Extend ServiceNow AI Platform capabilities

Extend the ServiceNow AI Platform with additional applications and features.

Get started

Choose one of these tiles to get started.

Manage the Configuration Management Database (CMDB)

Configure connected devices, apps, and services you use with a powerful decision support tool.

Manage Instance Data Sources

Handle all your data efficiently across instances, databases, and more.

Manage Content

Create and share documents and knowledge articles with your users.

Manage Services

Manage service-related applications like self-service, and the service catalog.

Manage People and Work

Take care of administrative and management demands in one place.

Additional Capabilities

Explore additional capabilities.

Manage the CMDB

Control your organization's infrastructure by tracking assets, services, and the relationships between them in the CMDB. Use configuration strategies and consistent modeling in the CMDB to work with all ServiceNow products on the ServiceNow AI Platform.

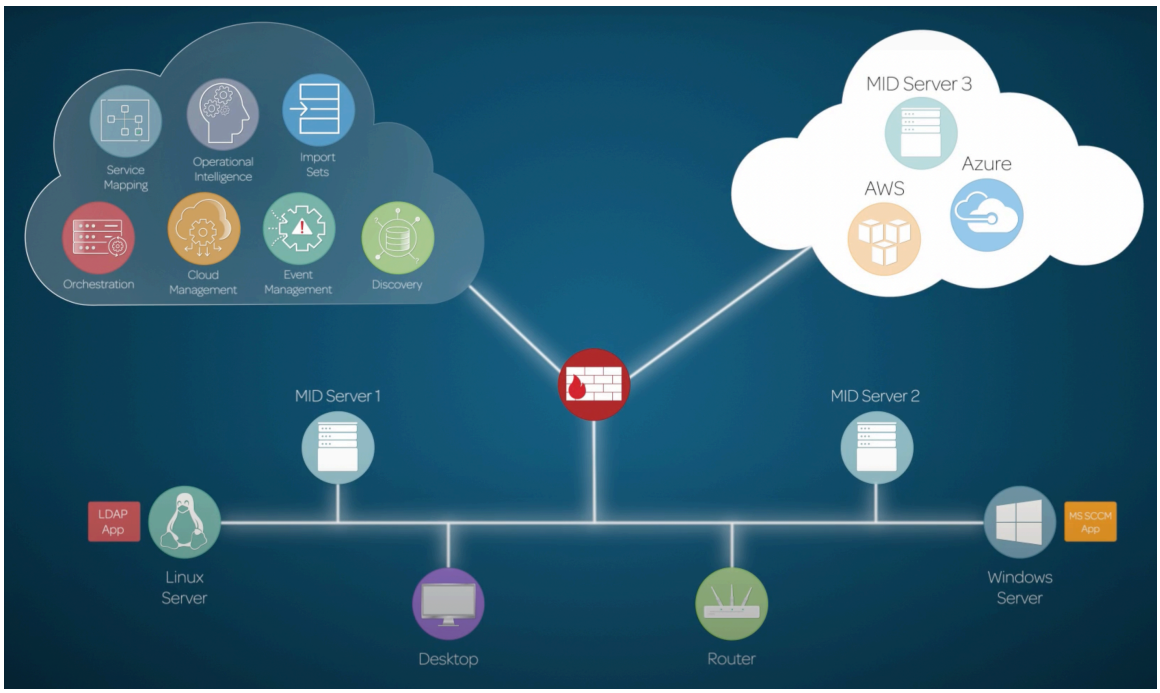
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Manage Instance Data Sources

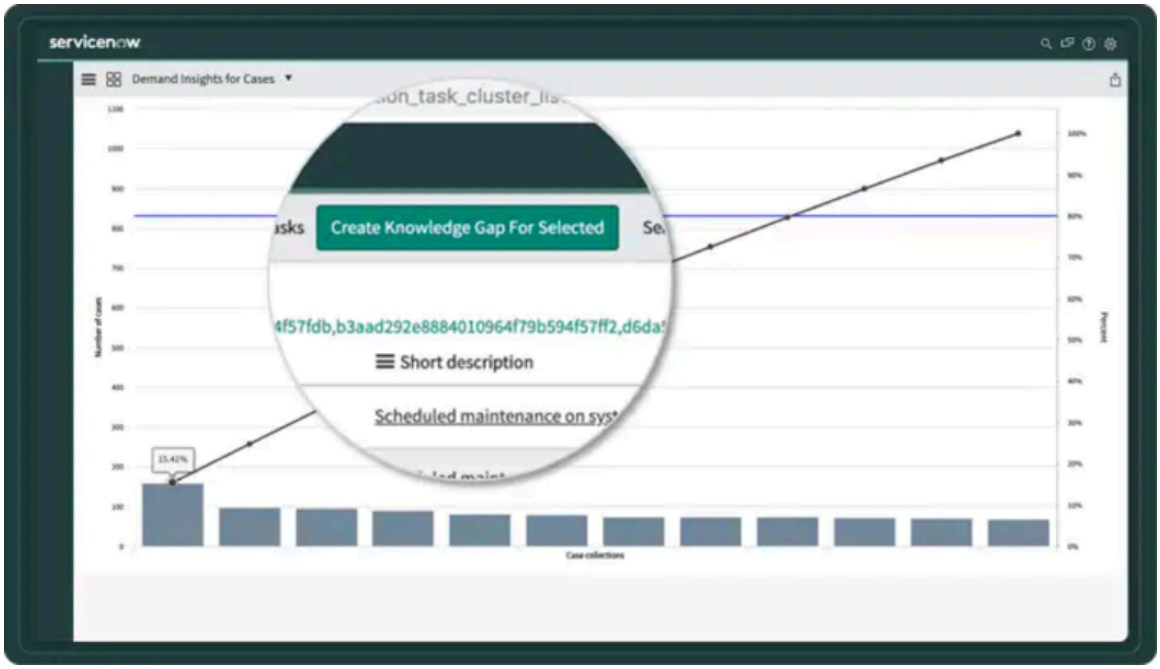
Ensure clear oversight of all data in your instances, databases, and third-party applications using ServiceNow tools to manage data retrieval, storage, sharing, standardization, and monitoring.



Manage Content

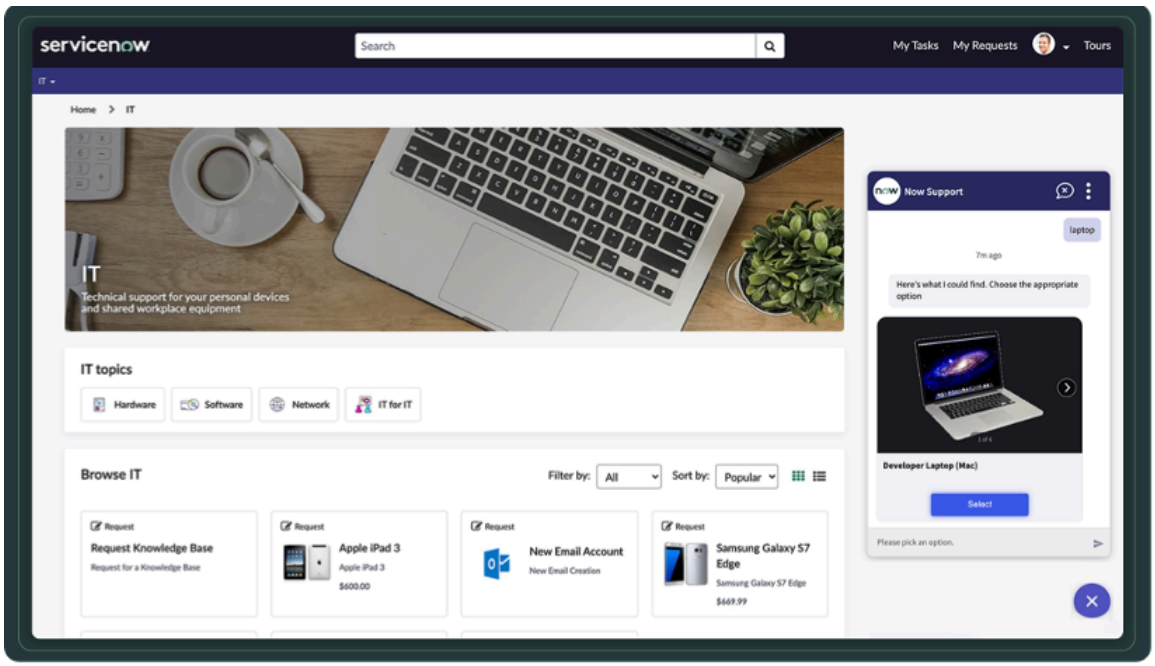
Give your users access to the information that they need quickly and easily using the content management suite with products for document and knowledge base management.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Manage Services

Give your customers tailored catalogs for products and create portals for service requests using the ServiceNow® Service Catalog application. Combine this application with the Self-Service plugin to provide your users with quick access to the tools at their disposal.



Manage People and Work

Supervise personnel, assignments, and tasks all on the ServiceNow AI Platform using tools to centralize communications, connect agents and users across apps, assess and associate skills with people, and assign tasks based on available personnel.

Configuration Management

The Configuration Management Database (CMDB) application is a centralized source that gives you full visibility into your IT environment. By storing information about your organization's infrastructure and how it is configured, this system allows you to monitor your network and ensure stability and best performance. Other ServiceNow® applications enhance the effectiveness of the CMDB application or closely overlap to enable needed business goals.

Overview of CMDB

https://player.vimeo.com/video/973320817?h=1eb2620107&badge=0&autopause=0&player_id=0&app_id=58479

Configuration Management CMDB (CMDB) Build, adjust, and monitor representations of your business infrastructure to support ServiceNow® products and services.	**Common Service Data Model (CSDM)** Get consistent modeling in the CMDB, with standardized data terminology that can be used across the entire ServiceNow AI Platform.	**Application Services**  Create application services CIs from devices and applications that business units and different products can use.
Data integration Use Service Graph and associated tools to populate the CMDB with data from third-parties. Convert imported data to comply with CMDB definitions and structures to ensure CMDB integrity.		

Configuration Management Database (CMDB)

Create models of your infrastructure using Configuration Management. Store your infrastructure data, represented by configuration items (CI)—all the computers, servers, routers, database instances, and services in your network. Analyze trends, reduce problems, and handle incidents by monitoring relationships between CI.

Common Service Data Model (CSDM)

Ensure your data is consistent across every database and ready for every ServiceNow product. The CSDM provides standard terms and definitions for your CI, and any IT services you use. Map your data to CMDB tables clearly using this modeling to provide it to the apps that use it, across the entire ServiceNow AI Platform.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Application services

Use application services to represent and manage operations of various ServiceNow business units and products. An application service is a set of interconnected applications and hosts which are configured to offer a service to the organization such as an organization's internal email system. The various CIs and the relationships between them comprise an application service and are stored in the CMDB.

Data integration

Populate the CMDB by importing and integrating third-party data into the CMDB, in bulk. Use Service Graph connectors to specify process parameters and any needed conversions to be applied to the imported data. Such integrations utilize robust CMDB processes, such as Identification and Reconciliation, to ensure the integrity of the CMDB after third-party data integrations.

Configuration Management Database (CMDB)

Use the ServiceNow® Configuration Management Database (CMDB) application to build logical representations of assets, services, and the relationships between them that comprise the infrastructure of your organization. Details about these components are stored in the CMDB as configuration items (CIs) which you can use to monitor the infrastructure, helping ensure integrity, stability, and continuous service operation.

Overview

Use core features such as CMDB Health, CMDB Identification and Reconciliation, and CMDB Data Manager to monitor and detect health issues, reconcile data integrity issues, and manage data life cycle.

Note:
CMDB modules, features, and wizards are not supported on mobile devices. You cannot use a mobile device to access the CI Class Manager, Query Builder, or Duplicate CI Remediator or to access or configure CMDB features such as Identification and Reconciliation, CMDB Health, CMDB Data Manager, baseline CMDB, and proposed changes.

Exploring CMDB

Use the topics in this section to learn and explore CMDB concepts, its predefined tables and the relationships between them.

Overview of CMDB

The Configuration Management Database (CMDB) creates and maintains the logical configurations your network infrastructure needs to support a ServiceNow service.

https://player.vimeo.com/video/973320817?h=1eb2620107&badge=0&autopause=0&player_id=0&app_id=58479

In CMDB, the logical service configurations are mapped to the physical layout data of the supporting network and application infrastructure in each of your respective domains. They

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

track the physical and logical state of IT service elements and associate incidents to the state of service elements, which helps in analyzing trends and reducing problems and incidents.

The configurations are stored in a configuration management database (ServiceNow CMDB) which consists of entities, called Configuration Items (CI), that are part of your environment. A CI may be:

- A physical entity, such as a computer or router
- A logical entity, such as an instance of a database
- Conceptual, such as a Requisition Service

In each case, there are attributes about the CI that you want to maintain, and there is control you want to have over the CI. There are changes that may need to be made and tracked against the CI. Also, a CI does not exist on its own. CIs have dependencies and relationship with other CIs. For example, the loss of disk drives may take a database instance down, which affects the requisition service that the HR department uses to order equipment for new employees.

It is this relationship data that makes the CMDB a powerful decision support tool. Understanding the dependencies and other relationships among your CIs can tell you, for example, exactly who and what is affected by the loss of that bank of disk drives. When you find out that a router has failed, you will be able to assess the effect of that outage. When you decide to upgrade the processor in a server, you can tell who or what will be affected during the outage.

Configuration items differ from environment to environment because each customer has unique needs. Details about the exact physical attributes of a computer may be needed by one customer, but may represent meaningless data to another. The NOW Platform provides a mechanism to easily define new classes of configuration items and new relationships that may exist between CIs. New classes can be defined that extend other classes. For example, a laptop class exists that extends the computer class. The computer class itself extends the base CI class. Customer class extensions are automatically part of the ServiceNow environment and blend seamlessly into the integration points for other ITIL processes.

You can for example, set the *Used for* attribute in the cmdb_ci_server table to a value such as 'development', 'test', or 'production'. These values indicate the environment that the CI is supporting, and serve as a way of tracking a CI through its life cycle in a changing environment.

Extended CMDB

In base systems, CMDB provides core functionality for the configuration management database, including modules for hardware and configuration items. The separate Extended CMDB plugin includes a collection of modules for specialized configuration items, such as radio hardware, test equipment, and voice system hardware.

To extend the CMDB you can activate the following plugins to access the modules for specialized configuration items.

- CMDB Mainframe (com.snc.cmdb.mainframe)
- CMDB Radio Category (com.snc.cmdb.radio.category)
- CMDB Telecom Category (com.snc.cmdb.telecom.category)
- CMDB Test Equipment (com.snc.cmdb.test.equipment)

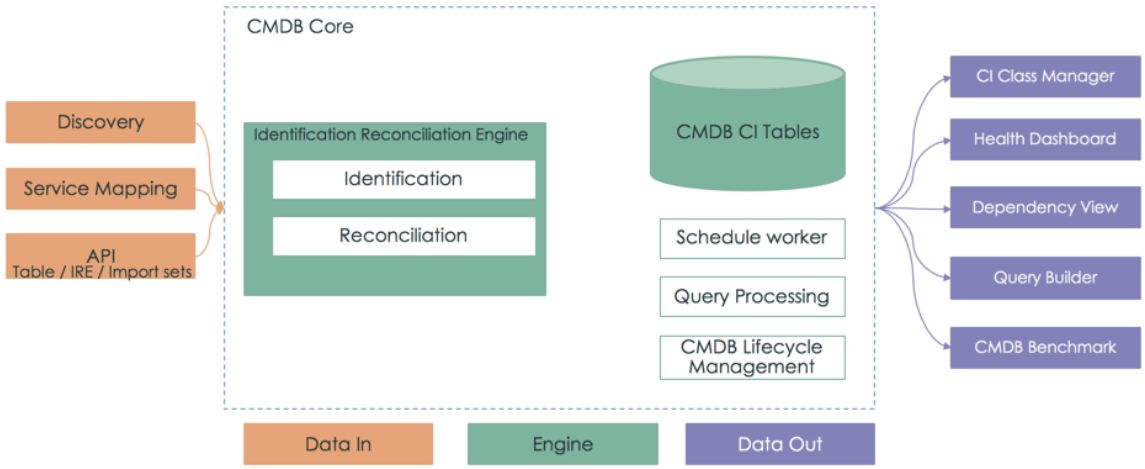
CMDB hierarchy and CI Class Manager

Sets of CIs that share attributes are stored in their own class table. All CMDB tables are connected by relationships and inherit attributes from each other to form a web of tables referred to as the CMDB hierarchy.

Use the CI Class Manager to manage CMDB classes within the CMDB hierarchy, CMDB Health, and other class-related definitions. For example, in the CI Class Manager you can view class attributes, class identification rules, and the list of CIs for a specific class. To view the list of CIs in the CMDB, you can also enter `cmdb_ci_list.do` in the filter navigator.

Architecture



Related tables

There are tables that are not part of the CMDB hierarchy but which still qualify as CMDB data. Related tables, such as the Serial Number [cmdb_serial_number] table, don't inherent from the Configuration Item [cmdb_ci] table, but have at least one column that references a CMDB CI. Related tables are specified in the Related Entries [cmdb_related_entry] table.

Some scenarios that involve related tables, can result in orphan or otherwise stale records in related tables. A CI in a related table can, for example, become orphan if the referenced CI in the CMDB is deleted. You can use the CMDB Data Manager to create a policy of the 'Delete CMDB Related Entry' policy type, that will cascade-delete that un-needed related items data. For more information about creating that CMDB Data Manager policy, see Create a CMDB Data Manager policy in CMDB Workspace.

Localization

Using the Translated Text field type (instead of string) for attributes in CMDB tables, can reduce overall performance, including performance of features such as CMDB Health. This is because values in CMDB tables are dynamic and are likely to change often, and the data itself is likely to continuously grow. Using the Translated Text field also requires manual update of related text. The Translated Text field type is typically effective with static data that doesn't change and doesn't grow. For more information about field types, see Field types reference.

Roles required

Reading CMDB tables directly requires the cmdb_read role, however accessing the **Configuration** module requires the asset, itil, or itil_admin roles. For viewing CMDB-related

records in the user interface, the itil role is usually sufficient. For updating records and for other manipulation of records, roles with higher credentials are usually required, as noted in each procedure throughout the documentation set.

For details about CMDB and other roles, see Base system roles, or see a feature components topic such as Components installed with CMDB Workspace.

Related topics

CMDB schema model

CMDB tables descriptions

List of tables in the CMDB in a base system with its name, label, and a description of the type of information that is stored in the table.

You can extend tables in a base system by installing a CMDB CI Class Models store app which adds class models that support specific technologies. These extensions include class definitions, identification rules, identifier entries, and dependent relationships if applicable. A CMDB CI Class Models store app can also modify the label of a base class. For more information, see CMDB CI Class Models.

Class descriptions are integrated into the CI Class Manager and appear in the **Description** field on the Basic Info page for a class. For more information about viewing class descriptions, see View and edit class definitions and metadata.

Table name	Display name (label)	Table description
cmdb_ci	Configuration Item	Base configuration item (CI) table.
cmdb_ci_acc	Accessory	Accessories for phones, computers, and so on.

cmdb_ci_appl_ora_metric_svr	Oracle Metric Server	Oracle Metric server software.
cmdb_ci_appl_ora_notif_svr	Oracle Notification Server	Oracle Notification Server (ONS) software.
cmdb_ci_appl_ora_oacore	Oracle OACORE Server	Oracle OACORE server software.
cmdb_ci_appl_ora_oafm	Oracle OAFM Server	Oracle OAFM server software.
cmdb_ci_appl_ora_pm	Oracle Process Manager	Oracle BPEL Process Manager server software.
cmdb_ci_appl_ora_queue	Advanced Queue Queue	Oracle Advanced Queuing software.
cmdb_ci_appl_ora_report	Oracle Report Server	The Oracle Report Server software.
cmdb_ci_appl_ora_tns	Oracle App TNS Service	Oracle Application Express (TNS) listener software.
cmdb_ci_appl_ora_tnslsnr	Oracle TNS Listener Engine	Oracle Application Express software.
cmdb_ci_appl_peoplesoft	Peoplesoft Application Server	Peoplesoft Application Server software.
cmdb_ci_appl_rabbitmq	RabbitMQ	RabbitMQ (open source) software.
cmdb_ci_appl_rabbitmq_cluster	RabbitMQ Cluster	RabbitMQ Cluster (open source) software.
cmdb_ci_appl_sap_ascs	SAP ASCS Application	SAP ASCS software.
cmdb_ci_appl_sap_bo	SAP Business Objects CMS Server	SAP Business Objects CMS server software.
cmdb_ci_appl_sap_bo_scheduler	SAP BO BOXISheduleRouter	SAP BO BOXISheduleRouter software.
cmdb_ci_appl_sap_bus_obj	SAP Business Objects	SAP bushiness Object application.
cmdb_ci_appl_sap_ci	SAP CI Application	The SAP Central Instance software.
cmdb_ci_appl_sap_di	SAP DI Application	Oracle Development Infrastructure (DI) software.
cmdb_ci_appl_sap_ers	SAP ERS Application	Oracle Evaluated Receipt Settlement (ERS) software.
cmdb_ci_appl_sap_hana_db	SAP Hana Db	SAP HANA software.
cmdb_ci_appl_sap_jc	SAP JC Application	SAP JC (java application) software.

Table name	Display name (label)	Table description
cmdb_ci_appl_sap_scs	SAP SCS Application	SAP SCS (central services) software.
cmdb_ci_appl_sendmail	Sendmail	Sendmail (open source) software.
cmdb_ci_appl_sharepoint	SharePoint	Microsoft SharePoint software.
cmdb_ci_appl_sp_service	SharePoint Service	Microsoft Windows Sharepoint Services (WSS) software.
cmdb_ci_appl_tibco_hawk	Tibco Hawk	TIBCO Hawk software.
cmdb_ci_appl_tibco_matrix	ActiveMatrix Business Works	TIBCO ActiveMatrix BusinessWorks software.
cmdb_ci_appl_tibco_matrix_proc	ActiveMatrix Business Works Process	TIBCO ActiveMatrix BusinessWorks Process software.
cmdb_ci_appl_tibco_message	Tibco Enterprise Message Service	TIBCO Enterprise Message Service software.
cmdb_ci_appl_tibco_queue	EMS Queue	Tibco EMS (Enterprise Message Service) Queues software.
cmdb_ci_appl_tuxedo	Tuxedo	Tuxedo software (middleware transactions for UNIX, Extended for Distributed Operations).
cmdb_ci_appl_tuxedo_portal	Tuxedo Portal	Tuxedo portal software.
cmdb_ci_appl_vign_content_svr	Vignette Content Management Server	Vignette (Open Text Corp) Content Management Server software.
cmdb_ci_appl_vignette_search	Vignette Search Starter	Vignette (Open Text Corp) Search Server software.
cmdb_ci_appl_vignette_server	Vignette Server	Vignette (Open Text Corp) Server software.
cmdb_ci_appl_weblogic_jms	Weblogic JMS Server	WebLogic JMS software.
cmdb_ci_appl_weblogic_lb	Weblogic LB	WebLogic Server load balancer software.
cmdb_ci_appl_weblogicmodule	Weblogic Module Server	WebLogic Server software.
cmdb_ci_appl_websphere_portal	Websphere Portal	WebSphere Portal software.
cmdb_ci_appl_wmb	WMB Flow	WebSphere Message Broker software.
cmdb_ci_application_cluster	Application Cluster	Logical cluster of application-tier servers.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table name	Display name (label)	Table description
cmdb_ci_application_software	Application Software	Computer program designed to perform a group of coordinated functions, tasks, or activities for the benefit of the user. An extension of the Software table, providing installed software information (not a running process).
cmdb_ci_ats_power_eq	Automatic Transfer Switch	Electrical power switch that switches a load between two sources.
cmdb_ci_availability_set	Availability Set	Logical grouping of virtual machines running on Microsoft Azure platform.
cmdb_ci_base_rpa_process	Base Bot Process	Business reason, process type, and schedule.
cmdb_ci_base_rpa_robot	Base Robot	Machine where robot is running, state, and type.
cmdb_ci_batch_job	Batch Job	A computer program or set of programs processed in batch mode.
cmdb_ci_aws_datacenter	AWS datacenter	Logical representation of an Amazon Web Services datacenter.
cmdb_ci_azure_datacenter	Azure datacener	Logical representation of a Microsoft Azure datacenter.
cmdb_ci_business_app	Business Application	All business applications.
cmdb_ci_business_process	Business Process	A process that is owned and carried out by the business and contributes to the delivery of a product or business service to a business customer.
cmdb_ci_chassis_server	Server Chassis	A metal structure that is used to house or physically assemble servers in various different form factors.
cmdb_ci_cim_profile	CIM Profiles	CIM Profiles (UML).
cmdb_ci_cim_server	CIM Server	Server hosting CIM profiles.
cmdb_ci_circuit	Circuit	Electrical circuits information.
cmdb_ci_cloud_database	Cloud Database	Database which runs on a cloud computing platform.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table name	Display name (label)	Table description
cmdb_ci_cloud_ip_address	Cloud IP Address	Web server which runs on a cloud computing platform.
cmdb_ci_cluster	Cluster	Logical group of computing resources bound together by software to function as one logical computing resource.
cmdb_ci_cluster_node	Cluster Node	Single computing resource which is logically/ operationally bound into a cluster.
cmdb_ci_cluster_resource	Cluster Resource	System object that is a set or grouping of cluster resources that are used to manage events that occur in a clustered environment.
cmdb_ci_cluster_vip	Cluster Virtual IP	Cluster VIP information.
cmdb_ci_cmp_price_product_base	Cloud Product Price Base	Used to calculate the approximate monthly cost of running a stack built on Virtual Servers in cloud environment: • Cloud Price Base: Common price base to store pricing info of all the resources of all the supported clouds. • Cloud Price Product Base: Base table to store the common attributes of all the pricing resources. • VM Instance Price: Specific table that extends the Cloud Price Product base to store the VM specific product info of all the supported clouds. Parent class for cloud product prices such as VM instance price.
cmdb_ci_cmp_resource	Cloud Resource	Generic cloud resources.
cmdb_ci_comm	Communication Device	Communication devices information. A choice list containing devices such as cellphone, phone, conference phone, and Wi-Fi.
cmdb_ci_computer	Computer	An extension of the Hardware table, capturing computer properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table name	Display name (label)	Table description
cmdb_ci_computer_room	Computer Room	Logical representation of a computer room.
cmdb_ci_config_automation_server	Management Server	Dev Ops tools such as Chef and Puppet, that are used to manage server configurations. Parent class for application management servers.
cmdb_ci_config_file	Configuration file	Configuration files which establish the parameters and initial settings for some computer programs.
cmdb_ci_crac	Computer Room AC	Air conditioning units used to cool data centers.
cmdb_ci_csu_dsu_network	CSU/DSU	Digital-interface device used to connect networking equipment to a digital circuit.
cmdb_ci_database	Database	Organized collection of data such as the set of files where data is stored, the reason for a database, and the metadata about the data.
cmdb_ci_datacenter	Data Center	Facility used to house computer systems and associated components, such as telecommunications and storage systems. It generally includes redundant or backup power supplies, redundant data communications connections, environmental controls (such as air conditioning and fire suppression), and various security devices.
cmdb_ci_datapower_server	Data Power Hosting Server	Server running IBM DataPower Gateway software.
cmdb_ci_datastore	Datastore	Datastores are like file systems, abstracting the physical storage and providing a model for storing files. The child class represents the VMware specific Datastore. Parent class for VMWare datastore object types such as vCenter Datastores.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table name	Display name (label)	Table description
cmdb_ci_db_catalog	Database Catalog	Metadata which defines database objects such as base tables, views (virtual tables), synonyms, value ranges, indexes, users, and user groups, for a specific database instance.
cmdb_ci_db_db2_catalog	DB2 Database (Before CMDB CI Class Models v1.67.0, the label (display name) was DB2 Catalog)	Database catalog for DB2 database.
cmdb_ci_db_db2_instance	DB2 Subsystem (Before CMDB CI Class Models v1.67.0, the label (display name) was DB2 Instance)	Instance of a DB2 database.
cmdb_ci_db_hbase_instance	HBase Instance	Instance of an HBase database.
cmdb_ci_db_instance	Database Instance	Software and memory used to manipulate data in a database.
cmdb_ci_db_mongodb_instance	MongoDB Instance	Instance of a MongoDB database.
cmdb_ci_db_mssql_analysis	SQL Server Analysis Services	Microsoft SQL Server Analysis Services software.
cmdb_ci_db_mssql_catalog	MSFT SQL Catalog	Database catalog for a specific instance of a Microsoft SQL database.
cmdb_ci_db_mssql_instance	MSFT SQL Instance	Microsoft SQL instance.
cmdb_ci_db_mssql_int_job	SQL Server Integration Services Job	Scheduled job to run a SQL Server Integration Service package.
cmdb_ci_db_mssql_integration	SQL Server Integration Services	MSQL Server Integration Services software.
cmdb_ci_db_mssql_reporting	SQL Server Reporting Services	SQL Server software used for server-based reporting generation.
cmdb_ci_db_mysql_catalog	MySQL Catalog	Database catalog for a specific instance of a MySQL database.
cmdb_ci_db_mysql_clustermgnode	MySQLClusterMGMNode	MySQL primary administrative interface to a running cluster.
cmdb_ci_db_mysql_clusternode	MySQLClusterDataNode	Summary table used in the [ndbd] or [ndbd default]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table name	Display name (label)	Table description
		sections of a config.ini file for configuring MySQL Cluster data nodes.
cmdb_ci_db_mysql_instance	MySQL Instance	Instance of a MySQL database.
cmdb_ci_db_ora_catalog	Oracle Catalog	Database catalog for a specific instance of an Oracle database.
cmdb_ci_db_ora_instance	Oracle Instance	Instance of an Oracle database.
cmdb_ci_db_ora_listener	Oracle Database Listener	Process that runs on an Oracle Database Server.
cmdb_ci_db_postgresql_instance	PostgreSQL Instance	Instance of a PostgreSQL database.
cmdb_ci_db_syb_catalog	Sybase Catalog	Database catalog for a specific instance of a Sybase database.
cmdb_ci_db_syb_instance	Sybase Instance	Instance of a Sybase database.
cmdb_ci_desktop_software	Desktop Software	Software used on desktops and laptops.
cmdb_ci_dir_policy_server	Policy Server	Policy server, which provides a security component of a policy-based network that provides authorization services and facilitates tracking and control of files.
cmdb_ci_dir_site_minder_server	Site Minder	Server running SiteMinder software.
cmdb_ci_directory_ad_forest	AD Forest	Active Directory forest.
cmdb_ci_directory_ha	HA Proxy	HAProxy software.
cmdb_ci_directory_iifp	IIFP	Identity Identification Feature Pack (Active Directory) software.
cmdb_ci_directory_ldap	LDAP DB	LDAP (Lightweight Directory Access Protocol) database software.
cmdb_ci_directory_server	Directory Server	Server running LDAP software.
cmdb_ci_disk	Disk	General category of data storage mechanisms.
cmdb_ci_disk_partition	Disk Partition	Sections of a disk separated so that information in each section can be managed separately.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table name	Display name (label)	Table description
cmdb_ci_display_hardware	Display Hardware	Hardware used to display information in visual form.
cmdb_ci_dns_alias	DNS Alias	Synonym for the host used to resolve DNS addresses.
cmdb_ci_dns_name	DNS Name	Primary DNS names.
cmdb_ci_docker	Docker Container	Docker containers (a runtime instance of a docker image).
cmdb_ci_docker_engine	Docker Engine	Docker software for running and managing Docker containers.
cmdb_ci_docker_image	Docker Image	Docker images. Ordered collection of root filesystem changes and the corresponding execution parameters for use within a container runtime.
cmdb_ci_docker_image_tag	Docker Image Tag	Docker tag, which is a label applied to a Docker image in a repository.
cmdb_ci_docker_local_image	Docker Local Image	Locally managed Docker image.
cmdb_ci_drs_vm_config	DRS VM Config	Distributed Resource Scheduler (DRS) behavior for the VMs in the vCenter that override the cluster behavior.
cmdb_ci_ec2_instance	EC2 Virtual Machine Instance	Virtual machine running in the Amazon Elastic Compute Cloud (EC2) platform.
cmdb_ci_email_server	Email Server	Server running email software.
cmdb_ci_email_server_jes	JES	Server running JES software (multi-featured hybrid MTA/MDA server).
cmdb_ci_endpoint	Endpoint	Endpoint, which represents the entry point to a service, a process, or a queue or topic destination in service-oriented architecture.
cmdb_ci_environment	Environment	Logical grouping of hardware and software used to develop, test, and deliver computing services. For example: development, test, quality assurance, and production.
cmdb_ci_esx_resource_pool	ESX Resource Pool	VMware set of physical resources.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table name	Display name (label)	Table description
cmdb_ci_esx_server	ESX Server	Physical ESX server running the VMware ESXi operating system.
cmdb_ci_exchange_backend	ExchangeBackEndServer	Server running Exchange software.
cmdb_ci_exchange_cas	Exchange Client Access Server	Server running Exchange software providing client access services.
cmdb_ci_exchange_edge_transport_server	Exchange Edge Transport Server	Server running Exchange Edge Transport software.
cmdb_ci_exchange_frontend	ExchangeFrontEndServer	Server running Exchange software.
cmdb_ci_exchange_hub	ExchangeHub	Server running Exchange Hub software.
cmdb_ci_exchange_hub_transport_server	Exchange Hub Transport Server	Server running Exchange Hub software providing transport services.
cmdb_ci_exchange_mailbox	Exchange MailBox	Exchange email account.
cmdb_ci_exchange_mailbox_server	Exchange Mailbox Server	Server running Exchange software providing client access services.
cmdb_ci_exchange_service_component	Exchange Service Component	Exchange Service Component software.
cmdb_ci_facility_hardware	Facility Hardware	Base class for hardware used to facilities services such as electric, water, sewer, air, and security.
cmdb_ci_fc_disk	Fibre Channel Disk	Base table for fibre channel disk.
cmdb_ci_fc_export	Fibre Channel Export	Storage volume exported by a storage server via Fibre Channel protocol.
cmdb_ci_fc_port	Fibre Channel Port	Fibre Channel port on a storage server, FC switch, or on a host's HBA.
cmdb_ci_fddi_network	FDDI Cards	Fiber Distributed Data Interface cards.
cmdb_ci_file_system	File System	File system information for a server, capturing details such as mount point, capacity, and type of file system.
cmdb_ci_file_system_nfs	NFS File system	Extension of File System, which provides NFS file system information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table name	Display name (label)	Table description
cmdb_ci_file_system_smb	SMB File system	Extension of File System, which provides SMB file system information.
cmdb_ci_firewall_network	Firewall Hardware	Firewall hardware.
cmdb_ci_ftp_server	FTP Server	Server providing FTP services.
cmdb_ci_fuel_tank	Fuel Tank	Fuel tank.
cmdb_ci_generator_power_eq	Power Generator	Power generator.
cmdb_ci_group	Group	Logical group of CIs.
cmdb_ci_hardware	Hardware	Base class for hardware.
cmdb_ci_host_cluster	Host Cluster	Cloud agnostic way of representing a group of hosts as a cluster. The child class represents VMware vCenter Cluster specific details. Parent class for VMWare host cluster object types such as vCenter Clusters.
cmdb_ci_hpux_server	HPUX Server	Server running HPUX software.
cmdb_ci_hub_network	Hub Hardware	Physical network hub.
cmdb_ci_hvac	HVAC Equipment	Heating, ventilation, and air conditioning equipment.
cmdb_ci_hyper_v_cluster	Hyper-V Cluster	Cluster of the Hyper-V servers.
cmdb_ci_hyper_v_instance	Hyper-V Virtual Machine Instance	Hyper-V virtual machine instance. This table extends the generic Virtual Machine Instance [cmdb_ci_vm_instance] table.
cmdb_ci_hyper_v_network	Hyper-V Virtual Network	Hyper-V virtual network.
cmdb_ci_hyper_v_object	Hyper-V Object	Base class for all Hyper-V objects.
cmdb_ci_hyper_v_resource_pool	Hyper-V Resource Pool	Hyper-V resource pool.
cmdb_ci_hyper_v_rpool_comp	Hyper-V Resource Pool Component	Resource pool component belonging to resource pool.
cmdb_ci_hyper_v_server	Hyper-V Server	Server running Hyper-V software.
cmdb_ci_ids_network	Intrusion Detection System	Security intrusion detection systems.
cmdb_ci_iisdirectory	IIS Virtual Directory	Virtual Directory in IIS Manager.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table name	Display name (label)	Table description
cmdb_ci_imaging_hardware	Imaging Hardware	Hardware used to create electronic/physical images.
cmdb_ci_inetinfo	Inetinfo service	Inetinfo service of IIS application.
cmdb_ci_inf_software	Infrastructure Software	Base class for enterprise software or programs specifically designed to help business organizations perform basic tasks such as workforce support, business transactions and internal services, and processes.
cmdb_ci_information_object	Information Object	Types of information that a business application or any other entity handles. For example: 'Employee Salary Data', Employee Personal Data', and 'Sales Data'. For more information, see CSDM implementation stages — Fly stage and Enterprise Architecture (formerly Application Portfolio Management) and CSDM tables.
cmdb_ci_installed_bundles	Installed Bundles	Extension of the Virtual Machine Object [cmdb_ci_vm_object] table, which represents bundles of installed software.
cmdb_ci_infra_service	Infrastructure Service	IT services which support providing computing infrastructure.
cmdb_ci_infra_service_ldap	LDAP Service	Running LDAP service.
cmdb_ci_ip_address	IP Address	IP address.
cmdb_ci_ip_device	IP Device	Base class for devices with an IP address.
cmdb_ci_ip_firewall	IP Firewall	Firewall hardware.
cmdb_ci_ip_network	IP Network	IP network information capturing details such as subnet, router, and router_interface_type.
cmdb_ci_ip_phone	IP Phone	IP-enabled (VOIP) phone.
cmdb_ci_ip_router	IP Router	Specialization of the Network Gear [cmdb_ci_netgear] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table name	Display name (label)	Table description
cmdb_ci_ip_server	IP Server	Server hardware.
cmdb_ci_ip_service	IP Service Instance	Base table for IP services running on a server such as Unix daemon or Windows service.
cmdb_ci_ip_switch	IP Switch	Specialization of the Network Gear [cmdb_ci_netgear] table.
cmdb_ci_iplanet_web_server	Iplanet Web Server	Server running Oracle iPlanet Web Server (OiWS) software.
cmdb_ci_isam_server	ISAM Server	Server running ISAM software.
cmdb_ci_iscsi_disk	iSCSI Disk	Host mount of an iSCSI disk.
cmdb_ci_iscsi_export	iSCSI Export	Storage volume exported by a storage server via iSCSI.
cmdb_ci_kubernetes_component	Kubernetes Component	Kubernetes cluster, ingress, namespace, node, pod, service, volume, and workload. Also represents open shift build conf, deployment conf, docker images repository, group, images, stream, project, route, and user. Parent class for Kubernetes components such as Pods and Clusters.
cmdb_ci_kvm	KVM	Hypervisor that manages kernel-based virtual machines (KVMs).
cmdb_ci_kvm_network	Network	KVM Virtual network.
cmdb_ci_kvm_object	KVM Object	Base object for all KVM objects.
cmdb_ci_kvm_storage_pool	Storage Pool	KVM storage pool.
cmdb_ci_kvm_storage_volume	Storage Volume	KVM storage volume.
cmdb_ci_kvm_vm_instance	KVM Virtual Machine Instance	Virtual machine instance running on a KVM hypervisor.
cmdb_ci_lb	Load Balancer	Server functioning as a load balancer.
cmdb_ci_lb_a10	A10 Load Balancer	Server functioning as an A10 load balancer.
cmdb_ci_lb_ace	ACE	Server functioning as an ACE load balancer.
cmdb_ci_lb_alteon	Alteon	Server functioning as an Alteon load balancer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table name	Display name (label)	Table description
cmdb_ci_lb_appl	Load Balancer Application	Application that provides load balancing functionality.
cmdb_ci_lb_backend_server	LB Backend Server	Server functioning as a backend load balancer.
cmdb_ci_lb_bigip	F5 BIG-IP	Server functioning as an F5 BIG-IP load balancer.
cmdb_ci_lb_cisco_csm	Cisco CSM	Server functioning as a Cisco CSM load balancer.
cmdb_ci_lb_cisco_css	Cisco CSS	Server functioning as a Cisco CSS load balancer.
cmdb_ci_lb_f5_gtm	F5 BigIP GTM	Server functioning as an F5 BigIP GTM load balancer.
cmdb_ci_lb_f5_ltm	F5 BigIP LTM	Server functioning as an F5 BigIP LTM load balancer.
cmdb_ci_lb_haproxy	HAProxy Load Balancer	Server functioning as an HA Proxy load balancer.
cmdb_ci_lb_isa	ISA Server	Server functioning as an ISA load balancer.
cmdb_ci_lb_modjk	Modjk Load Balancer	Server functioning as a Cisco CSM load balancer.
cmdb_ci_lb_modproxy	ModProxy Load Balancer	Server functioning as a ModProxy load balancer.
cmdb_ci_lb_netscaler	Citrix Netscaler	Server functioning as a Citrix Netscaler load balancer.
cmdb_ci_lb_network	Network Load Balancer	Server performing network load balancing.
cmdb_ci_lb_nginx	Nginx Load Balancer	Server functioning as an Nginx load balancer.
cmdb_ci_lb_pool	Load Balancer Pool	Collection of host-to-port mappings to be balanced.
cmdb_ci_lb_pool_member	Load Balancer Pool Member	Host-to-port mapping of a request to be balanced.
cmdb_ci_lb_radware	Radware Load Balancer	Server functioning as a Radware load balancer.
cmdb_ci_lb_service	Load Balancer Service	Virtual service that the device balances by forwarding requests to members within a pool.
cmdb_ci_lb_template	Load Balancer Template	Load balancer template which contains load balancer-related configuration settings for a specific type of network traffic.
cmdb_ci_lif	LIF	Logical interface.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table name	Display name (label)	Table description
cmdb_ci_lb_vlan	Load Balancer VLAN	Virtual LAN segment.
cmdb_ci_linux_server	Linux Server	Server running Linux software.
cmdb_ci_logical_datacenter	Logical Datacenter	VMware vCenter logical datacenter.
cmdb_ci_lpar	Logical Partition	Logical partition, commonly called an LPAR, is a subset of a computer's hardware resources, virtualized as a separate computer.
cmdb_ci_lvm_pool	LVM Pool	Linux Volume Manager storage pool.
cmdb_ci_lvm_pool_member	LVM Pool Member	Linux Volume Manager storage pool member.
cmdb_ci_mainframe	IBM Mainframe	IBM large-scale computer system.
cmdb_ci_mainframe_hardware	Mainframe Hardware	The hardware components of a large-scale computer system.
cmdb_ci_mainframe_lpar	IBM Mainframe LPAR	Logical partition, which is commonly called an LPAR, and is a subset of a mainframes computer's hardware resources, virtualized as a separate computer.
cmdb_ci_memory_module	Memory Module	Circuit board that provides for memory storage.
cmdb_ci_mfp_printer	Multi-function Printer	Physical device with scan, copy, and fax capabilities.
cmdb_ci_microsoft_iis_web_server	Microsoft iis Web Server	Server running Internet Information Services (IIS) for Windows software.
cmdb_ci_modem_network	Modem Hardware	Physical modem hardware.
cmdb_ci_mpio_pool	Multipath IO Pool	Multipath IO pool, representing multiple redundant paths to storage.
cmdb_ci_mpio_pool_group	Multipath IO Pool Group	Group of multipath IO pools.
cmdb_ci_mpio_pool_path	Multipath IO Pool Path	Single path in an MPIO pool.
cmdb_ci_msd	Mass Storage Device	Physical storage device.
cmdb_ci_nas_file_system	NAS File System	Extension of the File System [cmdb_ci_file_system]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table name	Display name (label)	Table description
		table, representing network attached storage.
cmdb_ci_nat_gateway	NAT Gateway	Functionality for NAT gateway.
cmdb_ci_netapp_cdot	NetApp CDOT	Functionality of NetApp Clustered Data OnTap operating system
cmdb_ci_netapp_datacenter	NetApp Datacenter	NetApp logical datacenter.
cmdb_ci_netapp_svm	NetApp SVM	NetApp Storage Virtual Machine.
cmdb_ci_netapp_volume	NetApp Volume	NetApp FlexVol storage volume.
cmdb_ci_net_app_server	Network Appliance Hardware	Server configured to perform as a networking appliance.
cmdb_ci_netgear	Network Gear	Extension of the Hardware table, that captures network equipment such as router, switch, hub, gateway, and bridge.
cmdb_ci_netware_server	Netware Server	Server running NetWare software.
cmdb_ci_network	Cloud Network	VMware vCenter cloud network.
cmdb_ci_network _acl	Network ACL	Network access control list (ACL).
cmdb_ci_network_acl_rule	Network ACL Rule	Rule used to control networking access rights.
cmdb_ci_network_adapter	Network Adapter	Network adapter hardware.
cmdb_ci_network_policy_group	Network Policy Group	Group policy consumed by Active Directory services.
cmdb_ci_network_template	Network Template	OpenStack file used to configure a network.
cmdb_ci_nic	Cloud Mgmt Network Interface	Virtual network adapter.
cmdb_ci_nginx_web_server	Nginx Web Server	Server running Nginx software.
cmdb_ci_openstack_datacenter	OpenStack Datacenter	OpenStack logical datacenter.
cmdb_ci_optical_transport (Installed with the com.snc.cmdb.telecom.category plugin)	Fiber Optic Equipment	Fiber optics which are used for long-distance and high-performance data networking. Fiber optics are commonly used in telecommunication services such as internet, television, and telephones.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table name	Display name (label)	Table description
		Child class of Transport Hardware and parent class for telecom fiber optic equipment such as optical multiplexers and terminal equipment.
cmdb_ci_oslv_container	Operating-system-level Virtualization Container	Containers (a runtime instance of a docker image).
cmdb_ci_oslv_engine	Operating-system-level Virtualization Engine	Software for running and managing containers.
cmdb_ci_oslv_image	Operating-system-level Virtualization Image	Container images. Ordered collection of root filesystem changes and the corresponding execution parameters for use within a container runtime.
cmdb_ci_oslv_image_tag	Operating-system-level Virtualization Image Tag	Container tag, which is a label applied to a container image in a repository.
cmdb_ci_oslv_local_image	Operating-system-level Virtualization Local Image	Locally managed container image.
cmdb_ci_osx_server	OS/X Server	Server running OS/X operating system.
cmdb_ci_os_template	Image	Software files used to create a new instance of a compute resource such as server, desktop, virtual machine, and virtual router.
cmdb_ci_outofband_device	Out-of-Band Device	Hardware used to perform out-of-band management.
cmdb_ci_patches	Patch	Patch software to fix or improve a computer program or its supporting data.
cmdb_ci_pc_hardware	Personal Computer	Multi-purpose electronic computer whose size, capabilities, and price make it feasible for individual use.
cmdb_ci_pcf_component	CloudFoundry Component	Cloud Foundry provides a highly efficient, modern model for cloud native application delivery on top of Kubernetes. Component represents application, domain, organization, quota, routes, service, service plan, space, and space instances.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table name	Display name (label)	Table description
		Parent class for price base of cloud products such as virtual machines.
cmdb_ci_pdu	PDU	Power distribution unit (PDU).
cmdb_ci_pdu_outlet	Outlet	Single outlet of a PDU.
cmdb_ci_peripheral	Computer Peripheral	Various computer peripherals such as monitor, docking station, KVM switch, projector, scanner, keyboard, mouse, and UPS.
cmdb_ci_personal_printer	Personal Printer	Printer whose size,capabilities and price make it feasible for individual use.
cmdb_ci_plotter	Plotter	Printer with capabilities to print large vector graphic images.
cmdb_ci_power_eq	Power Equipment	Hardware used to manage electrical power.
cmdb_ci_port	Port	Interface between a computer and other electronic devices.
cmdb_ci_port_group	Port Group	Group of ports on a virtual switch.
cmdb_ci_print_queue	Puppet Primary	Print queue, which is a list of printer output jobs held in a reserved memory area, including the most current status of all active and pending print jobs.
cmdb_ci_printer	Printer	Physical device which makes a persistent human-readable representation of graphics or text on paper or similar physical media.
cmdb_ci_printing_hardware	Printing Hardware	Physical device which makes a persistent human-readable representation of graphics or text on paper or similar physical media.
cmdb_ci_puppet_master		Server running PuppetMaster application.
cmdb_ci_qtree	Qtree	Qtree file system.
cmdb_ci_qualifier	Qualifier	Relation qualifier CIs which contain important information about CI relationships.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table name	Display name (label)	Table description
		In a relation qualifier, you can annotate arbitrary unique information about the relationship between two CIs. You can define multiple qualifiers for a single relationship, resulting in a qualifier chain. However, there can be only a single qualifier chain for a specific relationship type between two CIs. Parent class for the various relation qualifier types such as EntryPoint Markers and Boundary Connections.
cmdb_ci_rack	Rack	Datacenter racks containing details such as rack units, rack units in use, and power consumption.
cmdb_ci_raid	RAID	Storage pool using RAID mechanisms to ensure data integrity.
cmdb_ci_raid_member	RAID Member	Member of storage pool using RAID mechanisms.
cmdb_ci_resource_group	Resource Group	Resource pool is a logical abstraction for flexible management of resources.
cmdb_ci_sa_scaling_pol_base	Scaling Policy	Parent class for virtual machines scaling policy options such as simple and dynamic.
cmdb_ci_san	Storage Area Network	Network which provides access to block level storage.
cmdb_ci_san_connection	SAN Connection	Connection in a SAN network.
cmdb_ci_san_disk	SAN Disk	Base table for the iSCSI Disk [cmdb_ci_iscsi_disk] and the Fibre Channel Disk [cmdb_ci_fc_disk] tables.
cmdb_ci_san_endpoint	SAN Endpoint	One end of a SAN connection.
cmdb_ci_san_export	SAN Export	Base table for the iSCSI Export [cmdb_ci_iscsi_export] and the Fibre Channel Export [cmdb_ci_fc_export] tables.
cmdb_ci_san_fabric	SAN Fabric	Hardware that connects workstations and servers to

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table name	Display name (label)	Table description
		storage devices in a SAN. Referred to as a "fabric."
cmdb_ci_san_zone	SAN Zone	Subset of SAN storage that certain users are restricted to.
cmdb_ci_san_zone_alias	SAN Zone Alias	Collection of SAN zone members.
cmdb_ci_san_zone_alias_member	SAN Zone Alias Member	M2m relationship between SAN zone aliases and SAN zone members.
cmdb_ci_san_zone_member	SAN Zone Member	Ports and devices in a SAN zone.
cmdb_ci_san_zone_set	SAN Zone Set	Collection of SAN zones.
cmdb_ci_scanner	Scanner	Hardware used to create digital images of paper documents.
cmdb_ci_server	Server	Base class for all types of servers.
cmdb_ci_server_snapshot	Server Snapshot	Server snapshot, which is the state of a system at a particular point in time.
cmdb_ci_service	Service	IT Service that directly supports a Business Process (ITIL).
cmdb_ci_service_auto	Service Instance	Services that can be monitored by the system, which in the base system, includes only application services. If Service Mapping is activated, there can also be records for dynamic CI groups. If Event Management is activated, there can be records for alert groups.
cmdb_ci_service_business	Business Service	Business services are published to business users and typically underpin one or more business capabilities. Business services are often orderable by business users.
cmdb_ci_service_discovered	Mapped Application Service	Application services, created by the Manual service population method. For each application service, there is a container CI record that models the application service.
cmdb_ci_service_technical	Technology Management	Technology management services are published

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table name	Display name (label)	Table description
	Service (formerly Technical Service)	to service owners and typically underpin one or more business services. A technology management service may have an operational view made up of one or more technical management offerings.
cmdb_ci_solaris_instance	Solaris Virtual Machine Instance	Virtual machine instance running Solaris software.
cmdb_ci_solaris_server	Solaris Server	Physical server running Solaris software.
cmdb_ci_spkg	Software	Software package information containing details such as version, install count, license count, package name, and key (when SAM enabled).
cmdb_ci_storage_controller	Storage Controller	Logical device that controls a storage volume or Fibre Channel port.
cmdb_ci_storage_device	Storage Device	Base table for block storage devices such as DAS, SAN, and NAS.
cmdb_ci_storage_disk	Storage Disk	Disk installed in a storage server.
cmdb_ci_storage_export	Storage Export	Base table for the SAN Export [cmdb_ci_san_export] table.
cmdb_ci_storage_fileshare	Storage File Share	NAS file system on a storage server (an exported file system).
cmdb_ci_storage_hba	Storage HBA	Host bust adapter for Fibre Channel. The physical device that provides Fibre Channel ports.
cmdb_ci_storage_pool	Storage Pool	Logical collection of storage.
cmdb_ci_storage_pool_member	Storage Pool Member	Logical volume in a storage pool.
cmdb_ci_storage_switch	Storage Switch	Fibre Channel switch.
cmdb_ci_storage_volume	Storage Volume	Volume on a storage server.
cmdb_ci_storage_vol_snapshot	Storage Volume Snapshot	Server snapshot is the state of a system at a particular point in time.
cmdb_ci_subnet	Cloud Mgmt Subnet	Part of a larger network.
cmdb_ci_sun_dir_proxy_server	Sun Directory Proxy Server	Server running Sun ONE Directory Proxy Server software.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table name	Display name (label)	Table description
cmdb_ci_sun_ldap_dir_server	Sun LDAP Server	Server running Sun ONE Directory Server (LDAP) software.
cmdb_ci_surge_power_eq	Surger Protection Equipment	Power equipment used to prevent power surges.
cmdb_ci_tape_server	Server Tape Unit	Hardware for using magnetic tape storage.
cmdb_ci_tomcat_connector	Tomcat Connector	Software which provides web server plugins to connect web servers with Tomcat and other backends.
cmdb_ci_tower_eq	Tower Equipment	Parent class for facility towers and tower equipment such as lights and beacons.
cmdb_ci_translation_rule	NAT	Rules to allow router to remap one network address to another.
cmdb_ci_transport_hardware	Transport Hardware	Telecommunication hardware used for digital communication and related hardware such as telecommunication racks, servers to connect port to LAN, relays, channel banks, and network circuit switch. Parent class for telecom transport hardware such as multiplexers and fiber optic equipment.
cmdb_ci_ucs_blade	Cisco UCS Blade	Physical Cisco UCS Blade server hardware.
cmdb_ci_ucs_chassis	Cisco UCS Chassis	Physical Cisco UCS chassis hardware used to hold Cisco UCS Blade server hardware.
cmdb_ci_ucs_equipment	Cisco UCS Equipment	Cisco Unified Computing System (UCS) products.
cmdb_ci_unix_cluster	UNIX Cluster	Set of computers clustered together to present a single Unix server resource.
cmdb_ci_unix_daemon	UNIX Daemon	Long running Unix background process used to answer requests for services.
cmdb_ci_unix_server	UNIX Server	Server running Unix software.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table name	Display name (label)	Table description
cmdb_ci_ups	UPS	Uninterrupted Power Supply devices, where devices are traditional UPS devices.
cmdb_ci_ups_alarm	UPS Alarm	Uninterrupted Power Supply alarm.
cmdb_ci_ups_bypass	UPS Bypass	Uninterrupted Power Supply bypass.
cmdb_ci_ups_input	UPS Input	Electrical input to an Uninterrupted Power Supply device.
cmdb_ci_ups_output	UPS Output	Electrical output from an Uninterrupted Power Supply device.
cmdb_ci_ups_power_eq	Uninterruptible Power Supply	Uninterrupted Power Supply devices, where devices are any non-traditional UPS devices that manage electrical power.
cmdb_ci_vcenter	VMware vCenter Instance	Installed instance of VMware VCenter software.
cmdb_ci_vcenter_cluster	VMware vCenter Cluster	Set of servers that work together while running VMware VCenter software.
cmdb_ci_vcenter_cluster_drs_rule	VMWare vCenter Cluster DRS Rule	vCenter specific table which stores Distributed Resource Scheduler (DRS) basic rule information. Stores the affinity rule specifying that the members of a selected virtual machine DRS group can or must run on the members of a specific host DRS group. Populated by the vCenter API ClusterRuleInfo(vim.cluster.RuleInfo).
cmdb_ci_vcenter_datacenter	VMware vCenter Datacenter	VMware VCenter data center objects.
cmdb_ci_vcenter_datastore	VMware vCenter Datastore	VMware VCenter datastore objects containing details such as capacity, freespace, filesystem, and type.
cmdb_ci_vcenter_datastore_disk	Datastore Disk	Individual VMware VCenter datastore disk.
cmdb_ci_vcenter_folder	VMware vCenter Folder	VCenter folders, which can be used to group objects of the same type for easier management.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table name	Display name (label)	Table description
cmdb_ci_vcenter_network	VMware vCenter Network	VMWare vCenter virtual network.
cmdb_ci_vcenter_object	VMware vCenter Object	Base class for most VMware VCenter objects.
cmdb_ci_vcenter_server_obj	VMware vCenter Server Object	VMware hypervisor.
cmdb_ci_veritas_disk	Veritas Disk	Physical disk that is controlled by Veritas Volume Manager.
cmdb_ci_veritas_disk_group	Veritas Disk Group	Collection of disks in Veritas Volume Manager.
cmdb_ci_veritas_plex	Veritas Plex	Logical partition in Veritas Volume Manager.
cmdb_ci_veritas_subdisk	Veritas Subdisk	Partition of a Veritas_disk.
cmdb_ci_veritas_volume	Veritas Volume	Aggregation of plexes.
cmdb_ci_virtualization_server	Virtualization Server	Base table used by the ESX Server [cmdb_ci_esx_server] table.
cmdb_ci_virtual_desktop	Virtual Desktop	User's desktop environment (such as icons, wallpaper, windows, folders, toolbars, and widgets) is stored remotely on a server.
cmdb_ci_virtual_pvt_gateway	Virtual Private Gateway	Two VPN endpoints for automatic failover.
cmdb_ci_vm	Virtual Machine HyperVisor	Hypevisor software.
cmdb_ci_vm_instance	Virtual Machine Instance	Generic virtual machines information.
cmdb_ci_vm_object	Virtual Machine Object	Base class for all VM objects. Parent for all objects such as Hyper-V object and KVM object.
cmdb_ci_vm_parallels	Parallels	Instance of Parallels software.
cmdb_ci_vm_template	Virtual Machine Template	Template, which is a main copy of a virtual machine that can be used to create many clones. Base table for all VM templates.
cmdb_ci_vm_user_credentials	VM User Credentials	Credentials, which are used to authenticate access rights and permissions.
cmdb_ci_vm_vmware	VMware	**Note:** No longer used.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table name	Display name (label)	Table description
		VMWare specialization of the Virtual Machine table.
cmdb_ci_vm_zones	Zones	Partitioned virtual OS environment working in a Solaris operating system space.
cmdb_ci_voice_hardware (Installed with the com.snc.cmdb.telecom.category plugin)	Voice System Hardware	Telecommunication systems that represent telephone systems, telephone exchanges, and voice mail. Parent class for telecom voice system hardware such as voicemail and private branch exchanges.
cmdb_ci_volume_template	Volume Template	Set of rules that specify one or more capabilities of a storage volume (storage selection and layout rules).
cmdb_ci_vmware_instance	VMware Virtual Machine Instance	VMware VM instance on VMware hypervisor.
cmdb_ci_vmware_template	VMware Virtual Machine Template	Main copy of a VMware virtual machine that can be used to create many clones.
cmdb_ci_vpc	Virtual Private Cloud	On-demand configurable pool of shared computing resources allocated within a public cloud environment.
cmdb_ci_vpn	Virtual Private Network	Private network configured to run across a public network.
cmdb_ci_vpn_connection	VPN Connection	Secure connection to another network over the Internet.
cmdb_ci_vserver_peer	Vserver Peer	Extends the Virtual Machine Object [cmdb_ci_vm_object] table. Peer relationship between the Vservers (NetApp).
cmdb_ci_wap_network	Wireless Access Point	Networking hardware device that allows a Wi-Fi compliant device to connect to a wired network.
cmdb_ci_web_application	Web Application	Client–server software application in which the client (or user interface) runs in a web browser.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table name	Display name (label)	Table description
cmdb_ci_web_domino	Lotus Domino HTTP Server	Server running IBM Notes software (formerly Lotus Notes/IBM Domino).
cmdb_ci_web_server	Web Server	Computer system that processes requests via HTTP from the World Wide Web.
cmdb_ci_web_service	Web Service	Service offered by an electronic device to another electronic device, communicating with each other via the World Wide Web.
cmdb_ci_web_site	Web Site	A collection of related web pages.
cmdb_ci_websphere_cell	Websphere Cell	A logical grouping of IBM Websphere nodes (each of which runs one or more application servers) that are centrally managed.
cmdb_ci_win_cluster	Windows Cluster	A single (virtual) server composed of one or more physical Windows Servers.
cmdb_ci_win_cluster_node	Windows Cluster Node	A physical member of the Windows Cluster application.
cmdb_ci_win_cluster_resource	Windows Cluster Resource	A logical or physical entity managed by the Windows Cluster application.
cmdb_ci_win_domain_controller	Windows Domain Controller	A server that responds to security authentication requests within a Windows Server domain.
cmdb_ci_win_server	Windows Server	A server running Microsoft Windows Server operating system.
cmdb_ci_windows_service	Windows Service	A Windows computer program that operates in the background.
cmdb_ci_zone	Data Center Zone	A specified portion of a data center facility.

Service tables

In the CMDB, child tables of the Service [cmdb_ci_service] table store information about services, including application services.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Key fields in the Service table

Field	Description
Business criticality	The importance of this service to the business. This field can be used to determine disaster recovery strategies for this service. Default options are: • 1 - most critical • 2 - somewhat critical • 3 - less critical • 4 - not critical
SLA	A reference to the Agreement [sla] table.
Service classification	Designates the type of the service. • Application Service (For more information, see Application services) • Technical Service (For more information, see Application services and Populate an application service using the Dynamic CI Group method) • Service Offering (For more information, see Service Portfolio Management service offerings) • Shared Service (For more information, see IT shared services) • Billable Service (To represents a service that is billed, or that is cost managed)
Used for	Designates how this service is used. Default options are: • Production • Staging • QA • Test • Development • Demonstration • Training • Disaster Recovery
Users supported	The users that this service supports. A reference to the Group [sys_users_group] table.
Version	Use this field for your own versioning processes.

Service Configuration Item Association table

The Service Configuration Item Association table [svc_ci_assoc] binds an application service and a CI to track which CIs are part of each application service.

Field	Description
Configuration Item Id	A reference to the Configuration Item [cmdb_ci] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Service Id	A reference to the Service [cmdb_ci_service] table.

CMDB schema model

The Configuration Management Database (CMDB) schema model is a series of connected tables that contain all the assets and business services controlled by a company and its configurations.

Related ServiceNow® Store apps and reference information:

- CMDB tables descriptions: Descriptions of key CMDB tables in the base system.
- CMDB CI Class Models: A ServiceNow Store app that adds class models that extend the base CMDB class hierarchy. This includes class descriptions, identification rules, identifier entries, and dependent relationships if applicable. You can then use the added classes as any other CMDB base class.
- Populating the CMDB: Information about the various options for populating the CMDB.
- Discovery patterns : A ServiceNow Store app that provides a library of Discovery patterns for discovering specific devices and applications in the industry.
- Getting started with Service Graph Connectors: ServiceNow Store apps that provide pre-defined integrations for importing and integrating common third-party data into CMDB classes. Also includes the IntegrationHub ETL wizard for creating new ETL transform maps.

CMDB tables contain information about computers and devices on the network, software contracts and licenses, business services, and so on. The IT desk can use the CMDB to better understand their network users' equipment, and the relationships between them. The CMDB can also be referenced by other processes within the system.

Applications such as Asset Management and Contract Management, operate in conjunction with the CMDB. Asset Management and Software Asset Management link to CMDB all assets, hardware, software, assets in stock, as well as records for manufacturers and vendors. The Contract Management application contains information about contracts, including leases, service contracts, purchase orders, warranties, and software licenses. The Configuration Management Database (CMDB) application has a focus on operation.

For more background information about the CMDB, see the ServiceNow Community post) at CMDB 101- What is a configuration management database and why do you need one? .

Key CMDB tables

Key tables in the configuration management database (CMDB):

- The Base Configuration Item [cmdb] table, which is the core CMDB table for non IT CIs (descending classes are non IT CIs).
- The core Configuration Item [cmdb_ci] table, which stores the basic attributes of all the CIs. The admin, itil, or asset user role is required to access this table (descending classes are IT CIs).
- The CI Relationship [cmdb_rel_ci] table, which defines all relationships between CIs.

The Configuration Item table is extended to other tables, such as Database [cmdb_ci_database] and Computer [cmdb_ci_computer]. The Computer table is extended to the Server [cmdb_ci_server] table, which is extended to the UNIX Server [cmdb_ci_unix_server] table, and so on.

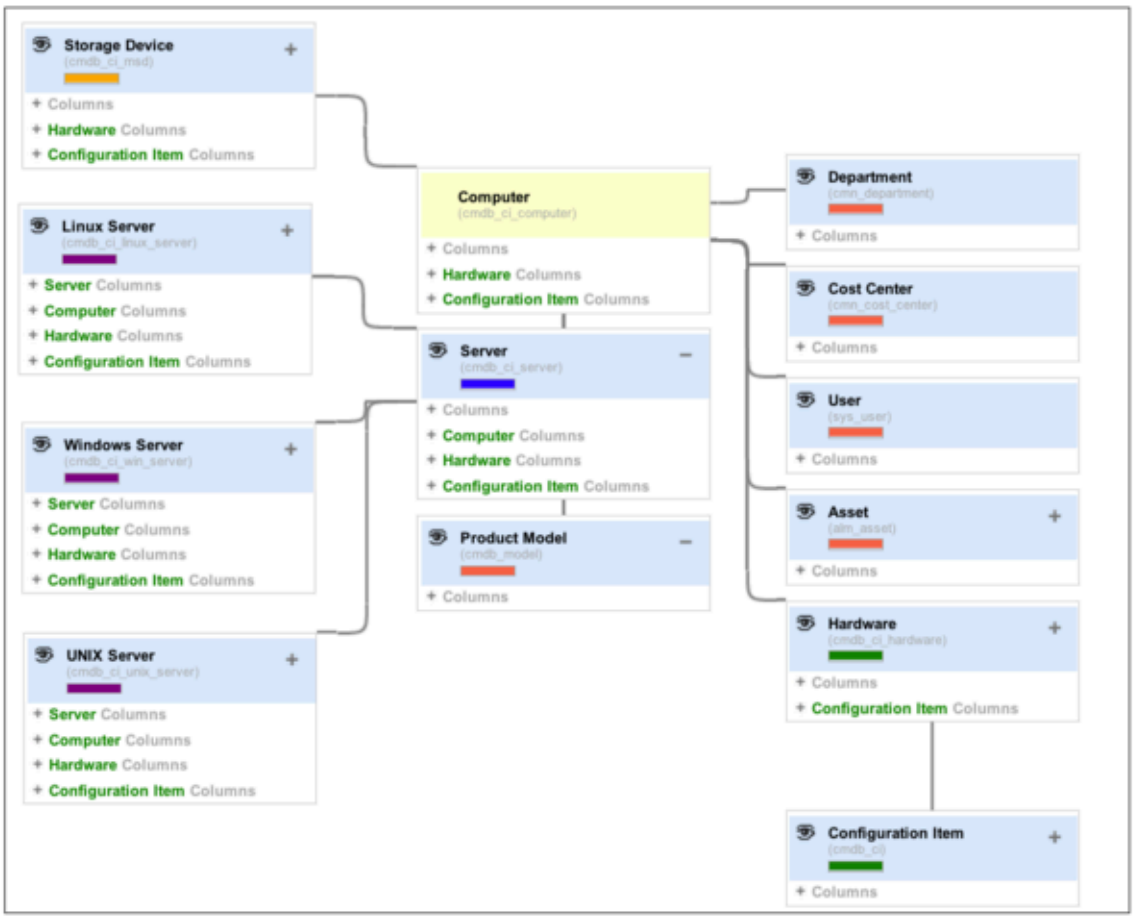
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The Base Configuration Item [cmdb] table uses the table per partition extension model, which has different behaviors for replicating and deriving information than other extended tables. See Table extension and classes.

You can use the schema map to view more details of tables and their relationships:

1. Navigate to **System Definition** > **Tables & Columns**.
2. Select a table and click **Schema Map**.

Schema Map



Note:
CIs not extended from the Configuration Item [cmdb_ci] table, are not displayed in Dependency Views maps and in CI relation formatters.

CI attributes

Attributes apply to all the CIs in a classification. To change attribute values for a CI, edit the appropriate CI. To add a unique attribute to a class, extend the class table and create a new classification for that CI.

The position of a CI in a classification hierarchy is determined by the attributes it shares with the CIs below it. Each time a CI has a single different attribute from its parent, the classification hierarchy branches.

For example, servers have different attributes from computers, which include workstations and laptops. Linux servers and UNIX servers have different attributes from the parent server classification and from each other, so they occupy separate branches in the hierarchy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

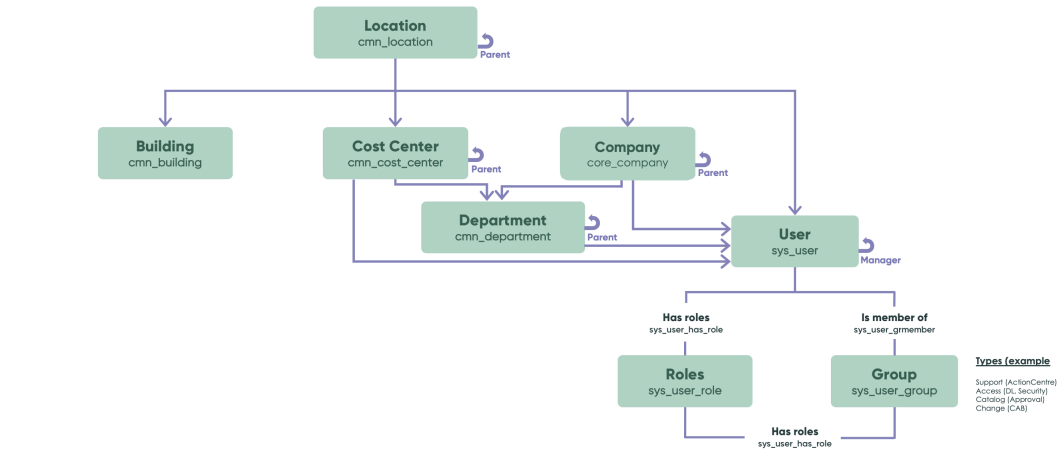
Configuration Item [cmdb_ci] class

Attributes in the Configuration Item [cmdb_ci] class, which extends the Base Configuration Item [cmdb] class.

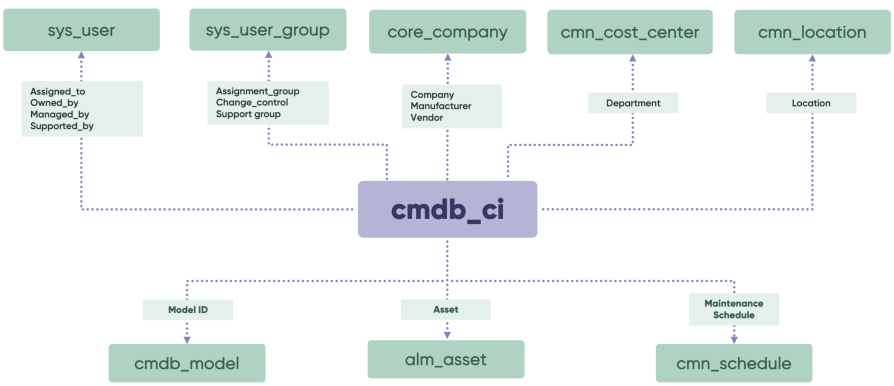
> **Warning:**
> Do not modify any of these attributes in the dictionary. For example, do not modify the type of the *location* attribute from reference to list. Such modifications may prevent features that use the CMDB, from functioning properly.

For descriptions of common CMDB tables in a base system, see CMDB tables descriptions.

Common core, user tables



CMDB CI schema related to common core and non-core tables



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Attributes

Attribute	Description
Asset tag	Asset tag/service tag for the specific asset
Assigned	Date and time of assignment to user
Attributes	Description of usage of attributes for the instance
Can Print	Indicates whether the instance can print
Category	Name of category applicable to the instance
Checked in	Date and time of checking in
Checked out	Date and time of checking out
Class	System class name
Comments	Comments related to the instance
Correlation ID	ID of the instance from another data source
Cost	Financial value in local currency (as defined in the Cost Currency field)
Cost currency	Name of currency (such as dollars, pounds, Euros)
Created	Date and time record was created
Created by	Name of person/data source which initially created the record
Description	Fit (how deployed) and function (purpose) of the instance
Discovery source	Name of primary (most trusted) discovery source
DNS Domain	Name of the DNS domain to which the instance belongs
Domain	ID of the domain to which the instance belongs
Domain Path	Path of the domain to which the instance belongs
Due	Date and time instance was due
Due in	Description of the manner of which the instance was due
Fault Count	Number of faulty recorded against the instance to date
First Discovered	Date and time instance was initially discovered
Fully Qualified Domain Name	Full path name of domain to which the instance belongs
GL account	General Ledger account name/number

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Attribute	Description
Installed	Date and time instance was most recently installed
Invoice number	Invoice number used in acquisition process
IP Address	Primary IP address used by the instance
Justification	Description of the justification for the instance
Lease contract	Number of current leasing contracts
MAC Address	MAC address of the instance
Model Number	Manufacturer original model number
Monitor	Indicates whether the instance is monitored
Most Recent Discovery	Date and time instance was last discovered
Name	Name of the CI instance
Operational Status	Configurable choice list with values for current operational states
Order received	Date and time instance was initially received
Ordered	Date and time instance was initially ordered
PO number	Purchase order number used in acquisition process
Purchased	Date instance was purchased
Requires verification	Flag indicating whether verification is required for the instance
Serial number	Serial number of the instance
Skip sync	Flag indicating whether synchronization between Asset Management and CMDB can be skipped
Start Date	Date and time the instance was last started
Subcategory	Name of Subcategory applicable to the instance
Sys ID	ServiceNow Sys ID (GUID)
Tags	Related tags
Updated	Date and time instance was last updated
Updated by	Person/data source which last updated the record
Updates	Configurable choice list with values for update states
Warranty expiration	Date current warranty expires

Reference attribute	Reference to
Approval Group	Group table

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

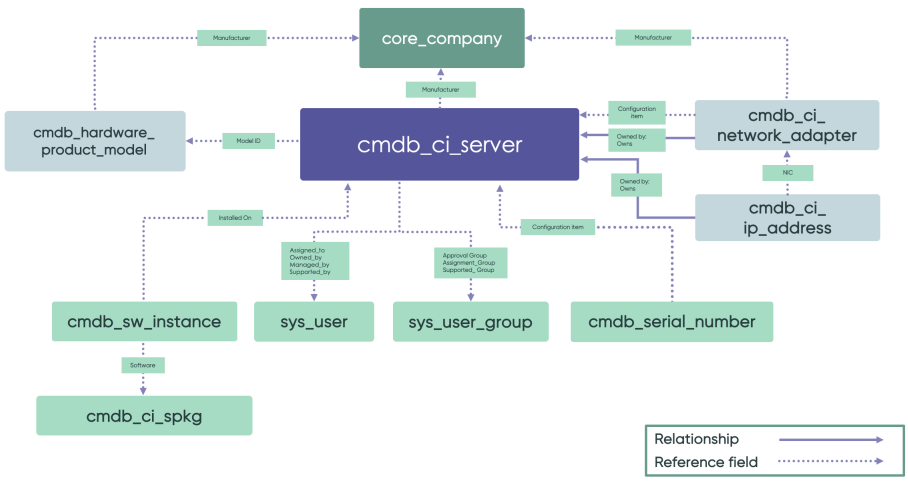
Reference attribute	Reference to
Asset	Asset table
Assigned to	User table
Change Group	Group table
Company	Company table
Cost center	Cost Center table
Department	Department table
Location	Location table
Maintenance Schedule	Schedule table
Managed by	User table
Manufacturer	Company table
Model ID	Product Model table
Owned by	User table
Schedule	Schedule table (for normal processing)
Support group	Group table
Supported by	User
Vendor	Company table

Hardware [cmdb_ci_hardware] class

Attributes, identification rule, and other important schema structures for the CMDB Hardware [cmdb_ci_hardware] class.

For descriptions of common CMDB tables in a base system, see CMDB tables descriptions.

Hardware, Computer, Server Schema



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
cmdb_sw_instance noted in the diagram, is a reference to the cmdb_software_instance class, and Supported_Group is a reference to Support_Group.

Attributes

The Hardware class adds the following unique attributes:

Attribute	Description
hardware_status	Status of hardware such as **In Maintenance** or **Retired**. Used to sync status to the Asset class.
hardware_substatus	Secondary hardware status. Each setting in *hardware_status* results in a different set of choices available for this field.
default_gateway	Default gateway that the computer is connected through.

Key relationship structures

Use the following key relationships as important guidelines when creating Hardware, Computer, or Server CIs:

- Serial number: During CI identification, Identification and Reconciliation Engine (IRE) processes search for a serial number in two locations. One is the CI serial number attribute, and the second one is the Serial Number [cmdb_serial_number] table, with reference back to the Hardware [cmdb_ci_hardware] table.

  - Store any serial number of any type other than System, only in the Serial Number table (and not in the server CI attribute).
  - If the system serial number is available, store it in both the *Serial Number* attribute of the CI and in the Serial Number table.

  The Serial Number table is a many to one relationship linking back to the server CI. This table has a type field for specifying the type of the serial number (system, uuid, chassis, bios, or baseboard) and storing the actual value itself. Use the following Windows standards for serial number types in the Serial Number [cmdb_serial_number] table:

  - *system*: Product identification such as a serial number for software, a die number on a hardware chip, or a project number (for noncommercial products).
  - *uuid*: Universally unique identifier (UUID) for the product. A UUID is a 128-bit identifier that is guaranteed to be different from other generated UUIDs.
  - *chassis*: Manufacturer-allocated number that is used to identify a physical element. Value is the Serial Number member of the System Enclosure or Chassis structure in the SMBIOS information. This type represents the properties associated with a physical system enclosure.
  - *bios*: The assigned serial number of the BIOS. This type represents the attributes of the computer system basic input/output services (BIOS) that are installed on the computer.
  - *baseboard*: Manufacturer-allocated number that is used to identify the physical element. This property is inherited from CIM_PhysicalElement, and is sometimes referred to as the 'Motherboard Serial Number'.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Network adapter:
  - Use the Network Adapter [cmdb_ci_network_adapter] class to store network adapters.
  - Set the *Name* attribute in the Network Adapter class to be the name of the Network Adapter device (such as eth0, eth1).
  - Set the *MAC Address* attribute to be the MAC address value. Format the string with colon separators between octets and lower case hexadecimal characters with padded zeros.

    For example: 'f8:f2:1e:00:d4:66'
  - In the CI Relationship [cmdb_rel_ci] table, create an *Owned By::Owns* relationship to the associated Hardware CI. Specify a reference from the Network Adapter [cmdb_ci_network_adapter] table using the CI with a reference to the associated Hardware CI.
- IP address:
  - Use the IP Address [cmdb_ci_ip_address] class to store IP addresses.
  - Store an IP address value in the *IP Address* attribute, and in the *Name* attribute (to avoid empty *Name* attributes).
  - Store an IPv4 IP address value using the format 'NNN.NNN.NNN.NNN', with decimal-based octets and period separators. Non-conforming values should be considered invalid and cleansed to null values.
  - Store an IPv6 IP address value using lower case hexadecimal with colon separators. Non-confirming values should be considered invalid and cleansed to null values.
  - Set the *Netmask* attribute to the IP address.
  - In the CI Relationship [cmdb_rel_ci] table, create an **Owned By::Owns** relationship to the associated Hardware CI.
  - Specify for the IP address a reference to the Network Adapter [cmdb_ci_network_adapter] table using the Configuration Item with a reference to the associated Hardware CI.
  - To ensure that base system identification rules work properly, also store the IP address in the associated Network Adapter class.
- Network adapter and IP address:
  - Store the MAC address of the network adapter installed on a server, in the Network Adapter [cmdb_ci_network_adapter] class.
  - Store the IP address in the IP Address [cmdb_ci_ip_address] class.
  - Do not store the MAC address or the IP address in the Server [cmdb_ci_server] class.

Key reference structures

Use the following key references as important guidelines when creating Hardware, Computer, or Server CIs:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Software and processes running on a server: The Software [cmdb_ci_spkg] class contains the generic software package that is related to the server CI. The cmdb_software_instance table instantiates each instance of the software package with:
  - One to one reference back to the Server [cmdb_ci_server] class
  - Many to one reference back to the Software class

  These references are stored in the *Installed on* and the *Product Name* reference attributes respectively.

  If either the Software Asset Management Foundation [com.snc.sams] or the Software Asset Management [com.snc.software_asset_management] plugin is installed, then store software details in the Software Installation [cmdb_sam_sw_install] table instead of the cmdb_software_instance table.
- The *Manufacturer* and *Model ID* are reference attributes to the Company [core_company] and Product Model [cmdb_model] tables respectively.
- The *Owned By*, *Assigned To*, *Managed By*, and *Supported By* are reference attributes to the User [sys_user] table. The *Change Group* and *Support Group* are reference attributes to the Group [sys_user_group] table.

Identification rule

The base system contains pre-defined identification rules for the Hardware, Computer, and Server classes, which are identical. That identification rule has the following key identifier entries, listed in priority order:

1. Identifier entry which uses lookup-based identification specified with Serial Number [cmdb_serial_number] as the lookup table. The Serial Number table is a many to one reference from Serial Number back to the server CI.
2. Identifier entry specified with the *Serial Number* attribute in the CI.
3. Identifier entry for the *Name* attribute. If *Serial Number* is not available, then the *Name* (which is the hostname) attribute is used. If both the *Serial Number* and the *Name* attributes are provided, then Identification and Reconciliation Engine (IRE) looks first for the Serial Number. Then, if a Serial Number is not found, IRE falls back to using Name.
4. Identifier entry specified for the *MAC Address*/*IP Address* attributes in the Network Adapter table. However, do not rely only on the *MAC Address*/*IP Address*.

   If both *Serial Number* and *Name* are not available, and only *MAC Address*/*IP Address* are available, use *MAC Address* as the name of the CI. Using the *MAC Address* as the name of the CI ensures that you don't create an empty CI.

For more information, see CMDB Identification and Reconciliation (IRE).

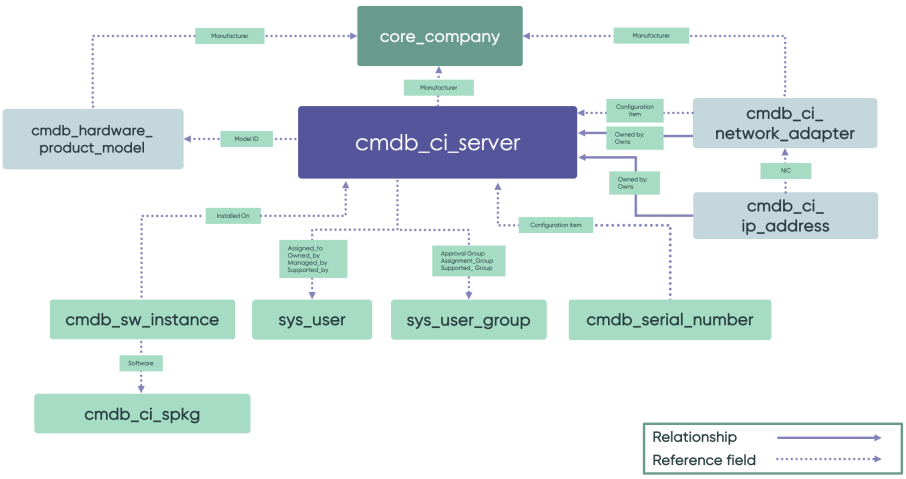
Computer [cmdb_ci_computer] class

Attributes, identification rule, and other important schema structures for the CMDB Computer [cmdb_ci_computer] class.

For descriptions of common CMDB tables in a base system, see CMDB tables descriptions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Hardware, Computer, Server Schema



Note:
cmdb_sw_instance noted in the diagram, is a reference to the cmdb_software_instance class, and Supported_Group is a reference to Support_Group.

Attributes

The Computer class adds the following unique attributes:

Attribute	Description
CD_ROM	Denotes whether a CD ROM exists.
CD Speed	Speed of CD_ROM.
Chassis type	Type of computer chassis.
CPU core count	Number of cores per CPU.
CPU core thread	Number of threads per core.
CPU count	Number of CPUs.
CPU name	Name of CPU.
CPU speed (MHz)	Speed of CPU.
CPU type	CPU type.
Disk space (GB)	Amount of disk space (in GB).
Floppy	Type of floppy drive.
Form factor	Form factor of the computer.
Object ID	Object ID of the computer (such as the virtual machine ID associated with the computer).
Operating System	Name of the operating system.
OS Address Width (bits)	Operating system bit (such as 32, 64).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Attribute	Description
OS Domain	NA
OS Service Pack	Service pack installed on the operating system .
OS Version	Version of the operating system.
RAM (MB)	Amount of RAM on the computer.
IsVirtual	True/False denoting whether the device is running on a virtual machine instance.

Reference attribute	Reference to
CPU manufacturer	Company [core_company] table

Schema description

The CMDB schema model does not separate between servers and computers that are physical and servers and computer that are virtual. Instead, the Computer and the Server classes have a field named *IsVirtual*. If a computer or server is a virtual instance, set this *IsVirtual* attribute to **true**.

As described in the Virtual Machine schema section, to fully model a virtual machine, set the *IsVirtual* attribute in the Computer or Server CI to **true**. Create a Virtual Machine Instance [cmdb_ci_vm_instance] record using the *BIOS UUID* attribute as the key identifier. Then create a Hosted_On relationship between the Virtual Machine Instance record and the Computer or Server instance and set *IsVirtual* to **true**.

Key relationship structures

Use the following key relationships as important guidelines when creating Hardware, Computer, or Server CIs:

- Serial number: During CI identification, Identification and Reconciliation Engine (IRE) processes search for a serial number in two locations. One is the CI serial number attribute, and the second one is the Serial Number [cmdb_serial_number] table, with reference back to the Hardware [cmdb_ci_hardware] table.

  - Store any serial number of any type other than System, only in the Serial Number table (and not in the server CI attribute).
  - If the system serial number is available, store it in both the *Serial Number* attribute of the CI and in the Serial Number table.

  The Serial Number table is a many to one relationship linking back to the server CI. This table has a type field for specifying the type of the serial number (system, uuid, chassis, bios, or baseboard) and storing the actual value itself. Use the following Windows standards for serial number types in the Serial Number [cmdb_serial_number] table:

  - *system*: Product identification such as a serial number for software, a die number on a hardware chip, or a project number (for noncommercial products).
  - *uuid*: Universally unique identifier (UUID) for the product. A UUID is a 128-bit identifier that is guaranteed to be different from other generated UUIDs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- *chassis*: Manufacturer-allocated number that is used to identify a physical element. Value is the Serial Number member of the System Enclosure or Chassis structure in the SMBIOS information. This type represents the properties associated with a physical system enclosure.
- *bios*: The assigned serial number of the BIOS. This type represents the attributes of the computer system basic input/output services (BIOS) that are installed on the computer.
- *baseboard*: Manufacturer-allocated number that is used to identify the physical element. This property is inherited from CIM_PhysicalElement, and is sometimes referred to as the 'Motherboard Serial Number'.

- Network adapter:
  - Use the Network Adapter [cmdb_ci_network_adapter] class to store network adapters.
  - Set the *Name* attribute in the Network Adapter class to be the name of the Network Adapter device (such as eth0, eth1).
  - Set the *MAC Address* attribute to be the MAC address value. Format the string with colon separators between octets and lower case hexadecimal characters with padded zeros.

    For example: 'f8:f2:1e:00:d4:66'
  - In the CI Relationship [cmdb_rel_ci] table, create an *Owned By::Owns* relationship to the associated Hardware CI. Specify a reference from the Network Adapter [cmdb_ci_network_adapter] table using the CI with a reference to the associated Hardware CI.

- IP address:
  - Use the IP Address [cmdb_ci_ip_address] class to store IP addresses.
  - Store an IP address value in the *IP Address* attribute, and in the *Name* attribute (to avoid empty *Name* attributes).
  - Store an IPv4 IP address value using the format 'NNN.NNN.NNN.NNN', with decimal-based octets and period separators. Non-conforming values should be considered invalid and cleansed to null values.
  - Store an IPv6 IP address value using lower case hexadecimal with colon separators. Non-confirming values should be considered invalid and cleansed to null values.
  - Set the *Netmask* attribute to the IP address.
  - In the CI Relationship [cmdb_rel_ci] table, create an **Owned By::Owns** relationship to the associated Hardware CI.
  - Specify for the IP address a reference to the Network Adapter [cmdb_ci_network_adapter] table using the Configuration Item with a reference to the associated Hardware CI.
  - To ensure that base system identification rules work properly, also store the IP address in the associated Network Adapter class.

- Network adapter and IP address:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Store the MAC address of the network adapter installed on a server, in the Network Adapter [cmdb_ci_network_adapter] class.
- Store the IP address in the IP Address [cmdb_ci_ip_address] class.
- Do not store the MAC address or the IP address in the Server [cmdb_ci_server] class.

Key reference structures

Use the following key references as important guidelines when creating Hardware, Computer, or Server CIs:

- Software and processes running on a server: The Software [cmdb_ci_spkg] class contains the generic software package that is related to the server CI. The cmdb_software_instance table instantiates each instance of the software package with:
  - One to one reference back to the Server [cmdb_ci_server] class
  - Many to one reference back to the Software class

  These references are stored in the *Installed on* and the *Product Name* reference attributes respectively.

  If either the Software Asset Management Foundation [com.snc.sams] or the Software Asset Management [com.snc.software_asset_management] plugin is installed, then store software details in the Software Installation [cmdb_sam_sw_install] table instead of the cmdb_software_instance table.
- The *Manufacturer* and *Model ID* are reference attributes to the Company [core_company] and Product Model [cmdb_model] tables respectively.
- The *Owned By*, *Assigned To*, *Managed By*, and *Supported By* are reference attributes to the User [sys_user] table. The *Change Group* and *Support Group* are reference attributes to the Group [sys_user_group] table.

Identification rule

The base system contains pre-defined identification rules for the Hardware, Computer, and Server classes, which are identical. That identification rule has the following key identifier entries, listed in priority order:

1. Identifier entry which uses lookup-based identification specified with Serial Number [cmdb_serial_number] as the lookup table. The Serial Number table is a many to one reference from Serial Number back to the server CI.
2. Identifier entry specified with the *Serial Number* attribute in the CI.
3. Identifier entry for the *Name* attribute. If *Serial Number* is not available, then the *Name* (which is the hostname) attribute is used. If both the *Serial Number* and the *Name* attributes are provided, then Identification and Reconciliation Engine (IRE) looks first for the Serial Number. Then, if a Serial Number is not found, IRE falls back to using Name.
4. Identifier entry specified for the *MAC Address*/*IP Address* attributes in the Network Adapter table. However, do not rely only on the *MAC Address*/*IP Address*.

   If both *Serial Number* and *Name* are not available, and only *MAC Address*/*IP Address* are available, use *MAC Address* as the name of the CI. Using the *MAC Address* as the name of the CI ensures that you don't create an empty CI.

For more information, see CMDB Identification and Reconciliation (IRE).

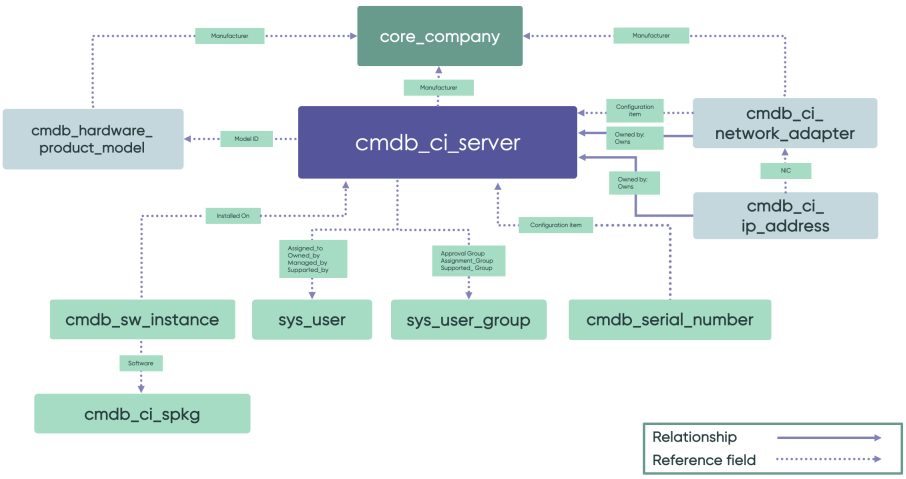
Server [cmdb_ci_server] class

Attributes, identification rule, and other important schema structures for the CMDB Server [cmdb_ci_server] class.

For descriptions of common CMDB tables in a base system, see CMDB tables descriptions.

Hardware, Computer, Server Schema



Note:
cmdb_sw_instance noted in the diagram, is a reference to the cmdb_software_instance class, and Supported_Group is a reference to Support_Group.

Attributes

The Server class adds the following unique attributes:

Attribute	Description
Classification	Type of server, such as production, development, disaster recovery, or user acceptance testing (UAT).
Firewall status	Internet or intranet facing server.
Host name	Use the Name attribute to store the host name of the server instead of the Host name attribute.
Used for	Business service supported by the server, such as production, staging, or quality assurance (QA). This attribute uses the *Used for* choice list field from the Service [cmdb_ci_service] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Reference attribute	Reference to
Disaster backup	Server [cmdb_ci_server] table. Reference to another server that is the backup server for this server.

Reference classes

The following reference classes extend the Server class. They do not add any new attributes.

Reference class	Name	Description
cmdb_ci_solaris_server	Solaris Server	Server running Oracle Solaris operating system.
cmdb_ci_lb_cisco_csm	Cisco CSM	Cisco Security Manager (CSM) load balancer.
cmdb_ci_win_server	Windows Server	Server running Microsoft Windows Server operating system.
cmdb_ci_lb_ace	ACE	Cisco Application Control Engine load balancer.
cmdb_ci_lb_netsclaer	Citrix Netscaler	Citrix Netscaler load balancer.
cmdb_ci_lb_alteon	Alteon	Alteon load balancer.
cmdb_ci_lb	Load Balancer	Generic load balancer.
cmdb_ci_lb_a10	A10 Load Balancer	A10 load balancer.
cmdb_ci_lb_cisco_css	Cisco CSS	Cisco Content Services Switch (CSS) load balancer.
cmdb_ci_lb_cisco_gss	Cisco GSS	Cisco Global Site Selector (GSS) load balancer.
cmdb_ci_osx_Server	OS/X Server	Server running OS/X operating system.
cmdb_ci_HPUX_Server	HPUX Server	Server running HP-UX operating system.
cmdb_ci_tape_server	Server Tape Unit	Server using a tape drive.
cmdb_ci_Server_Hardware	Server Hardware	Server hardware.
cmdb_ci_datapower_server	Data Power Hosting Server	IBM DataPower hosting server.
cmdb_ci_net_app_server	Network Appliance Hardware	NetApp hardware.
cmdb_ci_netware_server	Netware Server	Server running NetWare operating system.
cmdb_ci_ibm_zos_server	IBM zOS Server	Server running IBM z/OS operating system.
cmdb_ci_storage_node_element	Storage Node Element	Storage node.
cmdb_ci_chassis_server	Server Chassis	Server chassis.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Reference class	Name	Description
cmdb_ci_lb_network	Network Load Balancer	Network load balancer hardware.
cmdb_ci_Unix_Server	Unix Server	Server running Unix operating system.
cmdb_ci_linux_server	Linux Server	Server running Linux operating system.
cmdb_ci_virtualization_server	Virtualization Server	Abstract base table used by Hyper-V Server [cmdb_ci_hyper_v_server] and ESX Server [cmdb_ci_esx_server].
cmdb_ci_mainframe	IBM Mainframe	Large-scale computer system with high-end capabilities.

Schema description

The CMDB schema model does not separate between servers and computers that are physical and servers and computer that are virtual. Instead, the Computer and the Server classes have a field named *IsVirtual*. If a computer or server is a virtual instance, set this *IsVirtual* attribute to **true**.

As described in the Virtual Machine schema section, to fully model a virtual machine, set the *IsVirtual* attribute in the Computer or Server CI to **true**. Create a Virtual Machine Instance [cmdb_ci_vm_instance] record using the *BIOS UUID* attribute as the key identifier. Then create a Hosted_On relationship between the Virtual Machine Instance record and the Computer or Server instance and set *IsVirtual* to **true**.

Key relationship structures

Use the following key relationships as important guidelines when creating Hardware, Computer, or Server CIs:

- Serial number: During CI identification, Identification and Reconciliation Engine (IRE) processes search for a serial number in two locations. One is the CI serial number attribute, and the second one is the Serial Number [cmdb_serial_number] table, with reference back to the Hardware [cmdb_ci_hardware] table.

  - Store any serial number of any type other than System, only in the Serial Number table (and not in the server CI attribute).
  - If the system serial number is available, store it in both the *Serial Number* attribute of the CI and in the Serial Number table.

  The Serial Number table is a many to one relationship linking back to the server CI. This table has a type field for specifying the type of the serial number (system, uuid, chassis, bios, or baseboard) and storing the actual value itself. Use the following Windows standards for serial number types in the Serial Number [cmdb_serial_number] table:

  - *system*: Product identification such as a serial number for software, a die number on a hardware chip, or a project number (for noncommercial products).
  - *uuid*: Universally unique identifier (UUID) for the product. A UUID is a 128-bit identifier that is guaranteed to be different from other generated UUIDs.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- *chassis*: Manufacturer-allocated number that is used to identify a physical element. Value is the Serial Number member of the System Enclosure or Chassis structure in the SMBIOS information. This type represents the properties associated with a physical system enclosure.
- *bios*: The assigned serial number of the BIOS. This type represents the attributes of the computer system basic input/output services (BIOS) that are installed on the computer.
- *baseboard*: Manufacturer-allocated number that is used to identify the physical element. This property is inherited from CIM_PhysicalElement, and is sometimes referred to as the 'Motherboard Serial Number'.

- Network adapter:
  - Use the Network Adapter [cmdb_ci_network_adapter] class to store network adapters.
  - Set the *Name* attribute in the Network Adapter class to be the name of the Network Adapter device (such as eth0, eth1).
  - Set the *MAC Address* attribute to be the MAC address value. Format the string with colon separators between octets and lower case hexadecimal characters with padded zeros.

    For example: 'f8:f2:1e:00:d4:66'
  - In the CI Relationship [cmdb_rel_ci] table, create an *Owned By::Owns* relationship to the associated Hardware CI. Specify a reference from the Network Adapter [cmdb_ci_network_adapter] table using the CI with a reference to the associated Hardware CI.

- IP address:
  - Use the IP Address [cmdb_ci_ip_address] class to store IP addresses.
  - Store an IP address value in the *IP Address* attribute, and in the *Name* attribute (to avoid empty *Name* attributes).
  - Store an IPv4 IP address value using the format 'NNN.NNN.NNN.NNN', with decimal-based octets and period separators. Non-conforming values should be considered invalid and cleansed to null values.
  - Store an IPv6 IP address value using lower case hexadecimal with colon separators. Non-confirming values should be considered invalid and cleansed to null values.
  - Set the *Netmask* attribute to the IP address.
  - In the CI Relationship [cmdb_rel_ci] table, create an **Owned By::Owns** relationship to the associated Hardware CI.
  - Specify for the IP address a reference to the Network Adapter [cmdb_ci_network_adapter] table using the Configuration Item with a reference to the associated Hardware CI.
  - To ensure that base system identification rules work properly, also store the IP address in the associated Network Adapter class.

- Network adapter and IP address:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Store the MAC address of the network adapter installed on a server, in the Network Adapter [cmdb_ci_network_adapter] class.
- Store the IP address in the IP Address [cmdb_ci_ip_address] class.
- Do not store the MAC address or the IP address in the Server [cmdb_ci_server] class.

Key reference structures

Use the following key references as important guidelines when creating Hardware, Computer, or Server CIs:

- Software and processes running on a server: The Software [cmdb_ci_spkg] class contains the generic software package that is related to the server CI. The cmdb_software_instance table instantiates each instance of the software package with:
  - One to one reference back to the Server [cmdb_ci_server] class
  - Many to one reference back to the Software class

  These references are stored in the *Installed on* and the *Product Name* reference attributes respectively.

  If either the Software Asset Management Foundation [com.snc.sams] or the Software Asset Management [com.snc.software_asset_management] plugin is installed, then store software details in the Software Installation [cmdb_sam_sw_install] table instead of the cmdb_software_instance table.
- The *Manufacturer* and *Model ID* are reference attributes to the Company [core_company] and Product Model [cmdb_model] tables respectively.
- The *Owned By*, *Assigned To*, *Managed By*, and *Supported By* are reference attributes to the User [sys_user] table. The *Change Group* and *Support Group* are reference attributes to the Group [sys_user_group] table.

Identification rule

The base system contains pre-defined identification rules for the Hardware, Computer, and Server classes, which are identical. That identification rule has the following key identifier entries, listed in priority order:

1. Identifier entry which uses lookup-based identification specified with Serial Number [cmdb_serial_number] as the lookup table. The Serial Number table is a many to one reference from Serial Number back to the server CI.
2. Identifier entry specified with the *Serial Number* attribute in the CI.
3. Identifier entry for the *Name* attribute. If *Serial Number* is not available, then the *Name* (which is the hostname) attribute is used. If both the *Serial Number* and the *Name* attributes are provided, then Identification and Reconciliation Engine (IRE) looks first for the Serial Number. Then, if a Serial Number is not found, IRE falls back to using Name.
4. Identifier entry specified for the *MAC Address*/*IP Address* attributes in the Network Adapter table. However, do not rely only on the *MAC Address*/*IP Address*.

   If both *Serial Number* and *Name* are not available, and only *MAC Address*/*IP Address* are available, use *MAC Address* as the name of the CI. Using the *MAC Address* as the name of the CI ensures that you don't create an empty CI.

For more information, see CMDB Identification and Reconciliation (IRE).

CMDB Workspace store app

The CMDB Workspace is an efficient, central, and modernized way for you to work. Use CMDB Workspace to search and explore the CMDB, examine health and recent activities, and access CMDB dashboards and tools to support tasks in your organization.

Watch the following video to get started with CMDB Workspace. Depending on the version of your CMDB Workspace, some UI elements and features might differ. Introduction to CMDB Workspace

Get started

Explore	Configure	Reference
Learn about the different views in CMDB Workspace and how to use each to perform your assigned tasks.	Setup and configure CMDB Workspace.	Additional information about components such as properties, and class-specific criteria for the Cloud vs Non-cloud resources chart.

Troubleshoot and get help

- Ask questions and explore other resources for in the ServiceNow Community
- Search the Known Error Portal for known error articles
- Contact Customer Service and Support

Explore CMDB Workspace

Learn more about CMDB Workspace, its different views, and its benefits when using key CMDB features such as CMDB Health, CMDB Data Manager, and CMDB 360.

CMDB Workspace overview

The CMDB Workspace is an efficient, central, and modernized way for you to work. Use CMDB Workspace to search and explore the CMDB, examine health and recent activity, and access various CMDB dashboards and tools to support tasks in your organization.

General interaction and additional information

- CMDB Workspace leverages many Performance Analytics capabilities and features, such as indicator sources. Throughout the CMDB Workspace views, you can select the various cards to drill down to Performance Analytics KPI Details panes that show trends for the associated data. On a KPI Details pane, you can modify different settings to change the scope of the data. You can also select **Show Records** to list the records associated with the chart.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Lists throughout the CMDB Workspace have a filter icon ( ) that you can select to show the filter definition used for the list.
- You can open your Configurable Workspace experience in UI Builder to access and edit your CMDB Workspace experience.
- See List of workspaces for a list of all Workspaces that ServiceNow® provides.
- CMDB Workspace doesn't support domain separation.

CI details

When you drill down to CI details, how those details appear depends on system settings:

CI Form

By default, the system property *sn_cmdb_ws.explore_ci.record.enabled* is set to **true**, enabling the experience of the CI Form feature for viewing CI details. Using CI Form, you are navigated to a centralized location with a comprehensive set of CI details organized by sections. Use the forms provided by CI Form to examine and edit CI attributes, relationships, tags, services and offerings, CMDB Health and CMDB 360 data associated with the CI, related lists, and activities. When updating CIs in CI Form, IRE rules are applied to avoid potential issues such as duplicate CIs.

For more information, see:

- Components installed with CMDB Workspace: *sn_cmdb_ws.explore_ci.record.enabled* system property.
- Manage CI details in CI Form.

CI details pane

If *sn_cmdb_ws.explore_ci.record.enabled* is set to **false**, then the CI details pane is used for viewing CI details. When you drill down to a CI record in CMDB Workspace views and pages, the following details for the CI appear:

- CI Timeline - Last 14 days: A timeline of CI activities such as change requests.

  Note:
  A CI timeline in CMDB Workspace fails to load when the number of any of the following activities exceeds its threshold:
  - History: 200
  - Incidents: 100
  - Requests: 50
  - Total Events: 200

  Select the **Open CI Timeline** link in the error message to open the CI timeline in the base system, which shows activities for the CI, up to the specified threshold numbers.

- CI Health: A summary of the health of the CI, showing related items such as critical incidents, incomplete attributes, and stale relationships for the CI.

  Role requirement: sn_cmdb_user or itil (for accessing incidents).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Details: CI attributes, grouped into categories such as Key attributes, Asset attributes, Discovery attributes, Operational attributes, and More attributes.

  Note:
  Use the *CMDB - Workspace* form view for a CI class to configure which attributes appear.

- Activity: An activity stream to track what's changed in the CI record.
- Infrastructure Relationships: List of the infrastructure CIs related to the CI.
- Service Relationships: List of business applications, service offerings, and application services that the CI may be related to.

On the CI details pane, you can:

- Select **Open Dependency View** to open the Dependency Views map and display a graphic infrastructure view of the specific CI record.
- Select **View CMDB 360 Data** to show CMDB 360 details at the CI attribute level for the specific CI record.
- Select **Save** to save any changes made to attributes for the CI record.
- Select the More Actions icon (...) for additional functions:
  - Select **Create Change** to create a new change request for the CI record.
  - Select **Create Incident** to create a new incident for the CI record.
  - Select **Delete** to delete the CI record.

UI activity	Additional requirements

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Edit a related table from CMDB performance insights
- Edit a scheduled data import from CMDB performance insights
- Components installed with CMDB Workspace

Home view in CMDB Workspace

Home view is the default view in CMDB Workspace. It shows important tasks that you should tend to, various counts for activities in CMDB such as new CIs, CMDB Health aggregations, and various charts. The Home view also provides several links with immediate access to key CMDB tools.

Access

Role requirements: sn_cmdb_admin (CMDB Admin), sn_cmdb_editor (CMDB Editor), or sn_cmdb_user (CMDB User).

To access the Home view, navigate to **Workspaces** > **CMDB Workspace** and then select **Home** in the CMDB Workspace menu bar.

Now Assist for CMDB

Select the Now Assist icon to access Now Assist for CMDB skills, agents, and agentic workflows.

For more information, see Now Assist for Configuration Management Database (CMDB).

Intelligent Search

Accessible to: CMDB Admin, CMDB Editor, CMDB User.

Lets you use Natural Language Query (NLQ) search capabilities provided by Intelligent Search for CMDB. Use the input field to construct a search string using everyday language. As you type, a dynamic list of relevant suggestions appears, with items matching single words or part phrases in the typed-in text, such as table names.

You can:

- Select **Search tips** to see tips about constructing search strings. See details about the usage, examples for single and multi-table search, advanced filtering, and relationships in Intelligent Search.
- Select **Search** to either run the query if the search string is already fully converted into a valid CMDB query, or to open the Refine your query dialog box.

  - If the search string has no ambiguities with the table name or relationships, then the query runs and the results appear in a list view format.

    Only the first 100 results of the query appear in the results pane.

    - Select **Load More Results** to view the next set of 100 results.
    - Select **Load All Results** to view the rest of the query results, up to the number specified by the glide.cmdb.query.max_results_limit system property (10,000 by default).

    If the constructed CMDB query contains more than a single table, then the **View in Query Builder** button appears. Select the button to open the CMDB Query Builder with your query fully constructed on the Query Builder canvas. You can use the Query Builder to continue editing the query.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

  - If there are any ambiguities with table names or relationship types in the search string, then the search string can't be converted into a valid CMDB query. In this case, the Refine your query dialog box appears letting you select from suggested CI classes and continue to parse your search string into a valid CMDB query. Those suggested CI classes are based on phrases in your search string. Use the drop-down lists to select the CI classes that match your intended search and then select **View search results** to run the query.
  - If Intelligent Search is unable to convert your search string into a valid CMDB query, then selecting **Search** doesn't generate any query results. Instead, a feedback form appears. Fill out the form and select **Submit Feedback** to record your feedback for your CMDB Admin to review.
- Use the Sample searches list to get you started in running a pre-defined search. This list consists of more common searches, or searches that are more difficult to construct such as searches that involve application services.
- Use the Your recent searches list to rerun a previous search.
- Select **Results Feedback** to submit feedback on the search results for your CMDB Admin to review.

For more details about using NLQ with Intelligent Search, see Intelligent Search for CMDB.

Alternatively, you can select **Use conditional search instead** to use a basic condition builder functionality where you can specify conditions to search for CIs of a specific class.

You can:

- Select **New condition set** to add a condition phrase.
- Select **Related List Condition** to add a condition phrase for related lists.
- Select **Search** to search through the CMDB.
- Add and then adjust the *sn_cmdb_ws.list.record_count_limit* system property to limit the record count summation and so to minimize the performance impact of that operation. The record count shows on the Conditional search page, for example, above the results list. For more information about adding and modifying that system property, see Components installed with CMDB Workspace.

In the results list, select a CI to see its details.

UI activity	Additional requirements
• Mapped Application Service • Application Service • Application Service Group • Dynamic CI Group • Tag Based Service	app_service_user role
• Business Service • Technical Service • Application Service Outage	service_viewer role

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important actions

Accessible to: CMDB Admin and CMDB Editor.

Important actions of various categories that require your attention or action. There are several task categories such as:

- Health tasks generated by CMDB Health: In health-related cards, such as Duplicate CIs, Orphan CIs, stale CIs, and De-Duplication tasks, select **View CIs** or **View Tasks** to show the list of associated CIs or important tasks. In the CI list view page, you can select **CMDB Health Dashboard** to open the CMDB Health dashboard. In de-duplication-related cards generated by IRE, you can access the De-duplication dashboard and de-duplication libraries, to remediate de-duplication tasks in bulk.
- Data attestation and life cycle approval tasks generated by the CMDB Data Manager: In data attestation-related cards, such as Reassignment Requests and Unassigned Overdue cards, select **View Tasks** to drill down to the associated important tasks.

Important actions are stored in the CMDB WS Imp Action Card Config [sn_cmdb_ws_imp_action_card_config] table that is accessible for editing only to users with the sn_cmdb_admin role. Authorized users can modify attributes of an important action such as *`Active`* and *`Filter conditions`*, but can't modify the *`Type`*, *`Persona`*, and *`Table`* attributes.

- Important action cards show per the logged in user role, as specified in the CMDB WS Imp Action Card Config [sn_cmdb_ws_imp_action_card_config] table.
- A card appears only if there is at least one record that meets the card's filter condition.
- If you drill down a Health-related card and modify an associated CI, any resulting impact to health KPIs might appear only after the next cycle of the CMDB Health dashboard jobs.

For information about managing the cards in the Important actions tile, see Modify important actions on the Home view of CMDB Workspace.

What's new

Accessible to: CMDB Admin, CMDB Editor, CMDB User.

Counts of newly created CIs within a recent time interval. The New CIs total counts all CI types including applications, hardware, and application services, which also appear in separate cards in the tile. By default, historical data is aggregated for the **Last 24 hours**, which you can set to a different time interval such as **Last 7 days**.

Select a card to drill down to a Performance Analytics KPI Details pane that shows the trend for the respective item.

Counts in the What's new cards are based on the following tables:

Count	Table
New CIs	Configuration Item [cmdb_ci]
New application	Application [cmdb_ci_appl]
New hardware	Hardware [cmdb_ci_hardware]
New application services	Service Instance [cmdb_ci_service_auto]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CI overview

The following tabs provide summaries about CIs:

CI Summary

Accessible to: CMDB Admin, CMDB Editor, CMDB User (without tabs).

A chart of all CIs in the CMDB, grouped by up to 20 CMDB groups. The CMDB groups in the chart are specified as groups of closely-related classes. On this chart, you can:

- Select a bar to drill down to the classes in the group and their CIs.
- Drill down a CI to show the the CI form with a timeline, health overview, and several types of attributes such as key and discovery attributes.
- Drill down a class to access the Create CI experience to create a new CI in the selected class. For more information about the Create CI experience which applies Identification and Reconciliation Engine (IRE) processes, see Create a CI manually in CMDB Workspace.
- Add custom class groups by creating CMDB groups with the following settings:
  - Group type is set to 'CMDB Workspace'.
  - Populated by encoded queries.

  Such custom class groups will appear after the next time that the *CMDB Workspace - Group* and *Encoded Query Counts* scheduled jobs run and update the CMDB Workspace.

Note:

In systems with a very large number of CIs, for example a billion or more CIs, the set of queries that populate the CI Overview widget might run for an unreasonable length of time. In that case, you can choose to switch the default queries with a set of simpler queries that can handle such load and properly load the CI Overview widget. However, the results yielded from the simpler queries aren't as complete or accurate as the results of the original queries. A fundamental difference between the original and the simpler queries is that the simpler queries use only Common Service Data Model (CSDM) attributes for CI status (such as *life_cycle_stage*), while the default queries also use the legacy *operational_status* and *status* attributes. In an environment that hasn't migrated to CSDM, the simple queries yield fewer results.

You can examine (read access only) the simple query in the *Simple Condition* column in the *cmdb_group_contains_encoded_query* table.

To use the simpler set of queries, set the *sn_cmdb_ws.ci_overview.enable_simple_condition* system property to **true** (**false** by default).

My CIs

Accessible to: CMDB Admin, CMDB Editor.

A chart of CIs with *Managed By Group* being one of the groups you are a part of. CIs are grouped by up to 20 common class categories such as *Applications*, *Devices*, and *Servers*. If there are more than 20 classes to show, then all remaining classes are lumped into one additional bar on the chart.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Select a class bar to drill down into the CIs for the class. Then drill down to the CI form with a timeline, health overview, and several types of attributes such as key and discovery attributes.

Use the sn_cmdb_ws.ci_overview.managed_by_me.enabled property to show or hide this chart.

Cloud vs Non-cloud resources

Charts showing counts and details for resources that are hosted on various cloud services versus those resources that aren't, with breakdown by key CI classes such as applications, databases, and datacenters. Resources can be deployed on cloud services such as the Microsoft Azure Cloud, or on the local instance or other non-cloud solutions. For some ongoing operations in the organization, it might be necessary to have those details that can be difficult to obtain.

The following conditions must be met for the Cloud vs Non-cloud resources charts to appear and to show meaningful data:

- The table Cloud Service Accounts [cmdb_ci_cloud_service_account] must exist.
- The Logical Datacenter [cmdb_ci_logical_datacenter] table must contain at least one record for a cloud datacenter.
- The Datacenter Types [sn_cmdb_ws_datacenter_type] table must contain at least one record for a datacenter that is classified as cloud storage in the organization. In the base system, this table is pre-populated with several records for common cloud services such as the Azure Datacenter [cmdb_ci_azure_datacenter] class. The chart calculates and shows data only for cloud services for which there's a record in the Datacenter Types [sn_cmdb_ws_datacenter_type] table.

  For details about adding datacenters in your organization, with the cloud or non-cloud classification, see Configure datacenters for the Cloud vs Non-cloud resources chart.

The following cloud vs Non-cloud charts are available:

- CI classes bar chart:

  Each bar in the CI classes chart represents a pair of a CI class and a storage type (cloud, non-cloud), such as the bar for Applications/Cloud. For each bar, there's a scheduled job that runs every 24 hours to collect and calculate the data for the bar. The running time depends on the amount and complexity of the data that a job collects, which can be different for each scheduled job. Also, the schedules of the jobs are staggered so that they don't all run at the same time and exhaust resources. For details about the class-specific criteria used for the chart calculations, see Class-specific criteria for the Cloud vs Non-cloud resources chart.

  If there's a CI class/type pair that isn't important in the organization, you can exclude that pair from the CI classes chart. For more details, see Configure CI classes for the Cloud vs Non-cloud resources chart.

  On the CI classes chart, you can:

  - Select a bar to open the Cloud vs Non-cloud resources pane. Then, select either of the following tabs to drill down into further details for the bar:

    Cloud vs Non-cloud CIs

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Shows a bar chart for CIs stored on a cloud service and those CIs that aren't, per CI class. For each CI class, select the cloud or the non-cloud bar to show the CIs that are associated with the selected bar, in a list view. You can then select a CI from the list to see its details.

CI Classes by Cloud Providers

Pie charts per CI class with more granular details for those CIs that are hosted on cloud providers. Pie slices have randomly-selected colors, and they show a breakdown by cloud providers for various CI classes. For each pie, select a slice to show the CIs that are associated with the pie slice, in a list view. You can then select a CI from the list to see its details.

- Select **Latest updates** to see updated status for the scheduled jobs that produce the data for the chart. Status is color-coded to indicate whether the job has completed successfully (green), or failed to complete (red).

- Application Services pie chart:

  The Application Services pie chart uses the Service Configuration Item Associations [svc_ci_assoc] table and checks the cloud/non-cloud status of application service CIs in the CI classes chart. Application services in the Application Services pie chart are classified as follows:

  - Cloud: All of the CIs in the application service have been determined to be hosted on a cloud service.
  - Non-cloud: All of the CIs in the application service have been determined not to be hosted on a cloud service.
  - Hybrid: The application service contains a mixture of CIs where some are hosted and some aren't hosted on cloud services.
  - Unknown: The cloud/non-cloud classification couldn't be determined because some of the application service CIs aren't classified as cloud or non-cloud CIs.

  Note:
  Because classification of Application Services depends on the classification of CIs in the CI classes chart, there might be some discrepancy between the two charts. This can occur if an application service CI changed its cloud/non-cloud status, and the Application Services chart hasn't refreshed yet to reflect that change.

  Select the Application Services chart to access the list views of the associated application services, grouped by cloud/non-cloud classifications. From those list views, you can drill down to the Dependency Views map for application services.

The scheduled jobs associated with the charts are set up with several hard-coded limits that if exceeded, result in failure conditions that are reflected in the job status. Timing out is set to two hours and the maximum number of records to collect is set to 500,000. If a job exceeds any of those limits, it's automatically stopped.

A scheduled job that can't complete for 3 (default) consecutive days is automatically disabled for future runs. You can manage the disabling of scheduled jobs, in the following ways:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Modify the default number of consecutive days that are counted by adding the *sn_cmdb_ws.insight.category.disable_after_failure* system property to the System Properties [sys_properties] table and then setting its value. For more details, see Add a system property.
- Resume a disabled scheduled job.

UI activity	Additional requirements
• Mapped Application Service view • Application Service • Dynamic CI Group • Tag Based Service	app_service_user role

My work

Accessible to: CMDB Admin, CMDB Editor, CMDB User.

All open tasks from CMDB Data Manager that are assigned to you, or to an assigned group in the *Managed by Group* attribute which you are a member of. For CMDB Admins, also tasks that aren't assigned to anyone so that CMDB Admins can assign those unassigned tasks. Tasks can be, for example, attestation tasks and life cycle-related tasks.

Select **Open tasks** and **Overdue tasks** to review and process the tasks.

CMDB Health

Accessible to: CMDB Admin, CMDB Editor, CMDB User.

KPIs health scores calculated by CMDB Health for CIs. Select a percentage number for a KPI to navigate to the KPIs tile on the CMDB Health dashboard.

For more information, see CMDB Health, CMDB Health KPIs and metrics.

UI activity	Additional requirements
CMDB Health	asset or itil role Set up and configure CMDB Health

Quick links

A list of links to key CMDB dashboards and tools. You can add a link to the list of quick links that are available to you.

- Dependency Views: Provides a graphic infrastructure view for a CI and any application or business services that it's part of and that it supports.
- Query Builder: Easily build complex infrastructure and service queries, that span multiple CMDB classes, non-CMDB tables, and that can involve many CIs that are connected by different relationships.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Data Manager: Centrally create, edit, review, publish, and track Data Manager policies and the tasks generated by the policies.
- CI Class List : List view of CMDB CIs grouped by common classes.
- Unified Map: Graphical map showing the hierarchy of CIs and the relationships between them, and application services. Directly from the map, you can access attributes of CIs and relationships, and related items such as changes, incidents, and problems for a CI.
- CMDB Health Dashboard: View CMDB Health reports and configure the CMDB health KPIs and metrics that CIs are evaluated by in CMDB Health dashboards.
- Relationship Health Dashboard: View the Relationship health dashboard with CMDB Health scores for CI relationship.
- Create CI: Create a new CI while enforcing Identification and Reconciliation Engine (IRE) processes and other requirements that result in a valid and unique CI.
- Data Certification Dashboard: View Data Certification instances, tasks, and status such as past due certification tasks. Drill down to specific tasks to reassign them for faster resolution.

Add or edit a custom quick link	CMDB Admin, CMDB Editor, CMDB User	

Cloud vs Non-cloud resources

The Cloud vs Non-cloud resources chart appears on the Home view in CMDB Workspace.

Charts showing counts and details for resources that are hosted on various cloud services versus those resources that aren't, with breakdown by key CI classes such as applications, databases, and datacenters. Resources can be deployed on cloud services such as the Microsoft Azure Cloud, or on the local instance or other non-cloud solutions. For some ongoing operations in the organization, it might be necessary to have those details that can be difficult to obtain.

The following conditions must be met for the Cloud vs Non-cloud resources charts to appear and to show meaningful data:

- The table Cloud Service Accounts [cmdb_ci_cloud_service_account] must exist.
- The Logical Datacenter [cmdb_ci_logical_datacenter] table must contain at least one record for a cloud datacenter.
- The Datacenter Types [sn_cmdb_ws_datacenter_type] table must contain at least one record for a datacenter that is classified as cloud storage in the organization. In the base system, this table is pre-populated with several records for common cloud services such as the Azure Datacenter [cmdb_ci_azure_datacenter] class. The chart calculates and

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

shows data only for cloud services for which there's a record in the Datacenter Types [sn_cmdb_ws_datacenter_type] table.

For details about adding datacenters in your organization, with the cloud or non-cloud classification, see Configure datacenters for the Cloud vs Non-cloud resources chart.

The following cloud vs Non-cloud charts are available:

- CI classes bar chart:

  Each bar in the CI classes chart represents a pair of a CI class and a storage type (cloud, non-cloud), such as the bar for Applications/Cloud. For each bar, there's a scheduled job that runs every 24 hours to collect and calculate the data for the bar. The running time depends on the amount and complexity of the data that a job collects, which can be different for each scheduled job. Also, the schedules of the jobs are staggered so that they don't all run at the same time and exhaust resources. For details about the class-specific criteria used for the chart calculations, see Class-specific criteria for the Cloud vs Non-cloud resources chart.

  If there's a CI class/type pair that isn't important in the organization, you can exclude that pair from the CI classes chart. For more details, see Configure CI classes for the Cloud vs Non-cloud resources chart.

  On the CI classes chart, you can:

  - Select a bar to open the Cloud vs Non-cloud resources pane. Then, select either of the following tabs to drill down into further details for the bar:

    Cloud vs Non-cloud CIs

    Shows a bar chart for CIs stored on a cloud service and those CIs that aren't, per CI class. For each CI class, select the cloud or the non-cloud bar to show the CIs that are associated with the selected bar, in a list view. You can then select a CI from the list to further drill down to the CI details pane.

    CI Classes by Cloud Providers

    Pie charts per CI class with more granular details for those CIs that are hosted on cloud providers. Pie slices have randomly-selected colors, and they show a breakdown by cloud providers for various CI classes. For each pie, select a slice to show the CIs that are associated with the pie slice, in a list view. You can then select a CI from the list to further drill down to the CI details pane.

  - Select **Latest updates** to see updated status for the scheduled jobs that produce the data for the chart. Status is color-coded to indicate whether the job has completed successfully (green), or failed to complete (red).

- Application Services pie chart:

  The Application Services pie chart uses the Service Configuration Item Associations [svc_ci_assoc] table and checks the cloud/non-cloud status of application service CIs in the CI classes chart. Application services in the Application Services pie chart are classified as follows:

  - Cloud: All of the CIs in the application service have been determined to be hosted on a cloud service.
  - Non-cloud: All of the CIs in the application service have been determined not to be hosted on a cloud service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Hybrid: The application service contains a mixture of CIs where some are hosted and some aren't hosted on cloud services.
- Unknown: The cloud/non-cloud classification couldn't be determined because some of the application service CIs aren't classified as cloud or non-cloud CIs.

Note:
Because classification of Application Services depends on the classification of CIs in the CI classes chart, there might be some discrepancy between the two charts. This can occur if an application service CI changed its cloud/non-cloud status, and the Application Services chart hasn't refreshed yet to reflect that change.

Select the Application Services chart to access the list views of the associated application services, grouped by cloud/non-cloud classifications. From those list views, you can drill down to the Dependency Views map for application services.

The scheduled jobs associated with the charts are set up with several hard-coded limits that if exceeded, result in failure conditions that are reflected in the job status. Timing out is set to two hours and the maximum number of records to collect is set to 500,000. If a job exceeds any of those limits, it's automatically stopped.

A scheduled job that can't complete for 3 (default) consecutive days is automatically disabled for future runs. You can manage the disabling of scheduled jobs, in the following ways:

- Modify the default number of consecutive days that are counted by adding the *sn_cmdb_ws.insight.category.disable_after_failure* system property to the System Properties [sys_properties] table and then setting its value. For more details, see Add a system property.
- Resume a disabled scheduled job.

My Work view in CMDB Workspace

Use the My Work view in CMDB Workspace to manage your tasks. Tasks in this view are related to data compliance such as attestation tasks and other life-cycle related tasks.

For CMDB administrators, lists of tasks can also contain unassigned tasks, for reassignment. For managers, tasks of direct reports are included, and if you are a manager of a user group, then tasks of members in that group are also included.

Access

Role requirements: sn_cmdb_admin (CMDB Admin), sn_cmdb_editor (CMDB Editor), or sn_cmdb_user (CMDB User).

To access the My Work view, navigate to **Workspaces** > **CMDB Workspace** and then select **My Work** in the CMDB Workspace menu bar.

Task status

The Task status section provides overall counts of tasks by their status. Counts in each status card are for attestation, certification, and life-cycle tasks as applicable. Total tasks for example, is a count of all open tasks from CMDB Data Manager that are assigned to you, or to an assigned group in the *Managed by Group* attribute which you are a member of. For CMDB Admins, also tasks that aren't assigned to anyone. The Closed card counts all tasks that are in a closed state ('Closed Complete', 'Closed Canceled', 'Closed Incomplete', and 'Rejected').

Select a status card to show the associated tasks in the various lists such as **Attestation tasks** and **Certification** tabs in the My tasks section. For example, when you select the In progress

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

status card in the Task status section, the **Attestation tasks** list shows attestation tasks that are in progress and the **All other tasks** list shows all non-attestation and non-certification tasks that are in progress.

Certification tasks

The **Certification tasks** tab in the My tasks section lists any Data Certification tasks assigned to you or to an assignment group that you belong to in accordance with CMDB Data Manager policies. For managers, tasks of direct reports are included, and for user group managers, tasks of members in the group are also included. Review and process these tasks by checking audit results for the associated CIs and attribute values. For more information about reviewing Data Certification tasks, see Review certification tasks in CMDB Workspace.

Attestation tasks

The **Attestation tasks** tab in the My tasks section lists any attestation tasks assigned to you or to an assignment group that you belong to in accordance with CMDB Data Manager Attestation policies. For managers, tasks of direct reports are included, and for user group managers, tasks of members in the group are also included. Review and process these attestation tasks by checking the physical existence of IT infrastructure or applications associated with the CIs in the tasks. For information about reviewing and processing attestation tasks, see Review attestation tasks in CMDB Workspace.

The **Overdue tasks** tab lists those tasks that are overdue so you can review those tasks at a higher priority.

Life-cycle tasks

The **All other tasks** tab in the My tasks section lists any tasks, aside from attestation and certification tasks, assigned to you or to an assignment group that you belong to in accordance with CMDB Data Manager policies. The list includes tasks that are in a closed state ('Closed Complete', 'Closed Canceled', 'Closed Incomplete', and 'Rejected'). For managers, tasks of direct reports are included, and for user group managers, tasks of members in the group are also included. For information about reviewing and processing life-cycle tasks, see Review CMDB Data Manager tasks in CMDB Workspace.

CMDB 360 view in CMDB Workspace

The CMDB 360 dashboard provides aggregations and analysis of CMDB 360 data. CMDB 360 collects data about all the discovery sources reporting attribute values for CIs. Use the CMDB 360 view in CMDB Workspace to track activities and identify potential issues of discovery sources. You can also create your own queries and associated schedules and reports to explore CMDB 360 data.

- For concepts and other background information about CMDB 360, see CMDB 360/Multisource CMDB.
- For information about all CMDB 360 dashboard settings, see Configure the CMDB 360 dashboard.
- For information about using the CMDB 360 view, see CMDB 360 experience in CMDB Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Most cards on the CMDB 360 dashboard support non-CMDB tables in their aggregation, or can be configured to provide support. However, the CIs not reported by discovery sources card, for example, doesn't apply to non-CMDB tables. Creating queries for non-CMDB tables is also supported. For information about support for non-CMDB tables, see IRE support for non-CMDB tables.

Access

Requirements:

- Role requirement: sn_cmdb_user (CMDB user) or any role containing sn_cmdb_user
- Additional requirement: Enable and configure CMDB 360

To access the CMDB 360 view in the CMDB Workspace, navigate to **Workspaces** > **CMDB Workspace**. In the CMDB Workspace menu bar, select **CMDB 360**.

Insights view in CMDB Workspace

Use the Insights view in CMDB Workspace to see and increase the level of adoption of key CMDB features and application services to improve the overall health of the CMDB. Explore how tools and features can maximize the health and efficiency of your CMDB and use direct links to install and start using features immediately.

Access

Role requirement: sn_cmdb_user (CMDB User), or a user role containing sn_cmdb_user (sn_cmdb_admin, sn_cmdb_editor).

To access the Insights view, navigate to **Workspaces** > **CMDB Workspace** and then select **Insights** in the CMDB Workspace menu bar.

The Insights view includes the following tiles:

- CMDB feature adoption
- CMDB performance insights
- Application services
- Cloud vs Non-cloud resources

CMDB feature adoption

Shows dial charts for the overall adoption levels of all three categories of CMDB tools and features:

Data ingestion

Tools and features that support and ensure ingestion of high-quality data into the CMDB.

Data governance

Tools and features that let you manage the CMDB data after it has been ingested.

Search and analytics

Tools and features that provide meaningful and helpful insights into the CMDB data.

Select each dial chart in the tile to access its tab and associated cards with further details about the features in the category. Pay special attention to categories with low levels of adoption and those features that aren't yet implemented in the instance and which you should consider for adoption.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Each category tab shows cards for the features in the category and the following general cards:

- Overall adoption level for the tab: The calculated overall level of adoption for the tab. Calculations are specific for each tab, and can be based, for example, on the level of adoption of some or all the features in the tab.
- Adoption progress: Installation, activation, or usage status per feature in the tab. Select a feature link to access a relevant resource such as the feature's landing page with an overview dashboard or an installation location.

Depending on adoption level, a card might contain any of the following resource links:

- **Learn more**: Link to documentation to learn and explore the benefits and usage of the feature.
- **View demo**: Link to a short demo about the feature.
- **Get started**: Link to a landing page where you can start immediately utilizing the feature.
- **Install app**: Link to the ServiceNow Store where you can immediately install the app.

Cards use different methods to examine the instance and determine if the card's feature is installed, activated, and being used. For example, some cards check for the installation status of plugins and some cards rely on data in the specific feature tables. Many counts and aggregation data that appear on cards is based on Performance Analytics indicators built on top of the Base Aggregate Data [sn_cmdb_ws_base_aggregate_data] table.

- If the result is that the card's feature is installed or being used, then the card shows charts and counts about the level of usage. In which case, the card's label might slightly adjust.
- If the result is that the card's feature isn't installed or isn't in use, then links are provided to resources where you can explore, install, and start using the feature.

Most of the cards scheduled jobs run every 24 hours, therefore, depending on the type of data, some card data is based on recent but not current data. The Last updated timestamp in the cards reflects the collection time for the data that was used for the card. Also, immediately after getting started with a feature, a card won't reflect on the latest status or usage of the feature, until up to 24 hours when the card's scheduled job runs (for the CIs processed by IRE based on source card, the associated scheduled job, CMDB Workspace - Populate aggregates Monthly, runs monthly).

The following sections provide details for each card, including the calculation script used for the card.

CMDB feature adoption: Data ingestion

The overall adoption level for data ingestion maps to the following findings in the instance:

- Low (red): Less than 80% of CIs are processed by Identification and Reconciliation Engine (IRE)
- Moderate (amber): 80—90% of CIs are processed by IRE
- High (green): Over 90% of CIs are processed by IRE

Data ingestion contains the following features and aggregations:

CIs processed by IRE

Determines the percentage of CIs that are processed by IRE, by checking the Source [sys_object_source] table. CIs that aren't processed by IRE introduce a data integrity risk.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The percentage of CIs that are being processed by IRE determines both, the level of adoption for this feature card and the overall adoption level for the entire data ingestion category.

Service Graph Connectors

Determines the installation and usage status of Getting started with Service Graph Connectors, by checking:

- If the ITOM Licensing plugin (com.snc.itom.license) is active
- If there is at least one Service Graph Connector installed in the instance

If Service Graph Connectors are installed and are in use, then the card shows a count of those connectors.

> **Note:**
> The count of Service Graph connectors that appears on the card might be slightly different than the number of connectors that show on the ServiceNow Store site because the counting methods that are used are different.

IntegrationHub ETL

Determines whether the IntegrationHub ETL store app is installed and used, based on records in the CMDB Integration Studio Application Data Sources [cmdb_inst_application_feed] table. If IntegrationHub ETL is in use, then the card shows a count of ETL transform maps in IntegrationHub ETL (demo ETL transform maps aren't counted).

Select **View ETL transform maps** to open IntegrationHub ETL where you can examine existing ETL transform maps and create new ones.

CIs processed by IRE based on source

Chart showing CIs processed by IRE, grouped by Service Graph Connectors, ServiceNow Discovery, a combination of both, and others, for the past six months.

The following discovery sources are counted as ServiceNow Discovery:

- ServiceNow
- ServiceWatch
- ACC-Visibility
- AgentClientCollector
- CredentiallessDiscovery

Point to the chart to show monthly aggregation data.

This card is hidden if there are no CIs processed by IRE.

CMDB application for APIs and CLI

Determines whether the CMDB application for APIs and CLI store app is installed.

This card appears only if the store app isn't installed, providing helpful resources for exploration and adoption.

CMDB feature adoption: Data governance

The overall adoption level for data governance maps to the following findings in the instance:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Low (red): Less than 33% of features are used
- Moderate (amber): 33—66% of features are used
- High (green): Over 66% of features are used

The overall level of adoption of data governance is based on whether CMDB Data Manager features are used.

Note:
Historical data might not be available for all past 90 days because CMDB Workspace version 3.4, which relies on Performance Analytics indicators to collect and save historical usage data, was deployed less than 90 days ago. This situation might result in a discrepancy between actual usage and what the card shows.

CMDB Data Manager/CIs used in Data Manager policies

Determines usage by checking if either of the following conditions is true:

- There are any user-created Delete, Retire, or Archive policies (by searching table CMDB Data Manager Policy and Attributes [cmdb_data_manager_policy_and_attributes])
- There are any CIs processed by these user-created Delete, Retire, or Archive policies, in the last 90 days (by searching table CMDB Data Management Policy Executions [cmdb_data_management_policy_execution])

If CMDB Data Manager is in use, shows a chart with CIs that were processed by these policies in the past six months, by month, and by policy type.

Data attestation/CIs used in data attestation

Determines usage by checking if either of the following conditions is true:

- There are any user-created Attestation policies (by searching table CMDB Data Manager Policy and Attributes [cmdb_data_manager_policy_and_attributes])
- There are any CIs processed by these user-created Attestation policies, in the last 90 days (by searching table CMDB Data Management Policy Executions [cmdb_data_management_policy_execution])

If data attestation is in use, shows a chart with CIs that were processed by attestation policy tasks in the past six months, by month.

Data synchronization

Checks if there is at least one class for which the *managed_by_group* attribute is globally set so that all class CIs are synchronized on the same value.

For information about synchronizing group assignment attributes using the CI Class Manager, see Set the group for a CI or an entire class of CIs and Synchronizing group assignment attributes.

The Data synchronization card is available starting with CMDB Workspace v3.6.

Principal classes

Checks if the Principal Class filter is configured with at least one principal class. The Principal Class filter limits the number of CIs that appear in list views, to show only CIs of principal classes. Reducing the amount of data in list views to only relevant data, improves performance and efficiency.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information about managing the Principal Class filter in CI Class Manager, see Update the list of classes in the Principal Class filter.

The Principal class card is available starting with CMDB Workspace v3.6.

CMDB feature adoption: Search & analytics

The overall adoption level for search & analytics maps to the following findings in the instance:

- Low (red): Less than 33% of features are used
- Moderate (amber): 33—66% of features are used
- High (green): Over 66% of features are used

Search & analytics contains the following features and aggregations:

CMDB Query Builder/Query Builder queries

Determines if the CMDB Query Builder is in use, by checking if either of the following conditions is true:

- There are any records in the Saved Queries [qb_saved_query] table in which *Source* is **QB**
- There are any queries executed or queries executed with reports, in the last 90 days

> **Note:**
> Historical data might not be available for all past 90 days because CMDB Workspace version 3.4, which relies on Performance Analytics indicators to collect and save historical usage data, was deployed less than 90 days ago. This situation might result in a discrepancy between actual usage and what the card shows.

If CMDB Query Builder is in use, shows a chart with counts of query executions and query executions in reports, for the past six months, by month.

Point to the chart to see monthly aggregation data.

Intelligent search

Determines if Intelligent Search for CMDB is in use by checking the NLQ Query Logs [nlq_query_log] table for any records where *source* is **CMDB_WS**, from the past 90 days. If Intelligent Search is in use, shows counts of Intelligent Search queries for the past six months, by month.

> **Note:**
> Historical data might not be available for all past 90 days because CMDB Workspace version 3.4, which relies on Performance Analytics indicators to collect and save historical usage data, was deployed less than 90 days ago. This situation might result in a discrepancy between actual usage and what the card shows.

CMDB 360 — Records in Multisource

Total number of raw CMDB 360 records in the CMDB 360 data store that contains records for each discovery source report, per each CI attribute. This card is identical to the Total CMDB 360 records card in the Discovery Sources tile in the CMDB 360 view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This card appears only if CMDB 360 is enabled, which is determined by checking the ITOM Discovery License (com.snc.itom.discovery.license) plugin and the system property glide.identification_engine.multisource_enabled.

CMDB 360 queries

Count of CMDB 360 queries that exist in the CMDB Multisource Queries [cmdb_multisource_query] table.

This card appears only if CMDB 360 is enabled, which is determined by checking the ITOM Discovery License (com.snc.itom.discovery.license) plugin and the system property glide.identification_engine.multisource_enabled.

CMDB Data Foundation dashboard

Determines if the CMDB and CSDM Data Foundations Dashboards store app (which includes the CMDB Data Foundation dashboard) is installed.

This card appears only if the store app isn't installed, providing helpful resources for exploration and adoption. However, the feature is still included in calculating the search & analytics overall level of adoption.

CMDB Health Dashboard

Determines if CMDB Health is in use by checking if at least one CMDB Health Dashboard job is enabled.

This card appears only if the feature isn't in use, providing helpful resources for exploration and adoption. However, the feature is still included in calculating the search & analytics overall level of adoption.

CMDB performance insights

CMDB performance insights is available starting with CMDB Workspace v3.6 and only appears for users with the sn_cmdb_admin (CMDB Admin) role.

CMDB performance insights helps you understand the ways in which your configurations impact the performance of your CMDB. You can use the charts and tools within CMDB performance insights to troubleshoot, debug, or diagnose performance issues. CMDB performance insights also analyzes your CMDB and Service Graph Connectors on your instance to generate recommendations on how you can improve the performance of your CMDB. The CMDB performance insights tile itself can show up to two of those recommendations.

Select **View performance insights** to access the CMDB performance insights data.

The Payloads & CIs tab contains the following tiles:

Partial payloads

Partial payloads occur when the data source didn't provide enough information to uniquely identify the CI, preventing IRE from processing the CI.

- Total partial payload count:

  Shows the total number of partial payloads that exist in your instance. Large numbers of partial payloads in your instance can cause performance deterioration of the CMDB.

  For more information about partial payloads, see Identification and Reconciliation engine (IRE).

- Discovery source:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Breaks down the number of partial payloads by discovery sources. You can drill down on slices in this pie chart to see the list of partial payloads with errors, filtered by discovery source.

You can drill down on specific partial payloads to better understand the error that you're experiencing. When you drill down on a partial payload, you can see the full payload item, which you can review to troubleshoot and address the specific errors.

For more information about error types, see Generating and simulating payload execution using identification simulation.

Related records

Data about related records that are missing references. A record is missing a reference when the *Referenced* field for that record is empty.

- Related records missing reference:

  Shows the total number of records that do not reference a CI in the *Referenced* field in the Related table. You can see a full list of the Related tables and the associated *Referenced* fields in the Related Entries [cmdb_related_entry] table.

  For more information about Related tables, see Overview of CMDB.

- Related records missing reference by table:

  Breaks down the number of CMDB records missing references, by table. You can drill down on slices in this chart to see the list of specific records filtered by table.

  Before you can drill down on a slice of this pie chart, you must have any user roles required to view the table.

  You can also select **New** from the list view to create a new related entry table record. For more information about creating or editing a related entry table record, see Edit a related table from CMDB performance insights.

Duplicate and stale CIs

A CI is flagged as duplicate during identification and reconciliation. A CI is flagged as stale if it has not been updated within the Effective Duration time period specified in the CMDB Health staleness rule for the CI class.

- CIs:

  Shows the number of CIs that are either duplicate or stale.

- Stale records by class:

  Breaks down the number of stale CIs based on the CI class. You can drill down on slices in this pie chart to see the list of specific CI records filtered by class.

  For more information about stale CIs, see CMDB Health KPIs and metrics.

- Duplicate records by class:

  Breaks down the number of duplicate CIs based on the CI class. You can drill down on slices in this pie chart to see the list of specific CI records.

  For more information about duplicate CIs, see Duplicate CIs remediation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Relationship records missing parent or child

Shows the trend line and number of relationship records in the CI Relationships [cmdb_rel_ci] table that are missing a parent or child CI. CIs that are missing a parent or child are considered invalid records and can have a performance impact on your instance.

Recommendations

Recommendations on this panel include a link to the related documentation and typically enable direct access to the associated tool, feature, or system property. Expand or minimize the panel by selecting the light bulb icon.

The first two recommendations appear on the CMDB performance insights tile of the Insights view.

You can only see a recommendation if you have the roles needed to access the feature, tool, or system property. Users with the sn_cmdb_admin role can hide recommendations or adjust the order in which recommendations appear. Users can use the **Active** and **Order** fields in the CMDB WS Imp Action Card Config [sn_cmdb_ws_imp_action_card_config] table to configure those elements.

The Service Graph connectors tab contains the following tiles:

Note:

- The Service Graph connectors tab only appears if your instance has at least one Service Graph Connector and you have the cmdb_inst_admin role.
- To edit data source or scheduled data import records from CMDB Workspace, you may need to set **Application scope** to the **Application** of the data source or data import.

Connectors data source

Configurations on your Service Graph Connector data sources affect the ingestion and processing of incoming data. Changing your Service Graph Connector data source configurations can streamline data handling, making your CMDB more efficient and reducing impacts on the performance of your instance.

- Sources with batch processing turned off:

  Shows the percentage of Service Graph Connector data sources in the Data Sources [sys_data_source] table with disabled **Use Batch Import**. It also lists the total number of data sources, and the number of data sources with enabled or disabled batch processing.

  To enable batch processing, access the record of a specific data source from the list view and select **Use Batch Import**. For more information about batch processing, see Data source fields.

  You can also select **Edit** to update a data source from the list view. For more information about editing a data source, see Edit a data source from CMDB performance insights.

- Sources with concurrent import turned off:

  Shows the percentage of scheduled data imports of Service Graph Connector data sources in the Scheduled Data Imports [scheduled_import_set] table with **Concurrent Import** turned off. It also lists the total number of scheduled data imports, and the number of scheduled data imports with **Concurrent Import** turned on or off.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To enable concurrent import, access the record of a specific scheduled data import from the list view and select **Concurrent Import**. For more information about concurrent import, see Concurrent imports.

You can also select **Edit** to update a scheduled data import from the list view. For more information about editing a scheduled data import, see Edit a scheduled data import from CMDB performance insights.

- Sources with non-custom size partition method:

  Shows the percentage of scheduled data imports of Service Graph Connector data sources in the Scheduled Data Imports [scheduled_import_set] table that use a non-custom size partition method. It also lists the total number of scheduled data imports, and the number of scheduled data imports that use a non-custom size partition method.

  To use a custom size partition method, access the record of a specific scheduled data import from the list view. Ensure that **Concurrent Import** is selected. From the **Partition Method** drop-down menu that appears, select **Custom size**. For more information about partition methods, see Schedule a data import.

  You can also select **Edit** to update a new scheduled data import from the list view. For more information about editing a scheduled data import, see Edit a scheduled data import from CMDB performance insights.

Connectors execution trends

Aggregates Service Graph Connectors with outlier connector executions, where the number of imported rows or the rate of processing is significantly higher or lower than the 30-day trend.

- Connectors with processing rate outliers:

  Shows the number of Service Graph Connectors that are considered outliers with connector execution processing rates outside the expected trend lines within the past 30 days.

- Connectors with import count outliers:

  Shows the number of Service Graph Connectors that are considered outliers with connector execution import counts outside the expected trend lines within the past 30 days.

You can drill down the cards in the Connectors execution trends tile to access the Service Graph connector execution trends window. In that windows, a Service Graph Connector is available in the connectors drop-down menu only if it has an execution record.

Click the tabs on the Service Graph connector execution trends window to view the following charts and the Connector Execution list view of executed connector import sets:

- Processing rate:

  Models the trend line of processing rates for connector executions. Shows the rate at which a connector processes rows of data over a period of time.

  There are two zones, which are the Confidence Band and the Prediction Band. Service Graph Connectors with connection executions that have processing rates

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

outside of the Prediction Band are considered outliers. These zones don't appear when you select more than one Service Graph Connector.

- Import count:

  Models the trend line of rows processed for connector executions. Shows the number of rows a connector processes over a period of time.

  There are two zones, which are the Confidence Band and the Prediction Band. Service Graph Connectors with connector executions that have import row counts outside of the Prediction Band are considered outliers.

On both charts, you can select outlier and non-outlier Service Graph Connectors to see the trend lines against each other.

For more information about processing data with Service Graph Connectors, see Getting started with Service Graph Connectors.

Cloud vs Non-cloud resources

Charts showing counts and details for resources and application services that are hosted on various cloud services versus those that aren't. Resources and application services can be deployed on cloud services such as the Microsoft Azure Cloud, or on the local instance or other non-cloud solutions. For some ongoing operations in the organization, it might be necessary to have those details which can be difficult to obtain.

For details about the charts, see 'Cloud vs Non-cloud resources' in the Home view in CMDB Workspace topic.

Application services

Shows a count of application services in your organization, based on records in the Service Instance [cmdb_ci_service_auto] table. The chart shows the trend of total number of application services per day, for the past seven days.

Select the tile to access the Application Services dashboard where you can monitor the adoption level and health of application services. For details about the Application Services dashboard, see Monitor the health of application services on the Application Services dashboard.

Management view in CMDB Workspace

The Management view provides CMDB Admins with quick access to key management tools and deep insights into CMDB health and activities. The view provides and details such as duplicate CIs and recent activities in the CMDB.

Access

Role requirement: sn_cmdb_admin (CMDB Admin)

To access the Management view, navigate to **Workspaces** > **CMDB Workspace** and then select **Management** in the CMDB Workspace menu bar.

CMDB Data Manager

The following cards show details about CIs and policies associated with CMDB Data Manager:

Rejected CIs

CIs set as rejected during a review of attestation tasks.

Excluded CIs

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CIs set as excluded from CMDB Data Manager policies.

Draft policies

Draft Data Manager policies that were created but not published.

CI Correctness

Cards in this section show health state for the sub metrics of the CMDB Health correctness KPI. Counts are based on testing CIs against pre-defined data integrity rules such as:

- Identification rules (to detect duplicate CIs)
- Orphan CI rules
- Staleness CI rules

You can set the time interval used in calculations for these counts.

For more information about the correctness KPI, and the duplicate, orphan, and stale sub metrics, see CMDB Health KPIs and metrics.

Recent activity trends

The following cards show recent activities in the CMDB:

Recent CI Activity

A 7-day chart showing metrics and trend line related to CIs such as the number of new CIs and updated CIs.

Recent Application Service Activity

A 7-day chart showing metrics and trend line related to Application Services such as the total number of Application Services, new and updated Application Services, and the number of Application Services with outages.

Management tools

Provides links that you can use to access CMDB dashboards, tools, and list views. The links are grouped by categories as described below.

Note:
Some links are conditionally available based on installation of applications, active plugins, and your assigned role. For a link that doesn't appear, make sure that all the requirements for the link are met.

Manage:

- CI Class Manager: Centrally view, create, or edit class definitions and class settings for Identification and Reconciliation (IRE) and for CMDB Health.

  Additional role requirement: itil or personalize_dictionary.

- Data Manager: Centrally create, edit, review, publish, and track Data Manager policies and the tasks generated by the policies.
- De-duplication Template Library: Create and manage de-duplication templates and libraries to remediate de-duplication tasks in bulk.
- De-duplication Dashboard: Show counts and insights for duplicate CIs in the CMDB, and run and track de-duplication templates to remediate de-duplication tasks in bulk.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- CMDB Groups: Show a list view of current CMDB groups where you can create new CMDB groups, and manage the existing CMDB groups. A CMDB group is a collection of CIs to which you can apply CI actions collectively to all the CIs in the group. For example, CMDB Health can monitor CIs in a Health-type CMDB group, and report the aggregated health for the group as a whole.
- Dynamic CI Groups: Show a list view of current dynamic CI groups where you can create new dynamic CI groups, and manage the existing ones. Dynamic CI Groups act as application services that are populated with members of the CMDB group that is associated with the dynamic CI group. For more information about dynamic CI groups, see Application services.

Optimize:

- CMDB Health: View the CMDB Health dashboards and configure the CMDB health KPIs and metrics that CIs are evaluated by in CMDB Health dashboards.

  Additional requirements:

  - Set up and configure CMDB Health
  - Roles: asset or itil
- CMDB Data Foundations Dashboard: View the CMDB Data Foundations dashboard where you can explore potential risks in the CMDB implementation, and verify that important data is valid and properly configured.

  Additional requirements:

  - Set up CSDM and CMDB Data Foundations Dashboards
  - Roles: asset, Itil_admin, or admin
  - Plugin: com.snc.cmdb.getwell
- CSDM Data Foundations Dashboard: View the CSDM Data Foundations dashboard where you can explore key CSDM metrics on a single page to assist you in getting the full benefit from your implementation.

  Additional requirements:

  - Set up CSDM and CMDB Data Foundations Dashboards
  - Roles: app_service_admin, app_service_user, asset, cmdb_read, itil_admin, portfolio_admin, service_viewer, or technology_service_owner
  - Plugin: com.snc.cmdb.getwell
- De-Duplication Tasks: Remediate a de-duplication task by using the Duplicate CI Remediator wizard which guides you through the duplicate CI reconciliation process.

  Additional role requirement: itil.
- CMDB Remediation Rules: Rules associated with a CMDB Health task that was created for a failed CMDB Health test. A CMDB remediation rule runs a remediation workflow to remediate an issue reported by CMDB Health.

Visualize:

- Dependency Views: Provides a graphic infrastructure view for a CI and any applications or business services that it is part of and that it supports.

  Additional role requirement: dependency_views.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Query Builder: Easily build complex infrastructure and service queries, that span multiple CMDB classes, non-CMDB tables, and that can involve many CIs that are connected by different relationships.

  Additional role requirement: cmdb_query_builder_read.

Create: New Technical Service

Additional role requirement: service_admin.

Configuration identifiers framework

Configuration identifiers provide a framework that lets you customize some behaviors of a CMDB Workspace feature, enabling different settings for that feature, on different workspaces. Most importantly, you can use this customization framework when integrating a CMDB Workspace feature into another workspace.

Configuration identifier

A configuration identifier (also referred to as config identifier) is a configuration element within the configuration identifiers framework. A config identifier contains custom settings for a CMDB Workspace feature, that is applicable to a specific workspace. A config identifier contains settings and table-driven configurations used in a UX application such as a workspace. Using config identifiers lets you for example, integrate CMDB Workspace Unified Map into another workspace, with the integrated Unified Map being customized for the workspace. Config identifiers are stored in the Config identifiers [sn_cmdb_ws_config_identifier] table.

A config Identifier acts as the parent record for a set of configurations that are specific to a workspace and therefore overrides default behavior only for that workspace.

Default config identifier

Initially, the Config identifiers [sn_cmdb_ws_config_identifier] table in CMDB Workspace, contains a single config identifier named 'Default' and which is workspace-agnostic. This Default config identifier has its *Default* column set to **Yes**, a setting that can't be modified. Only a single config identifier can be set to **Yes**, therefore, any additional config identifiers that you create are set to **No**.

The default config identifier contains default settings for CMDB Workspace features. Any subsequent Config Identifier that you configure, is set for a specific workspace. When integrating a CMDB Workspace feature into another workspace and there are no entries in the table-driven configuration for that feature, look-up uses the settings in the default configuration identifier.

Key roles

The following roles are needed in order to use the configuration identifiers framework:

- sn_cmdb_ws.config_editor: Can modify child config tables, such as sn_cmdb_ws_config_property.
- sn_cmdb_ws.config_admin: Can modify both sn_cmdb_ws_config_identifier and child config tables.
- sn_cmdb_admin: Role required to modify default config records under the default identifier or the default identifier itself.

For more information about these roles, see Components installed with CMDB Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Examples of CMDB Workspace features using the configuration identifiers framework for feature settings

- Unified Map:
  - Configure how many nodes can appear on a map
  - Configure the default or maximum number of levels on maps
  - Configure endpoint de-duplication on maps
  - Configure which attributes to display in the Attributes panel
  - Create a class profile of visible layers for classes
  - Configure CIs to appear based on life cycle stage value
- Create CI:
  - Request additional attributes for a new CI being created in a workspace
  - Limit the class list for a new CI being created in a workspace

Configure CMDB Workspace

Plan and configure your implementation of CMDB Workspace.

Configuration overview

1. Set up CMDB Workspace

   Request the store app and enable demo data.

2. Configure any of the following options to show the most relevant data in your organization:
   - Modify important actions on the Home view of CMDB Workspace
   - Add a quick link to the Home view of CMDB Workspace
   - Configure datacenters for the Cloud vs Non-cloud resources chart
   - Configure CI classes for the Cloud vs Non-cloud resources chart

Set up CMDB Workspace

Set up and access the CMDB Workspace store app.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Note:
The CMDB Workspace store app is automatically installed when installing or upgrading the product.

Enable demo data

Enable demo data to install demo data-specific scheduled jobs that if the needed requirement is met, generates and populates demo data in CMDB Workspace cards such as:

- Cloud vs Non-cloud resources chart in the CMDB Workspace landing page and the Insights view: If Cloud Service Accounts [cmdb_ci_cloud_service_account] table exists
- Cards in the CMDB 360 view: If CMDB 360 is enabled

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Cards in the Insights view, CMDB Feature Adoption tile:
  - CIs processed by IRE
  - CIs processed by IRE based on source
  - Data Manager
  - Data attestation
  - Query Builder
  - Intelligent Search
- Cards in the What's new tile in the CMDB Workspace landing page.

