Cloud Runner overview

The test generator intelligently creates tests by analyzing instance behavior and workflows. The ATF Test Generator integrates with the existing ATF framework providing you with a seamless user experience. You also have the option to execute these tests using ServiceNow's Cloud Runner which runs ATF tests on a headless browser hosted by ServiceNow.

Note:
Check that your instance is using an ADCv2 load balancer. For more information, see the ADCv2 Migration knowledge article. If your instance is not using the ADCv2 load balancer, contact Now Support. Notice that mTLS is activated automatically and causes a rolling restart of the application nodes. See KB1639216 for more information.

What to explore next

To learn more about using Log Export Service, see:

- Configuring ATF Test Generator and Cloud Runner
- Operating ATF Test Generator and Cloud Runner
- Using ATF Test Generator and Cloud Runner
- ATF Test Generator and Cloud Runner reference

Configuring ATF Test Generator and Cloud Runner

Configure the ATF Test Generator and Cloud Runner store application by setting up the cloud user.

Set up cloud user

Set the credentials for the cloud user to be able to generate and run tests. This is a one time setup after the admin user installs the application.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Automated Test Framework (ATF)** > **Administration** > **Select Cloud User**.

   Note:
   The **Select Cloud User** module is visible only to the admins. Even an ATF test admin can't access the **Select Cloud User** module.

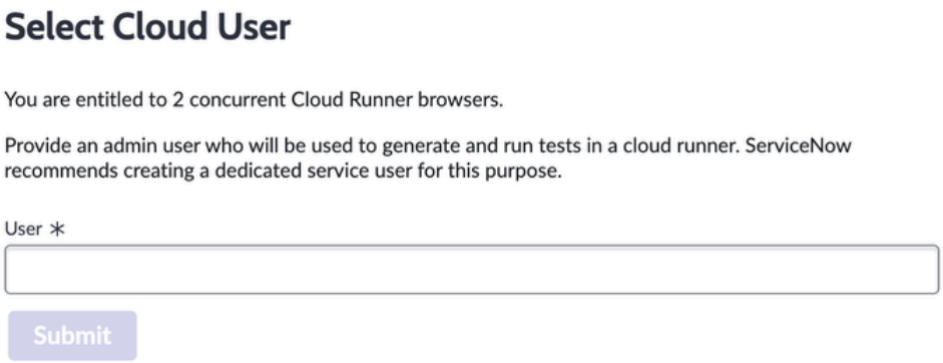
2. Select an admin user from the list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Even if you are an admin, it is recommended to select a dedicated admin user.

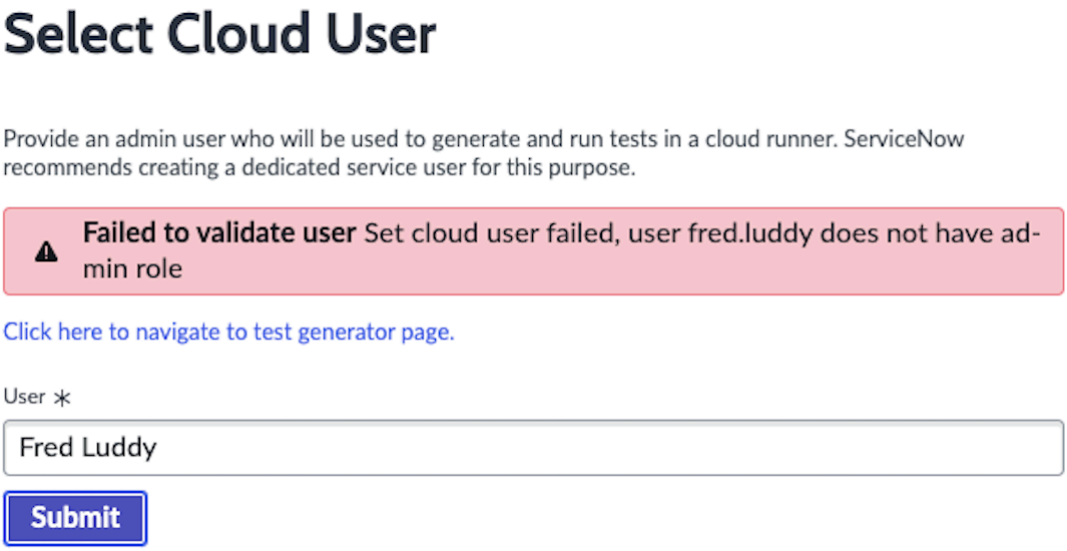
3. Click **Submit**.

If the admin user is selected successfully, the following message shows up:



Note:
You can see the number of entitled concurrent cloud runner browsers.

If the selected user is not an admin, an error message shows up. The following message is an example of one of the possible error messages. The error messages vary depending on the reason of the error.



The selection of a cloud user can fail for the following reasons:

- User wasn't found
- User is inactive
- User is locked out
- User needs a password reset
- User doesn't have an admin role

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- User has read-only access
- User has web services only access

Note:
Selecting an admin user might take some time because it tries spinning a cloud browser and then log in to the selected user.

Operating ATF Test Generator and Cloud Runner

Operate the ATF Test Generator and Cloud Runner store application by generating tests automatically.

Generating the tests

Generate tests automatically by leveraging ServiceNow Test Generation and Cloud Runner application. You can also run these tests with the click of a button.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Automated Test Framework (ATF)** > **Administration** > **Test Generator**.
   If you are on the **Select Cloud User** module and have setup the admin user, click **Click here to navigate to test generator page**.

   Note:
   The **Generate Tests** module is visible only to the admins. Even an ATF test admin can't access the **Select Cloud User** module.

   If you already have a test generation running, you will see the following message.

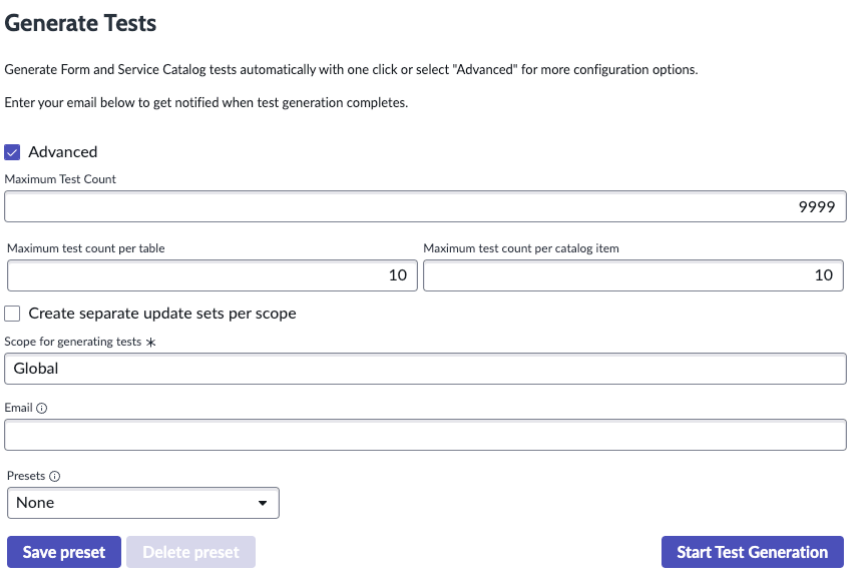
   
   Note:
   You can't start more than one test generation process simultaneously, but it will queue up for later execution.

2. **Optional:** If you want to see the currently running test and the queue, navigate to **Automated Test Framework (ATF)** > **Administration** > **Browser Orchestration Queue**.
   The Browser Orchestration Queues list shows up.

   Note:
   You can see the progress and state of each of the test generation and test run in the list.

3. Select one of the two ways to generate tests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



- Not selecting **Advanced**: Generates tests on every table by default
- Selecting **Advanced**: Option to specify a specific table to generate tests
  - Maximum Test Count: Upper bound on the number of generated tests.
  - Maximum test count per table: Upper bound on the test count for each table
  - Maximum test count per catalog item: Maximum number of generated tests per service catalog item, defaulting to maximum 10. You can modify the number of generated tests per service catalog item
  - Create separate update sets per scope: Option to create a separate update set for each scope
  - Scope for generating tests: Ability to have the tables in separate update sets for different scopes. For example, the generator gathers information about the scope of the tables and then saves the tests in a separate update set for each scope

    Note:
    This field is visible only if the **Create separate update sets per scope** field is not selected. You can then select the scope for the generated tests. The default scope is Global.

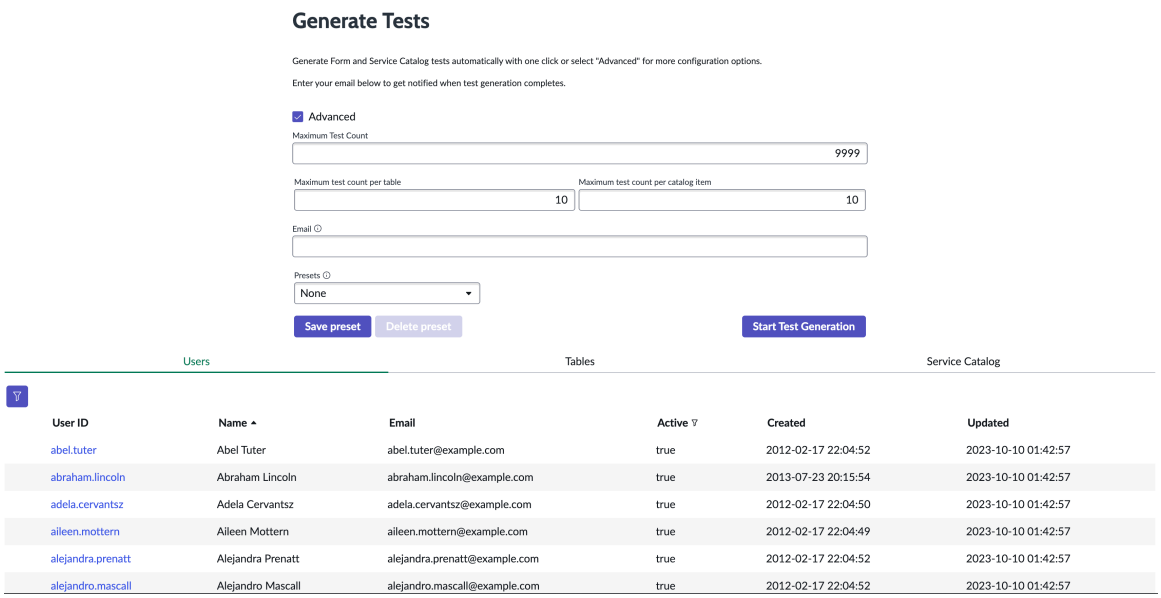
  - Email: Email address of the user to receive notifications about test generation summary
  - Presets: Number of user-control generated tests per service catalog item. The maximum default number is 10.

Note:
Since the test generation process is time consuming, check your provided email address regularly to receive the notification about the test generation.

4. **Optional:** Select **Save preset** to implement the preset filter conditions.
   You can also delete a preset by selecting **Delete preset**. All admins who can access the **Generate Tests** module can view the update on the **Presets** field.

   Note:
   You can't delete the default **None** preset. Some example presets have been provided which can be edited.

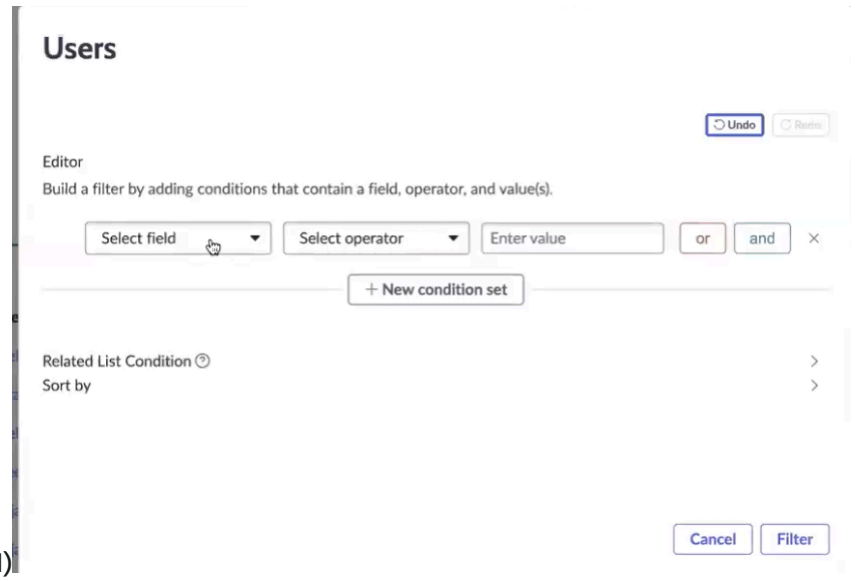
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Depending on the query created by the preset values, the following tabs return certain data.

- Users
- Tables
- Service Catalog

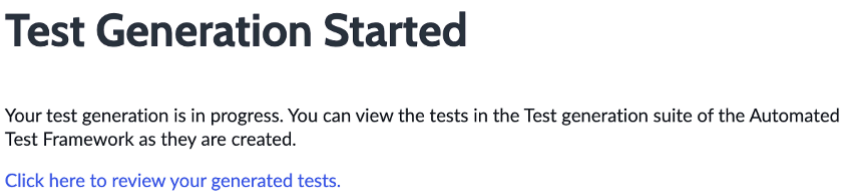
Note:
You can create new condition sets to filter the required information in tabs.



(Optional)

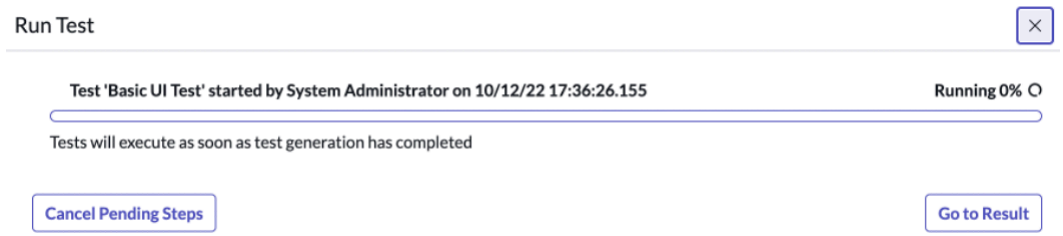
5. Select **Start Test Generation**.
   The Test Generation Started page shows up.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

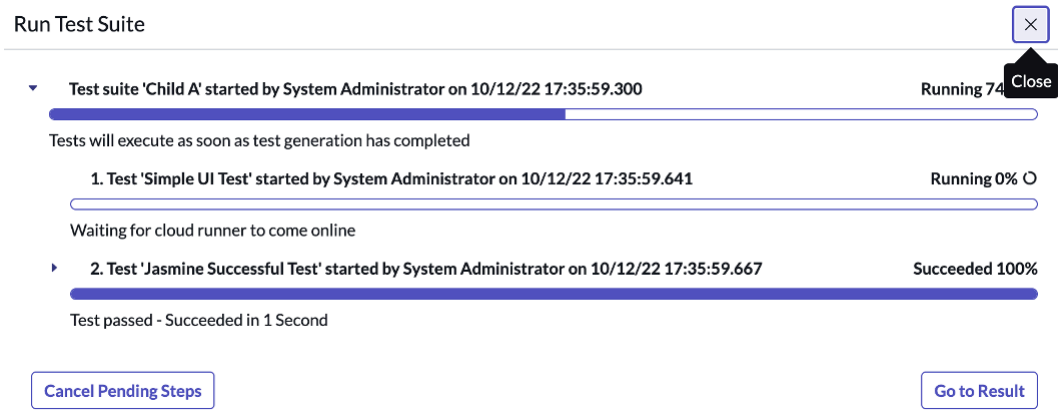


If you run a test or a suite when the test generation is in progress, one of the following messages shows up.

- For test run



- For suite run



6. Go to Suites to see the generated tests.
   A list of test suites shows up.

> **Note:**
> The tests start appearing as they are being generated. It is recommended not to run the generated tests or test suite when the test generation is still in progress.

7. Select the **ATF Generated Suite** suite.

> **Note:**
> It supports only the basic forms and server test steps.
>
> You can now set the `sn_atf_tg.generation.create_separate_update_set` property to False if you don't want an updated suite every time you run a test generation. The updated records created during tests generation are captured in the suite the user currently has selected. Its default value is set to True and it generates an updated suite after every test generation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A list of tests within the selected suite shows up. Only the successful tests show up in this suite.

8. **Optional:** Select the generated suite and scroll down to the Tests related list, if you want to view the generated automated tests using either Record Producer or Service Catalog. From the automated tests created, you can view all the users who have used that record or incident. Although the tests steps here are similar to the other test steps, the initial validation is done for the fields on the form. Also, for every mandatory field, a value is set based on the sample data. It also validates after every mandatory step. Once you submit, it does a final record validation.

Tests generation for flow and flow logic

Use the ATF Test Generator and Cloud Runner store application to auto-generate tests that drive a ServiceNow flow for Service Catalog.

Service Catalog

By default, the ATF Test Generator and Cloud Runner store app supports the auto-generation of the tests and test steps for flows and flow logics for Service Catalog.

There are three sys properties that the process of generating tests for flows for Service Catalog is dependent on:

- sn_atf_tg.enable_flow_generation: if set to true, only the flow generation steps are generated. The default value is true
- sn_atf_tg.unsupported_flow: It doesn't generate steps for the mentioned flow sys id. You can mention multiple flow names separated by commas
- sn_atf_tg.unsupported_flow_logic: It doesn't generate steps for the mentioned flow logic. You can mention multiple flow logic names separated by commas

Note:
If a Service Catalog item contains a flow or a flow logic, generate the test steps for flows after the record validation and record query steps are performed. A flow or a flow logic can have multiple tests and test steps.

All steps are server-side steps and the flow starts with a log message and ends with a log message. The logs are added before any actions to inform you of the actions that are followed in the flow.

Other trigger types

Apart from Service Catalog, the following are the trigger types supported by ATF Test Generator and Cloud Runner store app.

- Created: The flow steps begin after the initial set of record validation steps when submitting the form. It starts with a log message that contains the flow name and ends with a log message indicating the flow status.
- Updated: If the type is updated, the flow steps will occur at the end, following the record validation steps.
- Created or Updated: Depending on the type, the flow steps are generated either in the middle or at the end.

Note:
For Service Catalog, only one flow is tied to a catalog item. But for the other trigger types, you can have multiple flows tied to a trigger type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Using ATF Test Generator and Cloud Runner

Use the ATF Test Generator and Cloud Runner store application to execute the generated tests using the Cloud Runner option. You can also schedule test execution and nightly runs to completely automate test execution.

Executing the tests using Cloud Runner

Execute the generated tests suite using the Cloud Runner browser option.

Before you begin

Note:
ATF test data will temporarily be in the browser session which are stored in our ServiceNow data center. Test data will be removed after all test executions have been completed.

Role required: admin

Procedure

1. Navigate to **All** > **Automated Test Framework (ATF)** > **Suites** > **ATF Generated Suite**.

   Note:
   You can also execute an individual test. Navigate to **All** > **Automated Test Framework (ATF)** > **Tests**.

2. Select **Run Test Suite** to execute the selected suite.

   Note:
   You can also execute an individual test using the cloud runner browser option.

   The Pick a Browser dialog box shows up.

3. Select one of the two available options to run the test suite.

   - Start a new test runner: Runs the test by starting a new tab
   - Cloud Runner: Runs the test in the cloud

   Note:
   As an admin user, you can hide the Cloud Runner option on the Pick a browser dialog box by setting the atf_cloud_runner.radio_visible to false. The property is set to true by default.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If you run a test suite using the cloud runner, all the tests within the suite run in parallel. See Parallel testing using Cloud Runner for more information. The order in which the tests in a suite run is random. The parallel suites ignore the execution order and ignore abort on failure.

4. Select **Run Test Suite** on the dialog box after selecting the browser.

Note:
The number of cloud runners that can be used simultaneously is two by default. You also have the option of buying five more cloud runners.

The execution of the tests continues at the background even if you close the progress bar.

5. **Optional:** Select **Go to Result** if you want to review the tests execution results.

Parallel testing using Cloud Runner

Parallel testing using the Cloud Runner involves execution of tests within a suite in parallel.

Parallel testing of the tests within a single suite starts as soon as you run the suite. When you run a suite using the Cloud Runner, all the tests within the suite run in parallel ignoring the execution order and abort on failure. Parallel testing using Cloud Runner is different from parallel testing without Cloud Runner.

Note:
Parallel testing without Cloud Runner involves running of more than 1 suites in parallel.

Scheduling test execution

Use schedules and nightly runs to execute tests and test suites in ServiceNow's cloud infrastructure allowing you to fully automate ATF test executions.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Automated Test Framework (ATF)** > **Schedules**.
The Suite Schedules page shows up.
2. Select **New** to create a new schedule run.
The Suite Schedule record shows up.
3. On the form, fill in the fields.

Fields	Description
Name	Name of the schedule run.
Active	Option to activate the scheduled run.
Application	Application that has the schedule run.
Run	Frequency at which the scheduled run should execute
Time	Exact time at which the test run has been scheduled to execute

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Description
Run in cloud	Option to execute the scheduled run on cloud runner. The default value is True for new schedules. **Note:** The value is False for any existing schedule runs.

4. Select **Save**.
5. **Optional:** Add any child tests if needed.

   Note:
   If you change the browser name for the child test, it will still run on the cloud runner.

6. Select **Execute Now** to execute the suite.

ATF Test Generator and Cloud Runner reference

Reference information for the ATF Test Generator and Cloud Runner.

Log entries in the BOQ form

Debug errors or track any critical transactions during the execution of the test suites, setting up the Cloud Runner or generating the tests by viewing the log entries in the BOQ form.

You can now view important log entries in the BOQ form. When you go to the BOQ table, you will see the list of jobs. On entering one of the jobs, you will see some specific job log entries.

The following are some of the examples for log entries in the BOQ form for test execution.

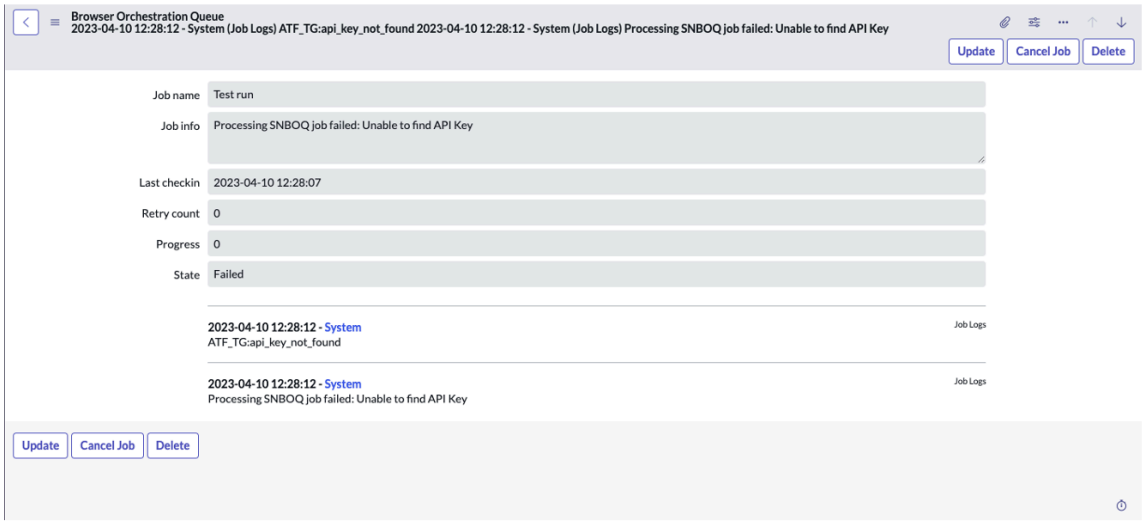
- If you have deleted an API key before the job is sent to BOS/ BOQ



- If the BOS is unable to login to an instance due to some client side script, API key being deleted after request has been sent to BOS/BOQ, etc.

ATF Test Generator and Cloud Runner roles

ATF Test Generator and Cloud Runner is installed with these roles.

To learn more about managing subscriptions, see Managing per-user subscriptions in Subscription Management and contact your account representative.

System Administrator [admin]

The admin role is required to access and use the ATF Test Generator and Cloud Runner store application.

Contains Roles

Note:
The modules in the store application is only visible to the admins. Even an ATF test admin can't access them. It is recommended to select a dedicated admin user.

List of roles contained within the role.

None.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Groups

List of groups this role is assigned to by default.

None.

Special considerations

Note:
Avoid granting an admin role when more specialized roles are available.

It is recommended to select a dedicated admin user who meets the following conditions:

- is not Locked out
- is Active
- is not Web services access only
- is not an Internal Integration User

HTTP Response Headers

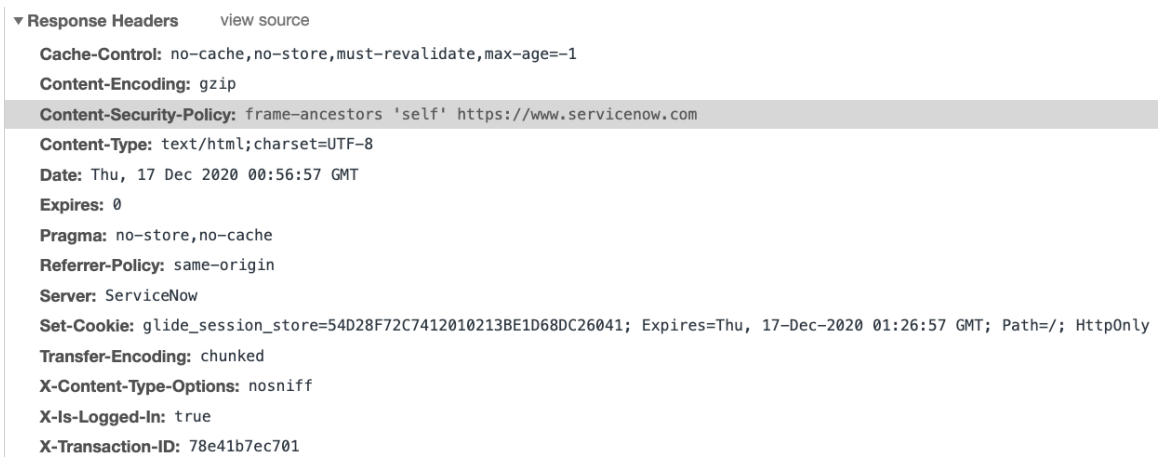
A response header is a simple name-value pair used in an HTTP response to provide additional information about page content or how the client should process it.

You can configure HTTP response headers for all, or specific types of pages, which include Service Portal, UI Page, or UX applications. The ability to configure and pass response headers enables special handling of the page content by a client, most typically a browser.

To learn more about what an HTTP header is, and about configuring the name-value pair for specific HTTP response headers, see:https://developer.mozilla.org/en-US/docs/Web/HTTP/Headers

When configuring response headers, you must look at the definition for the HTTP header to determine how the client would handle the page content.