To populate CMDB Workspace dashboards with demo data:

1. When installing the CMDB Workspace store app, check **Load demo data**.
2. Access the *[Demo] – CMDB Workspace demo data* scheduled job and select **Execute Now**.

Note:
As a general practice, don't enable demo data in a production instance to prevent demo data mixing with real production data.

Prerequisites

- Plugins:
  - Recommended: CSDM Activation (com.snc.cmdb.csdm.activation)

    Allows for legacy *Lifecycle Status* field mappings and synchronization to legacy status fields. For details about use and customization of retirement definitions when this plugin isn't activated, see Retirement definitions.
  - Required (activated by default): CMDB CSDM Support (com.snc.cmdb.csdm)
  - Required (activated by default): CMDB Page Templates (sn_cmdb_pg_templts)
  - Required (activated by default): CMDB NLQ Search Connected (sn-cmdb-nlq-search)

  For details about activating a plugin, see Activate a plugin.
- Roles: To access the CMDB Workspace, you must, at a minimum, have one of the following roles, which are essential for interacting with the CMDB Workspace. Depending on which of these roles is assigned to you, you might only have access to some of the features available in the CMDB Workspace:
  - sn_cmdb_admin
  - sn_cmdb_editor
  - sn_cmdb_user

  Note:
  As you drill down in the CMDB Workspace, there are some dashboards and list views that require specific roles in addition to the key CMDB Admin, CMDB Editor, or CMDB User roles.
- Features: CMDB Workspace provides access to a wide range of applications and features. However, for CMDB Workspace to provide meaningful reports, overviews, and trends, you must set up and configure some of those features. Setup for such features is listed under Additional requirements.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Access the CMDB Workspace

Navigate to **Workspaces** > **CMDB Workspace** to access CMDB Workspace.

Home view is the default view of CMDB Workspace and you can also use other views to access CMDB features:

- Home view in CMDB Workspace: View various CMDB Health aggregations, use Intelligent Search to search through the CMDB, see what changed in the CMDB, and access important tasks. This is the default view for CMDB Workspace.
- My Work view: Manage CMDB Data Manager tasks such as attestation tasks, that are assigned to you.
- CMDB 360 view: View aggregations and analysis of CMDB 360 data on a dashboard, and create CMDB 360 queries.
- Management view: View recent key activities and health indicators for the CMDB, and access management tools and dashboards (accessible only to CMDB admins) that support your management tasks.
- Insights view: View level of adoption of key CMDB tools, features, and application services. Explore benefits and install those tools and features to maximize the efficiency of your CMDB functionality.

Modify important actions on the Home view of CMDB Workspace

Modify the appearance order and other properties of the important action cards that appear on the Home view of the CMDB Workspace.

Before you begin

Role required: sn_cmdb_admin

About this task

The task cards that appear in the Important tasks tile on the landing page of the CMDB Workspace, are stored in the CMDB WS Imp Action Card Config [sn_cmdb_ws_imp_action_card_config] table. You can edit some attributes of these cards, including the setting that controls whether a specific card appears at all. Cards in the Important actions tile are available only for the CMDB Admin [sn_cmdb_admin] and the CMDB Editor [sn_cmdb_editor] user roles and each is configured per one of those roles.

There is some overlap in the task cards that appear for a CMDB Admin and for a CMDB Editor, however, the filters in those task cards are different. Typically, for CMDB Admins, the card filter also includes unassigned tasks that a CMDB Admin needs to assign.

Only editing is possible, you can't add or delete action records in this table.

Procedure

1. Navigate to **All**.
2. In the navigation filter, enter `sn_cmdb_ws_imp_action_card_config.list`.
3. In the list view of the table, edit the table row that you want to modify or click the row to open the record form.

Field	Description
Persona	The logged on user (such as CMDB Admin) for which this card appears.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	You can't edit this field.
Type	Tasks group that this task belongs to, such as Duplicate CIs. You can't edit this field.
Table	The table used in the card filter. You can't edit this field.
Active	Determines whether the card for this action appears in CMDB Workspace.
Order	Numeric value that determines the order of each card within the rest of the cards in the Important actions tile. Cards with lower order numbers appear before cards with higher order numbers.
Filter condition	Filters for the tasks that are included for the card.
List columns	Columns that appear in the list view when you click a card to show its associated tasks.
List groupby	Attribute to group by the card's associated tasks in the card's list view. The card's list view appears when you click a card to show its associated tasks.

4. Click **Update**.

Add a quick link to the Home view of CMDB Workspace

For an immediate access to tools or data that you need, add your own quick link to the Home view of CMDB Workspace.

Before you begin

Role required: sn_cmdb_admin, sn_cmdb_editor, or sn_cmdb_user

About this task

Quick links are stored in the Quick Links [sn_cmdb_ws_quick_links] table including those that are included in the base system. Only the user that added a quick link has access to that link, and can subsequently edit or delete that added link.

Procedure

1. Navigate to **Workspaces** > **CMDB Workspace**.
2. In the Quick links section, click the '+' icon.
3. Enter the **URL** and **Display text** for the link and then click **Add**.

   A valid URL must start with "http:" or "https:". To link to a tool in the instance such as the CI Class Manager, enter the full URL to the tool's landing page.

4. Click **Done**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The new link is available only for the user that created the link, in the Quick links section in the landing page of the CMDB Workspace.

What to do next
Click on the Edit quick links icon to edit, delete, or reposition an added link. Then use the up and down arrows to move a link within the list, and click the Edit icon next to a link that you want to modify or delete from the list.

Configure datacenters for the Cloud vs Non-cloud resources chart

The Cloud vs Non-cloud resources chart in CMDB Workspace determines which CIs and application services are stored on a cloud and which aren't in the organization. In addition to base system classifications, you can add cloud versus non-cloud classifications that reflect specific datacenter deployments in the organization.

Before you begin
Role required: sn_cmdb_admin

About this task
The Datacenter Types [sn_cmdb_ws_datacenter_type] table stores datacenter classes with a classification of being used as a cloud storage or not in the organization. The calculations for the Cloud vs Non-cloud resources chart in the CI overview tile in CMDB Workspace, reflects on the datacenters in that table and their classifications.

CIs are counted as non-cloud mainly if either of the following conditions is met:

- The CI is not associated with any datacenter.
- The CI is associated with a datacenter that is classified as non-cloud in the Datacenter Types table.

In the base system, the Datacenter Types table contains several common datacenters. For example, the Azure Datacenter [cmdb_ci_azure_datacenter) class is classified as 'Cloud'. Therefore, the Cloud vs Non-cloud resources chart includes in its calculations and bars the Azure Datacenter [cmdb_ci_azure_datacenter) class.

Procedure
1. Select **All**.
2. In the Filter navigator, enter `sn_cmdb_ws_datacenter_type.list` to access the Datacenter Types table.
3. Click **New** and fill out the Datacenter Type form for a datacenter that is used in the organization.

Field	Description
Datacenter class	A child class of the Logical Datacenter [cmdb_ci_logical_datacenter] class which is used in the organization.
Type	Classification that reflects whether the specified **Datacenter class** is being used as cloud storage or not.
Cloud Provider	Custom label for the cloud provider.

4. Click **Submit**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure CI classes for the Cloud vs Non-cloud resources chart

Include or exclude pairs of *CI Class*/*Type* in the Cloud vs Non-cloud resources chart in CMDB Workspace.

Before you begin
Role required: sn_cmdb_admin

About this task
The CMDB Insight Query Categories [sn_cmdb_ws_insight_query_category] table contains the pairs of *CI Class*/*Type* for the Cloud vs Non-cloud resources chart in the CI overview tile in CMDB Workspace. The *Active* setting in a record determines if the respective *CI Class*/*Type* pair appears in the chart. By default, all pairs are configured to appear in the chart.

A *CI Class*/*Type* pair appears or doesn't appear according to its *Active* setting and regardless of the status of its associated scheduled job.

Procedure
1. Select **All**.
2. In the Filter navigator, enter `sn_cmdb_ws_insight_query_category.list` to access the CMDB Insight Query Categories table.
3. Set *Active* to **true** or **false** for a CI Class/Type pair.
   For example, set *Active* to **false** for the **Applications**/**Non-cloud** pair. This setting will exclude from the chart all CIs in the Applications class which are determined to be non-cloud.

Request additional attributes for a new CI being created in a workspace

Integrate a request for specific CI attributes when manually creating a new CI in your workspace. When then creating a new CI in the respective workspace, users can enter values for the requested attributes, as appropriate for the new CI.

About this task
Creating a new CI is an experience in CMDB Workspace which you might be integrating into another workspace. Within CMDB Workspace, there are default settings for some of the behaviors of the create CI experience. However, you can use configuration identifiers to customize some of those default settings for CMDB Workspace or other workspaces. For example, you can customize the list of attributes that is requested for the new CI.

Requests for additional attributes for new CIs are stored in the CI additional attributes config [sn_cmdb_ws_ci_additional_attributes] table which is part of the configuration identifiers framework. Therefore, to manage requests for additional attributes in your workspace, you must use config identifiers. By default, the CI additional attributes config table contains a single entry for CMDB Workspace, that applies to the entire CMDB hierarchy. Any workspace or class without a direct config identifier for additional attributes, uses the default entry.

For more information:

- About configuration identifiers, see Configuration identifiers framework.
- About the experience of manually creating a new CI in CMDB Workspace, see Create a CI manually in CMDB Workspace.

Before you begin
Role required: sn_cmdb_ws.config_editor

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** and in the navigation filter, enter `sn_cmdb_ws_ci_additional_attributes.list` to access the CI additional attributes config table.
2. On the table list view page, select **New** and fill out the form.

Field	Description
Config identifier	Name of a configuration identifier from the Config identifier [sn_cmdb_ws_config_identifier] table. The default value of 'Default' is used as a fallback for any workspace without its own config identifiers.
CI class	Class for which the specified additional attributes will be requested when creating a new CI.
Active	Option to activate or deactivate the request for the additional attributes when creating a new CI.
Additional attributes	List of class attributes that will be requested when creating a new CI of the **CI class**.
Apply to hierarchy	Apply the request for additional attributes to all classes descending from the specified **CI class**.
Feature	Pre-set to 'Create CI'.

3. Select **Submit**.

Result

When manually creating a new CI for the specified **CI class** in the respective workspace, users are requested to enter values for the specified **Additional attributes** on the Additional attributes page.

Limit the class list for a new CI being created in a workspace

Limit the selection of classes for a new CI created in your workspace, to only those classes that are relevant to that workspace. When then creating a new CI in the respective workspace, users can only select a class that is authorized as an option.

About this task

Creating a new CI is an experience in CMDB Workspace which you might be integrating into another workspace. Within CMDB Workspace, there are default settings for some of the behaviors of the create CI experience. However, you can use configuration identifiers to customize some of those default settings for CMDB Workspace or other workspaces. For example, you can customize the list of classes to choose from, for the new CI.

By default, when creating a new CI in CMDB Workspace, the list of classes to choose from for the new CI, contains almost all classes in the CMDB hierarchy. For your workspace, it might be important to reduce that list to specific classes or hierarchy branches.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Settings for specific classes available for new CIs are stored in the CI class config [sn_cmdb_ws_ci_class_config] table which is part of the configuration identifiers framework. Therefore, to manage the list of classes for new CIs in your workspace, you must use config identifiers. To manage that list, you must create a config identifier for each class or hierarchy branch that you want to include or exclude in the class drop-down list. By default, the CI class config table contains a single entry for the Configuration Item [cmdb_ci] class, which is derived by the entire CMDB hierarchy. Any class or workspace without direct config identifiers for inclusion or exclusion, uses the default entry.

For more information:

- About configuration identifiers, see Configuration identifiers framework.
- About the experience of manually creating a new CI in CMDB Workspace, see Create a CI manually in CMDB Workspace.

Before you begin

Role required: sn_cmdb_ws.config_editor

Procedure

1. Navigate to **All** and in the navigation filter, enter `sn_cmdb_ws_ci_class_config.list` to access the CI class config table.
2. On the table list view page, select **New** and fill out the form.

Field	Description
Config identifier	Name of a configuration identifier from the Config identifier [sn_cmdb_ws_config_identifier] table. The default value of 'Default' is used as a fallback for any workspace without its own config identifiers.
CI class	Class to be included or excluded from the list of classes available for a new CI.
Active	Option to activate or deactivate the setting in the experience of creating a new CI.
Feature	Pre-set to 'Create CI'.
Apply to hierarchy	Apply the class setting to all classes descending from the specified **CI class**.
Operation	Include or exclude the **CI class** in the list of classes for a new CI.

3. Select **Submit**.

Result

When manually creating a new CI in the respective workspace, the specified **CI class** is included in the **Class** drop-down list on the Select class page only if it is set to be available.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a CI manually in CMDB Workspace

Create a new CI in CMDB Workspace, while applying Identification and Reconciliation Engine (IRE) processes and other requirements for the CI's class. IRE identification rules enforce the new CI to be unique and to comply with other class requirements.

About this task

Creating specialty CIs such as an application service, isn't supported in this experience. Typically, such CIs aren't discoverable and you must create them manually using specific wizards, such as the Application service wizard.

You can access the Create CI experience in either of the following ways:

- Selecting the **Create CI** quick link on the Home view of CMDB Workspace which lets you then select a class for the new CI.
- Drilling down a class group bar in the CI Summary tab on the CI overview tile, in which case the class you are drilling down from becomes the class for the new CI. This option is available only if you drill down a class that isn't excluded for the Create CI experience. For information about excluding classes for the Create CI experience in CMDB Workspace, see Limit the class list for a new CI being created in a workspace.

As you progress through the procedure, fields appear dynamically according to your selections and entries on the current or previous pages.

To manually create a new CI without applying IRE processes (Core UI), see Populating the CMDB. For more information about mandatory attributes, IRE processes, dependent CIs, and the CI relationship editor (Core UI), see:

- Set a CI attribute to be mandatory
- Identification rules
- CMDB classifications and class dependency
- CI relationship editor

Before you begin

Configure any customizations to the create CI experience before creating new CIs:

- Complete any request by an administrator for additional non-mandatory attributes. For information about how an administrator can use configuration identifiers to incorporate requests for attributes into the flow of creating a new CI, see Request additional attributes for a new CI being created in a workspace.
- Complete any settings for limiting the list of classes available to choose from, for a new CI. For information about how an administrator can use configuration identifiers to create a custom list of classes for a new CI, see Limit the class list for a new CI being created in a workspace.

If you want additional actions to be performed after creating a CI, such as creating a record that references the new CI, implement the ManualCreateCIExtPoint extension point:

- In the `getAppId()` function, add the sys_id of the application containing the workspace from the UX Application [sys_ux_page_registry] table.
- In the `postInsertCI()` function, define the additional actions you want to perform.

Your extension point implementation runs after a new CI is created in the application specified in `getAppId()`. You can create additional implementations as needed for additional applications. For more information about extension points, see Using extension points to extend application functionality.

Role required: cmdb_manual_ci_ire_access (contained in the sn_cmdb_editor role by default)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **CMDB Workspace**.
2. On the Home view of CMDB Workspace, use one of the following options:

   - Select the **Create CI** quick link, and then:
     a. On the **Select class** page, select the class for the new CI from the **Class** drop-down list. Classes without a valid identification rule are grayed out in the list and you can't select them.
     b. Select **Continue**.
   - On the CI overview tile, select the CI Summary tab, and then:
     a. Select the group bar with the class that you want to create the new CI in.
     b. Scroll down to the list view for the class group, and select the class in which you want to create the new CI.
     c. On the class list view page, select the **Create CI** button.

     Note:
     If you selected a class that is excluded from the Create CI experience, the **New** button appears. Select **New** to manually create a new CI without applying IRE processes (Core UI).

   Continue to fill out the rest of the Create a new CI pages as described in the following steps.

3. **Required attributes**:
   Configure attributes that are either mandatory for the new CI's class, or which the identification rule for the new CI's class requires. Also, if the new CI is a dependent CI, configure the dependency relationship.

   - In the Dependent-upon CI section, select a CI that the new CI depends on.

     Dependent-upon class: Select the class of the dependent-upon CI.

     Dependent-upon CI: Select the search icon and in the Dependent-upon CI dialog box, select a CI by selecting its link in the Name column.

   - In the Identifier entries section, select criterion attributes and set their values to uniquely identify the CI.

     Criterion attributes: In the drop-down list, select one or more criterion attributes sets. This drop-down list omits criterion attributes that are based on the *`Product instance identifier`* attribute.

   - In the criterion attribute fields section scroll down the page if needed and enter values for the criterion attributes fields for the CI.

   Select **Continue**. If the new CI is detected as a duplicate of an existing CI, then the CI already exists dialog box appears. Select **Review existing CI** and then decide whether to change the existing or the new CI to prevent the duplication and to continue creating the CI.

4. **Additional attributes**:

   Enter values for attributes that your administrator is requesting in addition to the required attributes from previous pages.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Select **Continue**.

5. **Relationship definition**:

   Review any existing relationships and decide whether to add a relationship for the new CI. For dependent CIs, a dependent relationship was already created in an earlier step.

   a. Select **Add**.

   b. On the Add relationships page, select a **Relationship type**.

      The Parent/Child notations in each relationship type denotes whether the new CI will have the role of a child or a parent in the new relationship.

   c. In the Configuration Item list, select the CIs that the new CI will have the relationship with. Whichever parent/child role you selected for the new CI, the selected CIs will have the other role.

   d. Select **Add**.

   > **Note:**
   > Creating relationships to the User and the Group tables is supported, however, those relationships aren't processed by IRE.

   On the Relationship definition page, select **Continue**.

6. **Review**:
   Review all the details of the new CI. Select **Create** to approve and create the new CI, or **Back** to change definitions.
7. In the New CI created dialog box, select **Done** to exit the operation, **Review new CI** to open the form view for the new CI, or **Create another CI**.

Result

In the new CI:

- *`Discovery source`* is set to **Manual via IRE**.
- **Operational status** is set to **Design** until the new CI is fully configured and ready to be used. You can modify the CI's status, for example, to **Operational** if appropriate.

In the new CI, *`Discovery source`* is set to **Manual via IRE**.

What to do next

You can view the new CI or other CIs, in the CI Form in CMDB Workspace. For more information about using the CI Form, see Manage CI details in CI Form.

Manage CI details in CI Form

Use CI Form in CMDB Workspace or in another workspace, to view, edit, and manage a comprehensive set of details of a CI such as its attributes, related lists, and CMDB 360 records. When updating CIs, IRE rules are applied to avoid potential issues such as duplicate CIs. CI Form supports derivation of form configurations throughout the CMDB hierarchy.

The CI Form feature is a centralized location with a comprehensive set of CI details, organized in sections. Anywhere CMDB Workspace provides a function to view a CI record, such as a list or a chart, CI Form is used for the selected CI when you select that function. Use the forms provided by CI Form to examine and edit CI attributes, relationships, tags, services and offerings, CMDB Health and CMDB 360 data associated with the CI, related lists, and activities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

General operations you can perform in CI Form:

- Select the Now Assist for CMDB CI Summarization skill: Requires that Now Assist for CMDB is set up. For more information, see Configure the CI summarization skill.
- Select **Open map** to open the CI map in Unified Map. This function isn't available for a non-operational CI. For information about using the *Life cycle stage* attribute to define a CI's operational state, see Configure CIs to appear based on life cycle stage value.

In general, a CMDB Admin and a CMDB Editor can view and edit CI records, and a CMDB User can view CI details on the form.

Explore CI view

By default, CI Form uses the Explore CI view, which is stored in the UI Views [sys_ui_view] table. The Explore CI view defines the structure of the view, its sections and attributes, and related lists that appear on the form. The system provides predefined Explore CI forms for many CMDB classes. Those forms are derived by child classes, which don't have their own form definition, throughout the CMDB hierarchy.

The various sections in Explore CI view are described in this topic.

Configuration

You can control the use and content of CI Form as follows:

- Set system property *sn_cmdb_ws.explore_ci.record.enabled*:

  This property toggles the use of CI Form when viewing CI records in CMDB Workspace, or in another workspace, if applicable. This property is set to **true** by default, enabling the experience of CI Form. For more information about this property, see Components installed with CMDB Workspace.

- Configure the Explore CI view:

  Select the More Actions icon (...) on the form and then select an option to modify the Explore CI view:

  - Select **Configure attributes** to modify the Summary and Attributes sections on the form, in Form Builder. For example, to add sections, modify section titles or the attributes included in sections: Requires the personalize_form user role.

    For more information about Form Builder and Table Builder, see Forms in Table Builder and Add fields to a form layout in Table Builder.

  - Select **Configure resources** to modify the Resources section on the form. For example, to add or remove subsections or items within subsections: Requires the personalize_list user role.

Highlighted attributes

Several key attributes are preconfigured to be highlighted on a CI form when specific conditions are met. Those highlights are meant to draw your attention to specific states, which are either healthy, or that indicate a problem and require your attention. Attribute highlight definitions are stored in the Highlighted Values [sys_highlighted_value] ServiceNow AI Platform table, which you can search for records where *Table* is prefixed by 'cmdb_ci'. For example, the *operational_status* attribute is configured as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If the attribute value is '**Operational**', then the attribute appears with a green highlight.
- If the attribute value is anything other than '**Operational**', then the highlight is red.

To see those preconfigured highlight records that are used in CI Form and in various other CMDB Workspace features, navigate to **All** > **Workspace Experience** > **Administration** > **Highlighted Values**.

For more information about configuring attribute highlights in the ServiceNow AI Platform, see Highlight list fields.

Summary

By default, the Summary tile shows the most meaningful CI attributes and appears at the top of all other form sections. You can select **Show more** or **Show less** to adjust the page layout. The Summary tile shows attributes such as *Created*, key ownership attributes such as *Managed by*, and other important attributes such as *Discovery source* and *Operational status*. The attributes that appear in this section map to the first section defined in the Explore CI view.

By default, the Important attributes tile shows CI attributes such as *Operating System* and *Serial number*. The attributes that appear in this tile map to the *Important attributes* section defined in the Explore CI view, if one exists.

Role requirements for operations in this section:

- Editing attributes by selecting the Edit icon: Permitted for attributes that you have permission to
- Modifying this section in the Explore CI view: personalize_form

Attributes

This section shows all the UI sections that are configured in the Explore CI view for the class, excluding:

- The first section (which populates the Summary tile).
- The Important attributes section, if one exists (which populates the Important attributes tile).

Select **Attributes** to access the subsections within. By default, the Discovery and the Operational attribute subsections map to the Discovery and the Operational sections in the Explore CI view. The All subsection shows all the CI attributes. Mandatory attributes are noted on the form by an "*" and must be set with a value.

When updating CI attributes, any Identification and Reconciliation Engine (IRE) rules that exist for the CI class are applied to help prevent potential problems with the update. IRE processes detect potential issues such as CI duplication and a dependent CI missing valid parent relationships. In these situations, the update is paused and you're presented with mitigation options to avoid the issue. Applying IRE processes might result in a partial update of attributes as reconciliation rules might block updates to some attributes and enable updates of others.

If there are no IRE rules for the class, the CI is updated directly without using IRE processes.

A CI that is updated in CI Form, has its *discovery_source* attribute set to **Manual via IRE** unless you set it to a different value.

- Identification and Reconciliation engine (IRE)
- Reconciliation rules
- Identification rules
- Mandatory attributes

Role requirements for operations in this section:

- Updating attributes: sn_cmdb_editor
- Modifying this section in the Explore CI view: personalize_form

Tags

This section shows the list of tags, stored as key/value pairs in the Key Values [cmdb_key_value] table. These tags are typically associated with CIs and resources for cloud providers such as Amazon Web Services and Google Cloud Platform, and in general are referred to as cloud tags. Cloud tags are used in ITOM applications, such as Tag Governance, and function as key dependencies in Tag-based discovery in Service Mapping. Discovery and Service Graph Connectors automatically populate cloud tags, which can then be grouped and managed as needed in an organization.

The Tags section in CI Form doesn't contain details about Platform tags, which are another type of tags that are stored in the *Tags* column that exists in most platform tables.

To manage tags, select **Manage** in the Tags tile, and then, in the Manage tags dialog box you can:

- Enter a **Key** and a **Value** pair, and then select the Add new tag ('+') icon.
- Select the Delete tag icon for a tag.
- Modify the **Key** or the **Value** fields for a tag.
- Select **Save** to save any changes to tags.

Managing tags requires the sn_cmdb_editor user role.

More information:

- Tag-based discovery in Service Mapping
- Data collected for Amazon AWS Cloud Discovery
- Data collected for Microsoft Azure Cloud Discovery

Resources

This section shows resources linked to the CI, and maps to the Related Lists specified in the Explore CI view. By default, resources include tables such as File Systems [cmdb_ci_file_system], Software Installed [cmdb_ci_spkg], and Network Adapters [cmdb_ci_network_adapter].

In this section, you can:

- Select **Manage** to add or remove records from a resource list, which is applicable to related lists that have many-to-many relationships. If you're authorized to update in the CMDB Workspace scope, then you're navigated to a list selector for the resource where you can add or remove multiple items. If you aren't authorized, then you're navigated to the Core UI experience.
- Select one or more related items and then select the **Delete** button, which is visible only if you have delete access to any of the related list tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Select **New** to add a related list item. The **New** button is available for all the resource tables that you have access to.

  Important notes about creating a new related list item:

  - If the related list table is within the cmdb_ci hierarchy, has an IRE identification rule, and isn't an excluded table, then you're navigated to the Create CI experience in CMDB Workspace or another workspace if applicable. In the Create CI experience, some CI attributes are pre-populated with the proper values for the class. For example, in the Required attributes section for dependent CIs, the **Dependent-upon CI** attribute is pre-populated with the parent of the current CI. Relationships and resources are also pre-populated according to the CI class definitions.

    For information about the Create CI experience, see Create a CI manually in CMDB Workspace.

  - If the related list table doesn't have an IRE identification rule, then you're navigated to a basic list view page instead of CI Form.
  - The system automatically creates the matching reference back to the current class. For example, for a dependent CI the system creates the file system and the necessary relationship to connect the file system to the computer CI.
  - For some resources such as CI IPs, **New** isn't available and the **Dependent-upon CI** isn't pre-populated. This behavior applies to CIs with scripted relationships.
  - After creating a new related list item, select the Refresh List icon to show the new record in the list on the Resource section.
- Configure the Resources section in the Explore CI view by selecting the More actions icon and then selecting **Configure resources**. Use the related lists slushbucket to add or remove resources and then select **Save**: Requires the personalize_list role.

Role requirements for operations in this section:

- Configuring resources in the Explore CI view: personalize_list
- Creating, updating, or deleting records in related tables included as Resources for a CI record: Requires create, update, and delete access to the resource table.

Activity

This section shows related items such as open incidents and the activity stream for the CI on the following tabs:

Related items

Pie charts that by default include Open incidents (Incidents table), Open changes (Change Request table), and Open problems (Problem table), broken down by priority or state.

In this tab, you can:

- Select a chart to drill down to the records associated with different chart sections. Depending on configuration, records open in CMDB Workspace or in another workspace.
- Configure the list of tables for which charts appear, which is stored in the Explore CI Related Item Configurations [sn_cmdb_ws_explore_ci_related_item_config] table. You can add records to that table, or modify behavior settings such as

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

where a record opens when selected: Requires the sn_cmdb_ws.config_editor role.

- Configure your preferences for which of the available charts appear when you log in. Select the Related Item Settings icon in the Related Items tab and in the Related item settings dialog box, select any charts that you prefer to hide.

CI history

History of the activities related to the CI, such as value changes in the CI attributes, listed in chronological order.

More information:

- Problem Management
- Incident Management
- Change Management

Role requirements for operations in this section:

- Accessing the Explore CI Related Item Configurations [sn_cmdb_ws_explore_ci_related_item_config] table to configure the list of charts that appear in the Related Items tab: sn_cmdb_ws.config_editor
- Configuring your preferences for which related item charts appear by selecting the Related Item Settings icon in the Related Items tab: Any logged in user

Relationships

This section shows the CI relationships, which include:

- Total relationships: Total number of relationships for this CI
- Duplicate relationships: Total number of duplicate relationship for this CI
- Stale relationships: Total number of stale relationship for this CI

In this section, you can:

- Switch between the following view types:
  - Tree view: Shows the downstream and upstream relationships in a tree format. You can expand and collapse any level that you want to see more or less details for.
  - Flat view: Shows the CI relationships in a flat view. You can adjust the number of levels of relationships to show, or filter to show only specific CIs.
- Select **Edit relationships** to open Unified Map for the CI in edit mode and with the following map settings:
  - Home node set to the current CI.
  - Relationship levels set to 1 level.
  - Layers set to show Business, Service Instances, Applications, and infrastructure.
  - Layout is set to Vertical.

  This function isn't available for a non-operational CI. For information about using the *Life cycle stage* attribute to define a CI's operational state, see Configure CIs to appear based on life cycle stage value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If the CI class is a Service Instance [cmdb_ci_service_auto] or a derived class, then you must either use Service Mapping (if installed) to edit a map for a Service Instance, or edit dependency relationships in Unified Map.

- Select **Refresh** after saving changes in Unified Map, to reflect your updates in the Relationship section.

More information about relationships and about editing relationships in Unified Map:

- CI relationships in the CMDB
- Edit relationships in Unified Map
- CI relationship editor
- Service Mapping
- Unified Map

Role requirements for operations in this section: **Edit relationships** requires sn_cmdb_editor

Services and Offerings

This section shows cards with counts of the following services and offerings associated with the CI:

- Service Instance: Any CI related to the Service Instance [cmdb_ci_service_auto] table where *`Service Classification`* is **Application Service**.
- Business Service Offering: Any Service Instance (*`Service Classification`* is **Application Service**) that this CI is related to, and which has a relationship to Service_Offering where *`Service Classification`* is **Business Service**.
- Technology Management Offering: Any Service Instance (*`Service Classification`* is **Application Service**) that this CI is related to, and which has a relationship to Service_Offering where *`Service Classification`* is **Technical Service** or the CI is related to a Dynamic CI Group, which is part of a Technical Service Offering.
- Technology Management Service: Parent of a Technology Management Offering.

Select a tile to drill down to the specific records associated with the tile.

- CSDM implementation stages — Walk
- Application services

Health

This section shows aggregations from the latest CMDB Health test results for the Completeness, Correctness, Compliance, and Relationship KPIs, and the aggregated state of attestation. Color codes are used to denote pass/fail scores.

This section shows meaningful details only if CMDB Health is set up and the associated dashboard jobs are running.

CMDB 360

This section shows discovery sources data from the CMDB 360 data store for the CI. It shows the CI attributes and for each attribute, its current CMDB value, and any values that were reported by discovery sources for that attribute.

This section appears only if CMDB 360 is enabled and configured.

More information:

- CMDB 360/Multisource CMDB

Resume a disabled scheduled job for the Cloud vs Non-cloud resources chart

Reactivate a scheduled job to resume data collection for the Cloud vs Non-cloud resources chart in CMDB Workspace.

Before you begin

Role required: cmdb_query_builder (contained in the sn_cmdb_user, sn_cmdb_editor, sn_cmdb_admin user roles)

About this task

The Cloud vs Non-cloud resources chart in CMDB Workspace Home view uses several scheduled jobs that gather and calculate the data for the charts. Each bar in the CI classes chart represents a pair of a CI class and a storage type (cloud, non-cloud) such as Applications/Cloud. Each bar is associated with its own scheduled job. When a scheduled job exceeds its limits of time and amount of collected data, it is automatically stopped. A job that can't complete for 3 (default) consecutive days is automatically disabled for future runs.

Use the following procedure to later resume that disabled scheduled job.

Procedure

1. Click **All**.
2. In the Filter navigator, enter `sysauto_query_builder.list` and open the Scheduled Email of Query Builders table.
3. In the **Scheduled Email of Query Builders** list view, set **Active** to **true** for the scheduled job to resume.

Edit a related table from CMDB performance insights

Edit a related table on the Related Entries [cmdb_related_entry] table directly from the CMDB performance insights tool in the CMDB Workspace Insights view. Update the related table to correctly reference another CI in the Referenced field when a reference is missing from the related table.

Before you begin

Role required: sn_cmdb_admin (CMDB Admin) and any role needed to access a related table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

A record is missing a reference when the **Referenced** field for that record is empty. CMDB performance insights enables you to easily edit related tables that are missing a reference after you drill down on a slice of the Related records missing reference chart.

You can see the full list of related tables and associated referenced fields in the Related Entries [cmdb_related_entry] table.

Procedure

1. Navigate to **Workspaces** > **CMDB Workspace**, and then in the CMDB Workspace menu bar, select **Insights**.
2. On the CMDB performance insights tile, select **View performance insights**.
3. Navigate to the Related records tile of the **Payloads & CIs** tab and then select a slice of the chart in the Related records missing reference by table card.
4. Select a check box next to a record and then select **Edit**.
5. Specify applicable CMDB CI references and then select **Update**.

Insights view in CMDB Workspace

Edit a data source from CMDB performance insights

Edit a data source for your Service Graph Connectors to specify the data that an import set should ingest. Consider configuring a batch process to make ingestion more efficient and improve performance.

Before you begin

Role required: sn_cmdb_admin (CMDB Admin) and import_admin.

Procedure

1. Navigate to **Workspaces** > **CMDB Workspace**.
2. In the CMDB Workspace menu bar, select **Insights**.
3. On the CMDB performance insights tile, select **View performance insights**.
4. Select the Sources with batch processing turned off card in the Service Graph connectors tab.
5. On the Data sources list view, select a check box next to a record.
6. Select **Edit**.
7. Configure the data source.
   For more information about data sources, see:
   - Create a data source
   - Data source fields
8. Select **Update**.

Edit a scheduled data import from CMDB performance insights

Edit a scheduled data import directly from CMDB performance insights for your Service Graph Connectors. Consider enabling **Concurrent Import** with a custom size partition to split incoming data into multiple import sets and transform the import sets concurrently to reduce processing time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: sn_cmdb_admin (CMDB Admin) and one of these roles:

- import_scheduler
- import_admin

Procedure

1. Navigate to **Workspaces** > **CMDB Workspace**.
2. In the CMDB Workspace menu bar, select **Insights**.
3. On the CMDB performance insights tile, select **View performance insights**.
4. In the Service Graph connectors tab, click the Sources with concurrent import turned off card or the Sources with non-custom size partition method card.
5. In the Scheduled Import sets list view, select a check box next to a record.
6. Select **Edit**.
7. Configure the scheduled data import.
   You may need to change your application scope to create or edit a scheduled data import from CMDB Workspace.

   For more information about updating a scheduled data import, see Schedule a data import.
8. Select **Update**.

CMDB Workspace reference

Reference topics provide additional information about components such as properties, installed with CMDB Workspace and class-specific criteria for the Cloud vs Non-cloud resources chart.

Class-specific criteria for the Cloud vs Non-cloud resources chart

The Cloud vs Non-cloud resources chart provides counts for several key classes. The chart uses different classes and relationship criteria for each class to determine which resources count as cloud and which count as non-cloud.

The Cloud vs Non-cloud resources chart shows in the CI overview tile in the CMDB Workspace store app.

Virtual Machine Instance [cmdb_ci_vm_instance]: • Cloud: Virtual Machine Instance [cmdb_ci_vm_instance] -> (Hosted on::Hosts) -> Datacenter class (one of the configured cloud datacenters) -> (Hosted on::Hosts) -> Cloud Service Account [cmdb_ci_cloud_service-account] • Non-Cloud:

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Virtual Machine Instance [cmdb_ci_vm_instance] -> (Hosted on::Hosts) -> Datacenter class (one of the configured non-cloud datacenters)

- Total: Equals the record count in the Virtual Machine Instance [cmdb_ci_vm_instance] table (unless there are Virtual Machine Instance records without any relationships)

Server [cmdb_ci_server]:

- Cloud:

  Server [cmdb_ci_server] -> (Virtualized by::Virtualizes) -> Virtual Machine Instance [cmdb_ci_vm_instance] -> (Hosted on::Hosts) -> Datacenter (one of the configured cloud datacenters) -> (Hosted on::Hosts) -> Cloud Service Account [cmdb_ci_cloud_service-account]

- Non-Cloud:

  Server [cmdb_ci_server] -> Virtual Machine Instance [cmdb_ci_vm_instance] -> Datacenter class (one of the configured non-cloud datacenters)

  OR

  Server [cmdb_ci_server] has no relationships with Virtual Machine Instance [cmdb_ci_vm_instance]

- Total: Equals the record count in the Server [cmdb_ci_server] table (unless there are Server records without any relationships)

Application [cmdb_ci_appl]:

- Cloud:

  Application [cmdb_ci_appl] -> (Runs on::Runs) -> Server [cmdb_ci_server]-> (Virtualized by::Virtualizes) -> Virtual Machine Instance [cmdb_ci_vm_instance] -> (Hosted on::Hosts) -> Datacenter (one of the configured cloud datacenters) -> (Hosted on::Hosts) -> Cloud Service Account [cmdb_ci_cloud_service-account]

  OR

  Application [cmdb_ci_appl] -> (Hosted on::Hosts) -> Datacenter class (one of the configured cloud datacenters)-> (Hosted on::Hosts) -> Cloud Service Account [cmdb_ci_cloud_service-account]

- Non-Cloud:

  Application [cmdb_ci_appl] -> Server [cmdb_ci_server] -> Virtual Machine Instance [cmdb_ci_vm_instance] -> Datacenter Datacenter class (one of the configured non-cloud datacenters)

  OR

  Application [cmdb_ci_appl] -> Server [cmdb_ci_server] -> no relationship with Virtual Machine Instance [cmdb_ci_vm_instance]

- Total: Equals the sum of Cloud + Non-Cloud (not the record count in the Application [cmdb_ci_appl] table)

Kubernetes Cluster [cmdb_ci_kubernetes_cluster]:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Cloud:

  Kubernetes Cluster [cmdb_ci_kubernetes_cluster -> (Hosted on::Hosts) -> Datacenter (cloud logical data center) -> (Hosted on::Hosts) -> Cloud Service Account [cmdb_ci_cloud_service-account]

- Non-Cloud:

  Kubernetes Cluster [cmdb_ci_kubernetes_cluster -> Datacenter (non-cloud logical datacenter)

  OR

  Kubernetes Cluster [cmdb_ci_kubernetes_cluster -> no relationship with -> Datacenter

- Total: Equals the record count in the Kubernetes Cluster [cmdb_ci_kubernetes_cluster] table (unless there are Kubernetes Cluster records without any relationships)

Database Instance [cmdb_ci_db_instance]:

- Cloud:

  Database Instance [cmdb_ci_db_instance] -> (Runs on::Runs) -> Server -> (Virtualized by::Virtualizes) -> Virtual Machine Instance [cmdb_ci_vm_instance] -> (Hosted on::Hosts) -> Logical Datacenter (one of the configured cloud datacenters)-> (Hosted on::Hosts) -> Cloud Service Account [cmdb_ci_cloud_service-account]

  OR

  Database Instance [cmdb_ci_db_instance] -> Logical Datacenter [cmdb_ci_logical_datacenter] (one of the configured cloud datacenters)-> (Hosted on::Hosts) -> Cloud Service Account [cmdb_ci_cloud_service-account]

- Non-Cloud:

  Database Instance [cmdb_ci_db_instance] -> Server [cmdb_ci_server] -> Virtual Machine Instance [cmdb_ci_vm_instance] -> datacenter (non-cloud logical datacenter)

  OR

  Database Instance [cmdb_ci_db_instance] -> Server [cmdb_ci_server] with no relationship -> Virtual Machine Instance [cmdb_ci_vm_instance]

- Total: Sum of Cloud + Non-cloud (can be less than total number of records, subtracting the badly created records)

Storage Volume [cmdb_ci_storage_volume]:

- Cloud:

  cmdb_ci_storage_volume -> (Hosted on::Hosts) -> Logical Datacenter [cmdb_ci_logical_datacenter] (one of the configured cloud datacenters)-> (Hosted on::Hosts) -> Cloud Service Account [cmdb_ci_cloud_service-account]

- Non-Cloud:

  cmdb_ci_storage_volume -> Logical Datacenter [cmdb_ci_logical_datacenter] (one of the configured non-cloud datacenters)

OR cmdb_ci_storage_volume -> no relationships with Datacenter
Cloud Object Storage [cmdb_ci_cloud_object_storage]: • Cloud: Cloud Object Storage [cmdb_ci_cloud_object_storage] -> (Hosted on::Hosts) -> Logical Datacenter [cmdb_ci_logical_datacenter] -> (Hosted on::Hosts) -> Cloud Service Account [cmdb_ci_cloud_service-account] (requires CMDB CI Class Models) • Non-Cloud: N/A (This table can never have non cloud records)
Service Accounts [cmdb_ci_cloud_service_account]: • Cloud: datacenter_type attribute is populated with correct datacenter class • Non-Cloud: N/A (This table can never have non-cloud records)

Components installed with CMDB Workspace

Several types of components are installed with the activation of the CMDB Workspace (sn_cmdb_ws) plugin, including properties, tables, user roles, and scheduled jobs.

Note:
The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

In addition, the CMDB Workspace plugin adds the CMDB Group type 'CMDB Workspace'.

Properties installed

The following properties are installed by the Configuration Management (CMDB) (com.snc.cmdb) plugin which is included in base systems.

Property	Description
sn_cmdb_ws.ci_overview.managed_by_me.enabled	Shows/hides the My CIs section of CI Overview on the CMDB Workspace landing page, for users with sn_cmdb_editor role. • Type: true | false • Default: true • Location: Add to System Properties [sys_properties] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
sn_cmdb_ws.total_cis.enabled	Shows/hides the Total CIs section on the CMDB Workspace landing page. • Type: true | false • Default: true • Location: Add to System Properties [sys_properties] table.
sn_cmdb_ws.ms.discovery_source_not_reporting_max_days	Number of days after which if one or more discovery sources stop reporting CIs, that CI is included in the CIs not reported by discovery sources chart in the CMDB 360 view. • Type: integer • Default: 7 • Location: Navigate to **Workspaces** > **CMDB Workspace** and then select **CMDB 360**. Select Settings and configure **Number of days since CIs were last discovered by a discovery source** in the Potential issues section. • Learn more: Configure the CMDB 360 dashboard.
sn_cmdb_ws.ms.report_max_limit	Maximum number of records that appear as list views when drilling down from the following charts: • CIs not reported by discovery sources • Data mismatch • CIs by number of discovery sources • CIs with a single source Details: • Type: integer • Default: 100,000 • Location: Navigate to **Workspaces** > **CMDB**

Property	Description
	Workspace and then select **CMDB 360**. Select Settings and configure **Maximum number of records to process** in the Global section. • Learn more: Configure the CMDB 360 dashboard.
sn_cmdb_ws.unifiedmap.map_search_filter.default_levels	Initial default number of levels from the home node, up and down the CMDB hierarchy, to show on a map. Up the hierarchy goes from all parents to their parents up to the specified level. Down the hierarchy goes from all children to their children up to the specified level. • Type: integer • Default: 3 • Location: Add to System Properties [sys_properties] table. Editing affects all users and requires the sn_cmdb_admin user role.
sn_cmdb_ws.unifiedmap.map_search_filter.max_levels	Maximum number of levels from the home node, up and down the CMDB hierarchy, to show on a map. Up the hierarchy goes from all parents to their parents up to the specified level. Down the hierarchy goes from all children to their children up to the specified level. • Type: integer • Default: 25 • Location: System Properties [sys_properties] table Editing affects all users and requires the sn_cmdb_admin user role.
sn_cmdb_ws.list.record_count_limit	The maximum number of results that the system counts for when using conditional search to search for CIs on the Home view

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	in CMDB Workspace. This count shows for example, at the top of the search results list. • Type: integer • Default: 100,000 • Location: Add to System Properties [sys_properties] table. • More information: CMDB Workspace store app For example, if a limit of 100,000 is reached, the count shows "100,000 +" to indicate that counting stopped at 100,000 and that there are additional uncounted results. Increasing the value of this property directly results in greater impact on performance. However, if a precise count is needed, set this limit to a number that isn't reached by the anticipated count.
sn_cmdb_ws.explore_ci.record.enabled	Enables the use of CI Form when selecting CIs to view in CMDB Workspace or in another workspace. When false, the system shows CI records in a basic list view instead of CI Form. You might need to temporarily disable the CI Form experience if its not yet ready to be used. For example, you might need to migrate previous custom configurations to CI Form to prepare it for use. • Type: true | false • Default: true • Location: Add to System Properties [sys_properties] table. • More information: Manage CI details in CI Form

Roles installed

The following roles are installed by the Configuration Management (CMDB) (com.snc.cmdb) plugin which is included in base systems. These roles are required for access and interaction with the CMDB Workspace, and are included for completeness.

Role title [name]	Description	Role containment
CMDB Admin [sn_cmdb_admin]	Provides the highest level of access to tools and UIs within CMDB Workspace. CMDB Admin, for example, can set policies in the CI Class Manager and application service requirements. CMDB Admin can also modify default config records under the default identifier or the default identifier itself. **Note:** Access to the Configuration Item [cmdb_ci] table and other details, differ by the Yokohama patch that is installed. For details, see the Yokohama Configuration Management Database (CMDB) release notes.	Contains: • data_manager_admin • canvas_admin • sn_cmdb_editor • cmdb_ms_admin • cmdb_dedup_admin
CMDB Editor [sn_cmdb_editor]	Provides access to tools and UIs within CMDB Workspace. A CMDB Editor has writing privileges to CMDB Data Manager tasks and to CIs but can't change policies such as in the CMDB Data Manager or in the CI Class Manager. **Note:** Access to the Configuration Item [cmdb_ci] table and other details, differ by the Yokohama patch that is installed. For details, see the Yokohama Configuration Management Database (CMDB) release notes.	Contains: • sn_cmdb_user • cmdb_ms_editor • cmdb_manual_ci_ire_access

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role title [name]	Description	Role containment
CMDB User [sn_cmdb_user]	Provides read-only access to the CMDB data and to basic UIs such as CMDB reports and dashboards, within CMDB Workspace.	Contained by: sn_cmdb_editor Contains: • canvas_user • data_manager_user • cmdb_ms_user
Multisource CMDB Admin [cmdb_ms_admin]	Provides full access to data, dashboard configurations, and queries related to Multisource CMDB and CMDB 360.	Contains: cmdb_ms_editor
Multisource CMDB Editor [cmdb_ms_editor]	Provides access to CMDB 360 records and enables users to create and edit CMDB 360 queries.	Contains: cmdb_ms_user
Multisource CMDB User [cmdb_ms_user]	Provides read-only access to multisource data, CMDB 360 queries, and to related UIs such as CMDB 360 reports and dashboards, and Multisource Report Builder.	Contains: cmdb_read
Workspace Config Admin [sn_cmdb_ws.config_admin]	Provides an administrator full access to the Config identifiers [sn_cmdb_ws_config_identifier] table and its descendent config tables. Can modify non-default config or config identifier records. Since config tables contain properties which belong to different applications, Workspace Config Admins should only modify records related to their application.	Contains: sn_cmdb_ws.config_editor
Workspace Config Editor [sn_cmdb_ws.config_editor]	Provides editing access to child config tables such as the Workspace Config Properties [sn_cmdb_ws_config_property] table. Can modify non-default config records. Since config tables contain properties which belong to different applications, Workspace Config Editors should only modify records related to their application.	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role title [name]	Description	Role containment
[cmdb_manual_ci_ire_access]	Provides access to the experience of manual CI creation in CMDB Workspace and in other workspaces.	

Scheduled jobs installed

Scheduled job	Description
CMDB Workspace Collection	Updates the information in all the 7-Day Activity charts such as the CI Activity in Last 7 Days chart.
Multisource Dashboard Analytics Population	Runs daily to calculate the aggregate statistics of CMDB 360 data and populates the CMDB 360 dashboard landing page.
Multisource Dashboard Collection	Collects CMDB 360 data and then invokes the *`Multisource Dashboard Analytics Population`* scheduled job.
Multisource Dashboard Data Generator (Demo data)	Demo job that populates CMDB 360 tables with simulated data, to showcase the CMDB 360 dashboard landing page. Runs on demand.
insight – cloud non-cloud aggregate	Runs every 30 minutes to collect data for the Cloud and non-cloud resources chart.
Insight - Cloud Applications	Collects cloud data for the cmdb_ci_appl table.
Insight - Non-cloud Applications	Collects non-cloud data for the cmdb_ci_appl table.
Insight - Cloud Object Storage	Collects cloud data for the cmdb_ci_cloud_object_storage table.
Insight - Cloud Service Account	Collects cloud data for the cmdb_ci_cloud_service_account table.
Insight - Cloud DB Instances	Collects cloud data for the cmdb_ci_db_instance table.
Insight - Non-cloud DB Instances	Collects non-cloud data for the cmdb_ci_db_instance table.
Insight - Cloud Kubernetes Cluster	Collects cloud data for the cmdb_ci_kubernetes_cluster table.
Insight - Non-cloud Kubernetes Cluster	Collects non-cloud data for the cmdb_ci_kubernetes_cluster table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scheduled job	Description
Insight - Cloud Servers	Collects cloud data for the cmdb_ci_server table.
Insight - Non-cloud Servers	Collects non-cloud data for the cmdb_ci_server table.
Insight - Cloud Storage Volume	Collects cloud data for the cmdb_ci_storage_volume table.
Insight - Non-cloud Storage Volume	Collects non-cloud data for the cmdb_ci_storage_volume table.
Insight - Cloud VM Instances	Collects cloud data for the cmdb_ci_vm_instance table.
Insight - Non-cloud VM Instances	Collects non-cloud data for the cmdb_ci_vm_instance table.
CMDB Workspace – Populate aggregates Daily	Runs daily to collect the latest data from the instance for cards such as the CI Summary chart in the CMDB Workspace landing page, and the following cards in the Insights view: • CIs processed by IRE • CIs used in Data Manager policies • CIs used in data attestation • Query Builder queries • Intelligent search Populates the Base Aggregate Data [sn_cmdb_ws_base_aggregate_data] table with the collected data. Once collection completes, invokes the *CMDB Workspace Aggregates Daily Collection* scheduled job.
CMDB Workspace – Populate aggregates Monthly	Runs monthly to collect data from the instance for cards such as the following, in the Insights view: • CIs processed by IRE based on source • CIs processed by IRE Once collection completes, invokes the *CMDB Workspace Aggregates Monthly Collection* scheduled job.
CMDB Workspace Aggregates Daily Collection	A Performance Analytics job that stores the latest data generated by the *CMDB Workspace – Populate aggregates Daily* scheduled job. The stored data is then shown in respective cards in the Insights view.
CMDB Workspace Aggregates Monthly Collection	A Performance Analytics job that stores the latest data generated by the *CMDB Workspace – Populate aggregates Monthly* scheduled job. The stored data is then shown in respective cards in the Insights view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scheduled job	Description
[Demo] — CMDB Workspace Collection	Supports demo data for CMDB Workspace charts in various views such as the Home view. Installed only if **Load demo data** was checked when the CMDB Workspace store app was installed or upgraded.
[Demo] — CMDB Workspace demo data	Activates demo data for CMDB Workspace charts in views such as the Insights view, and CMDB 360 view (if CMDB 360 is enabled). Populates the Base Aggregate Data [sn_cmdb_ws_base_aggregate_data] table with random numbers that illustrate trend lines in charts in the Home and Insights views. It then runs demo data collection scheduled jobs. Installed only if **Load demo data** was checked when the CMDB Workspace store app was installed or upgraded.
[Demo] CMDB Workspace Aggregates Daily Collection	A Performance Analytics job that supports demo data for CMDB Workspace charts in various views such as the Insights view and which is installed only if **Load demo data** was checked when the CMDB Workspace store app was installed or upgraded. Stores the demo data generated by the *`CMDB Workspace - Populate aggregates Daily`* scheduled job. The demo data is then shown in respective cards in the Insights view.
[Demo] CMDB Workspace Aggregates Monthly Collection	A Performance Analytics job that supports demo data for CMDB Workspace charts in various views such as the Insights view and which is installed only if **Load demo data** was checked when the CMDB Workspace store app was installed or upgraded. Stores the demo data generated by the *`CMDB Workspace - Populate aggregates Monthly`* scheduled job. The demo data is then shown in respective cards in the Insights view.
CMDB Workspace Collection On Demand With Lookback	Collects historical data (past 30 days) for some indicators such as the Integration outliers. Runs automatically during install or upgrade and isn't configured with any recurring schedule.
PopulateDuplicate Task Group Daily	Runs daily to populate the following tables: • Group Task Mapping [sn_cmdb_ws_reconcile_duplicate_task_group_m2m] • Remediate Duplicate Task Groups [sn_cmdb_ws_reconcile_duplicate_task_group] Reads de-duplication task data records and calculates the root cause analysis for the duplication. Used in support of Now Assist for CMDB.

Tables installed

Table	Description
CMDB Group Metadata [sn_cmdb_ws_group_metadata]	CMDB group data with count of CIs in each group.
CMDB Group Query Metadata [sn_cmdb_ws_group_query_metadata]	Encoded queries with count of CIs in each encoded quer subgroup.
NLQ Sample Search [sn_cmdb_ws_nlq_sample_search]	Sample searches that appear when selecting the search box of an Intelligent Search for CMDB widget.
NLQ Sample Search Table [sn_cmdb_ws_nlq_sample_search_table]	References the actual tables associated with sample searches that appear when selecting the search box of a Intelligent Search for CMDB widget.
NLQ Excluded Table [sn_cmdb_ws_nlq_excluded_table]	Tables with ambiguous names that should be excluded from Intelligent Search. These tables won't appear in suggestions, and other tables with similar names are give higher priority in search results.
Important Actions Configuration [sn_cmdb_ws_imp_action_card_config]	Configuration of appearance and behavior of Important action cards that appear on the landing page of the CMD Workspace. Editing in this table is accessible only to user with the sn_cmdb_admin role. Authorized users can mod attributes of an important action such as Active and Filter conditions, but can't modify the Type, Persona, and Table attributes.
Quick Links [sn_cmdb_ws_quick_links]	Quick links that appear on the CMDB Workspace landing page.
CIs by Number of Sources [sn_cmdb_ws_ms_cis_by_number_of_sources]	CIs grouped by the number of discovery sources they we discovered by. Records appear as a list view when clickin on the CIs by number of discovery sources bar chart in th CMDB 360 view.
CIs With a Single Source [sn_cmdb_ws_ms_cis_with_single_source]	CIs reported by only one discovery source. Records appe as a list view when selecting the CIs with a single discove source chart in the CMDB 360 view.
CMDB Workspace Multisource Class Metadata [sn_cmdb_ws_ms_class_metadata]	Class configuration settings such as class selections and weights, that CMDB Admins can modify from the CMDB 3 view. Used by CMDB 360 analytics population queries to store a sample set of coverage data for the CIs by numbe sources and CIs with a single source drill-downs cards.
Multisource Data Mismatch Records	Data mismatch records found from attribute discrepancie from various data sources. Records appear as a list view

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
[sn_cmdb_ws_ms_data_mismatch]	when selecting the Data mismatch chart in the CMDB 36 view.
CMDB Workspace Multisource Data Mismatch Configurations [sn_cmdb_ws_ms_data_mismatch_config]	Data mismatch settings, such as the selection of classes, attributes, conditions, and weights, that CMDB Admins ca modify in the CMDB 360 view. Used by CMDB 360 analyt population queries to store a sample set of data mismatc records in the sn_cmdb_ws_ms_data_mismatch table.
Discovery sources not reporting CIs [sn_cmdb_ws_ms_discovery_sources_not_reporting]	Data for when one or more discovery sources stop reporting CIs after the specific X number of days (X can be set in the CMDB 360 view and is stored in the sn_cmdb_ws.ms.discovery_source_not_reporting_max_c system property). Records appear as a list view when selecting the CIs not reported by discovery sources char the CMDB 360 view.
Multisource Workspace Settings Weight Type [sn_cmdb_ws_ms_settings_weight_type]	Weight type (automatic or manual) for data mismatch and coverage settings in CMDB 360 view.
Datacenter Types [sn_cmdb_ws_datacenter_type]	Classifications of datacenter classes which are considere cloud or non-cloud in the organization, which is used for Cloud and non-cloud resources chart.
CMDB Insight Query Categories [sn_cmdb_ws_insight_query_category]	Class categories and their status for inclusion in the Clou and non-cloud resources chart.
CMDB Insight Data [sn_cmdb_ws_insight_data]	Legacy table for storing data for the Cloud and non-cloud resources chart. Starting with CMDB Workspace version 3.4, the CMDB Product Insight Data [sn_cmdb_ws_product_insight_data table is used instead.
Base Aggregate Data [sn_cmdb_ws_base_aggregate_data]	Aggregation data for CMDB Workspace cards and parent table to other aggregation tables. When processing for a count completes, *State* of the existing record for that count is set to **retired** and a new record for that count is created with the updated count value. Cards in CMDB Workspace views show values only for counts where *Sta* = **ready**. Read only.
Service Graph Connector [sn_cmdb_ws_service_graph_connector]	Details about all Service Graph Connectors that are currently available in the ServiceNow Store (excluding any Innovation Lab connectors). Data is used to provide a current count for the Service Graph Connectors card in th Insights view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
	Read only.
Rating Configuration [sn_cmdb_ws_rating_config]	Start and end values for different ratings of a category. Fo example, start and end values for low, moderate, and high adoption level ratings for the data governance category i the Insights view. Read only.
Feature Category [sn_cmdb_ws_feature_category]	Metadata of the feature card for most of the features at CMDB Workspace level. Read only.
CMDB Product Insight Data [sn_cmdb_ws_product_insight_data]	Aggregated count for each class and datacenter class, us for cards in the Insights view. Read only.
Feature Category Runtime Attributes [sn_cmdb_ws_feature_category_runtime_attribute]	Runtime attributes related to performance insights, that c be used when running various scheduled jobs. Read only.
Integration Aggregate Data [sn_cmdb_ws_integration_aggregate_data]	Integration outlier information related to performance insights. Details for each Integration with execution recor which contain processing rate or rows outliers. Read only.
Partial Payload Items [sn_cmdb_ws_partial_payload_item]	Extracted partial payload information related to performa insights. Includes discovery source, error, and class, associated with each partial payload item. Read only.
Application Service Insights Data [sn_cmdb_ws_app_svc_insight_data]	Application services details such as classification (cloud non-cloud, hybrid, or unknown) and count of CIs associat with the application service. Read only.
Table Attributes [sn_cmdb_ws_node_map_table_attributes]	Set of extended properties, per class, that appear in the Attributes pane in the contextual side panel for a selecte in Unified Map. This table leverages the use of the configuration identifie framework.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
	For more information, see Configure which attributes to display in the Attributes panel.
Node Map Related Items [sn_cmdb_ws_node_map_related_item]	Categorization and order of related items, per class, that appear in the **Related items** panel, in CI badges, and on timeline in Unified Map. This table leverages the use of the configuration identifie framework. For more information, see Configure how to display relate items on the map.
Node Map References [sn_cmdb_ws_node_map_reference]	Reference relationships that appear as a dotted line relationship in Unified Map. This table leverages the use of the configuration identifie framework. For more information, see Configure display of connectio to a referenced class.
Class Icons [sn_cmdb_ws_class_icon]	Maps ServiceNow platform UI Builder (UIB) icon values (f example 'serverbox-outline') to CMDB class display name that they are used for (for example 'Network Disk') in Unifi Map.
Node Map Profiles [sn_cmdb_ws_node_map_profiles]	Class profiles that include default filters and some Unifie Map settings, per class. A class profile is applied if no filte preset is in effect, to the initial map and when setting the filter preset to `Default view`. Specifying a class profile can be especially useful for Service Mapping data with the Mapped Application Serv class. This table leverages the use of the configuration identifie framework. For more information, see Create a class profile of visible layers for classes.
CMDB Data Management Certification Task To Document [sn_cmdb_ws_dm_certification_task_to_document]	Mappings between certification tasks and each of their associated CI records targeted for certification.
CMDB Certification Attribute Status [sn_cmdb_ws_dm_certification_attribute_status]	Flattened failed attribute status JSON. Used for reporting certification exceptions.
CMDB Data Management Task Execution Context	Mappings between tasks and a policy's' execution contex

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
[sn_cmdb_ws_dm_task_execution_context]	
Remediate Duplicate Task Groups [sn_cmdb_ws_reconcile_duplicate_task_group]	Groupings of de-duplication tasks, the CI class affected, discovery source associated with the de-duplication task and the CI identification rule that was used to discover th CIs. Used in support of Now Assist for CMDB. • sn_cmdb_admin role has create/write/delete privileges • sn_cmdb_user OR dedup_admin roles have read privileges
Group Task Mapping [sn_cmdb_ws_reconcile_duplicate_task_group_m2m]	Reference to the Remediate Duplicate Task Groups table and a root cause analysis summary of the reason that the Cis were added to the de-duplication task Used in support of Now Assist for CMDB. • sn_cmdb_admin role has create/write/delete privileges • sn_cmdb_user OR dedup_admin roles have read privileges
Config identifiers [sn_cmdb_ws_config_identifier]	Parent table of the configuration identifiers framework. By default, contains the 'Default' config identifier with defaul settings for various CMDB Workspace features. Stores any additional config identifiers, configured with custom settings for a CMDB Workspace feature, that is applicable to a specific workspace. For information about the configuration identifiers framework, see Configuration identifiers framework.
Workspace Config Properties [sn_cmdb_ws_config_property]	Collection of properties that control different behaviors in Unified Map. This table leverages the use of the configuration identifie framework.
CI additional attributes config [sn_cmdb_ws_ci_additional_attributes]	Settings of requests for specific CI attributes when using CMDB Workspace feature of manually creating a new CI. This table leverages the use of the configuration identifie framework. For more information, see Request additional attributes f new CI being created in a workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
CI class configs [sn_cmdb_ws_ci_class_config]	Settings that limit the selection of classes for a new CI wh using the CMDB Workspace feature of creating manually new CI. This table leverages the use of the configuration identifie framework. For more information, see Limit the class list for a new CI being created in a workspace.

API Insights

The ServiceNow® API Insights workspace is an all-in-one application that enables you to track all your APIs. You can also use it to start workflows related to different stages in the application programming interface (API) life cycle.

Get started

Explore Learn about the benefits of API Insights and how it is used.	Configure Plan and configure your implementation.	Analyze Administer and monitor API data
Manage Manage API data for informed decision-making.	Reference Get details about installed components.	

Troubleshoot and get help

- Ask questions and explore other resources for API Insights in the ServiceNow Community
- Search the Known Error Portal for known error articles
- Contact Customer Service and Support

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Exploring API Insights

Learn about API Insights with a sample workflow and review the benefits it can provide for different users in your organization.

API Insights overview

API Insights is a centralized workspace for enterprise or software architects and Configuration Management Database (CMDB) administrators to analyze and take action on their organization's application programming interface (API) inventory.

API Insights users

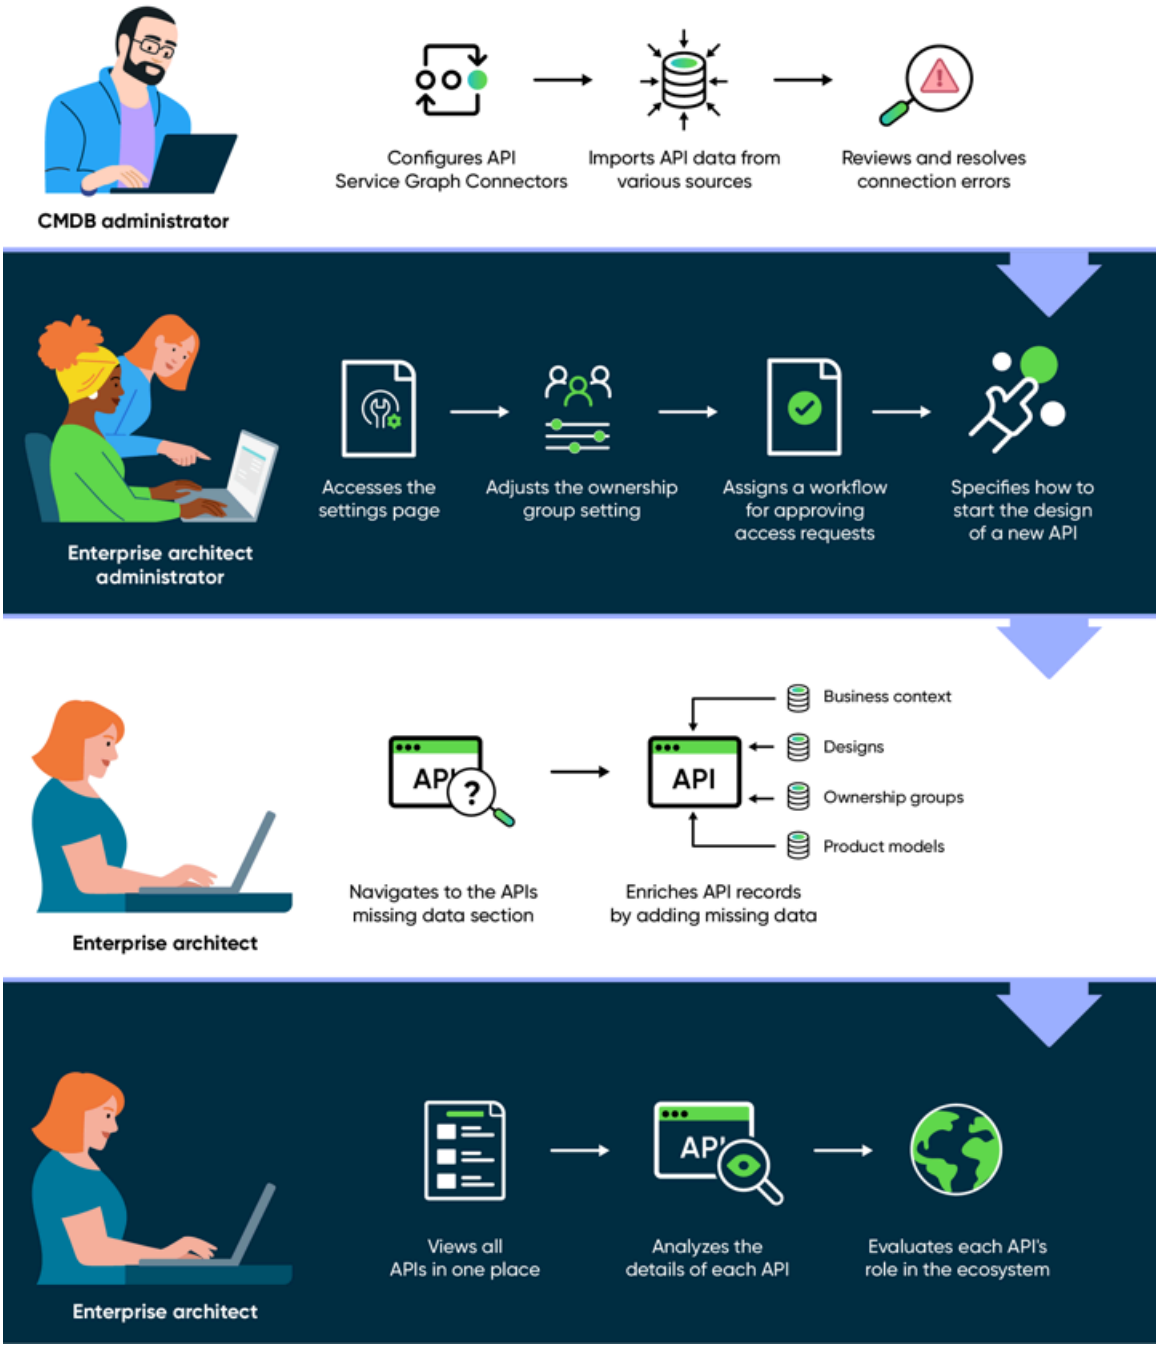
Users

User	Description
Enterprise architect	Users with the sn_api_insights_ws.api_mgmt_architect role can access the API Insights workspace to search APIs, monitor team APIs, view managed APIs, track API activity, review API access requests, and manage API life cycle aspects, including APIs without interfaces, business applications, ownership, or product models.
Enterprise architect administrator	Users with the sn_api_insights_ws.api_mgmt_architect_admin role can access the API Insights workspace to search APIs, evaluate metrics on API usage, set parameters for creating an API, connect APIs to a business context, specify the group attribute for ownership, and associate a workflow for granting access to APIs.
CMDB administrator	Users with the sn_cmdb_admin role can configure and manage the API-related Service Graph Connectors. They can accept or reject clustering recommendations, search for and compare APIs, and adjust settings related to API data management within the CMDB. **Note:** A CMDB administrator needs additional roles such as ml_report_user, platform_ml_read, and cmdb_inst_admin to access some of the features and data. Additionally, the CMDB administrator needs the following security roles to access specific widgets: • sn_si.basic or evt_mgmt_user – Required for Events and Critical alerts • sn_vul.vulnerability_read – Required for Active vulnerability items • sn_msi.msi_incident_read – Required for Security incidents • sn_si.read – Required for Incidents

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

API Insights example workflow

Example workflow for the API Insights users



1. A CMDB administrator with the sn_cmdb_admin role logs in to API Insights and configures the API Service Graph Connectors to import API data from various sources. Also, reviews and resolves any connection errors to ensure a smooth data import process.
2. An enterprise architect administrator with the sn_api_insights_ws.api_mgmt_architect_admin role accesses the settings page and adjusts the ownership settings according to their preferences.
3. An enterprise architect with the sn_api_insights_ws.api_mgmt_architect role navigates to the APIs missing data section to enrich API records by adding relationships and references. This includes associating business context, assigning ownership groups, linking product models, and defining API designs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. The enterprise architect explores the API page, which provides a centralized view of all APIs and views all APIs in one place. They drill down into specific APIs to analyze details such as ownership, deployment locations, consumer usage, security incidents, and alerts. Additionally, they assess how each API fits within the broader ecosystem, identifying key relationships and dependencies in the API relationship map.

API Insights benefits

Benefit	Feature	Users
Implement a system of record for enterprise-wide APIs.	Workspace to view and interact with API inventory	API Insights administrator
Achieve enterprise-wide visibility of APIs.	Automated discovery and ingestion of API data from various sources into Configuration Management Database (CMDB)	API Insights administrator
Map APIs to application services and business context.	Workflow for mapping APIs to relevant application services and business context	API Insights administrator
Integrate API data from a broad ecosystem of sources into the CMDB via Service Graph Connectors.	API data ingestion using API Service Graph Connectors into CMDB	CMDB administrator
Search for relevant APIs.	API search functionality with a user-friendly interface	API Insights administrator
Enable workflow configurations for API access requests.	Customization of API access request workflows	API Insights administrator
View the usage, security, and service mapping of each API and its components.	Detailed view of API inventory, requests according to minute, unique consumers, security data, IT Operations Management (ITOM) and IT Service Management (ITSM) data, and relationship mapping	API Insights architect API Insights administrator CMDB administrator

What to explore next

To learn more about configuring and using API Insights, see:

- Configuring API Insights
- Administering and monitoring API data with API Insights

- Managing API data in API Insights
- Managing API access within API Insights
- Optimizing API organization with clustering recommendations in API Insights
- Managing API data connections added for Service Graph Connectors in API Insights
- API Insights reference

Configuring API Insights

Complete the configuration tasks to start using the API Insights workspace.

Configuration overview

1. Configure API Insights installation.

   As an administrator with the admin role, set up API Insights by installing the application and assigning roles to users for managing API operations.

2. Configure API Insights data and imports.

   As a CMDB administrator with the sn_cmdb_admin role, set up data model recommendations for API clustering and configure settings for importing APIs into API Insights.

3. Configure settings to monitor and organize APIs in API Insights.

   As an enterprise architect administrator with the sn_api_insights_ws.api_mgmt_architect_admin role, configure API management workflows, including automating API actions and defining settings to monitor and organize APIs in API Insights.

Configuring API Insights as a system administrator

As a user with the admin role, set up the API Insights workspace by installing the application and assigning roles to users for managing API operations.

System administrator tasks overview

1. Install API Insights.

   Install the API Insights application (sn_api_insights_ws).

2. Assign roles for API Insights users

   Assign roles for using the API Insights workspace.

Install API Insights

You can install the API Insights application (sn_api_insights_ws) if you have the admin role.The application installs related ServiceNow® Store applications and plugins if they are not already installed.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application .
- Review the API Insights application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: admin

About this task

The following items are installed with API Insights:

- Plugins
- Store applications
- Roles
- Tables

For more information, see Components installed with API Insights.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the API Insights application (sn_api_insights_ws) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

   In the list next to the **Install** button, the versions that are available to you are displayed.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.
4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data are sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.
6. Select **Install**.

Assign roles for API Insights users

Assign roles to control access to features, capabilities, and data in the API Insights application.

Before you begin

Set the application scope to API Insights using the application picker. For more information, see Application picker.

Role required: admin

About this task

Users with the sn_api_insights_ws.api_mgmt_architect_admin, sn_api_insights_ws.api_mgmt_architect, or sn_cmdb_admin roles can use the API Insights application. See Exploring API Insights.

Procedure

Assign roles to users and groups using the ServiceNow AI Platform user administration feature.

- To assign a role to a user, see Assign a role to a user.
- To assign a role to a group, see Assign a role to a group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuring settings to manage API data and imports in API Insights

As a CMDB administrator with the sn_cmdb_admin role, you can set up data model recommendations for API clustering, configure settings for importing APIs into the API Insights workspace, and optionally review enterprise architect administrator settings for managing APIs.

CMDB administrator tasks overview

1. Configure data model recommendations for API clustering in API Insights

   Set recommendations for clustering related API components to align the organization's data with the desired data model.

2. Configure instance API import settings in API Insights.

   Set options to import custom and ServiceNow APIs from your instance into the CMDB.

3. Optional: Configure settings to manage APIs in API Insights.

   Review and configure enterprise architect administrator settings for managing APIs. You can turn on the All settings option to access both CMDB administrator and enterprise architect administrator settings from the API Insights settings page.

4. Optional: Automate creating tag-based relationship mapping within API Insights.

   Configure and automate creating CMDB relationships between APIs and application services or business applications based on API tags.

Configure data model recommendations for API clustering in API Insights

Set recommendations for clustering API components to align the organization's data with the desired data model.

Before you begin

Role required: sn_cmdb_admin

Procedure

1. Navigate to **Workspaces** > **API Insights**.
2. Select the **Settings** tab.
3. In the Data model recommendations section, configure system-generated recommendations for clustering related API components based on your organization’s data model.

Field	Description
Proposed API clustering	Option to enable the system-generated API clustering recommendations. When selected, the system will propose clustering connections between related API components within the same API.
Cluster quality	Desired quality level for the API clustering recommendations. The cluster quality can range from 0 to 100, where a higher value represents a stronger connection between related components.

4. Select **Save**.

Configure instance API import settings in API Insights

Set options to import custom and ServiceNow APIs from your instance into the CMDB.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Configure the *Import ServiceNow API to API Insights* scheduled job to automatically import configured APIs from your ServiceNow instance into the API Insights workspace at regular intervals. For more information, see Scheduled jobs.

Role required: sn_cmdb_admin

About this task

Configure API import options to bring custom and ServiceNow APIs from your ServiceNow instance into the CMDB. This feature enables you to analyze and manage ServiceNow instance APIs together with other enterprise APIs within the API Insights workspace.

Procedure

1. Navigate to **Workspaces** > **API Insights**.
2. Select the **Settings** tab.
3. In the Import instance APIs section, select **Configure API import**.
4. In the Set up import section, select the options for importing scripted and outbound REST APIs, and scripted and outbound SOAP APIs into the CMDB.

API import options

Option	Description
All custom APIs	Imports all custom-developed APIs within the instance.
ServiceNow APIs	Imports predefined ServiceNow APIs within the instance.
Active in last	Imports only APIs based on recent activity, available for scripted APIs only.

   a. If you select the **ServiceNow APIs** check box, select **Select APIs** and then manage the APIs to import.

Importing ServiceNow APIs

Action	Description
Add ServiceNow APIs	On the Select ServiceNow APIs page, select **Add to import list**. Then, on the Add to import list page, select the check box for APIs from the All ServiceNow APIs list and select **Add selected**.
Remove any selected ServiceNow APIs	On the Select ServiceNow APIs page, select the check box for APIs from the Selected APIs list, and select **Remove from import list**.

   b. If you select the **Active in last** option, enter the number of days in the **Days** field to import only APIs that have been active in the specified timeframe.

5. On the Select ServiceNow APIs page, select **Done**.
6. On the Configure API import page, select **Save configuration**.

Configure settings to manage APIs in API Insights

Configure API Insights settings, including API creation tools, relationship models, ownership groups, and automated workflows, to streamline API governance and operational processes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: sn_api_insights_ws.api_mgmt_architect_admin or sn_cmdb_admin

Procedure

1. Navigate to **Workspaces** > **API Insights**.
2. Select the **Settings** tab.
3. Turn on the All settings option.

> **Note:**
> This step is applicable to users with the sn_cmdb_admin role. You can skip this step if you have the sn_api_insights_ws.api_mgmt_architect_admin role.

4. In the API creation tool section, select an API creation tool from the available options.

Option	Description
None	Uses no external tool.
Digital Integration Management	Uses the Digital Integration Management application (part of the Enterprise Architecture Workspace), if enabled, to initiate the API design process by creating a digital interface record.
External tool	Uses a third-party tool for API creation, requiring the URL for the external tool (for example, `http://www.postman.com`) to be entered in the **External API authoring tool URL** field.

5. In the API-to-business application relationship model section, select a relationship model from the available options.
6. In the Ownership group section, set the ownership group responsible for managing the API.
7. In the Configure workflows section, select a workflow for automating an API action.

> **Note:**
> Workflows are created by your administrator using the Workflow Studio. See Configuring flows for API actions in API Insights.

8. Select **Save**.

Validating API specifications in API Insights

You can access API specification validation rules to verify that your API specifications are complete, consistent, and adhere to best practices.

Validation rules identify structural issues early during import or analysis, improving overall API quality. You can manage these rules to enforce standardization across API specifications and reduce errors by checking for missing or incorrect fields before APIs are published or used in production.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Storing API specifications

The API Specification [sn_api_insights_ws_api_specification] table stores the specification documents that describe individual APIs. Each record includes the following details to identify the API to which the specification belongs and to manage multiple versions.

API specification details

Field	Description
Name	Name of the API.
Version	Version of the API.
Type	Format and version of the API specification standard being used. For example, `openapi3.0.0` for an OpenAPI specification.
State	Current status indicating whether the API specification has been validated against the applicable rules and the validation outcome. Valid values are: • **Unprocessed**: Indicates that the API specification hasn't been validated. • **Valid**: Indicates that the API specification was validated and processed successfully or with warnings. If warnings are present, details are displayed in the **Message** field. • **Invalid**: Indicates that the API specification was validated but contains errors. Error details are displayed in the **Message** field.
Specification	Full content of the API specification file. **Note:** For OpenAPI, includes the complete OpenAPI document describing endpoints, methods, and schema.
Message	Messages are generated after processing all validation rules for the specification type. They include errors or warnings with explanations.

Validation rule structure

The Specification Validation Rule [sn_api_insights_ws_spec_validation_rule] table stores validation rules for the API specifications defined in the API Specification [sn_api_insights_ws_api_specification] table.

Note:
The sn_cmdb_editor role is required to edit or delete validation rules, and the cmdb_read role to view them.

Each validation rule contains the following key components:

Validation rule components

Component	Description
Specification	API specification for which the rule is designed.
Version	Version of the API specification the rule validates. If specified, the rule applies only to those versions. To restrict validation to specific versions, specify them

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Validation rule components (continued)

Component	Description
	in the **Version** field. Separate multiple values with commas. For example, `1.0,1.1,2.0`. **Note:** If the **Version** field is left empty, the rule runs for all installed versions of the specified API specification type.
Type	Type of validation to perform. The valid values are: • **Path**: Verifies that the specific keys are present within arrays of objects, individual objects, or both, in the designated sections of the API specification document. • **Expected value**: Validates whether the specified key matches the expected values specified in the **Value** field. This validation applies only to a single key specified in the **Key** field.
Key	Part of the specification to verify. If no expected value is provided, you can enter multiple keys in the **Key** field, separated by commas.
Value	Expected values for the key specified in the **Key** field. Separate multiple values with commas.
Severity	Severity level of the validation rule outcome, either a warning or an error. **Note:** When set to warning, the API specification remains valid if the rule isn't met, indicating it is not a failure, and only a message is displayed.
Message	Explanation of the issue when the rule is triggered.
Active	Option to activate the rule. Only active rules are triggered by the *`API Specification Validation`* scheduled job.

API specification validation process

The *`API Specification Validation`* scheduled job automatically validates unprocessed API specifications against active rules based on their specification type to ensure compliance with required standards.

The validation process includes:

1. Retrieving all active validation rules from the Specification Validation Rule [sn_api_insights_ws_spec_validation_rule] table.
2. Selecting APIs marked as unprocessed in the API Specification [sn_api_insights_ws_api_specification] table.
3. Applying relevant validation rules to each selected API based on its specification type, such as OpenAPI.
4. Verifying the presence or correctness of specific fields or their values within the API specification.
5. Updating the processing status and capturing any errors or warnings.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Predefined rules for OpenAPI specifications

By default, the application includes the following validation rules for OpenAPI specifications:

Validate tags

Verifies that each tag in the API specification includes a `name` field. If the `name` field is missing, the system returns a warning message but marks the specification as valid.

Validate required sections

Verifies that the API specification includes the required top-level sections: `info`, `paths`, and `components`. If any of these sections are missing, the system returns an error message and marks the specification as invalid.

Validate servers section

Verifies whether the API specification includes a `servers` section that defines the server endpoints. If the `servers` section is missing, the system returns an error message and marks the specification as invalid.

These predefined rules verify critical sections such as tagging, metadata, and server definitions in OpenAPI specifications.

Automating creating tag-based relationship mapping within API Insights

You can configure and automate creating CMDB relationships between APIs and application services or business applications based on API tags.

Tag-based relationship mapping enables CMDB administrators and enterprise architects to define rules that automatically create CMDB relationships between APIs and application services or business applications based on API tags. Each rule specifies how a tag on a source CI is matched to a field on a target CI, and which relationship type and direction to create. Rules are stored in the Tag Based Relationship Mapping [sn_api_insights_ws_tag_relationship_mapping] table, enabling automatic mapping of multiple APIs to application services or business contexts.

You can use tag-based relationship mapping for:

- Relating APIs to application services using a tag, such as a service name.
- Linking APIs or components to business applications by matching a tag to an external ID field.
- Standardizing relationship creation across different environments.

To create CMDB relationships between APIs and application services or business applications based on API tags, follow these steps:

1. Define tag-based mapping rules.
2. Schedule the tag-based mapping rule.

Define tag-based mapping rules

Establish relationships between APIs and application services by defining tag-based mapping rules for APIs available within the API Insights application.

Before you begin

Role required: sn_cmdb_admin or sn_api_insights_ws.api_mgmt_architect

About this task

Tag-based mapping rules enable you to automatically create relationships between APIs and application services or business applications based on tags. To define a tag-based mapping

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

rule, you need to create a tag relationship mapping record that specifies the source and target CI classes and the relationship details.

Procedure

1. In the navigation filter of the application navigator, enter `sn_api_insights_ws_tag_relationship_mapping.list` and press the Enter key.
2. On the Tag Relationship Mappings page, select **New**.
3. On the form, fill in the fields.

New record form for the tag-based relationship mapping

Field	Description
Name	Name for the relationship.
Source Class	CI class including **API**, **API Component**, **API Frontend**, **API Backend**, or **Managed API** that contains the tag as the source of the relationship.
Target Class	CI class including **Application Service** or **Business Application** that the source CI is related to as the target of the relationship.
Relationship Type	Type of relationship established between the source CI and the target CI.
Tag Key	Key from the Key Value [cmdb_key_value] table that corresponds to the target CI field.
Target Match Field	Field on the target CI that matches the tag value.
Parent Class Role	CI that acts as the parent in the relationship, either source or target.
Active	Option to enable the relationship.

4. Select **Submit**.

Scheduling the tag-based mapping rules

You can use a scheduled job to automatically create CMDB relationships between APIs and application services or business applications based on API tags.

Scheduled jobs automate tasks that run at a specific time or on a recurring schedule. You need the admin role to configure and run a scheduled job. For more information on configuring a scheduled job, see Scheduled jobs.

The *`Tag based relationship mapping`* scheduled job is available to schedule applying tag-based mapping rules between APIs and application services or business applications. By default, this job is inactive. As a user with the admin role, you can configure and activate it to run at regular intervals.

For each active tag-based relationship rule, the *`Tag based relationship mapping`* scheduled job processes active rules with the following workflow:

- Uses the specified tag key to retrieve relevant source CI tags.
- Identifies target CIs where the target CI's matching field matches the tag value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Creates the specified relationship type between the source and target CIs in the direction indicated by the `parent_class_role` setting.
- Avoids duplicating existing relationships.

By automating the process of creating relationships based on tags, the *`Tag-based relationship mapping`* scheduled job enables maintaining up-to-date and accurate mappings between APIs and related application services or business applications.

Configuring settings to organize APIs in API Insights

As an enterprise architect administrator with the sn_api_insights_ws.api_mgmt_architect_admin role, configure workflows for organizing APIs, including automating API actions and defining settings to enable enterprise architects manage APIs in the API Insights workspace.

Enterprise architect administrator tasks overview

1. Configure flow for automating API actions.

   Configure workflows for automating API actions within API Insights.

2. Configure settings to manage APIs in API Insights.

   Configure settings to manage APIs, including API creation tools, relationship models, ownership groups, and automated workflows, to streamline API governance and operational processes.

Configuring flows for API actions in API Insights

Configure flows in Workflow Studio for automating API actions within API Insights, streamlining processes like API access requests.

Configure flows to automate various API actions, such as granting access to APIs or processing API requests. Enterprise architect administrators with the sn_api_insights_ws.api_mgmt_architect_admin role can then select workflows that align with specific API automation tasks when they configure settings for managing APIs. See Configure settings to manage APIs in API Insights.

Predefined flow to send reminders for API access

The **API Request Reminder** subflow is available with the API Insights application that sends reminders for approving any API access requests. This flow automatically sends reminder notifications to the ownership groups specified in the flow, prompting them to review and approve pending API access requests.

Predefined flow to grant API access

The **API Grant/Reject Access Template** subflow is available with the API Insights application that grants access to any APIs. This flow automatically that identifies the API access requests and enables to grant or reject access to any APIs.

Configuring flow for API access request automation

To manage API access requests through custom flows, it's essential to configure the flow with specific input parameters. These parameters guide the flow's behavior.

To learn about creating flows, see Getting started with flows.

When creating a flow for API access request automation, you must use specific parameters that control how the flow works.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You must include the following input parameters in the flow:

```
Input params:
request (reference from sn_api_insights_ws_request_access_task
 table) - Required
grant (string) - Required
description (string) - Optional
```

request

A required reference to a specific record in the API Requests Access Task [sn_api_insights_ws_request_access_task] table that identifies the API access request and facilitates interaction with the API Insights application.

grant

A required string input that specifies the action to be taken, such as granting or denying access.

description

An optional string input to provide additional details or context about the API access request.

Configure settings to manage APIs in API Insights

Configure API Insights settings, including API creation tools, relationship models, ownership groups, and automated workflows, to streamline API governance and operational processes.

Before you begin

Role required: sn_api_insights_ws.api_mgmt_architect_admin or sn_cmdb_admin

Procedure

1. Navigate to **Workspaces** > **API Insights**.
2. Select the **Settings** tab.
3. Turn on the All settings option.

> **Note:**
> This step is applicable to users with the sn_cmdb_admin role. You can skip this step if you have the sn_api_insights_ws.api_mgmt_architect_admin role.

4. In the API creation tool section, select an API creation tool from the available options.

Option	Description
None	Uses no external tool.
Digital Integration Management	Uses the Digital Integration Management application (part of the Enterprise Architecture Workspace), if enabled, to initiate the API design process by creating a digital interface record.
External tool	Uses a third-party tool for API creation, requiring the URL for the external tool (for example, `http://www.postman.com`) to be entered in the **External API authoring tool URL** field.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. In the API-to-business application relationship model section, select a relationship model from the available options.

6. In the Ownership group section, set the ownership group responsible for managing the API.

7. In the Configure workflows section, select a workflow for automating an API action.

   Note:
   Workflows are created by your administrator using the Workflow Studio. See Configuring flows for API actions in API Insights.

8. Select **Save**.

Administering and monitoring API data with API Insights

The Overview tab in the API Insights workspace provides a centralized overview of your organization's API landscape.

Depending on your role, the API Insights page on the Overview tab serves as a centralized hub to manage data ingestion integrations, monitor your APIs, and assess data quality. Whether you're setting up new connections, tracking API performance, or evaluating the integrity of incoming data, this page provides the tools and visibility you need. By offering real-time metrics and quality checks, it empowers teams across the organization to gain actionable insights.

You can use the page to:

- As CMDB administrators, you can administer data ingestion and align data model for your organization. See Administering data ingestion and model alignment with API Insights.
- As enterprise architects, you can monitor APIs while assessing overall data quality and identifying key issues like missing data elements. See Monitoring APIs and assessing data quality with API Insights.

Administering data ingestion and model alignment with API Insights

The Overview tab in the API Insights workspace provides a centralized view of data ingestion activities and integration health.

incomplete data to verify consistent and accurate CMDB records. They can view and resolve errors in connections when importing API data into CMDB using Service Graph Connectors and adjust data based on clustering recommendations.

Note:
As a user with the sn_cmdb_admin role, you need additional roles such as ml_report_user and cmdb_inst_admin to access some of the features and data.

Features

Access the various cards on the Overview tab to gain insights on the API data available in your organization.

Note:
Select a segment or count on a chart to open the KPI Details page and analyze how a specific metric trends over time. To learn more about the KPI Details feature, see KPI Details.

Overview tab features for CMDB administrators

Feature	Description	Required roles
Search APIs	API search within the organization to locate specific APIs for review or management.	sn_cmdb_admin
Connection status	Total count of active API connections and processing errors. Provides insight into the status of API connections and highlights any processing issues to verify reliable data ingestion. **Active connections** Total number of installed connections with active import schedules. Select the count to view installed connections. **Errors** Total number of processing errors for installed connections.	sn_cmdb_admin and cmdb_inst_admin
API clustering recommendations	Number representing the current clustering recommendation, based on the data model recommendation settings. See Configure data model recommendations for API clustering in API Insights.	sn_cmdb_admin, ml_report_user, and platform_ml_read
APIs by discovery source	Total count of discovered APIs grouped by source. Provides insight into the discovery methods of APIs across your organization.	sn_cmdb_admin
APIs by life cycle	Total count of APIs grouped by life cycle stage as Operational, Deploy, or End of Life. Provides visibility into API readiness and maintenance status across your organization.	sn_cmdb_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Overview tab features for CMDB administrators (continued)

Feature	Description	Required roles
APIs by type	Total count of APIs categorized by protocol or communication type. Includes technologies such as REST, GraphQL, and SOAP, providing insight into the integration styles and interoperability across your organization.	sn_cmdb_admin
APIs by environment	Count of APIs deployed in each environment. Highlights distribution across Development, Test, and Production stages, enabling monitoring of deployment progress and assessment of risk exposure.	sn_cmdb_admin
APIs by ownership group	Total count of APIs categorized by assigned ownership group. Groups APIs by managing team or function, as defined by an enterprise architect administrator with the sn_api_insights_ws.api_mgmt_architect_admin role in settings. For more information on setting an ownership group, see Configure settings to manage APIs in API Insights.	sn_cmdb_admin
APIs missing data	Count of APIs missing key attributes, including business context, ownership group, product model, or design. Each bar represents a key attribute and indicates the number of APIs missing the attribute. Color coding indicates the severity of missing data: **Red** More than 50% of APIs are missing the attribute. **Yellow** Between 10% and 50% of APIs are missing the attribute. **Green** Less than 10% of APIs are missing the attribute. Use the visual indicator to prioritize remediation efforts based on data completeness. Select a bar in the bar chart to start the remediation process. See Identifying and remediating missing API data in API Insights.	sn_cmdb_admin
APIs by business application	Count of APIs linked to business applications. Enables tracking of API connections to business applications to improve integration after connections are established.	sn_cmdb_admin

End of Life	Number of APIs that are retired or decommissioned.	• sn_api_insights_ws.api_mgmt_architect • sn_api_insights_ws.api_mgmt_architect_admin
APIs managed by your team		
All APIs managed by your team	Overview of the APIs managed by a team, based on the group associated with the logged-in user and the APIs linked to that group. API details include name, consumer count, management platform, life cycle stage, version, and requests per minute. Populates data corresponding to the selected card in the Your team's APIs section.	• sn_api_insights_ws.api_mgmt_architect • sn_api_insights_ws.api_mgmt_architect_admin

Managing API data in API Insights

You can use the API Insights workspace to centralize and manage API data for informed decision-making.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Within the API Insights workspace, you can:

- View all APIs within your organization.

  Manage and monitor all APIs within your organization by reviewing their life cycle stages, identifying missing critical attributes, and accessing helpful resources to ensure proper API maintenance and governance.

- Search for an API.

  Search for an API or an API component available within your organization in the API Insights workspace.

- Compare APIs.

  Compare APIs available within your organization in the API Insights workspace.

- Connect to an API creation tool from API Insights.

  Initiate API creation directly from the API Insights workspace by connecting to an external API design tool of your choice.

- Request access.

  Request access to an API available within your organization in the API Insights workspace.

- Identify and remediate missing API data.

  Identify and remediate missing API data in the API Insights workspace by linking missing elements and verifying complete API records.

- Manage your team's API data.

  Improve the operational efficiency of the API ecosystem within your organization by creating a relationship for APIs that lack key attributes such as business context, ownership groups, product models, or designs.

- View details of an API.

  Gain insights into your organization's API performance, relationships, and governance from the API details page within the API Insights workspace.

- Manage application service relationships.

  Associate APIs with relevant configuration items (CIs) to ensure accurate mappings between APIs and the configuration items they support.

- Automate creating tag-based relationships.

  Configure and automate creating CMDB relationships between APIs and application services or business applications based on API tags.

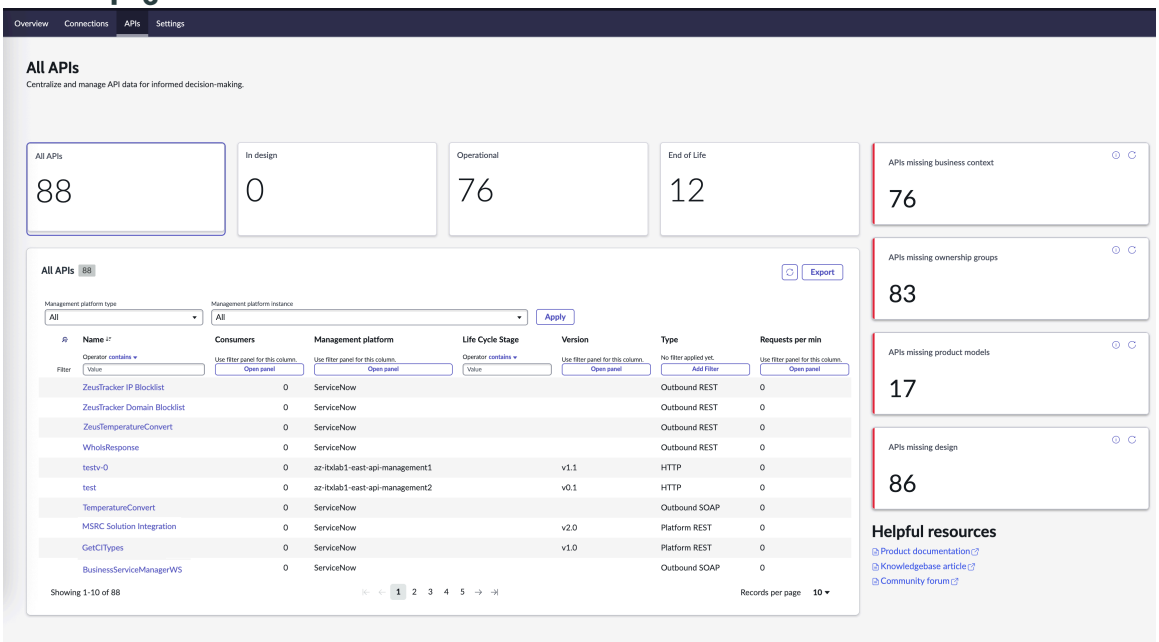
Viewing all APIs in API Insights

Manage and monitor all APIs within your organization by reviewing their life cycle stages, identifying missing critical attributes, and accessing helpful resources to ensure proper API maintenance and governance.

The All APIs page in the API Insights workspace provides a comprehensive overview of all APIs within an organization ensuring that APIs are properly maintained and aligned with the organization's standards for interfaces, ownership, and product models.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

All APIs page



Accessing and using the All APIs page

To access the All APIs page, navigate to **Workspaces** > **API Insights**, and then select the **API** tab.

Viewing data

By default, the page displays the following data:

All APIs list

Displays the total number of APIs managed by the organization and categorizes them by their life cycle stage (All APIs, In design, Operational, End of Life). You can select the each card to view APIs by their life cycle stage in the API data table.

API data table

Lists all APIs with detailed columns for the API name, the number of consumers, management platform, life cycle stage, version, and the number of API requests processed per minute for each API listed in the table. This table provides an overview of the APIs and their status within the organization. You can select an API from the **Name** column to view API details and request access to the API managed by your team. See Request access to an API in API Insights.

Available actions and filters in the API data table

Provides several actions and filtering options to manage and refine the displayed data. These include exporting the list in various formats, refreshing the data, and applying filters to narrow down the results by platform type, instance, or specific column criteria.

Exporting API data

Export the APIs list as a PDF, CSV, JSON, or Microsoft Excel file by selecting **Export**, and then selecting the desired file format from the File Type list. You can either download the file to your local directory or email the file by selecting a value from the Delivery Type list. After making your selections, select **Export** to complete the process.

Refreshing the API data

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Manually populate the API data table on demand by selecting the refresh icon ( ).

Filtering APIs by platform and instance

Narrow down the API list based on platform type and instance.

- Use the Management Platform Type list to filter APIs by platform category.
- Use the Management Platform Instance list to refine results by a specific ServiceNow instance.

Select **Apply** to update the list based on the selected filters. If you select **ALL** in either list, APIs from all available options are included in the table.

Applying filters to API data columns

Refine the list of APIs by using column-specific filters or advanced condition sets.

Each column in the All APIs list includes lightweight, inline filtering options:

Operator

Includes the comparison operator for the filter. The operator list includes `is`, `is not`, `starts with`, `ends with`, `contains`, `does not contain`, `is empty`, `is not empty`. In the **Value** field, you can enter the text or number you want to filter on and then press the Enter key. The list refreshes when the filter is applied.

For example, selecting **contains** and entering a value in the **Value** field, filters the list to show only API records where the column contains that text.

Open panel

Opens the full filter panel for the selected column and provides a finer control over the filters to refine the data in the table according to the parameters that are most important for your analysis.

You can define custom conditions for narrowing down data by selecting a field, choosing an operator, such as equals or contains, and entering a specific value. You can add multiple conditions to refine your search further, and once you've set the filters, selecting **Run** updates the API data table accordingly. The **Show labels** toggle switch controls whether the labels for the fields and operators are displayed. When enabled, it shows descriptive text next to each option to help you understand their purpose, while disabling it hides the labels for a more compact view.

Add Filter

Inline filter rule added for a column so you can immediately define conditions using the operator and value fields. For example, when filtering by **Type**, you can

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

choose REST, SOAP, gRPC, Websocket, Scripted REST, and other predefined options.

APIs missing data section

Highlights the APIs missing key attributes like business context, ownership groups, product models, and design helping to identify issues in API governance. You can select the numeric value displayed in each card to identify and resolve issues with API data. See Identifying and remediating missing API data in API Insights.

Helpful resources

Contains quick links to product documentation, knowledge base articles, and community forums, providing easy access to additional resources for API management.

Search for an API or an API component in API Insights

Search for an API or an API component available within your organization in the API Insights workspace.

Before you begin

Role required: sn_api_insights_ws.api_mgmt_architect

Procedure

1. Navigate to **Workspaces** > **API Insights**.
2. In the **Search APIs** text box on the Overview tab, enter your search phrase and select **Search**.

   Tip:
   Alternatively, after entering the search phrase, you can press the Enter key.

3. On the Search results page, select a tab to view more details.

Compare APIs in API Insights

Compare APIs available within your organization in the API Insights workspace.

Before you begin

Role required: sn_api_insights_ws.api_mgmt_architect or sn_cmdb_admin

Procedure

1. Navigate to **Workspaces** > **API Insights**.
2. In the **Search APIs** text box on the Overview tab, enter your search phrase and select **Search**.
3. On the Search results page, select the **APIs** tab.
4. Select the check boxes next to the Name column for APIs that you want to compare.

   Note:
   You can select up to three APIs to compare.

5. Select **Compare selected**.
6. On the Compare APIs page, compare the selected APIs based on version, type, business context also called as business application, managed by group, life cycle stage, and sources.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connect to an API creation tool from API Insights

Initiate API creation directly from the API Insights workspace by connecting to an external API design tool of your choice.

Before you begin

The application administrator must configure an API creation tool. See Configure settings to manage APIs in API Insights.

Role required: sn_api_insights_ws.api_mgmt_architect

About this task

Search for an existing API in the API Insights workspace, and if no matches are found, initiate API creation directly from the workspace.

Procedure

1. Navigate to **Workspaces** > **API Insights**.
2. In the **Search APIs** text box on the Overview tab, enter the name or keyword of the API to search for and select **Search**.
3. On the Search results page, select the **APIs** tab to view matching APIs.
4. If no matching API is found, select **Create API** to start designing a new API.

Result

Based on the settings configured by your application administrator, the API creation tool opens, enabling you to create an API.

Request access to an API in API Insights

Request access to an API available within your organization in the API Insights workspace.

Before you begin

The application administrator must configure an ownership group and set up a workflow for managing access requests.

Role required: sn_api_insights_ws.api_mgmt_architect

About this task

Alternatively, you can request access to an API managed by your team. See Manage your team's API data in API Insights,

Procedure

1. Navigate to **Workspaces** > **API Insights**.
2. In the **Search APIs** text box on the Overview tab, enter your search phrase and select **Search**.
3. On the Search results page, select the **APIs** tab.
4. Select the check box next to the **Name** column for the API for which you want to request access.

   Note:
   You can request access for only one API at a time.

5. Select **Request access**.
6. In the Request access dialog box, fill in the details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Access type	Method used for authenticating and authorizing users or applications when interacting with an API or service. The available options are: **API Key** Provides authentication using a unique token included in the request. **Application** Grants access at the application level, authenticating the application itself. **Basic Auth** Uses a base64-encoded string of credentials sent in the request header for authentication. **Developer** Offers access for individual developers or development environments. **OAuth 2.0** Employs tokens to authorize access securely, allowing applications to act on behalf of a user. **Other** Includes custom methods of authentication and authorization.
Access duration in days	Length of time, measured in days, for which access to an API is granted before reauthorization is needed.
Justification for your access request	Reason or explanation for why access to the API is needed.

7. Select **Request**.

Result

The access request is submitted for approval based on the workflow settings configured by your application administrator.

Identifying and remediating missing API data in API Insights

Identify and remediate missing API data in the API Insights workspace by linking missing elements and verifying complete API records.

Missing metadata can reduce the effectiveness of API discovery, life cycle tracking, and ownership accountability. Common missing elements include:

- Business context
- Ownership group
- Product model
- Design details

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Resolving missing data ensures a more complete, accurate view of dependencies and ownership, improving impact assessments and service management.

The Overview tab of the API Insights workspace enables improve the usability, governance, and integration of APIs by highlighting any incomplete or missing data within the Configuration Management Database (CMDB).

Remediating missing API data by roles

The following roles can identify and resolve missing metadata in API:

- An enterprise architect with the sn_api_insights_ws.api_mgmt_architect role can access the Overview tab in the API Insights workspace to remediate missing API information using dedicated tiles for each type of missing data.
- A CMDB administrator with the sn_cmdb_admin role can access the Overview tab in the API Insights workspace and select a bar within the APIs missing attributes bar chart to identify and update missing metadata.

Monitoring key metrics

You can monitor the following missing data associated with APIs within your organization:

Missing business context

APIs not associated with any business context reduce the clarity and governance over which business areas are providing them.

Missing ownership groups

APIs without an assigned ownership group affect governance. Assigning ownership groups streamlines tracking remediations, managing access, and resolving issues quickly.

Missing product models

APIs without an assigned product model limit the ability to provide accurate reporting and interactions with versioned APIs.

Missing design

APIs with no design representation hinder their full integration into the system. Linking these APIs with their design-time counterparts (such as digital interface records) improves usability and operational efficiency.

Resolving missing API data

You can resolve missing API data by creating relationships for business context or references for ownership groups, product models, or designs, to establish connections between the API and other CIs within the CMDB.

You can establish the following relationships or references in API Insights to resolve missing API data:

API-to-business context relationship

Links an API to a specific business context, defining the context in which the API is used and creating a relationship record in the CMDB.

API-to-ownership group reference

Links an API to a group responsible for its governance, access control, and maintenance, serving as a reference without creating a record in the CMDB.

API-to-product model reference

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Links an API to a product model, providing information on the API's versioning, product line, and life cycle stage, serving as a reference without creating a record in the CMDB.

API-to-design reference

Links an API to its runtime or design-time interface, serving as a reference without creating a record in the CMDB.

Create a relationship or reference to remediate missing API data

Improve the operational efficiency of the API ecosystem within your organization by creating a relationship or reference for APIs that lack key attributes such as business context, ownership groups, product models, or designs.

Before you begin

Role required: sn_api_insights_ws.api_mgmt_architect, sn_cmdb_admin

About this task

Available missing data categories include:

- Missing business context
- Missing ownership groups
- Missing product models
- Missing designs

Note:
Displayed only when the Digital Integration Management plugin (sn_apm_di) is activated.

Important:
When creating relationships for a large number of APIs, you can automate creating relationships based on tags on API. For more information, see Automating creating tag-based relationship mapping within API Insights.

Procedure

1. Navigate to **Workspaces** > **API Insights**.
2. Select the Overview tab, if not already selected by default.
3. Select a missing data category to open the list of APIs missing that attribute.
   - As a user with the sn_api_insights_ws.api_mgmt_architect role, in the APIs missing data section, select the number shown for a specific missing data category.
   - As a user with the sn_cmdb_admin role, select a category bar in the APIs missing data bar chart.
4. On the APIs missing data page, select the check boxes next to the API names.
5. Resolve missing data.
   - For resolving missing business context, select **Create relationships**.
   - For resolving missing ownership groups, product model, or designs, select **Create reference**.
6. Select the check boxes next to the **Name** column for the application services.
7. Based on the type of connection needed, establish relationships or a reference.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- For business context, select **Create relationships**.
- For ownership groups, product model, or designs, select **Create reference**.

8. In the dialog box that appears, select **Create**.

Manage your team's API data in API Insights

Improve the operational efficiency of the API ecosystem within your organization by creating a relationship for APIs missing key attributes such as business context also called as business application ownership groups, product models, or designs.

Before you begin

Role required: sn_api_insights_ws.api_mgmt_architect

Procedure

1. Navigate to **Workspaces** > **API Insights** > **Overview**.
2. In the Your team's APIs section, select a category based on the API's life cycle stage.
   - To view all the APIs managed by your team, select **All APIs**.
   - To view the APIs managed by your team that are currently in the design phase, select **In design**.
   - To view the APIs managed by your team that are active and in use, select **Operational**.
   - To view the APIs managed by your team that have reached the end of their life cycle, select **End of Life**.
3. From the **Name** column, select an API to view more details of the API.
   See Viewing API details in API Insights.
4. **Optional:** Select **Request access** to gain access to the API.

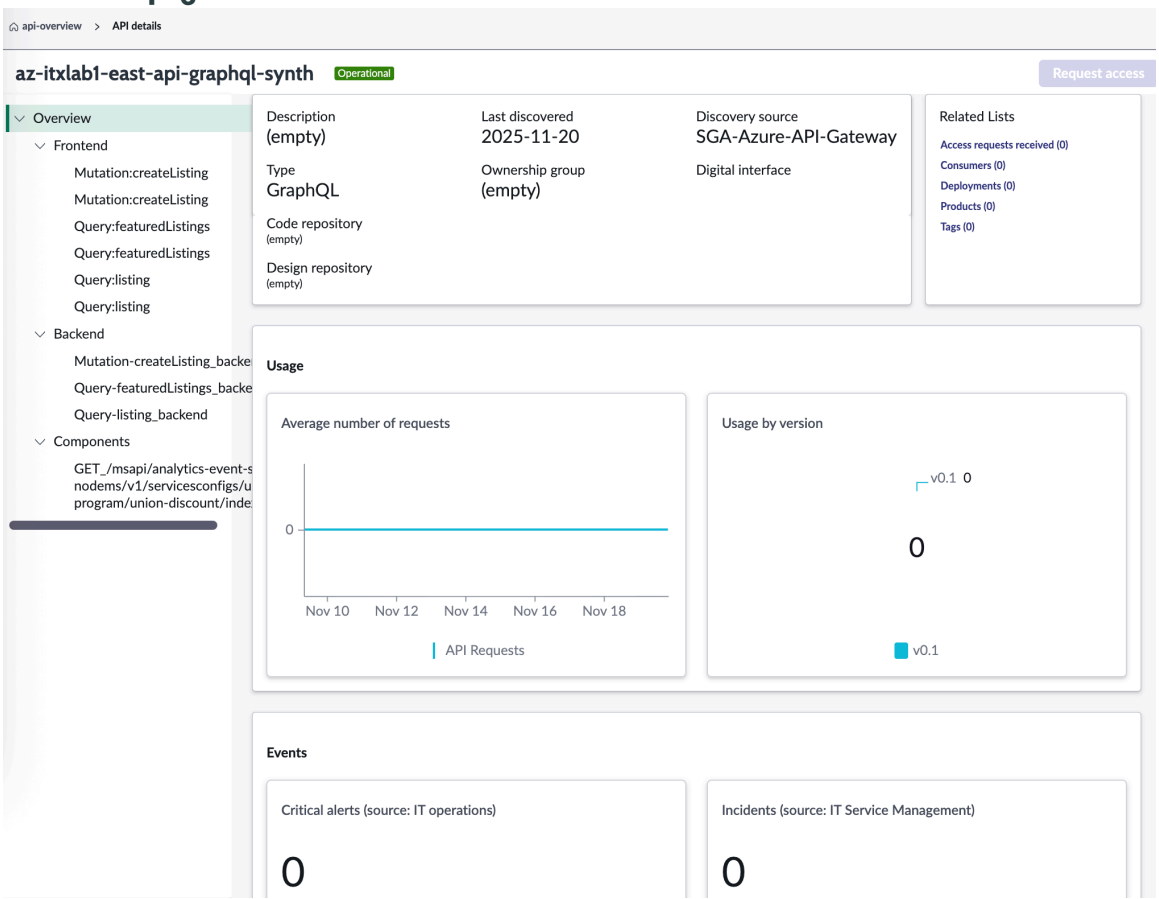
Viewing API details in API Insights

As an enterprise architect, gain insights into your organization's API performance, relationships, and governance from the API details page within the API Insights workspace.

The API details page in the API Insights workspace provides a detailed view of an API's operational status, usage, security, and relationships within CMDB.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

API details page



.

Accessing and using the API details page

To access the API details page, navigate to **Workspaces** > **API Insights**, select the **APIs** tab, and then select an API from the **Name** column from the API data table.

Viewing data

By default, the page displays the following data:

- Header region
- Metadata region
- Related lists
- Overview panel
- Usage
- Events
- Security
- Relationship map

Header region

Displays the name of the API, version information, the API's current life cycle stage, such as Operational, or End of Life.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **View By** list enables you to toggle between different management platforms, if available, under which the API is managed.

The version selector enables the selection of different versions of the API to view and manage. Select **Update** to update the details based on the selected version.

Note:
The **View By** list and the version selector appear only if applicable for an API.

Metadata region

Displays the following fields.

Field	Description
Description	Brief summary or purpose of the API.
Last discovered	Last date the API was discovered or updated in the CMDB.
Discovery source	Source from where the API was discovered.
Type	Type of the API whether scripted REST API, HTTP API, platform REST API, and so on.
Ownership group	Team or group responsible for managing the API.
Digital interface	Interaction method of the API within the system.

Related Lists

Displays the following items as links with their counts.

Item	Description
Access requests received	Displays the number of access requests made for the API. Select the link displayed on the card to view access request details.
Consumers	Displays the number of consumers of the API. Select the link displayed on the card to view details for each API consumer.
Deployments	Indicates any active or past deployments of the API across environments. Select the link displayed on the card to view API deployment details.
Products	Displays the number of products associated with the API. Select the link displayed on the card to view API product details.
Tags	Displays the number of tags associated with the API. Select the link displayed on the card to view details for each tag.

Overview panel

Lists all available components of the API, organized into three subsections within the Overview panel:

Frontend

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Contains client-side operations, including GraphQL mutations and queries that interact with the UI or user-facing functionality.

Backend

Contains server-side operations, including backend-specific GraphQL mutations and queries that process business logic and data.

Components

Contain various REST API endpoints or service interfaces, each providing a specific function or resource within the API.

You can expand each subsection to view its endpoints and select any endpoint to see its details.

Usage

Displays the following cards.

Card	Description
Average number of requests	Number of API component requests over time, represented as a line graph, with the x-axis showing the date range and the y-axis displaying the request count.
Usage by version	API request distribution across different versions over the past 10 days.

Events

Displays the following cards.

Card	Description
Critical alerts	Critical alerts from IT operations related to the API enabling identifying major issues that could affect the API's performance. Select the card to display all the open alerts in the Service Operations Workspace and access more detailed information on them. For more information, see Service Operations Workspace.
Incidents	Recorded incidents, such as outages, change requests, or problems related to the API essential for tracking operational health and remediation efforts. Select the card to display all the open incidents in the Service Operations Workspace and access more detailed information on them. For more information, see Service Operations Workspace.

Security

Displays the following cards.

Card	Description
Active vulnerability items	Security vulnerabilities associated with the API enabling to track and resolve potential risks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

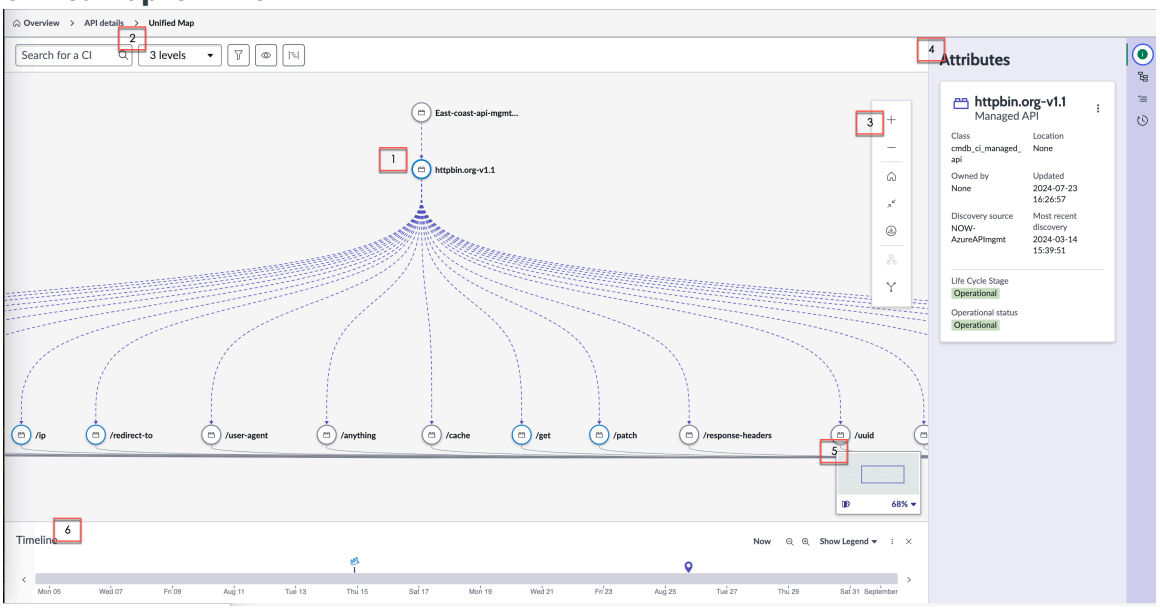
Card	Description
	Select the card to display all vulnerabilities in the Vulnerability Manager Workspace and access more detailed information on them. For more information, see Vulnerability Manager Workspace.
Security incidents	Security incidents, if enabled, providing insights into security breaches or issues that might have occurred with the API. Select the card to display all open security incidents in the Security Incident Response Workspace and access more detailed information on them. For more information, see Security Incident Response Workspace.

Relationship map

Provides a hierarchical overview of the API relationships with its components, management platforms, business applications, and designs, making it easier to understand the API's role within the broader system architecture. In addition, provides the option to manage application service relationships. See Managing application service relationships for APIs.

A relationship map is a partial unified map similar to the one used in the CMDB Workspace. To open the unified map for APIs, select **Open full map** in the Relationship map section of the API details page. To learn more, see Unified Map.

Unified map for APIs



Nodes on the map represent the API and its components in the CMDB and lines represent connections and relationships between API components. The connections help you, for example, to assess the impact of a change to a selected node by showing components that are connected to it through relationships and references. Products such as Change Management, Incident Management, and Event Management benefit from such information.

The map also shows the composition of application services useful with products such as Event Management and Incident Management. You can review historical changes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following elements are available in the unified map for APIs:

1: Map

The map displays the specified API and its connections and relationships. In the example, the `httpbin.org-v1.1` is the home node and the lines represent connections and relationships with other components. Select any node to view details like related application services, change history.

2: Content controls

- Search for and select the home node, specify the number of relationship levels for application services to display, and reload the map after making changes.
- Use filters to limit the types and relationship types that appear on the map.
- Show or hide the timeline of events (related items) for the selected API

3: Toolbox

Use the toolbox to control several visual aspects of the map, such as zoom level or layout mode.

4: Contextual side panel

- The **Attributes** panel ( ) lists attributes like location and operational status for the selected API or relationship.
- The **Application services** panel ( ) lists details of application services associated with the selected API.
- The **Related items** panel ( ) shows related items such as active incidents or active problems for the selected API.
- The **Changes** panel ( ) lists changes such as changes to operational status for the selected API.

5: Mini-map navigator

Set the zoom level or move the view to an area of interest. Select the icon to show or hide the navigator.

6: Timeline

The timeline indicates events (related items) like incidents, problems, and changes for the selected API over a specified period of time. You can use the timeline to visualize the history of changes to an API and how they affect the topology of the CMDB.

Managing application service relationships for APIs

You can associate APIs with relevant configuration items (CIs) to ensure accurate mappings between APIs and the configuration items they support.

Application service relationships link APIs to business context and the CIs they depend on, providing clarity on dependencies and improving performance visibility. They enable you to monitor, track changes, and resolve issues more efficiently.

For APIs, application service relationships map how they interact with other CIs, enabling you to manage dependencies, ensure business continuity, and respond quickly to incidents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

By understanding these relationships, you gain better control over API performance and the availability of connected CIs.

By using application service relationships, you can:

- Identify which APIs are tied to specific application services and their related CIs.
- Understand the dependencies between APIs and the CIs they support.
- Manage and monitor API performance and its impact on critical business services and CIs.

For more information, see Application services.

The available actions for handling application service relationships for APIs include:

- View application service relationships.
- Create application service relationships.
- Remove application service relationships.

Note:
When managing multiple API relationships for application services, you can automate the mapping. For more information, see Automate tag-based relationship mapping.

View application service relationships

View existing relationships between an API and application services.

Before you begin
Role required: sn_cmdb_admin, sn_api_insights_ws.api_mgmt_architect_admin, or sn_api_insights_ws.api_mgmt_architect

Procedure

1. Navigate to **Workspaces** > **API Insights**.
2. Select the **APIs** tab.
3. Select an API from the **Name** column on the API data table.
4. In the Relationship map section, select **Manage service relationships**.
5. View existing relationships between application services and the selected API on the Related application services table.

Create application service relationships

Create relationships between an API and application services.

Before you begin
Role required: sn_cmdb_admin or sn_api_insights_ws.api_mgmt_architect_admin

Procedure

1. Navigate to **Workspaces** > **API Insights**.
2. Select the **APIs** tab.
3. Select an API from the **Name** column on the API data table.
4. In the Relationship map section, select **Manage service relationships**.
5. Select **Create relationships**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Select application services to create relationships with the selected API.
7. Select **Create**.

Remove application service relationships

Remove relationships between an API and application services.

Before you begin

Role required: sn_cmdb_admin or sn_api_insights_ws.api_mgmt_architect_admin

Procedure

1. Navigate to **Workspaces** > **API Insights**.
2. Select the **APIs** tab.
3. Select an API from the **Name** column on the API data table.
4. In the Relationship map section, select **Manage service relationships**.
5. On the Related application services table, select the check box for an existing relationship.
6. Select **Remove relationships**.

Automating creating tag-based relationship mapping within API Insights

You can configure and automate creating CMDB relationships between APIs and application services or business applications based on API tags.

Tag-based relationship mapping enables CMDB administrators and enterprise architects to define rules that automatically create CMDB relationships between APIs and application services or business applications based on API tags. Each rule specifies how a tag on a source CI is matched to a field on a target CI, and which relationship type and direction to create. Rules are stored in the Tag Based Relationship Mapping [sn_api_insights_ws_tag_relationship_mapping] table, enabling automatic mapping of multiple APIs to application services or business contexts.

You can use tag-based relationship mapping for:

- Relating APIs to application services using a tag, such as a service name.
- Linking APIs or components to business applications by matching a tag to an external ID field.
- Standardizing relationship creation across different environments.

To create CMDB relationships between APIs and application services or business applications based on API tags, follow these steps:

1. Define tag-based mapping rules.
2. Schedule the tag-based mapping rule.

Define tag-based mapping rules

Establish relationships between APIs and application services by defining tag-based mapping rules for APIs available within the API Insights application.

Before you begin

Role required: sn_cmdb_admin or sn_api_insights_ws.api_mgmt_architect

About this task

Tag-based mapping rules enable you to automatically create relationships between APIs and application services or business applications based on tags. To define a tag-based mapping

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

rule, you need to create a tag relationship mapping record that specifies the source and target CI classes and the relationship details.

Procedure

1. In the navigation filter of the application navigator, enter `sn_api_insights_ws_tag_relationship_mapping.list` and press the Enter key.
2. On the Tag Relationship Mappings page, select **New**.
3. On the form, fill in the fields.

New record form for the tag-based relationship mapping

Field	Description
Name	Name for the relationship.
Source Class	CI class including **API**, **API Component**, **API Frontend**, **API Backend**, or **Managed API** that contains the tag as the source of the relationship.
Target Class	CI class including **Application Service** or **Business Application** that the source CI is related to as the target of the relationship.
Relationship Type	Type of relationship established between the source CI and the target CI.
Tag Key	Key from the Key Value [cmdb_key_value] table that corresponds to the target CI field.
Target Match Field	Field on the target CI that matches the tag value.
Parent Class Role	CI that acts as the parent in the relationship, either source or target.
Active	Option to enable the relationship.

4. Select **Submit**.

Scheduling the tag-based mapping rules

You can use a scheduled job to automatically create CMDB relationships between APIs and application services or business applications based on API tags.

Scheduled jobs automate tasks that run at a specific time or on a recurring schedule. You need the admin role to configure and run a scheduled job. For more information on configuring a scheduled job, see Scheduled jobs.

The *`Tag based relationship mapping`* scheduled job is available to schedule applying tag-based mapping rules between APIs and application services or business applications. By default, this job is inactive. As a user with the admin role, you can configure and activate it to run at regular intervals.

For each active tag-based relationship rule, the *`Tag based relationship mapping`* scheduled job processes active rules with the following workflow:

- Uses the specified tag key to retrieve relevant source CI tags.
- Identifies target CIs where the target CI's matching field matches the tag value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Creates the specified relationship type between the source and target CIs in the direction indicated by the `parent_class_role` setting.
- Avoids duplicating existing relationships.

By automating the process of creating relationships based on tags, the *`Tag-based relationship mapping`* scheduled job enables maintaining up-to-date and accurate mappings between APIs and related application services or business applications.

Managing API access within API Insights

Manage received and sent requests by granting or rejecting API access, sending reminders, or withdrawing requests in API Insights.

You can manage API access requests by performing the following actions:

- Manage requests received for API access in API Insights.
- Manage requests sent for API access in API Insights.

Manage requests received for API access in API Insights

Manage incoming received requests for API access in API Insights.

Before you begin

Role required: sn_api_insights_ws.api_mgmt_architect

Procedure

1. Navigate to **Workspaces** > **API Insights**.
2. In the Access requests received section on the Overview tab, select the displayed numeric value.
3. In the **Requests received** tab, review all incoming requests.
   You can review the details such as API name, requested by, request type, duration, and the reason for the request.

   Important:
   The **View requests** link in the API request reminder email works only if you have the sn_api_insights_ws.api_mgmt_architect or sn_api_insights_ws.api_mgmt_architect_admin role and are part of the same group that received the email to view the requests.

4. Select the check boxes next to the request names to select one or more access requests that you want to process.
5. Manage the received requests.
   - Select **Grant access** to approve access to the requested API.
   - Select **Reject request** to deny access to the requested API.

Result

A confirmation notification appears, indicating that the API request access flow process was initiated or completed successfully.

Manage requests sent for API access in API Insights

Manage your sent access requests by either sending a reminder or withdrawing the request in API Insights.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: sn_api_insights_ws.api_mgmt_architect

Procedure

1. Navigate to **Workspaces** > **API Insights**.
2. In the Your access requests section on the Overview tab, select the displayed numeric value.
3. In the **Requests sent** tab, view a list of access requests you have sent.
4. Select the check boxes next to the request names to select one or more sent requests that you want to process.
5. Manage the sent requests.

Optimizing API organization with clustering recommendations in API Insights

Use clustering recommendations to organize and group related API components, improving the efficiency and accuracy of API management.

The API clustering recommendations feature analyzes unlinked API components and proposes clusters likely belonging to the same API. Each recommendation includes a cluster concept, size, and quality score. By accepting a recommendation, you can link the components to an existing API or create another API record, improving data organization and management.

As a CMDB administrator, you can:

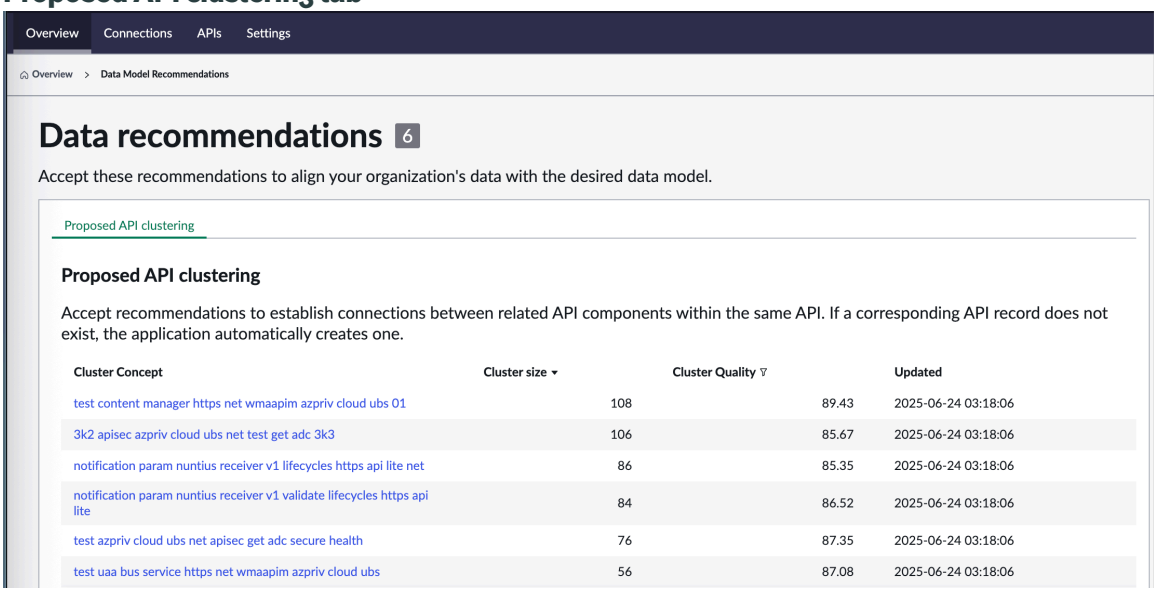
- View API clustering recommendations.
- Accept clustering recommendations.

Viewing API clustering recommendations in API Insights

Use machine learning-based suggestions to group related API components, improving the organization and mapping of APIs within the system.

The Proposed API clustering tab of the Data recommendations page in the API Insights workspace provides machine learning-generated recommendations for API clustering.

Proposed API clustering tab



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Accessing the Proposed API clustering tab

To access the Proposed API clustering tab, navigate to **Workspaces** > **API Insights**. On the **Overview** tab, select the count metric in the API clustering recommendations section. The **Proposed API clustering** tab is displayed on the Data recommendations page.

You need the following roles to access the API clustering recommendations section: sn_cmdb_admin, ml_report_user, and platform_ml_read.

Viewing data

By default, the page displays the following data:

Cluster Concept

Displays the API components that the machine learning model has grouped together based on similarities. These concepts represent the core idea or functionality that defines each cluster.

Cluster size

Indicates the total number of components within the cluster. A larger size suggests that many components are related and grouped together under the same API concept.

Cluster Quality

Reflects the confidence or strength of the relationship between components in the cluster, measured on a scale from 0 to 100. A higher quality value implies stronger relationships among the API components within the cluster.

Updated

Displays the most recent timestamp when the cluster was updated, enabling tracking the recency of the machine learning recommendations and any changes to the clusters.

Accept clustering recommendation in API Insights

Associate API components with an API record by accepting clustering recommendation in the API Insights workspace.

Before you begin

Role required: sn_cmdb_admin, ml_report_user, and platform_ml_read

Procedure

1. Navigate to **Workspaces** > **API Insights**.
2. On the **Overview** tab, select the count metric displayed in the API clustering recommendations section.
3. On the **Proposed API clustering** tab, review the list of recommendations.
4. From the **Cluster Concept** column, select a cluster concept link.
5. On the Missing API page, review the list of API components that have not yet been associated with an API record.
6. Select the check boxes next to the API components to associate with an API record.

> **Note:**
> You can select one or multiple components depending on your requirement.

7. Select **Accept**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Select an API record.

9. Select **Submit**.

Result
The Missing API list is refreshed with the linked components removed from the list and associated with the specified API record.

Managing API data connections added for Service Graph Connectors in API Insights

You can view the status of your API data connections, including success rates, processing status, and ongoing executions, and monitor the progress of connections added using Service Graph Connectors in API Insights.

- View the status of API data connections in API Insights.
- Monitor configuration progress of connections in API Insights.

View the status of API data connections in API Insights

View the status of your API data connections using Service Graph Connectors, including success rates, processing status, and ongoing executions.

Before you begin
Role required: sn_cmdb_admin and cmdb_inst_admin

Procedure
1. Navigate to **Workspaces** > **API Insights**.
2. In the Connections overview section of the Overview tab, access the various cards to gain insights on the performance of Service Graph Connectors.

Connections overview

Card	Description
Connections status	Percentage of connections tested successfully based on connection status, with the count of success, error, and unknown statuses.
Processing status	Percentage of connections for which all data import runs in the last import execution were successful, with the count of success and error statuses.
Ongoing executions	Number of connections where data import execution is currently in progress.

3. From the **Connection** column, select a connection.
4. On the connection record page, select a tab to view more information about the selected connection.

Connection record details

Tab	Description
Details	Connection information, such as the connection name and credentials associated with the connection.
Connection properties	Properties configured for the connection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tab	Description
Data sources	Data sources associated with the connection, specifying what data is being retrieved or synchronized.
Import schedules	Scheduled imports for the connection, including parent schedule, data source, timing and frequency of data retrieval.
Errors	Error related to the connection.

Monitor configuration progress of connections in API Insights

Check progress status of API data connections in API Insights.

Before you begin

Role required: sn_cmdb_admin and cmdb_inst_admin

About this task

Service Graph Connectors are integrations that facilitate API data ingestion into the Configuration Management Database (CMDB) from various third-party sources. To learn more, see Getting started with Service Graph Connectors.

Procedure

1. Navigate to **Workspaces** > **API Insights**.
2. On the Connection status section of the Overview tab, monitor the progress of connections configured for Service Graph Connectors that import API data.
3. To view the number of installed connections, select the count metric from **Active connections**.
4. Review the list of installed and draft connections in their respective tabs.
   See Viewing API data connections for a Service Graph Connector within API Insights.
5. **Optional:** Select **Create connection** to create a connection for importing API data.
   See Create an API data connection for a Service Graph Connector within API Insights.
6. **Optional:** Select **Explore connectors** to explore available options for onboarding and maintaining Service Graph Connectors that import API data within API Insights.
   See Exploring Service Graph Connectors for API data within API Insights.

Viewing API data connections for a Service Graph Connector within API Insights

You can view installed and draft API data connections that were added using Service Graph Connectors within API Insights.

The following connection types are available for viewing:

- Installed connection (see View an installed connection within API Insights.)
- Draft connection (see View a draft connection within API Insights.)

View an installed connection within API Insights

View the details of an installed connection that was added using a Service Graph Connector within SGC Central.

Before you begin

Role required: sn_cmdb_admin and cmdb_inst_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **API Insights**.
2. Select the **Connections** tab.
3. On the API connections page, select **All connections**.
4. Select the **Installed** tab.
5. Review the list of installed API data connections.
6. Select a connection from the **Connection** column to view the details, data sources, import schedules, and errors associated with the connection.

View a draft connection within API Insights

View the details and resume setting up draft connections.

Before you begin

Role required: sn_cmdb_admin and cmdb_inst_admin

Procedure

1. Navigate to **Workspaces** > **API Insights**.
2. Select the **Connections** tab.
3. On the API connections page, select **All connections**.
4. Select the **Drafts** tab.
5. Review the list of draft connections.
6. Complete setting up the draft connections.
   - Select **Configure** to continue where a Service Graph Connector was last configured within SGC Central.
   - Select **Resume setup** to set up a single instance connector for the first time.

Create an API data connection for a Service Graph Connector within API Insights

Create an API data connection added for a Service Graph Connector within API Insights.

Before you begin

Role required: sn_cmdb_admin and cmdb_inst_admin

Procedure

1. Navigate to **Workspaces** > **API Insights**.
2. Select the **Connections** tab.
3. On the API connections page, select **Create connection**.
4. On the Create connection window, select a connector type for importing API data and then follow the playbook instructions to create a connection.

Exploring Service Graph Connectors for API data within API Insights

You can explore available options for onboarding and maintaining API data using Service Graph Connectors within API Insights.

Service Graph Connectors are integrations that facilitate data ingestion into the Configuration Management Database (CMDB) from various third-party sources. To learn more, see Getting started with Service Graph Connectors and API Service Graph Connectors.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Options for maintaining Service Graph Connectors for importing API data within API Insights include:

- Update an installed Service Graph Connector in API Insights.
- Install a Service Graph Connector with an available entitlement in API Insights.
- Install a Service Graph Connector from ServiceNow Store within API Insights.

Update an installed Service Graph Connector in API Insights

Keep a Service Graph Connector for importing API data up-to-date within API Insights.

Before you begin

Role required: sn_cmdb_admin and cmdb_inst_admin

Procedure

1. Navigate to **Workspaces** > **API Insights**.
2. Select the **Connections** tab.
3. On the API connections page, select **Explore connectors**.
4. In the Updates available section, review the updates that are available for a Service Graph Connector.
5. Update the connector.
   - Select a connector to access the connector in Application Manager and then install any updates.
   - Select **Install updates** to open Application Manager, and then view and install updates for a connector from the **Updates** tab.

   For more information, see Application Manager.

Install a Service Graph Connector with an available entitlement in API Insights

Install a Service Graph Connector for importing API data that matches an entitlement available in Application Manager from within API Insights.

Before you begin

Role required: sn_cmdb_admin and cmdb_inst_admin

Procedure

1. Navigate to **Workspaces** > **API Insights**.
2. Select the **Connections** tab.
3. On the API connections page, select **Explore connectors**.
4. In the Entitlements available section, select **Explore in Application Manager**.
5. In Application Manager, review the entitlements and install a connector for API data.
   For more information, see Application Manager.

Install a Service Graph Connector from ServiceNow Store within API Insights

Explore ServiceNow Store to request and use a Service Graph Connector with no available entitlements for importing API data from within API Insights.

Before you begin

Role required: sn_cmdb_admin and cmdb_inst_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **API Insights**.
2. Select the **Connections** tab.
3. On the API connections page, select **Explore connectors**.
4. In the Available from ServiceNow Store section, select **Explore in ServiceNow Store**.
5. On ServiceNow Store, review the list of Service Graph Connectors for importing API data and install a connector.
   For more information, see the ServiceNow Store website.

API Insights reference

Reference topics provide additional information about API Insights components, API Insights properties, and domain separation.

Components installed with API Insights

Several types of components are installed with activation of the API Insights plugin, including tables, user roles, and scheduled jobs.

Roles installed

Role title [name]	Description	Contains roles
Enterprise architect administrator [sn_api_insights_ws.api_mgmt_architect_admin]	Accesses the API Insights workspace to search APIs, review data model recommendations, monitors API connections, evaluate metrics on API usage, and set parameters for data model recommendations and de-duplication tasks.	sn_api_insights_ws.api_mgmt_architect
Enterprise architect [sn_api_insights_ws.api_mgmt_architect]	Accesses the API Insights workspace to search APIs, monitor team APIs, view managed and subscribed APIs, track API activity, review API access requests, and manage API life cycle aspects, including APIs without	• task_editor • sn_incident_read • sn_vul.vulnerability_read • sn_cmdb_editor • sn_msi.msi_incident_read

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role title [name]	Description	Contains roles
	business context, ownership, product models, or designs.	

Scheduled jobs installed

Scheduled job	Description
Gather APIs without Business App relationship	Identifies and collects APIs that do not have an associated business context also called as business application.
Import ServiceNow API to API Insights	Retrieves ServiceNow APIs from the ServiceNow registry and imports them into API Insights.
Import ServiceNow API usage to MetricBase	Collects ServiceNow API usage data and pushes it to the MetricBase application.
SyncOwnershipGroupsOfAPIVersions	Synchronizes ownership groups for API versions in API Insights.
API Specification Validation	Performs automated validation of API specifications in an instance.
Tag based relationship mapping	Applies tag-based mapping rules between APIs and application services or business applications.

Tables installed

Table	Description
APIs missing relationships [sn_api_insights_ws_apis_missing_relationships]	API records that lack a defined relationship.
API Specification [sn_api_insights_ws_api_specification]	API specification details, such as OpenAPI definitions.
Importable ServiceNow APIs [sn_api_insights_ws_importable_servicenow_api]	Details of APIs imported from ServiceNow.
Open API Specifications [sn_api_insights_ws_openapi_specifications]	OpenAPI specification records for API Insights.
Push API Specification [sn_api_insights_ws_push_api_spec]	Records for pushing API specifications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
API Requests Access Task [sn_api_insights_ws_request_access_task]	Tasks related to API access requests.
Specification Validation Rule [sn_api_insights_ws_spec_validation_rule]	Validation rules that validate API specifications based on the configured rules.
API Metric Configuration [sn_api_insights_ws_api_metric_config]	Configuration that maps each discovery source to the MetricBase application used for analytics, defining the metric name, whether it applies at API or component level, and the metric type (usage, error rate, latency, cache hit).
Tag Based Relationship Mapping [sn_api_insights_ws_tag_relationship_mapping]	Relationship rules that apply tag-based mapping between APIs and application services or business applications, defining the CI types involved, the relationship type, and which CI acts as the parent.

Plugins installed

Plugin	Description
MetricBase (com.snc.clotho)	Collects, retains, analyzes, graphs, and acts on time-series data.

ServiceNow Store applications installed

Application	Description
@devsnc/sn-list-selector (sn_list-selector)	Enables selecting a set of values from a simple or multi-dimensional data source.
CMDB CI Class Models (sn_cmdb_ci_class)	Provides the single source for all new base-system CMDB CI class models defined by ServiceNow.
CMDB Workspace (sn_cmdb_ws)	Enables a workspace for working with the CMDB to search and explore the CMDB, understand its health, work on related tasks, view activity, performance and feature usage, and access various management tools to support tasks in an organization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Application	Description
Node map Experience Component (sn_node_map)	Enables mapping and visualizing connections between concepts.
SGC Central (sn_sgc_central)	Enables discovering, installing, and monitoring Service Graph Connectors.
Timeline component (sn_ui_timeline)	Shows events and information across a timeline to contextualize history or important information for an object.
UX Commons (sn_app_ux_commons)	Enhances component experience with common UI Builder utilities, controllers, and bundles.

API Insights properties

API Insights properties control the behavior of the application.

System properties

These system properties are available for API Insights.

Note:
To open the System Properties [sys_properties] table, enter `sys_properties.list` in the navigation filter.

System properties for API Insights

Property	Description
sn_api_insights_ws.import_outbound_rest_api	Set the property to enable or disable the import of o Insights workspace. • Type: string • Default value: {"custom_api":false,"ser • Location: System Property [sys_properties] table
sn_api_insights_ws.import_outbound_soap_api	Set the property to enable or disable the import of o ServiceNow instance to the API Insights workspace. • Type: string • Default value: {"custom_api":false,"ser • Location: System Property [sys_properties] table
sn_api_insights_ws.import_scripted_rest_api	Set the property to enable or disable the import of s timeframe for recent activity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

sn_api_insights_ws.show_overview_metrics_widgets	Set the property to `true` to enable showing the Me • Type: true | false • Default value: `false` • Location: System Property [sys_properties] table

Domain separation and API Insights

Domain separation is unsupported for API Insights. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: No support

- The domain field may exist on data tables but there is no business logic to manage the data.
- This level is not considered domain-separated.

For more information on support levels, see Application support for domain separation.

Exploring CMDB Identification and Reconciliation

The Identification and Reconciliation (IRE) module provides a centralized framework for identifying and reconciling data from different data sources. It helps maintain the integrity of the CMDB and some non-CMDB tables when multiple data sources are used to create and update CI records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The use of multiple data sources increases the risk of introducing inconsistencies through duplicate records. To maintain the integrity of the database, it is important to correctly identify CIs and services so that new records are created only for CIs that are truly new.

The Identification and Reconciliation Engine (IRE) helps maintain the data integrity as follows:

- Prevent duplicate CIs by uniquely identifying CIs using sets of identification rules
- Reconcile CI attributes by allowing only authoritative data sources to write to the CMDB or to a supported non-CMDB table
- Reclassify CIs
- Provide a centralized framework to perform identification and reconciliation across different data sources

Data sources such as ServiceNow Event Management, Horizontal Discovery, Import Sets, Cloud Insights, Pattern Discovery, and Manual Entry, use IRE APIs to perform CI identification and reconciliation. In addition, any 3rd party data source can leverage REST/Scriptable IRE APIs to also perform CI identification and reconciliation.

Support for non-CMDB tables

IRE processes support some non-CMDB tables. You can create identification rules, reconciliation rules, and other IRE-related rules to ensure the integrity of data inserted or updated in supported non-CMDB tables. For details, see IRE support for non-CMDB tables.

Components and process of Identification and Reconciliation

The CMDB Identification and Reconciliation functionality is supported by the Identification and Reconciliation engine (IRE), rules, and tasks. Identification rules, reconciliation rules, IRE data source rules, de-duplication tasks, and reclassification tasks determine how IRE identifies and reconciles CI.

Concepts and Components of Identification and Reconciliation

Identification

Process of uniquely identifying CIs, to determine if a CI already exists in the CMDB or if it is a newly discovered CI that must be added to the CMDB. Identification processes rely on identification rules, or on unique IDs for CIs that data sources can provide.

Reconciliation

Process of reconciling CIs and CI attributes by allowing only designated authoritative data sources to write to the CMDB at the CI table and attribute level. The CMDB is updated in real time as records are being processed. There is no staging area to verify the reconciliation activities before they are committed. Reconciliation processes rely on reconciliation rules and IRE data source rules.

Reconciliation is required only for update operations, when the identification process identifies a CI in the CMDB that matches an incoming CI in the payload. When IRE inserts a new CI, reconciliation is not applied.

De-duplication tasks

If the instance encounters duplicate CIs during the Identification and Reconciliation process, it groups each set of duplicate CIs into a de-duplication task. Review the information in these tasks to see how it was determined that these CIs are duplicates.

Reclassification tasks

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

During the CI identification process, a matched CI might need to be upgraded, downgraded, or switched to another CI class. If automatic reclassification is disabled, then the system generates a reclassification task. Review the information in these tasks, and decide whether a manual reclassification of the CI is appropriate.

APIs

The Identification and Reconciliation APIs are a centralized set of APIs that can be used with different sources of data such as Discovery, Monitoring, or Import Sets. You can use it to enforce Identification and Reconciliation before data is stored in the CMDB. Data sources do not directly write to the CMDB. Instead, they call APIs first to ensure that the data being written does not introduce inconsistencies.

Identification engine APIs are accessible in scoped apps. The Configuration Management For Scoped Apps (CMDB) plugin (com.snc.cmdb.scoped) allows a scoped app in scripts to use the prefix 'sn_cmdb.IdentificationEngine.<method>' to access identification engine APIs. The Configuration Management For Scoped Apps (CMDB) plugin is activated in base systems.

- createOrUpdateCI() : A scriptable API that creates or updates a CI based on identification and reconciliation rules.
- identifyCI() : Similar to the *createOrUpdateCI* API, but does not commit the result to the database. Use this API with a given payload to find out if the identification engine will perform insert or update operations, without committing the operation.
- CreateOrUpdateCIEnhanced() : A scriptable API that provides the functionality of enhanced IRE features such as partial payload, partial commit, incomplete payload, and deduplication of payload items. You can select the enhanced features to use. However, if you enable partial payloads, then deduplication of payload items and partial commit are automatically enabled.
- identifyCIEnhanced : Similar to the *createOrUpdateCIEnahnced* API, but does not commit the result to the database. Use this API with a given payload to find out if the identification engine will perform insert or update operations, without committing the operation.
- CMDBTransformUtil : An API to be used exclusively with Import Sets to apply Identification and Reconciliation processes to data imported by Import Sets.

Predefined identification are included for many of the tables in the base system. You can customize these rules for your organization. When a new table is created in the CMDB, it derives identification and reconciliation rules from its parent table if these rules exist. To apply identification and reconciliation rules to a new table, create the rules either at the child level or at its parent level.

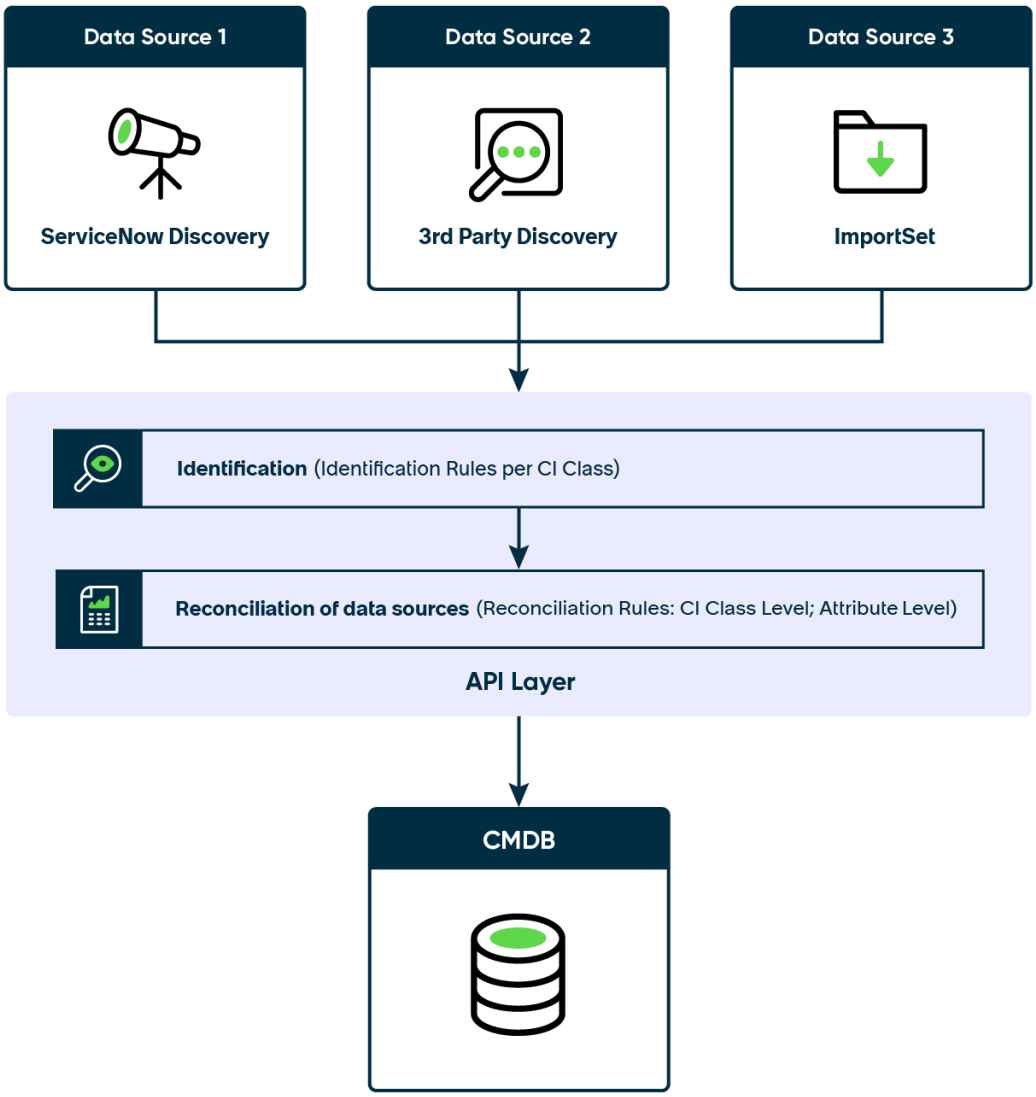
Process flow of Identification and Reconciliation



Identification and Reconciliation Engine (IRE)

Identification and Reconciliation engine (IRE) is a rule-based engine, operating as an underlying key component in Identification and Reconciliation. IRE provides a centralized framework to perform identification and reconciliation processes across different data sources. IRE uses identification rules, reconciliation rules, and IRE data source rules when processing incoming data before inserting or updating data in the CMDB. IRE processes help maintain data integrity in the CMDB.

- IRE prevents duplicate CIs by uniquely identifying CIs.
- IRE reconciles CI attributes by allowing only authoritative data sources to write to CMDB.

Identification and Reconciliation engine (IRE)

IRE is an underlying key component in Identification and Reconciliation, providing a centralized framework to perform identification and reconciliation processes across different data sources. IRE uses identification rules, reconciliation rules, and IRE data source rules when processing incoming data before inserting that data to the CMDB.

IRE processes help maintain data integrity in the CMDB.

- IRE prevents duplicate CIs by uniquely identifying CIs.
- IRE reconciles CI attributes by allowing only authoritative data sources to write to CMDB.

ServiceNow® applications such as Service Mapping, horizontal discovery, and pattern discovery, use APIs to apply identification and reconciliation processes. You can also apply IRE processes to data imported by import sets. When using other data sources including third-party data sources, you can leverage REST or scriptable IRE APIs to perform identification and reconciliation.

Additional information:

- About properties that affect some functions of IRE: See Properties for Identification and Reconciliation.
- About using IRE APIs: See IdentificationEngine - Scoped.
- About enabling debugging and checking on issues with a payload: See How to log the payload sent to IRE and check the issues with the payload [KB0750382].
- About the steps that IRE performs illustrating how IRE works, such as validating the payload, applying reconciliation, and committing the data to the CMDB: See [CMDB - IRE] How the CMDB Identification and Reconciliation Engine works when passing a CI (as payload) to the createOrUpdateCI() [KB0750386].
- About how to run a payload through IRE: See [CMDB IRE] How to run the CI identification on demand using the payload [KB0750383].

CI identification

The CMDB identification process relies on identification rules to uniquely identify CIs. When possible, CIs can also be uniquely identified using *source_name* and *source_native_key* values provided in the *sys_object_source_info* section of the payload, and the Source [sys_object_source] table. If identification is successful using that method, then it is not necessary to apply matching algorithms that rely on identification rules, which is a slower identification method.

A unique CI identifier can be provided in the optional *sys_object_source_info* object in the IRE payload.

```
{
  "items": [
    {
      "className": "cmdb_ci_win_server",
      "values": {
        "name": "SAMLABVM52"
      },
      "sys_object_source_info": {
            "source_native_key": "16777219",
            "source_name": "SCCM",
            "source_feed": "SCCM Computer Identity",
            "source_recency_timestamp": "2019-08-26 13:00:00"
      }
     }
    ]
  }
```

Identification processes rely on CIs dependency classification to uniquely identify CIs. For example, to identify a Tomcat CI which is a dependent CI. Assuming a Windows Server CI

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

(independent class) which is running a Tomcat application (dependent class). Relying on 'config file path' to uniquely identify the Tomcat CI, isn't sufficient because the Tomcat application can run on multiple machines with identical paths. The identification engine won't be able to choose a CI to update. Dependent relationships force the identification process to first identify the Windows Server host on which the Tomcat application is running, and only then, in the context of the host, to uniquely identify the Tomcat application itself.

Payload items identification

IRE generates identifier keys for all payload items in an incoming payload and then uses those keys when trying to match partial and incoming payloads. An identifier key is based either on:

- Combination of the *source_name* and *source_native_key* values from the *sys_object_source_info* object.
- Identification criterion attributes.

IRE stores the identifier keys associated with partial items in the CMDB IRE Partial Payloads Index [cmdb_ire_partial_payloads_index] table, and then uses those keys to try to match with identifier keys of incoming payloads.

Timestamps in key attributes

To help resolve conflicting attribute values, IRE uses timestamps in the following attributes to identify records that are older than the current record and therefore can be ignored:

- Most recent discovery (*last_discovered*) and Discovery source (*discovery_source*):

  Most recent discovery (*last_discovered*) is the timestamp of when the CI was last discovered. IRE always updates CIs' *last_discovered* and *discovery_source* attributes during payload processing, even when no other CI attributes are updated. When *last_discovered* is provided in the payload, IRE updates the CI with the provided value only if the *last_discovered* time in the payload is newer than the one in the CMDB. If *last_discovered* is not provided in the payload, IRE updates the *last_discovered* attribute with the current timestamp.

  You can use the glide.identification_engine.skip_updating_source_last_discovered_if_older and the glide.identification_engine.ire_message_listener_skip_updating_source_last_discovered_to_now system properties to modify this default behaviour.

- First discovered (*first_discovered*) is the timestamp of when the CI was first created.

  - When the CI is first created: If a value is provided in the payload, IRE inserts that value. Otherwise, IRE inserts the current timestamp.
  - In subsequent updates: If a value is provided, IRE updates the CI with the provided value. Otherwise, the attribute is not updated.

You can also use the following system properties to modify how IRE uses the *source_recency_timestamp* value in a payload to update the *last_scan* attribute in the Source [sys_object_source] table:

- glide.identification_engine.skip_updating_last_scan_if_older
- glide.identification_engine.ire_message_listener_skip_updating_last_scan_to_now

Enhanced IRE features

The CreateOrUpdateCIEnhanced() and identifyCIEnhanced scriptable APIs provides the functionality for the following enhanced IRE features, which can be enabled or disabled as needed:

Partial payloads

IRE isolates items for which data sources did not provide enough information to uniquely identify the CI and therefore processing cannot continue. Some of these items are identified as partial items, which get stored for potential later processing. Other items are identified as incomplete items, which get stored for logging purposes only.

For example: SCCM has multiple feeds such as a disk feed and a computer feed. The disk feed might have complete information about the disk but insufficient information about the computer CI that it depends on.

API option: *partial_payloads* which is enabled by default.
When *partial_payloads* is enabled, *partial_commits* and *deduplicate_payloads* are automatically enabled regardless of their setting in options.

Partial commits

Errors in some items do not prevent committing the rest of the items in a payload. Therefore, when a payload contains items with errors, IRE still commits the remaining valid items in the payload. In this situation, some of the uncommitted items are saved as partial payloads and other uncommitted items are saved as incomplete payloads.

API option: *partial_commits* which is enabled by default.

Deduplicate payload items

IRE deduplicates duplicate items within the payload, merging those duplicates into a single payload item for processing.

API option: *deduplicate_payloads* which is enabled by default.

Generate summary

IRE generates summaries in the output payload with processing details such as the number of updates per class.

API option: *generate_summary* which is disabled by default.

Partial items

A payload item is determined to be a partial item if it doesn't contain the necessary data for unique identification and if it has one of the following errors. Unique identification requires that the payload item has the *sys_object_source_info* section with *source_name* and *source_native_key* values, or the full set of the identification criterion attributes specified for the CI class, or both.