- For example, you configure an HTTP header for a specific page or all the pages with a Content-Security-Policy: frame-ancestors 'self' https://www.servicenow.com.
- When you invoke the page in a browser such as Chrome, you can review it in the Response Headers section of Chrome Developer Tools.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To learn more about how browsers handle a page with frame-ancestors, see https://developer.mozilla.org/en-US/docs/Web/HTTP/Headers/Content-Security-Policy/frame-ancestors.

Warning:
When using URLs with custom name-value pairs, proceed with caution because there is a potential security risk when doing so. The signed security amendment to the ServiceNow AI Platform contract has implied security. You may potentially or accidentally override it when you use custom name-value pairs in the resulting URLs.

- If you want to entirely disable HTTP response header configuration functions, set the *glide.http.headers_config.enabled* property to **false**.
- Once you set it to false, ServiceNow AI Platform does not use any of the header configurations you defined in the sys_response_header table.

Special handling of the Content-Security-Policy: frame-ancestor header

Normally, the ServiceNow AI Platform automatically includes the X-Frame-Options: SAMEORIGIN header.

- It supports use of this header in all types of browsers, based on the setting of the *glide.set_x_frame_options* global property, which is enabled by default.
- When you configure a page with a Content-Security-Policy: frame-ancestor 'self' URL1 URL2 header, the ServiceNow AI Platform does not automatically include the X-Frame-Options: SAMEORIGIN header. Excluding it prevents the browser from being confused, because Content-Security-Policy: frame-ancestor 'self' already has a similar effect.

Special handling of Content-Security-Policy: frame-ancestor header for Internet Explorer

Using the Content-Security-Policy: frame-ancestor 'self' URL1 URL2 header enables you to configure multiple URL sources to include the page from within an iFrame rendered from a third-party site. However, Internet Explorer does not support this type of header.

- Instead, the Internet Explorer only supports the X-Frame-Options: ALLOW-FROM URL (ALLOW-FROM) directive in this header, although the restriction is for a single host URL.
- If you configure the frame-ancestor 'self' URL1 URL2 header, and Internet Explorer is in use, the ServiceNow AI Platform automatically uses the X-Frame-Options: ALLOW-FROM URL (ALLOW-FROM) header instead.

If the Internet Explorer request includes the referrer URL header:

- It attempts to match it with the host URLs (full or wildcard http://*.example.com type URL format only) configured in the Content-Security-Policy: frame-ancestor 'self' URL1 URL2 header.
- If there is a match, include the matched URL as X-Frame-Options: ALLOW-FROM URL1.
- If there is no referrer header, it uses the first non-wildcard based host URLs configured in the Content-Security-Policy: frame-ancestor 'self' URL1 URL2 header.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
When configuring URLs, do not include a forward slash at the end of the URL.

- This example of an incorrect configuration that may not work properly with this special handling:
  - Name: Content-Security-Policy
  - Value: frame-ancestors 'self' https://microsoft.com/
- Use this correct syntax instead:
  - Name: Content-Security-Policy
  - Value: frame-ancestors 'self' https://microsoft.com

Control request and response content type

Content-Security-Policy: frame-ancestor 'self' URL1 URL2

X-Frame-Options: SAMEORIGIN

X-Frame-Options: ALLOW-FROM URL

Configure HTTP response headers

Configure standard name-value pairs for HTTP response headers. You designate if the configuration applies to all pages, or to specific types (Service Portal, UI Page, or UX application record).

Before you begin

Role required: An elevated access security_admin role is required to configure an **All Pages** type header. An admin role is required to configure a **Specific Type** header.

Procedure

1. In the Navigator pane, type `sys_response_header.list`.
2. Click **New**.
3. Fill in the fields on the form.

HTTP Response Header

Field	Description
Active	Check box that designates that this HTTP response header configuration is active.
Application	Application scope for this record.
Applies to	Type of record the HTTP response header configuration applies to. **Specific Type** HTTP response header configuration is for the specific type and record you select in the **Type** and **Record** fields. **All Pages**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	HTTP response header configuration is for all pages and record types. **Note:** Only users with an elevated access privilege security_admin role can configure HTTP response headers for the All Pages type header.
Type	Type of record the HTTP response header configuration applies to. **Service Portal [sp_portal]** Records related to the Service Portal. **UI Page [sys_ui_page]** Standard UI pages in the ServiceNow AI Platform. **UX Application [sys_ux_page_registry]** Standard UX applications in the ServiceNow AI Platform.
Record	Specific record the HTTP response header configuration applies to. To select a record: **a.** Click the Search ( ) icon to access the Select the document form. **b.** In the **Table name** field, the default is the type you selected in the **Type** field. Do not change it. **c.** In the **Document** field, select the record from the table. For example, if you selected **Service Portal [sp_portal]**, you select a specific Service Portal-related record in that table. **d.** Click **OK**. You can only access this field if you selected **Specific Type** in the **Applies to** field.
Name	Name you want to assign to the name-value pair for the HTTP response header.
Value	Value you want to assign to the name-value pair for the HTTP response header.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Description	Detailed description for the HTTP response header.

4. Click **Submit**.

HTTP header configuration for advanced users

The HTTP response header table (sys_response_header) in the List view contains two additional columns - **Add by** and **Order**.

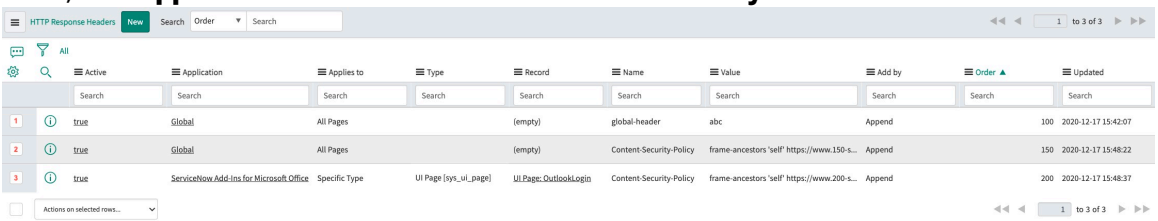
Column	Description
Order	Adds a default integer order value to a header configuration regardless of the type of header (**All Pages** or a **Specific page**). • When a specific page request takes place, both of the header types are interleaved based on the **Order**. • The net headers, regardless of the type, are sorted first, based on the **Order** and added to the response based on the ordered header list.
Add By	Contains the following values: **Append** (Default value) This option is relevant when multiple headers with the same name are configured. In this case, they are both added to the HTTP response header. **Overwrite** This option is relevant when the same header (a header with the same name) is attempting to add twice in the ordered header list (see **Order** description). The header with the higher order and with an **Overwrite** selection in **Add By** overwrites the same header trying to be set with a lower order.

You may have situations where a couple of similar **All Pages** type header configurations could overwrite a **Specific Type** type header configuration. An example of a **Specific Type** configuration would be one for a specific UI page. You can remedy this situation by adjusting the **Add by** and **Order** columns, as in the following examples.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Append example

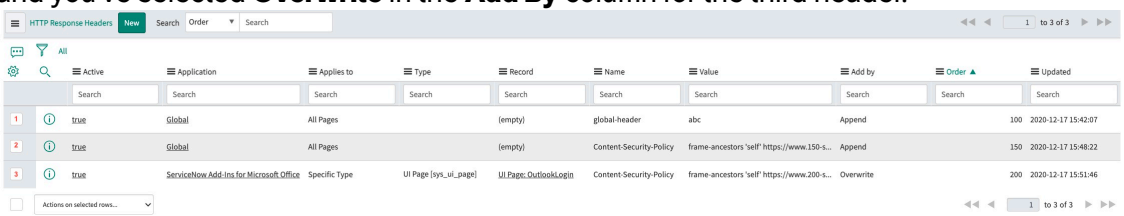
The ServiceNow AI Platform is trying to set headers in the following order, and **Append** is the default value for each in the **Add By** column.



In this example, the second (Header 2) and third (Header 3) response header configurations have the same name (Content-Security-Policy). In this case, Header 3 is appended to Header 2. If a request is made for a specific page you configured with a Header 3 response, the net HTTP response headers are both Header 2 and Header 3.

Overwrite

The ServiceNow AI Platform is trying to set headers in the following order, and you've selected **Overwrite** in the **Add By** column for the third header.



In this example, the second (Header 2) and third (Header 3) response header configurations have the same name (Content-Security-Policy). In this case, Header 3 overwrites Header 2. If a request is made for a specific page you configured with a Header 3 response, the net HTTP response header is only Header 3.

Response templates

Resolve cases or support issues faster and more efficiently with response templates. Response templates (formerly known as templated snippets) are reusable messages that can be copied to case or task forms to provide quick and consistent messages to users, or to display standard chat response messages to requesters in Agent Chat.

Note:
Response templates are available only for existing records.

Assign response template roles

The following roles are installed when you activate the response templates plugin.

Response template role	Description
Response template administrator [sn_templated_snip.template_snippet_admin]	Grants access to scoped administration of the response templates feature.
Response template writer [sn_templated_snip.template_snippet_writer]	Grants access to create, read, update, and delete (CRUD) response template content.
Response template reader [sn_templated_snip.template_snippet_reader]	Grants access to read response template content.
System Administrator [admin]	Response template administrator [sn_templated_snip.template_snippet_admin]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response template role	Description
	Note: Admin inherits this role by default. When the Templated Responses [com.sn_templated_snip] plugin is activated without activating related HR applications, you can still use response templates. • Admin can reassign this role to other users. • Admin can also remove the Contained Role [sys_user_role_contains] table so Admin users do not inherit this role by default. Or: 1. Enter **sys_store_app_list.do** in the Filter navigator search bar of an instance, or **https://YOUR_INSTANCE/sys_store_app_list.do** from a web browser. 2. Search for and select **Templated Snippets**. 3. Scroll down to **Related Links**. 4. Click **Remove from the role contained by admin**.

Before you begin using response templates, you must assign these roles to the appropriate roles, groups, or users in your application.

- To assign a role to another role, see Add a role to an existing role.
- To assign a role to a group, see Assign a role to a group.
- To assign a role to a user, see Assign a role to a user.

For example,

- In the HR Service Delivery application, users with the HR administrator role are assigned the response template administrator role, users with the HR manager role are assigned the response template writer role, and users with the HR case writer role are assigned the response template reader role.
- In the Customer Service Management application, users with the customer service manager role (sn_customerservice_manager) inherit the response template writer role. Users with the customer service agent role (sn_customerservice_agent) inherit the response template reader role and can access response templates assigned to all groups to which they belong.

How to use response templates

Users with the response template writer [sn_templated_snip.template_snippet_writer] role can create response templates. Each template is associated with a table that is an extension of the Task [task] or Interaction [interaction] table. Response templates include a short name for specifying a shortcut that can be used to identify the message. For chat response templates used in Agent Workspace, agents use the slash command with a short name to present the standard message during a chat. You can also configure the template to

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Include variables pulled from a table
- Specify a condition builder to specify the conditions that must be met for the template to be available for use, such as for a specific HR service

For more information, see Create or modify a response template.

Users with the response template reader [sn_templated_snip.template_snippet_reader] role can then copy response template content and use it in their responses to users when working on case or task forms that meet the specified conditions. For example, a response template for payroll discrepancy cases enables HR agents to use a standardized message when responding to that case type. See Copy a response template to an HR case for an HR-specific example.

Example: Response template to escalate payroll discrepancy cases

You are part of an enterprise HR organization using the HR Service Delivery application. You want your HR agents to respond to and, when necessary, escalate payroll discrepancy cases quickly and consistently. Create a response template so that HR agents have a reusable message to use when responding to employees about that case type.

One of your HR managers with the response template writer role is responsible for creating the template to escalate payroll discrepancy cases. The template is associated with the HR Payroll Case [sn_hr_core_case_payroll] table, and a condition filters on cases that match the appropriate HR service called Payroll Discrepancy. In the template body, the response text appears with variables, such as the subject person name in the salutation.

HR case writers with the response template reader role can copy the response template content and use it in their responses to employees when working on cases. Response templates provide a faster and efficient way to resolve cases.

Activation information

To use response templates in your application, you must activate response templates. For information on what components are installed with the feature, see Components installed with response templates.

Activate response templates

You can activate response templates (formerly known as templated snippets) [com.sn_templated_snip] if you have the admin role. This plugin includes demo data and activates related plugins if they are not already active.

Before you begin
Role required: admin

Note:
If you are using Agent Chat, the Agent Chat (com.glide.interaction.awa) plugin automatically activates response templates.

About this task
Response templates activate these related plugins if they are not already active.

Plugins for response templates

Plugin	Description
Scoped Application Restricted Caller Access	Allows scoped applications to restrict access to public tables and script includes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Plugins for response templates (continued)

Plugin	Description
[com.glide.scope.access.restricted_caller]	

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Related topics

List of plugins (Madrid)

Components installed with response templates

Several types of components are installed with activation of the Templated Responses (com.sn_templated_snip) plugin, including tables and user roles.

Note:
The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Demo data is available for this feature.

Roles installed

By default, the following HR roles contain the following response template roles.

Note:
The Templated Responses [com.sn_templated_snip] plugin activates the sn_templated_snip.min_admin_count system property [sys_properties.list]. This property prevents you from deleting your only Response Template admin user by requiring a minimum number (default is two) of active users with this role.

Roles installed with response templates

Role title [name]	Description	Contains roles
Response templates administrator	Grants access to	sn_templated_snip.template_snippet_writer

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles installed with response templates (continued)

Role title [name]	Description	Contains roles
[sn_templated_snip.template_snippet_admin]	scoped administration of the response templates feature.	
Response templates writer [sn_templated_snip.template_snippet_writer]	Grants access to create, read, update, and delete (CRUD) response template content.	sn_templated_snip.template_snippet_reader
Response templates reader [sn_templated_snip.template_snippet_reader]	Grants access to read response template content.	None

You can assign these roles to the appropriate roles, groups, or users in your application.

- To assign a role to another role, see Add a role to an existing role.
- To assign a role to a group, see Assign a role to a group.
- To assign a role to a user, see Assign a role to a user.

For further information on user administration and how to manage users, see User administration.

Tables installed

Tables installed with response templates

Table	Description
Response Template [sn_templated_snip_note_template]	Stores response template information. Response templates are reusable messages that can be copied to case or task forms. Response templates provide quick and consistent messages to users, or display standard chat response messages to requesters in Agent Chat.
M2M Response Template to Channel [m2m_response_template_to_channel]	Maps channels to response templates.
Response Template Channel [sn_templated_snip_channel]	Stores information about response template channels.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables installed with response templates (continued)

Table	Description
Note Template for Table [sn_m2m_note_template_for_table]	Maps notes to response templates.

For further information on table administration and how to manage data, see Table administration.

Create or modify a response template

Create or modify a response template (formerly known as a templated snippet) to define a reusable message that can be copied to case or task forms or used in Agent Chat sessions to provide quick and consistent messages to users.

Before you begin

Role required: sn_templated_snip.template_snippet_writer

About this task

Each response template is associated with a table that is an extension of the Task [task] table or, if using Agent Workspace, the Interaction [interaction] table. The template can be configured to include variables pulled from that table. You can also use a condition builder to specify the conditions that a case must meet for the template to be available for use, such as for a specific HR service or for chat. For chat response templates, you specify a short name (shortcut) that is used with the slash command as a quick way to present the response message to a user.

Procedure

1. Navigate to **All** > **System Definition** > **Response template configuration**.
2. Select **New** to create a response template.
   Or, select an existing response template to modify from the list.
3. Fill in the fields on the form.

Response template form

Field	Description
Name	Name of the response template.
Short Name	Short description that identifies the response template when using chat in Agent Workspace. Use the short name with a quick command (/) to show the text from the template body of the response template while in chat. This feature provides a fast and consistent way to populate text while in chat. For example, the short name `gm` identifies the chat response template for a Good Morning greeting. Enter **/gm** in a chat window to show the text from this response template.
Table	Name of the table that the response template is associated with.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

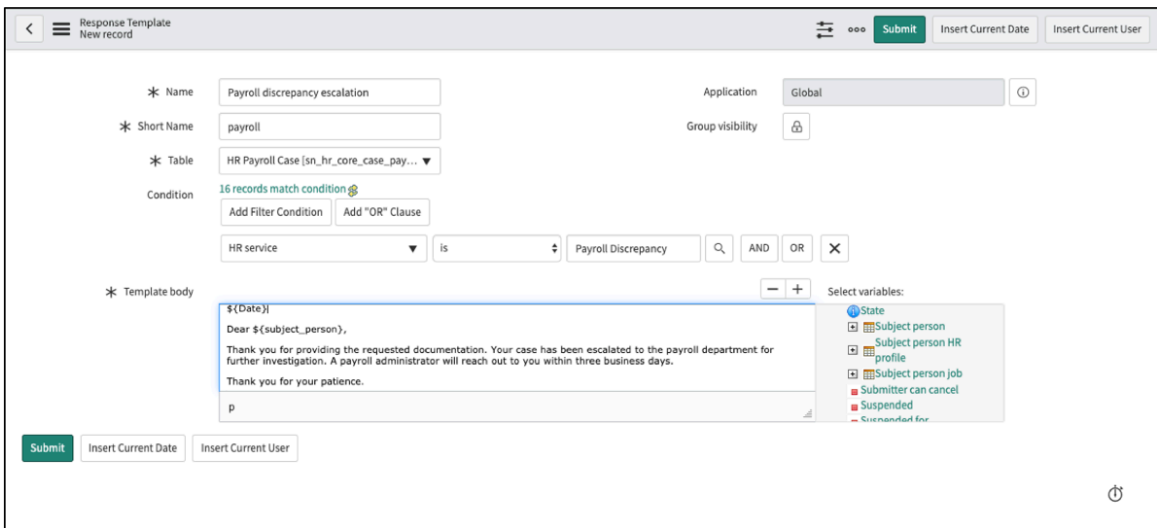
Field	Description
	If you are creating a response template for Agent Workspace chat, the associated table is the Interaction [interaction] table. For other response templates, the table must be an extension of the Task [task] table. **Note:** Creating custom COE tables do not allow you to add the Copy to Clipboard UI action. Users can still use the copy and paste function.
Condition	Conditions that determine when the response template is available for use. When defining conditions like case sensitivity or null values, see API GlideFilter - Scoped, Global. **Note:** The conditions available depend on the table you select. For chat response templates, specify the condition: **[Type] [is] [Chat]**
Application	The application that created the response template.
Group visibility	Indicates what groups have access to the response template. Adding groups filters who can view the response template. **Note:** Leaving this field empty makes the response template available to all groups.
Language	Language in which you want the response template to be translated. **Note:** Translation feature is available only when the required language plugins are installed on the instance.
Template body	Text of the response template providing instructions to the agent on how to respond to a specific case or task. You can reference field values by selecting variables from the variables list based on the table you select.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

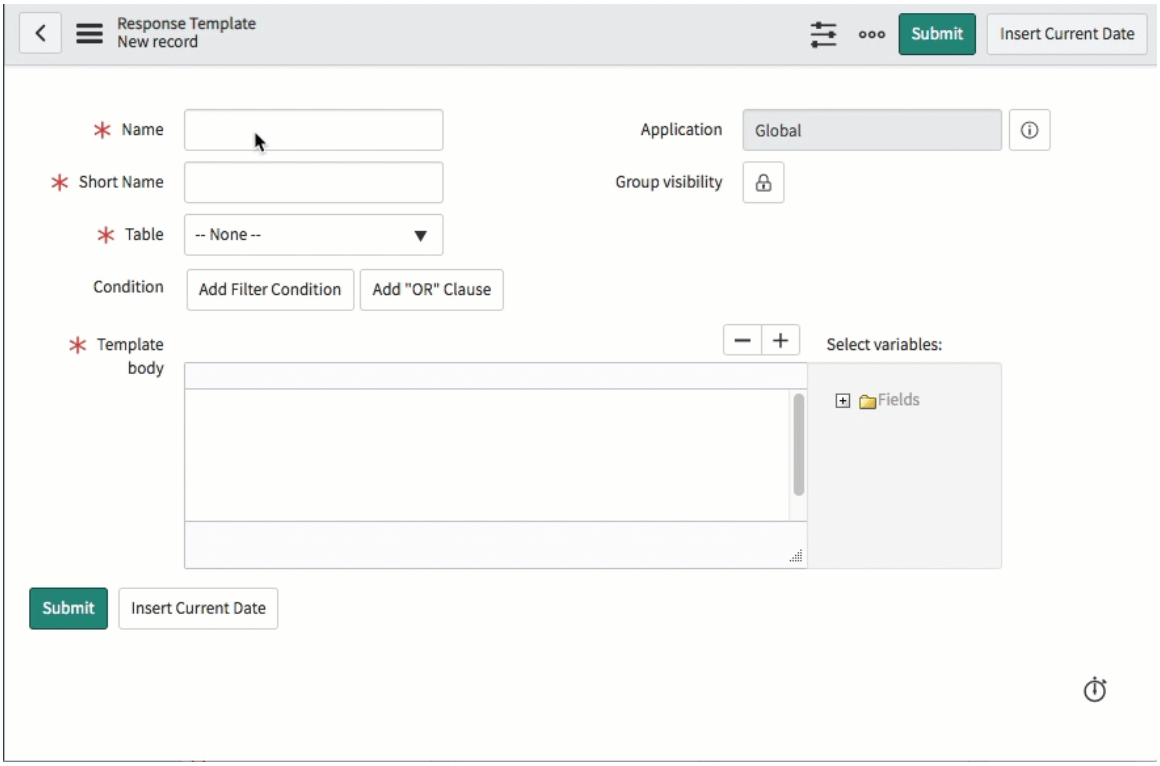
Field	Description
	You can manually enter custom variable references: ○ Current user: `${current_user}` ○ Current date: `${Date}` Or, place your mouse where you want the custom variable reference to appear and select the **Insert Current User** or **Insert Current Date** buttons. **Note:** Response templates do not support rich text.
Select variables	Variables you can add to the template body. For example, if you choose the HR Case (sn_hr_core_case) table, you can select the Subject person variable to appear in the Template body and it will replace the variable with the actual name of the subject person when the response template is used. **Note:** The variables available depend on the table you select.

Example

The following GIF shows an example of an HR manager in the HR Service Delivery application creating a response template to escalate payroll discrepancy cases. The template is associated with the HR Payroll Case [sn_hr_core_case_payroll] table, and a condition is set to filter on cases that match the Payroll Discrepancy HR service. The template text is pasted into the body, and then a variable for the subject person is added to the salutation.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Click **Submit** or **Update**.
   Channels limit the response template to only the channels you add. If you leave this blank, the response template is available to no channels. This feature allows you to have different messages for chats, emails, or form. For more information, see Create a response template channel.
   The Channels related list appears.

What to do next

You can copy response template content to any field on a form that meets the specified conditions.

The following GIF shows an example of an HR case writer in the HR Service Delivery application opening a payroll discrepancy case and copying a payroll discrepancy escalation template to the comments field in the HR case form for the employee to read.

© 2026 ServiceNow, Inc. All rights reserved.

Policy as Code Engine (PaCE)

You can administrate the full life cycle of policies using PaCE in applications by searching, reviewing, and updating existing policies, and creating policies as required. Policies in the applications are powered by PaCE.

Understanding PaCE

PaCE enables you to manage, administer, and audit policies from a centralized location.

A PaCE policy is a set of pre-defined rules and logic that determines the desired behavior of an application or a service. When invoked, the rules in the policy are applied on the provided input, and a decision is reached. This decision-making is the main function of PaCE and helps determine if a policy is compliant or non-compliant. The decision is then relayed to the software calling service or application, so that it can act on it to enforce a desired behavior.

PaCE provides the following capabilities:

- Full life cycle management of policies
- Policy reuse
- Audit and compliance
- Testing and validation of policies
- Central automation of compliance and regulatory processes

PaCE can be used to:

- Identify posture drifts from a desired state in the current application.
- Make decisions (compliant or non-compliant) based on a change in the application or service and enforce the decision to prevent a drift.
- Automate execution of policies and eliminate dependency on humans.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Standardize policies so that they can be shared and reused within a service and across services.
- Increase change velocity while including guardrails with automated workflows to provide preventive controls.
- Collect evidence and proof of compliance for audit purposes. This feature can be used by internal auditors to automate the process of collecting evidence for governance and risk requirements.
- Provide business context to PaCE policies by using control objectives to connect PaCE with the Integrated Risk Management and Policy and Compliance Management workspace.

PaCE enables policy developers to view and understand an existing policy, make and assess changes, and decide if a policy can be used as a baseline for another policy. They can also use PaCE before debugging to understand how the policy should work and why it is not working as expected.

PaCE provides a centralized platform for storing, managing, and using policies. By using PaCE, policies can be:

- Well documented and all the requirements clearly defined.
- Reused across the organization.
- Tracked and new versions can be created when a policy is changed.
- Tested and validated before deployment.

Policies are also containers for all the elements that make up a policy. These elements include meta-data related to the policy, the policy versions (including policy scripts and inputs), mapping information, and policy execution history.

You can define any number of policies within PaCE.

Key user personas and roles

This section describes different user personas and roles in PaCE. These personas are defined with the application where PaCE is being used.

All roles except the super administrator role must be assigned to a calling service or application where PaCE is being used. The assigned calling service defines the scope for the user role.

Role	High-level Permissions	Persona
sn_pace.execution_reader	A read-only user with view-only access. This user can view policies, categories, and executions.	Policy user, internal auditor.
sn_pace.code_reader	Can review PaCE versions, policy code, and run tests.	Internal auditor
sn_pace.code_editor	This user has all the sn_pace_code_reader permissions plus the ability to create PaCE policy versions.	Policy developer
sn_pace.policy_reader	This user has all the sn_pace_code_reader permissions	Policy user, internal auditor

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role	High-level Permissions	Persona
	plus the ability to review policy details and mapping information.	
sn_pace.policy_editor	This user has all the sn_pace_policy_reader and sn_pace.code_editor permissions plus the ability to create policies and mappings.	Policy developer
sn_pace.mapping_admin	This user can map policies and edit config parameters for policy mappings.	Mapping admin
sn_pace.admin	This user has the permissions of all the other roles plus the ability to create categories, policies, mappings, and code.	Policy admin
sn_pace.super_admin	This user has all the sn_pace.admin role permissions across all calling services.	Not applicable
Maint role	Internal user who can create default content.	Not applicable

PaCE administration life cycle

This checklist lists the tasks involved in administering PaCE policies.

Task	Description
Set up and install PaCE.	PaCE is installed as part of the application you want to create policies in.
Create a policy.	See Create a PaCE policy.
Create a new policy version	See: • Create a new variable for a policy version (if required). • Define mappings for a PaCE policy. • Edit a PaCE policy script
Test a policy version	Use the Test Playground for PaCE policies
Publish a new policy version	See Publish a PaCE policy version.
Activate a published policy	See Activate or deactivate a PaCE policy.
Use the policy.	See Execute policies.

Install PaCE

Install PaCE.