IRE errors for a partial item:

- MISSING_MATCHING_ATTRIBUTES –– Item does not have identification criterion attributes to use at least one identifier entry for matching.
- REQUIRED_ATTRIBUTE_EMPTY –– Unable to create a CI because a required attribute is missing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- MISSING_DEPENDENCY –— Dependent CI is missing a dependency relation which is specified in the payload.
- INSERT_NOT_ALLOWED_FOR_SOURCE –— An IRE data source rule prevents the specified data sources from creating CIs of the specified class.

For more details about IRE error messages, see IRE error messages.

If processing fails because payload items are determined to be partial items, then the partial items are saved as partial payloads in the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] table in JSON format for later potential processing. IRE uses identifier keys to attempt to match incoming payloads with stored partial payloads.

If later, a data source sends the data that was missing in the partial item, IRE matches the incoming payload with the stored partial payloads. IRE then merges any matching partial payloads with the incoming payload. To resolve any conflicting attributes, IRE uses either *source_recency_timestamp* (when *source_native_key* and *source_name* are identical), or static reconciliation rules specified for the class. The result is a complete and valid payload which IRE then processes to create or update the respective CIs.

Partial payloads older than 90 days are deleted from the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] table.

Sample of a partial payload:

```
Disk feed:
{
  "items": [
    {
      "className": "cmdb_ci_computer",
      "sys_object_source_info": {
            "source_native_key": "Server001",
            "source_name": "SCCM",
            "source_feed": "DISK_FEED",
            "source_recency_timestamp": "2019-08-26 13:00:00"
      }
    },
    {
      "className": "cmdb_ci_disk",
      "values": {
        "name": "disk1"
      }
    }
  ],
  "relations": [{
              "parent": 0,
              "child": 1,
              "type": "Contains::Contained by"}
              ]
}
```

The computer item in the above payload does not have any attributes and therefore IRE can't process it. However, *source_name* and `source_native_key` are provided making it a partial item. Because the computer item is partial, the disk item that depends on the computer item, is a partial item too.

Sample of a subsequent payload that completes the previous partial payload by providing the missing details:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
Server/Computer feed:
 {
  "items": [
    {
      "className": "cmdb_ci_linux_server",
      "values": { "name": 'linux001',
                  "ip_address": "100.126.38.19",
                  "mac_address": "DSWER4587" },
      "sys_object_source_info": {
            "source_native_key": "Server001",
            "source_name": "SCCM",
            "source_feed": "COMPUTER_IDENTITY",
            "source_recency_timestamp": "2019-08-26 14:00:00"
      }
    }
  ]
}
```

The computer in the partial payload and the server in the new payload match because they have identical *source_name* and *source_native_key*. Therefore, the partial payload and the new payload are merged, the operation is committed, and the partial payload is deleted from the Partial Payloads table.

There is a limit on the number of items per partial payload, which is set by the glide.identification_engine.partial_payload_items_max_size property (1000 by default). Storing associated relationships, references, and dependent items, in one partial payload, can result in reaching that limit, in which case, the payload is split into multiple partial payloads.

For more information about partial payloads, see CreateOrUpdateCIEnhanced().

Incomplete items

A payload item is determined to be an incomplete item if:

- It does not contain all the data necessary for unique identification
- It has an error that is not associated with a partial item

Unique identification is not possible if neither *source_name* and *source_native_key* within the *sys_object_source_info* object, nor the full set of identification criterion attributes specified for the CI class, is provided.

Incomplete items are saved as incomplete payloads in the CMDB IRE Incomplete Payloads [cmdb_ire_incomplete_payloads] table in JSON format. Incomplete items are stored for the purpose of logging payloads with irrecoverable errors, and are never processed again.

Adding relationships

Add relationships by using either indices, or the optional JSON internal_id element.

Use the *relations* object in the payload to add or update relationships by referring to *internal_ids* of items. Relationships can be created using main items and related items in the payload. For example:

- Relation (parent Index, child Index, Relation Type)
- Relation (parent Internal Id, child Internal Id, Relation Type)

For more information and for code samples, see CreateOrUpdateCIEnhanced().

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Adding references between payload items

Add references between two payload items by using the optional JSON *internal_id* element, which uniquely identifies payload items.

Use the *referenceItems* block to add or update references. You can add references between any two items, including main items, lookup items, and related items, in a single payload.

For more information and for code samples, see CreateOrUpdateCIEnhanced().

CI reclassification

Use the *updateWithoutUpgrade*, *updateWithoutDowngrade*, and *updateWithoutSwitch* flags in the settings block in a payload, to prevent unintentional updates to CIs' class. These flags prevent upgrading, downgrading, or switching the class of a CI that multiple data sources unintentionally might attempt while updating the same CI. For more information and for code samples, see CreateOrUpdateCIEnhanced().

Reclassification flags have precedence over any other system settings for Configure CI reclassification during IRE processing.

Adding custom before and after scripts

Use the IntegrationHub ETL to add custom Java scripts for a data source of a CMDB integration application. Those scripts provide access to the IRE input and output payloads, while processing CMDB integrations.

Before scripts provide access to a batch of input payloads that will be sent to IRE. Using a custom before script lets you:

- Skip a payload in the batch by setting the *status* to SKIPPED. Optionally, provide a reason for skipping the payload which will appear as a comment on the respective import set row table.
- Modify the input payload.
- Write other custom logic inside the script that uses the IRE payload.

After scripts provide access to the IRE input and output payloads. Using a custom after script lets you:

- Easily compare the input and output payloads and identify the different operations that IRE performed on each CI.
- Access the sys_ids of the CIs that IRE created or updated.
- Write other custom logic inside the script that uses the IRE output payload.

Configuring CMDB Identification and Reconciliation

Configure the necessary rules for CMDB Identification and Reconciliation (IRE) to function effectively.

Configuration overview

- Create identification rules

  Identification rules are essential in correctly identifying CIs in the CMDB to prevent the creation of duplicate CIs. Effective identification rules help determine whether an incoming CI is added to the CMDB or used to update and existing CI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Create reconciliation rules

  Static and dynamic reconciliation rules determine which discovery source is authorized to update which CI attributes. Reconciliation rules are important in preventing discovery sources from overwriting each other's updates to the same attribute values.

- Create data source rules

  Data source rules prevent discovery sources from inserting new CIs for a specific class. Data source rules are useful in preventing untrusted discovery sources from creating new CIs while continuing to trust these discovery sources in updating existing CIs.

- Create dependent relationship rules

  Dependent relationship rules define the dependency structure of the CI types and the relationship types in service definitions, which help in CI identification and in the construction of business service maps.

Identification rules

The CMDB identification process relies on identification rules to uniquely identify CIs.

An identification rule applies to a CI class and consists of a single CI identifier and one or more identifier entries and related entries, each with a different priority. Each identifier entry defines a unique attribute set with a specific priority and each related entry defines rules for identifying related items. Create strong identification rules that are set with the highest priority for the strongest identifier entries and related entries.

The identification process and identification rules use the CI's attributes for identification:

Unique attributes

Designated sets of criterion attribute values of a CI that can be used to uniquely identify the CI. Unique attributes can be from the same table or from derived tables.

Required attributes

Designated attributes of a CI that cannot be empty.

Derivation across the CMDB hierarchy

If no identification rule is explicitly defined for a child class, then the child class derives its identification rule, including any associated identification entries and related entries, from its parent class. Later, an own identification rule can be explicitly defined for the child class. In that case, the identification rule that was initially derived from the parent class, including any associated identification entries and related entries, is no longer in effect at the child class. Also, you must explicitly add identification entries and related entries in the newly created identification rule at the child class.

For example: The *Hardware* class identification rule has a related entry for the *Software Instance* table. This identification rule, including its associated related entry for the *Software Instance* table, is derived by the *Computer* class. If you then create a new identification rule for the *Computer* class, it overwrites the identification rule that was derived from the *Hardware* class. Therefore, the *Hardware* class identification rule, including its associated related entry for the *Software Instance* table, is no longer in effect for the *Computer* class. If the same related entry is needed, you must explicitly add a related entry for the *Software Instance* table in the newly created identification rule for the *Computer* class.

Identification rule types

CI dependency is specified in the CI Class Manager by the dependent relationship rules for the CI's class:

Independent CIs

CIs, such as Server CIs, which exist on their own and are not dependent on any other CIs.

Dependent CIs

CIs which depend on a relationship to another CI and can't exist on their own in the absence of the dependent relationship. For example:

- *Network Adapter* CIs can't exist meaningfully without the *Hardware* CIs that contain them.
- *Application* CIs can't exist on their own without the *Server* CI they are hosted on.

The steps for identifying dependent CIs can be different from the steps for identifying independent CIs. This difference is reflected in the differences between dependent identification rules and independent identification rules:

Independent identification rule

A rule that identifies a CI based on the CI's own attributes, independently of other CIs or relationship.

Dependent identification rule

A rule in which identifying a CI requires identifying a dependent CI first. A CI can have dependency on one or more CIs, and a dependent CI can have only a single parent CI with dependency. The relationship types between the CI and its dependent CIs are also included in the identification process. To help with the identification process of dependent CIs, create dependent relationships that define the dependency chain within CI types.

The payload used for identification of a dependent CI, can include a relationship with a qualifier chain. For such relationship, if there is a matching parent/child pair, the system compares the qualifier chain in the payload, with the qualifier chain of the CIs in the database. If there is a difference, the qualifier chain in the database is updated to match the qualifier chain in the payload for that relationship.

Identifier entries

You can configure an identifier entry to match a CI not only based on the CI's own attributes (field-based identification) but also based on the CI's related list (lookup-based identification) such as **Serial Numbers** or **Network Adapters**. The lookup table that is used for identification, needs to have a reference field that points to *cmdb_ci*.

There are three types of identifier entries:

Regular identifier entry

Identification is based on CI's own attributes that uniquely identify the CI.

Lookup identifier entry

Identification uses a lookup table (related table) which can be any table that has a reference to the CI that is being identified. After you select a related lookup table, you select identifier attributes from the related table that reference either the cmdb_ci table itself, or one of its descendants.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If the lookup records don't already exist, then they are inserted in the lookup table referenced in the identifier entry.

Hybrid identifier entry

A combination of both, a regular identifier entry and a lookup identifier entry.

Example: When discovering virtual machines in a cloud environment which might contain two virtual machines with an identical set of serial numbers. A lookup identifier entry for the Hardware table such as `[Table: Serial Number, Criterion Attributes: Serial Number, Serial Number Type]` cannot uniquely identify these two virtual machines. However, a hybrid identifier entry such as `[Table: Serial Number, Criterion Attributes: Serial Number, Serial Number Type + (Name field from main Hardware table)]` can uniquely identify the two virtual machines.

Guidelines for lookup tables

Follow these guidelines when specifying a lookup table in an identifier entry.

1. Ensure that lookup tables reference the cmdb_ci table.
2. It is preferable to enforce exact count match (check box **Enforce exact count match (Lookup)**) for a stronger identification rule. During lookup identification, this option enforces matching only on exact lookup records count match. See Create a CI identification rule for more details.
3. Do not create conflicting identification rules especially for lookup-based rule.

   Example: In a CI Identifier for the Hardware class, you specify a lookup-based rule for the Network Adapter class and you also define a CI Identifier for the Network Adapter class. Duplicates might potentially be created in the Network Adapter table, because there are contradicting rules to identify a unique CI in that table:

   - One rule that looks only at criterion attributes (CI identifier rule)
   - Another rule that looks at criterion attributes and referenced sys_id (lookup rule).

Example: CI with related items that needs to be inserted - sysId is available.

```
var payload = {
    items: [{
        className:'cmdb_ci_linux_server',
       related: [{
              className:'cmdb_ci_spkg',
              values: {
                name:'package1',
                version:'version1'
                }
        }],
        values: {
            sys_id:'194876usytrr65378098'
        }
}]
};
```

Related entries

You can define related entries which are rules that are based on related CIs. A related entry is based on a related table which can be any table (CMDB or non-CMDB) that has a reference to the CI that is being identified. Related entries let you create or update records on other tables in

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

which the data is associated with the CI being identified by the identifier entries. Related entries are not used to directly identify CIs.

After you select a related table for the rule, the list in **Referenced field** is populated with fields from the related table that reference either the cmdb_ci table itself, or one of its descendants.

A related entry for a class is derived by child classes for which no related entries are specified.

Related topics

Relation qualifier

Create a CI identification rule

Identification rules are used to uniquely identify CIs in the CMDB, as part of Identification and Reconciliation (IRE) processes. Each CMDB class can be associated with a single identification rule.

Before you begin

You can update a CI identification rule only at the class level that the rule is defined for. You can't update a derived rule.

Role required: itil has read access, itil_admin (on top of itil) has full access.

About this task

In a CI identification rule, specify a CI identifier, and identifier entries and related entries that uniquely identify the CI.

Review the following before creating identification rules:

- Identification rules
- General guidelines for using CMDB Identification
- Explore predefined identification rules:
  1. Navigate to **All** > **CI Class Manager**.
  2. Select **Hierarchy** and then search and select, for example, the Hardware class.
  3. In the Hardware bar, expand **Class Info** and select **Identification Rule**.
  4. Examine all the sections and tiles with the settings of the Hardware class identification rule.

Procedure

1. Navigate to **All** > **Configuration** > **CI Class Manager**.
2. Select **Hierarchy** to show the CI Classes list and then select the class for which to create an identification rule.
3. In the class navigation bar, expand **Class Info** and then select **Identification Rule**.
4. Select **Edit**, **Add**, or **Replace** (for a class that has derived the CI identification rule), in the Identification Rule section to create one.
5. Fill out the form, and then select **Save**.

Field	Description
Independent/ Dependent	Designation of whether the CI identifier can identify the CI independently of other CIs, or not.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: To set the rule as **Dependent**, you must specify dependent relationship rules for the selected class.
Name	Name of CI identifier.
Description	Description of the CI identifier.

6. In the Identifier Entries section, select an existing identifier entry to edit, or select **Add** to create one.
7. In the Identifier Entry dialog box, choose an option and then select **Next**.
Continue with one of the following three steps according to the option you selected:

Option	Description
Use attributes from main table <table>	Lets you select attributes from the currently selected table (regular identifier entry).
Use attributes from another table (Lookup table)	Lets you select attributes from any related table, other than the currently selected table (lookup identifier entry).
Use attributes from main and another table (Hybrid)	Lets you select attributes from both the currently selected table, and from another table (hybrid identifier entry).

8. **Use attributes from main table <'table'>** option: Set the options on the form and then select **Save**.

   Search On Table is preset to the currently selected table in the CI Classes list.

Field	Description
Active	Check box that specifies the identifier entry is active. At least one identifier entry in an identification rule must be active for the rule to apply.
Priority	Priority of the identifier entry. Identifier entries are applied based on priority. Rules with lower priority numbers are given higher priority. Identifier entries of identical priorities are applied randomly. You can keep gaps between the priority numbers, so you can assign the unused priority numbers to new entries without modifying the existing priority order.
Criterion Attributes	Set of attributes that uniquely identify the CI. Attributes can belong to the current class, or to a parent class.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: It is possible to add reference fields as a criterion attribute. However, such fields might not always be effective: ○ Reference fields store *sys_id*s that point to a record in another table, and thus is considered a weak criterion attribute (in terms of uniqueness) for the current table. ○ The system detects and then replaces invalid values in a reference field with 'Unknown'. For example, an invalid *Model ID* value is replaced with the value 'Unknown'. Also, if several CIs end up having that same reference field set to 'Unknown', then these CIs become duplicate CIs.
Allow null attribute	When selected, then if at least one criterion attribute is not null, attempt matching with an identifier entry even if there are criterion attributes that are null. Otherwise, all criterion attributes must have values to attempt matching with an identifier entry.
Allow fallback to parent's rules	Allows the identification rules of the CI's parent to be used if a match is not found for this identification rule. Applies only for dependent identification rules.
Advanced Options	A filter to narrow the set of records that will be searched for a matching CI. Available only if the *glide.identification_engine.enable_identifier_optional_condition* system property is set to **true** (**false** by default). In the base system, identifier entries of various classes are pre-configured with advanced options conditions. All these pre-configured conditions in regular identifier entries will automatically apply when you set this property to **true**. Therefore, to prevent unexpected behavior, review those predefined conditions in regular identifier entries before setting this property to **true**. For more details about this property, see Properties for Identification and Reconciliation.

Note:
If criterion attributes have only two attributes and *sys_class_name* is one of them (for example [name, sys_class_name], [ip_address, sys_class_name]), then the other attribute cannot be NULL, even if **Allow null attribute** is enabled. This restriction is due to *sys_class_name* being considered a special system matching attribute.

9. **Use attributes from another table (Lookup table)** option:

   a. Set **Search On Table** to a table other than the currently selected table in the CI Classes list. The **Search On Table** must have a reference field to *cmdb_ci*, otherwise the identifier entry is considered invalid.

   b. Set the rest of the fields as described in the previous step.

   c. **Optional:** Select **Advanced options** and enter the information for a lookup identifier (scroll down if necessary).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced Option	Description
All of these conditions must be met	A filter to narrow the set of records that will be searched for a matching CI.
Enforce exact count match	For lookup identification, match a CI only on exact lookup records count match. When enforced, all lookup items for a CI in the payload must have matching records in the lookup table, that reference the same CI: **i.** Only matches CIs that have all the lookup items from the input payload referencing the CI in CMDB. **ii.** If there are multiple matches, selects the oldest created CI as the final match. When not enforced, one lookup item for a CI in the payload matching a record in the lookup table, is sufficient to consider a match: **i.** Matches any CI that has at least one of the lookup items from the input payload referencing the CI in CMDB. **ii.** If there are multiple matches, selects the CIs with the max number of lookup items from the input payload referencing the CI in CMDB. **iii.** If there are still multiple matches, selects the oldest created CI as the final match.

d. Select **Save**.

10. **Use attributes from main and another table (Hybrid)** option:

    a. Set the options on the **General Settings** tab as described in previous steps, and then select **Next**.

    b. On the **Main Table Settings** tab, select the attributes to use from the currently selected table, and then select **Next**.
    Search On Table is preset to the currently selected table in the CI Classes list.

    c. On the **Lookup Table Settings** tab, select a **Search On Table** and then in **Criterion Attributes** select attributes from the specified table. **Search On Table** must have a reference field to *cmdb_ci*, otherwise the identifier entry is considered invalid.
    You can select **Advanced options** and enter the information for a lookup identifier as described in the previous step (scroll down if necessary).

    d. Select **Save**.

    Note:
    The **Allow null attribute** option in the hybrid option, is set to **false**. Therefore, all of the selected criterion attributes from both the currently selected table and the lookup table, must have a value. Also, setting optional conditions is available only for the lookup table, and is not available for the main table.

11. **Optional:** On the Related Entries section select an existing related entry to edit, or select **Add** to create one.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Update the Related Entry form and then select **Save**.

Related Entry form

Field	Description
Active	Check box that specifies that the related entry is active.
Related table	A related table that references the CI that is being matched.
Referenced field	A referenced field in **Related table** that should store the referenced CI. This field always references the cmdb_ci table, or a descendent of the cmdb_ci table.
Priority	Priority of the related entry for the specified **Related table**. Rules with lower priority numbers are given higher priority while matching a related item for specific related table. Related entries for the specified related table with identical priorities are applied randomly. You can keep gaps between the priority numbers, so you can assign the unused priority numbers to new entries without modifying the existing priority order.
Criterion attributes	The set of attributes to uniquely identify the related item. Attributes can belong to the current class, or to a parent class. **Note:** It is possible to add reference fields as a criterion attribute. However, such fields might not always be effective: ▪ Reference fields store *sys_id*s that point to a record in another table, and thus is considered a weak criterion attribute (in terms of uniqueness) for the current table. ▪ The system detects and then replaces invalid values in a reference field with 'Unknown'. For example, an invalid *Model ID* value is replaced with the value 'Unknown'. Also, if several CIs end up having that same reference field set to 'Unknown', then these CIs become duplicate CIs. Select the lock icon to view, add, or remove attributes from the identification rule.
Allow null attribute	If at least one criterion attribute in the related table is not null, allow to attempt matching with an identifier entry even if there are criterion attributes which are null.
Filter conditions	Add conditions to construct a filter to narrow the set of records that will be searched for a matching related item.

Note:
If criterion attributes have only two attributes and *sys_class_name* is one of them (for example [name, sys_class_name], [ip_address, sys_class_name]), then the other attribute cannot be NULL, even if **Allow null attribute** is enabled. This restriction is due to *sys_class_name* being considered a special system matching attribute.

Example:
For example, the pre-defined **Hardware Rule** applies to the Hardware [cmdb_ci_hardware] table. It has an identifier entry with the criterion attribute **Serial Number, Serial Number Type** and its **Search on table** field is set to **Serial Number**.

The following payload snippet adds a CI to the *cmdb_ci_linux_server* class, that is a child of the *Hardware* class. It also shows how you can add related items in the payload for which you should create **Related Entries** on the CI Identifier page for the Hardware [cmdb_ci_hardware] table:

```
{
    "items": [
        {
            "className": "cmdb_ci_linux_server",
            "lookup": [
                {
                    "className": "cmdb_serial_number",
                    "values": {
                        "serial_number": "VMware-42 21 e3 da 44
 14 5a a6-56 48 2b 0a 28 53 42 4c",
                        "serial_number_type": "system",
                        "valid": "true"
                    }
                },
                {
                    "className": "cmdb_serial_number",
                    "values": {
                        "serial_number":
 "4221E3DA-4414-5AA6-5648-2B0A2853424C",
                        "serial_number_type": "uuid",
                        "valid": "true"
                    }
                },                }
            ],

    “related": [
                {
                    "className": "cmdb_ci_ucs_chassis",
                    "values": {
                        “name": “chassis1",
                        “category": “category1",
                        “short_description": “My Chassis 1"
                    }
                },
                {
                    "className": "cmdb_ci_ucs_chassis",
                    "values": {
                        “name": "chassis2",
                        "category": "category2",
                        "short_description": "My Chassis 2"
                    }
                },    }
     ],

            "values": {
                ......
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
                "name": "xpolog2.lab3",
                "os_name": "Linux",
                "output": "Linux xpolog2.lab3
 2.6.32-431.el6.x86_64 #1 SMP Fri Nov 22 03:15:09 UTC 2013
 x86_64 x86_64 x86_64 GNU/Linux",
                "serial_number": "VMware-42 21 e3 da 44 14 5a
 a6-56 48 2b 0a 28 53 42 4c",
                "sys_class_name": "cmdb_ci_linux_server"
            }
        }
    ]
}
```

When the **Hardware Rule** is applied, the Serial Number [cmdb_serial_number] table is searched for a match with the values specified within the `lookup` key. Unless **Enforce exact count match (Lookup)** is checked, it is not necessary for every lookup key to return a match, as long as there is at least one match. If all matches reference the same CI, then that CI is considered to be the existing CI record. If no match is found, then the identification search continues to the next rule entry. If after all the rules are exhausted without finding a match, a new CI record is created in the database.

What to do next

You can optionally create an inclusion rule to narrow the scope of CIs that are included in identification.

Create an identification inclusion rule

Narrow the scope of CIs that are included in the identification process by creating an identification inclusion rule.

Before you begin

Role required: itil has read access, itil_admin (on top of itil) has full access.

About this task

During duplication detection of independent CIs, the identification and reconciliation engine (IRE) processes only the CIs that satisfy the identification inclusion rules. For example, you can set a filter to include only CIs whose state is operational. When no identification inclusion rules exist, all CIs are included in the identification process and in the CMDB Health duplicate metric calculations. In the base system, there are no predefined identification inclusion rules. Identification inclusion rules are defined at the class level.

Identification inclusion rules also indirectly impact what appears in CMDB health dashboards for duplicate CIs, in addition to any health inclusion rules.

> **Note:**
> Identification inclusion rules impact any script that calls IRE, therefore create them carefully. Identification inclusion rules can prevent the identification of certain types of CIs, affecting some features of Discovery and Service Mapping.

Procedure

1. Navigate to **All** > **Configuration** > **CI Class Manager**.
2. Select **Hierarchy** to display the CI Classes list.
3. Select the class for which to create an identification inclusion rule.
4. In the class navigation bar, expand **Class Info** and then select **Identification**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Create or edit a rule and specify its criteria.

   a. In the Inclusion Rule (Advanced) section, select **Add** to create a rule or select **Edit** to edit an existing rule.

   b. In the Create Inclusion Rules dialog box, specify a criteria in the **Active record condition** field.
   CIs must meet this criteria to be included in the identification process and in the duplicate CMDB Health metric.

6. Select **Save**.

What to do next

Navigate to **All** > **Configuration** > **Identification/Reconciliation** > **Identification Inclusion Rules** > to see the list of all identification inclusion rules.

Create health inclusion rule

General guidelines for using CMDB Identification

Review the following general guidelines for using CMDB Identification effectively.

Identification rules

An independent identification rule identifies a CI based on the CI's attributes, independently of other CIs.

A dependent identification rule identifies a CI by its dependent CIs and the relationships of the identified CI with those dependent CIs. Identification with a dependent identification rule is based on the dependent CIs and the relationships and qualifiers between the identified CI and its dependent CIs. Identification then requires more time than with an independent identification rule and is prone to some identification errors. Usage of dependent rules should therefore be minimized.

CI modeling determines which type of identification rules are required for proper CI identification.

Create identification rules using the following order of importance:

1. Independent identification rules — It is always preferable to create independent identification rules rather than dependent identification rules. When you model a CI, define the CI with a complete set of attributes that lend themselves to independent identification, eliminating the need to use additional CIs for identification.
2. Dependent identification rules — If it is necessary to create dependent identification rules, then define a single level of dependency. Two is the maximum number of dependency levels that is supported.
3. Avoid creating lookup identifier entries. The use of lookup identifier entry is highly discouraged as it can reduce performance. If unavoidable, ensure to first review class definitions and consider updates that allow usage of independent identification rules.
4. Limit the number of identifier entries within an identification rule, ideally to 1. A second identifier entry can further reduce performance, as will each additional identifier entry.
5. Create strong identification rules in which the strongest identifier entries and related entries are set with the highest priority.
6. Ensure that the identification rule is at the class level that it needs to be.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Payload

Create the payload using the following order of importance:

1. Payload size — Limit the number of CIs per payload to 500.
2. Avoid duplicate entries in the payload.

   Example: If an identification rule has a criterion attribute for the **name** field, then the following payload has duplicate items resulting in failure:

```
var payload = {
    items: [{
        className:'cmdb_ci_linux_server',
        values: {
            name:'Win Server 200',
            ram:'2048'
        }},
{
        className:'cmdb_ci_linux_server',
        values: {
            name:'Win Server 200',
            ram:'4096'
        }}]
};
```

3. Do not pass system data such as the following in the payload.

```
var payload = {
    items: [{
        className:'cmdb_ci_linux_server',
        values: {
            name:'Win Server 200',
            sys_domain:'global',
            sys_domain_path:'xyz',
            sys_updated_on:'2017-06-15 16:25:11',
            sys_mod_count:23,
        }}]
};
```

4. Provide the minimum necessary set of criterion attributes for each payload item, according to what is specified in the corresponding identification rules.
5. When matching CIs, use CIs' sysIds if available. If provided, IRE can use the sysId to directly locate a CI without requiring any criterion attributes from the identification rule. In this case, IRE does not use the sysId in the matching process.
   - Example: Independent CI that needs to be updated — sysId is available.

```
var payload = {
    items: [{
        className:'cmdb_ci_linux_server',
        values: {
            sys_id:'194876usytrr65378098',
            ram:'2048',
        }}]
};
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Example: Dependent CI that needs to be inserted. Tomcat War CI depends on Tomcat CI, and Tomcat CI depends on Linux Server CI. SysIds for the Tomcat and the Linux CIs are available.

```
var payload = {
        items: [{
            className:'cmdb_ci_app_server_tomcat_war’,
            values: {
                name:'war1',
                short_description:'my description'
  }
        }, {
            className:'cmdb_ci_app_server_tomcat',
            values: {
                sys_id:'194876usytrr65378098'
            }
        }, {
            className:'cmdb_ci_linux_server',
            values: {
                sys_id:'09876tysueyt6345lakiu'
            }
        }],
        relations: [{
                    parent:1,
                    child:0,
                    type: 'Contains::Contained by’}, {
                        parent:1,
                        child:2,
                        type:'Runs on::Runs'}
                    ]
                };
```

- Example: Dependent CI that needs to be updated — sysId is available.

```
var payload = {
        items: [{
            className:'cmdb_ci_app_server_tomcat_war',
            values: {
                sys_id:'039387euey637465sytet',
                short_description:'my description new'
     }
        }]
                };
```

6. When inserting many CIs, all of which depend on the same CI, you should serialize your API calls. Otherwise, attempting to concurrently process many CIs can clog the system, significantly degrading overall system performance.

Reconciliation rules

Reconciliation rules determine which discovery sources can update CI attributes.

Discovery sources, such as EventManagement, ImportSet, ManualEntry, and Tivoli, are used with the createOrUpdateCI() API to simulate manual updates to CIs. Without reconciliation rules, discovery sources can overwrite each other's updates to attribute values.

There are two types of reconciliation rules:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Static reconciliation rules

Static reconciliation rules are the legacy reconciliation rules that set priorities for the various discovery sources for updating CI attributes. Static reconciliation rules specify which discovery sources can update class attributes, and the precedence order among these discovery sources.

When creating static reconciliation rules, ensure that there is a reconciliation rule for each discovery source that is authorized to update an attribute. Reconciliation rules can be defined at the parent and the child class level.

Static reconciliation rules are stored in the Reconciliation Definition [cmdb_reconciliation_definition] table.

Dynamic reconciliation rules

Dynamic reconciliation rules are based on attribute values processed by CMDB 360/Multisource CMDB rather than on discovery source priority. First, CMDB 360 processes the current payload data into the CMDB 360 data store. Then, applying a dynamic reconciliation rule, IRE selects the largest or most reported value, for example, across all discovery sources. Because dynamic reconciliation rules leverage CMDB 360, you must enable that feature to use dynamic reconciliation rules.

Creating dynamic reconciliation rules can be useful, for example, if it becomes difficult to set priority order for multiple discovery sources. Only a single dynamic reconciliation rule can exist per class attribute.

Dynamic reconciliation rules are stored in the Dynamic Reconciliation Definitions [cmdb_dynamic_reconciliation_definition] table.

Examples of static reconciliation rules

The following sample static reconciliation rules are created for the *cmdb_ci_computer* class and its *cmdb_ci_linux_server* child class:

1. Discovery is exclusively authorized to update the *name* attribute in the *cmdb_ci_computer* class.

   Because reconciliation rules are derived by child classes from parent classes, this rule also authorizes Discovery to update the *name* attribute in any child classes for the *cmdb_ci_computer* class.

2. ServiceWatch is exclusively authorized to update the *name* attribute in the *cmdb_ci_linux_server* class.
3. ServiceWatch is exclusively authorized to update all attributes in the *cmdb_ci_linux_server* class, as configured by leaving the **Attributes** field empty in the rule.

See Create a CI reconciliation rule for details about creating a static reconciliation rule that, for example, authorizes a discovery source to update a specific attribute such as *name*.

Using reconciliation rules

As you create reconciliation rules, keep in mind the following principles which are designed for flexibility and the refinement of rules at the attributes level:

Precedence of dynamic reconciliation rules

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When both, static and dynamic reconciliation rules exist for the same CI attribute, the dynamic reconciliation rule takes precedence over the static reconciliation rule.

Authorization for all attributes in a class

A static reconciliation rule lets you authorize a discovery source to update all attributes in a class. However, this authorization can be overridden for some of the attributes by rules for child classes in which specific attributes are listed.

For example, if only example rules #1 and #3 above are created, then Discovery is authorized to update the *name* attribute in the *cmdb_ci_linux_server* class. ServiceWatch is authorized to update all other attributes in the class except for the *name* attribute.

To override the authorization of Discovery to update the *name* attribute, example rule #2 above is added to specifically authorize ServiceWatch to update the attribute.

Authorization to only specific attributes in a class

To authorize a discovery source to update specific attributes in a class, create a static reconciliation rule for the discovery source, and list these attributes in the rule. A rule that grants access to specific attributes in a class overrides other static reconciliation rules with an empty attribute list that grants access to the entire class.

Example rule #1 above grants Discovery with exclusive authority to update the *name* attribute of the *cmdb_ci_computer* class. All other discovery sources are prevented from updating the *name* attribute of any CI in the *cmdb_ci_computer* class.

Child class rules overrides parent class rules

Any reconciliation rules defined for a child class override the rules defined for its parent class. So if an attribute of a derived rule is overridden by a child's class rule for a specific class, then the derived rule has no effect on that attribute. This behavior applies also when the child's reconciliation rule is static and the parent's rule is dynamic (dynamic reconciliation rules have precedence over static reconciliation rules when they are for same level class).

For example, rule #1 above lets Discovery update the *name* attribute in the *cmdb_ci_computer* class and all of its child classes. However, rule #2 for the *cmdb_ci_linux_server* child class, which overrides rule #1 for the parent class, explicitly authorizes ServiceWatch to update this attribute in the child class.

As a result:

- Discovery cannot update the *name* attribute of the child *cmdb_ci_linux_server* class. Only ServiceWatch is authorized to update this attribute.
- Discovery is authorized to update the *name* attribute of CI records in all other child classes of the *cmdb_ci_computer* class.

Overlapping static reconciliation rules

Static reconciliation rules that authorize different discovery sources for the same attributes of the same class can coexist and do not exclude each other.

For example, assume the following rule is added. It is similar to example rule #1 above but authorizes a different discovery source:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ServiceWatch is authorized to update the *name* attribute in the *cmdb_ci_computer* class.

Like example rule #1 above, this new rule applies to the *name* attribute in the *cmdb_ci_computer* class so both Discovery and ServiceWatch can update the attribute. Any reconciliation rules are enforced to prevent the discovery sources from overwriting each other's updates.

For more information about reconciliation rules, see the [CMDB - Data Precedence Rules] Understanding the CMDB data precedence rules and troubleshooting [KB0756709] knowledge base article (Starting with the Paris release, reconciliation and data precedence rules are merged.)

Domain separation

If Domain Separation is enabled, then you can scope reconciliation rules to specific domains. Rules of the parent domain, if not overridden, apply to CIs of child domain. All rules that are visible to a domain are applied, and a rule overriding the parent domain displays thele child domain version.

Understanding the CMDB reconciliation rules and troubleshooting [KB0756709]

Create a CI reconciliation rule

Create a static or a dynamic CI reconciliation rule.

If both, static and dynamic reconciliation rules exist for the same CI attribute, the dynamic rule has precedence.

Note:
You can't create a reconciliation rule for system fields or for Identification and Reconciliation Engine (IRE) specific fields such as the Discovery source (discovery_source) field. Also, reconciliation rules can't be dot-walked using reference fields.

Create a static reconciliation rule

A static reconciliation rule specifies class attributes that discovery sources are authorized to update, and prevents unauthorized discovery sources from overwriting the attributes' values. A static reconciliation rule also specifies the prioritization among multiple discovery sources. Without static reconciliation rules, discovery sources can overwrite each other's updates to attribute values.

Before you begin
Role required: itil has read access, itil_admin (on top of itil) has full access.

About this task
Static reconciliation rules are used in conjunction with data refresh rules to determine reconciliation steps for a CI. These rules determine if, when, and by which discovery source a CI can be updated. If multiple discovery sources are authorized to update the same class attributes, assign a priority to each of these discovery sources to prevent them from overwriting each other's updates.

After an authorized discovery source updates an attribute, subsequent updates are accepted only from the same discovery source or from a discovery source with a higher priority. Updates from a discovery source with a lower priority are rejected, unless these two conditions are met:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The lower priority source is the first source updating the CI.
- The CI became stale based on data refresh rules for the CI class. However, a reconciliation rule that applies to all attributes, doesn't have precedence over a lower priority reconciliation rule that applies to a specific attribute, even if the CI is stale.

Precedence order of static reconciliation rules:

- Rule configured for a specific attribute, has precedence over rule set with **Apply to all attributes** (regardless of priority value).
- Between two rules for the same attribute or between two rules set with **Apply to all attributes**, the rule that is specific directly for the class has precedence over the derived rule.
- Between two rules for the same attribute or between two rules set with **Apply to all attributes** at the same class level, precedence is determined by rule priorities.

Information about the last discovery source that updates each attribute is stored in the Data Source History [cmdb_datasource_last_update] table, but only after enabling the reconciliation rule. Therefore, there might be unexpected updates after you enable the rule until the highest priority data source has updated the CI.

Static reconciliation rules affect reconciliation of stale CI attributes. During reconciliation, the information in the Data Source History table is considered along with the data refresh rules for the CI's class, to determine if a CI attribute is stale. A CI attribute is determined to be stale if it was not updated by the latest discovery source to update the CI, within a time period. The time period is specified by the Effective Duration time in the data refresh rule for the class for the discovery source. In this case, if another authorized discovery source, with a lower priority attempts to update the stale CI attribute, the update is allowed.

If there is a dynamic reconciliation rule for the same CI attribute as in a static reconciliation rule, the dynamic rule takes precedence.

Procedure

1. Navigate to **All** > **Configuration** > **CI Class Manager**.
2. Select **Hierarchy** to open the CI Classes hierarchy list.
3. Select a class for which to create a reconciliation rule.
4. In the class navigation bar, expand **Class Info** and then select **Reconciliation Rules**.
5. In the Reconciliation Rules section, select **Add** to create a rule or select an existing rule to edit.
6. Select the **Static Reconciliation Rule** tile if it appears.
   If CMDB 360/Multisource CMDB is not enabled, you can't create a dynamic reconciliation rule and the tiles to choose the rule type do not appear.
7. Fill out the fields on the **Add Data Sources & Prioritize** tab, and then select **Next**.

Field	Description
Active	Check box to activate this reconciliation rule.
Discovery Source	Discovery source that you are configuring this rule for.
Priority	Priority of **Source** within other discovery sources for the specified attributes. Smaller numbers designate higher priority. Discovery

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	sources without a reconciliation rule are assigned the lowest priority.

You can add multiple pairs of **Discovery Source** and **Priority**.

8. Fill out the fields on the **Select Attributes** tab, and then select **Next**.

Field	Description
Apply to all attributes	Authorizes the specified discovery sources to update all attributes of the specified class. **Note:** This rule will be overridden by any rule that applies to a specific attribute. In which case, instead of using this option, you can directly include all attributes for **Attributes**.
Attributes	Attributes, from the current or from a parent class, that the specified discovery sources are authorized to update. Available only if **Apply to all attributes** is not selected.
Update with Null	Attributes that the specified discovery sources can update with a null value. By default, authorized discovery sources cannot overwrite a non-null value with a null value. Attributes in this list, which are not in the **Attributes** list, are not included with the attributes that the discovery sources can update with a null value.

9. Fill out the fields on the **Set Filter Condition** tab, and then select **Save**.

Field	Description
Filter Condition	Conditions that CIs must meet for the rule to be applicable. For example, to apply this rule only to CIs that are associated with the Finance department,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	select this condition: **[Department] [is] [Finance]**.

Note:
The glide.identification_engine.enable_reconciliation_filter_before_update system property determines when filter conditions are applied. By default, those filter conditions are applied after attribute values have changed during payload processing. Set this property to **true** so that Identification and Reconciliation Engine (IRE) applies the filter conditions before attribute values change.

What to do next

- Select the filter icon ( ) and select:
  - **Attributes**: To show only reconciliation rules for a specific attribute.
  - **Discovery sources**: To show only reconciliation rules for a specific discovery source.
- Select **Preview Rule** to see per attribute, the precedence order between any discovery sources that are authorized to update that attribute and any dynamic reconciliation rules.
- If CMDB 360/Multisource CMDB is enabled, you can:
  - Select **Preview Data** to see all attributes for a specific CI. Also, for each attribute, the current CMDB value and discovery sources reported values for the attribute.
  - Select **Recompute** to recompute CI attribute values after changing reconciliation rules.
- Navigate to **All** > **Configuration** > **Identification/Reconciliation** > **Reconciliation Definitions** to see a list view of all definitions of reconciliation rules.

Create a dynamic reconciliation rule

A dynamic reconciliation rule uses CMDB 360 data to choose a value such as the largest value that is reported, for updating a CI.

Before you begin

CMDB 360/Multisource CMDB must be enabled.

Role required: itil has read access, itil_admin (on top of itil) has full access

About this task

If the same CI attribute has both, a static reconciliation rule and a dynamic reconciliation rule, the dynamic reconciliation rule has precedence.

A dynamic reconciliation rule supports several rule types, such as largest reported value and most reported value. When applying a dynamic reconciliation rule, IRE processes the current payload and then examines the CMDB 360 data store to select a value with which to update the CMDB. Depending on the dynamic reconciliation rule type, selecting the appropriate value might not be immediately conclusive. For example, there might not be a single value that is most reported, or for some values, the last discovered timestamp isn't reported. Therefore, when necessary, IRE falls back to examining additional details such as last reported, last discovered, and last updated values to select the most appropriate value.

Note:
You can't add a dynamic reconciliation rule when creating a new child class in the CI Class Manager. You must first save the new child class and then add the dynamic reconciliation rule.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Configuration** > **CI Class Manager**.
2. Select **Hierarchy** to open the CI Classes hierarchy list.
3. Select a class for which to create a reconciliation rule.
4. In the class navigation bar, expand **Class Info** and then click **Reconciliation Rules**.
5. In the Reconciliation Rules section, click **Add** to create a rule or select an existing rule to edit.
6. Select the **Dynamic Reconciliation Rule** tile.
7. On the **Select Rule** tab, select a rule type in the **Dynamic Rule Type** list field, and then click **Next**.
8. On the **Select Attributes** tab, select the attributes for which to apply the rule.
9. Select **Next**.
   Attributes that the specified rule type can't be applied to and attributes for which a dynamic reconciliation rule already exists for, don’t appear.
10. Fill out the fields on the **Set Filter Condition** tab, and then select **Save**.

Field	Description
Filter Condition	Conditions that CIs must meet for the rule to be applicable. For example, to apply a rule only to CIs that are associated with the Finance department, select this condition: **[Department] [is] [Finance]**.

What to do next

- Select the filter icon ( ) and select:
  - **Attributes**: To show only reconciliation rules for a specific attribute.
  - **Discovery sources**: To show only reconciliation rules for a specific discovery source.
- Select **Preview Rule** to see per attribute, the precedence order between any discovery sources that are authorized to update that attribute and any dynamic reconciliation rules.
- Select **Preview Data** to see all attributes for a specific CI. Also, for each attribute, the current CMDB value and discovery sources reported values for the attribute.
- Recompute CI attribute values.
- Navigate to **All** > **Configuration** > **Identification/Reconciliation** > **Reconciliation Definitions** to see a list view of all definitions of reconciliation rules.

Create a data refresh rule

Specify data refresh rules to determine if a CI is stale for a specific discovery source. Such CIs can then be updated by a lower-priority authorized discovery source.

Before you begin

Role required: itil has read access, itil_admin (on top of itil) has full access.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Data refresh rules are used in conjunction with static reconciliation rules to determine reconciliation steps for a CI. These rules determine if, when, and by which discovery source a CI can be updated. The precedence order of applying reconciliation rules to a class, remains the same even when there are data refresh rules for that same class.

Data refresh rules have no impact when dynamic reconciliation rules are in effect.

Procedure

1. Navigate to **All** > **Configuration** > **CI Class Manager**.
2. Select **Hierarchy** to show the CI Classes list and then select the class for which to create a data refresh rule.
3. In the class navigation bar, expand **Class Info** and then click **Reconciliation Rules**.
4. Create a rule by selecting **Add** in the Data Refresh Rules section, or select an existing rule to edit. Then fill out the details in the Create Data Refresh Rules dialog box.

Field	Description
Discovery source	Discovery source for which staleness is evaluated.
Effective Duration	The time period that is used for the staleness test. If the fields specified in the static reconciliation rule for the CI's class weren't updated by **Discovery source** within the specified **Effective Duration** — the CI is determined to be stale for **Discovery source** and a lower priority discovery source is authorized to update the CI. When set to 0 (default), the CI is determined to be stale for **Discovery source** immediately after an update and therefor, a lower priority discovery source will always be authorized to update the CI. If you enter a value with a prefix that is valid and a suffix that is not, such as `15 x` — the valid portion of the value is used ('15'). If the entire value is invalid — the default value of 0 is used.
Active	Activates the rule.

5. Click **Save**.

Configure CI reclassification during IRE processing

During the Identification and Reconciliation Engine (IRE) CI identification process, a CI might need to be reclassified to a different *`sys_class_name`* type. By default, CIs are reclassified automatically. If automatic reclassification is disabled, then the CI is not reclassified and the system generates a reclassification task for your review.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The class of a CI can be upgraded, downgraded, or switched to a different branch in the class hierarchy. For more details about reclassification operations, see Reclassify a CI. You can use system properties and payload flags to configure the IRE behavior of CI reclassification, globally or individually per CI.

Note:
CI reclassification is possible only between two classes that have identical identification rules.

Configure automatic CI reclassification using system properties

You can use system properties to configure system-wide IRE behavior for CI reclassification. For information about CI reclassification-related properties, including access, see Properties for Identification and Reconciliation.

- The following properties enable or disable automatic reclassification updates that are specified in a payload. These properties are set to **true** in the base system, enabling processing of CI updates, including CI reclassification updates.

  To disable any automatic reclassification update, set the respective property to **false**. In that case, IRE rejects a payload (or a payload item in Enhanced IRE) with the respective reclassification updates, and creates a reclassification task.

  - *glide.class.upgrade.enabled*
  - *glide.class.downgrade.enabled*
  - *glide.class.switch.enabled*

- The following properties enable IRE to process CI updates with reclassification operations. However, depending on the property setting, IRE processes or skips the reclassification update. These properties are set to **false** in the base system, in which case IRE processes CI updates including any CI reclassifications.

  Set a property to **true** to configure IRE to process CI updates but not the CI respective reclassification update.

  - *glide.identification_engine.update_without_switch_enabled*
  - *glide.identification_engine.update_without_downgrade_enabled*
  - *glide.identification_engine.update_without_upgrade_enabled*

  This set of properties takes precedence over the previous set of properties (glide.class.<reclassification>.enabled). For example, with the following conflicting property settings, the second property takes precedence over the first:

  - *glide.class.downgrade.enabled* = **false**
  - *glide.identification_engine.update_without_downgrade_enabled* = **true**

Example for IRE processing of a payload item with a switch of a CI from Linux Server to Window Server. With the following default property settings in the base system, IRE updates the attributes including the class switch:

- *glide.class.switch.enabled* = **true**
- *glide.identification_engine.update_without_switch_enabled* = **false**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

However, with the following property settings, IRE updates the attributes but skips the class switch:

- *glide.class.switch.enabled* = **true**
- *glide.identification_engine.update_without_switch_enabled* = **true**

Configure automatic CI reclassification in input payloads

You can use flags which correspond to the system properties, in the input payload of the CreateOrUpdateCIEnhanced() or the createOrUpdateCI() APIs. In the payload, set these flags to **true** or **false** to temporarily override the respective system property settings, at the payload item level.

For the following payload flags that control reclassification behavior, if any is set, the setting has precedence regardless of the setting of the corresponding *glide.class.xxx.enabled* property:

- `classUpgrade`
- `classDowngrade`
- `classSwitch`

For the following payload flags that control reclassification behavior, the system checks if either the flag or its corresponding *glide.identification_engine.update_xxx_enabled* property is true to allow the update without the respective reclassification operation:

- `updateWithoutUpgrade`
- `updateWithoutDowngrade`
- `updateWithoutSwitch`

Also, you can pass payload level settings (which apply to all items within a payload), per data source, by specifying CI reclassification properties on the Robust Import Set Transformers form. For more information, see Robust import set transformer properties.

The following sample JSON payload enables automatic reclassification for the specified CI:

```
{ items: [{className: 'cmdb_ci_server', classUpgrade:
 true, classDowngrade: true, classSwitch: true, values:
 {name: 'linux123', serial_number: '12srt567', ip_address:
 '10.2.3.4'}, }]}
```

Reclassification restriction rules

Prevent IRE from downgrading or switching a CI class during payload processing to help prevent data loss. A reclassification restriction rule prevents a CI class change for specific source and target classes, while still processing any other property updates for the CI.

You can use a reclassification restriction rule, for example, to prevent a CI class downgrade from *cmdb_ci_linux_server* (source class) to *cmdb_ci_server* (target class). Or, to prevent a CI class switch from Linux Server to Windows Server. Reclassification restriction rules can be useful when using a Service Graph Connector which might lead to a class downgrade or switch, and a potential loss of important data.

To control the application of reclassification restriction rules:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Use the *glide.identification_engine.reclassification_restriction_rules_enabled* system property to globally enable or disable the application of active reclassification restriction rules. This property is set to **true** by default.

- Use the *skipReclassificationRestrictionRules* payload flag in an IRE payload to prevent the application of active reclassification restriction rules.

  For example, a payload with the *skipReclassificationRestrictionRules* flag:

```
{
  "items": [
    {
      "className": "cmdb_ci_server",
      "values": {
        "short_description": "Linux server description",
        "name": "Linux Server 1"
      },
      "settings": {
        "skipReclassificationRestrictionRules": "true"
      }
    }
  ]
}
```

For information about how to create a reclassification restriction rule, see Create a reclassification restriction rule.

Create a reclassification restriction rule

Reduce data loss during IRE processing by preventing a CI class change for specific source and target classes. A reclassification restriction rule affects only the *Class* attribute and does not prevent the update to the rest of the CI properties.

Before you begin
Role required: Itil_admin (Itil has read privilege only)

About this task
If during IRE processing of a payload, a CI needs to be reclassified (downgrade or switch class), IRE checks reclassification restriction rules. If any reclassification restriction rule applies to the current CI reclassification, IRE processes the CI properties update, but skips the CI reclassification.

IRE output provides specific details about any processing related to reclassification restriction rules.

A reclassification restriction rule applies only to the direction between the specified source and the target classes. The rule doesn't prevent a reclassification in the opposite direction, from the specified target class to the source class. To restrict reclassification between two classes in both directions, specify two separate reclassification restriction rules, one for each direction.

Procedure
1. Enter `cmdb_ire_reclassification_restriction.list` in the filter navigator.
2. Fill out the Reclassification Restriction form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Name	Name of the reclassification restriction rule.
Source table	Current CI class.
Source inheritance	Whether to apply the reclassification restriction rule to child classes of **Source table**.
Target class	Reclassification target class.
Target inheritance	Whether to apply the reclassification restriction rule to child classes of **Target table**.
Type	CI reclassification type: **Downgrade** or **Switch**.

3. Click **Submit**.

What to do next
In the Reclassification Restrictions list view, you can activate or deactivate a reclassification restriction rule by setting its **Active** value to true or false.

Create an IRE data source rule

When using Identification and Reconciliation Engine (IRE), you can prevent a specific discovery (data) source from inserting new CIs for a specific class. Create IRE data source rules for discovery sources that you don't trust in creating CIs but continue to trust in updating those CIs that exist.

Before you begin
Role required: itil_admin

About this task
IRE data source rules have no impact when dynamic reconciliation rules are in effect.

For example, an IP scan tool that discovers network gear but does not discover servers and therefore creates server CIs without details. You can prevent such discovery source from creating specific CIs, while still permitting it to update those specific CIs if they exist. IRE data source rules are stored in the IRE Data Source Rule [cmdb_ire_data_source_rule] table.

- Child classes derive IRE data source rules from parent classes like identification rules do.
- IRE data source rules that are specified for a child class, override any IRE data source rules derived from a parent class.

When IRE processes an insert operation that is prohibited by an IRE data source rule, the insert operation fails. This failure happens when the discovery source and CI class in the insert operation and in an IRE data source rule, match. When CreateOrUpdateCIEnhanced() is used, IRE stores the failed payload in the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] table for future potential use.

Note:
When an insert operation is not allowed by the IRE data source rule, then when using createOrUpdateCI(), the entire IRE payload fails since createOrUpdateCI() doesn't allow partial commits.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If later, a permitted discovery source attempts to insert that same CI, then IRE inserts the CI after merging it with the matching CI from the partial payloads. IRE then deletes the partial payload from the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] table, and allows future updates by the discovery source specified in the rule.

IRE data source rules do not apply to lookup and related items, and only a single rule can be active for any class/discovery source pair.

Procedure

1. Navigate to **All** > **Configuration** > **Identification/Reconciliation** > **IRE Data Source Rule**.
2. In the list view, click **New** and fill out the IRE Data Source Rule form.

Field	Description
Active	Activates the IRE data source rule.
Applies to	The class (and child classes) that the specified discovery (data) source is not allowed to create CIs of.
Data source	Discovery (data) source that is not allowed to create CIs of the specified class.
Insert Not Allowed	Disables the specified discovery (data) source from inserting new CIs from the specified class, to the CMDB.

3. Click **Submit**.

Result

If a payload item with an insert request, and in which the discovery source and the CI class match the discovery source and the CI class specified in the IRE data source rule:

1. The insert operation fails and IRE logs the following message:

   INSERT_NOT_ALLOWED_FOR_SOURCE Insert into [xyz] is blocked for data source [xyz] by IRE data source rule.

2. If using CreateOrUpdateCIEnhanced(), then IRE stores the payload item as a partial payload in the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] table.

If later, a permitted discovery source successfully inserts a CI that matches the CI from a partial payload item:

1. The current CI is merged with the matching CI from the partial payload, applying static reconciliation rules as needed.
2. The respective partial payload in the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] table is deleted.
3. Later payloads in which the non-permitted discovery source updates the respective CI, run successfully.
4. IRE allows the discovery source, that was previously prohibited from inserting the CI, to update that same CI which now exists in the CMDB.

© 2026 ServiceNow, Inc. All rights reserved.

CMDB dependent relationship rules

Service definitions consist of CI types and relationship types. Dependent relationship rules define the dependency structure of the CI types and the relationship types in these service definitions, helping in CI identification and in the construction of business service maps.

The dependencies that are defined by these rules are used when identifying dependent CIs to prioritize the order of CI identification, and to match CIs and respective dependent CIs in a payload. Dependent relationship rules are also used by Service Mapping and can be defined for custom CI types. After defining a new CI type, you can define dependent relationship rules that specify how the new CI type is related to existing types in the CMDB.

Dependent relationship rules consist of hosting and containment rules (dependent relationship rules), each type modeling the data from a different perspective of the CI. Containment rules represent CIs' configuration hierarchy, describing which CI contains which other CIs. Hosting rules represent CIs' placement in a business definition, describing what CIs run on.

Both hosting and containment rules describe a relationship type between two CI types and the same relationship type can be used in a hosting rule and in a containment rule. It is the context in which the relationship is used that distinguishes between a containment and hosting rule.

Manage dependent relationship rules:

- To access rules at the class level, use the CI Class Manager. Navigate to **All** > **Configuration** > **CI Class Manager**.
- To access grouped rules, use the Metadata Editor. Navigate to **All** > **Configuration** > **Identification/Reconciliation** > **Metadata Editor**.

The plugins that have been activated on an instance determine which hosting and containment rules exist in a base system.

Hosting rules

Hosting rules represent all the possible valid combinations of pairs of hosting and hosted CIs in the service definition. Hosting rules are a flat set of rules that can be only one level deep, and which always involve resources, typically physical or virtual hardware. Each hosting rule is a stand-alone rule between two CI types, describing either a valid CI type that another CI type can host, or by which another CI type can be hosted. A hosting rule consists of a parent CI type, a relationship type (such as Hosted On::Hosts) and a child CI type. For example, you can have a hosting rule that specifies that the CI type ‘Application’ ‘Runs On::Runs’, the CI type ‘Hardware’.

A CI can be hosted on multiple resources (such as Windows and Linux). This CI is represented by a hosting rule for the CI with each resource that the CI can be hosted on. During CI identification, the pair of CIs that are being examined, should satisfy at least one hosting rule.

Hosting rules are stored in the CMDB Metadata Hosting Rules [cmdb_metadata_hosting] table.

Containment rules

Containment rules represent the containment hierarchy for a CI type, describing valid objects that a CI type can contain in the service definition, and valid objects that can be contained by the CI type. Containment rules are chained to each other in a containment rules group, with a CI type that is the top-level (root) parent of the group. The collection of containment rules construct a hierarchy-like map of containment relationships. Containment rules are logical concepts used to represent logical CIs, for example to describe software that runs on a server. A containment rule consists of a parent CI type, a relationship type (such as 'Contained By::Contains'), and a child CI type. For example, you might have a containment rule specifying that the CI type ‘Tomcat’ ‘Contains::Contained By' CI type ‘WAR File’.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Endpoints are special containment rules that specify incoming or outgoing connections in the model, designating the CI types that data of some specified type flows in to or out from the service definition. After adding an endpoint to a containment rule, you cannot add any child rules to the endpoint rule.

Containment rules are stored in the CMDB Metadata Containment Rules [cmdb_metadata_containment] table.

Reference rules

Reference rules are used mostly by Cloud Management to represent all of the possible valid combinations of pairs of referencing and referenced CIs in the service definition.

- Reference rules are a flat set of rules that can be only one level deep.
- Reference rules always involve resources, typically virtual entities. Each reference rule is a stand-alone rule between two CI types, describing either a valid CI type that another CI type can reference, or by which another CI type can be referenced. Both the CI classes should be able to live independent of each other.
- A referencing rule consists of a parent CI type, a relationship type (such as `Provisioned From::Provisioned`) and a child CI type. For example, you can have a referencing rule that specifies that the CI type 'Virtual Machine' `Provisioned From::Provisioned`, the CI type 'Image'.
- A CI can reference multiple resources (for example, a VM Instance can have a reference relation with both the Image and the Hardware templates). This CI is represented by a referencing rule for the CI with each resource that the CI can be referenced from.
- The reference rule cannot be part of the CI identification.
- Reference rules are stored in the CMDB Metadata Reference Rules [cmdb_metadata_reference] table.

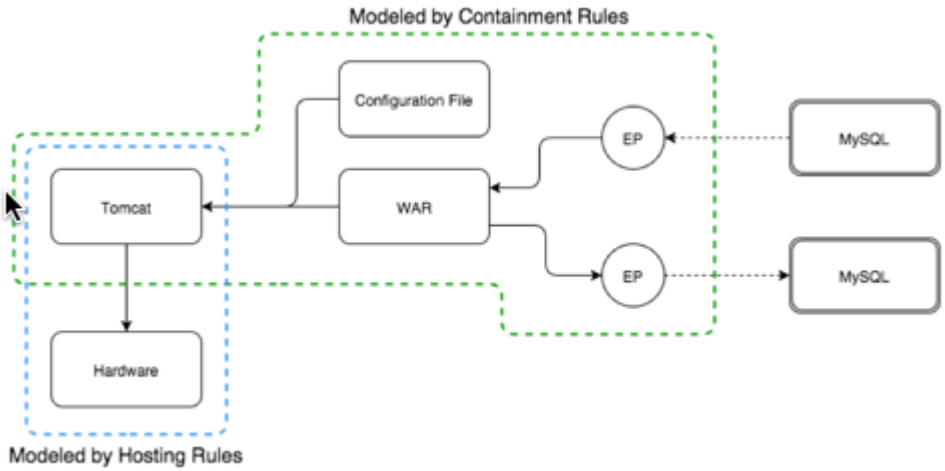
Rules requirements

The rules that you create are bound by the following requirements which narrow the relationships and ensure that only valid options are available in the drop-down lists in the Metadata Editor.

- Given a CI type that is as a child in a containment rule: Not this CI type or its children can be a top-level (root) parent of any other containment rule, and it cannot be in any hosting rule, either as a parent or as a child.
- Given a CI type that is a top-level (root) parent of a containment rule: It cannot be a child in a hosting rule (for example, you cannot be hosted on Tomcat, if Tomcat has any containment rules).
- Given a CI type that is a child in a hosting rule: It cannot be in any containment rule, either as a parent or a child.
- Given a CI type that is a parent in a hosting rule: It cannot be a child in any containment rule.
- Hosting rules cannot create loops such as Tomcat –runs_on- VMWare –runs_on- Tomcat.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: Hosting and containment rules model



Hosting rules that model the diagram:

Tomcat 'Runs on' Hardware.

Containment rules that model the diagram:

- Tomcat 'Contains' Configuration File
- Tomcat 'Contains' WAR
- WAR has two endpoints for JDBC with MySQL:
  - Inbound
  - Outbound

Example: Valid set of rules

```
Tomcat Hosted Linux
Linux Hosted Computer
```

The second metadata entry triggers the third requirement, which is satisfied (it is a hosting rule, not a containment rule).

Create dependent relationship rules

Create hosting and containment rules (dependent relationship rules) for CI classes to help with correctly identifying dependent CIs during the business discovery process and service mapping. Discovery calls the identification API that applies dependent relationship rules.

You can create a basic hosting or containment rule in the CI Class Manager. Or, use the Metadata Editor to create groups of hosting and containment rules, and inbound or outbound endpoints in containment rules. The CI Class Manager and the Metadata Editor are synchronized, and you can use each of those tools to display and edit a dependent rule.

Create a dependent relationship rule for a CMDB class

Use the CI Class Manager to create a basic dependent relationship rule (hosting or containment relationship rule) for a CMDB class.

Before you begin
Role required: itil has read access, itil_admin (on top of itil) has full access.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The class for which you create dependent relationship rule, must have a dependent identification rule.

Procedure

1. Navigate to **All** > **Configuration** > **CI Class Manager**.
2. Click **Hierarchy** to display the CI Classes list, and select the class for which you want to create a hosting or a containment rule.
3. In the class navigation bar, click **Dependent Relationships**.
4. In the Dependent Relationships view, click **Add dependency**.
5. Fill out the details in the Add Dependent Relationship Rule dialog box.

Field	Description
Rule Type	Designation of whether this rule is a hosting rule or a containment rule.
This Class	The class that the rule applies to.
Relationship	The relationship type for the rule.
Target Class	The target class for the dependent relationship rule. The designation of this class as a child or parent class, is based on the specified **Relationship**.

6. Click **Save**.

What to do next

You can click **Reset to derived** and then confirm the operation to delete all dependent relationship rules that were added specifically for the selected class. Only dependent relationships that are derived from a parent class, remain.

For more information about child and parent classes, see Table extension and classes.

Create or edit a collection of containment rules

Create containment rule for CIs to help with correctly identifying dependent CIs during the business discovery process and service mapping. Discovery calls the identification API that applies dependent relationship rules.

Before you begin

Role required: admin

About this task

A containment rule is a dependent relationship rule which defines a relationship between two CIs, structured as: CIType1 RelationshipType CIType2. The first CI type that you add becomes the top level CI of a containment rules group which is a chain of containment rules. The entire set of containment rules is organized as groups according to top-level CIs.

To create a containment rules group for a new CI type, you need to first add the CI Type1 of the relationship. To add a child containment rule for a CI type that exists, you need to select that CI type, and define the second portion of the relationship rule which is the relationship type and CI Type2.

To each rule within a containment rules group you can add inbound or outbound endpoints, which are noted by blue up and down arrows. After adding an endpoint, you can not add a containment rule in that branch of the containment rules hierarchy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Configuration** > **Metadata Editor**.
2. In the Metadata Editor, click the **Containment Rules** tab.
3. Click **Add New Rule** to add a top-level rule or point to a rule for which you want to add a child rule and click the green '+' icon that appears on the right.
4. Complete the **Add Containment Rule to <class>** form.

Field	Description
Configuration Item Type	The CI class that the rule applies to.
Relationship Type	The relationship type for the rule.
Reverse Relationship Direction	Enable to use the reverse relationship in the rule.
Always include in Service Model	Enable to always include the CIs of the specified class in the Service Map if their parent CI (based on the containment relationship) is present in the Service Map.

5. Click **Create**.
6. Add an endpoint to a child rule:

   a. Point to a child rule for which you want to add an endpoint.

   b. Click the blue "+" icon that appears on the right.

   c. Complete the **Add Endpoint To <class>** form.

Field	Description
Endpoint Type	The type of endpoint.
Inbound or Outbound	The direction of the endpoint.

   d. Click **Create**.

Create or edit a collection of hosting rules

Create hosting rule for CIs to assist in correctly identifying dependent CIs during the business discovery process and service mapping. Discovery calls the identification API that applies dependent relationship rules.

Before you begin

A hosting rule is a dependent relationship rule which defines a relationship between two CIs, structured as: <CI Type1> <relationship type> <CI Type2>. To create a hosting rule, you need to add a CI type as <CI Type1> in the relationship rule, and then define the second portion of the relationship rule which is the relationship type and <CI Type2>. The entire set of hosting rules is organized as groups according to the top-level hosted CIs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A hosting rule implicitly contains two rules, which are the reversal of each other. When you create the rule '<CI Type1> <relationship type> <CI Type2>', the rule '<CI Type2> <reversed relationship type> <CI Type1>' is automatically added.

Role required: admin

Procedure

1. Navigate to **All** > **Configuration** > **Metadata Editor**.
2. In the Metadata Editor, click the **Hosting Rules** tab.
3. Click **Add New Rule** to add a top-level rule or point to a rule for which you want to add a child rule and click the green '+' icon that appears on the right.
4. Complete the **Add Hosted/Hosting Rule to <class>** form.

Field	Description
Configuration Item Type	The <CI Type2> in the rule.
Relationship Type	The relationship type for the rule.
Reverse Relationship Direction	Check to reverse relationship in the rule.

5. Click **Create**.

Applying CI Identification and Reconciliation to Import Sets

You can apply CMDB Identification and Reconciliation processes when Import Sets are used to import CIs into the CMDB. CI identification can prevent duplicate CIs in the CMDB, which Import Sets might otherwise cause.

Populating CMDB tables using Import Sets can inadvertently result in duplicate CIs when multiple imported records are identical to an existing CI. To minimize this duplication, you can apply CMDB Identification and Reconciliation processes to Import Sets when importing new records into CMDB tables.

Transform map script

In the onBefore transform map script for an import set, add a call to the CMDBTransformUtil API, similar to the following code sample:

```
(function runTransformScript(source, map, log, target) {
// Call CMDB API to do Identification and Reconciliation of
 current row
var cmdbUtil = new CMDBTransformUtil();
cmdbUtil.setDataSource('ImportSet');
cmdbUtil.identifyAndReconcile(source, map, log);
ignore = true;

if (cmdbUtil.hasError()) {
        var errorMessage = cmdbUtil.getError();
        log.error(errorMessage);
} else {
        log.info('IE Output Payload: ' +
 cmdbUtil.getOutputPayload());
        log.info('Imported CI: ' +
 cmdbUtil.getOutputRecordSysId());
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
})(source, map, log, target);
```

The `ignore = true` code phrase prevents Import Sets from creating the same record again after it is processed by the identification engine.

Process

The identification engine performs identification of each source record before it is inserted into the CMDB. The identification engine determines if the record is a duplicate of an existing CI, and then:

- If not duplicate: Inserts the record to the target table.
- If duplicate: Updates the existing CI in the CMDB, with data from the source record.

The CMDBTransformUtil API pre-processes the source data, then passes the input values to the identification engine with import set being the data source by default. The CMDBTransformUtil API supports a target field that is a reference field in the same manner that Import Sets supports it. The CMDBTransformUtil API also supports a source script, evaluating source scripts to determine the target value which is then passed to the identification engine. For more information, see Creating a field map.

Specify multiple target tables for an import set

You can configure each record in an import set with its own target table. Then, instead of inserting all the transformed records into a single target table, the records are inserted into the different target tables that are specified per record. For example, you might need to insert some records from the import set to the Computer class and other records to the Server class.

When importing data using Import Sets, incorporate the following steps:

- In the data source file, add a target table column. Use a string such as "MyTable" to label the column header. In each record row, enter the target table for the record, as a valid CMDB class name such as "cmdb_ci_computer".
- After you **Auto Map Matching Fields** on the Table Transform Map form, add a field map for the added target table column to establish a relationship between classes and the target tables in the CMDB.
  1. In the **Field Map** related list on the Table Transform Map form, click **New**.
  2. Set **Source field** to the header of the target table column that you added in the data source file, such as `MyTable`.
  3. Set **Target field** to **Class**.
  4. Click **Submit**.

When you configure an import set with multiple target tables as described in the steps above, the **Target table** that is specified on the Table Transform Map form is not used.

Restrictions

The following restrictions apply:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- An import set should be associated with a single transform map. While adding a call to the CMDBTransformUtil API, ensure that still a single transform map exists for the import set.
- The CMDBTransformUtil API does not check if mandatory fields have values when used with Import Sets . Regardless of how *enforce mandatory fields* is set in the transform map, data import fails if a mandatory field does not have a value.
- CI Identification and Reconciliation cannot be applied to Import Sets for dependent CIs (CIs with dependent identification rules).

Create a transform map

Detecting duplicate CIs

When IRE identification process detects duplicate CIs, it groups each set of duplicate CIs into a de-duplication task for review and remediation. A large number of duplicate CIs might be due to weak identification rules. You can configure the identification engine to reconcile duplicate CIs.

During Identification and Reconciliation Engine (IRE) processes, handling of duplicate CIs is determined by the properties *glide.identification_engine.skip_duplicates* (set to true by default) and *glide.identification_engine.skip_duplicates.threshold* (set to 5 by default), and on the number of duplicate CIs that are detected. You can configure these properties so duplicate CIs are automatically reconciled, skipping duplication.

- If *glide.identification_engine.skip_duplicates* is true, and the number of duplicate CIs is less than the threshold specified by *glide.identification_engine.skip_duplicates.threshold*, then the oldest of the duplicate CIs is picked as a match and gets updated. That oldest duplicate CI also becomes the main CI for that set of duplicate CIs. The rest of the duplicate CIs are tagged as duplicates by setting their *duplicate_of* attribute to the appropriate main CI. During matching, IRE filters out any CI that is tagged as duplicate of any CI.
- If *glide.identification_engine.skip_duplicates* is false, then matching of duplicate CIs fails with an error, and none of the duplicate CIs are updated.

Also, the *glide.duplicate_ci_remediator.max.cis* property determines de-duplication processing for a large number of duplicate CIs. For more information, see the 'Large number of duplicate CIs' section in the Duplicate CIs remediation topic.

In either case, de-duplication tasks are always created.

Note:
For a duplicate CI, if any of the CI's attributes, other than *duplicate_of*, is updated by IRE processing, then the CI is no longer considered a duplicate CI. In that situation, the value of *duplicate_of* is cleared in the CI.

For more information about these properties, see Properties for Identification and Reconciliation.

Remediating de-duplication tasks

For information about reviewing and remediating de-duplicate tasks, and how the main CI is used, see Duplicate CIs remediation.

Generating and simulating payload execution using identification simulation

Identification simulation is a central location for automatically constructing a payload that is guaranteed to be complete and valid. You can then simulate the processing of the payload by the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

identification and reconciliation engine (IRE) and examine the results before actually submitting it for execution by IRE.

Use identification simulation to construct an input payload, and simulate processing of the payload by IRE. You can then examine the results, adjust identification rules if needed, and re-run the simulation of the updated payload.

Use the identification simulation to:

- Automatically construct input payload that is based on existing identification rules, hosting and containment rules.
- Simulate execution of a payload (automatically constructed by identification simulation, or manually created).
- Browse payload output and execution log messages for a simulated run.

Note:

- Identification simulation does not commit any updates to the CMDB.
- Identification simulation supports simulation of processing payloads that are provided and which contain non-CMDB tables, but doesn't support the generation of such payloads.

Automatically generate payload using identification simulation

Use identification simulation to automatically construct an input payload for a specified class. The constructed payload is complete with any required dependent CIs, correctly structured, and syntactically valid for processing by the identification and reconciliation engine (IRE).

Before you begin

Role required: admin

About this task

The payload that is constructed during identification simulation is for the specified class. For a dependent CI class, you will be prompted for information about all dependencies. After you provide the required details, identification simulation constructs the payload based on your input.

Note:
Automatically generating payloads that contain non-CMDB tables, isn't supported.

Procedure

1. Navigate to **All** > **Configuration** > **Identification/Reconciliation**, and click **Identification Simulation**.
2. In the **Start with CI Class** box click **Start**.
3. On the **Payload Information** form, in the **Data source** field, select the data source that is associated with this class update.
   For the ServiceNow Discovery data source, select `ServiceNow`.
4. Select the **Class** in the payload.
   a. In the **Criterion Attributes** area select the CI identifier attributes and then specify the values that uniquely identify a CI.
   b. In the **Additional Attributes** area specify attributes and values that matching CIs will be updated with.
5. For dependent CIs associated with dependent identification rules, fill out the **Criterion Attributes** and **Additional Attributes** sections in all **Container level** sections that display.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Click **Generate Script**.
7. If any errors indicate that there are missing fields, fill in the missing fields and then click **Generate Script** again.

What to do next

- Click **Run Simulation** to simulate processing of the payload by IRE.
- Examine the results of the simulation, fine-tune the payload as needed, and combine with other payloads for other classes as desired. After finalizing the payload, use the createOrUpdateCI() API to execute the payload by IRE which will result in actual updates to the CMDB.
- Click **Copy Script** to copy the JSON script into the clipboard. You can then paste that script into a third party software or to another screen of the identification simulation.

Simulate payload processing using identification simulation

Use identification simulation to simulate the identification and reconciliation engine (IRE) process of CI identification for an input payload. Provide a valid payload, which was constructed using identification simulation or that was created manually.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Configuration** > **Identification/Reconciliation**, and click **Identification Simulation**.
2. **Optional:** To run a simulation of an existing payload:
   a. Click **Start** in the **Start with Existing Payload** tile.
   b. On the Insert JSON Payload page, select the **Data source** that is associated with this class update.
   c. **Optional:** Select **Use Enhanced Identification** to apply the identifyCIEnhanced API for enhanced CI identification, instead of using the identifyCI API.
   d. Paste the JSON payload into the empty canvas.
3. **Optional:** To construct a new payload click **Start** in the **Start with CI Class** tile. See Automatically generate payload using identification simulation for more information.
4. Click **Run Simulation** to simulate processing of the payload by IRE.

What to do next

1. Examine the results of the simulation in the results pane, and fine-tune the payload as needed:
   a. Click **Run #1** to display the **Context ID** and the **Run ID** of the simulated run.
   b. Click the drop down arrow next to **Run #1** to display additional details.
      - **Input**: Displays the payload for the simulation.
      - **Logs**: Displays all the logged messages that IRE generated while simulating processing of the payload, according to the specified logging level.
      - **Output**: Displays the output payload returned by IRE.
2. After finalizing the payload, use the createOrUpdateCI() API to execute the payload by IRE which will result in actual updates to the CMDB.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set logging level for identification simulation

Identification simulation logs each step of a simulated payload processing. You can then examine these run logs to determine if a payload was processed as expected, and if identification rules are effective. You can adjust the level of logging so it is helpful, and so that the amount of messages is not excessive or insufficient.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Configuration** > **Identification/Reconciliation**, and click **Identification Simulation**.
2. Click the **Settings** icon.
3. Select logging level for the identification and reconciliation engine (IRE) under **IE Log Level** and for the service cache under **Service Cache Log Level**.
   The logging levels are displayed in ascending order, from the minimum level to the maximum level of logging.
4. Click on the **Settings** icon again to close the **Settings** dialog box.

Examine run logs

Identification simulation provides run logs which are generated by Identification and Reconciliation Engine (IRE). You can access these run logs for payload runs, to examine results and for debugging purposes. IRE payload output logs appear in a user friendly format on a central page.

Before you begin
Role required: admin

About this task
Also, internal applications that use IRE (such as Discovery) can call an internal API to provide a URL to viewing IRE run logs.

Logging is in the context of a specific run of the identification engine, and you can filter the log list by a specific data source and time range. Up to 1000 run logs that are up to 2 months old are listed, grouped by Context IDs, and run times. You can use the glide.identification_logs.max_run_ids property to modify the 1000 limit.

You can control the logging level by using the *glide.discovery.identification.log_level* Discovery system property and setting the value to one of the following:

- Info
- Warn
- Error
- Debug
- DebugVerbose
- DebugObnoxious

Note:
IRE performs an initial verification of a payload before processing identification rules. If IRE detects any duplicate CIs based on any class identifiers, the payload is rejected and processing stops.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Configuration** > **Identification/Reconciliation** > **Identification Logs**.
2. Filter the runs list as follows:
   a. **Source**: Select the data source for which to display run logs.
   b. **Time Range**: Specify a time range for which to display run logs.
   The **Runs** list displays all runs for the specified data source, during the specified time range.
3. In the **Runs** list, click a **Run #** to display its **Context ID** and **Run ID**.
   A unique Context ID is associated with each specific payload that is run. Each run of that payload, is associated with a unique Run ID. A single Context ID for a payload that is run multiple times is associated with multiple Run IDs.
4. Click the drop down arrow for a **Run #** to display additional details.
   - **Input**: Displays the payload for the run.
   - **Logs**: Displays all the logged messages that the identification engine generated while running the payload, according to the specified logging level.
   - **Output**: Displays the output payload returned by the identification engine.

View a reclassification task

Reclassification tasks are created for CIs that couldn't be automatically reclassified during the identification process. Review these tasks to locate the CIs and decide if to reclassify them.

About this task

The properties you use to disable automatic CI reclassification determine whether reclassification tasks are created for those CIs that couldn't be automatically reclassified:

- Using any one of the 'glide.class.<reclassification operation>.enabled' properties (such as *`glide.class.upgrade.enabled`*): Reclassification tasks are created.
- Using any one of the 'glide.identification_engine.update_without_<reclassification operation>_enabled' properties (such as *`glide.identification_engine.update_without_switch_enabled`*): Reclassification tasks aren't created.

For more information about reclassification during IRE processing, see Configure CI reclassification during IRE processing.

Before you begin

Role required: admin or itil

Procedure

1. Navigate to **All** > **Configuration** > **Identification/Reconciliation** > **Reclassification Tasks**.
2. Select a reclassification task.
3. Examine the details on the Reclassification Task form.

Reclassification Task form

Field	Description
Configuration item	The CI that must be reclassified.
Short description	Short description noting that CI reclassification was not allowed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Description	Description noting the current class of the CI and the class that the CI must be changed to.
Internal payload	Payload used in the identification process.

What to do next

After examining the task details, you can locate the CI that is noted in the task **Description** and manually reclassify it. For details, see Reclassify a CI.

IRE support for non-CMDB tables

Apply Identification and Reconciliation Engine (IRE) processes to supported non-CMDB tables to ensure data integrity and health of those tables.

Starting with the Yokohama release, IRE supports some non-CMDB tables. You can use all IRE features with some non-CMDB tables after creating identification rules (CI identifiers and identifier entries) for those tables. Non-CMDB tables supported for IRE features include:

- In an application-specific scope: All non-CMDB tables
- In the global scope: Only non-CMDB tables that are preset in the base system. In the Yokohama release for example, the Location [cmn_location], Department [cmn_department], Cost Center [cmn_cost_center], Building [cmn_building], User [sys_user], and Group [sys_user_group] non-CMDB tables are supported.

You can't use the CI Class Manager to manage any IRE-related rules for non-CMDB tables. Instead, you must work directly with the respective tables in list views to create and manage those rules as described in the following procedures:

- Create an identification rule for a non-CMDB table
- Create a reconciliation rule for a non-CMDB table
- Create an IRE data source rule for non-CMDB tables
- Create a data refresh rule for a non-CMDB table
- Create an identification inclusion rule for a non-CMDB table
- Simulate payload execution using identification simulation
- Use partial payloads
- Review and remediate de-duplication tasks

You can use the following store apps with supported non-CMDB tables:

- CMDB 360 in CMDB Workspace
- IntegrationHub ETL

IRE processes are applied to supported non-CMDB tables with the following differences:

- IRE doesn't populate the *discovery_source*, *last_discovered*, and the *first_discovered* attributes if those attributes don't exist in the non-CMDB table.
- IRE uses the non-CMDB table's class name as *sys_class_name* if the table doesn't include a *sys_class_name* attribute.
- IRE payloads don't support relationships with non-CMDB tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Although IRE-related user interface and accompanying documentation might reference CMDB and CMDB elements, most of those references also apply to any supported non-CMDB tables.

Create an identification rule for a non-CMDB table

To use Identification and Reconciliation Engine (IRE) features with supported non-CMDB tables, you must first create identification rules that uniquely identify the table records. Each non-CMDB table can be associated with a single identification rule.

Before you begin
Role required: itil has read access, itil_admin (on top of itil) has full access

About this task
Each identification rule consists of a single identifier for the table, one or more identifier entries, and one or more related entries.

Review the following topics before creating identification rules:

- Identification rules
- General guidelines for using CMDB Identification

When creating identifier entries, you can configure the **Search on table** and **Criterion attributes** fields on the Identifier Entry form to implement one of the following options:

Regular identifier entry

Lets you select attributes from the associated identifier table.

Lookup identifier entry

Lets you select attributes from any related table (Lookup table), other than the currently selected table.

Hybrid identifier entry

Lets you select attributes from both the currently main selected table, and from another table (Lookup table).

For non-CMDB tables, only independent identification rules are supported.

Procedure
1. Navigate to **All** > **Identification/Reconciliation** > **CI Identifiers**.
2. In the Identifiers list view, click **New**.
3. Fill out the Identifier form.

Field	Description
Name	Name of CI identifier.
Applies to	Supported non-CMDB table.
Independent	Must be checked to indicate that the identifier can identify a record independently of other records.

4. Click **Submit**.
5. In the Identifiers list view, locate and open the identifier that you just created.
6. On the Identifier form, select the **Identifier Entries** tab and then click **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Fill out the Identifier Entry form.

Field	Description
Identifier	Preset with the name of the table of the associated identifier.
Search on table	Preset with the label of the table of the associated identifier. To create: ○ A regular identifier entry: Set to the identifier table and select **Criterion attributes** from that same table. ○ A lookup identifier entry: Set to another table (lookup table) and select **Criterion attributes** from that lookup table. ○ A Hybrid identifier entry: Set to another table (lookup table) and then do the following steps. ▪ Select **Criterion attributes** from the lookup table. ▪ Add **Hybrid Entry CI Criterion Attributes** from the current table using background scripts, after saving the rule. For more details, see the 'What to do next' section at the end of this task. A lookup table should have a reference to the associated identifier table.
Criterion attributes	Set of attributes that uniquely identify the record. Attributes can belong to the current class, or to a parent class. **Note:** It's possible to add reference fields as a criterion attribute. However, such fields might not always be effective: ○ Reference fields store *sys_id*s that point to a record in another table, and thus is considered a weak criterion attribute (in terms of uniqueness) for the current table. ○ The system detects and then replaces invalid values in a reference field with 'Unknown'. For example, an invalid *Model ID* value is replaced with the value 'Unknown'. Also, if several CIs end up having that same reference field set to 'Unknown', then these CIs become duplicate CIs.
Priority	Priority of applying the identifier entry. Rules with lower priority numbers are given higher priority. Identifier entries of identical priorities are applied randomly. You can keep gaps between the priority numbers, so you can assign the unused priority numbers to new entries without modifying the existing priority order.
Active	Specifies whether the identifier entry is active. At least one identifier entry in an identification rule must be active for the rule to apply.
Enforce exact count match	For lookup identification, match a record only on exact lookup records count match. When enforced, all lookup items for a record in the payload must have matching records in the lookup table that reference the same record: **a.** Only matches records that have all the lookup items from the input payload referencing the record in the table. **b.** If there are multiple matches, selects the oldest created record as the final match.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	When not enforced, one lookup item for a record in the payload matching a record in the lookup table, is sufficient to consider a match: **a.** Matches any record that has at least one of the lookup items from the input payload referencing the record in the table. **b.** If there are multiple matches, selects the records with the max number of lookup items from the input payload referencing the record in the table. **c.** If there are still multiple matches, selects the oldest created record as the final match.
Allow null attribute	When selected, then if at least one criterion attribute isn't null, attempt matching with an identifier entry even if there are criterion attributes that are null. Otherwise, all criterion attributes must have values to attempt matching with an identifier entry.
Allow fallback to parent's rules	Allows the identification rules of the record's parent table to be used if a match isn't found for this identification rule. Applies only for dependent identification rules.
Optional condition	A filter to narrow the set of records that will be searched for a matching record. Available only if the *glide.identification_engine.enable_identifier_optional_condition* system property is set to **true** (**false** by default). In the base system, identifier entries of various classes are pre-configured with advanced options conditions. All these pre-configured conditions in regular identifier entries will automatically apply when you set this property to **true**. Therefore, to prevent unexpected behavior, review those predefined conditions in regular identifier entries before setting this property to **true**. For more details about this property, see Properties for Identification and Reconciliation.

Note:
If criterion attributes have only two attributes and *sys_class_name* is one of them (for example [name, sys_class_name], [ip_address, sys_class_name]), then the other attribute can't be NULL, even if **Allow null attribute** is enabled. This restriction is due to *sys_class_name* being considered a special system matching attribute.

8. Click **Submit**.
9. On the Identifier form, select the **Related Entries** tab and then click **New**.
10. Fill out the Related Entry form.

Related Entry form

Field	Description
Identifier	Preset with the identifier that this related entry is associated with.
Active	Check box that specifies that the related entry is active.
Related table	A related table (lookup table) that references the record that is being matched.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Referenced field	A referenced field in **Related table** with a reference to the associated identifier table.
Criterion attributes	The set of attributes to uniquely identify the related item. Attributes can belong to the current class, or to a parent class. **Note:** It's possible to add reference fields as a criterion attribute. However, such fields might not always be effective: ○ Reference fields store *sys_id*s that point to a record in another table, and thus is considered a weak criterion attribute (in terms of uniqueness) for the current table. ○ The system detects and then replaces invalid values in a reference field with 'Unknown'. For example, an invalid *Model ID* value is replaced with the value 'Unknown'. Also, if several CIs end up having that same reference field set to 'Unknown', then these CIs become duplicate CIs. Click the lock icon to view, add, or remove attributes from the identification rule.
Allow null attribute	If at least one criterion attribute in the related table isn't null, allow to attempt matching with an identifier entry even if there are criterion attributes which are null.
Priority	Priority of the related entry for the specified **Related table**. Rules with lower priority numbers are given higher priority while matching a related item for a specific related table. Related entries for the specified related table with identical priorities are applied randomly. You can keep gaps between the priority numbers, so you can assign the unused priority numbers to new entries without modifying the existing priority order.
Optional condition	Filter conditions to narrow the set of records that will be searched for a matching related item.

11. Click **Submit**.

What to do next

To add criterion attributes to a **Hybrid Entry CI Criterion Attributes** field in a hybrid identifier entry, instead of using the Identifier Entry form, you must use background scripts. After saving the identification rule, navigate to **System Definitions** > **Scripts - Background**, and then enter a script that adds the attributes and click **Run script**.

Sample script:

```
var gr = new GlideRecord('cmdb_identifier_entry');
// get the identifier entry you want to update
gr.get('<identifier_entry_sys_id>');
// set the attributes you want in the hybrid rule in a comma
 separated list
// for example: 'name,serial_number'
gr.
 hybrid_entry_ci_criterion_attributes='<column_name_1>,<column_n
ame_2>,<etc.>';
gr.update();
```

This process requires the admin role.

Create a reconciliation rule for a non-CMDB table

Create a static or a dynamic CI reconciliation rule for a non-CMDB table.

For information about static reconciliation rules, dynamic reconciliation rules, and other principals related to reconciliation rules, see Reconciliation rules.

If both, static and dynamic reconciliation rules exist for the same record attribute, the dynamic rule has precedence.

Note:
You can't create a reconciliation rule for system fields or for Identification and Reconciliation Engine (IRE) specific fields such as the Discovery source (discovery_source) field. Also, reconciliation rules can't be dot-walked using reference fields.

Create a static reconciliation rule for a non-CMDB table

A static reconciliation rule specifies class attributes that data sources are authorized to update, and prevents unauthorized data sources from overwriting the attributes' values. A static reconciliation rule also specifies the prioritization among multiple data sources. Without static reconciliation rules, data sources can overwrite each other's updates to attribute values.

Before you begin
Role required: itil has read access, itil_admin (on top of itil) has full access.

About this task
Static reconciliation rules are used in conjunction with data refresh rules to determine reconciliation steps for a record. These rules determine if, when, and by which data source a record can be updated. If multiple data sources are authorized to update the same attributes, assign a priority to each of these data sources to prevent them from overwriting each other's updates.

After an authorized data source updates an attribute, subsequent updates are accepted only from the same data source or from a data source with a higher priority. Updates from a data source with a lower priority are rejected, unless these two conditions are met:

- The lower priority source is the first source updating the record.
- The record became stale based on data refresh rules for the class.

Precedence order of static reconciliation rules:

- Rule configured for a specific attribute, has precedence over rule set with **Apply to all attributes** (regardless of priority value).
- Between two rules for the same attribute or between two rules set with **Apply to all attributes**, the rule that is specific directly for the class has precedence over the derived rule.
- Between two rules for the same attribute or between two rules set with **Apply to all attributes** at the same class level, precedence is determined by rule priorities.

Information about the last discovery source that updates each attribute is stored in the Data Source History [cmdb_datasource_last_update] table, but only after enabling the reconciliation rule. Therefore, there might be unexpected updates after you enable the rule until the highest priority data source has updated the CI.

Static reconciliation rules affect reconciliation of stale attributes. During reconciliation, the information in the Data Source History table is considered along with the data refresh rules for the CI's class, to determine if a CI attribute is stale. A CI attribute is determined to be stale if it was not updated by the latest discovery source to update the CI, within a time period. The

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

time period is specified by the Effective Duration time in the data refresh rule for the class for the discovery source. In this case, if another authorized discovery source, with a lower priority attempts to update the stale CI attribute, the update is allowed.

If there is a dynamic reconciliation rule for the same record attribute as in a static reconciliation rule, the dynamic rule takes precedence.

Procedure

1. Navigate to **All** > **Configuration** > **Identification/Reconciliation** > **Reconciliation Definitions**.
2. In the Reconciliation Definitions list view, click **New**.
3. Fill out the Reconciliation Definition form.

Field	Description
Data source	The data source that you are configuring this rule for.
Priority	Priority of **Data source** within other data sources for the specified attributes. Smaller numbers designate higher priority. Data sources without a reconciliation rule are assigned the lowest priority.
Applies to	Authorizes the specified data source to update all attributes of the specified non-CMDB table. **Note:** This setting will be overridden by any setting that applies to a specific attribute. In which case, instead of using this option, you can directly include all attributes for **Attributes**.
Filter condition	Conditions that records must meet for the rule to be applicable. For example, to apply this rule only to records that are associated with the Finance department, select this condition: **[Department] [is] [Finance]**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: The glide.identification_engine.enable_reconciliation_filter_be system property determines when filter conditions are applied. By default, those filter conditions are applied after attribute values have changed during payload processing. Set this property to **true** so that Identification and Reconciliation Engine (IRE) applies the filter conditions before attribute values change.
Attributes	Attributes from the current or from a parent class, that the specified data source is authorized to update. Available only if **Apply to all attributes** is not selected.
Update with null	Attributes that the specified data source can update with a null value. By default, authorized data sources cannot overwrite a non-null value with a null value. Attributes in this list, which are not in the **Attributes** list, are not included with the attributes that the data source can update with a null value.

4. Click **Submit**.

Create a dynamic reconciliation rule for a non-CMDB table

A dynamic reconciliation rule for non-CMDB table uses CMDB 360 data to choose a value such as the largest value that is reported, for updating a record.

Before you begin

CMDB 360/Multisource CMDB must be enabled.

Role required: itil has read access, itil_admin (on top of itil) has full access

About this task

If the same CI attribute has both, a static reconciliation rule and a dynamic reconciliation rule, the dynamic reconciliation rule has precedence.

A dynamic reconciliation rule supports several rule types, such as largest reported value and most reported value. When applying a dynamic reconciliation rule, IRE processes the current payload and then examines the CMDB 360 data store to select a value with which to update the CMDB. Depending on the dynamic reconciliation rule type, selecting the appropriate value might not be immediately conclusive. For example, there might not be a single value that is most reported, or for some values, the last discovered timestamp isn't reported. Therefore, when

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

necessary, IRE falls back to examining additional details such as last reported, last discovered, and last updated values to select the most appropriate value.

Note:
You can't add a dynamic reconciliation rule when creating a new child class in the CI Class Manager. You must first save the new child class and then add the dynamic reconciliation rule.

Procedure

1. Click **All**.
2. In the Filter navigator, enter `cmdb_dynamic_reconciliation_definition.list` to open the Dynamic Reconciliation Definitions table.
3. In the Dynamic Reconciliation Definitions list view, click **New**.
4. Fill out the Dynamic Reconciliation Definition form.

Field	Description
Name	
Attributes	Attributes for which to apply the rule. Attributes that the specified rule type can't be applied to and attributes for which a dynamic reconciliation rule already exists for, don't appear.
Filter condition	Conditions that CIs must meet for the rule to be applicable. For example, to apply a rule only to CIs that are associated with the Finance department, select this condition: **[Department] [is] [Finance]**.
Applies to	Non-CMDB table that this rule applies to.
Dynamic Rule Type	Rule type which is based on CMDB 360 data.

5. Click **Submit**.

Create a data refresh rule for a non-CMDB table

To apply Identification and Reconciliation Engine (IRE) features to supported non-CMDB tables, create data refresh rules for those tables. Data refresh rules are used to determine if a record is stale for a specific data source. Such records can then be updated by a lower-priority authorized data source.

Before you begin
Role required: itil has read access, itil_admin (on top of itil) has full access

About this task
Data refresh rules have no impact when dynamic reconciliation rules are in effect.

Data refresh rules are used in conjunction with static reconciliation rules to determine reconciliation steps for a record. These rules determine if, when, and by which data source a record can be updated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Click **All**.
2. In the Filter navigator, enter `cmdb_datasource_staleness.list` to open the Data Source Staleness Definitions table.
3. In the Data Source Staleness Definitions list view, click **New**.
4. Fill out the Data Source Staleness Definitions form.

Field	Description
Applies to	Non-CMDB class that this rule applies to.
Data source	Data source for which record staleness is evaluated.
Effective Duration	The time period that is used for the staleness evaluation. If the fields specified in the static reconciliation rule for the record's class were not updated by the specified data source within the specified time period — the record is determined to be stale for that data source. If you enter a value with a prefix that is valid and a suffix that is not, such as `15 x` — the valid portion of the value is used ('15'). If the entire value is invalid — the default value of 0 is used.
Active	Activates the rule.

5. Click **Submit**.

Create an identification inclusion rule for a non-CMDB table

Narrow the scope of records that are included in the identification process of non-CMDB records by creating an identification inclusion rule.

Before you begin

Role required: itil has read access, itil_admin (on top of itil) has full access.

About this task

During duplication detection of independent CIs, the Identification and Reconciliation Engine (IRE) processes only the records that satisfy the identification inclusion rules. For example, you can set a filter to include only records whose state is operational. When no identification inclusion rules exist, all records are included in the identification process.

In the base system, there are no predefined identification inclusion rules. Identification inclusion rules are defined at the class level.

Note:
Identification inclusion rules impact any script that calls IRE, therefore create them carefully. Identification inclusion rules can prevent the identification of certain types of records, affecting some features of Discovery and Service Mapping.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Configuration** > **Identification/Reconciliation** > **Identification Inclusion Rules**.
2. In the Identification Inclusion Rules list view, click **New**.
3. Fill out the Identification Inclusion Rules form.

Field	Description
Applies to	Non-CMDB table that this rule applies to.
Inclusion condition	Criteria that non-CMDB records must meet to be included in the identification process.

4. Click **Save**.

Create an IRE data source rule for non-CMDB tables

When using Identification and Reconciliation Engine (IRE), you can prevent a specific data source from inserting new records for a specific non-CMDB table. Create IRE data source rules for data sources that you don't trust in creating records but continue to trust in updating those records that exist.

Before you begin
Role required: itil_admin

About this task
IRE data source rules have no impact when dynamic reconciliation rules are in effect.

- Child classes derive IRE data source rules from parent classes like identification rules do.
- IRE data source rules that are specified for a child class, override any IRE data source rules derived from a parent class.

When IRE processes an insert operation that is prohibited by an IRE data source rule, the insert operation fails. This failure happens when the data source and record class in the insert operation and in an IRE data source rule, match. When CreateOrUpdateCIEnhanced() is used, IRE stores the failed payload in the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] table for future potential use.

Note:
When an insert operation is not allowed by the IRE data source rule, then when using createOrUpdateCI(), the entire IRE payload fails since createOrUpdateCI() doesn't allow partial commits.

If later, a permitted data source attempts to insert that same record, then IRE inserts the record after merging it with the matching record from the partial payloads. IRE then deletes the partial payload from the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] table, and allows future updates by the data source specified in the rule.

IRE data source rules do not apply to lookup and related items, and only a single rule can be active for any class/data source pair.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Configuration** > **Identification/Reconciliation** > **IRE Data Source Rules**.
2. In the IRE Data Source Rules list view, click **New** and fill out the IRE Data Source Rule form.

Field	Description
Data source	Data source that is not allowed to create CIs of the specified class.
Active	Activates the IRE data source rule.
Applies to	The class (and child classes) that the specified data source is not allowed to create records for.
Insert Not Allowed	Disables the specified data source from inserting new records of the specified class, to the non-CMDB table.

3. Click **Submit**.

Result

If a payload item with an insert request, and in which the data source and the record class match the data source and the record class specified in the IRE data source rule:

1. The insert operation fails and IRE logs the following message:

   INSERT_NOT_ALLOWED_FOR_SOURCE Insert into [xyz] is blocked for data source [xyz] by IRE data source rule.

2. If using CreateOrUpdateCIEnhanced(), then IRE stores the payload item as a partial payload in the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] table.

If later, a permitted data source successfully inserts a record that matches the record from a partial payload item:

1. The current record is merged with the matching record from the partial payload, applying static reconciliation rules as needed.
2. The respective partial payload in the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] table is deleted.
3. Later payloads in which the non-permitted data source updates the respective record, run successfully.
4. IRE allows the data source, that was previously prohibited from inserting the record, to update that same record which now exists in the non-CMDB table.

CMDB Identification and Reconciliation reference

Reference topics provide property settings, domain separation, and other reference content for the CMDB Identification and Reconciliation Engine (IRE).

Domain separation and CMDB Identification and Reconciliation

Domain separation is supported in the CMDB Identification and Reconciliation feature. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Overview

Domain separation is enforced during the CMDB Identification and Reconciliation (IRE) process. IRE processes are domain aware and domain separation is applied to the Identification and Reconciliation rules.

For more information about domain separation, see domain separation.

How domain separation works in Identification and Reconciliation

Domain separation in the identification engine is enforced when users activate the domain separation plugin. Domain separation for IRE has two modes of operation in domain separated instances:

- Strict mode (enabled by default): In this mode, identification processes only those CIs in which the domain ID is identical to the domain of the currently logged in user. If duplicate CIs exist across domains (including parent and child domains), then those CIs aren't considered duplicate CIs because their domain IDs don't match.

- Platform domain separation mode (disabled by default): In this mode, IRE follows the platform domain separation behavior. So during identification, parent domains can access all CIs within their child domains or any of the domains it has visibility into. For more information, see Visibility domains and Contains domains.

  Platform domain separation mode is intended to be used by advanced users for very specific or advanced use cases.

  Note:

  Platform domain separation mode introduces some risks that are greater on upgraded instances and much lesser on zBooted instances.

  Depending on how IRE processes are configured on a domain separated instance, setting IRE to use platform domain separation mode might result in unexpected and undesirable behavior if not used carefully. One of the risks is if enabling platform domain separation mode is followed by running IRE processes from a different domain than the one on which IRE processes were previously run. In this situation, CIs that were previously identified as unique, might get identified as duplicate CIs and might cause some applications to start failing.

  If any application is already using IRE effectively in domain separated environment, then there's no advantage in switching to platform domain separation mode that might create some risk.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the glide.identification_engine.platform_domain_separation_enabled system property to switch between those two modes for IRE domain separation. By default, this property is set to **false**.

Platform domain separation mode

Set the system property glide.identification_engine.platform_domain_separation_enabled to **true** to enable the platform domain separation mode for IRE processing. With the platform domain separation mode, parent domains can access all of their child domains during IRE processing. For example, IRE can detect a matching CI in a child domain and then update that CI instead of creating a new one.

In the platform domain separation mode for IRE:

- IRE run from a parent domain can access CIs contained within their domain, child domains that are lower in the domain hierarchy, and global domain.
- IRE run from the global domain can access all CIs.
- Visibility domains and Contains domains are supported.

Note:
When platform domain separation mode is enabled, there might be a sudden increase in IRE detection of duplicate CIs.

Domain separation during the Identification Process

Domain separation during the Identification process is enforced as follows:

- Regardless of the setting of the glide.identification_engine.platform_domain_separation_enabled system property:
  - Domain IDs don't need to be explicitly sent in the input payload of the identification engine APIs. Internally, the identification engine causes the current domain ID of the user to call the identification engine APIs.
  - During matching, if no records are found and a CI is inserted, the CI domain ID is the same as the domain ID of the logged-in user's domain. When updating a CI, the CI domain ID doesn't change.
  - During matching, if duplicates are found, De-Duplication tasks created in the [reconcile_duplicate_task] table have the same domain ID as of the duplicate CIs.
  - During matching, if reclassification of the CI isn't allowed, reclassification tasks are created in the [reclassification_task] table, with the same domain ID as the CI for which reclassification is needed.
- When the system property glide.identification_engine.platform_domain_separation_enabled is set to **false**:
  - Only CIs that have the same domain ID as the currently logged-in user's domain are used during matching.
  - Duplicate CIs that exist across domains (including parent and child domains) aren't considered as duplicate CIs by IRE.
- When the system property glide.identification_engine.platform_domain_separation_enabled is set to **true**:
  - Duplicate CIs that exist across domains (such as parent and child domains) are considered as duplicate CIs by IRE.
  - CIs from the logged in user domain and child domains are used during matching.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Domain separation and Identification Rules

The identification rules and identification inclusion rules used during the identification process are always defined at the global level. For example, the following tables don't have a sys_domain field:

- Identifier (cmdb_identifier)
- Identifier Entries (cmdb_identifier_entry)
- Related Entries (cmdb_related_entry)
- Identification Inclusion Rules (cmdb_ie_active_config)

Domain separation and Reconciliation Rules

The reconciliation definition rules that are used during the reconciliation process can be defined for different domains. For example, the following tables do have sys_domain, sys_overrides, sys_domain_path fields:

- Reconciliation Definition (cmdb_reconciliation_definition)
- Datasource Precedence (cmdb_datasource_precedence)
- Data Source Staleness Definitions (cmdb_datasource_staleness)

Properties for Identification and Reconciliation

Use the Identification and Reconciliation properties to configure the identification and reconciliation engine (IRE).

These properties are available for Identification and Reconciliation. To view and edit these properties, the admin role is required.

Note:
To open the System Properties [sys_properties] table, enter `sys_properties.list` in the navigation filter.

IRE error messages

The Identification and Reconciliation Engine (IRE) generates the following errors and messages. Depending on settings, these messages appear in the Identification Logging pane and in the system logs.

For information about lookup-based CI identification and qualifier chains, see Create a CI identification rule.

Note:
IRE performs an initial verification of a payload before processing identification rules. If IRE detects any duplicate CIs based on any class identifiers, the payload is rejected and processing stops.

For information about CMDB Identification Payload error: "FAILED TRYING TO EXECUTE ON CONNECTION", see CMDB Identification Payload error - "Insertion failed with error Error during insert of cmdb_ci...", where node logs show "FAILED TRYING TO EXECUTE ON CONNECTION" "Duplicate entry 'XXX' for key 'XXX'" knowledge base article.

Error- IDENTIFICATION_RULE_MISSING

Message	Description and Resolution
Identity Rule Missing for table [xyz]	**Description:** Identification rule is missing for a class. **Resolution:** Ensure that there is an identification rule for table [xyz], and that the rule is active.

MISSING_MATCHING_ATTRIBUTES

Message	Description and Resolution
In payload missing minimum set of input values for criterion (matching) attributes from	**Description:**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Message	Description and Resolution
identify rule for table [xyz]. Add these input values in payload item 'abc'	Missing minimum set of values for criterion attributes for an identification rule. **Resolution:** In the payload, add minimum set of values for criterion attributes for CI Identifier for table [xyz]. Open the CI Class Manager, click **Hierarchy** and select the [xyz class. Check the identification rule and the identifier entries for table [xyz.

Error- NO_CLASS_NAME_FOR_INDEPENDENT_CI

Message	Description and Resolution
Cannot have 'sys_class_name' as a key field in an Independent Identity Rule on 'xyz'	**Description:** The class attribute was added to the CI identifier which is not supported. **Resolution:** Remove the class attribute from CI Identifier for table [xyz].

Error- IDENTIFICATION_RULE_FOR_LOOKUP_MISSING

Message	Description and Resolution
Identity Rule for table [xyz] missing Lookup Rule for class [abc]	**Description:** The payload has a lookup class name, but the corresponding lookup rule is missing. **Resolution:** Add lookup identifier entry with [Search on table] as [abc] for CI Identifier for table [xyz]. For more information about this error message, see Identification error "Identity Rule for table [cmdb_ci_table_name] missing Lookup Rule for class [table_name]" [KB0786444] .

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Error- IDENTIFICATION_RULE_FOR_RELATED_ITEM_MISSING

Message	Description and Resolution
Identity Rule for table [xyz] missing Related Rule for class [abc]	**Description:** The payload has a related class name, but the corresponding related rule is missing. **Resolution:** Add related entry with [Related table] as [abc] within CI Identifier for table [xyz].

Error- NO_LOOKUP_RULES_FOR_DEPENDENT_CI

Message	Description and Resolution
Cannot have Lookup Rule for a Dependent Identity Rule on 'xyz'	**Description:** Cannot have Lookup Rule for a Dependent Identity Rule. **Resolution:** Remove lookup identifier entry from dependent CI Identifier for table [xyz].

Error- INVALID_INPUT_DATA

Message	Description and Resolution
Found invalid sys_id in payload. No record with sys_id [xyz] exist in table [abc] or is a duplicate record with [duplicate_of] field set to a main CI	**Description:** The payload has a reference to an invalid sys_id. **Resolution:** Remove the referenced sys_id, or provide a valid sys_id.
In payload no data source exist. You need to provide choice value from choice field [discovery_source] in table [cmdb_ci]	**Description:** In payload no data source exists. **Resolution:** In the payload, provide a valid choice value from choice field [discovery_source] from table [cmdb_ci].
In payload invalid data source [xyz] exist. You need to provide a valid choice value from field [discovery_source] in table [cmdb_ci]	**Description:** The payload contains an invalid data source. **Resolution:**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Message	Description and Resolution
	In the payload, provide a valid choice value from choice field [discovery_source] from table [cmdb_ci].
No such relationship with name [xyz] exist in table [cmdb_rel_type]. If out-of-box relationship for [xyz] has been removed or renamed, it should be restored	**Description:** The payload is referencing a relationship that does not exist in the [cmdb_rel_type] table. **Resolution:** Verify that the reference to the relationship is accurate. Or, if it is a new relationship, add it to the [cmdb_rel_type] table. Or, If out-of-box relationship for [xyz] has been removed or renamed, restore it.
Payload relations 'xyz' has invalid parent record index: [0]	**Description:** Payload references invalid parent indexes. **Resolution:** Check payload indexes and ensure that they are all valid.
Payload relations 'xyz' has invalid child record index: [0]	**Description:** Payload references invalid child indexes. **Resolution:** Check payload indexes and ensure that they are all valid.

Error- DUPLICATE_RELATIONSHIP_TYPES

Message	Description and Resolution
Duplicate relationship type records exists with name [xyz] in table [cmdb_rel_type] having sys_ids: [abc]	**Description:** There are duplicate records in the [rel_ci_type] table for the relationship. **Resolution:** Remove the duplicate records.

Error- DUPLICATE_PAYLOAD_RECORDS

Message	Description and Resolution
Found duplicate items in the payload (index 0 and 1), using className [xyz] and fields [abc]. Remove duplicate items from payload	**Description:**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Message	Description and Resolution
	The payload contains two items whose criterion attributes have identical values. **Resolution:** Remove one of the duplicate items.

Error- LOCK_TIMEOUT

Message	Description and Resolution
Failed to acquire synchronization lock for xyz	**Description:** Failed to acquire the system mutex lock. **Resolution:** Increase the mutex expiration time by adding the system property **glide.identification_engine.mutex_expiration_time** and setting to an integer value that is greater than the default value (15 min).

Error- MULTIPLE_DUPLICATE_RECORDS

Message	Description and Resolution
Found duplicate records in table [xyz] using fields [abc]	**Description:** Found duplicate records in the specified table. **Resolution:** Fix the duplicate records found by the identification engine. Check de-duplication tasks for information about all duplicates.

Error- REQUIRED_ATTRIBUTE_EMPTY

Message	Description and Resolution
Missing mandatory field [xyz] in table [abc]. Add input value for mandatory field in payload	**Description:** A required attribute is missing in the payload. **Resolution:** In the payload, add input value for mandatory field [xyz] in table [abc].

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Error- MISSING_DEPENDENCY

Message	Description and Resolution
In payload no relations defined for dependent class [xyz] that matches any containment/ hosting rules: [abc]. Add appropriate relations in payload for 'def'	**Description:** No relations defined for the dependent class that matches any of its metadata rules. **Resolution:** In payload add appropriate relations for dependent class [xyz] that matches any containment/hosting rules: [abc].

Error- METADATA_RULE_MISSING

Message	Description and Resolution
No containment or hosting rules defined for dependent class [xyz]. Add containment/ hosting rules for ‘abc'	**Description:** There are no containment or hosting rules defined for dependent class. **Resolution:** Add containment or hosting rules for dependent class [xyz].

Error- MULTIPLE_DEPENDENCIES

Message	Description and Resolution
Found multiple dependent relation items [xyz] and [abc] in payload	**Description:** Multiple dependent relation items exist. **Resolution:** Remove one of the multiple dependent relation items [xyz] or [abc].
Multiple paths leading to the same destination: xyz -> abc	**Description:** Multiple paths leading to the same destination. **Resolution:** Remove duplicate relationship/ qualifier chains that might exists between xyz -> abc.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Error- ABANDONED

Message	Description and Resolution
Abandoning processing payload item 'xyz', since its depends on payload item 'abc' has errors	**Description:** Dependent payload item has errors, so abandoning processing. **Resolution:** Resolve the error on the dependent payload item ‘abc'.
Can't find matched record with sys_id [xyz] in table [abc]	**Description:** Matched sys_id does not exist in the corresponding table. **Resolution:** Check in table [abc] whether matched record is a valid record based on input payload.
Identification engine API got called recursively, aborting...	**Description:** The Identification engine API was called recursively. **Resolution:** Avoid calling the Identification engine API recursively.
Detected error while processing payload from xyz	**Description:** Error occurred during processing payload. **Resolution:** Resolve all errors mentioned in the output payload from xyz.
While processing relations encountered errors in payload item: xyz	**Description:** Payload item has errors. **Resolution:** Resolve errors in payload item ‘xyz'.
Error occurred during parsing input json payload: xyz	**Description:** Error occurred during parsing JSON payload. **Resolution:** Ensure that input JSON payload has correct JSON format.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Error- MULTI_MATCH

Message	Description and Resolution
Duplicate dependent records found having relationship [xyz] with same CI (className: [abc], sysId:[def])	**Description:** Found duplicate dependent CIs. **Resolution:** Check de-duplication tasks for information about all duplicates, and then delete duplicate records.
Found multiple relations between payload items: 'xyz' and 'abc'	**Description:** Found multiple relations between payload items. **Resolution:** Check for duplicate relationship chains and qualifier chains that might exist.
Found duplicate records in lookup table [xyz] using fields [abc] and reference field [def]	**Description:** Found duplicate records in lookup table. **Resolution:** Check de-duplication tasks for information about all duplicates, and then delete duplicate records.

Error- QUALIFICATION_LOOP

Message	Description and Resolution
Qualification chain has loop that contains relation 'xyz'	**Description:** Qualification chain has a loop. **Resolution:** Remove the loop from the qualification chain with relation ‘xyz'.

Error- TYPE_CONFLICT_IN_QUALIFICATION

Message	Description and Resolution
Invalid payload, qualification chain has multiple possible paths for payload items: 'xyz' and 'abc'	**Description:** Multiple qualification paths found. **Resolution:**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Message	Description and Resolution
	Remove multiple possible qualification paths between items ‘xyz’ and ‘abc'.

Error- RECLASSIFICATION_NOT_ALLOWED

Message	Description and Resolution
CI Reclassification not allowed from class: [xyz] to [abc]	**Description:** CI reclassification not allowed. **Resolution:** Check reclassification tasks for information about reclassification, and check if reclassification from class: [xyz] to [abc] is valid.

Error- DUPLICATE_RELATED_PAYLOAD

Message	Description and Resolution
Found duplicate Related items (0 and 1) in the payload index 1 using fields xyz	**Description:** Duplicate Related items present. **Resolution:** Remove one of the duplicate related items present in the payload.

Error- DUPLICATE_LOOKUP_PAYLOAD

Message	Description and Resolution
Found duplicate Lookup items (0 and 1) in the payload index 1 using fields xyz	**Description:** Duplicate lookup items present. **Resolution:** Remove one of the duplicate lookup items present in the payload.

INSERT_NOT_ALLOWED_FOR_SOURCE

Message	Description and Resolution
Insert into [xyz] is blocked for data source [abc] by IRE data source rule	**Description:** An IRE data source rule is configured to prevent data source

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Message	Description and Resolution
	[abc] from inserting CIs of the [xyz] class. **Resolution:** Delete or update the appropriate IRE data source rule to let data source [abc] insert CIs of the [xyz] class. Or, wait for another permitted data source to create the same CI.

Components installed with Identification and Reconciliation

Several types of components are installed with Identification and Reconciliation (included in the com.snc.cmdb plugin), including tables.

Tables installed

Table	Description
Identifier [cmdb_identifier]	Identification rule sets defined for different classes of CIs.
Reconciliation Definition [cmdb_reconciliation_definition]	Static reconciliation rules defined for different classes of CIs at the table and field level.
Dynamic Reconciliation Definitions [cmdb_dynamic_reconciliation_definition]	Dynamic reconciliation rules defined for different attributes and classes.
Identifier Entry [cmdb_identifier_entry]	Rule entries with different priorities assigned to each identifier.
Duplicate Audit Result [duplicate_audit_result]	Duplicate audit results corresponding to a specific duplicate task. These results are generated automatically during the identification process and should not be added manually.
Remediate Duplicate Task [reconcile_duplicate_task]	Task to address duplication that is detected during the identification process. Records are generated automatically, and users should not add records manually.
Reclassification Task [reclassification_task]	Reclassification tasks that were generated during the identification process.
Data Source History [cmdb_datasource_last_update]	Information about the last data source that updated each attribute. Used to determine if a data source can update a stale CI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
Data Source Staleness Definition [cmdb_datasource_staleness]	Effective duration per data source. When effective duration is exceeded, then CMDB Health determines that the information provided by that data source is stale.
Identification Engine Context [cmdb_ie_context]	Input payload, and data source (cmdb_ci's discovery_source) that will be used as input for a specific identification engine API. Stores information about which specific identification engine API will be called (`identifyCI` or `createOrUpdateCI` API). Also stores information about enhanced IRE options used in Identification Simulation. **Note:** Internal table used by identification simulation.
Identification Engine Run [cmdb_ie_run]	Specific cmdb_ie_context record that was used to run against the identification engine. Also details about the output payload returned by APIs, such as start and end time of the run and whether the run was successful. **Note:** Internal table used by identification simulation.
Identification Engine Log [cmdb_ie_log]	Identification engine logs for a specific cmdb_ie_run simulated in the identification simulation. Also details about logs level and order. **Note:** Internal table used by identification simulation.
IRE Data Source Rule [cmdb_ire_data_source_rule]	IRE data source rules.
CMDB IRE Partial Payloads [cmdb_ire_partial_payloads]	Payload items that were determined to be partial, and which might be later matched with an incoming payload. If a partial payload is matched and processed, it is deleted from the CMDB IRE Partial Payloads table. Partial payloads older than 90 days are deleted from the table. For more information about usage of this table in IRE processes, see Identification and Reconciliation engine (IRE).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
CMDB IRE Partial Payloads Index [cmdb_ire_partial_payloads_index]	Identifier keys associated with partial items. IRE uses those keys to try to match with identifier keys of incoming payloads. For more information about usage of this table in IRE processes, see Identification and Reconciliation engine (IRE).
CMDB IRE Incomplete Payloads [cmdb_ire_incomplete_payloads]	Incomplete items, stored using JSON format as incomplete payloads. Incomplete items are stored for the purpose of logging payloads with irrecoverable errors, and are never processed again. The table is configured for table rotation, with duration of one day and seven table rotations. For more information about usage of this table in IRE processes, see Identification and Reconciliation engine (IRE).
IRE Output Aggregate Stats [cmdb_ire_output_aggregate_stats]	This table is populated when RTE invokes IRE, for example, when processing integrations. Details about data inserted by Import Sets or Robust Transform Engine (RTE) to the CMDB (via IRE). Numbers of items inserted, partial items, and updated items, are stored for each type of CI, per run.
IRE Output Target Items [cmdb_ire_output_target_item]	This table is populated when RTE invokes IRE, for example, when processing integrations. Details about data inserted by Import Sets or Robust Transform Engine (RTE) to the CMDB (via IRE). Target class and the sys_id are stored per ImportSet row id, within a run. For this table to populate, RTE must pass the *`ire_output_detailed_stats`* property.
Reclassification Restrictions [cmdb_ire_reclassification_restriction]	Reclassification restriction rules. These rules prevent switch and downgrade reclassification updates for specific source and target classes. For more information, see Configure CI reclassification during IRE processing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

User roles installed

Role	Description
cmdb_payload_admin	Automatically assigned to users with the cmdb_admin role for internal use only.

Related topics

Properties for Identification and Reconciliation

Populating the CMDB

You can populate the CMDB by using Discovery, by using the IntegrationHub ETL or Import Sets to import and integrate data from a third-party source, by integrating with an external CMDB, or by manually creating CIs.

When you populate the CMDB with information, you create a record for each configuration item in the cmdb_ci table or on one of the tables that extend that table.

Related ServiceNow® Store apps and reference information:

- CMDB schema model: A collection of class diagrams and class attributes for key CMDB classes.
- CMDB tables descriptions: Descriptions of key CMDB tables in the base system.
- CMDB CI Class Models: A ServiceNow Store app that adds class models that extend the base CMDB class hierarchy. This includes class descriptions, identification rules, identifier entries, and dependent relationships if applicable. You can then use the added classes as any other CMDB base class.
- Discovery patterns: A ServiceNow Store app that provides a library of Discovery patterns for discovering specific devices and applications in the industry.
- Getting started with Service Graph Connectors: ServiceNow Store apps that provide pre-defined integrations for importing and integrating common third-party data into CMDB classes. Also includes the IntegrationHub ETL wizard for creating new ETL transform maps.

ITIL configuration management auto-discovery

The key to any configuration management business practice is the initial and on-going inventory or discovery of what you own. The ServiceNow platform provides three options for auto-discovery:

- The separate and highly robust Discovery product.
- For organizations that want to leverage the discovery technologies they already have deployed (SMS, Tally NetCensus, LanDesk, and so on), the ServiceNow platform supports integrations to those technologies via web services. Scanned data can be mapped directly into the CMDB.

For further information on designing, constructing, and maintaining the CMDB, see the CMDB Design & Configuration white paper.

Discovery

The Discovery product automatically populates the CMDB. Discovery searches the network for all attached computers and devices, then populates the CMDB with information on each computer/device's configuration, provisioning, and current status. Discovery uses probes, sensors, and patterns, to collect and process data about computers, servers, printers, a variety of IP-enabled devices, and the relationships between all the items found. Discovery also reports

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

on any software which is running, and the TCP connections between computer systems, thereby establishing their relationships. This information is sent back to the instance and is used to populate the CMDB.

For more information about Discovery see:

- ITOM Visibility
- Discovery basics

Integrate third-party data using IntegrationHub ETL

Use the IntegrationHub ETL to import and integrate data from a third party into the CMDB. Using IntegrationHub ETL, create ETL transform maps which are used for integrating data from specific data sources. IntegrationHub ETL guides you through importing source data, transforming any data if needed, and selecting target CMDB classes and attributes to map the data to. You then preview the integration results and adjust any configurations before scheduling recurring integrations.

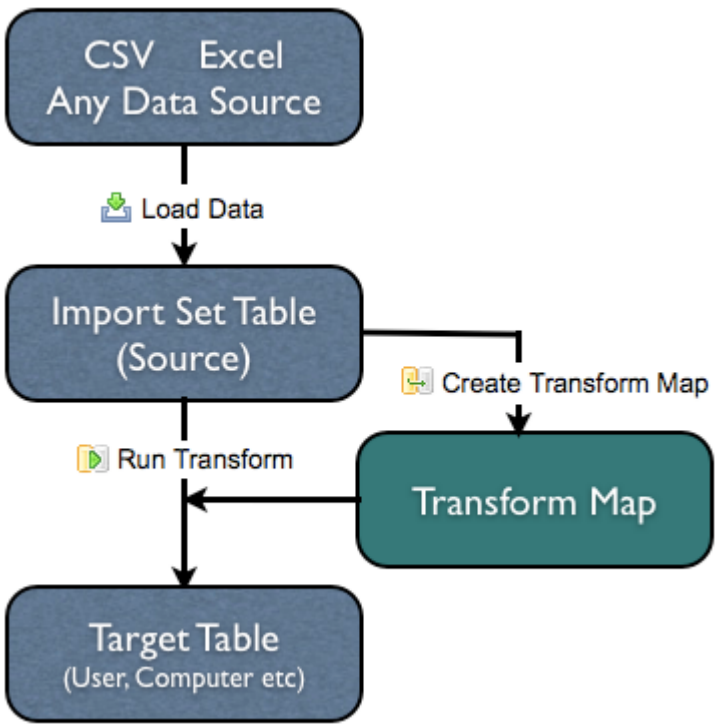
Visit the ServiceNow Store website to view and download common integrations.

Import data from another source using Import Sets

You can import data to the CMDB using Import Sets. Import sets find files of information (in formats such as XML, Excel, or CSV), import them, and transform them onto the required table. This process can be scheduled or performed on demand.

To import relationships between CIs, use import sets to populate the table [cmdb_rel_ci] with information on the parent, the child, and the nature of the relationship. The [cmdb_rel_ci] table displays a list of all CI relationships and is useful when importing CI data.

Import Sets overview



CMDB instance API

Use the CMDB instance API to populate the CMDB by creating or updating CMDB tables.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Manually create a CI

Create a single CI for a specific class in CMDB Workspace or in Core UI. The role required for this operation depends on the settings of the class table you select for the CI.

You can also manually create a CI while leveraging Identification and Reconciliation Engine (IRE) processes to ensure that the new CI complies with various class requirements and that it's unique. For more information, see Create a CI manually in CMDB Workspace.

1. Use the CI Class Manager:
   a. Navigate to **All** > **Configuration** > **CI Class Manager**.
   b. Select **Hierarchy** to display the list of CI Classes. Select the class to use for the CI.
   c. In the class navigation bar, select **CI List** and then on the CI list view, select **New**.
   d. Fill out the CI form and then select **Submit**.
2. Or, manually create a CI while leveraging Identification and Reconciliation Engine (IRE) processes to ensure that the new CI complies with various class requirements and that it's unique. For more information, see Create a CI manually in CMDB Workspace.
3. Or, directly use a table:
   a. Navigate to **All** > **Configuration** and then elect the class to use for the CI, such as Business Services.
   b. In the navigation filter of the application navigator, enter the table label (such as 'Linux'), or the table name in the format of <table name>.list (such as 'cmdb_ci_linux_server.list'). Then, press Enter.
   c. In the list view of the table, select **New** and fill out the form fields for the table.
   d. Select **Submit**.

Backing up CMDB data

The cmdb_backup_storage_information table (part of the [app-cmdb-content] ServiceNow Store application) holds generic backup storage information for a CI as a platform related item. The table includes a CI as a reference attribute and stores information for hardware, cloud, containers, and other CI types.

Backup Store Information [cmdb_backup_storage_information] table

The table captures backup policy, last successful backup, last backup attempt, execution mode, backup source, backup source ID, and backup service.

To mitigate the risk of uncontrolled growth of the table, a cascade-delete rule applies to the Backup Source (CI) reference field. When a CI is deleted, the corresponding rows in the table are deleted.

Tables related to backup operations

Tables related to backup operations

Table	Contents
Backup Store Information [cmdb_backup_storage_information]	Informational object that stores CI backup/ snapshot information.
cmdb_related_entry	To populate the cmdb_backup_storage_information with an IRE payload, you define a CMDB-related rule in cmdb_related_entry. For the related rule, use the Backup Source ID criteria attributes and Backup Source as a reference field. Example:

```
//. Sample IRE payload  var
 payload =
{
 "items": [
   {
     "className":
 "cmdb_ci_hardware",

 "sys_object_source_info": {
       "source_name":
 "ServiceNow",
       "source_native_key":
 "some key"
     },
     "values": {
       "name": "I am a good
 cat"
     },
     "lookup": [],
     "related": [
       {
```

Columns in cmdb_backup_storage_information

Column	Description
Backup Configuration Status [backup_config_status]	String (choice) • Backup Disabled [False, default]: CI has not been configur • Backup Enabled [True]: CI has policies and configurations service, or appliance for regular backups • Unknown • Not Applicable • Planned • Not Planned
Last Successful Backup [last_successful_backup]	glide_date_time

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Columns in cmdb_backup_storage_information (continued)

Column	Description
	Date and time of last successful backup. Platform-specific va or end of the backup attempt as reported by the platform AP time of the backup attempt.
Last Backup Attempt [last_backup_attempt]	glide_date_time Date and time of the last successful or failed backup attemp can be either the start or the end of the backup attempt as re ambiguous, use the start time of the backup attempt. For a successful backup, both last_backup and last_backup value.
Execution Mode [backup_execution_mode]	String (choice) • Manual: Run as needed. • Automatic: Run periodically. • Unknown
sys_domain and sys_domain_path	glide columns Values copied from cmdb_ci.
managed_by and managed_by_group	Values copied from cmdb_ci.
Backup Source [backup_source_configuration_item]	reference (ci) Backup status details for the referenced CI being backed up
Backup Source ID [backup_source_id]	String (1024) Backup Service source identifier for the CI. Identifies the CI i service such as host_id, vcenter_id, instance_id, and db_id.
Backup Service [backup_service_configuration_item]	reference (ci) Reference to the CSDM technical service that hosts the exte service, or appliance.
Recovery Point Objective [recovery_point_objective]	Duration Time that can elapse between backups and the acceptable

CMDB 360/Multisource CMDB

CMDB 360 retains complete history about discovery sources and proposed values, involved in updates of CI attributes. Use CMDB 360 data to track how the CMDB is populated by various

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

discovery sources at the CI attribute level. Also, to revert CI updates from a specific discovery source, or to recompute attribute values using updated reconciliation rules.

Starting with the Utah release, the Multisource CMDB feature is part of the CMDB 360 feature. CMDB 360 provides all the functionality of Multisource CMDB and additional capabilities such as an analytics dashboard, and new query functionality. You can access all of the CMDB 360 capabilities in the CMDB 360 view in CMDB Workspace.

How CMDB 360 works

When multiple discovery sources attempt to update the same CI attribute, the Identification and Reconciliation Engine (IRE) uses reconciliation rules to select a single discovery source for the update. Without CMDB 360, details about the lower-priority discovery sources whose values were rejected, are discarded. Also, it is difficult to identify the source of an attribute value without CMDB 360.

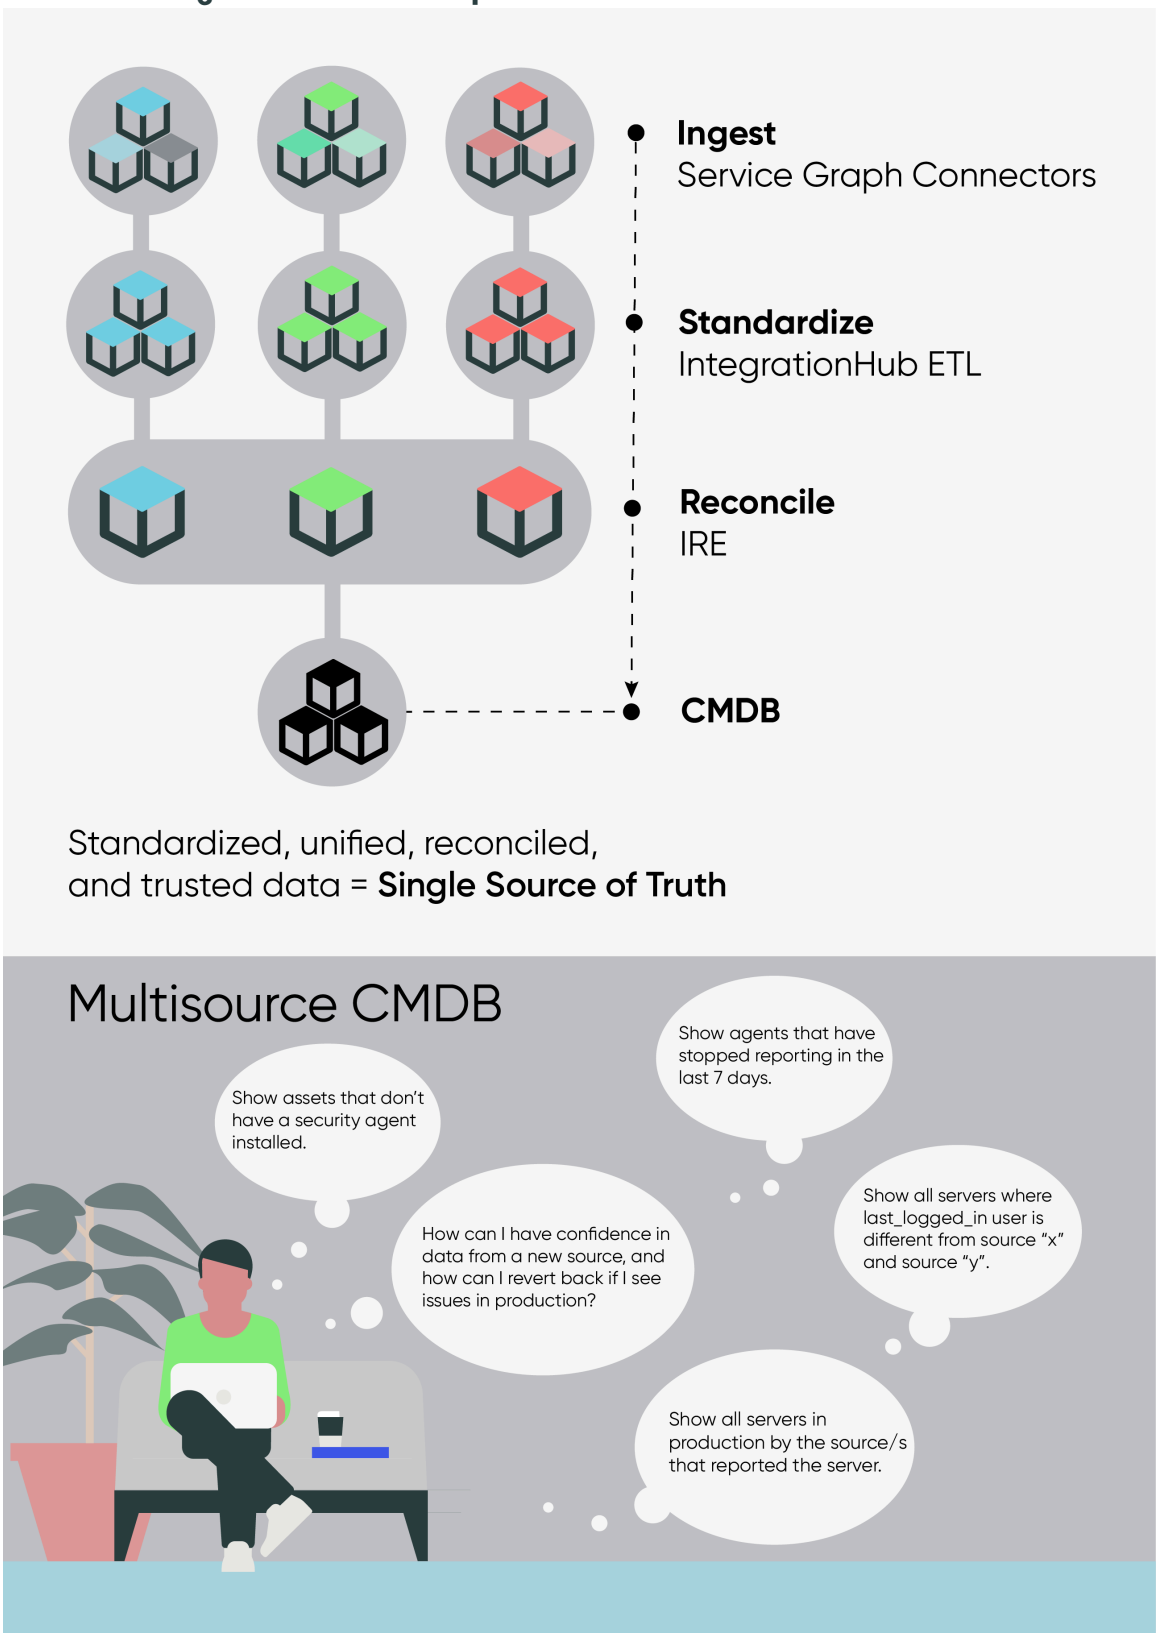
With CMDB 360, the raw details for every discovery source and CI combination are retained for both, discovery sources that were selected for an update and all others that were not. CMDB 360 data, consisting of records for each discovery source and CI combination, is stored in the CMDB MultiSource Data [cmdb_multisource_data] table. You can examine, query, and report on the CMDB 360 data store.

You can optionally exclude classes and their descendents from collecting and processing CMDB 360 data. The CMDB MultiSource Data [cmdb_multisource_data] table doesn't contain data for those excluded classes. For more information, see Exclude classes from CMDB 360.

Note:
CMDB 360 supports non-CMDB tables. The widely used term Configuration Item (CI), can also refer to a non-CMDB table record. For information about support for non-CMDB tables, see IRE support for non-CMDB tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CMDB 360 insights into data source processes



After data is initially ingested from multiple data sources, several processes are applied to standardize and reconcile the data before it is stored in the CMDB. CMDB 360 provides insights that can help you configure some of these processes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Using CMDB 360

Use CMDB 360 to:

- Create a dynamic reconciliation rule.
- Control CI updates at the discovery source and CI attribute level.
- Visualize discovery sources of attribute values, at the attribute level.
- Modify reconciliation rules and then recompute CMDB data, reflecting the updated reconciliation rules.
- Revert CMDB data integration from a specific discovery source, if, for example, you realize that the discovery source is not reliable. Recompute CI attribute values, while excluding the discovery source that you want to ignore.
- Validate a new discovery source by comparing its data to data from other discovery sources, which are known to be valid.
- Improve data management, data quality, and operational insights, by querying on CMDB 360 data. Use the CMDB 360 query builder in CMDB Workspace to create queries for CMDB 360 records, discovery sources, and CI records.

Enable and configure CMDB 360

- Activate the ITOM Discovery License (com.snc.itom.discovery.license) plugin.
- Navigate to **All** > **Configuration** > **CMDB 360 Properties**. Then, in the CMDB 360 Properties pane ensure that the glide.identification_engine.multisource_enabled (Enables CMDB 360) property is set to **true**.
- Optionally, Exclude classes from CMDB 360.

By default, CMDB 360 tracks discovery source information for CIs from CMDB classes and doesn't collect data for non-CMDB tables. You can independently enable or disable tracking data for CMDB and for non-CMDB classes, using these system properties:

- glide.identification_engine.multisource_cmdb_ci_enabled (Enables capturing CMDB 360 data for CIs from CMDB classes)
- glide.identification_engine.multisource_non_cmdb_ci_enabled (Enables capturing CMDB 360 data for CIs from non-CMDB classes

Report on CMDB 360 data

Use the CMDB 360 view in CMDB Workspace to gain insights into the CMDB 360 data store. Build reports that, for example, do the followings:

- Find CIs not reported by any discovery source.
- Find discovery sources populating data in your CMDB.
- Compare attribute values across discovery sources.
- Compare attribute values between CMDB and other discovery source.
- Limit reports for CMDB 360 data, to a specific application service, technical service, or a CMDB group.

See Sample CMDB 360/Multisource CMDB queries for more details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Visualize CMDB 360 data

CMDB 360 is highly verbose in the user interface:

- On the Reconciliation Rules page in CI Class Manager, click the **Preview Data** tab to see per attribute, discovery sources that are authorized to update that attribute, in precedence order.
- On a CI form, click the **CMDB 360 Data Preview** related link to see per CI attribute, current value in the CMDB and incoming values from other discovery sources.

Logging

Enable logging for CMDB 360 by adding and enabling the system property glide.cmdb.logger.source.cmdb_multisource. In the Log [syslog] table, search for entries in which `source="cmdb_multisource"`.

CMDB 360 experience in CMDB Workspace

The CMDB 360 view provides aggregations and analysis of CMDB 360 data which you can use to track activities and identify Potential issues of discovery sources. You can also create different types of your own queries and associated schedules and reports to explore CMDB data.

Use the CMDB 360 view in CMDB Workspace to access all of the CMDB 360 capabilities. For information about all CMDB 360 dashboard settings, see Configure the CMDB 360 dashboard.

Note:
Most cards on the CMDB 360 dashboard support non-CMDB tables in their aggregation, or can be configured to provide support. However, the CIs not reported by discovery sources card, for example, doesn't apply to non-CMDB tables. Creating queries for non-CMDB tables is also supported. For information about support for non-CMDB tables, see IRE support for non-CMDB tables.

Access

Requirements:

- Role requirement: sn_cmdb_user (CMDB user) or any role containing sn_cmdb_user
- Additional requirement: Enable and configure CMDB 360

To access the CMDB 360 view in the CMDB Workspace, navigate to **Workspaces** > **CMDB Workspace**. In the CMDB Workspace menu bar, select **CMDB 360**.

Potential issues

Cards on the Potential issues tile show details about CIs with discovery sources that are incorrectly reporting on the CIs.

CIs not reported by discovery sources

Lists CIs that are discovered by multiple discovery sources, but one or more of the discovery sources has stopped reporting within a specified number of days. The Number of days since CIs were last discovered by a discovery source dashboard setting is used in the card's aggregation.

Drill down on this card to see a list view of the CIs for the card and the specific discovery source per CI that is no longer reporting.

Example: You configure 7 days for the setting. A Linux server CI named backup-linux.sea.com is reported by these discovery sources within the specified number of days:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- ServiceNow - today.
- ServiceWatch - 4 days ago.
- AgentClientCollector - 8 days ago.

In this scenario, the CI shows on the CIs not reported by discovery sources card, since AgentClientCollector reported over seven days ago.

Data mismatch

Lists CIs for which different discovery sources are reporting different values. Attributes are considered mismatched when different discovery sources report different values for the attribute. CIs that appear when you drill down on this card can reveal issues with the individual CI, or your reconciliation rules.

The specific records that appear in the drilled-down list view, depend on the Data mismatch dashboard settings.

In the Data mismatch records list view, select an item in a Source column to access the Multisource Data Preview page with details about all discovery sources with values for the attribute. On the Multisource Data Preview page you can use the Search Attributes box to search for specific attributes and also choose one of the following options:

- **All attributes**: Shows all attributes of the selected class, regardless of whether they have a value in the CMDB.
- **Attributes with CMDB values**: Shows only attributes of the selected class, with a value in the CMDB.
- **Attributes with multisource data**: Shows all attributes of the selected class, and for each attribute shows current CMDB value and any other discovery sources with a value for the attribute.

Regardless of the option that you choose on the Multisource Data Preview page, a discovery source value that was used for the current CMDB value – is highlighted in green. These values are identical to the CMDB value of the attribute.

Saved queries

The Saved queries card shows up to 20 of your CMDB 360 queries. You can use the card to edit and run those queries, or create new queries. Saved queries are sorted on both the card and list view by the most recently created or updated queries.

If your instance has been upgraded from an instance that contained Multisource Report Builder queries, then those queries appear on the Saved queries card.

- Click a saved query to modify or view it before running.
- Click a query's action icon and then select **Run**.
- Click **View All Queries** to see all the Saved queries where you can examine or run a query.
- Click **Create Query** to create a query of one of the following types:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Get Records: Creates a query that you can use to explore your CMDB 360 data. It queries your CMDB 360 for CIs matching your criteria that are reported by specified discovery sources.
- Find Gap: Creates a query that you can use to analyze gaps in discovery sources reporting your CMDB 360 data. It queries discovery sources that report CIs against discovery sources that don't report those same CIs.
- Compare Attribute Values: Creates a query that you can use to identify CIs with attribute values that differ across multiple discovery sources or against the CMDB. It queries at least two discovery sources and/or the CMDB for CIs that match your criteria.

- Schedule a CMDB 360 query for a report to run that query on a regular basis. Scheduling a query enables you to create a CMDB 360 report that integrates the query results with the platform Reporting feature.

Discovery sources

Cards in the Discovery sources tile show aggregated counts for your discovery sources. This tile also includes coverage cards showing a breakdown of CIs per the number of discovery sources reporting those CIs.

Number of discovery sources

The total number of discovery sources that report CMDB 360 data.

Total CMDB 360 records

The total number of raw CMDB 360 records in the CMDB 360 data store that contains records for each discovery source report, per each CI attribute.

Reconciled CIs

The total number of unique CIs created in the CMDB after processing incoming data from all discovery sources, including after reconciling data from multiple discovery sources for the same CIs. For more information, see CMDB Identification and Reconciliation.

Discovery source overview

The distribution of CMDB 360 CIs across all reporting discovery sources.

Coverage: CIs with a single discovery source

Shows CIs that are only reported by a single discovery source, with a breakdown by the discovery source reporting those CIs. The number on the chart is the actual total number of CIs with a single discovery source, regardless of any dashboard settings. The number of records in list views that appear when you drill down the chart, depends on dashboard settings and can be only a subset of that total.

Coverage: CIs by number of discovery sources

Shows CIs reported by multiple discovery sources, grouped by the number of discovery sources that are reporting those CIs.

You can use the following options to filter the calculated records in the CMDB 360 data store that apply to all cards in the Discovery sources tile:

- All (default): Includes records from both CMDB and non-CMDB tables.
- CMDB CI: Includes records only from CMDB classes.
- Principal Class: Includes records only from principal classes. For information about defining a class as principal and therefore including that class in the Principal Class filter, see Create a CI class.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Various settings apply only to the coverage charts. They determine the scope and type of data that is included in the coverage charts and can greatly affect the performance of the associated calculation job:

- The dashboard Coverage settings determine the mixture of classes for the records in drill-down list views. For information about these settings and their effect, see Coverage cards.
- The system properties *sn_cmdb_ws.ms.calculate_cmdb_only* and *glide.identification_engine.multisource_non_cmdb_ci_enabled* determine if both CMDB and non-CMDB or CMDB only data, is included in the coverage charts. For more information about these system properties, see Components related to CMDB 360.

  Note:
  If the *sn_cmdb_ws.ms.calculate_cmdb_only* is true or *glide.identification_engine.multisource_non_cmdb_ci_enabled* is false, then both 'All' and 'CMDB CI' filters show CMDB data only (non-CMDB data is ignored).

- The *sn_cmdb_ws.ms.report_class_ci_count_max_threshold* system property and the CMDB 360 Analytics Skipped Class [sn_cmdb_ws_ms_skip_class] table, together, determine class inclusion in the coverage charts.

  If the record count for a class (CMDB or non-CMDB) in the CMDB 360 Data [cmdb_multisource_data] table exceeds the value set by the *sn_cmdb_ws.ms.report_class_ci_count_max_threshold* system property, then a record is created in the CMDB 360 Analytics Skipped Class [sn_cmdb_ws_ms_skip_class] table and by default, the class is skipped in future calculations for the coverage charts. You can include a skipped class in the coverage charts by setting the *Override class CI records population* column of a skipped class in the *sn_cmdb_ws_ms_skip_class* table, to 'true'.

  Note:
  Some classes, when included or excluded from the coverage charts, can greatly impact the overall performance of the chart calculations. For more information, see Components related to CMDB 360.

Coverage

Cards on the Coverage tile show a breakdown of CIs per the number of discovery sources reporting those CIs:

CIs with a single source

Shows CIs that are only reported by a single discovery source, with a breakdown by the discovery source reporting those CIs.

CIs by number of sources

Shows CIs reported by multiple discovery sources, grouped by the number of discovery sources that are reporting those CIs.

The following settings determine the scope and type of data that is included in the Coverage tile charts, these settings can greatly affect the performance of the Coverage tile calculation job:

- The 'Coverage cards' dashboard settings determine the data that the cards show in list views.
- The system properties *sn_cmdb_ws.ms.calculate_cmdb_only* and *glide.identification_engine.multisource_non_cmdb_ci_enabled*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

determine if both CMDB and non-CMDB or CMDB only data, is included in the Coverage chart. For more information about these system properties, see Components related to CMDB 360.

- Filter options filter the calculated records in the CMDB 360 data store, that apply to the Coverage charts:
  - All (default): Includes records from both CMDB and non-CMDB tables.
  - CMDB CI: Includes records only from CMDB classes.
  - Principal Class: Includes records only from principal classes. For information about defining a class as principal and therefore including that class in the Principal Class filter, see Create a CI class.

  Note:
  If the *sn_cmdb_ws.ms.calculate_cmdb_only* is true or *glide.identification_engine.multisource_non_cmdb_ci_enabled* is false, then both 'All' and 'CMDB CI' Coverage chart filters show CMDB data only (non-CMDB data is ignored).

- The *sn_cmdb_ws.ms.report_class_ci_count_max_threshold* system property and the CMDB 360 Analytics Skipped Class [sn_cmdb_ws_ms_skip_class] table, together, determine class inclusion in the Coverage chart.

  If the record count for a class (CMDB or non-CMDB) in the CMDB 360 Data [cmdb_multisource_data] table exceeds the value set by the *sn_cmdb_ws.ms.report_class_ci_count_max_threshold* system property, then a record is created in the CMDB 360 Analytics Skipped Class [sn_cmdb_ws_ms_skip_class] table and by default, the class is skipped in future calculations for the Coverage chart. You can include a skipped class in the Coverage chart by setting the *Override class CI records population* column of a skipped class in the *sn_cmdb_ws_ms_skip_class* table, to 'true'.

  Some classes, when included or excluded from the Coverage chart, can greatly impact the overall performance of the chart calculations. For more information, see Components related to CMDB 360.

In addition to the settings listed above, internal filters and excluded classes in the CMDB 360 denied classes [cmdb_multisource_deny_class] table also affect the final inclusion or not inclusion of classes. You can review the list of CI classes in the 'Coverage cards' settings to see any notes about inclusion status.

Configure the CMDB 360 dashboard

Configure settings on the CMDB 360 of the CMDB Workspace to determine how your CMDB 360 data is analyzed and aggregated. These settings affect the data that appears on the cards and the records shown when you drill down on those cards on your CMDB 360 dashboard.

About this task

For detailed information about CMDB 360-related components, such as system properties, scheduled jobs, and tables, that are installed with CMDB Workspace, see Components installed with CMDB Workspace.

Before you begin

Role required: cmdb_ms_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **CMDB Workspace**.
2. In the CMDB Workspace menu bar, select **CMDB 360**.
3. Select **Settings**.
4. Configure Global settings.
   The **Maximum number of records in a list view** setting determines the maximum number of records that can show when you drill down on the cards in the CMDB 360 dashboard (drill-down set). If the total number of returned records is greater than the specified setting value, the dashboard trims the list view output according to this setting and the settings of individual cards.

   You can use this setting to limit the number of records that CMDB 360 must process. The setting applies to these cards:

   - CIs not reported by discovery sources
   - Data mismatch
   - Coverage: CIs with a single discovery source
   - Coverage: CIs by number of discovery sources

   The CMDB 360 dashboard defaults this value to 100,000.

5. Configure Potential issues settings.
   These settings affect the calculations for cards on the CMDB 360 view/Potential Issues tile and the list of CIs that appear when you drill down on those cards.

   a. Configure CIs not reported by discovery sources.
   The **Number of days since CIs were last discovered by a discovery source** setting determines the number of days used in the calculation of the CIs not reported by discovery sources card. The card shows CIs that are discoverable by multiple sources, but at least one discovery source hasn't reported on that CI in the specified number of days.

   b. Configure Data mismatch.

   These settings determine the classes of CIs included in the calculation and in the drill-down list views of the Data mismatch card. These settings determine which classes to use for the card and the relative weight (%) of each of those classes in the card calculations.

   Using these settings, add the classes for which you are interested in seeing CMDB 360 mismatch data. Regardless of the classes that you add in the Data mismatch settings, the 'Maximum number of records in a list view' setting, is always in effect when you drill down the card (100,000 by default).

Setting	Description
Automatic data weights	Evenly distributes weights among any added classes. The global setting of 'Maximum number of records in a list view' is evenly divided between all added classes so that each class can contribute an equal number of records to the drill-down set. For example, if you added four classes, the weight of each class = 25. Therefore, the system adds to the set of drill-down records, up to 25,000 CMDB 360 records (25% of 100,000) of each added class.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Setting	Description
Manual data weights	Custom weight (%) for each added class. The global setting of 'Maximum number of records in a list view' is divided between the added classes, according to the specified class weights. For example, if you added two classes, class A weight = 25 and class B weight = 75. The system adds to the set of drill-down records, up to 25,000 CMDB 360 records (25% of 100,000) of class A, and up to 75,000 CMDB 360 records (75% of 100,000) of class B.
Select CI classes you want to include in the calculation	Specify the CI classes that you want to check for attribute mismatches. CI classes you specify also include any child classes. Attributes are considered mismatched when different discovery sources report different values for the attribute.
Show CIs where EVERY attribute doesn't match	Select to include only CIs with a mismatch between discovery sources for every attribute that you specify.
Show CIs where ANY attribute doesn't match	Select to only include CIs with a mismatch between discovery sources for any attribute you specify.
Select an attribute	Specify the attributes that you want to check for mismatches.

6. Configure Coverage settings.

   These settings affect the calculations related to the coverage cards ('Coverage: CIs with a single discovery source' and 'Coverage: CIs by number of discovery sources') in the Coverage tilein the Discovery Sources tile on the CMDB 360 view. These settings determine the mixture of classes in the drill-down set of records.

   Using these settings, you can give priority to classes for which you are most interested in seeing CMDB 360 data in the Coverage charts. The number of records that you can drill down to in the Coverage charts, is limited by the global setting 'Maximum number of records in a list view' (100,000 by default). Regardless of your settings and class priorities, the 'Maximum number of records in a list view' setting, is always in effect.

   By default, the classes of the records in the drill-down set are random. You can add classes in this Coverage settings to ensure that your preferred classes have priority in being included in the drill-down set of records. You can prioritize any number of classes and assign a weight (%) for each of those classes within the total number of drill-down records.

Setting	Description
Automatic data weights	Evenly distributes weights among any added classes. The global setting of 'Maximum number of records in a list view' is evenly divided between all added classes so that each class can contribute an equal number of records to the drill-down set.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Setting	Description
	For example, if you added four classes, the weight of each class = 25. Therefore, the system adds to the set of drill-down records, up to 25,000 CMDB 360 records (25% of 100,000) of each added class.
Manual data weights	Custom weight (%) for each added class. The global setting of 'Maximum number of records in a list view' is divided between the added classes, according to the specified class weights. For example, if you added two classes, class A weight = 25 and class B weight = 75. The system adds to the set of drill-down records, up to 25,000 CMDB 360 records (25% of 100,000) of class A, and up to 75,000 CMDB 360 records (75% of 100,000) of class B.
Select CI classes you want to include in the calculation	Prioritized classes for which you are most interested in seeing CMDB 360 data in the Coverage charts ('CIs with a single discovery source' and 'CIs by number of discovery sources'). CI classes that you specify also include any child classes.

Using the Coverage settings, the system calculates an allowance of records per class, in the drill-down set of records. If the number of actual records per added class, is less than the computed allowance for that class, then the system adds records of random classes, up to the computed allowance for the class.

7. Select **Save**.

Create a CMDB 360 Get Records query

Create a Get Records query from the CMDB 360 dashboard of your CMDB Workspace to help you explore your existing CMDB 360 data.

Before you begin

Role required: sn_cmdb_user and either cmdb_ms_admin or cmdb_ms_editor

Procedure

1. Navigate to **Workspaces** > **CMDB Workspace**.
2. In the CMDB Workspace menu bar, select **CMDB 360**.
3. On the Saved Queries tile, click **Create Query.**
4. Click **I want to get CMDB 360 data**.
5. Select the CI classes to include in the query.
   You can click a selected class to open the condition builder. Use the condition builder to specify conditions that must be met for each class. Use **And** or **Or** to specify multiple conditions.

   Select **All Classes** if you want to include all CI classes without conditions.
6. Click **Continue**.
7. Select discovery sources to query on.
   The query retrieves CMDB 360 data that originates from the discovery sources you specify.

   You can leave the Select discovery sources prompt empty to retrieve data for all discovery sources.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Click **Continue**.
9. On the form, select the options:

Results Layout form

Field	Description
Show unique CMDB 360 records	Select if you want to see only unique CMDB 360 records. Records for the same CIs from different discovery sources are consolidated.
Show CI records by discovery source	Select if you want to see records for each CI and discovery source pair.
Limit results to	Limits the query results to CIs that belong to a service or CMDB group. When you select **Application Services**, **Technical Services**, or **CMDB Groups**, a prompt appears. You can use the prompt to specify the service or group that you want the query to filter for.

10. Click **Continue**.
11. Enter a name and description for your query.
12. Click **Save** .

What to do next

Run the query at least once if you want to create a schedule or report.

On the CMDB 360 Query Results page:

- If the number of results exceeds the number of results appearing on the page:
  - Click **Load More Results**: To show the next page of results. The number of results that appear on each result page is specified by the glide.identification_engine.multisource.query.batch.limit system property (100 items by default).
  - Click **Load All Results**: To show all results, up to the limit specified by the glide.identification_engine.multisource.query.max.limit system property (10000 by default).
  - Click a CMDB 360 Source link to easily access preview data of a source and see more details.
- You can click **Create Schedule** to set up a schedule that runs your query on a regular basis. Scheduling your query enables you to use the query results in reports you create.
- After creating a schedule, you can click **Create Report** to configure a report that you can manage using Reporting capabilities .
- On the Query Results page, access a record to view further details. For example, click a link in the Primary Record column, and then in the CI Details page, click **View CMDB 360 Data**.

Create a CMDB 360 Find Gap query

Create a Find Gap query from the CMDB 360 dashboard of your CMDB Workspace to help you find CIs that are not being reported by a discovery source.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_cmdb_user and either cmdb_ms_admin or cmdb_ms_editor

About this task
Gaps in discovery source reporting occur when at least one discovery source reports on the CI and another doesn't, enabling you to identify discovery sources that might have an issue.

Procedure
1. Navigate to **Workspaces** > **CMDB Workspace**.
2. In the CMDB Workspace menu bar, select **CMDB 360**.
3. Click **Create Query.**
4. Click **I want to find gaps in data between discovery sources**.
5. Select the CI classes that you want to check for gaps.
6. Click **Continue**.
7. Select non-reporting discovery sources.
   A non-reporting discovery source is a discovery source that doesn't report CIs as expected. Multiple non-reporting discovery sources have an OR condition with each other.
8. Select one or two reporting discovery sources.
   These discovery sources report the CI as expected and act as a baseline for identifying the gap in reporting.

   You can leave the **Select reporting discovery sources for gap tracking** prompt empty to include all discovery sources in the query.
9. Click **Continue**.
10. On the form, select the options:

Results Layout form

Field	Description
Show unique CMDB 360 records	Select if you want to see only unique CMDB 360 records. Records for the same CIs from different discovery sources are consolidated.
Show CI records by discovery source	Select if you want to see records for each CI and discovery source pair.
Limit results to	Limits the query results to CIs that belong to a service or CMDB group. When you select **Application Services**, **Technical Services**, or **CMDB Groups**, a prompt appears where you can specify the service or CMDB group that you want the query to filter for.

11. Click **Continue**.
12. Enter a name and description for your query.
13. Click **Save** .

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next
Run the query at least once if you want to create a schedule.

On the CMDB 360 Query Results page:

- If the number of results exceeds the number of results appearing on the page:
  - Click **Load More Results**: To show the next page of results. The number of results that appear on each result page is specified by the glide.identification_engine.multisource.query.batch.limit system property (100 items by default).
  - Click **Load All Results**: To show all results, up to the limit specified by the glide.identification_engine.multisource.query.max.limit system property (10000 by default).
  - Click a CMDB 360 Source link to easily access preview data of a source and see more details.
- You can click **Create Schedule** to set up a schedule that runs your query on a regular basis. Scheduling your query enables you to use the query results in reports you create.
- After creating a schedule, you can click **Create Report** to configure a report that you can manage using Reporting capabilities.
- On the Query Results page, access a record to view further details.

Create a CMDB 360 Compare Attribute Values query

Create a Compare Attribute Values query from the CMDB 360 dashboard of your CMDB Workspace to help you find CIs with mismatched attribute values between discovery sources.

Before you begin
Role required: sn_cmdb_user and either cmdb_ms_admin or cmdb_ms_editor.

About this task
The query enables you to determine if there's an issue with how a discovery source reports a CI.

The Compare Attribute Values query compares CIs from different discovery sources for mismatched values. Mismatches occur when a discovery source reports attribute values for a CI that are different from values reported by other discovery sources or the CMDB. You can use the query to identify these CIs and reconcile the attribute values, or fix any issues with the discovery sources.

Procedure
1. Navigate to **Workspaces** > **CMDB Workspace**.
2. In the CMDB Workspace menu bar, select **CMDB 360**.
3. Click **Create Query**.
4. Click **I want to compare attribute values between discovery sources or against the CMDB**.
5. Select a CI class that you want to compare attribute values for.
   You can click a selected class to open the condition builder. Use the condition builder to specify conditions that must be met for each class. Use **And** or **Or** to specify multiple conditions.
6. Click **Continue**.
7. On the Attributes to compare form, select the options:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
Any attribute doesn't match	Select if you want to retrieve CIs where there's a mismatch with any specified attribute values between the discovery sources.
Every attribute doesn't match	Select if you want to retrieve CIs where there's a mismatch with every specified attribute value between the discovery sources.
Select attributes to compare	Specify the attributes that you want to compare for mismatched values.

8. Click **Continue**.
9. Select your discovery sources that you want to compare attribute values for.

Discovery sources form

Field	Description
Compare to CMDB	Select if you want to compare the specified attribute values against your CI attributes recorded in the CMDB. When you compare against the CMDB, you only need one discovery source.
Select discovery sources	The discovery sources that you want to compare. Select at least two.
Limit results to	Limits the query results to CIs that belong to a service or CMDB group. When you select **Application Services**, **Technical Services**, or **CMDB Groups**, a prompt appears. You can use the prompt to specify the service or group that you want the query to filter for.

10. Click **Continue**.
11. Enter a name and description for your query.
12. Click **Save** .

What to do next

Run the query at least once if you want to create a schedule.

On the CMDB 360 Query Results page:

- If the number of results exceeds the number of results appearing on the page:
  - Click **Load More Results**: To show the next page of results. The number of results that appear on each result page is specified by the glide.identification_engine.multisource.query.batch.limit system property (100 items by default).
  - Click **Load All Results**: To show all results, up to the limit specified by the glide.identification_engine.multisource.query.max.limit system property (10000 by default).
  - Click a CMDB 360 Source link to easily access preview data of a source and see more details.
- You can click **Create Schedule** to set up a schedule that runs your query on a regular basis. Scheduling your query enables you to use the query results in reports you create.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- After creating a schedule, you can click **Create Report** to configure a report that you can manage using Reporting capabilities.
- On the Query Results page, access a record to view further details.

Schedule a CMDB 360 query for a report

Set up a schedule to regularly query for CMDB 360 data. Use scheduled queries to provide CMDB 360 data to reports you create, which can provide insight into how discovery sources populate the CMDB and the reliability of those discovery sources.

Before you begin

Ensure that you run the CMDB 360 query at least once.

Role required: sn_cmdb_user and either cmdb_ms_admin or cmdb_ms_editor.

Procedure

1. Navigate to **Workspaces** > **CMDB Workspace**.
2. In the CMDB Workspace menu bar, select **CMDB 360**.
3. On the Saved queries tile, create or access a CMDB 360 query.
   If you created a new query, you must run the query at least once before you can click **Create Schedule** on the query results page.
4. Select **Schedule query** on the Results Layout page of the query.
   To create a schedule for the Compare attributes values query, select **Schedule query** on the Discovery Sources page.
5. Specify a **Run** frequency and time you want to schedule the query to run.
   When you select Weekly or Monthly, you must also select a day of the week or calendar day, respectively.
6. Click **Save**.

What to do next

Create a CMDB 360 report to integrate CMDB 360 query results with platform Reporting capabilities. Each run of the query automatically updates the generated report.

Create a CMDB 360 Get Records query

Create a CMDB 360 Find Gap query

Create a CMDB 360 Compare Attribute Values query

Exclude classes from CMDB 360

Prevent CMDB 360 from collecting, storing, and analyzing data for classes for which it isn't needed. CMDB 360 processes large amounts of data. Therefore, excluding classes can help improve the performance of the Multisource Dashboard Analytics Population scheduled job and of CMDB 360 queries.

Before you begin

Role required: cmdb_ms_admin (automatically included in the CMDB Admin role)

About this task

To exclude classes from CMDB 360, you must directly manage records in the CMDB 360 denied classes [cmdb_multisource_deny_class] table. For each class that you want to exclude, add an active record for that class. Excluding a class from CMDB 360 also automatically excludes any of

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

its descending classes. In the base system, the CMDB 360 denied classes table is populated by default with some classes, such as dscy_net_base and discovery_net_base.

Procedure

1. Select **All** and then, in the Filter navigator, enter `cmdb_multisource_deny_class.list` to open the CMDB 360 denied classes table.
2. Select **New** and then fill out the form.
   - Select the class to exclude (with its descendents) in the field labeled **Deny this class and all extended classes from this class to store CMDB 360 data**.
   - Ensure that **Active** is selected. If **Active** isn't selected, then the specified class isn't excluded from CMDB 360.
   - Select **Submit**.

Result

Existing data for the specified class and its descending classes will be gradually removed from the CMDB 360 Data [cmdb_multisource_data] table using record cleaners, without any impact to the system.

What to do next

You can deselect **Active** or completely delete a record for a class that you want to include in CMDB 360 data collection.

Recompute CI attribute values

Modify reconciliation rules, or exclude a discovery source which is found to be invalid. Then, use the updated reconciliation rules in recomputing CI attribute values, for which those reconciliation rules or discovery source are applicable to.

Before you begin

Enable and configure CMDB 360.

If you want to recompute to apply updated reconciliation rules, then you must first update the reconciliation rules.

Role required: itil_admin or sn_cmdb_admin

About this task

CMDB 360 automatically generates a recompute task for each recompute that you submit. If you submit multiple recomputes, a recompute task is generated for each operation, but only one task runs at any given time. To list all recompute tasks, enter `cmdb_multisource_recomp_task.list` in the left navigation search box.

There is a maximum number of records that can be included in a single recompute operation. This number is specified by the system property glide.identification_engine.multisource.recompute.max.ci.limit (100,000 by default).

Note:

- Recompute skips CIs which are reported by multiple discovery sources, but with different class names.
- Recomputing CI attribute values is not supported with non-CMDB tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Configuration** > **CI Class Manager**.
2. Select a class from the CI Classes hierarchy list.
3. In the left-side pane, expand **Class Info**, and select **Reconciliation Rules**.
4. On the Reconciliation Rules page, click **Recompute**.
5. Select the **Recompute Type**.
   - **Replace values from the specified discovery source with value from the discovery source next in priority, according to reconciliation rules**: Recompute attribute values for the class CIs, applying priorities specified in reconciliation rules and while excluding the specified **Discovery Source**. Records for the discovery source you are excluding, are also removed from the CMDB 360 data store.

     This operation applies to data that exists in the CMDB. If reconciliation rules remain in effect for the discovery source that you have excluded, then future data from that discovery source, can populate the CMDB.
   - **Apply updated reconciliation rules**: Recompute attribute values for the class CIs, applying the updated reconciliation rules which are now in effect.
6. Select the **Recompute Scope**.
   The scopes grow from one option to the next:
   - **Recompute only CIs of this class**: Basic scope of CIs to recompute.
   - **Recompute CIs of this and derived classes**: Expand the basic scope to include CIs from derived classes.
   - **Recompute CIs of this and derived classes, along with selected related items**: Expand the previous scope to also include CIs from specified related items. Select the related items to include in the recompute.
7. Select the **Delete action** for CIs for which the excluded discovery source, is the only discovery source.
   - **Delete record**: Delete the CI record from CMDB.
   - **Set record attributes to custom value**: Set a specified CI attribute to a custom value to remove the CI from regular operations without deleting the CI. For example, set the *`Operational status`* attribute to *`Retired`*.
8. Select **Next**.
9. On the Review page, carefully review the counts for the affected CIs to ensure that all record counts are as you expect.
10. Select **Back** to adjust any settings for the recompute.
11. Select **Recompute**.

What to do next

You can do any of the followings:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- In the status message that appears for the recompute operation, click the link to see the CMDB 360 Recompute Task for more details. The Recompute Task shows the progress and status of the recompute operation.

  You can abort the recompute by setting **Status** to **Closed Incomplete** and selecting **Update**. You can then set **Status** back to **Work in progress** to resume recompute from where it was aborted.

- Enter `cmdb_multisource_recomp_task.list` in the left navigation search box, to see the status and progress of all recompute tasks.

Multisource Report Builder (legacy)

Improve CMDB data management by querying and reporting on Multisource CMDB data. Use the Multisource Report Builder to gain insights about how discovery sources are populating the CMDB and their reliability. You can then adjust reconciliation rules to improve the quality of CMDB data, if needed.

CMDB 360 in CMDB Workspace

Starting with the Yokohama release, the Multisource CMDB feature is part of the CMDB 360 feature which is accessible in the CMDB Workspace. Create, view, modify, schedule, create reports, and run CMDB 360 queries using the CMDB 360 query builder in the CMDB Workspace store app. Use the CMDB 360 query builder to create queries of the following types:

- Get Records: Queries your discovery sources for CIs that match your criteria.
- Find Gap: Queries for gaps in discovery sources reporting your CMDB 360 data. Queries discovery sources that report CIs against discovery sources that don't report those same CIs.
- Compare Attribute Values: Queries for CIs with attribute values that differ across multiple discovery sources or against the CMDB. Queries at least two discovery sources and/or the CMDB for CIs that match your criteria.

Legacy Multisource Report Builder

Instead of using the CMDB 360 query builder in CMDB Workspace, you can still use the legacy Multisource Report Builder as described in this topic.

After you create a Multisource query in the Multisource Report Builder, you can run the query to see the results. You can then also create a Multisource report that integrates the Multisource query results with the platform Reporting capabilities. High level steps for creating a Multisource report:

1. Create a query, then save and run it.
2. Create a schedule for the query.
3. Create a Multisource report that is based on the Multisource query.

You can create queries that find:

- All the discovery sources populating data in your CMDB.
- CIs not reported by any discovery source.
- All CIs discovered by one discovery source, but not by another discovery source.

You can create other queries that show differences in CI attribute values between multiple data sources, while being compared to the CMDB:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Show how an attribute value is different between a discovery source and the current CMDB record. For example, find Hardware CIs with different location than what SCCM reports.

- Show how an attribute is different between SourceA, SourceB, and SourceC. For example, show all Computer CIs where RAM is different between SCCM, ServiceWatch, and CMDB.

You can show query results by CI records, Multisource CMDB data records, or discovery sources. You can also limit the report results to CIs within a specific application service, technical service, or a CMDB group.

Create a Multisource query in the legacy Multisource Report Builder

Query the Multisource CMDB data to gain insights about how discovery sources are populating the CMDB, and then use that query to create a Multisource data report.

Before you begin

Enable and configure CMDB 360.

Role required: cmdb_ms_editor

About this task

The Multisource Report Builder page updates dynamically as you set fields. Therefore, some of the fields that are described in the steps below might not appear.

Procedure

1. Navigate to **All** > **Configuration** > **Multisource Report Builder**.
2. On the Multisource Report Builder page, select a query to edit or run, or click **New**.
3. Enter **Name** and **Description** for the query.
4. Select the **Result type** for the query.
   - **CI records**: Results show unique CIs from the Multisource CMDB data store.
   - **Multisource data records**: Results show all entries of CI/discovery source combinations from Multisource CMDB data.
   - **Discovery sources**: Results are grouped by discovery sources that match the query criteria.
5. Select **Only show difference** to show differences in CI attribute values and then select the **Type of difference**.
   - **Between CMDB record and discovery source**: Show differences in attribute values between the CMDB data and the specified discovery sources.
   - **Between discovery sources**: Show differences in attribute values between specified discovery sources based on Multisource data.
6. Select the **Class** to apply the query to, or select **All Classes** to apply the query to all classes. Use the condition builder to specify conditions that must be met for the class. Use **And** or **Or** to specify multiple conditions.
7. Use the list collector to select one or more **Discovery source** items to query on.
8. Set **Field to compare** to the class attributes for which to show differences.
   Use the OR and AND operators to compare based on multiple attributes. The list of attributes is a pre-populated subset of the class attributes, to which you cannot add or remove items.
9. Set **Limit results to** to limit the query results to CIs that belong to a specific application service, technical service, or a CMDB group.
10. Click **Save** and then click **Run**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

- On the CMDB Multisource Query Results page:
  - If the number of results exceeds the number of results appearing on the page:
    - Click **Load More Results**: To show the next page of results. The number of results that appear on each result page is specified by the glide.identification_engine.multisource.query.batch.limit system property (100 items by default).
    - Click **Load All Results**: To show all results, up to the limit specified by the glide.identification_engine.multisource.query.max.limit system property (10000 by default).
    - Click a Multisource CMDB value link or a CI value link to access the respective records and see more details.
  - In the Configuration Item column, click a CI link to open the CI form. In the Related Links section on the CI form, click the **Multisource Data** tab to show Multsource data, such as discovery sources, related to the CI.
- Create a schedule for the query and ensure that the schedule runs at least once. This step is required for creating a Multisource report.

> **Note:**
> Initially, after creating a query, both the **Create Schedule** and the **Create Report** buttons are grayed out. Only after saving the query, you can create and run a schedule for the query, and only then you can create a report that is based on the query.

Schedule a Multisource query

After saving and running a Multisource query, create a schedule for the query to run automatically on a set schedule. Query results are stored in a results table and you can configure email addresses for the results to be sent to or include the results in CMDB dashboards.

Before you begin

The query for the schedule must be already saved and run at least one time.

Role required: cmdb_ms_user

Procedure

1. Navigate to **All** > **Configuration** > **Multisource Report Builder**.
2. On the Multisource Report Builder page, select the query that you want to create a schedule for.
3. On the Multisource Report form, click **Create Schedule**.
4. On the Scheduled Email of Multisource Report Builders, click **New**.
5. Fill in the Scheduled Email of Multisource Report Builders form.

Field	Description
Query	Saved query that was created in Multisource Report Builder.
Users	Users to email the query results to.
Groups	User groups to email the query results to.
Run	Frequency and time to run the query automatically.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Time	When you set **Run** to **On Demand**, the query runs only when you run it manually.
Email addresses	More ad-hoc email addresses to email the query results to.
Subject	Text that will appear as the subject of the email with the query results.
Introductory message	Text that is included in the body of the email with the query results.
Type	Type of the file with the query results, which will be attached to the email.
Zip output	Enables zipping of the results file.
Conditional	Enable a condition for running the query and specify the condition in the **Condition** field. If the specified condition isn't met, the query doesn't run.
Condition	Condition that must be met for the query to run (Java script). Appears only if **Conditional** is selected.
Omit if no records	Disable sending an email for a query run that returns no results.

Note:
When using update sets to port Multisource schedules from a non-production to a production environment, check the **Users** and **Groups** settings in the schedule. Any user or group that doesn't exist in the production environment, and which needs to receive the query results, must be re-added in either of the following ways:

- Manually created in the production environment. In this case, you must also remove the invalid user or group in the production environment (ported from non-production environment) from any schedules and add the new user or group instead.
- Explicitly ported from the non-production to production environment.

6. Click **Submit**.

What to do next

- If **Run** is set to **On Demand** in a schedule, or if you need to run a query randomly even if it has a recurring schedule, you can manually run that query as follows:
  1. Navigate to **All** > **Configuration** > **Multisource Report Schedules**.
  2. In the Scheduled Email of Multisource Report Builders list view, select the query that you want to run.
  3. On the Scheduled Email of Multisource Report Builder form, click **Execute Now**.
- Create a Multisource report for the query, that integrates the Multisource query results with the platform Reporting feature.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a report based on a Multisource (CMDB 360) query

After creating, saving, running, and scheduling a Multisource (CMDB 360) query, you can create a Multisource (CMDB 360) report that integrates the query results with the platform Reporting feature. You can for example, include such Multisource (CMDB 360) report in the platform CMDB dashboards.

Before you begin

The Multisource (CMDB 360) query for the report must be already saved, have a schedule, and must have already run at least once.

Role required: cmdb_ms_user

About this task

Creating a report that is based on a Multisource (CMDB 360) query, creates a report source which you can then manage using Reporting capabilities.

Note:
If you are using the CMDB 360 view in CMDB Workspace to generate the CMDB 360 query and the report, you can skip to step 4 in the procedure below.

Procedure

1. Navigate to **All** > **Configuration** > **Multisource Report Builder**.
2. In the Multisource Report Builder list view, select the query that you want to create a schedule for.
3. On the Multisource Report form, click **Create Report**.
4. On the Create a report form, click **Save** or **Run**.

Trouble?
A report shows the results for the most recent query run. If meanwhile the query has changed, then the report shows results that are out of synchronization with the query. When you update the query, ensure to immediately run the updated query so that the report is synchronized with the query.

What to do next

To add a Multisource (CMDB 360) report to the CMDB Correctness Dashboard for example, see Add a report to a dashboard.

Sample CMDB 360/Multisource CMDB queries

Use sample queries to create your own CMDB 360/Multisource CMDB queries.

Discrepancy in multiple attributes between multiple discovery sources

Field	Setting
Name	Discrepancy in multiple attributes between multiple discovery sources (discovery source vs. discovery source)
Description	Find Linux servers with name containing “backup” which have discrepancy in *`Disk Capacity`* OR *`CPU Count`* OR *`Serial Number`* between discovery sources ServiceNow/ServiceWatch/SCCM/Tivoli.

© 2026 ServiceNow, Inc. All rights reserved.

All CMDB 360/Multisource CMDB records for Linux Server, where the Location value is different than the reported value by Tivoli

Field	Setting
Name	Linux Server Location - Diff than Tivoli value
Description	All Multisource CMDB records for Linux Server, where the Location value is different than the value reported by Tivoli.
Result type	Multisource data records
Class	Linux Server
Only show difference	Selected
Type of difference	Between CMDB record and discovery source
Discovery Source	[is][Tivoli]
Field to compare	Location
Limit results to	All

Components related to CMDB 360

Several types of components are related to CMDB 360 (included in the com.snc.cmdb plugin), such as tables and properties.

Properties

Open the CMDB 360 Properties page by navigating to **All** > **Configuration** > **CMDB 360 Properties**. You can hover over the '?' icon for a property, to show property names.

You must have the cmdb_ms_admin role to modify property values.

Property	Description
glide.identification_engine.multisource_enabled	Enables CMDB 360. • Type: true | false • Default value: false • Location: CMDB 360 Properties page
glide.identification_engine.multisource_cmdb_ci_enabled	Enables capturing CMDB 360 data for CIs from CMDB classes (derived from the cmdb_ci class). • Type: true | false • Default value: true • Location: CMDB 360 Properties page

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
glide.identification_engine.multisource_non_cmdb_ci_enabled	Enables capturing CMDB 360 data for CIs from non-CMDB classes (not derived from the cmdb_ci class). For example, the Serial Number [cmdb_serial_number] class, or the Software instance [cmdb_software_instance] class. • Type: true | false • Default value: false • Location: CMDB 360 Properties page
glide.identification_engine.multisource.query.batch.limit	Max number of items to show per query results page, in the CMDB 360 Report Builder. Changing the value of this property, might affect performance when running a query. • Type: numeric • Default value: 100 • Location: CMDB 360 Properties page
glide.identification_engine.multisource.query.max.limit	Max number of query results to show when you click **Load All Results** in the CMDB 360 Report Builder. Changing the value of this property, might affect performance when running a query. • Type: numeric • Default value: 10000 • Location: CMDB 360 Properties page
glide.identification_engine.multisource.recompute.max.ci.limit	Max number of CIs that can be included in a CMDB 360 recompute operation. • Type: numeric • Default value: 100000 • Location: CMDB 360 Properties page
glide.cmdb.logger.source.cmdb_multisource	Enable logging for CMDB 360. CMDB 360 logs are stored in the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	Log [syslog] table with *source* set to "cmdb_multisource". • Type: string • Values: info, warn, error, debug, or debugVerbose • Location: Add to System Properties [sys_properties] table.

sn_cmdb_ws.ms.calculate_cmdb_only	Limits the scope of data in the Discovery sources tile in the CMDB 360 dashboard in CMDB Workspace, to CMDB classes only (derived from the cmdb_ci class).
	
	• Type: true | false
	• Default value: true
	• Values:
	  ○ True: Include data only from CMDB classes.
	  ○ False: Include data from CMDB and non-CMDB tables.
	• Location: Add to System Properties [sys_properties]

sn_cmdb_ws.ms.report_class_ci_count_max_threshold	Threshold number of multisource records that when exceeded for a class, CMDB 360 Coverage charts in CMDB Workspace stop populating data for that class (CMDB or non-CMDB tables). When the specified threshold number is reached for a class, the system creates a record in the CMDB 360 Analytics Skipped Class [sn_cmdb_ws_ms_skip_class] table causing that class to be skipped in future job runs.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	Note: Managing class inclusion in the Coverage charts, by using this system property and the CMDB 360 Analytics Skipped Class [sn_cmdb_ws_ms_skip_class] table, can greatly decrease or increase performance of the Coverage chart job. • Type: numeric • Default value: 10 million • Location: Add to System Properties [sys_properties] • Learn more: CMDB 360 experience in CMDB Workspace

Tables

Table	Description
CMDB 360 Data [cmdb_multisource_data]	CMDB 360 data store. Contains the raw data sent by all discov
CMDB MultiSource Column Metadata [cmdb_multisource_column_metadata]	Mapping of attributes for each class to floatable columns. Used performance of queries that involve high volumes of data.
CMDB Multisource Queries [cmdb_multisource_query]	CMDB 360 query definitions created by the user in CMDB Wor the legacy Multisource Report Builder.
Query Status [cmdb_multisource_query_status]	State of execution, of queries created in CMDB Workspace or i Multisource Report Builder.
CMDB Multisource Query Results [cmdb_multisource_query_result]	Results for queries created in CMDB Workspace or in the legac Report Builder, configured with result type of CI records.
CMDB Multisource Query Result Multisource Records [cmdb_multisource_query_result_ms_record]	Results for queries created in CMDB Workspace or in the legac Report Builder, configured with result type of CMDB 360 record
CMDB Multisource Query Result Discovery Sources [cmdb_multisource_query_result_disco_source]	Results for queries created in CMDB Workspace or in the legac Report Builder, configured with result type of Discovery source
CMDB MultiSource Recompute Task CIs	All CIs that are involved in a recompute operation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
[cmdb_multisource_recomp_task_ci]	
CMDB Multisource Recompute Tasks [cmdb_multisource_recomp_task]	Recomputation requests and progress status.
CMDB 360 denied classes [cmdb_multisource_deny_class]	Classes that are excluded from CMDB 360 data collection and For any class with an active record, there won't be any data in t Data [cmdb_multisource_data] table.
CMDB 360 Analytics Skipped Class [sn_cmdb_ws_ms_skip_class]	Internally used to store records of classes for which the threshold number of multisource records, as set in the *sn_cmdb_ws.ms.report_class_ci_count_max_thi* property, has exceeded. Classes in this table are excluded from charts in CMDB Workspace. You can set the *Override class CI records popula* column for an excluded class to 'true', to include it in Coverage computations. **Note:** Managing class inclusion in the Coverage charts, by using this table and the *sn_cmdb_ws.ms.report_class_ci_count_max_* system property, can greatly decrease or increase perform Coverage chart job.

Roles

Role	Description
cmdb_ms_read	Can access and run a CMDB 360 query but can't create a query. Contains cmdb_read role.
cmdb_ms_editor	Can create and run a query, has full read and write access, but can't do Recompute. Contains cmdb_ms_read role.
cmdb_ms_admin	Can create and run a query, and can modify CMDB 360 properties. Contains cmdb_ms_write role.

CMDB data management

The integrity and health of the CMDB is essential for the various features that depend on the data in the CMDB. As the CMDB grows and infrastructures change, the CMDB can accumulate stale, duplicate, or outdated CIs and therefore no longer accurately reflect the IT infrastructure and applications in the organization.

The CMDB Data Manager is an essential tool where you can create, publish, and manage policies that reflect organizational needs for data management. The CMDB Data Manager is a comprehensive and integrated solution that scales to large CMDBs. It supports bulk management of CI life cycle operations such as deletion, archival, and attestation. Use the CMDB Data Manager to automate and govern CI life cycle operations to help maintain the CMDB in a healthy and efficient operational state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Managing duplicate CIs is also an important data management task that helps maintain the health of the CMDB.

Working with CMDB Data Manager

CMDB Data Manager is a policy-driven framework for bulk management of CI life-cycle operations such as deletion, archival, and attestation. The CMDB Data Manager is a comprehensive and integrated solution that scales to large CMDBs and copes with rapid changes in a cloud-based world.

Large CMDBs can over time accumulate large amounts of stale CIs that can impact overall performance. Custom mitigating solutions can be difficult to develop and to maintain, and are also prone to errors. The CMDB Data Manager is the tool where you can create, publish, and manage policies. Create policies to automate and govern CI life-cycle operations to help maintain the CMDB in a healthy and efficient operational state.

Use the CMDB Data Manager to create policies that represent your organizational processes for managing the life cycle of CIs such as:

- Retire all computers without owners that were created more than a year ago ('Retire' policy type).
- Archive all Linux servers in the Seattle datacenter that haven't been updated for six months ('Archive' policy type).
- Delete all containers that haven't been discovered in the past week ('Delete' policy type).
- Attest all the CIs in a specified location (Attestation policy type).
- Approve cascade-delete, archive, or retire life-cycle tasks generated by dependent CI management.
- Delete orphan, stale, or irrelevant records in non-CMDB related tables. The non-CMDB Related tables in the Related Entry [cmdb_related_entry] table have references to CMDB tables. A CI in a related table can, for example, become orphan if the referenced CI in the CMDB is deleted ('Delete CMDB Related Entry' policy type).
- Certify that attributes have a specific value required for the business.

You can apply CMDB Data Manager policies only to classes that extend the Configuration Item [cmdb_ci] table.

CMDB Data Manager experience in CMDB Workspace

You can use the CMDB Workspace landing page and its views to fully administer CMDB Data Manager, access high-level analytic and counts for its policies and tasks, and review your tasks. For information about using the CMDB Data Manager in CMDB Workspace, see CMDB Data Manager experience in CMDB Workspace.

CMDB Data Manager on Core UI (UI 16)

Starting with the Washington DC release, CMDB Data Manager on Core UI (UI 16) is being prepared for future deprecation. It will be hidden and no longer activated on new instances but will continue to be supported. CMDB Workspace provides the latest experience for this functionality.

CMDB Data Manager built on Core UI (UI 16) is available by navigating to **All** > **Configuration** > **CMDB Data Manager**. For information about using the CMDB Data Manager legacy build on Core UI, see CMDB Data Manager (Core UI).

© 2026 ServiceNow, Inc. All rights reserved.

Terms

Policy

A CMDB Data Manager policy captures the overall management plan for a life-cycle event, such as CI retirement. A policy is associated with a subflow (the policy subflow) which creates the tasks (the policy tasks) for the target CIs of the policy. A policy is configured with a policy type and the policy tasks perform operations associated with that policy type, such as archiving or deleting a CI record. Also, you can configure a policy to require an approval.

The policy type, policy subflow, and policy tasks are all aligned to a specific CI life-cycle event. For example, a policy set with the delete policy type is associated with the delete subflow, and its policy tasks handle the deletion of CIs.

A daily scheduled job processes all published CMDB Data Manager policies.

Policy subflow

The policy subflow contains the underlying logic to process a life-cycle event such as retire or delete. If the policy is configured to require approval, then the policy subflow runs only after a policy task is approved.

The base system provides several common subflows such as delete, archive, and retire, which you can use with policies. You can also create custom subflows for your organization.

Policy task

A separate task is created and assigned to each unique *`Managed By Group`* value within the set of target CIs in a policy. A policy task triggers the policy subflow, tracks the set of target CIs for the task, and handles the approval of the task, if necessary.

If a policy requires an approval, the policy tasks don't trigger the policy subflow until a member of the group assignment in the *`Managed by Group`* attribute of the target CIs, approves the tasks. If a task is rejected or if the *`Managed by Group`* attribute is empty, the task is assigned to an administrator who must manually intervene to resolve the task.

If a policy isn't configured to require an approval, then the policy tasks are automatically approved.

CI exclusion list

A set of CIs to which policies of a specified type don't apply.

Policy types

You can create policies of the following types:

Delete

Use to remove a CI from its current table with no option to restore the CI into an active state.

Retire

Use to retire a CI while keeping the CI active in list views and in processes such as CMDB Health.

Attestation

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use to assign and process attestation tasks that verify the existence of actual IT infrastructure and applications that you own. As CIs are continuously ingested into the CMDB from various data sources, attesting CIs support the integrity of the CMDB. For more information about using the Attestation policy type, see CIs attestation.

Archive

Use to remove a CI from its current table and store the CI in a separate archive table for temporary retention. Archiving a CI excludes the CI from views and from features such as maps and the relations formatter. During the retention period, you can restore CIs into active state. At the end of the retention period, archived CIs are deleted from their archive table.

Delete CMDB Related Entry

Use to clean up any irrelevant or stale data from related tables to help keep CMDB data healthy and relevant as the state of referenced CIs change.

Related tables, such as the Serial Number [cmdb_serial_number] table, aren't part of the CMDB hierarchy but still qualify as CMDB data. Related tables don't inherent from the Configuration Item [cmdb_ci] table, but have at least one column that references a CMDB CI. Related tables are specified in the Related Entries [cmdb_related_entry] table.

Certification

Use to certify that specific attributes are of a specific value.

You can implement your Retire, Delete, and Archive policies so that they follow Common Service Data Model (CSDM) standards where for example, CIs are archived and deleted only when a CI is already in retired state. When you create these life-cycle policies, the system applies processes to manage any dependent CIs that might be left behind. For more details about these processes and about verifying that the feature is enabled, see Dependent CIs management.

ServiceNow AI Platform® data archiving

The functionality that the Archive policy type in CMDB Data Manager provides, relies and extends the ServiceNow AI Platform® data archiving feature, applied specifically for CMDB CIs. While processing an Archive policy to archive CMDB CIs, CMDB Data Manager uses components and processes of ServiceNow AI Platform® data archiving in the following ways:

- The Archive Rule [sys_archive] table contains the ServiceNow AI Platform® archive rules including the *`Archive Configuration Items`* CMDB archive rule which CMDB Data Manager Archive policies use.
- Data Manager relies on the *`Archive`* scheduled job to run (every hour by default) and process CMDB Data Manager archive policies. The *`Archive`* scheduled job is stored in the Schedule Item [sys_trigger] table.
- In the ServiceNow AI Platform® table Archive Job Execution Chunks [sys_archive_run_chunk], the *`Keys`* attribute contains the sys_ids of the CMDB CIs to be archived (where Rule ID is the CMDB archive rule ID).
- Archived records are stored in the ServiceNow AI Platform® archive tables, which are prefixed by 'ar_'. In a similar way, the first time that a CMDB archive job runs, it creates an archive table for each CMDB class (prefixed by 'ar_cmdb'). The initial CMDB archive task, therefore, takes longer than subsequent CMDB archive tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For each Data Manager archive policy, the system batches the policy CIs to be archived into batches of 1000 CIs. The sys_archive_run_chunk table contains a record for each of the batches.

CMDB archive tables, such as ar_cmdb_ci_computer, are listed under **All** > **System Archiving** > **Archive Tables**.

When using the CMDB Data Manager to archive CIs, you can also directly apply ServiceNow AI Platform® data archiving features, such as restore CIs into active state during a CIs retention period.

CI life cycle management

You can use life-cycle policies in CMDB Data Manager to manage the life cycle of CIs. Those life-cycle policies use retirement definitions that specify the retirement state for classes in your organization and support the transition of CIs through life cycle stages. For more information about accessing and managing retirement definitions, see Retirement definitions.

In general, CIs that are no longer needed should be retired. Then, to complete the CI life-cycle, retired CIs should be deleted or archived according to business needs. The following high level steps describe how to manage CIs' life cycle:

1. Use a non-production instance as a safe environment for configuring and testing life-cycle management in your organization.
2. Choose the CI class for which you want to define a retirement definition while carefully considering derivation. Due to derivation, the retirement definition that you are specifying for a class, is also in effect for all child classes that don’t have their own retirement definition.
3. Specify the retirement definition for the class.
4. Create a retirement policy targeting the CIs that you want to retire.
5. Create a delete or an archive policy targeting the retired CIs.
6. After testing and verification that the entire life-cycle management plan works as intended, transfer all of those configurations to the production instance.

The life cycle state of a CI affects the CIs visibility and inclusion in ongoing CMDB processes:

- A retired CI isn't excluded from any views or processes such as CMDB Health.
- An archived CI no longer exists in its active table and instead it's stored in a separate archive table. Archived CIs are no longer visible or included in processes such as list views, maps, and relations formatters. Archived CIs can be retained for a specified retention period before being deleted from the archive table. During the retention period, archived CIs can be manually restored into an active state by using the ServiceNow AI Platform® feature to restore CIs into active state.

Note:
Deleting a CI is an irreversible operation. A deleted CI no longer exists in the table that it belonged to and there's no way to restore it to an active state.

Configure the environment for CMDB Data Manager

Prepare your environment for using the CMDB Data Manager:

1. Some policy types such as the life-cycle policies Retire, Archive, and Delete, require that an active retirement definition exists for each targeted class in the policy. This requirement doesn't apply to all policy types. For example, this requirement doesn't apply to the Attestation

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

policy type. If you attempt to create a policy of a policy type for which this requirement applies but isn't met, an error message appears and the operation fails.

2. You can streamline approval of policies by populating the *Manage by Group* attribute of CIs that you plan to target in policies. Use the CI Class Manager to populate that attribute for an entire class, in a single synchronization operation. For more information about this data synchronization, see Set the group for a CI or an entire class of CIs. If the *Managed by Group* attribute isn't populated for a CI, then the approval process is directed to the administrator.

CMDB Data Manager experience in CMDB Workspace

Use the CMDB Data Manager in CMDB Workspace to administer policies, CIs life-cycle and attestation tasks, view analytics about on-going CMDB Data Manager processes, and to approve or reject assigned tasks.

CMDB Data Manager experience in CMDB Workspace

Use the CMDB Workspace landing page and its views to administer CMDB Data Manager, to access overall analytic and counts for its policies and tasks, and review your tasks:

- Use the Management view in CMDB Workspace to create and track policies, and to manage exclusion lists and retirement definitions.
- Use the Important actions tile on the CMDB Workspace landing page to access data attestation and life cycle approval tasks such as reassignment requests and unassigned overdue tasks. Drill down these task cards to see further details about the tasks.
- Use the My work tile on the CMDB Workspace landing page to access all open tasks, which are assigned to you, or to the group assigned in the *Managed by Group* attribute and which you're a member of. For CMDB administrators, any unassigned tasks are also included for reassignment. Review and process all tasks. Review and process attestation tasks by checking the physical existence of IT infrastructure or applications associated with the CIs in the tasks.
- Use the My Work view in CMDB Workspace to access attestation and non-attestation tasks that are assigned to you or to an assignment group that you belong to in accordance with CMDB Data Manager policies. Overdue attestation tasks appear in a separated **Overdue tasks** list.

Manage policies in CMDB Data Manager in CMDB Workspace:

- Create a CMDB Data Manager policy in CMDB Workspace
- Review CMDB Data Manager tasks in CMDB Workspace
- Review attestation tasks in CMDB Workspace
- Manage retirement definitions for CMDB Data Manager
- Manage exclusion lists for CMDB Data Manager in CMDB Workspace

Administer Data Manager in CMDB Workspace

As a CMDB administrator, you can create policies, manage CI attestation, manage CI exclusion lists, access CMDB Data Manager insights, and access subflows and settings that are used in the CMDB Data Manager.

Get started with CMDB Data Manager in CMDB Workspace

The Data Manager overview page provides a dashboard view of Data Manager tasks, and lets you get started in using the CMDB Data Manager.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: sn_cmdb_admin

Procedure

1. Navigate to **Workspaces** > **CMDB Workspace** and then select **Management** in the CMDB Workspace menu bar.
2. Select the **Data Manager** link in Management tools, in the Manage section.
3. Select **Data Manager overview** in the left navigation bar.
   The Data Manager overview page provides the following cards:

   Open tasks

   Count of the open tasks created for Data Manager policies.

   Drill down the card to open a list view with details of the tasks associated with the card.

   Unassigned tasks

   Count of the open tasks created for Data Manager policies, which aren't assigned.

   Drill down the card to open a list view with details of the tasks associated with the card.

   Pending tasks

   Tasks in Pending state, such as archive tasks where archive is still being processed.

   Closed incomplete tasks

   Tasks that encountered errors while processing, resulting with the task not completing successfully. Such tasks are in a Closed Incomplete state.

   Overdue tasks

   Count of tasks with a due date, such as attestation tasks, whose due date has passed.

   Aging tasks

   A bar chart showing counts of tasks without a due date and with no activity for over the number of days specified by the *sn_cmdb_ws.glide.cmdb.data.manager.aging.policy.task.timeframe* system property (30 by default).

   Policies failing evaluation

   Policies whose evaluation failed at some point and are in an error state. These policies require your attention, and after resolving any issues, you can publish them again.

   Workload

   - Groups: Tasks that are assigned to a group.
   - Individuals: Tasks that are assigned to individual users.

What to do next

- Create a CMDB Data Manager policy in CMDB Workspace.
- Manage retirement definitions for CMDB Data Manager.
- Manage exclusion lists for CMDB Data Manager in CMDB Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- View CMDB Data Manager analytics in CMDB Workspace.
- View properties and other settings for CMDB Data Manager by selecting **Settings** in the left navigation pane. For details about the system properties associated with those settings, see Components related to CMDB Data Manager.

Manage retirement definitions for CMDB Data Manager

Use CMDB Workspace to create, delete, edit, or activate retirement definitions in your organization, for a class. Tables that are targeted in CMDB Data Manager life-cycle policies, must be associated with an active retirement definition. Target CIs in Retire policies, are set to match their associated class retirement definitions.

Before you begin

Role required: sn_cmdb_admin

For information about retirement definitions used in CMDB Data Manager (Core UI), see Retirement definitions.

About this task

Some retirement definitions in the base system are inactive and you must activate any retirement definition that you want to use with a CMDB Data Manager life-cycle policy by setting its *Active* attribute to **true**. Retirement definitions are stored in the CMDB Retirement Custom Definitions [cmdb_retirement_custom_definitions] table.

When a CMDB Data manager retires a CI, ensure that any of its dependent CIs are also retired and don't remain as orphan CIs, by enabling management of dependent CIs. Orphan CIs can impact the consistency, accuracy, and integrity of the CMDB.

- For information about enabling and managing dependent CIs, especially in the context of cascade-retire, cascade-archive, and cascade-delete, see Dependent CIs management.
- For details and definitions of independent and dependent CIs, see CMDB classifications and class dependency.

Note:

- Always be aware of the automatic derivation of retirement definitions throughout the class hierarchy. For example, an active retirement definition for the Configuration Item [cmdb_ci] class can potentially be in effect throughout the entire CMDB hierarchy (aside from classes with their own retirement definition).
- You can't deactivate (or delete) the retirement definition of the Configuration Item [cmdb_ci] class.
- Each CMDB class can be associated with only a single retirement definition.
- Regardless of where you manage retirement definitions, the definitions are used in both the Data Manager (Core UI) and Data Manager in CMDB Workspace.

Procedure

1. Navigate to **Workspaces** > **CMDB Workspace** and then select the **Data Manager** quick link on the Home view.
2. In the Get started area on the Data Manager overview page, select **Manage retirement definitions**.
3. On the Data Manager settings page, review the Retirement definitions list view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. **Optional:** Drill down to a definition and then, on the Retirement definition form, toggle the **Active** switch to activate or deactivate a definition.

b. **Optional:** Edit the conditions on the definition.

c. Select **Save definition**.

4. On the Data Manager settings page, select **Add definition**.
5. Fill out the Retirement definition form and then select **Save definition**.

Field	Description
Active	Toggles the retirement definition between active and inactive.
Table	Table that the retirement definition applies to. The retirement definition will be derived by all child classes of the specified parent class.
Condition builder	Condition that reflects on what retirement means in the organization. Target CIs in Retire policies that belong to the specified table are set as specified in the retirement definition. You can, therefore, only use **AND** clauses in the definition. **OR** clauses aren't applicable.

Delete a CMDB Data Manager retirement definition

Delete a retirement definition that is no longer needed, in CMDB Workspace.

Before you begin

The following restrictions are in effect:

- The retirement definition that you want to delete must be in an inactive mode (*Active* = **false**).
- The retirement definition for the Configuration Item [cmdb_ci] class can't be deleted.

Role required: sn_cmdb_admin, data_manager_admin

About this task

Procedure

1. Navigate to **Workspaces** > **CMDB Workspace** and then select the **Data Manager** quick link on the Home view.
2. In the Get started area on the Data Manager overview page, select **Manage retirement definitions**.
3. On the Data Manager settings page, in the Retirement definitions tile select the retirement definition that you want to delete.
4. On the Retirement definition page, select **Delete definition**.
5. In the Delete retirement definition dialog box, select **Delete**.

Result

After the deletion, a retirement definition for the class is derived from a parent class.

© 2026 ServiceNow, Inc. All rights reserved.

Manage exclusion lists for CMDB Data Manager in CMDB Workspace

Create and manage exclusion lists for the various policy types in CMDB Data Manager. Policies of the specified type won't target CIs and other records in the exclusion list for that policy type.

Before you begin

Role required: sn_cmdb_admin

About this task

Note:

- Regardless of where you manage exclusion lists, that same list is used in both the Data Manager (Core UI) and Data Manager in CMDB Workspace.
- The Certification policy type doesn't support exclusion lists.

Procedure

1. Navigate to **Workspaces** > **CMDB Workspace** and then select Management in the CMDB Workspace menu bar.
2. Select the **Data Manager** link in Management tools, in the Manage section.
3. Select **Excluded records** in the left-side bar.
   The Excluded records list view shows lists of all records currently excluded, grouped by policy type. You can expand any group to show its CIs and other records and then drill down to any record.
4. **Optional:** Remove excluded records from the exclusion list:
   a. Expand a policy type group to show its list of excluded records.
   b. In the list view, select the records that you want to remove from the exclusion list.
   c. Select **Remove from list**
   d. In the Confirm removal from exclusion list dialog box, select **Confirm**.
   The selected records are removed from the exclusion list and can be targeted for the policy type.
5. **Optional:** Add records to an exclusion list:
   a. Select **Exclude Records** and fill out the Data Filter form.

Field	Description
Tables	Table from which to select CIs or records for the exclusion list.
Filter conditions	Use the condition builder to specify the criteria that CIs or records from the specified **Tables** must meet to be included in the exclusion list.
Related List Condition	Add a condition that is based on related lists that are associated with the records that you want to exclude.

   b. Select **Apply filters** and then review the Search results list.
   c. Select the records that you want to add to exclusion lists and then select **Continue**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. On the Select policy type page, select the policy types for which to exclude the selected records and then select **Continue**.

e. Review the details of the exclusion on the summary page and then select **Save**.

Create a CMDB Data Manager policy in CMDB Workspace

Create a CMDB Data Manager policy to automatically process CIs life-cycle events such as deletion. Applying consistent and standard life-cycle policies to CIs helps maintain the health of the CMDB.

Before you begin

- The life-cycle policies Retire, Archive, and Delete, require that an active retirement definition exists for each targeted class in the policy. If you attempt to create a policy of a policy type for which this requirement applies but isn't met, an error message appears and the operation fails.

  For more information about retirement definitions, see Retirement definitions.

- Verify that any custom subflow that you want to associate with a policy exists:
  1. Navigate to **Workspaces** > **CMDB Workspace** and then select **Management** in the CMDB Workspace menu bar.
  2. Select the **Data Manager** link in Management tools, in the Manage section.
  3. Select **Subflows** in the navigation bar on the left.
  4. Review the subflows on the Data Manager subflows page, and drill down to a subflow to open it in Workflow Studio.
  5. Select **Create new subflow** to create a new subflow in Workflow Studio.
- To require a review and an approval for a policy task: Ensure that the *Managed By Group* attribute is populated in target CIs and that the assigned users have the privilege to approve the policy tasks.
- When Asset Management is activated, check if there's an asset record associated with that CI before retiring the CI. Check the associated asset record, if there's one, and verify that its asset state (install_status) is *Retired*.

Role required: sn_cmdb_admin

About this task

Specify for each policy a policy type, a subflow for life-cycle policies, a set of CIs to operate on as target CIs, and any other options specific to the selected policy type. Target CIs must typically be from classes extending the Configuration Item [cmdb_ci] table, and with the Delete CMDB Related Entry policy type, also tables in the Related Entries [cmdb_related_entry] table. However, the Certification policy type for example, also supports non-CMDB tables.

Set condition filters to specify the initial set of CIs that the policy applies to. You can then further narrow down the initial set of CIs by using a CI exclusion list for the policy type. During the final preview of the policy, or from a policy task, you can select individual CIs to also exclude for the policy type. In addition, for operations that require that CIs are in a retired state, retirement definitions are enforced. The policy eventually applies to the resulting set of CIs, after applying all those filters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
CMDB Data Manager limits the number of target CIs per task to 10,000. Therefore, when a task exceeds that number, Data Manager automatically creates as many additional tasks as needed to include all the CIs for the task. For example, if you target 30,000 CIs in an attestation task, Data Manager breaks down that task into three tasks, each targeting 10,000 CIs.

For more information about life-cycle state definitions and other concepts for working with the CMDB Data Manager, see Working with CMDB Data Manager.

Procedure

1. Navigate to **Workspaces** > **CMDB Workspace** and then select Management in the CMDB Workspace menu bar.
2. Select the **Data Manager** link in Management tools, in the Manage section.
3. Select **Policies** in the left-side bar.
   For information about the Policies page, see View CMDB Data Manager policies in CMDB Workspace.
4. Select **Create new policy**.
5. Fill out the General information form and then select **Continue**.

Field	Description
Name	Unique name for the policy.
Description	Description for the policy.
Policy type	Life-cycle event or data management action, such as Delete or Attestation, that this policy manages, indicating the type of actions to perform on target CIs. Your **Policy Type** setting determines which fields appear in the forms that follow.
Work notes	Notes that are internal and visible only to administrators.

6. Fill out the Data Filter form.

   a. Fill out filter conditions for the target CIs and records for the policy.

Field	Description
Table	Table from which to select target CIs or records for the policy.
Filter conditions	Use the condition builder to specify the criteria that CIs from the specified **Table** must meet to be included as target CIs for the policy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Select **New condition set** to add a condition to the filter.
Related List Condition	Add a condition that is based on related lists that are associated with the target records for the policy.

b. Select **Apply filters** and then review the results of the impact analysis.

This analysis estimates the number of CIs that the policy applies to based on the policy filters, any CI exclusion lists, and the life cycle stage of CIs. For example:

- If the policy type is retired, CIs that meet the policy filters but are already in a retired state according to the class retirement definitions, aren't targeted for the policy.
- If the policy type is archive or delete, CIs that meet the policy filters but aren't retired according to the class retirement definitions, aren’t targeted for the policy. A filter on the *Life Cycle Stage* or the *Life Cycle Stage Status* attributes has no effect if the respective class retirement definition is based on those attributes.

Review the lists in the following tabs:

- **Included records**: You can select records to be excluded from the policy, and select **Exclude records**.
- **Excluded records**: Select records to be included in the policy, and select **Include records**.

> **Note:**
> The Excluded records tab doesn't appear when the policy type is Certification.

c. Select **Continue**.

7. Fill out the Assignment form and then select **Continue**.

a. Set the **Assignment type** and then the **Task assignment** field that appears, to specify the type of assignment and the table columns to use for assigning the policy tasks. The drop-down list in **Task assignment** is dynamically populated with columns in the table that the policy is created for, that reference **Assignment type** tables, as follows:

- **User Field**: Assigns policy tasks to a user in the user field specified in **Task assignment**. The drop-down list in **Task assignment** contains fields in the table set by the data filter, that reference the User [sys_user] table (such as *Attested by* and *Assigned to*).

  During assignment, records will be grouped based on the selected column, allocated to tasks, and then the tasks will be assigned to the resulting users.

- **User Group Field**: Assigns policy tasks to the user group in the user group field specified in **Task assignment**. The drop-down list in **Task assignment** contains fields from the table set in the data filter, that reference the Groups [sys_user_group] table (such as *Change Group* and *Support Group*).

  During assignment, records will be grouped based on the selected column, allocated to tasks, and then the tasks will be assigned to the resulting user group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Specific User**: Assigns policy tasks to the user specified in **Task assignment**. The drop-down list in **Task assignment** contains users with the *data_manager_user* role.
- **Specific User Group**: Assigns policy tasks to the user group specified in **Task assignment**. The drop-down list in **Task assignment** contains user groups that are either directly associated with the *data_manager_user* role, or contain at least one user with the *data_manager_user* role.

In the **User Group Field** and **User Field** you can use dot-walking by selecting the search icon for the field: . In the selection dialog box, drill down lists by expanding or selecting list items that are links (usually appear in a unique text color).

b. For certification and attestation tasks, set the **If task assignment field is empty** field to create assigned or unassigned tasks in cases where the specified task assignment field is empty. If you select to create an assigned task, then depending on the **Assignment type** setting, select the user or user group to assign a task to in that situation. Unassigned tasks are later reviewed by an administrator for assignment.

8. Fill out the Options form and then select **Continue**.
The options that appear depends on whether they are relevant to the selected policy type. Therefore, some of the following options don't appear on your form. For example, not all policy types are associated with a subflow.

Field	Description
Days to complete	Maximum number of days that policy tasks must be completed by. If notifications are enabled for certification or attestation tasks, then this number is used to calculate the milestones for sending notifications. The full time (100%) interval starts when a task is created and ends when the number of days to complete the task arrives. Notifications are sent if a task isn't closed when 50%, 70%, and 90% of that interval passes. For more information about setting those notifications, see Components related to CMDB Data Manager.
Subflow	A subflow with the actions that will run on the target CIs for the policy. The subflow typically matches the policy type. For example, if **Policy type** is set to **Delete CMDB Related Entry**, then set **Subflow** to **Delete Related Entry Configuration Item**.
Needs review	Option to require a review and an approval of the policy tasks, by the group assignment in CIs' *Managed by Group* attribute or by an administrator.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Otherwise, all policy tasks are approved automatically.
Retention time	The length of time for retaining archived CIs in the archive table before they're deleted. During the specified retention period, you can use the ServiceNow AI Platform® data archiving feature to restore archived CIs. **Note:** You can't use the CMDB Data Manager to re-archive a CI that was previously archived and restored.
Display fields	One or more fields that appear in list views in Data Certification tasks, that uniquely identify the records that require certification. The selected fields can't overlap fields in **Certification fields**.
Certification fields	One or more fields whose value requires verification and certification. The selected fields can't overlap fields in **Display fields**.
Allow field updates	Option to allow certification task reviewers to update field values while reviewing CIs. ○ When selected, certification task reviewers can update field values in order to certify a CI. ○ When clear, certification task reviewer can't update field values, and therefore reject CIs that aren't compliant.
Allow empty field values	Option to allow users to certify CIs with empty attributes: ○ When selected, certification task reviewers can certify or fail certification of a CI with an empty attribute. ○ When clear, certification task reviewers can fail certification of a CI with an empty attribute but aren't able to certify that CI.
Instructions	Any instructions to assigned users, to help them complete the tasks.

9. Fill out the Schedule form and then select **Continue**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Schedule	Recurring schedule for how often and when to run the task. The **On demand** option doesn't set any recurring schedule for running the policy. To learn how to run a task configured with **On demand**, see 'What to do next' below. Your setting determines which other fields appear on the form.
Start time	Time in the day to start running the policy.
Day of the week	Day of the week to run the policy.
On	Day of the month to run the policy.
Start day and time	Date and time of first run of the policy.
Run after every	Interval (by days) between subsequent runs after running the policy for the first time.
Run policy scheduled job as	User to set the *Run as* field with, in scheduled jobs for attestation and certification tasks. By default, the drop-down list is populated with users in the Data Manager Scheduled Job Users user group and the field is set to the user specified by the *Scheduled job default user* property (DataManager Job Runner). For more information about this property and the *Scheduled job default user* user role, see Components related to CMDB Data Manager.

10. Review the policy details on the Review form, and then select **Publish policy** to activate the policy or **Save & Exit** to save the policy as a draft.
You can later continue to configure a draft policy, and then publish it when it's ready.

Result

After you publish a policy:

- A daily scheduled job processes the published policy and policy tasks are assigned as set in the policy. If the policy is associated with a subflow, then policy tasks trigger the policy subflow. Policy execution issues are recorded in an error log with notifications sent to the CMDB Data Manager administrator.

  If the policy is configured to require an approval for its tasks, then email notifications are sent to members of the assignment group in the *Managed by Group* attribute of the CI. If the policy is associated with a subflow, then a policy task triggers the policy subflow only after the task is approved.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If the policy is associated with a subflow, then after a policy task is complete, the policy subflow closes the task. For an Attestation policy (which isn't associated with a subflow), a user must process all CIs in the task and submit the task to close it.
- For Attestation policies, attestation tasks are assigned to users as specified, and those tasks appear in the CMDB Workspace when those users log in.
- For some policy types, such as Delete, the list of the target CIs is rolled up in a CSV file that is then attached to the task for tracking purposes.
- Stale tasks are set to **Closed Cancelled** by a daily scheduled job. A task becomes stale when it's still open and not approved after at least 90 days. The number of days after which a task is considered stale is determined by the *`cmdb.data.manager.stale.task.life.in.days`* system property.

What to do next

- Publish a draft Data Manager policy in CMDB Workspace.
- On the Policies page, in the Published policies list view, select a policy to see policy details on a policy form. Select **View Policy** to see the settings in all of the policy form pages.
- For **On demand** policies, the system generates a scheduled job prefixed with the policy name. To run such task:
  1. Navigate to **System Definition** > **Scheduled Jobs**.
  2. Select the scheduled job for the task policy that you want to run.
  3. On the scheduled job form, select **Execute Now**.
- On the Policies page, in the Published policies list view, select a policy that you want to deactivate. On a policy form select **Deactivate Policy** to temporarily prevent the policy from running.
- Select **View Open Tasks** in the Open Policy Tasks tile to track the processing of policy tasks in the CMDB Data Management Task Control list view. The Success Percent column shows the percentage of CIs in the task for which the task is completed. A CI is counted as complete in an archival task only after the archival process has been fully completed for the CI (and isn't counted as complete while the CI is initially staged for archival for example).
- Users log in to the CMDB Workspace to review and process attestation tasks assigned to them.
- Users log in to the CMDB Workspace to review and process non-attestation tasks assigned to them.

Publish a draft Data Manager policy in CMDB Workspace

If you created a draft Data Manager policy in CMDB Workspace, or imported legacy certification schedules, you can activate that draft policy by publishing it.

Before you begin

Role required: sn_cmdb_admin

Procedure

1. Navigate to **All** > **Workspaces** > **CMDB Workspace** and then select Management in the CMDB Workspace menu bar.
2. Select the **Data Manager** link in Management tools, in the Manage section.
3. Select Policies in the left-side bar in the Data Manager overview page.
4. Select the Draft policies list view on the Data Manager policies page.
5. Select the policy that you want to publish and then, on the policy form, select **Edit Policy**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Review any policy settings by selecting the pages to review in the left-side bar.
7. Select Review in the left-side bar and then, on the Review form select:
   a. **Publish Policy** to activate the policy.
   b. **Save & Exit** to save any changes and keep the policy in draft mode.

What to do next

Deactivate a policy to temporarily prevent the policy from running:

1. On the Policies page, select the Published policies list view.
2. Select a policy that you want to deactivate.
3. On a policy form select **Deactivate Policy**.

View CMDB Data Manager policies in CMDB Workspace

View Data Manager policies on a dashboard view, with a timeline of upcoming scheduled policies, counts, and grouped by policy status.

Before you begin

Role required: sn_cmdb_admin

Procedure

1. Navigate to **Workspaces** > **CMDB Workspace** and then select Management in the CMDB Workspace menu bar.
2. Select the **Data Manager** link in Management tools, in the Manage section.
3. Select **Policies** in the left-side bar.

   Select a tab on the Data Manager policies page:

   - Published policies: Provides the following cards:

     Upcoming scheduled policies

     Timeline showing scheduled policies across time. On the timeline, you can:

     - Point to indicators to show details about a scheduled policy.
     - Zoom in or out to extend or shorten the time span of the timeline.
     - Go forward or backward in time.
     - Show or hid the timeline legend, where you can toggle the Attestation Policy switch to show or hide attestation policy indicators on the timeline.

     Policies

     Pie chart showing the breakdown of policies by policy type.

     Published policies

     List view of policies that are published. You can drill down a policy to show the policy form view with further details about the policy.

   - Draft policies: Policies in draft state.
   - De-activated policies: Policies that have been de-activated and therefore aren't active.
   - Policies failing evaluation: Policies that are invalid and therefore require your attention.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

- Create a CMDB Data Manager policy in CMDB Workspace
- Manage retirement definitions for CMDB Data Manager

View CMDB Data Manager analytics in CMDB Workspace

The CMDB Data Manager in CMDB Workspace provides charts and counts that show the overall state of Data Manager policies in the organization. Review these details to track progress and to identify any problems that require your attention.

Before you begin

Role required: Role required: data_manager_admin or sn_cmdb_admin

Procedure

1. Navigate to **Workspaces** > **CMDB Workspace** and then select Management in the CMDB Workspace menu bar.
2. Select the **Data Manager** link in Management tools, in the Manage section.
3. Select **Analytics** in the left navigation bar.
   The Data Manager analytics page provides the following charts:

   CIs processed by lifecycle policies

   Counts of CIs processed by each type of lifecycle policy type such as Delete and Archive, over the past six months.

   Average time to close tasks

   Average number of days it took to close tasks, by general policy type such as lifecycle and attestation, over the past six months.

   Closed complete vs closed incomplete tasks

   Number of tasks per month, that were closed complete and incomplete, over the past year.

   Policy execution time

   Number of policies per day, broken by the length of execution time, over the past month.

Review CMDB Data Manager tasks in CMDB Workspace

Review Data Manager tasks (such as life-cycle tasks) that are assigned to you, to an assignment group that you belong to, to people you manage, or to members of a group that you are the manager of. All in accordance with CMDB Data Manager policies. During the review, you can approve, cancel, reject, or reassign a task.

Before you begin

Role required: sn_cmdb_user, sn_cmdb_editor, or sn_cmdb_admin

Canceling a life-cycle task is available only for tasks that are in the 'Not started' status, and the required role is data_manager_admin or sn_cmdb_admin.

About this task

- To review attestation tasks, see Review attestation tasks in CMDB Workspace.
- To review certification tasks, see Review certification tasks in CMDB Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **CMDB Workspace** and then select **My Work** in the CMDB Workspace menu bar.
2. In the My tasks section, select the **All other tasks** tab.
3. Review the Approval tasks list view and then select the task that you want to process.
4. Review the task details on the task form.
5. **Optional:** CMDB administrators can select **Cancel task** if the task isn't needed. The canceled task is deleted without any further processing.
6. **Optional:** Select **Reassign** if the task isn't appropriately assigned, and then select **Assign to me** or **Request reassignment** as appropriate.
7. **Optional:** Select **Review records** to review the target CIs and records for the task.

   a. Select any records that you want to exclude for the task and then select **Exclude**. The records being excluded for the task are also being added to the exclusion list of the associated policy type. Therefore, these records will be excluded from any future tasks of the associated policy type.

   b. Select **Reassign** if the task isn't appropriately assigned.

   c. Select **Reject task** to reject a task, fill in a **Reason for rejection** and then select **Save**.

   (Optional) You can only reject a task that is assigned to you.

   After you reject a task, the *State* of the task is set to **Closed Canceled** and *Approval* is set to **Rejected**. Also, appropriate notifications are sent to members of the group specified in the *glide.cmdb.data_manager.rejected.task.notification_group* system property. For more information about how this property is used for notifications, see Components related to CMDB Data Manager.

   d. Select **Assign to me** or **Request reassignment** as appropriate.

   e. Select **Approve task** to trigger the subflow associated with the policy.

CMDB Data Manager (Core UI)

The CMDB Data Manager built on Core UI lets you centrally create, edit, review, publish, and track Data Manager policies and the tasks generated by the policies.

The landing page of the CMDB Data Manager (Core UI) provides a dashboard view of policies, excluded CIs, and open policy tasks. Access the open policy tasks that need attention from the management group or from the CMDB Data Manager administrator. Preview those tasks, and then approve or reject to continue the process.

Important:

CMDB Data manager on Core UI is now deprecated and no longer supported or available for new activation. CMDB Workspace provides the latest experience for this functionality. For more information, see Create a CMDB Data Manager policy in CMDB Workspace.

Manage policies in the CMDB Data Manager (Core UI):

- Create a CMDB Data Manager policy (in Core UI)
- Approve or reject a CMDB Data Manager task (in Core UI)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Review attestation tasks in CMDB Workspace
- Manage exclusion lists of CMDB Data Manager (in Core UI)

To access the CMDB Data Manager (Core UI), navigate to **All** > **Configuration** > **CMDB Data Manager**.

Note:
Dependent CI management processes generate dependent CI policies for which CMDB Data Manager shows policy preview details that aren't relevant.

1. Select **View Policies** on the Policies tile on the CMDB Data Manager landing page.
2. Select **All** in the breadcrumbs string.
3. Select one of the following policies: 'Dependent CI - Deletion', 'Dependent CI - Archive', or 'Dependent CI - Retire'.
4. Select the Preview Policy tab on the policy form.

The data that appears on the Preview Policy page is irrelevant for any of those policies.

Create a CMDB Data Manager policy (in Core UI)

Create a policy in the CMDB Data Manager legacy build on Core UI to automatically process CIs life-cycle event such as deletion. Applying consistent and standard life-cycle policies to CIs helps maintain the health of the CMDB.

Before you begin

- The life-cycle policies Retire, Archive, and Delete, require that an active retirement definition exists for each targeted class in the policy. If you attempt to create a policy of a policy type for which this requirement applies but isn't met, an error message appears and the operation fails.
- Ensure that any custom subflow that you want to associate with a policy, exists.
- To require a review and an approval for a policy task: Ensure that the *Managed By Group* attribute is populated in target CIs and that the assigned users have the privilege to approve the policy tasks.
- When Asset Management is activated, check if there is an asset record associated with that CI before retiring the CI. Check the associated asset record, if there is one, to ensure that the asset state (install_status) is *Retired*.

Role required:

- data_manager_admin: Full access to policies
- data_manager_user: Can read and preview policies

About this task

Specify for each policy a policy type, a life-cycle subflow, and a set of CIs to operate on as target CIs. Target CIs must be from classes extending the Configuration Item [cmdb_ci] table, and with the Delete CMDB Related Entry policy type, also tables in the Related Entries [cmdb_related_entry] table.

Set condition filters to specify the initial set of CIs that the policy applies to. You can then further narrow down the initial set of CIs by using a CI exclusion list for the policy type. During the final preview of the policy, or from a policy task, you can select individual CIs to also exclude for the policy type. In addition, for operations that require that CIs are in a retired state, retirement definitions are enforced. In these cases:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- CIs that meet the policy filters but aren't retired according to the class retirement definitions, aren’t targeted for the policy.
- A filter on the *Life Cycle Stage* or the *Life Cycle Stage Status* attributes has no effect if the respective class retirement definition is based on those attributes.

The policy eventually applies to the resulting set of CIs, after applying all those filters.

Note:
CMDB Data Manager limits the number of target CIs per task to 10,000. Therefore, when a task exceeds that number, Data Manager automatically creates as many additional tasks as needed to include all the CIs for the task. For example, if you target 30,000 CIs in an attestation task, Data Manager breaks down that task into three tasks, each targeting 10,000 CIs.

More information:

- About life cycle state definitions, see Working with CMDB Data Manager.
- About creating a policy in the CMDB Data Manager in CMDB Workspace, see Create a CMDB Data Manager policy in CMDB Workspace.

Procedure

1. Navigate to **All** > **Configuration** > **CMDB Data Manager**.
2. On the CMDB Data Manager landing page, in the Policies tile, click **View Policies**.
3. In the CMDB Data Manager Policy and Attributes list view, click **New**.
4. Fill out the fields in the different sections on the **Define Policy** tab.

Note:
Some fields are applicable only to specific policy types. Therefore some of the following fields, might not appear for the policy type that you choose.

Field (General)	Description
Name	Unique name for the policy.
Task Assignment Group	Group to assign the task to.
Task Due In Days	Due date for completing the policy tasks such as attestation tasks.
Needs Review	Check to require a review and an approval of the policy tasks, by the group assignment in CIs' *Managed by Group* attribute or by an administrator. Otherwise, all policy tasks are approved automatically.
Policy Type	Life-cycle event or data management action, such as Delete or Attestation, that this policy manages, indicating the type of actions to perform on target CIs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field (General)	Description
User Group	Group to use as the task assignment group for the Delete CMDB Related Entry policy type. The list is a subset of user groups from the Group [sys_user_group] table, where at least one member has a data_manager_user role.
Apply Retention Time	The length of time for retaining archived CIs in the archive table before they are deleted. During the specified retention period, you can use the ServiceNow AI Platform® data archiving feature to restore archived CIs. .

Field (Condition Filter)	Description
Related Entry Table	The related table to apply a Delete CMDB Related Entry policy. The list contains related tables from the Related Entry [cmdb_related_entry] table.
Condition Filter	Criteria that CIs must meet to be included for the policy as target CIs. Additional filtering such as a CI exclusion list, can further narrow down the set of target CIs.

Field (Action)	Description
Subflow	A subflow with the actions that will run on the target CIs for the policy. The subflow typically matches the policy type. For example, if **Policy type** is set to **Delete CMDB Related Entry**, then set **Subflow** to **Delete Related Entry Configuration Item**. **Note:** The Attestation policy type is not associated with a subflow.

Field (Schedule)	Description
Frequency	How often to run the task.
Start Time	Time to start running the task when it is due to run.

5. **Optional:** Click **Run filter** in the Condition Filter section, to see the resulting list of CIs that match the condition filters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Click **Save**.
7. Click **Preview** and wait for an impact analysis for the policy on the **Preview Policy Impact** page to complete.
   This analysis estimates the number of CIs that the policy applies to based on the policy filters, any CI exclusion lists, and the life cycle stage of CIs. For example:
   - If the policy type is retired, CIs that meet the policy filters but are already in a retired state, are not targeted for the policy.
   - If the policy type is archive or delete, CIs that meet the policy filters but are not retired, are not targeted for the policy.
8. **Optional:** Select CIs in the target CIs list that you want to also exclude for the policy type. Click **Exclude CI** and then click **Recalculate Preview** to recalculate the data on the preview page.
9. Click **Publish** to activate the policy.
   Unpublished tasks are saved as draft policies.

Result

After you publish a policy:

- A daily scheduled job processes the published policy and policy tasks are assigned as set in the policy. If the policy is associated with a subflow, then policy tasks trigger the policy subflow. Policy execution issues are recorded in an error log with notifications sent to the CMDB Data Manager Administrator.

  If the policy is configured to require an approval for its tasks, then email notifications are sent to members of the assignment group in the *Managed by Group* attribute of the CI. If the policy is associated with a subflow, then a policy task triggers the policy subflow only after the task is approved.

- If the policy is associated with a subflow, then after a policy task is complete, the policy subflow closes the task. For an Attestation policy (which is not associated with a subflow), a user must process all CIs in the task and submit the task to close it.
- For Attestation policies, attestation tasks are assigned to users as specified, and those tasks appear in the CMDB Workspace when those users log in.
- For some policy types, such as Delete, the list of the target CIs is rolled up in a CSV file that is then attached to the task for tracking purposes.
- Stale tasks are set to **Closed Cancelled** by a daily scheduled job. A task becomes stale when it is still open and not approved after at least 90 days.
  The number of days after which a task is considered stale is determined by the *cmdb.data.manager.stale.task.life.in.days* system property.

What to do next

- Click **View Open Tasks** in the Open Policy Tasks tile to track the processing of policy tasks in the CMDB Data Management Task Control list view. The Success Percent column shows the percentage of CIs in the task, for which the task is completed. A CI is counted as complete in an archival task only after the archival process has been fully completed for the CI (and isn't counted as complete while the CI is just staged for archival for example).
- Users log in to the CMDB Workspace to review and process attestation tasks assigned to them.
- You can open a policy in CMDB Data Manager and click **Deactivate** to temporarily prevent the policy from running.
- Manage exclusion lists of CMDB Data Manager (in Core UI).

Working with CMDB Data Manager

Approve or reject a CMDB Data Manager task (in Core UI)

If you are an authorized approver, you might receive an email notification directing you to review a CMDB Data Manager policy task. Approve the task in the CMDB Data Manager legacy build on Core UI, to continue its processing, or reject the task to send it to the CMDB Data Manager administrator for a more detailed review.

Before you begin

Role required:

- data_manager_admin: Full access to policy tasks and can set state to 'Work in progress' of an unassigned task.
- data_manager_user: Read access to policy tasks and can approve or reject an assigned policy task.

About this task

Authorized approvers for a task are all users in the assignment group of the task, with the data_manager_user or data_manager_admin roles.

For information about using the more advanced CMDB Data Manager in CMDB Workspace, see CMDB Data Manager experience in CMDB Workspace.

Procedure

1. Navigate to **All** > **Configuration** > **CMDB Data Manager**.
2. On the CMDB Data Manager landing page, in the Open Policy Tasks tile, select **View Open Tasks**.
3. On the CMDB Data Management Task Control list view, select a task to review.
4. Select the **Approvers** tab in the related lists section.
5. In a record where you are the **Approver**, select the **Requested** value in the **State** column.
6. On the Approval form, set **State** to your approval choice such as **Approved** or **Rejected**.
7. Select **Update**.

Result

1. The *Approval* field of the task is set to **Approved** or **Rejected**.
2. If the task is approved, then the policy subflow is triggered to continue processing the policy tasks for the target CIs.

Edit and activate a retirement definition (in Core UI)

Create, edit, activate, or delete a retirement definition that reflects the retirement state in your organization, for a class. Tables that are targeted in CMDB Data Manager life-cycle policies, must be associated with an active retirement definition. Target CIs in Retire policies, are set to match their associated class retirement definitions.

Before you begin

Role required:

- data_manager_user has read access
- cmdb_admin and data_manager_admin have full access

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Retirement definitions in the base system are inactive and you must activate any retirement definition that you want to use with a CMDB Data Manager life-cycle policy. To activate a retirement definition, set its *Active* attribute to **true**.

Each CMDB class can be associated with only a single retirement definition. Retirement definitions are stored in the CMDB Retirement Custom Definitions [cmdb_retirement_custom_definitions] table.

You can alternatively manage retirement definitions in CMDB Data Manager in CMDB Workspace. For more information, see Administer Data Manager in CMDB Workspace and Manage retirement definitions for CMDB Data Manager. Regardless of where you manage retirement definitions, those same definitions are used in both the Data Manager legacy built on Core UI and Data Manager in CMDB Workspace.

Always be aware of the automatic derivation of retirement definitions throughout the class hierarchy. For example, an active retirement definition for the Configuration Item [cmdb_ci] class can potentially be in effect throughout the entire CMDB hierarchy (aside from classes with their own retirement definition).

Note:
The retirement definition for the cmdb_ci class, can't be deactivated or deleted.

Procedure

1. Navigate to **Configuration** > **CMDB Retirement Definitions**.
2. In the list view, select the retirement definition/table that you want to edit and then edit or fill out the CMDB Retirement Custom Definition form.

Field	Description
Active	Activates the retirement definition.
Table	The CMDB class that the retirement definition applies to. The retirement definition will be derived by all child classes of the specified parent class.
Retirement definition	One or more attribute conditions that together define the retirement state for the class. Target CIs in Retire policies that belong to the specified table, are set as specified in the retirement definition. Therefore, you can only use **AND** clauses in this definition while **OR** clauses aren't applicable.

3. Select **Update**.

Result

After the deletion, a retirement definition for the class is derived from a parent class.

What to do next

To delete a retirement definition (in Core UI), the retirement definition must be in an inactive mode (*Active* = **false**):

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Navigate to **Configuration** > **CMDB Retirement Definitions**, and then select the retirement definition that you want to delete.
2. On the CMDB Retirement Custom Definition form, select **Delete**.
3. In the Delete retirement definition form, select **Delete**.

Manage exclusion lists of CMDB Data Manager (in Core UI)

Create an exclusion list for the various policy types of the CMDB Data Manager, by using the CMDB Data Manager legacy build on Core UI. Policies of a specific policy type will not target the CIs or other records in the exclusion list for that policy type.

Before you begin

Role required:

- data_manager_admin: Full access to CI exclusion lists
- data_manager_user: Read access and can add a CI to a CI exclusion list

About this task

Note:
Regardless of where you manage exclusion lists, the list is used in both the Data Manager (Core UI) and Data Manager in CMDB Workspace. For information about managing CI exclusion lists in the more advanced CMDB Data Manager in CMDB Workspace, see CMDB Data Manager experience in CMDB Workspace.

Procedure

1. Navigate to **All** > **Configuration** > **CMDB Data Manager**.
2. On the CMDB Data Manager landing page, in the Excluded CIs tile, click **View Excluded CIs**.
3. On the Excluded CIs list view, click **Edit Exclusion List** and fill out the Specify Excluded CIs form.

Field	Description
Policy Type	Type of policy from which to exclude the specified CIs.
Condition Filter	Conditions that CIs must meet to be excluded for the specified policy type.

4. Click **Run filter**.
   All the CIs that meet the condition filters, appear in the Results section.
5. In the Results list, select any or all of the CIs that you want to exclude from the policies of the respective policy type.
6. In the Excluded CIs section, click the '+' icon to add the selected CIs to the Excluded CIs list.
7. **Optional:** In the Excluded CIs list, select CIs that you want to remove from the exclusion list, then click the trash icon.
8. Click **Save**.

Retirement definitions

Specify a retirement definition for a class, to reflect protocols in your organization applicable to the class and to its child classes. These definitions support the transition of CIs through life cycle

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

stages as implemented by CMDB Data Manager life-cycle policies. A class can have a retirement definition by derivation, or by a retirement definition specified for that class.

Note:
The same retirement definitions are used in both the Data Manager legacy build on Core UI and Data Manager in CMDB Workspace.

CMDB Data Manager requirement and usage

An active retirement definition is required for each targeted class in a Retire, Archive, or Delete CMDB Data Manager policy. A retirement definition is used to flag a CI as retired according to the CI's class retirement definition in effect. When retiring a CI, the CI's attributes are set according to the retirement definition for the CI's class. A subsequent operation such as delete or archive, that needs to be applied to retired CIs, first checks if a CI is in a retired state by verifying that it satisfies the retirement definition for its class.

Retirement definitions are used in life-cycle policies as follows:

- Setting target CIs in Retire policies, according to their associated class retirement definitions.
- Filtering out target CIs In Retire policies, that are determined to already be in a retired state according to their associated retirement definitions. Those CIs aren't targeted even if they meet the policy filter.
- Identifying CIs as being ready to be processed by an Archive or Delete policies. Archive and Delete policies can only process CIs that are in a retired state that matches their associated class retirement definition. Therefore, target CIs in Archive and Delete policies, are checked against their associated class retirement definition to verify that they are in a retired state before they can be archived or deleted.

Derivation across the CMDB hierarchy

Retirement definitions are derived throughout the CMDB hierarchy in the same way that rules, such as identification rules, are derived. Child classes extended from a parent class with a retirement definition, derive that definition unless there's a retirement definition defined at the child class level.

When retirement definitions for classes exist in different levels in the class hierarchy, then the retirement definition that applies is the one that is most specific for a class. For example, if there are retirement definitions for both, the Computer and the Configuration Item class, then the Computer class definition also applies to its descendant classes. All other classes that aren't descendants of the Computer class, use the Configuration Item retirement definition.

Always be aware of the automatic derivation of retirement definitions throughout the class hierarchy. For example, an active retirement definition for the Configuration Item [cmdb_ci] class can potentially be in effect throughout the entire CMDB hierarchy (aside from classes with their own retirement definition).

Predefined retirement definitions

The base system includes predefined retirement definitions for key classes such as Hardware [cmdb_ci_hardware] and Application [cmdb_ci_appl], and are stored in the CMDB Retirement Custom Definitions [cmdb_retirement_custom_definitions] table. For example, the predefined retirement definition for the Service [cmdb_ci_service] class specifies that for a retired CI, the value of the attributes [operational status], [Phase], and [Status] is **Retired**.

Predefined retirement definitions are inactive by default (other than the cmdb_ci retirement definition which is always active), and you must activate a retirement definition that corresponds

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

to a targeted class in a Retire, Archive, or Delete CMDB Data Manager policy. By default, the cmdb_ci retirement definition is in effect throughout the entire CMDB hierarchy due to derivation.

You can use the default retirement definitions, or customize a definition to reflect practices in your organization. You can also add a custom retirement definition for a class. However, each CMDB class can be associated with only a single retirement definition.

To create a retirement definition, see Manage retirement definitions in CMDB Workspace or Edit and activate a retirement definition (in Core UI).

Duplicate CIs remediation

Duplicate CIs in the CMDB unnecessarily overload the system and interfere with the CMDB's integrity and reliability. It is therefore important to regularly use CMDB tools that detect and remediate duplicate CIs.

De-duplication tasks

When Identification and Reconciliation Engine (IRE) processes detect duplicate CIs, IRE groups each set of duplicate CIs into a de-duplication task for review and remediation. De-duplication tasks provide details about the duplication, including a list of all the duplicate CIs in the set. Review the details of each duplicate CI in the task and the data that was used to determine that the CI is a duplicate. For more information about IRE processes that detect duplicate CIs and generate de-duplication tasks, see Detecting duplicate CIs.

Under some circumstances, IRE doesn't automatically generate de-duplication tasks for duplicate CIs. To still remediate the duplication in such case, you must create the de-duplication task manually. For information about when this happens and how to manually create a task, see Manually create a de-duplication task.

Remediation of a de-duplication task consolidates its set of duplicate CIs into a single CI, eliminating the duplication.

To process de-duplication tasks (automatically-generated by IRE or manually created) to remediate duplicate CIs:

- In bulk: Use the De-duplication dashboard and the De-duplication Template Library in CMDB Workspace to:
  - Review de-duplication tasks
  - Remediate de-duplication tasks in bulk by using de-duplication templates
  - Gain insights into de-duplication counts and status in your organization

  Access the CI de-duplication experience in CMDB Workspace to create de-duplication templates that remediate similar de-duplication tasks in bulk.
- A single task: Review de-duplication tasks (legacy) and use the Duplicate CI Remediator wizard to process a single de-duplication task.

Main CI

The main CI plays a key role in the remediation of duplicate CIs. The main CI is one of the duplicate CIs that you want to retain as an active CI after reconciling the rest of the duplicate CIs into that main CI. You can then potentially retire or delete the rest of the duplicate CIs, or assign custom values to their attributes. The first step during remediation is to select a main CI for the remediation process. During remediation, you choose which attribute values, relationships, and related items from the duplicate CIs to reconcile into the main CI. Alternatively, you can choose not to consolidate any data and retain the main CI as it is.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The *duplicate_of* attribute in duplicate CIs, is used to store a reference to the main CI. For duplicate CIs which existed in an instance that was upgraded to the New York release or later, the main CI is unknown. After upgrade, *duplicate_of* for those duplicate CIs is set to 'Unknown', indicating that the CI is a duplicate but the main CI is unknown.

Before remediation, the CIs in a duplicate CIs set are all duplicates of each other. After remediation, a set of duplicate CIs consists of one main CI, and any number of CIs, each considered a duplicate of the main CI. The *duplicate_of* attribute of the main CI is empty. The *duplicate_of* attribute for all the rest of the duplicate CIs in the set, is a reference to the main CI of the set.

Default related items list

A list of related items that is used globally in the remediation of duplicate CIs, with all de-duplication tasks. During remediation, all items from the default related items list are selected by default to be merged to the main CI. During remediation, adding or removing related items to be merged doesn't affect the default related items list. See Manage default related items list for more information.

Note:

- Merging of attributes and related items that are associated with assets is not supported. Asset related tables are not included in the default related items list and therefore they are not available for merge.
- If a scenario involves an inactive change request, the **Configuration item** field on the Change Request form is cleared. If the current value is a duplicate CI, then it isn't merged with the main CI.

De-duplication dashboard

CMDB Workspace provides a de-duplication remediation solution letting you remediate de-duplication tasks, in bulk. The De-duplication dashboard, and the de-duplication templates and libraries, let you remediate multiple de-duplication tasks, consistently, in a single operation. The De-duplication Template Library in CMDB Workspace lets you create a preconfigured de-duplication template with the remediation settings for a class. The De-duplication dashboard in CMDB Workspace lets you then run the preconfigured template on multiple de-duplication tasks for the class that is set in the template. The remediation settings in the template, are then consistently applied to the duplicate CIs of the de-duplication tasks, to remediate CI duplication.

For more information about remediating duplicate CIs in CMDB Workspace, see CI de-duplication experience in CMDB Workspace.

Duplicate CI Remediator

A de-duplication remediation tool, that is wizard-like and that lets you reconcile a set of duplicate CIs associated with a single de-duplication task. You can choose one of the duplicate CIs to retain as an active CI, and then decide how to process the rest of the duplicate CIs. The Duplicate CI Remediator lets you set reconciliation options for attributes, relationships, and related items.

For information about using the Duplicate CI Remediator, see Remediate a de-duplication task (legacy).

Effects on related tables (such as change requests)

Remediation can potentially have the following effects on change requests:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- When a CI is associated with a change request whose state isn't **New**, then when duplicate CI remediation processes delete the CI, the CI is removed from the change request.
- When a CI is associated with a change request whose state is **New**, then when duplicate CI remediation processes delete the CI, the CI in the change request is updated to the main CI.

The business rule *Ready only CI when not New* prevents change requests that aren't in the New state, from getting updated. This behavior ensures the validity and the continued processing of a change request when change request CIs are affected by duplicate remediation processing.

When a CI is associated with a problem or an incident task, those tasks remain valid after duplicate CI remediation processes run as the system merges the main CI in those tasks even if the remediation processes deleted the associated CI.

Properties that affect processing of duplicate CIs

During CMDB Identification, processing of sets of duplicate CIs is determined by:

- Property *glide.identification_engine.skip_duplicates* (true by default).
- Property *glide.identification_engine.skip_duplicates.threshold* (5 by default).
- Number of duplicate CIs in a set.

For information about how these properties affect the management of duplicate CIs, see Detecting duplicate CIs.

Special remediation scenarios

There are a few special remediation scenarios in which the remediation of duplicate CIs behaves differently:

Large number of duplicate CIs

Support for reconciliation of duplicate CIs is limited when the number of duplicate CIs exceeds a certain threshold. This threshold is based on the value of the *glide.duplicate_ci_remediator.max.cis* property, which is 1,000 by default. You can update this property to increase the threshold. However, this threshold never exceeds 5,000, even if you set the property to a value greater than 5,000.

When the number of duplicate CIs for a de-duplication task exceeds the threshold, the options available in the wizard are limited:

- On the **Select Main CI** tab, only the **Recommended** list of main CIs appears, and only the **Use Main CI** option is available.
- Recommendations are based only on the oldest created, newest updated, and most recently discovered CIs.
- Reconciliation of attribute conflicts and CI relationships is not supported, and only default related items are reconciled.

Duplicate serial numbers

Duplicate CI remediation is usually applied to duplicate CMDB CIs. However, in some situations de-duplication tasks might be created for duplicate serial numbers. When remediation is applied to duplicate serial numbers, the merge of relationships from duplicate records, is not referenced and is not applied.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Large number of related items

A de-duplication task might be associated with a large number of related items which might block the remediation process as loading the task times out. To continue the remediation process in this case, you can try running remediation in a restricted mode. Add the *glide.duplicate_ci_remediator.enable_restricted_mode* system property, and set its value to **true** to show the **Use the Duplicate CI Remediator (Restricted Mode)** option in the Remediate dialog box. For more information about using this option to restrict the use of related items in de-duplication remediation and allow remediation to proceed, see Using restricted mode within the Duplicate CI Remediator [KB1542272].

Restrictions

IRE uses the *duplicate_of* field internally by populating it as part of the skip duplicate mechanism, and you should restrict manual updates of that field. For more details, see Detecting duplicate CIs.

If you do attempt to modify the value of *duplicate_of* directly on a CI form or by using a script, the following restrictions are enforced to ensure data integrity:

- A CI cannot be its own main CI (you cannot set a CI as a duplicate of itself).
- A CI and its main CI cannot be from different domains.
- The *duplicate_of* attribute of the main CI cannot reference any CI as its main CI (you cannot set a CI as a duplicate of another duplicate CI to create a chain of duplicate CIs).
  - If you attempt to set a CI as a duplicate of another duplicate CI, then the CI is set as a duplicate of the main CI of the duplicate CI you are trying to set. If the main CI of the duplicate CI you are trying to set is 'Unknown', the operation fails.

Example: Attempt to set a CI as duplicate of another duplicate CI

CIs	Attempted setting	Result (System enforced)
CI1: *duplicate_of* = empty CI2: *duplicate_of* = **CI3** CI3: Main CI	CI1: *duplicate_of* = **CI2**	CI1: *duplicate_of* = **CI3** CI2: *duplicate_of* = **CI3** CI3: Main CI

If CI2 is a duplicate of 'Unknown', the operation fails.

  - If a main CI becomes a duplicate of another CI, then it can no longer be a main CI. All CIs that were duplicates of that main CI are set as duplicates of the new main CI.

Example: Attempt to set a main CI as duplicate of another CI

CIs	Attempted setting	Result (System enforced)
CI1: *duplicate_of* = **CI4** CI2: *duplicate_of* = **CI4**	CI4: *duplicate_of* = **CI5**	CI1: *duplicate_of* = **CI5** CI2: *duplicate_of* = **CI5**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CIs	Attempted setting	Result (System enforced)
CI3: *duplicate_of* = **CI4** CI4: Main CI CI5: *duplicate_of* = empty		CI3: *duplicate_of* = **CI5** CI4: *duplicate_of* = **CI5** CI5: Main CI

- If a main CI becomes a duplicate of a CI within the same duplicate CI set, then the selected duplicate becomes the main CI in the duplicate CI set. The rest of the duplicate CIs in the set are set as duplicates of the new main CI.

Example: Attempt to set a main CI as duplicate of a CI within the duplicate CIs set

CIs	Attempted setting	Result (System enforced)
CI1: *duplicate_of* = **CI4** CI2: *duplicate_of* = **CI4** CI3: *duplicate_of* = **CI4** CI4: Main CI	CI4: *duplicate_of* = **CI1**	CI1: Main CI CI2: *duplicate_of* = **CI1** CI3: *duplicate_of* = **CI1** CI4: *duplicate_of* = **CI1**

- You can't delete a CI that is the main CI for a set of duplicate CIs. To delete a main CI, you must first disassociate that main CI with all of its duplicate CIs. Either delete all duplicate CIs that are associated with that main CI, or remove the reference to that main CI from all *duplicate_of* attributes in any duplicate CIs that have it.

CI de-duplication experience in CMDB Workspace

Create libraries of de-duplication templates in CMDB Workspace, to remediate de-duplication tasks in a consistent manner, and in bulk. De-duplication templates are preconfigured with all necessary settings for remediating duplicate CIs in de-duplication tasks, per class.

Use the De-duplication dashboard in CMDB Workspace to see an overview and insights about duplicate CIs in your CMDB. The De-duplication dashboard lets you create de-duplication templates and organize these templates into libraries. You can also examine de-duplication tasks and then run a pre-configured template to remedy duplicate CIs in multiple de-duplication tasks in a single operation.

More information:

- To learn about general duplicate CI remediation concepts, restrictions, and special cases such as remediations that involve a large number of duplicate CIs, see Duplicate CIs remediation.
- To remediate a single de-duplication task using the legacy Duplicate CI Remediator, see Remediate a de-duplication task (legacy).
- To learn about Identification and Reconciliation (IRE) processes that detect duplicate CIs and other concepts related to duplication CI, see Detecting duplicate CIs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Access

To access the de-duplication functionality in the CMDB Workspace, navigate to **Workspaces** > **CMDB Workspace** and select **Management** in the CMDB Workspace menu bar. Then select the following links in Management tools, in the Manage section:

- **De-duplication Dashboard**
- **De-duplication Template Library**

Role requirement:

- To access the Management view in CMDB Workspace to perform de-duplication tasks, sn_cmdb_admin
- To perform de-duplication tasks, cmdb_dedup_admin or any role containing cmdb_dedup_admin (such as sn_cmdb_admin)

De-duplication templates and libraries

Use a de-duplication template to apply a consistent remediation to multiple, similar, de-duplication tasks, in a single action. A de-duplication template contains the settings that are required to remediate de-duplication tasks for a class. For example, how to choose the main CI, which method to use to consolidate attributes, and what to do with the duplicate CIs (aside from the main CI) after remediation. A de-duplication template also contains conditions that de-duplication tasks are matched on. When you run a de-duplication template, the remediation settings in the template are applied to all de-duplication tasks that match the template conditions.

To be able to run a de-duplication template, the template must be in a published state (a template is initially in a draft state).When published, you can create a schedule for a de-duplication template so it will automatically run on a recurring time interval. When necessary, you can unpublish a published template so it is temporarily unavailable for use until you republish it.

Organize your de-duplication templates into libraries to group templates by categories that are meaningful in your organization and to help locate a template. For example, you can create several de-duplication templates, all of which for the same CMDB class such as *`cmdb_ci_win_server`*. Then, add all those templates to the 'De-duplication templates for cmdb_ci_win_server' library for easy access.

De-duplication dashboard

The De-duplication dashboard in CMDB Workspace is a central location for remediating de-duplication tasks. Use the dashboard to:

- See all de-duplication templates on a set of cards. Each card shows details about a template. On a template card, you can select **Assign task** to assign de-duplication tasks to the template, and run the template to remediate its associated de-duplication tasks. You can also create a recurring schedule for a template such as daily and monthly.
- Select **Run all** to run all templates, each template remediating its assigned and matching de-duplication tasks.
- Select **View de-duplication tasks** to access a list view of de-duplication tasks with details such as the de-duplication template assignment. In the list view, you can select **Only show tasks that do NOT match any template conditions** to show only those de-duplication tasks that are unassigned or unmatched to any template class.
- Select **View template libraries** to create and manage de-duplication templates and libraries.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Select the **Running** tab to track templates that are currently running.
- Select the **Completed** tab to check the status and details about the final state of a run, such as Completed, Cancelled, or Completed with errors.

De-duplication insights pane

The De-duplication insights pane on the right side of the De-duplication dashboard provides counts and insights related to the on-going de-duplication processes in your organization. This pane provides the following cards and links to help you resolve issues:

- Total count of de-duplication tasks that were remediated in the past week.
- De-duplication tasks that have completed with various types of errors and therefore need your attention. Provides the **View de-duplication tasks that need your attention** link to access a list view of the associated de-duplication tasks. You can examine error messages and drill down tasks for further troubleshooting details.
- De-duplication tasks that don't match the conditions in any template and therefore can't be assigned for remediation by a template. Provides the **View de-duplication tasks that don't match** link to access a list view of the associated de-duplication tasks. You can drill down tasks for further details.

Review the de-duplication templates and ensure that they're properly configured for remediating the on-going duplicate CIs that are being generated in the CMDB by newly added data.

Manage duplicate CIs skill

You can use the manage duplicate CIs skill that Now Assist for CMDB provides to get step-by-step guidance through the de-duplication process. The manage duplicate CIs skill guides you through reviewing de-duplication templates, assigning tasks to the templates, and then running the templates. The manage duplicate CIs skill presents you with relevant options for your next step, as you go, until you complete the remediation.

For more information, see Now Assist for Configuration Management Database (CMDB).

Create a de-duplication template

Create a de-duplication template that you can then run to apply pre-configured and consistent remediation to de-duplication tasks, in bulk. Organize your templates in libraries that make sense in your organization.

Before you begin

Role required:

- To access the Management view in CMDB Workspace to perform de-duplication tasks, sn_cmdb_admin
- To perform this task, cmdb_dedup_admin or any role containing cmdb_dedup_admin (such as sn_cmdb_admin)

About this task

By default, a newly created template is in draft mode. Therefor, after creating a template, you must publish the template to make it available for remediation.

Procedure

1. Navigate to **Workspaces** > **CMDB Workspace** and then select **Management** in the CMDB Workspace menu bar.
2. Select the **De-duplication Template Library** link in Management tools, in the Manage section.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. **Optional:** Create a library for the new template.
   a. On the De-duplication templates page, select **Create a library**.
   b. In the Create new library dialog box, fill out the **Name** and the **Description** for the new library.
   c. Select **Create**.
4. On the De-duplication templates page, select **Create a template**.
   On the New template page, configure the different sections of the template by completing the rest of the steps.
5. **General information**: Fill out the form and then select **Next**.

Field	Description
Name	Unique name for the template.
Class	CMDB class that this template can be applied to.
Template library	Library that the de-duplication template belongs to. Select a newly created library or any other librarySelect a library, or select the '+' icon to create a new library.

Option	Description
Automatically select all de-duplication tasks that match the selected class	Assign all de-duplication tasks that match the template class, to the template for remediation.
Add all child classes	Also assign all de-duplication tasks that match descending classes of the template class, to the template for remediation. This option is available only if the **Automatically select all de-duplication tasks that match the selected class** option is selected.

6. **Create condition**: Use a condition builder or a custom script to narrow down the list of de-duplication tasks assigned to the template, and then select **Next**.
   Use script toggle options:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Off: Specify conditions to filter on CIs from the template class. Only the de-duplication tasks containing CIs that match the filter will be assigned to the template.

- On: Enter a custom script that returns a valid array of de-duplication tasks sys_ids (from the Remediate Duplicate Task [reconcile_duplicate_task] table), that are applicable to the template class. Those de-duplication tasks will then be assigned to the template.

  Note:
  Ensure that the script runtime doesn't exceed your intended runtime expectation and doesn't unexpectedly affect performance. Invalid values returned by the script are ignored.

7. **Select main CI**: Select the method for choosing the main CI from the drop-down list and then select **Next**.

   Note:
   - Applying the chosen method to a set of duplicate CIs must result in exactly one CI. If during remediation, the chosen method yields no CIs or multiple CIs, then the **Newest updated** method is automatically applied regardless of your choice.
   - After selecting the main CI out of the set of duplicate CIs, the main CI is separate from the rest of the duplicate CIs. From that point, 'duplicate CIs' refers to all of the initial duplicate CIs, aside from the selected main CI.

8. **Merge attributes**: Configure merging attributes from duplicate CIs into the main CI, and then select **Next**.

   a. Select the method to use for merging the attributes of duplicate CIs into the corresponding attributes of the main CI.
   For each method card on the left (such as Use latest updated CI), select attributes in the list on the right, that should be merged into the main CI using that method.

   b. Select options as appropriate.

Option	Description
Allow null value updates when merging attributes to main CIAllow null value updates from duplicate CIs to main CI	When merging duplicate CIs into the main CI, lets a null value from a duplicate CI to overwrite a non-null value in main CI.
Allow updates from duplicate CIs only when the main CI value is null	When merging duplicate CIs into the main CI: ▪ Prevents updates to main CI attributes that have non-null value. ▪ Allows updates to main CI attributes that have a null value, with a non-null value.

9. **Merge relationships**: Select an option for merging relationships from duplicate CIs into the main CI, and then select **Next**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

10. **Merge related items**: Select the method to use for merging related items associated with the duplicate CIs into the main CI, and then select **Next**.
    For information about the default list of related items used in de-duplication processes, see Manage default related items list.
11. **Duplicate CI actions**: Select what to do with the duplicate CIs after they're merged into the main CI, according to the template settings, then select **Next**.
12. **Review and test**: Access the following tabs to complete the template by reviewing and testing it.
    a. **Summary**: Review all template settings and select **Back** to modify any settings.
    b. **Test**: Select a sample de-duplication task and then select **Save and Preview Results** to save and run the template.
    c. Preview the results of the remediation test.
    d. Select **Save & Exit** to save the template and return to the De-duplication templates home page.

Result
The new template is added to the specified library in draft mode and can be edited. However, a template in draft mode isn't available for remediation of de-duplication tasks until you publish it.

What to do next
- Publish a de-duplication template
- Run a template to remediate de-duplication tasks
- Remediate a single de-duplication task

Run a template to remediate de-duplication tasks

Run a de-duplication template to remediate de-duplication tasks in bulk. A de-duplication template is pre-configured with remediation settings per class. Running a de-duplication template, remediates its assigned de-duplication tasks, consistently, according to the template settings.

Before you begin
Role required:
- To access the Management view in CMDB Workspace to perform de-duplication tasks, sn_cmdb_admin
- To perform this task, cmdb_dedup_admin or any role containing cmdb_dedup_admin (such as sn_cmdb_admin)

About this task
You can run a single template to remediate its associated de-duplication tasks, or run all published templates at once, each remediating duplicate CIs in its associated tasks. Before running any templates, ensure that those templates are properly configured with their remediation settings and are properly assigned with de-duplication tasks. De-duplication tasks can be automatically assigned to a template based on the template conditions. You can also manually assign additional de-duplication tasks to a template.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **CMDB Workspace** and then select **Management** in the CMDB Workspace menu bar.
2. Select the **De-duplication Dashboard** link in Management tools, in the Manage section.
3. Select a template library in the **Ready** tab, or select **All libraries** in the libraries drop-down list (set to **All libraries** by default).
   The set of cards is filtered to show only the templates from the selected library, or to show all templates from all libraries if you select **All libraries** from the drop-down list.
4. **Optional:** On the De-duplication templates page, select **Run all** to run all de-duplication templates on their assigned de-duplication tasks.
   To assign de-duplication tasks to a template or to run a single template, continue with the following steps.
5. On the De-duplication templates page, locate the card with the template that you want to run and select **Assign tasks** in that card.
6. Select the tasks in the Available de-duplication tasks list that you want to remediate using the selected de-duplication template. Then select **Add Selected** to assign the selected tasks to the current template.

   Available de-duplication tasks lists all open de-duplication tasks, some of which can be non-compatible with the template. If you try to associate a non-compatible task, an error appears. Some of the tasks in the list might be assigned to another template, and you can reassign those to the current template.

   The Assigned de-duplication tasks pane on the right contains two tabs:

   - **All matching tasks**: Shows de-duplication tasks that match the condition of the selected template.
   - **Your selected tasks**: Shows the tasks that you've assigning to the template for remediation.

   The selected tasks are added to the list in the **Your selected tasks** tab in the Assigned de-duplication tasks pane on the right. The template will run for all tasks in the **Your selected tasks** list and any tasks in the **All matching tasks** list that aren't assigned to another template.
7. Select **Run template**.
   The selected template is added to the running queue.

What to do next

- Select the **Running** tab to track the progress and details of templates that you added to the running queue and are currently running. General counts for the template run appear when those counts become available. The templates are sorted by their start time, with the template with the most recent start time at the top of the list.
  - Select **Details** (accessible only after all de-duplication tasks have been calculated) to show further details about this run and to drill down to de-duplication tasks.
  - Select **Cancel** to stop a template's run. The details for the cancelled template are added in the **Completed** tab with the state of Cancel Requested. Upon completing the cancellation, the state changes to Cancelled.

  After a template run completes, its details no longer appear under the **Running** tab, but are available in the **Completed** tab. Also, the completed template is available again for running in the **Ready** tab.

- Select the **Completed** tab to view general counts per template, such as erroneous and skipped tasks, and general run time. The templates are sorted by their completion time, with the template that completed most recently at the top of the list. Select **Details** for a template to

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

access a list view of the template's assigned de-duplication tasks. This list view shows details for each de-duplication task, such as its state (color coded) and error message if applicable. You can drill down a de-duplication task for further details.

- Select **View de-duplication tasks that need your attention** in the De-duplication tasks completed with errors card in the De-duplication insights pane on the right. The De-duplication tasks with errors list view shows de-duplication tasks that didn't complete successfully along with an error message. You can drill down de-duplication tasks in the list for more details.
- Schedule a de-duplication template.

Remediate a single de-duplication task

Remediate a single de-duplilcation task using a de-duplication template in CMDB Workspace, or using the legacy Duplicate CI Remediator.

Before you begin

Role required:

- To access the Management view in CMDB Workspace to perform de-duplication tasks, sn_cmdb_admin
- To perform this task, cmdb_dedup_admin or any role containing cmdb_dedup_admin (such as sn_cmdb_admin)

Procedure

1. Navigate to **Workspaces** > **CMDB Workspace** and then select **Management** in the CMDB Workspace menu bar.
2. Select the **De-duplication Dashboard** link in Management tools, in the Manage section.
3. In the De-duplication templates section, select **View de-duplication tasks**.
4. In the De-duplication tasks list view, select the task that you want to remediate.
5. Select **Remediate** on the task form.
6. In the Remediate dialog box, choose which method you want to use for remediation, and then select **Remediate**.

What to do next

On the task form:

- Track the progress and the details of remediation in the Activity stream until remediation is complete.
- Select the **Duplicate Audit Results** tab to see the results of the duplicate audit.

Publish or unpublish a de-duplication template

After creating a de-duplication template, you must publish the draft template to make it available to run. You might also need to unpublish a published de-duplication template so it's temporarily unavailable for de-duplication remediation, until you republish it again.

Before you begin

- A template that you want to publish must not be in a published state.
- A template that you want to unpublish must be currently published.
- If the template that you want to unpublish is currently running or in the running queue, you must wait for the run to complete or cancel the run. In the De-duplication dashboard, select the **Running** tab, locate the template that you want to unpublish, and then select **Cancel** in the template's card.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required:

- To access the Management view in CMDB Workspace to perform de-duplication tasks, sn_cmdb_admin
- To perform this task, cmdb_dedup_admin or any role containing cmdb_dedup_admin (such as sn_cmdb_admin)

About this task

Procedure

1. Navigate to **Workspaces** > **CMDB Workspace** and then select **Management** in the CMDB Workspace menu bar.
2. Select the **De-duplication Template Library** link in Management tools, in the Manage section.
3. In the libraries pane locate the template that you want to publish or unpublish and then either:
   a. Publish: Ensure that all the sections of the template are complete and select **Publish**.
   b. In the Publish template dialog box, select **Publish**.
   c. Unpublish: Select **Unpublish** and in the Unpublish template dialog box, select **Unpublish**.

Result
A published template:

- Becomes available on the De-duplication templates page and can be used for remediation.
- Can't be edited or retired.

An unpublished template is set back into draft mode:

- Is no longer available on the De-duplication templates page and can't be selected for remediation.
- Can be edited or retired.

Schedule a de-duplication template

Create a schedule, such as a monthly schedule, for a published de-duplication template so it will automatically run on a recurring interval.

Before you begin
The de-duplication template that you want to create a schedule for, must be in a published state. For information about publishing a template, see Publish or unpublish a de-duplication template.

This functionality requires CMDB Workspace version 7.5 or later.

Role required:

- To access the Management view in CMDB Workspace to perform de-duplication tasks, sn_cmdb_admin
- To perform this task, cmdb_dedup_admin or any role containing cmdb_dedup_admin (such as sn_cmdb_admin)

Procedure

1. Navigate to **Workspaces** > **CMDB Workspace** and then select **Management** in the CMDB Workspace menu bar.
2. Select the **De-duplication Dashboard** link in Management tools, in the Manage section.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the De-duplication templates pane, select the More options icon ( ) for the template that you want to create a schedule, and then select **Create schedule**.
4. On the Schedule <template> dialog box, fill in the scheduling details.
   Various fields, such as **Time zone** and **Time** appear on the form according to your choice in the **Run** field. If **Run** is **Periodically**, you must set the **Repeat internal (day)** or the **Repeat interval (time)** fields (or both) before you can save the schedule.
5. Select **Save**.

Result
The newly created schedule is active by default.

What to do next
Track the state and details of templates:

- Select the **Running** tab to track the progress and details of the scheduled templates that are currently running. General counts for the template run appear when those counts become available. The templates are sorted by their start time, with the template with the most recent start time at the top of the list.
  - Select **Details** (accessible only after all de-duplication tasks have been calculated) to show further details about this run and to drill down to de-duplication tasks.
  - Select **Cancel** to stop a template's run. The details for the cancelled template are added in the **Completed** tab with the state of Cancel Requested. Upon completing the cancellation, the state changes to Cancelled.

  After a template run completes, its details no longer appear under the **Running** tab, but are available in the **Completed** tab. Also, the completed template is available again for running in the **Ready** tab.
- Select the **Completed** tab to view general counts per template, such as erroneous and skipped tasks, and general run time. The templates are sorted by their completion time, with the template that completed most recently at the top of the list. Select **Details** for a template to access a list view of the template's assigned de-duplication tasks. This list view shows details for each de-duplication task, such as its state (color coded) and error message if applicable. You can drill down a de-duplication task for further details.
- Select **View de-duplication tasks that need your attention** in the De-duplication tasks completed with errors card in the De-duplication insights pane on the right. The De-duplication tasks with errors list view shows de-duplication tasks that didn't complete successfully along with an error message. You can drill down de-duplication tasks in the list for more details.

On the De-duplication templates pane, select the More options icon ( ) for a template with a schedule. Some of the following options appear, according to the state of the schedule:

- Select **Edit schedule** to modify the schedule.
- Select **Deactivate schedule** to halt temporarily the automatic runs of the template, while preserving the schedule settings.
- Select **Activate schedule** to resume automatic runs of the template according to the schedule settings.

Retire a de-duplication template

Retire a template that is no longer needed for remediating de-duplication tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
The template that you want to retire must be in an unpublished state.

Role required:

- To access the Management view in CMDB Workspace to perform de-duplication tasks, sn_cmdb_admin
- To perform this task, cmdb_dedup_admin or any role containing cmdb_dedup_admin (such as sn_cmdb_admin)

Procedure
1. Navigate to **Workspaces** > **CMDB Workspace** and then select **Management** in the CMDB Workspace menu bar.
2. Select the **De-duplication Template Library** link in Management tools, in the Manage section.
3. In the library pane, select the template that you want to retire and then select **Retire**.
4. Select the template's context menu and then select **Retire template**.
5. In the Retire template dialog box, select **Retire**.

Result
A retired template is no longer available in the De-duplication dashboard and can't be used for remediation.

Review de-duplication tasks (legacy)

Review details of de-duplication tasks, and then potentially remediate a de-duplication task.

Before you begin
Role required: itil to view, and itil_admin or cmdb_dedup_admin to remediate a de-duplication task.

About this task
Alternatively, you can use de-duplication capabilities in the CMDB Workspace. Use the De-duplication dashboard and the De-duplication Template Library to:

- Review de-duplication tasks
- Remediate de-duplication tasks in bulk by using de-duplication templates
- Gain insights into de-duplication counts and status in your organization

For more information, see CI de-duplication experience in CMDB Workspace.

If a duplicate CI is a dependent CI, then you can view the details of the dependent relationship, the Depend on CI, and any relation qualifier chain. If the dependent CI has a lookup table, then you can see the details of the respective lookup table.

Procedure
1. Navigate to **All** > **Configuration** > **Identification/Reconciliation** > **De-duplication Tasks**.
2. Select a task.

Remediate Duplicate Task form

Field	Description
Number	Unique task number.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Assigned to	Person who is responsible for resolving the task.
Short description	Description for the task.
Work notes	Details describing how the CI was identified as a duplicate. **Note:** Not available in de-duplication tasks that were created prior to the London release. This field also contains user notes about the decisions and steps of resolving the task.
Priority	Task priority.
State	State of the de-duplication task as it progresses through resolution.

3. In the related lists section, click the **Duplicate Audit Results** tab to see the list of duplicate CIs in this task. You can click a CI to display more CI details.

Column	Description
Duplicate CI	Reference to the duplicate CI. **Note:** This field is a document ID type, which means that it can reference any record on any table. If the referenced CI is deleted as part of resolving duplicate tasks, then this field is empty.
Relationship	For a duplicate CI that is a dependent CI, this field shows the relationship between the duplicate CI and depend on CI.
Depend on CI	If the duplicate CI is a dependent CI, then this field displays the depend on CI.
Discovery source	Discovery method used for the CI.

What to do next

Analyze de-duplication tasks to determine which CIs should remain active and which of the duplicate CIs in the Duplicate Audit Results lists are stale or incorrect. Click **Remediate** to remediate a single de-duplication task.

Related topics

Relation qualifier

Document ID field

Remediate a de-duplication task (legacy)

Remediate a single de-duplication task by using the Duplicate CI Remediator wizard. Use the wizard to guide you through the duplicate CI reconciliation process or to apply a custom workflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Review the following topics to familiarize yourself with important concepts of duplicate CI remediation:

- Duplicate CIs remediation to learn about general duplicate CI remediation concepts, restrictions, and special cases such as remediations that involve a large number of duplicate CIs.
- Properties related to remediation of duplicate CIs for information about important properties that affect processes of duplicate CI remediation. Including the glide.duplicate_ci_remediator.dry_run property that determines if the Duplicate CI Remediator actually updates the CMDB or not.

Role required: itil to read, itil_admin or cmdb_dedup_admin to write

About this task

Instead of using the legacy build of the Duplicate CI Remediator on Core UI, you can use the De-duplication dashboard, and de-duplication templates and libraries, available in CMDB Workspace. Using de-duplication capabilities in CMDB Workspace is especially useful for bulk remediation of de-duplication tasks. These capabilities let you pre-configure a de-duplication template with remediation settings, which can then be applied in a consistent manner to multiple de-duplication tasks. For more information, see CI de-duplication experience in CMDB Workspace.

As you progress through the tabs of the Duplicate CI Remediator, CIs are not updated. All updates are applied only in the final step, after you click **Remediate**.

> **Note:**
> Remediation behaves differently when remediation involves a large number of duplicate CIs or where the duplicates are serial numbers. For information about special cases in remediation, see Duplicate CIs remediation.

Procedure

1. Navigate to **All** > **Configuration** > **Identification/Reconciliation** > **De-duplication Tasks**.
2. Open the de-duplication task that you want to remediate.
3. On the task form, select **Remediate**.
4. In the Remediate dialog box, select either of the following options:
   - **Use the Duplicate CI Remediator (Recommended)**: Use the wizard to consolidate duplicate CIs according to your configurations and settings. Follow the Duplicate CI Remediator tabs to configure the reconciliation.

     > **Note:**
     > This option is not available with non-CMDB tables.

   - **Use a custom remediation workflow**: Use an existing CMDB remediation rule or select **Add New** to create a new one.
     - On the CMDB Remediation Rule form, set **Task type** to `Remediate Duplicate Task` and select **Active**.
     - On the Workflow form, set **Table** to Remediate Duplicate Task [reconcile_duplicate_task] and **If condition matches** to `None`.
     - Ensure that the associated workflow remediates duplicate CIs.

     In the Remediate dialog box, select **Next** to start the workflow and to exit the Duplicate CI Remediator. The Remediate Duplicate Task form appears, where you can update the **State** of the task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Use the Duplicate CI Remediator (Restricted Mode)**: Appears only if the *glide.duplicate_ci_remediator.enable_restricted_mode* system property is set to **true**. You might need to use this option if remediation is blocked because loading the de-duplication task times out. This option might be relevant when there is a large number of related items associated with a de-duplication task, allowing remediation to continue with the limited features in a restricted mode. For more information about using this option to restrict the use of related items in de-duplication remediation and allow remediation to proceed, see Using restricted mode within the Duplicate CI Remediator [KB1542272].

5. On the **Select Main CI** tab in the Duplicate CI Remediator:

   a. Select the main CI for this reconciliation using either of the following lists of duplicate CIs. For any CI, you can click the **Name** link to display the CI's attributes, or click the **Related Items** link to display the number of related items.

   - **Recommended**: A subset of the **All** list, containing only system recommended main CIs. System recommendations are based on checking the duplicate CIs for the following criteria:
     - CI with most related items.
     - CI with most relationships.
     - Newest discovered CI.
     - Newest updated CI.
     - Oldest created CI.
     - Previous main CI, if one was previously selected.
   - **All**: All duplicate CIs for the de-duplication task.

   Either option lets you review a summary of the remediation settings before starting the remediation.

   b. Select one of the following options to choose whether to consolidate any attribute values, relationships, or related items from any of the duplicate CIs into the main CI:

   - **Remediate Manually**: Lets you specify which attribute values, relationships, and related items from duplicate CIs to consolidate into the main CI.
   - **Use Main CI**: Retains main CI attribute values, merges relationships, and merges only the default related items.

     Skip to step number 7 as this selection skips all configurations other than choosing the action for the duplicate CIs on the **Determine Duplicate CI Actions** page.

6. On the **Merge Attribute Values** tab review inconsistent values of each attribute. For each attribute, choose to retain the main CI's value, or choose a value from a duplicate CI for the main CI to be set with.
7. Select **Next**.

Column	Description
Attribute	Attribute for which there are different values.
Main CI Value	**Attribute** value in the main CI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description
Other Values	The number of unique **Attribute** values within the duplicate CIs.

To override the main CI attribute value with a duplicate CI value:

a. Click the **Other Values** link.

b. In the attribute dialog box, click **Unique Values** to display only unique attribute values, or **All** to display all attribute values including identical values.

c. Select a value for the main CI **Attribute** to be set with.
You can click **Reset to Original** to undo the selection of a different attribute value for the main CI.

d. Click **Select**.

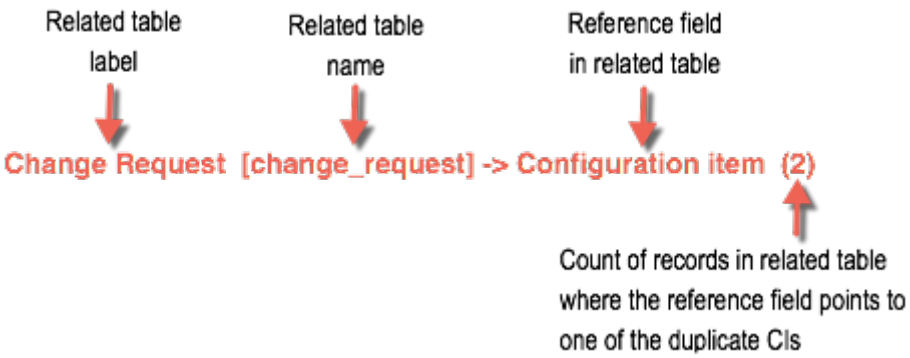
Note:
Attributes, such as system fields, discovery fields (*discovery_source*, *last_discovered*, *first_discovered*), and read-only fields (such as the asset field) do not appear in the list.

8. On the **Merge Relationships and Related Items** tab:

a. In the Merge Relationships section, select whether to merge all relationships from all duplicate CIs into the main CI. Click **View all relationships** to display all the relationships in which a duplicate CI is a parent or a child. You can click a **Parent** or a **Child** link to display more details. Orphan and duplicate relationships of duplicate CIs are deleted if you choose to merge relationships. For more information about the CMDB Health relationship KPI, see CMDB Health KPIs and metrics.

b. In the Merge Related Items section use the list collector to select related items to be merged into the main CI. Click **View all related items** to display all related tables (items) and the count of references in each table to one of the duplicate CIs. You can click the links in **Main CI Related Items** and **Duplicate CIs Related Items** to display details about the related items.

Related items in the list collector have the following format:



- By default, all items in the default related items list are selected to be merged.
- Related items (tables) that have no references to a duplicate CI are not listed, unless that table is included in the default related items list.
- Since asset related tables are part of the exclusion list, they are not available for merge.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

See Manage default related items list for more information about configuring a default list of related items.

c. Click **Next** .

9. On the **Determine Duplicate CI Actions** tab, choose one of the following actions to perform after completing the reconciliation. Then click **Next**.
   - **Set attributes to custom values** (recommended): Retain all duplicate CIs. Mark the duplicate CIs as invalid by setting a specific **Attribute** to a specific **Value** for all duplicate CIs. For example, set *Operational Status* to `Retired` to retire the duplicate CIs.

     The *duplicate_of* attribute of the duplicate CIs is automatically set to the appropriate main CI. Also, the duplicate CIs will not be added to any de-duplication task after this task is remediated. If the identification engine is not configured to skip duplication, ensure that identification inclusion rules are configured to exclude the duplicate CIs during identification. This configuration prevents new de-duplication tasks with the same duplicate CIs from being created after remediation.

     Note:
     Discovery fields, system fields, read only fields, and date fields are excluded from the attributes list.

   - **Delete**: Delete all duplicate CIs (only the main CI remains).

     Note:
     Review Roll back and delete recovery for information about reverting the deletion of CIs and related records.

10. On the **Review and Confirm** tab:

    a. Review the summary of the expected updates for this duplicate CIs reconciliation. Updates are based on your selections and therefore the summary includes only the details that are applicable. This summary can include details of the relationships and related items that will be merged to the main CI, the attribute values that the main CI will be set with, and the number of CIs that will be deleted. Click **Attributes**, **Relationships**, **Related Items**, or **Duplicate CI Actions** if applicable, to display further details such as changes to attribute values.

    b. Click **Remediate** to complete the reconciliation according to your reconciliation settings. Once complete, the task **State** is set to **Closed Complete**.

Result

The following relationships are deleted without being merged to the main CI:

- Relationships in which the type, child, or parent field is empty.
- Relationships for which merging to the main CI will result in cyclic relationships.
- Relationship for which merging to the main CI will result in duplicate relationships.

What to do next

The reconciliation process runs in the background and may take a while to complete. Upon completion, the system sends a confirmation notice to the remediator of the task. Meanwhile, you can:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Review Identification Rules**: Review identification and inclusion rules and make any necessary updates to reduce CI duplication.
- **Check Progress**: View the task activities that are logged as the remediation progresses.
- **View Main CI**: View the main CI for this reconciliation process.

Manually create a de-duplication task

Manually create a de-duplication task when it is not automatically created. You can then use the Duplicate CI Remediator or the De-duplication dashboard in CMDB Workspace to remediate the manually created task.

In some situations, duplicate CIs are not automatically detected and de-duplication tasks are not automatically generated. Such situation happens with a class for which identification rules are not defined and the identification engine cannot be applied. However, you still want to reconcile these duplicate CIs by utilizing the Duplicate CI Remediator or the De-duplication dashboard in CMDB Workspace.

Use the CMDBDuplicateTaskUtils API to manually create a de-duplication task in which all duplicate CIs are specified. The de-duplication tasks that you create manually and the automatically created tasks, are stored in the same table ([reconcile_duplicate_task]) and are processed in the same manner.

Note:
You can manually create a de-duplication task only for CMDB CIs and a CI can be specified as a duplicate CI only in a single de-duplication task.

Manage default related items list

You can add or remove items from the default list of related items which is used in duplicate CI remediation for all de-duplication tasks.

Before you begin
Role required: itil_admin

About this task
The default related items list is used by the Duplicate CI Remediator, appearing on the **Merge Relationships and Related Items** tab. You can modify the list for only a specific task in the Duplicate CI Remediator without affecting the default global list.

The default related items list is also used by the De-duplication dashboard in CMDB Workspace for remediation.

Globally modifying the list affects the remediation of all de-duplication tasks in the Duplicate CI Remediator and in the De-duplication dashboard in CMDB Workspace.

Note:
Only related items in which the reference field points to Configuration Item [cmdb_ci] in *sys_dictionary* can be selected for the default related items list. Related items with references to any child of the Configuration Item class cannot be selected for the default related items list, but are still available for merging in the Duplicate CI Remediator for a specific task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Configuration** > **Identification/Reconciliation** > **Duplicate CI Remediator Default Related Items**.
2. On the Default Related Items List for Duplicate CI Remediator page, use the list collector to add or remove items from the **Selected** list.
3. Click **Save**.

Properties related to remediation of duplicate CIs

Use de-duplication properties to configure how remediation of duplicate CIs works when using the Duplicate CI Remediator or the De-duplication dashboard in CMDB Workspace.

To view and edit these properties, the admin role is required.

Although the properties below reference the Duplicate CI Remediator, these properties have an equivalent effect in duplicate CI remediation in CMDB Workspace.

Property	Description
Attributes in which *max_length* exceeds this property value (4000 by default) are excluded from the **Select Main CI**, **Merge Attribute Values**, and **Determine Duplicate CI Actions** tabs in the Duplicate CI Remediator wizard. glide.duplicate_ci_remediator.max.field_length	If the *max_length* for an attribute is equal to the prop data is truncated to the property value and the attribute • Type: integer • Default value: 4000 • Location: **Configuration** > **CMDB Properties** > **Duplic** **Note:** This property impacts the performance of de-duplic
Comma separated list of related tables in the format '<table>.<reference column>', that are excluded from merging during duplicate CI remediation. glide.duplicate_ci_remediator.related_items_blacklist	• Type: string • Default value: cert_task.cmdb_ci,cert_audit_result.configuration_iter • Location: **Configuration** > **CMDB Properties** > **Duplic**
Threshold for the number of duplicate CIs, which if exceeded, support for reconciliation in the Duplicate CI Remediator is limited (1,000 by default). glide.duplicate_ci_remediator.max.cis	• Type: integer • Default value: 1000 • Location: **Configuration** > **CMDB Properties** > **Duplic** • Learn more: See 'Large number of duplicate CIs' in Re This threshold never exceeds 5,000, even if you set the
Determines whether the Duplicate CI Remediator actually remediates CI duplication by updating records in the CMDB, or not. glide.duplicate_ci_remediator.dry_run	When set to false (default value), updates specified in th You can set this property to true and then test run throu updated. In this case, the work notes for the task descril • Type: true | false • Default value: false • Location: **Configuration** > **CMDB Properties** > **Duplic**

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
glide.duplicate_ci_remediator.enable_restricted_mode	Enables restricted mode remediation in the Duplicate C duplication remediation and allows a blocked remediati **Mode)** option. For more information, see Using restricte • Type: true | false • Default value: false • Location: Add to System Properties [sys_properties] • Learn more: Remediate a de-duplication task (legacy) Set to **true** to enable restricted mode remediation.

Components installed for duplicate CI remediation

Tables installed to support duplicate CI remediation (included in the com.snc.cmdb plugin).

Tables installed

Table	Description
Remediate Duplicate Task [reconcile_duplicate_task]	De-duplication tasks.
Duplicate Audit Result [duplicate_audit_result]	CIs associated with each de-duplication task.
Duplicate CI Remediation [cmdb_duplicate_ci_remediation]	Input, selections on each tab, overall status of remediation, and results of each run of the Duplicate CI Remediator.
CMDB Workspace De-duplication template library [sn_cmdb_ws_reconcile_duplicate_template_library]	Library names and their descriptions.
De-duplication template suggested task [sn_cmdb_ws_reconcile_duplicate_template_suggested_task]	Mappings of de-duplication tasks to templates.

Scheduled jobs installed

Scheduled job	Description
De-duplication: Populate Duplicate Task Data	Runs daily to copy metadata, such as the identification attributes and identification rules used in generating a de-duplication task, into an easily accessible table. The metadata is stored in the Reconcile Duplicate Task Data [reconcile_duplicate_task_data] table and used for analytics for the De-duplication dashboard.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scheduled job	Description
De-duplication: Populate Template Task Run Records	Runs every minute to evaluate the de-duplication tasks applicable for a template according to your settings. Based on settings, assigns matching tasks and manually added tasks to the template for remediation. De-duplication tasks are remediated after you select **Run template**.
De-Duplication: Template Scheduler	Runs every minute by the template scheduler to check the capacity of the execution engine. If there is available capacity, picks any new de-duplication tasks added to the queue, for remediation. De-duplication tasks aren't remediated and remain in ready state unless this job runs periodically.
De-duplication: Populate Template Suggested and Orphan Tasks	Runs hourly to count the number of tasks that match each published template and the number of tasks that don't match any published template. These counts then appear on various cards in the De-duplication dashboard.

CIs attestation

Verify the existence of actual IT infrastructure and applications that you own, systematically and in bulk. As CIs are continuously ingested into the CMDB from various data sources, ensure the integrity of the CMDB. Remove any stale CIs that are associated with IT infrastructure or applications that no longer exists.

Use the CMDB Data Manager in CMDB Workspace to create an Attestation policy, specifying CIs that need to be attested and the attestation frequency. Assign Attestation tasks to users that are familiar with or that manage the CIs, and who can attest or reject the IT infrastructure or applications that those CIs represent. Rejected CIs that are no longer needed can then be retired, archived, or deleted from the CMDB.

Users can go to the My Work view in CMDB Workspace to see their assigned attestation tasks, and then review and process the tasks.

Smart detection and auto-attestation

Smart detection streamlines and simplifies CI attestation. With smart detection you can auto-attest CIs that are automatically detected by discovery programs, based only on recent discovery results.

The following conditions must be met to enable smart detection:

- Discovery is enabled in your organization or Getting started with Service Graph Connectors are implemented.
- The system property *sn_cmdb_ws.attestation.smart_detection.disabled* is set to **false** (default value).

In addition, smart detection uses the following system properties as filters when creating a list of CIs that are candidates for auto-attestation. To be included as candidates for auto-attestation, CIs must be discovered:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Within the discovery time window specified by the *sn_cmdb_ws.attestation.smart_detection.discovery_window* system property (for example, within the last 30 days)
- By any discovery source that isn't excluded by the *sn_cmdb_ws.attestation.smart_detection.discovery_source.exclusion* system property

Then, when you review those candidate CIs, you can choose to auto-attest them.

Properties associated with Attestation

Property	Description

sn_cmdb_ws.attestation.smart_detection.disabled	Disables smart detection.
	• Type: true | false
	• Default value: false
	• Values:
	  ○ **true**: Disable smart detection.
	  ○ **false**: Enable smart detection.
	• Location: Add to System Properties [sys_properties] table.
	• Learn more: Review attestation tasks in CMDB Workspace

sn_cmdb_ws.attestation.smart_detection.discovery_source.exclusion	Comma-separated list of discovery sources that are excluded in smart detection processing. For example, a data source that is unreliable in detecting CIs. CIs discovered by discovery sources in the list, can't be candidates for auto-attestation. • Type: string • Default value: Manual Entry

Property	Description
	• Location: System property • Learn more: Review attestation tasks in CMDB Workspace
sn_cmdb_ws.attestation.smart_detection.discovery_window	Number of days (discovery window) that smart detection uses to determine whether a CI is a candidate for auto-attestation. Only CIs that were discovered within this discovery window can be candidates for auto-attestation. • Type: integer • Default value: 30 • Location: System property • Learn more: Review attestation tasks in CMDB Workspace

Review attestation tasks in CMDB Workspace

Review attestation tasks that are assigned to you or to an assignment group that you belong to in accordance with CMDB Data Manager Attestation policies. Check the physical existence of IT infrastructure or applications associated with CIs in the attestation task and then process those CIs as appropriate.

About this task

For managers, tasks of direct reports are included, and for user group managers, tasks of members in the group are also included.

Before you begin

Role required:

- CMDB administrator: data_manager_admin, sn_cmdb_admin (already includes the data_manager_admin role)
- CI and service owner or manager: data_manager_user, sn_cmdb_user (already includes the data_manager_user role)

Canceling an attestation task is available only for tasks that are in the 'In progress' or 'Not started' status, and the required role is data_manager_admin or sn_cmdb_admin.

About this task

After you receive notifications about attestation tasks assigned to you, check the actual IT infrastructure or applications that you own, and then process the CIs in the task accordingly. Initially, all the CIs in the attestation task are listed in a Not Yet Reviewed list and therefore require a review. Attested CIs are then moved to an Attested CIs list, while CIs you reject are moved to a

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

separate Rejected CIs list. After processing all the CIs in the task, you can submit and complete the task. For general information about attestation and the flow of attestation, see CIs attestation.

As you process the CIs in the task, only the fields *Attestation Status* (values: **Attested**, **Rejected**, **Not Yet Reviewed**), *Attested By*, and *Attested Date* are automatically updated. Also, details of your activities are captured in the activity stream of the task.

Attesting tasks is performed in the My Work view in the CMDB Workspace store app.

Procedure

1. Navigate to **Workspaces** > **CMDB Workspace** and then select **My Work** in the CMDB Workspace menu bar.
   Any attestation tasks that are assigned to you or to assignment groups you belong to, appear in the **Attestation tasks** tab in the My tasks section. Attestation tasks are associated with details such as the due dates and short descriptions for those tasks. Assignment groups that you are a member of, are also listed.
2. Select a task to review from the Attestation tasks list. For a bulk review, select multiple tasks or check the box next to 'Configuration Item' to review all the tasks in the list.
3. Review details of a task:

   a. **Optional:** Administrators can select **Cancel task** if attesting the CIs in the task isn't needed. For example, if the task was created by error. The canceled task is deleted without any further processing.

   b. **Optional:** If the task isn't properly assigned, select **Reassign** and then select one of the following options.

      (Optional) Depending on your selection, the task might no longer be assigned to you.

      - **To me**: If the task isn't yet assigned to a specific user and you are the owner of the CIs who can process the task.
      - (Optional) **To other user**: If you aren't the actual owner of the CIs and there is someone else that is more appropriate as the owner for the task. In the Reassign to other user dialog box, set **Assign to** to that user and enter the reason for the reassignment. Then select **Proceed**.

        For a CI owner, only users from the assignment group that the task is currently assigned to, appear. For Admins, all users with the data_manager_user role appear.
      - **Send for reassignment**: If you aren't the appropriate user for this task and the administrator needs to assign the task to someone else. In the Send for reassignment dialog box, enter the reason for the operation and then select **Submit** to send a notification to the administrator.

   c. Select **Review CIs to attest** to continue the CI attestation process.
      If the task is not assigned to anyone, it is automatically assigned to the current user.

4. **Optional:** If the Smart detection dialog box appears, select **Review** to review the CIs or **Auto-attest** to attest the detected CIs without a review.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Review the details of the CIs in the list.

b. **Optional:** Select **Auto-attest** to automatically attest all the CIs in the list and to move them to the Attested CIs list.

c. **Optional:** Select **Cancel auto-attestation** to leave all the CIs in the Not Yet Reviewed list and to later continue attesting those CIs regardless of smart detection.

If you select **Cancel**, you can later select **Run auto-attestation** in the Smart detection widget. When reviewing the CIs to attest, the list in the Smart detection pane is filtered to CIs that are candidates for auto-attestation, letting you auto-attest all those CIs in bulk.

5. Review the CIs in the Not Yet Reviewed list.

   You can select a CI to open a dashboard with more details such as CI health, key properties, and CMDB 360 data. The CI health details that appear depend on settings and activation of various features.

   Use the following cards on the right hand bar to get help and status:

   - Select Attestation actions ( ) to get help on the possible actions you can take while reviewing CIs.
   - Select Attestation status ( ) to see your progress in reviewing and attesting CIs.
   - Select Smart detection status ( ) to see if any CIs are candidates for auto-attestation and to apply auto-attestation if applicable.

6. In the **Details** tab of the Attestation Review CIs pane, select the CIs that you are ready to process and select an action to apply to all selected CIs.

   - Select the CIs that you can attest their existence and select **Attest** to move them to the Attested list.

     To undo attestation, select the Attested list, select the CIs that you want to move back to the Not Yet Reviewed list and select **Unattest**. Or, select the CIs that you want to move to the Rejected list and select **Reject**.

   - Select the CIs that you can't attest their existence and select **Reject** to move them to the Rejected list. In the Confirm rejecting CIs dialog box, enter an explanation and then select **Proceed**.

     To undo rejection, select the Rejected list, select the CIs that you want to move back to the Not Yet Reviewed list and select **Unattest**. Or, select the CIs that you want to move to the Attested list and select **Attest**.

   - Select the CIs that shouldn't be included in this task and in future Data Manager attestation policies, and select **Exclude**. In the Confirm excluding CIs dialog box, enter an explanation and then select **Proceed**.

     Those excluded CIs are added to the exclusion list of CMDB Data Manager attestation policies. For more information, see Manage exclusion lists of CMDB Data Manager (in Core UI). Only an admin can undo this operation using the CMDB Data Manager.

   - Select any CIs that you identify as duplicates of other CIs and select **Remove duplicates from task**. In the Confirm removing duplicate CIs dialog box, enter an explanation and then select **Proceed**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Those duplicate CIs are removed from the attestation task and a de-duplication task is generated for them, which is similar to the de-duplication tasks created by the Identification and Reconciliation Engine (IRE). For more details about how to process and remediate de-duplication tasks, see Duplicate CIs remediation.

Note:
Only an admin can undo this operation.

- After processing all the CIs in the task, when the Not Yet Reviewed list is empty, the **Submit** button is enabled. Select **Submit**, and then in the Submit attestation dialog box select **Submit** to close the task.

Data Certification

Data Certification manages scheduled and on-demand validations of data in CMDB and non-CMDB tables.

Information is added to the CMDB by Discovery, by importing from third-party tools, or manually. For regulatory or procedural reasons, information in the CMDB requires checks for accuracy and certification. The person or team responsible for certification can define what information requires verification and a verification schedule. The schedule then generates a checklist for verifying the data. Individuals assigned to certification tasks answer a series of questions to verify the data.

Data certification can be performed against specific fields on specific tables. Based on the certification schedule, certification tasks are automatically created and assigned. For example, you can set up a certification to validate key information fields, such as **Operating System** and **CPU count**, on all Windows servers located in Chicago. You can then assign the tasks to the appropriate team member automatically.

Domain separated systems can use the Data Certification application.

Data Certification experience in CMDB Workspace

You can use the CMDB Workspace landing page and its views to fully administer and use Data Certification, view various analytics, and handle Data Certification tasks such as:

- Create a Data Manager Certification policy.
- Convert legacy certification schedules into Data Manager Certification policies.
- Review certification tasks in CMDB Workspace.
- Review failed certification tasks in CMDB Workspace.

The Data Certification experience in CMDB Workspace doesn't provide functionality such as reset, merging of multiple Data Certification tasks, and escalation.

For more information about using Data Certification in CMDB Workspace, see Data Certification experience in CMDB Workspace.

Data Certification on Core UI (UI 16)

Data Certification experience in CMDB Workspace provides the latest Data Certification functionality. However, the legacy build of Data Certification on Core UI (UI 16) is available by navigating to **All** > **Data Certification**. For information about using the CMDB Data Manager legacy build on Core UI, see Data Certification on Core UI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

Data Certification in CMDB Workspace and the legacy build of Data Certification on Core UI operate separately, and aren't synchronized. Therefore, any Data Certification elements, such as definitions and schedules, that you create in one of those implementations, doesn't appear and isn't included in the other implementation.

To convert data created in the legacy build of Data Certification on Core UI, into draft Certification policies in CMDB Workspace, see Convert legacy certification schedules into Data Manager Certification policies.

Data Certification experience in CMDB Workspace

Use Data Certification in CMDB Workspace to administer Data Certification, create Certification policies, manage Data Certification tasks, and view analytics about on-going processes.

Note:
Data Certification in CMDB Workspace and the legacy build of Data Certification on Core UI operate separately, and aren't synchronized. Therefore, any Data Certification definitions, such as filters and certification schedules, that you create in one of those implementations, doesn't appear and isn't available in the other implementation.

Data Certification experience in CMDB Workspace

Use the CMDB Workspace landing page and its views to administer Data Certification:

- Use the Management view in CMDB Workspace to navigate to CMDB Data Manager to create a new Certification policy.
- Use the My work tile on the CMDB Workspace landing page to access your open and overdue Certification tasks that you need to review and process.
- Use the My Work view in CMDB Workspace to access any Data Certification tasks assigned to you under the Certification tasks section.

Manage certification tasks in CMDB Workspace:

- Manage Data Certification instances and tasks, and see progress, status, and insights in the Data Certification Dashboard
- Review Certification tasks in CMDB Workspace
- Review failed certification tasks in CMDB Workspace

Retention of Data Certification records

Archival and destroy processes of certification policy related records, are separate from those processes for records of all other policy types. This separation facilitates the extension of the retention period of certification policy records. Retaining certification policy execution records for longer periods of time is useful in situations where those records are needed for audits and is also useful for the Data Certification Dashboard, which is populated by these records.

The following configurations facilitate the separation of retention policies for Data Certification records:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The table cleanup rule for the CMDB Data Management Policy Executions [cmdb_data_management_policy_execution] table, which is stored in the Auto Flushes [sys_auto_flush] table, excludes certification policy execution records from recurring cleanups.
- The Archive CMDB Data Management Tasks archive rule, that applies to all CMDB Data Manager policy execution records, excludes certification policy records. At each archive run, this archive rule is configured to also automatically archive its related records in the CMDB Data Management Certification Task To Document [sn_cmdb_ws_dm_certification_task_to_document] table (Archive Related Records).
- The archive rule, Archive Certification Instances, archives certification policy execution records from the CMDB Data Management Policy Execution [cmdb_data_management_policy_execution] table. This archive rule is configured to archive certification policy execution records 2 years after creation, and to destroy those records 7 years after they are archived.
- The archive rule, Archive Certification tasks, archives the certification task records from the CMDB Data Management Task [cmdb_data_management_task] table. This archive rule also contains an Archive Related Records entry that archives the related records in the CMDB Data Management Certification Task To Document [sn_cmdb_ws_dm_certification_task_to_document] table.

Convert legacy certification schedules into Data Manager Certification policies

Convert certification schedules created in the legacy Data Certification application (running on Core UI), into draft Data Manager Certification policies available in CMDB Workspace.

Before you begin

Role required: data_manager_admin or sn_cmdb_admin

About this task

If you have been using the legacy Data Certification application on Core UI, then any associated certification schedules aren't automatically available in the new implementation of Data Certification in CMDB Workspace version 6.0. You can convert those definitions into draft Data Manager Certification policies. Then you can publish the converted policies in CMDB Workspace just like publishing any draft Data Manager policy.

Important things to know:

- Legacy certification schedules that were successfully converted are automatically deactivated.
- This conversion migrates most fields from the legacy certification schedule. However, the *`Assign to empty`* and the *`Last run date`* fields aren't migrated into CMDB Workspace Data Manager tables.
- Any dot-walking settings in the legacy certification schedules used for assignments of *`User Field`* or *`User Group Field`* are preserved in this conversion.

Procedure

1. Navigate to **All** > **Workspaces** > **CMDB Workspace** and then select Management in the CMDB Workspace menu bar.
2. Select the **Data Manager** link in Management tools, in the Manage section.
3. On the Data Manager overview page, select **Import** on the banner at the top of the page. If there aren't any legacy certification schedules to import, the notification banner about importing existing policies doesn't appear.
4. In the Confirm import of certification schedule into draft policies, select **Import into draft policies**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Track progression in the Import in progress dialog box.

b. Review the import results in the Import summary dialog box.

If there were earlier conversion operations, the results reflect only the current conversion operation. For example, the Completed count includes only those records that were successfully converted in the current run.

Select the links associated with the completed and skipped results to drill down to the associated records.

Also, to see additional details, select **All** and in the Filter navigator, enter `cert_schedule.list` to open the Certification Schedules table. The *Migration Status* and the *Migration exception* columns provide details that are especially important for failed and skipped records.

c. Select **View draft policies** to view the converted policies in the Data Manager policies page, under the Draft policies tab.

5. **Optional:** Publish a draft Data Manager policy in CMDB Workspace

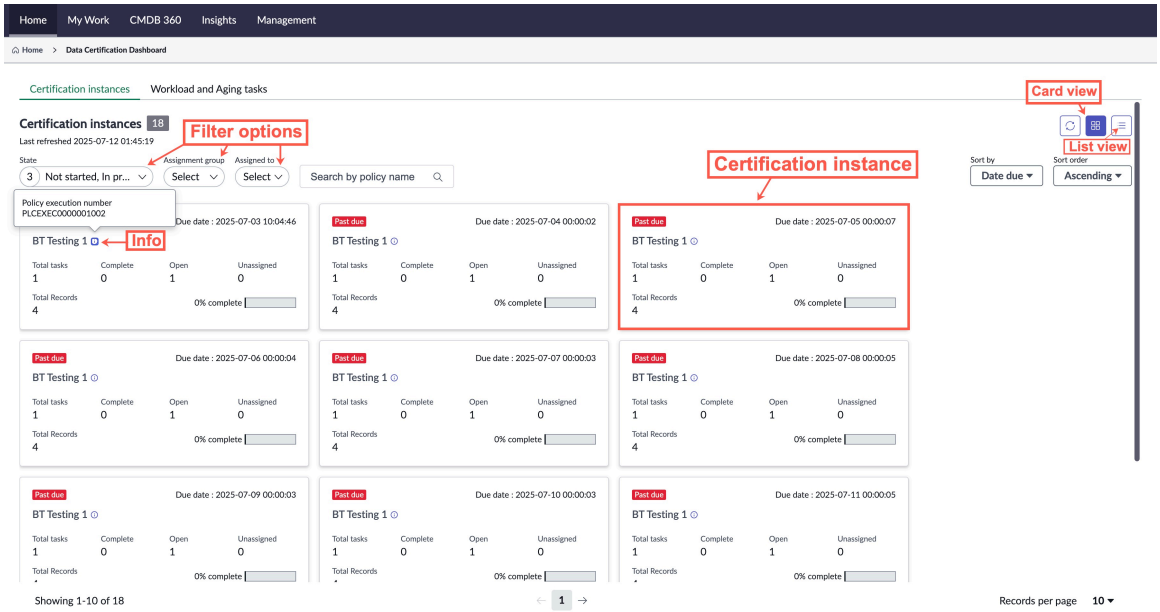
Result

- If you log in while this conversion is in process, a progress message appears on the Data Manager overview page. You can select the **View details** link to open the Import in progress dialog box with details about the progress of the operation.
- The legacy certification schedules are available as draft Certification policies in Data Manager in CMDB Workspace.
- The legacy certification schedules are deactivated.
- The legacy certification tasks are unchanged and you can review and resolve them as needed.

Data Certification Dashboard

Use the Data Certification Dashboard in CMDB Workspace as a central location to manage Data Certification instances and tasks, and to see counts, progress, state, and analytical insights. You can drill down past due certification tasks to examine and to reassign them, for example, so that they can be completed by an appropriate user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The Data Certification Dashboard gets populated by Data Certification execution records. For information about the archive rules that control the retention of those records, see 'Retention of Data Certification records' in Data Certification experience in CMDB Workspace.

Role requirements

The user role determines which certification tasks are included in the dashboard, as follows:

- data_manager_user: Minimum role required for access. Provides access to those certification tasks that are assigned to the user, to an assignment group that the user is a member of, or if the user is the manager of the assigned user or of the assignment group.
- data_manager_admin: Provides access to all certification tasks.

Reviewing certification tasks

The Data Certification Dashboard provides several ways for you to drill down to the certification tasks list, which can contain tasks requiring review. For information about reviewing (and then certifying or failing), reassigning, or canceling tasks, see Review certification tasks in CMDB Workspace.

Certification instances

The Certification instances tab shows counts and other details for certification instances. A certification instance is the collection of certification tasks for a policy execution identified by its unique policy execution number. For each certification instance, the dashboard shows progress indicators such as the overall percent complete, and a general state such as Not Started and Past Due. Each card shows the total number of associated tasks, and within that total, the number of tasks in a complete, open, and unassigned state.

You can:

- Switch the type of view by selecting the List or the Cards icon.
- Filter the list of certification instances that appear, by selecting the available filters such as State, Assignment group, or Assigned to filter and then selecting the specific items that you want to filter by.
- Filter the list of certification instances that appear by searching for specific strings in certification policy names.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Sort the list of certification instances by various attributes such as instance state, percent complete, or policy execution number. Select ascending or descending sort order to apply along with any list filter.
- Select the info icon next to a certification instance name, to show its respective policy execution number. For information about policy execution numbers, see table CMDB Data Management Policy Executions [cmdb_data_management_policy_execution] in Components related to CMDB Data Manager.

Select a card to see more details about the certification instance, and all the tasks in that instance based on your user role. In the Certification tasks tab you can drill down the certification tasks list to access the tasks themselves for processing.

Select the Certification records tab to see all the certification records associated with all of the certification tasks in the certification instance. You can filter the certification records by **Certified** or **Failed** to show those records with at least one attribute in the selected state.

Workload and Aging tasks

The Workload and Aging tasks tab contains two tabs showing the distribution of certification tasks workload and past-due tasks.

Workload

Shows the distribution of work related to certification tasks, by user groups and by individual users. Select the Groups or the Individuals tab to see the distribution by percentage and by total number of tasks. Select any entry in a list to drill down to the certification tasks list which lets you then access the tasks themselves for processing.

Aging

Shows bar charts with counts of data certification tasks that are past due. Past due state is determined by the setting of the *sn_cmdb_ws.glide.cmdb.data.manager.aging.policy.task.timeframe* system property (by default, 61–90 and over 90 days old). Select a chart to drill down to the certification tasks list which lets you then access the tasks themselves for processing.

Review certification tasks in CMDB Workspace

Review the values of record fields and CI attributes in certification tasks assigned to you, and then certify, edit, or fail the review according to your findings. For managers, tasks of direct reports are included, and for user group managers, tasks of members in the group are also included.

Before you begin

Role required: sn_cmdb_user, sn_cmdb_editor, or sn_cmdb_admin

Canceling a certification task is available only for tasks that are in the 'In progress' or 'Not started' status, and the required role is data_manager_admin or sn_cmdb_admin.

About this task

If a certification task isn't properly assigned, you can reassign it to another user if you know who the appropriate reviewer is, or request an administrator to reassign the task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- If the policy is configured to disallow empty attribute values, you will only be able to fail certification of the associated CIs, but you won't be able to certify them unless you populate the empty attributes first.
- If the policy is configured to disallow updates to field values, you won't be able to update non-compliant CIs, resulting in failing their certification.

Procedure

1. Navigate to the Certification tasks list in either of the following ways.
   - Navigate to **Workspaces** > **CMDB Workspace**, then select **My Work** in the CMDB Workspace menu bar. In the My tasks section, select the Certification tasks tab.
   - Navigate to **Workspaces** > **CMDB Workspace**. On the Home view in CMDB Workspace, select the **Data Certification Dashboard** quick link. Then, on the Data Certification Dashboard, drill down to the Certification tasks list from a certification instance card or from the Workload and Aging tasks tiles, as described in Data Certification Dashboard.
2. **Optional:** In the Certification tasks list, select multiple tasks to reassign tasks in bulk.

   a. Select the Certification tasks tab, then the task or tasks that you want to reassign.
      - Select **Reassign**: Reassign a task to another group or user if you aren't the appropriate user to review the field values and you know who the appropriate reviewer is.
        - **Assignment group**: Select the assignment group the user belongs to.
        - **Assign to:** Search for the appropriate reviewer to reassign this task to.
        - **Submit a reason for this action**: Enter a reason why you are reassigning the task.
      - Select the **Reassign** drop-down menu then select **Assign to me**: Assign the task that isn't assigned, to yourself, if you are the appropriate reviewer for this task.
      - Select the **Reassign** drop-down menu then select **Request reassignment**: Request to reassign the task, that is assigned to you incorrectly, to someone else. Enter a reason why the task needs to be reassigned, then select **Submit**.

   b. Select **Proceed**.

3. In the Certification tasks tab, select the certification task that you want to review.
4. Review the details of the certification task, then select **Review records to certify**.

   Note:
   You can reassign the tasks on this page, see Step 2 to review the reassignment options.

5. Select the records that you want to conclude the review for in the Review not completed tab, and then select **Certify** or **Fail**.

   You can select all the records showing on the page for bulk processing by selecting the check box in the first column header, and then selecting the **Select all <n> item/s in this list** link that appears.

   - The review conclusion of certified or failed is applied in bulk only to those certification fields in the selected records, which are still pending a review. For example, a certification field that is already marked as certified, isn't affected by selecting **Fail**. Only the unreviewed fields are

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

marked as failed. Records whose review is concluded are moved to the Review completed tab.

- If the policy is configured to disallow empty attribute values, then CIs with empty fields won't be certified when you select **Certify**. In this situation, to certify those CIs, you must first populate the empty attributes.

6. Select the records that you want to review in details and then select **Review records**.

   A check mark next to a column header, denotes the fields whose values are included in this certification review (certification fields). All other columns show additional fields that are included only to help you identify records (display fields).

   When you select records (or CIs) to review, the fields (or attributes) for the selected records appear on the right, in a separate field review section. When you select a single record to review, the field values of the selected record appear. When you select multiple records to review, the field values don't appear. In that section, select the fields to apply your review results, or select **Select all fields** to apply the review results to all fields.

7. Select **Submit** when all the records have been reviewed.
   The **Submit** button isn't available until all the records in the task are reviewed and the task is complete.

What to do next

You can review the certification results in the Review completed tab, and change certification results or edit field values.

Review failed certification tasks in CMDB Workspace

Review records (and CIs) that failed the certification review and are assigned to you. Those exceptions appear in a list that is dynamically updated as certification tasks are being reviewed.

Before you begin

Role required: sn_cmdb_admin

Procedure

1. Navigate to **Workspaces** > **CMDB Workspace**, then select **My Work** in the CMDB Workspace menu bar.
2. In the Certification exceptions pop-up banner, select **Click here to view**.
3. Select a drop-down to expand a task to show the records and fields that failed the certification review.
4. Select the Certification Document Id of the field that you want to update.
   The Element column shows the fields that failed the review. The Certification Document Id column contains links to the respective records.
5. Review the details of fields that require updating.

What to do next

See the Review certification tasks in CMDB Workspace topic to locate and review the respective certification task and to update incorrect field values. You can also directly access record and CI forms to update incorrect values.

Data Certification on Core UI

The legacy build of Data Certification on Core UI lets you centrally track and handle Data Certification tasks, create certification filters, and define certification schedules.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Starting with the Xanadu release, Data Certification plugin (com.snc.certification_v2) is being prepared for future deprecation. It will be hidden and no longer activated on new instances but will continue to be supported. The CMDB Workspace store app provides the latest experience for this functionality.

- For details about the deprecation, see the Deprecation Process [KB0867184] article in the Now Support knowledge base.
- For information about using Data Certification, see Data Certification experience in CMDB Workspace.
- For information about converting schedules created in the legacy build of Data Certification on Core UI, into draft Certification policies in CMDB Workspace, see Convert legacy certification schedules into Data Manager Certification policies.

Note:

Data Certification in CMDB Workspace and the legacy build of Data Certification on Core UI operate separately, and aren't synchronized. Therefore, any Data Certification elements, such as filters and schedules, that you create in one of those implementations, doesn't appear and isn't included in the other implementation.

Activate Data Certification

Activate the Data Certification plugin to access the application. Activating this plugin also activates the Version Management plugin, which manages certification filter versions.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Data Certification plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Installed With Data Certification

Activating the Data Certification plugin installs the following components.

Demo data is available with Data Certification. The demo data provides information including filters, schedules, instances, and tasks.

Tables

Data Certification adds the following tables:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
Certification Audit Definition [cert_audit_definition]	Stores collections of certification schedules that can be run as a single entity.
Certification Audit Definition Elements [m2m_cert_audit_def_cert_sched]	Lists the certification schedules in each certification audit definition.
Certification Audit Instance [cert_audit_instance]	Stores the certification instances associated with a specific audit definition.
Certification Element [cert_element]	Stores the data elements that are grouped into certification tasks.
Certification Filter [cert_filter]	Stores the data that requires certification using a filtering condition for the certification.
Certification Instance [cert_instance]	Stores a collection of certification tasks representing a single instance of a scheduled certification. This table extends the Audit [cert_audit] table.
Certification Schedule [cert_schedule]	Stores certification for a specific set of information on a specific table, what user or group the tasks are assigned to, and how often this certification is done.
Certification Task [cert_task]	Stores individual certification tasks. Certification Task extends the Task table.

Script Includes

Data Certification adds the following script includes:

Name	Description
CertificationAjax	Provides utilities that enable individual certification elements to be certified, rejected, or reverted.
CertificationTaskCreate	Custom code that extends the standard code for certification tasks.
CertTaskEscalationTimerPercentage	Updates time and percentage complete information for a certification.
CertificationUtilities	Provides utility functions for certification.

Client Scripts

Data Certification adds the following client scripts:

Name	Table	Description
Alert If Boxes Checked	Certification Task [cert_task]	Provides a warning if the certifier attempts to leave a record without certifying the checked elements
Check Table Name	Certification Schedule [cert_schedule]	Updates the table name when a different filter is selected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

UI Policies

Data Certification adds the following UI policies:

Name	Table	Description
Hide next scheduled run	Certification Schedule [cert_schedule]	Hides the *Next Scheduled Run* field when the schedule is set to run once or on demand only.
Hide Run When Not Active	Certification Schedule [cert_schedule]	Hide "run" associated fields when active is set to false.
Make table name read only	Certification Schedule [cert_schedule]	Makes the *Table* field read-only.
Hide Table field	Certification Element [cert_element]	Hides the *Table* field on the certification task form.
Make percent complete field read only	Certification Instance [cert_instance]	Makes the *Percent complete* field read only when the *State* is *Work in Progress, Closed Complete, Closed Incomplete,* or *Cancelled*.
Show Assign to fields	Certification Schedule [cert_schedule]	Shows the *Assign To* field when the assignment type is *User* and hides the *Assign To* field for all other assignment types.
Show Group field	Certification Schedule [cert_schedule]	Shows the **Change Group** (formerly Assignment Group) field when the assignment type is *Group* and hides the **Change Group** field for all other assignment types.
Show User field	Certification Schedule [cert_schedule]	Shows the *User* field when the assignment type is *User*.
Show Assignment Fields	Certification Schedule [cert_schedule]	Shows the *Assign To Empty* option when the assignment type is *User Field* or *Group Field*.

Business Rules

Data Certification adds the following business rules:

Name	Table	Description
Adjust dates for cert tasks	Certification Instance [cert_instance]	Adjusts dates for tasks belonging to the certification instance when the dates are changed for an active certification.
Cancel Instance	Certification Instance [cert_instance]	Cancels all open certification tasks when an active certification is canceled.
certification audit instance events	Certification Audit Instance [cert_audit_instance]	Sends an inserted event when an active certification audit instance is created. Sends a completed event

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Table	Description
		when an active certification audit instance is marked as complete or incomplete.
certification element events	Certification Element [cert_element]	Sends a failed event when an element of a certification is marked as failed.
certification instance events	Certification Instance [cert_instance]	Sends an inserted event when an instance of a certification is created. Sends a completed event when an instance of a certification is completed.
Certification Instance Rollup	Certification Task [cert_task]	Updates the *Percent complete* field on the certification instance record.
certification task events	Certification Task [cert_task]	Sends an inserted event when a task is inserted. Sends a completed event when a task is deactivated. Sends a canceled event when a task is canceled.
Certification Task Values	Certification Element [cert_element]	Updates the percent complete of the parent task when a certification element is updated.
Check Certification Audit Progress	Certification Instance [cert_instance]	Updates the completion status of the audit instance as a whole when a certification that is part of an audit is complete.
Clean Certification Views	Certification Instance [cert_instance]	Cleans all related records when a certification instance is deleted.
Copy certification schedule fields	Certification Instance [cert_instance]	Copies changes to the certification schedule to the certification instance.
Merge Certification Tasks	Certification Task [cert_task]	Merges two tasks together when a task is reassigned and there is another task for the same instance with the new user.
Prevent delete of Filter with Schedule	Certification Filter [cert_filter]	Prevents the deletion of a filter that is used in a schedule.
Reassign Notification	Certification Task [cert_task]	Sends out a notification to the new and previous assignees when a task is reassigned.
Rollup State	Certification Task [cert_task]	Updates all necessary parent items when task state is changed.
Update audit reference	Certification Task [cert_task]	Makes Data Certification records compatible with Desired State records. This rule makes sure that the *Audit* field is correctly completed when a record is inserted using Insert and Stay.
Update audit result	Certification Element [cert_element]	Makes Data Certification records compatible with Desired State records for reporting purposes. This rule puts certified values in the *Desired value* column when an audit is *Certified*. It also puts actual values in the *Discrepancy value* column when an audit is *Failed*.
Update follow_on_task	Certification Element [cert_element]	Makes Data Certification records compatible with Desired State records for reporting purposes. This rule

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Table	Description
& audit references		makes certification tasks compatible with follow-on tasks and displays all tasks, regardless of origin.
Update next run time	Certification Schedule [cert_schedule]	Updates the *Next scheduled run* field when a schedule runs *Daily*, *Weekly*, *Monthly*, or *Periodically*.
Verify Fields	Certification Schedule [cert_schedule]	Verifies that no field is used in both *Display* and *Certification* fields when the fields of a certification schedule are changed.