PaCE is automatically bundled with the application you want to use PaCE with. PaCE is automatically installed in the following applications:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- DevOps Config
- Digital Product Release (DPR)
- Cloud Account Management (CAM)
- SecOps Software Bill of Materials (SBOM)
- Social Benefits Playbook

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Administer PaCE policies

Use PaCE to manage the life cycle of a policy and create, update, review, and execute policies.

In addition, you can:

- Evaluate any changes to ensure they meet your organization's policy management requirements.
- Create a policy, modify policy information, copy a policy and its version to a new policy.
- Create a new policy version by copying an existing policy version and modifying it.
- View and define mapping information for any policy.
- Review executed policy activity and execution history for policies and policy versions.
- Use tags and categories to manage your policies more efficiently.

Note:
You can create any number of policies, which can be updated, activated, or deactivated as required.

Manage PaCE policies

You can define and manage your PaCE policies in a single management console.

Policies are containers for all the elements that make up a policy. These elements include metadata related to the policy, the policy versions (including policy scripts and inputs), mapping information, and policy execution history.

You can easily create policies, and search and review existing policies. In addition, you can:

- Assess and implement changes to each policy.
- Determine if a policy should be used as the template for another policy.
- Understand why a policy may not be working as expected.

You can create any number of policies, which can be updated as required.

View existing PaCE policies

You can view a list of all PaCE policies created by you and other policy administrators. The PaCE management console is your gateway to viewing and updating policies, and managing policy versions.

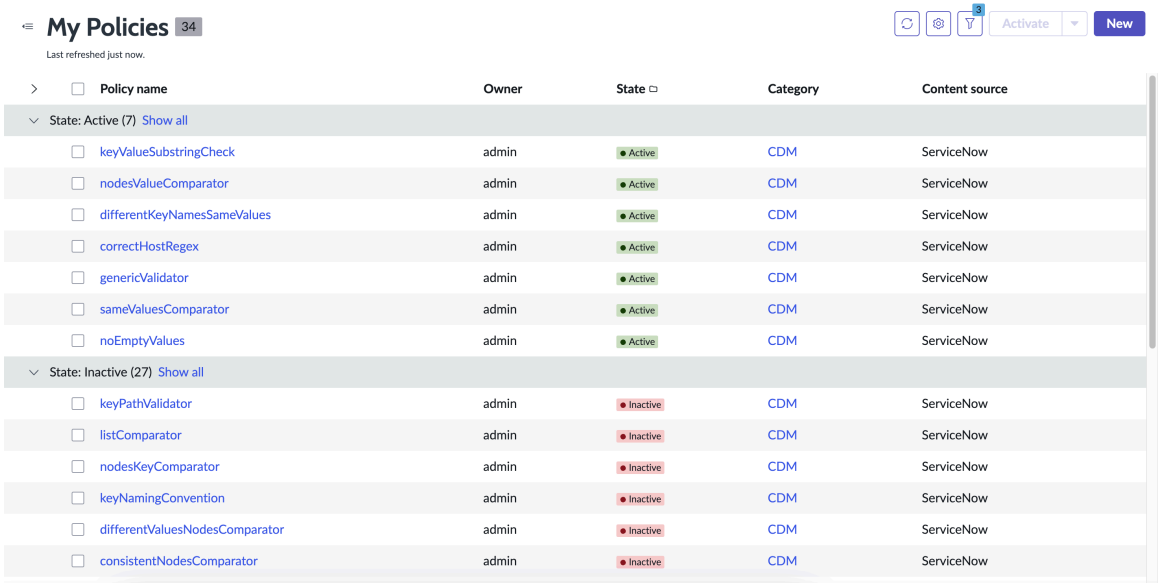
Before you begin
Role required: sn_pace.execution_reader

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Policies** > **My Policies**.

> **Note:**
> To view all policies generated by admin/other users, navigate to **Policies** > **All Policies**. These policies are viewable to all logged in users.



On this page, you can do the following:

- Create a PaCE policy
- Edit a PaCE policy
- Delete a PaCE policy

The My Policies list displays the following columns.

Column	Description
Policy name	The name of the policy as defined by the user.
Owner	The owner of the policy.
State	The current state of the policy: ○ Active: The policy is **Active** and can be used. For details on how to activate a policy, see Activate or deactivate a PaCE policy ○ Inactive: The policy is **Inactive**, and must be activated before it can be used. **Note:** Each policy can only have one Current (published) policy version. Only policies that have a Current version can be activated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description
	See Manage PaCE policy versions for details.
Category	The category assigned to the policy. Only one category can be assigned to a policy. See Managing categories in PaCE for details
Content source	The source used to create the policy: ○ User: This policy was created or copied by a user. ○ ServiceNow: This policy was shipped as part of the PaCE content pack.

2. **Optional:** Use the ServiceNow AI Platform filter controls to filter the displayed list.
3. To view the details of a policy, click the required row in the **Policy Name** column.

> **Note:**
> Alternatively, click the information icon to see a quick glance view of the policy.

Create a PaCE policy

Create a PaCE policy to determine if changes to a software service or application comply with a set of pre-defined rules.

Before you begin
Role required: sn_pace.policy_editor

About this task
After you create a PaCE policy, a decision is then made about these changes, and if they are compliant, non-compliant, or compliant-exception according to these pre-defined rules. The policy must be mapped correctly to the relevant object (table and document ID) to invoke the policy when any changes are made to the object.

> **Note:**
> Policies are only used if they have active mapping records, and if there was a request to validate an object (tables and document IDs) mapped to the policy. For further information, see Map PaCE policies.

Procedure
1. Navigate to **All** > **Policies** > **My Policies**.

> **Note:**
> To view all policies generated by admin/other users, navigate to **Policies** > **All Policies**.

2. Click **New**.
   The New policy page appears.
3. Select the New blank policy tile or an existing policy template, then **Create**.
   Templates can be filtered by most used, alphabetically, state, and type. By default, inactive templates are hidden.
4. In the Create New Policy form, fill in the fields.

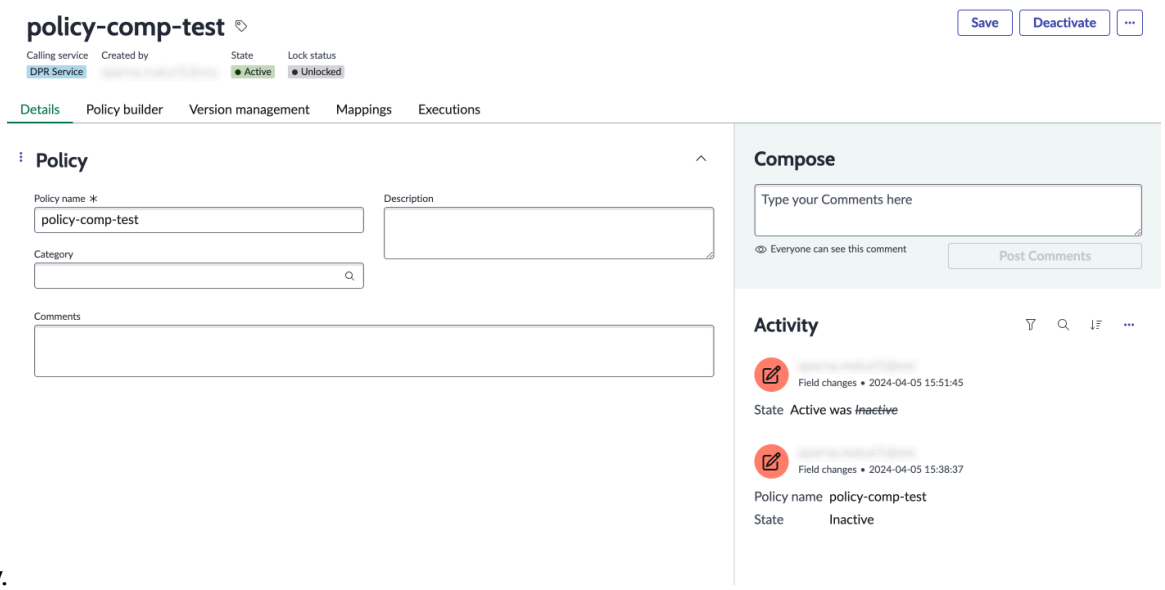
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Policy form

Field	Description
Policy name	The policy name. **Note:** The policy name must be unique, and is used as the identifier of the policy.
Document type	Select a document type for the table of items for the policy to be applied to.
Category	Categories enable you to group and manage policies more efficiently. See Managing categories in PaCE for details.
Calling service	The name of the calling service the policy was created in.
Description	Additional details for this policy.
Comments	Comments about the policy.

Note:
You can add additional comments in the Compose text box, that will show up in the Activity stream.

5. Click **Save**.
The form is refreshed to display the newly created



policy.

6. **Optional:** Add tags by selecting the tag icon alongside the policy name to add tags.
For more information about defining tags, Add tags to PaCE policies.

Result
The newly created policy contains the following tabs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tab name	Description
Details	The details of the policy including the policy name, category, date on which it was created, and a description is displayed.
Policy builder	When you create a policy, by default a draft policy version is created. Each policy version contains version meta-data, a policy script, and variable input definitions, which you can modify according to your requirements. Click the **Policy builder** tab to view the Policy builder page. You can: • Edit a policy version. **Note:** You can edit a policy version only if it is a Draft state. • View version details • Create a new version • Switch from low-code to the code editor • Save the policy as a template • Compare versions • Duplicate policy versions For more details, see Manage PaCE policy versions. **Note:** You must publish the (See Publish a PaCE policy version) policy version to make it **Current** before it can be used.
Version management	The Version management tab lists out the previous versions of the policy. You can also create a new version of the policy.
Mappings	The Mappings tab enables you to define the object (table and document ID) to which the policy is to be mapped. For more information, see Map PaCE policies.
Executions	The Executions tab enables you to review the execution activity for the policy.

What to do next

You can perform the following actions:

- Delete a policy that is in an inactive state. See Delete a PaCE policy.
- Duplicate or create a copy of an existing policy.
- Write and test custom PaCE policies. See How to write and test custom PaCE policies.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activate or deactivate a PaCE policy

You can activate or deactivate any PaCE policy. Only activated policies can validate object (tables and document IDs) changes. Deactivated policies are not executed, even if the policy is mapped. Deactivating a policy enables you to place the policy into a maintenance-like mode.

Before you begin

Role required: sn_pace.policy_editor

About this task

You can deactivate or activate any policy at any time.

For activated policies:

- The policy must include a Current (published) version. For more information, see Manage PaCE policy versions.
- The policy is auto-validated when you activate it (if the policy has mapping inputs defined). Validation verifies the validity of mapping inputs, and checks that all required inputs were set. For more information, see the Validate mapping inputs section.

Deactivating a policy enables you to place the policy into a maintenance-like mode. You can make changes, safe in the knowledge that no one is using the policy. While deactivated, the policy mappings are kept, but the policy cannot be executed. After you are done with any changes, you can reactivate the policy and any existing mappings are reused.

Note:
The activation or deactivation of a policy is audited for tracking purposes. This audit information is included in the standard ServiceNow AI Platform auditing records.

Procedure

1. Navigate to **All** > **Policies** > **My Policies**.

   Note:
   To view all policies generated by admin/other users, navigate to **Policies** > **All Policies**.

2. Select the check box next to the policy that you want to activate or deactivate.

   Note:
   To activate a policy, its current state must be Inactive. To deactivate a policy, its current state must be Active. You can select multiple policies, as required.

3. Activate or deactivate the selected policy.

What to do next

If you did not publish your policies, you can publish multiple policies. Select the check box next to the Policy names that you want to publish or select the **Select All** box next to the Policy name list. Select the **Activate** drop-down menu then **Publish latest**.

Note:
This only works with content-based policies and not user-based policies.

Duplicate a PaCE policy

Create a duplicate of an existing policy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_pace.policy_editor

Procedure

1. Navigate to **All** > **Policies** > **My Policies**.

   Note:
   To view all policies generated by admin/other users, navigate to **Policies** > **All Policies**.

2. Click the **Policy name** link for the policy that you want to duplicate.
3. In the Details page, click the **More Actions** icon and select **Duplicate**.
4. In the Duplicate Policy window, select the version of the policy you want to copy and click **Duplicate**.
   A new policy with the same parameters as the selected policy is created in an **Inactive** state. You must publish a version of the new policy before you can activate it.

Edit a PaCE policy

You can update any existing PaCE policies, whether they are activated or deactivated.

Before you begin
Role required: sn_pace.policy_editor

Procedure

1. Navigate to **All** > **Policies** > **My Policies**.

   Note:
   To view all policies generated by admin/other users, navigate to **Policies** > **All Policies**.

2. Click the information icon located to the left of the policy name to see a quick glance view of the policy.
   The policy details display to the right of the My Policies list and can be edited. You can also review the **Activity** stream to see a list of all changes made to the policy. This list can be filtered as required.
3. Edit the relevant details for the selected policy, and click **Save**.
4. Click the **Policy name** link on the All Policies page to update existing versions or add a new version.
5. Click the **Policy builder** tab, create a copy of the version in which you want to make changes, and make the relevant changes in the new version.
   You can select different versions of the policy in the Version drop-down menu. For more information about creating and managing versions, see Manage PaCE policy versions.

   Note:
   You can't update API Variables and Config Parameters for an existing policy version that is Current (published) or archived. To modify a Current version, create a copy of that version, as described in the Create a copy of a policy version section.

6. Select the overflow menu icon ⋮ and choose from the following options:
   - Version details
   - Create a new version
   - Switch to code editor

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Save as Template
- Compare versions
- Duplicate
- Delete

7. When you're finished, click **Publish**.
8. Click the **Mappings** tab and make the relevant changes.
   For more information about defining caller and mapping inputs, see Map PaCE policies.

Delete a PaCE policy

You can delete a PaCE policy at any time. All related versions for that policy are also deleted. However, for auditing reasons you cannot delete policies that were or are currently in use.

Before you begin
Role required: sn_pace.policy_editor

About this task
Policies and their related versions can be deleted. However, policies that are in use, or were used can't be deleted, including:

- Policies that are mapped to an object.
- Policies that were activated and executed in Standard mode. These policies, and their policy versions, include execution data critical for auditing purposes, and therefore cannot be deleted.
- Policies that have a version in either **Current** or **Archived** state.

Procedure

1. Navigate to **All** > **Policies** > **My Policies**.

   Note:
   To view all policies generated by admin/other users, navigate to **Policies** > **All Policies**.

2. Click the **Policy name** link for the policy that you want to delete.

   Note:
   You can only delete individual policies. However, you can select multiple policies to activate or deactivate. For further information, see the Activate or deactivate a policy section.

3. In the displayed policy form, click **Delete**.
4. Click **Delete** to confirm.
   The policy versions that are to be deleted are displayed.

Map PaCE policies

For a policy to be invoked correctly, it must be mapped to an object (table or document ID). The defined mapping settings are automatically verified when the policy is invoked.

Mapping a policy to an object enables you to verify updates on that object, whenever a change in the provided inputs occurs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Define mappings for a PaCE policy

You can map a policy to any number of objects. When you map a policy, validate the inputs, and execute the policy, a compliant, non-compliant, or compliant-exception decision is returned.

Before you begin

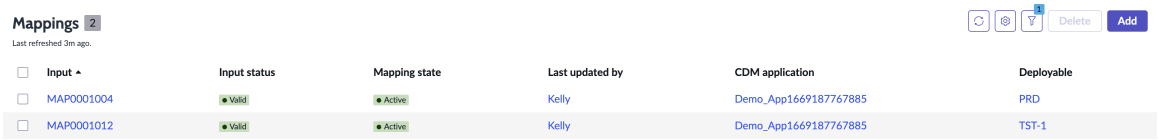
Role required: sn_pace.mapping_admin

Procedure

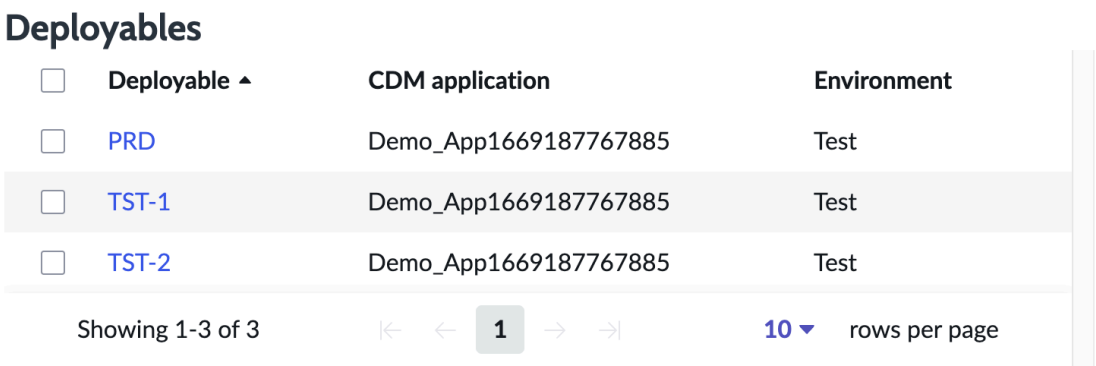
1. Navigate to **All** > **Policies** > **My Policies**.

   Note:
   To view all policies generated by admin/other users, navigate to **Policies** > **All Policies**.

2. Click the **Policy name** link for the policy that you want to update.
3. Click the **Mappings** tab.
   If there are any existing mappings for the selected policy, they are displayed.



4. To add a new mapping input, click **Add**.
   Any objects that are available for mapping are displayed.



5. Select the check box to the left of each object that you want to map the policy to, and click **Map Policy**.
   The new mapping input is added to the list of policy mappings. In addition, an alert message indicates whether the mapping is valid and active. For information about editing existing mapping inputs, see Edit mapping inputs.

Edit mapping inputs

You can edit the mapping settings that map a policy to an object.

Before you begin

Role required: sn_pace.mapping_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Policies** > **My Policies**.

   Note:
   To view all policies generated by admin/other users, navigate to **Policies** > **All Policies**.

2. Click the **Policy name** link for the policy that you want to update.
3. Click the **Mappings** tab, and click the Mapping ID link in the Input field.
4. Click the mapping input that you want to update.
   In the displayed mapping input form, edit the details as required, and click **Save**.

PaCE Static and Dynamic Mapping

Static Mapping enables you to map a set of policies to a record or object such as an incident or deployable. Dynamic Mapping enables you to map a set of policies on a dynamic set of records or objects such as a set of incidents or a set of deployables.

Static Mappings

Static Mapping enables you to map multiple policies that you want to validate against a specific deployable or incident. For example, if you need to map a policy to multiple deployables, you'll need to map it multiple times to each deployable.

Dynamic Mappings

Dynamic Mapping enables you to map multiple policies that you want to validate against specified conditions. You can configure the conditions set to a specific table, each condition can return multiple records or objects. The condition is applied at a runtime where the set of policies will be mapped to the set of returned records by the condition. Multiple conditions can be defined in the condition fields in the Conditions tab.

Map PaCE policies using Static Mapping

Use Static Mapping to map multiple PaCE policies against a record such as a change request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_pace.mapping_admin

Procedure
1. Navigate to **Mappings** > **Static Mappings**.
2. Select **Add**.
3. Select a document type in the **Document Type** field.
4. Select a policy in the **Policy** field or you can select the Search icon to view and select multiple policies, then select **Map**.
5. When you're finished, select **Done**.

Result
The map will show up in the Static Mappings list. You can delete a map on the list by selecting the box next to the Input, then select **Delete**.

Map PaCE policies using Dynamic Mapping

Use Dynamic Mapping to map multiple PaCE policies against specified conditions.

Before you begin
If you don’t have a condition created, do the following steps.

1. Navigate to **Mappings** > **Conditions**.
2. Select **New**.
3. Fill in the **Short description** and **Table** field, then add the conditions of the deployables you want to map.
4. Select **Run** to preview the existing deployables that will be mapped in the condition.

   Note:
   The results are capped at 10,000 records.

5. Select **Save** or **Continue to mapping** to navigate to the Dynamic Mapping page.

   Note:
   When you select **Continue to mapping**, the condition is pre-selected based on the condition you created, additionally you can edit or delete the condition by selecting the short description.

Role required: sn_pace.mapping_admin

Procedure
1. Navigate to **Mappings** > **Dynamic Mappings**.
2. Select **Add**.
3. Select a document type in the **Document Type** field, then a condition in the **Condition** field.
4. Select a policy in the **Policy** field or you can select the Search icon to view and select multiple policies, then select **Map**.
5. When you're finished, select **Done**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result

The map will show up in the Dynamic Mappings list. You can delete a map on the list by selecting the box next to the Input, then select **Delete**.

Request an exception for Dynamic Mapping

Request an exception on policies that are dynamically mapped to conditions.

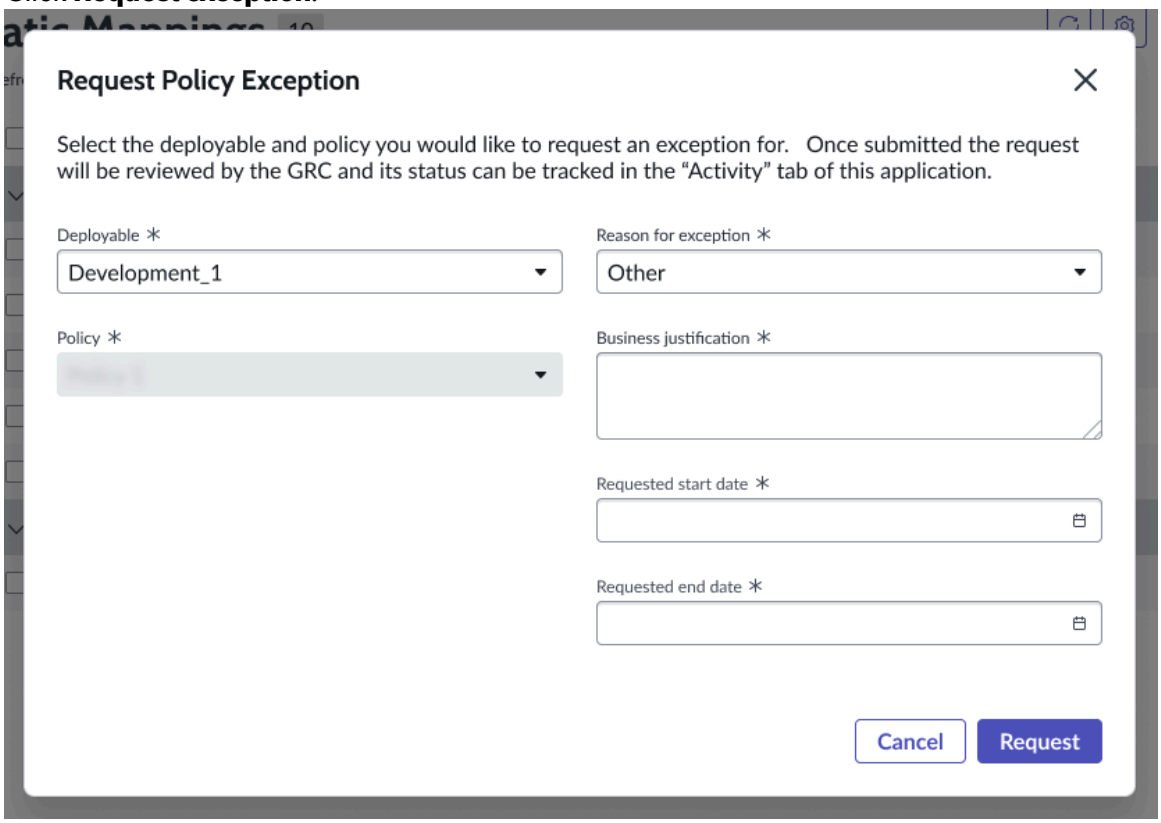
Before you begin

You need to have the Governance, Risk, and Compliance (GRC) application installed to have the Request Exception button to show up on the mappings list. If you don't have the GRC application, see the Download a GRC application from the ServiceNow Store for the first time topic.

Role required: sn_pace.admin, sn_pace.mapping_admin, or sn_pace.execution_reader

Procedure

1. Navigate to > **Mappings** > **Dynamic Mappings**.
2. Select the check box of the mapped policy you want to request an exception for.
3. Click **Request exception**.



4. In the Request policy exception form, fill in the fields.

Request policy exception

Field	Description
Deployable	Select the name of the deployable you want to request an exception for.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: The list of deployables is not filtered and all possible deployables will be available to be selected without filtering based on the dynamic mapping condition.
Reason for exception	Select a reason type why the exception is being requested.
Policy	Name of the policy.
Business justification	Explanation why the exception is being requested.
Requested start date	Select the date when this exception is submitted.
Requested end date	Select a date when you want this exception to be approved by.

5. Click **Request**.

Create a PaCE policy template

Create PaCE templates for the PaCE policy forms that you use frequently.

Before you begin

Role required: sn_pace.code_editor

Procedure

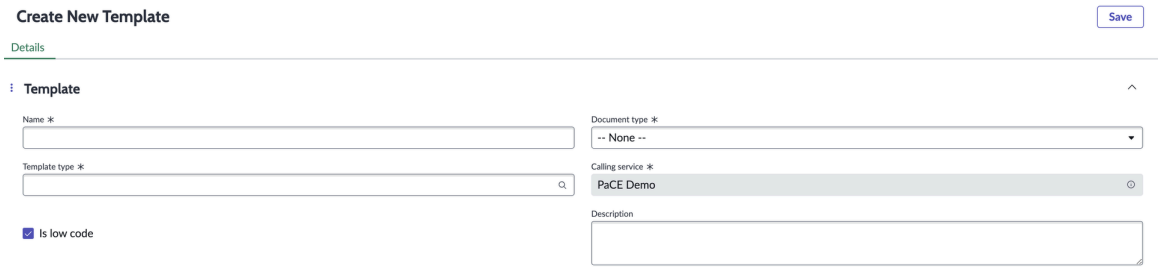
1. Navigate to **Templates** > **All Templates**.
2. Select **New**.
3. In the Create New Template form, fill in the fields.

Create New Template form

Field	Description
Name	Name of the policy template.
Document type	Select a document type for the table of items for the template to be applied to.
Template type	Template type organized by category. Template types enable you to select a category, if you have multiple types of policy templates. You can create a template type by following these steps: **a.** Navigate to **Templates** > **Template Type**. **b.** Select **New**. **c.** Fill in the **Name** and **Description** field. **d.** Select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	The type can be selected from the **Template type** field.
Description	Additional details for this template.
Is low code	Select this check box if the policy template will be written in low-code. **Note:** You can switch to the code editor from low-code when you create the conditions, but you'll be unable to switch back to low-code.



4. Select **Save**.
   By default, when you create a template it's inactive and it will be filtered out on the New policy page. You can select the inactive filter box on the New policy page to see the inactive template.
5. Select the **Template Builder** tab and fill in the conditions in the Policy logic section, then **Save**.
   For more information about the parameters and condition fields, see the Passing parameters to PaCE policies and Policy logic condition fields topic.

What to do next

Before you activate your template, you can create a policy to test the template.

1. Navigate to **Policies** > **My Policies**.
2. Select **New**.
3. Select **Preview** on the template that you created to see if the information is correct.
4. Select **Save**.
5. Select the template that you want to create a policy with, then **Create**.
6. Fill in the fields, then select **Save**.
7. Select the new draft of the policy and select the **Test Playground** tab to test the policy.
8. When you're finished, navigate back to **Templates** > **All Templates**. Select the template that you tested, then **Activate**.

If you make any updates to a template, it won't affect previous policies that you created using the template.

Manage PaCE policy versions

PaCE policy versions contain the actual policy script, as well as API Variable and Config Parameter definitions used for validating policies. Each policy can have many versions, each of which can be easily managed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can create a new policy version, search and review existing versions, and test changes to the policy script before it is deployed in a production environment. You can also compare policy versions, copy a policy, and modify it as required.

Note:
To activate a policy, a policy version must be created, and published to be in the **Current** state.

PaCE policy version states

A PaCE policy version can be in one of four states: Draft, Current, Archived, and Now-Content. The policy version state also defines the version numbering.

Only one policy version in each policy can be Current at any one time. There is no limit to the number of Draft or Archived policy versions.

Policy version states

State	Description
Draft	When a version is created, its initial state is Draft. The new Draft version can be saved as a Draft for later use, or published to become the Current version. The draft versions cannot be used until they are published.
Current	Draft versions can be published to Current, which means the former draft version becomes the default published version used for policy execution. **Note:** When publishing the version, if mapping exists, verification is performed to confirm that all required inputs for mapping inputs were provided. If you update the mapping inputs, you must update the inputs in the Mapping screen. If you updated caller inputs, you must update the PaCE API call to ensure that the policy is executed.
Archived	A published Current version becomes Archived when a different version is published. Only Current versions can be Archived. If necessary, you can also republish an Archived version. **Note:** When a version is published, it becomes the Current version irrespective of its previous states.
Ready	The Ready state is assigned to optional policies available when an application content pack is installed. These policies cannot be modified. If you want to modify a policy, create a copy and make the required changes.

Policy version numbering

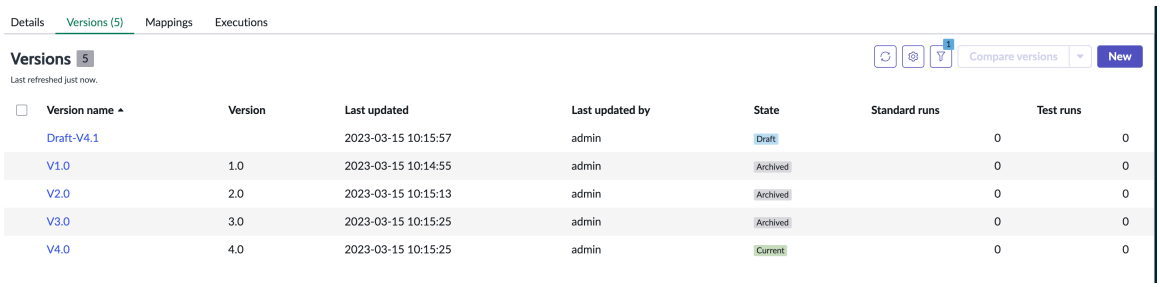
There are three identifiers for each version: Version name, Version, and Revision number. These identifiers are shown as three separate columns in the **Versions** tab.

Identifier	Description
Version name	For Draft versions, the version name uses Draft-V{Revision number}. For Current (published) or Archived versions, V{Version} is used for the name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Identifier	Description
Version	The Version number is assigned only when you publish a version. The number is automatically created according to the existing version number. For the first Current (published) version, the number is 1.0 and for subsequent current versions, the number increases by +1.0. For example, 2.0, 3.0, 4.0, and so on. Current versions that have been Archived retain the original version number. Draft versions are not assigned a version number.
Revision number	The Revision number is derived from the version that it was created from. If an empty new policy is created, the initial draft version is assigned 0.1. Each subsequent draft version is assigned 0.2, 0.3, 0.4, and so on. If the version was created from a published (Current or Archived) version, it inherits the Version number. For example, you can create a draft version from the Current (published) version 2.0. The draft version is assigned the revision number 2.1.

The following image illustrates the different states and their version numbering.



As shown in the preceding image, the first draft policy version created was automatically assigned the Revision number 0.1. Each subsequent draft is assigned V0.2, V0.3, and so on. Draft version 0.2 (as indicated in the Revision number column) was published and became the Current version, with the Version name of V1.0.

A draft version of this Current version was created, with the Revision number 1.1. That draft was published to become the Current version and was assigned the Revision number 1.1. The previously Current version is now Archived, but retains the Revision number 0.2.

Create new PaCE policy versions

You can create new versions for any of your existing policies.

After you have created a policy, a draft policy version is automatically created. This policy version contains the actual policy script, and may also contain mapping inputs and caller input definitions.

You can create a policy version from scratch, using low-code, or copy an existing policy version and use that as the basis for a new version. The version can include input definitions for mapping or caller variables. These parameters are used with the logic of the policy to determine whether the policy is in compliance.

For example, for a travel expense policy you can create several policy versions. Each version can include different mapping inputs, for example, limiting the different types of expenses. In one version, the breakfast expense limit could be $25, and the dinner expense limit could be $50. Each time the policy (and the relevant Current version) is invoked, the various expenses are validated by the policy to ensure they are in compliance.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a PaCE policy version

Create a version from scratch at any time for any of your existing PaCE policies.

Before you begin

Role required: sn_pace.code_editor

About this task

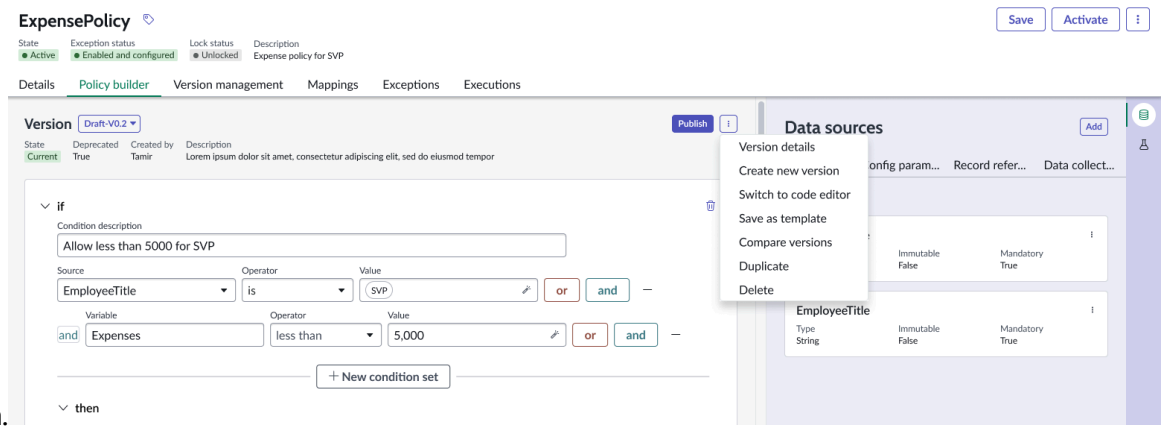
Note:
Your administrator may have pre-configured policy versions that contain default caller and mapping inputs. You may not be able to edit these input variables, but you can add new inputs, as required.

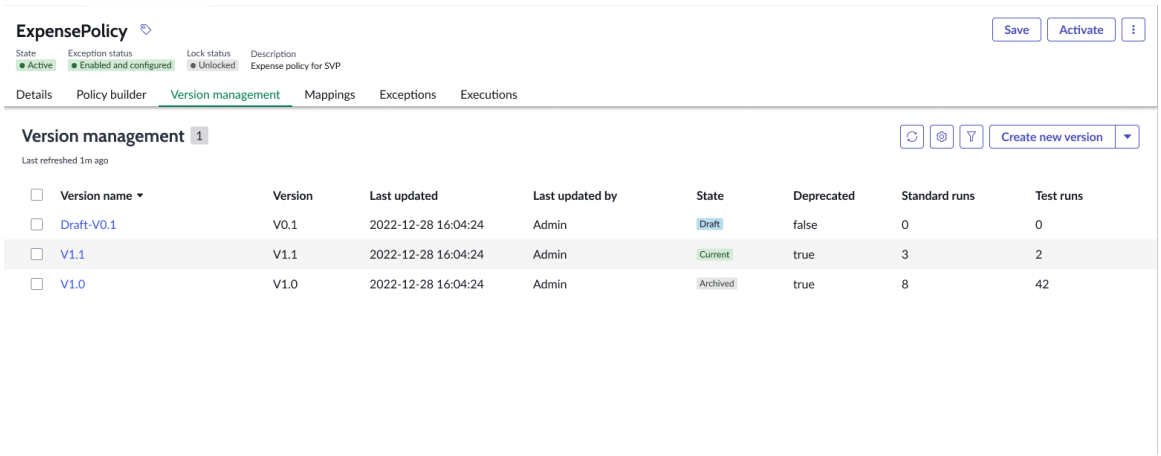
Procedure

1. Navigate to **All** > **Policies** > **My Policies**.

   Note:
   To view all policies generated by admin/other users, navigate to **Policies** > **All Policies**.

2. Click the policy name for the policy that you want to add a new version to.
3. You can create a new version two different ways:
   - Select the **Policy builder** tab, then the Overflow menu icon
   - Select the **Version management** tab then **Create new version**.
4. Select **Create new version**.





5. Select the New blank version tile or an existing policy template, then **Create**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Templates can be filtered by most used, alphabetically, state, and type. By default, inactive templates are hidden.

6. Clear the **Is low code** check box.
7. **Optional:** In the Create New Policy Version form, add a description in the **Description** field.

   Note:
   The **Description** field is the only editable field in the form. The version and revision numbering cannot be modified and are automatically assigned.

8. Click **Save**.

What to do next

The policy version is saved and the version is assigned a number according to policy numbering. You can:

- Define API Variables, Config Parameters, and Record References.

  See Passing parameters to PaCE policies.

- Modify the policy script.

  See Edit a PaCE policy script.

- Test your policy version to ensure it is compliant.

  See Use the Test Playground for PaCE policies for details.

- Publish the policy version.

  See Publish a PaCE policy version.

- Review execution activity for the version.

  See Review executed policy activity.

- Delete the version.

  See Delete a PaCE policy version.

Create a PaCE policy version using low-code

Create a policy version using low-code for any of your existing PaCE policies.

Before you begin

Role required: sn_pace.code_editor

About this task

The low-code function enables you to write policies using simple UI elements by defining conditions for the policy to determine if it's compliant or non-compliant. If the **Is low code** check box is selected when you create a policy version, the **Policy Builder** and **Test Playground** tabs will automatically have the Policy logic page set to low-code.

You can switch to the Policy Script to create a policy using JavaScript by selecting the **Switch to code editor** button, but you'll be unable to switch back to low-code. For more information on how to write PaCE policies using JavaScript, see How to write and test PaCE policies.

Note:
Policy Builder works best in Google Chrome and Firefox.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Policies** > **My Policies**.
2. Select the policy name for the policy that you want to add a new version to.
3. In the Policy Details page, select the **Versions** tab.
4. Select **New**.
   The New version page appears.
5. Select the New blank version tile or an existing policy template, then **Create**.
   Templates can be filtered by most used, alphabetically, state, and type. By default, inactive templates are hidden.
6. Fill in the **Description** field.

> **Note:**
> By default, the **Is low code** check box is automatically selected.

7. Select **Save**.

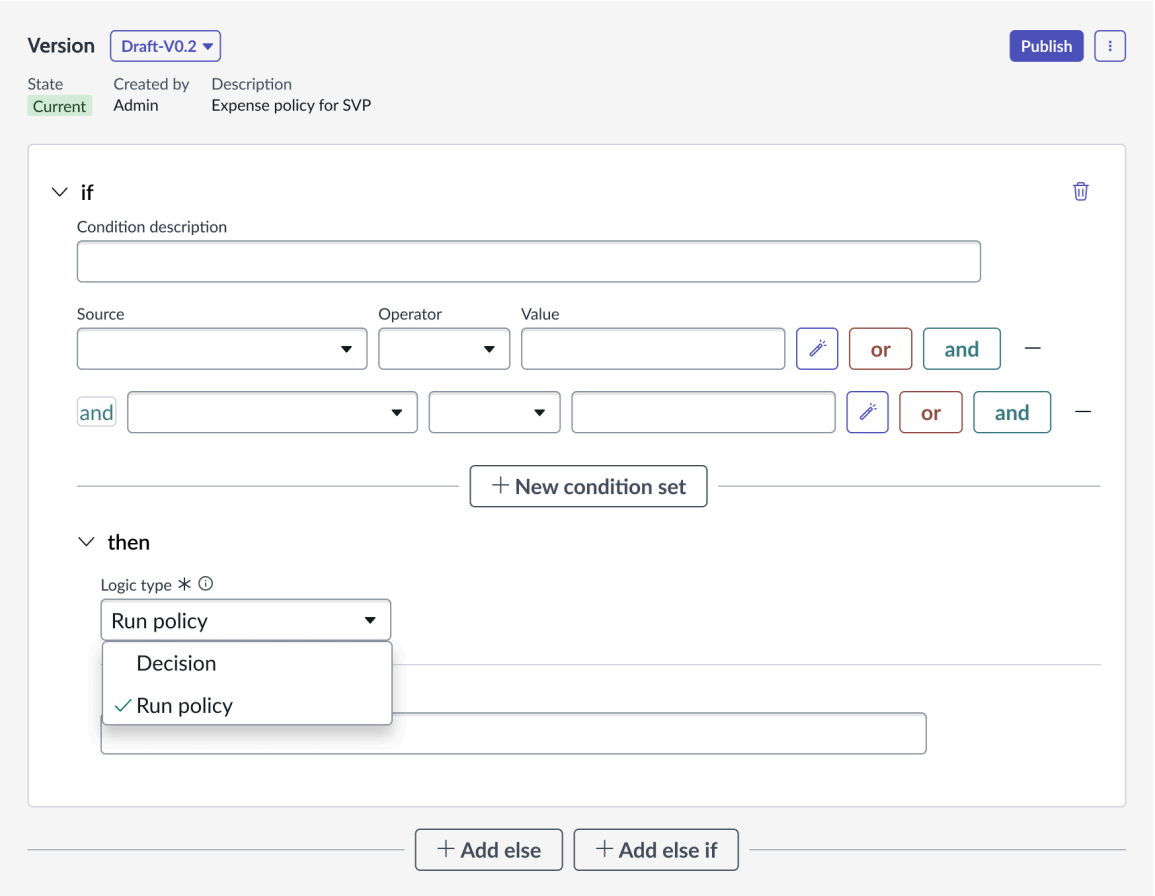
Result

The policy version is saved with an assigned number according to the policy numbering and will enable you to set the conditions using low-code.

Policy logic condition fields

Policy logic is a set of conditions that is used for determining whether a policy is compliant or non-compliant. You can use the condition builder to specify conditions for the policy.

Policy logic page



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Select the **or** and **and** button to add multiple rules in the condition set. Select the minus icon to delete a condition.

You can add a condition set by selecting the **New condition set** button.

If and else if statement fields

Field	Description
Condition description	Description of the field.
Source	Variable of the source for the condition.
Operator	List of operators to filter the source for the condition. The list changes depending on the source selected.
Value	Value to enter text. Select the Data picker icon to concatenate multiple text strings with multiple data pills to select a variable for the log. **Note:** If your Source is choice, the Data pill picker icon is inactive.

The **else if** statement enables you to specify a new condition if the first condition is false. The **else** statement enables you to specify a new condition if it does not apply to the **if** statement.

You can add a dependent condition by selecting **or** or **and** next to the condition.

Then and else statement fields

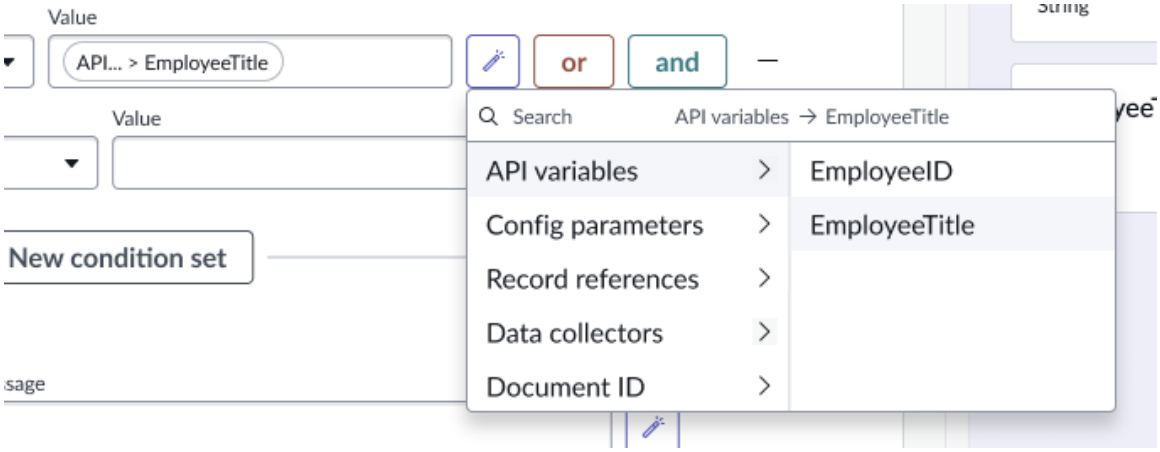
Field	Description
Logic type	Select the logic type of the policy: • Decision: Determines if the policy is **Compliant** or **Non-compliant**. • Run policy: For nested policies, the parent policy will return the decision of the child policy that has been selected in the builder. **Note:** PaCE supports nesting policies for decision-making and up to two levels are supported, a child and a grandchild.
Log level	Level of the log.
Log message	Log message field to enter text or select the Data picker icon to concatenate multiple text strings with multiple data pills to select a variable for the log.

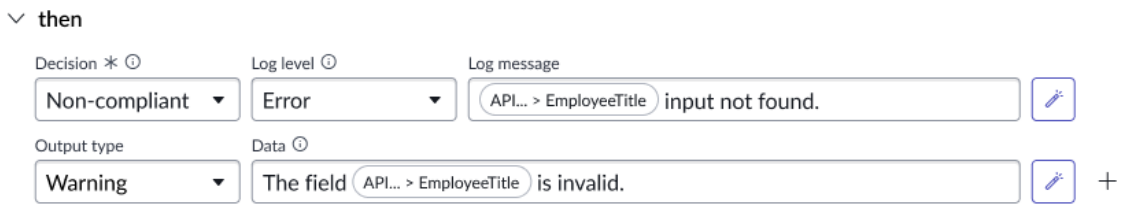
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Then and else statement fields (continued)

Field	Description
Output type	Output type of the log. You can select the plus icon + to add multiple output types or the minus icon − to delete the output type.
Data	Data field to enter text. Select the Data picker icon to concatenate multiple text strings with multiple data pills to select a variable for the log.

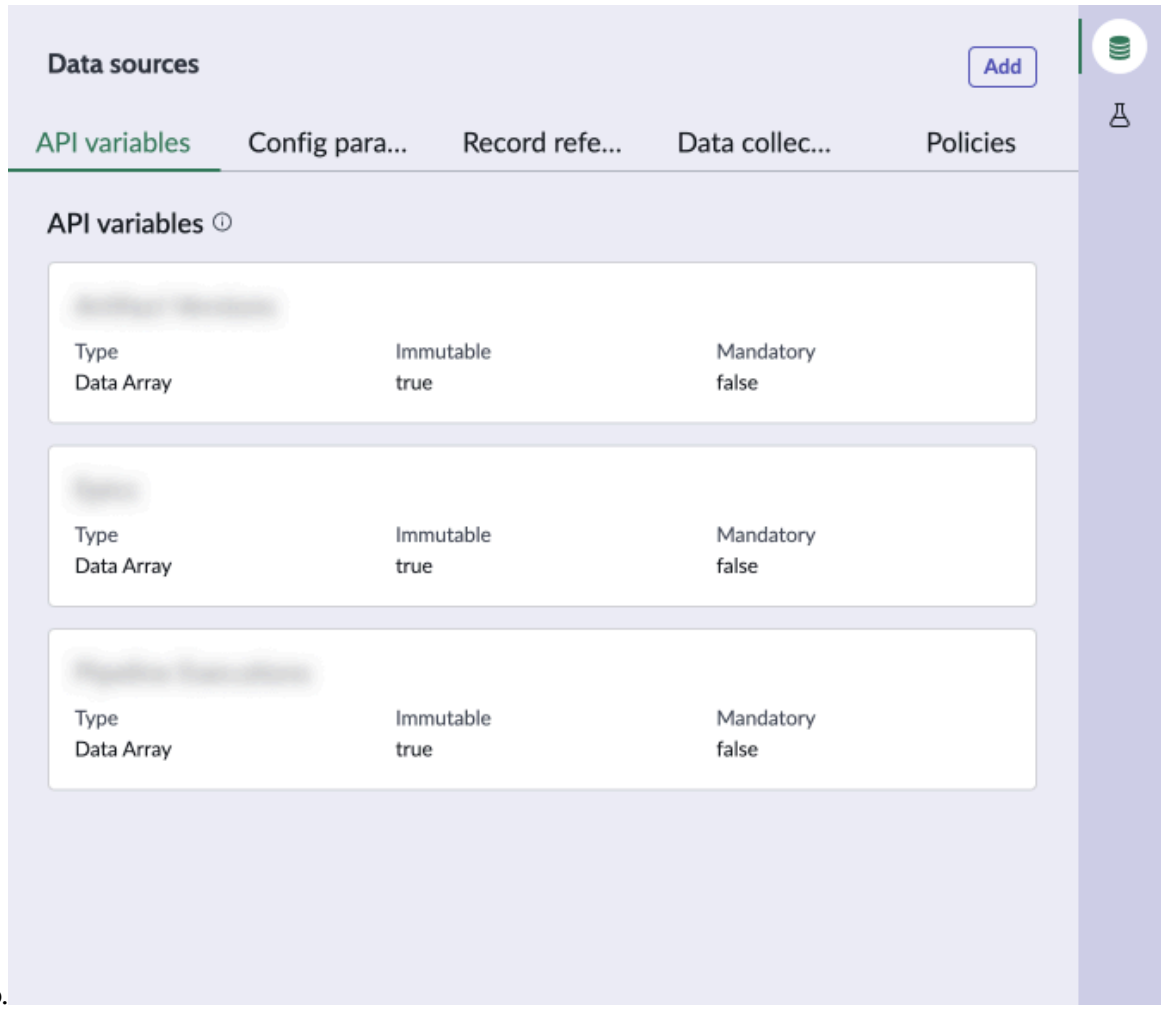
The following images show you are able to use the data pill picker to concatenate data in the fields:





© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can see a list of the data sources under the Data source



tab.

You can calculate fields using numeric operators and use these variables to calculate the desired value in a policy logic.

Note:
This only supports numeric fields.

Calculated fields

Operator	Description
Plus (+)	Add variables and constants. For example, "Var1 + Var2..."
Minus (-)	Subtract variables and constants. For example, "Var1 - Var2..."
Multiplication (*)	Multiple variables and constants. For example, "Var1 * Var2..."
Division (/)	Divide variables and constants. For example, "Var1 / Var2..."
Parentheses ()	Use parentheses to support the order of operators.
calc[]	Use the brackets to evaluate an expression.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can mix and match between the operators. For example, "Var1 +Var2*Var3 / Var4".

Create a copy of a PaCE policy version

You can create a copy of an existing policy version. All the settings and mappings from the existing version are copied over to the new one.

Before you begin
Role required: sn_pace.code_editor

About this task
When you create a new policy version from an existing one, the input definitions and the policy script from the original version are copied to the new version. The version is assigned a number according to policy numbering.

Note:
The new policy version is initially created as a draft, with a revision number based on the original policy version. For further details about version states and numbering, see PaCE policy version states.

Procedure

1. Navigate to **All** > **Policies** > **My Policies**.

   Note:
   To view all policies generated by admin/other users, navigate to **Policies** > **All Policies**.

2. Click the name of the policy for which a version is to be created.
3. In the Policy Details page, click the **Versions** tab.
4. Click the **Version name** link of the policy version that you want to copy.
5. Click **Create New Draft**.
   A new copy of this policy version is created.
6. Enter a description for the new version and click **Save**.

Duplicate PaCE policy versions

You can create a duplicate policy from a policy version or multiple versions from two or more policy versions. If you want to use a locked policy, you must first create a duplicate version and then modify the policy version as required.

Duplicate a single policy version

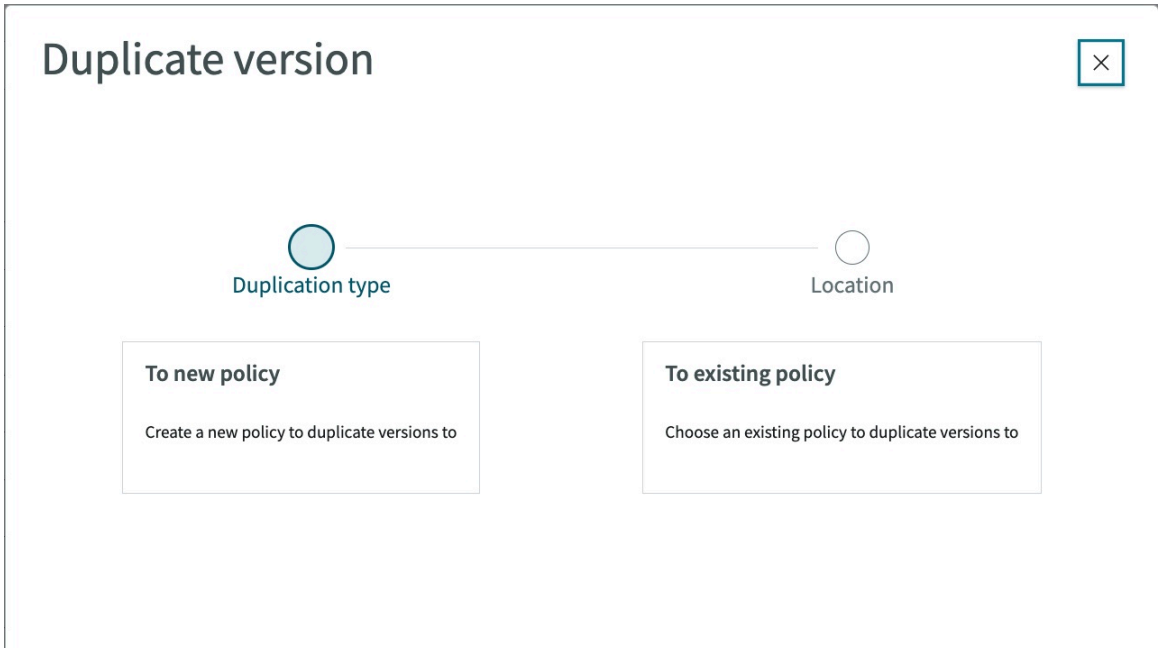
To create a duplicate policy from a policy version, follow these steps:

1. Navigate to **All Policies** > **My Policies**.

   Note:
   To view all policies generated by admin/other users, navigate to **Policies** > **All Policies**.