Formatter

Data Certification adds the following formatter:

Formatter

Name	Description
Certification Task Elements	Enables custom user interface formatting of elements on a certification task. For example, displays the green check mark and red exclamation point to use when certifying an element.

Properties

Properties

Name	Table	Description
glide.ui.cert_task_activity.fields	System Properties [sys_properties]	Defines which journal field is the task activity field. Default: work_notes

User Roles

Data Certification adds the following user roles:

User Roles

Role	Contains Roles	Description
certification_admin	certification	Can: • Create and configure certifications • Override provided answers • Perform certification tasks for certification task owners • Send certification task notifications to users and owners at any time • Cancel or delete certifications in any state

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

User Roles (continued)

Role	Contains Roles	Description
certification_filter_admin	certification	Can create and manage all data certification filters.
certification	none	Can update active or incomplete tasks assigned to them or to groups of which they are a member. Can also update configuration items owned by them or by groups of which they are a member. Receives email notifications when assigned certification tasks.

Events

Data Certification adds the following events. The ServiceNow system uses these events to send email notifications to task owners and managers about changes in certification records.

Name	Description
cert_audit_instance.completed	A certification audit instance has been completed.
cert_audit_instance.inserted	A certification audit instance has been inserted.
cert_element.failed	A certification element has failed certification.
cert_instance.complete	A certification instance has been completed.
cert_instance.inserted	A certification instance has been inserted.
cert_task.cancelled	A certification task has been canceled.
cert_task.completed	A certification task has been completed.
cert_task.escalate	A certification task record has been escalated.
cert_task.inserted	A new certification task has been created.
cert_task.notifications	A certification task notification has been resent to a user.
cert_task.overdue	A certification task is past its specified completion date.
cert_task.reassign	A certification task has been reassigned.
cert_task.warning	A new task escalation point has been reached.

Email Templates

Data Certification adds the following email templates:

Name	Message
certification.task.cancelled	A certification task assigned to you/your group as part of the data certification and management process has been canceled.
certification.task.reminder.inserted	A certification task that has been assigned to you/your group as part of the data certification and management process requires attention.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

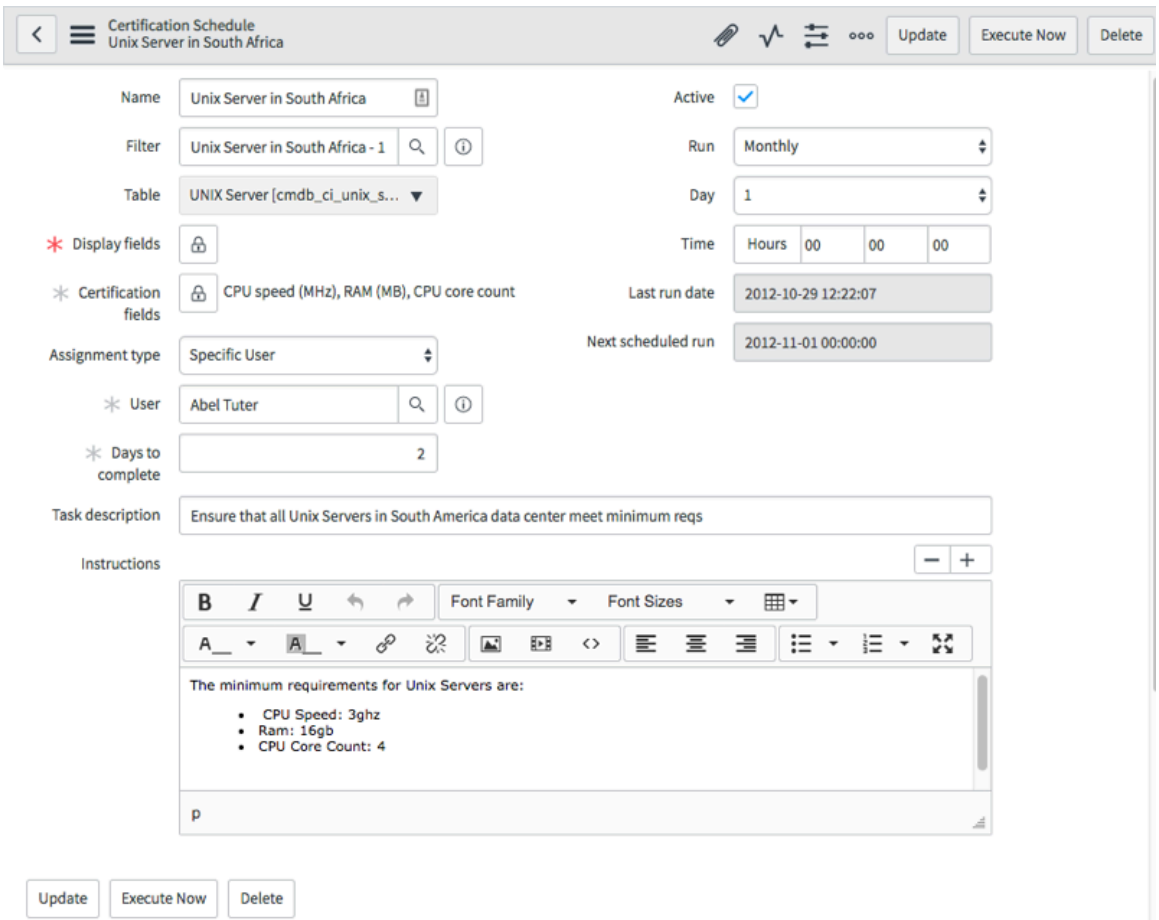
Name	Message
certification.task.reminder.outstanding	A certification task that has been assigned to you/your group as part of the data certification and management process requires attention.
certification.task.reminder.overdue	A certification task that has been assigned to you/your group as part of the data certification and management process is overdue.

Certification schedules

A certification schedule defines the information that requires certification and the frequency of execution.

At each time interval specified, or on-demand, the certification schedule generates a set of certification tasks based on set conditions. Use the Preview Certification Tasks related link to preview the certification tasks generated from a certification schedule.

Certification schedule



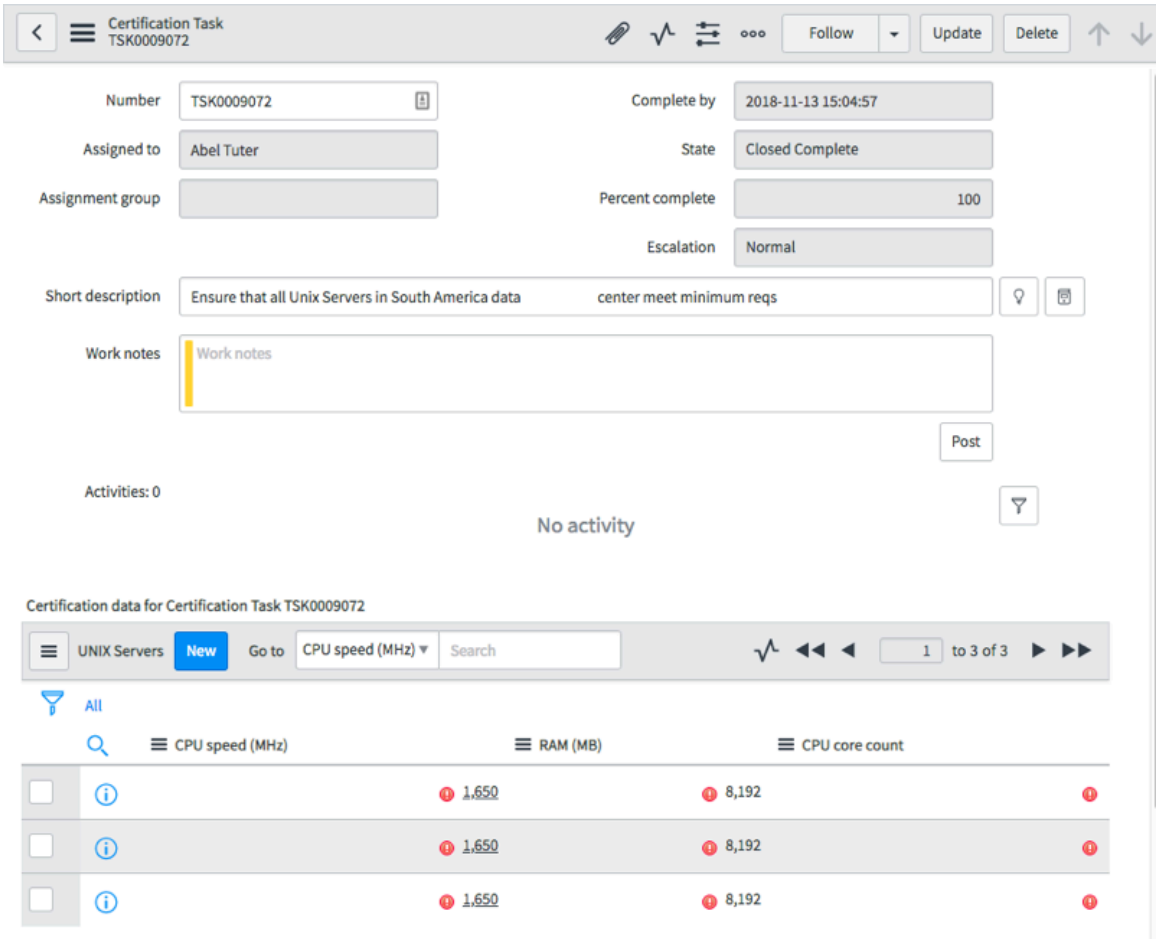
Certification tasks

A certification task represents the work of verifying the data associated with a particular record.

Task owners are responsible for performing the certification tasks. Tasks have an associated workflow that sends reminders to the task owner and, if necessary, the manager of the owner at regular intervals.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Certification task



Note:
If the message

```
Record cannot be certified until the instance is finished
 creating all certification tasks and elements. Reload the
 page to try again
```

appears, it signifies that:

- A large amount of data is present in the cmbd_ci and cmdb_ci_server tables.
- Data certification task processing is not complete (Data Certification jobs are still in process).

As directed, reload the page and wait for the processing to complete.

Clean up invalid elements

Use the **Clean up invalid elements** UI action to query and delete certification elements that reference invalid records. Each certification task has a certification schedule, and each certification schedule has Table and Filter fields. When you use this UI action, it performs the following processing:

1. Collects all available records from Table field in the certification schedule with filters that are available in certification schedule.
2. Collects all certification elements associated with the current certification task.
3. Deletes the certification elements that are no longer available for the data collected in the previous step.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. After deleting invalid records, it recomputes the certification completion percentage using the following formula:

   (1 - (number of certification elements pending / total no of certification elements associated)) * 100;)

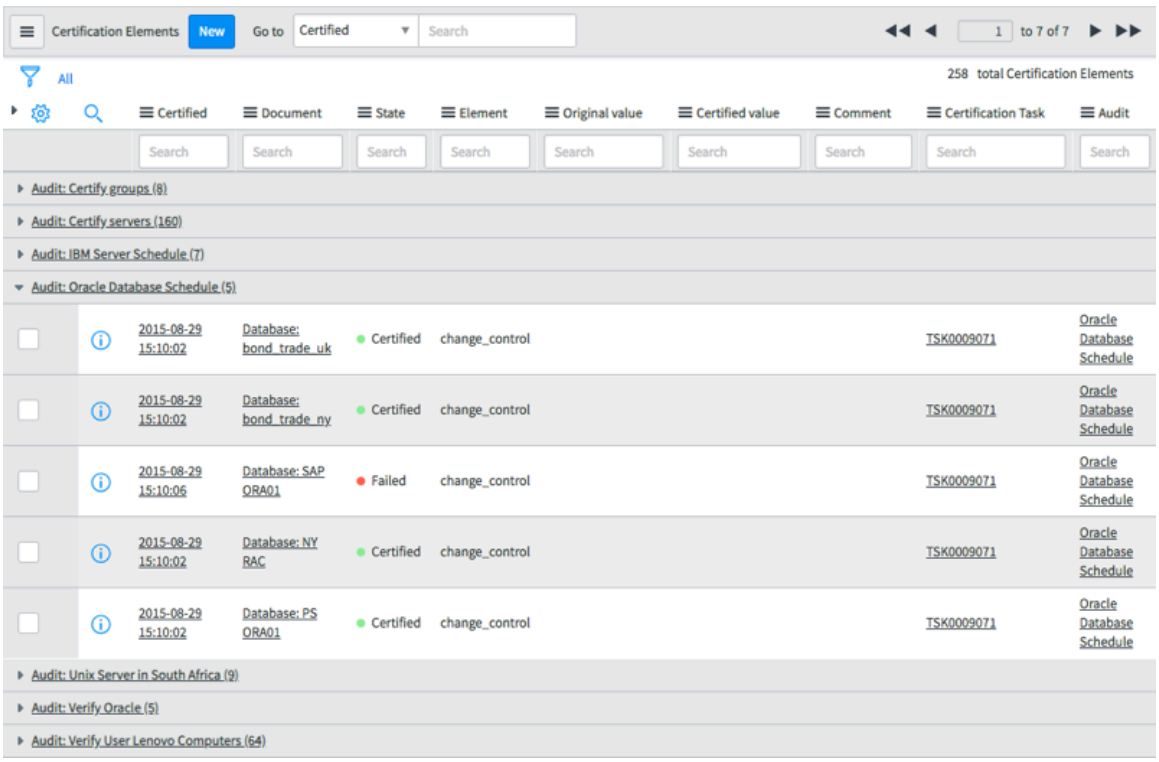
5. If there are no certification elements with a Pending status, it marks the associated certification task as Closed, and deactivates it.
6. If there are remaining certification elements with a Pending status, it activates the associated certification task and changes its status to Work in Progress.

Certification elements

Each element of each record being certified is tracked in its own certification element record.

Also tracked are the date and time when the element was certified, comments, and the original and certified values of the field. You can view elements on individual certification tasks. Or, you can directly access the Certification Elements [cert_element] table by navigating to **All** and then in the Filter box, entering `cert_element.list`.

Certification elements

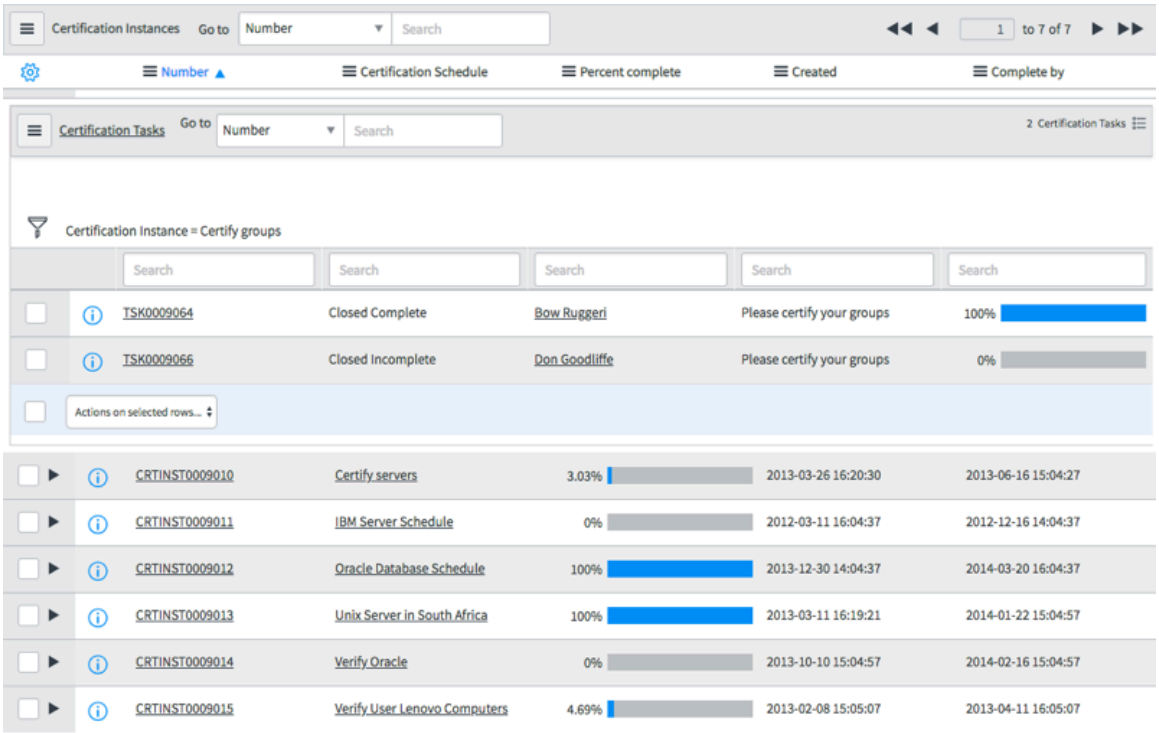


Certification instances

A certification instance is the collection of certification tasks for one execution of a certification schedule.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

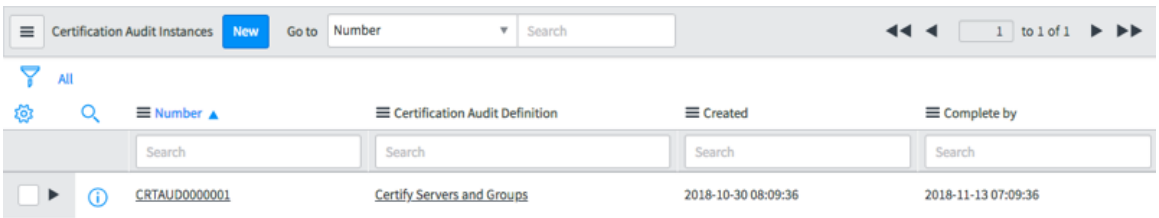
Certification instances



Certification audit instances

A certification audit instance is a collection of the certification instances and tasks generated by a single execution of the certification audit definition.

Certification audit instance

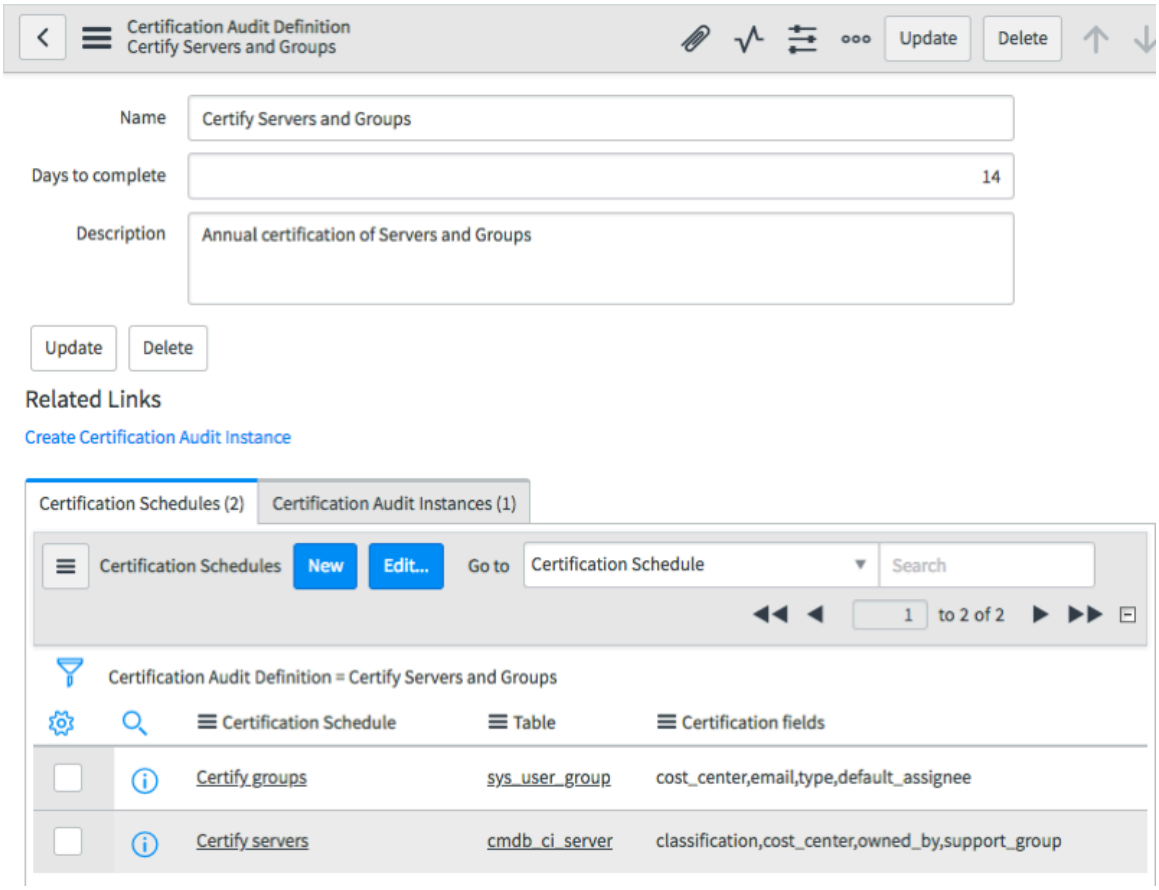


Certification audit definition

A certification audit definition is a collection of certification schedules that can be run at once.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Certification audit definition



Data Certification Overview module

The Data Certification Overview module displays various data certification-related reports on the Data Certification Console homepage.

The Overview module is a type of homepage.

The different levels of access are:

Access levels per role

Role	Access
certification	• View (view overview page and refresh reports) • Review, certify, and fail certifications
certification_admin	• View (view overview page and refresh reports) • Customize (refresh, add, delete, and rearrange reports) View, customize
admin	• View (view overview page and refresh reports) • Customize (refresh, add, delete, and rearrange reports) • Edit (can edit reports)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data Certification Overview Module

The Overview module includes the following reports:

Data Certification Overview Module Description

report	Description	Table
30/60/90 Day Aging	Groups tasks by the number of days (*30*, *60*, *90*, and *90 and over*) since the task was opened.	Certification Task
Certification Instances	Lists all certification instances.	Certification Instance
Certification Progress Report	Groups tasks by task owner, indicating task progress as a percentage.	Certification Task
Certification Task Completed Report	Groups tasks by task owner, indicating tasks that are complete.	Certification Task
Exceptions To Date	Lists all task elements that have comments added and a state of *Failed* or *In Progress*.	Certification Element
Functional Roll Up	Lists the managers that have groups with assigned certification tasks. The report is a horizontal bar chart, grouped by status, with each bar representing a manager of an assignment group.	Certification Task
Hierarchical Roll Up	Shows the managers that have employees with assigned certification tasks (task owners). The report is a horizontal bar chart, grouped by status, with each bar representing a manager of a task owner (identified in the **Assigned to** field).	Certification Task
Upcoming Schedules	Lists all schedules that are scheduled to run within the next 30 days.	Certification Schedule

Data Certification planning

Initial planning can make the certification process more successful.

By defining certification schedules and certification audit definitions, users with the certification_admin role establish when certifications are performed, who performs it, and what data must be certified.

Required Roles

Users with the certification_admin role can view filter versions. These users can create, update, and delete filters, if they have the proper access to necessary tables. In the base ServiceNow system, certification_admin users have limited system rights and do not have access to all the tables required for creating a filter. When assigning compliance resources, make sure to grant additional roles to the certification_admin user as needed. For example, this user requires roles that grant access to these tables:

- Company `[core_company]`
- Cost Center `[cmn_cost_center]`
- Schedule `[cmn_schedule]`

Planning Data Certification

Planning the data certification process requires defining:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The certification schedule defines certification for a particular set of information on a particular table. It also generates certification tasks to perform that certification. One certification task is generated per task owner and a certification instance record groups the tasks.
- The optional certification audit definition groups some certification schedules to be performed together and generates certification audit instances to perform them.

The following questions require answers for each certification schedule:

- What information requires certification?
- When is the due date for certification?
- Who must perform the certification?

Create a certification filter

A filter is a subset of configuration items from any ServiceNow table that is created with a standard condition builder.

Before you begin

Role required: admin

About this task

An example is a filter that selects all UNIX servers in the Australian data center.

With filters, you can:

- Create multiple versions of a filter and then select the version you want to use.
- Use one filter on multiple certification schedules.
- View the number of records that match your filter as you create the conditions.

Note:
Be sure to create certification filters before creating certification schedules.

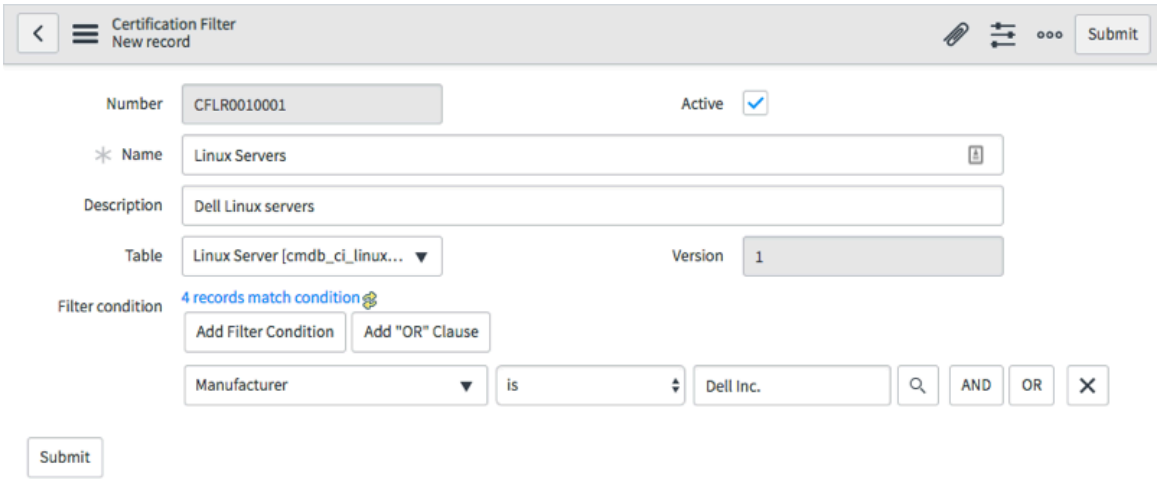
Procedure

1. Navigate to **All** > **Data Certification** > **Certification Filters**.
2. Click **New**.
3. Fill in the form (see table).
4. Click **Submit**.

   This action saves the filter as version 1.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Certification filter V1



5. To create another filter version, modify the filter conditions and click **Update**.

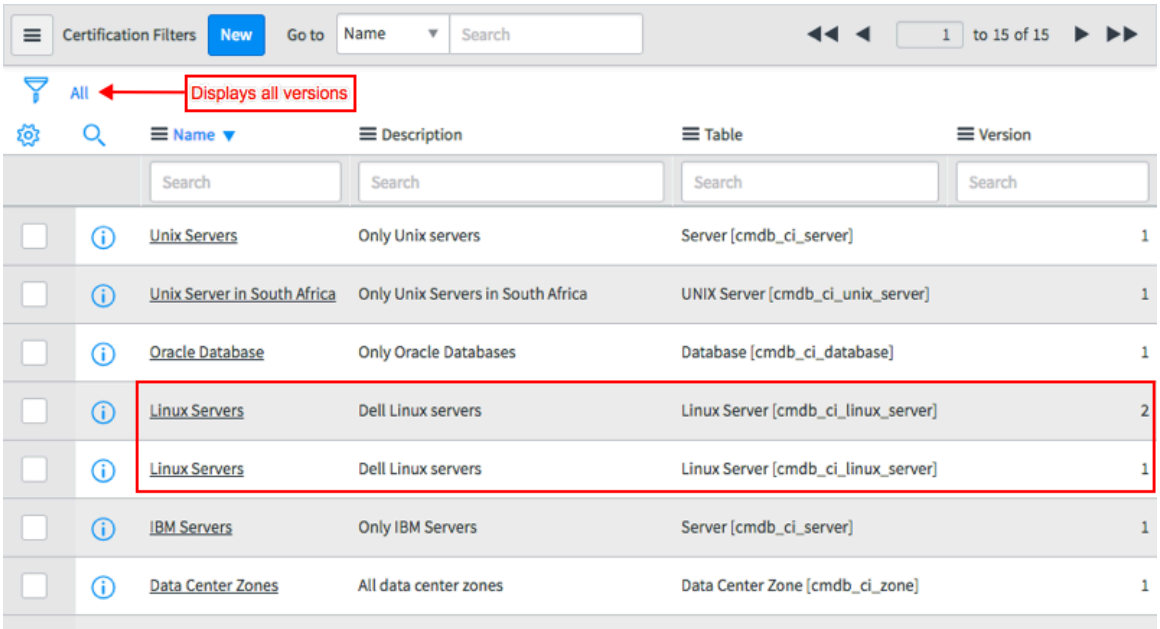
   The system saves the new filter and increments the version number.

Certification filter V2

   By default, the Certification Filters list shows only the current version of each filter. To see all filter versions, click **All** in the breadcrumbs.

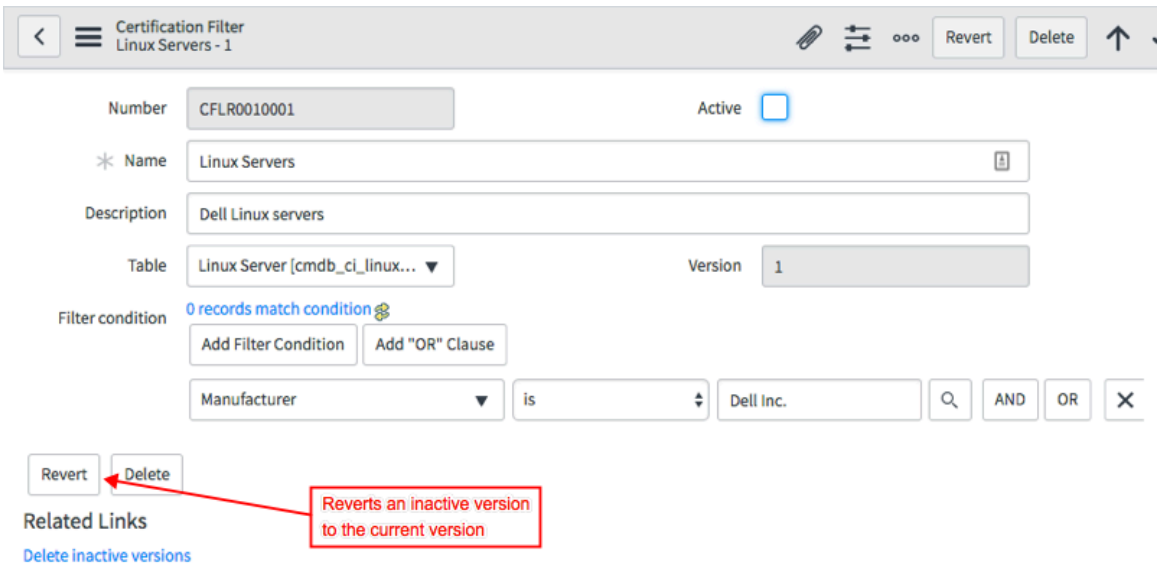
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Certification Filter List



6. To make an inactive filter the current version, open the inactive filter and click **Revert**.

Certification filter revert



This action creates a new, active version of the filter and makes all previous versions inactive.

7. To delete a single filter version, open that version record and click **Delete**.
8. To delete inactive versions of a filter, click **Delete inactive versions** under **Related Links** in that filter record.

   You cannot delete a filter that is used in a schedule definition. The system displays a warning and the filter is not deleted.

Creating certification filters

Field	Description
Name	[Required] Filter name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Description	[Optional] Brief description of the filter.
Number	[Read-only] Automatically assigned filter identification number.
Table	Table containing the records to be filtered. Use of the Database View `[sys_db_view]` table is limited by version.
Active	Control to make the filter available for use from the **Filter** field on the Certification Schedule form.
Version	Current version of this filter. Any significant changes to the filter make the current version inactive. The system copies the updated filter, marks it as active, and increments the version number. The system saves all versions of the filter and makes them available to users. More than one version of a filter can be marked active.
Filter condition	Field, operator, and value to create the condition. The available options depend on the table selected. You can view the number of records that match the filter by clicking the refresh icon. **Refresh Conditions** If the filter does not match any records, the system marks the certification instance as **Closed Complete**, with the **Percent complete** value set to **100%**.

Define a certification schedule

A certification schedule specifies the fields to display, the fields that require certification, certification task assignments, completion requirements for task owners, frequency of schedule, and detailed instructions.

Before you begin

Role required: admin

About this task

Use the preview option to see what tasks are created before saving the schedule. If the tasks are not what you want, edit the schedule and preview the tasks again. The system creates certification tasks automatically when it executes a schedule.

To schedule a certification:

Procedure

1. Navigate to **All** > **Data Certification** > **Schedule Definitions**.
2. Click **New**
3. Fill in the fields (see table).
4. Click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Defining A Certification Schedule

Field	Description
Name	A schedule name.
Filter	A certification filter for this schedule.
Table	[Read-only] The table holding the records to be certified. To change the table name, select a different **Filter** or create a new **Filter**.
Display fields	The fields displayed in the Certification Task list to provide context. These do not require certification themselves. For example, although users are not required to certify the **Name** field of a record, it displays so that users know what record they are certifying.
Certification fields	The fields to certify on this certification schedule.
Assignment type	A choice list to select how the certification schedule assigns the certification tasks. ○ **User Field**: Select a user reference field on the table being certified. As an example, select the user named in the **Managed by** field to identify the user who performs the task. This selection displays the **Assign to** and **Assign to empty** fields. If the reference field on the record is empty, the value in the **Assign to empty** field is used. ○ **Specific User**: Select a specific user to perform the tasks. This selection displays the **User** field. ○ **Group Field**: Select a group reference field on the table being certified. As an example, select the **Support group** field to identify the user who performs the task. This selection displays the **Assign to group** and **Assign to empty** fields. All members of the group from the reference field on the record are assigned to the tasks. If the reference field on the record is empty, the value in the **Assign to empty** field is used. ○ **Specific Group**: Select a specific group to perform the tasks. This selection displays the **Group** field. All members of the named group are assigned to the tasks.
User	This field appears when: ○ **Assignment type** is **Specific User**. This system assigns this user to all certification tasks for this schedule. ○ The **Assign to empty** field is set to **Create Assigned Task**, and you have selected **User Field** as the assignment type. The system assigns this user to certification tasks containing unassigned records. You can only select users with the certification role.
Assign to group	The group field that defines the group assigned to the certification tasks. This field is available only when the **Assignment type** is **Group Field**.
Group	The specific group to which certification tasks are assigned for this schedule. This field is available only when the **Assignment type** is **Specific Group**
Assign to	The user field that defines which user is assigned to the certification task. This field is available only when the **Assignment type** is **User Field**.
Assign to empty	The behavior to use if the field selected in **Assign to** or **Assign to group** is blank on the record being certified. For example, if a task must be assigned to

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	a manager, but no manager is identified, the value in this field determines what happens. This field appears only when the **Assignment type** is **User Field** or **Group Field**. The possible selections are: ○ **Do Not Create Task**: No task is created when the **Assign to** or **Assign to group** field is empty. ○ **Create Unassigned Task**: Create a task, but do not assign it to any user or group. The task can be manually assigned later. ○ **Create Assigned Task**: Create a task and assign it to the user or group specified. If you selected an assignment type of **User Field**, the **User** field is available. If you selected the **Group Field** type, the **Group** field is available. The schedule automatically creates certification tasks for all records that do have "Assign to" populated, regardless of which selection you make for "Assign to empty."
Days to complete	[Required] The number of days that task owners have to complete the certification tasks. When the certification schedule is part of a certification audit definition, the **Days to Complete** audit definition value overrides the value set for the certification schedule.
Active	Check box to activate this certification schedule, generating certification tasks at the scheduled date and time. Clear this check box to hide scheduling fields on the form (except **Last run date**) and not generate certification tasks.
Run	How often to run the schedule that generates certification tasks: ○ Daily ○ Weekly ○ Monthly ○ Periodically ○ Once ○ On Demand
Day	When **Run** is **Weekly**, the day of the week when the schedule runs and generates certification tasks. When **Run** is **Monthly**, the day of the month the schedule runs and generates certification tasks. If the day is **29**, **30** or **31**, the certification runs on the last day of the month for shorter months.
Repeat Interval	When **Run** is **Periodically**, the frequency that the schedule runs to generate certification tasks, entered in time, days, or both. For example, set **Days** to **10** and **Hours** to **14:00:00** to run the schedule and generate certification tasks every 10 days at 14:00.
Starting	When **Run** is **Periodically** or **Once**, the date and time the schedule runs and generates certification tasks.
Time	When **Run** is **Daily**, **Weekly**, **Monthly**, or **Once**, the time of day, on a 24-hour clock, the schedule runs and generates certification tasks.
Last run date	[Read-only] The date and time that the schedule ran last, either on its regular schedule or manually, and generated certification tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Next scheduled run	[Read-only] The next date and time the schedule runs and generates certification tasks.
Task Description	A description to add to the **Short Description** field of the certification task.
Instructions	An HTML field for providing instructions to the user or group performing the certification.

Preview a certification task

Previewing certification tasks saves any changes to the Certification Schedule form and displays the tasks that are created when you execute the certification schedule.

Before you begin

Role required: admin

About this task

Previewing tasks is especially useful if you want to test different combinations of options in the **Assignment type**, **Assign to**, and **Assign to empty** fields.

Procedure

1. Navigate to **All** > **Data Certification** > **Schedules** > **Schedule Definitions**.
2. Click a certification schedule **Name**.
3. In **Related Links**, click **Preview Certification Tasks**.

   The tasks to be created appear at the top of the screen.

Certification info message

Data Certification planning

Define a certification schedule

Use a certification schedule notification

After you define a certification schedule, the system automatically sends notifications to specific users based on the information in the schedule.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The following notifications are sent automatically:

Certification Schedule Notifications

Time elapsed to end date	Email template name	Notification message is sent to
0% (when task is created)	certification.task.reminder.inserted	Task owner or assignment group, if specified
50%	certification.task.reminder.outstanding	Task owner or assignment group, if specified
75%	certification.task.reminder.outstanding	Task owner, assignment group, if specified, and manager of the task owner, if specified
95%	certification.task.reminder.outstanding	Task owner, assignment group, if specified, and manager of the task owner, if specified
100%	certification.task.reminder.overdue	Task owner, assignment group, if specified, and manager of the task owner, if specified

The email templates used in the notifications can be edited, for example, to change the email message text.

Executing a Certification Schedule

Executing a certification schedule generates certification tasks based on the schedule.

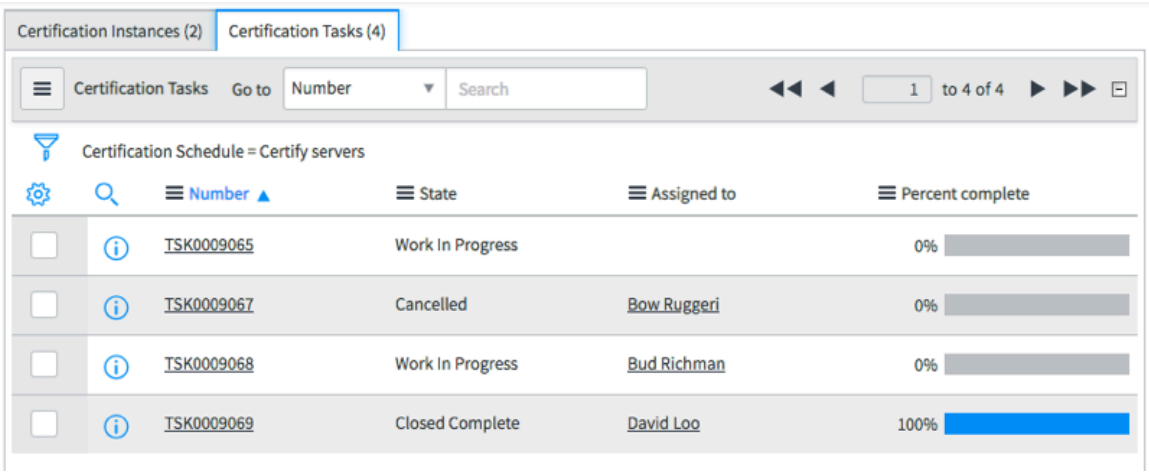
Procedure

1. Navigate to **All** > **Data Certification** > **Schedules** > **Schedule Definitions**.
2. Click a certification schedule **Name**.
3. Click **Execute Now**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The related lists **Certification Instances** and **Certification Tasks** display the instances or tasks generated by the schedule. The amount of time it takes to generate all certification tasks depends on the size of the table selected and how many fields require certification.

Execute certification schedule



Define and create a certification audit

A certification audit is a collection of certification schedules that can be run as a single entity.

Before you begin

Role required: admin

About this task

Certification audits can be useful when there are multiple certification schedules. After creating a certification audit definition, you can generate a certification audit instance. The certification audit instance is a collection of the certification instances and tasks generated by a single execution of the certification audit definition.

Procedure

1. Navigate to **All** > **Data Certification** > **Audits** > **Audit Definitions**.
2. Click **New**.
3. Fill in the fields (see table).
4. Right-click the header bar and select **Save**.
5. In the **Certification Schedules** related list, click **Edit**.
6. In the **Collection** list on the left, select one or more schedules and click **Add**.
7. Click **Save**.
8. In **Related Links**, click **Create Certification Audit Instance**.

   The system generates an audit instance based on the certification schedules selected. All audit instances based on this audit definition are listed in the **Certification Audit Instances** related list.

Defining and Creating a Certification Audit

Field	Description
Name	The name of the audit definition.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Days to Complete	The number of days that task owners have to complete the certification tasks created by this audit definition. Overrides the identical field on the certification schedule.
Description	A short description of the intended audit.

Related topics

Define a certification schedule

Installed With Data Certification

View and resolve certification tasks

After you execute a certification schedule manually or at a scheduled time, the ServiceNow system performs certain actions.

- Creates certification tasks for any records that meet the filter requirements in the specified table, like tasks from the Configuration Item `[cmdb_ci]` table.
- Assigns the new tasks to the user or group identified in one of these certification schedule fields:
  - Assign to
  - User
  - Assign to group
  - Group

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Places the new tasks in the *Work in Progress* state.
- Adds the certification schedule *Short description* and *Assigned to* values to the corresponding fields on the certification task record.
- Adds the certification schedule *Days to complete* and *Complete by* date fields to the certification task record, based on when the task is created.

Note:
If the certification filter does not match any CIs, the system sets the *State* to *Closed Complete* and the *Percent complete* to *100*.

To view tasks assigned to you, navigate to **Data Certification** > **Tasks** > **My Tasks**. To resolve tasks assigned to you, see Certify an element. For more information about purpose and usage of certification tasks, see certification tasks.

The following information is tracked on the certification task record:

Certification task record

Field	Description
Number	An identification number for the certification task.
Assigned to	The user responsible for certifying the data.
Assignment group	The group responsible for certifying the data.
Complete by	[Read-only] A date field containing a deadline for the task. This field is automatically filled in based on the Days to Complete field on the certification schedule.
State	[Read-only] The current state of the certification task. The selections are: Work in Progress, Closed Incomplete, Closed Complete, and Cancelled.
Percent complete	The task progress as a percentage. This field is read-only when a task is in a Closed Incomplete, Closed Complete, or Cancelled state.
Escalation	[Read-only] The escalation level of the task. When 0–49% of the time to Complete By has elapsed, this field is set to Normal. At 50%, this field changes to Moderate and an email reminder is sent to the task owner. At 75%, this field changes to High and an email reminder are sent to the task owner and the manager of the task owner. At 95%, this field remains set to High, but a second email reminder is sent to the task owner and manager.
Short Description	A short description of the task. This field is automatically filled in with the text from the certification schedule of the Task description field.
Work notes	Information about work performed on the certification.

Certify an element

The Certification Task form contains a list of all elements to be certified.

Before you begin
Role required: admin

About this task

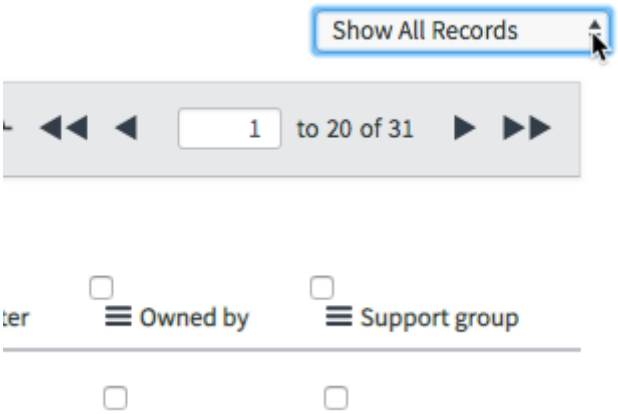
Note:
After you certify all the elements in a task, no elements can be reverted.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

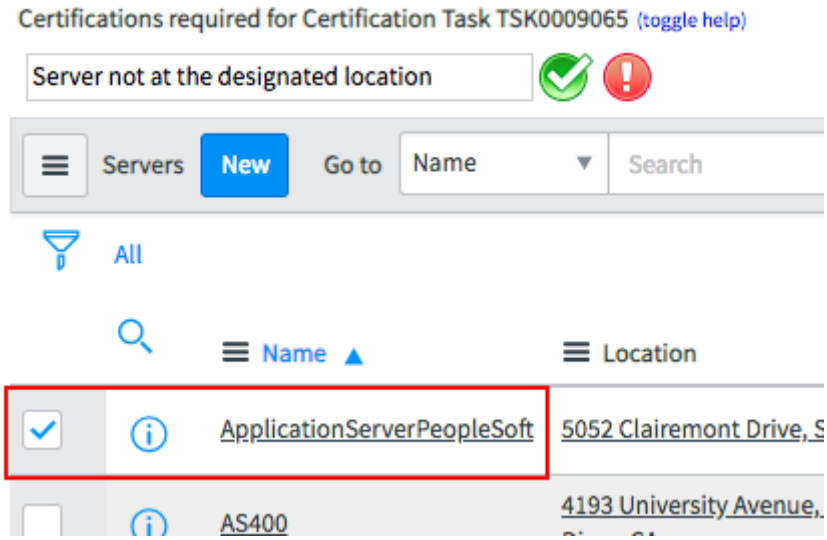
1. Navigate to **All** > **Data Certification** > **Tasks** > **My Tasks**.
2. Open a certification task with a *State* of *Work in Progress*.
3. In the upper right corner of the list, select records that require certification for this task or all records that are part of this certification task.

Certification list 3



4. Select the check box beside a certification element.
5. In *Optional comment for checked elements*, above the list, enter information that would be useful to others.

Certification list



6. Do:
   - Click the green check mark to certify the element.
   - Click the red exclamation point to fail the element.
7. To see the certified or failed element, set the view to *Show All Records*.

   A green check mark or red exclamation mark appears beside the element.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Point to an icon to see any certification comments.
9. Ensure that all elements have the correct certification, either accepted or rejected.

   After you certify all elements, no elements can be reverted. When all elements of a certification task are certified or rejected, the task *State* changes to *Closed Complete*.

View an audit result

View audit results after you certify the elements.

Before you begin

Role required: admin

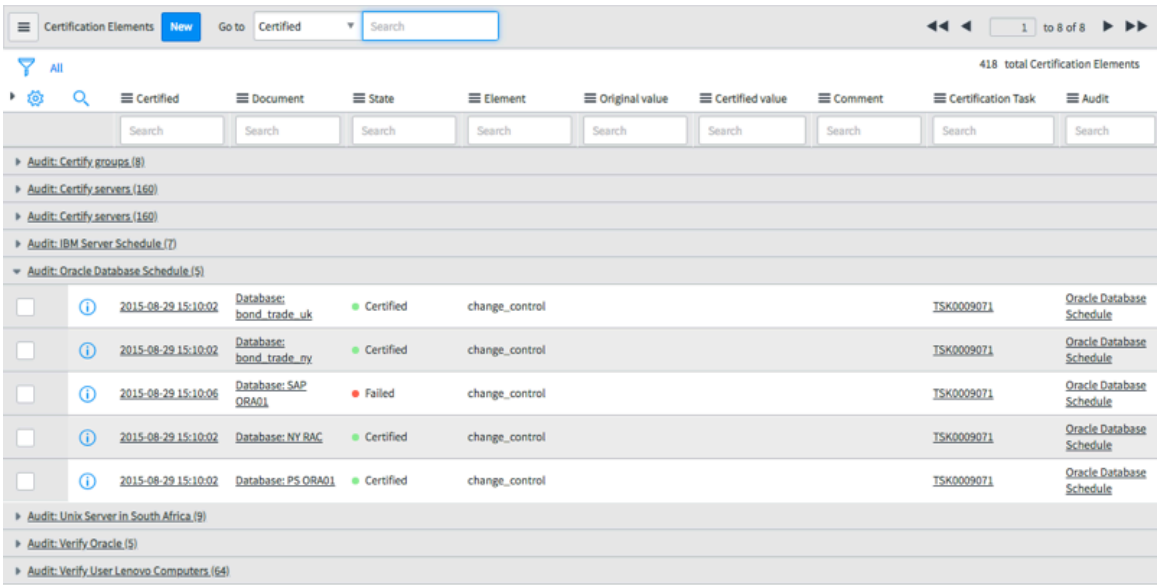
Procedure

1. Navigate to **All** > **Data Certification** > **Schedules** > **Audit Results**.

   The list of data certification audit results appears, grouped by certification instances. Certified configuration items show the *Original value* only. Failed CIs contain the *Certified value* and the *Original value*.

2. Click the links in the list to open any of the related records.

Data cert audit results



Export the certification list

Users with the certification_admin role can export the certifications list and save the list in Excel, CSV, XML, or PDF format. This list is useful when you have a long list of certification elements or if many different users are assigned to certify elements on a single certification schedule.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Data Certification** > **Tasks** > **All Tasks**
2. Open a task.
3. Open any column context menu in the certification data list and complete the export.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Reset certifications

You cannot reset any element after all elements are certified.

- To reset individual certifications, right-click the element in the certification list and select **Revert Certification**.
- To reset the entire task to its starting point, click the **Reset all Certifications to Pending** related link.

Track a task with a certification instance

The Certification Tasks related list on the certification instance record provides information about associated tasks.

Before you begin

Role required: admin

About this task

The *State* field on the certification instance record is read-only and is based on the cumulative states of the certification tasks associated with the instance. The *Percent complete* column allows users with the certification_admin role to track task progress quickly. For more information, see Track Certification Tasks.

To track a certification instance:

Procedure

1. Navigate to **All** > **Data Certification** > **Schedules** > **Instances**.
2. Click a certification instance *Number*.
3. View and edit the following fields as necessary.

Certification instance

Field	Description
Number	[Read-only] Automatically generated identification number for the instance.
Certification Schedule	The certification schedule used to create the certification instance.
State	[Read-only] Current state of the certification instance: Work in Progress, Complete, Closed Incomplete, or Cancelled. For more information, see Track Certification Tasks.
Created	[Read-only] Date and time the certification instance was created. Date is filled in automatically when the Execute Now button clicks the associated certification schedule.
Complete by	[Required] Date and time when the certification instance must be completed. The system updates this field when it executes the schedule, using the deadline specified on the instance. All certification tasks associated with the certification instance must be marked Complete, Closed Incomplete, or Cancelled before the instance is complete.
Percent complete	Percentage of the instance that has reached the Closed Complete state. This field is automatically filled in based on the Percent Complete fields on the associated certification tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Task Description	Information about the certification instance. This field automatically displays the text from the Task description field of the associated certification schedule.
Instructions	Field for providing instructions to the user or group performing the certification. This field is automatically filled in with information from the Instructions field on the associated certification schedule.

Cancel a certification instance

Users with the certification_admin role can cancel a certification instance.

Before you begin
Role required: admin

About this task
The instance must have a *State* of *Work in Progress*. Canceling a certification instance:

- Changes the certification instance *State* to *Cancelled*.
- Changes all associated *Work in Progress* certification tasks to *Cancelled*.

To cancel a certification instance:

Procedure

1. Navigate to **All** > **Data Certification** > **Schedules** > **Instances**.
2. Click a certification instance *Number*.
3. Click **Cancel**.

Track a certification task

Use the certification task state to track the progress of a task.

Before you begin
Role required: admin

About this task
The available task states are *Work in Progress*, *Closed Complete*, *Closed Incomplete*, and *Cancelled*.

When the state of a certification task changes, the certification instance state also changes in the following cases:

- If any certification task is in *Work in Progress* state, the certification instance is placed in *Work in Progress* state.
- If all certification tasks are in *Cancelled* state, the certification instance is placed in *Cancelled* state.
- If all certification tasks are in *Cancelled* or *Closed Complete* state, the instance is placed in a *Closed Complete* state. For example, if three certification tasks are *Cancelled*, and one task is *Closed Complete*, the instance state is changed to *Closed Complete*.
- When one certification task is *Closed Incomplete* and the remainder of the tasks are *Cancelled* or *Closed Complete*, the instance is placed in *Closed Incomplete*.

To view the state of certification tasks:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Data Certification** > **Tasks** and select **My Tasks** or **All Tasks**.
2. View the *State* column for each task.

Escalate a certification task

Users with the certification_admin role can escalate a task in the Work in Progress state. To escalate a task, the task owner identified in the Assigned to field on the task record must have an associated manager.

Before you begin
Role required: admin

About this task
Personalize the User form to see the *Manager* field.

Escalating a task:

- Sends an email message to the task owner and the manager of the task owner stating that the task has been escalated.
- Sets the manager as the new task owner.

The event that triggers the escalation is named cert_task.escalate and the email notification is named *Escalation Notification*. To edit the text of the email message that is sent, edit the *Escalation Notification* email notification directly.

For more information, see Email notifications.

To escalate a certification task from the Certification Task form:

Procedure

1. Navigate to **All** > **Data Certification** > **Tasks** > **All Tasks**.
2. Select a certification task *Number*.
3. Select **Escalate**.
   If the *Escalate* button is not available, the user in the *Assigned to* field does not have an associated *Manager*.

Escalate a certification task from the certification task list

Escalate a certification task to notify the manager of the current task owner.

Before you begin
Role required: admin

To escalate a task, the task owner identified in the Assigned to field on the task record must have an associated manager.

Procedure

1. Navigate to **All** > **Data Certification** > **Tasks** > **All Tasks**.
2. Select the check box to the left of a certification task *Number*, you can select multiple check boxes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. From the *Actions on Selected Rows* menu below the list, select **Escalate**.
   If the *Escalate* button is not available, the user in the *Assigned to* field does not have an associated *Manager*. Select multiple tasks from the list. The menu option shows how many tasks are not eligible for escalation, such as *Escalate (4 of 6)*.

Reassign a certification task

If you have the certification_admin role, you can reassign any certification task in the *Work in Progress* state. Tasks in *Closed Complete*, *Closed Incomplete*, or *Cancelled* state cannot be reassigned. When a task is reassigned, the current task owner and the new task owner are sent a message.

Before you begin
Role required: certification_admin

About this task
The event associated with the reassignment is named cert_task.reassign and the email notification is named *Certification Task Reassignment*. To edit the text of the email message that is sent, edit the *Certification Task Reassignment* email notification directly.

For more information, see Email notifications.

To reassign a certification task:

Procedure
1. Navigate to **All** > **Data Certification** > **Tasks** > **All Tasks**.
2. Click a certification task *Number*.
3. Enter a new name in the *Assigned to* field.

Send certification task reminders

The Certification Task Escalations workflow sends automatic email reminders.

The Certification Task Escalations workflow sends automatic email reminders to the:

- Certification task owner.
- Assignment group, if the assignment group was specified on the *Certification Task* form.
- Manager of the certification task owner, if necessary and if a manager was specified on the User form.

The reminders are based on the *Complete by* field on the certification task record. If the *Complete by* date is changed, the reminder schedule automatically adjusts to reflect the new date.

Certification task reminders

Time elapsed to end date	Email reminder is sent to	Escalate field on task record reads
50%	task owner and assignment group (if specified)	Moderate
75%	task owner, assignment group, and manager of the task owner	High
95%	task owner, assignment group, and manager of the task owner	High

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Certification task reminders (continued)

Time elapsed to end date	Email reminder is sent to	Escalate field on task record reads
100%	task owner, assignment group, and manager of the task owner	High

To set reminders for different or more intervals, edit the workflow Certification Task Escalations. In addition to the email reminders sent automatically, users with the certification_admin role can send email reminders manually at any time.

Send an email reminder from the certification task form

How to manually send email reminders from the Certification Task form.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Data Certification** > **Tasks** > **All Tasks**.
2. Click a certification task *Number*.
3. Right-click the header bar and select **Resend email notifications**.

Send an email reminder from the certification task list

How to manually send email reminders from the Certification Task list.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Data Certification** > **Tasks** > **All Tasks**.
2. Select the check box to the left of a certification task *Number*, you can select multiple check boxes.
3. From the *Actions on Selected Rows* menu below the list, select **Resend email notifications**.
4. Select multiple tasks from the list.
   The menu option shows how many notifications are outstanding and how many were sent, such as *Resend email notifications (15 of 18)*.

Mark a certification task as closed incomplete

Mark a task as closed incomplete if, for example, only some of the elements can be certified.

Before you begin

Role required: admin

About this task

The following users can mark a task as closed incomplete:

- Users with the certification_admin role.
- User identified in the *Assigned to* field on the certification task record.

To mark a task as closed incomplete:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Data Certification** > **Tasks** and select **All Tasks**, or **My Tasks**.
2. Click a certification task *Number*.
3. In *Work Notes*, enter information about why the task could not be completed.
4. Click **Close Incomplete**.

   If at least one task on a certification instance is marked *Closed Incomplete*, the *Completed* date and *Percent complete* fields on the certification instance record are not updated. A user with the certification_admin role can:

   - Complete the incomplete task or tasks.
   - Cancel the incomplete task or tasks.

   When all tasks on the certification instance are *Closed Complete* or *Cancelled*:

   - The system sets the *Completed* date field on the certification instance record to the current date and time.
   - The *Percent complete* field on the certification instance record is set to 100 percent.

Certification tasks cancellation

Users with the certification_admin role can cancel a certification task in the Work in Progress or Closed Incomplete state.

When a certification task is cancelled, a notification email is sent to the task owner or assignment group assigned to the task. The task owner or assignment group manager is not notified.

Cancel an individual task

Cancel a particular data certification tasks in the Work in Progress state.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Data Certification** > **Tasks** > **All Tasks**.
2. Find a task with a *State* of *Work in Progress*.
3. Click the task *Number*.
4. Click **Cancel**.

Cancel all tasks in an instance

Cancel data certification tasks in the Work in Progress state.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Data Certification** > **Schedules** > **Instances**.
2. Find an instance with a *State* of *Work in Progress*.
3. Click the instance *Number*.
4. Click **Cancel**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

All tasks in the instance with a state of *Work in Progress* are cancelled. The task owner or assignment group is notified.

The email template used for the notification is named *certification.task.cancelled*. The email templates can be edited to change the email message text, for example.

Domain separation and Data Certification

Domain separation is supported in Data Certification processing. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure data goes into the proper domain for the application's service provider use cases.
- In the application, the user interface, cache keys, reporting, rollups, aggregations, and so on, all consider domain at production run time.
- The owner of the instance needs to be able to set up the application to function normally across multiple tenants.

Use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the client must be able to see my response.

How domain separation works in Data Certification

- Data Certification has only basic domain separation. As long as the Certification Instances (CIs) or records that must be certified are correctly domain-separated and the users who must certify the CIs or records are in a domain that can view the data, Data Certification works as expected.
- Recommendation: The instance owner must be responsible for assigning Certification Tasks and Certification Instances to the correct domain. Changing the domain for these records does not change functionality, but limits the view of the records.

How to set up domain separation for Data Certification

After enabling the Domain Separation plugin, there are no additional steps required to set up domain separation for Data Certification.

- instance owners determine which CIs or records that need to be certified can be domain-separated.
- Customers can configure a domain-separated environment by assigning tasks to a domain, but if the data is already domain-separated, then only users with the right domain permissions can view the data in a certification task.

How tenant domains manage their own application data

It's not necessary to set the domain on the certification tables but it can be done if the instance owner should want that. As long as the CI's or records that must be certified are domain-separated, users with the correct domain permissions can view them.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Domain-separated tables

- cert_instance – Changing the domain on this table does not change any functionality, nor does it change the domains of the tasks created from the table.
- cert_task – Changing the domain on this table changes the domain viewing permissions of the task.
- cert_element – It is not recommended to change the domain on these records. As long as the CIs or records to be certified are already domain-separated, cert_element records will reflect that.
- cert_filter – Changing the domain on this table changes the domain viewing and filtering of CIs or records.

Use cases

Instance owners who have multiple clients that certify the infrastructure they own can assign domains to those CIs and the Certification Tasks to restrict the view from one client to another.

Domain separation for service providers

Components related to CMDB Data Manager

The following scheduled jobs, tables, roles, and properties, are related to CMDB Data Manager. Some of those, are installed with CMDB Workspace.

System properties

As a Data Manager Administrator (data_manager_admin) you can view CMDB Data Manager properties in CMDB Workspace.

1. Navigate to **Workspaces** > **CMDB Workspace** and then select **Management** in the CMDB Workspace menu bar.
2. Select the **Data Manager** link in Management tools, in the Manage section.
3. Select **Settings** in the left navigation bar.

Properties/Settings/Labels in the Data Manager settings page

Property/Setting/Label	Description
glide.cmdb.data.manager.delete.batch.size	Size of each batch of CIs that is deleted or archived (affects performance optimization). • Type: Integer • Default value: 1000
Retirement definitions	List of retirement definitions used in CMDB Data Manager life-cycle policies. For more information about the concept and usage of retirement definitions, see: • Retirement definitions • Manage retirement definitions for CMDB Data Manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties/Settings/Labels in the Data Manager settings page (continued)

Property/Setting/Label	Description
Scheduled job users	User group from which to select the user that scheduled jobs run as, when creating certification and attestation policies. The default value for the *Scheduled job default user* field is DataManager Job Runner which is a member of the default *User group* Data Manager Scheduled Job Users. The setting of this property determines the list of users available in the **Run policy scheduled job as** field on the Schedule form of a new policy.
sn_cmdb_ws.cmdb.dm.policy_types.due_date_notification Notifications	Notifications about certification and attestation incomplete tasks. When either is checked, the system notifies task owners as the due date for incomplete tasks is approaching. Notifications are sent when 50%, 70%, and 90% of the time to due date has passed. On the task due date, a past due notification is sent to the task owner and to the task owner's manager. Upon closing a task, sending notifications stops. For information about how the **Days to complete** setting is used to calculate when notifications are sent, see Create a CMDB Data Manager policy in CMDB Workspace.
sn_cmdb_ws.glide.cmdb.data.manager.aging.policy.task.timeframe Aging policy task timeframe	Number of days before a Data Manager task is marked as aged. • Type: Integer • Default value: 30
glide.cmdb.data.manager.subflow.timeout Threshold for subflow run time	Threshold (in milliseconds) for subflow running time. A subflow that passes this threshold while running, is cancelled. • Type: Integer • Default value: 600,000 (10 minutes)
glide.cmdb.data_manager.default_archive_time Number of days CIs are archived before they get deleted permanently	Number of days that it is still possible to restore archived CIs from archive tables. After the specified number of days pass, archived CIs are permanently deleted from the archive tables.

Properties/Settings/Labels in the Data Manager settings page (continued)

Property/Setting/Label	Description
	• Type: Integer • Default value: 120
cmdb.data.manager.stale.task.life.in.days Number of days after which task is considered stale	Number of days after which a task is considered stale and is set to **Closed Cancelled** by the *CMDB Data Manager - Stale Task Cleaner* daily scheduled job. Details: • Type: Integer • Default value: 90
glide.cmdb.data_manager.rejected.task.notification.group Group to receive notifications for a rejected task	System identification of a user group to notify about tasks that are being rejected. By default, this property has no value, in which case, all data manager administrators are notified about rejected tasks. For information about reviewing and rejecting life-cycle tasks, where this property is being used, see Review CMDB Data Manager tasks in CMDB Workspace.
sn_cmdb_ws.glide.cmdb.data_manager.rejected.task.notification.group Group to receive notifications for a rejected task	System identifier of a user group to notify about tasks that are being rejected. By default, this property has no value, in which case, all data manager administrators are notified about rejected tasks. For information about how this property is used when reviewing and rejecting life-cycle tasks, see Review CMDB Data Manager tasks in CMDB Workspace.

Scheduled jobs

Scheduled job	Description
CMDB Data Manager Archive/Delete Policy Processor	Processes all published polices of type Archive and Delete:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scheduled job	Description
	• Applies policies only to CIs that are already retired. • Processes all Archive policies first, and if no errors encountered, continues to process any Delete policies.
CMDB Data Manager Retire Policy Processor	Processes all published polices of type Retire: Applies policies only to CIs that are not retired.
CMDB Data Manager - Stale Task Cleaner	Cleans up stale CMDB Data Manager tasks by setting the task to **Closed Cancelled**. The *cmdb.data.manager.stale.task.life.in.days* system property determines the number of days after which a task is considered stale (90 by default). A task becomes stale if: • The task was created at least 90 days (by default) ago and it is still open. • The approval requests are older than 90 days (by default) and the task is not yet approved.
CMDB Data Manager Delete Related Entry Policy Processor	Processes the Delete CMDB Related Entry policy by deleting the specified related tables from the Related Entry [cmdb_related_entry] table.

Tables

Table	Description
CMDB Data Management Policy [cmdb_data_management_policy]	Details about CMDB Data Manager policies.
CMDB Data Management Policy Executions [cmdb_data_management_policy_execution]	Execution records that correspond to each policy run. As policies run according to their recurring schedule, for each run the system generates a record with a unique policy execution number for that run. A policy execution number has a prefix of 'PLCEXEC'. Execution records associated with certification policy runs, are used for populating the Data Certification Dashboard.
CMDB Data Management Policy Runtime Attributes [cmdb_data_management_policy_runtime_attributes]	Current policy metadata including status and summary.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
CMDB Data Management Task Control [cmdb_data_management_task]	Open policy tasks generated by published policies.
CMDB Data Management Tasks to CIs [cmdb_data_management_task_to_ci]	Associations of tasks to CIs.
CMDB Data Manager Task to Documents [cmdb_data_management_task_to_document]	Associations of task and to related items.
CMDB Data Management Attestation Tasks to CIs [sn_cmdb_ws_attestation_task_to_ci]	Associations of task and attestation CIs.
CMDB Data Management Tasks to CIs [cmdb_ci_state_management_task_to_ci]	Associations of task and CIs for 'Dependent CI Deletion' policy type.
Excluded CIs [cmdb_policy_ci_exclusion_list]	Tracks the CIs that are set to be excluded during policy evaluation.
CMDB Policy Type [cmdb_policy_type]	Policy types supported by the CMDB Data Manager.
CMDB Policy Type Categories [cmdb_policy_type_categories]	Associations of policy types to Workflow Studio Categories.
CMDB Retirement Custom Definitions [cmdb_retirement_custom_definitions]	Custom retirement definitions used in life-cycle policies (Retire/Archive/Delete).
CMDB Policy Scheduled Jobs [cmdb_policy_scheduled_job]	Policy scheduled Job details.
Dependent CI Relations Evaluation Config [cmdb_dependent_ci_extra_rels_config]	Information about CIs' extraneous relationships which is used for the delete and archive operations. Extraneous relationships are those relationships that are not in the CI's chain of dependency. For more information, see Dependent CIs management.
CMDB Dependent CI Class Exclusions [cmdb_dependent_ci_class_exclusion]	Excluded classes for dependent CI, which is used with the Archive/Retire/Delete policy types to determine which CIs are orphan dependent CIs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
	For more information, see Dependent CIs management.
CMDB Dependent CI Ledger [cmdb_dependent_ci_ledger]	Staging table for orphaned dependent CI related to the deletion or archival of the main CI that they depend on. Also used in a cascade-retire dependent CIs operation. For more information, see Dependent CIs management.
CMDB CI End Of Life Ledger [cmdb_ci_end_of_life_ledger]	CIs that are being set as retired that belong to a class that has any downstream dependencies. Used in the Dependent CI Retire policy.

Roles

Role title [name]	Description	Contains roles
CMDB Data Manager administrator [data_manager_admin]	Can access all features in the CMDB Data Manager, including: • Full access to assigned tasks. • Full access to policies. • Ability to associate subflow categories to policy type. Can create, edit, and delete policies, calculate previews, approve tasks, and manage exclusion lists.	• task_editor • data_manager_user • cmdb_query_builder_read
CMDB Data Manager user [data_manager_user]	Can view CMDB Data Manager policies in read-only mode and calculate previews. Can perform the following tasks: • View assigned tasks. • Update, approve, or reject an assigned task. • Add a CI to an exclusion list from their task.	cmdb_read
DataManager Job Runner [dataManager.jobRunner]	Default user for the *Scheduled job default user* CMDB Data Manager property.	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role title [name]	Description	Contains roles
	The **Run policy scheduled job as** field on the Schedule form in a policy, is set to this user if no other option is chosen.	

CMDB groups

A CMDB group is a collection of CIs that lets you apply CI actions collectively to all the CIs that are members in the group.

For example, a CMDB CI Lifecycle Management API can use a CMDB group scriptable API to retrieve the group's list of CIs, and then apply a CI Lifecycle Management action collectively to all the CIs. You can also use a CMDB group with the Dynamic CI Group service population method, to populate an application service.

Group type

You can configure a CMDB group with one of the following group types:

- Health: The CIs in the group can be monitored by CMDB Health, and the aggregated health is reported for the group as a whole in the CMDB group view dashboard. For example, you can monitor health only for CIs in a specific location.
- CMDB Workspace: Group appears in the Management view in the CMDB Workspace.

Create and populate a CMDB group

Depending on the group type, you can populate a CMDB group by manually adding individual CIs, selecting saved CMDB queries, or building encoded queries in the CMDB group itself. The resulting CIs from each query are added as members to the group.

Before you begin

Roles required:

- To view CMDB groups - itil
- To use a CMDB queries - cmdb_query_builder on top of itil
- To manually add CIs - itil or asset

Also, to populate a CMDB group using a CMDB query, a saved CMDB query must exist.

About this task

The system property *glide.cmdb.group.max_ci_limit* determines the maximum number of CIs that a CMDB group can contain (by default 10,000). Once the specified limit is reached, CIs can't be added to the group unless you increase the value of that property.

Procedure

1. Navigate to **All** > **Configuration** > **CMDB Groups**.
2. In the CMDB Groups pane, select **New**.
3. Fill out the form, right-select the title bar and select **Save**.

CMDB Group form

Field	Description
Group Name	A unique name for the group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Group type	○ Default: Basic group type which can be populated by manually adding CIs, saved queries, and encoded queries. ○ Health: Sets CMDB Health to monitor the health of the group CIs and aggregate health results for the group as a whole. Can be populated only by encoded queries. **Note:** Dynamic filters are not supported when populating this type of CMDB groups. ○ CMDB Workspace: Custom class group which appears in the CI Overview panel in CMDB Workspace store app. Can be populated only by encoded queries.

4. To use saved CMDB queries:
   a. Select **CMDB Group Contains Saved Queries** and then select **Add Query**.
   b. Select a query from the **Query Builder Saved Query** list.
   c. Select **Submit**.
   The returned results consists of the CIs from all the classes that are referenced in the saved query. Those CIs become members of the CMDB group.
5. To manually add CIs:
   a. Select **CMDB Group Contains Configuration Items** and then select **Edit Manual CI**.
   b. **Optional:** Add filters.
   c. Select CIs in the **Configuration Item** list and select the '**+**' icon at the bottom.
   d. In the **Group members** list, select the CIs to add to the group.
   e. Select **Save** or **Save and Exit**.
   f. In the **Save Confirmation** dialog box, select **OK**.
   g. Select **Submit**.
6. To use encoded queries:
   a. Select **CMDB Group Contains Encoded Queries** and then select **New**.
   b. Fill out the CMDB Group Contains Encoded Query form with the query conditions that filter the CIs to be included in the group.

Note:
Dynamic filters aren't supported for CMDB health-type groups, even though it's possible to add them in a condition clause.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Class	Class for which the encoded query applies to.
CI Overview Condition	Filter that is used in the calculation for the CI Overview chart in CMDB Workspace. Applies only if the *sn_cmdb_ws.ci_overview.enable_simple_condi* system property is set to **true** (**false** by default). Improves performance by yielding less results when there is a large amount of data in an environment that hasn't migrated to CSDM. This condition isn't used when selecting **Show All CI**.
Condition	Filters the CIs that are included in the group. Used if **CI Overview Condition** isn't applicable.

c. Select **Submit**.

What to do next
Select **Show All CI** to show all CIs from all the result columns of the query. However, only CIs from CMDB tables are shown.

Show CI Lifecycle Management details for CMDB group CIs

Display CI Lifecycle Management operational state and CI actions that apply to the CIs that are members of a CMDB group.

Before you begin
Role required: none

About this task
If the CMDB group is based on a CMDB query, then the query runs in real-time and displays the resulting CIs. If the query does not complete successfully due to timing out or for other reasons, then appropriate error messages are displayed.

Procedure
1. Navigate to **All** > **Configuration** > **CMDB Groups**.
2. On the **CMDB Groups** page, click a CMDB group.
3. Click **Show All CI**.

Field	Description
Configuration Item	CI group member.
Class	Class of CI group member.
Operational Status	CI Lifecycle Management operational state of the CI such as 'Repair in Progress'

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	or 'Operational'. Possible operational states are defined in the choice list of the *Operational status* field in the cmdb_ci table.
Actions	CI Lifecycle Management actions that apply to the CI such as 'Cloning' and 'Provision'. Possible actions are defined in the CMDB CI Actions [statemgmt_cmdb_actions] table.

CMDB Compliance

CMDB Compliance is a tool set that enables administrators to certify CMDB data for correctness and fix any discrepancies found in the data.

Note:
For compliance in the context of internal business goals and objectives, and external legislation and regulations, see Exploring Policy and Compliance Management.

Certification options

CMDB Compliance offers these certification options to suit the size and requirements of your organization:

Option	Description
Desired State	Automatically compares the actual attributes and relationships of specific ServiceNow records against the desired states for those records. For example, an audit can detect a Linux database server with insufficient RAM or whose Depends on relationships with another CI is incorrect. The system then publishes any discrepancies found and automatically assigns follow-on tasks to qualified users to bring that server into compliance.
Architecture Compliance	Automatically compares the actual attributes of specific CIs, such as CPU count, RAM, or disk size against the expected attributes for those CIs. The system publishes any discrepancies found and automatically assigns remediation tasks to qualified users.

Compliance Templates and Audits

The Templates and Audits modules on the top level of the Compliance menu enable a certification_admin user to create, edit, and delete all template and audit types.

You can use Compliance Templates and Audits to evaluate records for any table in the ServiceNow system, not just those tables extending the Configuration Item `[cmdb_ci]` table. Compliance audits certify record attributes only. Compliance templates can be used in Control Test Definitions in Governance Risk and Compliance.

Compliance Activation

Compliance functionality is provided by the Certification Core (com.snc.certification_core) plugin which contains shared functionality required for certification audits.

The Certification Core (com.snc.certification_core) plugin consists of the following plugins, and is activated by default.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Activated by default: Desired State Certification (com.snc.certification_desired_state)
- Activate : Architecture Compliance (com.snc.architecture_compliance), which automatically activates the Version Management (com.snc.version) plugin that manages certification filter and template versions.
- Activate : Data Certification (com.snc.certification_v2), which automatically activates the Version Management (com.snc.version) plugin that manages certification filter versions.

Installed with Compliance

These components are installed with the Certification Core plugin.

Demo data is included with the Desired State and Architecture Compliance plugins.

The Certification Core plugin adds or modifies these tables.

Compliance Certification Core tables

Name	Description
Audit [cert_audit]	Contains all the data required to run an audit, including the users assigned to follow-on tasks and the run schedule.
Audit Result [cert_audit_result]	Contains the results of specific, certification audits.
Follow On Task [cert_follow_on_task]	Contains the tasks that were generated from an audit discrepancy.
Certification Template [cert_template]	Contains the definition of the desired state of the record. The template includes a filter that identifies the records to evaluate and the expected attributes and relationship values. Contains the records to certify, the expected attributes, and the expected relationship values.
Certification Condition [cert_cond]	Base table that defines the desired attribute or relationship conditions used in templates.
Certification Attribute Condition [cert_attr_cond]	Contains the conditions that define the desired CI attribute values. This table extends the Certification Condition [cert_cond] base table.
Certification CI Relationship Condition [cert_ci_rel_cond]	Contains the CI to CI relationship conditions. This table extends the Certification Condition [cert_cond] base table.
Certification User Relationship Condition [cert_user_rel_cond]	Contains the CI to user relationship conditions. This table extends the Certification Condition [cert_cond] base table.
Certification Group Relationship Condition [cert_group_rel_cond]	Contains the CI to group relationship conditions. This table extends the Certification Condition [cert_cond] base table.
Certification Related List Condition [cert_related_list_cond]	Contains the related list conditions. This table extends the Certification Condition [cert_cond] base table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Compliance Certification Core tables (continued)

Name	Description
Certification Filter [cert_filter]	Contains a certification filter, including the table that contains the records to audit and the filter conditions.

User roles

The certification role is automatically assigned to all users with the itil role when the Certification Core plugin is activated or when compliance applications are upgraded. Certification core installs two business rules, both called **Add Certification Role To Manager**, that perform similar tasks on different tables. One rule checks for a manager specified on the User [sys_user] table, and the other checks for the certification role on the User Role [sys_user_has_role] table. When both a manager and the certification role are specified for a user, the system automatically grants the certification role to the manager. This functionality ensures that a certification task can be escalated successfully to the next level. The system grants this automatic role to the user's immediate manager only and not to others up the management chain.

Note:
When a manager has only the certification role and no other role, the manager is considered a Requester and is not counted as a subscribed user (Fulfiller).

Compliance Certification Core user roles

Name	Contains roles	Description
certification	none	Can read and update certification tasks to resolve discrepancies.
certification_filter_admin	none	Can create, read, and update certification filters.
certification_admin	certification, certification_filter_admin	Can manage the entire certification process. These users can create, edit, and delete all certification records.

UI policies

Compliance Certification Core UI policies

Name	Table	Description
Make table read only	Audit [cert_audit]	Sets the table field derived from the selected filter to read-only.
Hide Audit Type	Audit [cert_audit]	Hides the Audit type field.
Hide next scheduled run	Audit [cert_audit]	Hides the Next scheduled run date when an audit is inactive or on-demand.
Show task fields when create tasks is set to true	Audit [cert_audit]	Displays all fields related to creating tasks when the user selects the Create tasks check box.
Make name mandatory	Audit [cert_audit]	Makes Name a mandatory field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Compliance Certification Core UI policies (continued)

Name	Table	Description
Prevent editing of Last run date	Audit [cert_audit]	Makes Last run date field read-only.
Show User field	Audit [cert_audit]	Shows or hides fields based on the Assignment type selected. The system shows the User field when you select the following assignment types: • User Field if the Assign to empty option is Create Assigned Task. • Specific User
Show Assign to fields	Audit [cert_audit]	Shows or hides fields based on the Assignment type selected. The system shows the Assign to field when the assignment type is User Field.
Show Assignment Fields	Audit [cert_audit]	Shows or hides fields based on the Assignment type selected. The system shows the Assign to empty field when you select either of the following assignment types: • User Field • Group Field
Show Group field	Audit [cert_audit]	Shows or hides fields based on the Assignment type selected. The system shows the Group field when you select either of the following assignment types: • Specific Group • Group Field if the Assign to empty option is Create Assigned Task.
Hide "run" associated fields when active is set to false	Audit [cert_audit]	Hides these scheduling fields when the audit is inactive: • Run • Day • Time • Last scheduled run
Show script window on Scripted Audit	Audit [cert_audit]	Displays the Run this script field when the audit type is Scripted.
Make table read only	Certification Condition [cert_cond]	Sets the table field derived from the selected filter to read-only.

Script includes

Compliance Certification Core script includes

Name	Description
DesiredStateUtil	Utility functions for desired state, used to clone a template for Insert functionality.
CMDBRElationshipAjax	Tool to get all relationships for a given table.
RelationshipQueryParseAjax	Parses condition filters. This script include is the internal code used in generating the compliance conditions.
CertificationUtils	Utility functions for certification that find Next run time value, and so on.
CertTaskEscalationTimerPercentage	Utility method for setting escalation timer durations.
ConditionUtilsAjax	AJAX utilities for parsing queries into a human-readable format.
DeleteInactiveVersionsAjax	AJAX server-side script to delete all inactive versions of a record.

Client scripts

Compliance Certification Core client scripts

Name	Table	Description
Make audit type read only if not new	Certification Template [cert_template]	Sets the correct audit type for new records, and if the record is not new, sets the Audit type field to read only.
Update table name (filter)	Audit [cert_audit]	Updates the table Name field when the filter is updated.
Update table name	Audit [cert_audit]	Updates the table Name field when the template is updated.
Set table name on new	Audit [cert_audit]	Returns the table name from the template or filter.
Update table name	Certification Template [cert_template]	Updates the table Name field when a new filter is chosen and checks all existing conditions to see if they work for the new table.
Show conditions when table is set	Certification Template [cert_template]	Shows and hides conditions appropriately when the table is set.
Reset filter when audit type changes	Certification Template [cert_template]	Clears the filter and updates the lists shown when the audit type is changed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Business rules

Compliance Certification Core business rules

Name	Table	Description
Clone condition	Certification Condition [cert_cond]	Part of certification versioning. This business rule retains the original ID when a condition is changed.
Copy audit type from audit	Audit Result [cert_audit_result]	Ensures that all audit results have the same audit type as the audit that generated them.
Copy values from template	Audit [cert_audit]	When a user selects a template, and updates the table, filter, and audit type from the template.
Delete condition	Certification Condition [cert_cond]	Part of certification versioning that deletes a condition.
Prevent deletion of audit with results	Audit [cert_audit]	Prevents deletion of an audit containing results.
Prevent delete of Filter with Template	Certification Filter [cert_filter]	Prevents deletion of a filter still linked to a template or audit.
Prevent deletion of result with task	Audit Result [cert_audit_result]	Prevents deletion of an audit result with an attached task.
Prevent delete of Template with Audit	Certification Template [cert_template]	Prevents deletion of a template still being used by an audit.
Update conditions' tables	Certification Template [cert_template]	When storing template conditions, properly run all workflows and update the condition fields to contain the display version of the conditions.
Update filter version	Certification Filter [cert_filter]	Creates a version when the filter changes in any meaningful way.
Update next run time	Audit [cert_audit]	Updates the time in the Next scheduled run field when an audit is modified.
Update next run time during execution	Audit [cert_audit]	When the audit runs, update the Next scheduled run field to the next time the audit is scheduled to run.
Update table	Certification Template [cert_template]	Update the stored table to the table of the filter.
Update template version	Certification Template [cert_template]	Creates a version when the template changes in any meaningful way.

Compliance Overview module

The Compliance Overview module is a type of a homepage.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The Compliance Overview module summarizes:

- Current audit states
- Outstanding certification tasks
- Compliance discrepancies
- Upcoming audits
- General state of compliance audits for Data Certification, Desired State, Architectural Compliance, and Scripted audits

Only users with certain roles can access the Overview module. The different levels of access are:

Access levels per role

Role	Access
certification	View (view overview page and refresh reports)
certification_admin	• View (view overview page and refresh reports) • Customize (refresh, add, delete, and rearrange reports) View, customize
admin	• View (view overview page and refresh reports) • Customize (refresh, add, delete, and rearrange reports) • Edit (can edit gauges)

Procedure

1. Navigate to **All** > **Compliance** > **Overview**.
2. Select elements within the reports to obtain more information.
   For example, select a bar in the Compliance Discrepancies chart to open a list of audit results filtered by the respective attributes.

Architecture Compliance

Architecture Compliance manages scheduled or on-demand audits of CMDB data to determine which configuration items (CI) match expected attributes. The compliance audits check servers to ensure that their physical resources, such as CPU speed or memory, comply with certain standards.

The compliance process checks servers to ensure that their resources, such as CPU speed or memory, comply with standards set by your organization. Audit reports show any discrepancies in the attributes of the target CIs, and ServiceNow automatically assigns follow-on tasks to qualified users who can remediate those discrepancies.

The administrator responsible for compliance checking creates template definitions of expected attributes and then schedules an audit to check CIs for compliance. The audit results identify CIs that pass certification and itemize the discrepancies in those CIs that fail. ServiceNow automatically generates and assigns follow-on tasks to track the process of getting the CIs back into compliance. Users with the admin role activate Architecture Compliance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Architecture Compliance roles

To access or configure certification elements, a user must have the certification_admin role. These users can create, update, and delete filters if they have the proper access to necessary tables.

In the base system, certification_admin users have limited system rights and do not have access to all the necessary tables. When assigning compliance resources, make sure to grant additional roles to the certification_admin user as needed. For example, the certification administrator needs roles that grant access to these tables:

- Company `[core_company]`
- Cost Center `[cmn_cost_center]`
- Schedule `[cmn_schedule]`

Architecture Compliance Process

Perform these tasks in this order to certify configuration items with Architecture Compliance.

1. Create a filter.

   Create a filter that defines a subset of configuration items to certify. You can create multiple versions of a filter, and then activate the version you want to use for compliance checking. Architecture compliance only supports filters on the Configuration Item [cmdb_ci] table and all tables that extend it.

2. Create a template.

   Create template conditions using values from reference fields in a related list or conditions that define the expected physical attributes of each CI in an audit. The template uses a filter to determine which configuration items the system examines based on these conditions.

3. Create and run an audit.

   Create and schedule an audit or run an audit on demand. The audit generates a set of results based on the conditions in the template you specify.

4. View audit results.

   View the audit results which display any discrepancies between the expected state, as expressed by the template conditions, and the actual state of the target configuration items.

5. Correct discrepancies.

   Correct the discrepancies the audit found by completing the follow-on tasks created by the system.

Architecture Compliance Overview module

The Architecture Compliance Overview module displays various architecture compliance reports. The Overview module is a type of homepage.

Only compliance users with certain roles can access the Overview module. The different levels of access are:

© 2026 ServiceNow, Inc. All rights reserved.

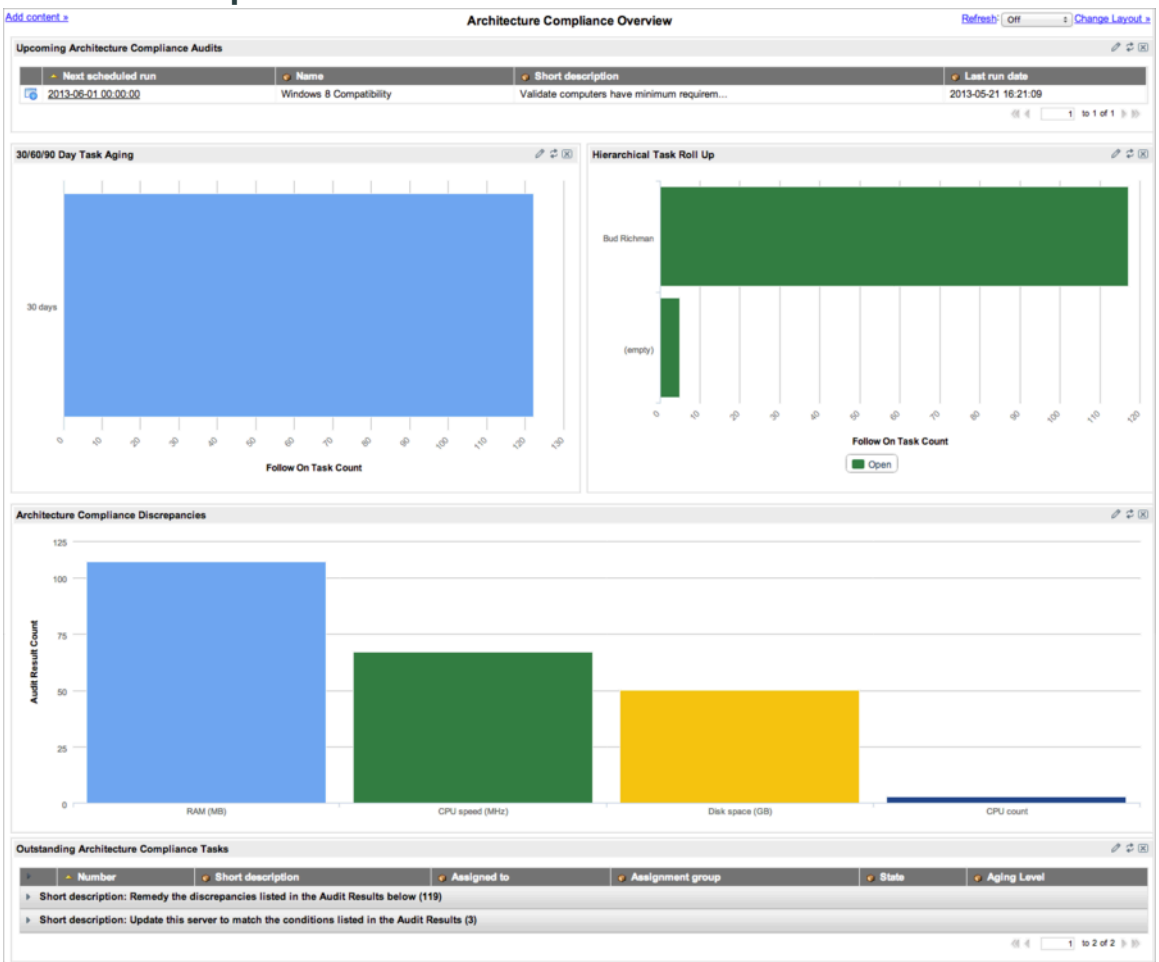
Architecture Compliance module



Desired State

Desired State performs scheduled or on-demand audits of CMDB data to determine which records match the expected attributes, CI relationships, and relationships to other records in the system.

For example, desired state can determine if a computer has a license for a particular software program. The compliance process checks configuration items (CI) to ensure that their attributes and relationships comply with standards set by your organization. Audit results show any discrepancies in the desired state of a record, and ServiceNow automatically assigns follow-on tasks to qualified users who can remediate those discrepancies.

Desired State roles

To access or configure certification elements, a user must have the certification_admin role. These users can create, update, and delete filters if they have the proper access to necessary tables.

In the base system, certification_admin users have limited system rights and do not have access to all the necessary tables. When assigning compliance resources, make sure to grant additional roles to the certification_admin user as needed. For example, the certification administrator requires roles that grant access to these tables:

- Company [`core_company`]
- Cost Center [`cmn_cost_center`]
- Schedule [`cmn_schedule`]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Desired State process

The desired state certification process can mean checking servers to ensure that their physical resources, such as CPU speed or memory, comply with certain standards. This process also ensures that all critical business services have a manager, support group, and approval group assigned.

The administrator responsible for certification creates definitions of desired states and then schedules an audit to check CIs for compliance. The audit results identify CIs that pass certification and itemize the discrepancies in those CIs that fail. The ServiceNow system automatically generates follow-on tasks to track the process of adjusting the CIs to the desired state.

Desired state differs substantially from data certification. Data certification is a manual process to ensure that your data matches reality. Desired state examines the same data and determines when the configuration of each item is in the desired and approved state.

1. Create a certification filter: Create a filter that defines a subset of configuration items to certify. You can create multiple versions of a filter, and then activate the version you want to use for certification. You can create filters on the Configuration Item [`cmdb_ci`] table and all tables that extend it.
2. Create a template: Create a template with conditions that define the desired state of the physical attributes, related records, and relationships for a CI. The certification filter you select for the template determines which configuration items the system examines.
3. Create and run an audit: Create an audit using the template. Set the audit to run on a schedule or on demand. The audit generates a set of results based on the conditions from the template you specify. Determine usage of follow-on tasks:
   - Determine if the audit creates follow-on tasks and assignment.
   - Determine if the same follow-on task is used for the same audit failure across multiple runs. The system attribute *`glide.allow.new.cert_follow_on_task`* is set to true by default, allowing for new follow on tasks to be created for the same failure, at each audit run (this property applies only to audits that aren't scripted).
4. View audit results: View the audit results which display any discrepancies between the desired state, as specified by the template, and the actual state of the target configuration items.
5. Correct discrepancies: Correct the discrepancies the audit found by completing the follow-on tasks created by the system.

Desired State Overview module

The Desired State Overview module displays various desired state reports. The Overview module is a type of homepage.

Desired State Overview module roles

Only compliance users with certain roles can access the Overview module. The different levels of access are:

Access levels per role

Role	Access
certification	View (view overview page and refresh reports)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Access levels per role (continued)

Role	Access
certification_admin	• View (view overview page and refresh reports) • Customize (refresh, add, delete, and rearrange reports) View, customize
admin	• View (view overview page and refresh reports) • Customize (refresh, add, delete, and rearrange reports) • Edit (can edit reports)

The different levels of access are:

- View: can view the overview page and refresh reports.
- Customize: can refresh, add, delete, and rearrange reports.
- Edit: can edit reports.

Use the Desired State Overview module

The Desired State Overview module displays various desired state reports.

Before you begin

Role required: none

Procedure

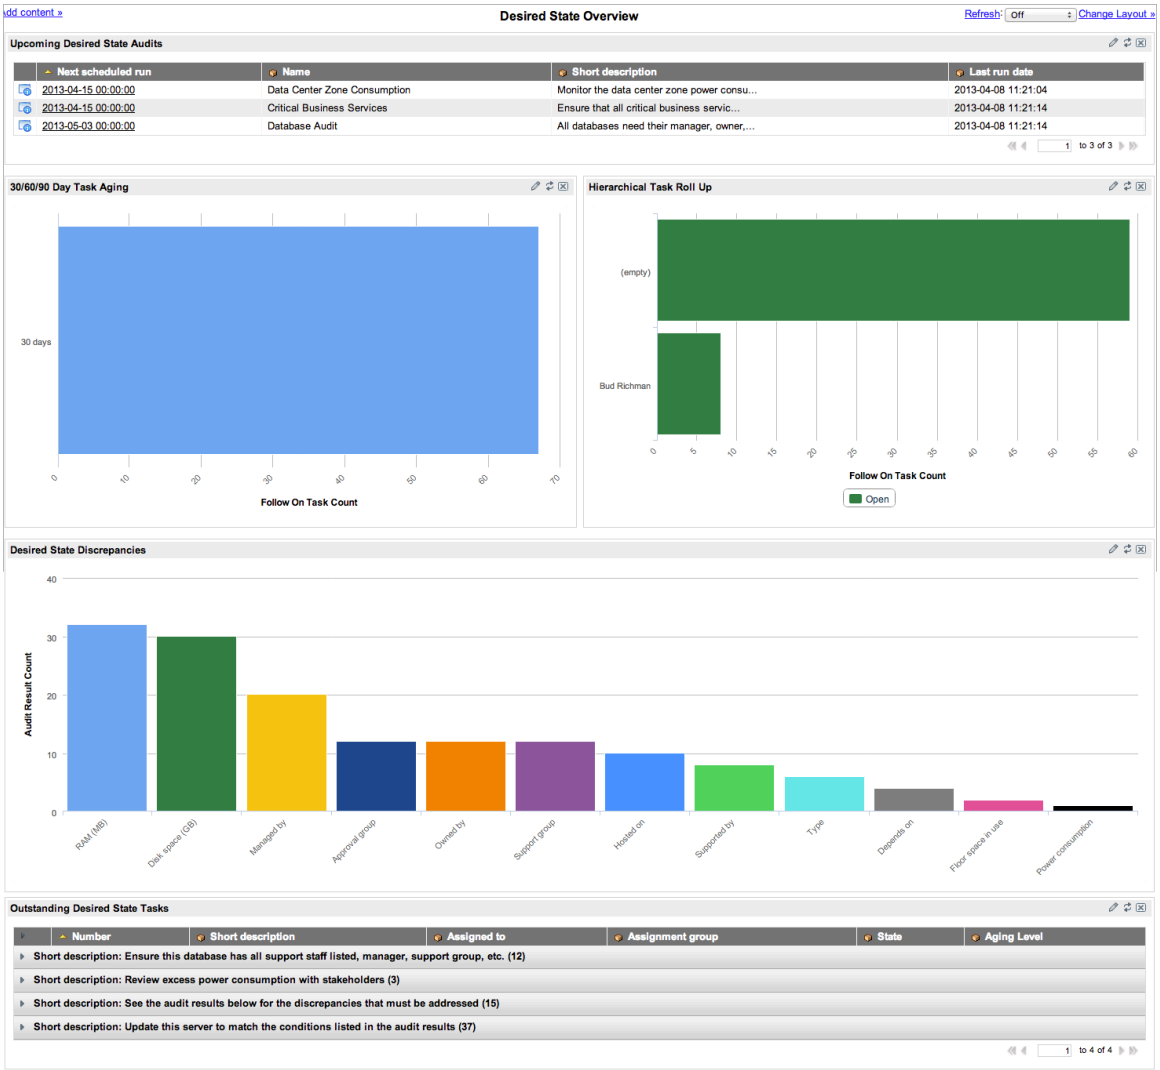
1. Navigate to **All** > **Compliance** > **Desired State** > **Overview**.
2. Move or add reports where needed.
3. Click elements within the reports to obtain more information.

   The Desired State Overview Module in the base system contains these reports:

   - Upcoming Desired State Audits: All scheduled audits.
   - Outstanding Desired State Tasks: All follow-on tasks in the **Pending**, **Open**, or **Work in Progress** state.
   - Hierarchical Task Roll Up: All follow-on tasks grouped by **Assigned to** user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Desired State Discrepancies: All audit discrepancies for attributes and relationships.
- 30/60/90 Day Task Aging: All outstanding follow-on tasks grouped by age in 30-day increments.



Desired State reporting

The Desired State application includes reports to assess your audit results.

These reports are available to all users whose role gives them access to the Reporting application. Users with the admin role can share these reports with specific users of groups or change the display options.

Navigate to **Reports** > **View / Run**. In the *Reports* search field, enter all or part of the report name such as `Desired State`. You can also scroll to the designated category and select one of the reports.

In addition to these reports, you can generate your own reports.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Desired state report table

Report	Description	Category
Desired State Discrepancies	This report displays all desired state audit results that have a follow-on task that is not yet in the Closed Complete state. This report displays by column name. • Type: bar chart • Table: Audit Result [cert_audit_result]	Audit Result
Desired State Result with Stability Unstable	This report displays all audit results where the Stability field has the value Unstable. This report displays by CI and stacked by audit. • Type: bar chart • Table: Audit Result [cert_audit_result]	Audit Result
Desired State Result with Threshold Exceeded	This report displays all audit results where the Threshold field has the value Exceeded. This report displays by CI and stacks by each audit. • Type: bar chart • Table: Audit Result [cert_audit_result]	Audit Result
Upcoming Desired State Audits	This report displays the desired state audits that are scheduled to run in the next two quarters. • Type: List (tabular) report • Table: Audit [cert_audit]	Audit
30/60/90 Day Desired State Task Aging	This report displays the number of follow-on tasks that are not Closed Complete for desired state audit types. The report is grouped by aging level. • Type: Horizontal bar chart • Table: Follow On Task [cert_follow_on_task]	Follow On Task
Desired State Hierarchical Task Roll Up	This report displays similar data to the Task Aging report, but groups the results by manager. • Type: Horizontal bar chart • Table: Follow On Task [cert_follow_on_task]	Follow On Task
Outstanding Desired State Tasks	This report displays similar data to Task Aging report, but groups the results by short description. • Type: List (tabular) report • Table: Follow On Task [cert_follow_on_task]	Follow On Task

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Certification audits

A certification audit compares the actual attributes of certain ServiceNow records. This audit selects a filter, against the expected attributes, relationships, and related record values defined by template conditions or a script.

You can configure the audit to create and assign follow-on tasks to remediate any discrepancies the audit finds. Audit records use a standard ServiceNow scheduler to determine when to run. After an audit runs, the results and follow-on tasks appear in related lists in the audit record.

Users with the certification_admin role can create, update, delete, and run audits. Users with the certification role can view audits, audit results, and follow-on tasks.

Create a compliance audit

Create a compliance audit. Compliance offers two types of audits: one uses templates to define conditions and the other uses a script.

Before you begin

Role required: certification_admin

Procedure

1. Ensure that an appropriate template record was created for this audit.

   Note:
   Conditions in the template define the values to audit.

2. Use the CI Class Manager:
   a. Navigate to **All** > **Configuration** > **CI Class Manager**.
   b. Select a class from the **Class Hierarchy**.
   c. In the sidebar, check **Advanced** and then select **Audit** in the **Compliance** group.
3. Or, navigate to one of these modules:
   - **All** > **Compliance** > **Audits**
   - **All** > **Compliance** > **Architecture Compliance** > **Audits**
   - **All** > **Compliance** > **Desired State** > **Audits**
   - **All** > **Compliance** > **Scripted Audits** > **Audits**
4. Select **New**.
   The system opens a new record for the audit type associated with the navigation path you selected. The **Audit type** field is read-only.
5. Complete the form using the fields described in the table below.
6. Right-click the header bar and select **Save**.

   The Audit Results and the Follow On Tasks related lists appear on the form.
7. To run the audit immediately, select **Run Audit**.

   When template audits run, ServiceNow updates the date and time in the **Last run date** field and populates the related lists. For scripted audits, the **Last run date** field is not populated.
8. View the records that passed and the discrepancies found by the audit in the **Audit Results** related list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can open template records and any follow-on tasks directly from this related list. Notice that the value in the **Task description** field appears as the **Short description** in the follow-on tasks.

Note:
You cannot delete audit records that have audit results or audit results that have follow-on tasks. ServiceNow disables the **Delete** option in records and lists where these dependent records exist.

Creating Audits

Field	Description
Name	Name for this audit.
Filter	Filter to use when the audit type is Scripted. This field is required for scripted audits, but is hidden for all other audit types.
Template	[Required] Template to use when this audit runs. Audit type filters the list of available templates, and only the active versions of templates are available for selection. For example, when you create an audit from Desired State, only templates of the Desired State audit type are available for selection. For the Desired State and Architecture Compliance audit types, only templates for tables that extend the Configuration Item [cmdb_ci] table are available. This field is hidden when the audit type is **Scripted**.
Table	[Read-only] Table for the template.
Create tasks	Option to create follow-on tasks for correcting discrepancies (selected). In a scripted audit, you can create the logic for either task state by using **true** to create tasks or **false** to not create tasks. By default, this check box is cleared (**false**) in a new audit record.
Assignment type	Method for assigning follow-on tasks. This field is visible only when the **Create task** check box is selected. Choices are: ○ User Field: Select a user reference field on the table being audited. For example, you choose the user identified in the **Managed by** field on the failed record to perform the tasks. This selection displays the **Assigned to** and **Assign to empty** fields. If the reference field on the record is empty, the value in the **Assign to empty** field is used. ○ Specific User: Select a specific user to perform the tasks. This selection displays the **User** field. ○ Group Field: Select a group reference field on the table being audited. For example, you choose the group identified in the **Support group** field on the failed record to perform the tasks. Tasks are assigned to all members of the group. This selection displays the **Assign to group** and **Assign to empty** fields. If the reference field on the record is empty, the value in the **Assign to empty** field is used. ○ Specific Group: Select a specific group to perform the tasks. This selection displays the **Group** field. All members of the selected group are assigned to the tasks.
User	Specific user this audit assigns to follow-on tasks. This user must have the certification role. This field is available under these conditions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Assignment type is set to **Specific User**. ○ Assign to empty is set to **Create Assigned Task**, and **Assignment type** is set to **User Field**.
Assign to group	Group field that defines which group this audit assigns to the follow-on task. This field is available only when the **Assignment type** is **Group Field**.
Group	Specific group this audit assigns to follow-on tasks. This field is available only when the **Assignment type** is **Specific Group**.
Assign to	User field that defines which user this audit assigns to the follow-on task. This field is available only when the **Assignment type** is **User Field**.
Assign to empty	Behavior to use if the field selected in **Assign to** or **Assign to group** is blank on the record being audited. For example, if a follow-on task must be assigned to a manager, but no manager is identified, the **Assign to empty** setting determines what happens. This field appears only when the **Assignment type** is **User Field** or **Group Field**. Choices are: ○ Do Not Create Task: No follow-on task is created when the **Assign to** or **Assign to group** field is empty. ○ Create Unassigned Task: Create a follow-on task, but do not assign it to any user or group. The task can be manually assigned later. ○ Create Assigned Task: Create a follow-on task and assign it to the user or group specified. If the assignment type is **User Field**, the **User** field becomes available. If the assignment type is **Group Field**, the **Group** field becomes available. The audit automatically creates follow-on tasks for all records that have **Assign to** populated, regardless of the **Assign to empty** setting.
Short description	Brief description of the purpose of the audit.
Task description	General description of the work required for the follow-on tasks for the audit. All follow-on tasks created by this audit inherit this description.
Active	Activation control for this audit record. Clear this check box to prevent this audit from running and creating follow-on tasks.
Run	How often to run the schedule that generates the audit. ○ Daily ○ Weekly ○ Monthly ○ Periodically ○ Once ○ On Demand
Day	○ If **Run** is **Weekly**, the day of the week when the audit runs. ○ If **Run** is **Monthly**, the day of the month when the audit runs. If the day is 29, 30 or 31, for shorter months the audit runs on the last day of the month.
Repeat Interval	If **Run** is **Periodically**, the frequency that the audit runs, based on a 24-hr. clock. Enter the number of days between audits and the time of day that you

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	want the audit to run. For example, set **Days** to **10** and **Hours** to **14:00:00** to run the audit every 10 days at 2:00pm.
Starting	If **Run** is **Periodically** or **Once**, the date and time when the audit runs.
Time	If **Run** is **Daily**, **Weekly**, **Monthly**, or **Once**, the time of day, on a 24-hour clock, when the audit runs.
Last run date	[Read-only] The last date and time the audit ran, either on its regular schedule or manually. Audit previews do not update this field.
Next scheduled run	[Read-only] The next date and time when the audit runs. The system recalculates this field when you change the schedule.
Audit type	[Read-only] The type assigned to this audit. The system selects the audit type based on the application from which the audit is created. The type can be: ○ Desired State ○ Architecture Compliance ○ Compliance ○ Scripted
Health window	Duration of the evaluation period for threshold and stability. The health window value defines the number of Health window units in an evaluation period for an audit. This value is expressed as a positive integer. The default value for this field is **7**.
Health window unit	Unit of measurement that defines the duration of a health window. The default value for this field is **Days**. Choices are: ○ Minutes ○ Hours ○ Days ○ Months
Threshold count	Acceptable number of audit failures for the desired state field that can occur within the specified health window for a CI. The audit results indicate when a desired state field is within or has exceeded this threshold limit. The default value for the threshold is 5.
Stability count	Acceptable number of times that audit results for a CI can switch between **Certified** and **Failed** within the specified health window. The audit results for a CI indicate whether it is stable or unstable. The default value for stability is 1.
Run this script	Audit script to run which contains the conditions that a CI need to comply with to pass the audit. This field is available only when the audit type is **Scripted**. The Audit form includes a sample script with instructions for performing the audit and generating the follow-on tasks.

Copy an audit

New audits can be created from an existing audit.

Procedure

1. Open the audit record you want to copy.
2. Change the name or short description to distinguish this audit from the original.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Make any other changes you need.
4. Right-click in the header bar and select either Insert or Insert and Stay from the context menu. The system clears the **Last run date** field and inserts the record into the database.

Schedule and run an audit

The system performs audits automatically from the schedule you configure.

Users with the certification_admin or admin role can generate on-demand audits directly from the Audit form by clicking **Run Audit**. When an audit runs, ServiceNow populates the **Audit Results** related list in the form and shows follow-on tasks, if any, in the **Follow On Tasks** related list. Click **Preview Audit Results** to generate an audit preview that tests your template conditions without generating any audit results.

Certification audit results

Audit results show the records that have passed or failed an audit and itemize any discrepancies detected.

A discrepancy is considered any departure from the expected conditions defined in the template or script used for the audit. Audit results provide links to the source records and to the follow-on tasks for bringing failed records into compliance. Records that pass an audit have a single entry in the results table with a state of Certified. Records that fail an audit show all discrepancies, each with a state of Failed.

ServiceNow displays results from a certification audit in these locations:

- Audit Results list
- A related list in the Audit record
- A related list in the compliance view of a CI record

View an audit result

To generate certification results, you must first create and run an audit.

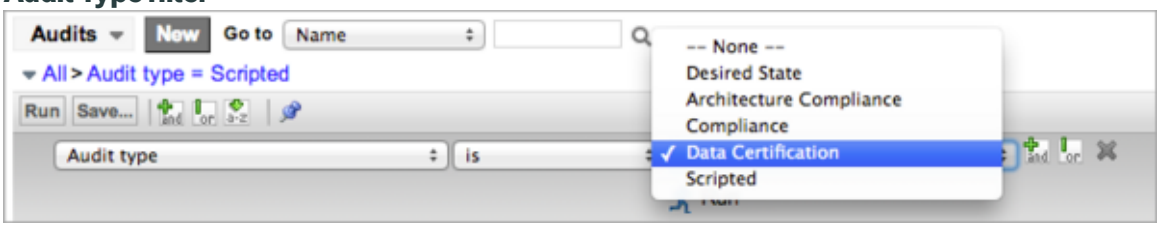
Before you begin

Role required: none

Procedure

1. Navigate to one of the following locations:
   - **Compliance** > **Desired State** > **Audit Results**
   - **Compliance** > **Architecture Compliance** > **Audit Results**
   - **Compliance** > **Scripted Audits** > **Audit Results**
   - **Data Certification** > **Schedules** > **Audit results**
2. From any audit results list, you can edit the filter to show the results for any audit type.

Audit Type filter



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The results filter by audit type and grouped by audit number. Within the groups, results list by date, from oldest to newest.

3. You can open the audit record, the CI record, or the follow-on tasks from this list.

> **Note:**
> The **Audit type** field was set automatically when the audit result was created and cannot be changed. For scripted audits, the audit type is set when you create the audit record.

Audit results show this information:

Audit Results

Field	Description
Created	Date and time the audit ran.
Document	Record that was certified, such as a configuration item (CI).
State	Results of certification for each condition evaluated. The three possible states are: ○ *Certified* A certified record is one that passed all conditions. The instance generates only one audit result for a certified record. ○ *Failed* Records that are not certified have an audit result for each failed condition. The **Column name**, **Desired value**, **Discrepancy value**, and **Follow on task**are only populated for failed results. ○ *Pending* A pending state indicates that the audit is incomplete. Data certification audits use this state when a result is awaiting user input.
Column name	Audited field, relationship, or related list column that did not match the expected state.
Desired value	Attribute or relationship required for this record that was not found, from the condition in the expected state template. For data certification, this column is blank if the record has a state of *Failed* or *Pending*.
Discrepancy value	Actual value of the attribute that did not match the expected state. The follow-on task, if provided, tracks resolution of this discrepancy. In a list of results for the **Data Certification** audit type, this column is blank if the record has a state of *Certified* or *Pending*.
Follow on task	Link to the follow-on task generated for remediating a discrepancy.
Audit	Link to the audit record that produced the results.
Threshold	State of an audited, desired state field with a defined failure threshold. This threshold is the acceptable number of failures for a desired state field within a specified health window and is configured in the Audit form. Possible threshold states for the results are: ○ *In Limit* ○ *Exceeded*
Stability	Stability state of a CI. Stability state is based on the number of times the audit result for a desired state field changes from Certified to Failed within a specified health window. Possible stability states are:

Field	Description
	○ *Stable* ○ *Unstable*

Delete an audit result

While audit results can be deleted, you cannot delete an audit result that has a follow-on task associated with it.

Before you begin

Role required: none

Procedure

1. Navigate to one of these modules:
   - **Compliance** > **Desired State** > **Audit Results**
   - **Compliance** > **Architecture Compliance** > **Audit Results**
   - **Compliance** > **Scripted Audits** > **Audit Results**

   The list groups by audit name.
2. Select the check box for a result in the list, and then select **Delete** from the **Actions on selected rows** menu at the bottom of the list.

   Note:
   If the result record has a follow-on task, the **Delete** option is not available. If you select multiple records, some with and some without tasks, the system only deletes those records that do not have tasks.

3. Click a date/time link to see the results for a specific CI.

   Note:
   The **Delete** button only appears on the form if the audit result does not have a follow-on task.

4. Click **Delete**.

View an audit result in the Compliance view

After an audit has run, you can view the results and follow-on tasks from the Compliance view in the records of every CI audited.

Before you begin

Role required: none

About this task

This view is available only for systems that use the default CI classes provided with the base ServiceNow system, such as Hardware, Software, and Computer. For information about creating views, see View Management.

Procedure

1. Navigate to **All** > **Configuration** and open the record of a CI that was included in a compliance audit.
2. Select the view to configure by performing the appropriate action for your list version.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Audit Results Compliance View appears.

Audit Results Compliance View List Descriptions

Lists	Description
Passed Audit Results	Lists audits for this CI that passed without discrepancies. The information includes the versions of the template and filter used. Records are grouped first by audit, and then by creation date and time.
Failed Audit Results	Lists all failed audits for this CI. The information includes the discrepancy data, the follow-on task, and the versions of the template and filter used. Records are grouped first by audit, and then by creation date and time.
Follow On Tasks	Lists all follow-on tasks generated from audit discrepancies for this CI.

3. Right-click the header bar and select **View** > **Compliance** from the context menu.

Results preview

You can preview an audit to view potential results without saving audit results or generating follow-on tasks. For example, use this feature to test template conditions for correctness without creating thousands of result records.

In an audit record, click **Preview Audit Results** under **Related Links** to show a summary of the potential audit results appears at the top of the audit record.

Previewing does not change the **Last run date** field.

Health windows

A health window is a trailing time frame in which the ServiceNow system evaluates audit results from CIs that have desired state fields defined.

The **Health window** and **Health unit** fields define each window, and ends when an audit runs. For example, an audit runs on the fifteenth of the month with a seven-day window. It evaluates the threshold values of a desired state field from the eighth to the fifteenth. When the same audit runs the next day, the system evaluates the threshold from the ninth to the 16th, and so on. The audit counts backward seven days from the current day. ServiceNow evaluates a CI threshold value for each health window, without considering the results from the previous window. As a result, the health of a CI can fail for one audit and then pass in a subsequent audit that runs in a new window.

ServiceNow evaluates stability by recording the number of times a desired state threshold value for a CI switch between **Failed** and **Certified** within the health window. In the example shown here, a 5-minute health window was set for the desired state field on a UPS unit that measures the remaining battery time. The threshold was set at 2, which allows the field to fail two audits in the same health window.

In the initial audit, the system evaluated the threshold value for the **Seconds on battery** field within a 5-minute window. This window ran from 13:52:51 to the time of the audit at 13:57:51. The desired state field showed In Limit for that audit and the second audit conducted less than a minute later. The next two audits were conducted within five minutes of the first audit and both showed that the threshold (set at 2) was Exceeded. A subsequent audit was conducted five minutes after the audit in which the desired state field threshold was first exceeded. Since the health window had moved forward enough units, the **Seconds on battery** field was within limits again with only one failure in the 5-minute window being evaluated.

Certification filters

A certification filter creates a subset of ServiceNow records to audit, typically from configuration items (CI) of a certain type, such as all UNIX servers in a specific datacenter.

However, you can define a filter for any ServiceNow table by using any set of system-supported conditions. Audited records identified by a filter for expected attributes or relationships, depending on the audit type.

You can create multiple versions of a filter, reactivate inactive versions, and select the version you want to use in a template or a certification schedule. Only the active versions of a filter are available for selection in template records. You can use a single filter for multiple certification templates or schedules.

Certification filters

Filter	Description
Data Certification	Validates CMDB data.
Architecture Compliance	Manages reviews of CMDB data in architecture compliance audits to determine which configuration items (CIs) match expected attributes.
Desired State	Manages reviews of CMDB data to determine which CIs match a desired state for both attributes and relationships.
Compliance	Manages reviews of records from any ServiceNow table to determine which records match an expected set of attributes and related record conditions.
IT Governance Risk and Compliance	Generates audits and tests to ensure that controls are being followed and creates tasks to track corrective actions.

Roles

In the base ServiceNow system, users with the certification_admin role have limited system rights and do not have access to the tables required for creating a filter.

When assigning compliance resources, make sure certification_admin users have any additional roles they need. For example, a user requires roles that grant access to the Company `[core_company]` table.

Compliance filter

The compliance filter for license bases uses the following fields to define entitled users or CIs.

These field values can be used independently or together to calculate compliance.

Compliance Filter

Value	Description
Entitled company	All users or configuration items (CI) at all locations of this company, in all departments are entitled to use this software package. Compliance at this level calculates how many licenses are purchased for the company at large and how many entitled users or CIs consume them.
Entitled location	CIs and users who are assigned to this company location in any department are entitled to use this software package. Compliance at this level calculates how many licenses are purchased for this company location and how many users and CIs consume them.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Compliance Filter (continued)

Value	Description
Entitled department	Only the users or CIs in this department at this company location are entitled to use this software package. Compliance is calculated for a single department only.

The license form can display information about all CIs or named users who are using this software package. The form indicates when license reconciliation is necessary and displays all compliant users or CIs.

Possible compliance levels are:

Compliance

Level	Description
Non applicable	Compliance levels for all infrastructure licenses that are related to cluster licenses are set to **Non applicable** automatically. Compliance levels are calculated in the cluster license only, and not in the related infrastructure licenses.
Out of compliance	More licenses are being consumed than were purchased. There are more users or CIs using this license than the license allows, and some users or CIs are not be entitled to use this software package.
Unused	The licenses for this software package are currently unused.
Reconciliation required	CIs or users who are not entitled to use this software are consuming licenses. Licenses that require reconciliation are considered out of compliance. Reconciliation requires action to ensure that unentitled users are not using the software. Reconciliation involves uninstalling software or increasing license counts to match actual user counts.
Nearly out of compliance	For a software package to be at this compliance level, more than 95% of the licenses are in use by entitled users or CIs. License bases at this level are considered to be **In compliance**.
In compliance	This software package has unused licenses. All users or CIs using a license are entitled to use this software package.

Create a filter

You can create as many versions of a filter as necessary. You can then designate which versions are active and available for selection in Compliance template records, Governance Risk and Compliance control test definitions, or Data Certification schedule definitions.

Before you begin

Role required: none

Procedure

1. Navigate to **All** > **Configuration** > **CI Class Manager**, and:

   a. Click **Hierarchy** to display the CI Classes list.
   Select the class to create a filter for.

   b. In the class navigation bar, expand **Health**, select **Compliance**, and then click **Certification Filter**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Or, navigate to one of these modules:
   - **Compliance** > **Filters**
   - **Data Certification** > **Schedules** > **Certification Filters**
3. Select an existing filter to edit, or click **New**.
4. Fill in the fields (see table below).
5. Click **Submit**.
   This action saves the filter as version 1.
6. To create another version of this filter, open the record and modify the name, table, or conditions.

   Note:
   You can change a filter Description without incrementing a version.

7. Click **Update**.

   The system saves a new version of the current filter and makes it the Active version. The previous version is marked inactive. The system displays only active filter versions for selection when you create templates or schedules.

Creating Filters

Field	Description
Number	[Read-only] Displays the automatically assigned filter identification number. All versions of a filter have the same number.
Name	[Required] Filter name.
Description	[Optional] Describes this filter. You can change the description of a filter without incrementing a version.
Table	Specifies the table containing the records to select. The template or schedule that uses this filter works on this table. For example, select the ESXi Server `[cmdb_ci_esx_server]` table to select VMware ESX servers.
Active	Makes this filter available for use from the **Filter** field on the Certification Template or Schedule Definition form. Multiple versions of a filter can be active. You can activate or deactivate a filter without incrementing the version.
Version	[Read-only] Indicates the version of this filter. Any changes to this filter, except to the description or the **Active** check box, makes it inactive. The system increments the version of the updated filter and marks it as active. The system saves all versions of the filter and makes them available for reactivation.
Filter condition	Specifies the fields, operators, and values that create the filter. The available fields are based on the selected table. The condition builder shows the number of records that match the conditions. Click the refresh icon **Refresh Conditions** to recalculate the number of matching records when you edit the conditions.

Copy a filter

New filters can be created from an existing filter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: none

Procedure
1. Navigate to **All** > **Configuration** > **CI Class Manager**, and:

   a. Click **Hierarchy** to display the CI Classes list.
   Select the class to create a filter for.

   b. In the class navigation bar, expand **Health** and select **Compliance**.
   Then click **Certification Filter**.

2. Or, navigate to one of these modules:
   - **Compliance** > **Filters**
   - **Data Certification** > **Schedules** > **Certification Filters**
3. Open the filter record that you want to copy.
4. Make sure to change the filter name or description to distinguish the new filter from the original.
5. Make any other necessary changes.
6. Right-click in the header bar and select either **Insert** or **Insert and Stay** from the context menu.
   The system increments the record number and sets the version to 1 for the new record. Both the original filter and the copy are Active and appear in the record list. Showing all copies of a filter allows you to see the entire history of the filter.

Delete a certification filter

Delete certification filters that are no longer needed and no longer in use.

Before you begin
Role required: certification_admin or admin

About this task
You can't delete a certification filter that is being used in a template or a scripted audit.

Procedure
1. Navigate to **All** > **Configuration** > **CI Class Manager**, and:
   a. Select **Hierarchy** to show the CI Classes list.
   b. Select the class to delete a filter for.
   c. In the class navigation bar, expand **Health**.
   d. Select **Compliance** and then **Certification Filter**.
2. Or, navigate to one of these modules:
   - **Compliance** > **Filters**
   - **Data Certification** > **Schedules** > **Certification Filters**
3. Open the filter record you want to delete.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. To delete a single filter version, open that version record and click **Delete**.

   The system hides the **Delete** button for filters that are in use. If you delete the latest version of a filter that is active, the previous version of that filter is reset to Active.

b. To delete all unused and inactive versions of a filter, open any version of that filter and click **Delete inactive versions** under **Related Links**.

4. When prompted, select **OK** to proceed.
   The system deletes unused filter versions. A message in the header bar identifies filter versions that cannot be deleted because they are used in a template or scripted audit.

Manage a filter version in a form

You can view and manage all versions of a filter from the Certification Filter form.

Before you begin
Role required: none

About this task
Versions can be displayed in a list. The default list of filters displays only the active version of each filter. To see all filter versions in the list view, select **All** in the breadcrumbs.

Procedure

1. Open any version of a filter.
   The Other Versions related list displays all other versions of this filter, both active and inactive. The system prevents you from editing either the filter version or the record number in the list view.
2. Click any version in the related list to display the record for that version.
3. To make an inactive filter the current version, open the filter, edit it if desired, and then click **Revert**.

   This action:

   - Deactivates the previous active version of the filter.
   - Copies the inactive filter.
   - Makes this new copy current and active.

Certification follow-on tasks

The ServiceNow system can automatically generate and assign follow-on tasks to correct discrepancies detected during compliance audits.

The system property *glide.allow.new.cert_follow_on_task* is set to true by default, allowing for new follow on tasks to be created for the same failure, at each audit run. You can set this property to false, to configure audit to use the same follow-on task for the same audit failure across multiple runs.

The system property *glide.allow.new.cert_follow_on_task* applies only to audits which aren't scripted.

You configure and assign follow-on tasks to qualified users or groups in the audit record. A user with the certification_admin role can reassign any follow-on task. The Audit Results related list in the Follow On Task form contains links to the records that failed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Access follow-on tasks

Users with the certification role can only access follow-on tasks assigned to them but can reassign these tasks to other users.

Procedure

1. Navigate to **All** > **Compliance** > **My Follow On Tasks**.
   The list contains all active follow-on tasks assigned to the logged in user.
2. Open a task.

   The record shows the specifics of the task, the task activity, and the failed audit results.
3. Open records from the **Audit Results** related list to see each discrepancy.
4. Go to the CI named in the record and perform the work to bring it into compliance.
5. Update the **State** field in the follow-on task record and add work notes as you correct each discrepancy.

   When you change the state, the system updates the task activity appropriately.

   When the task is **Closed Complete** it no longer appears on the **My Work** list.

Manage follow-on tasks

Users with the certification_admin or admin role can see all follow-on tasks.

Before you begin
Role required: none

About this task
Tasks are pre-assigned to a user or group as specified in the audit record, but users with the certification_admin role can reassign the task.

Procedure

1. Navigate to the appropriate application:
   - **Compliance** > **Architecture Compliance** > **Follow On Tasks**
   - **Compliance** > **Desired State** > **Follow On Tasks**
   - **Compliance** > **Scripted Audits** > **Follow On Tasks**

   The list of follow-on tasks appears, filtered by audit type.
2. Open a task.

   The **Audit** and **Configuration item** fields are read-only for all users.
3. Edit the **Change group** or the **Assigned to** field if necessary.
4. Edit the **Short description** field if necessary.

   The short description is inherited from the **Task description** field in the Audit form.
5. Use the links in the **Audit Results** related list to open the individual records that failed the audit.
6. If you update the follow-on task record, be sure to add work notes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Certification templates

Certification templates can define attributes, relationships, and reference field values that indicate what a record is expected to contain.

These values are used to perform audits on ServiceNow records. The certification filter selected in the template identifies the table and records to audit, and the template conditions set the expected state for those records. The type of audit you create determines which tables and template conditions are available.

Users with the certification_admin role can create, update, and delete templates. Users with the certification role can view template versions.

Certification template audit types

When you create a template, ServiceNow assigns an Audit type that determines which tables and conditions are available in the certification template. This value is based on the application from which the template is created. Each application lists only the templates with the associated type.

Available Condition Builders

The available condition builders for each audit type:

- *Compliance*: Runs audits on any set of ServiceNow records, not only configuration items (CI). This audit type provides the following types of conditions for any ServiceNow table:
  - *Attribute*: Sets conditions for the attributes of the records.
  - *Related List*: Runs audits on records in tables that reference the table defined in the template.
- *Architecture Compliance:* Defines the following types of conditions for tables that extend the Configuration Item [cmdb_ci] table.
  - *Attribute:* Sets conditions for physical attributes of CIs, such as memory or disk size.
  - *Related List:* Runs audits on records in tables that reference the table defined in the template.
- *Desired State*: Defines the following types of conditions for tables that extend the Configuration Item [cmdb_ci] table.
  - *Attribute*: Sets conditions for physical attributes of CIs, such as memory or disk size.
  - *CI relationship*: Defines the relationships these CIs have with other CIs. An example of a relationship is a business service, such as Outlook Web Access, that depends on a server.
  - *User relationship*: Defines the user who reviewed the log records. The only operator available with this condition builder.
  - *Group relationship*: Defines user groups who backed up this CI. The only operator available with this condition builder.
  - *Related List*: Runs audits on records in tables that point toward the table defined in the template.

Certification Template Record List

The default Templates list displays only the active version of each template, but you can update the breadcrumbs to display all template versions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Default Templates List: The default Templates list displays only the active version of each template, filtered by **Audit type**.
- All Template Versions: To view all template versions for an audit type, click the arrow before **Active=true** to remove that condition from the breadcrumbs.

Create or edit a certification template

To create a certification template, follow these instructions.

Before you begin

Activate the Certification Core plugin to enable the Compliance functionality. See Compliance Activation for details.

Procedure

1. Ensure that you have an appropriate filter that defines the records the template evaluates.

   The template applies its conditions to these records.

2. Use the CI Class Manager to navigate to the Certification Template form:

   a. Navigate to **All** > **Configuration** > **CI Class Manager**.

   b. Select **Hierarchy** to display the CI Classes list.
   Select the class for which to create a certification template.

   c. In the class navigation bar, expand **Health** and then select **Compliance**.

3. Select **Certification Template**.
4. Or, navigate using one of these paths:
   - **All** > **Compliance** > **Architecture Compliance** > **Templates**
   - **All** > **Compliance** > **Desired State** > **Templates**
   - **All** > **Compliance** > **Templates**
   - **All** > **Audit Definitions** > **Templates**
5. Select **New** or select a certification template to edit.

   The following fields are completed automatically:

   - **Number**: Each new template has a unique number. All versions of the same template use the same number.
   - **Active**: All new templates are set to *Active*.
   - **Version**: The version of a new template is set to *1*.
   - **Audit type**: The system sets the default type to *Architecture Compliance*, *Desired State*, or *Compliance*, depending on the application in which the template was created. You can select a different type when you create the template, but the field becomes read-only when you submit the record. The system uses audit types to filter record lists for appropriate data and determine which conditions are visible on the template form.
6. Complete the following mandatory fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Name**: Enter a descriptive name for this template. The name helps identify the purpose.
- **Filter**: Select the filter that identifies the records to be certified. You can select either active or inactive filter versions. By default, the system presents only active versions for selection. If you start enteringthe name of a filter, the auto-complete feature displays all versions for selection. For architecture compliance and desired state templates, only filters that use a table extended from Configuration Item [cmdb_ci] appear on the choice list. All filters appear on the choice list for a compliance template. After you select a filter, the template condition builder appears. The template operates on the table specified in the filter.

7. Enter a description for this template.
8. Define certification conditions using the condition builders.

   All conditions are AND conditions. The audit type of the template determines which conditions are available.

   - **Certification Attribute Conditions**: [All audit types] Select configuration item attributes or specifications to certify, such as CPU count, memory, or disk space. Available fields in the attribute condition builder depend on the table from the filter. Typical ServiceNow conditions for attributes are available, including the *between* operator for setting numerical conditions with high and low boundary values. This operator was added specifically for desired state conditions.

     The **Show Related Fields** item supports dot-walking, enabling you to include referenced fields in a certification attribute condition. Select **Show Related Fields** or **Remove Related Fields** to add or remove referenced fields (in the form of <field> => <field>). Select a referenced field to drill down to the next level of referenced fields.

     See Dot walking.

   - **Certification CI Relationship Conditions**: [Desired State audit types] Define the CI relationships to certify, such as *Runs on* or *Depends on*.
   - **Certification User Relationship Conditions**: [Desired State audit types] Select the desired user relationship for this configuration item. The relationship provided in the base system is *Log reviewed by*.
   - **Certification Group Relationship Conditions**: [Desired State audit types] Select the desired group relationship for this configuration item. The relationship provided in the base system is *Backed up by*.

   - **Certification Related List Conditions**: [All audit types] Select field values from tables that reference the template table, or user-defined related lists ,which are created via custom relationships in the sys_relationship table. To create a condition that evaluates all servers in the Server [cmdb_ci_server] table for the presence of Microsoft Word 2007, as referenced in the Software Installation [cmdb_sam_sw_install] table. The resulting condition is *[Software Installation->Installed on] [Display name] [is] [Microsoft Word 2007]*.

     Check **All** to include all records in the condition requirements of the related list. If there are no records in the related list, then:

     - If **All** is checked, the condition requirement is met.
     - If **All** is cleared, the requirement is not met.

     Note:
     By default, the condition builders for relationships display only suggested relationships. To see all possible relationships, select the **Show all relationships** check box on the side of the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select **Insert a new row** to insert a condition.
You cannot insert an empty condition.

b. Select the green check mark icon to save a condition.
Make sure to save the condition before performing any other operation. Updating the form does not save the condition.

c. To delete a condition, select the red **X** beside the condition.
The system marks the condition as inactive.

d. To reactivate a condition, select the gray **X**.
If another condition for the same field exists, the system prevents reactivation and warns you of the conflict.

9. Select **Submit**.
ServiceNow saves the template as version 1.
10. To create another version of the template, change the name, edit the conditions, or select a different filter.
Updating the template description does not create a new version.

Note:
If you select a filter whose table is incompatible with the existing template conditions, the system displays a warning that the conditions cannot be applied.

11. Select **Update**.
The system saves a new version of the current template and makes it the *Active* version. The previous version is marked inactive.

Clone a Certification template

New templates can be cloned from an existing template.

Procedure

1. Open the template record to be copied.
2. Make any necessary changes.
3. Change the template name or description to distinguish it from the original.
4. Click **Clone**.
ServiceNow increments the record number above the highest template number and sets the version of the new record to *1*. A message appears under the header bar naming the source record for the clone.Both templates are *Active* and appear in the record list. The record list allows you to see the entire history of the template.

Manage Certification template versions

You can view and manage all versions of a template from the Template form.

Procedure

1. Open any version of a template.
The **Other Versions** related list displays all other versions of this template, both active and inactive.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Click any version in the related list to display the record for that version.
3. Update the template to create a new version.
   The system increments a version of the template when you edit any field except **Description** and **Active**. You can manage the template versions without returning to the list view.
4. To make an inactive template the current version, open that version, edit it if desired, and then click **Revert**.
   This action does:
   - Deactivates the previously active version of the template.
   - Copies the inactive template.
   - Makes the new copy the current, active version.
5. Select the **Audits** related list to view all audits configured to use this template.
6. Click **New** to create a new audit record with the template selection and table pre-populated.

Delete a Certification template

Certification templates can be deleted.

About this task

Only users with the certification_admin or admin role can delete template versions. You cannot delete a template version that is being used for an audit.

Procedure

1. To delete a single template version, open that version record and click **Delete**.

   The system hides the **Delete** button for templates that are in use. If you delete the latest, active version of a template, the previous version of that template is reset to *Active*.

2. To delete all unused and inactive versions of a template, open any version of that template and click **Delete inactive versions** under **Related Links**.
   This control appears on all versions, whether they are used in an audit.
3. When prompted, click **OK** to proceed.
   The system deletes only template versions that are not used in an audit. All protected versions are named in a message that appears in the header bar.

Scripted audits

A scripted audit enables users with the certification_admin role to conduct an audit from a script rather than using restrictive template conditions.

A scripted audit uses a certification filter to select the records to audit, and then creates standard follow-on tasks for remediation of any discrepancies. Use this type of audit to query for any values or states that a script can define. A scripted audit is a specific audit type that is activated together with the Desired State plugin. ServiceNow provides a sample audit script with configuration instructions.

Create a scripted audit

A scripted audit is an audit whose conditions are defined by a script.

Procedure

1. Navigate to **All** > **Compliance** > **Scripted Audits** > **Audits**.

   An audit type of *Scripted* filters the list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Click **New**.
3. Complete the form (see table).
4. Create the audit script.

   The *Run this script* field includes a sample script with instructions for performing the audit and generating the follow-on tasks. This field appears only when you access audits from the Scripted Audits module.

5. Click **Submit**.

   Sample script:

```
/*
////////////////////////////////////////////////////
/// This script works with Data Center Zones filter //
////////////////////////////////////////////////////

var desiredFloorSpaceUsage = 30;  // Value to audit against
var assignToUser = '46d44a23a9fe19810012d100cca80666';  // Beth
 Anglin
var assignToGroup = '8a5055c9c61122780043563ef53438e3'; //
 Hardware group
var taskMsg = 'See the audit results below for the
 discrepancies that must be addressed';

// API call to retrieve records based on the filter
var gr = new
 SNC.CertificationProcessing().getFilterRecords(current.filte
r);

// Loop over all records defined by the filter
while(gr.next()) {
 var sysId = gr.getValue('sys_id'); // Sys ID of audited record
 var floorSpaceInUse = gr.getValue('floor_space_in_use'); //
 Value to audit

 // Determine if certification condition passes or fails
 if (floorSpaceInUse < desiredFloorSpaceUsage) {
  var columnNameSpace = gr.floor_space_in_use.getLabel(); //
 String value of column audited against

  // Call create Follow on Task API and save the returned
 sys_id for use in logging audit result fail
  // Params:
  // auditId - Sys id of the audit record executed
  // ciId Sys - id of the configuration item.  Empty string if
 not a cmdb ci
  // assignedTo - Sys id of user to assign task to.  Can be
 empty
  // assignmentGroup - Sys id of group to assign task to.  Can
 be empty
  // shortDescr - Short description for the Follow On Task.
 Can be empty
  // Return value: Sys id of the created follow on task
```

```
  var followOnTask = new
 SNC.CertificationProcessing().createFollowOnTask(current.sys_
id, sysId, assignToUser, '', taskMsg);

  // Call log failed result API
  // Params:
  // auditId - Sys id of audit record executed
  // auditedRecordId - Sys id of the record audited
  // followOnTask - Sys id of the follow on task associated
 with the audited record(@see auditedRecordId). Can be empty
  // columnDisplayName - Label of the column audited(ex. Disk
 space (GB)).  Can be empty
  // operatorLabel - Label of the operator used to audit the
 column(ex. is not empty, greater than). Can be empty
  // desiredValue - Desired value of the column.  Can be empty
  // discrepancyValue - Discrepancy value.  Can be empty
  // isCI - True, if audited record is a CI. False, otherwise.
  // domainToUse - Sys domain of the "cert_audit" record.  Can
 be empty
  new
 SNC.CertificationProcessing().logAuditResultFail(current.sys_
id, sysId, followOnTask, columnNameSpace, 'greater than',
 desiredFloorSpaceUsage, floorSpaceInUse, true);
 } else { // If certification condition pass, write a Audit
 Result Pass via API
  // Params:
  // auditId - Sys id of audit record executed
  // auditedRecordId - Sys id of the record audited
  // isCI - True, if audited record is a CI. False, otherwise.
 Can be empty.
  // domainToUse - Sys domain of the "cert_audit" record.  Can
 be empty.
  new
 SNC.CertificationProcessing().logAuditResultPass(current.sys_
id, sysId, true);
 }
}
*/
```

New scripted audit table.

Field	Description
Name	Name for this audit.
Filter	Filter to use when the audit type is Scripted. This field is required for scripted audits, but is hidden for all other audit types.
Template	[Required] Template to use when this audit runs. Audit type filters the list of available templates and only the active versions of a template are available for selection. This field is hidden when the audit type is Scripted.
Table	[Read-only] Displays the table for the template.
Create tasks	Creates follow-on tasks for correcting discrepancies when selected. In a scripted audit, you can create the logic for either task state by using true to create a task or false if no task is created. By default, this check box is cleared (false) in a new audit record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Assignment type	A choice list to select how the audit assigns the follow-on tasks. This field is visible only when the Create task check box is selected. Choices are: ○ User Field: elect a user reference field on the table being audited. As an example, select the user named in the Managed by field on the failed record to perform the tasks. This selection displays the Assigned to and Assign to empty fields. If the reference field on the record is empty, the value in the Assign to empty field is used. ○ Specific User: Select a specific user to perform the tasks. This selection displays the User field. ○ Group Field: Select a group reference field on the table being audited. As an example, select the Support group from the failed record to perform the tasks. This selection displays the Assign to group and Assign to empty fields. All members of the group from the reference field on the failed record are assigned to the tasks. If the reference field on the record is empty, the value in the Assign to empty field is used. ○ Specific Group: Select a specific group to perform the tasks. This selection displays the Group field. All members of the selected group are assigned to the tasks.
User	The specific user this audit assigns to follow-on tasks. This field is available under these conditions: ○ Assignment type is set to Specific User. ○ Assign to empty is set to Create Assigned Task, and Assignment type is set to User Field. **Note:** Ensure that the specified user has the certification role.
Assign to group	The group field that defines which group this audit assigns to the follow-on task. This field is available only when the Assignment type is Group Field.
Group	The specific group this audit assign to follow-on tasks. This field is available only when the Assignment type is Specific Group and you have selected Group Field as the assignment type.
Assign to	The user field that defines which user this audit assigns to the follow-on task. This field is available only when the Assignment type is User Field.
Assign to empty	The behavior to use if the field selected in Assign to or Assign to group is blank on the record being audited. For example, if a follow-on task must be assigned to a manager, but no manager is identified, the value in this field determines what happens. This field appears only when the Assignment type is User Field or Group Field. The possible selections are: ○ Do Not Create Task: No follow-on task is created when the Assign to or Assign to group field is empty. ○ Create Unassigned Task: Create a follow-on task, but do not assign it to any user or group. The task can be manually assigned later. ○ Create Assigned Task: Create a follow-on task and assign it to the user or group specified. If you selected an assignment type of User Field, the User field becomes available. If you selected the Group Field type, the Group field becomes available.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	The audit automatically creates follow-on tasks for all records that have Assign to populated, regardless of which selection you make for Assign to empty.
Short description	Brief description of the purpose of the audit.
Task description	General description of the work required for the follow-on tasks created by this audit. All follow-on tasks created by this audit inherit this description.
Active	Activates this audit schedule and generates follow-on tasks at the scheduled date and time. Clear this check box to hide scheduling fields on the form (except Last run date) and not generate follow-on tasks.
Run	How often to run the schedule that generates the audit. ○ Daily ○ Weekly ○ Monthly ○ Periodically ○ Once ○ On demand
Day	○ If Run is Weekly, the day of the week when the audit runs. ○ If Run is Monthly, the day of the month when the audit runs. If the day is 29, 30 or 31, for shorter months the audit runs on the last day of the month.
Repeat Interval	If Run is Periodically, the frequency that the audit runs entered in time, days, or both. For example, set Days to 10 and Hours to 14:00:00 to run the audit every 10 days at 2:00pm.
Starting	If Run is Periodically or Once, the date and time when the audit runs.
Time	If Run is Daily, Weekly, Monthly, or Once, the time of day, on a 24-hour clock, when the audit runs.
Last run date	[Read-only] The last date and time the audit ran, either on its regular schedule or manually. Audit previews do not update this field.
Next scheduled run	[Read-only] The next date and time on which the audit runs. The system recalculates this field when you change the schedule.
Audit type	[Read-only] The type assigned to this audit. The system selects the audit type based on the application from which the audit was created and can be: ○ Desired State ○ Architecture Compliance ○ Compliance ○ Scripted
Run this script	Audit script to run. This field is available only when the audit type is Scripted. The Audit form includes a sample script with instructions for performing the audit and generating the follow-on tasks. See Script Methods for a list of the methods provided and the accepted parameters.

Script methods

ServiceNow provides four methods for creating the audit script.

Script methods

Name	Description	Parameters
getFilterRecords	public GlideRecord getFilterRecords(String filterId)	filterID: The sys_id of the filter to use.
logAuditResultPass	public void logAuditResultPass(String auditId, String auditedRecordId, boolean isCI, String domainToUse)	auditId: Sys_id of audit record executed auditedRecordId: Sys_id of the record audited. isCI: True, if the audited record is a CI, false if otherwise. domainToUse: Sys_domain of the cert_audit record.
logAuditResultFail	public void logAuditResultFail(String auditId, String auditedRecordId, String followOnTask, String columnDisplayName, String operatorLabel, String desiredValue, String discrepancyValue, boolean isCI, String domainToUse)	auditId: Sys_id of audit record executed. auditedRecordId: Sys_id of the record audited. followOnTask: Sys_id of the follow-on task associated with the audited record and can be an empty string. columnDisplayName: Label of the column audited. For example, Disk space (GB). operatorLabel: Label of the operator used to audit the column. For example, is not empty or greater than can be the label. desiredValue: Desired value of the column. discrepancyValue: Discrepancy value. isCI: True, if the audited record is a CI, false if otherwise.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Script methods (continued)

Name	Description	Parameters
		domainToUse: Sys_domain of the cert_audit record.
createFollowOnTask()	public String createFollowOnTask(String auditId, String ciId, String assignedTo, String assignmentGroup, String shortDescr)	auditId: Sys_id of the audit record executed. ciId: Sys_id of the configuration item. This string is empty when the table is not extended from the cmdb_ci table. assignedTo: Sys_id of the assigned user of the task. This string can be empty. assignmentGroup: Sys_id of the group the task is assigned to. This string can be empty. shortDescr: The text to use for the short description of the follow-on task.

Managing proposed changes

The proposed changes feature allows you to pre-configure changes to configuration items and their associated relationships. These pre-configured changes are prepared to be implemented, but do not actually happen until they are applied at a later time.

When you view a CI, the proposed changes can be displayed so that you can see what is planned.

This feature is useful when you want to make modifications while a change process is in the approval stage, and only implement the changes after the approvals are complete. If the change is never approved, no changes to records have to be reversed. If the change is approved, a quick command applies all the proposed changes.

You can make the following proposed changes to a CI:

- Modify any field on the CI form.
- Add or delete a relationship to that CI.

To modify a relationship, you must delete the current relationship and add a new relationship. You cannot delete a proposed change.

View CI history

You can view the history of changes to a CI in a list, calendar, or timeline format.

View the proposed changes of a CI

You can view the proposed changes so that you can see what is planned for the CI.

Before you begin
Role required: personalize_form

About this task
To view any proposed changes, configure the CI form layout to display the **CMDB Scheduled Changes** field. Proposed changes are not displayed in a CI form by default.

Procedure

1. Navigate to **All** > **Change** > **Open** and open a change request.
2. In the **Affected CIs** related list, open the **Configuration Item**.
   You may also navigate directly to the CI form.
3. Right-click the form header bar.
4. Select **Configure** > **Form Layout**.
5. Move the **CMDB Scheduled Changes** field to the **Selected** pane.
6. Click **Save**.
   The CI form shows the details of any proposed changes in the **Scheduled changes** area.

Add a proposed change to a CI

Proposed changes to a CI can be made while viewing a change request or any task-related record.

Before you begin
Role required: itil

Procedure

1. In the Change Request form, go to the **Affected CIs** related list.
   If there are no CIs in the Affected CIs list, click **Edit** to add CIs that are affected by this change request.
2. Right-click the CI that you want to configure for a proposed change, and select **Proposed Change**.
3. Complete the form to make the proposed changes, and click **Save Proposed Change**.
   Click **Update** to apply the changes immediately. Click **Delete** to delete the CI.
4. To propose an addition or a removal of a CI relationship:

   a. Click the plus icon in the **Related Items** section.

   b. In the Relationships section, add or delete a relationship.
      For information about using the relationship editor, see Create or edit a CI relationship.

   c. Click **Save Propose Change**.

   d. Confirm saving the proposed change.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Click **Update** or **Delete** to commit the changes immediately.

Note:
Use only with CI relationships. Proposing additions or removal of relationships is not valid for user relationships and group relationships.

What to do next
After the proposed changes are saved, the **Apply Proposed Changes** button appears on the Change Request form. This button lets the user commit the proposed changes to the CI. Your business processes determine the appropriate time to commit the changes. The CI retains the existing data until the proposed changes are committed. However, users can see that changes have been proposed.

Apply a proposed change to a CI

When you apply the proposed changes, all the proposed changes for that change request are applied to the configuration item. You can apply proposed changes without verification, or if verification tests of the proposed changes have failed.

Before you begin
Role required: itil

About this task
After you apply the proposed changes, the **Scheduled changes** part of the form displays **No scheduled changes found**. You can configure proposed change verification rules which you can use to verify proposed changes before applying the changes.

Procedure

1. Navigate to the **Change Request** form.
2. Click the **Apply Proposed Changes** button.
   You may have to right-click the form header and select the **Reload Form** option to see the changes.

Create or edit a proposed change verification rule

Ensure that proposed changes meet business requirements and do not introduce invalid data to the CMDB, create a rule that includes a script to verify the proposed changes.

Before you begin
Role required: asset or itil

About this task
When you configure proposed change verification rules for a CI, you have an option to verify that the proposed changes pass the verification test script in the rule. The verification test results are logged as passed or failed, and you can view the results. Running the verification test is not mandatory, and a failed verification test does not prevent you from applying proposed changes.

Procedure

1. Navigate to **All** > **Configuration** > **Change Verification** > **Proposed Change Verification Rules**.
2. Click **New** or select an existing rule to edit.
3. Fill in the fields, as appropriate.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Proposed Change Verification Rules form

Field	Description
Rule name	The name of this rule.
Table name	The table to which the rule applies.
Filter condition	Conditions to apply this rule to specific CIs.
Active	Check box to activate this rule.

Rule script	A verification Java script that needs to return true or false. For example:
	`validateRule()`
	`{`
	`var os = current.getValue("os");`
	`var cpu = current.getValue("cpu_count");`
	`//Use current.getValue(fieldName) to get the proposed change value, eg. var os = current.getValue("os");`
	`//Your verification code`
	`if (os != "SunOS" || cpu < 2)`
	`return false;`
	`//Return true to pass the verification and false if the verification failed`
	`return true;`
	`}`

4. Click **Submit** or **Update**.

Result

On the **Change Request** form, you can click **Verify Proposed Changes** to verify proposed changes for the affected CIs.

Verify proposed changes

Before applying proposed changes to affected CIs, use proposed change verification rules to verify that the changes meet business requirements and do not add invalid data to the CMDB.

Before you begin

Create or edit the rules used to verify proposed changes. For details, see Create or edit a proposed change verification rule.

Role required: none

About this task

You can apply proposed changes even if they are unverified or fail a verification test.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Open the **Change Request** form that affects the CI.
2. Click **Verify Proposed Changes**.
   The proposed changes are verified against any proposed change verification rules in which the CI meets the **Filter condition** criteria.
3. Review the message that appears at the top of the form after the verification process is finished.
   The message states whether the verification tests passed or failed.

What to do next

To view the details of any verification tests that were performed for the change request in the past two days, click the **Proposed Change Verification Log** related link.

Create or edit a planned change validation script

Create a custom script that checks if a change to a class was valid according to business requirements, and whether the change was planned or not. A planned change validation script is used whenever a CI change is viewed in the CI timeline or change history.

Before you begin

Role required: admin or itil

About this task

The system attempts to validate each CI change as follows:

- If a custom script exists for the CI or one of the CI parents, then the script is executed and the results are used to flag the change as valid or invalid. Parent CIs are examined in the hierarchical order.
- If a custom script does not exist for the CI or any of its parents, then a predefined validation script is used. The change is determined as a planned change if the change occurred between the **Work start** and **Work end** dates of the change request associated with the changed CI.

  However, this check is not always reliable because a user might have manually modified the CI within the work dates, which flags the change as valid even if it is invalid.

The script needs to return a boolean, true or false, which depends on meeting the test criteria in the script. You can define a separate script for each CI class, and you can define multiple planned change validation scripts for a single class. For example, to maintain different versions of the script. Only one script can be active for a CI class at any given time.

These are the parameters that uniquely characterize a change:

- The fields that were changed
- The data source that performed the change
- The time stamp of the change

To correctly determine the validity of a change, examine the parameters and apply business logic to evaluate if the validation tests are met. A planned change validation script can test any of these characteristics and determine when a change meets pre-established criteria. For example, the custom script can check if the mode of the CI is operational or maintenance, or who initiated the change.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Configuration** > **Change Verification** > **Planned Change Validation Script**.
2. Click **New** or select a validation script to edit.
3. Complete the form.

Planned change validation script form

Control	Description
Active	Check box to activate this script for validating changes.
Applies to	Class that this script applies to.
Script	Script to run to validate a change. If the script does not return a boolean value, then it is configured to false.

The script has a template which displays the input variables of the script.

Template script input variables

Variable	Type	Description
current	GlideRecord	Current record that is being processed.
updatedOn	GlideDateTime	Time stamp of the change.
updatedBy	String	Entity responsible for the change.
fieldsChanged	String	Comma-separated list of the names of all fields that were changed.

Example

This sample script checks who initiated the record update. It returns true if admin initiated the record update. Otherwise, the script returns false.

```
isValidChange();

function isValidChange(/*GlideRecord current, GlideDateTime
 updatedOn, String updatedBy, String changedFields*/)
{
   //Return true if the user that updated the record has an
 admin role
   return isUserAdmin(updatedBy);
}

function isUserAdmin(userName)
{
   var grUser = new GlideRecord("sys_user");
   grUser.addQuery('name', userName);
   grUser.query();
   if(grUser.next())
   {
       var roles = new GlideRecord ("sys_user_has_role");
       roles.addActiveQuery();
       roles.addQuery('user', grUser.sys_id);
       roles.query();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        while(roles.next())
        {
           if(roles.role.name == 'admin')
              return true;
        }
    }
    return false;
}
```

4. Click **Submit**.

Intelligent Search for CMDB

Use everyday natural language query (NLQ) in a search string to query for a set of CIs in the CMDB. Intelligent Search for CMDB, parses, resolves ambiguities, and converts your search string into a valid CMDB query. Complex search strings open fully constructed on a canvas of CMDB Query Builder where you can continue and refine, or run.

Intelligent Search for CMDB is supported only on English language instances and isn't supported when the instance preferred language is set to a language other than English.

Integration with CMDB Workspace

Intelligent Search for CMDB is integrated into Home view in the CMDB Workspace store app. For more information, see:

- Home view in CMDB Workspace (Intelligent Search section) for details about how to use Intelligent Search, sample search strings, and helpful tips.
- CMDB Workspace for additional details about CMDB Workspace.

Integration with CMDB Query Builder

Intelligent Search for CMDB is integrated with the CMDB Query Builder in the ServiceNow AI Platform. This integration is controlled by the system property *glide.cmdb.query.nlq.activated*, which is set to **true** by default. Intelligent Search for CMDB lets you use natural language processing in the CMDB Query Builder to find CIs and their relationships using Intelligent Search for CMDB functions.

Using Intelligent Search for CMDB

Intelligent Search is tailored to the CMDB, searching only through the CMDB class hierarchy for tables, and for CIs and their relationships.

Use the Intelligent Search search field to construct a search string using everyday natural language. Your queries can span multiple CMDB classes and involve many CIs that are connected by different relationships. After resolving any ambiguities with table names or relationship types, Intelligent Search converts your search string into a query that the CMDB can run. The CMDB query is constructed dynamically as you type into the search box and spell checker is applied if needed. A dynamic list of relevant suggestions appears as you type, with items such as table names, matching single words or part phrases in the typed-in text.

Use Intelligent Search:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Search tips**: Shows details and tips about the usage, and examples for single and multi-table search, advanced filtering, and relationships in Intelligent Search. The Relationships tab contains a link to the CMDB Implicit Relationships table.

- **Search**: Depending on whether the search string is already fully converted into a valid CMDB query and whether the search is for a single or multiple tables.

  - If the search string has no ambiguities with the table name or relationships, then the query runs and the results appear in a list view format.

    If the constructed CMDB query contains more than a single table, then the **View in Query Builder** button appears. Click the button to open the CMDB Query Builder with your query fully constructed on the Query Builder canvas. You can use the Query Builder to continue editing the query.

  - If there are any ambiguities with table names or relationship types in the search string, then the search string can't be converted into a valid CMDB query. In this case, the Refine your query dialog box appears to continue and parse your search string into a valid CMDB query. The dialog box contains suggested synonyms and labels for phrases in your search string. Use the drop-down lists to select the synonyms that match your intended search and then click **Go** to run the query.
  - If Intelligent Search is unable to convert your search string into a valid CMDB query, then clicking **Search** does not generate any query results. Instead, a feedback form appears. Fill out the form and click **Submit Feedback** to send your feedback to ServiceNow analysis.
- **Results Feedback**: Submit feedback to ServiceNow analysts, to express your assessment of the results. Choose descriptions that capture any gap between the results and your expected results, and add any helpful details.

Sample searches

When you click the search box, the drop-down list of pre-defined sample searches appears. The list consists of more common searches, or searches that are more difficult to construct such as searches that involve application services. Run any of those searches to get started.

- Sample searches are stored in the NLQ Sample Search [sn_cmdb_ws_nlq_sample_search] table
- Referenced tables are stored in the NLQ Sample Search Table [sn_cmdb_ws_nlq_sample_search_table] table

CMDB Admins (sn_cmdb_admin user role) can modify a sample search by directly editing its record in the NLQ Sample Search table. Click **All** and then in the Filter navigator, enter `sn_cmdb_ws_nlq_sample_search.list`. In the NLQ Sample Searches list view edit the record for a search that you want to modify.

Any modification to sample searches is reflected in both, the CMDB Workspace and the CMDB Query Builder.

Synonyms

The NLQ Synonym [nlq_synonym] table is pre-populated with synonyms for natural language strings for CMDB table and column names, and relationships. This table is used to match natural language search words to the CMDB query language. For example, the phrase ‘linux server’ has synonyms such as ‘Linux Server’, ‘Server’, and ‘Virtual Machine Instance’.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For details about viewing and adding synonyms customized to your business needs, see NLQ synonyms.

CMDB Implicit Relationships

You can help Intelligent Search find more results by defining some of the relationships between classes as implicit relationships. Implicit relationships can be useful in queries that involve service offering and application services.

NLQ admins can create new implicit relationships by navigating to **All** > **NLQ** > **CMDB Implicit Relationships**.

An implicit relationship defines the relationship between two tables and includes any filters you want to apply. When creating an implicit relationship, you set the following items:

- From table (from_table): The class that acts as the parent
- Filters: Conditions that are applied to the columns of the from_table
- To table: The class that acts as the child
- Relationship: How the from_table interacts with the to_table. For example, Contains: Contained by means the from_table contains the to_table
- Skipped table: The class that is implied and not captured by the CMDB Query Builder

For example, in CMDB Query Builder, you want to see your service offerings that have had a P1 incident in the last 10 days. However, if you were to type `show me all business service offerings with p1 incidents in the last 10 days`, NLQ wouldn't understand the relationship.

Implicit relationships are stored in the NLQ CMDB Implicit Relationship [nlq_cmdb_implicit_relationship] table and are used in the CMDB Workspace and if integrated, also in CMDB Query Builder.

For more information about NLQ in the ServiceNow AI Platform, see Natural Language Query (NLQ).

Unified Map

The Unified Map feature displays a graphical hierarchical map of the CMDB — CIs and the connections between them. Unified Map combines some of the capabilities of Dependency Views and of Service Mapping into a single map experience.

Get started

Explore	Administer	Use
Explore map tools and controls.	Set up uniform map experiences for users.	View and manage the displayed data.

© 2026 ServiceNow, Inc. All rights reserved.

Unified Map

The Unified Map feature displays a graphical hierarchical map of the CMDB — CIs and the connections between them. Unified Map combines some of the capabilities of Dependency Views and of Service Mapping into a single map experience.

Unified Map

Unified Map is included in CMDB Workspace.

Nodes on the map represent CIs in the CMDB and lines represent connections between CIs. The connections help you, for example, to assess the impact of a change to a selected node by showing CIs that are connected to it through relationships. Products such as Change Management, Incident Management, and Event Management benefit from such information.

The map also shows the composition of service instances — useful with products such as Event Management and Incident Management. For example, you can view all CIs that are members of the 'Revenue App' service instance. You can review historical changes and then, for example, filter the CIs so that only application CIs appear on the map.

Accessing Unified Map

To enable Unified Map, enable the *sn_sm_scoped_app.sa.unified_map.enabled* system property.

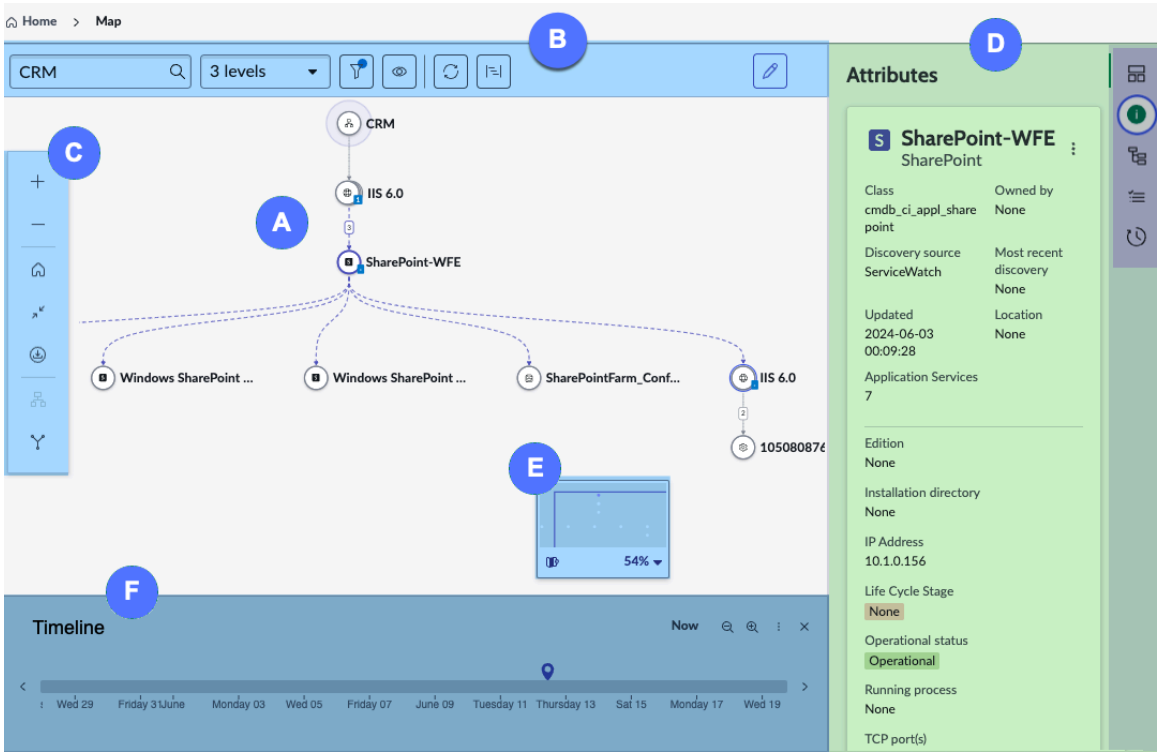
Use either of the following methods to open a map:

- Navigate to **Workspaces** > **CMDB Workspace**. In the Quick Links section on the CMDB Workspace, select **Unified Map**.
- On a CI form for a CI in an operational state, select **Open Map** to open a map with the CI as the home node.

> **Note:**
> An admin can specify additional operational status values for this option. For more information, see Configure CIs to appear based on life cycle stage value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Work areas on the map



A: Map

The map displays specified CIs and their connections. In the example, the CRM CI is the home node and the connections represent relationships with other CIs. Select any node to view details like related service instances, change history, and so on. For more information, see Controlling Unified Map contents and appearance.

Two CIs might be connected by one or more relationships (stored in the CI Relationship [cmdb_rel_ci] table). For example, two CIs might be connected by the *`Runs On::Runs`*, *`Depends On::Discovered From`*, and by the *`Owned By::Owns`* relationships.

- A solid line indicates a relationship. The arrowhead indicates the dependent node.
- A dashed line indicates a reference.
- A badge on a line indicates the number of relationships between the CIs.

B: Content controls

- Search for and select the home node, specify the number of relationship levels to display for service instances, and reload the map after making changes. For more information, see Controlling Unified Map contents and appearance.
- Use filters to limit CI types and relationship types that appear on the map. For more information, see Use filters to specify which nodes should appear on a map.
- Show or hide the timeline of related items (typically events) for the selected CI. For more information, see Viewing related items on the Unified Map timeline.
- Open the map editor ( ) to add or remove CIs and to update relationships in the CMDB. For more information, see Editing maps in Unified Map

C: Toolbox

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Use the toolbox to control visual aspects of the map, such as zoom level or layout mode. For more information, see Controlling Unified Map contents and appearance.
- In the toolbox, select the Export map icon to save the current appearance of the map as a PDF document on your local drive.

D: Contextual side panel

- The **Overview** panel ( ) displays summary data for all CIs that are associated with and downstream of the home node — counts and types of CIs and connections, discovery sources, and so on. For more information, see View a summary of map contents on the Overview panel.
- The **Attributes** panel ( ) lists attributes like location and operational status for the selected CI or relationship. For more information, see View the attributes of a CI or a relationship.
- The **Service instances** panel ( ) lists details of service instances associated with the selected CI. For more information, see View service instances for a CI.
- The **Related items** panel ( ) shows related items such as changes, active incidents, or active problems for the selected CI. For more information, see View related items for a CI.
- The **Changes** panel ( ) lists changes such as changes to operational status for the selected CI. For more information, see View historical changes for a CI.

  Changes are also indicated on the timeline. For more information, see Viewing related items on the Unified Map timeline.

E: Mini-map navigator

Use the navigator to set the zoom level or move the view to an area of interest. Select the icon to show or hide the navigator. For more information, see Controlling Unified Map contents and appearance.

F: Timeline

The timeline indicates related items like incidents, problems, and changes over a specified period of time for the selected CI. You can use the timeline to visualize the history of changes to a CI and how they affect the topology of the CMDB. For more information, see Viewing related items on the Unified Map timeline.

Unified Map settings that admins can configure

These workspace-specific configuration settings affect all users of the CMDB Unified Map page. The settings do not affect other copies of the Unified Map template.

- Create or manage a shared preset
- Configure how many nodes can appear on a map
- Configure the default or maximum number of levels on maps
- Configure endpoint de-duplication on maps
- Configure CIs to appear based on life cycle stage value
- Configure how to display related items on the map
- Configure which attributes to display in the Attributes panel
- Configure display of connections to a referenced class
- Create a class profile of visible layers for classes
- Create or manage a shared preset

How configuration settings for Unified Map are stored

See How configuration settings for Unified Map are stored.

Unified Map settings that non-admin users can configure

Non-admin users can customize some aspects of their personal experience with Unified Map, but can't configure instance-wide workspace-specific settings. Non-admin users can control which elements appear on the map, isolate and analyze relationships between CIs, and simplify the map to isolate issues.

For more information, see Controlling Unified Map contents and appearance.

How configuration settings for Unified Map are stored

Create or manage a shared preset

Admins can save a set of Unified Map map filter settings (layer, CI class, relationship type, and other CI attribute settings) as a shared preset that any user can apply to their map view.

Before you begin

Role required: sn_cmdb_config_admin

About this task

Follow this procedure to create a shared preset with specified filter settings. The workspace-specific filter criteria in a shared preset are available for all users of the current CMDB Unified Map page. Shared presets defined in one workspace are not available in other workspaces.

Configuration settings for shared presets are saved in the **Unified Map shared presets** profile in the configuration identifier that is applied to the workspace.

- When a user applies a shared preset or a user preset, all filter settings are overridden. Filter attributes from a shared preset or a user preset that do not apply to the current map are listed in the **Unused filter attributes** section of the filter panel. The order of precedence from the various sources is as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. user presets
2. shared presets
3. shared presets that are defined in a **Unified Map shared presets** profile
4. class profile (Class profiles are defined in the **Node Map Profiles** related list and contain only layer settings)

- You can include a shared preset in a node map profile. Layer settings in the shared preset will override the layer settings defined in the class profile.
- A shared preset defined in a profile will be applied when the map opens. If the user has explicitly defined a shared preset or a user preset, then the preset takes precedence as outlined above.
- An individual user can apply a shared preset and then save it as a user preset. For more information, see Create or manage a user preset.
- Unused filter criteria in the current filter are saved with a preset.

Procedure

1. Select Open filter panel ( ) and then select or clear filters.

   Each filtering category includes only items that are relevant to the current map. The map immediately applies the filters you select.

2. Select the Manage presets icon , and in the Manage shared presets list, select **Create shared preset**.
3. Enter a preset name and then select **Save**.
4. Close the Map filter panel.

Result

The new shared preset is listed in the **Unified map shared presets** related list on the Configuration Identifier form. In addition, shared presets used in a map profile are listed in the **Node Map Profiles** related list. For more information, see How configuration settings for Unified Map are stored

What to do next

To apply a preset:

1. While working in a map, select the open filter panel icon
2. Select the View preset list icon and then select the preset.

To update a preset or save an updated version as a new preset:

1. While working in a map, select the open filter panel icon
2. Apply the preset that you want to update and then make the desired changes.
3. Select the Manage presets icon and then select **Update preset** or **Update shared preset**.
4. Select one of the following actions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Select **Update preset** to update the current preset with the current filter settings.
- Select **Save as new preset** and then enter a new name.

5. Select **Save**.

To delete a preset:

1. While working in a map, select the open filter panel icon
2. Apply the preset that you want to delete.
3. Select the Manage presets icon and then select **Delete preset** or **Delete shared preset**.
4. Select **Yes**.

To apply the home CI's default filter settings

Select **Reset filter**.

Configure how many nodes can appear on a map

Configure the maximum number of nodes that can be loaded when a map in this workspace opens. These are general settings that only sn_cmdb_admin can configure.

Before you begin

Set the application scope in your instance to **CMDB Workspace**.

Role required: sn_cmdb_admin

About this task

Admins can set the maximum node count using the *unifiedmap.map_search.max_nodes* property in the workspace-specific [sn_cmdb_ws_config_property] table.

These workspace-specific configuration settings affect all users of the CMDB Unified Map page. The settings do not affect other copies of the Unified Map template.

Procedure

1. Navigate to **All** and then, in the filter box in the main navigation bar, enter `sn_cmdb_ws_config_property.list`.
2. Select the *unifiedmap.map_search.max_nodes* property.
3. Select **New** or select the configuration identifier to update and then fill in the form.

Settings that configure the maximum number of nodes that can appear on a map.

Field	Description
Config identifier	Unique name of the configuration identifier that specifies the settings for the current workspace. **Note:** The base system includes a configuration identifier named **Default** that specifies the default settings for Unified Map.
Name	The name of the property that you are updating: unifiedmap.map_search.max_nodes.
Value	Maximum count of nodes that are loaded when a map in this workspace opens.
UX application	The top-level **UX Application ID** to which this configuration applies. This is the application ID of your workspace. This value is referenced from the record associated with the **Config identifier** setting.

4. Select **Submit** or **Update**.
   The updated settings appear in the appropriate related list on the Configuration identifier form, as described in Configuring Unified Map — Admin settings.

Configure the default or maximum number of levels on maps

Configure the default or maximum number of levels on maps. These are general settings that only sn_cmdb_admin can configure.

Before you begin

Set the application scope in your instance to **CMDB Workspace**.

Role required: sn_cmdb_admin

About this task

Admins can set default and maximum levels using the *unifiedmap.map_search_filter.default_levels* or *unifiedmap.map_search_filter.max_levels* property in the workspace-specific [sn_cmdb_ws_config_property] table.

These workspace-specific configuration settings affect all users of the CMDB Unified Map page. The settings do not affect other copies of the Unified Map template. Non-admin users can customize some aspects of their personal experience with Unified Map, but can't configure instance-wide workspace-specific settings.

Procedure

1. Navigate to **All** and then, in the filter box in the main navigation bar, enter `sn_cmdb_ws_config_property.list`.
2. Select the *`unifiedmap.map_search_filter.default_levels`* or *`unifiedmap.map_search_filter.max_levels`* property, as needed.
3. Select **New** or select the configuration identifier to update and then fill in the form.

Workspace Config Property table
Settings that configure the maximum number of nodes that can appear on a map.

Field	Description
Config identifier	Unique name of the configuration identifier that specifies the settings for the current workspace. **Note:** The base system includes a configuration identifier named **Default** that specifies the default settings for Unified Map.
Name	The name of the property that you are updating: unifiedmap.map_search.max_nodes.
Value	Maximum count of nodes that are loaded when a map in this workspace opens.
UX application	The top-level **UX Application ID** to which this configuration applies. This is the application ID of your workspace. This value is referenced from the record associated with the **Config identifier** setting.

4. Select **Submit** or **Update**.
   The updated settings appear in the appropriate related list on the Configuration identifier form, as described in Configuring Unified Map — Admin settings.

Configure endpoint de-duplication on maps

Configure how duplicate edges are displayed on maps. These are general settings that only sn_cmdb_admin can configure.

Before you begin

Set the application scope in your instance to **CMDB Workspace**.

Role required: sn_cmdb_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

These workspace-specific configuration settings affect all users of the CMDB Unified Map page. The settings do not affect other copies of the Unified Map template. Non-admin users can customize some aspects of their personal experience with Unified Map, but can't configure instance-wide workspace-specific settings. Non-admin users can customize some aspects of their personal experience with Unified Map, but can't configure instance-wide workspace-specific settings.

Note:
This property setting is typically not altered for Unified Map.

Procedure

1. Navigate to **All** and then, in the filter box in the main navigation bar, enter `sn_cmdb_ws_config_property.list`.
2. Select the *`unifiedmap.map_search_filter.endpoint_deduplication_fields`* property.
3. Select **New** or select the configuration identifier to update and then fill in the form.

Workspace Config Property table
Settings that configure endpoint de-duplication.

Field	Description
Config identifier	Unique name of the configuration identifier that specifies the settings for the current workspace. **Note:** The base system includes a configuration identifier named **Default** that specifies the default settings for Unified Map.
Name	The name of the property that you are updating: unifiedmap.map_search_filter.endpoint_deduplication_fields.
Value	The default value of `sourceId,targetId,_label,endpoints` means: Collapse the edges (show only one connection between edges on the map) whenever multiple endpoints between source CI and target CI result in the same labeled edges. **Note:** This setting is typically not changed for Unified Map.
UX application	The top-level **UX Application ID** to which this configuration applies. This is the application ID of your workspace. This value

Field	Description
	is referenced from the record associated with the **Config identifier** setting.

4. Select **Submit** or **Update**.
   The updated settings appear in the appropriate related list on the Configuration identifier form, as described in Configuring Unified Map — Admin settings.

Configure CIs to appear based on life cycle stage value

By default, only CIs for which *Life cycle stage* is **Operational** or empty appear on maps. You can configure the map to display CIs with other *Life cycle stage* values. These are general settings that only sn_cmdb_admin can configure.

Before you begin

Set the application scope in your instance to **CMDB Workspace**.

Role required: sn_cmdb_admin

About this task

- By default, non-operational CIs are filtered out and do not appear on maps.
- Search results don't include CIs that are filtered out based on operational state.
- The **Open Map** button (for viewing details) on the CI form isn't available for CIs that are filtered out based on operational state.

These workspace-specific configuration settings affect all users of the CMDB Unified Map page. The settings do not affect other copies of the Unified Map template. Non-admin users can customize some aspects of their personal experience with Unified Map, but can't configure instance-wide workspace-specific settings.

Procedure

1. Navigate to **All** and then, in the **Filter** box in the main navigation bar, enter `sn_cmdb_ws_operational_lifecycle_for_unified_map.list` to open the *Operational life cycle modes* table.
2. Select the list of selected live cycle stage values.

   For Unified Map, the default list of selected live cycle stage values is named **CMDB Workspace Unified Map View**.

   a. Unlock the **Life cycle list** field and then select the Edit multiple icon .

   b. In the Edit Members pop-up, move the life cycle stage values for CIs that should appear on maps into the **Selected life cycle stages** list and then select **Save**.

   c. On the record form, select **Update** or **Save**.

   - The updated settings appear in the appropriate related list on the Configuration identifier form, as described in Configuring Unified Map — Admin settings. The updated list of life cycle stage values is added to the **CMDB Workspace Unified Map View** life cycle mode on the **Operational life cycle modes** related list for the affected configuration identifier.
   - You can also perform this operation from the **Operational life cycle modes** related list.

Configure how to display related items on the map

Add related items categories, specify which information should appear on cards on the Unified Map **Related items** panel, and specify how related items (events) appear on the timeline and on badges. These are general settings that only sn_cmdb_admin can configure.

Before you begin

Set the application scope in your instance to **CMDB Workspace**.

Role required: sn_cmdb_admin

About this task

These workspace-specific configuration settings affect all users of the CMDB Unified Map page. The settings do not affect other copies of the Unified Map template. Configuration settings that non-admin users can specify are described in Configure the Related items panel.

Related items are grouped by category in the **Related items** panel. Related items also appear for CI badges on the map and timeline.

The [sn_cmdb_ws_node_map_related_item] table contains the settings that determine which related items and associated details appear. By default, common categories of related items, such as active incidents and other events for example, are configured to appear. You add or modify records to globally manage related items on maps.

Procedure

1. Navigate to **All** and then, in the search box on the main navigation bar, enter `sn_cmdb_ws_node_map_related_item.list` to open the Node Map Related Item table.
2. Select an existing record or select **New** and then fill in the form.

Node Map Related Item table — general section

Settings that configure how categories appear.

Field	Description
Name	The category label that appears on the **Related items** panel for a selected CI.
Table	Tables from which records for the category are retrieved.
Order	Order that the category appears within all related items categories. The list of related items categories is sorted in ascending order. The category with the smallest order number appears at the top of the list.
Active	Enables the appearance of the related item category.
Reference field	Reference attribute in the specified **Table** that references the CIs for the category. Typically set to **Configuration Item [cmdb_ci]**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select the Related fields and conditions tab and then fill in the settings.

Related fields and conditions tab
Settings that configure how data appears on cards.

Number field	Numeric attribute from the specified table that uniquely identifies each record in the category. This attribute is used in the record link that appears on each card when drilling down the related item category.
Title field	Attribute from the specified table that appears as the title of each card when drilling down the category in the panel.
Fields	Set of attributes from the specified table that appears on each card when drilling down the related item category. For example, when drilling down alerts, the set of attributes that appears on each alert card.
Sort fields	Order of appearance of the fields specified in the **Fields** setting.
Footer field	Attribute from the specified table that appears at the bottom of individual cards when drilling down the related item category, regardless of the sort order specified in the **Sort fields** setting.
Conditions	Conditions to apply to the specified table that retrieve the set of records for the category.

4. Select the Badge and timeline configuration tab and then fill in the settings.

Badge and timeline configuration tab
Settings that configure badge and timeline operation.

Badge and timeline icon	Icon that appears on CI badges and on the timeline for the specified related item.
Badge and timeline highlight field	Highlight configuration for applying colors to timeline and map icons.
Date field	The date field to position the event on the timeline.
End date field	Optional end date field to use for a range on the timeline.

5. Select **Submit** or **Update**.
The updated settings appear in the appropriate related list on the Configuration identifier form, as described in Configuring Unified Map — Admin settings.

Configure which attributes to display in the Attributes panel

Each class has a unique set of extended attributes that appear in the bottom section of the **Attributes** panel for a CI. For any class, you can specify which extended attributes should be displayed. These are general settings that only sn_cmdb_admin can configure.

Before you begin

Set the application scope in your instance to **CMDB Workspace**.

Role required: sn_cmdb_admin

About this task

In the base system, extended attributes are preconfigured for many common classes. You can modify the default settings and configure settings for additional classes. This example shows where base attributes (A) and extended attributes (B) appear in the Attributes panel. For more information on the Attributes panel, see View the attributes of a CI or a relationship

View the attributes of a CI or a relationship

Configure display of connections to a referenced class

Configure how to display connections to a referenced class and from a referencing class on Unified Map. A reference connects two CIs from differing classes that aren't connected by a relationship. These are general settings that only sn_cmdb_admin can configure.

Before you begin

Set the application scope in your instance to **CMDB Workspace**.

Role required: sn_cmdb_admin

About this task

These workspace-specific configuration settings affect all users of the CMDB Unified Map page. The settings do not affect other copies of the Unified Map template. Non-admin users can customize some aspects of their personal experience with Unified Map, but can't configure instance-wide workspace-specific settings.

References connect CIs from two classes that don't have a direct relationship connection between them. On the map, any two CIs from the referenced class and from the referencing class appear connected by a dotted line. The relationship type is **Reference**. There are several preconfigured map references that you can modify, and you can also add map references.

For example, you want the map to display references to records in the File System table for Windows Server CI records. In that case, Server ABC (referencing CI) shows connections to the C:\ and D:\ file systems (referenced CIs).

Procedure

1. Navigate to **All** and then, in the filter box on the main navigation bar, enter `sn_cmdb_ws_node_map_reference.list`.
2. On the Node Map References table, select an existing record or select **New** and then fill in the form.

Node Map References table

Settings that configure how to display referenced-class and referencing-class connections.

Field	Description
CI class	The referencing class that this configuration applies to.
Referenced CI class	Class that the specified **Reference field** references.
Reference field	Attribute in the specified **CI class** that contains the reference.
Show Reverse	Creates a map reference for the reverse reference between the specified **CI class** and **Referenced CI class**.
Active	Enables the configuration so that the connection appears on maps — the map displays referenced CIs.

3. Select **Submit** or **Update**.
   The updated settings appear in the appropriate related list on the Configuration identifier form, as described in Configuring Unified Map — Admin settings.

Create a class profile of visible layers for classes

Configure a class profile that specifies which layers should appear for a particular class: application, service instance, business, or infrastructure. For example, you can configure that the mapped application service (service instance) [cmdb_ci_service_discovered] class should display only Service Mapping data and not infrastructure elements.

Before you begin

Set the application scope in your instance to **CMDB Workspace**.

Role required: sn_cmdb_admin

About this task

These workspace-specific configuration settings affect all users of the CMDB Unified Map page. The settings do not affect other copies of the Unified Map template. Non-admin users can customize some aspects of their personal experience with Unified Map, but can't configure instance-wide workspace-specific settings.

Class profiles let you configure the **Layers** filter. Several common classes such as the mapped application service (service instance) [cmdb_ci_service_discovered] class are preconfigured with class profiles.

Class profiles are applied when no filter preset is used for the current map. This typically happens when you load a map without a filter preset or when you set the filter preset to **Default view**.

Procedure

1. Navigate to **All** and then, in the search box on the main navigation bar, enter `sn_cmdb_ws_node_map_profiles.list`.
   The Node Map Profiles table lists all classes for which the **Layers** property is set.
2. Select an existing record or select **New** and then fill in the form.

Node Map Profiles table

Settings that configure map filters and map orientation for a class.

Field	Description
Config identifier	Unique name of the configuration identifier that specifies the settings for the current workspace. **Note:** The base system includes a configuration identifier named **Default** that specifies the default settings for Unified Map.
Layers	**Layers** value to apply when the map opens with a home node that is in the class specified by the **CMDB CI class** setting. ○ Application, ○ Service instance (formerly application service) ○ Business ○ Infrastructure On the map display, in the **Layers** category, the listed filter values are selected and values that are not in the list are deselected.
CMDB CI class	Class of CI that this profile applies to. Whenever a map opens with a home node of the specified class, the **Layers** values are applied.
Orientation	○ Vertical layout: Displays nodes in a vertical tree pattern: upstream relationships top and downstream bottom. This is the default layout for displaying mapped application services and service instances. In the toolbox, select the Vertical layout icon . ○ Force layout: Displays nodes in a clustered arrangement around the home node, regardless of upstream or downstream relationships. In the toolbox, select the Force layout icon .
UX application	The top-level **UX Application ID** to which this configuration applies. This is the application ID of your workspace. This value is referenced from the record associated with the **Config identifier** setting.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Active	Option to set the profile as available for use.

3. Select **Submit** or **Update**.
   The updated settings appear in the appropriate related list on the Configuration identifier form, as described in Configuring Unified Map — Admin settings.

Create or manage a user preset

How configuration settings for Unified Map are stored

General configuration settings that control Unified Map are collected in a configuration identifier. A configuration identifier is a set of properties and table-driven configurations that specify the appearance and content of an instance of a UX application. The *CMDB Workspace* UX application contains Unified Map.

Important:
Because each configuration identifier is unique to an instance of a UX application, the settings for one UX application do not affect the user experience of any other UX application. This means that your admin settings for this instance of Unified Map will not affect Unified Map users in another instance.

Viewing Unified Map configuration settings

The configuration identifier form displays all configurations settings for Unified Map. To view the configuration identifier, navigate to **All** and then, in the filter box in the main navigation bar, enter `sn_cmdb_ws_config_identifier.list`.

On the form, each related list displays property settings or a table of configuration settings.

The base system includes a configuration identifier named **Default** that specifies all default settings.

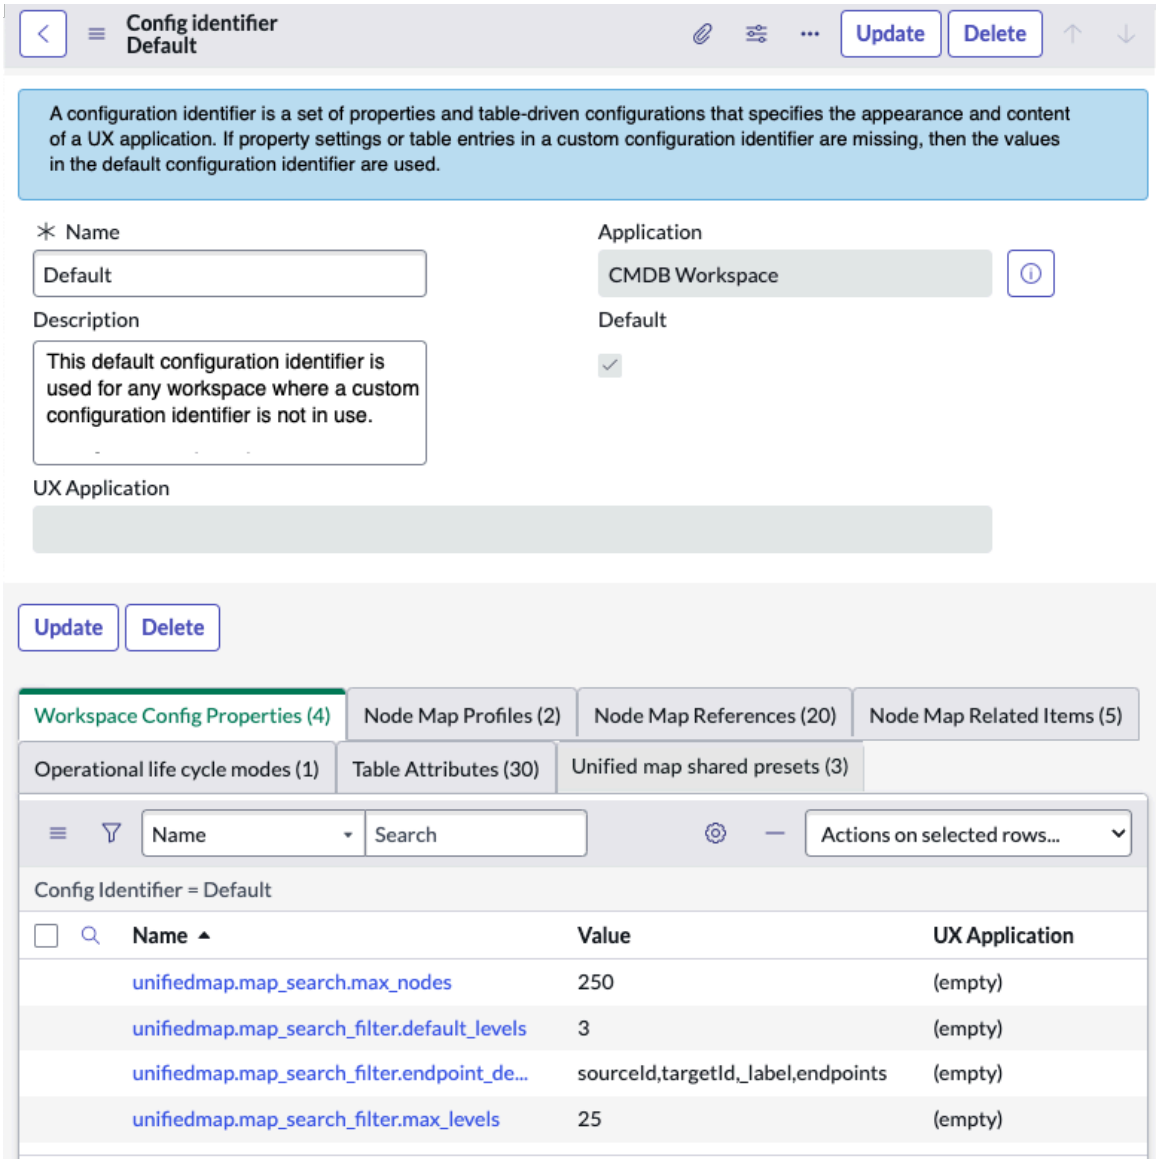
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Defining custom settings for your CMDB Workspace instance

To create a custom configuration identifier for your workspace, modify the default settings and then save the updates with a new name.

Note:
When a custom configuration identifier doesn't specify a particular property setting or table entry, the value in the default configuration identifier is used.

Additional Information

Controlling Unified Map contents and appearance

Manipulating the contents and layout of a map can greatly assist with understanding and optimizing your CMDB. You can control which elements appear on the map, isolate and analyze relationships between CIs, and simplify the map to isolate issues.

Important:
This topic describes changes that you can make to your view of the map. The changes do not affect other users. In contrast, administrators can configure general settings that affect all users in the workspace, as described in Configuring Unified Map — Admin settings.

Save a map as a PDF document

In the toolbox, select the Export map icon to save the current appearance of the map as a PDF document on your local drive.

Controlling map content

Controlling map content

Change	Tool and actions
Specify or change the home node	The home node is the CI that all other CIs on the map are associated with, directly or indirectly. The home node icon has a thicker border that pulsates. The map is redrawn when you specify a home node. Use either of the following methods: • Use the **Search** box to find and select a CI. • Right-click a node on the map and select **Set as home node**. **Note:** Connecting lines between nodes represent relationships and references, not data flow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Controlling map content (continued)

Change	Tool and actions
	• In the vertical layout, the home node appears at the center of CI connections. Upstream connections appear at the top and downstream at the bottom. This is the default layout for displaying mapped service instances (formerly application services) [cmdb_ci_service_discovered]. • In the force layout, the home node appears at the center of CI connections.
Reload the map after a change	Select the Reload map icon
Configure a filter to display only pertinent items	Select the Filter icon • When a user applies a shared preset or a user preset, all filter settings are overridden. Filter attributes from a shared preset or a user preset that do not apply to the current map are listed in the **Unused filter attributes** section of the filter panel. The order of precedence from the various sources is as follows: **1.** user presets **2.** shared presets **3.** shared presets that are defined in a **Unified Map shared presets** profile **4.** class profile (Class profiles are defined in the **Node Map Profiles** related list and contain only layer settings) • Filter conditions that would filter out the home node might appear in the panel. You can't, however, filter out the home node even if it does not match the filter conditions. **Note:** Filter settings that would filter out the home node might appear in the list. You can't, however, filter out the home node even if it does not match the filter settings. For more information, see Use filters to specify which nodes should appear on a map.

© 2026 ServiceNow, Inc. All rights reserved.

Controlling map content (continued)

Change	Tool and actions
Show/hide filtered items	Select the Show/Hide filtered items icon to expose the filtered items on the map as dimmed view-only nodes. For more information, see Use filters to specify which nodes should appear on a map.
Show complete CI details	Select a CI (CI border thickens) to display its details in the **Overview**, **Attributes**, **Service instances**,**Related items**, or **Changes** panel. For group CIs, such as an service instance or a dynamic CI group, the **Attributes** panel also shows detail cards for the CIs that are members of the group.
Show relationship details	Two CIs might be connected by one or more relationships (stored in the CI Relationship [cmdb_rel_ci] table). For example, two CIs might be connected by the *Runs On::Runs*, *Depends On::Discovered From*, and by the *Owned By::Owns* relationships. • A solid line indicates a relationship. The arrowhead indicates the dependent node. • A dashed line indicates a reference. • A badge on a line indicates the number of relationships between the CIs. Select a connection to display its attributes in the **Attributes** panel. For a CI with multiple relationships, select the badge to view details for all relationships.
Set the number of relationship levels to display on the map	Use the **Levels** drop-down list to specify how many relationship levels to display on the map (default 3). A low setting is useful for viewing a simplified map that shows only direct connections and for limiting the overall size of a map. A higher setting enables you to review more complex CMDB structures. When a mapped application service (service instance) CI is set as the home node, the **Levels** setting has no effect and all levels of relationships appear.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Controlling map content (continued)

Change	Tool and actions
	Note: Connecting lines between nodes represent relationships and references, not data flow.
Highlight the relationships between CIs	Point to a CI to animate the connections between CIs. Two CIs might be connected by one or more relationships (stored in the CI Relationship [cmdb_rel_ci] table). For example, two CIs might be connected by the *Runs On::Runs*, *Depends On::Discovered From*, and by the *Owned By::Owns* relationships. • A solid line indicates a relationship. The arrowhead indicates the dependent node. • A dashed line indicates a reference. • A badge on a line indicates the number of relationships between the CIs. **Note:** Connecting lines between nodes represent relationships and references, not data flow.
View mapped application services (service instances)	The Service Mapping app might use mapped application services. Mapped application services appear as group CIs that you can expand to show members. Mapped application services [cmdb_ci_service_discovered] are descendents of the Service Instance [cmdb_ci_service_auto] class, such as service instances and dynamic CI groups. • A badge shows the number of members in the group. • Select the badge to expand the group and show its member CIs. Select again to collapse. • In the expanded mode, point to any member CI to temporarily highlight all group members.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Controlling map content (continued)

Change	Tool and actions
Show or hide the timeline	Select the Show/Hide timeline icon. For more information, see Viewing related items on the Unified Map timeline.
View non-operational CIs	• Non-operational CIs do not appear in search results or on the map. • The **Open Map** button on a CI form isn't available for non-operational CIs. • Only CIs for which the *Life Cycle Stage* attribute is **Operational** or empty appear on maps. An administrator can change the default behavior to show non-operational CIs or CIs of any combination of *Life Cycle Stage* values. For more information, see Configure CIs to appear based on life cycle stage value.

Controlling map appearance

Controlling appearance of the map

Change	Tool and actions
Zoom in or out	Use any of the following methods: • Select + or - in the toolbox. • Scroll up or down in the map pane. • Specify a zoom value in the mini-map navigator.
Align the map to the home node	In the toolbox, select the Align to home node icon.
Fit all CIs on the map	Select the Fit to map icon. Result: Center the map on the canvas and set the zoom level to the maximum level that enables the entire map to fit on the canvas. By default, up to 250 nodes can appear on a map. CIs in a collapsed group CI are counted.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Controlling appearance of the map (continued)

Change	Tool and actions
	Note: Admins set the maximum node count using the *unifiedmap.map_search.max_nodes* property in the workspace-specific [sn_cmdb_ws_config_property] table. Higher values can decrease performance.
Move a CI to another location	Drag a CI to a different place on the map. Map elements that are connected to that CI might be moved to accommodate the new placement.
Move the entire map on the canvas and set the zoom level	Use either of the following methods: • Drag the rectangle in the mini-map navigator. • Select an empty area on the map and drag.
Show CI key details on the map	Point to a CI to show its full name and class (or zoom into the map until those details appear), its related items details, and the direction of the CI relationships. If there are multiple related items associated with a CI, then the CI badge contains the string 'Multiple' and a badge showing the count of related items appears on the timeline. You can point to the badge on the timeline to show all related items.
Switch the layout of the map	• Vertical layout: Displays nodes in a vertical tree pattern: upstream relationships top and downstream bottom. This is the default layout for displaying mapped application services and service instances. In the toolbox, select the Vertical layout icon . • Force layout: Displays nodes in a clustered arrangement around the home node, regardless of upstream or downstream relationships. In the toolbox, select the Force layout icon . **Note:** Connecting lines between nodes represent relationships and references, not data flow.

Use filters to specify which nodes should appear on a map

Customize the map to focus on the CIs that you want to work on by filtering out (hiding) irrelevant CIs. You can filter by layer count, CI class, relationship type, discovery source, location, and CI ownership.

Before you begin

Role required:

- To access maps: sn_cmdb_user, sn_cmdb_editor or sn_cmdb_admin
- To access maps with operational application services: app_service_user, and sm_user or sm_admin
- To access maps with operational and non-operational application services: app_service_admin, and sm_user or sm_admin
- To access and view related items: itil

About this task

- When a user applies a shared preset or a user preset, all filter settings are overridden. Filter attributes from a shared preset or a user preset that do not apply to the current map are listed in the **Unused filter attributes** section of the filter panel. The order of precedence from the various sources is as follows:
  1. user presets
  2. shared presets
  3. shared presets that are defined in a **Unified Map shared presets** profile
  4. class profile (Class profiles are defined in the **Node Map Profiles** related list and contain only layer settings)
- Filter conditions that would filter out the home node might appear in the panel. You can't, however, filter out the home node even if it does not match the filter conditions.

Procedure

1. Select Open filter panel ( ) and then select or clear filters.

   Each filtering category includes only items that are relevant to the current map. The map immediately applies the filters you select.

2. Close the Map filter panel.
   - A dot appears on the Map filter icon to indicate that filters are applied.
   - To expose filtered CIs and relationships on the map as dimmed view-only images, select the Show filtered items icon .
   - You can save filter settings for reuse. For more information, see Create or manage a user preset.
   - Maps show up to 250 CMDB elements. Remaining elements are truncated and don't appear on the map.

What to do next

To apply the home CI's default filter settings, select **Reset filter**.

Admins can save filter settings as a shared preset that all users can apply. For more information, see Create or manage a user preset.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related topics

Create or manage a user preset

Create or manage a user preset

Save useful Unified Map filter settings as a user preset that you can apply to a map at any time. For example, define a filter to display only CIs of a particular class and then save the filter settings as a user preset.

Before you begin

Role required:

- To access maps: sn_cmdb_user, sn_cmdb_editor or sn_cmdb_admin
- To access maps with operational application services: app_service_user, and sm_user or sm_admin
- To access maps with operational and non-operational application services: app_service_admin, and sm_user or sm_admin
- To access and view related items: itil

About this task

- Follow this procedure to create a user preset that applies specified filter settings. Only you can apply your user presets to your personal view of the map.
- In addition, admins can define shared presets that you and other users can access. For more information, see Create or manage a shared preset.
- - When a user applies a shared preset or a user preset, all filter settings are overridden. Filter attributes from a shared preset or a user preset that do not apply to the current map are listed in the **Unused filter attributes** section of the filter panel. The order of precedence from the various sources is as follows:
    1. user presets
    2. shared presets
    3. shared presets that are defined in a **Unified Map shared presets** profile
    4. class profile (Class profiles are defined in the **Node Map Profiles** related list and contain only layer settings)
  - Filter conditions that would filter out the home node might appear in the panel. You can't, however, filter out the home node even if it does not match the filter conditions.

Procedure

1. Select Open filter panel ( ) and then select or clear filters.

   Each filtering category includes only items that are relevant to the current map. The map immediately applies the filters you select.

2. Select the Manage presets icon and then, in the Manage my presets list, select **Create preset**.
3. Enter a preset name and then select **Save**.
4. Close the Map filter panel.

What to do next

To apply a preset:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. While working in a map, select the open filter panel icon
2. Select the View preset list icon and then select the preset.

To update a preset or save an updated version as a new preset:

1. While working in a map, select the open filter panel icon
2. Apply the preset that you want to update and then make the desired changes.
3. Select the Manage presets icon and then select **Update preset** or **Update shared preset**.
4. Select one of the following actions:
   - Select **Update preset** to update the current preset with the current filter settings.
   - Select **Save as new preset** and then enter a new name.
5. Select **Save**.

To delete a preset:

1. While working in a map, select the open filter panel icon
2. Apply the preset that you want to delete.
3. Select the Manage presets icon and then select **Delete preset** or **Delete shared preset**.
4. Select **Yes**.

To apply the home CI's default filter settings

Select **Reset filter**.

Related topics

Use filters to specify which nodes should appear on a map

View a summary of map contents on the Overview panel

The Overview panel displays summary data for items on the map that are associated with the home node — counts and types of CIs and connections, discovery sources, and so on.

Before you begin

Role required: sn_cmdb_user

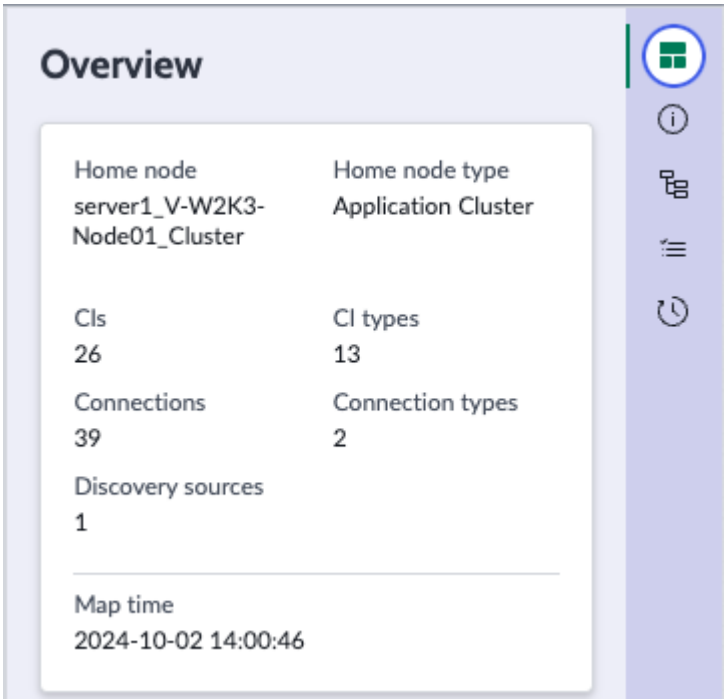
About this task

Note:
The information on the Overview panel isn't affected by zoom settings or by filter settings even if nodes that are associated with the home node are not visible on the map.

Procedure

While working in a map, in the Search bar, search for and select the CI to set as the home node and then select the Overview icon .

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Information on the Overview panel

Field	Description
Home node	The CI that is currently the home node. For more information, see Specify the home node.
Home node type	The CI type of the home node CI.
CIs	Count of CIs that are associated with the home node.
CI types	Count of types of CI for CIs that are associated with the home node.
Connections	Count of connections for CIs that are associated with the home node.
Connection types	Count of connection types for the CIs that are associated with the home node.
Discovery sources	Count of discovery sources related to the CIs that are associated with the home node.
Map time	The timestamp that is specified on the timeline. The time is set to "now" when you first open a map. For more information, see Viewing related items on the Unified Map timeline.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

View the attributes of a CI or a relationship

Open the **Attributes** panel in Unified Map to view attributes like location and life cycle stage for a CI or a relationship.

Before you begin

Role required:

- To access maps: sn_cmdb_user, sn_cmdb_editor or sn_cmdb_admin
- To access maps with operational application services: app_service_user, and sm_user or sm_admin
- To access maps with operational and non-operational application services: app_service_admin, and sm_user or sm_admin
- To access and view related items: itil

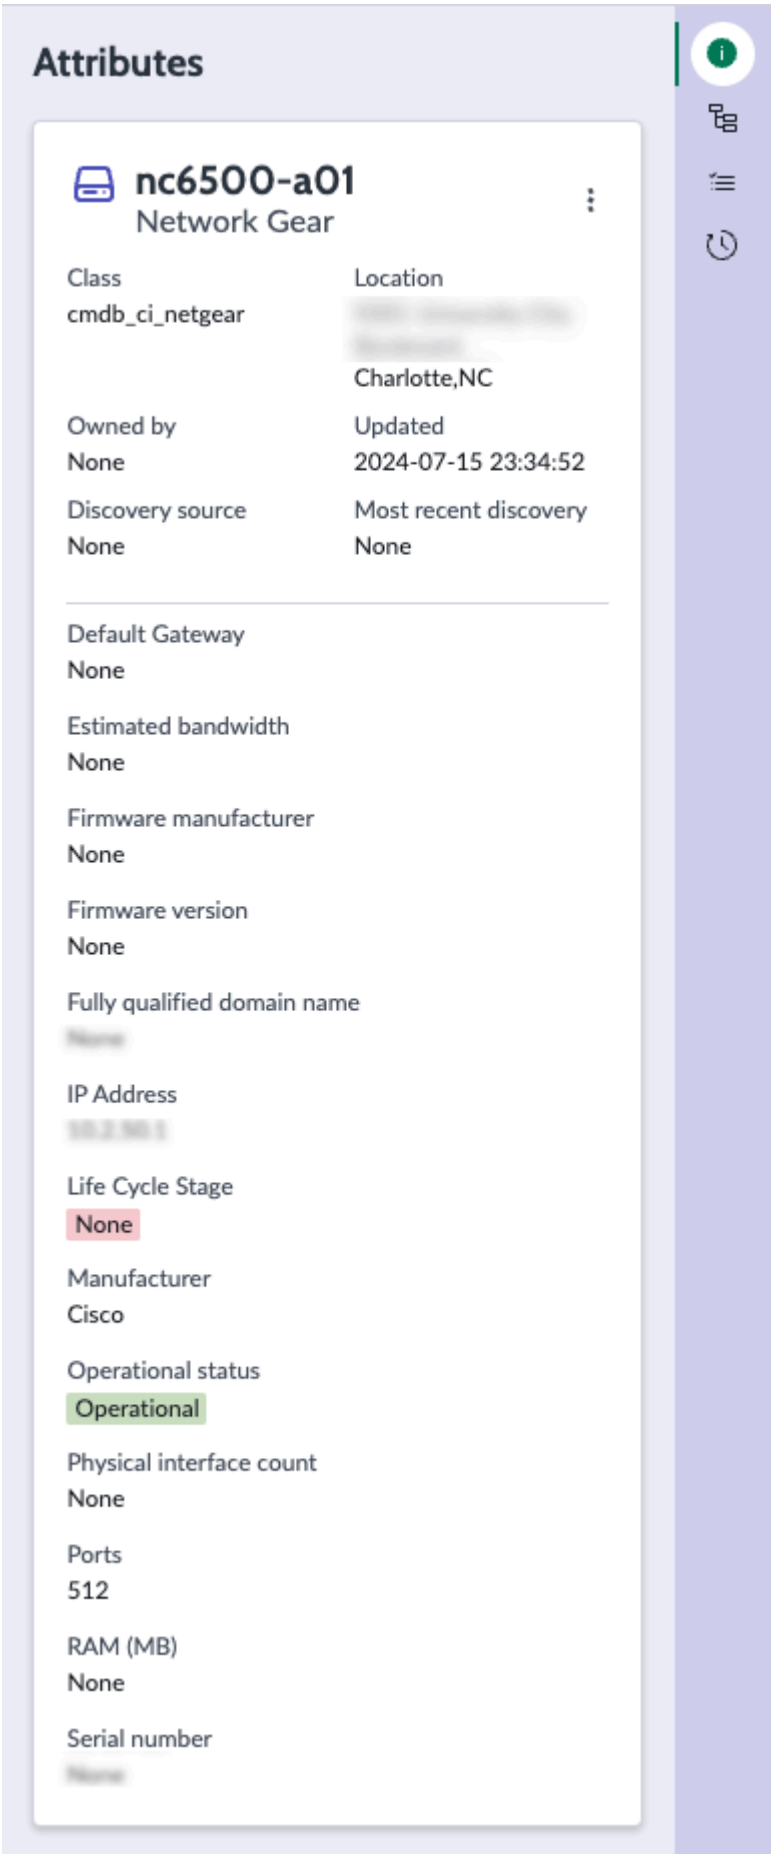
About this task

When you select a group CI such as a service instance or a dynamic CI group as the home node, the **Attributes** panel shows the attributes of the group CI itself and a card for each CI and relationship member of the group. When you open a map for a service instance CI, a badge on group CIs shows the number of members. Select a badge to expand or collapse the group.

Procedure

While working in a map, select a CI or a relationship on the map and then select the Attributes icon .

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **Attributes** panel shows the following details:

- For a non-group CI: The top section displays base properties — common key attributes, such as *Class* and *Discovery source* that appear for CIs of any class (other than service instance CIs). You cannot change the group of properties that appear in this section.
- The bottom section displays extended properties — attributes that uniquely extend the class of a CI in the CMDB hierarchy. You can specify the properties that should appear in this section. For more information, see Configure which attributes to display in the Attributes panel.
- For a group CI: The top card shows attributes of the group CI. The cards in the Configuration items section display attributes for each of the group member CIs.
- For a single relationship: A card with the attributes for the selected relationship.
- For a multi-relationship badge: A card for each of the relationships in the relationship set that shows the attributes for the relationship. The number of cards is equal to the number on the relationship badge, which is a count of the different types of relationships between the two CIs in that direction. Relationship connections are based on records in the CI Relationship [cmdb_rel_ci] table.

What to do next

In a CI card on the **Service instances** panel, select the **Actions** menu and then select any of the following options:

- Select **View CI details** to open the CI form for the CI.
- Select **Open in new map** to open an additional map with the current CI set as the home node.
- Select **Set CI as home** to set the selected CI as the home node for the map.

Select a mapped service instance (formerly application service) CI [cmdb_ci_service_discovered] on the map to display its entry points on the **Attributes** panel.

View service instances for a CI

For a selected CI, the **Service instances** panel in Unified Map lists details in the Service Mapping application for all associated service instances (formerly application services).

Before you begin

Service Mapping must be installed. For more information, see Service Mapping.

Role required:

- To access maps: sn_cmdb_user, sn_cmdb_editor or sn_cmdb_admin
- To access maps with operational application services: app_service_user, and sm_user or sm_admin
- To access maps with operational and non-operational application services: app_service_admin, and sm_user or sm_admin
- To access and view related items: itil

About this task

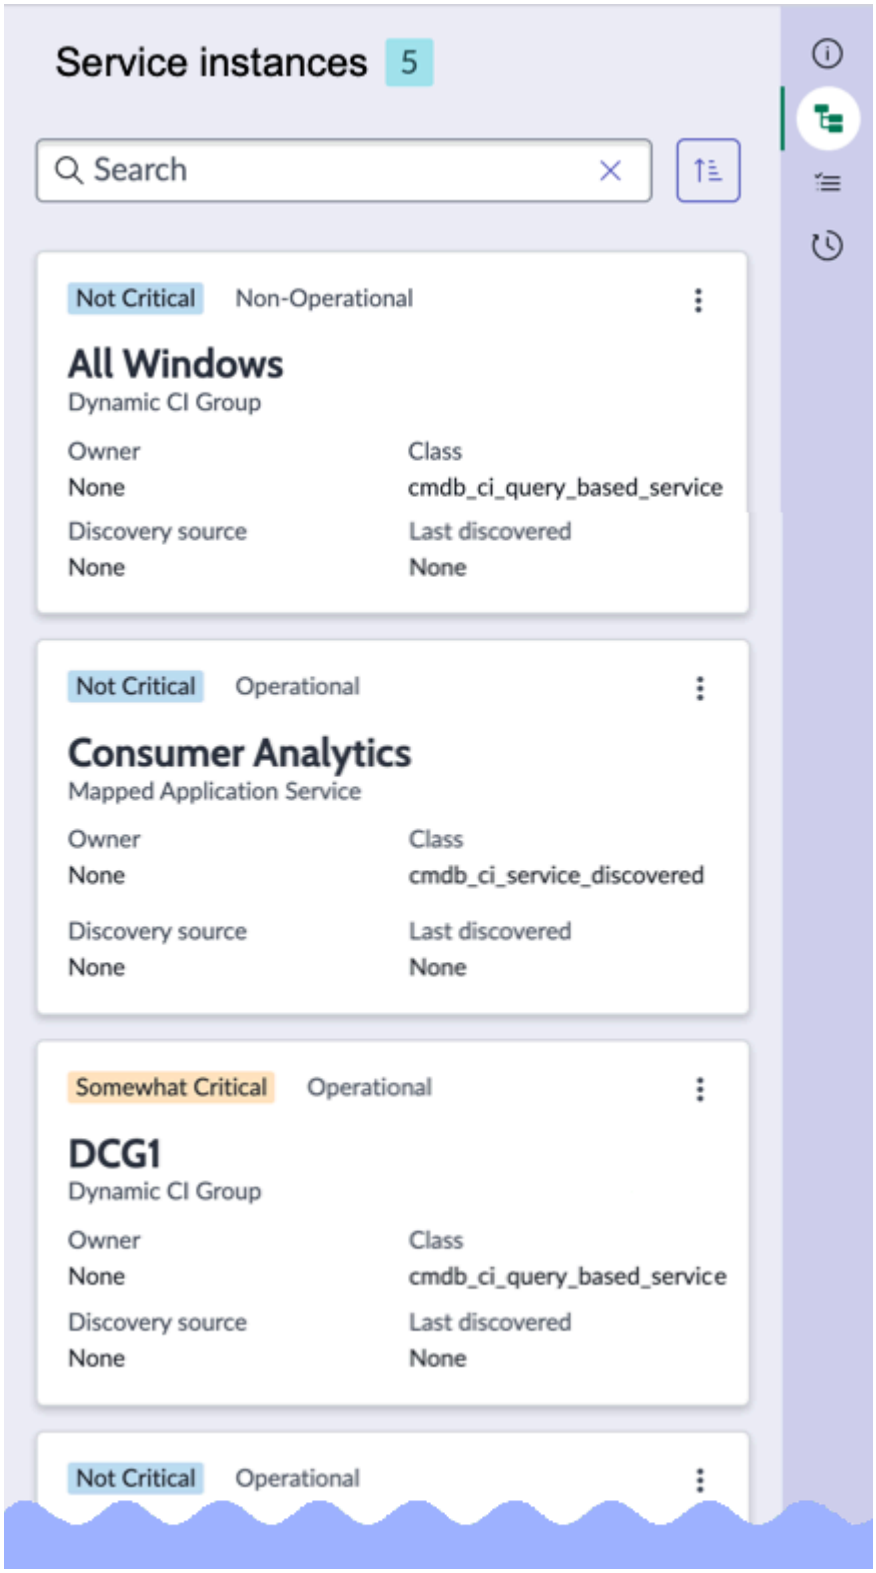
The information that appears on a service instance card is described in Service Mapping data.

Procedure

While working in a map, select a CI on the map and then select the Service Instances icon .

The panel displays a card with details for each related service instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



What to do next

- Select another CI on the map to show its related service instances.
- Select an empty space on the map to show all service instances for any of the CIs on the map.
- In the **Service instances** (formerly Application services) panel:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Use the Search box to search for a specific service instance.
- Select the Open filter icon to open the filter panel, and then select a category and a sort order by which to sort the service instance cards. Close the filter panel to apply your settings.

- On an individual service instance card, select the additional actions icon and then select one of the following options:
  - Select **View CI details** to open the CI form for the service instance CI.
  - Select **Open in new map** to open a new map in which the service instance is set as the home node.
  - Select **Set CI as home** to set the service instance as the home node on the map and redraw the map accordingly.

  Some fields, such as *Business criticality*, are color-coded to denote specific values. For example, a status of Most Critical is highlighted with a red background.

Related topics

Service Mapping data that appears on maps

Service Mapping data that appears on maps

Service instances that are populated using Service Mapping methods are included in maps. Service Mapping provides significant information for mapped service instances (application services) [cmdb_ci_service_discovered] such as relationships and grouping.

Considerations

If Service Mapping is installed and the *sn_sm_scoped_app.sa.unified_map.enabled* system property is enabled, you can access Unified Map from the Service Mapping workspace. For more information, see Access the Unified Map feature from the Service Mapping Workspace.

If Service Mapping is not installed, only service instances that are populated by CMDB-related methods appear on maps. Unified Map traverses the CMDB hierarchical data both up and down using user-specified levels.

Related topics

Configuring Service Mapping

View related items for a CI

Open the **Related items** panel in Unified Map to show all related items (typically, events such as changes, active incidents, or active problems) for the selected CI.

Before you begin

Role required:

- To access maps: sn_cmdb_user, sn_cmdb_editor or sn_cmdb_admin
- To access maps with operational application services: app_service_user, and sm_user or sm_admin
- To access maps with operational and non-operational application services: app_service_admin, and sm_user or sm_admin
- To access and view related items: itil

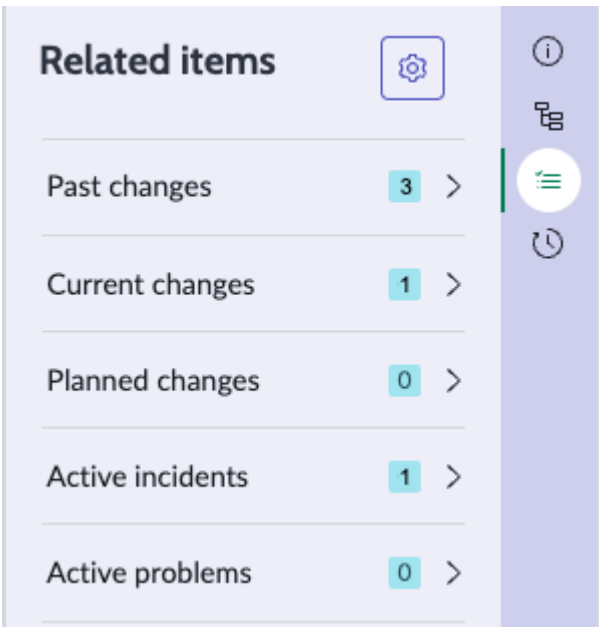
About this task

Note:
The timeline also indicates related items (events). One important difference is that the timeline indicates only historical related items — events that occurred before the timeline's map time. In contrast, the **Related items** panel lists all related items. For more information, see Viewing related items on the Unified Map timeline.

Procedure

While working in a map, select a CI on the map and then select the Related items icon . Related items are grouped by category. Badges show the count of related items for the selected CI (or for all CIs if no CI is selected).



To specify which related item categories should appear on the **Related items** panel, see Configure the Related items panel.

What to do next

- Select another CI on the map to show its related items.
- Select an empty space on the map to show all related items for all CIs on the map.
- Select a related item category with one or more items to view detailed related item cards. On a card:
  - Select the related item link to drill down to the related item record.
  - Open the filter panel to set a sorting category and order for the cards.
  - Some details, such as *Priority* and *Risk*, are color-coded using the default platform color code settings.

Configure the Related items panel

Configure which categories of related items, such as active incidents and active problems, appear on the Unified Map **Related items** panel.

Before you begin

Role required:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To access maps: sn_cmdb_user, sn_cmdb_editor or sn_cmdb_admin
- To access maps with operational application services: app_service_user, and sm_user or sm_admin
- To access maps with operational and non-operational application services: app_service_admin, and sm_user or sm_admin
- To access and view related items: itil

About this task

The Related items panel groups related items by category on the side panel. Administrators configure which related item categories are globally available, and you can further customize the settings.

Procedure

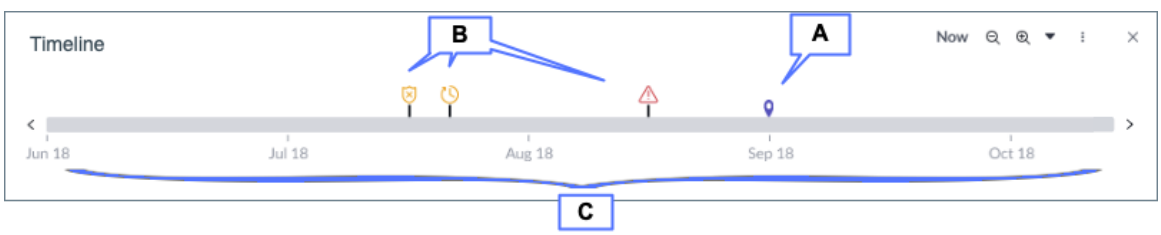
1. While working in a map, select the Related items icon .
2. In the **Related items** panel, select the User preferences icon .
3. In the Related items settings pop-up, move desired items to the **Selected items** list and undesired items to the **Available items** list.
4. Select **Apply**.
   When you select a CI on the map, the desired related item categories appear.

Viewing related items on the Unified Map timeline

The timeline indicates related items like incidents, problems, and changes over a specified period of time for the selected CI. You can use the timeline to visualize the history of changes to a CI and how they affect the topology of the CMDB.

Viewing related items

- When you first open a map, CIs and relationships appear as they are at the current moment in time. When you select a CI on the map, the timeline displays related items for the CI.
- You can drag the map time marker (A in the image) on the timeline to specify the end date (the map time) for data that should appear on the map and on the timeline. The default map time is "now", but you can specify a particular date or drag the marker to a date.
- The map and the timeline are synchronized. The map shows the selected CI and its connections as they existed (based on the creation date of nodes) at the specified map time. The timeline displays markers (B in the image) to indicate related items that happened at or before map time.



- You can also specify the overall time span (C in the image) of the timeline view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- CIs that were created after the map time don't appear on the timeline and don't affect items on the timeline.
- Multiple related items on the same date are indicated by a badge that shows the count of related items.

Actions on the timeline

Desired result	Action
Show or hide the timeline	Select the Timeline icon .
Set the map time marker (and therefore the items on the map) to the current time	Select **Now**.
Set map time to a particular date and time	Drag the map time marker.
Scroll the timeline toward the past or the future	Select an arrow at the side of the timeline.
View the date and time for a related item marker	Point to the marker.
View the details for a related item	Point to the badge for the related item.
Change the time span of the timeline	Select a zoom icon or . The time span can range from six months in the past to six months in the future. A related item that has occurred or that will occur outside the range doesn't appear on the timeline. Such related items, however, still appear in the corresponding **Related items** panel. In addition, a badge in the map might show data for the related item.
Manage a marker	Select the marker, select the more actions icon , and then select one of the following actions: • **Replace marker**: Replace the current marker with a marker for the specified date. • **Clear marker**: Clear all markers. • **Add marker**: Add a marker for the specified date.
View related items for all CIs on the map	Select an empty space on the map.

Configuring general timeline properties

Admins can configure some properties of the timeline that affect all users, such as which related item details appear on timelines. For more information, see Configure how to display related items on the map.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

View historical changes for a CI

The **Changes** panel in Unified Map displays change details such as changes to life cycle stage or operational state for the selected CI.

Before you begin

Role required:

- To access maps: sn_cmdb_user, sn_cmdb_editor or sn_cmdb_admin
- To access maps with operational application services: app_service_user, and sm_user or sm_admin
- To access maps with operational and non-operational application services: app_service_admin, and sm_user or sm_admin
- To access and view related items: itil

About this task

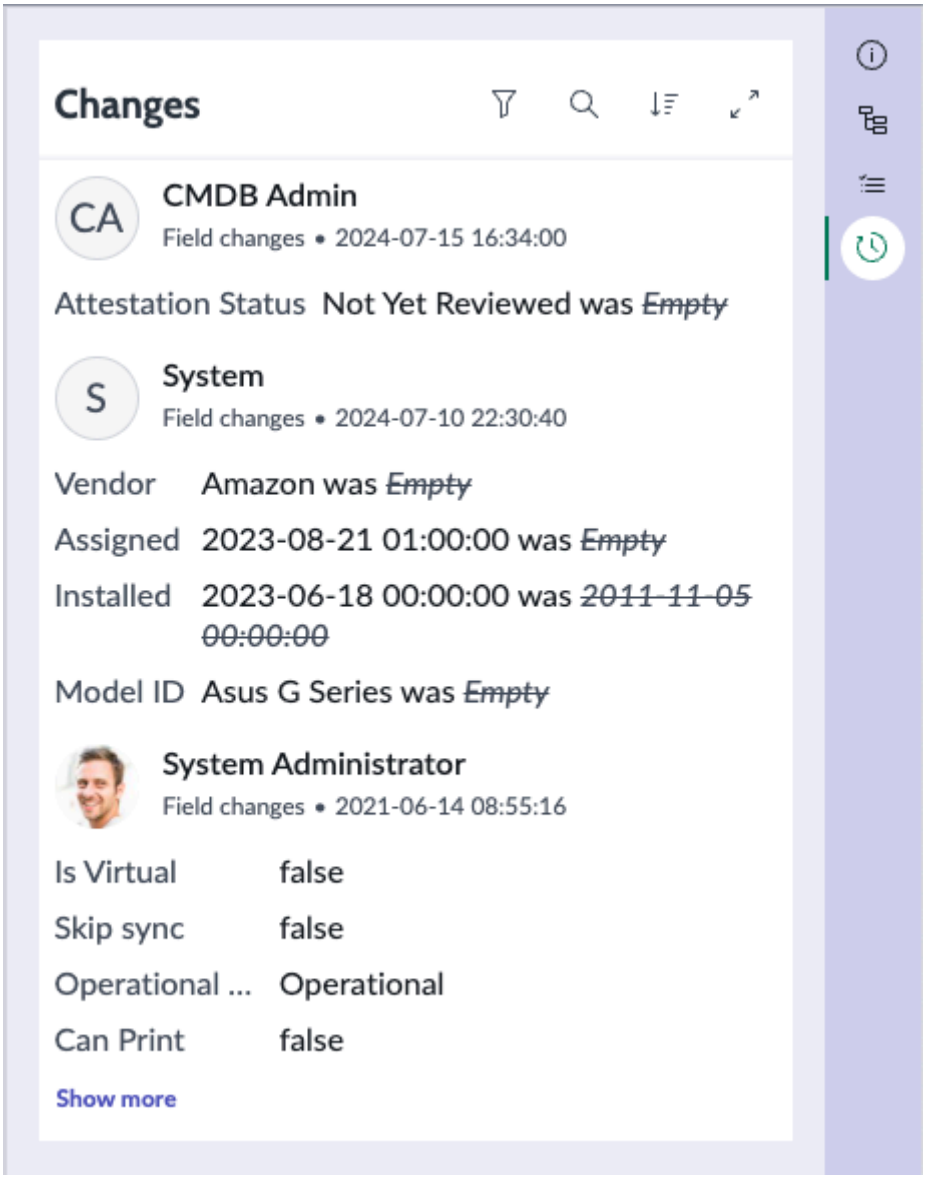
Changes are also indicated on the timeline. For more information, see Viewing related items on the Unified Map timeline.

Procedure

1. While working in a map, select a CI on the map and then select the Changes icon .

   All changes for the selected CI appear on the panel.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



- Select **Show more / Show less** for details on a card.
- Hold the cursor over a change to select the Flag as important icon to flag the change as important.

2. Perform other tasks.
   - Select another CI on the map to view its changes.
   - Select the Open filters and then select and configure any of the following filter types:
     - Post types
     - Field changes
     - Flagged
     - Filter sets
   - Select the Search icon and enter text in the Search Activity Stream field to find specific changes by entering terms.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Select the ascending or descending sort icon to toggle between ascending or descending sort.
- Create a filter set to supplement the existing filtering options on the Changes panel. You can save filter settings for reuse. For more information, see Create or manage a user preset.

Viewing related items on the Unified Map timeline

Editing maps in Unified Map

While you work in the map editor, you can add a CI to the map and remove (hide) a CI from the map. Removing a CI node from a map deletes the records of the CI's relationships, but does not delete the CI record from the CMDB. You can also add, modify, and delete CI relationships in the CMDB.

Actions you can take in the map editor

You can perform the following actions in the map editor:

- Right-click a CI, relationship, or anywhere in the map to open a context menu.
- Select the Attributes icon to manage CIs and relationships.
- Select the Add CI icon to add an existing CI and its existing relationships to the map.
- Select a relationship or CI and then select the Manage relationship icon to add, update, or delete relationships.
- You can remove a CI from the map only if you added it during the current editing session. You cannot remove CIs that were on the map when you started the editing session. Select **Remove** for a CI to delete the CMDB records for all relationships to and from the CI. The CI is removed from the map, but the CI record isn't deleted from the CMDB.

Working in the map editor

- You must have either the sn_cmdb_admin or sn_cmdb_editor role to use the map editor.
- Before editing a map, prepare it to optimize your experience. Use filters and levels to display the minimum set of CIs to work on. Minimizing the map makes it easier to understand and control the effects of changes that you make.
- To edit a map, select the edit map icon . A thick blue outline on the map indicates that the map editor is active.
- While you work in the map editor, no changes are made to the CMDB until you select **Save**.
- During an editing session, related items and associate badges are not shown on the map.
- At any time, select the reset icon to undo all unsaved changes.
- End an editing session by selecting **Exit**. You must exit the editor to access the timeline and controls (search, filter, zoom, and so on).

Adding a CI to or removing a CI from the map

- You can view an existing CI on the map to enable you to create, modify, or delete its connections.
- You can add only CIs that have existing records in the CMDB.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If you try add a CI that already has a connection to another CI on the map, the map re-centers and the CI is highlighted. In some cases, due to filter settings, the CI isn't displayed.
- An added CI appears on the map but its CMDB record isn't changed unless you change the CI's connections and save the changes. After you add a CI, it is saved to the map only if it has a path (direct or indirect) to the home node.
- When you delete all connections between one CI and another CI so that no connection path remains to the home node, the isolated CI and all of its downstream connections are considered an island branch. When you save, changes that you made to downstream connections are saved and the island branch CI is removed from the map (hidden). The CI record is not, however, removed from the CMDB.
- When you remove (hide) a CI from the map, the record of the CI in the CMDB is not deleted. In contrast, connection records for a removed CI are affected as described in Deleting a connection.

Creating or modifying a connection (relationship or reference) between CIs

Use the map editor to add a connection between two CIs or to modify an existing connection.

To learn more, see CI relationships in the CMDB.

Deleting a connection

> **Warning:**
> Deleting a connection might result in an invalid CMDB state.

Connections that are not editable are dimmed and view-only.

- When you delete a connection, the connection is removed from the map (hidden). The relationship is deleted from the [cmdb_ci_rel] table only when you save your changes.
- When you delete all connections between one CI and another CI so that no connection path remains to the home node, the isolated CI and all of its downstream connections are considered an island branch. When you save, changes that you made to downstream connections are saved and the island branch CI is removed from the map (hidden). The CI record is not, however, removed from the CMDB.
- When you delete all connections to and from a CI and save the change, the following actions occur:
  - The records of all relationships — both upstream to and downstream from — the CI are deleted from the CMDB [cmdb_ci_rel] table.
  - The CI is removed from the map (hidden).
  - The record of the CI in the CMDB is not deleted.

Limitations

The map editor does not support the following actions:

- Editing mapped application services (service instances).
- Deleting a CI record from or adding a CI record to the CMDB.
- Adding endpoint CIs to or removing endpoint CIs from the map.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Deleting reference or endpoint connections or removing from the map a CI that has reference or endpoint connections.
- Updating the applicative flow relationship type (connection between endpoint CIs).

Create or modify a connection using the map editor

Delete a connection using the map editor

Add a CI to a map using the map editor

You can view an existing CI on the map to enable you to create, modify, or delete its connections.

Before you begin

Role required: sn_cmdb_admin or sn_cmdb_editor

About this task

- You can add only one CI at a time.
- You can remove an added CI from the map if you have not yet saved the CI to the map.
- You can add only CIs that have existing records in the CMDB.
- If you try add a CI that already has a connection to another CI on the map, the map re-centers and the CI is highlighted. In some cases, due to filter settings, the CI isn't displayed.
- An added CI appears on the map but its CMDB record isn't changed unless you change the CI's connections and save the changes.
- The map editor doesn't support adding endpoint CIs.
- After you add a CI, it is saved to the map only if it has a path (direct or indirect) to the home node.

Procedure

1. While working in a map, select the edit map icon and then take one of the following actions:
   - Right-click in a blank spot on the map and select **Add CI**.
   - Select the Add CI icon .
2. On the Add a CI panel, specify the class of CI to add.
3. Define a filter that will generate a list of CIs of the class that you specified.

   a. Select one CI in the filtered results list and then select **Apply filters**.

   b. **Optional:** Save the condition set as a custom filter for future use.

   Select the save custom icon and specify a name for the filter. You can select the filter whenever you add a CI.
4. To add a CI that is already connected to another CI on the map, select **Add to map** or skip this step for a CI that is not yet connected to another CI on the map.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The map re-centers on the added CI. Skip the remaining steps.

5. To add a CI that is not yet connected to another CI on the map, select **Add to map and connect**.

   The map re-centers on the added CI and the Manage connection panel opens.

6. On the Manage connection panel (), specify the settings.

Manage connection panel

Field	Description
Source CI	You can select the swap icon to swap source and target. **Note:** In the context of a CI relationship, this is the parent CI.
Target CI	You can select the swap icon to swap source and target. **Note:** In the context of a CI relationship, this is the child CI.
Show suggested relationships	Option to control the contents of the **Relationship type** selection box: The relationship types that are most appropriate for the two CIs appear at the top of the list.
Relationship type	The relationship between the CIs. For example, the relationship between the parent 'Tomcat' and the child 'WAR File' is *`Contains::Contained By`*.

7. When you have specified all connection settings, select **Create connection**.

Remove a CI from a map using the map editor

You can remove (hide) a CI from the map only if you added it during the current editing session. You cannot remove CIs that were on the map when you started the editing session.

Before you begin

Role required: admin

About this task

The following things happen when you remove (hide) a CI from the map:

- The CI no longer appears on the map, but the CI record isn't deleted from the CMDB.
- The records in the [cmdb_ci_rel] table for all relationships to and from the CI are deleted.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

While editing a map, take one of the following actions:

- Select the CI and then select **Remove** in the Attributes panel.
- Right-click the CI and then select **Remove**.

Create or modify a connection using the map editor

Use the map editor to add a relationship between two CIs or to modify an existing relationship.

Before you begin

Role required: sn_cmdb_admin or sn_cmdb_editor

About this task

- A solid line indicates a relationship. The arrowhead indicates the dependent node.
- A dashed line indicates a reference.
- A badge on a line indicates the number of relationships between the CIs.

Two CIs might be connected by one or more relationships (stored in the CI Relationship [cmdb_rel_ci] table). For example, two CIs might be connected by the *`Runs On::Runs`*, *`Depends On::Discovered From`*, and by the *`Owned By::Owns`* relationships.

You can learn more about relationships at CI relationships in the CMDB.

The map editor does not support the following actions:

- Editing mapped application services (service instances).
- Deleting reference or endpoint connections or removing from the map a CI that has reference or endpoint connections.
- Updating the applicative flow relationship type (connection between endpoint CIs).

Note:
At any time, select the reset icon to undo all unsaved changes.

Procedure

1. While editing a map, specify whether to create or modify a connection.

2. On the Manage connection panel ( ), specify the settings.

Manage connection panel

Field	Description
Source CI	You can select the swap icon to swap source and target. **Note:** In the context of a CI relationship, this is the parent CI.

Editing maps in Unified Map

Delete a connection using the map editor

Delete a connection using the map editor

While editing a map, you can delete a connection (a relationship record) from the CMDB. The CIs that are involved in the connection are not deleted from the CMDB.

Before you begin

Role required: sn_cmdb_admin or sn_cmdb_editor

About this task

Warning: Deleting a connection might result in an invalid CMDB state.

The map editor does not support the following actions:

- Editing mapped application services (service instances).
- Deleting reference or endpoint connections or removing from the map a CI that has reference or endpoint connections.
- Updating the applicative flow relationship type (connection between endpoint CIs).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- When you delete a connection, the connection is removed from the map (hidden). The relationship is deleted from the [cmdb_ci_rel] table only when you save your changes.
- When you delete all connections between one CI and another CI so that no connection path remains to the home node, the isolated CI and all of its downstream connections are considered an island branch. When you save, changes that you made to downstream connections are saved and the island branch CI is removed from the map (hidden). The CI record is not, however, removed from the CMDB.
- When you delete all connections to and from a CI and save the change, the following actions occur:
  - The records of all relationships — both upstream to and downstream from — the CI are deleted from the CMDB [cmdb_ci_rel] table.
  - The CI is removed from the map (hidden).
  - The record of the CI in the CMDB is not deleted.

You can learn more about relationships at CI relationships in the CMDB.

At any time, select the reset icon to undo all unsaved changes.

Procedure

1. While editing a map, take one of the following actions:

   Note:
   No deletions happen until you select **Save**.

   - To delete a single connection, select it and then select **Delete** in the Attributes panel. Alternatively, right-click the connection and then select **Delete**.
   - To delete only particular connections for a CI, select the CI. In the editing panel, scroll to the connections and select **Delete**.
   - To delete all connections both upstream and downstream of a CI, select the CI and then select **Remove CI**.
2. Deletions happen when you select **Save**.

Dependency Views

ServiceNow® Dependency Views graphically displays an infrastructure view for a configuration item (CI) and the application or business services that it is part of and that it supports. Dependency Views indicates the status of its configuration items, and allows access to CIs related alerts, incidents, problems, changes, and services.

If Service Mapping is activated, Dependency Views maps are enhanced to display dependencies that reflect connections in service maps.

Supported browsers for Dependency Views

The latest version or service pack of internet browsers are required to view and manipulate Dependency Views maps.

The Dependency Views module supports the latest version or service pack of the following browsers:

- Firefox with the latest ESR
- Chrome latest version
- Safari version 8 or later (latest is recommended)
- Microsoft Internet Explorer (IE) version 11 and Microsoft Edge.

The Dependency Views module is not supported on tablets and on mobile devices.

Domain separation and Dependency Views

Domain separation is unsupported in Dependency Views. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

How domain separation works in Dependency Views

Dependency views are generated using both Configuration Item [cmdb_ci] and CI Relationship [cmdb_rel_ci] tables. The [cmdb_ci] table is domain separated, but the [cmdb_rel_ci] table is not. You can create relationships only by selecting two CIs. They should be in the same domain for you to be able to see them.

To be successful with domain separation in Dependency Views, make sure that relevant CIs are visible for the current domain. If the instance is domain separated, ServiceNow domain separation rules apply (see Related information link below).

Tenant domains will be able to see only their domain and global CIs.

Domain separation for service providers

Dependency Views map

ServiceNow® Dependency Views maps graphically display CIs that support application or business services and the relationships between the CIs.

The CMDB Workspace store app provides the Unified Map feature as an alternative to using Dependency Views. Unified Map combines the capabilities of Dependency Views and Service Mapping into a single map experience.

A ServiceNow service (application service or business service) is work or goods that are supported by an IT infrastructure. For example, delivering email service to an employee can require services such as email servers, web servers, and the work to configure the user's account.

A Dependency Views map has one starting point, called the root CI or root node of the map. The root CI is surrounded by a darker frame that repaints itself with a pulsing effect drawing the attention to the root CI. The maps can show both upstream and downstream dependencies for the root CI. By default the Dependency Views map displays 3 levels, both upstream and downstream relationships. Administrators can configure the number of levels displayed. The map collapses and expands clusters to make them easier to view. By default, clusters are collapsed.

In a Dependency Views map, map indicators indicate if a CI has any active, pending issues. You can investigate the tasks that are connected to a CI to get more details. When you return to the map from another form, the system restores the last map viewed, using the default filter and layout settings. When you click the icon ( ) on a CI record or on a task record that identifies a CI, the map opens.

Many of the relationships in map are created through the discovery process. You can also create, define, and delete CI relationships in the map. You can display the map from different

Node menu

The following options are available if you right-click a node.

View Form	Displays the CMDB record of the selected CI in a new tab of the browser.
View Map	Reloads the map using the selected CI as the new root node, with the currently defined layout setting. This option does not display on the root node.
View Related Tasks	Displays all tasks or outages associated with the selected CI, including incidents, problems, change requests, and follow-on tasks. This option is always available, even if there are no tasks associated with the CI. This option does not appear on collapsed nodes.
View Affected CIs	Shows a list of all tasks that have the CI listed as an Affected CI. This option is only visible when you access the map from the map icon in a task record's Configuration item field.
View Related Outages	Displays all outages involving the selected CI. This option only appears when there is an outage associated with the CI. This option does not appear on collapsed nodes.
Add Relationship	This option displays a dotted green line that you can drag to another CI to create a relationship link. A popup dialog allows you to define the relationship type.
Expand	Displays all CIs and components within a clustered node, or virtual groups (virtual nodes that appear when *glide.bsm.too_many_children* is reached). This option appears only if the node is a cluster node or a virtual group node. If **Load More** was previously used, then **Expand** reverts the results of the **Load More** operation. The number of additional icons to display is bound by the value of the *glide.bsm.max_nodes* property.
Collapse	Collapses all CIs and components within a cluster node back to a single node. Also, collapses a virtual group that has been expanded. This option only appears if the node has been expanded using the **Expand** menu item. If **Load More** was previously used, then **Expand** reverts the results of the **Load More** operation.
Run Layout From Here	This option re-runs the chosen layout using the current node. Use this option to get a new or clearer view on the same map.
Load More	Starting at the selected icon, loads the next level of the map, past the setting of **Max Levels**. Virtual grouping is not applied at the newly loaded level even if the criteria for virtual grouping is met. The number of additional icons to display is bound by the value of the *glide.bsm.max_nodes* property.

Relationship menu

The following options are available if you right-click a relationship link.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

View Relationship Form	Opens the **CI Relationship** form. You can modify the **Parent**, **Type**, and **Child** of the relationship from this form.
Modify Relationship	Searches for and selects a new relationship for this link.
Delete Relationship	Deletes a relationship. The relationship is deleted after prompting for confirmation.

Cluster nodes in a Dependency Views map

Dependency Views maps can display cluster group nodes alongside individual CI nodes, and the child nodes of these cluster groups.

Clusters are CIs in the Cluster [cmdb_ci_cluster] table. A cluster CI is an organized set of computer CIs that work together as a single system. Each node in a cluster group represents a CI, typically a server, that can have referenced hardware, such as disks and network adapters.

Cluster nodes on a Dependency Views map can display in two modes:

- Collapsed mode: Displays only the cluster CI node without its child CI nodes. This mode avoids unnecessary clutter in large maps.
- Expanded mode: Displays the cluster CI node and all its child CI nodes.

Menu options available for a clustered node include **Collapse** and **Expand**, which allow you to control the density on the map.

By default, Dependency Views collapses all cluster groups and displays clusters in collapsed mode on the map.

Annotation

Icons for cluster nodes and cluster group CI nodes are noted by the string "Cluster" and by a unique cluster icon. The system searches through all the component nodes in a cluster CI or collapsed node looking for tasks, outages, and trouble, such as incidents, problems, or change requests. This search evaluates only the number of levels that are displayed in the diagram.

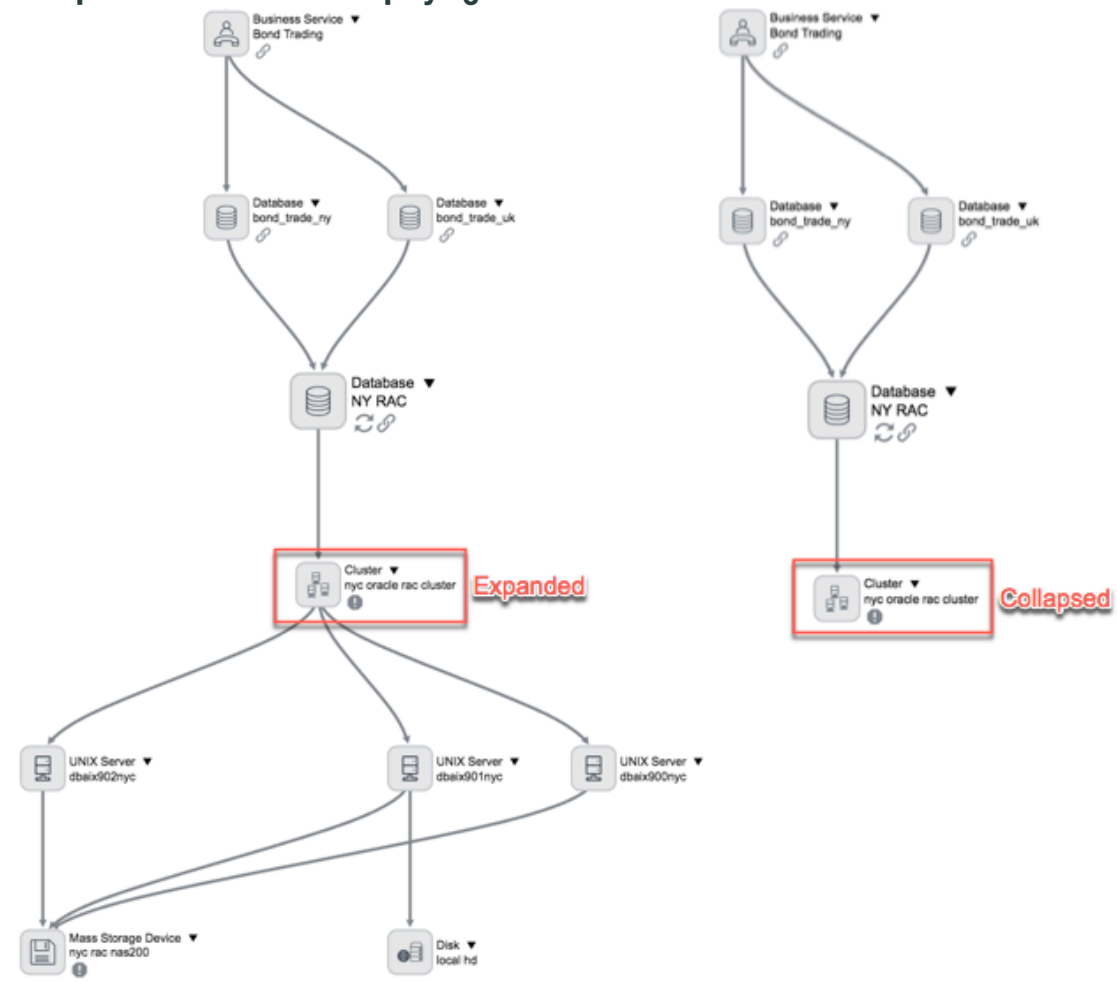
An expanded cluster node displaying its child nodes



Virtual grouping of nodes in a Dependency Views map

To reduce the density on a map, Dependency Views automatically groups CIs of a similar CI type from the same level.

A large number of nodes can cause a Dependency Views map to become too dense to be helpful. Therefore, if the number of nodes with a similar CI type from same level, exceeds the value of the *Maximum number of nodes (of a similar CI type and at the same level) to display before applying virtual grouping* property, then those nodes are automatically grouped into a virtual group. A single node, the virtual group node is displayed to represent the virtual group, while all actual nodes in the virtual group (that are of a similar CI type), are hidden. Virtual group nodes represent CIs of a similar CI type but are not CIs by themselves and cannot have tasks assigned to them. The number of actual collapsed nodes in the virtual group is noted on the virtual group node.

By default, child nodes of a virtual group are not displayed. You can enable the *Show children of virtual groups* property to display child nodes underneath virtual groups.

Virtual grouping is not applied at the level underneath a virtual group even if the criteria for virtual grouping is met (the number of nodes with a similar CI type from that level exceeds the preconfigured property value). However, virtual grouping can happen at the following level if that criteria is met. This behavior does not depend on any property settings, and you cannot change it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Menu options for a virtual group include **Expand** and **Collapse**, which allow you to apply virtual grouping and display only the virtual group node, or to undo the virtual grouping and display all actual nodes.

Virtual links

A virtual node is connected to other nodes with a virtual link. A virtual link denotes that there such link between at least one CI in the virtual group, to another CI node on the map.

Note:
Predefined filters do not apply to virtual groups. Therefore a virtual group displays even if it contains CIs that a predefined filter would have excluded. Upon the expansion of a virtual group, predefined filters are applied, and any or all of the CIs that were previously virtually grouped, might no longer display on the map.

Also, when using the node menu option **Load More**, virtual grouping is not applied at the newly loaded level even the criteria for virtual grouping is met.

An expanded virtual group

Properties for Dependency Views

Use Dependency Views

Use the layout controls on a Dependency Views map to display elements in different configurations for easier management. Use the filter panel on the map to display fewer levels or to filter out elements you don't want to see, then save the filter for use later. Draw new relationships between elements or edit existing relationships.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

View a Dependency Views map

When you display a Dependency Views map, the map is centered on the root CI and displays the layout and number of levels defined in the map properties. If Operational Intelligence is activated, then a Dependency Views map provides a mode that lets you directly access metrics information for the CIs on the map.

Before you begin

Role required: dependency_views (see general requirements)

General role requirements:

- To access a Dependency Views map from either the navigation menu, a script API, or directly from a URL, the minimum role required is the dependency_views. Some operations that are related to icons, indicators, and menu actions require the ecmdb_admin role. Some operations that are related to properties and dependency types require the admin role.
- Dependency Views enforces ACL permissions on CIs, and visually hides them and their relationship from the map if the permission requirement is not met.

About this task

The maps generated by Dependency Views are based on D3 and Angular technology, providing a modern interactive graphical interface to visualize configuration items and their relationships.

If Service Mapping is activated, Dependency Views maps are enhanced to display dependencies that reflect connections in service maps. In addition, the list of related services in the **Details** section, includes application services, and technical and manual services if Event Management is activated. All CIs that are included in a service, are displayed underneath the service node on the map.

Maps provided by Service Mapping are for application services, including comprehensive maps from the perspective of application services. For more information, see Service Mapping.

Administrators can configure the setting for the default layout of the map and number of levels displayed. When you access the map from a saved view, the map opens using the properties in the saved view, and not the default map properties.

Procedure

Navigate to **All** > **Dependency Views** and open one of these modules:

- **View Map in New Tab**: Opens the map in a new, full screen tab without the application navigator.
- **View Map**: Opens the map in the content pane of the current tab.
- **Saved Views**: Opens a view of a map that you previously saved.

  Click a number in the **Version** column, and then click the Display Dependency Views map icon ( ).

Save or load a Dependency Views map

In the **View Map** module, use the menu icon to save and load Dependency Views maps.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Dependency Views** > **View Map**.
2. Click the View menu icon ( ).
3. Select **Save View**, **Load View**, or **Last View**.

Delete a saved Dependency Views map view

Use the **Saved Views** module to delete a previously saved view.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Dependency Views** > **Saved Views**.
2. Select the check box for map view that you want to delete.
3. Select **Delete** from the **Actions on selected rows** drop-down menu.

Change the layout of Dependency Views map

You can select from different layout options for your Dependency Views map.

Before you begin
Role required: none

Procedure

1. Navigate to **All** > **Dependency Views** > **View Map**.
2. Select one of the following layout options from the menu across the top of the view.
   - **Vertical**: Displays the elements in a vertical tree pattern according to their upstream and downstream relationships. This is the default value for the initial display of the map.
   - **Horizontal**: Displays the elements in a horizontal tree pattern according to their upstream and downstream relationships.
   - **Radial**: Displays the elements in a radial pattern according to their upstream and downstream relationships.
   - **Force**: Centers the elements around the parent CI, regardless of upstream or downstream relationships.
   - **Group**: Groups the elements according to their CI type.
   - **Details**: Displays related alerts, incidents, problems, and related services.

     Related Services displays application services related to the CIs currently displaying in the map. If Event Management is activated then technical services and manual services are included. You can double-click a service to display the map in the Event Management dashboard.

Filter the view of a Dependency Views map

Filter a Dependency Views map to display specific types or categories of configuration items.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Use the filter panel to control which elements of the map are displayed and to save versions of a filter for later use.

Procedure

1. Navigate to **All** > **Dependency Views** > **View Map**.
2. Click the Map settings icon to open map settings.

Map settings

Filter panel strips and options	Description
Save Custom Settings	Configure desired custom settings, then enter a name and click **Save**. Custom settings can be loaded by using the **Load Saved Custom Settings** option. Navigate to **Dependency Views** > **Saved Settings** > to display all saved custom settings.
Load Custom Settings	Apply previously saved custom settings to the current map.
Predefined Filters	Apply previously defined filters consisting of configuration type, CI type, and relationship filters. You can Set a predefined filter as default. This filter is applied first, before any other filters (such as **Filter CIs by Depth**) are applied.
Dependency Type	Apply a filter that runs in real time and generates a custom view of a service map for a specific CI.
Max Levels	Designate how many levels from the root CI display on the map.
Filter CIs by Depth	Designate which levels of CI display on the map.
Filter CIs by CI Type	Designate what CI types display in the map.
Filter CIs By CI Location	Designate what CI locations display in the map.
Filter CIs By CI Manufacturer	Designate what CI manufacturers display in the map.
Filter CIs By Audit Failure	Hides CIs that failed the CMDB health staleness test. This option is available only if there are any such CIs.
Filter Relationship Types	Designate what relationship types display in the map.
Map Indicators	Designate what types of tasks display and get counted in the map.
Remove Filtered Items	**Off:** Gray out filtered items on the map. **On:** Do not display filtered items on the map.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Filter panel strips and options	Description
Run Layout Automatically	**On:** The configured layout to the map is reapplied whenever the filter is changed. **Off:** The map layout remains static when the filter is changed.
Fit to Screen Automatically	**On:** The map magnification will increase or decrease automatically to display all CIs on the map. **Off:** The map magnification remains unchanged when the map is reloaded.

3. Click a filter strip to expand or collapse it, and to set filter items.

View metrics for CIs in a Dependency Views map

Operational Intelligence processes metrics data for CIs, calculates statistics and aggregations, and detects metrics anomalies. A Dependency Views map lets you switch to metrics mode to directly access the Insights Explorer that displays metrics data for CIs on the map.

Before you begin

The Operational Intelligence (com.snc.sa.metric) plugin must be activated to enable this functionality, and metrics data needs to be processed for the CIs on the Dependency Views map.

Role required: admin

About this task

Open a Dependency Views map in metric mode which integrates a Dependency Views map with the Insights Explorer functionality that is tailored to the map. In this mode, you can access Insights Explorer functions directly from the map, to explore metrics data for the CIs on the map. All map CIs are accessible in the right hand side pane, from where you can drill into metrics data.

Procedure

1. Navigate to **All** > **Dependency Views** > **View Map** to open a map.
2. Right-click on a CI on the map and select **View Metrics** to open the Dependency View map in metrics mode.
   In the panel on the right side, the CI that you selected on the Dependency View map is selected by default, and the list of all the metrics available for that CI are displayed.
3. Click the '**<**' sign on the left of the CI to display all the CIs that you can explore metrics for.
   The Insights Explorer is scoped for exploring only the CIs that currently display on the Dependency Views map, and you cannot add or remove CIs from the list. If you use map settings or filters to filter out CIs from the map, the same filtering will apply to the list of CIs that you can explore metrics for.
4. Click on a CI in the CIs list or right-click on a CI on the Dependency Views map, to drill down to the CI's metrics.
5. Click the **Dependencies Map** tab or the **Metrics** tab to switch modes:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In **Metrics** mode: The full functionality of the Insights Explorer is available, you can create metric charts by dragging metrics into the canvas.
You can modify chart settings, select different time ranges for the charts, and perform other actions as described in View metric values in the Insights Explorer.

b. In **Dependencies Map** mode: Select a CI on the map to drill down to its metrics data, drop-down the **Layout** list to choose a different layout, or modify map settings.

Perform actions on nodes in a Dependency Views map

You can view various related items for the nodes in a Dependency Views map.

About this task

If the node is a collapsed node or represents a cluster, the incidents, problems and change requests are for all the collapsed nodes.

Procedure

1. Navigate to **All** > **Dependency Views** > **View Map**.
2. Click the Node menu icon ▼ next to a node or right-click a node on the map to access the following menu items:

Node Menu

View Form	Displays the CMDB record of the selected CI in a new tab of the browser.
View Map	Reloads the view using the selected CI as the new root node, with the currently defined layout setting. This option does not display on the root node.
View Related Tasks	Displays all tasks or outages associated with the selected CI, including incidents, problems, change requests, and follow-on tasks. This option is always available, even if there are no tasks associated with the CI. This option does not appear on collapsed nodes.
View Affected CIs	Shows a list of all tasks that have the CI listed as an Affected CI. This option is only visible when you access the view from the view icon in a task record's Configuration item field.
View Related Outages	Displays all outages involving the selected CI. This option only appears when there is an outage associated with the CI. This option does not appear on collapsed nodes.
Add Relationship	This option displays a dotted green line that you can drag to another CI to create a relationship link. A popup dialog allows you to define the relationship type.
Expand	Displays all CIs and components within a cluster node or a collapsed node. This option only appears if the node is a collapsed or cluster node. The number of additional icons to display is bound by the value of the *glide.bsm.max_nodes* property.
Collapse	Collapses all CIs and components within a cluster node or a collapsed node back to a single node. This option only appears if the node has been expanded using the Expand menu item.
Run Layout From Here	This option re-runs the chosen layout using the current node. Use this option to get a new or clearer view on the same map.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Load More	Starting at the selected icon, loads the next level of the map, past the setting of **Max Levels**. The number of additional icons to display is bound by the value of the *glide.bsm.max_nodes* property.

Export a Dependency Views map

Export a Dependency Views map to an image in PNG format.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Dependency Views** > **View Map**.
2. Configure the map view as you want the image to appear.
   The exported image displays the current view of the map.
3. Click the view menu icon ( ).
4. Click **Export Image**.
5. Right-click the image and select **Save Image As**, **Print**, or any other menu option.

   Note:
   You can't export images from a Dependency Views map using Internet Explorer as your browser.

6. Click the "X" button to close the **Export Image** window.

View collapsed nodes in a Dependency Views map

Cluster and virtually grouped nodes can be displayed in a collapsed mode to avoid unnecessary clutter in large maps.

Procedure

1. To expand a collapsed node, right-click the CI and select **Expand** from the context menu.
2. To collapse an expanded cluster node with children, right-click the CI and select **Collapse**from the context menu.

Administer Dependency Views

Users with the admin role can control the appearance and behavior of Dependency Views by configuring map indicators, map related items, map icons, and menu actions.

Create or modify map indicators

Dependency Views maps and application service maps, use icons to display additional information for a CI by displaying its related records such as alerts, outages, incidents and problems. These icons are called map indicator.

Before you begin
Role required: admin

About this task
The default configuration includes map indicators for the following record types:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Open incident.
- Open alert.
- Unplanned current outage.
- Planned current outage, or an open problem.
- Current, planned, or recent change request.

You can filter out the display of affected CIs, alerts, current change requests, incidents and problems from the map settings menu.

The Affected CI's map indicator appears for CIs in two related but not identical situations. It appears for CIs for which tasks such as change request, incident, or problem were directly created for, and for any CIs that were added in those tasks (parent tasks) as Affected CIs (The CI for which a task is directly created for, is automatically added as an affected CI in that task). The state of affected CI's depends on the status of the respective parent task. For as long as the parent task is active, the associated affected CIs continue to be impacted by the task issue. In a map, the Affected CI's indicator displays for all affected CIs for as long as the parent task is active. On a map, the Affected CI tooltip displays the details of the task records in which the CI was added as an affected CI. However, the **Details** pane does not contain an Affected CI's tab, and no further details about affected CIs, or the associated tasks are displayed. After the parent task is closed, the Affected CI's indicator no longer displays for any of the tasks' affected CIs. For information about affected CIs in Change Management, see Associate CIs to a change request.

Note:
Details about affected CIs are derived from the *task* and the *cmdb_ci* tables and their extensions. Therefore, if you use custom tables to store CIs for incidents, problems and changes, it affects the details that are displayed for affected CIs.

For more information on how map indicators are used to show tasks and outages in clusters and collapsed nodes, see Cluster nodes in a Dependency Views map.

Procedure

1. Navigate to **All** > **Dependency Views** > **Map Indicators**.
2. Click **New** to create a new map indicator, or click the name of an indicator from the **Table** column to modify an existing map indicator.
3. Fill in the fields on the form, as appropriate.

Map Indicator form

Field	Description
Table	Name of the table represented by this map indicator. **Note:** The list shows only tables and database views that are in the same scope as the map indicator. Views are not supported, although included in the list.
Name	Name of the indicator.
Order	Priority order of the task. The highest priority task is the indicator with the lowest order number.
Icon	File name and path of the icon image file, which can be a system image.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ To create a new icon, see Create or modify map icons ○ To create or use a system image see Storing images in the database.
CMDB CI field	Name of the field on the selected table that contains the configuration item.
Start field	Record property that determines the time-point on the metric chart timeline for placing records in the Insights Explorer. Possible values depend on the selected **Table**. For example, the incident indicator has values such as **Actual end**, **Actual Start**, and **Approval Set**.
Description field	Name of the field on the selected table that contains the description of the configuration item.
Description	Text to display when hovering over the indicator. Alphanumeric characters and spaces are valid for this field.
Conditions	Condition builder that specifies for which CIs to apply this indicator. For example, a CI that has a current past outage is highlighted for 5 days. You can configure a condition to designate a different timeframe for what is considered to be current.
Active in Service Map	Toggle that you can enable to make the specified table available in the Settings dialog box for application service maps. You can then toggle between displaying or not displaying the respective records on the map.
Active Dependencies	Toggle that you can enable to make the specified table available in the Settings dialog box for Dependency Views maps. You can then toggle between displaying or not displaying the respective records on the map.
Active in Metrics	Enable to make the toggle for the specified table available in the Settings dialog box for the Insights Explorer. You can then toggle between displaying or not displaying the respective records on the Insights Explorer.
Label	Text to display for the indicator on the map.
Tooltip Label	Prefix portion of the tooltip (Tooltip Label : Tooltip info).
Tooltip Info	Suffix portion of the tooltip (Tooltip Label : Tooltip info).

4. Click **Submit** to enter a new map indicator or click **Update** to modify an existing map indicator.

Result
For an indicator to appear in a Dependency Views map, a CI must meet all filter conditions, and **Active Dependencies** must be selected.

Create or modify map icons

Upload new icons or modify existing icons to customize the icon displayed for a CI in maps in Dependency Views, Service Mapping, and Event Management.

Before you begin
Role required: admin

About this task
The icons used in Dependency Views maps are listed in the Map Icons module. Records in the **Map Icons** list are arranged by CI classes, such as cmdb_ci_linux_server. The path to the default image files is https://<instance name>.service-now.com/images/app.ngbsm/<image name.svg>. For information about uploading images to the database, see Storing images in the database.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: admin or cmdb_admin roles are required to access the records in this table [ngbsm_icon] to upload new icons.

Procedure

- Navigate to **All** > **Configuration** > **CI Class Manager**, and do the following actions:
  1. Click **Hierarchy** to display the CI Classes list.
  2. Select a class to modify the icon for.
  3. In the class navigator bar, expand **Class Info** and then select **Basic Info**.
  4. On the Basic Info form, click **Icon**.
  5. In the Icons dialog box, select an icon and then click **Update**.
  6. On the **Basic Info** form, click **Update**.
- Navigate to **All** > **Dependency Views** > **Map Icons**, and do the following actions:

1. Click **New** to create a new map icon or click the name of an existing icon in the **Label** column to modify an existing icon.

2. On the form, fill in the fields.

Map Icons form

Field	Description
CI Type	Label or the informal name of the CI table that this icon represents in the view.
Icon	Name of the icon.
URL	Path to the icon image using the following format: `/image name.svg` Click the lock icon to enter a new path.

3. Fill in the fields on the form, as appropriate.

4. Click **Submit** to enter a new icon or click **Update** to modify an existing icon.

What to do next
You can modify a Dependency Views map indicator to use the new icon.

Create a predefined filter

Create filters to narrow down the CIs that are displayed on a Dependency Views map. You can create filters that are based on CIs' class, CIs' attributes, or CIs' relationships.

Before you begin
Role required: ecmdb_admin

About this task
Create a predefined filter that you can then select to determine the scope of the CIs that are displayed in a Dependency Views map. **Configuration type** filters filter by CI class, **CI filters** filter by CI attributes, and **relationship filters** filter by relationships. Only CIs that match at least one of the configuration type filters (if any exists), and at least one of the CI filters (if any exists), and at least one of the relationship type filters (if any exists) - are displayed on the map. If no filters are defined, then no filtering is applied.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Predefined filters do not apply to virtual groups. Therefore a virtual group displays even if it contains CIs that a predefined filter would have not included. Upon the expansion of a virtual group, predefined filters are applied, and any or all of the CIs that were previously virtually grouped, might no longer display on the map.

Procedure

1. Navigate to **All** > **Dependency Views** > **Predefined Filters**.
2. On the **Predefined Filters** page, click **New**.
3. Type in a **Name** for the filter.
4. Click **Roles**, and in the **Roles** dialog box, select the roles that this filter will be available for.
5. Right-click on the page header, and click **Save**.
6. Create a configuration type filter:
   a. Click **Configuration Types**, and then click **Edit**.
   b. In the **Collection** list collector, select the classes that CIs must belong to in order to be displayed on the map, and move them to the **Configuration Types List**.
   c. Click **Save**.
7. Create a CI filter:
   a. Click **CI Filters**, and then click **New**.
   b. In the **CI Filters** page enter conditions to filter CIs by specific attribute values.
   c. Click **Submit**.
8. Create a relationship type filter:
   a. Click **Relationship Type**, and then click **New**.
   b. In the **Collection** list collector, select the relationships that CIs must have in order to be displayed on the map, and move them to the **Relationship Types List**.
   c. Click **Save**.

What to do next

After creating a predefined filter, you can apply it to a map:

1. Click the Map settings icon to open **Map Settings**.
2. Select a filter from the **Predefined Filters** list.
3. Click **Apply**.

Related topics

Filter the view of a Dependency Views map

Set a predefined filter as default

You can set a custom predefined filter as the default predefined filter for viewing maps.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Create the custom predefined filter to be used as the default predefined filter.
2. On the predefined filter form, click the context menu and select **Copy sys_id**.
3. Navigate to **User Administration** > **User Preferences**.
4. Click **New** and create a new user preference record using these values:
   - **Name**: ecmdb.ciview
   - **Type**: String
   - **Value**: Paste the sys_id of the custom predefined filter
   - **User**: Leave blank to create a system-wide setting
   - **Description**: Description of the predefined filter
   - **System**: Selected
5. Click **Submit**.

What to do next

In **Map Settings**, when you select the `Default` option for **Predefined Filters**, the custom predefined filter that was set, will be applied.

Filter the view of a Dependency Views map

Create or modify Map Related Items

The Map Related Items module relates referenced CIs to one another, which allows them to be displayed in a Dependency Views map.

Before you begin

Role required: admin

About this task

The base system configuration includes the following tables and relates them to items in the Computer [cmdb_ci_computer] and Server [cmdb_ci_server] tables.

- Disk [cmdb_ci_disk]
- Network Adapter [cmdb_ci_network_adapter]
- Database [cmdb_ci_database]

Some additional referenced CIs that can be related in this manner are file systems and running processes.

In the following example, computer nodes in the map are related to network adapter nodes if the **Configuration Item** field of the adapter records reference the specific CI node. Access or create a network adapter record from the Network Adapter related list in the cmdb_ci_computer record.

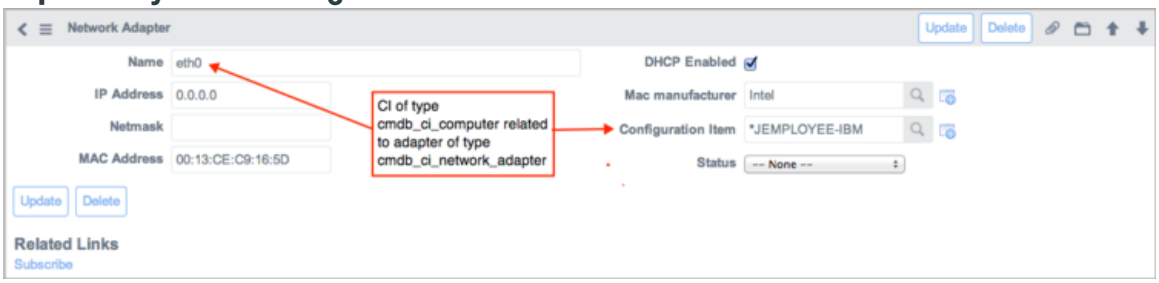
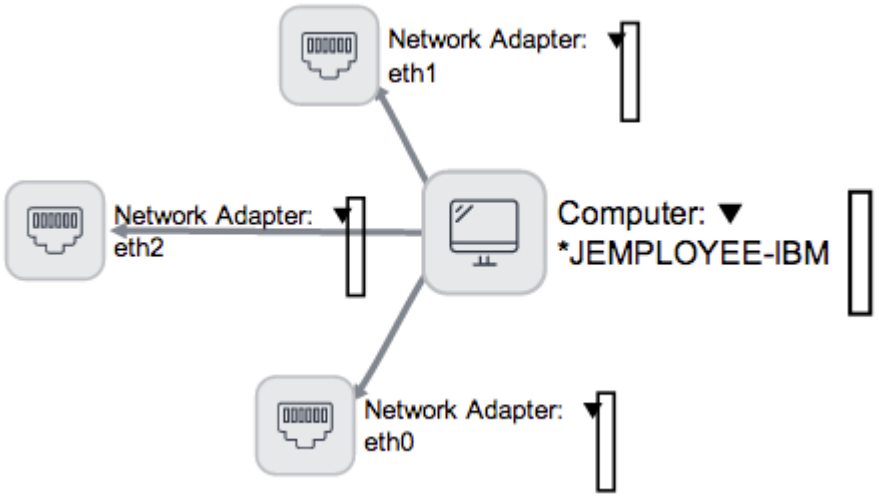
Dependency Views Configuration Item field



The Dependency Views map for the *JEMPLOYEE-IBM computer shows the network adapter attached to the computer.

Dependency Views map Related Items example



You can configure Dependency Views to display CIs that have no relationship record, but are related to other CIs by reference fields.

Procedure

1. Navigate to **All** > **Dependency Views** > **Map Related Items**.
2. Click **New** to create a new related item, or click in the row of an existing CI to modify an existing map related item.
3. On the form, fill in the fields.
   See the Related Items form table.
4. Click **Submit** to enter a new map related item or click **Update** to modify an existing map related item.

Related Items form

Control	Description
Configuration item	CI that represents the base node or a CI in a table that extends the base node table. In the base system, the configuration item that represents the base node is Computer [cmdb_ci_computer], which includes all types of workstations and servers.
Related item	Table name of the related item. Only the cmdb_ci table and tables that extend it are displayed in the choice list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Control	Description
Related field	Field that links this related item to the configuration item. In many cases, the appropriate value is automatically populated in the field after the first two fields are selected. Select the drop-down menu for additional options.
Active	Check box to enable or disable this record.

Create or modify Dependency Views menu actions

To modify an existing menu option, first you create a copy of the original menu action record, and then you modify the copy.

Before you begin

Role required: admin

About this task

This ensures that your instance can update the record normally during the upgrade process and allows you to quickly restore the original menu option, if necessary.

Procedure

1. To create a new menu option, navigate to **Dependency Views** > **Map Menu Actions** and click **New**.
   Fill in the fields on the form, as appropriate. See the Menu Action form table.
2. To modify an existing menu option, navigate to **Dependency Views** > **Map Menu Actions**.
3. Open the menu action you want to edit.
4. Right-click in the header and click **Insert and Stay**.
   This step creates a duplicate copy of the menu action and leaves it open for editing.
5. Change the name of the copied record to avoid confusion.
6. Modify the form fields as necessary and save the record.
7. Open the original record and disable it by clearing the **Active** check box.

Menu Action form

Control	Description
Name	Descriptive name that appears as the menu option.
Active	Check box that allows you to enable or disable this record.
Condition	Condition that triggers the display of this menu option. If the condition evaluates to **false** the menu option does not display. Script is evaluated in JavaScript in the user's browser and does not have access to all the APIs that Business Rules do. For details on available parameters, see Condition Parameters. .
Item	Map element for which the menu option displays. Valid values are: ○ **Canvas** for the menu on the map background. ○ **Node** for the menu on a CI. ○ **Relationship** for the menu on a relationship link.
Order	Physical location of the option in the menu. The option with the lowest order number appears first in the menu. All editable and custom options appear below the permanent menu options.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Control	Description
Script	Script that is executed in the browser when the menu option is selected. Script is evaluated in JavaScript in the user's browser and does not have access to all the APIs that Business Rules do.
Type	Menu action type being created, either a menu option or a menu separator. The menu separator is a single line. When the type is a separator, the **Script** field is ignored.

Condition and script parameters for menu actions

You can use the following condition and script parameters for menu actions.

Condition parameters

Note:
The usual regular expression conventions are valid in the condition field, such as ! for NOT, && for AND, and || for OR.

The **Condition** field contains a boolean expression that evaluates to true or false. If the condition is true or if there is no condition, the specified option appears in the menu when you right-click a CI or a relationship link. When you select the option from the menu, ServiceNow executes the associated script.

Common Elements for Building a Condition

Text	Description
item	Node or reference link's data on which you performed the right-click action.
item.label	Label of the node.
item.ci_type	CI's type (table), such as `cmdb_ci_service`.
item.name	Name of CIs. CI's type name or the table label.
item.location	Location of the CI, such as New York.
item.manufacturer_name	Name of the CI's manufacturer, such as Dell Inc.
item.id	The sys_id of the CI.
item.is_selected	The item that is selected in the map.
item.level	The current default level.
item.locationId	The sys_id of the CI node's location.
item.locationName	The full address of the location.
item.manufaturerId	The sys_id of the CI's manufacturer.

Valid Conditions for Condition Parameters

Condition	Description
item.is_collapsed	The node is a collapsed node.
item.is_cluster	The node is a cluster node.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Script parameters

Menu action scripts are executed on the client when a user clicks the menu option. You can use the same building blocks in scripts as in conditions. Menu action scripts do not function on separators. These are some additional, useful expressions for scripts:

Condition	Description
item.id	The sys_id of the CI node or relationship link.
item.source	The sys_id of the relationship's parent or child.
item.target	The sys_id of the relationship's parent or child.
item.label	The name of the CI node, such as IronMail-SD-02.
item.location	The sys_id of the CI node's location.
item.location_name	The full address of the location, such as 4616 Clairemont Drive, North Clairemont, San Diego CA.
item.manufacturer_id	The sys_id of the CI's manufacturer.

Create or edit a dependency type

Use one of the dependency types provided, or create a custom dependency type with a script that will execute in real time to generate a custom view of a Dependency Views map for a specific CI.

Before you begin
Role required: none

About this task
Create a JavaScript to customize the map. The script must comply with JavaScript syntax guidelines and the directions in the default script template, and it can call platform APIs. Use a dependency type, for example:

- To narrow down and simplify a map, leaving out CIs that are not important for a specific task.
- To include only specific CIs that are hidden by default, such as qualifiers, end-points, and entry points.
- To display virtual relationships that are calculated, and that otherwise do not exist in the CMDB.
- As a tool to plan a new topology deployment that is based on existing resources.

The following dependency types are available in the base system:

Default

The default setting in the base system. With this setting, there is no processing of the dependency map through any dependency type scripts that might filter or modify the map.

Show All Relationships

Returns all qualifiers, end points, and entry points. This dependency type is available in the base system and is disabled by default. Typically, you would enable this dependency type for debugging and tracking purposes.

The following dependency types are available with Service Mapping:

Application to Network Devices

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns the network devices in the network paths leading to/from the given CI.

Network Device to Applications

Returns the applicative CIs which are target or source of network paths containing the given network device. In addition, returns the hosts of those applicative CIs, and for an applicative CI that is an inclusion, its parent CI is returned too.

Physical Network Connections

Returns hosts/network devices that are physically connected to the given host or network device.

Flow Dependencies

Returns all the server to server connections that were discovered using the Netflow collector. The script builds a graph based on data in the [sa_flow_server_comm] table. This table contains pairs of services represented by an IP and a listening port that are communicating with each other. For more information, see Data collection and discovery using Netflow and Data collection and discovery using VPC Flow Logs.

Procedure

1. Navigate to **All** > **Dependency Views** > **Dependency Types**.
2. In the **Load Filter Scripts** list view, select an existing depenency type, or click **New**.
3. Enter or modify a script, adhering to the guidelines and requirements in the script template that is provided.
4. Click **Submit**.

Result

In a Dependency Views map, you can click **Dependency Type** to apply a custom script defined in a dependency type.

Properties for Dependency Views

Use Dependency Views properties to configure how data appears in Dependency Views maps.

These properties are available for Dependency Views. To view and edit these properties, the admin role is required.

Properties for Dependency Views

Property	Description
Maximum number of CIs to display on a map at once. glide.bsm.max_nodes	The maximum number of nodes to retrieve from the database. If more nodes exist in the database, they are not displayed in the map. • Type: Integer • Default value: 1000 • Location: **Dependency Views** > **Map Properties**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties for Dependency Views (continued)

Property	Description
Maximum level depth from the root CI that can be initially displayed in Dependency Views. glide.bsm.max_levels	Level depth is the graph distance between the root CI and a node. • Type: Integer • Default value:: 3 • **Other possible values**: 1-49 • Location: **Dependency Views** > **Map Properties**
Display the continuation of the map underneath virtual group. Virtual links are used to connect virtual groups to their child nodes. glide.bsm.show_virtual_node_children	• Type: Yes | No • Default value: No • Location: **Dependency Views** > **Map Properties**
Maximum number of child nodes to display (the rest will be collapsed). glide.bsm.too_many_children	Maximum number of nodes (of a similar CI type and at the same level) to display before applying virtual grouping. Nodes are collapsed for the map to meet this limit. • Type: Integer, valid values 1 or greater • Default value: 10 • Location: **Dependency Views** > **Map Properties**
A value of true indicates that filtered out items will be removed from the graph along with any disconnected children while a value of false indicates that the items will be dimmed in color. glide.ngbsm.filters_remove_filtered_items	• Type: Yes | No • Default value: Yes • Location: **Dependency Views** > **Map Properties**
Maximum number of relations per node. glide.bsm.max_num_rels	The maximum number of relations to retrieve from the database. If more relations exist in the database, they are not displayed in the map. • Type: Integer • Default value: 100 • Other values: 1 or greater • Location: **Dependency Views** > **Map Properties**

Properties for Dependency Views (continued)

Property	Description
A value of true indicates that when filters are changed the graph will recalculate it layout using the currently selected layout algorithm. glide.ngbsm.filters_run_layout_automatically	• Type: Yes | No • Default value: Yes • Location: **Dependency Views** > **Map Properties**
A value of true indicates that when filters are changed the graph will be fit to the screen automatically. glide.ngbsm.filters_fit_to_screen_automatically	• Type: Yes | No • Default value: No • Location: **Dependency Views** > **Map Properties**
A value of true allows relationship lines to be drawn using smooth curves instead of straight line segments. These curves can be more taxing on the browser, setting to false may improve fluidity of animation and interaction for Dependency Views. glide.ngbsm.performance_allow_curves	• Type: Yes | No • Default value: Yes • Location: **Dependency Views** > **Map Properties**
Amount of time in milliseconds a notification stays on the screen. glide.ngbsm.notification_display_time	• Type: Integer • Default value: 5000 • Location: **Dependency Views** > **Map Properties**
The maximum amount of results displayed when searching for CIs. glide.ngbsm.search_ci_limit	• Type: Integer • Default value: 10 • Location: **Dependency Views** > **Map Properties**
The maximum amount of results displayed when searching for Relationship Types. glide.ngbsm.search_rel_type_limit	• Type: Integer • Default value: 5 • Location: **Dependency Views** > **Map Properties**
When available, the map should display the class labels for each CI. glide.ngbsm.show_class_labels	• Type: Yes | No • Default value: Yes • Location: **Dependency Views** > **Map Properties**

Properties for Dependency Views (continued)

Property	Description
Truncate node labels to a single line and to fit available space (default). Disable to display entire labels on multiple lines and wrapped as needed. glide.ngbsm.truncate_long_labels	If *glide.ngbsm.show_class_labels* is enabled, then the class label always displays on top of the CI label, and wrapping applies to both the class and the CI labels. • Type: Yes | No • Default value: No • Location: **Dependency Views** > **Map Properties**
Minimum horizontal distance between nodes in horizontal layout. glide.bsm.layout_horizontal_spacing_x	The distance is measured in pixels between one node's center to another node's center. • Type: Integer • Default value: 200 • Location: **Dependency Views** > **Map Properties**
Minimum vertical distance between nodes in horizontal layout. glide.bsm.layout_horizontal_spacing_y	The distance is measured in pixels between one node's center to another node's center. • Type: Integer • Default value: 100 • Location: **Dependency Views** > **Map Properties**
Minimum horizontal distance between nodes in vertical layout. glide.bsm.layout_vertical_spacing_x	The distance is measured in pixels between one node's center to another node's center. • Type: Integer • Default value: 125 • Location: **Dependency Views** > **Map Properties**
Minimum vertical distance between nodes in vertical layout. glide.bsm.layout_vertical_spacing_y	The distance is measured in pixels between one node's center to another node's center.

Components installed with Dependency Views

Several types of components are installed with the activation of the Next_Gen BSM (com.snc.ng_bsm) plugin, such as tables.

Note:
The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Tables installed

Table	Description
Available CI icons [ngbsm_ci_icons]	Stores all available CI class icons.
Icons for CI types [ngbsm_ci_type_icon]	Maps icons to CI class names.
Map Script [ngbsm_script]	Custom scripts that run in real time and generate a custom view of a map for a specific CI.
Map View [ngbsm_view]	Serialized map views saved by users.
Map Filter [ngbsm_filter]	Filters saved by users.
Menu Action [ngbsm_context_menu]	Default and custom context menu actions that appear when users right click a map.
Related Item [ngbsm_related_item]	Stores which reference fields should be treated as relationships when building the map. This allows users to include CI's that are related via a reference field instead of a relationship.
Edge Colors [bsm_edge_color]	Color definitions to use when drawing the relationships between nodes based on relationship type.
Map Indicator	Stores all map indicators.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
[bsm_indicator]	
BSM Saved Map [bsm_graph]	Details of maps.
BSM Map Actions [bsm_action]	Actions on the map.
BSM Map View [map_view]	Parents' predefined filters.
Map View Configuration Types [map_view_ci_type]	Configuration type filters, limiting the CI class types to be displayed, per predefined filter.
Map View Relationship Types [map_view_rel_type]	Relationship type filters, limiting the links to be displayed between CIs, per each predefined filter.
[map_viewroles]	Roles that a specific predefined filter should be applied to.
CI Filters [map_filters]	CI attribute filters, limiting the CIs to be displayed, per predefined filter.

CMDB Query Builder

The CMDB Query Builder enables you to build complex infrastructure and service queries that span multiple CMDB classes, non-CMDB tables, and that involve many CIs that are connected by different relationships.

Get started

Explore	Configure	Build a CMDB query
Build complex infrastructure and service queries.	Configure settings and properties	Construct the classes, and the relationships and references that connect them, to query on.

Exploring CMDB Query Builder

The CMDB Query Builder enables you to build complex infrastructure and service queries that span multiple CMDB classes, non-CMDB tables, and that involve many CIs that are connected by different relationships.

The CMDB Query Builder provides a canvas into which you drag the CI classes that you want to include in a query. Then you add relationships, AND/OR operators between the CI classes, and define the relationship properties to query for. You can use saved queries to populate a CMDB group with CIs, and then use scriptable APIs to retrieve the CI list and apply actions collectively to all the CIs in the group.

There are two query types: CMDB Query and a Service Mapping query, which you can use separately or in combination to create queries such as:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- All hardware in my service offering that has Windows installed.
- All CIs of a certain type in an application service. For example, all Apaches/Web Servers/Linux servers per service.
- All virtual servers and the physical servers that host them.
- All servers that are not mapped to any application service.
- All application services and their associated servers and the cost of each server. This query helps evaluate the cost of technology for each application service.

Starting node: The starting point of the query which is labeled as **STARTING NODE** on the Query Builder canvas. The first class that you drag to the canvas becomes automatically the starting node of the query and you cannot select a different starting node. In a complex query, the starting node must always be the only node connected to an AND/OR operator. If you try to connect a second node to an operator that the starting node is connected to, the query fails to run and a prompt to select a different starting node appears.

Additional information

For a webinar, see CMDB Query Builder Queries and Reporting - Platform Analytics Academy blog post in the ServiceNow Community.

Intelligent Search for CMDB integration

By default, Intelligent Search for CMDB functionality is integrated into the CMDB Query Builder. When opening the Query Builder, you can use the Intelligent Search search box which appears above the Query Builder canvas. Intelligent Search lets you use everyday natural language query (NLQ) to build a query. Intelligent Search parses, resolves any ambiguities in table names and relationship types, and then converts your search string into a valid query. The query appears fully constructed on the Query Builder canvas where you can run or continue and develop the query.

The integration of Intelligent Search for CMDB with the CMDB Query Builder is controlled by the system property *`glide.cmdb.query.nlq.activated`*, which is set to **true** by default. If you set the property to **false**, Intelligent Search for CMDB will not be available within the Query Builder.

AI Search and CMDB

NLQ Genius Results for AI Search use natural language queries to find CMDB tables that match your search without leaving a portal or workspace. For more information, see NLQ Genius Results.

Note:
AI Search is a complementary search experience that allows you to surface CMDB records in your normal flow of work, without having to access the CMDB Query Builder. It doesn't replace intelligent Search for CMDB, which is purpose-built and integrated into CMDB Query Builder.

CMDB Query

A query type that queries the infrastructure for CI classes and the relationships and references that connect them. You can optionally add the context of non-CMDB tables to a CMDB query.

You can include Application services in a CMDB query, to find, for example:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- All critical application services in your database.
- All infrastructure in a particular application service.
- All incidents for a particular CI in an application service, or all incidents for all the CIs of an application service.
- All application services with a pattern of a service connected to a database, and where the database has incidents.

The list of available non-CMDB tables includes a subset of tables within the system, which have a reference to the Configuration Item [cmdb_ci] class or its children. The list of non-CMDB tables, includes tables such as Asset, Task, and Problem. You can use the system property glide.cmdb.query.non_cmdb.black_listed_tables to narrow down the list of non-CMDB tables to choose from.

Service Mapping Query

A query type that queries application services. The query is framed within an application service map. You define a pattern, and query for application service maps that have that pattern in their definition. The relationships in Service Mapping queries are matched by single-level direct relationships which is similar to the CMDB queries, and in addition, they are also matched by multi-level indirect relationships if they exist. A query for a relationship between two CI classes is satisfied even if the two CI classes are connected by intermediate CI classes that are not specified in the query.

Combination Query

You can combine the two query types by incorporating a saved Service Mapping query into a CMDB query. For example, create a CMDB query for Windows Servers that are connected to Tomcat WAR. Then connect the Tomcat WAR CI class to a Service Mapping query. The query changes to find Windows Servers that are connected to Tomcat WAR which is included in the services that returned by the Service Mapping query. You can inverse that query by choosing **Does Not Belong To Service**. This changes the query to find Windows Servers that are connected to Tomcat WAR that is not included in services returned by the Service Mapping query.

Configuring CMDB Query Builder

You can configure settings that affect some functionality of the CMDB Query Builder.

Configuration overview

Configure CMDB Query Builder settings

Configure settings that control the appearance and operation of the CMDB Query Builder canvas.

Configure the relationships to query on

Configure relationships between CIs, such as the parent/child (direction) relationship or first- or second-level relationships.

Configure CMDB Query Builder settings

Configure settings that control some of the functionality of the CMDB Query Builder.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **Configuration** > **CMDB Query Builder**.
2. On the **CMDB Query Builder** page, select the Settings icon ( ) and then configure the settings.

Setting	Description
Display Relationships in Results	Display the relationship between CIs in the query results.
Display Suggested Connections	This setting applies only to CMDB queries. Filter the CMDB classes and the non-CMDB tables lists in the side-panel to display only classes and tables with which the selected node on the canvas has a relationship. You can then drag any item from the filtered list to the canvas and connect it to the selected node on the canvas.
Display Results in New Tab	Display query results in a separate browser tab titled **Query Results**.

3. Select the Settings icon again to close the dialog box.

Configure the relationships to query on

Configure the type of relationships that you want to query for in CMDB Query Builder. For example, configure which CI on the canvas is the parent and which is the child in the relationship or the level of relationships to query on.

Before you begin
Role required: cmdb_query_builder_read

About this task
When you connect CI classes on the canvas, the CMDB Query Builder displays the Connection Properties in the right-side bar, where you can configure the properties of the relationship to query on. For Service Mapping queries, you can also configure whether to query for related or unrelated CIs.

Note:
Newly added relationships between CI classes might take up to 30 minutes to appear in the relationship list.

Procedure
1. While adding CIs to the canvas, select a connection box on a CI and then select the connection box on another CI that you want to create a relationship with.
2. Configure the relationship properties in the Connection Properties side-bar.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Relationship type	Query for CIs and descending classes with specific relationship types.
Relationship direction	Which CI class is the parent and which CI class is the child in the relationship.
Relationship level	Query only on first-level relationship or also on second-level relationships.
No relationships	Query for CIs which have no relationship to the set class.
References fields	A field that the parent and ancestor parent CI classes use to reference the child CI class.

3. Select **Save**.

CMDB groups

Batch size for CMDB Query Builder queries

In a base system, a global batch size of 100 is allocated for every Query Builder query run. If needed, you can use a system property to override the default global batch size, or optimize the batch size value per saved query.

Queries can differ widely as they can be configured to query a wide variety of classes. Therefore, the batch size in the base system might not be optimal for every query, and some queries might time out or take a long time to complete. The optimal batch size for running queries depends on system load such as amount of data and number of relationships in your system. Contact Support for assistance in calculating the batch size for your query.

Batch size is applicable and behaves the same in all query run scenarios, regardless of how the run was initiated:

- Query Builder user interface (ad hoc or saved query)
- Query Builder Scriptable API
- Scheduled jobs
- CMDB groups

The batch size for query runs is allocated in the following priority order:

1. The value in the *Execution Batch Size* field in the Saved Queries table, for a specific saved query. If set, this value applies only to the saved query, and has priority over the global value of 100 and the value of the glide.cmdb.query.batch_size system property.
2. The value of the system property glide.cmdb.query.batch_size, if exists, determines globally the batch size that is allocated to all query runs. If you add and set this property, the value applies to all queries, other than saved queries with *Execution Batch Size* value set.
3. A global value of 100, if the previous two options are not configured.

Modifying batch size for queries

If you are experiencing performance problems when running queries, you can modify the batch size value:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Globally for all queries: By adding (if necessary) and setting the value of the system property glide.cmdb.query.batch_size.
- Per saved query: Set batch size for a specific saved query

Set batch size for a specific saved query

Configure a custom batch size for a CMDB Query Builder saved query that takes a long time to complete or that times out. A custom batch size overrides the global batch size in the base system and the value of the *glide.cmdb.query.batch.size* system property.

Before you begin

Role required: admin

About this task

Contact Support for assistance in calculating the batch size for your query.

Procedure

1. In the Filter navigator, enter `qb_saved_query.list` and press Enter to navigate to the Saved Queries table.
2. In the Saved Queries list view, locate the saved query for which you want to change batch size.
3. Set or modify the value in the *Execution Batch Size* field.
   Set the value to be greater than the global value in the glide.cmdb.query.batch.size property, or increase any existing value.

Navigation in CMDB Query Builder

Use the navigation tools to enlarge or shrink the query, to move the query, or to border a section of the query to run.

Use the buttons in the navigation tool as follows:

- Use the plus sign (+) to increase magnification of the query.
- Use the minus sign (-) to decrease magnification of the query.
- Select the center dot to center the query on the canvas.
- Use the direction arrows to move the query in that direction.
- Use the selection tool under the navigation tool to toggle between two states:
  - Moving the entire query on the canvas.
  - Bordering a section of the query, which you can then run as a partial query.

Build a CMDB query using the CMDB Query Builder

A CMDB query type that queries the infrastructure for CI classes and optionally non-CMDB tables, and the relationships and references that connect them.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: cmdb_query_builder_read to only view and run saved queries, and cmdb_query_builder (contained for itil, itil_admin, and asset) to create and save queries, modify saved queries, and run queries. For reporting on queries, report related ACLs are required.

Authorized users can update and delete a query created by another user.

About this task

Build the query by dragging the CI classes and non-CMDB tables that you want to include in the query. Then dropping them as nodes on the canvas, and defining relationship properties between them. You can filter on the attributes of any node to narrow down the results to a specific set of CIs of that class or to a single specific CI. You can also select which property columns appear in the query results.

As you step through building a query, list options and other user interface elements of the CMDB Query Builder, are dynamically filtered as appropriate to your selections.

To learn more about using Query Builder, see the CMDB Query Builder Queries and Reporting - Platform Analytics Academy ServiceNow Community video. For a step-by-step walk through of building CMDB queries in the Query Builder, including queries with application services, see Example queries.

Procedure

1. Navigate to **All** > **Configuration** and select **CMDB Query Builder**.
2. On the **CMDB Query Builder** page do either of the following steps:
   - Select **Create new**. Type in a **Name**, choose **CMDB Query** as the **Query type**, and then select **Create**.
   - Select a widget of a saved query to continue building an existing query. Search for a saved query first if needed.
   - Point to the upper right corner of a saved query widget, and select the **Duplicate Query** icon to edit a copy of a saved query. The default name of the new query contains the string 'copy'.
3. On the canvas, you can do any of the following operations:
   - Add CI classes to the query: On the **CMDB Classes** tab, select classes from the hierarchy list and drag them to the canvas.
   - Add an Application Service CI to the query: On the **CMDB Classes** tab, select the **Application Service** class from the hierarchy list and drag it to the canvas.

     In Application Service Properties on the right-side bar, you can select **Convert attached nodes to pattern** to query on patterns between the application service and other CMDB class nodes. When querying on a pattern, the nodes on both ends of the pattern connection, can be any number of levels apart. If **Convert attached nodes to pattern** is not selected, then the connection between the application service node and other CMDB class nodes, represent direct relationships.
   - Add non-CMDB tables to the query: Select a table from the **Non-CMDB Tables** list and drag it to the canvas.

     Note:
     A non-CMDB table cannot be the starting node in the query.
   - Add connections (relationships or patterns for application services) between two nodes on the canvas:

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. On the first node in the connection, select the small square at the center of the right side.

b. On the second node in the connection, select the small square at the center of the left side to create the connection.

Connection UI Notations

Notation	Description
Full line	A relationship in a CMDB query.
Red asterisk at the center of the connection line	Information such as relationship type is missing, invalidating the query.
Levels:<n> Types:<n> or a **<Reference type>** notation on the connection line	As applicable: The number of relationship levels and the number of relationship types included for the connection. Or, a reference type for a relationship that is a reference.
Dashed line	A pattern connection between an application service node and another node.

- In Connection Properties on the right-side bar, configure relationship settings (select the connection line if necessary):

  a. In the Relationship Direction section, select the **Parent** node (the **Child** node automatically adjusts).

  b. In the Relationship Levels section, set **Level** to **First level relationships** if the CIs are directly connected. Or, **Up to 2nd level relationships** if the CIs are connected either directly or indirectly through another CI.

  c. In the Relationship Types and Related Items section, select either option:

Option	Description
No Relationships	To query for CIs with no connecting relationships, such as `All Tomcat WAR CIs which are not connected to a Windows Server`.
Add Relationship Types	To select specific or any relationship type.
Add a Related Item	To query for related CIs between the nodes.

- Configure CI reference column for a connection to a non-CMDB table: In the Connection Properties right-side bar, in the CI Reference Column section, select the column with a reference to a CI from the **Use CI reference column** list. If only one option is available, it is automatically selected.
- Configure the pattern between an application service node set with the **Convert attached nodes to pattern** option, and a non-CMDB table node: Select **Apply <table> reference filter to all nodes in the pattern** to apply the query to the application service CI itself and to the CIs within the application service.
- Add filters to a class node: Apply filters to narrow down a class query to a specific set of CIs or to a single specific CI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Point to the node to add a filter to, and then select the **Apply filters** icon that pops up above the node.

b. In the Filters section, add attribute and related list conditions.

c. Close the **Filters** section.
For example: Add a filter for database location to query for databases located in Seattle.

Select **Applied Filters** in the right-side bar to view all filters for each node on the canvas.

- Add And/Or operators to the query:

  a. Connect one node to two other nodes.

  b. Select the **And** box that appears on the connection line, to toggle between the **And**/**Or** operators.
  For example: C1 is Tomcat WAR, C2 is Linux Server, and C3 is Windows Server. Query for `All Tomcat WAR CIs which are connected either to Linux Server Or to a Windows Server`.

- Add property columns for a node, to appear in the query results:

  Note:
  For a relationship, the query results include the *parent*, *child*, and *type* columns. You cannot add any other columns from the [cmdb_rel_ci] table.

  a. Select **Properties** in the right-side pane.

  b. Select a node once or twice, so that the Report Columns section appears in the right-side bar, and then select **Add Columns**.

  c. Select properties and then select outside the properties list to close it.

- Create a combination query by integrating a Service Mapping query into a CMDB query:

  a. When building a CMDB query, select **Saved Service Queries** in the left-side bar.

  b. Select and then drag a Service Mapping query to the canvas.
  This query returns all CIs that satisfy the CMDB query, and that are included in the services returned by the embedded Service Mapping query.

- Add a search tag that can then be used as a search criteria for saved queries:

  a. Select the **Add Tags** icon at the top of the canvas.

  b. Select **Add Tag** and in the **Query Tags** dialog box enter one or more tag strings.

  c. Select the **Add Tags** icon again to close the **Query Tags** dialog box.

4. Select **Save**.

   On the **Saved Queries** tab, point to a saved query widget and select **Query Information**. Query details such as the query type, last update date, CMDB groups associated with the query, and the query schedules appear.

What to do next

- Select **Run**.

  Only the first 100 results of the query appear in the results pane.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Select **Load More Results** to view the next set of 100 results.
- Select **Load All Results** to view the rest of the query results, up to the number specified by the glide.cmdb.query.max_results_limit system property (10,000 by default).

Select a CI to open its CI form, and on the CI form select **Open in CMDB Workspace** to view CI health in the CI Health tile in CMDB Workspace. This operation requires the sn_cmdb_user (CMDB user) role.

Note:

- Ensure that the glide.security.use_csrf_token property is set to true, allowing all results to appear.
- When **Level** is set to **Up to 2nd level relationships**, the relationship type does not appear in the query results.
- When a query is running, wait for it to complete or to time out before opening or running another query.

- Modify Query Builder settings: Select the (**Settings**) icon to open the **Query Builder Settings** dialog box.
- Copy and share the URL of a saved query with users that have access to the CMDB Query Builder. Pasting the shared URL in a new internet browser window, directly opens the saved query in the CMDB Query Builder.
- Create a report in CMDB Query Builder.
- Create a schedule to run the query at a future time, and to email the results to interested parties.
- Export query results:

  Select the Query Results context menu and select **Export**. Even if the **Load More Results** button is visible, indicating that there are additional query results, only the results that are visible are exported.

- Export and import a CMDB query to port a query definition between instances.
- Populate a CMDB group using a saved query.
- Delete a CMDB query.

Example queries

Build a Service Mapping query using the CMDB Query Builder

The Service Mapping query type is a pattern consisting of classes and relationships between those classes. After you build the pattern and run the query, the query returns all the Service Mapping services that contain that pattern.

Before you begin

Role required: cmdb_query_builder_read to only view and run saved queries, and cmdb_query_builder (contained for itil, itil_admin, and asset) to create and save queries, modify saved queries, and run queries.

Authorized users can update and delete a query created by another user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Build the query by dragging the CI classes that you want to include in the query, dropping them as nodes on the canvas, and then defining relationship properties between them. For every class node in the query, you can filter on its attributes to narrow down the results to a specific set of CIs of that class or to a single specific CI. You can also select which property columns appear in the query results.

As you step through building a query, list options and other user interface elements of the CMDB Query Builder, are dynamically filtered as appropriate to your selections.

See Example queries for a step-by-step walk through of building a Service Mapping query in the CMDB Query Builder.

Procedure

1. Navigate to **All** > **Configuration** > **CMDB Query Builder**.
2. On the **CMDB Query Builder** page do either of the following:

   a. Select **Create new**.

   b. Enter a **Name**.

   c. Select **Service Mapping Query** as the **Query type**.

   d. Select **Create**.

   e. Select a widget of a saved query to continue building an existing query. Search for a saved query first if needed.

   f. Point to the upper right corner of a saved query widget.

   g. Select the **Duplicate Query** icon to edit a copy of a saved query.
   The new query's default name contains the string 'copy'.

3. On the canvas, you can do any of the following:
   - Add CI classes to the query: Select classes from the **CMDB Classes** hierarchy list and drag them to the canvas.
   - Add connections (relationships) between two nodes on the canvas:

     a. On the first node in the relationship, select the small square at the center of the right side.

     b. On the second node in the relationship, select the small square at the center of the left side to create the connection.

     c. In **Connection Properties** on the right-side bar, configure the following (select the connection line if necessary):

     - In the Relationship Direction section, select the **Parent** node (the **Child** node automatically adjusts).
     - In the Service Query Properties section, select **Find Related CIs** or **Find Unrelated CIs** to query for a pattern in which the two classes have or do not have relationships with each other, respectively.

       For example, `All Tomcat WAR CIs which are not connected to a Windows Server`.

Relationship UI Notations

Notation	Description
Dashed line	A relationship in a Service Mapping query.

- Add filters to a class node: Apply filters to narrow down a class to a specific set of CIs or to a single specific CI.

  a. Point to the node to add a filter to, and then select the **Apply filters** icon that pops up above the node.

  b. In the Filters section, add attribute and related list conditions.

  c. Close the **Filters** section.
  For example: Add a filter for business criticality to query for businesses that are 'most critical'.

  Select **Applied Filters** in the right-side bar to view all filters for each node on the canvas.

- Add And/Or operators to the query:

  a. Connect one node to two other nodes.

  b. Select the **And** box that appears on the connection line, to toggle between the **And** and the **Or** operators.

  For example C1 is Tomcat WAR, C2 is Linux Server, and C3 is Windows Server. Query for all Tomcat WAR CIs which are connected either to Linux Server Or to a Windows Server.

- Add property columns for a node, to display in the query results:

  Note:
  For a relationship, the query results display the *parent*, *child*, and *type* columns. You cannot add any other columns from the [cmdb_rel_ci] table.

  a. Select **Properties** in the right-side pane.

  b. Select a node once or twice, so that the node's Report Columns section appears in the right-side bar, and then select **Add Columns**.

  c. Select properties and then select outside the properties list to close it.

- Select columns and add filters that will be applied to the resulting set of services:

  a. Select **Properties** in the right-side bar, and then select an empty space on the canvas to ensure that nothing is selected.

  b. Select **Add Columns** at the bottom of the right-side bar and select columns to add. Select outside the columns list to close it.

  c. Select the **Apply Service Mapping Query Filters** icon at the top of the canvas and add filters.

- Inverse the entire query and search for all Service Mapping services that do not include the query pattern: Select a node once or twice so that Query Properties appear in the right-side bar. In the Metadata section, toggle **Services Including This Pattern** to enable or disable the option.

- Add a search tag that can then be used as a search criteria for saved queries:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select the **Add Tags** icon at the top of the canvas.

b. Select **Add Tag** and in the **Query Tags** dialog box enter one or more tag strings.

c. Select the **Add Tags** icon again to close the **Query Tags** dialog box.

4. Select **Save**.

On the **Saved Queries** tab, point to a saved query widget and select **Query Information** to view query details such as the query type, last update date, and the query schedules.

What to do next

- Select **Run**.

  The query results pane displays only the first 100 results of the query.

  - Select **Load More Results** to display the next set of 100 results.
  - Select **Load All Results** to display the rest of the query results, up to the number specified by the glide.cmdb.query.max_results_limit system property (10,000 by default).

  Select a CI to open its CI form, and on the CI form select **Open in CMDB Workspace** to view CI health in the CI Health tile in CMDB Workspace. This operation requires the sn_cmdb_user (CMDB user) role.

  Note:
  When a query is running, wait for it to complete or to time out before opening or running another query.

- Modify Query Builder settings: Select the Settings icon ( ) icon to open the **Query Builder Settings** dialog box.
- Copy and share the URL of a saved query with users that have access to the CMDB Query Builder. Pasting the shared URL in a new internet browser window, directly opens the saved query in the CMDB Query Builder.
- Create a report in CMDB Query Builder.
- Create a schedule to run the query at a future time, and to email the results to interested parties.
- Export query results:

  Export query results that are visible: Select the Query Results context menu and select **Export**. Even if the **Load More Results** button is visible, indicating that there are additional query results, only the results that are visible are exported.

- Export and import a CMDB query to port a query definition between instances.
- Populate a CMDB group using the saved query.
- Delete a CMDB query.

Example queries

Run a partial CMDB query

You can run a partial query in the CMDB Query Builder by defining a section of a query, and then running it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: cmdb_query_builder (contained for itil, itil_admin, and asset)

About this task
While building a query or reviewing a saved query, you can run only a section of the query. On the canvas in the CMDB Query Builder, highlight a section of the query which contains the nodes and relationships of the partial query that you want to run. You can then examine the results of the partial query, and update the query if needed.

Procedure
1. Navigate to **All** > **Configuration** > **CMDB Query Builder**.
2. On the CMDB Query Builder page, select a tile to open an existing query.
3. Select the selection tool under the navigation tool to switch to a section selection mode.
4. Border a section of the query:
   a. Select the upper left corner of the section.
   b. Drag and release at the bottom right corner of the section that you want to create.
   As the cursor moves, the selected section is highlight in light blue. The query nodes that are included in the partial query, appear with a blue border.
5. Select **Run**.
6. In the Pick Starting Node dialog box, select the starting node for the partial query and then select **Confirm**.

Result
The results of the partial query appear in the Results pane.

Delete a CMDB query

Delete a CMDB query that is no longer used or needed.

Before you begin
The query that you want to delete must be already saved.

Role required: cmdb_query_builder (contained for itil, itil_admin, and asset). Authorized users can delete a query created by another user.

Procedure
1. Navigate to **All** > **Configuration** and select **CMDB Query Builder**.
2. On the **CMDB Query Builder** page, select the Saved Queries tab and set the viewing mode to Card view ( ).
3. Move to the card with the query that you want to delete.
4. Select the Delete Query (X) icon that appears in the card.

Create a report in CMDB Query Builder

Use CMDB Query Builder reports to show the results of a CMDB query or a Service Mapping query. Create a basic report or a dynamic report that auto-updates when the results of the associated saved query change.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a basic report

After running a query in the CMDB Query Builder, you can create a basic report that is scoped to the query execution.

Before you begin

The Core UI plugin (com.glide.ui.ui16) must be activated.

Role required:

- View report: cmdb_query_builder or cmdb_query_builder_read
- Create report: cmdb_query_builder or cmdb_query_builder_read, and report_user

In a base system, the cmdb_query_builder role is contained in the itil and asset roles.

Procedure

1. Navigate to **All** > **Configuration** and click **CMDB Query Builder**.
2. Build a query.
3. In the query results pane, click **Load More Results** or **Load All Results** to load all the results that you want to include in the basic report.
4. In the query results pane, click the column context menu and select **Bar Chart** or **Pie Chart**.

Result

The Reports application creates a basic report, which is scoped to the query results that are currently loaded and is static.

Related topics

Reporting

Build a CMDB query using the CMDB Query Builder

Build a Service Mapping query using the CMDB Query Builder

Run a partial CMDB query

Create a dynamic report

After running a saved query in the CMDB Query Builder, create a dynamic report that continuously updates to show the latest query results. You can use a dynamic report as any other report created using Reporting and you can add it to Performance Analytics dashboards.

Before you begin

Ensure that the query that you want to create a dynamic report for is a saved query, and that there is a specified schedule for the query. Also, run the saved query and ensure that all query results are visible.

Role required:

- To create: cmdb_query_builder and report_user
- To view: Reporting role requirements might apply, see Administering reports for Reporting role requirements.

In the base system, the cmdb_query_builder role is contained in the itil and asset roles.

About this task

The **Create Report** button in CMDB Query Builder which is used to create a dynamic report, is activated only if:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The query is saved
- The query has a schedule
- The entire set of query results is present after a query run

The initial dynamic report that you create, is based on the results from the initial run of the saved query. Then, on every subsequent run of the saved query, the associated report automatically updates with the latest query results.

However, if you change the query definition itself, the query and the report are no longer in sync and you must create a new report.

Procedure

1. Navigate to **All** > **Configuration** > **CMDB Query Builder**.
2. In the **Saved Queries** tab, select the saved query for which you want to create a report. Ensure that the query has a specified schedule.
3. Select **Run** and ensure that all query results appear.
   Click **Load All Results** if available, to load all results. The **Create Report** button is enabled only if all query results are showing.
4. Click **Create Report**.
   If the CMDB Query Builder displays the query results in a new tab, then after the new tab opens with the query results, return to the CMDB Query Builder window.
5. In the Report Designer, click **Next** or **Back** to view and configure the new report in the **Data**, **Type**, **Configure**, and **Style** tabs.
   The report is pre-populated with the CMDB query results and a few other report details.
   - **Report name** is set to the name of the saved query.
   - **Source type** is set to **Data source**.
   - **Data source** is set to the table in which the query results are stored.
   - **Query Sys ID** is the ID of the latest run of the query.

   For more details about Reporting and about configuring a report in the Report Designer, see Reporting, Creating reports.
6. Click **Save** or **Run**.

Result

CMDB Query Builder creates a report source which you can attach to a report and use with dashboards. For more details about report sources, see Report sources.

What to do next

Use either of the following steps to view the new report source. The name of the new report source is set to the name of the CMDB query it was created from, and cannot be changed.

- In Query Builder, click **Saved Queries**. In the Saved Queries window, click the **Query Information** icon in the tile of the saved query. Scroll to the bottom of the information list and then click the link under **Report source**.
- Navigate to **All** > **Reports** > **Administration** > **Report Sources** and locate the new report source.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Search for a saved query

The CMDB Query Builder allows you to search for a specific saved query using any combination of search criteria such as the query's name, type, custom tags, and who created or updated the query.

Before you begin

To locate a saved query using a **Query Tags** search criteria, the query must have a query tag associated with it. For more information see Build a CMDB query using the CMDB Query Builder, or Build a Service Mapping query using the CMDB Query Builder.

Role required: cmdb_query_builder (contained for itil, itil_admin, and asset)

Procedure

1. Navigate to **All** > **Configuration** > **CMDB Query Builder**.
   The Saved Queries tab shows all saved queries in tiles, and also a tile for creating a new query.
2. On the Saved Queries tab, specify a **Sort by** criteria to filter the saved queries that are showing.
3. In the **Search Saved Queries** field, enter a search string that corresponds to the **Sort by** selection and then select an item from the list that gets populated as you type.
   The drop-down list includes search strings that can be applied to the sorting criteria such as 'Query name'.
4. Refine the search by entering additional **Search Saved Queries** search strings as needed.

Schedule a CMDB query

Schedule a saved CMDB query to run once at a scheduled time or on a recurring schedule, and to email the query results to specified users.

Before you begin

A saved CMDB query that was built in the CMDB Query Builder must exist.

Role required: cmdb_query_builder (contained for itil and asset)

About this task

The query results are attached to the email as a file in the specified format.
The maximum number of result rows that can be attached is determined by the *glide.cmdb.query.max_results_limit* system property (10,000 by default).

Procedure

1. Navigate to **All** > **Configuration** > **CMDB Query Builder** and then select a saved query.
2. Select **Create Schedule** and then fill in the form.

Scheduled Email of Query Builder form

Field	Description
Query	The query to run.
Users	Users who should receive query results email. To receive emails, users must have an Email address defined and have Notifications set to Enable in their user records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Groups	Groups to email the query results to.
Zip output	Indicates whether the report should be sent as a zip file.
Active	Indicates whether to run the query according to the specified schedule.
Run	Frequency for running the query.
Time	Time of day to run the query.
Conditional	Indicates whether to display the **Condition** field, which allows you to specify conditions under which the query runs.
Omit if not records	Indicate whether to distribute email if the query returns zero results.
Email addresses	Email addresses of users who should receive the email but who are not in the system.
Subject	Text that appears in the subject line of the distribution email.
Introductory message	Additional message that is delivered with the query results.
Condition	User-created script that checks for certain conditions to be true before running the query. This field is visible only when **Conditional** is checked.
Type	File format to use for the query results. **Note:** Configure the form layout to add this field to the form.

Export and import a CMDB query

Export a saved CMDB or Service Mapping query definition to an XML file which you can later import and run in the CMDB Query Builder. This process lets you port a saved query between instances, such as from a development environment to a production environment.

Before you begin

- You must save a query before you can export it.
- Domain in an exported query must be visible in both, source and destination instances.

Role required: cmdb_query_builder (contained in itil, itil_admin, and asset).

About this task

When exporting a combination query, the integrated Service Mapping query definition is included in the exported query.

For backward compatibility, you can alternatively Export and import a query as an update set.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Configuration** > **CMDB Query Builder**.
2. Export a saved query:
   a. In the **Saved Queries** tab, in either list view or card view, select a saved query.
   b. Select the **Export query** icon at the top of the Query Builder canvas.
   c. Wait for the **Query Export Complete** message to appear and then select **Download**.
   You can now access the query XML file.
3. Import a saved query:
   a. In the **Saved Queries** tab, select the **Import query** icon at the top of the CMDB Query Builder window.
   b. In Finder, select the saved query XML file and select **Open**.
   The imported query is available in the **Saved Queries** tab of the CMDB Query Builder on the instance.

Export and import a query as an update set

Export a saved query definition to an XML file as an update set, which you can later import.

Before you begin

Role required: To export — cmdb_query_builder (contained in itil and asset). To import — user with permission to import an update set.
Domain in the exported query must be visible in both, source and destination instances.

About this task

Export a query definition as an update set which you can later import and commit. This process lets you port a query between instances, such as from a development environment to a production environment. For more information about exporting and then committing update sets using XML files, see Save an update set as a local XML file.

When exporting a combination query, the integrated Service Mapping query definition is included in the exported update set.

Procedure

1. Export a saved query:
   a. In the **Filter navigator**, enter `qb_saved_query.list`.
   b. Select **Enter** to navigate to the Saved Queries table.
   c. In the Saved Queries list view, select the query that you want to export.
   d. Select **Actions on selected rows** and then **Export query**.
   e. Wait for the **Query Exporter** to complete the export.
2. Import the exported saved query:
   a. Navigate to **System Update Sets** > **Retrieved Update Sets**.
   b. On the Retrieved Update Sets form, select **Import Update Sets from XML**.
   c. On the Import XML page, select **Choose file**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Select the exported XML file.

e. Select **Upload**.

f. Open the new record that was added to the Retrieved Update Sets list view.

g. On the Retrieved Update Set form, select **Preview Update Set Batch**.

h. Close the Batch Update Set Preview dialog box.

i. Select **Commit Update Set Batch**.

j. Close the Commit Update Set Batch dialog box.

Result
The imported query is added to the Query Builder saved queries on the instance.

CMDB Query Builder reference

Reference topics provide example queries and descriptions of navigation and property settings.

Reference topics

Domain separation and CMDB Query Builder

Domain separation is supported in the CMDB Query Builder. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Navigation in CMDB Query Builder

Use the navigation tools to enlarge or shrink the query, to move the query, or to border a section of the query to run.

Property settings for CMDB Query Builder

Use the CMDB Query Builder properties to configure query processing.

Example queries

Use the example queries as models for building your custom CMDB queries and Service Mapping queries.

Domain separation and CMDB Query Builder

Domain separation is supported in the CMDB Query Builder. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Overview

How domain separation works in the CMDB Query Builder

With the CMDB Query Builder you can easily build complex infrastructure and service queries that span multiple CMDB classes, and that involve many CIs that are connected by different relationships. Domain separation is set to be on by default.

- **Saved Query**

  The user creates a query by dragging a class node from the class hierarchy and dropping it to the canvas and connecting the nodes with the relationships type.

  The user can save the created query as an XML file to the database [qb_saved_query] table in the CMDB for future use. The saved query is domain separated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Query results**

  With a saved query, the user selects **Run** and the query result is saved and displays in the platform list view.

  In the query results, domain separation behaves in the same way as the platform list view for the CI relationship [cmdb_rel_ci] table and CMDB CI [cmdb] table. Consequently, since the CI relationship is not domain separated, all relationships of the query result display, regardless of the domains. Conversely, if the query result is CI only, since the CMDB CI is domain separated, the results display only if visible in the current domain.

Properties for CMDB Query Builder (continued)

Property	Description
	exclude all tables containing 'abc' in their table name. • Location: **Configuration** > **CMDB Properties** > **Query Builder Properties**
glide.cmdb.query.batch_size	Batch size allocated globally when saved queries run. • Type: integer • Default value: 100 • Location: Add to System Properties [sys_properties] table.