2. Select the name of the policy that you want to duplicate.
3. In the Policy Details page, click the **Versions** tab and select the version you want to duplicate.
4. Click the **More Actions** icon and select **Duplicate**.
5. Select an option in the **Duplicate version** form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



- To new policy:
  a. Select this option to create a duplicate policy from this version.
  b. Enter the policy name, category, and description.
  c. Click **Duplicate**.

     The newly created policy is a duplicate copy and contains the same parameters and mappings of the selected policy version.
- To existing policy:
  a. Select this option to create a duplicate version for an existing policy.
  b. In the Duplicate Version form, select the policy to which the version is to be duplicated.
  c. Click **Duplicate**.

     The newly created duplicate version is displayed in the Versions page of the selected policy.

Duplicate multiple policy versions

1. Navigate to **All Policies** > **My Policies**.

   Note:
   To view all policies generated by admin/other users, navigate to **Policies** > **All Policies**.
2. Select the name of the policy that you want to duplicate.
3. In the Policy Details page, click the **Versions** tab.
4. Select the policies that you want to duplicate and from the drop-down list, select **Duplicate versions**.
5. Select an option in the **Duplicate version** form and follow the remaining steps as listed in Duplicate a single policy version.

Edit a PaCE policy script

Edit the PaCE policy script to apply any changes to the policy logic.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_pace.code_editor

About this task
Important:
For further information about testing your policy script, see Use the Test Playground for PaCE policies.

Procedure
1. Navigate to **All** > **Policies** > **My Policies**.

   Note:
   To view all policies generated by admin/other users, navigate to **Policies** > **All Policies**.

2. Select the policy for which you want to update the script.
3. In the Details form of the relevant policy, click the **Versions** tab and select the version you want to edit.
4. In the policy version page, click the **Policy builder** tab.
   The following image shows a sample policy script.

   Note:
   The script is editable for policy versions in Draft state only. For policy versions in Current or Archived state, the script is read-only.

5. Apply any changes to the policy script, as required.
6. Click **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Publish a PaCE policy version

You can publish a policy version at any time. When the policy is published, a compliant, non-compliant, or compliant-exception decision is made for objects (tables or document IDs) mapped to the policy.

Before you begin

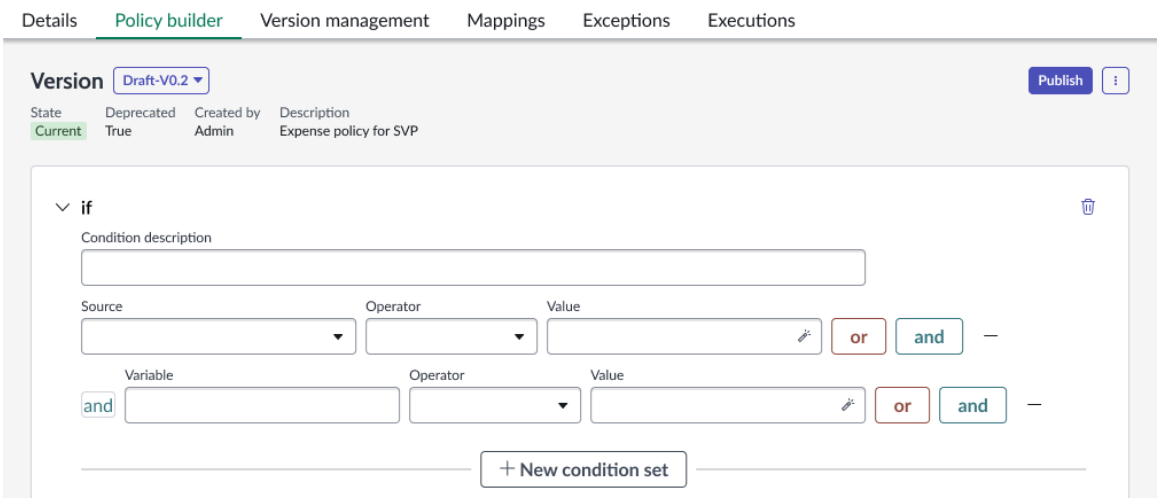
Role required: sn_pace.code_editor

Procedure

1. Navigate to **All** > **Policies** > **My Policies**.

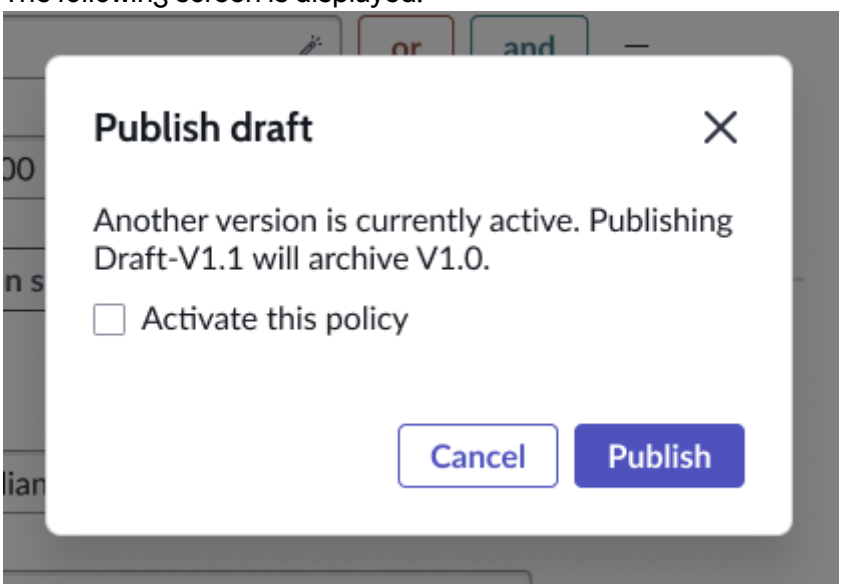
> **Note:**
> To view all policies generated by admin/other users, navigate to **Policies** > **All Policies**.

2. Click the policy name for the policy that includes the version you want to publish.
3. In the Details page, click the **Policy builder** tab.



Typically you would publish a Draft policy, but you can also republish an Archived version.

4. Click **Publish**.
The following screen is displayed.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select the **Activate this policy** check box to activate the policy when it is published.
6. In the displayed confirmation message, click **Publish**.

   The policy version becomes the Current version and is used the next time the policy is invoked.

> **Note:**
> If the policy has an existing mapping to document IDs, when you publish a new version it verifies that all mandatory inputs for mapping inputs are provided. If you changed a mapping input, it must be updated. If you changed a caller input, you must update the PaCE API call to ensure that the policy is executed. If there is no mapping associated with the policy, or the policy is in an Inactive state, the mapping inputs are not verified.

Edit a draft PaCE policy version

You can edit a Draft PaCE policy version at any time. The Draft version can be published to become the Current version. You can also create multiple different Draft versions from different Archived versions.

Before you begin
Role required: sn_pace.code_editor

Procedure

1. Navigate to **All** > **Policies** > **My Policies**.

> **Note:**
> To view all policies generated by admin/other users, navigate to **Policies** > **All Policies**.

2. Click the **Policy name** for the policy that includes the version you want to edit.
3. In the Policy Details page, click the **Versions** tab.
4. Click the **Version name** that you want to edit.
5. Edit the information and inputs in the **Details** and **Policy Builder** tabs.
6. Perform one of the following actions.

Edit a current or archived PaCE policy version

To edit a Current (published) or Archived PaCE policy version, you must create a copy of that version, which can then be updated as required.

Before you begin
Role required: sn_pace.code_editor

Procedure

1. Navigate to **All** > **Policies** > **My Policies**.

> **Note:**
> To view all policies generated by admin/other users, navigate to **Policies** > **All Policies**.

2. Click the **Policy name** for the policy that includes the version you want to edit.
3. In the Policy Details page, click the **Versions** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Click the **Version name** that you want to edit.
   As you can't update a policy version that is Current (published) or Archived, the displayed fields are read-only.
5. Click **Create New Version**.
   In the Version page, define the details of the new version. For further information, see the Create a new version of a policy section. In addition, you can create multiple Draft versions from an Archived or Current (published) version and work on them in parallel.

Compare PaCE policy versions

You can compare two versions of a PaCE policy, whatever their state. Any differences between the two selected versions are highlighted for quick analysis.

Before you begin

Role required: sn_pace.code_editor

Procedure

1. Navigate to **All** > **Policies** > **My Policies**.

   Note:
   To view all policies generated by admin/other users, navigate to **Policies** > **All Policies**.

2. Click the **Policy name** for the policy that includes the versions you want to compare.
3. In the Policy Details page, click the **Versions** tab.
4. Select the relevant two versions to compare, and click **Compare**.
   The **Compare Versions** tab displays several container sections that highlight any differences between the two versions.
   - The **Details** container highlights differences between the details of the two versions. For example, differences between the state, version name and numbering, and the number of test or standard runs.
   - The **Script** container highlights any differences in the policy script of the two versions.

     
   - The **Mapping Inputs** container also lists any differences between the two versions.
5. To make any changes based on your analysis of the two compared versions, return to the **Versions** tab, select the relevant version, and modify and test as required.

Delete a PaCE policy version

You can delete a policy version at any time. However, only versions that have never been published can be deleted. Published versions are stored for auditing purposes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_pace.code_editor

About this task
- Policy versions in Draft state can be deleted. When a version is deleted, all defined caller/mapping inputs and policy metadata associated with the version are also deleted.
- Policy versions that cannot be deleted include:
  - Policy versions in Current or Archived state.
  - Policy versions that have been executed in a Standard run.

Procedure
1. Navigate to **All** > **Policies** > **My Policies**.

   Note:
   To view all policies generated by admin/other users, navigate to **Policies** > **All Policies**.

2. Click the **Policy name** for the policy that includes the version you want to delete.
3. In the Policy Details page, click the **Versions** tab.
4. Select the relevant version, click **Delete** and **OK** to confirm.

Passing parameters to PaCE policies

Parameters can be passed to a PaCE policy to validate updates to an object (tables and document IDs). These variables apply to authoring in both low-code or JavaScript. Policy versions include three types of parameter inputs: API Variables, Config Parameters, and Record References.

API Variables

Previously known as Caller Inputs, the API Variables is passed to the PaCE API at the time of invocation by a developer. The API Variable is a variable that enables you to pass the value to the policy whenever the policy is invoked. Specify a value for this API Variable when calling the API, otherwise the policy is not executed and no decision is reached. In the code editor, the variable name is `apiVars`.

For each PaCE policy, there is only one pre-defined API Variable called **SnapshotId**. This API Variable is Immutable and cannot be modified or deleted. You cannot define any additional API Variables for a policy.

Config Parameters

Previously known as Mapped Inputs, the Config Parameters can be passed when mapping policies to an object (tables and document IDs). When you define a Config Parameter, you are creating a parameter that enables you to pass values to the policy whenever the policy is mapped. If you define mandatory inputs, you must specify values for these inputs when mapping the policy. If the inputs you define are not mandatory, the policy is not executed (the status is set to inactive) and no decision is reached. In the code editor, the variable name is `configParams`.

For example, for a travel expenses policy you can add variables to define the limits of different types of expenses. The limits are specified when mapping the policy, and set the limits on the expense when the policy is invoked on this object. The breakfast expense limit for one group of employees could be $25, and for a different group of employees the limit could be $50. Each

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

time the policy is invoked, the expenses are validated by the policy according to the limits specified in the mapping.

Record References

Record references define queries to extract data from any ServiceNow® tables and use the data to configure the policy logic. This feature enables you to retrieve additional data that may be required while defining the policy. You can define a query to perform aggregate functions for a record reference. In the code editor, the variable name is `recordRefs`.

Data Collectors

The data collectors function collects input process data from ServiceNow or an external data source to provide an output. The output can be used in the policy logic to make a decision. You can define and manage data collectors by creating, editing, updating, and activating them to your policy builder.

Data collectors can be accessed by using the `dataCollectors` object in JavaScript.

Note:
Auto-completion lists all possible outputs and data collectors that are available to use.

While editing a policy in low-code, an output of the configured data collectors is available under the drop-down menu.

Create a new variable for a policy version

Create an API Variable, Config Parameter, or Record Reference for the policy version in the Define Variables section of the Policy Builder.

Before you begin

If you want to create a variable that will apply to all of your policies, then do the following:

1. Go to the Variable Definition section on the main page.
2. Select the variable section that you want to create.
3. Select **Add**.

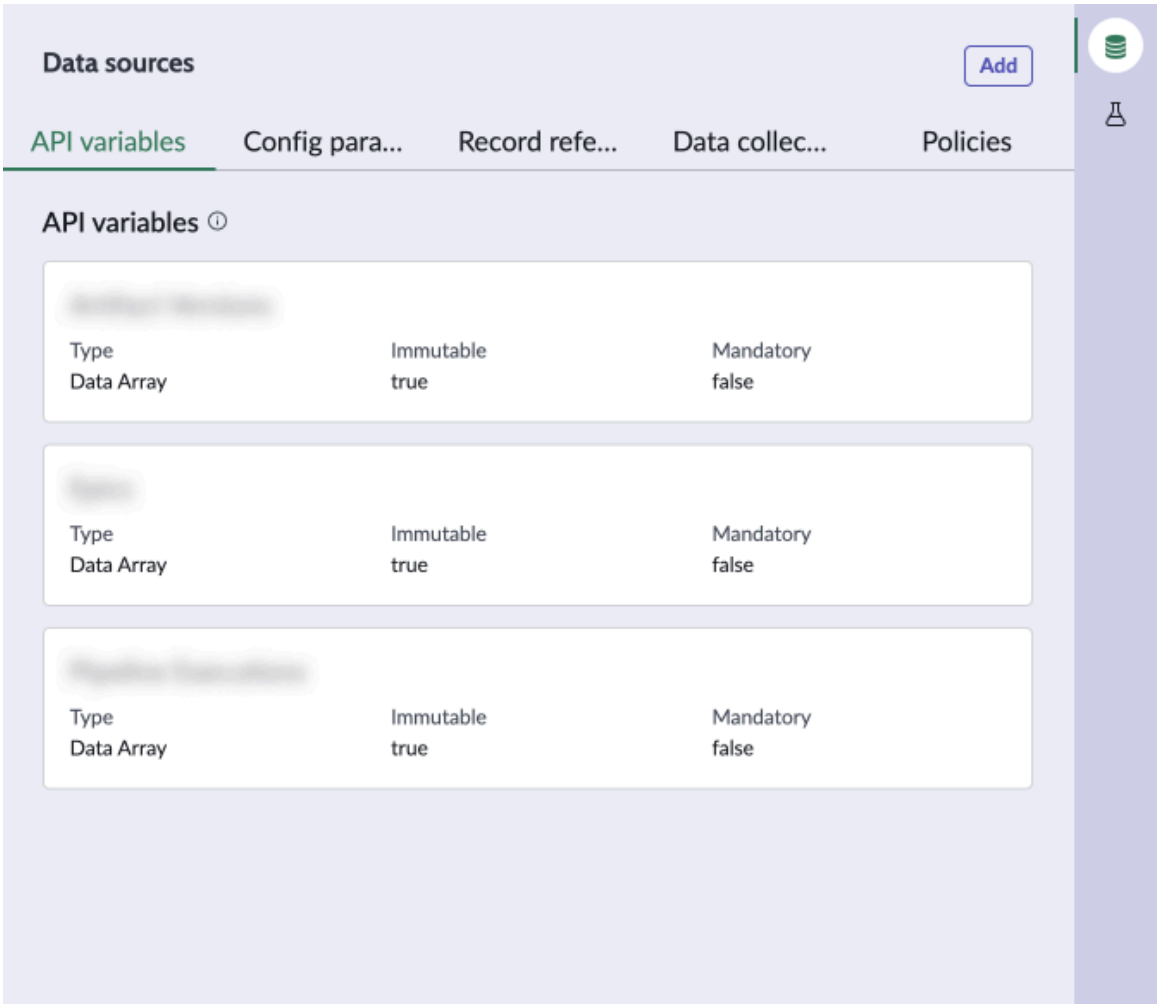
When you save the variable, it will show up in the Define Variables section on the Policy Builder of the policy.

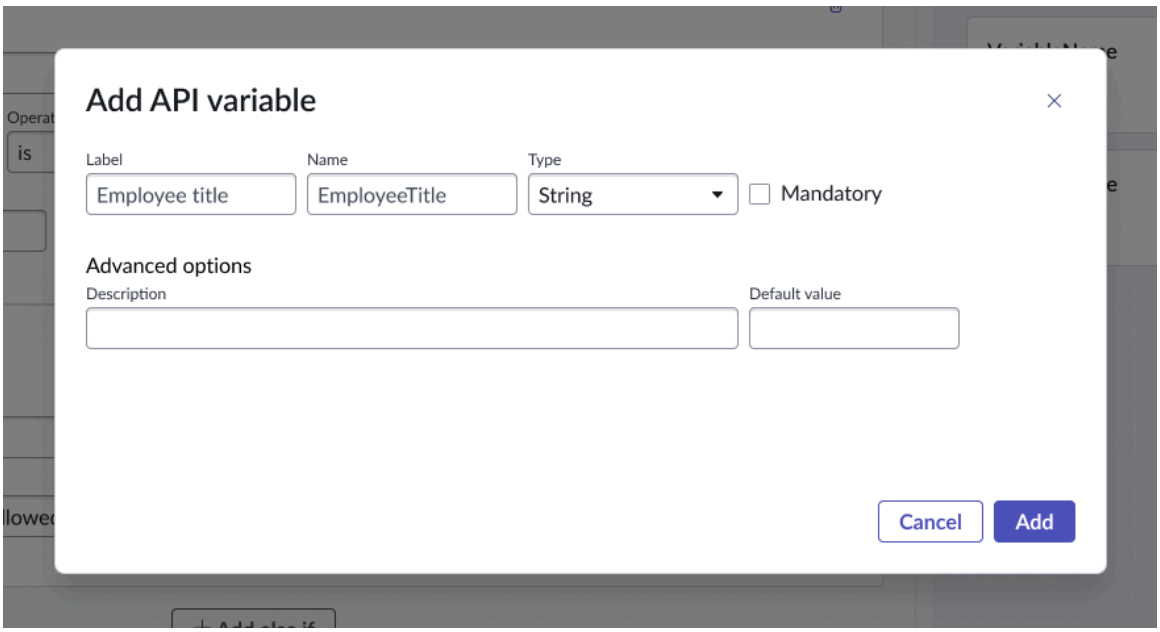
Role required: sn_pace.code_editor

Procedure

1. In the **Policy builder** tab, select the version of the policy you want to add a new variable to, then the Data sources icon .
2. Select the variable tab that you want to create a variable from then select **Add**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.





A pop-up window appears titled with the variable you want to create.

3. On the form, fill in the fields as needed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a new variable form

Field	Description
Label	Label name of the variable.
Name	Name of the variable.
Type	Drop-down list of input types: ○ Basic Date/Time ○ Basic Time ○ Choice ○ Data Array ○ Data Object ○ Decimal ○ Email ○ Integer ○ IP Address ○ JSON ○ Other Date ○ Reference ○ String ○ Sys ID (GUID) ○ True/False Depending on the input you choose, the Advanced Options provides different fields for some inputs. For more information, see the Data type descriptions topic. **Note:** The list only shows the most common used data types.
Mandatory	Option to make this variable mandatory. When the variable is mandatory, a value must be provided when mapping the policy. Otherwise the policy can't be executed.
Description	Description of the variable. **Note:** When you add a description for a Config Parameter variable, it will show up under the tool tip icon ⓘ in the Test Parameters tab.
Default Value	Default value for the variable.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: When you create a record reference, select a reference in the Table field, this field enables you to select a dependent document from the reference.
Function (Optional)	Functions to aggregate your condition. Choices are as follows: ○ Average: Average value of the condition. ○ Count: Count of the number of non-null values. ○ Maximum: Largest or maximum value. ○ Minimum: Minimum value. ○ Standard deviation: Population of standard deviation. ○ Sum: Sum of all values. **Note:** This field will only show up in the Record Reference variable form with the qualifier condition fields.
Match criteria	A match criteria for your record reference. Choices are as follows. ○ Select first match ○ Error on multiple When you create a Record Reference, it will query multiple answers. The match criteria enables you to filter out the match by selecting the first match or return an error if there are multiple answers. **Note:** This field will only show up in the Record Reference variable form with the qualifier condition fields. For more information about condition fields, see Policy logic condition fields.

4. Select **Save**.

Result
You can add your variables into the Policy Builder as needed. Additionally, you can delete a variable by selecting it and selecting the **Delete** button.

Data type descriptions

The following is a list of the most common data types for creating a variable.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data types

Data type	Description
Basic Date/Time	Day and time of day, which can be selected with a calendar widget.
Basic Time	Specific time.
Choice	Script that returns an array of choices that will be displayed for selection in a drop-down menu. If you select the **Multi select** check box, then multiple options can be selected from the drop-down. If it's unselected, then only one option can be selected.
Data Array	Data Array structure represented as a String.
Data Object	The Data Object input enables you to select the plus icon to add a new property to the data object or the minus icon to delete it. Additionally, you can select the Star icon that will search for a name if you don't know the structure of the JSON format property. A JSON path and match criteria field will appear and enable you to search for a key in the JSON structure.
Decimal	Number with up to two digits after the decimal points.
Email	Email represented as a String.
Integer	Number with zero decimal points.
IP Address	Variable character field that stores IPv4 and IPv6 addresses.
JSON	JavaScript Object Notation represented as a String.
Other Date	Date, which can be selected with a calendar widget.
Reference	Query that displays records from another table. The data type includes a match criteria field and qualifier conditions that you can set.
String	For 255 characters or less, the string field is a single-line text field.
Sys ID (GUID)	Field that contains a unique identifier for each record.
True/False	Boolean field that appears as a one-digit integer.

Create a data collector for a policy version

Create a data collector for a policy version in the Define Variables section of the Policy Builder.

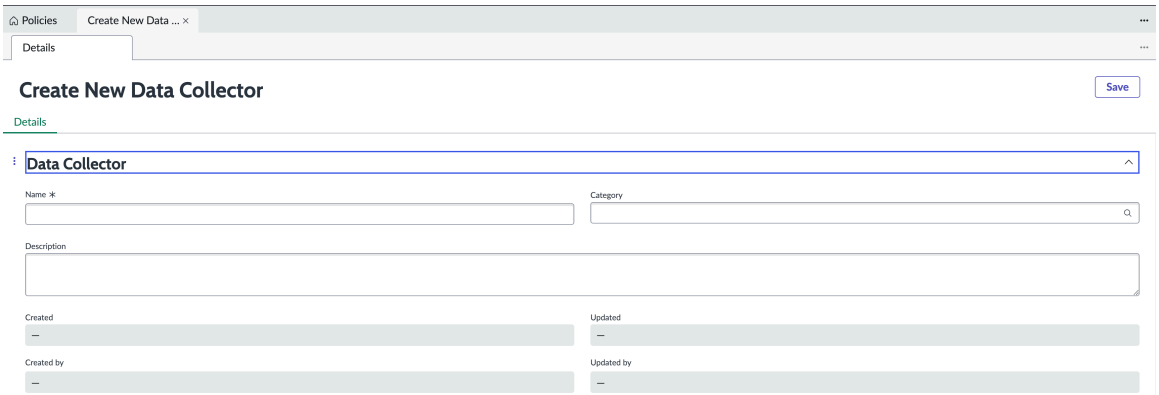
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: sn_pace.code_editor

Procedure

1. Navigate to **All** > **Variable Definition** > **Data Collectors**.
2. Select



New.

3. On the form, fill in the fields as needed.

Create New Data Collector

Field	Description
Name	Name of the data collector.
Category	Category of the data collector. See Managing categories in PaCE for details.
Description	Additional details of the data collector.
Created	Date and time when the data collector was created.
Created by	Name of the user who created the data collector.
Updated	Date and time when the data collector was updated.
Updated by	Name of the user who updated the data collector.