Example queries

Use the example queries as models for building your custom CMDB queries and Service Mapping queries.

CMDB query example — servers connected to database

Use this example to build a CMDB query to find all servers with a connection to a database.

CMDB query example — critical application services

Use this example to build a CMDB query to find all critical application services, and their owner.

CMDB query example — application services with incident or change

Use this example to build a CMDB query to find all application services for which there is an incident or a change request. Results are returned for either the application service itself or any CI within the service.

CMDB query example — hardware with Windows installed

Use this example to build a CMDB query to find all hardware in my service offering that has Microsoft Windows installed.

Service Mapping query example — Linux servers in services

Use this example to build a Service Mapping query to find all Linux servers in services.

CMDB query example — servers connected to database

Use this example to build a CMDB query to find all servers with a connection to a database.

Before you begin

Role required: none

Procedure

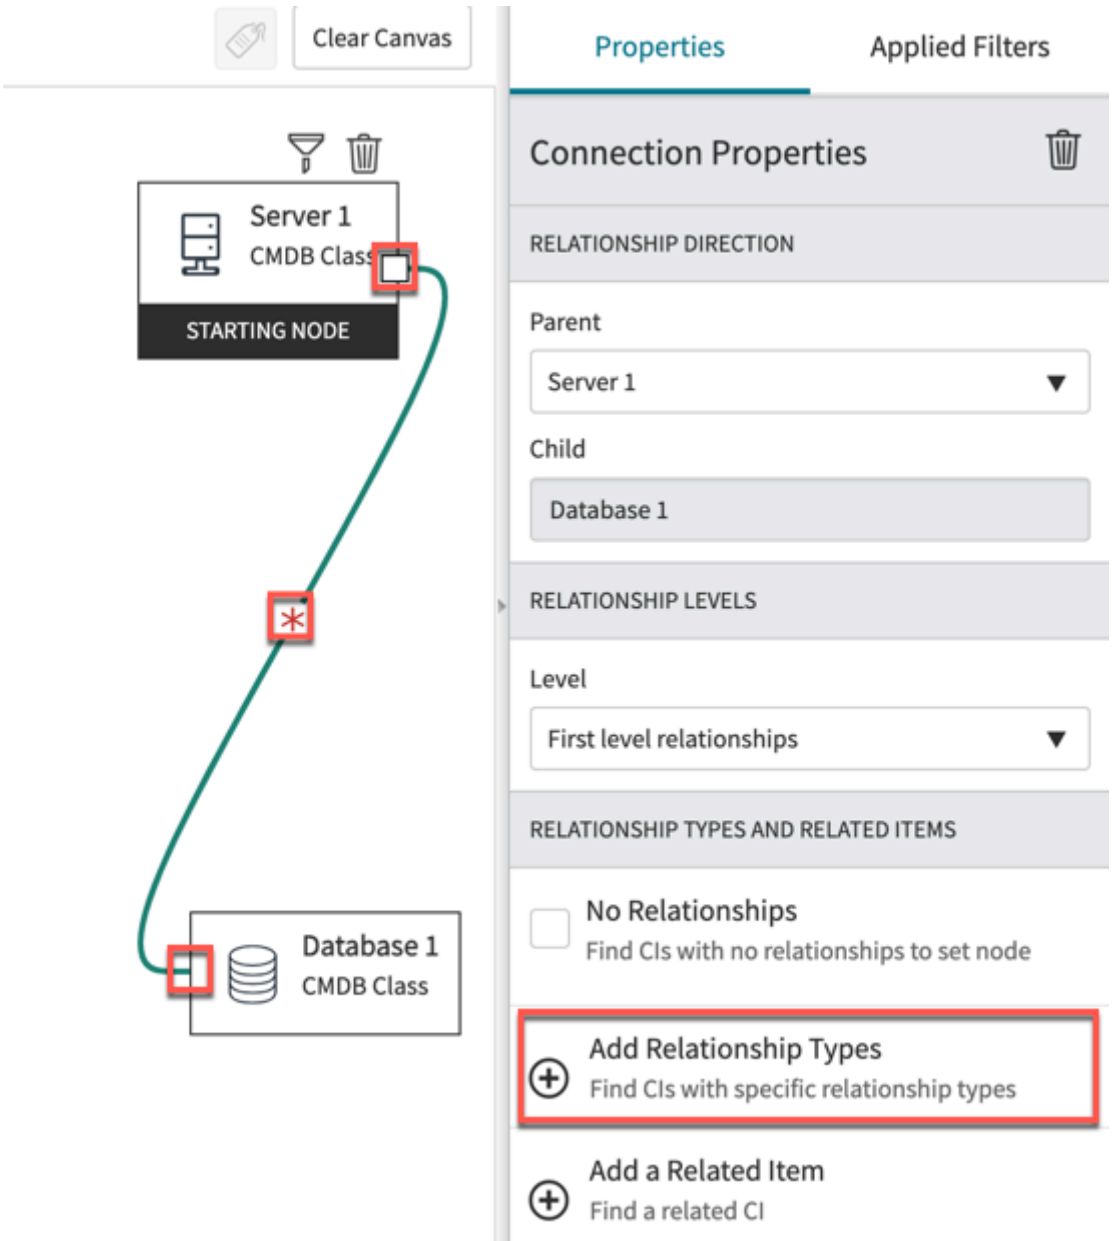
1. Navigate to **All** > **Configuration** > **CMDB Query Builder**.
2. Select **Create new** and then enter a name, for example `All servers with a connection to a DB`.
3. Choose **CMDB Query** and then select **Create**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the **CMDB Classes** list, locate the **Server** class and drag it to the canvas.

   Tip:
   Use the search box to find items quickly.

5. Locate the **Database** class, and place it to the right of the **Server** class node on the canvas.
6. Select at the center of the right side of **Server**, and then at the center of the left side of **Database** to create a connection line between the two class nodes.
7. Select once or twice on the connection line until the Connection Properties panel appears in the sidebar.
8. In the Relationship Types and Related Items section, select **Add Relationship Types** and add all the relationships from the list.



Settings in the Relationship Direction section reflect the parent-child direction in the relationship. If the Database class is the parent in the relationship, then the **Parent** and **Child** settings are switched.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. Select **Save**, and then select **Saved Queries** on the left to see the widget for the saved query.
10. Select the query widget to return to the canvas in edit mode.
11. Select **Run** to execute the query.
    Review the query results. Each row displays the name of a server CI, the name of a database CI, and the relationship type between them.
12. Add columns to the query results.

    a. Select the **Server 1** node on the canvas once or twice so that the Server 1 Report Columns section appears in the right-side pane.

    b. Select **Add Columns**.

    c. Select **Manufacturer** and then select outside the columns list to close it.

    d. Select **Run**.
    The query results now include the **Manufacturer** column.

    e. Select **Save** again to save your customization for this query.

CMDB query example — critical application services

Use this example to build a CMDB query to find all critical application services, and their owner.

Before you begin
Role required: none

Procedure

1. Navigate to **All** > **Configuration** > **CMDB Query Builder** and then select **Create new**.
2. Enter `All critical application services` as the query **Name**.
3. Choose **CMDB Query** and then select **Create**.
4. In the **CMDB Classes** list, locate the **Application Service** class and then drag it to the canvas.

   Tip:
   Use the search box to find items quickly.

5. Add a filter to the application service node.
   a. Point to the application service node and then select the **Apply filters** icon.
   b. In the Filters section, add the condition **[business criticality] [is] [1 - most critical]**.
   c. Close the Filters section.
6. Add columns to the query results.
   a. In the Properties sidebar, select **Add Columns**.
   b. Select **business criticality** and **owned by**, and then select outside the columns list to close it.
7. Select **Save**.
8. Select **Run** and then review the results.
   You can, for example, locate any of the critical application services without an owner.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CMDB query example — application services with incident or change

Use this example to build a CMDB query to find all application services for which there is an incident or a change request. Results are returned for either the application service itself or any CI within the service.

Before you begin
Role required: none

Procedure

1. Navigate to **All** > **Configuration** > **CMDB Query Builder**.
2. Select **Create new** and then enter `Application services with incidents or change requests` as the query name.
3. Choose **CMDB Query** and then select **Create**.
4. In the **CMDB Classes** list, locate the **Application Service** class and then drag it to the canvas.

   Tip:
   Use the search box to find items quickly.

5. Select **Non-CMDB Tables**.
6. Locate the **Incidents** class in the class hierarchy, and then drag it to the canvas.
7. Locate the **Change Requests** class in the class hierarchy, and then drag it to the canvas.
8. Connect the Application Service and the Incidents nodes, and then, in the Properties right-side bar.
   a. Select **Apply Incidents reference filter to all nodes in the pattern**.
   b. Set **Use CI reference column** to **Configuration item**.
9. Connect the Application Service and the Change Request node, and then, in the Properties right-side bar.
   a. Select **Apply Change Request reference filter to all nodes in the pattern**.
   b. Set **Use CI reference column** to **Configuration item**.
10. Select the **And** operator between the Incidents and the Change Request nodes, and switch it to **Or**.
11. Select **Save**.
12. Select **Run** and then review the results.

CMDB query example — hardware with Windows installed

Use this example to build a CMDB query to find all hardware in my service offering that has Microsoft Windows installed.

Before you begin
Role required: none

Procedure

1. Navigate to **All** > **Configuration** > **CMDB Query Builder** and then select **Create new**.
2. Enter `All hardware in my service offering that has Windows installed` as the query name.
3. Choose **CMDB Query** and then select **Create**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the **CMDB Classes** list, locate the following classes, and then drag them to the canvas:

   Tip:
   Use the search box to find items quickly.

   - **Service**
   - **Service Offering**
   - **Application Service**
   - Searching for infrastructure, **Hardware**

5. Connect the Service node to the Service Offering node.

   In the Properties sidebar, select **Add Relationship Type** and select the **Connect to::Connected by** relationship.

6. Connect the Serviced Offering node to the Application Service node.

   In the Properties right-side bar, select **Add Relationship Type** and select the **Connect to::Connected by** relationship.

7. Select the Application Service node.

   In the Properties right-side bar, select **Convert attached nodes to pattern** to include all CIs within the application service, in the query.

8. Connect the Application Service node to the Hardware node.
9. All infrastructure under Service,
10. Select **Save**.
11. Select **Run** and then review the results.

    You can select **Column options** of the Service column header, and select to **Group by Service**. Then expand a service to see all the hardware infrastructure under that service.

12. Return to the CMDB Query Builder window, to expand the query to include only infrastructure CIs on which Windows is installed.
13. Select **Non-CMDB Tables**, locate the **Software Instance** class, and drag it to the canvas.
14. Connect the Hardware node to the Software Instance node.

    In the Properties right-side bar, set **Use CI reference column** to **Installed on**.

15. Point to the Software Instance node, and select on the **Apply filters** icon that appears.
    a. In the Filters section, add the condition **[Product Name.Name] [is] [windows]**.
    b. Close the Filters section.
16. Select **Save**.
17. Select **Run** and review the new results.

Service Mapping query example — Linux servers in services

Use this example to build a Service Mapping query to find all Linux servers in services.

Before you begin
Role required: none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

This example Service Mapping query finds all services that include Linux servers. Then, with a simple modification, the query can find all services that do not include a Linux server.

Procedure

1. Navigate to **All** > **Configuration** and select **CMDB Query Builder**.
2. Select **Create new** and then enter `Linux server in services` in the **Name** field.
3. Choose **Service Mapping Query** and then select **Create**.
4. In the **CMDB Classes** hierarchy list, locate **Linux Server** and drag it to the canvas.

   Tip:
   Use the search box to find items quickly.

5. Select **Run**.

   Review the query results. Each row displays the name of a Service Mapping service and the name of a Linux server that is a member of that service.

6. On the right-side pane, disable **Services Including This Pattern** and then select **Run** again.

   Review the query results. Now, each row displays the name of a Service Mapping service that doesn't include the specified Linux server.

Monitor system foundations in the CSDM and the CMDB Data Foundations Dashboards

The ServiceNow® CSDM and CMDB Data Foundations Dashboards store app contains dashboards which provide insights into the key foundational metrics of your CMDB and Common Service Data Model (CSDM). This app provides recommendations to ensure that the CMDB and CSDM are properly configured for optimal usage and to mitigate any potential risks.

Note:
CSDM and the CMDB Data Foundations Dashboards don't support domain separation.

For an introduction, watch the ServiceNow Data Foundations Dashboards for CSDM and CMDB video.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

The CSDM and CMDB Data Foundations Dashboards store app provides dashboards that complement each other. See the respective sections for each of the following dashboards:

CMDB Data Foundations dashboard

Evaluates various configurations and customizations in the CMDB. This dashboard checks that important data is valid and properly configured, and identifies and provides visibility into potential risks in the implementation. Use the CMDB Data Foundations dashboard to prevent issues and support continuous effective functioning of the CMDB.

CSDM Data Foundations dashboard

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The CSDM Data Foundations dashboard displays key CSDM metrics on a single page to assist you in getting the full benefit from your ServiceNow AI Platform® products.

The CSDM and the CMDB Data Foundations dashboards capability is provided by the com.snc.cmdb.getwell plugin, which is activated by default in base systems.

Access the dashboards

Use either of the following steps to access the CSDM and the CMDB Data Foundations Dashboards:

- In CMDB Workspace:
  1. Navigate to **Workspaces** > **CMDB Workspace**.
  2. Select **Management** in the CMDB Workspace menu bar.
  3. Select **CMDB Data Foundations Dashboard** or **CSDM Data Foundations Dashboard** in Management tools, in the Optimize section.
- Navigate to **All** > **Configuration**, and then select **CMDB Data Foundations Dashboard** or **CSDM Data Foundations Dashboard**.

You can toggle between the two dashboards by clicking the change dashboard icon ( ) on the title bar of either dashboard.

Manage performance

It might be useful to manage the performance impact of some metrics that are greatly affected by, for example, a large CMDB or a high number of non-compliant CIs. You can use any of the following methods to manage performance of those metrics to improve the overall performance of the dashboards:

Deactivate a metric

Deactivate any CMDB or CSDM metrics that aren't needed or that require extensive resources and affect performance. The active/non-active settings for metrics are preserved across family release upgrades.

To deactivate a metric:

1. Access the CMDB/CSDM Get Well Metrics [sn_getwell_metric] table where all CMDB and CSDM metrics are stored.
2. Navigate to the list view of the table [sn_getwell_metric].
3. Locate the metric that you want to deactivate and set its **Active** column to **false**.

Tiles on the dashboards that are associated with inactive metrics stop collecting data and aren't refreshed.

Limit a metric

For the following metrics, you can use metric-specific settings to limit their performance impact:

- CMDB metrics:
  - *CIs Processed via IRE*
  - *CIs with Relationships to Parent and Child*
  - *Hardware CIs with Serial Numbers*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- CSDM metrics:
  - *Application Services with 'Consumes::Consumed By' Relationship to Business Application*
  - *Application Services with Business Application Relationships*
  - *Business Application with Application Service Relationship*

The following columns in the CMDB/CSDM Get Well Metrics [sn_getwell_metric] table are set with default values per metric that limit performance impact, some of which can be fine tuned. Review those settings for example, when there is a large number of non-compliant CIs for a metric. Another example is having a large CMDB where a small number of compliant CIs for a metric is already a sufficient indication of health and there is no need to process the rest of the CIs for that metric.

- *Aggregate limit*: The maximum number or percentage of non-compliant CIs that are reported for the metric. Once that threshold is reached, counting for the metric stops for the run and the score for the metric is set to 0 (you can't customize the default value).
- *Fail count threshold*: The threshold of the number of consecutive metric runs that failed due to exceeding the metric's *Runtime threshold*. When that threshold is reached, the respective metric is automatically deactivated.
- *Runtime threshold*: The time threshold in seconds that is considered too long for a metric run. When exceeded, the current metric run is considered failed.

For most metrics, when the number of consecutive runs that fail because the runtime exceeds *Runtime threshold*, is greater than the *Fail count threshold*, the system automatically deactivates the metric. You can manually reactivate a deactivated metric by setting its **Active** column to **true**. An exception to those column definitions and usage is the CMDB *CIs Processed via IRE* metric. For details, see CMDB Data Foundations dashboard.

CMDB Data Foundations dashboard

Use the CMDB Data Foundations dashboard to monitor foundational key health-related metrics in CMDB.

Requirements

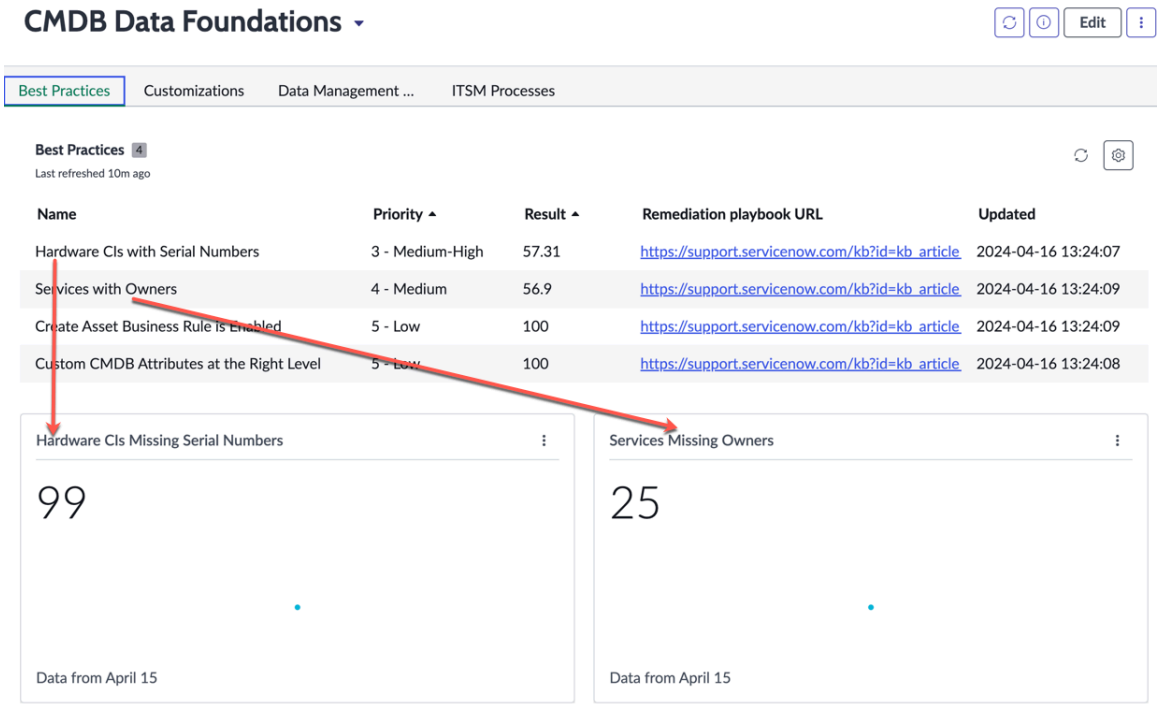
- To access the CMDB Data Foundations dashboard, users must be configured with the sn_cmdb_admin, admin, itil_admin, or asset roles. Some metrics that let you drill-down to Performance Analytics (PA) data, might require additional roles for accessing specific tables. Those roles are specified as appropriate per metric.
- The CMDB Data Foundations dashboard adds the following scheduled jobs, which must be running:
  - *CMDB Get Well Metric Collection*: Calculates and stores details for compliant CIs associated with metrics, populating the list view of the metrics. Data appears on the dashboard only after the first run of this scheduled job. Metrics' scores are stored in the CMDB Data Foundations Metric Scores [sn_getwell_cmdb_score] table. This non-PA job runs daily by default.
  - *CMDB Data Foundations PA Metric Collection*: Calculates the total non-compliant CIs associated with metrics and populates the PA widgets on the dashboard. Also,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

provides trending data over time for the non-compliant CIs associated with metrics. This PA job runs daily by default.

- *CMDB Get Well CIs Processed Via IRE Metric Batch Collection*: Invoked once a day (by default) by the *CMDB Get Well Metric Collection* job and repeatedly runs in 10 minute intervals, to process as many 1,000-CIs (default) batch files as possible. After each 10-minute run, the job stops for a minute.

Overview



The CMDB Data Foundations dashboard provides four tabs, each grouping a distinctive set of CMDB metrics:

- **Best Practices**: Checks if usage of tables and properties is as intended for supporting the health of the CMDB. This set of metrics checks adherence of CSDM-related standards, for example, for populating services and relationships.
- **Customizations**: Checks how customizations to the CMDB are used. This set of metrics checks that customizations are not used excessively, and that they are used only when needed and are correctly applied.
- *Data Management Practices*: Checks if importing third-party data into the CMDB is properly done without compromising the integrity of the CMDB. This set of metrics checks if the imported data is properly configured and formatted to provide the foundation for CMDB functions.
- **ITSM Processes**: Check if ITSM processes leverage CMDB data.

Columns in the list view of metrics

The following columns appear in the list view of metrics:

Name

Name of metric.

Priority

Priority of an metric. The priority for an metric is a calculation of the weight of the metric and the severity of the percentage score. Priority ranges from **1- Critical** as

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

the highest priority, to the lowest priority which is **5 - Low**. Metrics are listed in their priority order, starting with the highest priority metric (lowest priority number).

Result

Percentage number of CIs (or the measured item) which are in compliance with the metric.

> **Note:**
> Some metrics use a lower threshold value which impacts the result that appears in the dashboard. For these metrics, if the percentage of compliant CIs is less than the lower threshold value, then the result appears as 0 for the metric.

Remediation playbook URL

Links to remediation playbook articles in Now Support. These knowledge articles provide context for the respective issue, guidelines to help remediate the issue, and other necessary details to bring CIs into compliance. Click the link and use your Now Support credentials to access the knowledge article.

Performance Analytics widgets

Most metrics are associated with Performance Analytics (PA) widgets (tiles) that provide further details about CIs that are not in compliance with the metric. Drill down the tiles to access PA widgets, which are provided by the *`CMDB Data Foundations PA Metric Collection`* scheduled job.

On the Analytics Hub page:

- Click the **Breakdowns** context menu to see any available breakdowns.
- Ensure that the **Real-time** (

) option is selected and then click **Show Records** to see a list view of the respective CIs.

Best Practices metrics

The **Best Practices** tab contains the following metrics:

Create Asset Business Rule is Enabled

Checks for the existence of the *`Create Asset on insert`* business rule. If the business rule exists, the percentage score for the metric is 100. Otherwise, the percentage score is set to 0.

Custom CMDB Attributes at the Right Level

Percentage of custom attributes that should be added at a higher level in the CMDB hierarchy. For example, the custom attribute *`Warranty duration`* was added three times in the Computer class, instead of adding the attribute once at a higher level in the hierarchy, which is more efficient.

- If (total number of attributes that can be moved up > 10): Percentage is set to 0.
- Otherwise: Percentage is set to (10 – total number of attributes that can be moved up)*10.

Hardware CIs with Serial Numbers

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Percentage of Computer or Network Gear CIs with a serial number versus those CIs without. The metric is based on the following conditions:

- Class is an instance of Computer or Gear
- Status = installed
- Operational status = operational
- Serial number is empty

The complete set of CIs for this metric consists of the CIs that satisfy the first three conditions. The CIs that satisfy all conditions are counted as non-compliant Computer or Network Gear CIs, which are without a serial number.

Note:
If the percentage of compliant CIs is less than 70%, then the percentage score for this metric is set to 0.

The Hardware CIs Missing Serial Numbers tile shows the total number of CIs which are not in compliance with the metric. Click the tile to drill down the PA widget for further details, such as the list all those CIs.

The Hardware CIs Missing Serial Number by Key Classes chart shows those CIs that are missing a Serial Number, grouped by key classes. Point to a class bar on the chart to show more details, and click a class bar to access a list view of those CIs for class.

To manage a potential performance impact, other than deactivating the metric, you can limit the performance impact by adjusting the following performance management columns for the metric in the CMDB/CSDM Get Well Metrics [sn_getwell_metric] table. For this metric, those columns are set with the following default values:

- *Aggregate limit*: 30 (% of CIs in the metric)
- *Fail count threshold*: 3
- *Runtime threshold*: 3,600

For more information about these columns, see Performance management in Monitor system foundations in the CSDM and the CMDB Data Foundations Dashboards.

Services with Owners

Percentage of operational services in which the *owned_by* field is populated versus those operational services in which this field isn't populated.

The complete set of CIs for this metric consists of all the operational services in the Service [cmdb_ci_service] table (where *operational_status* = **Operational**). The percentage score for this metric is calculated as (Compliant CIs/Complete set of CIs) *100.

The Services Missing Owners tile shows the total number of CIs which are not in compliance with the metric. Click the tile to drill down the PA widget for further details, such as the list all those CIs.

Customizations metrics

The **Customizations** tab contains the following metrics:

Base System Business Application Table Usage

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Checks for the existence of a custom business application table, which is any table that extends [cmdb_ci], whose name starts with “u_” or “x_” and which contains the strings “bus” and “app”.

If such custom table exists, then is 0, and if not, the percentage is 100.

The Custom Business Application Tables tile shows any custom business application tables. Click the tile to drill down the PA widget for further details, such as the list all those tables.

Base System CMDB Relationship Types Usage

Percentage of base system relationship types versus custom relationship types that were created by users. Creating custom relationship types can interfere with the integrity of the CMDB therefore this metric can help you prevent such problems.

This metric counts records in the Relationship Type [cmdb_rel_type] table where *sys_package* is “global” and *name* is not “Manages::Managed by”. The percentage score for this metric is calculated as follows:

- If count is <= 0, then percentage is 100
- If count is > 10, then percentage is 0
- Otherwise percentage = (10 – count)*10

The Custom CMDB Relationship Types tile shows the relationships which are not in compliance with the metric. Those are the relationships that were not included in the base system and were custom created. Click the tile to drill down the PA widget for further details, such as the list all those relationships.

Base System Relationship Types Not Deleted or Recreated

Percentage of relationship types that exist in the base system and which were not deleted or recreated, versus those that were deleted and maybe recreated. Deleting and recreating base system relationships can interfere with the integrity of the CMDB, therefore this metric can help you prevent potential problems.

This metric counts the number of base system relationships that were deleted and possibly recreated. The percentage score for the metric is calculated as follows:

- If count is <= 0 then the percentage is set to 100
- If count is > 10 then the percentage is set to 0
- Otherwise, the percentage = (10 – count)*10

.

The Base System CMDB Relationship Types Deleted and/or Recreated tile shows the relationships which are not in compliance with the metric. Click the tile to drill down the PA widget for further details, such as the list all those relationships.

Custom CMDB Tables Using Standard Naming

Percentage of custom CMDB tables whose name doesn't start with the standard string “u_cmdb_ci”. The metric counts tables in the Tables [sys_db_object] table that extend from the CMDB table and whose name starts with the string “u_” (indicating that it is a custom table) but not with “u_cmdb_ci”.

The percentage score for this metric is calculated as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If count <= 0 then percent is 100
- If count > 6 then percent is 0
- If count is between 0 and 6, then percent is (1-(count/6))*100

The Custom CMDB Tables Not Using Standard Naming tile shows the tables which are not in compliance with the metric. Click the tile to drill down the PA widget for further details, such as the list all those tables.

Use of Custom Attributes

Percent of custom attributes that were added to CMDB tables in the base system. Custom attributes are identified by a table name that starts with "cmdb_ci" and a column name that starts with “u_.”

The percentage score for the metric is calculated as follows:

- If (total custom attribute count > 50): Percentage is set to 0.
- If (total custom attribute count < 10): Percentage is set to 100.
- If (total custom attribute count is 10–50): Percentage is set to (total custom attribute count – 10)/(50-10)*100.

Data Management Practices metrics

The **Data Management Practices** tab contains the following metrics:

Active CIs Updated in Last 90 days

Percentage of Hardware [cmdb_ci_hardware] or Virtual Machine Instance [cmdb_ci_vm_instance] active CIs that were updated in the past 90 days versus those CIs that were not (stale CIs). The metric is based on the following conditions:

- Class is an instance of Hardware or VMware Virtual Machine Instance
- Status = installed
- Operational status = operational
- Updated >= 90 days

The complete set of CIs for this metric consists of CIs that satisfy the first three conditions. The CIs that satisfy all conditions, are counted as stale CIs of the Hardware [cmdb_ci_hardware] and Virtual Machine Instance [cmdb_ci_vm_instance] classes.

Note:
If the percentage of compliant CIs is less than 65%, then the result displayed for this metric is set to 0.

The Active CIs Not Updated in 90 Days tile shows the total number of CIs which are not in compliance with the metric. Click the tile to drill down the PA widget for further details, such as the list all those CIs.

CIs Processed via IRE

Percentage of Hardware [cmdb_ci_hardware] or Virtual Machine Instance [cmdb_ci_vm_instance] CIs processed via IRE versus those CIs not processed via IRE. CIs are counted as processed via IRE if they satisfy all of the following conditions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Instance of Hardware [cmdb_ci_hardware] or Virtual Machine Instance [cmdb_ci_vm_instance]
- Status = installed
- Operational status = operational
- Sys_id is IN (target_sys_id FROM sys_object_source table)

The CIs that satisfy only the first three conditions but fail the forth condition, are counted as CIs not processed via IRE.

Note:
Viewing the data provided by PA for this metric, requires the additional role of admin or discovery_admin. However, the **Show Records** button on the Analytics Hub page isn't supported.

To manage a potential performance impact, other than deactivating the metric, you can limit the performance impact by adjusting the following performance management columns for the metric in the CMDB/CSDM Get Well Metrics [sn_getwell_metric] table. For this metric, those columns are set with the following default values:

- *`Aggregate limit`*: 1,000 (Number of records in each batch file processed by the *`CMDB Get Well CIs Processed Via IRE Metric Batch Collection`* job during its 10-minute run intervals. Non customizable).
- *`Fail count threshold`*: 3
- *`Runtime threshold`*: 72,000 (Daily limit of total runtime of all *`CMDB Get Well CIs Processed Via IRE Metric Batch Collection`* job runs)

For this metric, there is no trigger for automatically setting the metric score to 0. For more information about these columns, see 'Performance management' in Monitor system foundations in the CSDM and the CMDB Data Foundations Dashboards.

CIs with Names

Percentage of Hardware, VMware Virtual Machine Instance, or Application CIs with a name up to 200. The metric is based on the following conditions:

- Class is an instance of Hardware [cmdb_ci_hardware], Virtual Machine Instance [cmdb_ci_vm_instance], or Application [cmdb_ci_appl]
- Status = installed
- Operational status = operational
- Name is empty

Non-compliant CIs are counted as the CIs that are missing a name, which are those CIs that satisfy all conditions.

The percentage score for the metric is calculated as follows:

- If count of CIs without names is > 200, percent is 0
- If count of CIs without names is < 200, percent is (200-(count of CIs without names)/200 * 100)

The CIs Missing Names tile shows the total number of CIs which are not in compliance with the metric. Click the tile to drill down the PA widget for further details, such as the list all those CIs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CIs with Relationships to Parent and Child

Percentage of non-orphan CIs versus orphan CIs.

The complete set of CIs for this metric consists of CIs in records from the CI Relationship [cmdb_rel_ci] table. CIs in which [parent.sys_class_name=(empty)] OR [child.sys_class_name=(empty)], are counted as orphan CIs.

The Orphan CIs tile shows the total number of orphan CIs, correlating the darker portion of the metric bar. Select the tile to drill down to the list all those CIs.

To manage a potential performance impact, other than deactivating the metric, you can limit the performance impact by adjusting the following performance management columns for the metric in the CMDB/CSDM Get Well Metrics [sn_getwell_metric] table. For this metric, those columns are set with the following default values:

- *Aggregate limit*: 1,000
- *Fail count threshold*: 3
- *Runtime threshold*: 3,600

For more information about these columns, see Performance management in Monitor system foundations in the CSDM and the CMDB Data Foundations Dashboards.

Handled Duplicate CIs

Percentage of duplicate CIs of the Hardware or VMware Virtual Machine Instance classes, that were remediated, up to 200. If the number of unhandled duplicate CIs is greater than the upper threshold of 200, then is set to 0. The metric is based on the following conditions:

- Class is an instance of the Hardware [cmdb_ci_hardware] or the Virtual Machine Instance [cmdb_ci_vm_instance] class.
- Status = installed
- Operational status = operational
- Duplicate_of in not empty

Non-compliant CIs are counted as those CIs that satisfy all conditions. Non-compliant CIs are those Hardware [cmdb_ci_hardware] or Virtual Machine Instance [cmdb_ci_vm_instance] duplicate CIs that were not remediated. For more information, see Duplicate CIs remediation.

The percentage score for this metric is calculated as follows:

- If count of non-compliant CIs is > 200 then percent is 0
- If count of non-compliant CIs is < 200 then percent is (200-count of non-compliant CIs)/200*100

The Unhandled Duplicate CIs tile shows the total number of CIs which are not in compliance with the metric. Click the tile to drill down the PA widget for further details, such as the list all those CIs.

Installed Server CI Naming Reflecting Hostname

Percent of Server CIs where name reflects the host name, up to the first period in the name. The complete set of CIs for the metric are all the servers in the Server

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

[cmdb_ci_server] table in which *install_status*=1 and *host_name* is not empty.

Examples of compliant CIs:

- Server Name is “abc”, and host name is “abc.1.2.3”
- Server Name and host name are the same

The percentage score for the metric is calculated as (Compliant CIs/Total CIs)*100.

The Installed Server CI Naming Not Reflecting Hostname tile shows the number of Server CIs which are not in compliance with the metric. Click the tile to drill down the PA widget for further details, such as the list all those CIs.

Note:
If you need to manually refresh the Installed Server CI Naming Not Reflecting Hostname widget, then you must first run the CMDB Get Well Metric Collection job, and then run the CMDB Data Foundations PA Metric Collection job.

Managed CIs with Model Entries

Percentage of Hardware [cmdb_ci_hardware] CIs with a model ID versus those CIs without.

The complete set of CIs for this metric consists of all the CIs in the Hardware [cmdb_ci_hardware] table. Compliant CIs are those in which *model_id* is populated.

The Managed CIs Missing Model Entries tile shows the total number of CIs which are not in compliance with the metric. Click the tile to drill down the PA widget for further details, such as the list all those CIs.

Servers with Location

Percentage of Server CIs in which *Location* is populated versus Server CIs in which *Location* isn't populated. The complete set of CIs for this metric are the Server CIs in the Server [cmdb_ci_server] table in which install_status =1 and operational_status=1. Compliant CIs are those CIs in which also location is not null.

The percentage score for the metric is calculated as (Compliant CIs/Total CIs)*100.

The Servers Missing Location tile shows the number of Server CIs which are not in compliance with the metric. Those are the Server CIs in which *Location* is empty. Click the tile to drill down the PA widget for further details, such as the list all those CIs.

Unique Locations

Percentage of unique locations versus non-unique (duplicate) locations.

The complete set of locations for this metric consists of all the locations in the Location [cmn_location] table records, in which *name* is not null. A duplicate location is counted as a record in which *name* is not null, and the same name is used more than once.

The percentage score for the metric is calculated as (Compliant CIs/Total CIs)*100.

The Duplicate Locations tile shows the total number of CIs which are not in compliance with the metric. Click the tile to drill down the PA widget for further details, such as the list all those CIs.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If you need to manually refresh the Installed Server CI Naming Not Reflecting Hostname widget, then you must first run the CMDB Get Well Metric Collection job, and then run the CMDB Data Foundations PA Metric Collection job.

ITSM Processes metrics

The **ITSM Processes** tab contains the following metrics:

Changes Referencing a CI

Percentage of change requests with a reference to CIs versus those change requests without. The complete set includes all change requests created in the last 90 days. Compliant records are those change requests in which the *cmdb_ci* field is not empty.

The percentage score for the metric is calculated as (Compliant change requests/ Total change requests) * 100.

The Changes Not Referencing a CI tile shows the total number of records which are not in compliance with the metric. Click the tile to drill down the PA widget for further details, such as the list all those change requests.

Note:
Viewing all the data provided by Performance Analytics for this metric (when drilling down), requires the additional role of sn_cmdb_editor, itil or sn_change_read.

Changes Relating to both a Service and a CI

Percentage of changes relating services to CIs versus those changes that don't. The complete set of CIs for this metric consists of all change request records. Compliant records are those change requests in which both, the *cmdb_ci* and the *business_service* fields, are not empty.

The Incidents Relating to Neither a Service nor a CI tile shows the total number of records which are not in compliance with the metric. Click the tile to drill down the PA widget for further details, such as the list all those CIs.

Note:
Viewing all the data provided by Performance Analytics for this metric (when drilling down), requires the additional role of sn_cmdb_editor, itil or sn_change_read. Click the tile to drill down the PA widget for further details, such as the list all those CIs.

Incidents Referencing a CI

Percentage of incidents referencing a CI versus those incidents that don't. The complete set of records includes all incidents created in the last 60 days. Compliant incidents are all those in which the *cmdb_ci* field is not empty.

The percentage score for the metric is calculated as (Compliant Incidents/Total Incidents)*100.

The Incidents Not Referencing a CI shows the total number of incidents which are not in compliance with the metric. Click the tile to drill down the PA widget for further details, such as the list all those incident records.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Viewing all the data provided by Performance Analytics for this metric (when drilling down), requires the additional role of sn_cmdb_editor, itil or sn_incident_read.

Incidents Relating to both a Service and a CI

Percentage of incidents relating to both a service and a CI versus those incidents that don't. The complete set for this metric is all incident created in the last 60 days. Compliant records are those incidents in which both, the *cmdb_ci* and the *business_service* fields, are not empty.

The percentage score for the metric is calculated as (Compliant Incidents/Total Incidents) * 100.

The Incidents Relating to Neither a Service nor a CI shows the total number of records which are not in compliance with the metric. Click the tile to drill down the PA widget for further details, such as the list all those incident records.

Note:
Viewing all the data provided by Performance Analytics for this metric (when drilling down), requires the additional role of sn_cmdb_editor, itil or sn_incident_read. Click the tile to drill down the PA widget for further details, such as the list all those CIs.

CSDM Data Foundations dashboard

The CSDM Data Foundations dashboard displays key CSDM indicators on a single page to help you get the full benefit from your ServiceNow AI Platform products.

Access the dashboard

Use either of the following methods to open the dashboard:

Navigate to **All** > **Configuration**, and then select **CSDM Data Foundations Dashboard**.

1. In CMDB Workspace, navigate to **Workspaces** > **CMDB Workspace**.
2. Select **Management** in the CMDB Workspace menu bar.
3. Select **CSDM Data Foundations Dashboard** in the Optimize section of the Management tools.

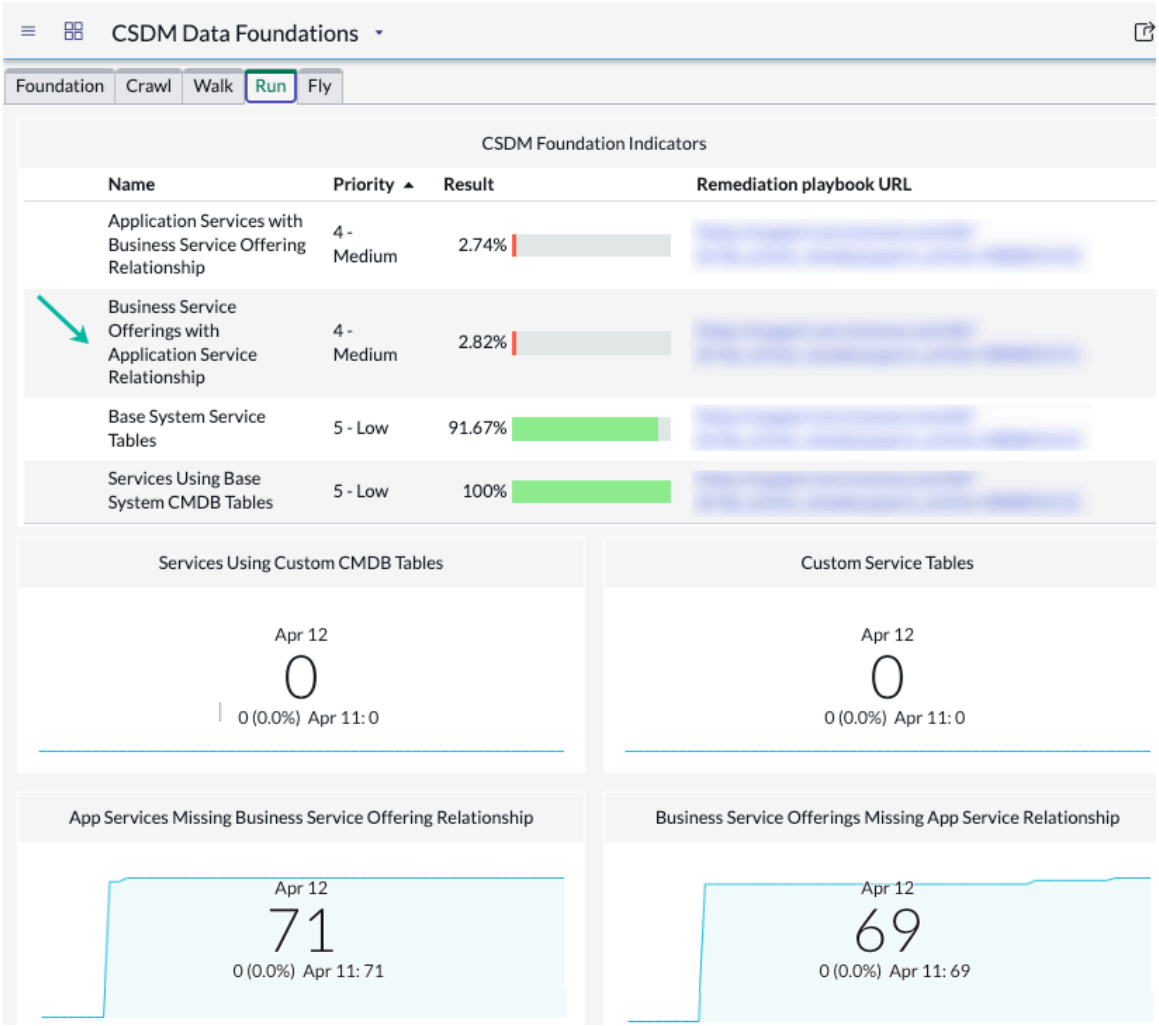
Select the change dashboard icon ( ) to toggle between the CSDM and CMDB dashboards.

Example

The reports on each tab display the data metrics that are appropriate for the maturity of your organization's CSDM implementation stage (foundation, crawl, walk, run, and fly). A label on each report identifies the metric being displayed.

In this example, a report on the **Run** tab indicates that several business service offerings don't have the required relationships to service instances . With this knowledge, Service owners can add the relationships to ensure that customer service agents get complete information on the upstream impacts of applications that are down.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Tabs on the dashboard

- The Foundation domain involves tables that contain base data that is referenced from or to objects in the other CSDM domains. Foundation data is required before you can use ServiceNow products or add data to the CMDB. See 'Foundation' stage reports on the CSDM Data Foundations dashboard.
- In the Crawl stage, you work on base-system CMDB tables that are associated with IT Service Management (ITSM). See 'Crawl' stage reports on the CSDM Data Foundations dashboard.
- In the Walk stage, you identify and populate the network infrastructure CIs and applications that your organization's technical teams support. See 'Walk' stage reports on the CSDM Data Foundations dashboard.
- In the Run stage, you set up the relationship between a technology and the business that sells and/or consumes the technology. See 'Run' stage reports on the CSDM Data Foundations dashboard.
- When you reach the Fly stage, you've accomplished all or most of the process of implementing the CSDM framework. The fly stage completes the process. See 'Fly' stage reports on the CSDM Data Foundations dashboard.

Managing performance of data collection

For information on managing data collection for a metric that isn't needed or that affects performance of the dashboard, see Manage performance.

CMDB Health

Monitoring and maintaining the health of the CMDB is essential to an effective and continuous use of the product. Health indicators such as duplicate CIs, required CI fields, and audits are evaluated and aggregated into health scores at the class, health group, and service levels. CMDB Health also provides a framework for applying standardized CI remediation.

Get started

Explore Explore the KPIs and metrics that are evaluated for health, and the health results dashboards.	Configure Select the health metric to monitor and configure any associated rules.	Use CMDB Health in CMDB Workspace Access CMDB Health dashboards and related tasks in CMDB Workspace views.
Remediate  Create and apply remediation rules to CIs that failed health tests.	Track processes Use logging and other troubleshooting methods to resolve issues with CMDB Health processes.	Reference Details about properties, scheduled jobs, and tables, used by CMDB Health, and domain separation.

CMDB Health overview

CMDB Health Monitors and helps maintain the integrity and effectiveness of the CMDB. CMDB Health evaluates Health indicators such as duplicate CIs, required CI fields, and audits and aggregates them into health scores at the class, health group, and service levels. CMDB Health also provides a framework for applying standardized CI remediation for health issues that are detected.

CMDB Health benefits

CMDB Health is configurable so you can track specific areas of concern. It provides dashboards with aggregated numbers that you can easily glance and drill-down to locate the source of a problem.

What to explore next

To learn more about configuring and using CMDB Health, see:

- Set up and configure CMDB Health
- CMDB Health experience in CMDB Workspace
- View CMDB Health reports:
  - View CMDB Health dashboard
  - View relationships health
  - View CI health
- Create a CMDB remediation rule
- Track CMDB Health processes
- CMDB Health reference

Overview of CMDB Health

Learn about the benefits, configuration, and usage of the CMDB Health feature.

The health of the CMDB data is monitored and reported for the following KPIs, each further consisting of sub-metrics:

Completeness

CIs are tested for required and recommended fields that are not populated.

Correctness

CIs are tested against predefined data integrity rules such as identification rules (to detect duplicate CIs), orphan CI rules, and stale CI rules.

Compliance

The CMDB data is audited for adherence to predefined certificates.

Relationships

The health of CI relationships is tested for indicators such as orphan and duplicate relationships, and for compliance with suggested relationships, hosting and containment rules.

After CIs are tested for various health indicators (metrics), the results are aggregated at the class, health group, service, and relationship level, and appear on CMDB Health dashboards. For most metrics, you can configure the health tests themselves to determine how compliance and non-compliance of CIs are evaluated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more details about the KPIs and their associated metrics, see CMDB Health KPIs and metrics.

Note:
CMDB Health doesn't support non-CMDB tables.

CMDB Health dashboards and reports

You can view CMDB Health dashboards and reports in CMDB Workspace. Those dashboards show CMDB Health aggregated results for compliant and non-compliant CIs for CMDB Health KPIs and their metrics.

Dashboard/Report	Use
CMDB Health Dashboard 1. Navigate to **Workspaces** > **CMDB Workspace**. 2. Select **Home** in the CMDB Workspace menu bar. 3. In the Quick links section select the **CMDB Health Dashboard** link. or: 1. Navigate to **All** > **Configuration** > **CMDB Health Dashboard**. 2. Select one of the views.	Main CMDB Health dashboard with the following views: **Class View** • Shows CIs and classes health reports with aggregations for metrics, KPIs, and class branches. • Access to remediation tasks that were generated for CIs that failed a health test. **Service View** • Shows service health reports. • Detailed health for CIs per service with aggregations for metrics and services. • Access to remediation tasks that were generated for CIs in a service that failed a health test. **Health Group View** • Shows health reports for CMDB groups of type *Health*. • Detailed health for CIs in the group, with aggregations for KPIs, metrics, and health groups. In either dashboard view you can select **CMDB Health settings** to manage the CMDB Health Dashboard jobs and configure other CMDB Health settings. For more information, see Set up and configure CMDB Health.
Relationship Health dashboard	Shows various charts for relationships health, such as duplicate, orphan, and stale

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dashboard/Report	Use
1. Navigate to **Workspaces** > **CMDB Workspace**. 2. Select **Home** in the CMDB Workspace menu bar. 3. In the Quick links section select the **Relationship Health Dashboard** link.	relationships. For more information, see View relationships health.
CI health report • On a CI form that isn't in CMDB Workspace, select **Open in CMDB Workspace**. • In CMDB Workspace, select a CI in a list view to open the CI's form. For example, on the CMDB Health dashboard, drill down a KPI tile and then select a CI in the tile's list view.	On a CI form, the CI Health tile contains widgets that show CIs health reports. Select the right (>) or left (<) handles in the CI Health tile to scroll through the widgets.

Setup and configuration

To start gathering and aggregating health data, you must enable the CMDB Health-related jobs (CMDB Health Dashboard jobs) which are initially disabled. You also need to configure CMDB Health related system properties and health KPIs and metric test rules, to reflect health standards in your organization.

For details about setting up and configuring CMDB Health, see Set up and configure CMDB Health.

Location	Configuration
CI Class Manager **Configuration** > **CI Class Manager**	Central location to manage CI classes and to configure CMDB health settings. Use the CI Class Manager to Manage rules and definitions that are used for health tests, such as orphan rules, audit certificates, and recommended fields rule. For information about configuring KPI and metric tests, see CMDB Health KPIs and metrics.
CMDB Health Preferences Navigate to **Configuration** > **Health Preferences**, or perform the following steps:	Central location for configuring CMDB Health settings: • Configure CMDB Health system properties. • Enable and manage the CMDB Health Dashboard jobs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Location	Configuration
1. Navigate to **All** > **Configuration** > **CMDB Health Dashboard**. 2. Select a view. 3. On the CMDB Health dashboard, select **CMDB Health settings**.	• Activate or deactivate KPIs and metrics. • Set the maximum failure threshold for the KPIs and metrics. • Configure creation of tasks for failed CIs.

CI remediation

CMDB Health provides a framework for configuring CI remediation. Remediation lets you proactively apply corrective actions to unhealthy CIs in a managed and standardized fashion.

Domain separation

CMDB Health is domain aware. If the domain separation plugin has been activated, then the CMDB Health dashboard shows health based on data, rules, and settings from the logged-on user domain. If rules and settings aren't defined for a child domain, then the parent's settings are applied, recursively.

For more information, see Domain separation in CMDB Health.

CMDB Health KPIs and metrics

CMDB Health calculates an aggregated score for three Key Performance Indicators (KPIs) which are correctness, compliance, and completeness, each further consisting of sub-metrics.

You can configure which KPIs and metrics are included in CMDB Health evaluations and dashboards. In the base system, all KPIs and all their metrics are included.

To access the CMDB Health dashboard and view CMDB health, see View CMDB Health dashboard.

Correctness

A KPI which is an aggregation of the following metrics:

Orphan

Measures the percentage of orphan CIs in the CMDB. A CI can become orphan if it was unintentionally left in the CMDB when it is no longer needed. A CI is determined to be orphan if:

- The CI satisfies the criteria in an orphan rule. This criteria checks for specific attributes that a CI must have, and for CIs that have no relationships or that don't have specific relationships.
- Data is missing for the CI in its respective table, or in one of its parents' table.

Staleness

Measures the percentage of stale CIs in the CMDB. A CI is stale if it was not updated within the **Effective Duration** time period that is specified in the staleness rule that applies to the class.

The base system includes a default staleness rule for the Configuration Item [cmdb_ci] class, which sets the **Effective Duration** time to 60 days. This rule applies to all extended CMDB classes, and can be overridden by class specific staleness

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

rules defined by the user. To determine CI staleness, a staleness rule for the CI's class is used if it exists, otherwise, the default staleness rule is used.

In addition, a relationship in which a stale CI is a parent or a child, is determined to be a stale relationship.

Note:

Discovery marks VMware vCenter CIs that no longer physically exist, as stale. By default, this setting takes precedence over a CMDB Health staleness rule defined for the CI. When drilling-down in the CMDB Health dashboard to Health Results, the **Source** for CIs determined to be stale by Discovery, is Cloud Discovery.

For the aggregated score of the correctness KPI to include only health results generated by CMDB Health, set the *glide.cmdb.health.src.cmdb_health_audit_only* system property to **true**. In which case, drilling-down to the details of stale CIs still shows those CIs in which source is Cloud Discovery. For more information, see CMDB Health system properties and Discovery for VMware vCenter.

Duplicate

Measures the percentage of duplicate CIs in the CMDB using identification rules. Only independent CIs are evaluated for duplication. In a set of duplicate CIs, the count of duplicate CIs is the total number of CIs in the set, minus one. The detailed graphs for a duplicate set of CIs display all the CIs in the set.

For more details, examples, and troubleshooting information about duplicate metric, see the CMDB Health - Duplicate Metric - algorithm [KB0726425] knowledge base article.

Completeness

A KPI which is an aggregation of the following metrics:

Required

Measures the percentage of CIs in which fields that are defined as mandatory, are not populated. Missing fields are tagged as incomplete noting that for this CI some information is missing. Required fields are equivalent to the fields that are specified as mandatory in the system dictionary.

Recommended

Measures the percentage of CIs in which fields that are set as recommended, are not populated. Out-of-box, no recommended fields are specified.

You can use the Add Identifier Fields In Recommended Rules scheduled job to set criterion attributes from active identification rules, as recommended fields. You can use the Remove Identifier Fields In Recommended Rules scheduled job to unset criterion attributes from active identification rules, as recommended fields.

Compliance

Based on the results of actual CMDB audit runs.

Note:
Audit must be activated for the compliance KPI to show results. For more information, see Compliance Activation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Audit

Audit compares actual values of specified fields, against expected values defined in template and scripted audits. Based on the *Last run date* of audits, CMDB Health identifies the set of the most recent complete audit run, and uses those audit results. To pass the CMDB Health audit test, a CI must be in compliance with all audits for that CI. Create a compliance-type audit, for which the results are calculated into the CMDB Health compliance KPI.

When running scripted audits, the *Last run date* is not populated. Therefore, for the compliance KPI to include the results of a scripted audit, update the script in the audit to record the audit run time.

Relationships

Measures the health of CI relationships, consisting of the following metrics which are not-configurable:

Duplicate relationships

Relationships that have identical parent and child CIs, identical relationship type, and an identical port. Duplicate relationships are displayed per relationship type. In a set of duplicate relationships, the duplicate relationship count is the total number of duplicate relationships in the set, minus one. The detailed graphs for a duplicate set of relationships display all the relationships in the set.

Orphan relationships

A relationship that is missing either a parent CI, a child CI, or both.

Stale relationships

A relationship in which the parent CI or the child CI is a stale CI.

A single relationship can fail more than one health test. For example, a duplicate relationship can also be stale.

Also reports the following relationship-related summaries:

- Relations not compliant with suggested relations
- Relations not compliant with containment rules
- Relations not compliant with hosting rules

To access the Relationship Health dashboard and view relationships health, see View relationships health.

CMDB Health system properties

Configure KPI and metrics preferences

Set up and configure CMDB Health

Data collection for CMDB Health is highly configurable to reflect data health requirements and standards in your organization. Most importantly, the CMDB Health Dashboard jobs are disabled by default and health data isn't collected until you enable those jobs.

To report valuable and meaningful health data, review and adjust CMDB Health-related settings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Review CMDB Health KPIs and metrics to learn what CMDB Health can monitor, and what to configure to enable and support each metric. Deactivate any KPIs and metrics that you aren't interested in reporting, and set failure thresholds.
2. For each KPI and associated metric that you want monitored, define the necessary rules and fulfill other needed requirements. For example, you might need to:
   - Set a CI attribute to be mandatory
   - Set a CI field to be recommended
   - Create a CMDB Health orphan rule
   - Create a CMDB Health staleness rule
3. Narrow the scope of CIs that are included in health calculations - see Create health inclusion rule.
4. Examine and adjust as needed the CMDB Health system properties.
5. Enable the Health Dashboard jobs for the KPIs that you want reported - for more information, see Enable and configure a CMDB Health Dashboard job.

Configure KPI and metrics preferences

Include or exclude KPIs and metrics as needed in your organization, and configure system behaviour when CIs fail metric health tests.

Before you begin

To start collecting and reporting CMDB health KPIs and metrics, you must first enable and configure the CMDB health dashboard jobs.

Role required: itil_admin (on top of itil)

About this task

If Domain Support - Domain Extensions is activated, then you can configure aggregation preferences per domain.

Procedure

1. Navigate to **All** > **Configuration** > **Health Preference**.
2. Select **Health Metrics** on the right-hand side bar.

   a. In the **Select Metric** drop-down list select the **Completeness**, **Compliance**, or the **Correctness** KPI and toggle **Active** to included that KPI and its associated metrics in CMDB Health analysis and reporting.

   b. In the **Select Metric** drop-down list select a metric, such as **Required**, and configure its associated fields.

      For a metric:

Field	Description
Active	Activate the metric to include it in the aggregated health report for the respective KPI.
Failure Threshold	Threshold number of CIs that can fail the health metric test. When reached, health

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	processing stops for the metric for this cycle. Maximum number is 100,000, even if you specify a higher number.
Create Task	If a CI fails the metric test, create a task with details about the failure. You can then view any generated tasks in the CMDB Workspace store app, and configure remediation for the task.
Task Assignee Group	An assignment group for the task.

3. Select **Save**.

Set a CI attribute to be mandatory

Configure a CI attribute as mandatory so it is included in the CMDB Health tests for the *required* metric if enabled. *Required* is a metric of the CMDB Health *completeness* KPI.

Before you begin

Role required:

- Itil_admin and personalize_dictionary: For editing the dictionary table
- itil has read access

About this task

When a field is configured as mandatory, then if the *required* metric is enabled, the CMDB health tests check whether that field is populated or not. The CMDB Health dashboard shows the aggregated report of the percentage of CIs for which one or more required fields is empty.

Procedure

1. Navigate to **All** > **Configuration** > **CI Class Manager**.
2. Select **Hierarchy** to display the CI Classes list. Then select the class with the field that needs to be set as mandatory.
3. In the class navigation bar, expand **Class Info** and then select **Attributes**. In the Attributes view, click **Added**.
4. Locate the attribute that you want to set as mandatory, and then double-click its **Mandatory** value and set it to true.

   The next time the form is opened, a field status indicator appears next to the field label, indicating that a value is mandatory.

> **Note:**
> Mandatory fields are global. The field is marked as mandatory everywhere it appears on a form. Also, mandatory fields do not appear correctly when using Service Mapping tag-based discovery. For more information, see Tag-based discovery in Service Mapping.

Make a field mandatory

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set a CI field to be recommended

Define a list of CI fields as recommended, noting that it is desirable that they are populated by a data source such as Discovery. You can then configure the CMDB completeness KPI to include recommended fields in its aggregated health reports.

Before you begin

Role required:

- Itil_admin and personalize_dictionary: For editing the dictionary table
- itil has read access

About this task

Use this procedure for fields which should not be mandatory, but that might have useful information that the CI should have. For example, a field with information that might at some point help with diagnosis. Initially, a derived class is set with the recommended fields that are defined at the parent level. You can add or remove recommended fields for a derived class, setting it with its own recommended fields, without affecting the recommended fields at the parent or sibling levels. If all recommended fields for a derived class are removed, then the derived class automatically derives the recommended fields from its parent class.

The CI Class Manager doesn't support dot-walking for selecting fields from referenced tables, as recommended. See the steps at the end of this procedure to directly update tables with recommended fields, using one level dot-walking.

For more information about child and parent classes, see Table extension and classes.

Procedure

1. Navigate to **All** > **Configuration** > **CI Class Manager**.
2. Select **Hierarchy** to show the CI Classes list, and then select the class that contains the fields that need to be set as recommended.
3. In the class navigation bar, expand **Health**, select **Completeness**, and then select the Recommended Fields tab.
4. In the Recommended Fields tab, use the list collector to move the fields that you want to designate as recommended, from the **Available** list to the **Selected** list.
5. Click **Save**.

What to do next

To directly update the CMDB Recommended Fields [cmdb_recommended_fields] table, (outside the CI Class Manager), using dot-walking to designate a field from a referenced table, as recommended:

1. Select **All**.
2. In the Filter navigator, enter `cmdb_recommended_fields.list` to access the CMDB Recommended Fields table.
3. On the CMDB Recommended Field form, set **Table** to the table that you want to set with recommended fields.
4. Select **Recommended fields** and use the list collector to select recommended fields for the table. You can expand a reference field up to one level, and use dot-walking to select a field from a referenced table.
5. Select **Submit**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a CMDB Health orphan rule

Create an orphan rule to determine the percentage of orphan CIs in the CMDB. This sum is then aggregated into the correctness CMDB Health KPI. Orphan rules are defined per class, and only a single orphan rule can be defined per class.

Before you begin

Role required: itil has read access, itil_admin (on top of itil) has full access.

About this task

Specify the conditions that CIs must meet to be considered an orphan CI. Specify attributes that a CI must have, relationships that a CI should not have, or both. In the relationship conditions, you can either specify that the CI has no relationships, or a set of specific relationships that the CI doesn't have.

> **Note:**
> If there is a health inclusion rule for the orphan metric, then the conditions in the health inclusion rule and the conditions in the health orphan rule, shouldn't be identical.

A health orphan rule can for example, identify a CI of the cmdb_ci_computer class as an orphan CI if the CI is not set with an owner or an asset. Or, for example, you can create an orphan rule for a CI in the Disk [cmdb_ci_disk] class. If that CI doesn't have a Contains::Contained by or Contained by::Contains relationship with a Computer CI, then it is an orphan CI.

Procedure

1. Navigate to **All** > **Configuration** > **CI Class Manager**.
2. Select **Hierarchy** to show the CI Classes list and then select the class for which to create an orphan rule.
3. In the class navigation bar, expand **Health**, select **Correctness**, and then select the Orphan Rule tab.
4. Select a rule to edit, if one exists, or select **New**, and then fill out the form.

Field	Description
Class	The class for which the orphan rule applies.
Attributes	Attribute conditions that a CI must satisfy to be considered an orphan CI. For example, the filter conditions in which both the *Assigned to* and the *Owned by* fields are empty, will identify the matching CIs as orphans.
Condition	And/Or operation between the **Attributes** conditions and the **Relationship** conditions.
Relationship	The relationship conditions that a CI must fail,based on records in the CI Relationship [cmdb_rel_ci] table, in order to be considered an orphan CI.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	To specify that a CI must have no relationships, choose **Any Relation** and **Any Class** respectively.

5. Select **Submit** or **Update** to save the rule.

Related topics

CMDB Health Dashboard for Helsinki | Overview

Create a CMDB Health staleness rule

If the staleness metric is in effect, then staleness rules are used to determine the percentage of stale CIs in the CMDB. This sum is then aggregated into the correctness KPI.

Before you begin

Role required: itil has read access, itil_admin (on top of itil) has full access.

About this task

The Discovery setting of certain types of CIs as stale takes precedence over a CMDB Health staleness rule defined for the CI. For more information about Discovery marking CIs as stale, see Discovery for VMware vCenter.

Staleness rules are defined per class. If a rule isn't defined for a class, then the parent's rule is automatically derived by the child class and applies for the child class. If later a staleness rule is defined at the child class level, it overwrites the staleness rule that was derived from the parent class.

Procedure

1. Navigate to **All** > **Configuration** > **CI Class Manager**.
2. Select **Hierarchy** to show the CI Classes list and then select the class for which to create a staleness rule.
3. In the class navigation bar, expand **Health**, select **Correctness**, and then select the Staleness Rule tab.
4. Select a staleness rule to edit or select **New**, and then fill out the Staleness Rule form.

Field	Description
Applies to	The class for which the rule applies.
Effective Duration	The time period that is used for the staleness test. If the CI was not updated (based on Updated *sys_updated_on*) within the specified time period — the CI is determined to be stale. If you enter a value with a prefix that is valid and a suffix that is not, such as `15 x` — the valid portion of the value is used ('15'). If the

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	entire value is invalid — the value is ignored and the previous valid value is used.

5. Select **Submit** or **Update** to save the rule.

Related topics

CMDB Health Dashboard for Helsinki | Overview

Create health inclusion rule

Filter the CIs that are included in health calculations and that appear in the CMDB Health dashboard by defining health inclusion rules. Use health inclusion rules to temporarily filter out classes that generate a large number of failures, until the problems are fixed.

Before you begin

Role required: itil has read access, itil_admin (on top of itil) has full access.

About this task

Evaluation for the required, orphan, recommended, duplicate and staleness health metrics, will apply only to CIs that satisfy health inclusion rules. For example, health inclusion rules can limit CMDB Health scores of the duplicate metric only for server and network CIs.

Note:

- You can specify health inclusion rules per domain.
- Creating health inclusion rules at the level of the base cmdb_ci table can potentially filter out health results of all classes in CMDB health dashboards.
- Applying a health inclusion rule to the duplicate metric, is supported only in the global domain.
- Due to performance issues, dot-walking in health inclusion rules for the duplicate metric is not supported.

In addition to any health inclusion rules, identification inclusion rules also indirectly impact what appears in the CMDB Health dashboard for duplicate CIs. The dashboard itself uses the identification engine (IRE) to identify duplicate CIs and therefore identification inclusion rules are applied.

Inheritance of health inclusion rules:

- If there are no health inclusion rules specified for a child class, then rules specified on a parent class are applied to the child class.
- If health inclusion rules are specified for a child class, then those rules take precedence over rules specified on a parent class.

In the base system, there are no predefined health inclusion rules, in which case all CIs are included in the CMDB Health calculations.

Procedure

1. Navigate to **All** > **Configuration** > **CI Class Manager**.
2. Select **Hierarchy** to show the CI Classes list and then select the class for which to create a health inclusion rule.
3. In the class navigation bar, expand **Health** and then select **Health Inclusion Rules**.
4. Select an existing rule to edit or select **New** and then fill out the Health Inclusion Rules form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Applies to	Class this rules applies to.
Active record condition	Criteria that CIs must meet to be included in the evaluation for the specified health metrics.
Applies to metric	Metrics that the rule applies to.

5. Select **Save** or **Update**.

What to do next
You can delete a health inclusion rules that is no longer needed by selecting that rule, and then on the CMDB Health Configuration form, selecting **Delete**.

Configure aggregation weights for CMDB Health score calculations

Metrics health scores are aggregated into their respective KPI (key performance indicator) scores, which in return are aggregated into the overall CMDB Health score. Modify the default aggregation weights for metrics and KPIs to reflect on the importance of one metric over another is assessing the health of CMDB in the organization.

About this task
The completeness KPI, for example, consists of the metrics required fields and recommended fields. By default, those metrics are configured to contribute 60% and 40% respectively to the aggregated score of the completeness KPI. You can modify that proportional weight of required fields and recommended fields within the completeness KPI to be, for example, 25% and 75% respectively. You can also modify the proportional weights of the completeness, compliance, and correctness KPIs within the aggregated overall score.

To modify aggregation weights, you must directly access the CMDB Health Metric Preferences [cmdb_health_metric_pref] table, where those settings are stored. However, custom settings are used only if the system is set to use legacy calculation methods.

If Domain Support - Domain Extensions is activated, then you can configure aggregation preferences per domain. By default, the weights of KPIs have default settings, and metrics are globally set.

Before you begin
Toggle the **Use legacy calculation methods** switch on the CMDB Health dashboard to use legacy calculation methods. Custom weight settings are used in aggregated score calculations only if using legacy calculation methods is in effect.

Role required: itil or itil_admin

Procedure
1. Select **All** and then, in the navigation filter, enter `cmdb_health_metric_pref.list` to open the CMDB Health Metric Preferences table.
2. Select a metric, KPI, or the *`Overall`* entry, and set its *`Weighted average contribution`* attribute to the percentage number that you want.

   Ensure that the sum of the percentage weights adds up to 100% for the respective aggregation:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The sum of the percentage weights of all metrics for a KPI, must add up to 100.
- The sum of the percentage weights of all three KPIs (correctness, compliance, completeness) must add up to 100.

CMDB Health system properties

Configure the following system properties to customize how CMDB Health monitors and evaluates CIs health.

Role required: itil_admin

Note:
To open the System Property [sys_properties] table, enter `sys_properties.list` in the navigation filter.

Property	Description
Max time in minutes for which individual metric processor will run in each scheduled cycle [glide.cmdb.health.metricProcessor.maxRunningTime]	If processing of a metric exceeds the specified time, CMDB Health processing halts until the next CMDB Health job is scheduled to run. • Type: integer • Default value: 120 • Location: Navigate to **All** > **Configuration** > **Health Preference**. In the right hand-side pane, select **System Properties**. For performance reasons, it is recommended not to set this property to a value greater than 120. **Note:** If you enter an invalid value, the default value is used.
Attribute in the [cmdb_ci] table that references the User or User Group table. CMDB Health Dashboard charts use this attribute to determine CIs' ownership. glide.cmdb.health.ci_ownership_field	Attribute in the [cmdb_ci] table that the CMDB Health dashboard uses to determine CI ownership. • Type: string • Default value: managed_by_group • Location: Navigate to **All** > **Configuration** > **Health Preference**. In the right hand-side pane, select **System Properties**.
glide.cmdb.logger.use_syslog.CMDBHealth	A comma-separated list that controls the level of logging of CMDB Health jobs. Logging creates entries in the system logs to capture messages

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
glide.cmdb.health.staleness_exclude_dependent_cis	Exclude dependent CIs for the staleness CMDB Health metric. When enabled, dependent CIs are not checked for staleness, regardless of any staleness or inclusion rules that are defined for the respective CI types. • Type: true | false • Default value: false • Location: System Property [sys_properties] table.

Enable and configure a CMDB Health Dashboard job

Enable and configure the CMDB Health Dashboard jobs that process CMDB Health tests, to start calculating CMDB Health scores for the *completeness*, *compliance*, *correctness* KPIs, associated metrics, and relationships.

Before you begin

Role required: admin

About this task

In the base system, CMDB Health Dashboard jobs are disabled by default. Enable and configure the respective job for the CMDB health KPI that you want data collected and aggregated for. You can schedule a job to run on a recurring schedule, or run it once at any time.

For more information about how CMDB Health Dashboard jobs work, see the Understanding the CMDB HealthDashboard Numbers blog post in the ServiceNow Community.

Procedure

1. Navigate to **All** > **Configuration** > **Health Preference**.
2. Select **Scheduled Jobs** on the left-side bar and then select the job that you want to enable or configure.

CMDB Health Dashboard job	Description
CMDB Health Dashboard - Completeness Score Calculation	Script for calculating the completeness KPI of CMDB health.
CMDB Health Dashboard - Compliance Score Calculation	Script for calculating the compliance KPI of CMDB health.
CMDB Health Dashboard - Correctness Score Calculation	Script for calculating the correctness KPI of CMDB health.
CMDB Health Dashboard - Relationship Score Calculation	Script for calculating the CI relationships KPI of CMDB health.
CMDB Health Dashboard - Relationship Compliance Processor	Script for calculating compliance of relationships with suggested relationships, and with hosting and containment rules.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Review the default configuration, and update as necessary.

Field	Description
Name	Job name. Leave this field with the pre-populated name.
Active	Select to activate the job.
Conditional	If selected, the scripted condition must evaluate to true before the job can run.
Run	Configure the schedule for job execution, or select **On Demand** to run the job manually when needed. If **Active** is selected, then additional fields appear according to your choice. For example, **Repeat Interval** (when **Run** is set to **Periodically**), and **Time** for various settings of **Run**. Fill in the details to set precise running times.
Time zone	Local time zone.
Run this script	The job's script. **Note:** Changes to the script might result in unexpected behavior.

4. **Optional:** Select **Execute Now** to immediately run the job once.

Result

After you enable a CMDB Health Dashboard job, the results for the KPI are aggregated and appear in the CMDB Health dashboard and CI Health widget on CI forms, at the CMDB, class, and CI levels.

CMDB Health experience in CMDB Workspace

View CMDB Health dashboards and use other CMDB Health-related features in CMDB Workspace.

Starting with CMDB Workspace version 7.0, CMDB Health is fully integrated into CMDB Workspace. CMDB Workspace is required in order to access CMDB Health features, primarily to:

- View CMDB Health dashboard
- View relationships health
- View CI health

In addition, you can use the CMDB Workspace landing page and its views to access CMDB Health tiles that are based on CMDB Health activities and aggregations. For example:

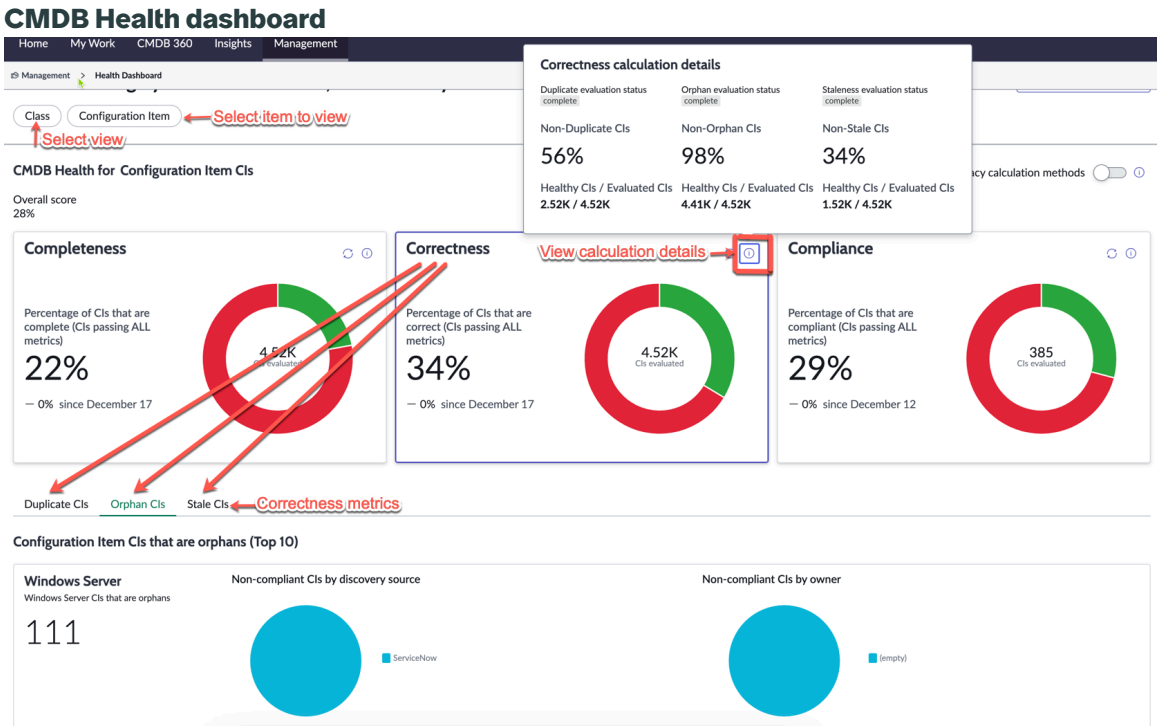
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Use the Important actions tile on the landing page to access cards with CMDB Health-related tasks such as de-duplication tasks.
- Use the CMDB Health tile to see overall health scores for the completeness, compliance, and correctness KPIs, and to drill down to the CMDB Health dashboard within CMDB Workspace.
- Use tiles throughout the CMDB Workspace to drill down to health overviews of specific CIs.

View CMDB Health dashboard

The CMDB Health dashboard serves as a central location to view detailed health reports for your CMDB at a glance. Also, it provides functions to remediate issues that CMDB Health detected, to improve CMDB health.

Once you configure CMDB Health and the CMDB Health Dashboard Jobs are enabled, the CMDB Health dashboard shows meaningful data that is automatically collected and calculated on a recurring schedule. For more information, see Set up and configure CMDB Health.



Access

Use either of the following ways to access the CMDB Health Dashboard:

Within CMDB Workspace

1. Navigate to **Workspaces > CMDB Workspace**.
2. Select **Home** in the CMDB Workspace menu bar and then, in the Quick links section, select the **CMDB Health Dashboard** link.

Navigation filter

Navigate to **All** > **Configuration** > **CMDB Health Dashboard** and then select one of the following dashboard views:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Class View**: Default view for the CMDB Health Dashboard, showing health reports for CIs and classes in the CMDB hierarchy.
- **Service View**: Health reports for services with details for CIs per service.
- **Health Group View**: Health reports for CMDB groups of type Health with details for CIs per group.

Role requirement: Using the CMDB Health dashboard requires the asset, itil, or cmdb_user role.

Legacy calculation methods

By default, all metrics and KPIs are set with a specific percentage weight in score calculations. However, you can use legacy calculation methods which were used up until the Washington DC release by toggling the **Use legacy calculation methods** switch (requires the sn_cmdb_admin role) on the CMDB Health dashboard. In those methods, calculating aggregation scores is based on weights settings for metrics within their KPI, and KPIs within the overall score. Use the legacy calculation methods when it is important to reflect on specific weights of metrics and KPIs in the assessment of CMDB health in your organization.

For more information about customizing calculation weights for metrics, KPIs, and the overall score, see Configure aggregation weights for CMDB Health score calculations.

KPI tiles

The Completeness, Correctness, and Compliance KPI tiles on the dashboard, show the aggregated health for CIs of the specified class (and its descendants), health group, or service. The KPI's aggregated percentage is represented on the donut as follows:

- Green: Represents the CIs that are compliant on all of the KPI's metrics
- Red: Represents the CIs that fail one or more metric

The distribution of metric compliance can vary greatly across CIs. For example, a single CI failing all metrics or 3 unique CIs each failing a different metric will result in a different KPI final score of aggregation.

You can show additional details and further drill down the CMDB Health dashboard:

- Point to the green and red portions in the donut reports, to show details.
- Select the View calculation details icon ("i") in a KPI tile to show the calculation details of failure and success for each of the KPI metrics. Calculation details also show the status of the calculation, such as complete.

- Select a KPI tile and then select a tab for a metric that you want to see more details for. For each metric, the dashboard shows up to ten classes (each class in its own tile) with the highest number of non-compliant CIs for the metric. Each tile for a class shows the total number of non-compliant CIs and also pie reports of those non-compliant CIs by discovery source and by owner.

  For example:

  1. Select the Correctness tile.
  2. Select the Orphan CIs tab.
  3. Assuming that the largest number of CIs that aren't compliant with the orphan metric are Windows Servers, the first tile shows details for those CIs. The tile shows the total number of Windows Server CIs that are orphans. This tile also shows pie reports of those CIs, one by discovery source and another by owner.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select a CI in the list view to open its CI form.
5. Scroll in the CI Health tile to the CMDB Health widgets with details about the CI's health.

The '<x>% since <date>' shows the increase or decrease (in %) in the KPI health since <date> (<date> being the previous time that change was noted). A icon indicates that the maximum failure threshold for the metric has been reached. The tests for the metric are halted for this cycle, and all associated aggregated summaries show 0%.

Overall score

The overall score appears on the dashboard above the KPI tiles and represents the aggregated health score for the CMDB. The overall score is calculated as an aggregation of the three KPIs (correctness, completeness and compliance). By default, the overall score is a simple average of the KPI scores. However, if using the legacy calculation methods is in effect, then the overall score is based on any weight settings of any of the KPIs.

Class view in the CMDB Health dashboard

The class view shows health reports for CIs and classes in the CMDB hierarchy. Select any class in the CMDB hierarchy to filter all tiles on the dashboard to show health data only for CIs in the selected class and its child classes.

Select the **Class** drop-down to switch to the **Health Group** or the **Service** view.

Health Group view in the CMDB Health dashboard

Select the **Health Group** view to show health reports for CIs of a CMDB health group. Select any health group to filter all tiles on the dashboard to show health data only for CIs in the selected health group.

Select the **Health Group** drop-down to switch to the **Class** or the **Service** view.

Service view in the CMDB Health dashboard

Select the **Service** view to show health reports for CIs of a service class, such as *`Business Service`*, including the service CI itself. Select any service to filter all tiles on the dashboard to show health data only for CIs in the selected service.

Note:
The Event Management and Service Mapping Core plugin must be activated to enable meaningful data in the service view.

Select the **Service** drop-down to switch to the **Health Group** or the **Class** view.

Settings affecting the service view:

- The service view uses the settings for the *`Business Service`*, *`Manual Service`*, and *`Technology Management Service`* classes.
- The service view doesn't include all services from the Service [cmdb_ci_service] table. Only services from the cmdb_ci_service_auto table and its descendants (cmdb_ci_service_discovered, cmdb_ci_service_manual, cmdb_ci_query_based_service), are included.
- Property settings, such as *`glide.cmdb.services_query_limit`*, *`glide.cmdb.services_hierarchy_limit`*, and

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

glide.cmdb.service_associated_ci_query_limit. For information about how you can use these properties to control the number of items that appear in the service view, see Components installed with CMDB Health.

View relationships health

View health scores for relationship health such as orphan, stale, and duplicate relationships, in the Relationship Health dashboard.

Before you begin

The CMDB Health Dashboard - Relationship Compliance Processor dashboard job must run to generate data for these reports.

Note:
As a general guideline, activate this job only if you need the relationship reports as this job can affect performance.

Role required: itil or asset

About this task

The Relationship Health dashboard shows various scorecards for health indicators of CI relationships in your CMDB. It contains donut reports for duplicate, orphan or stale relationships, broken down by relationship type. You can drill down these charts for further details.

The icon indicates that the maximum failure threshold for the metric has been reached. The tests for the metric are halted for this cycle, and all associated aggregated summaries show 0%. Review the scorecard rules which might be ineffective, or the CMDB might be in an unstable state.

CMDB Health reports for the following metrics:

Duplicate relationship

Relationships that have identical parent, child, and relationship type.

Orphan relationship

A relationship that is missing parent, child, or relationship type.

Stale relationship

A relationship in which one of the CIs is stale. For a stale CI — its associated relationships are also stale.

In addition, the following relationship compliance reports with breakdown by relationship types, are available:

Relationships not compliant with all relationship rules

Relationships that do not comply with any relationship governance rule, including suggested relationships and dependent relationship rules.

Relationships not compliant with suggested relationships

Suggested CI relationships are used as rules to test if relationships comply with specified suggested relationships.

Relationships not compliant with containment rules

Containment rules are used to test if relationships comply with specified containment relationships.

Relationships not compliant with hosting rules

Hosting rules are used to test if relationships comply with specified hosting relationships.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For each of the compliance reports, testing a relationship requires a rule (suggested relationship, hosting rule, or containment rule) in which the parent and child CI classes match the parent and child CI classes in the tested relationship. If the relationship types in the rule and in the tested relationship don't match, then the relationship isn't in compliance. If an applicable rule isn't found, then the relationship is considered to be in compliance. Rules apply to the classes specified in the rule, and also to descendant classes. Therefore, when testing a relationship, rules that apply to ascendant parents of the CIs in the tested relationship are used. If there are multiple rules that match the parent and the child CI classes of the tested relationship, then the tested relationship needs to satisfy only one of these rules to be in compliance.

Procedure

1. Navigate to **Workspaces** > **CMDB Workspace**.
2. Select **Home** in the CMDB Workspace menu bar and then, in the Quick links section select the **Relationship Health Dashboard** link.
3. Examine the donut reports and the charts in the Relationship health overview and Relationship compliance overview sections on the dashboard.
   Report results are grouped by relationship type, and you can drill down for further details:
   - Point to a donut report to show more details about compliant and non-compliant relationships.
   - Point to a bar in a bar chart to show more details for the bar.
   - Select a bar in a bar chart to drill down to a list view of all the associated relationships that aren't compliant. The list view includes the **Failure Description** field which lists only a single rule that the relationship didn't comply with, even if there are additional rules that the relationship fails to comply with.

What to do next

For troubleshooting information, see the How to identify and delete duplicate CMDB CI Relationship records, or ones that have orphan or missing parent/child relationships [KB0780988] knowledge base article.

Related topics

Enable and configure a CMDB Health Dashboard job

View CI health

View CMDB Health report for an individual CI, on the CIs form in CMDB Workspace.

Before you begin

Starting with CMDB Workspace version 7.0, CMDB Health is fully integrated into CMDB Workspace and is required in order to access CMDB Health features, including to view CI health.

Role required: sn_cmdb_user (CMDB user)

About this task

CI health scores are based on settings of CMDB Health KPIs and metrics. Aggregations are calculated in real-time from data stored in health-related tables which the CMDB Health Dashboard jobs update on a recurring schedule. The completeness and correctness KPIs are always up to date. However, the compliance KPI depends on audit cycles and on the *`CMDB Health Dashboard - Compliance Score Calculation`* dashboard job that might not have run yet.

To ensure that the latest updates to these KPIs are reflected, navigate to the respective CMDB Health dashboard job, and select **Execute Now**. For more information, see Enable and configure a CMDB Health Dashboard job.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Open the CI form for a CI, in CMDB Workspace.
   - On a CI form that isn't in CMDB Workspace, select **Open in CMDB Workspace**.

     Role required: sn_cmdb_user (minimum)
   - In CMDB Workspace, select a CI in a list view to open the CI's form. For example, on the CMDB Health dashboard, drill down a KPI tile and then select a CI in the tile's list view.
2. Select the right (>) or left (<) handles in the CI Health tile to see all CI health-related widgets.

Result

The widgets in the CI Health tile on the CI form show the aggregated health for the CI using the following color codes:

- Green: The CI passed the health test (for example, it isn't a duplicate).
- Red: The CI failed the health test (for example, it is a duplicate)
- Grey: The CI wasn't tested for this metric, because the threshold wasn't set for the CI (class) in the CI module.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Missing rules or other class definitions can prevent some health scores from being evaluated for a CI. The results in the CI Health widget in these situations, are described below:

Duplicate

- If no identification rules ([cmdb_identifier]) are defined for the CI's class or its ancestors: A notification to that effect appears.
- If only dependent identification rules are defined: `Not applicable` notification appears.

Orphan

- If the CI is excluded by health inclusion rules: `Not applicable` notification appears.
- If no orphan rules (in the [cmdb_health_orphan_rule] table) are defined for the CI's class or its ancestors: A notification about missing a rule appears.

Staleness

- If the CI is excluded by health inclusion rules: `Not applicable` notification appears.
- If no staleness rules (in the [cmdb_health_staleness_rule] table) are defined for the CI's class or its ancestors: A notification about missing a rule appears.

Audit

- If no audits ([cert_audit]) are defined for the CI (The CI Health widget checks only desired states and scripted audits): `Not applicable` notification appears.
- If there are audits defined for the CI but the audits did not run: `Not applicable` notification appears.

Timeline of CI changes

Create a CMDB remediation rule

A CMDB remediation rule is associated with a task that was created for a failed CMDB health test. A CMDB remediation rule is applied automatically or manually to execute a remediation workflow that can, for example, delete stale CIs.

Before you begin

You must first create and publish a remediation workflow that addresses the CI issue, stored in the Workflow [wf_workflow] table. The workflow can be a regular workflow or an Orchestration workflow, and must adhere to the following requirements:

- The table in the workflow must match the task type in the remediation rule.
- The workflow isn't configured with any filter conditions by setting **If condition matches** to `None`, so that the filters of the CMDB remediation rule will apply.

For more information about using Classic Workflows, see Classic Workflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: itil_admin (on top of itil)

Procedure

1. Navigate to **All** > **Configuration** > **CMDB Remediations**.
2. Select **New** and then fill out the CMDB Remediation Rule form.

Field	Description
Name	Remediation name.
Task type	Type of CMDB health-related tasks to apply the remediation to.
Task filter	Filters tasks to apply remediation to. Also applies dot-walking on CI fields so that remediation is applied to tasks associated with matching CIs.
Execution	○ Manual: Remediation is applied manually. ○ Automatic: The workflow is applied once, upon the creation of a task that matches the **Task type** and **Task filter**.
Active	Allowing the workflow to run.
Workflow	The CMDB remediation workflow (regular or Orchestration) that will execute automatically or manually, depending on the **Execution** setting. You can click the **Lookup using list** icon, and then click **New** to create a new workflow.

3. Select **Submit**.

Result

If **Execution** is set to Automatic, then the business rule *`Run remediations for CMDBHealth task`* applies the remediation workflow to CIs that match the Task filter. If **Execution** is set to Manual, then you can manually apply the remediation workflow defined in the rule.

Related topics

Dot-Walking

Apply CMDB remediation

Manually initiate a workflow to remediate a CI that failed a CMDB health test. For example, you can remediate CIs that are orphan or stale.

Before you begin

Role required: itil_admin

To manually apply a CMDB remediation, a CMDB remediation rule must exist, in which **Execution** is set to **Manual**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Except for the duplicate and audit health metrics, you can choose to create tasks for health test failures for a metric.
To remediate failures of the duplicate metric, use de-duplication tasks.

For all metrics except for audit, each CI that failed a metric test is associated with a single task. Because a CI can fail multiple audits, a single CI can be associated with multiple audit tasks. The first of those tasks is in the **Task** field, and any additional tasks are in the **Additional Tasks** field. To remediate failures of the audit metric, refer to the audit tasks for the audits that the CI failed.

CMDB remediation is applied in the CMDB Workspace store app.

Procedure

1. Navigate to **Workspaces** > **CMDB Workspace**.
2. Select **Home** in the CMDB Workspace menu bar and then, in the Quick links section, select the **CMDB Health Dashboard** link.
   Ensure that the CMDB Health Dashboard is in **Class** view.
3. Select one of the KPI tiles (Completeness, Correctness, or Compliance).
4. Select the metric tab that is associated with the remediation that you want to apply (such as Stale CIs) and then select one of the class tiles.
5. In the list view of the non-compliant CIs for the metric, select the task link (in the Task column) for a CI that you want to remediate.
6. On the remediation form, select **Remediate**.
7. In the Remediate dialog box, select the remediation workflow that you want to apply.
   The list of remediation workflows is based on the type of health metric (such as orphan, stale), and on the filter defined for the workflow in the associated remediation rule.
8. Select **Next**.

Create a CMDB remediation rule

CMDB Health process tracking and troubleshooting

Use the following information to track and resolve issues with the CMDB Health processes.

Logging

By default, only error messages are logged to the syslog table, with the source name CmdbHealth. To enable logging of 'info' and 'warning' messages (which are typically logged at the start and end of each processing cycle), update the system property glide.cmdb.logger.use_syslog.CMDBHealth. For information about using this property, see CMDB Health system properties.

Processing status

If scheduled jobs are enabled, but data is not displaying on the <ph keyref="var.config-mgmt-database-short"/> dashboard, you can check the processing status in the CMDB Health Metric Status [cmdb_health_metric_status] table. Depending on the status of the *inactive* metric, decide how to proceed.

Initially, the state of all metrics is 'In Progress'.

Possible final states of a metric:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Complete

All classes are processed and the number of failures is under the maximum failures threshold.

Max Failures

The number of failures for this metric reached the maximum failures threshold. Processing has been aborted and will start over in the next run.

Daily Time Out Pause

The processor reached the processing time limit. Processing is paused and will resume in the next run.

At the end of a processing cycle, the final state of a KPI depends on the final state of its associated metrics. Possible final state of a KPI:

Complete

All associated metrics are in Complete state and score calculation is complete.

Incomplete

Score is not calculated because one of the associated metrics reached its maximum failure thresholds.

Daily Time Out Pause

Timed out because one of the associated metrics has reached its processing time limit.

Processing time

If processing of a metric times out, you can find out which class takes too long to process. Use this information to find out if any validation rules are weak.

The progress of each metric is tracked in the CMDB Health Processor Status table [cmdb_health_processor_status]. Status for classes that have been processed for a metric is Complete, and for classes that are yet to be processed is Draft. By looking at the update time for each class, you can calculate the length of processing time for each class.

Orphan records due to broken hierarchy

Orphan rules might detect an orphan CI, which you are not able to access and delete. Or, there might be a mismatch between the list view that displays the orphan records, and the total number of records. These findings are due to records being deleted in the database from only one table in the CMDB hierarchy.

These CI records are not accessible via GlideRecord and must be deleted directly from the database. Therefore, in this case, to delete an orphan CI from the database you must contact Support to get help.

Orphan test results provide the details of where exactly the hierarchy is broken. For example, the message "This cmdb_ci_linux_server CI [91054fc24f22520053d6e1d18110c713] is missing record in cmdb_ci_computer table" means that a record of that sys_id must be deleted from the CMDB, cmdb_ci, cmdb_ci_hardware, cmdb_ci_server, and the cmdb_ci_linux_server tables (the Computer class is between the Hardware and the Server classes in the hierarchy.)

Scripted audits Skipped

An error message is logged if the results from a scripted audit are not included in the compliance KPI. The reason can be that the script in the audit was not updated to populate its **Last ran date**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

field. Without a **Last ran date** value, CMDB Health is unable to identify these run results as part of a recent complete audit run, and skips those results.

CMDB Health process status: failure threshold reached

The CMDB Health dashboard shows the string 'failure threshold reached' when the number of CIs that are failing the metric tests, reaches the failure threshold set for the metric.

CMDB Health stops processing for this metric in the current cycle, and therefore there is no aggregated health score for the metric. Processing will be attempted again in the next cycle. Also, status in the CMDB Health Metric Status [cmdb_health_metric_status] table is set to *`Max Failures`* for this metric.

When the health score of a metric cannot be evaluated, then the processing status of the respective KPI (for example, correctness) is set to *`Incomplete`*. The CMDB Health dashboard shows the string *`Incomplete score`* for the respective KPI. Also, aggregated health scores for the metric are not available for any class in the CMDB hierarchy.

Review and refine the rules defined for the metric which has reached max failures. If a rule associated with the metric is too generic, resulting in large number of failures, attempt to refine it as follows:

- Completeness:

  Review the mandatory fields for the associated classes and remove those that aren't critical for the health score. Also, review the recommended fields that are causing failures and remove those that aren't critical for the health score.

  For more information see Set a CI attribute to be mandatory and Set a CI field to be recommended.

- Compliance:

  Review the audit failures from the audit jobs and adjust the audits to reduce the number of failures. For more information, see CMDB Health KPIs and metrics.

- Correctness:

  - Orphan: Review the orphan rules and adjust them to remove excessive orphan failures. For more information, see Create a CMDB Health orphan rule.
  - Staleness: Review the effective duration for the classes that are causing failures and adjust the duration to reduce the number of failures. For more information, see Create a CMDB Health staleness rule.
  - Duplicate: Review the de-duplication tasks and remediate the tasks to remove duplicate CIs and to avoid creating failure records. For more information, see Remediate a de-duplication task (legacy).

For more troubleshooting information about failure threshold related issues, see How to Resolve Max Failure Threshold Errors for CMDB Health Dashboard [KB2487349].

CMDB Health process status: incomplete score

The CMDB Health dashboard shows the string 'incomplete score' for a metric when it fails to calculate the score for the metric.

'Incomplete score' is displayed when:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The number of CIs that are failing the tests of one of its sub-metric, reaches the failure threshold set for the metric. In this situation, the processing status for the respective parent metric (for example, correctness) is set to 'incomplete' in the CMDB Health Metric Status [cmdb_health_metric_status] table. Processing for the failing metric in the current cycle stops, and therefore there are no aggregated health scores for the sub-metric or for the parent metric.

  To remediate, you need to resolve the underlying cause of CIs failing the sub-metric tests. See CMDB Health process status: failure threshold reached for more information about resolving the failures of the sub-metric.

- An error is encountered while processing the sub-metric.

  To remediate, examine the system logs to determine the cause of the error. After fixing the cause of the problem, restart processing by manually executing the respective parent metric dashboard job.

CMDB Health reference

Reference topics provide additional information about the KPIs and metrics that CMDB Health uses and about tables, scheduled jobs, and properties that are used by CMDB Health.

Domain separation in CMDB Health

This is an overview of domain separation as it pertains to CMDB Health. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Overview

CMDB dashboards should be set up with their own set of rules to best accommodate how the user needs them. CMDB dashboard jobs adhere to those rules to produce reports. These are covered in separate sections below.

How domain separation works in CMDB Health

For dashboards to be the most effective, users should configure the dashboard accordingly. This is done by setting up the orphan, staleness, and inclusion rules to meet their needs, which then affect the reports displayed on the dashboard.

The settings and metrics define different aspects of each application because each domain can be configured differently. These rules are set up in addition to those that are included in the base system. There are different types of owners for different CIs; each domain has its own set of rules.

Metric tests from the global domain propagate to subdomains. However, subdomains can have their own local metric tests which override the global domain tests. Up until the San Diego release, subdomain local metric tests were applied to the subdomain CIs and also to the global domain CIs (which are visible on subdomains). Global domain CIs that failed metric tests of local subdomains, could have generated large amounts of data due to duplicated data.

Starting with the Tokyo release, CIs in the global domain are evaluated only against metric tests specified in the global domain. In subdomains, local metric tests are applied only to the CIs in that subdomain and are not applied to the global domain CIs (even though the global domain CIs are visible in the subdomain). Health results for CIs in the global domain appear on subdomains and health results on subdomains reflect this new behavior.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Domain separation is on by default, but each domain can be configured as needed.

Health Preferences

Configure these preferences during setup:

1. Global system properties that control CMDB Health – System properties are not domain separated. To learn more see CMDB Health system properties.

2. CMDB Health Dashboard Jobs – There is a dashboard job for each major KPI, such as Completeness. That job finds the health of the CIs across all the enabled domains. There is only one job run for all domains and jobs themselves are not domain separated.

   Users can define the frequency with which they want to run jobs; the report runs for all the domains. The more domains included in the job, the longer the job runs.

3. Health Metrics – These selections are domain-separated and adhere to the established "system overrides" logic of domain separation. Changes are made according to the domain for which the user is logged in. Base system values are defined at the global domain. The overriding domain logic means these values apply for all domains. If users want different values for a domain, they must be logged in to a specific domain and change the property from there. The new property setting applies only to that domain and any domain that inherits this domain. To learn more, see Health Metrics.

   Note:
   Regarding the Completeness, Compliance, and Correctness KPIs: Users can disable this KPI if they don't want to see that as part of the dashboard score. All these settings are domain-separated and the user can define specific properties for the domain.

   a. Active – This setting is the most important because it affects how long the jobs run. The more domains with flags set to *Active*, the longer the jobs take. It's best to select only those domains you wish to be *Active* and render the rest as *Active* = **false**. You can set this in Health Preferences. The default settings for global domain are *Active* = **true**, but you can modify or disable specific domains the user wants to see in the dashboard. Users should consider the domain hierarchy when changing these values. If there is a large number of domains (>100) the job can take a very long time. To mitigate this, set *Active* to **false** for all the root domains, thereby disabling all the other domains in the hierarchy. If there is a rule at the top, all child domains inherit that rule.

   b. *Failure Threshold*, *Create Task*, *Task Assignee Group* – All these settings can be set differently for different domains depending on what is needed in each domain.

   c. Exceptions – For Relationship metrics (relationship, duplicate relations, orphan relations, stale relations) the failure threshold setting is not domain separated. The Failure Threshold for the global domain is applied to all domains. For example, even if users were to override the Failure Threshold for a domain, the global domain setting for Threshold is still applied.

   d. Troubleshooting / Implementation detail – These settings are stored in the *cmdb_health_metric_pref* table, which is domain separated.

CMDB Health-related rules

See CMDB Health-related rules settings at:

- Required
- Recommended

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Orphan
- Staleness

Most of the CMDB Health-related rules are domain separated and provided by the users. Users can define different rules for different domains by logging in to each domain and adding/overriding rules in the CI Class Manager.

1. Completeness
   a. Required fields – These are based on the class schema defined in the platform's System dictionary and is fixed for all domains. These cannot be changed.
   b. Recommended fields – These are domain separated. The table used is CMDB Recommended Fields [cmdb_recommended_fields], which is domain separated. The user can set these up for different domains.
2. Correctness
   a. Duplicates – Duplicates are based on Identification rules, which are not domain separated, so the same rules apply to all domains.
   b. Orphan – Orphan rules are domain separated; there are different orphan rules for different domains. The table used in the CMDB Health Orphan Rule [cmdb_health_orphan_rule] table and is domain separated.
   c. Staleness – Staleness rules are domain separated. The table used is cmdb_health_staleness_rule. The base system rule (60 days) is set for global domain so is inherited by all domains as the default rule.
3. Compliance

   Audit – Audit scores are based on the desired state or scripted audits defined in the compliance module by the user.Audits themselves are domain separated. When audit score evaluation is enabled for a domain, scores become based only on the audits visible in that domain.

Health inclusion rules:

- Health inclusion rules are domain separated. The rules are stored in the cmdb_health_config table which is domain separated.
- Each domain can have its specific health inclusion rules and domain-specific rules for each sub-metric.
- When a health inclusion rule is defined globally, all sub-domains inherit the rule according to the domain structure and the rule can be overridden at any domain.
- When a health inclusion rule is defined at the Configuration Item [cmdb_ci] class level, all descending classes inherit the rule and the rule can be overridden at any class level.

CMDB Health dashboard

If the Domain Support — Domain Extensions Installer plugin is activated, then the CMDB Health dashboard is domain aware:

- The CMDB Health dashboard aggregates and reports health failures and scores based on user's domain visibility of CIs. If domain visibility lets a user see a CI, then the audit rule in that user's domain applies to that CI, whether the CI is in the user's domain or in a contained domain. If a CI fails health tests from different user domains, then separate failure records are created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Users can configure KPI and metric settings specific to the needs in their domain. So different domains can have different settings such as active/inactive, and thresholds.
- A child domain derives its immediate parent's domain health configurations if the child domain does not configure its own. A child domain can override parent's configurations by modifying them.

Health Dashboards (Class View/Service View/Health Group View)

In general, CMDB Health dashboards are domain aware and show data according to the logged-on domain user. If a user is logged into a domain and views a health dashboard:

1. Only scores for enabled metrics in that domain display (based on the Health Preferences *Active* flag as discussed above).
2. All scores are based on CIs that are visible from the specific domain. (These are regular domain visibility rules: From that domain you can see CIs in global domain, the specific domain, any child domain of that domain or any domain that gets directly or indirectly contained by that domain.)
3. The dashboard view is based on domain rules defined in domain mapping, as opposed to those provided by the logged-in user. This view overrides any additional domain visibility rules that a logged-in user might have. The admin sets the basic rules, but does not set each individual domain. The admin can give specific users or user groups additional visibility to other domains and the dashboard still does not change. The dashboard strictly follows the domain rules mentioned above, based on the domain hierarchy for the domain in which the user is logged in.
4. As explained in the Health Preferences section, users can define different preference values for any domain which impact the scores reported in the dashboard. Preferences that can impact scores include **Failure Threshold** and **Active**.
5. As explained in the CMDB Health Rules section, the scores reported for the metrics are based on the health rules defined for them (staleness, orphan, recommended, audit, and inclusion rules) which can be defined differently for a specific domain (in the CI Class Manager). Only the required metric and duplicate metric are based on rules that apply in all domains.
6. Service View/ Group View – These reports also largely follow the above points. Typically, these views differ from various views/filters for the Health Report. One is based off business rules, the other is based off CMDB Health groups.

Related topics

Domain separation and Configuration Management Database (CMDB)

Components installed with CMDB Health

Several types of components are installed with CMDB Health (included in the com.snc.cmdb plugin), such as tables, properties, and scheduled jobs.

Note:
The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Properties installed

Property	Description
glide.cmdb.services_hierarchy_limit	Maximum number of service CIs that can appear in the CMDB service dashboard. This limit applies to any child class of the Service Instance [cmdb_ci_service_auto] class. • Type: integer • Default: 10,000 • Range: 0-100,000 • Location: Add to System Properties [sys_properties] table. • Learn more: View CMDB Health dashboard

Scheduled jobs installed

Scheduled job	Description
CMDB Health Dashboard - Completeness Score Calculation	Script for calculating the completeness KPI of CMDB health.
CMDB Health Dashboard - Compliance Score Calculation	Script for calculating the compliance KPI of CMDB health.
CMDB Health Dashboard - Correctness Score Calculation	Script for calculating the correctness KPI of CMDB health.
CMDB Health Dashboard - Relationship Score Calculation	Script for calculating the CI relationships KPI of CMDB health.
CMDB Health Dashboard - Relationship Compliance Processor	Script for calculating compliance of relationships with suggested relationships, and with hosting and containment rules.
Add Identifier Fields In Recommended Rules	Sets all criterion attributes from all active identifier entries from all active identification rules, as recommended fields. These added recommended fields are then checked by the CMDB Health Dashboard - Completeness Score Calculation scheduled job when evaluating the recommended health metric.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scheduled job	Description
Remove Identifier Fields In Recommended Rules	Identifies any recommended field that is a criterion attribute in any active identifier entry in any active identification rule. Then removes the recommended setting for that field.

Tables installed

Table	Description
CMDB Health Metric [cmdb_health_metric]	Details such as if a KPI or metric is enabled, maximum failure threshold, and other settings for all CMDB Health KPIs and metrics.
CMDB Health Result [cmdb_health_result]	Results from the most recent CMDB Health processing cycle.
CMDB Health Scorecard [cmdb_health_scorecard]	Current and historic health scores. Status of historic score records is 'Historic', and of latest score records is 'Complete'.
CMDB Health Orphan Rule [cmdb_health_orphan_rule]	Rules for calculating orphan records per class.
CMDB Recommended Fields [cmdb_recommended_fields]	Recommended fields per class.
CMDB Health Metric Status [cmdb_health_metric_status]	Internal table that tracks the status of each KPI and metric that is being processed. Includes status, processing time, and processing start date. State for a KPI or metric changes from 'In Progress' to either of: • Complete • MaxFailures • Daily Processing Time Out Processing of a timed out KPI or metric continues on the following day.
CMDB Health Processor Status [cmdb_health_processor_status]	Internal table that tracks the processing progress of each KPI and metric. Contains a list of tables that are processed for each KPI and metric, and processing status. Classes are processed sequentially, changing status from Draft -> In Progress -> Complete.
CMDB Relationship All Rules Health Results [cmdb_health_result_rel_all]	Stores results about relationship health, to be used by the All Relationships report.

CMDB success advisor

The ServiceNow® CMDB success advisor is a scoped application that drives business outcomes for targeted business products, including Data Foundations and Hardware Asset Management, by improving Configuration Management Database (CMDB) data quality. Use a specialized advisor to resolve data quality issues through guided remediation, and identify which data integrations are keeping your CMDB accurate and complete.

Get started

Exploring CMDB success advisor

Learn about CMDB success advisor and review the benefits it can provide for different users in your organization.

CMDB success advisor overview

With the CMDB success advisor application, you can review CMDB Data Manager policies and Configuration Management Database (CMDB) settings to identify areas where improvements can be made in Data Foundations and the Hardware Asset Management (HAM) application. The advisor uses customized CMDB metrics to improve data quality for targeted configuration item (CI) classes, identifying and monitoring the CI classes most critical to your organizational processes to enable complete and accurate data in Data Foundations, and tracking hardware model categories for HAM.

CMDB success advisor users

Users

User	Description	Additional roles required
CMDB administrator	Users with the sn_cmdb_admin role can configure and improve CMDB data accuracy based on specific business use cases. With targeted CI tracking, practical data integration suggestions, and application-specific dashboards, the CMDB success advisor enables CMDB administrators to improve CMDB data accuracy and achieve key business outcomes. For Data Foundations, administrators can select and manage principal classes, monitor data quality across the CI classes most critical to incidents, changes, and problems, and use integration coverage analysis to ensure the right data sources are keeping the CMDB accurate and complete. For Hardware Asset Management, administrators can focus on critical hardware model categories to improve normalization rates, asset life cycle tracking, and data accuracy for business outcomes like HAM.	**pa_viewer** Required to filter data by principal classes in Data Foundations advisor dashboard and model categories in HAM advisor dashboard. **pa_data_collector** Required to view the last updated data timestamp on an advisor dashboard. **cmdb_inst_admin** Required to manage Service Graph Connector connections in SGC Central through CMDB success advisor. **pd_user** Required to view Discovery and Service Mapping Patterns through CMDB success advisor with read-only access. **pd_admin** Required to modify Discovery patterns through CMDB success advisor with write access.

CMDB success advisor benefits

The following benefits are available to CMDB administrators across both Data Foundations and HAM.

Benefit	Feature	Users
Focused CMDB setup for specific business outcomes For Data Foundations, advisor dashboard scope is built from principal classes recommended based on incident, problem,	Use-case-driven CMDB configuration. To learn more, see: Set up CMDB success advisor for Data	CMDB administrator

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Benefit	Feature	Users
and change (IPC) activity. If IPC data is unavailable, classes are ranked by how widely they are used across your CMDB. For new instances with no historical data, a set of default classes is suggested. For HAM, advisor dashboard scope is defined by hardware model categories.	Foundations and Set up CMDB success advisor for HAM	
Improved visibility For Data Foundations, view CI data quality metrics by principal CI class, including missing attributes, stale records, duplicate CIs, and discovery source breakdown. For HAM, view hardware asset metrics by model category and integration source.	Dashboard with consolidated insights and metrics To learn more, see: Monitoring CMDB data quality using dashboard metrics in CMDB success advisor for Data Foundations and Monitoring CMDB data quality using dashboard metrics in CMDB success advisor for HAM	CMDB administrator
Continuous data quality improvement For Data Foundations, track KPIs for CI completeness, stale records, duplicates, and integration coverage across principal classes. For HAM, track KPIs for missing model ID, serial number, location, duplicates, and asset state.	KPI details access from the dashboard for metric monitoring, remediation tracking, and guided resolution steps To learn more, see: Monitoring CMDB data quality using dashboard metrics in CMDB success advisor for Data Foundations and Monitoring CMDB data quality using dashboard metrics in CMDB success advisor for HAM	CMDB administrator
Data quality improvement suggestions For Data Foundations, playbooks target principal class issues such as stale CIs and duplicate records. For HAM, guided playbooks address hardware issues such as missing serial numbers and asset/CI mismatches.	Remediation actions panel available for a chart in the dashboard To learn more, see: Improving CMDB data quality for Data Foundations and Improving CMDB data quality for HAM	CMDB administrator
Better alignment of CMDB rules and policies For Data Foundations, align CMDB Data Manager ownership policies and reconciliation rules for principal classes. For HAM, configure synchronization rules, asset creation rules, and status mappings.	Settings summary for gap analysis and configuration guidance To learn more, see: Analyze CMDB settings for Data Foundations and Analyze CMDB settings for HAM	CMDB administrator

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Benefit	Feature	Users
Improved CMDB data coverage and accuracy For Data Foundations, evaluate integration sources with attribute-level coverage analysis across principal classes. For HAM, review SGC and Discovery pattern rankings for hardware model categories.	Data integrations summary for reviewing and evaluating integration sources To learn more, see: Analyzing data integrations for improving Data Foundations and Analyzing data integrations for improving HAM data coverage	CMDB administrator

Use cases

You can use CMDB success advisor for the following business outcomes:

- Data Foundations: Improve data quality across the principal classes your organization relies on for incidents, changes, and problems. Monitor attribute completeness, detect stale and duplicate records, and evaluate integration coverage to ensure the right data sources are populating your CMDB. For more information, see Using CMDB success advisor for Data Foundations.
- HAM: Improve hardware data quality across model categories such as computers, servers, and printers. Identify and fix missing model IDs, serial numbers, and locations, eliminate duplicate CIs and align asset and CI states to support accurate life cycle tracking and financial reporting. For more information, see Using CMDB success advisor for HAM.

What to explore next

To learn more about configuring and using CMDB success advisor for supported business outcomes, see:

- Configuring CMDB success advisor
- Supported business outcomes
- CMDB success advisor reference

Configuring CMDB success advisor

Complete the configuration tasks to start using the CMDB success advisor.

Configuration overview

1. Install CMDB success advisor.

   Set up CMDB success advisor by installing the application.

2. Assign roles for CMDB success advisor users.

   Assign roles to control access to features, capabilities, and data in the CMDB success advisor application.

3. Optional: Configure record count visibility in the CMDB success advisor dashboard for managing large datasets.

   Improve the performance of the CMDB success advisor dashboards by hiding the record count on click-through from donut charts using a configurable system property.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Optional: Manage principal class marking during upgrade.

   Make sure that existing Hardware Asset Management (HAM) CI classes are included as principal classes in Data Foundations during upgrade, without requiring manual configuration.

Install CMDB success advisor

You can install the CMDB success advisor application (sn_cmdb_advisor) if you have the admin role. The application installs related ServiceNow applications and plugins if they are not already installed.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Make sure that you have the required entitlements and that all dependent applications are installed on your instance.
- Review the CMDB success advisor application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Role required: admin

About this task

The following items are installed with CMDB success advisor:

- Scheduled jobs
- Tables

For more information, see Components installed with CMDB success advisor.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the CMDB success advisor application (sn_cmdb_advisor) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

   In the list next to the **Install** button, the versions that are available to you are displayed.

3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.

4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data are sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.
6. Select **Install**.

Assign roles for CMDB success advisor users

Assign roles to control access to features, capabilities, and data in the CMDB success advisor application.

Before you begin

Set the application scope to CMDB success advisor using the application picker. For more information, see Application picker.

Role required: admin

About this task

Users with the following combination of roles can use the CMDB success advisor application.

Roles required

Role	Description	Applies to
sn_cmdb_admin	Required to access the CMDB success advisor. Users with the sn_cmdb_admin role can configure and improve CMDB data accuracy based on specific business use cases.	Data Foundations and HAM dashboards
pa_data_collector	Required to view the last updated data timestamp on the dashboard.	Data Foundations and HAM dashboards
pa_viewer	Required to filter data by principal classes in Data Foundations advisor dashboard and model categories in HAM advisor dashboard.	Data Foundations and HAM dashboards
cmdb_inst_admin	Required to manage Service Graph Connector connections in SGC Central through CMDB success advisor. **Note:** Service Graph Connector data can be read without any additional role. The cmdb_inst_admin role is required for creating or modifying connector configurations through CMDB success advisor.	Data Foundations and HAM dashboards
pd_user	Required to view Discovery and Service Mapping Patterns through CMDB success advisor with read-only access.	Data Foundations and HAM dashboards
pd_admin	Required to manage Discovery patterns with create and write access.	Data Foundations and HAM dashboards

For more information, see Exploring CMDB success advisor.

Procedure

Assign roles to users and groups using the ServiceNow AI Platform user administration feature.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To assign a role to a user, see Assign a role to a user.
- To assign a role to a group, see Assign a role to a group.

Configuring record count visibility in the CMDB success advisor dashboard to handle large datasets

Improve the performance of the CMDB success advisor dashboards for large datasets by hiding the record count on click-through from donut charts using a configurable system property.

Before you begin

Set the application scope to CMDB success advisor using the application picker. For more information, see Application picker.

Role required: admin

About this task

Selecting a segment in a donut chart on a CMDB success advisor dashboard displays a list page with records that match the criteria of the selected segment. By default, this list shows a record count in the header and a total count in the pagination area. In environments with large datasets, retrieving these counts can increase load time. To improve page responsiveness, add the *hide_list_record_count* system property and set its value to `true`. Enabling this property hides the record count in the list header and the total count in the pagination area, reducing the data load during navigation from donut charts without affecting the functionality of the charts or the list results.

Procedure

1. In the navigation filter, enter `sys_properties.list`.
2. Select **New**.
3. In the **Name** field, enter `hide_list_record_count`.
4. From the Type list, select **true | false**.
5. In the **Choices** field, enter `true`.
6. Select **Submit**.

Managing principal class marking during upgrade

Make sure that existing Hardware Asset Management (HAM) CI classes are included as principal classes in Data Foundations during upgrade, without requiring manual configuration.

Upgrading to a version of CMDB success advisor that introduces the Data Foundations principal class concept can result in CI classes being automatically marked as principal classes when existing HAM model category selections are present.

In CMDB success advisor, each HAM model category maps to one or more CI classes.

For example, if you selected the Computers model category, the cmdb_ci_computer class was included. Before the upgrade, these classes were used only for HAM data quality tracking.

After you upgrade to a version that includes Data Foundations, CMDB success advisor automatically marks those same CI classes as principal classes. This gives you a starting point for Data Foundations without requiring manual configuration.

Upgrade impact

The following table shows how principal classes from HAM model categories are applied across key features in Data Foundations after upgrade.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Principal class updates by feature

Feature	Impact after upgrade
Principal classes list	Your Data Foundations principal classes list is already populated with CI classes from your HAM model category selections.
CI picker on task records	On incidents, problems, and changes, the CI picker shows only CIs from your principal classes.
Data Foundations dashboard	Your Data Foundations advisor dashboard may already display data using the HAM derived principal classes as the initial scope.

Recommended actions

1. Go to CMDB success advisor landing page, and on the Data Foundations card, select **Edit principal classes** to review automatically marked classes.

   See Manage Data Foundations advisor scope in CMDB success advisor.

2. Confirm that the marked classes align with your Data Foundations advisor scope. Remove any unwanted classes and add others as needed (up to 50 principal classes).
3. If CI picker filtering affects users, adjust behavior using the system properties for CMDB success advisor.

   See Principal class tracking in CMDB success advisor.

Note:

Automatic principal class marking happens only once during upgrade. Later changes to HAM model categories do not update the principal classes list automatically. Similarly, principal class changes made without using CMDB success advisor, for example through CI Class Manager, are not reflected in the Data Foundations advisor scope automatically.

Access CMDB success advisor

You can access CMDB success advisor within the CMDB Workspace for both setting up and managing application-specific dashboards. Depending on your progress, you can either begin the setup or access the dashboard to monitor and manage targeted configuration items (CIs) for an application.

Before you begin

Important:
CMDB success advisor (sn_cmdb_advisor) is a Next Experience application. It requires CMDB Workspace (sn_cmdb_ws) and SGC Central (sn_sgc_central) to be installed on your instance. If the application is not visible, contact your administrator to confirm these dependencies are installed and that you have the sn_cmdb_admin role.

Role required: sn_cmdb_admin

About this task

You can access the CMDB success advisor app from the Home and Management views in CMDB Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **CMDB Workspace**.
2. Locate the CMDB success advisor tool.
   - In the Home view, select the CMDB success advisor card available within the Product highlights section.
   - In the Management view, select the CMDB success advisor link, available within the Optimize category in the Management tools section.
3. Select an action based on your progress.
   - On first access, select **Get started**, and then in the Get started with CMDB success advisor dialog box, select **Continue**.

     Tip:
     Select the **Don't show again** check box to skip the dialog box in the future.

   - On subsequent visits, select **View details**.

Result

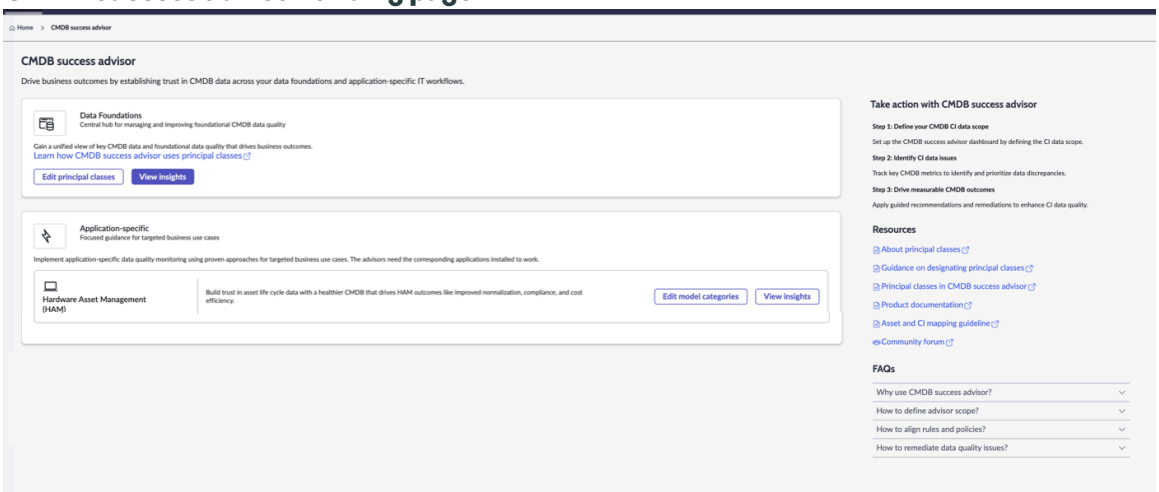
The CMDB success advisor landing page opens, displaying product cards for Data Foundations and application-specific modules like Hardware Asset Management (HAM). Each card includes a brief description and action buttons to configure dashboards and review data quality insights and metrics.

Viewing the CMDB success advisor landing page

As a CMDB administrator, you can use the CMDB success advisor landing page to configure and manage data quality dashboards for Data Foundations and Hardware Asset Management (HAM).

The CMDB success advisor landing page opens when you select CMDB success advisor from the Product highlights section in the Home view of CMDB Workspace, the Management view in CMDB Workspace, or the Data Governance tab in Service Graph Workspace.

CMDB success advisor landing page



Role required

You must have the sn_cmdb_admin role to access the CMDB success advisor landing page.

Accessing and using the landing page

To access the CMDB success advisor landing page, use the following navigation paths.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Entry point	Steps
Product highlights in CMDB Workspace	Navigate to **Workspaces** > **CMDB Workspace**. In the Home view, select the CMDB success advisor card in the Product highlights section.
Management view in CMDB Workspace	In the Management view, select the **CMDB success advisor** link in the Optimize view under Management tools.
Service Graph Workspace	Navigate to Service Graph Workspace. In the Data Governance view, select **Get started** (first visit) or **View details** (subsequent visits).

Tip:
On first access, select **Get started** in the Get started with CMDB success advisor dialog box, then select **Continue**. Select **Don't show again** to skip the dialog box on future visits.

Viewing data

From the landing page, you can:

- View and configure the scope for Data Foundations and application-specific advisors including HAM.
- Open a product dashboard to review data quality KPIs and trends.
- Follow guided steps to define scope, identify issues, and drive CMDB outcomes.
- Access resources and FAQs for additional guidance.

Advisor cards

The landing page organizes advisors into the following sections:

Data Foundations

Central hub for managing and improving foundational CMDB data quality. Gain a unified view of key CMDB data and foundational data quality that drives business outcomes.

Select **Select principal classes** to configure your Data Foundations advisor scope for the first time or **Edit principal classes** to update an existing scope. Select **View insights** to open the Data Foundations advisor dashboard. You can select up to 50 principal classes.

Use Data Foundations to keep your CI data accurate, complete, and reliable for processes such as incidents, problems, and changes. Select the CI classes that matter most to your organization. The selected classes are automatically marked as principal classes, which filters CI picker fields on task records to show only the most relevant items. You can select up to 50 principal classes.

Application-specific

Focused guidance for targeted business use cases. This section contains advisors for specific installed applications. The advisors need the corresponding application to be installed and entitled to work. Currently includes:

Hardware Asset Management (HAM)

Build trust in asset life cycle data with a healthier CMDB that drives HAM outcomes like improved normalization, compliance, and cost efficiency. Select **Select model categories** to configure your HAM advisor scope for the first time or **Edit model categories** to update

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

an existing scope. Select **View insights** to open the HAM advisor dashboard. You can select up to 50 hardware model categories.

Right panel

The right panel of the landing page provides additional context and links to enable you to get started and learn more.

Take action with CMDB success advisor

A guided three-step process to help you define scope, identify data issues, and drive measurable CMDB outcomes.

Resources

Links to related documentation including guidance on principal classes, product documentation, asset and CI mapping guidelines, and the community forum.

FAQs

Expandable answers to common questions about using CMDB success advisor, defining scope, aligning rules and policies, and remediating data quality issues.

Advisor card states

Each advisor card shows action buttons that reflect its current state. Cards for application-specific advisors may also show a badge when the required app is not available.

State	Description	Action
Shows **Select principal classes** or **Select model categories**	The advisor is available but scope has not been configured yet.	Select **Select principal classes** or **Select model categories** to define the scope and set up the advisor dashboard.
Shows **Edit principal classes** or **Edit model categories** and **View insights**	The advisor is configured and the dashboard is available.	Select **Edit principal classes** or **Edit model categories** to update scope, or **View insights** to open the dashboard.
Needs installation	The app is entitled on your instance but has not been installed.	Select **Learn more** to install the app and gain insights with CMDB success advisor.
Needs entitlement	The app has not been entitled on your instance.	Select **Learn more** to request an entitlement and gain insights with CMDB success advisor.

Supported business outcomes

CMDB success advisor drives measurable CMDB improvements by aligning data quality efforts with specific business outcomes. Instead of tackling the entire CMDB at once, the advisor enables you to target the areas that matter most, beginning with the outcomes you want to achieve.

Each supported business outcome maps to a dedicated product with its own scope, dashboard, data quality monitoring, and guided remediation. CMDB success advisor supports the following business outcomes:

Data Foundations

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use Data Foundations to keep your CI data accurate, complete, and reliable. By selecting the CI classes that matter most to your organization, you give your teams a focused, clear view of your IT infrastructure in the CMDB.

When you configure your Data Foundations scope in CMDB success advisor, the selected CI classes are automatically marked as principal classes. Doing so filters the CI fields on task records to show only the most relevant items, enabling you to reduce data entry errors and improve the accuracy of your incident, problem, and change records.

You can select up to 50 principal classes, which enables you to improve foundational data accuracy, align with Common Service Data Model (CSDM), strengthen incident and change CI links, and increase integration coverage for important CI classes.

To learn more, see Using CMDB success advisor for Data Foundations.

Hardware Asset Management (HAM)

Use HAM to keep your hardware data accurate and complete. This includes computers, servers, printers, and other physical devices. Focus on the hardware model categories that create the most business risk. By doing this, you can fix data issues that affect asset tracking and financial reports.

CMDB success advisor for HAM shows you hardware CIs that are missing model IDs, serial numbers, or locations, identifies duplicate records, and highlights asset and CI state mismatches. It then guides your team through targeted remediation to resolve each issue.

You can select up to 50 hardware model categories to improve hardware normalization rates, track asset life cycles accurately, strengthen financial and compliance reporting, and reduce duplicate and outdated hardware records.

To learn more, see Using CMDB success advisor for HAM.

Choosing your CMDB success advisor outcome

Use the following table to get the right CMDB success advisor guidance for your organization's goals. Each outcome activates a dedicated advisory experience with its own scope, KPI dashboard, issue detection, and guided remediation. You can start with one outcome and expand to the other at any time or run both simultaneously if your organization has overlapping goals.

Business goal	Recommended outcome
Improve integration coverage for your most critical CI classes	Data Foundations
Track and fix missing serial numbers, model IDs, and locations for hardware	HAM
Support asset life cycle management and financial reporting accuracy	HAM
Eliminate duplicate hardware records and asset and CI state mismatches	HAM
Improve both data quality and hardware asset accuracy	Both: Data Foundations and HAM can run simultaneously

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Using CMDB success advisor for Data Foundations

As a CMDB administrator, you can use the Data Foundations dashboard in CMDB success advisor to improve data quality for the most critical CI classes. Use Data Foundations to keep your CI data accurate, complete, and reliable across the CI classes your organization relies on for incidents, problems, and changes.

When you configure your Data Foundations scope, the selected CI classes are automatically marked as principal classes, filtering CI picker fields on task records to show only the most relevant CIs. You can select up to 50 principal classes.

Principal classes in CMDB success advisor

In CMDB success advisor, principal classes are the foundation of the Data Foundations product.

A principal CI class is a CI class that your organization has designated as important. When you set up your Data Foundations scope, the CI classes you select are automatically marked as principal on your ServiceNow instance.

Once a CI class is designated as principal, an automatic filter is applied to the **Configuration Item** field on task records.

Principal classes benefits

Selecting the right principal classes keeps your CMDB focused and healthy. The CMDB success advisor monitors and improves data quality for the classes that matter most to your business.

Principal class selection

CMDB success advisor analyzes your instance's history and ranks CI classes by relevance before you set up your advisor scope.

For guidance on choosing the right classes, see the Guidance on designating principal classes in the CMDB [KB2707240] article in the Now Support Knowledge Base.

You can manage most important CI classes with CMDB success advisor by:

- Selecting CI classes from the grouped, recommended list in the Data Foundations scope setup. Classes are marked as principal automatically when you save.
- Using intelligent recommendations based on the past 180 days of incident, problem, and change activity on your instance.
- Monitoring data quality continuously through the Data Foundations advisor dashboard.

Principal class tracking in CMDB success advisor

Use the following system properties to customize how CMDB success advisor recommends and manages principal classes. As a user with the admin role, you can adjust these properties to control the scope and quality of principal class recommendations in CMDB success advisor for Data Foundations.

System properties in CMDB success advisor for principal classes

Property	Purpose
sn_cmdb_advisor.principal_class_suggestion_period	Number of days of task history CMDB success advisor scans when

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

System properties in CMDB success advisor for principal classes (continued)

Property	Purpose
	generating class recommendations. Default value: 180 days
sn_cmdb_advisor.principal_class_suggestion_limit	Maximum number of recommendations shown in the Recommended group. Default value: 20
sn_cmdb_advisor.cmdb_advisor_scope_limit	Maximum number of classes allowed in the Data Foundations scope. Default value: 50
sn_cmdb_advisor.other_principal_classes	Comma-separated list of custom CI classes to include in the Data Foundations scope selection that are not in the standard list.

Principal class synchronization

The Data Foundations advisor maintains its own record of which CI classes are in scope and does not automatically synchronize changes made outside CMDB success advisor. Changes to principal class designations made through CI Class Manager or directly on the instance are not reflected automatically in the Data Foundations advisor scope.

Consider the following behavior:

- When you mark a class as principal without using the CMDB success advisor after the Data Foundations advisor dashboard scope is configured, the class is marked as principal on the instance but is not automatically added to the Data Foundations advisor dashboard scope.
- When you remove the principal designation from a class outside the advisor, the class remains in the Data Foundations advisor dashboard scope until you remove it manually.

To keep the Data Foundations advisor dashboard scope accurate, make all principal class updates directly in CMDB success advisor by selecting **Edit principal classes** on the CMDB success advisor card. For more information, see Manage Data Foundations advisor scope in CMDB success advisor.

CI class recommendations

CMDB success advisor analyzes your instance's historical data to recommend which CI classes should be in your Data Foundations scope.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Recommendations help prioritize classes that provide the most operational value. They are based on:

- Task activity: Frequency of each CI class appearing in incidents, problems, and changes (IPC) over a configurable period (default 180 days, set in the *sn_cmdb_advisor.principal_class_suggestion_period* system property).

  Note:
  If IPC data is unavailable, classes are ranked by how widely they are used across your CMDB. For new instances with no historical data, a set of default classes is suggested.

- CI population: Number of CI records in each class.
- Common Service Data Model (CSDM) alignment: Support for service mapping and dependency tracking.

Note:
You aren't required to accept all recommendations. Recommendations are guidance. Your organization's priorities should drive the final advisor scope selection.

Set up CMDB success advisor for Data Foundations

Use the CMDB success advisor application to configure and manage the CMDB success advisor for Data Foundations.

Plugins and dependencies

Review the CMDB success advisor application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Set up overview

1. Get started with Data Foundations advisor dashboard setup.

   Set up your Data Foundations specific advisor dashboard in CMDB success advisor.

2. Manage Data Foundations advisor scope in CMDB success advisor.

   After completing the initial setup, you can continue to improve your CMDB data quality by adjusting principal class selection for your current Data Foundations goals.

Get started with Data Foundations advisor dashboard setup

Set up your Data Foundations advisor dashboard by selecting principal classes to define the Data Foundations scope in CMDB success advisor.

Before you begin
Role required: sn_cmdb_admin

Note:
In addition to the sn_cmdb_admin role, the pa_data_collector role is required to view the last updated data timestamp on the dashboard and pa_viewer is required to filter data by principal classes.

About this task
The Data Foundations scope defines which principal classes CMDB success advisor monitors. When a CI class is included in the Data Foundations advisor dashboard scope, the class is automatically marked as a principal class, which means it appears in CI selection filters on incident, change, and problem forms.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For guidance on choosing the right classes, see the Guidance on designating principal classes in the CMDB [KB2707240] article in the Now Support Knowledge Base.

Procedure

1. On the CMDB success advisor landing page, select **Select principal classes**.
   See Viewing the CMDB success advisor landing page.
2. On the Select principal classes dialog box, select a group to choose all its classes or expand a group to select individual classes, then move them from the **Available classes** column to the **Selected classes** column.
   Any CI classes added to an application-specific advisor dashboard such as for Hardware Asset Management (HAM) are automatically monitored as principal classes. You can select up to 50 classes.

   Tip:
   The **Recommended** group, shown at the top of the Group list, includes CI classes based on the recent incident, problem, and change (IPC) activity, ranked by task volume. You can start with these recommended principal classes to improve foundational CMDB data and maximize operational value. To learn more, see CI class recommendations.

3. **Optional:** To remove a CI class, select the X icon next to the class in the **Selected classes** column.
4. Select **Done** to build the CMDB success advisor for Data Foundations dashboard.

Result
The selected classes are marked as principal classes and data collection begins. The Data Foundations advisor dashboard is populated after data collection completes.

Manage Data Foundations advisor scope in CMDB success advisor

Manage the scope of your advisor for Data Foundations by editing principal classes in CMDB success advisor to support your targeted Data Foundations outcomes.

Before you begin
Role required: sn_cmdb_admin

About this task
Control which principal classes are included in your Data Foundations advisor dashboard in CMDB success advisor. You can add or remove entire CI class group or fine-tune the selection by including or excluding specific classes within a group.

For guidance on choosing the right classes, see the Guidance on designating principal classes in the CMDB [KB2707240] article in the Now Support Knowledge Base.

Note:
Principal classes that are currently in use by CMDB success advisor for HAM can't be edited here. To edit those classes in Data Foundations, you must first remove them from the HAM advisor. See Manage HAM advisor scope in CMDB success advisor.

Procedure

1. On the CMDB success advisor landing page, select **Edit principal classes** within the Data Foundations card.
   See Viewing the CMDB success advisor landing page.
2. In the Edit principal classes dialog box, add or remove CI classes to update your principal class selection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Principal class selection actions

Purpose	Action	Data coverage
Add a CI class group	Select the check box for the group to include all its CI classes.	Includes all CI classes associated with the selected group.
Expand CI class selection	Select **>** to expand a group, then select check boxes for specific CI classes.	Includes only the selected CI classes associated with a group.
Narrow down CI class selection	Select **>** to expand a group, then clear check boxes for specific CI classes.	Excludes only the CI classes cleared from a group.
Remove a CI class group	Clear the check box for the CI class group.	Excludes all CI classes associated with the removed group.
Remove a selected CI class	Select the X icon next to the category in the **Selected classes** column.	CI class is removed from scope.

3. Select **Save** to apply the changes.

Result

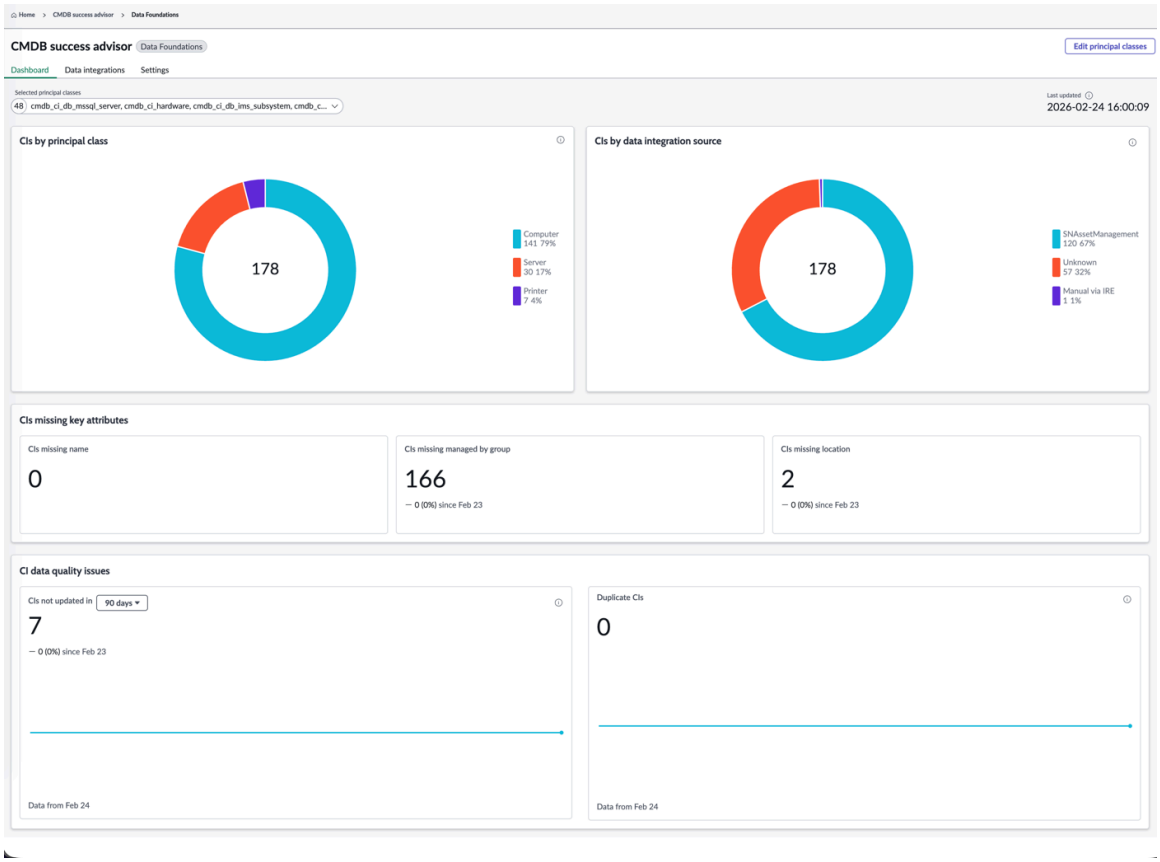
The CMDB success advisor for Data Foundations dashboard is updated to reflect the data based on the principal class selection.

Monitoring CMDB data quality using dashboard metrics in CMDB success advisor for Data Foundations

The CMDB success advisor for Data Foundations dashboard enables CMDB administrators to identify and address data quality issues specific to principal classes in the Configuration Management Database (CMDB).

Important:
When you select a segment or count on a chart from a CMDB success advisor dashboard, the KPI Details page opens. On the page, you can analyze how a specific metric trends over time. Additionally, the Remediation actions panel appears when remediation actions are available for that card. Use the panel to improve the quality of CMDB. To learn more, see KPI Details and Improving CMDB data quality for Data Foundations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Access the dashboard

To open the dashboard, select **View insights** for Data Foundations on the CMDB success advisor landing page. See Access CMDB success advisor.

Note:
The CMDB success advisor for Data Foundations dashboard is available only after the setup process is complete. For more information, see Set up CMDB success advisor for Data Foundations.

Required roles

Roles required for CMDB success advisor for Data Foundations dashboard

Role	Description
sn_cmdb_admin	Required to access the Data Foundations dashboard.
pa_viewer	Required to filter data by principal classes.
pa_data_collector	Required to view the last updated data timestamp on the dashboard.

Use cases

For examples of how different people in your organization would use this dashboard, see these use cases.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

User	Dashboard use
CMDB administrator	• Monitor CI attribute completeness across principal classes • Identify classes at risk with low data quality scores • Detect stale and duplicate CI records affecting CMDB data accuracy • Evaluate integration coverage to ensure the right sources are populating the CMDB • Prioritize remediation efforts based on incident, change, and problem impact • Track progress toward CSDM alignment

Dashboard features

The dashboard provides clear, consolidated insights into principal CI class data quality and completeness. Use the dashboard to identify and resolve data quality issues within the CMDB through dedicated sections, filters, indicators, and visual reports. Gain valuable insights into CMDB performance related to Data Foundations. Targeted CMDB metrics focus remediation efforts. Regularly monitor these metrics and follow suggested remediation actions to systematically improve CMDB data quality over time.

Important:
The dashboard data is filtered based on the Selected principal classes and Date range filters. See Filters.

Feature description

Feature	Description
CIs by principal class	Displays the breakdown of operational CIs by principal CI class to highlight CI distribution in the CMDB.
CIs by data integration source	Displays the breakdown of operational CIs by data integration source to highlight their contribution to CMDB population.
CIs missing key attributes	Displays completeness metrics per principal CI class, identifying classes below the defined threshold.
CI data quality issues	Displays key metrics related to CIs that have not been updated or may have duplicate records, leading to outdated information and inconsistencies in the CMDB.

Filters

Enables narrowing the data shown in graphs and metrics based on principal class, date range, or stale CI threshold.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Type	Description
Selected principal classes	List	Filters CIs based on the selected principal classes. **Note:** Requires the `pa_viewer` role.
Date range	Date	Filters the dashboard data based on the selected date range.
Stale CI	List	Filters stale CIs based on the number of days since their last update. Available values: 7, 14, 30, 60, and 90 days.

CIs missing key attributes

Key metrics for the completeness of CI attributes across principal classes, identifying gaps that affect data quality.

Card	Description	Indicators
CIs missing name	Total number of CI records from principal classes missing a name, measured daily, where the CI does not have a name specified.	DF CIs missing name
CIs missing managed by group	Total number of CI records from principal classes missing a managed by group, measured daily, where the CI does not have a managed by group assigned.	DF CIs missing managed by group
CIs missing location	Total number of CI records from principal classes missing a location, measured daily, where the CI does not have a location assigned.	DF CIs missing location

CI data quality issues

Key metrics for CIs that have not been updated or may have duplicate records, leading to outdated information and inconsistencies in the CMDB.

Card	Description	Indicators
Stale CIs	Principal class CIs not updated within the expected maintenance window, causing data gaps and inaccuracies that affect incident and change impact analysis. Additionally filtered by the Stale CI filter.	DF CIs not updated in last 7 days DF CIs not updated in last 14 days DF CIs not updated in last 30 days DF CIs not updated in last 60 days

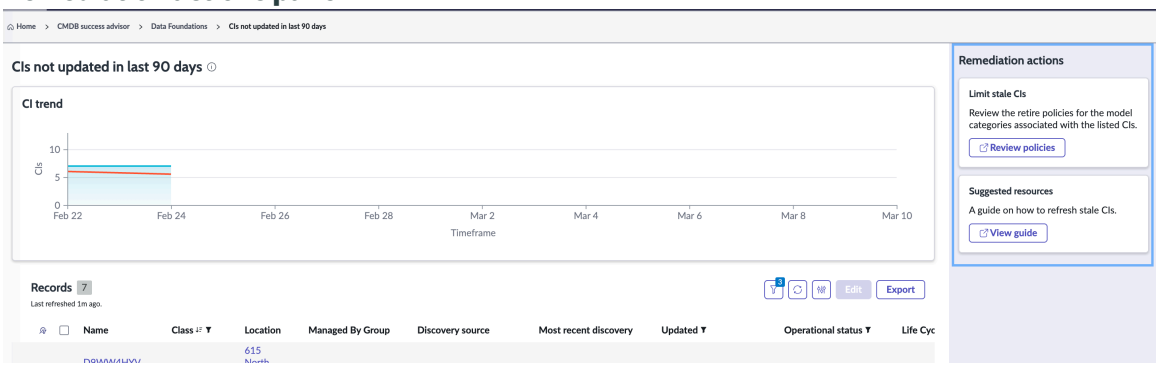
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Card	Description	Indicators
		DF CIs not updated in last 90 days **Note:** The CIs not updated card data is additionally filtered based on the Stale CI filter. See Filters.
Duplicate CIs	Operational CIs identified as duplicates within principal classes, causing ambiguous CI selection in processes and data redundancy.	DF duplicate CIs

Improving CMDB data quality for Data Foundations

The Remediation actions panel available for a chart in the CMDB success advisor dashboard for Data Foundations suggests targeted actions to address Data Foundations data quality issues and improve the overall quality of your Configuration Management Database (CMDB).

Remediation actions panel



When remediation actions are available for a chart, the Remediation actions panel appears on the KPI Details page.

You can perform the actions suggested within the Remediation actions panel to address Data Foundations data quality issues in the CMDB. These actions help improve the accuracy, consistency, and usability of configuration items (CIs), promoting better alignment with Data Foundations.

The Remediation actions panel:

- Improves CMDB data quality through guided actions
- Suggests context-aware actions
- Supports quick, informed remediation steps
- Focuses attention on meaningful tasks
- Appears only when actionable insights are available

Accessing the Remediation actions panel

To open the Remediation actions panel, select a segment or count on a chart in the CMDB success advisor dashboard for Data Foundations. The KPI Details page opens. If the remediation actions are available for the selected data, the panel appears on the details page suggesting various remediation actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Available remediation actions

The Remediation actions panel provides relevant suggestions and actions based on the information in the selected chart. For example, if the chart shows CIs that weren't updated recently, the panel suggests reviewing retirement policies.

The remediation actions are available for the improvement of the following issues:

CIs with invalid or unpopulated names

Identify and correct CIs in your principal classes that lack a valid name. Accurate names are required to correctly reference data to the right configuration item.

CIs missing location

Resolve CIs in your principal classes that have no location assigned. Location data supports incident routing, asset tracking, and compliance reporting across your organization.

CIs missing managed by group

Assign a managed by group to CIs in your principal classes that are missing ownership. Ownership data is critical for routing incidents, changes, and service requests to the correct team.

Stale CIs

Remove or update CIs in your principal classes that have not been updated or discovered for an extended period. Stale records reduce trust in the CMDB and can cause incorrect assignments.

Duplicate CIs

Remove or merge duplicate records within your principal classes. Duplicates can cause split incident history and routing errors in workflows.

Data Foundations specific remediation tips

- For stale CIs in principal classes: check whether a Discovery schedule is running against the affected network segment or cloud account. Stale data often means a Discovery job is failing or out of scope.
- For duplicate CIs: review the CMDB Identification and Reconciliation (IRE) rules for the affected CI class. Duplicates often signal that IRE rules need updating.
- For missing location or owner: consider using a CMDB enrichment rule to auto-populate these fields from related records. For example, derive location from IP subnet.

Analyzing data integrations for improving Data Foundations

Improve Data Foundations coverage by analyzing existing and suggested data integrations, including Discovery patterns and Service Graph Connectors.

Use the **Data integrations** tab in the CMDB success advisor for Data Foundations to assess the effectiveness of your current data integration sources in the Configuration Management Database (CMDB) and identify opportunities to improve coverage across your principal classes. The **Data integrations** tab provides a breakdown of active Discovery patterns and installed Service Graph Connectors, including how many key configuration item (CI) attributes each integration source is populating.

For a quick reference to improve Data Foundations coverage, see Data integration checklist for Data Foundations in CMDB success advisor.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Access data integrations

Navigate to the CMDB success advisor landing page, and on the Data Foundations card, select **View insights**. Select the **Data integrations** tab to access integration-related details. For more information, see Access CMDB success advisor.

Note:
The CMDB success advisor for Data Foundations dashboard is available only after the setup process is complete. For more information, see Set up CMDB success advisor for Data Foundations.

Required roles

Roles required for accessing data integration sources in the CMDB success advisor for Data Foundations

Role	Description
sn_cmdb_admin	Required to access the CMDB success advisor.
cmdb_inst_admin	Required to manage Service Graph Connector connections in SGC Central.

Use cases

For examples of how different people in your organization would use this feature, see these use cases.

User	Feature use
CMDB administrator	• Identify an inactive Discovery pattern that can populate attribute data for your principal classes • Identify Service Graph Connectors that cover your principal classes with the highest attribute coverage • Detect integration sources that are installed but have no active connections • Evaluate which integrations populate ownership, relationship, and infrastructure attributes for CMDB data accuracy • Prioritize which integrations to improve to maximize data quality across principal classes

Data integration features

Feature description

Feature	Description
Integration overview	Displays the count of all Discovery patterns and Service Graph Connectors contributing CI data to your principal classes in the CMDB.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Feature description (continued)

Feature	Description
Status indicators	Check whether Discovery patterns are active and Service Graph Connectors are installed with active connections. For more information, see Reviewing data integrations for Data Foundations.
Attribute coverage insights	Select the **Attribute coverage** link next to the integration to review which CI attributes it populates for your principal classes. For more information, see Evaluate Data Foundations data integration coverage.
Access integration details	Configure integrations to improve attribute coverage. For more information, see Evaluate Data Foundations data integration coverage.

Reviewing data integrations for Data Foundations

Review both existing and suggested Discovery patterns and Service Graph Connectors to improve your Data Foundations data coverage.

The **Data integrations** tab in CMDB success advisor for Data Foundations provides insight into current integration usage for Discovery patterns and Service Graph Connectors. To make sure your CMDB is being correctly populated with high-quality CI data for your principal classes, check the status of both integration types.

Integration types

The **Data integrations** tab displays two key data sources that support Data Foundations:

Discovery patterns

Discovery patterns identify IT infrastructure components through network-based discovery.

To evaluate Discovery pattern effectiveness for Data Foundations, review the fields as described in the following table.

Fields to monitor for Discovery pattern

Field	Description
Status	Indicates whether a Discovery pattern is currently active. Only active patterns contribute data to the CMDB.
Attribute coverage	Displays how many Data Foundations relevant attributes within a principal class are being populated by each pattern.
View pattern	Opens the Discovery pattern configuration, enabling you to inspect or refine the logic, identification rules, and targeted CI classes.

Low attribute coverage might occur if the Discovery pattern is limited in scope, not collecting detailed CI information, or if its identification rules are not aligned with the actual devices in your network. In such cases, required CI attributes may be missing from the resulting CI records.

Service Graph Connectors

Service Graph Connectors import CI data from third-party platforms.

To evaluate Service Graph Connectors effectiveness for Data Foundations, review the fields as described in the following table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Installed	Indicates whether the connector is deployed. A value of `Yes` confirms it is installed and available for use.
Attribute coverage	Displays how many Data Foundations relevant attributes within a principal class are being populated by each connector.
Active connections	Represents the number of connections actively importing data into the CMDB.
Inactive connections	Displays connections that are configured but not currently importing data and may need troubleshooting.

If a Service Graph Connector shows low attribute coverage or no active connections, it may indicate that the specific version being evaluated has limited attribute coverage. This can happen if the connector is installed but not fully mapped to populate key attributes or if the data source is unavailable or misconfigured. As a result, critical CI data, such as ownership, location, or relationship information, may not be imported into the CMDB, affecting data quality for your principal classes.

Evaluate Data Foundations data integration coverage

Identify supported principal classes and attributes from a Discovery pattern or Service Graph Connector to evaluate data coverage and upgrade requirements.

Before you begin

Role required: sn_cmdb_admin

Procedure

1. Navigate to the CMDB success advisor landing page.
2. On the Data Foundations card, select **View insights**.
3. Select the **Data integrations** tab.
4. Find the Discovery pattern or Service Graph Connector by selecting the respective cards.
5. Identify the status of your Discovery patterns and Service Graph Connectors to improve CMDB data coverage.
6. Select the **Attribute coverage** link for a data integration source.
7. In the Supported principal classes and attributes dialog box, review the attribute coverage details.
   The following details are available:
   - Integration suggested vs. installed version
   - Supported CI classes identified as principal classes
   - List of attributes and whether each is supported by the selected data integration source
8. **Optional:** When installed version is lower than the suggested version, select the **View available version** link to open the Application manager.

Note:
The **View available version** link is available only when applicable for a data integration source. Also, only users with the admin role can install or upgrade an application. See Application Manager.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. Determine which CI attributes are being populated by the integration and whether an upgrade is needed to improve the data coverage.
   Available options for improving the data coverage are:
   - For Discovery patterns, you can perform the following actions based on the applicable criteria:
     - If you have the pd_user, you can select **View pattern** for a Discovery pattern to view the pattern. For more information, see Patterns and horizontal discovery.
     - If you have the pd_admin role, you can select **View pattern** for a Discovery pattern to understand its contribution and modify the pattern to maximize the attribute coverage. For more information, see Patterns and horizontal discovery.
   - For Service Graph Connectors, if you have the cmdb_inst_admin role, you can perform the following actions based on the applicable criteria:
     - Select **Install connector** to add a connector from the ServiceNow Store.
     - Select **Create connection** to configure a Service Graph Connector from SGC Central. For more information, see Create a connection for a Service Graph Connector in SGC Central.
     - Select **View connections** to open and review details of existing installed connections importing hardware asset data within SGC Central. For more information, see Viewing connections for a Service Graph Connector in SGC Central.

Data integration checklist for Data Foundations in CMDB success advisor

Use the data integration checklist to verify that Discovery patterns and Service Graph Connectors are correctly configured and actively contributing to your Configuration Management Database (CMDB), promoting quality foundational data.

Discovery patterns checklist

Confirm each Discovery pattern is enabled and effectively populating attributes for your principal classes.

Discovery patterns configuration checks

Select	Check item (field)	Description	Action
☐	Pattern name	Name of the discovery pattern contributing CI data for Data Foundations.	Confirm that the pattern is relevant for your principal classes.
☐	Status	Current state of the pattern as active or inactive. Only active patterns contribute data.	Verify that the pattern is active with Status set to Active to confirm it's contributing data.
☐	Attribute coverage	Number of CI attributes populated by the pattern.	Check how many relevant CI attributes are populated for each principal class. **Note:** Low attribute coverage may suggest shallow discovery or misaligned pattern logic.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Discovery patterns configuration checks (continued)

Select	Check item (field)	Description	Action
☐	Suggested version	Latest suggested version for optimal attribute coverage.	Plan and perform an upgrade to the suggested version or higher to improve coverage.
☐	Installed version	Version currently in use in your instance.	Compare with the suggested version and upgrade if necessary.
☐	View pattern	Link to inspect the pattern configuration.	Select the link to review or modify the pattern logic.

Service Graph Connectors checklist

Confirm Service Graph Connectors are installed and actively contributing hardware data.

Service Graph Connectors configuration checks

Select	Check item (field)	Description	Action
☐	Connector name	Name of the Service Graph Connector providing CI data for Data Foundations.	Confirm that the Service Graph Connector is required for your principal classes.
☐	Status	Current state of the Service Graph Connector as active or inactive.	Activate Service Graph Connectors that are needed for Data Foundations but currently inactive.
☐	Attribute coverage	Number of hardware attributes populated by the Service Graph Connector.	Check how many relevant CI attributes are being populated for each principal class. **Note:** Low coverage may indicate incomplete mappings or missing source data.
☐	Suggested version	Latest suggested version for optimal attribute coverage.	Plan and perform an upgrade to the suggested version or higher to improve coverage.
☐	Installed version	Version currently in use in your instance.	Compare with the suggested version and upgrade if necessary.
☐	Active connections	Number of active connections.	Confirm that at least one connection is actively importing data per principal class.
☐	Inactive connections	Number of inactive connections.	Review and troubleshoot any configured connections that aren't currently active.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Optional checks for Discovery patterns and Service Graph Connectors

Optional data integration checks

Select	Check item	Description	Action
☐	No entitlements warning	Discovery patterns or Service Graph Connectors tile showing no entitlements, indicating missing access or licensing.	Verify licensing and entitlements with your administrator.
☐	Suggested integrations reviewed	Some Discovery patterns are listed as suggestions because they aren't installed or active, and some Discovery patterns are listed but are not actively used.	Evaluate business need and consider implementing high-value suggested integrations.

Final validation

Once all data integration checks are complete:

- Discovery patterns relevant to your principal classes are active.
- At least one Service Graph Connector is active for each principal CI class in your DF scope.
- Attribute coverage across integrations supports your Data Foundations outcome.
- Integrations are populating ownership, relationship, and key infrastructure attributes.
- CMDB records for principal classes are accurate and complete.

Analyze CMDB settings for Data Foundations

Monitor and optimize Configuration Management Database (CMDB) settings that support configuration item (CI) data quality, Common Service Data Model (CSDM) alignment, and Data Foundations outcomes.

Use the **Settings** tab in the CMDB success advisor for Data Foundations to review configuration indicators and identify opportunities to improve CMDB alignment with Data Foundations guidelines.

The CMDB success advisor for Data Foundations evaluates your current configuration across key areas such as:

- CMDB Data Manager ownership policies for principal classes
- Reconciliation rules ensuring the right integration source owns each attribute
- CI class manager configuration for principal class designation

Settings are categorized as `Ideal` or `Requires attention`, enabling you to prioritize actions and maintain a healthy CMDB for Data Foundations.

For a quick reference to validate CMDB settings for Data Foundations, see Settings checklist for Data Foundations in CMDB success advisor.

Access settings

Navigate to the CMDB success advisor landing page, and on the Data Foundations card, select **View insights**. Select the **Settings** tab to access settings-related details. For more information, see Access CMDB success advisor.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The CMDB success advisor for Data Foundations dashboard is available only after the setup process is complete. For more information, see Set up CMDB success advisor for Data Foundations.

Required roles

You need the sn_cmdb_admin role to access the CMDB success advisor for Data Foundations.

To manage business rules, change the application scope from CMDB success advisor to Global in the application picker.

Use cases

For examples of how different people in your organization would use this feature, see these use cases.

User	Feature use
CMDB administrator	• Make sure Data Manager ownership policies are configured for all principal classes • Verify reconciliation rules prevent lower-quality sources from overwriting high-quality CI data • Identify CI classes with no Data Manager policy coverage and remediate gaps • Align CMDB settings with CSDM to support service mapping and dependency tracking

Settings features

The **Settings** tab in the CMDB success advisor for Data Foundations provides visibility into key configuration areas that promote accurate and complete CI data for your principal classes. These settings include business rules for CI creation, reconciliation rules that govern attribute ownership across integration sources, and Data Manager policies that support automated life cycle management and data integrity. To maintain CMDB data quality for Data Foundations, regularly review and validate these settings. For more information, see CMDB and Data Foundations settings assessed in the CMDB success advisor.

Evaluate CMDB settings for Data Foundations

Identify and evaluate settings including CMDB reconciliation rules, CI creation business rules, and CMDB Data Manager policies that support data quality and life cycle management for your principal classes.