4. Click **Save**.

What to do next

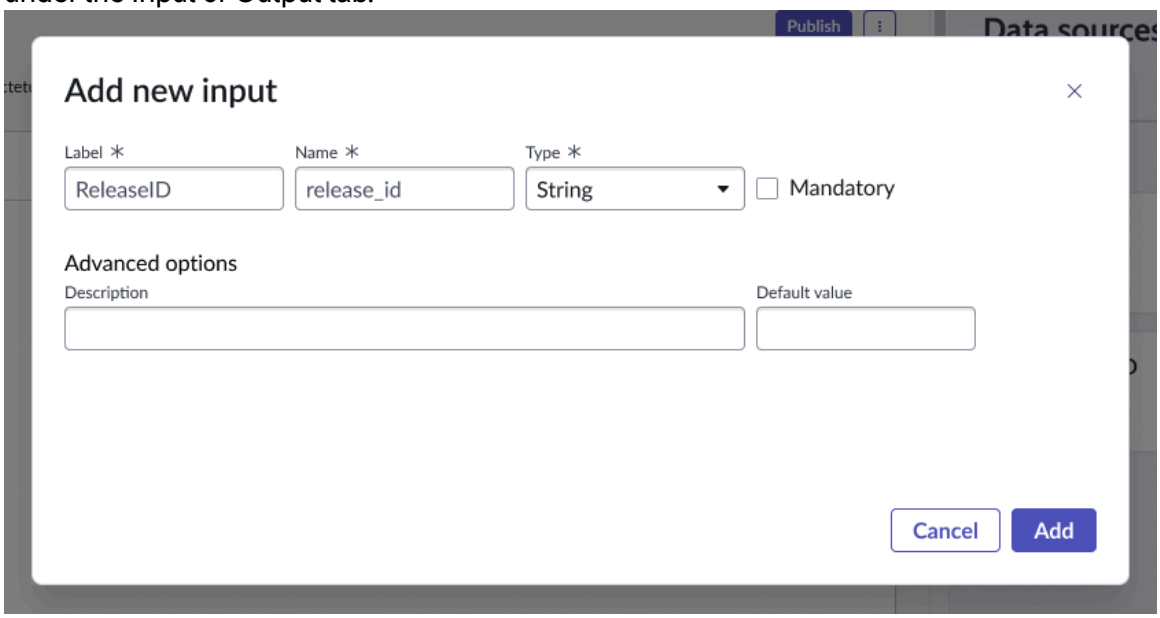
- Activate and build data collectors
- Test a data collector for a policy version
- Add data collectors to a policy version

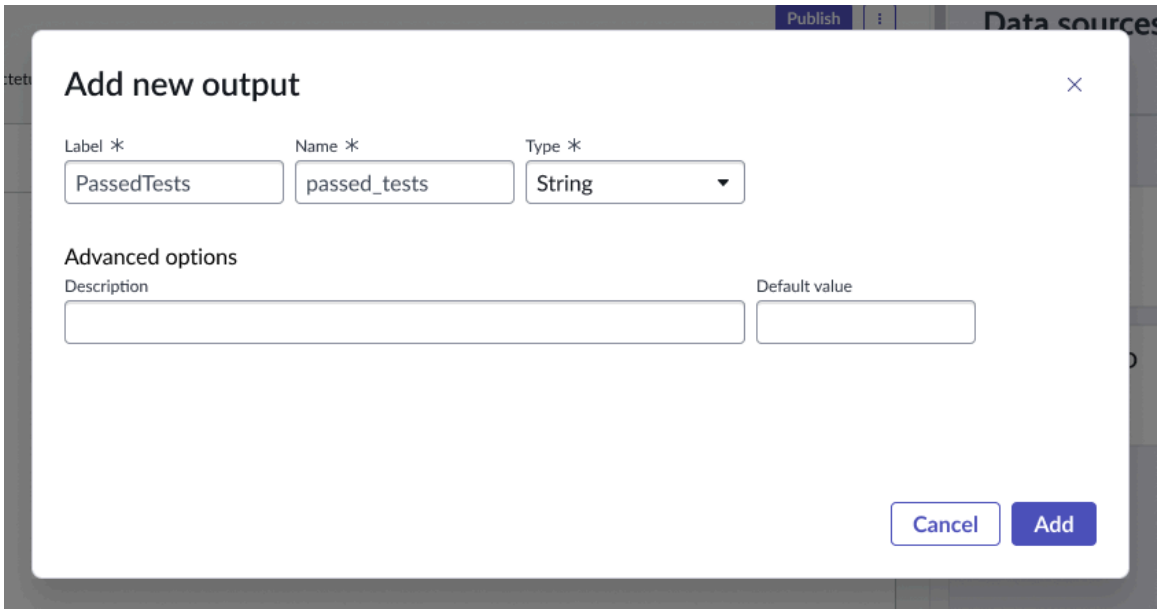
Structure of a data collector

This section describes the structure of a PaCE data collector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

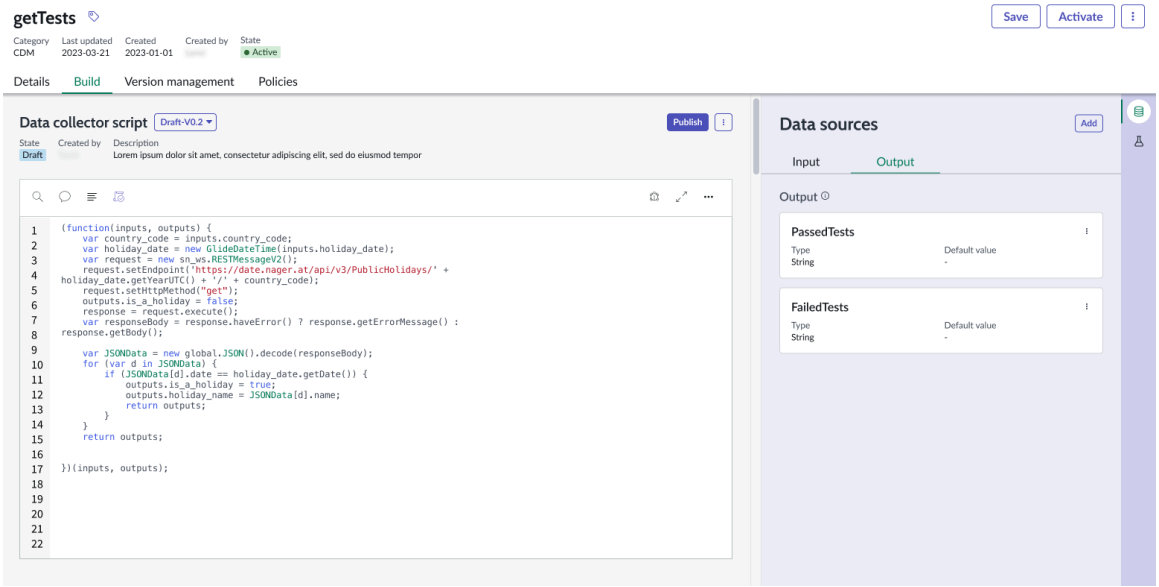
When you create a data collector, you can add inputs and outputs in the Javascript code. In the Data sources tab, select **Add** to create the inputs and outputs you want to add to your data collector. The following images show the pop-up window that will show up when you select **Add** under the Input or Output tab.





The following image shows a sample data collector:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



To debug the data collector script, select the Debugger script icon . For more information, see Script Debugger API.

The following table lists the data collector function parameters and how they can be used in the script.

Variable name	Description
Input	Inputs are used as parameters that help collect the correct data to be used in the policy.
Output	The parameter is used to pass the output of the data collector. Outputs are used to specify output variables that can be used in the policy logic.

Refer to the Data type descriptions topic to see a list of the supported data types for the inputs and outputs.

Activate and build data collectors

Activate and build data collectors to add to a policy.

Before you begin

Role required: sn_pace.code_editor

Procedure

1. Select the **Versions** tab, then the data collector draft name.
2. Select the **Build** tab.
3. In the Data sources section, select the variable tab you want to define.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Click **Add**.

b. On the Add new input form, fill in the fields.

Add new input

Field	Description
Label	(Optional) Label of the input or output.
Name	Enter a name of the input or output.
Type	Select the type of the input or output.
Mandatory	Select this check box if the input is mandatory.
Description	Description of the input or output.
Default value	Specify a default value.

Note:
Inputs are used as parameters that help collect the correct data to be used in the policy. Outputs are used to specify output variables that can be used in the policy logic.

c. Click **Save**.

d. Repeat the steps to create the inputs and outputs as needed.

4. Enter your inputs or outputs and write your code in the Data collector script, as needed.
5. **Optional:** Add an exception error in your data collector by entering the following script: `throw new PaCEExecutionError`.
   When you execute the policy with the data collector exception, the error message will appear under the Output tab in the Execution errors section.
6. Click **Save**.
7. When you're finished, select **Publish**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. In the Publish draft window, select the **Activate this data collector** check box, then **Publish**.

> **Note:**
> When the data collector has been activated, you will be unable to make changes to the inputs or outputs.

Test a data collector for a policy version

Test a data collector for a policy version in the Test Playground.

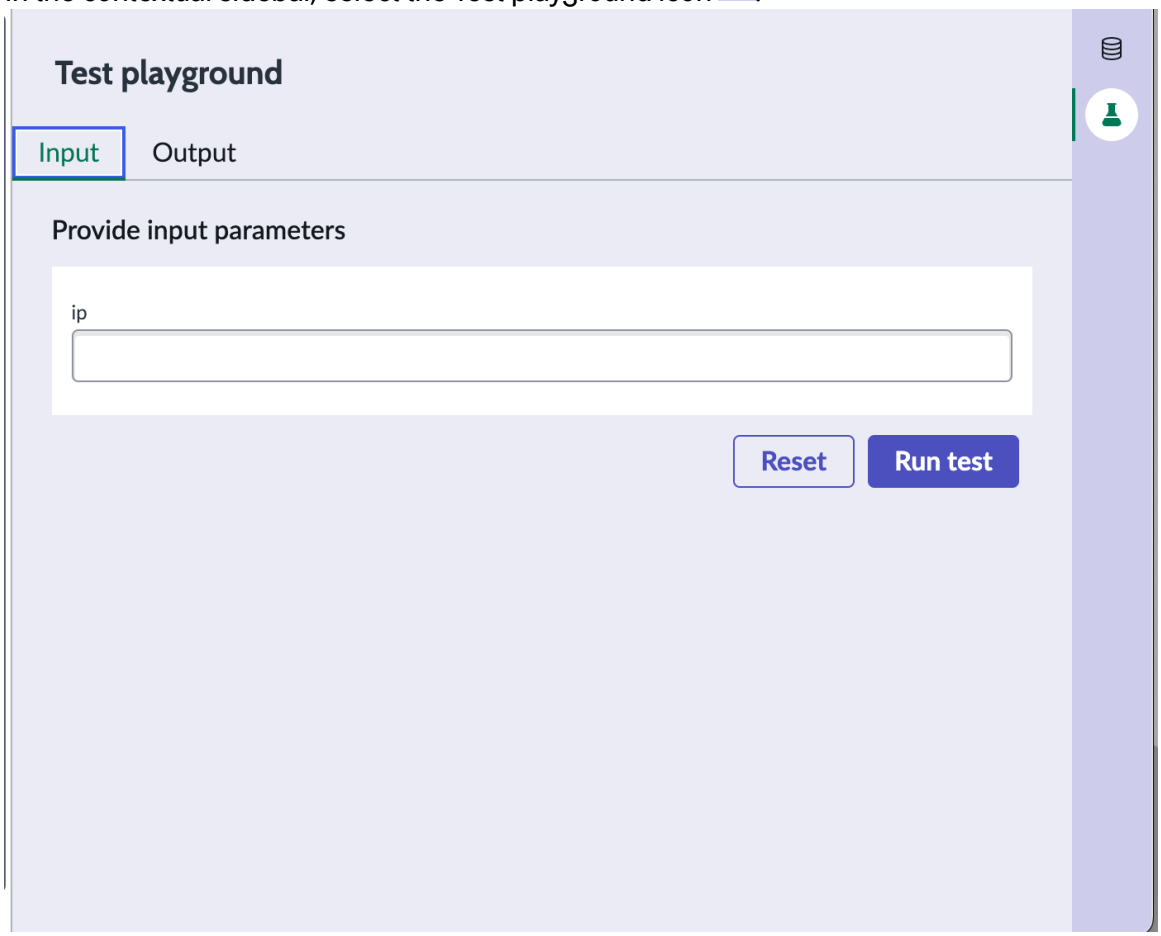
Before you begin

Make sure you created a data collector in the policy. For more information, see Create a data collector for a policy version.

Role required: sn_pace.code_editor

Procedure

1. Navigate to **All** > **Variable Definition** > **Data Collectors**.
2. Select the data collector you want to test.
3. Select the **Versions** tab, then the data collector name.
4. Select the **Build** tab.
5. In the contextual sidebar, select the Test playground icon .



6. Add the parameters in the inputs you want to test in the data collector, then select **Run test**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The results will appear in the Output tab.

7. In the Publish draft window, select the **Activate this data collector** check box, then **Publish**.

Add data collectors to a policy version

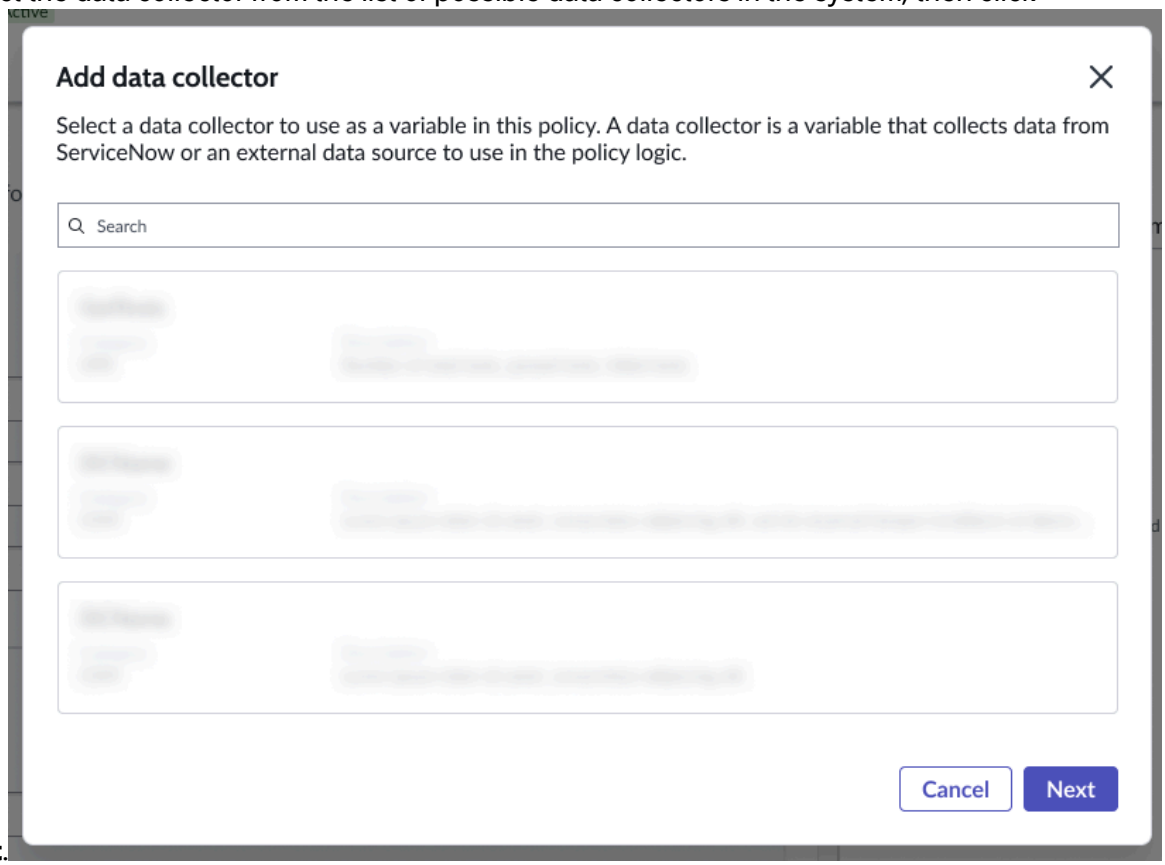
After testing the activated data collectors, add them to a policy in the Policy Builder.

Before you begin

Role required: sn_pace.code_editor

Procedure

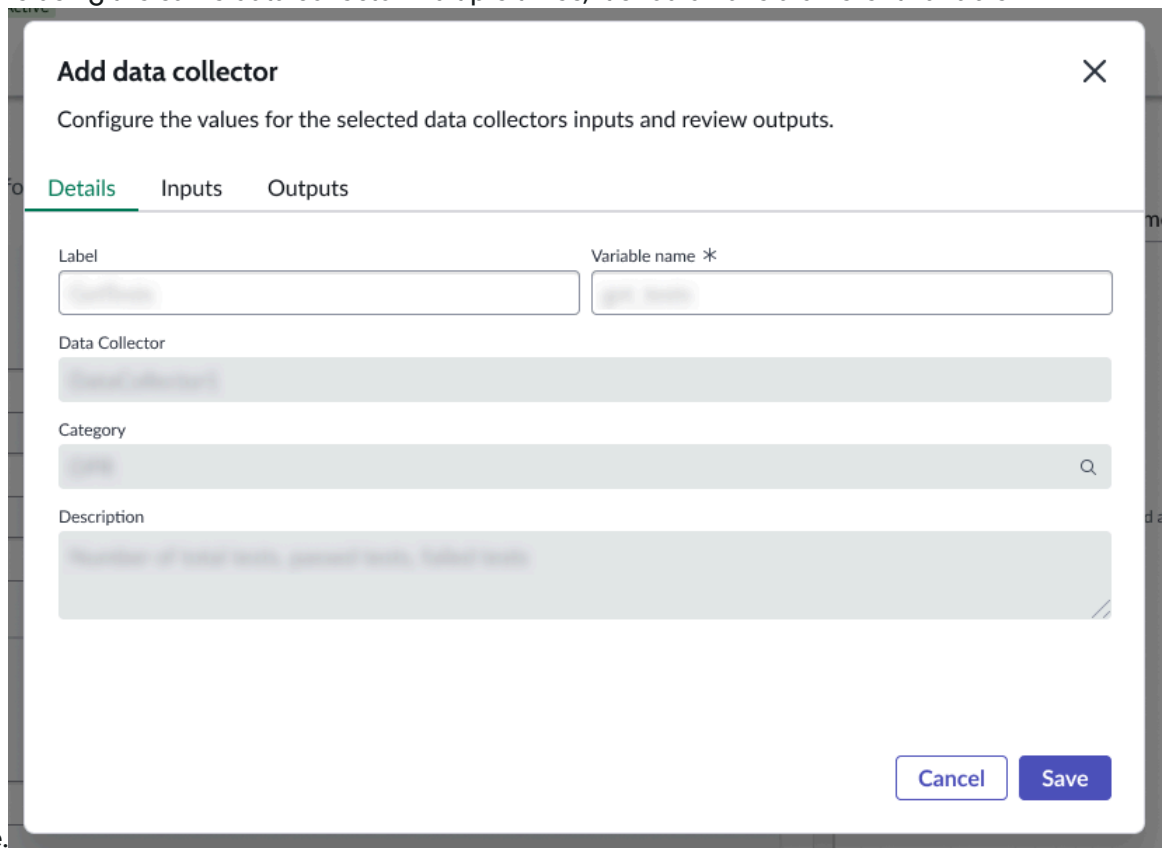
1. In the Policy Builder tab, select the version of the policy you want to add the new data collector to, then the Data sources icon .
2. Select the data collector from the list of possible data collectors in the system, then click **Next**.



3. In the Add data collector page in the Details tab, give the data collector a label and variable name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If you're using the same data collector multiple times, it should have a different variable name.



4. Provide inputs to complete the configuration of the data collector in the Input tab.

Note:
The input can be user-specified or selected from the data picker icon.

5. Click **Save**.
After the data collector is added and configured, you can access the data collector in the script editor using the data picker in low-code. Additionally, you can delete a data collector by selecting it and selecting the **Delete** button

Add nested policies in a policy

Add existing policies to a policy's conditions to define the order a policy's execution and the conditions is executed.

Before you begin

Note:
You must create a policy before adding it to another policy. For more information, see Create a PaCE policy.

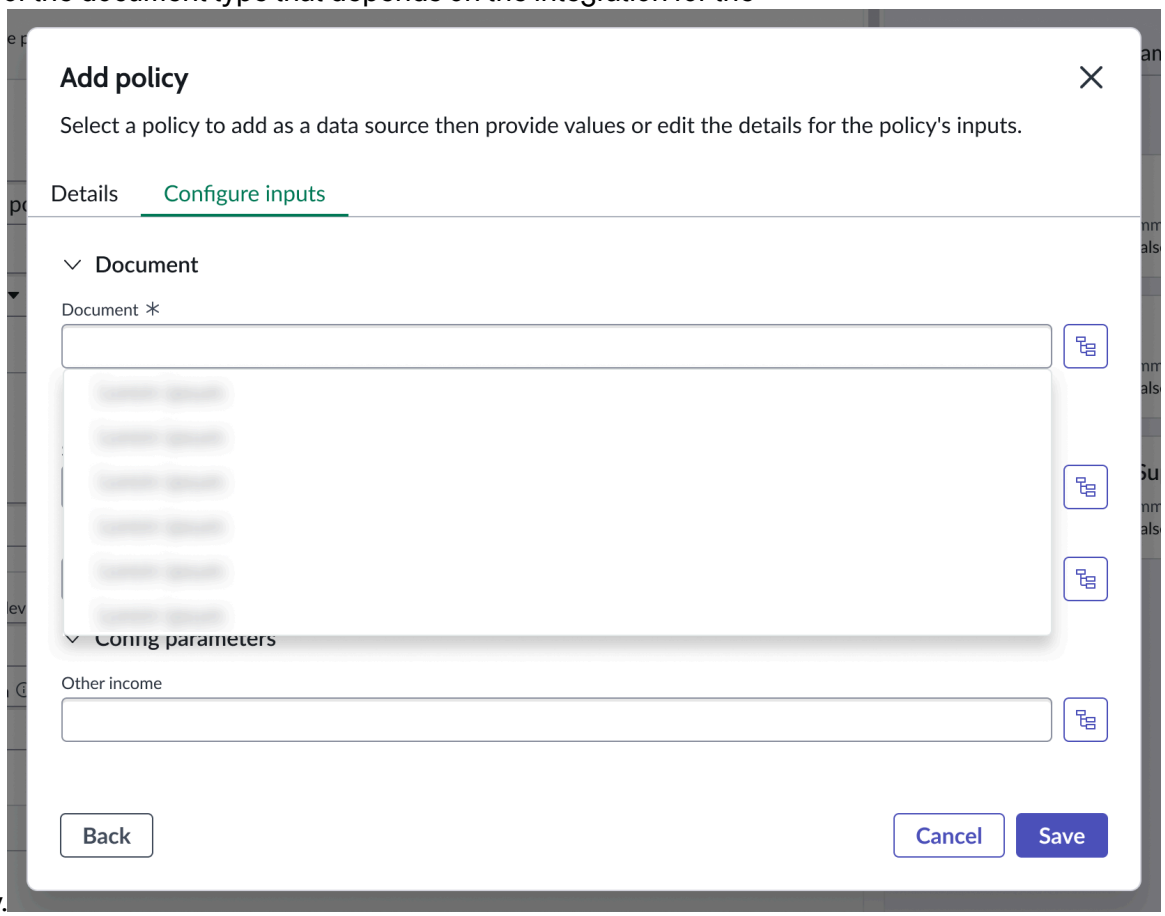
You can add a policy multiple times with different names and parameters. The policies must be configured and mapped to a document, and API variables and Config parameters may be required and mapped to be configured. For more information on how to add variables, see Create a new variable for a policy version.

Role required: sn_pace.code_editor

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Policies** > **My Policies**.
2. Select the policy you want to nest the policies in.
3. In the **Data sources** section, select the **Policies** tab.
4. Select **Add**.
5. In the Add policy window, search and select the policy you want to add as a data source, then select **Next**.
6. On the Details tab, enter the **Label** field and **Variable name** field and other configuration inputs as needed for the policy.
7. In the Configure Inputs tab, under the Document section, select the value of the document type that depends on the integration for the policy.

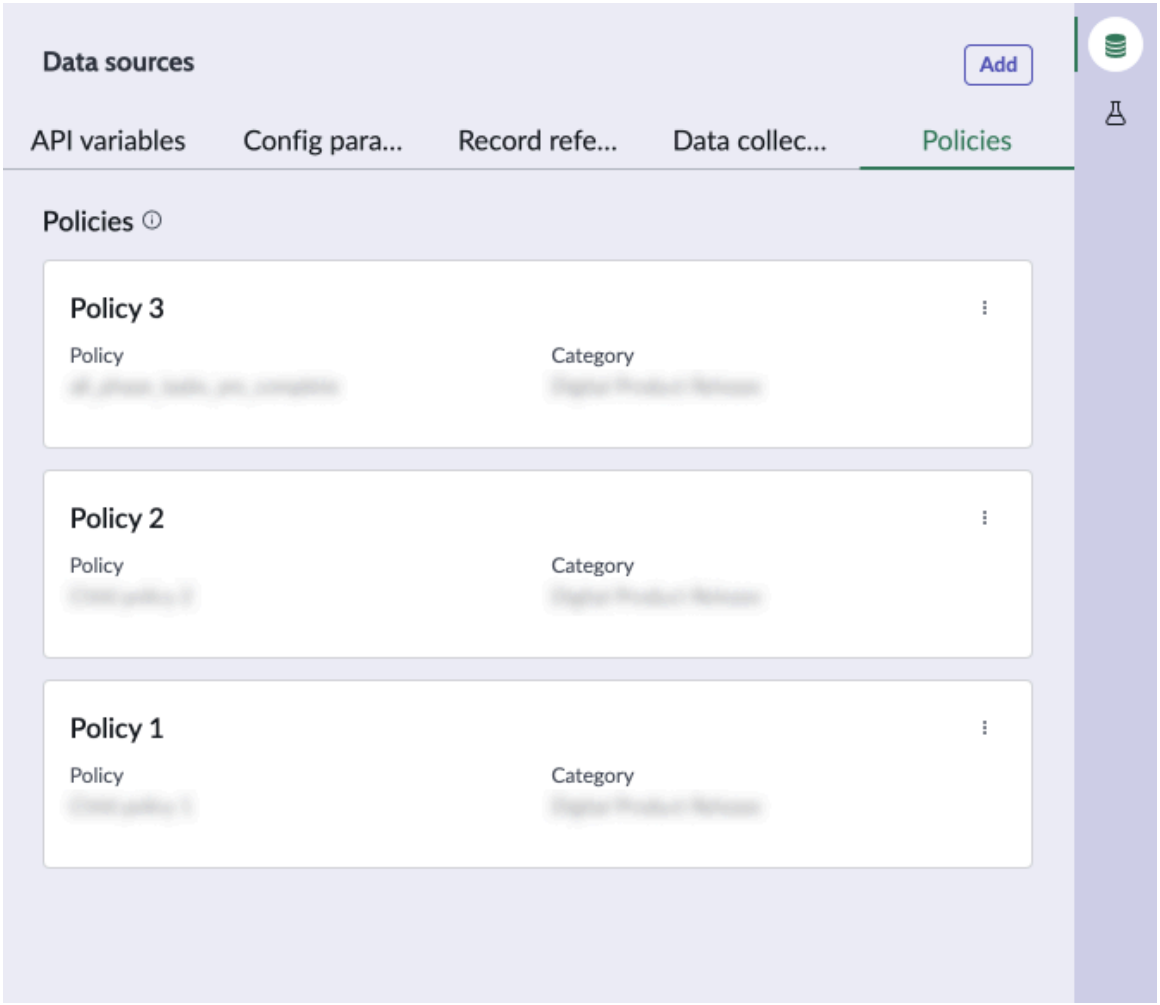


8. Pick a variable to pass for in the API variable and Config parameter sections you created in the beginning of this task.

Note:
You can specify the value in the fields as needed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. Select **Save**.



Result
The policies now appear on the Policies tab and can be added in the condition section or the Then section of the Policy builder. For more information on how to add the policies in the builder, see Policy logic condition fields.

Use the Test Playground for PaCE policies

The Test Playground enables you to test updates to a PaCE policy at any time, without the need to test or evaluate them in a Production environment.

You can update API Variables, Config Parameters, and Record References, and modify the policy script. After completing your changes, evaluate the updates in the Test Playground and review the execution output to ensure that the policy is compliant. Use the Test Playground to fine-tune your policy administration. Updates to a policy can be made on-the-fly, and tested in real time in a test environment. In addition, use the Test Playground to:

- Set execution parameters.
- Set and modify variables.
- Edit the policy script and policy logic.
- Use previously evaluated variables from a previous evaluation run.
- Review the execution output and the decision of compliance (compliant or non-compliant).
- Review a log of executions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Test updates to a PaCE policy version

Use the Test Playground to test updates to a PaCE policy script. You can evaluate changes to the policy script in real time, enabling you to determine if the changes that are applied render the policy compliant or non-compliant.

Before you begin

Role required: sn_pace.admin

About this task

The Test Playground enables you to apply changes to the policy script, and see the impact of those changes in real time. After the changes have been evaluated, save the script to ensure that the changes are implemented when the policy is next invoked.

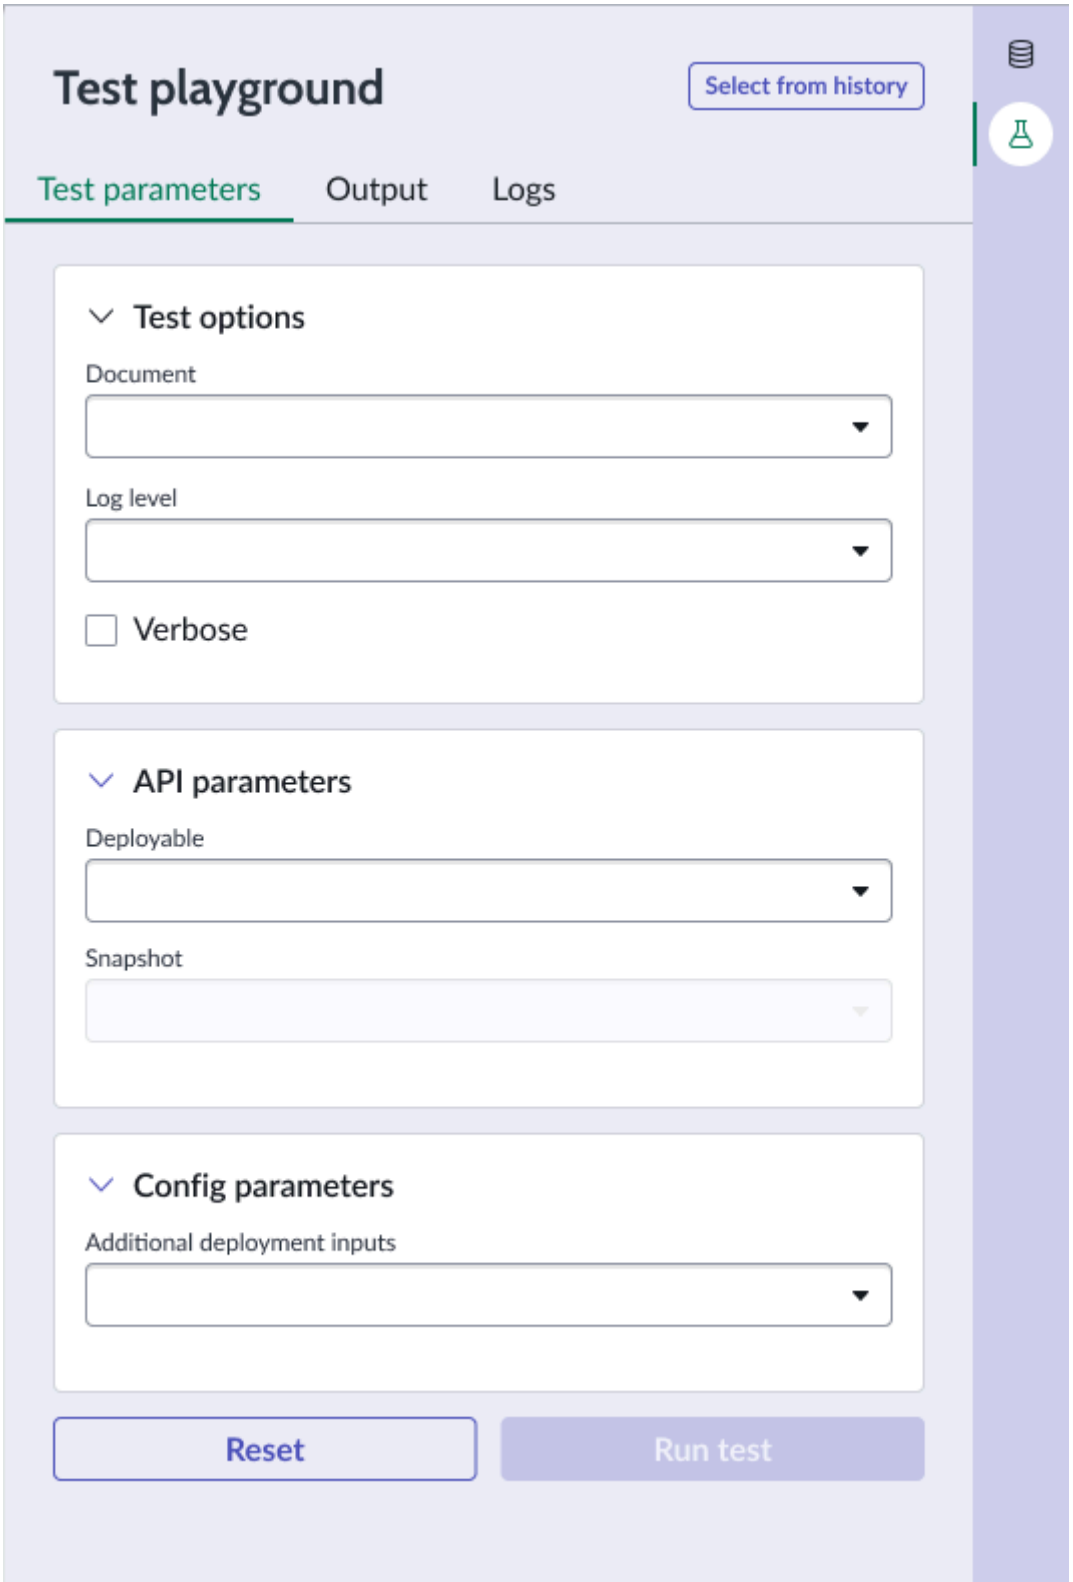
Procedure

1. In the **Policy builder** tab, select the Test playground icon in the right-hand menu.
2. In the Test parameters tab, fill in the forms as needed.

Test options fields

Field	Description
Document	The document that you want to test the policy version with. **Note:** This field will change depending on which application PaCE is being used.
Log level	Level of the log.
Timeout	Timeout to determine the execution threshold of the test.
Execution log	Execution tag for the policy version.
Verbose	Option to make the test display in a verbose format.

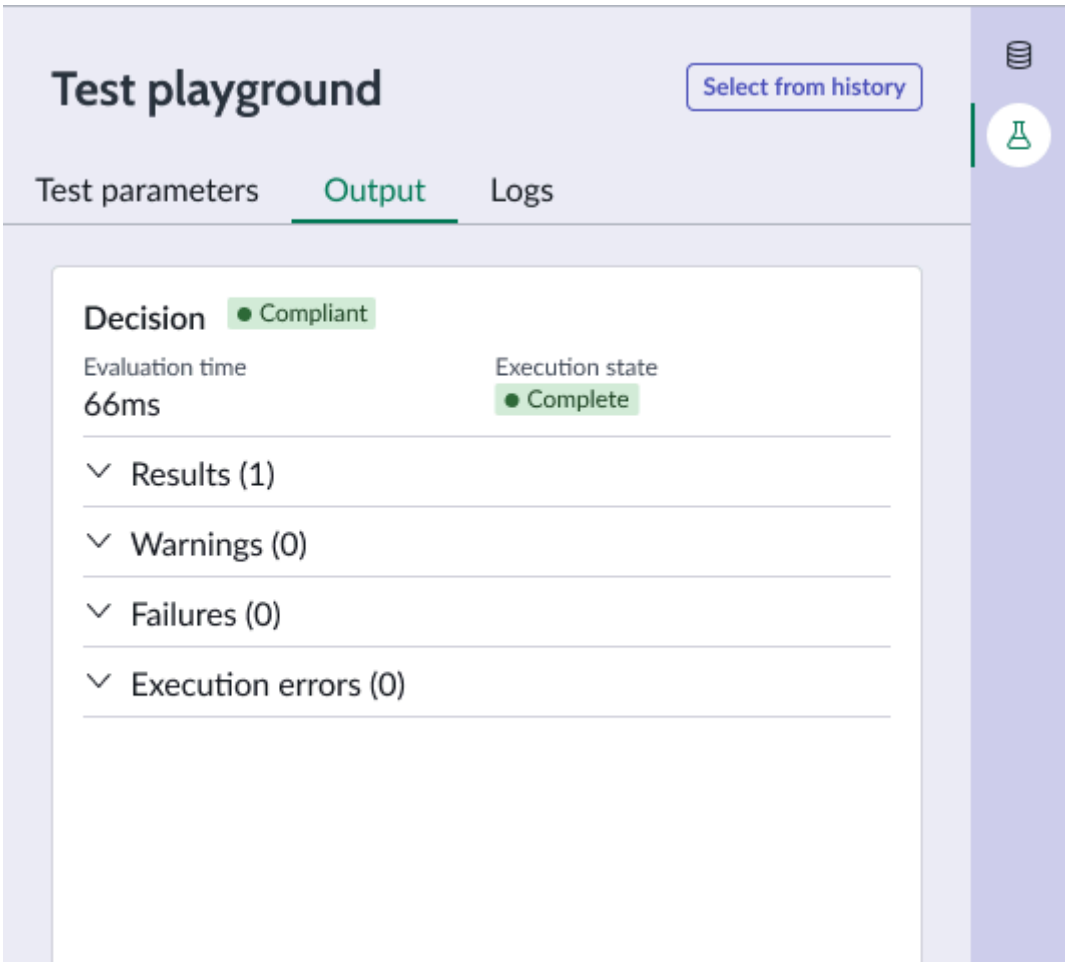
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Under the **API parameters** and **Config parameters** tabs, select the variables you want to test with the policy version.
4. When you are done modifying your policy script, click **Run Test**.
   A decision is reached regarding the compliance or non-compliance of the policy, based on the changes you made to the script. In the Test Parameters section, either **Compliant** or **Non-compliant** is displayed, along with additional output on any warnings or failures, and how long the evaluation took.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
A decision with Compliant with exception will not work with a custom decision.



Review execution output and decision

After evaluating any changes made to the PaCE policy script, you can review the execution output and compliance decision reached. You can review this output immediately after evaluating any policy script changes.

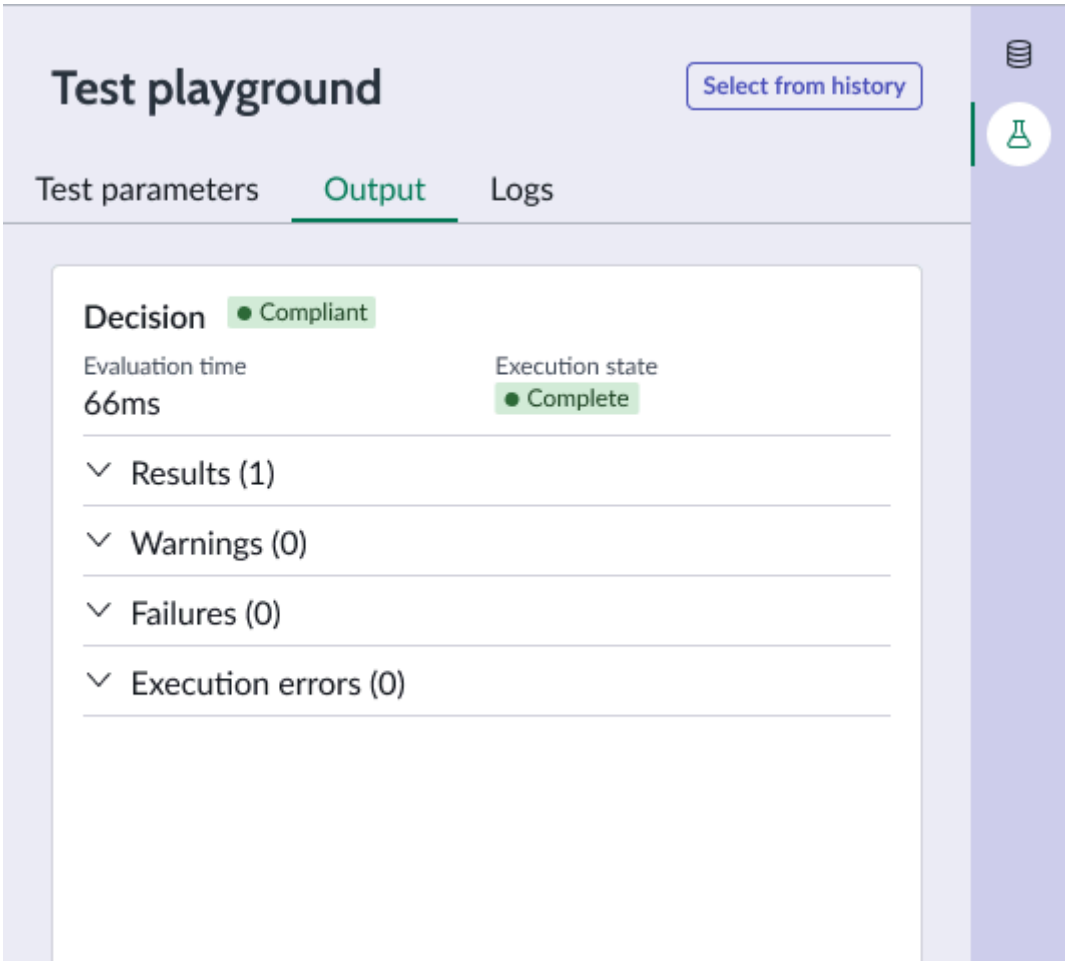
Before you begin

Role required: sn_pace.execution_reader

Procedure

1. In the **Policy builder** tab, click the policy version you want to evaluate.
2. Select the Test playground icon .
3. After modifying the policy script according to your requirements, click **Run Test**
   The **Output** tab is displayed automatically, and shows the output and the decision reached.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Review the execution output in the **Output** tab:

Output tab section	Description
Compliance decision	The decision can be: ○ **Compliant**: The changes you applied to the policy script are compliant with the policy logic. When you click **Save Script**, the changes are saved, and the changes implemented the next time the policy is invoked. ○ **Non-compliant**: The changes you applied to the policy script are not compliant with the policy logic. ○ **Compliant-exception**: In this case, if a policy exception has been approved, any policies that are non-compliant are set to the compliant-exception state. ○ **Name of a custom decision**: In this case, the decision is pre-defined by the admin for decisions other than complaint or non-complaint. **Note:** There could be multiple custom decisions depending on the type of application you're integrating with PaCE.
Warnings/ Failures	Lists the number of warnings or failures generated during the execution.
Evaluation time	Shows how long the evaluation took, in milliseconds.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output tab section	Description
Execution output	Shows the execution output in JSON format. You can integrate this output with other applications and services and present it in your required format.
Custom	Shows the custom output of the custom decision. **Note:** This tab will only show up if you are testing a custom decision.

If required, modify the policy script to resolve any issues that arose during the evaluation. You can also review policy execution logs for further analysis.

Review execution log

After evaluating any changes made to the PaCE policy script, you can review the execution log generated.

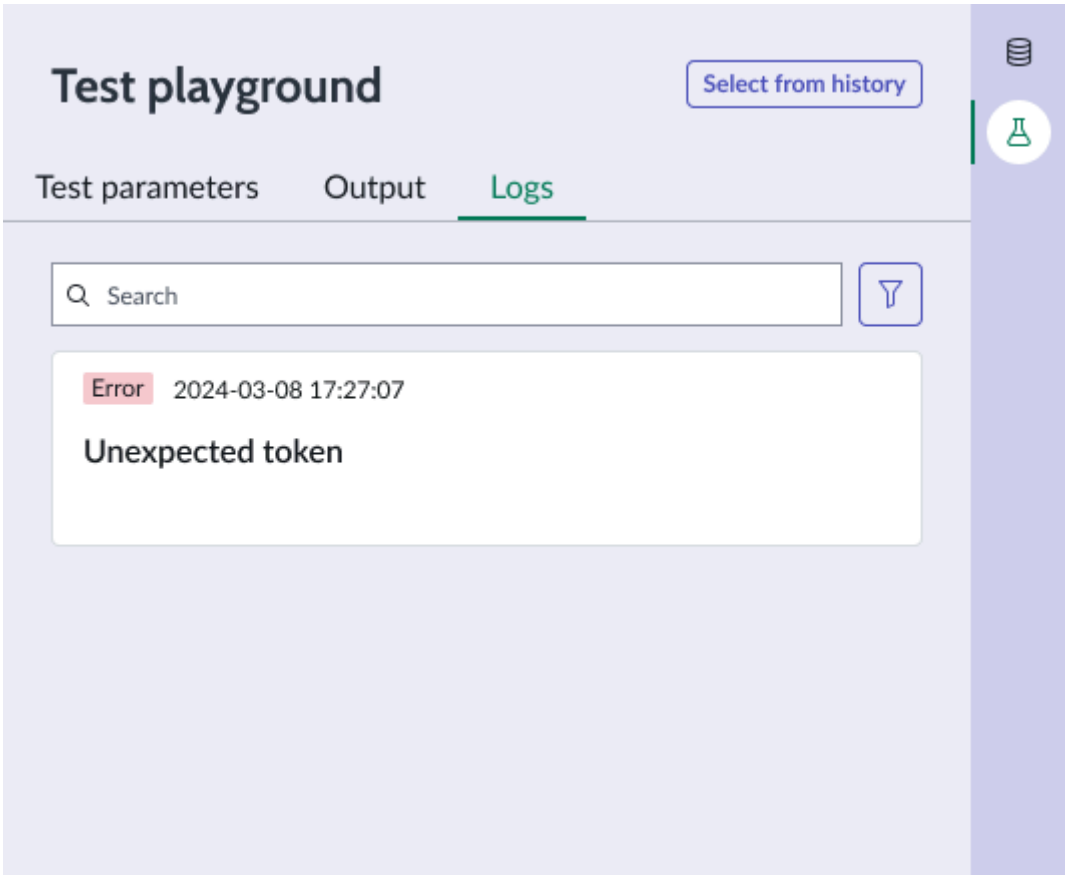
Before you begin

Role required: sn_pace.execution_reader

Procedure

1. In the **Policy builder** tab, click the policy version you want to review/evaluate.
2. Select the Test playground icon .
3. Click the **Logs** tab to view the execution logs generated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The displayed logs include all execution data generated during the evaluation. To filter logs, select the filter icon .

Execute policies

Execute a policy to determine if the policy is compliant or non-compliant. Executions can be run as part of your policy evaluation process, or in real time when mapped to an object (table or document ID).

Before you publish a policy version, you can run a test evaluation of the version to determine if it is compliant, non-compliant, compliant-exception, or other. Evaluating a policy enables you to test repeatedly and apply any required changes to the policy version, before moving it to a production environment. For further information about testing your policy version, see Use the Test Playground for PaCE policies.

When the version is ready to be moved into the production environment, make sure that all policy mappings are in place and verified. When the policy is invoked by the relevant object, its execution output is stored for review. For further information, see Review executed policy activity.

Review executed policy activity

You can review the execution activity of any policy at any time. Recorded execution activity includes the time taken to execute, decisions of compliance, execution types, and the outcome of the execution.

Before you begin
Role required: sn_pace.execution_reader

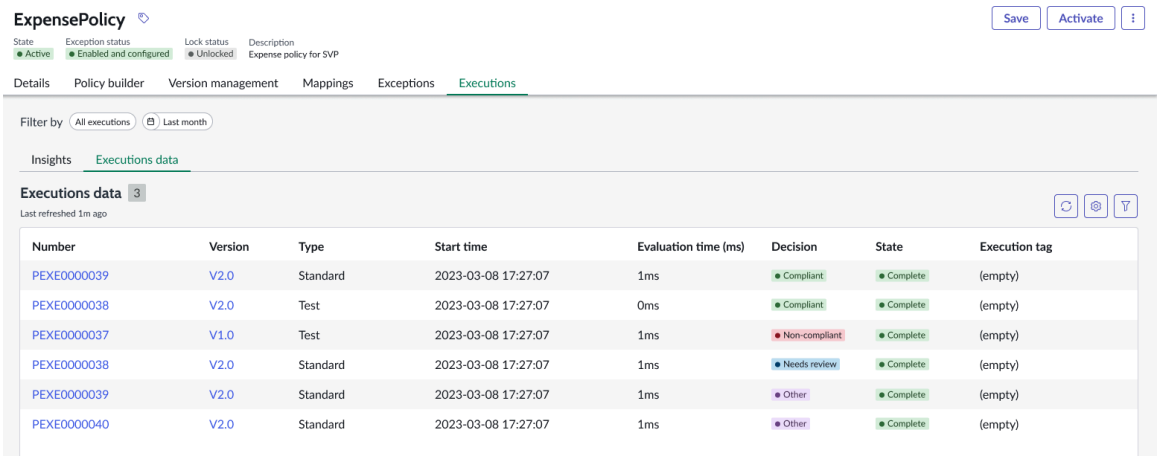
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Policies** > **My Policies**.

> **Note:**
> To view all policies generated by admin/other users, navigate to **Policies** > **All Policies**.

2. Click **Executions** to display the execution activity for the selected policy.



3. Review the execution information in the following columns.

Column	Description
Number	The automatically generated execution number. Click the link to review the following execution information: ○ Caller and mapping inputs used in the execution. ○ The JSON output generated on execution. ○ The execution log. ○ The policy script used in the execution.
Version	The policy version used in the execution. Click the link to review the version details.
Type	The type of execution performed: ○ Test ○ Standard
Start time	The time and date the execution was initiated.
Processing time (ms)	The execution processing time, in milliseconds.
Decision	The decision reached on execution: ○ Compliant ○ Non-compliant

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description
	○ Compliant-exception ○ Other
State	The state of the execution.
CDM application	The name of the relevant application. Click the link to review and update the application details.
Name	The name of the object. Click the link to review and update the object details.

Manage PaCE policy categories and tags

Use categories and tags to manage and group your PaCE policies more efficiently. As the policy administrator, you can create and edit any number of categories and tags.

You must have the sn_pace.admin role to manage categories and tags.

Policy categories and how to use them

Policy categories enable you to categorize your policies into relevant groups or sections.

You can create any number of categories, but only one category can be assigned at any one time to a policy. Categories can include product or industry-specific terms, such as PCI, HIPAA, or FedRAMP. If a PCI or HIPAA-specific update must be applied to a policy, select the relevant category to locate and update the policies under that category.

When creating or updating the policy with a category, the category must be pre-defined.

Policy tags and how to use them

Policy tags enable you to define a policy with relevant reference tags. These tags can be defined according to your requirements, providing an element of flexibility to your policy management. For example, if a group of users have access to some policies, you can create a meaningful tag or a set of tags only for those policies.

You can add any number of tags to a policy, and also configure who can view the tags. You can also add tags on-the-fly as you view or edit policies.

Tags can be especially useful in collaboration efforts, in turn making the entire policy life-cycle easier to manage.

Managing categories in PaCE

Use the Categories option to group your PaCE policies more efficiently. As the policy administrator, you can create and edit any number of categories.

Categories are especially useful for grouping your policies into relevant sections. You can create and edit categories as required, but only one category can be assigned at any one time to a policy.

In addition, when creating a policy, the category must be pre-defined to ensure it can be assigned to the policy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a category

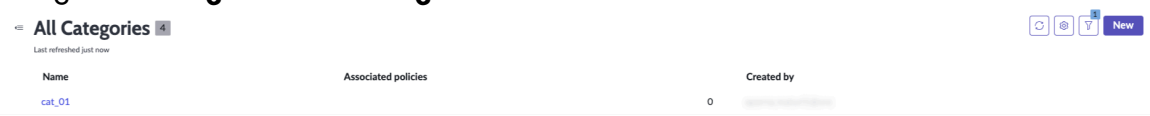
Create PaCE policy categories to assign to a policy when creating or updating a policy. Categories enable you to categorize and manage policies more efficiently.

Before you begin

Role required: sn_pace.policy_editor

Procedure

1. Navigate to **Categories** > **All Categories**.



2. Click **New**.
3. In the Create New Category form, define a name and description for the category.
4. Click **Save**.
   The new category is added to the All Categories form.

Edit categories

Update categories for a PaCE policy as required. You can also update categories for Active policies.

Before you begin

Role required: sn_pace.policy_editor

Procedure

1. Navigate to **Categories** > **All Categories**.

2. Click the name of the category that you want to edit.
3. In the Details form for the selected category, edit the category **Name** and **Description** fields, as required.
   When updating a category name, the update is applied to all policies assigned with that category, whatever their state.
4. Click **Save**.
   The edited category is updated in the All Categories form.

> **Note:**
> You can also delete a category, as long as the category is not assigned to an Active policy. To delete a category, in the Details form for the selected category, click **Delete**.

View PaCE policies associated with a category

You can view the PaCE policies that have been assigned to a specific category. All the categories created, together with their associated policies, can be viewed in the All Categories table.

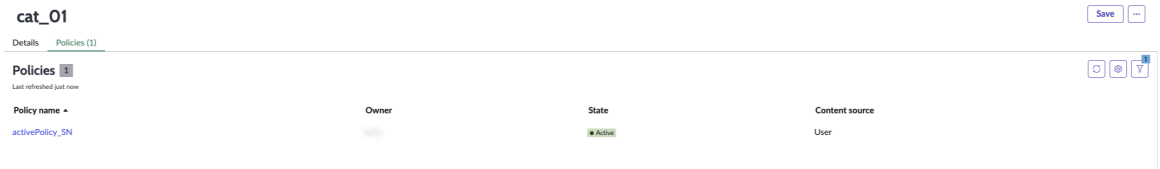
Before you begin

Role required: sn_pace.execution_reader

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Categories** > **All Categories**.
2. In the All Categories table, click the relevant category name.
3. In the displayed Details form, click the **Policies** tab.
   The policies associated with the selected category are displayed.



4. Click a policy name to view the policy and its settings.

Managing tags in PaCE

Use tags to manage your PaCE policies more efficiently. As the policy administrator, you can create and edit any number of tags.

Policy tags enable you to add any number of reference tags to a policy. Tags can be especially useful in collaboration efforts, and can easily be viewed and edited. They can also be used to group policies based on any number of tags.

Add tags to PaCE policies

Add or create policy tags on-the-fly for any PaCE policy, including currently Active policies. Tags enable you to manage policies more efficiently.

Before you begin

Role required: sn_pace.admin

Procedure

1. Navigate to **Policies** > **My Policies**.

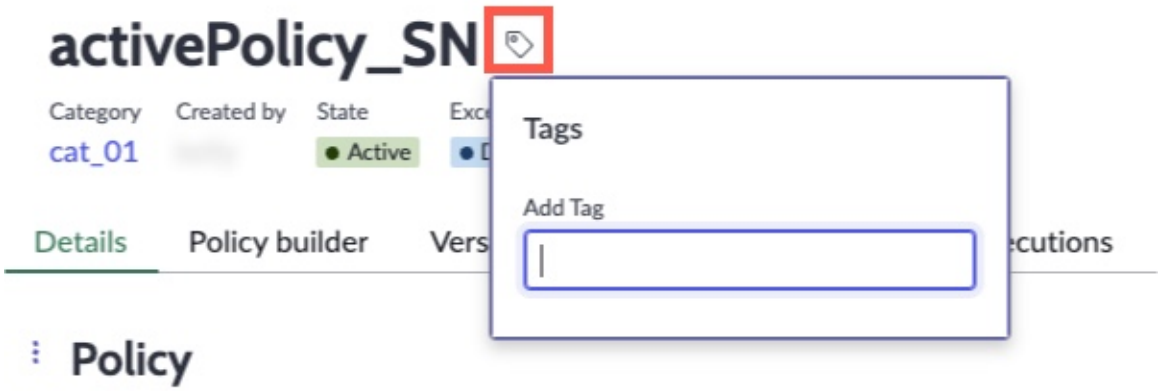
   Note:
   To view all policies generated by admin/other users, navigate to **Policies** > **All Policies**.

2. Click the policy name for the policy that you want to add a tag to.
3. In the Policy Details page, click the tag icon.

   Note:
   Unlike categories, you do not have to pre-define a tag before adding it to a policy.

4. In the **Add Tag** field, enter the required tag.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Press **Enter** to add the tag.
   The tag is added to the **Tags** dialog.

> **Note:**
> By default, the added tags are viewable to you only. Edit the tag to modify who can view the tag.

6. Repeat as required for additional tags.

> **Note:**
> - Tags are not case-sensitive, you cannot create tags using different capitalization.
> - Tags are automatically assigned to the policy when added in the **Tags** dialog, you don't need to save the policy to save the assigned tags.

Edit PaCE policy tags

Edit and remove tags from a PaCE policy as required. When editing a tag, you can also define who can view the tag.

Before you begin

Role required: sn_pace.admin

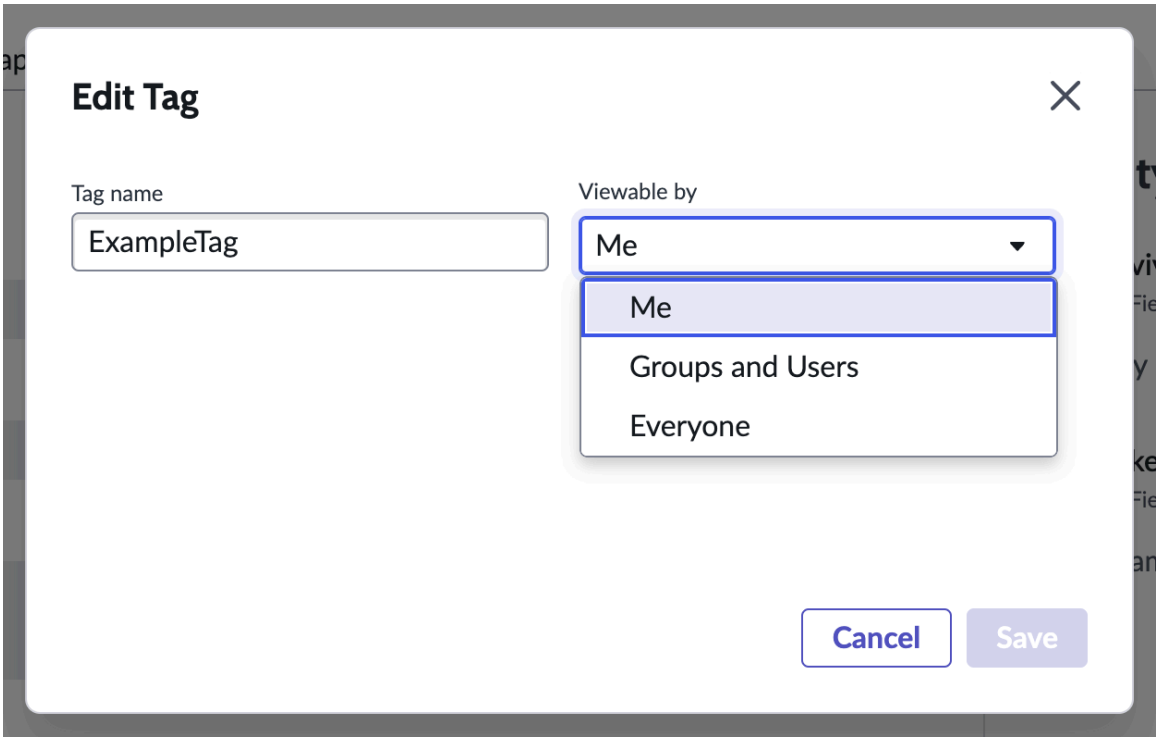
Procedure

1. Navigate to **Policies** > **My Policies**.

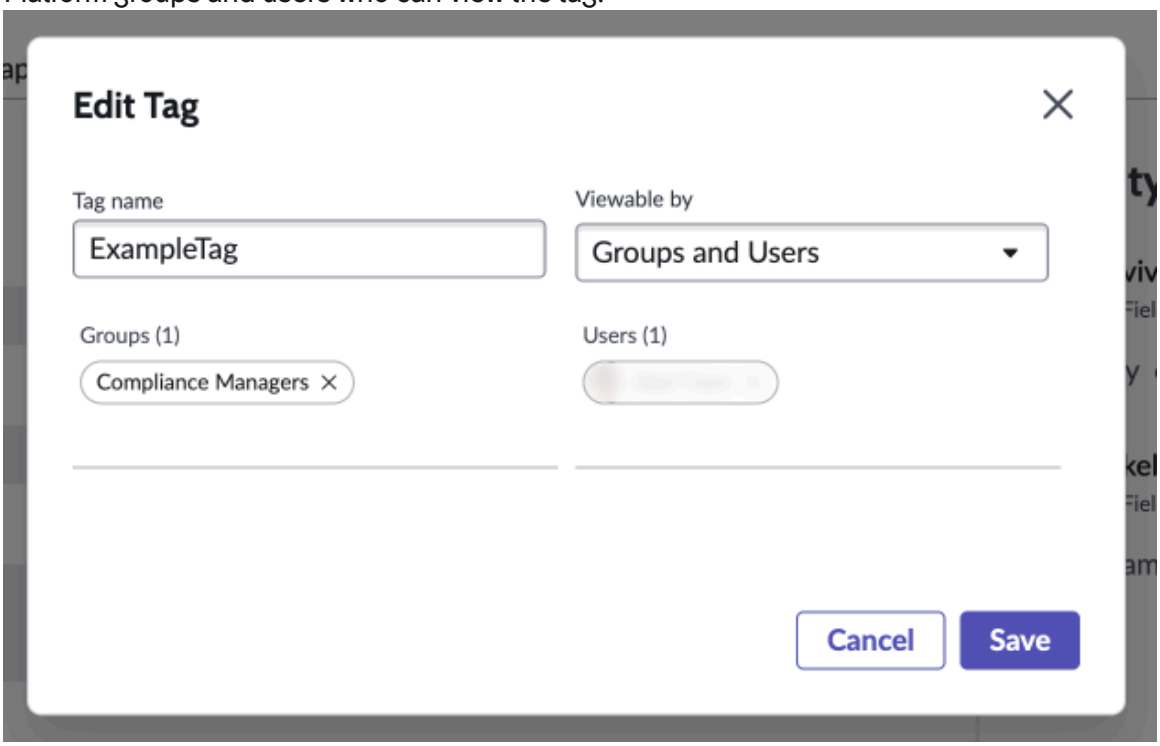
> **Note:**
> To view all policies generated by admin/other users, navigate to **Policies** > **All Policies**.

2. Click the policy name for the policy that you want to edit or remove tags from.
3. In the Policy Details page, click the tag icon.
4. To edit a tag:
   a. Click the tag.
   b. In the Edit Tag dialog, edit the tag name.
   c. In the Viewable by list, select from **Me**, **Groups and Users**, or **Everyone**. By default, **Me** is selected when initially creating a tag.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note:
When you select **Groups and Users**, you are prompted to choose the ServiceNow AI Platform groups and users who can view the tag.



d. Click **Save**.

5. To remove a tag, click the x on the tag itself.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The tag is removed from the policy.

View PaCE policies associated with a tag

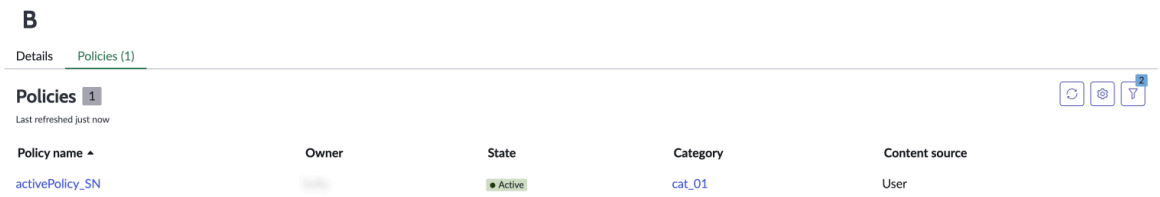
You can view the PaCE policies that have been assigned to a specific tag. All tags together with their associated policies can be viewed in the All Tags table.

Before you begin
Role required: sn_pace.admin

Procedure

1. Navigate to **Tags** > **All Tags**.
2. In the All Tags table, click the name of the relevant tag.

3. In the displayed Details form, click the **Policies** tab.
   The policies associated with the selected tag are displayed.



4. Click a policy name to view the policy and its settings.

How to write and test custom PaCE policies

This section provides guidelines on how to write and test PaCE policies.

You can write PaCE policies using JavaScript and create the policy record within your instance application scope. PaCE policies can be executed within the scope in which they are created and all functions available in this scope are available to the policy.

When a policy is invoked, a default set of parameters is passed and these parameters can be used in the policy logic as required. A decision indicating whether the policy is compliant, non-compliant, or compliant-exception and additional information is returned using the decision object.

Structure of a PaCE policy script

This section describes the structure of a PaCE policy script.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When a policy is executed, a set of parameters is passed and the policy developer can use these parameters in this policy script to make a decision whether it is compliant, non-compliant, or compliant-exception and return this decision back to the calling service. The following image shows a sample script:

Sample policy script

```
/**
  @param logger: ExecutionLogger.
  @param currentRecord: GlideRecord('sn_pace_policy_version').
  @param documentRecord: GlideRecord(documentTable), where documentTable is runtime value provided as a part of invocation.
  @param apiVars: Object, passed as a invocation input.
  @param configParams: Object, retrieved from application for the current run.
  @param recordRefs: Object, retrieved from application for the current run that are evaluated based on other parameters.
  @param dataCollectors: Object, stores data collectors of this policy version and has access to the corresponding outputs. A Data collector is a scripted function which takes inputs and gives outputs.
  @param childrenOutputs: Array, stores outputs of children executions for the policy, where if present the first output is always a result of data collector, followed by outputs from other children policies.
  @param output: Object - { decision: 'compliant/non_compliant', results: [], failures: [], warnings: [] } is exposed, where output of the script is stored.
*/
(function(logger, currentRecord, documentRecord, apiVars, configParams, recordRefs, dataCollectors, childrenOutputs, output) {
    var snapshotId = apiVars.snapshotId;
    var dbPort = configParams.dbPort;
    // var cdmQ = new sn_cmdb_ci_class.CdmQuery().version ("latest").snapshotId(snapshotId).query();
    var cdmQ = new sn_cdm. CdmQuery().version ("latest").followIncludes (true).decryptPassword(true).substituteVariable(true).useCache(true).snapshotId(snapshotId).query();
    while (node = cdmQ.next()) {
      if (node.getValue('name') === "dbPort") {
        if (!gs.nil(cdmQ.getValue('value')) && Number (node.getValue('value')>= 30000)) {
            logger.info("dbPort is: " + node.getValue('value'));
            output.failures.push('The DB Port is not in range');
        }
      }
    }
    output.decision = output. failures.length? "non_compliant": "compliant";
    return output;
})(logger, currentRecord, documentRecord, apiVars, configParams, recordRefs, dataCollectors, childrenOutputs, output);
```

To debug the script, select the Debugger script icon . For more information, see Script Debugger API.

The following table lists the policy function parameters and how can they be used in your policy script.

Variable Name	Description
logger	`Logger` is an object that the policy coder can use to log messages. The log messages are stored in the `sn_pace_execution_log` table. You can review these log messages for debugging, tracking, or monitoring purposes. The log messages can be logged with one of the following levels: • 1: info • 2: debug • 3: warning • 4: error When a policy is invoked through the API, you can specify the desired log level. For example:The format is as follows: `logger.info("** snapshotId is: "+snapshotId);`
current Record	`currentRecord` is an object of the current version of the policy that is executed when the policy is used. To view the `currentRecord` details, navigate to the **Versions** tab on the Policy Home page and locate the policy whose version state is set to **Current**. In the image below, you can see that the current active version of the policy highlighted. It shows the following details: • version number • last update date • the name of the user who updated the version

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Variable Name	Description
	• the number of times it was executed by the calling application • the number of times it was run in the test environment The policy script can access this data during policy execution time by interacting with the `currentRecord` object passed to the policy. This example shows how a policy developer can access the properties of the policy version record: `(function(logger, currentRecord, documentRecord, apiVars, configParams, recordRefs, dataCollectors, childrenOutputs, output) { //retrieve the input values logger.info(currentRecord.getValue('name')); })(logger, currentRecord, documentRecord, apiVars, configParams, recordRefs, dataCollectors, childrenOutputs, output);`

document Record	The `documentRecord` is used to map the policy to the relevant object (table and documentID) that is being validated. The `documentRecord` is a combination of the table_name and sysID. Based on the properties of the object, the policy logic is used to manage and interact with the object being validated to determine the right decision.
	
	For example: In the DevOps Config environment, a policy can be mapped to the deployable. When the API is invoked, a query is initiated on the document (deployable) table and the Sys ID of the deployable.
	
	`{ "table": "sn_cdm_deployable", "sysId": "d1be8f5e87d80110eec7dbdd3fbb357d" }`
	
	This example shows how the documentRecord can be used in a policy script:
	
	`(function(logger, currentRecord, documentRecord, apiVars, configParams, recordRefs, dataCollectors, childrenOutputs, output) { //assuming that associated document has state field var documentState = documentRecord.getValue(“state”); if (documentState == “new”) … else … })(logger, currentRecord, documentRecord, apiVars, configParams, recordRefs, dataCollectors, childrenOutputs, output);`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Variable Name	Description
apiVars	The apiVars is passed to the PaCE API when it is invoked. It includes all the API variables defined in the policy version. See <Defining Caller Inputs> section for details The Sample policy script shows how policies can be used to validate configuration data in the DevOps environment. In the sample script, the apiVars variable is defined as `var snapshotId = apiVars.snapshotId;` where the specified `snapshotId` is mapped to the corresponding `snapshotId` of the DevOps Config deployable being validated based on specified criteria. The policy developer can define logic in the policy script to use the apiVars values passed when the API is invoked to determine the decision. For example, the SnapshotID passed is used to identify key-values related to the specific snapshotID for a deployable passed in the documentRecord object.
configParams	Config Parameters are variables are passed when mapping the policy and includes all the Config Parameters variables defined for a specific version of the policy. The `configParams` variable is defined as follows in the Sample policy script. `var dbPort = configParams.dbPort;` The policy developer can define the logic in the policy script to use the values passed at mapping to determine the decision. For example, the `dbPort` number must be less than 30000, otherwise the policy is considered to be non_compliant.
recordRefs	Record references define queries to extract data from any ServiceNow® tables and use the data to configure the policy logic. There is an auto-completion function that can select the record reference in the Javascript editor.
dataCollectors	The data collectors function collects input process data from ServiceNow or an external data source to provide an output.
children	Not supported in this version.
Outputs	

output

This parameter is used to pass the output of the policy execution that includes the decision back to the calling service. It provides a decision related to this policy, with additional information such as errors, warnings, and result details.

This example shows a sample output with compliant and non_compliant decisions:

```
{
    "decision": "compliant",
    "results": [],
    "warnings": [],
    "failures": [],
    "state": "complete"
}
```

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Variable Name	Description

	<pre>{
	"decision": "non_compliant",
	"results": [],
	"warnings": [],
	"failures": [“Failed to validate key”],
	"state": "complete"
	}</pre>

output. decision	The decision property can be set to: • Compliant: Determines that the policy complies with requirements. • Non-compliant: Determines that the policy does not comply with the requirements. • Compliant-exception: Determines that an exception to the policy has been approved and any policies that are non-compliant are set to the compliant-exception state. The decision is returned in a JSON format back to the calling service. **Note:** If a value is not specified in the `output.decision` field in the script, when the policy is executed, by default this field is set to **compliant** if there are no failures.
output. results	The `results` property can be used to pass data back to the calling service on decisions made during the policy validation phase. A list object with a list of results can be passed back to the calling service.
output. warnings	The `warnings` property can be used to pass data back to the calling service on any warnings that occurred during the policy validation phase.
output. failures	The `failures` property can be used to pass data back to the calling service on any errors that occurred during the policy validation phase.
Note: The following fields are automatically filled in when the PaCE policy script is executed.	
output. name	The name (current version) of the policy being executed.
output. state	It indicates the state of the policy invocation. • Complete: The invocation was completed successfully. • Pending: Indicates that the policy could not be successfully executed and is an incomplete state.

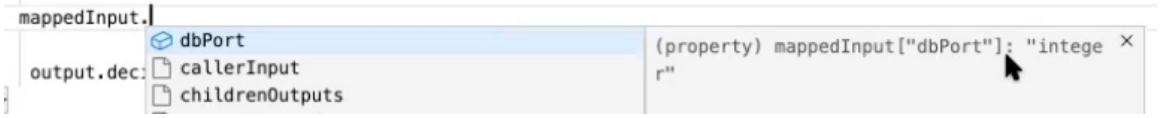
Note:

- Auto-complete suggestions are available in the policy script editor for the `logger`, `callerInput` and `mappedInput` parameter.
- To view additional information for a parameter, enter the parameter name and select one of the options as follows:



Policy invocation API

When a PaCE policy is invoked, the calling service passes the relevant object (tables and document IDs) that is being validated by providing the `documentRecord` object. A calling service is a service or product that uses the PaCE API. PaCE determines which policies must be executed by using the mapping table and the `documentRecord`.

All selected policies are executed concurrently. When all the policies have been executed, a final single decision is returned (in JSON format) with information on all executed policies and policy-level decisions. The final decision can be:

- compliant: Indicates that all the selected policies comply with the requirements and have returned a compliant decision.
- non_compliant: Indicates that one or more of the selected policies do not comply with the requirements and have returned a non_compliant decision.
- complaint-exception: Indicates that a policy exception has been approved and any policies that are non-compliant are set to the compliant-exception state.
- other: Indicates decisions that are not complaint, non_compliant, or complaint-exception.

Policy invocations can be in one of the following states:

- new
- in_progress
- complete
- canceled
- error
- timeout

Sample API

The following is a sample invocation request when the PaCE API is executed.

```
var request = {"documentIds":

 [{"table":"sn_cdm_deployable","sysId":"d1be8f5e87d80110eec7dbdd
3fbb357d"}],"service":"CDM","category":"CDM","data":{"snapshotId
":"2bcec7de87d80110eec7dbdd3fbb3529"},"options":{"verboseRespons
e":true,"logLevel":"debug","type":"standard","failFast":false,
 "executionTag":"cdm"}}

         try {
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
            var api = new sn_pace.InvocationAPI();

            var execResponse = api.execute(request);

            gs.info(" Got execution response:\n " +
JSON.stringify(execResponse,null,4));

        } catch (err) {

            //var errJSON = JSON.parse(err);

            //gs.info(errJSON.code);

            gs.info(" Error message is:" + err + "\n stack:" +
err.stack);

            // gs.info(" Error is:" + err);

        }
```

PaCE API invocation parameters

This table describes the properties that can be configured when the PaCE API is invoked. These properties can be set whenever the API is invoked or when you test a policy in the Test Playground.

Property name	Required	Default value	Description
service	yes		The calling service that is invoking the API.
category	no		The category type.
type	no	standard	Can be standard or test.
documentIds	yes (array of table, sysID)		The documentIds is an array of the table and sysID (of the deployable).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property name	Required	Default value	Description
Note: The properties shown in the preceding table cannot be configured in the Test Playground. They can only be used when the PaCE API is invoked.			
data	yes		The policy-specific data that includes all possible caller inputs.
executionTag	no		Can be used to tag one or more policy executions records resulting from this invocation. It can be used to retrieve execution details of the policy based on the executionTag.

verboseResponse	no	false	Default value is **false**. If set to **true**, additional debug information (in this case the ids of the mapped policies) is returned.
			
			A sample invocation response with options.verboseResponse:true is shown here:
			
			`// Sample execution response`
			`{`
			`"rootExecutionId": "50202b3ec37b101017e06c576e40dd81",`
			`"mappedPolicies": [`
			`{`
			`"policyId": "3d1de0a8c363101017e06c576e40dde4",`
			`"policyName": "Production Database Policy",`
			`"shortDescription": "Policy to check database passwords",`
			`"versonId": "4ed08520c3a3101017e06c576e40ddcb",`

Property name	Required	Default value	Description

			<pre>"policyName": "API Policy",
			"shortDescription": "Policy to check API policies",
			"versonId": "a6418920c3a3101017e06c576e40dd57",
			"versonTyep": "4f2cb75473331010ce6c39282bf6a753",
			"versionState": "published",
			"versionApproval": "approved"
			}
			],
			"logs": []
			}</pre> If `options.verboseResponse:false`, the mapped policies are not included in the response.

failFast	no	false	The default value is **false**. If this property is set to **true**, the first failed policy stops the execution of all the mapped policies.
logLevel	no	info	This parameter can be used to specify how the log messages should be displayed. • info • debug • warn • error
timeout	no	3600	The timeout period in seconds. The default value is 3600.
waitForResult	no	3600	The waitForResult period in seconds. **Note:** This parameter is available only in the Test Playground.

About policy exceptions

By integrating Policy as Code Engine with Integrated Risk Management and Policy and Compliance Management workspace, the Compliance administrator can manage an

organization's overall compliance posture and provide a business and regulatory context for codified policies.

The Compliance administrator can associate PaCE policies with control objectives and map policies to other deployables. It enables preventive controls and ensures that no risky or non-compliant changes are introduced in the production environment. If required, you can also grant and monitor exceptions on these policies. This provides real-time risk visibility of control objectives and exception management to accelerate the pipeline process. Refer to the Governance, Risk, and Compliance documentation for more information on the exception management process.

Enable exceptions for a policy

Enable exceptions for a PaCE policy and associate it with a control objective in GRC.

Before you begin

- Role required: sn_pace.admin
- Governance, Risk, and Compliance 14.1 or later

Procedure

1. Navigate to **Policies** > **My Policies**.

   Note:
   To view all policies generated by admin/other users, navigate to **Policies** > **All Policies**.

2. Click the policy for which you want to enable exceptions.
   The Details page is displayed.

   As you can see in this image, the Exception status is **Disabled**.

3. Click the **More Actions** icon and select **Enable exceptions**.
   The Exception status is changed to **Enabled**.

   Note:
   After an exception has been enabled, the policy must be configured in the Policy and Compliance Management workspace and connected to a control objective. See Policy as Code Engine for Preventive compliance management for details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result

After the policy has been configured in Policy and Compliance Management workspace, the Exception status for the policy is updated to **Enabled and Configured**. The sn_pace.admin can then request exceptions to this policy.

Disable exceptions for a policy

You can disable exceptions for a policy for which exceptions have been granted. When this option is selected, you can no longer request exceptions and control objectives can no longer be associated with the policy.

Before you begin

- Role required: sn_pace.admin

Procedure

1. Navigate to **Policies** > **My Policies**.

   Note:
   To view all policies generated by admin/other users, navigate to **Policies** > **All Policies**.

2. Click the policy for which an exception has already been granted.
   The Details page is displayed.
3. Click the **More Actions** icon and select **Disable exceptions**.
   The Exception status is changed to **Disabled** You can no longer request exceptions for this policy.

Request exception for a policy

After a policy has been enabled and configured for exceptions, you can map a policy to a deployable and request an exception.

Before you begin

Role required: sn_pace.admin

Procedure

1. Navigate to the Mappings page.

2. Select a mapping from the list and click **Request exception.**.
3. In the Request policy exception window, specify the following:
   - Reason for exception: Select a reason for the exception from the drop-down list. Refer to the Governance, Risk, and Compliance for details.
   - Business justification: Enter a business justification for the exception.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Start and End Date: Specify the period for which the exception should be valid. The default validity period is 30 days. The default period can be modified by the Compliance administrator (sn_compliance.admin).

  Note:
  - You can also specify a Start Date that is in the future.
  - When the request is approved, the sn_compliance.admin can override the requested dates.

4. Click **Request** and navigate to the **Exceptions** tab to view the requested exceptions.

   You can see that the exception status is **Pending**. The Compliance Manager assesses this exception request and can choose to approve or reject the request. See Policy as Code Engine for Preventive compliance management for details. For each exception request, the following details are displayed:

   - Exception ID: Click the Exception ID to view detailed information about the exception request.
   - Deployable: Click the link to view the details of the deployable mapped to the policy.
   - Exception active: If the exception has been granted, the status is set to **Yes**.

     Note:
     If the exception has been granted for a future date, the status is set to **No** until the effective Start Date.

   - Status: The status of the request:
     - Pending: An exception request has been created but has not been approved.
     - Granted: The exception request has been approved.
     - Extension Pending: An extension request for a granted exception has been created.
     - Extension Granted: The extension request has been approved.
     - Declined: The exception request was not approved.
     - Extension Declined: The request to extend a granted exception was declined.
     - Expired: The period for which the exception was granted has expired.
     - Withdrawn: The granted exception request is withdrawn.
   - Expires in: The number of days after which the exception request expires.
5. After the request is approved, navigate to the **Exceptions** tab.
   You can see that the exception request status has changed to **Granted**. You can also see the number of days and minutes for which the exception is valid.
6. After an exception has been granted, you can request an extension before the end of the validity period.
7. Select a request with a **Granted** status and click **Extend**.

   Note:
   You can request an extension for only one policy at a time.

8. In the Request extension window, specify a business justification, an end date for the request and click **Request**.
9. Navigate to the **Exceptions** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The exception status has changed to **Extension Pending**. The sn_compliance.admin assesses this extension request and can choose to approve or reject the request. See Governance, Risk, and Compliance for details.

10. After the request is approved, navigate to the **Exceptions** tab.
    You can see that the exception request status has changed to **Extension Granted**. You can also see the number of days for which the extension is valid.

> **Note:**
> When you execute a policy with exceptions, it is validated and returns a **Compliant-exception** result.

Withdraw an exception request

If an exception is no longer required, you can withdraw a granted exception request for a policy.

Before you begin

Role required: sn_pace.admin

Procedure

1. Navigate to **Policies** > **My Policies**.
2. Navigate to the policy that has been enabled and configured for exceptions and click the **Exceptions** tab.
3. Select the granted exception request and click **Withdraw**.
   A confirmation message appears.
4. Click **Withdraw** to withdraw the exception request.
   The request status is changed to **Withdrawn**.

Integrating PaCE with other applications

Extend the capabilities of Policy as Code Engine (PaCE) by creating policies with other applications.

PaCE provides integrations with the applications listed in the following table:

PaCE Integrations

Integration	Description
Digital Product Release (DPR)	Define policies in Digital Product Release, see the Define policies in Digital Product Release topic.
Software Bill of Materials (SBOM)	Starting with version 4.0 of SBOM Response, an application that is part of the Security Operations suite of applications, you can view components that are identified as stale or abandoned as 'Non-compliant' in the Policy as Code Engine (PaCE) interface that is available in the Software Bill of Materials Workspace. • Determine if components are stale or abandoned with the *Run PaCE policies for SBOM Response* scheduled job. This scheduled job is deactivated by default.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

PaCE Integrations (continued)

Integration	Description
	• View components that are identified as stale or abandoned as Non-compliant in the PaCE interface that is available and viewed in the SBOM Workspace. See Configuring the Deps.dev, OSV.dev, and PaCE integrations for Software Bill of Materials for more information.