Before you begin
Role required: sn_cmdb_admin

Procedure

1. Navigate to the CMDB success advisor landing page.
2. On the Data Foundations card, select **View insights**.
3. Select the **Settings** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select a status tile to view settings by category.

5. Evaluate each setting that requires attention and use the available actions to open the related configuration pages and make updates.

   Tip:
   Select **Learn more** next to a setting to open a related help topic in a new browser tab or window with additional details about that setting.

6. To view any updated configuration status on the **Settings** tab, select the refresh icon .

Administer Data Manager in CMDB Workspace

CMDB and Data Foundations settings assessed in the CMDB success advisor

The Configuration Management Database (CMDB) and Data Foundations settings review provides a configuration-level assessment of the CMDB configuration item (CI) classes for your principal classes to support data quality, life cycle management, and integration accuracy.

Settings overview

Each setting is checked for alignment with suggested business rules, reconciliation guidelines, and Data Manager policy coverage.

CMDB settings for Data Foundations

Setting	Description
CI creation from assets using IRE	Enables the automatic creation of a CI from an asset record using the CMDB Identification and Reconciliation Engine (IRE) for CI classes identified by serial number and without dependent relationships. Requires the relevant business rule to be active for CI creation to occur during asset insertion.
Review reconciliation rules	Evaluates whether reconciliation rules correctly assign attribute ownership to the authoritative integration source for each principal CI class. Helps prevent lower-quality integration sources from overwriting high-quality CI attribute data, maintaining accuracy and consistency across the CMDB.
Review CMDB Data Manager policies	Assesses the configuration of CMDB Data Manager policies, including archive, attestation, certification, delete, and retire, for your principal classes. Each policy type manages a specific life cycle action: **Archive** Archives inactive CIs without deleting them. **Attestation** Validates CI data or runs automated checks. **Certification** Verifies CI data for accuracy and readiness. **Delete** Removes CIs based on defined criteria such as inactivity. **Retire**

Administer Data Manager in CMDB Workspace

Settings checklist for Data Foundations in CMDB success advisor

Use this checklist to review Configuration Management Database (CMDB) and Data Foundations settings in CMDB success advisor that directly affect Data Foundations data quality, configuration item (CI) to asset synchronization, and life cycle alignment.

CMDB and Data Foundations settings checklist

Confirm that each setting is configured to support accurate and complete CI data for your principal classes in the CMDB.

Settings configuration checks

Select	Check item (field)	Description	Action
☐	CI creation from assets using IRE	Enables the automatic creation of a CI from an asset record using the CMDB Identification and Reconciliation Engine (IRE) for CI classes identified by serial number and without dependent relationships.	Verify that the rule is active for all applicable principal classes.
☐	Review reconciliation rules	Evaluates whether reconciliation rules correctly assign attribute ownership to the authoritative integration source for each principal CI class, preventing lower-quality sources from overwriting high-quality data.	Update reconciliation rules to ensure the most authoritative source owns each CI attribute.
☐	Review CMDB Data Manager policies	Assesses the configuration of Data Manager policies, including archive, attestation, certification, delete, and retire, for your principal classes.	Enable and configure appropriate policies for all principal classes.

Final validation

Once all settings checks are complete:

- The business rule for CI creation from assets using IRE is `Active` for applicable principal classes.
- Reconciliation rules are configured to protect high-quality CI attribute data from being overwritten by lower-quality sources.
- Data Manager policies are configured for all principal classes.
- No `Requires attention` status is displayed for any setting in the **Settings** tab.

Indicators used in the CMDB success advisor for Data Foundations dashboard

Indicators enable viewing of high-level metrics that highlight data quality, completeness, and integration coverage issues across principal classes and configuration items (CIs).

CMDB success advisor for Data Foundations dashboard indicators

DF CIs by principal class

Total number of CI records across principal classes, measured daily and grouped by CI class and data integration source.

DF CIs by discovery source

Total number of CI records from principal classes, measured daily and grouped by the discovery source populating each CI.

DF CIs missing name

Total number of CI records from principal classes missing a name, measured daily, where the CI does not have a name specified.

DF CIs missing location

Total number of CI records from principal classes missing a location, measured daily, where the CI does not have a location assigned.

DF CIs missing managed by group

Total number of CI records from principal classes missing a managed by group, measured daily, where the CI does not have a managed by group assigned.

DF duplicate CIs

Total number of CI records within principal classes identified as duplicates based on key matching attributes, measured daily.

DF CIs not updated in last 7 days

Total number of CI records from principal classes not updated in the last seven days, measured daily, where the update timestamp is older than seven days.

DF CIs not updated in last 14 days

Total number of CI records from principal classes not updated in the last 14 days, measured daily, where the update timestamp is older than 14 days.

DF CIs not updated in last 30 days

Total number of CI records from principal classes not updated in the last 30 days, measured daily, where the update timestamp is older than 30 days.

DF CIs not updated in last 60 days

Total number of CI records from principal classes not updated in the last 60 days, measured daily, where the update timestamp is older than 60 days.

DF CIs not updated in last 90 days

Total number of CI records from principal classes not updated in the last 90 days, measured daily, where the update timestamp is older than 90 days.

Using CMDB success advisor for HAM

As a CMDB administrator, you can use the Hardware Asset Management (HAM) dashboard in CMDB success advisor to keep hardware asset data accurate and aligned with data quality guidelines.

1. Set up CMDB success advisor for HAM.

   Set up the CMDB success advisor for HAM.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Monitor CMDB data quality for HAM.

   Identify and address data quality issues specific to HAM in the CMDB.

3. Improve CMDB data quality for HAM.

   Use the Remediation actions panel available for a data card in the advisor dashboard for HAM to improve the overall quality of your CMDB.

4. Analyze data integrations for HAM.

   Improve HAM data coverage by analyzing existing and suggested data integrations, including Discovery patterns and Service Graph Connectors.

5. Analyze CMDB settings for HAM.

   Monitor and optimize CMDB settings that support CI-to-asset synchronization, life cycle alignment, and HAM data quality.

Related topics

Hardware Asset Management

Set up CMDB success advisor for HAM

Use the CMDB success advisor application to configure and manage the CMDB success advisor for Hardware Asset Management (HAM).

Plugins and dependencies

Review the CMDB success advisor application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Set up overview

1. Manage opt in HAM resource categories.

   Opt in to Hardware Asset Management (HAM) license resource categories to make the corresponding model categories available for selection in CMDB success advisor for HAM.

2. Get started with CMDB success advisor setup for HAM.

   Set up your HAM specific advisor dashboard by selecting model categories to define the HAM advisor scope.

3. Manage HAM advisor scope in CMDB success advisor.

   After completing the initial setup, you can continue to improve your CMDB data quality by adjusting model category selection for your current HAM goals.

Related topics

Hardware Asset Management

Managing opt-in and opt-out resource categories for HAM in CMDB success advisor

You can opt in to Hardware Asset Management (HAM) license resource categories to make the corresponding model categories available for selection in CMDB success advisor for HAM.

Before you can set up or update the HAM advisor scope in CMDB success advisor, at least one HAM license resource category must be opted in. Resource categories define the hardware

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

types, such as Servers, Storage, or Mobile Device, covered by your HAM subscription. Only model categories belonging to opted-in resource categories appear in the CMDB success advisor for HAM.

The opted-in resource categories are set to `true` in the HAM Resource Category [sn_hamp_resource_category] table. For more information, see Opt-in or opt-out of HAM license resource categories.

Model category availability based on opt-in status

The opt-in status of resource categories determines which model categories are available in the HAM advisor.

The following table describes the HAM advisor behavior based on opt-in status.

Model category availability by opt-in status

Status	Advisor behavior
No resource categories opted in	The Select model categories dialog box displays a message indicating that no categories are currently available. You must opt in to at least one resource category before you can configure or update the HAM advisor scope.
Resource categories opted in	The corresponding model categories appear in the **Available resource and model categories** column of the Select model categories and Edit model categories dialog boxes and can be selected for the HAM advisor scope.
Resource category opted out after selection	Model categories from that resource category are no longer available in the advisor. If those categories were previously selected for the HAM advisor scope, they may become unavailable and the dashboard scope may be reduced.

Opt in resource categories

Select HAM resource categories to make their model categories available for configuration in CMDB success advisor.

Role required: sn_hamp.admin

To opt in resource categories, follow these steps:

1. On the CMDB success advisor landing page, select **Select model categories** within the HAM card.

   See Viewing the CMDB success advisor landing page.

2. If the dialog box displays **No model categories available**, select **Opt in categories** to open the HAM license resource categories management page.
3. Select the resource categories included in your HAM subscription and opt them in.
4. Return to CMDB success advisor and proceed with selecting model categories.

   For more information, see Get started with CMDB success advisor setup for HAM.

Opt out resource categories

When a resource category is opted out in HAM, its model categories remain in the CMDB success advisor until you manually remove them. A message is displayed in the advisor indicating that opted-out resource categories are part of the current scope.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: sn_hamp.admin

To remove opted out resource categories, follow these steps:

1. On the CMDB success advisor landing page, select **Edit model categories** within the HAM card.

   See Viewing the CMDB success advisor landing page.

2. In the **Available resource and model categories** column, locate the opted-out resource category and clear its check box.
3. Select **Save**.

Removing an opted-out resource category excludes all model categories associated with it from the HAM advisor scope and reduces the scope of your HAM advisor dashboard accordingly.

Get started with CMDB success advisor setup for HAM

Set up your Hardware Asset Management (HAM) specific advisor dashboard by selecting model categories to define the HAM advisor scope.

Before you begin

- Install Hardware Asset Management (sn_hamp) on your instance.
- Obtain entitlement for Hardware Asset Management (ham_hamp_license).
- Opt in HAM resource categories. See Managing opt-in and opt-out resource categories for HAM in CMDB success advisor

Role required: sn_cmdb_admin

Note:
In addition to the sn_cmdb_admin role, the pa_data_collector role is required to view the last updated data timestamp on the dashboard and pa_viewer is required to filter data by model categories.

About this task

Selecting model categories defines which hardware asset types CMDB success advisor monitors for HAM data quality. The selected categories determine the scope of the HAM advisor dashboard, including the KPIs, data integrations, and settings that are tracked.

Important:
To determine which model categories to select, review the count of operational assets under each category in the Hardware Asset Workspace, or consult with your IT Asset Management (ITAM) or HAM administrator for guidance. See Hardware Asset Workspace.

Procedure

1. On the CMDB success advisor landing page, select **Select model categories** within the HAM card.
   See Viewing the CMDB success advisor landing page.
2. On the Select model categories dialog box, select a resource category to choose all its model categories or expand a resource category to select individual categories, then move them from the **Available resource and model categories** column to the **Selected** column.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If the Select model categories dialog box shows **No model categories available**, select **Opt in categories** to opt in at least one HAM license resource category, then return to this step.

Model category selection actions

Purpose	Action	Data coverage
Add an available resource category	Select the check box for the resource category to include all its model categories.	Includes all model categories associated with the selected resource category.
Expand model category selection	Select **>** to expand a resource category, then select check boxes for specific model categories.	Includes only the selected model categories associated with a resource category.
Narrow down model category selection	Select **>** to expand a resource category, then clear check boxes for specific model categories.	Excludes only the model categories cleared from a resource category.
Remove an opted-out or available resource category	Clear the check box for the resource category.	Excludes all model categories associated with the removed resource category.
Remove a selected model category	Select the X icon next to the category in the **Selected** column or clear the check box for the category	Model category is removed from scope.

Tip:
You can use the **Search** field to find specific categories. You can select up to 50 model categories.

3. Select **Done** to build the CMDB success advisor for HAM dashboard.

Result
The HAM data collection begins. The HAM advisor dashboard is populated after data collection completes.

Manage HAM advisor scope in CMDB success advisor

Manage the scope of your advisor for Hardware Asset Management (HAM) by editing model categories in CMDB success advisor to support your targeted HAM outcomes.

Before you begin
Role required: sn_cmdb_admin

About this task
Control which resource and model categories are included in your HAM advisor dashboard in CMDB success advisor. You can add or remove entire resource categories or fine-tune the selection by including or excluding specific model categories within a resource category. Resource categories may be opted in or out based on your hardware asset manager's preferences. This flexibility enables you to customize the dashboard to display only the most relevant HAM data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. On the CMDB success advisor landing page, select **Edit model categories** within the HAM card.
   See Viewing the CMDB success advisor landing page.
2. In the Edit model categories dialog box, add or remove categories to update your model category selection.

Model category selection actions

Purpose	Action	Data coverage
Add an opted-in resource category or an available resource category	Select the check box for the resource category to include all its model categories.	Includes all model categories associated with the selected resource category.
Expand model category selection	Select **>** to expand a resource category, then select check boxes for specific model categories.	Includes only the selected model categories associated with a resource category.
Narrow down model category selection	Select **>** to expand a resource category, then clear check boxes for specific model categories.	Excludes only the model categories cleared from a resource category.
Remove an opted-out or available resource category	Clear the check box for the resource category.	Excludes all model categories associated with the removed resource category.
Remove a selected model category	Select the X icon next to the category in the **Selected** column.	Model category is removed from scope.

3. **Optional:** To remove a model category, select the X icon next to the category in the **Selected** column.
4. Select **Save** to apply the changes.

Result

The HAM dashboard in CMDB success advisor is updated to reflect the data based on the model category selection.

Monitoring CMDB data quality using dashboard metrics in CMDB success advisor for HAM

The CMDB success advisor for HAM dashboard enables CMDB administrators to identify and address data quality issues specific to HAM in the Configuration Management Database (CMDB).

Important:
When you select a segment or count on a chart from a CMDB success advisor dashboard, the KPI Details page opens. On the page, you can analyze how a specific metric trends over time. Additionally, the Remediation actions panel appears when remediation actions are available for that card. Use the panel to improve the quality of CMDB. To learn more, see KPI Details and Improving CMDB data quality for HAM.

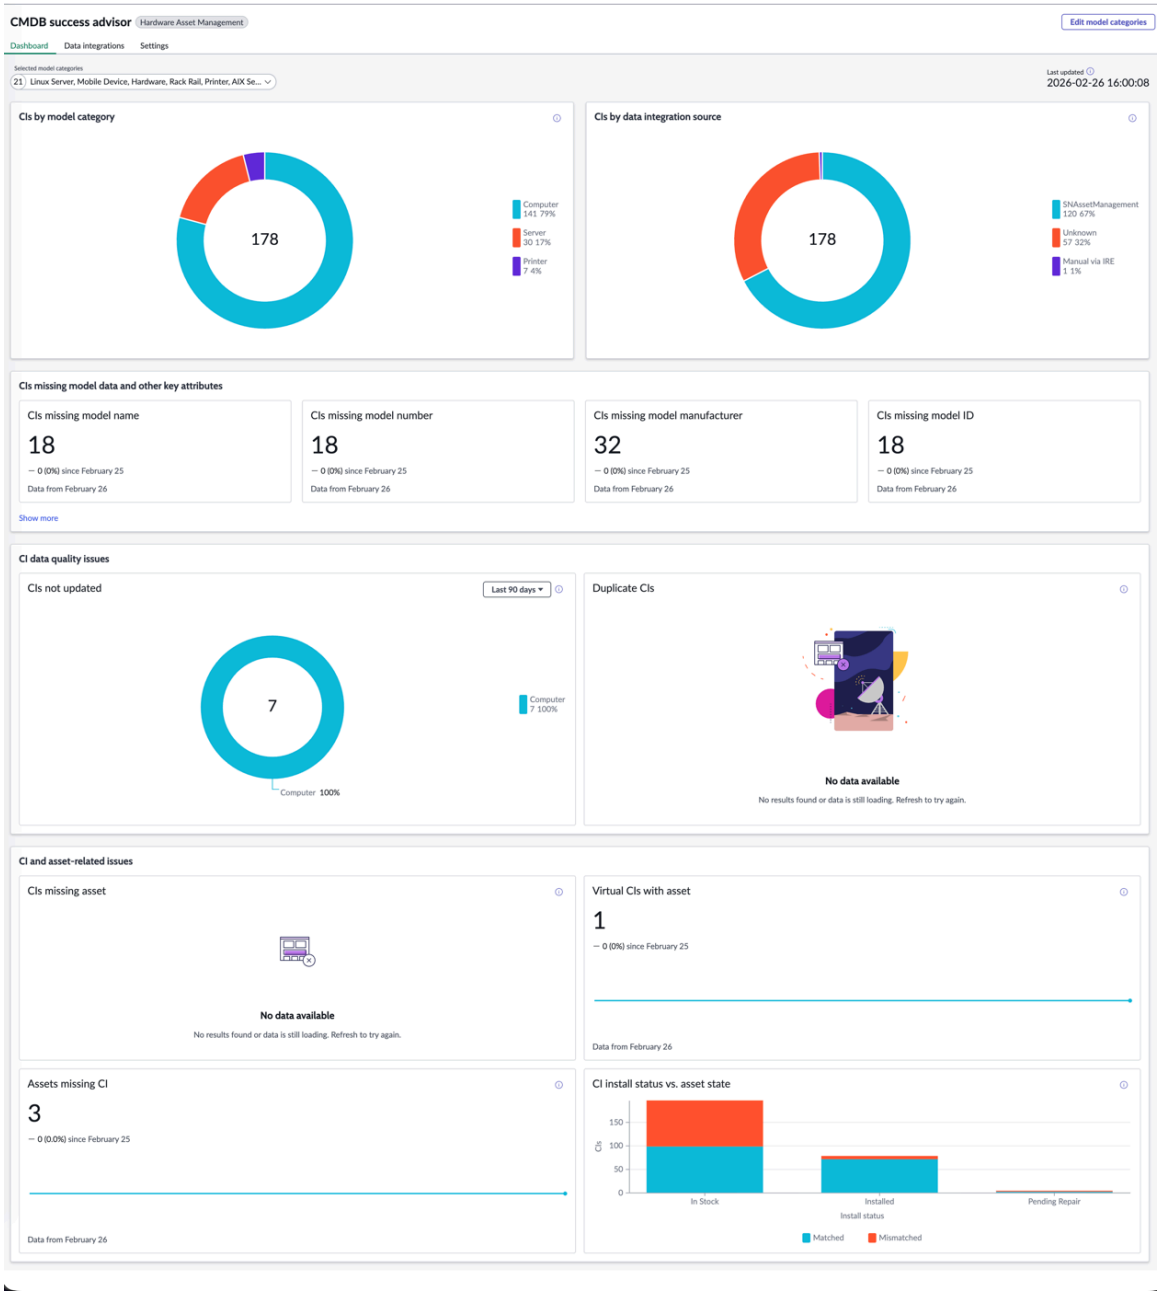
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Access the dashboard

To open the dashboard, select **View insights** for HAM on the CMDB success advisor landing page. See Viewing the CMDB success advisor landing page.

Note:
The CMDB success advisor for HAM dashboard is available only after the setup process is complete. For more information, see Set up CMDB success advisor for HAM.

Required roles

Roles required for CMDB success advisor for HAM dashboard

Role	Description
sn_cmdb_admin	Required to access the dashboard.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles required for CMDB success advisor for HAM dashboard (continued)

Role	Description
pa_viewer	Required to filter data by model categories.
pa_data_collector	Required to view the last updated data timestamp on the dashboard.

Use cases

For examples of how different people in your organization would use this dashboard, see these use cases.

User	Dashboard use
CMDB administrator	• Gain real-time visibility into hardware asset data quality and completeness • Identify missing or incorrect CI attributes quickly • Detect duplicate CIs and unlinked assets • Monitor asset life cycle status (installed, retired, inactive) • Prioritize and track data cleanup and remediation tasks • Verify that the CMDB stays accurate to support HAM

Dashboard features

The dashboard provides clear, consolidated insights into hardware asset data quality and asset status. Use the dashboard to identify and resolve data quality issues within the CMDB through dedicated sections, filters, indicators, and visual reports. Gain valuable insights into CMDB performance related to HAM.

Targeted CMDB metrics focus remediation efforts. Regularly monitor these metrics and follow suggested remediation actions to systematically improve CMDB data quality over time.

Important:
The dashboard data is filtered based on the Selected model categories and Date range filters. See Filters.

Feature description

Feature	Description
CIs by model category	Displays the breakdown of operational CIs by associated model category to highlight CI distribution in the CMDB.
CIs by data integration source	Displays the breakdown of operational CIs by data integration source to highlight their contribution to CMDB population.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Feature description (continued)

Feature	Description
CIs missing model data and other key attributes	Displays key metrics related to CIs missing model details, ownership, and other key attributes, leading to incomplete records and operational inefficiencies.
CI data quality issues	Displays key metrics related to CIs that have not been updated or may have duplicate records, leading to outdated information and inconsistencies in the CMDB.
CI and asset-related issues	Displays key metrics related to mismatches and missing links between CIs and assets, leading to incomplete asset life cycle tracking and reporting issues.

Filters

Enables narrowing the data shown in graphs and metrics based on model category, date range, or stale CI threshold.

Name	Type	Description
Selected model categories	List	Filters CIs based on the selected model categories. **Note:** Requires the `pa_viewer` role.
Date range	Date	Filters the dashboard data based on the selected date range.
Stale CI	List	Filters stale CIs based on the number of days since their last update. Available values: `7`, `14`, `30`, `60`, and `90` days.

CIs missing model data and other key attributes

Displays key metrics related to CIs missing model details, ownership, and other key attributes, leading to incomplete records and operational inefficiencies.

CIs missing model data and other key attributes section

Card	Description	Indicators
CIs missing model name	Operational CIs not associated with a model ID or associated with a model ID missing a name.	CIs missing model name
CIs missing model number	Operational CIs not associated with a model ID or associated with a model ID missing a model number.	CIs missing model number
CIs missing model manufacturer	Operational CIs not associated with a model ID or associated with a model ID missing a manufacturer.	CIs missing manufacturer

CIs missing model data and other key attributes section (continued)

Card	Description	Indicators
CIs missing model ID	Operational CIs not associated with a model ID.	CIs missing model ID
CIs missing assigned to	Operational CIs not assigned to a specific user, leading to unclear ownership and delayed action.	CIs missing assigned to
CIs missing location	Operational CIs not associated with a location, leading to gaps in asset tracking and service mapping.	CIs missing location
CIs missing owner	Operational CIs not associated with an owner, leading to unclear accountability and delayed issue resolution.	CIs missing owner
CIs missing managed by group	Operational CIs not managed by a specific ownership group, leading to inefficient support assignment and operational risk.	CIs missing managed by group
CIs missing serial number	Operational CIs missing a serial number, leading to issues with duplicate identification.	CIs missing serial number

Note:
Select **Show more** in the CIs missing model data and other key attributes section to view all the cards.

CI data quality issues

Displays key metrics related to CIs that haven't been updated or may have duplicate records, leading to outdated information and inconsistencies in the CMDB.

CI data quality issues section

Card	Description	Indicators
CIs not updated	Operational CIs not updated, causing data gaps and inaccuracies in the CMDB.	CIs not updated in last 7 days CIs not updated in last 14 days CIs not updated in last 30 days CIs not updated in last 60 days CIs not updated in last 90 days **Note:** The CIs not updated card data is additionally filtered based on the Stale CI filter. See Filters.
Duplicate CIs	Operational CIs identified as duplicates based on key matching attributes, causing data redundancy.	Hardware CIs group by

CI and asset-related issues

Displays key metrics related to mismatches and missing links between CIs and assets, leading to incomplete asset life cycle tracking and reporting issues.

© 2026 ServiceNow, Inc. All rights reserved.

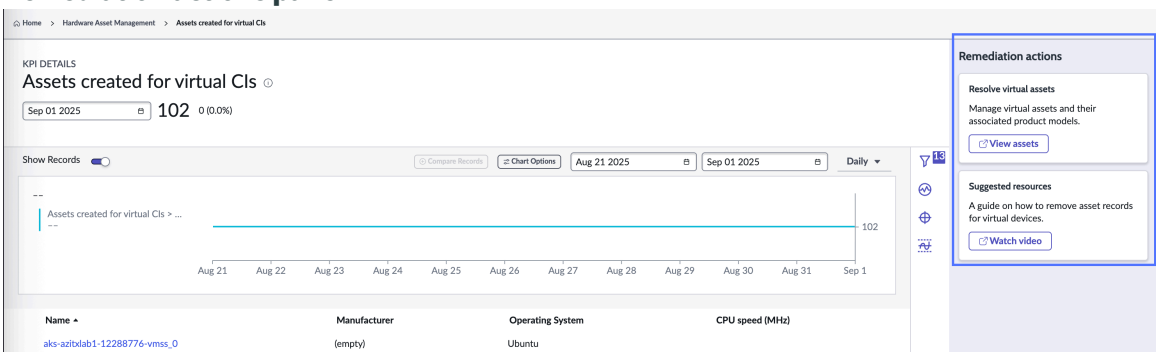
CI and asset-related issues section

Card	Description	Indicators
CIs missing asset	Operational CIs not associated with an asset record, leading to incomplete asset life cycle tracking.	CIs missing asset
Virtual CIs with asset	Virtual assets created for virtual CIs that are operational, leading to inaccurate consumption of HAM licenses.	Assets created for virtual CIs
Assets missing CI	Assets without a matching CI, caused by CIs not being discoverable on the network.	Assets missing CI
CI install status vs. asset state	All CIs where the install status matches or differs from the corresponding asset state.	CI install status vs. asset state matched CI install status vs. asset state mismatched

Improving CMDB data quality for HAM

The Remediation actions panel available for a chart in the CMDB success advisor dashboard for Hardware Asset Management (HAM) suggests targeted actions to improve the overall quality of your Configuration Management Database (CMDB).

Remediation actions panel



When remediation actions are available for a chart, the Remediation actions panel appears on the KPI Details page.

You can perform the actions suggested within the Remediation actions panel to address HAM data quality issues in the CMDB. These actions help improve the accuracy, consistency, and usability of configuration items (CIs), promoting better alignment with HAM.

The Remediation actions panel:

- Improves CMDB data quality through guided actions
- Suggests context-aware actions
- Supports quick, informed remediation steps
- Focuses attention on meaningful tasks
- Appears only when actionable insights are available

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Accessing the Remediation actions panel

To open the Remediation actions panel, select a segment or count on a chart in the CMDB success advisor dashboard for HAM. The KPI Details page opens. If the remediation actions are available for the selected data, the panel appears on the details page suggesting various remediation actions.

Available remediation actions

The Remediation actions panel provides relevant suggestions and actions based on the information in the selected chart. For example, if the chart shows CIs that weren't updated recently, the panel suggests reviewing retirement policies.

The remediation actions are available for the improvement of the following issues:

CIs with invalid or unpopulated names

Identify and correct CIs that lack meaningful or complete naming, which can impact discovery and asset alignment.

CIs with missing model entries

Resolve CIs missing any model-related data in the CMDB, including model ID, model name, model number, and manufacturer, all of which are essential for normalization and life cycle tracking.

Stale CIs

Remove or update CIs that weren't updated or discovered for an extended period, helping maintain an accurate representation of your environment.

Duplicate CIs

Remove or merge duplicate records to avoid data fragmentation and promote a single source of truth.

Virtual CIs with asset

Identify and remove hardware assets incorrectly created for virtual CIs, which can lead to inaccurate HAM license consumption and reporting.

CIs missing serial number

Identify and resolve CIs that have no assigned serial number, which can affect duplicate detection and hardware asset tracking.

CIs missing location

Identify and resolve CIs that have no assigned location, which can cause gaps in asset tracking and service mapping.

CI and asset state mismatch

Identify and resolve CIs where the installation status does not align with the corresponding asset state, which can lead to inaccurate asset life cycle reporting.

Analyzing data integrations for improving HAM data coverage

Improve HAM data coverage by analyzing existing and suggested data integrations, including Discovery patterns and Service Graph Connectors.

Use the **Data integrations** tab in the CMDB success advisor for HAM to assess the effectiveness of your current data integration sources in the Configuration Management Database (CMDB) and identify opportunities to improve HAM data coverage. The **Data integrations** tab provides a breakdown of active Discovery patterns and installed Service Graph Connectors, including how many key configuration item (CI) attributes each integration source is populating.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For a quick reference to improve HAM data coverage, see Data integration checklist for HAM in CMDB success advisor.

Access data integrations

Navigate to the CMDB success advisor , and on the HAM card, select **View insights**. Select the **Data integrations** tab. To access the dashboard, see Access CMDB success advisor.

Note:
The CMDB success advisor for HAM dashboard is available only after the setup process is complete. For more information, see Set up CMDB success advisor for HAM.

Required roles

Roles required for accessing data integration sources in the CMDB success advisor for HAM

Role	Description
sn_cmdb_admin	Required to access the CMDB success advisor.
cmdb_inst_admin	Required to manage Service Graph Connector connections in SGC Central.
pd_admin	Required to manage Discovery patterns with create and write access.
pd_user	Required to view Discovery patterns with read-only access.
pd_mid	Required to view Discovery and Service Mapping Patterns with read-only access.

Use cases

For examples of how different people in your organization would use this feature, see these use cases.

User	Feature use
CMDB administrator	• Identify an inactive Discovery pattern that can populate attribute data for hardware assets. • Identify a Service Graph Connector relevant to hardware assets that is installed but without any active connections. • Prioritize which hardware-related integrations to improve to maximize CMDB data quality for improving the completeness, accuracy, and reconciliation of hardware asset records.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data integration features

Feature description

Feature	Description
Integration overview	Displays the count of all Discovery patterns and Service Graph Connectors contributing hardware asset data to the CMDB.
Status indicators	Check whether Discovery patterns are active and Service Graph Connectors are installed with active connections. For more information, see Reviewing data integrations for HAM.
Attribute coverage insights	Select the **Attribute coverage** link next to the integration to review which hardware asset attributes are populated by a Discovery pattern or Service Graph Connector. For more information, see Evaluate HAM data integration coverage.
Access integration details	Configure integrations to improve attribute coverage. For more information, see Evaluate HAM data integration coverage.

Reviewing data integrations for HAM

Review both existing and suggested Discovery patterns and Service Graph Connectors to improve your HAM data coverage.

The **Data integrations** tab in CMDB success advisor for HAM provides insight into current integration usage for Discovery patterns and Service Graph Connectors. To make sure your CMDB is being correctly populated with high-quality HAM data, check the status of both integration types.

Integration types

The **Data integrations** tab displays two key data sources that support HAM:

Discovery patterns

Discovery patterns identify IT infrastructure components through network-based discovery.

To evaluate Discovery pattern effectiveness for HAM, review the fields as described in the following table.

Fields to monitor for Discovery pattern

Field	Description
Status	Indicates whether a Discovery pattern is currently active. Only active patterns contribute data to the CMDB.
Attribute coverage	Displays how many HAM relevant attributes within a model category are being populated by each pattern.
View pattern	Opens the Discovery pattern configuration, enabling you to inspect or refine the logic, identification rules, and targeted CI classes.

Low attribute coverage might occur if the Discovery pattern is limited in scope, not collecting detailed CI information, or if its identification rules are not aligned with the actual devices in your network. In such cases, required hardware attributes may be missing from the resulting CI records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Graph Connectors

Service Graph Connectors import asset and CI data from third-party platforms.

To evaluate Service Graph Connectors effectiveness, review the fields as described in the following table.

Field	Description
Installed	Indicates whether the connector is deployed. A value of `Yes` confirms it is installed and available for use.
Attribute coverage	Displays how many HAM relevant attributes within a model category are being populated by each connector.
Active connections	Represents the number of connections actively importing data into the CMDB.
Inactive connections	Displays connections that are configured but not currently importing data and may need troubleshooting.

If a Service Graph Connector shows low attribute coverage or no active connections, it may indicate that the specific version being evaluated has limited attribute coverage. This can happen if the connector is installed but not fully mapped to populate key attributes or if the data source is unavailable or misconfigured. As a result, critical hardware data, such as serial numbers, models, or manufacturers, may not be imported into the CMDB, affecting the completeness and reliability of asset records.

Evaluate HAM data integration coverage

Identify supported model categories and attributes from a Discovery pattern or Service Graph Connector to evaluate data coverage and upgrade requirements.

Before you begin

Role required: sn_cmdb_admin

Procedure

1. Navigate to the CMDB success advisor landing page.
2. On the HAM card, select **View insights**.
3. Select the **Data integrations** tab.
4. Find the Discovery pattern or Service Graph Connector by selecting the respective cards.
5. Identify the status of your Discovery patterns and Service Graph Connectors to improve CMDB data coverage.
6. Select the **Attribute coverage** link for a data integration source.
7. In the Supported model categories and attributes dialog box, review the attribute coverage details for model categories.
   The following details are available:
   - Integration suggested vs. installed version
   - Supported CI classes identified as model categories
   - List of attributes and whether each is supported by the selected data integration source
8. **Optional:** When installed version is lower than the suggested version, select the **View available version** link to open the Application manager.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The **View available version** link is available only when applicable for a data integration source. Also, only users with the admin role can install or upgrade an application. See Application Manager.

9. Determine which hardware asset attributes are being populated by the integration and whether an upgrade is needed to improve the data coverage.
   Available options for improving the data coverage are:
   - For Discovery patterns, you can perform the following actions based on the applicable criteria:
     - If you have the pd_user, you can select **View pattern** for a Discovery pattern to view the pattern. For more information, see Patterns and horizontal discovery.
     - If you have the pd_admin role, you can select **View pattern** for a Discovery pattern to understand its contribution and modify the pattern to maximize the attribute coverage. For more information, see Patterns and horizontal discovery.
   - For Service Graph Connectors, if you have the cmdb_inst_admin role, you can perform the following actions based on the applicable criteria:
     - Select **Install connector** to add a connector from the ServiceNow Store.
     - Select **Create connection** to configure a Service Graph Connector from SGC Central. For more information, see Create a connection for a Service Graph Connector in SGC Central.
     - Select **View connections** to open and review details of existing installed connections importing hardware asset data within SGC Central. For more information, see Viewing connections for a Service Graph Connector in SGC Central.

Data integration checklist for HAM in CMDB success advisor

Use the data integration checklist to verify that Discovery patterns and Service Graph Connectors are correctly configured and actively contributing to your Configuration Management Database (CMDB), promoting high-quality hardware asset data.

Discovery patterns checklist

Confirm each Discovery pattern is enabled and effectively populating hardware-related attributes.

Discovery patterns configuration checks

Select	Check item (field)	Description	Action
☐	Pattern name	Name of the discovery pattern contributing Hardware Asset Management (HAM) data.	Confirm that the pattern is relevant for hardware asset discovery.
☐	Status	Current state of the pattern as active or inactive.	Verify that the pattern is active with Status set to Active to confirm it's contributing data.
☐	Attribute coverage	Number of hardware attributes populated by the pattern.	Check how many relevant CI attributes are being populated for each model category.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Discovery patterns configuration checks (continued)

Select	Check item (field)	Description	Action
			Note: Low attribute coverage may suggest shallow discovery or misaligned pattern logic.
☐	Suggested version	Latest suggested version for optimal attribute coverage.	Plan and perform an upgrade to the suggested version or higher to improve coverage.
☐	Installed version	Version currently in use in your instance.	Compare with the suggested version and upgrade if necessary.
☐	View pattern	Link to inspect the pattern configuration.	Select the link to review or modify the pattern logic.

Service Graph Connectors checklist

Confirm Service Graph Connectors are installed and actively contributing hardware data.

Service Graph Connectors configuration checks

Select	Check item (field)	Description	Action
☐	Connector name	Name of the Service Graph Connector providing HAM data.	Confirm that the Service Graph Connector is required for your HAM processes.
☐	Status	Current state of the Service Graph Connector as active or inactive.	Activate Service Graph Connectors that are needed for HAM but currently inactive.
☐	Attribute coverage	Number of hardware attributes populated by the Service Graph Connector.	Check how many relevant CI attributes are being populated for each model category. **Note:** Low coverage may indicate incomplete mappings or missing source data.
☐	Suggested version	Latest suggested version for optimal attribute coverage.	Plan and perform an upgrade to the suggested version or higher to improve coverage.
☐	Installed version	Version currently in use in your instance.	Compare with the suggested version and upgrade if necessary.
☐	Active connections	Number of active connections.	Confirm that at least one connection is actively importing data into the CMDB.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Graph Connectors configuration checks (continued)

Select	Check item (field)	Description	Action
☐	Inactive connections	Number of inactive connections.	Review and troubleshoot any configured connections that aren't currently active.

Optional checks for Discovery patterns and Service Graph Connectors

Optional data integration checks

Select	Check item	Description	Action
☐	No entitlements warning	Discovery patterns or Service Graph Connectors tile showing no entitlements, indicating missing access or licensing.	Verify licensing and entitlements with your administrator.
☐	Suggested integrations reviewed	Some Discovery patterns are listed as suggestions because they aren't installed or active, and some Discovery patterns are listed but are not actively used.	Evaluate business need and consider implementing high-value suggested integrations.

Final validation

Once all data integration checks are complete:

- Attribute coverage across integrations supports your HAM business outcome.
- CMDB records for hardware assets are accurate and complete.

Analyze CMDB settings for HAM

Monitor and optimize Configuration Management Database (CMDB) settings that support configuration item (CI) to hardware asset synchronization, life cycle alignment, and Hardware Asset Management (HAM) data quality.

Use the **Settings** tab in the CMDB success advisor for HAM to review configuration indicators and identify opportunities to improve CMDB alignment with HAM guidelines.

The CMDB success advisor for HAM evaluates your current configuration across key areas such as:

- Automatic asset and CI creation
- Field and model category mappings
- CI state and substate usage
- CMDB Data Manager policy coverage

Settings are categorized as `Ideal` or `Requires attention`, enabling you to prioritize actions and maintain a healthy CMDB for HAM.

For a quick reference to validate CMDB settings for HAM, see Settings checklist for HAM in CMDB success advisor.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Access settings

Navigate to the CMDB success advisor landing page and for the HAM card, select **View insights**. Select the **Settings** tab to access settings-related details. For more information, see Access CMDB success advisor.

Note:
The CMDB success advisor for HAM dashboard is available only after the setup process is complete. For more information, see Set up CMDB success advisor for HAM.

Required roles

You need the sn_cmdb_admin role to access the CMDB success advisor for HAM.

To manage business rules, change the application scope from CMDB success advisor to Global in the application picker.

Use cases

For examples of how different people in your organization would use this feature, see these use cases.

User	Feature use
CMDB administrator	• Improve the accuracy of asset reconciliation by aligning CI and asset record creation. • Promote consistent asset life cycle management through status field alignment across asset and CI records. • Automate policy-based workflows for asset retirement, deletion, certification, or archival using policy-driven rules. • Standardize hardware model categories to improve normalization processes and reporting accuracy.

Settings features

The **Settings** tab in the CMDB success advisor for HAM provides visibility into key configuration areas that promote accurate synchronization between hardware assets and CIs. These settings include business rules, field mappings, model categories, and Data Manager policies that support automated life cycle management and data integrity. To maintain CMDB data accuracy and HAM integration, regularly review and validate these settings. For more information, see CMDB and HAM settings assessed in the CMDB success advisor.

Evaluate CMDB settings for HAM

Identify and evaluate settings including Hardware Asset Management (HAM) business rules, configuration item (CI) to asset field mappings, hardware model categories, and CMDB Data Manager policies that support synchronization and automation between hardware assets and CIs.

Before you begin
Role required: sn_cmdb_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the CMDB success advisor landing page.
2. On the HAM card, select **View insights**.
3. Select the **Settings** tab.
4. Select a status tile to view settings by category.
5. Evaluate each setting that requires attention and use the available actions to open the related configuration pages and make updates.

> **Tip:**
> Select **Learn more** next to a setting to open a related help topic in a new browser tab or window with additional details about that setting.

6. To view any updated configuration status on the **Settings** tab, select the refresh icon .

Asset and CI management

Model categories

CMDB and HAM settings assessed in the CMDB success advisor

The Configuration Management Database (CMDB) and Hardware Asset Management (HAM) settings review provides a configuration-level assessment of the CMDB configuration item (CI) classes and HAM assets for maintaining data accuracy.

Settings overview

Each setting is checked for alignment with suggested business rules and mapping guidelines.

CMDB integration settings

Setting	Description
Create asset on CI insertion	Enables the automatic creation of an asset record when a CI is inserted into the CMDB. Requires the Create Asset on Insert business rule to be active for asset creation to occur during CI insertion.
Update asset fields on CI change	Enables automatic updates to asset records when a related CI is modified. Requires the Update Asset Fields on Change business rule to be active to synchronize CI changes with asset data.
Create CI on asset insertion	Enables the automatic creation of a configuration item when an asset record is added. Requires the Create CI on Insert business rule to be active to reflect asset data in the CMDB.
Update CI on asset update	Enables automatic updates to configuration item records when associated asset data is changed. Requires the Update CI Fields on Change business rule to be active to maintain data consistency.
Review custom model categories	Validates that custom model categories are properly mapped to predefined model categories. Verifies accurate classification, consistent reporting, and standardized data alignment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CMDB integration settings (continued)

Setting	Description
Review asset CI field mappings	Evaluates whether asset fields are correctly mapped to configuration item fields using standard mappings. Helps prevent data discrepancies caused by custom or incorrect mappings.
Review asset CI install status mappings	Checks that CI install status values are accurately mapped to the state and substate fields of the corresponding asset record. Verifies precise life cycle tracking and status reporting.
Review asset CI hardware status mappings	Verifies that CI hardware status values align with the state and substate fields of the corresponding asset record. Supports consistent representation of physical asset conditions.
Review Data Manager policies	Assesses the configuration of CMDB Data Manager policies, including archive, attestation, certification, delete, and retire, for the selected hardware CI classes. Each policy type manages a specific life cycle action: **Archive** Archives inactive CIs without deleting them. **Attestation** Validates CI data or runs automated checks. **Certification** Verifies CI data for accuracy and readiness. **Delete** Removes CIs based on defined criteria such as inactivity. **Retire** Marks CIs as retired when no longer in use.

Settings checklist for HAM in CMDB success advisor

Use this checklist to review Configuration Management Database (CMDB) and Hardware Asset Management (HAM) settings in CMDB success advisor that directly affect HAM data quality, configuration item (CI) to asset synchronization, and life cycle alignment.

CMDB and HAM settings checklist

Confirm that each setting is configured to support accurate and consistent hardware asset records in the CMDB.

Settings configuration checks

Select	Check item (field)	Description	Action
☐	Create asset on CI insertion	Enables the automatic creation of an asset record when a CI is inserted into the CMDB.	Verify that rule is active and set to

© 2026 ServiceNow, Inc. All rights reserved.

Settings configuration checks (continued)

Select	Check item (field)	Description	Action
			create asset records on CI insertion.
☐	Update asset fields on CI change	Enables automatic updates to asset records when a related CI is modified.	Verify that rule is active and correctly updates asset fields on CI change.
☐	Create CI on asset insertion	Enables the automatic creation of a configuration item when an asset record is added.	Verify that rule is active and set to create CI records on asset insertion.
☐	Update CI on asset update	Enables automatic updates to configuration item records when associated asset data is changed.	Verify that rule is active and correctly updates CI fields on asset changes.
☐	Review custom model categories	Validates that custom model categories are properly mapped to predefined model categories	Map custom categories to predefined ones.
☐	Review asset CI field mappings	Evaluates whether asset fields are correctly mapped to configuration item fields using standard mappings.	Try using predefined mappings.
☐	Review asset CI install status mappings	Checks that CI install status values are accurately mapped to the state and substate fields of the corresponding asset record.	Try using predefined mappings.
☐	Review asset CI hardware status mappings	Verifies that CI hardware status values align with the state and substate fields of the corresponding asset record.	Try using predefined mappings.
☐	Review CMDB Data Manager policies	Assesses the configuration of Data Manager policies, including archive, attestation, certification, delete, and retire, for the selected hardware CI classes.	Enable and configure appropriate policies for the required CI classes.

Final validation

Once all settings checks are complete:

- All business rules for automatic asset and CI creation or updates are `Active`.
- Custom model categories are correctly mapped to predefined categories.
- Data Manager policies are configured for all required CI classes.
- No `Requires attention` status is displayed for any setting in the **Settings** tab.

Indicators used in the CMDB success advisor for HAM dashboard

Indicators enable viewing of high-level metrics that highlight data quality, completeness, and synchronization issues across hardware assets and configuration items (CIs).

CMDB success advisor for HAM dashboard indicators

Assets created for virtual CIs

Total number of virtual CI assets in the Hardware [alm_hardware] table created daily, where the life cycle stage of CI is operational, the asset field is not empty, and the CI is marked as virtual.

Assets missing CI

Total number of hardware assets in the Hardware [alm_hardware] table missing a linked CI from the Hardware [cmdb_ci_hardware] class, measured daily, where the CI is operational, the asset is actively in use, and no CI is linked to the asset.

CI install status vs. asset state matched

All CI records from the Hardware [cmdb_ci_hardware] class where the installation status correctly aligns with the expected asset state, promoting accurate and reliable asset management.

CI install status vs. asset state mismatched

All CI records from the Hardware [cmdb_ci_hardware] class with an installation status that doesn't align with the expected asset state, resulting in erroneous asset management.

CIs missing asset

Total number of CI records from the Hardware [cmdb_ci_hardware] class missing a linked asset, measured daily, where the life cycle stage of CI is operational and no asset is associated with the CI.

CIs missing assigned to

Total number of CI records from the Hardware [cmdb_ci_hardware] class missing an assigned owner, measured daily, where the CI lacks an assigned owner.

CIs missing location

Total number of CI records from the Hardware [cmdb_ci_hardware] class missing a location, measured daily, where the CI doesn't have a location assigned.

CIs missing managed by group

Total number of CI records from the Hardware [cmdb_ci_hardware] class missing a managed by group, measured daily, where the CI doesn't have a managed by group assigned.

CIs missing manufacturer

Total number of CI records from the Hardware [cmdb_ci_hardware] class missing a manufacturer, measured daily, where the CI doesn't have a manufacturer specified.

CIs missing model ID

Total number of CI records from the Hardware [cmdb_ci_hardware] class missing a model ID, measured daily, where the CI doesn't have a model ID or model display name specified.

CIs missing model name

Total number of CI records from the Hardware [cmdb_ci_hardware] class missing a model name, measured daily, where the CI doesn't have a model name specified, with or without a model ID.

CIs missing model number

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Total number of CI records from the Hardware [cmdb_ci_hardware] class missing a model number, measured daily, where the CI is not associated with a model ID, or is associated with a model ID that is missing a model number.

CIs missing owner

Total number of CI records from the Hardware [cmdb_ci_hardware] class missing an owner, measured daily, where the CI doesn't have an owner assigned.

CIs missing serial number

Total number of CI records from the Hardware [cmdb_ci_hardware] class missing a serial number, measured daily, where the CI doesn't have a serial number assigned.

CIs not updated in last 7 days

Total number of CI records from the Hardware [cmdb_ci_hardware] class not updated in the last seven days, measured daily, where the update timestamp is older than seven days.

CIs not updated in last 14 days

Total number of CI records from the Hardware [cmdb_ci_hardware] class not updated in the last 14 days, measured daily, where the update timestamp is older than 14 days.

CIs not updated in last 30 days

Total number of CI records from the Hardware [cmdb_ci_hardware] class not updated in the last 30 days, measured daily, where the update timestamp is older than 30 days.

CIs not updated in last 60 days

Total number of CI records from the Hardware [cmdb_ci_hardware] class not updated in the last 60 days, measured daily, where the update timestamp is older than 60 days.

CIs not updated in last 90 days

Total number of CI records from the Hardware [cmdb_ci_hardware] class not updated in the last 90 days, measured daily, where the update timestamp is older than 90 days.

Hardware CIs group by

Total number of CI records from the Hardware [cmdb_ci_hardware] class, measured daily and grouped by model category and discovery source.

CMDB success advisor reference

Reference topics provide additional information about CMDB success advisor components, configuration reviews, and data integration checklists.

Components installed with CMDB success advisor

Several types of components are installed with activation of the CMDB success advisor plugin, including tables and scheduled jobs.

Scheduled jobs installed

Scheduled job	Description
CMDB success advisor data collection for HAM	Identifies Hardware Asset Management CI records and collects data for their corresponding indicators.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables installed

Table	Description
CMDB Advisor CI attribute coverage [sn_cmdb_advisor_ci_attribute_coverage]	Details of configuration item (CI) attributes for a specific ingestion source, version, CI class, and selected attributes in CMDB success advisor using a Service Graph Connector or Discovery pattern.
CMDB Advisor Content Template [sn_cmdb_advisor_content_template]	Product-specific model categories used by CMDB success advisor to generate data quality insights.
CMDB Advisor settings [sn_cmdb_advisor_settings]	Details of CMDB success advisor settings, including product association, access roles, and remediation guidance.
CMDB Advisor suggested attribute [sn_cmdb_advisor_suggested_attribute]	Attribute suggestions for CMDB success advisor based on the selected product and CI class context.
CMDB Advisor suggested ingestion source [sn_cmdb_advisor_suggested_ingestion_source]	Ingestion source suggestions for CMDB success advisor based on the associated Service Graph Connectors, Discovery patterns, and product.
CMDB Advisor targeted product [sn_cmdb_advisor_targeted_product]	Targeted product definitions for CMDB success advisor, including icon, display name, and display order.

Key CMDB success advisor concepts

Familiarize yourself with the key terms and concepts to work with CMDB success advisor.

Configuration Management Database (CMDB)

The central database that stores information about IT assets (CIs) and their relationships.

Configuration item (CI)

Any IT component tracked in the CMDB, including hardware, software, applications, or network devices.

Scope

The set of principal classes in Data Foundations or model categories in HAM that CMDB success advisor monitors for your organization.

Principal class

A CI class, such as Server [cmdb_ci_server], designated as important for your organization within Data Foundations. When a class is principal, a filter is automatically applied to the CI fields in incidents, changes, and problems.

Model category

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A hardware classification used as the scope unit for HAM such as Computers, Servers, Printers.

Service Graph Connectors

A pre-built integration that imports data from an external system into the CMDB.

Discovery pattern

An automated ServiceNow Discovery rule that scans the network to find and populate CI attributes.

Key Performance Indicator (KPI)

A measurable metric showing CMDB health in a specific area including completeness, correctness, and compliance.

Remediation actions

Context-aware suggestions shown on the KPI details page for addressing a specific data quality issue. Actions appear only when actionable insights are available for the selected chart segment.

Data quality issue

A detected problem in CMDB data, such as a CI missing a serial number, a stale record, or a duplicate.

CMDB Data Manager

A ServiceNow feature that defines which integration source has authority (ownership) over each CI attribute.

CI Class Manager

Use the CI Class Manager to centrally view, create, or edit basic class definitions and class settings for identification, reconciliation, and CMDB Health.

Note:
CI Class Manager doesn't support working with non-CMDB tables. For more details, see IRE support for non-CMDB tables.

To access the CI Class Manager, navigate to **All** > **Configuration** > **CI Class Manager**.

Class Basics	CMDB Health	IRE

• Create a class
• View class basic information
• Class columns
• Add a suggested relationship
• Display all CIs for a class
• Dependency Views map icons for a class
• Delete CIs
• Update the list of classes in the Principal Class filter
	• Create a compliance audit
	• Create a certification filter
	• Create a certification template
	• CMDB Health orphan rule
	• CMDB Health staleness rules
	• Set a CI field to be recommended
	• Set a CI attribute to be mandatory
	• Health inclusion rules
		• Identification:
		  ○ CI identification rules
		  ○ Identification inclusion rules
		• Reconciliation:
		  ○ CI reconciliation rules
		  ○ Data refresh rules
		• Dependencies:
		Dependent relationship rules (hosting and containment)

Service Mapping

- Entry point types for Service Mapping
- CI types for Service Mapping and Discovery

CMDB CI Lifecycle Management (legacy)

From the time of its creation to the time that it is no longer needed, a CMDB CI would typically transition through several operational states while undergoing various operations. CI LIfecycle Management provides the mechanism to define states and actions for a CI and lets you apply appropriate actions based on a CI's state to tailor the management of CI lifecycle to business needs.

The CMDB Data Manager is now a more comprehensive and integrated solution for managing CI life cycle operations such as deletion and archival, in bulk. For information about the CMDB Data Manager, see Working with CMDB Data Manager.

Terms associated with CI Lifecycle Management:

Operational states

A set of states that a CI can be at such as 'Operational' or 'Repair in Progress'. A CI can be associated with only a single operational state at any given time. The choices for operational states are based on the *operational_status* field in the [cmdb_ci] table. There are several operational states that are defined in the base system such as 'Retired' and 'Repair in Progress'. You can modify this list to reflect operational states that are relevant in your business.

> **Note:**
> By default, Service Mapping is configured to ignore all host CIs for which the value of Operational status *[operational_status]* is not **1** (Operational) or the value of status *[install_status]* is **100** (absent). For additional information about this behavior, see Preparing customized ServiceNow deployments to work with Service Mapping [KB0647574] in the HI Knowledge Base.

CI Lifecycle Management allows multiple operators and automations to simultaneously set different operational states of a CI. Since a CI cannot be associated with multiple operational states, it is important to configure each operational state with a priority. These priorities are then used in such situation to determine which of the operational states is the cumulative operational state.

CI actions

A set of actions that can be applied to a CI during its lifetime. You can define CI actions that are relevant in your business.

Compatible CI Actions

CI Lifecycle Management allows a CI to have multiple active CI actions simultaneously, however they must be specifically defined as compatible. By default, there are no two actions for a CI that are compatible with each other. You can change this behavior by specifying pairs of actions that are compatible and thus allowed to be applied simultaneously to a CI. For example, you can specify that the 'Patching' and the 'Provisioning' CI actions are compatible making it possible to apply both simultaneously to a CI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Not Allowed CI Actions

By default, any CI action can be applied to any CI. You can restrict this behavior by defining a rule that an action is not allowed for a CI when it is in a specific operational state. For example, you can define a Not Allowed CI Action in which it is not allowed to apply the 'Provisioning' action to a Linux Server that is in a 'Non-Operational' state.

Not Allowed Operational Transitions

By default, transitions are allowed from any operational state to another. You can restrict this behavior by defining a rule that for a specified CI, a transition from a certain operational state to another operational state is not allowed. For example, you can define that for a Linux Server it is not allowed to transition from 'Repair in progress' to 'Non-Operational'.

Requestor

A requestor can be a workflow or a non-workflow operator that is trying to set operational states and apply CI actions. Each requestor has an associated requestor ID that is a GUID and that can be an active workflow context or a non-workflow registered operator ID.

Lease time

A time period that each requestor (especially non-workflow operators) can provide, during which a specified CI action is allowed to be active for a specified CI.

CMDB CI Lifecycle Management provides a set of APIs to manage CI operational states and CI actions. And the UI where you define a set of rules to restrict certain operational state transitions and to restrict actions based on operational states. It also provides a mechanism to audit CI operational state and CI actions during the entire CI lifecycle.

Providers such as automation, workflows, or Change Management can use CI Lifecycle Management as a mechanism to manage CI operational states and apply CI actions. By default, the behavior of CI Lifecycle Management has no restrictions on some operations, and full restrictions on other operations. The CI Lifecycle Management UI lets you modify this default behavior by specifying Not Allowed CI Actions, Compatible CI Actions, and Not Allowed Operational Transitions that restricts some operations and enables for others.

With CI Lifecycle Management you can:

- Manage CI operational states and CI actions throughout the entire CI lifecycle.
- Manage CI operational state transitions.
- Restrict certain operational state transitions.
- Associate certain actions for certain CI types that are in specific operational state.
- Restrict IT Service Management applications based on CI operational state.
- Audit CI operational states and CI actions during the entire CI lifecycle.

Lifecycle management APIs

CI Lifecycle Management provides a set of APIs to manage CI operational state and CI actions during the entire CI lifecycle. All restrictions and allowances specified by rules in the UI are enforced when state management APIs run, and if an API attempts to perform a restricted operation, the operation is blocked and an error is logged.

Registering requestors

When using the lifecycle management APIs to apply CI actions, requestors are required to be registered and to obtain a requestor ID which is unique within the lifecycle management

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

tables. To register and to obtain a requestor ID, non-workflow users should call the *registerOperator* API. Workflow users can use the active Workflow context as the requestor ID, and they do not need to explicitly call *registerOperator*.

After completing the CI lifecycle operations, the requestor should call the *unregisterOperator* API to unregister. All the state management records associated with that specific requestor ID are then marked as inactive or they are removed by the *CI Lifecycle Management – Restore Internal State Management Tables* scheduled job.

Integration with Incident Management and Problem Management

A base instance includes the pre-defined CI action *CreateTask* used for creating a task for a CI. New instances have a pre-defined Not Allowed CI Action, specifying that the 'CreateTask' action is not allowed for any CI with a **Retired** operational state. This restriction is integrated with Incident Management and with Problem Management to prevent the creation of incident or problem tasks for retired CIs. The 'CreateTask' CI action is used as a reference qualifier to the *Configuration Item* field of the Incident/Problem tables. In a new incident or problem, CIs in which *Operational Status* is 'Retired' — are filtered out from the *Configuration Item* list on the form. For more information about reference qualifiers, see Reference qualifiers .

Integration with Asset Management

In a base system, a CI's *Operational Status* field and the *Status*/*Hardware Status* (if its hardware) fields are kept synchronized if one of the two fields' values is **Retired**. When *Operational Status* of a CI is set to **Retired**, then the *Status*/*Hardware Status* field is automatically set to **Retired**. In the opposite direction, when the *Status*/*Hardware Status* field of a CI is set to **Retired**, *Operational Status* is automatically set to **Retired** too.

- When an *Operational Status* field changes from **Retired** to another status, the CI's *Status*/*Hardware Status* field is set to **Installed**.

- When a CI's *Status*/*Hardware Status* field changes from **Retired** to another status, the *Operational Status* field is automatically set to **Non-Operational**.

  The change of state from 'Retired' to another state is seldom, and by default, the state is changed to 'Non-Operational'. However, this might not be the intended state for the record. Therefore, it important that administrators review and manage the state appropriately in this case.

Whenever CI's *Status*/*Hardware Status* changes, it is synchronized to the CI's corresponding *Asset State* field, and vice versa — keeping the CI's *Operational Status* and the CI's corresponding *Asset State* synchronized.

For more information about mapping *Asset State* and *Substate* fields to a CI's *Status*/*Hardware Status* (if its hardware) field, see Map asset state and CI hardware status. And for more information about retiring assets, see Retire assets.

Get started with CI Lifecycle Management

Follow these high level steps to get started and to track activities of the CI Lifecycle Management module of the CMDB application.

Before you begin
Role required: none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Activate the base system CI Lifecycle Management - Restore Internal State Management Tables scheduled job that continuously checks and maintains data integrity of all internal CI Lifecycle Management tables.
2. Define CI actions.
3. Define compatible CI actions rules.
   Navigate to **All** > **Configuration** > **CI Lifecycle Management** > **CMDB CI Actions** to display currently active/inactive CI actions in the CMDB.
4. Define not-allowed CI actions rules.
5. Define not-allowed operational state transitions rules.
6. Define new operational states by modifying the *operational_status* field in the [cmdb_ci] table in the system dictionary.
   Navigate to **All** > **Configuration** > **CI Lifecycle Management** > **View Internal Operational States** to display available operational states set by each requestor.
7. Set priority for operational states.
8. Call APIs to apply CI actions.
   Navigate to **All** > **Configuration** > **CI Lifecycle Management** > **CMDB CI Actions** to display which actions were submitted and thier active/inactive state in the CMDB.
9. Navigate to **All** > **Configuration** > **CI Lifecycle Management** > **View CI State Registered Users** to display currently registered operators that were registered via the *registerOperator* API.
10. Review Renew Lease tasks and extend leases as needed: Navigate to **All** > **Configuration** > **CI Lifecycle Management** > **Renew Lease Tasks**. These tasks are created automatically by the *CI Lifecycle Management - Restore Internal State Management Tables* scheduled job for CI action records in which the lease for a valid requester has expired. The Requestor should use the lifecycle management API *ExtendCIActionLease* to extend the lease. Otherwise, if the lease remains expired for a specified grace period, the *CI Lifecycle Management - Restore Internal State Management Tables* scheduled job marks the respective CI action record as 'inactive'.
    The grace period for expired lease time is configurable by the system property *glide.cmdb.statemgmt.max_lease_expired_days*.
11. Navigate to **All** > **Configuration** > **CI Lifecycle Management** > **State Management Logs** to display logs of CI Lifecycle Management operations.

Lifecycle management APIs

CI Lifecycle Management provides a set of state management APIs for manipulating CI operational states, and applying CI actions.

State management APIs adhere to restrictions and allowances specified by Not Allowed CI Actions, Compatible CI Actions, and Not Allowed Operational Transitions. If an API attempts to perform a restricted operation, the operation is blocked, an error is logged, and a task is automatically created if appropriate.

Lifecycle management APIs can set operational states and CI actions to CMDB groups by utilizing lifecycle management bulk APIs.

Registration APIs

- registerOperator() - Method to register operator with state management for non-workflow user.
- unregisterOperator(String requestorId) - Method to unregister operator for non-workflow users.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- isValidRequestor(String requestorId) - Method to determine if the specified requestor is a valid active workflow user or a registered user.
- isLeaseExpired(String requestorId, String ciSysId, String ciActionName) - Method to check if registered user lease expired.
- extendCIActionLease(String requestorId, String ciSysId, String ciActionName, String leaseTime) - Method to extend CI Action Lease time, for registered users. If previous lease already expired, extend lease from now.

Operational State APIs

- setBulkCIOperationalState(String requestorId, String sysIdList, String opsLabel, String opsStateListOld) - Method to set Operational State for an array of CIs.
- getOperationalState(String ciSysId) - Method to get CI Operational State.

CI Actions APIs

- addBulkCIAction(String requestorId, String sysIdList, String ciActionName, String ciActionListOld, String leaseTime) - Method to add CI Action for an array of CIs.
- removeBulkCIAction(String requestorId, String sysIdList, String ciActionName) - Method to remove a CI Action for a list of CIs.
- getCIActions(String ciSysId) - Method to get CI Actions.

Not Allowed Action Based on Operational State API

isNotAllowedAction (String ciType, String opsLabel, String actionName) - Method to check if a specific CI action is not allowed for specific Operational State on a CI Type.

Not Allowed Operational State Transition API

isNotAllowedOpsTransition(String ciType, String opsLabel, String transitionOpsLabel) - Method to check if specific operational state transition is not allowed on a CI Type.

Compatible Action API

isCompatibleCIAction(String actionName, String otherActionName)- Method to check if two specific actions are compatible with each other.

Example: Using state management APIs

```
// 1. Register Operator with State Mgmt
var output =
 SNC.StateManagementScriptableApi.registerOperator();
var jsonUntil = new JSON();
var result = jsonUntil.decode(output);
var requestorId = result.requestorId;

// Get list of sys_ids to update
var sys_ids;

// 2. Set list of sys_ids's Operational State to 'Repair in
 Progress'
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
output =
 SNC.StateManagementScriptableApi.setBulkCIOperationalState(requ
estorId, sys_ids,'Repair in Progress');
gs.print(output);

// 3. Set list of sys_ids's CI Action State to 'Patching'
output =
 SNC.StateManagementScriptableApi.addBulkCIAction(requestorId,
 sys_ids, 'Patching');
gs.print(output);
```

Components installed by CI Lifecycle Management

Several types of components are installed by CI Lifecycle Management (included in the com.snc.cmdb plugin), including tables, scheduled jobs, and properties.

Note:
The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Scheduled jobs installed

Scheduled job	Description
CI Lifecycle Management - Restore Internal State Management Tables	Continuously checks and maintains the data integrity of all internal CI Lifecycle Management tables.
Update life cycle from legacy	Updates CIs *Life cycle stage* and *Life cycle status* fields when legacy status fields change.
Update legacy from CSDM"	Updates CIs legacy status fields when life cycle changes.

Tables installed

Table	Description
CI State Registered Users [statemgmt_register_users]	All currently active registered users that were created via the *registerOperator* API. You cannot manually add new records to this table.
CI Actions [statemgmt_ci_actions]	A set of CI actions that can be applied to a CI during its lifetime.
CMDB CI Actions [statemgmt_cmdb_actions]	Active/inactive CI actions set by a specific requestor for a specific CI. You cannot manually add new records to this table.
Compatible CI Actions [statemgmt_compat_actions]	Set of rules that define pairs of CI actions that are compatible for a CI and can be applied simultaneously.
Not Allowed CI Actions [statemgmt_not_allow_actions]	Set of rules that define specific actions that are not allowed for a CI when its in a specific operational state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
Internal Operational States [statemgmt_ops_state]	Internal operational states set by a specific active requestor for a specific CI. You cannot manually add new records to this table.
Renew Lease Task [statemgmt_renew_lease_task]	Set of tasks that were automatically created to renew the lease of CI actions whose lease has expired. You cannot manually add new records to this table.
Operational State Priorities [statemgmt_ops_state_pri]	Priorities of operational states which determine precedence when multiple operational states are set for same CIs by different requestors.
Not Allowed Operational Transitions [statemgmt_not_allow_ops]	Set of rules that define specific operational state transitions that are not allowed.

Properties installed

Property	Description
glide.cmdb.statemgmt.max_lease_expired_days	Maximum number of days that lease expiration can be set with for CI Actions. • Type: integer • Default value: 15 • Location: System Property [sys_properties] table.
glide.cmdb.statemgmt.max_bulk_count	Maximum number of CIs that CI Lifecycle Management can process in a bulk update operation. • Type: integer • Default value: 1000 • Location: System Property [sys_properties] table.

Activate the CI Lifecycle Management scheduled job

When starting to use the CI Lifecycle Management module, ensure to activate the *`CI Lifecycle Management - Restore Internal State Management Tables`* scheduled job which is disabled by default. This scheduled job continuously checks and maintains the data integrity of all internal CI Lifecycle Management tables.

Before you begin

Role required: none

About this task

When CI Lifecycle Management operations do not complete properly, for example due to a failure of the requestor or a requestor whose lease has expired, the integrity of tables related to CI Lifecycle Management might be compromised. The *`CI Lifecycle Management -`*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Restore Internal State Management Tables scheduled job scans tables related to CI Lifecycle Management, and does the following:

- De-activates or removes all internal lifecycle management records with invalid requestors, and closes any corresponding Renew Lease Tasks if present.
- Detects records associated with a valid requestor whose lease has expired, and automatically creates a Renew Lease Task to notify the user and to provide details for extending the lease. If the requestor takes no action and the lease remains expired for a specified grace period (default 15 days), automatically de-activates the corresponding CI action record, and closes any corresponding Renew Lease Task if present.

Procedure

1. Navigate to **System Definition**, and click **Scheduled Jobs**.
2. Search for the *CI Lifecycle Management - Restore Internal State Management Tables* job.
3. In the respective **Active** column, double-click the value *false*, and select *true*.
4. Click the **Save** icon.

Define a CI action

Define a CI Lifecycle Management CI action that can be later applied to CIs.

Before you begin
Role required: none

About this task
You can view a list of all the actions that are currently applied to CIs by navigating to **Configuration** and clicking **CMDB CI Actions**.

Procedure

1. Navigate to **All** > **Configuration** > **CI Lifecycle Management** > **CI Actions**.
2. On the CI Actions page, select **New**.
3. Enter **Name** and **Description**.
4. Select **Submit**.

Define compatible CI actions

Allow a CMDB CI Lifecycle Management operation in which two specified CI actions can be applied simultaneously to a CI.

Before you begin
Role required: none

About this task
By default, it is not allowed to apply more than a single action to a CI. You can change that behavior by defining pairs of CI actions as compatible and therefore these actions can be applied simultaneously to a CI. For example you can specify that Provisioning and Patching are compatible CI actions, which lets you apply both to a CI at the same time.

Procedure

1. Navigate to **All** > **Configuration** > **Compatible CI Actions**.
2. On the **Compatible CI Actions** page click **New** and fill out the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Compatible CI Actions

Field	Description
Action	First action in the compatibility actions pair.
Compatible Action	Second action in the compatibility actions pair.

Result
An API can successfully apply the two specified actions simultaneously to a CI.

Define a not-allowed CI action

Define a restriction for CI Lifecycle Management in which a specified action is not allowed for a CI that is in a specified operational state.

Before you begin
Role required: none

About this task
By default, there are no restrictions in the CMDB CI Lifecycle Management on applying CI actions. You can restrict this behavior by not allowing a specified action to be applied to a CI when it is in a specified operational state. For example, you can define a restriction in which the provisioning action cannot be applied to a Linux Server that is in a non-operational state.

Procedure
1. Navigate to **All** > **Configuration** > **CI Lifecycle Management** > **Not Allowed CI Actions**.
2. Click **New** on the **Not Allowed CI Actions** page, and fill out the form.

Field	Description
Not Allowed Action	The action that is being restricted.
CI Type	The CI type for which the restriction applies to. To apply a rule to all CIs, select Configuration Item.
Operational State	The operational state that the CI must be at in order to apply the restriction.

3. Click **Submit**.

Result
If an API attempts to apply the specified action to the specified CIs, while it is in the specified operational state, the operation fails and an error is logged.

Set priority for an operational state

CI Lifecycle Management allows multiple operators or automations to simultaneously set different operational states for a CI. A CI can have only a single operational state, so in this case, the cumulative operational state of the CI is set to the one with the highest priority. It is recommended that you specify a priority for each operational state that you define so that a cumulative state can be correctly calculated.

Before you begin
Role required: none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Procedure

1. Navigate to **All** > **Configuration** > **CI Lifecycle Management** > **Operational State Priority**.
2. On the **Operational State Priority** page, click the operational state for which you want to set or update priority.
3. Enter a **Priority** and click **Update**.
   Smaller numbers represent higher priority.

Define a non-allowed operational transition

Define a restriction for CI Lifecycle Management in which a specified CI cannot transition from one operational state to another.

Before you begin
Role required: none

About this task
By default, CI Lifecycle Management has no restrictions for transitioning CIs from one operational state to another. You can restrict this behavior by defining transitions that are not allowed for a specified CI. For example, you can define a restriction on transitioning a Linux server from non-operational state to repair in progress state.

Procedure

1. Navigate to **All** > **Configuration** > **CI Lifecycle Management** > **Not Allowed Operational Transitions**.
2. On the **Not Allowed Operational Transitions** page, click **New** and fill out the form.

Field	Description
CI Type	The CI type for which the restriction applies.
Not Allowed Transition	The CI state into which transitioning is restricted.
Operational State	The operational state that the CI must be in for the restriction to apply.

Result
If an API attempts to transition a CI that is in the specified operational state to a state that is not allowed, the operation fails and an error is logged.

View CMDB benchmarks

CMDB calculates several CMDB Health benchmarks which then display in the Benchmarks dashboard. These benchmarks are based on various CMDB Health metrics, displaying monthly averages, trends, comparisons to industry averages of your ServiceNow peers, and global benchmarks.

Before you begin
Role required: none

The CMDB Health Dashboard jobs must be enabled and health data must be collected.
Also, navigate to **Benchmarks** > **Setup** and ensure that the CMDB KPIs are enabled under **IT Operations Management**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

CMDB provides the following benchmarks:

- % of non-compliant CIs
- % of duplicate CIs
- % of stale CIs

For an instance, each of these benchmarks is the calculated monthly average for the corresponding CMDB Health metric. Calculating a monthly average requires that there is a metric result value for each day of the month. Therefore, each day on which the respective Health Dashboard job did not run, is assumed with the aggregated result from the run that is most recent to that day. The monthly average is then calculated based on the sum of all the daily aggregated results for the metric in that month, divided by the number of days of the month. For a CMDB Health Dashboard job that ran multiple times in a single day, only the results of the last run in that day are used for the monthly average calculation.

Note:
The frequency of CMDB Health Dashboard job executions depend on whether the job is enabled, its schedule and on manual runs.

Global averages are based on the sum of monthly averages of all peer instances, divided by the number of instances (aside from instances for which the monthly average is 0).

Procedure

1. Navigate to **Benchmarks** > **Dashboard**.
2. Click the icon and select **IT Operations Management**.
3. Click **ALL** or **CMDB**.
4. Click on a CMDB benchmark to drill down to trend data, and other benchmark details.

Useful related lists in CI forms

By default, the forms that display manageable configuration items (CI) - computers, printers, network gear, uninterruptible power supplies (UPS), and power distribution units (PDU) - provide a number of related lists for the form.

The following related lists are common to all forms for manageable CIs.

- Network Adapters - Displays all the NICs installed on a CI.
- CI IPs - Displays all the IP addresses on this CI:
  - Computers (workstations, laptops using various macOS and Windows operating systems)
  - Windows servers
  - Linux servers
  - AIX servers

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Solaris servers
- Devices discovered through SNMP.

- DNS Names for CIs - Displays all the DNS names on a CI.

The IP version information appears in all IP address related lists and forms.

Note:
Since all paths here click into the **IP Address to DNS Names** list that associates an IP address with a DNS name, this part of the common flow was not added to the tree structure.

Discovery source

A table called Source [sys_object_source] stores information identifying the source of a discovery (by ServiceNow Discovery or another product), the ID of that source, and the date/time of the last scan. To view this information, configure a CI form and add the **Sources** related list.

This table is populated automatically when the Discovery plugin is enabled.

Platform Analytics Solution for Configuration Management (CMDB)

Platform Analytics Solutions contain preconfigured dashboards. These dashboards contain actionable data visualizations that help you improve your business processes and practices.

Platform Analytics data visualizations use Performance Analytics indicator data to show you data over time, helping you analyze your business processes and identify areas of improvement. With Platform Analytics Solutions, you can get value from Performance Analytics for your application with minimal setup. You can always create your own objects as well.

The Platform Analytics Solution for Configuration Management (CMDB) has been replaced by the CMDB Workspace. For more information, see CMDB Workspace store app.

accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy, which may be updated by ServiceNow.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal.

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. In addition, this application will collect incident data (for Incident Assist and Knowledge Assist) and chat transcripts (for Chat Assist). Customers can opt out of future data collection at any time, as described in the Now Assist Opt-Out page.

For more information, see the Now Assist documentation.

Available LLMs

You can use Now LLM Service, Now LLM Long Term Stable models (LTS), Azure OpenAI, Google Gemini or Anthropic Claude on AWS as the AI model provider for all Now Assist skills and AI agents. Use the Configuration Controls in AI Control Tower to define which options are available, then set the skill-level preferences in the Now Assist Admin console. For more information, see Large language models on the ServiceNow AI Platform®.

Now Assist for CMDB

Now Assist for CMDB provides the following abilities:

Create configuration item agentic workflow

Occasionally, you might need to create a CI manually. To help you, the Create configuration item agentic workflow accepts your natural language request and verifies that it understands which class the new CI should belong to. The workflow then checks Identification and Reconciliation engine (IRE) rules to determine the required attributes for the CI and requests that information. After you provide sufficient data, the workflow ensures that the proposed CI includes the attributes that you requested, complies with IRE rules, and is not a duplicate. The workflow then creates the CI.

The Create configuration item agentic workflow is particularly useful for adding CIs to tables accessed by Operational Technology because users might add physical CIs while unaware of the need to manage CI data in the CMDB.

To learn more, see Create a CI using Now Assist.

Provide advice on CMDB governance agentic workflow

Data governance can be an overwhelming task. The Provide advice on CMDB governance agentic workflow supports data admins and owners by methodically working through the many-faceted process of improving CMDB data accuracy, completeness, and health. The objective is to ensure that users can trust the data that they use for their work.

To learn more, see Getting advice from Now Assist on CMDB governance.

Search CMDB agentic workflow

The Search CMDB agentic workflow enables you to search for CIs by specifying any of several attributes of the CI of interest. The workflow accepts your natural language request, verifies your search goal, and then generates a keyword search, a single-table search with dot walks, or a multi-table searches that involve relationship navigation, depending on the information you provided. The workflow can infer CI relationship data to generate an appropriate query.

To learn more, see Use Now Assist to search the CMDB for CIs.

Service Graph Connector diagnosis

Service Graph Connectors are integrations that facilitate data ingestion from third-party sources into the CMDB. Errors in Service Graph Connectors can disrupt the flow of configuration item (CI) data resulting in inconsistencies between the actual state of CIs and their CMDB records.

The Service Graph Connector diagnosis skill automates error diagnosis and recommendation generation, enabling CMDB installation administrators to identify and resolve the issues. This automation reduces manual effort and saves time in debugging Service Graph Connectors issues.

To learn more, see the following topics:

© 2026 ServiceNow, Inc. All rights reserved.

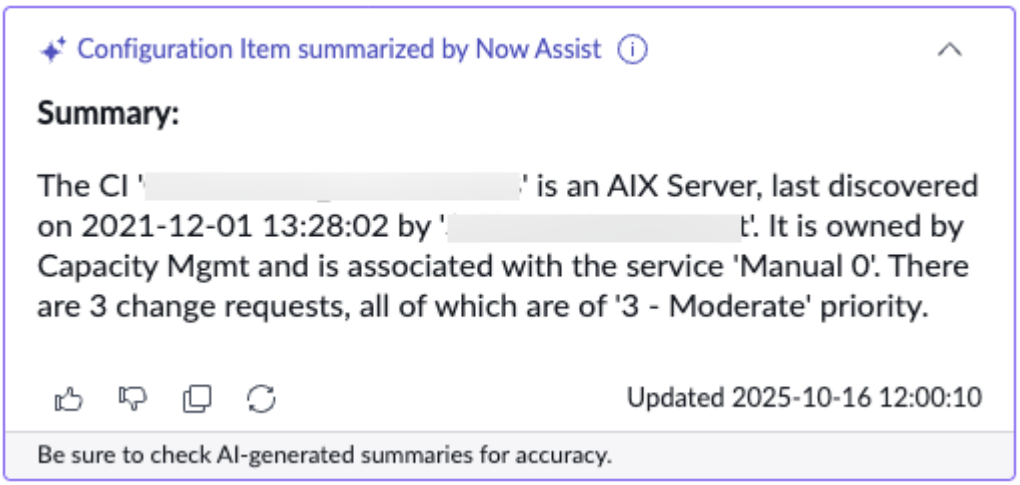
- Getting started with Service Graph Connectors
- Learn how IRE detects duplicate CIs and creates de-duplication tasks
- Learn how CMDB Health uses the duplicate metric to track duplicate CIs.
- Learn how to manage and remediate de-duplication tasks by using de-duplication templates in CMDB Workspace.

Duplicate CI remediator agentic workflow

The Duplicate CI remediator agentic workflow completes the full range of de-duplication tasks. The workflow presents its reasoning for each step so CMDB administrators can review and update the AI decisions.

CI summarization skill

View a concise summary of key CI data. You can select the CI on a CI form, in a workspace page, or on any list view. The summary can include discovery data, ownership, and key related items such as open incidents, alerts, problems, upcoming change requests, and security vulnerabilities. Additionally, the summary lists the service instances that the CI is part of. Summary information is useful while working in applications such as Incident Management, Change Management, and Event Management.



To learn more, see View CI information with the Now Assist CI summarization skill.

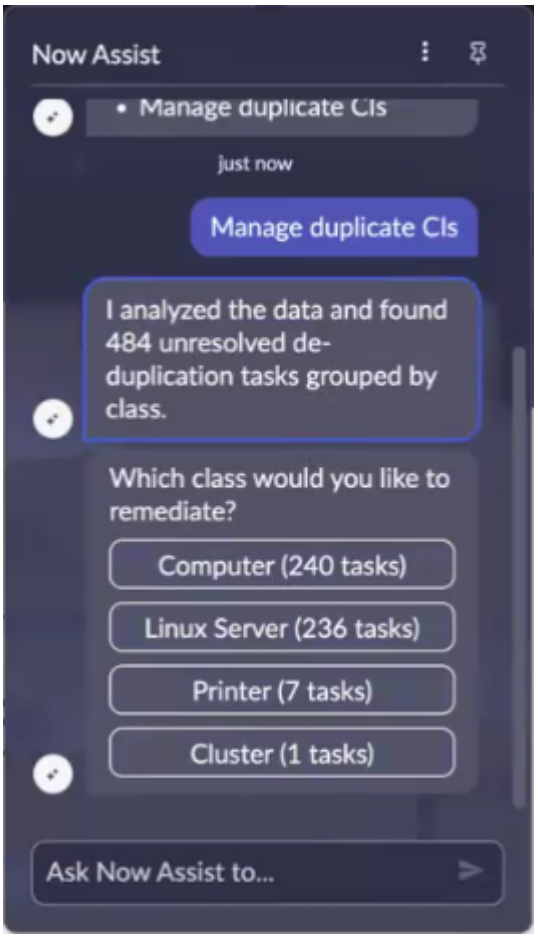
Manage duplicate CIs skill

Duplicate CIs interfere with the integrity, reliability, and general health of CMDB. Resolve de-duplication tasks with support from the Now Assist Manage duplicate CIs skill. CMDB administrators follow step-by-step guidance to perform remediation, and can preview remediation results before applying a template. The manage duplicate CIs skill accelerates the work that you normally perform manually.

In this example, the manage duplicate CIs skill presents a list of classes with duplicate CIs and suggests possible actions. You can select an option or enter the action text in your own words:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Review de-duplication tasks, create de-duplication templates, assign tasks to templates, and run the templates.
- Preview the results of applying a de-duplication template before you decide to apply it.
- Identify the root cause of duplications so that you can review the groups of de-duplication tasks that share a common cause and possibly avoid the issue in the future.



To learn more, see Let Now Assist help you to manage duplicate CIs.

Skill activation

Important:
Some Now Assist skills, agents, and agentic workflows are turned on by default. For more information, see Now Assist skills, agents, and agentic workflows on by default.

Skill reuse in a domain-separated environment

By default, all skills exist in the global domain. When you use Now Assist in a domain-separated environment, users are only able to access data in their domain. For example, if a user uses the summarization skill, Now Assist only uses material that exists in the user's domain when generating that summary. Additionally, there is no co-mingling of data for domain-separated instances when using generative AI skills. The data resides only on the instance, and the shared services used for generative AI do not persist any requests (prompts) and responses. For more information, see Domain separation in the Now Assist Admin console. (Note that global domain is not the same as global scope. For more information, see Exploring Next Experience pickers.)

Procedures

Follow these procedures to set up and configure Now Assist for Configuration Management Database (CMDB).

Configure Now Assist for CMDB

Configure the Now Assist for CMDB application so users can benefit from Agentic workflows, agents, and skills.

Before you begin
Role required: sn_nowassist_admin.nsa_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Important:
Some Now Assist skills, agents, and agentic workflows are turned on by default. For more information, see Now Assist skills, agents, and agentic workflows on by default.

Procedure

1. Navigate to **Admin** > **Now Assist Admin** and then select the **Settings** tab.
2. In the list, select **Plugins**.
   Plugins that have already been activated are listed on the **Installed** tab.
3. Uninstall Now Assist for Service Graph Connectors (SGC).
4. On the Now Assist for Configuration Management Database (CMDB) card, select **Get plugins** and then in the pop-up window, select **Install Plugin**.

   You install the Now Assist for CMDB (com.snc.cmdb.gen.ai) plugin.

   You are redirected to the ServiceNow Store in a new browser tab so you can get the plugin.

5. Install the Now Assist for CMDB plugin.

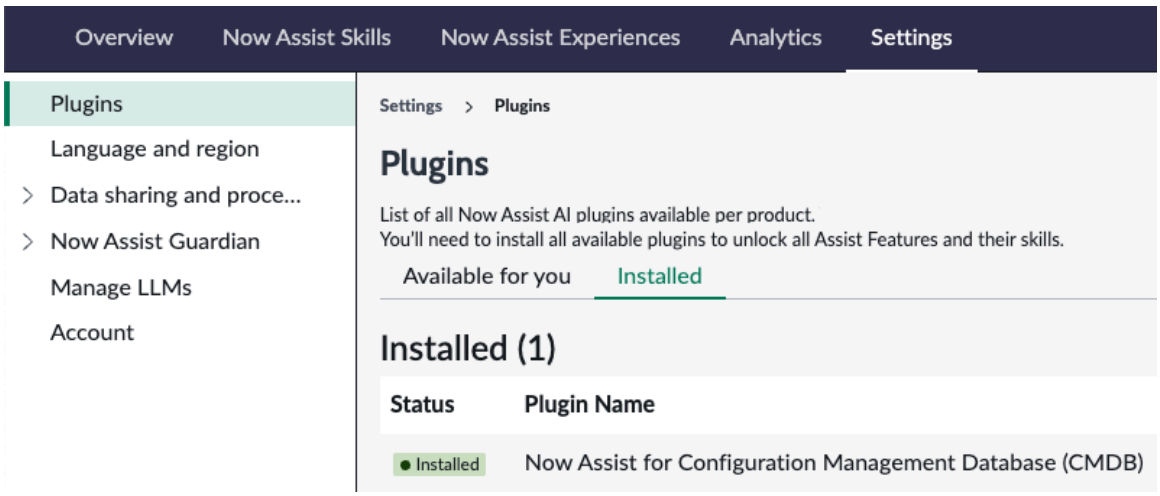
   For instructions on the installation process, see Install Now Assist plugins.

6. Confirm that Now Assist for CMDB is installed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

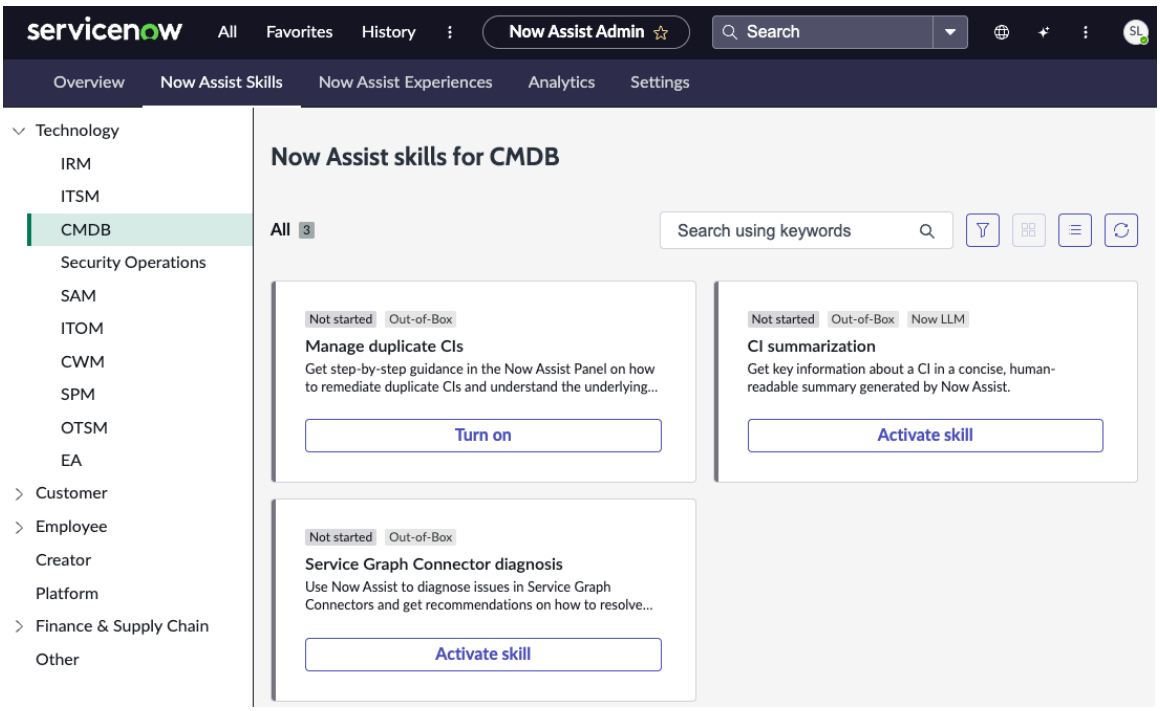
a. On the **Now Assist Admin** console, select the **Settings** tab and then select **Plugins** in the list.

b. On the **Installed** tab, verify that the **Status** value is **Installed**.



Now that you have installed the plugin, you set up the skills for Now Assist for CMDB.

7. On the **Now Assist Skills** tab, expand **Technology** and then select **CMDB**.



8. On the Now Assist skills for CMDB page, select **Turn on** for the Manage duplicate CIs skill. No configuration is required for the skill. On the pop-up, select **Back to skills** to set up the other skills.
9. On the Now Assist skills for CMDB page, select **Activate skill** for the CI summarization skill. The skill requires configuration as described in Configure the CI summarization skill.
10. On the Now Assist skills for CMDB page, select **Activate skill** for the Service Graph Connector diagnosis skill.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The skill requires configuration as described in Configure the Service Graph Connector diagnosis skill.

11. Configure property settings.
    See Property settings for Now Assist for CMDB.

What to do next

To start using Now Assist for CMDB skills, see Using agentic workflows in Now Assist for CMDB.

To deactivate a skill, select the menu icon for the skill and then select **Deactivate skill**.

Admins might be interested in Query Generation. Query Generation is an AI-powered service that translates user questions into an executable query. An executable query contains the data source, filter, aggregation, and visualization instructions that best answer the user's question. For more information, see Exploring Query Generation.

CMDB Workspace store app

Configure the Search CMDB agentic workflow

Review and configure the settings of the Search CMDB agentic workflow.

Before you begin

Role required: admin

Procedure

1. Activate the Query Generation skills as described in Query Generation skills.
2. Index the CI data.
   a. Navigate to **Query Generation** > **Indexed Sources**.
   b. Open the two records and select **Index all tables** or **Index table**.

Use Now Assist to search the CMDB for CIs

Configure the CI summarization skill

Review and configure the settings of the Now Assist for Configuration Management Database (CMDB) CI summarization skill to restrict the availability of the skill to certain users or conditions.

Before you begin

Role required: admin

About this task

The CI summarization skill might scan activated plugins, activated applications, and CMDB tables. The skill uses the Now LLM Service to generate summaries.

Requirements and dependencies for the skill

Detail type	Requirements and dependencies
Discovery	The CI summarization skill extracts details from the *`Discovery source`* and *`Most recent discovery`* CI attributes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Requirements and dependencies for the skill (continued)

Detail type	Requirements and dependencies
	If CMDB 360 is enabled, the summary can show additional discovery sources for the CI. For more information, see CMDB 360/ Multisource CMDB.
Alerts	Event Management must be activated for the CI summarization skill. For more information, see Event Management.
Security vulnerabilities	Security Operations must be activated for the CI summarization skill. For more information, see Security Operations.
CI ownership	The CI summarization skill determines the CI ownership based on the attribute that is specified in the *glide.cmdb.health.ci_ownership_field* system property. For more information, see CMDB Health system properties and CMDB Health.
Data on the CMDB Health Dashboard	The Correctness Score Calculation scheduled job improves the accuracy of the summary details on the CMDB Health Dashboard. For more information, see Enable and configure a CMDB Health Dashboard job.

By default, all skills exist in the global domain. When you use Now Assist in a domain-separated environment, users are only able to access data in their domain. For example, if a user uses the summarization skill, Now Assist only uses material that exists in the user's domain when generating that summary. Additionally, there is no co-mingling of data for domain-separated instances when using generative AI skills. The data resides only on the instance, and the shared services used for generative AI do not persist any requests (prompts) and responses. For more information, see Domain separation in the Now Assist Admin console. (Note that global domain is not the same as global scope. For more information, see Exploring Next Experience pickers.)

Procedure

1. **Optional:** Access the setting tabs for the CI summarization skill.
   a. Navigate to **All** > **Now Assist Admin**.
   b. On the **Now Assist Features** tab, expand **Technology** and then select **CMDB**.
   c. On the Now Assist Skills for CMDB page, review the skills and then select **View details**.
   d. On the **Active skills** card on the Configuration Management Database (CMDB) page, select the context menu for the CI summarization skill and then select **Edit**.
2. Review and configure the settings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Setting tabs for the CI summarization skill

Tab	Action
General details	Review general information on the CI summarization skill.
Choose inputs	**Note:** In this release of the skill, all configuration settings on this section are read-only. Review the tables and fields that the Now LLM Service uses to gather details for the CI summary.
Define availability	Select **Customize skill availability** to restrict the availability of the skill to certain conditions or particular users or groups. Use the condition builder to specify the field conditions that must be met for the skill to be available and then select **Save and continue**.
Select display	**a.** Toggle the Display switch to expose the CI summarization skill on CI forms. When the **Display** toggle is in the off state, the CI summarization skill isn't available even when the skill itself is activated. **b.** Specify the user roles that can use the CI summarization skill by selecting the drop-down list icon and then selecting the user roles in the **User roles** field. **c.** Select **Save and continue**.
Review and activate	Review the summary of settings for the skill (each card displays a different category of settings). Select **Activate** or **Done**. **Important:** Confirm that the answer is **Yes** on the card titled **Will CI summarization display in product?**. Otherwise, the CI summarization function won't be available to users even if the skill itself is activated.

The **Summarize** button appears when a user with the appropriate role views a CI.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next
Use the CI summarization skill.

Configure the manage duplicate CIs skill

Enable and configure scheduled jobs that support the manage duplicate CIs skill.

Before you begin
In this procedure, you enable scheduled jobs that support the manage duplicate CIs skill.

By default, all skills exist in the global domain. When you use Now Assist in a domain-separated environment, users are only able to access data in their domain. For example, if a user uses the summarization skill, Now Assist only uses material that exists in the user's domain when generating that summary. Additionally, there is no co-mingling of data for domain-separated instances when using generative AI skills. The data resides only on the instance, and the shared services used for generative AI do not persist any requests (prompts) and responses. For more information, see Domain separation in the Now Assist Admin console. (Note that global domain is not the same as global scope. For more information, see Exploring Next Experience pickers.)

Role required: admin

Procedure

1. Enable the De-duplication: Populate Duplicate Task Data scheduled job.
   For instructions, see Components installed for duplicate CI remediation.
2. Enable the PopulateDuplicate Task Group Daily scheduled job to provide analysis of the root cause of remediation tasks.
   For instructions, see Components installed with CMDB Workspace.
3. Enable the CMDB Health Dashboard - Correctness Score Calculation scheduled job.
   The job improves the accuracy of summary details on the CMDB Health Dashboard. For instructions, see Enable and configure a CMDB Health Dashboard job.

and can preview remediation results before applying a template. For more information, see Let Now Assist help you to manage duplicate CIs.

Service Graph Connector diagnosis skill

To reduce debugging and resolution time and effort, the Service Graph Connector diagnosis skill generates summaries of errors and recommendations for resolving processing errors with SGC import sets. For more information, see Fix SGC import set issues with the Now Assist SGC diagnosis skill

View CI information with the Now Assist CI summarization skill

View a concise summary of key CI data. You can select the CI on a CI form, in a workspace page, or on any list view. The summary can include discovery data, ownership, and key related items such as open incidents, alerts, problems, upcoming change requests, and security vulnerabilities. Additionally, the summary lists the service instances that the CI is part of.

Before you begin

Role required: sn_cmdb_user

About this task

This procedure describes how you can manually access the skill in Core UI or in the CMDB Workspace. In addition, any agentic workflow can use the skill.

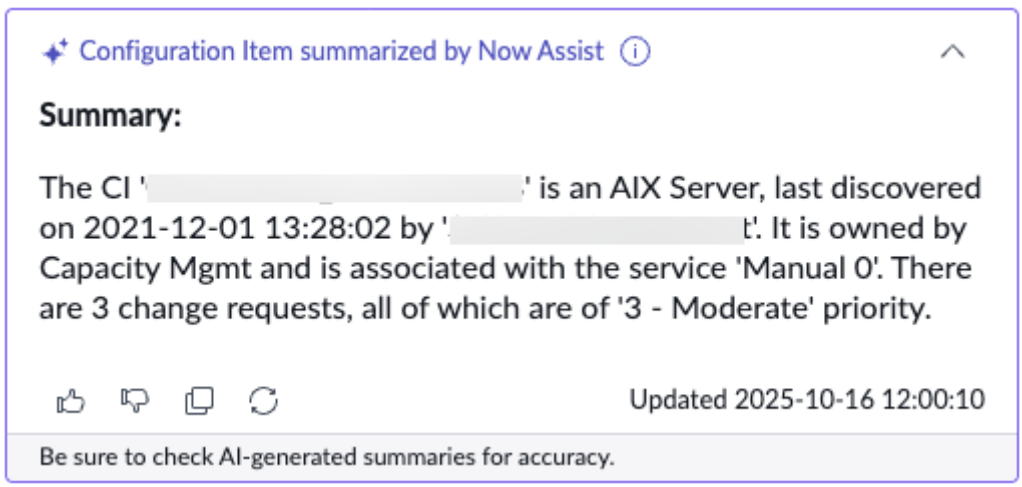
Procedure

1. Select a CI from the workspace or from any list view.

   For example, select **All** and enter `cmdb_ci.list` in the search filter. Select a CI to open its CI form.

2. Select **Summarize** in the Now Assist box.

   Now Assist generates and displays summary information for the CI, as in this example.

3. **Optional:** Provide feedback, copy the summary text to the clipboard, or refresh the summary.

Let Now Assist help you to manage duplicate CIs

Resolve de-duplication tasks with support from the Now Assist Manage duplicate CIs skill. CMDB administrators follow step-by-step guidance to perform remediation, and can preview remediation results before applying a template.

Before you begin

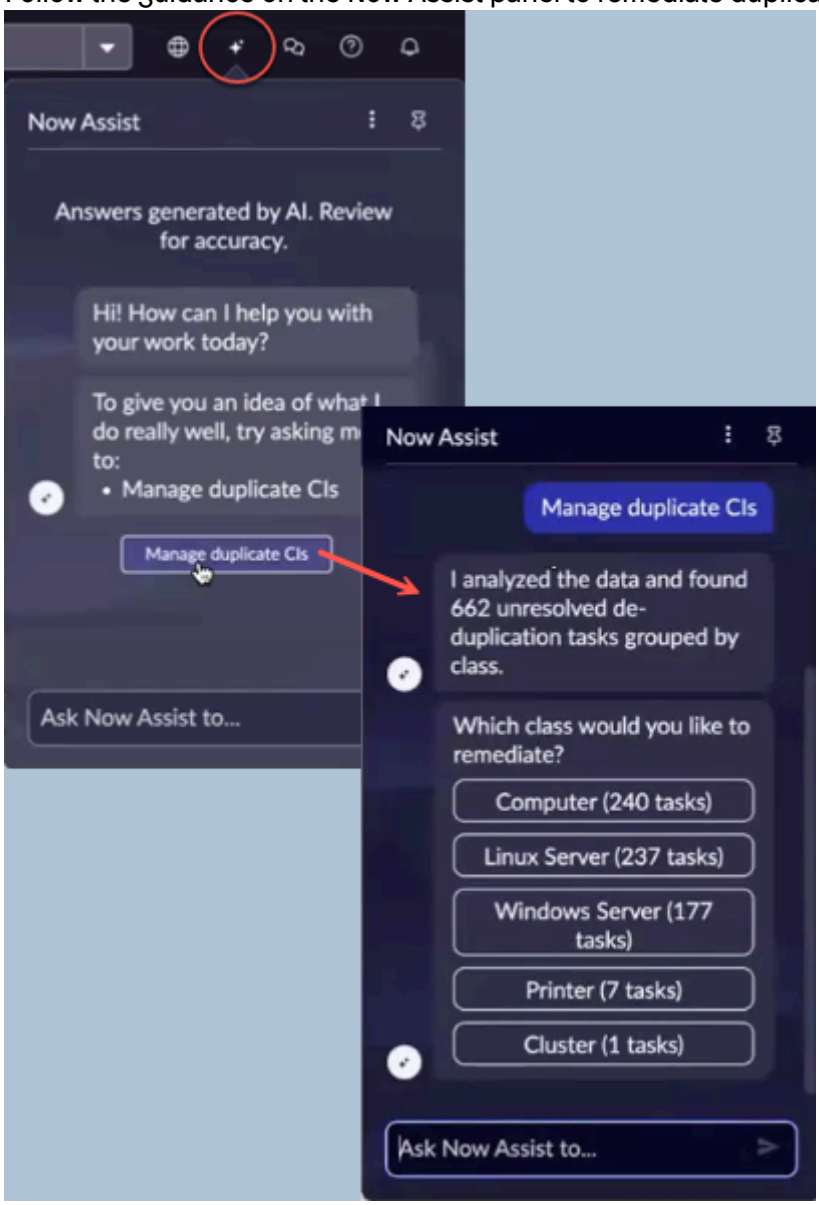
Role required: cmdb_dedup_admin and now_assist_panel_user

About this task

When a Now Assist for SGC skill is enabled, the Now Assist icon appears in the SGC Central view of the CMDB Workspace. For more information, see Working in the Now Assist panel.

Procedure

1. On the CMDB Workspace or in any form or list view, select the Now Assist icon and then select **Manage duplicate CIs** in the Now Assist panel.
2. Follow the guidance on the Now Assist panel to remediate duplication.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Select an option in the Now Assist panel or enter text that resembles one of the options. As you select options to remediate duplication, the skill adjusts the options and guides you through the process.
- Review root causes for duplication: The analysis surveys IRE identification rules (including criterion attributes) and discovery sources and responds by grouping causes to suggest related groups of tasks.

  Tip:
  Use this information to help prevent further creation of duplicate CIs.

- Decide which de-duplication template to apply: Select **Review existing templates** and then follow the suggestions to preview the results of applying the template. Now Assist generates a preview of the results of applying a template without actually running the remediation process. You can preview the results for any existing template. When you see the desired result in a preview, you can specify that template and proceed with the de-duplication process.

Fix SGC import set issues with the Now Assist SGC diagnosis skill

To reduce debugging and resolution time and effort, the Service Graph Connector diagnosis skill generates summaries of errors and recommendations for resolving processing errors with SGC import sets.

Before you begin

Enable the Service Graph Connector diagnosis skill as described in Configure the Service Graph Connector diagnosis skill.

Role required: cmdb_inst_admin and now_assist_panel_user

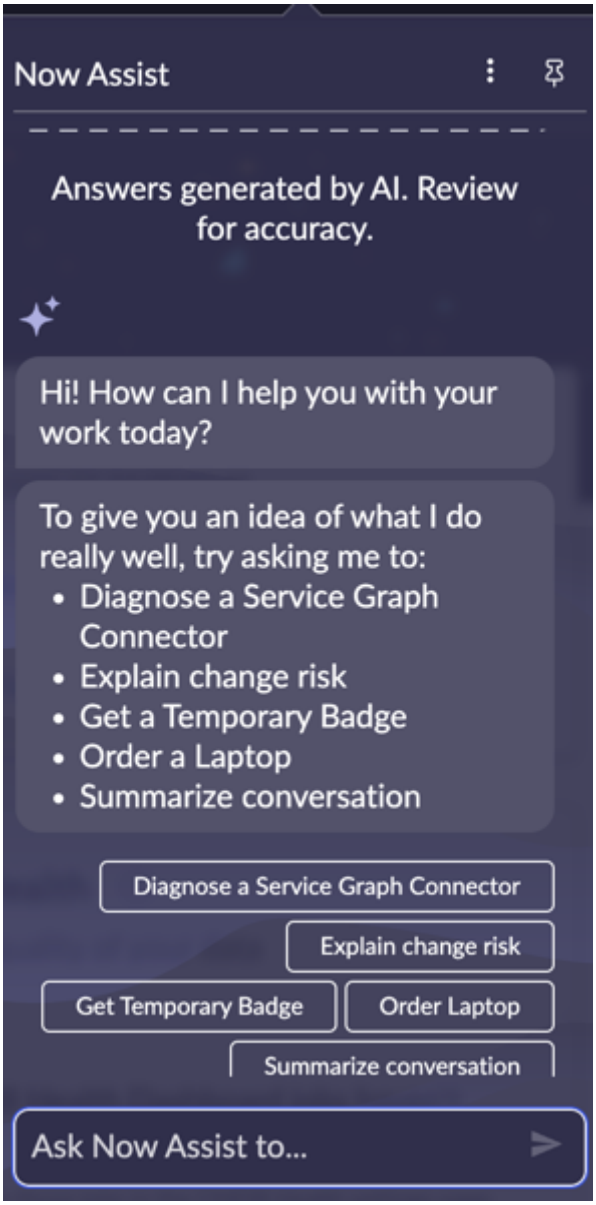
About this task

When a Now Assist for SGC skill is enabled, the Now Assist icon appears in the SGC Central view of the CMDB Workspace. For more information, see Working in the Now Assist panel and Diagnose a processing error in SGC Central.

Procedure

1. Navigate to **Workspaces** > **CMDB Workspace**.
2. Select the Now Assist icon to open the Now Assist panel and then select or enter **Diagnose a Service Graph Connector**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



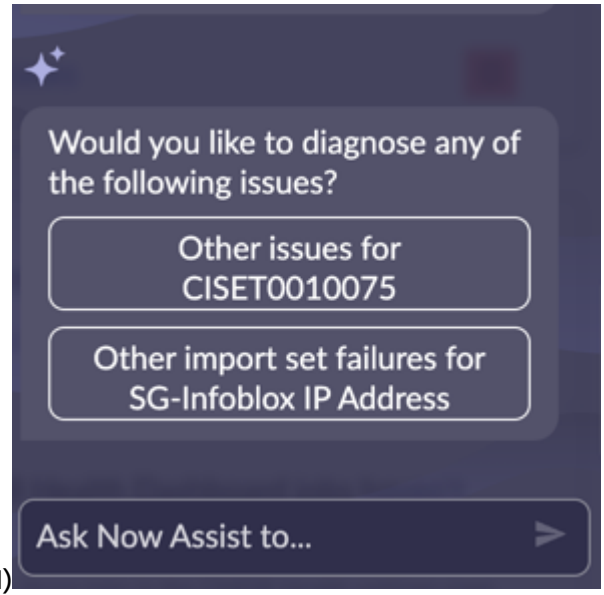
3. Begin the diagnostic process by entering the connector name, specific data source, or import-set number of a Service Graph Connector.

   Note:
   If Now Assist doesn't recognize the entered text, it displays a list of the Service Graph Connectors installed on your instance by their discovery source names, such as `SG-Infoblox`. You can then select a connector for further diagnosis.

4. **Optional:** Analyze other issues for the import set or other import set failures for the selected data source.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

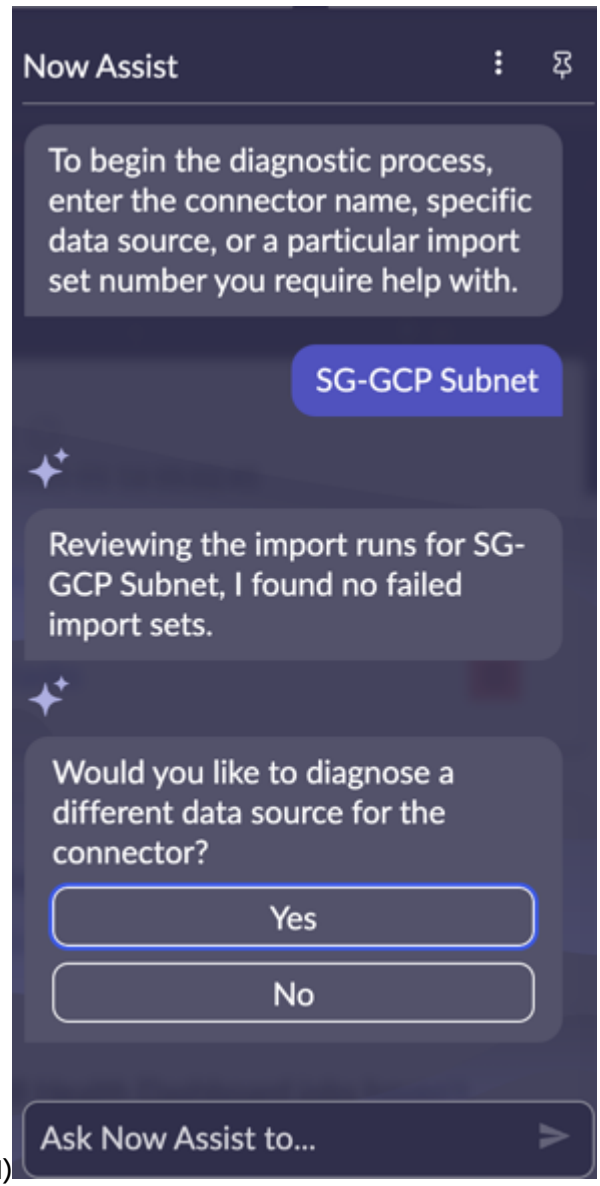
(Optional)



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. **Optional:** If no other import set issues are observed within a data source, analyze a different data source for the connector.

(Optional)



Result

Now Assist triggers the diagnosis process for the failed import sets. The Now Assist panel includes two key sections: Issue and Diagnosis recommendation, focused on the latest issue. The recommendation for an issue is based on a knowledge article matched using AI Search. A link to the knowledge article is provided in the Source section for additional guidance.

For issues related to Identification and Reconciliation engine (IRE), the panel provides a detailed summary of errors, including import errors, flow errors, partial payloads, and incomplete payloads.

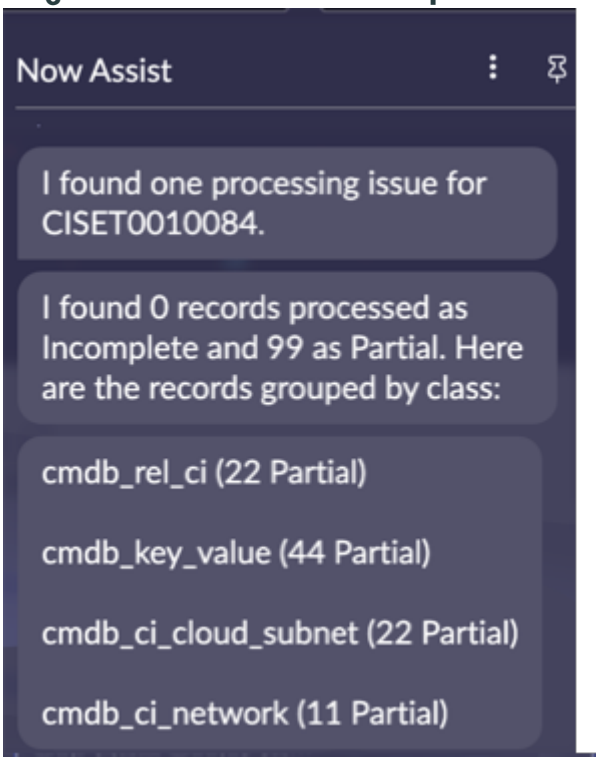
Diagnosis results for the failed import set with IRE issues



Tip:

To restart the conversation, select the reset icon ( ). If you reset the conversation, the existing messages are deleted, and a new conversation is started. You won't be able to access the previous messages after you reset the conversation. To learn more about how to use the Now Assist panel, see Now Assist panel.

What to do next

You can hover over the diagnosis recommendation and select an option to provide feedback or copy the summary text to the clipboard.

Optional actions

Action	Procedure
Provide feedback	If you think that the summary was helpful, select thumbs-up. If you think that the summary wasn't helpful, select thumbs-down. This feedback improves the Agentic AI model and can help to improve the future versions of this skill. The system gathers the feedback on each generated summary and stores it in the Agentic AI logs (sys_generative_ai_log_list.do).
Copy the summary	Select the copy to clipboard icon to use the content for another purpose, such as pasting into an email.

Using agentic workflows in Now Assist for CMDB

Users with the sn_cmdb_user role can access several Now Assist for CMDB agentic workflows.

Agentic workflows

Looking for an AI agent?

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see Find AI agents.
- To find agents that might not be installed on your instance, visit the AI Agent Marketplace on the ServiceNow Store.

Available agentic workflows for Now Assist for CMDB

Agentic workflow name	Description	Available AI agents
Create configuration item	Occasionally, you might need to create a CI manually. To help you, the Create configuration item agentic workflow accepts your natural language request and verifies that it understands which class the new CI should belong to. The workflow then checks Identification and Reconciliation engine (IRE) rules to determine the required attributes for the CI and requests that information. After you provide sufficient data, the workflow ensures that the proposed CI includes the attributes that you requested, complies with IRE rules, and is not a duplicate. The workflow then creates the CI. For more information, see Create a CI using Now Assist	CMDB CI creator
Provide advice on CMDB governance	Data governance can be an overwhelming task. The Provide advice on CMDB governance agentic workflow supports data admins and owners by methodically working through the many-faceted process of improving CMDB data accuracy, completeness, and health.	• CMDB data manager • CMDB data certification and attestation manager • CMDB data ownership manager • CMDB health metrics manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Available agentic workflows for Now Assist for CMDB (continued)

Agentic workflow name	Description	Available AI agents
	The objective is to ensure that users can trust the data that they use for their work. For more information, see Getting advice from Now Assist on CMDB governance.	• CMDB life cycle manager • CMDB principal class manager
Search CMDB	The Search CMDB agentic workflow enables you to search for CIs by specifying any of several attributes of the CI of interest. The workflow accepts your natural language request, verifies your search goal, and then generates a keyword search, a single-table search with dot walks, or a multi-table searches that involve relationship navigation, depending on the information you provided. The workflow can infer CI relationship data to generate an appropriate query. For more information, see Use Now Assist to search the CMDB for CIs.	CMDB CI search
Remediate duplicate CIs [FUTURE]	The Duplicate CI remediator agentic workflow completes the full range of de-duplication tasks. The workflow presents its reasoning for each step so CMDB administrators can review and update the AI decisions.	[FUTURE]

AI agents used by Now Assist for CMDB

CMDB CI creator AI agent

The CMDB CI creator AI agent creates a new configuration item (CI) record in the CMDB.

Configuration item summarizer AI agent

Given a CMDB (Configuration Management Database) record GUID or' sys_id" summarize the CI using an existing skill.

CMDB data certification and attestation manager AI agent

The CMDB data certification and attestation manager AI agent retrieves the data certification and attestation policies for a CI class and for similar classes. It can also create a data certification and an attestation policy. For more information, see Data Certification.

CMDB data manager AI agent

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The CMDB life cycle manager AI agent helps admins to ensure that CMDB life-cycle policies are in place for principal classes or for specified classes. For more information, see Working with CMDB Data Manager.

CMDB data certification and attestation manager AI agent

The CMDB data certification and attestation manager AI agent retrieves and applies data certification and attestation policies to manage the data certification and attestation of CI classes. It can the data certification policies and the data attestation policies of a CI class.

CMDB data ownership manager AI agent

The CMDB data ownership manager AI agent helps you to assess the quality of CI ownership data for a CI class to determine ownership, validate ownership, and evaluate ownership quality. You can validate fields that reference sys_user or sys_user_group like **Assigned To**, **Managed by Group** (default), **Support Group**, and so on. The agent answers the following questions:

- Is CI ownership specified? Is the **Managed by group** attribute value set for the CI? Does it point to an active and correctly configured record? The value of the system property for ownership is a default field for the evaluation. For the **Managed by group** CI attribute, you can specify the percentage values that classify the result as `Poor`, `Average`, or `Healthy`. For more information, see Property settings for Now Assist for CMDB.
- If you provide a user referencing value: Does the **User Referencing** value point to an active record? This evaluation identifies CIs that have inactive users and CIs with no **User** value.
- If you provide a user referencing value: Does the **Group Referencing** value point to an active record? This evaluation identifies CIs that have inactive groups, empty groups (no users), and CIs with no **Group** value.

CMDB health metrics manager AI agent

The CMDB health metrics manager AI agent displays information on CMDB Health Dashboard jobs, health metrics status, and health scores. If the jobs are not configured, the workflow provides a link to the setup instructions. For more information, see CMDB Health.

CMDB life cycle manager AI agent

The CMDB life cycle manager AI agent performs actions related to life-cycle management of CI classes: retrieve the life-cycle management policy and retirement definition for a CI class and create a life-cycle policy.

CMDB principal class manager AI agent

The CMDB principal class manager AI agent determines whether you can set CI classes as principal, suggests principal classes, and can set or unset a class as principal. Setting a class as a principal class is a practical way to save time because you can configure ServiceNow AI Platform products to display only principal classes in list views. The workflow helps you to decide which CIs you are most likely to work with day-to-day and then provides a link to enable you to set the associated classes as principal classes. For more information, see Update the list of classes in the Principal Class filter.

CMDB search AI agent

The CMDB search AI agent searches the CMDB for a particular CI using single table query search or keyword query search and then displays a link to search results.

CI summarizer AI agent

View a concise summary of key CI data. You can select the CI on a CI form, in a workspace page, or on any list view. The summary can include discovery data, ownership, and key related items such as open incidents, alerts, problems, upcoming change requests, and security vulnerabilities. Additionally, the summary lists the service instances that the CI is part of.

Note:

You can use Now LLM Service, Now LLM Long Term Stable models (LTS), Azure OpenAI, Google Gemini or Anthropic Claude on AWS as the AI model provider for all Now Assist skills and AI agents. Use the Configuration Controls in AI Control Tower to define which options are available, then set the skill-level preferences in the Now Assist Admin console. For more information, see Large language models on the ServiceNow AI Platform®.

Enable security implementation to execute AI agents and agentic workflows through Access Control Lists (ACLs) and user identities. ACLs provide the Run As capability to let agents and agentic workflows execute actions either as a dynamic user or as an AI user. For more information, see Implement access control in Now Assist AI agents

Running AI agents autonomously

Important:
By default, all agentic workflow and AI agent records are read only.

To run the AI agents autonomously, you must first duplicate the agentic workflow and then proceed with the following steps:

- Activate the agentic workflow.
- Activate all agents within the agentic workflow.
- Activate the trigger to invoke the agentic workflow automatically. If you prefer to invoke it manually, activating the trigger isn't necessary.

Create a CI using Now Assist

The Create configuration item agentic workflow accepts your natural language request to manually generate a valid CI in the class that you specify.

Before you begin

Role required:

- Now Assist for CMDB v2.4 and earlier: sn_cmdb_editor and now_assist_panel_user
- Starting with Now Assist for CMDB v2.5: sn_cmdb_admin and now_assist_panel_user
- Starting with Now Assist for CMDB v3.0: sn_cmdb_editor and now_assist_panel_user

About this task

Occasionally, you might need to create a CI manually. To help you, the Create configuration item agentic workflow accepts your natural language request and verifies that it understands which class the new CI should belong to. The workflow then checks Identification and Reconciliation engine (IRE) rules to determine the required attributes for the CI and requests that information. After you provide sufficient data, the workflow ensures that the proposed CI includes the attributes that you requested, complies with IRE rules, and is not a duplicate. The workflow then creates the CI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Create configuration item agentic workflow is particularly useful for adding CIs to tables accessed by Operational Technology because users might add physical CIs while unaware of the need to manage CI data in the CMDB.

Note:
The workflow prevents creation of a CI whose class does not have an identification rule. For more information, see Identification rules.

To learn more about using the Now Assist panel, see Working in the Now Assist panel.

Procedure

1. Use either of the following methods to start the process.
   - While working in the CMDB Workspace, select **Create CI** in the Quick Links section.
   - While working in the CMDB Workspace, select the Now Assist icon and then enter `create a ci`.

     For more information, see Working in the Now Assist panel.
2. Enter the class of CI to create and then continue by answering the Now Assist questions.

Getting advice from Now Assist on CMDB governance

Data governance can be an overwhelming task. The Provide advice on CMDB governance agentic workflow supports data admins and owners by methodically working through the many-faceted process of improving CMDB data accuracy, completeness, and health. The objective is to ensure that users can trust the data that they use for their work.

Access the workflow

See Get advice on CMDB governance from Now Assist for information on accessing the workflow.

Provide advice on CMDB governance agentic workflow

The Configuration Management Database (CMDB) is the central repository of your organization's IT assets, services, and their relationships. The Provide advice on CMDB governance agentic workflow helps to ensure CMDB accuracy, completeness, and integrity to maximize the value and performance of your ServiceNow AI Platform products. The results are faster incident resolution, enhanced compliance, and a reduced risk of service disruption. The agentic workflow evaluates CIs updated in the last 90 days.

The Provide advice on CMDB governance agentic workflow supports admins and owners with information on data health and ongoing guidance for governance as data models and integrations grow. The workflow calls on AI agents.

Agentic workflows

Looking for an AI agent?

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see Find AI agents.
- To find agents that might not be installed on your instance, visit the AI Agent Marketplace on the ServiceNow Store.

CMDB principal class manager AI agent

The CMDB principal class manager AI agent determines whether you can set CI classes as principal, suggests principal classes, and can set or unset a class as principal. Setting a class as a principal class is a practical way to save time because you can configure ServiceNow AI Platform products to display only principal classes in list views. The workflow helps you to decide which CIs you are most likely to work with day-to-day and then provides a link to enable you to set the associated classes as principal classes. For more information, see Update the list of classes in the Principal Class filter.

CMDB life cycle manager AI agent

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The CMDB life cycle manager AI agent helps admins to ensure that CMDB life-cycle policies are in place for principal classes or for specified classes. For more information, see Working with CMDB Data Manager.

CMDB data certification and attestation manager AI agent

The CMDB data certification and attestation manager AI agent retrieves the data certification and attestation policies for a CI class and for similar classes. It can also create a data certification and an attestation policy. For more information, see Data Certification.

CMDB health metrics manager AI agent

The CMDB health metrics manager AI agent displays information on CMDB Health Dashboard jobs, health metrics status, and health scores. If the jobs are not configured, the workflow provides a link to the setup instructions. For more information, see CMDB Health.

CMDB data ownership manager AI agent

The CMDB data ownership manager AI agent helps you to assess the quality of CI ownership data for a CI class to determine ownership, validate ownership, and evaluate ownership quality. You can validate fields that reference sys_user or sys_user_group like **Assigned To**, **Managed by Group** (default), **Support Group**, and so on. The agent answers the following questions:

- Is CI ownership specified? Is the **Managed by group** attribute value set for the CI? Does it point to an active and correctly configured record? The value of the system property for ownership is a default field for the evaluation. For the **Managed by group** CI attribute, you can specify the percentage values that classify the result as `Poor`, `Average`, or `Healthy`. For more information, see Property settings for Now Assist for CMDB.
- If you provide a user referencing value: Does the **User Referencing** value point to an active record? This evaluation identifies CIs that have inactive users and CIs with no **User** value.
- If you provide a user referencing value: Does the **Group Referencing** value point to an active record? This evaluation identifies CIs that have inactive groups, empty groups (no users), and CIs with no **Group** value.

Get advice on CMDB governance from Now Assist

Work through the process of improving CMDB data accuracy, completeness, and health. The objective is to ensure that users can trust the data that they use for their work.

Before you begin

Role required: sn_cmdb_admin

About this task

To learn more about using the Now Assist panel, see Working in the Now Assist panel.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Use either of the following methods to start the process.
   - While working in the CMDB Workspace, select **Provide advice on CMDB governance** in the Quick Links section.
   - While working in the CMDB Workspace, select the Now Assist icon and then enter `Provide advice on CMDB governance`. For more information, see Working in the Now Assist panel.
2. Enter the class of CI to create and then continue by answering the Now Assist questions.

Property settings for Now Assist for CMDB

Use Now Assist to search the CMDB for CIs

The Search CMDB agentic workflow enables you to search for CIs by specifying any of several attributes of the CI of interest. The workflow accepts your natural language request, verifies your search goal, and then generates a keyword search, a single-table search with dot walks, or a multi-table searches that involve relationship navigation, depending on the information you provided. The workflow can infer CI relationship data to generate an appropriate query.

Before you begin

Ensure that Query Generation skills are activated. For instructions, see Configuring Query Generation.

Note:
Because activation configures a large amount of data, wait one day after activation to use the Search CMDB agentic workflow.

Role required: sn_cmdb_user and now_assist_panel_user

About this task

The Search CMDB agentic workflow can perform the following types of search:

- CMDB searches that are keyword searches for a specific CI. You can search using name, IP address, serial number, MAC address, or asset tag. For example, "Search the CMDB for Linux Servers", or "List all IPs".
- CMDB searches that are single-table queries (including dot walk conditions for one level). For example,"What servers does Wile E. Coyote own?" or "Search the CMDB for operational windows servers that aren't assigned to anyone".

Procedure

1. On the CMDB Workspace or in any form or list view, select the Now Assist icon.

   For more information, see Working in the Now Assist panel.
2. Start a Now Assist query with "`Search the CMDB for `" and then enter the search criteria as described in the next step.
3. Enter the information that describes the searched-for CI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Provide as much as you know about the CI. Ideally provide the class type followed by other search values and conditions. For example, name, IP address, serial number, MAC address, or asset tag.
- If a query fails, you can check query generation events to determine the cause. Select **All** > **Query Generation** > **Event Queue** to view events. In some cases, a log will exist for the query. Select **All** > **Query Generation** > **Logs** to view the logs. For more information, see Query Generation logs.

4. Refine the query if Now Assist returns a CI, but not the CI that you're interested in.
   For example, you might have specified an IP address that is duplicated in multiple tables. In such cases, provide details that narrow the search.

Result

If fewer than five search results are returned, they are summarized. If more results are returned, they appear in a linked list (limited to 100 records).

To learn more about using the Now Assist panel, see Working in the Now Assist panel.

Now Assist for CMDB reference

Reference topics provide additional information about the property settings that you use to configure and administer Now Assist for CMDB.

Property settings for Now Assist for CMDB

List of system properties for the agents used by Now Assist for CMDB agents.

Property settings

Note:
All properties are in the System Property [sys_properties] table. To open the sys_properties table, enter `sys_properties.list` in the navigation filter.

System properties for Now Assist for CMDB

Property	Description
sn_cmdb_gen_ai.principal_class_suggestion_period	The CMDB data governance manager agentic workflow collects and aggregates Change Management, Incident Management, and Problem Management data for the specified CI class. If the workflow collects too much data, the process might fail. This property limits the duration in days (integer starting at zero) for the query. For instances with little data, set the property to a high value like 36000 (10 years). For instances with a large store of data, experiment to determine a practical value. • Type: integer • Default value: 90 (Query all tasks that were updated in the last 90 days.)

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

System properties for Now Assist for CMDB (continued)

Property	Description
sn_cmdb_gen_ai.suggested_principal_classes_limit	Specifies the maximum number of principal classes that are suggested to the user. Type: integer
sn_cmdb_gen_ai.health_ownership_evaluation_period	If the CMDB data governance manager agentic workflow collects too much health data, the process might fail. This property limits the duration in days (integer starting at zero) for the query. • Type: integer • Default value: `90` (Query all tasks that were updated in the last 90 days.)
sn_cmdb_gen_ai.ownership_evaluation_health_score_thresholds	The CMDB data governance agentic workflow determines the percentage of CIs in the specified class that have values for the **Managed by group** attribute. The process returns health scores of `Poor`, `Average`, or `Healthy`. The default setting of `40,60,80` returns a score of `Poor` for less than 40%, `Average` for 60%-79%, and `Healthy` for 80% and above. Default: 40,60,80
sn_nowassist_sgc.ai_search_kb_score_threshold	Enter the relevancy score threshold for AI Search, used when retrieving knowledge articles with Now Assist for SGC. • Type: integer • Default value: `5`
sn_nowassist_sgc.kb_filtering_strategy	Set the knowledge article filtering strategy for retrieving articles with Now Assist for SGC. • Type: choice list • Default value: `strict` Choices: **strict** Retrieves knowledge articles from the selected connector category only. **non-strict**

System properties for Now Assist for CMDB (continued)

Property	Description
	Retrieves knowledge articles from other connector categories, in addition to the selected connector category.

CMDB reference

The topics in this section provide various reference details for CMDB.

- Domain separation and Configuration Management Database (CMDB)
- CMDB APIs (CMDB SDK)
- Quick start tests for Configuration Management Database (CMDB)
- CMDB glossary

Domain separation and Configuration Management Database (CMDB)

Domain separation is supported in the CMDB. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Standard

- Includes all aspects of **Basic** level support.
- Application properties are domain-aware as needed.
- Business logic: The service provider (SP) creates or modifies processes per customer. The use cases reflect proper use of the application by multiple SP customers in a single instance.
- The instance owner must configure the minimum viable product (MVP) business logic and data parameters per tenant as expected for the specific application.

Sample use case: An admin must be able to make comments required when a record closes for one tenant, but not for another.

For more information on support levels, see Application support for domain separation.

Overview

The following topics provide details about domain separation in Configuration Management (CMDB) modules:

- Domain separation in CMDB Health
- Domain separation and CMDB Query Builder
- Domain separation and CMDB Identification and Reconciliation
- Domain separation and the relations formatter and the CI relationship editor
- CMDB APIs (CMDB SDK)

List of classes added by the CMDB CI Class Models app

Alphabetical list of classes that are added by the CMDB CI Class Models ServiceNow® Store app. The app adds class models (name, label, and a description of the type of information stored in the table) to the base-system CMDB. The app can also update the label (display name) of an existing base class.

Classes added by the CMDB CI Class Models app

For more information, see CMDB CI Class Models.

Table name	Label (Display name)	Table description
cmdb_ci_antenna	Antenna	An Antenna is a device that receives or transmits electromagnetic signals, typically used to facilitate wireless communication by converting electrical currents into radio waves or vice versa.
cmdb_ci_antenna_control	Antenna Control	An Antenna Control is a device that manages the orientation and positioning of antennas in wireless systems. Controls the antenna's direction, tilt, and beamwidth to optimize signal coverage, enhance network performance, and ensure efficient communication
cmdb_ci_antenna_structure	Antenna Structure	Physical structure that supports the antennas in a radio network.¬† Raises them to a suitable height for optimal signal coverage and minimizing interference with nearby structures.
cmdb_ci_anypoint_api_gateway	Anypoint API Gateway	An API Gateway service provided by MuleSoft for hosting and managing APIs.
cmdb_ci_api	API	A representation of the primary API object that has many API components.
cmdb_ci_api_backend	API Backend	The backend component of an API definition that handles API requests and provides a response.
cmdb_ci_api_component	API Component	A reusable resource representing a specific aspect of an API.
cmdb_ci_api_consumer_subscription	API Consumer Subscription	To access one or more API product bundles, a developer can register for an API consumer subscription on a developer portal. The subscription registers with one or more bundles and provides a key for access to the APIs in the bundles.
cmdb_ci_api_frontend	API Frontend	The frontend component of an API definition representing the entry point of an API request.
cmdb_ci_api_gateway	API Gateway	A service that manages APIs to facilitate the interactions between applications, data, and clients.
cmdb_ci_api_product_bundle	API Product Bundle	API Product Bundles are a construct within API gateways and developer portals to

Table name	Label (Display name)	Table description
		represent a collection of one or more APIs for consumption by developers and applications. Some platforms use the term for an API product alone.
cmdb_ci_apigee_api_gateway	Apigee API Gateway	An API Gateway service provided by Google Cloud platform for hosting and managing APIs.
cmdb_ci_appl_ai_application	AI Model Application	AI software applications that can run on various platforms such as Linux, Windows, Docker containers, or Kubernetes (K8) clusters. These platforms support diverse AI workloads, including machine learning models, data analytics, and intelligent services or AI enabled applications.
cmdb_ci_appl_ibm_cics_program	IBM CICS Program	IBM CICS Program is a family of mixed-language application that provide transaction management and connectivity for applications on IBM mainframe systems under z/OS and z/VSE.
cmdb_ci_appl_ibm_cics_region	IBM CICS Region	CICS Region is a named collection of resources that are controlled by CICS as a unit
cmdb_ci_appl_ibm_cics_transaction	IBM CICS Transaction	A CICS transaction consists of an item of processing that can be run by one or more application programs
cmdb_ci_appl_ibm_cicsplex	IBM CICSplex	A CICSplex is any grouping of CICS systems to manage and manipulate as a single entity
cmdb_ci_appl_ibm_mq_channel	IBM MQ Channel	In IBM MQ, a channel is a unidirectional communication link that allows two queue managers to connect over a network and transmit messages between each other.
cmdb_ci_appl_ibm_wmq	IBM MQ Manager	IBM Websphere MQ software.
cmdb_ci_appl_ibm_wmq_queue	IBM MQ Queue	Inner module of IBM WebSphere MQ software.
cmdb_ci_appl_ims_program	IMS Program	A program that runs within IMS. An IMS Program name is specified for each IMS Transaction that is defined.
cmdb_ci_appl_ims_region	IMS Subsystem Region	The IMS region provides the central point of control for an IMS subsystem. The IMS region provides the interface to z/OS for the operation of the IMS subsystem.
cmdb_ci_appl_ims_transaction	IMS Transaction	An IBM IMS transaction is a message that is sent to an application program. When defining a transaction to IMS, several characteristics can be identified such as: transaction codes, output limits, scheduling rules, and exceptions to those rules.
cmdb_ci_appl_mq_queue_alias	IBM MQ Queue Alias	An alias queue is an IBM MQ object that you can use to access another queue or a topic

Table name	Label (Display name)	Table description
cmdb_ci_appl_mq_queue_local	IBM MQ Queue Local	A local queue is a definition of both a queue and the set of messages that are associated with the queue. The queue manager that hosts the queue receives messages in its local queues.
cmdb_ci_appl_mq_queue_model	IBM MQ Queue Model	A model queue is a template for queues that you want the queue manager to create dynamically as required.
cmdb_ci_appl_mq_queue_remote	IBM MQ Queue Remote	Remote queue definitions are definitions on the local queue manager of queues that belong to another queue manager. To send a message to a queue on a remote queue manager, the sender queue manager must have a remote definition of the target queue.
cmdb_ci_aws_api_gateway	AWS API Gateway	An API Gateway service provided by Amazon Web Services (AWS) for hosting and managing APIs.
cmdb_ci_azure_api_mgmt	Azure API Management	An API Management service provided by Microsoft Azure for hosting and managing APIs.
cmdb_ci_base_station_controller	Base Station Controller	A Base Station Controller (BSC) is a central unit in cellular network. It manages multiple base stations to handle call routing, resource allocation, and mobility management for efficient communication and seamless handover between stations.
cmdb_ci_baseband_unit	Baseband Unit	A Baseband Unit (BBU) is a wireless communication processing unit that converts digital data to analog signals for transmission, performing modulation, coding, and decoding for efficient data transfer and reliable communication in the network.
cmdb_ci_battery_distribution_fuse_bay	Battery Distribution Fuse Bay	A Battery Distribution Fuse Bay is a compartment that distributes power from batteries to circuits. Equipped with fuses or breakers for overcurrent and short-circuit protection, ensuring safe and controlled power distribution in electrical systems.
cmdb_ci_battery_distribution_fuse_panel	Battery Distribution Fuse Panel	A battery distribution fuse panel distributes power within an equipment holder (rack/cabinet) and connects to a Battery Distribution Bay.
cmdb_ci_boomi_api_gateway	Boomi API Gateway	An API Gateway service provided by Boomi for hosting and managing APIs.
cmdb_ci_bosh_component	BOSH Component	Base class for storing all BOSH Components.
cmdb_ci_bosh_deployment	BOSH Deployment	This class stores discovered BOSH Deployments. The collection of instructions and actions to provision a new system.

Table name	Label (Display name)	Table description
cmdb_ci_cable	Cable	A tangible physical media that encompasses one or more strands (optical or electrical). Cables are procured as asset and laid between sites to consume it.
cmdb_ci_call_content_delivery_unit	Call Content Delivery Unit	A Call Content Delivery Unit is a system or unit that is involved in the delivery or optimization of content related to voice communications or calls.
cmdb_ci_call_server	Call Server	A Call Server is a centralized communication system that manages telephony calls, handling call routing, setup, termination, and processing. It provides call control and features for efficient and reliable communication within a network.
cmdb_ci_certificate	Unique Certificate	A public key certificate in a X.509 standard format.
cmdb_ci_channel_bank	Channel Bank	A Channel Bank device converts multiple analog voice or data channels into digital format for transmission over a digital network. It enables efficient utilization of bandwidth and supports voice and data communication in a compact and scalable solution.
cmdb_ci_comm_hardware	Communication Hardware	Communication device information.
cmdb_ci_communication_distribution_panel	Communication Distribution Panel	A Communication Distribution Panel is a central hub that organizes and distributes communication connections, like phone lines and data cables within a building. This simplifies management and enhances communication infrastructure.
cmdb_ci_connection_medium	Connection Medium	Any connection medium used to connect two end points where A/Z termination can be site, equipment, or interface.
cmdb_ci_connection_service_instance	Connection Service Instance	A Connection Service Instance represents a network connection between two endpoints, crucial for end-to-end service delivery. It differs from Network Service Instances by representing the provisioned interconnection.
cmdb_ci_container_cabinet	Cabinet	A Cabinet is a physical enclosure that houses and secures network equipment. It provides organization, cooling, and connectivity for efficient telecom infrastructure operation.
cmdb_ci_container_multi_rack	Multi Rack	A Multi-rack is a modular rack system for housing and organizing network equipment. It offers flexibility, scalability, and efficient cable management. It enhances space utilization and facilitates easy equipment installation and maintenance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table name	Label (Display name)	Table description
cmdb_ci_container_rack	Equipment Rack	A Rack is a structured framework for housing network equipment. It provides organization, security, and efficient cable management. It optimizes space utilization and simplifies equipment installation and maintenance.
cmdb_ci_container_shelf	Container Shelf	A Shelf is a mountable platform for holding network equipment. It provides space-saving storage, organization, and easy access. It facilitates cable management and supports efficient equipment installation and maintenance.
cmdb_ci_container_slot	Slot	In the context of technology and hardware, a slot refers to modular space for inserting network modules. It enables flexible configuration and expansion of telecom equipment. It also streamlines installation and maintenance processes.
cmdb_ci_container_subslot	Subslot	A Subslot is a subdivision within a slot for additional module insertion. It allows further expansion and customization of telecom equipment and enhances flexibility and scalability in network configuration.
cmdb_ci_converged_infra	Converged Infrastructure	Devices that serve both a computing and networking function.
cmdb_ci_data_service_instance	Data Service Instance	A Data Service Instance extends a Service Instance and represents a logical instance of a data service that can persist structured and unstructured data, process data (pipeline) or retrieve data (data, search, query, etc.).
cmdb_ci_db_db2_sharing_group	DB2 Sharing Group	A collection of one or more Db2 subsystems that share Db2 data
cmdb_ci_db_db2_stored_procedure	DB2 Stored Procedure	A DB2 stored procedure is a compiled program that can run SQL statements and is stored on a local or remote DB2 Universal Database Server
cmdb_ci_db_ims_area	IMS Area	Data sets, called areas, with each area containing the entire data structure
cmdb_ci_db_ims_database	IMS Database	An IMS Database running within an IMS Subsystem (database instance)
cmdb_ci_db_ims_plex	IMS Plex	An IMSplex is made up of IMS and z/OS components that work together
cmdb_ci_db_ims_subsystem	IMS Subsystem	A control program that can be either online or batch and runs in a z/OS address space. It is a part of IBM's Information Management System (IMS). IMS systems help with the organization, storage, and retrieval of data.
cmdb_ci_deployed_marketplace_product	Deployed Marketplace Product	Cloud deployed marketplace product is a preconfigured cloud service or application,

		that simplifies deployment and streamlining access to third-party solutions in cloud environments.
cmdb_ci_deployment_component	Deployment Component	Base class for storing all Deployment Components.
cmdb_ci_digital_cross_connect_patch_panel	Digital Cross Connect Patch Panel	A Digital Cross Connect Patch Panel facilitates the routing and management of digital signals in telecom networks, allowing flexible connections between network elements, enhancing signal flow, and simplifying network maintenance and troubleshooting.
cmdb_ci_digital_cross_connect_system	Digital Cross Connect System	A Digital Cross Connect System is telecommunications device that routes and manages digital signals in networks, optimizing connectivity for efficient data transmission. Enhances performance with quick provisioning and flexible connection rearrangement.
cmdb_ci_digital_distribution_panel	Digital Distribution Panel	A Digital Distribution Panel is a centralized point for distributing digital signals. It enables organized routing, testing, and maintenance of digital connections. Facilitates efficient and reliable distribution of digital signals within the network
cmdb_ci_display	Display Device	Connected Device that displays images.
cmdb_ci_distributed_antenna_system_controller	Distributed Antenna System Controller	A Distributed Antenna System (DAS) Controller is a centralized equipment that manages distributed antenna systems. It controls signal distribution, monitors performance, and optimizes coverage for improved wireless connectivity in large buildings or venues.
cmdb_ci_distributed_antenna_system_remote	Distributed Antenna System Remote	Distributed Antenna System (DAS) Remote is a device that extends cellular coverage. It receives, amplifies, and distributes signals from a central DAS hub, eliminating dead zones and improving wireless connectivity in large buildings or outdoor areas.
cmdb_ci_dns_domain_info	DNS Domain Info	Domain Name allows you to trace the ownership and tenure of domain name details from tools like whois and DNS lookup tools.
cmdb_ci_dns_resource_records	DNS Resource Records	DNS record detail from Domain Name Server (DNS) for a WWW Domain
cmdb_ci_dns_zone_a_records	DNS Zone A Records	DNS Zone A records hold only IPv4 addresses.
cmdb_ci_dns_zone_aaaa_record	DNS Zone AAAA Records	DNS Zone AAAA records hold only IPv6 addresses
cmdb_ci_dns_zone_alias_record	DNS Zone Alias	An ALIAS record that points a domain name to a hostname instead of an IP address.

Table name	Label (Display name)	Table description
cmdb_ci_dns_zone_cname	DNS Zone CNAME	A canonical name (CNAME) record points from an alias domain to a canonical domain
cmdb_ci_drone	Drone	Unmanned Connected Device with mobility.
cmdb_ci_dslam	DSLAM	A Digital Subscriber Line Access Multiplexer (DSLAM) centralizes DSL connections and optimizes bandwidth. It enables reliable and high-speed internet access for multiple users. It enhances network performance and user experience.
cmdb_ci_echo_cancellation_system	Echo Cancellation System	An Echo Cancellation System is a device that minimizes echo in audio communication by removing reflected signals. Ensures clear and high-quality sound transmission, enhancing the overall audio experience.
cmdb_ci_edge_appl	Edge Application	Thick client software purpose built and deployed typically at a place closer to where data is being generated, leveraging local computing resources to execute tasks closer to the data source enabling processing at greater speeds and volumes, minimizing latency and enhancing responsiveness leading to greater action-led results in real time. Edge Application is one component in larger system and it will send the resulting small amount of data to the server counterpart. Typically large number of Edge Applications are deployed and overall load on the server side component is reduced as majority processing is done at Edge application and minor results are sent to server side to either surface it to customer or to perform aggregations and take actions.Examples of Edge Applications include purpose built software deployed smart grids to send alarms, action oriented small set of data to server side system, purpose built software at the retail store for performing retail analytics at store and sending minimal results such as events, purpose built thick client application built for industrial IoT applications where application is in close proximity to data being generated and doing the computations to finally send out the resulting small dataset to the server side component to source to customers or to perform aggregations. Though generic purpose age
cmdb_ci_edge_device	Edge Device	Edge device on either the provider's edge or at customer branch locations.
cmdb_ci_edge_rack	Edge Rack	Infrastructure on the provider or customer edge.

Table name	Label (Display name)	Table description
cmdb_ci_enode_b	EnodeB	An EnodeB, short for Evolved Node B, is an LTE base station. It connects user devices to the LTE core network, providing wireless access, managing radio resources, and enabling high-speed data transmission for cellular communication.
cmdb_ci_fabric_interconnect	Fabric Interconnect	A Fabric Interconnect is a networking component that connects servers, storage devices, and network resources, enabling high-speed communication, centralized management, and efficient data transfer within a data center environment.
cmdb_ci_facility_service_instance	Facility Service Instance	A Facility Service Instance extends a Service Instance, representing a logical instance of a service tied to the operations of a facility, such as an office building, residential building, manufacturing plant, or operations control center.
cmdb_ci_fan_module	Fan Shelf	A Fan Shelf is a rack-mounted unit with built-in fans for equipment cooling. It ensures optimal temperature management, prevents overheating, and enhances the reliability and performance of network devices.
cmdb_ci_fiber_cross_connect_panel	Fiber Cross Connect Panel	A Fiber Cross Connect Panel is a device used in organizing and managing fiber connections. It enables easy interconnection, testing, and maintenance of fiber-optic cables. It ensures efficient routing for a reliable and scalable network infrastructure.
cmdb_ci_fiber_distribution_panel	Fiber Distribution Panel	A Fiber Panel is a component used in fiber optic networks that provides termination and connection points for fiber optic cables, allowing for efficient routing and management of optical signals, enhancing the performance and reliability of the network.
cmdb_ci_fiber_serving_terminal	Fiber Serving Terminal	A Fiber Serving Terminal (FST) connects fiber optic cables from the service provider to subscribers, enabling high-speed data transmission and delivery of services like internet and phone, enhancing connectivity and network performance for end-users.
cmdb_ci_filler_component	Filler Component	A flat metal or plastic cover for empty spots/slots in a rack or device. It helps separate cold and hot air zones, prevents dust from entering the chassis, and ensures proper airflow through the chassis or rack.
cmdb_ci_fortinet_firewall_interface	Fortinet Firewall Interface	Fortinet firewall interface connects network segments, allowing traffic flow while applying assigned security policies and configurations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table name	Label (Display name)	Table description
cmdb_ci_fortinet_firewall_policy	Fortinet Firewall Policy	Fortinet firewall policy defines the security rules that control traffic flow between network interfaces, specifying conditions like source/ destination and services. It ensures granular traffic management and enforces security across network segments.
cmdb_ci_fortinet_vdom	Fortinet Virtual Domain	VDOM in a firewall represents a virtual instance within a physical firewall that enables independent security policies, routing, and configurations for different network segments. Each VDOM functions like a separate firewall, isolating traffic and rules.
cmdb_ci_function_ai	AI Function	AI SaaS applications deployed on public cloud platforms that offer scalable, on-demand services for machine learning, data processing, and AI-driven tasks, providing flexible solutions without the need for on-premises infrastructure management.
cmdb_ci_gnode_b	GnodeB	A GnodeB, or Next-Generation NodeB is a 5G base station. It connects user devices to the 5G core network, supporting ultra-fast data transfer, low latency, and massive device connectivity, revolutionizing mobile communication capabilities.
cmdb_ci_gpu	Graphics Processing Unit	The GPU helps handle graphics-related work like graphics, videos, and AI ML workloads. The GPU could be externally connected or internally installed in a computer. Typically characterized by number of cores and GPU memory.
cmdb_ci_handheld_computing_device	Handheld Computing Device	Hand held device running an operating system. Includes smart phones and tablets.
cmdb_ci_hc_device	Healthcare device	Base class for various clinical equipments.
cmdb_ci_heat_baffle	Heat Baffle	Represents hardware used to help direct rising hot air away from equipment.
cmdb_ci_hmc_server	IBM HMC Server	IBM console that manages frames and assigns lpars to pools.
cmdb_ci_hmi	Human Machine Interface [DEPRECATED]	DEPRECATED — OT assets moved to cmdb_ci_ot to support broader use cases. Instead use cmdb_ci_ot_hmi
cmdb_ci_ibm_api_connect	IBM API Connect	An API Gateway service provided by IBM for hosting and managing APIs.
cmdb_ci_ibm_frame	IBM Frame	IBM physical machine with considerable resources that can be virtualized.
cmdb_ci_ibm_i_server	IBM i Server	A fully integrated operating system for IBM Power servers

Table name	Label (Display name)	Table description
cmdb_ci_ibm_vios_server	IBM viOS Server	A Virtual I/O Server that facilitates the sharing of physical I/O resources between client logical partitions within the server
cmdb_ci_ibm_ztpf_server	IBM zTPF Server	The z/Transaction Processing Facility operating system is a special-purpose system that is used by companies with very high transaction volume
cmdb_ci_ibm_zvm_server	IBM zVM Server	IBM z/VM is an operating system with security-rich and scalable hypervisor and virtualization technology designed to run guest servers
cmdb_ci_ibm_zvse_server	IBM zVSE Server	The z/VSE operating system provides a smaller, less complex base for batch processing and transaction processing
cmdb_ci_imaging	Imaging Device	Connected device that captures images.
cmdb_ci_incomplete_ip	Incomplete IP Identified Device	Devices that can be identified only by IP Address.
cmdb_ci_interface_card	Network Interface Card	This class stores interface cards installed in slots in edge devices enabling a clear relationship between the edge device and cards installed within that network chassis.
cmdb_ci_iot	IoT Device	Parent table that contains Internet of Things device types.
cmdb_ci_ipdslam	IP DSLAM	An Internet Protocol Digital Subscriber Line Access Multiplexer(IP DSLAM) centralizes IP-based DSL connections, optimizing bandwidth. It enables high-speed and reliable internet access for multiple users. Enhances network performance and user experience
cmdb_ci_keyboard_video_mouse_switch	Keyboard Video Mouse Switch	A Keyboard Video Mouse Switch (KVM Switch) is a device for controlling multiple computers using a single set of keyboard, video, and mouse. It simplifies management and improves efficiency in multi-system environments.
cmdb_ci_kong_gateway	Kong Gateway	An API Gateway service provided by Kong for hosting APIs.
cmdb_ci_kong_lb	Kong Load Balancer	A built-in load balancer in the Kong Gateway for distributing API requests across multiple Kong targets.
cmdb_ci_kong_target	Kong Target	An individual backend server that identifies an instance of a backend service configured in a Kong Gateway.
cmdb_ci_kubernetes_node_pool	Kubernetes Node Pool	A Node Pool class that belongs to a Kubernetes cluster in cloud environment.
cmdb_ci_logical_composite	Logical Composite	Logical device that is composed of multiple distinct entities that are aggregated to provide a function. The Logical Composite is not a

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table name	Label (Display name)	Table description
		physical device separate from its constituent entities. The entities that the logical composite is composed of are themselves typically realized as separate CIs with relationships to the Logical Composite CI.
cmdb_ci_lpar_instance	IBM LPAR Instance	IBM logical partition representing the virtual aspect of the OS.
cmdb_ci_lpar_resource	LPAR Resource	Resources of an LPAR instance.
cmdb_ci_mainframe	IBM Mainframe	High performance computers with large amounts of memory and processors that process billions of simple calculations and transactions in real time.
cmdb_ci_mainframe_lpar	IBM Mainframe LPAR	A Logical Partition (LPAR) is a subset of an IBM Mainframe computer.
cmdb_ci_mainframe_sysplex	Mainframe Sysplex	A collection of z/OS systems that cooperate using certain hardware and software products to process work
cmdb_ci_managed_api	Managed API	An API object dependent on an API Gateway and identified through the Gateway.
cmdb_ci_manufacturing	Manufacturing Device [DEPRECATED]	DEPRECATED class — OT assets moved to cmdb_ci_ot to support broader use cases. Instead, use cmdb_ci_ot as the base class or other generic child classes as appropriate.
cmdb_ci_med_clinical_device	Clinical Device	Devices used in a clinical setting for overall management, medical staff, and patient aid.
cmdb_ci_med_dental	Dental Equipment	Dental equipment and supplies as defined by UNSPSC family code 42150000.
cmdb_ci_med_device	Medical device	Class of Medical devices that are used for patient treatment.
cmdb_ci_med_diagnostic_imaging	Diagnostic Imaging	Specialized equipment used in medicine to visualize the internal structures of the body.
cmdb_ci_med_lab_equipment	Lab Equipment	Specialized tools, apparatus, and instruments used in scientific research, experiments, and analysis.
cmdb_ci_med_patient_implant	Patient Implant	Medical devices or tissues that are surgically placed inside a patient's body.
cmdb_ci_med_patient_monitoring	Patient Monitoring	Monitors and tracks various physiological parameters of a patient. Monitors heart rate, blood pressure, oxygen levels, respiratory rate, and so on.
cmdb_ci_med_surgical_instrument	Surgical Instrument	Devices used during surgical interventions. Life support tools and tools to assist surgeons in precise and controlled maneuvers.
cmdb_ci_med_therapeutic_device	Therapeutic Device	Specialized tools designed to aid in the treatment, rehabilitation, or management of health conditions. Can range from

Table name	Label (Display name)	Table description
		orthopedic supports to cardiac implants and neurostimulation devices.
cmdb_ci_media_converter	Media Converter	A Media Converter is a device that converts signals between different network media types (e.g., fiber to copper), enabling seamless connectivity and extending network reach. It facilitates smooth communication in diverse network environments.
cmdb_ci_media_gateway	Media Gateway	A Media Gateway is a device that connects different communication networks, converting signals between different protocols or media types. It enables seamless interoperability and facilitates smooth communication across diverse networks.
cmdb_ci_medical	Medical Device [DEPRECATED]	DEPRECATED class — Instead, use cmdb_ci_med_device
cmdb_ci_microwave_radio_equipment	Microwave Radio Equipment	A wireless technology for high-speed data transmission over long distances using microwave frequencies. It is reliable, efficient, and widely used in telecom and backhaul networks for point-to-point connectivity.
cmdb_ci_mixed_node_b	Mixed NodeB	Telecommunications equipment that supports multiple radio access technologies, typically combining both 2G and 3G technologies in a single base station.
cmdb_ci_mobile_switching_center	Mobile Switching Center	A Mobile Switching Center (MSC) is a core component in a cellular network, connecting mobile devices to the rest of the network. It handles call routing, switching, and mobility management, facilitating seamless communication.
cmdb_ci_mobility_management_entity	Mobility Management Entity	A Mobility Management Entity (MME) manages mobility-related functions in a wireless network. It handles tasks such as user authentication, tracking, and handover between cells. Enables seamless mobility and efficient utilization of network resources.
cmdb_ci_monitoring_unit	Monitoring Unit Shelf	A Monitoring Unit Shelf is a rack-mountable platform for centralized monitoring of network devices. It streamlines monitoring, troubleshooting, and maintenance tasks and also enhances network performance and reliability
cmdb_ci_multi_service_network_router	Multi Service Network Router	A versatile networking router device that supports various networking services, such as voice, video, and data, providing efficient and reliable communication across multiple networks and protocols.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table name	Label (Display name)	Table description
cmdb_ci_multi_service_switch	Multi Service Switch	A network device that aggregates and routes multiple types of traffic (voice, data, video) in a network. Provides efficient and flexible connectivity, ensuring seamless communication and optimized resource utilization.
cmdb_ci_multimedia	Multimedia Device	A connected device that assists in the generation or delivery of media content.
cmdb_ci_multiplexer	Multiplexer	A Multiplexer (MUX) is a device that combines signals into one transmission to optimize bandwidth. It simultaneously transmits multiple data streams for efficient communication in various applications. It also enhances network performance.
cmdb_ci_network_circuit	Network Circuit	A discrete path between two or more points that enables telecommunication connectivity services.
cmdb_ci_network_controller	Network Controller	Network controllers are responsible for orchestrating network functions.
cmdb_ci_network_interface_device	Network Interface Device	A Network Interface Device (NID) connects customer equipment to the service provider's network. It serves as a demarcation point, ensuring reliable and secure connectivity for end-users. It provides physical and logical interface for communication services.
cmdb_ci_network_interface_unit	Network Interface Unit	A Network Interface Unit (NIU) connects customer devices to the network. Acts as a demarcation point, enabling reliable and secure connectivity. It provides interface and protocols for seamless communication between customer equipment and the network.
cmdb_ci_network_link	Network Link	Physical network links in the provider's network and up to the customer edge. (for example, fiber, coax, an so on)
cmdb_ci_network_monitoring	Network Monitoring	A Network Monitoring Unit is a dedicated device or software that continuously monitors network traffic, collects data, and provides real-time insights and alerts for effective network management, troubleshooting, and security analysis.
cmdb_ci_network_node	Network Node	General class to capture network infrastructure when a specific CI class doesn't exist.
cmdb_ci_network_port	Network Port	Network ports that are contained in interface cards or independently in access class network chassis.
cmdb_ci_network_service_instance	Network Service Instance	A specific deployed, provisioned and/or configured instance of a set of network

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table name	Label (Display name)	Table description
		services that in turn are based on Network Functions.
cmdb_ci_network_tap	Network Tap	A passive device that captures and copies network traffic for monitoring and analysis. Provides visibility without interrupting flow, aiding performance monitoring, security analysis, and troubleshooting.
cmdb_ci_network_testing_unit	Network Testing Unit	A device for assessing network performance, reliability, and security. Conducts tests like bandwidth measurement, latency analysis, and vulnerability scanning, ensuring optimal functioning and identifying potential issues.
cmdb_ci_network_timing	Network Timing	A Network Timing device, also known as network time server, synchronizes clocks across a network, ensuring accurate data transmission, synchronization, and performance optimization for network devices and systems.
cmdb_ci_network_topology	Network Topology	Network topology describes the physical and logical structure of a network.
cmdb_ci_ni_logical_path	Logical connection	Intangible entity between two active interfaces. These are formed through multiple network links (like physical connections / microwave links) or other logical connections or combination of all
cmdb_ci_ni_physical_link	Physical connection	A Network Link, Configured Connection between two end points realized via Connection Medium (for example a cable, a wireless connection, a strand, and so on).
cmdb_ci_nids	Network Intrusion Detection System	The NIDS class builds the relationships between passive network monitoring appliances and the devices on the network that it discovers.
cmdb_ci_nutanix_cluster	Nutanix Cluster	Cluster made up of the physical nodes running Nutanix software.
cmdb_ci_nutanix_controller_vm	Nutanix Controller VM	Nutanix controller virtual machine that is present in each node and that provides the storage clustering and management capabilities.
cmdb_ci_nutanix_host	Nutanix Host	Physical host on which all the virtual machines run.
cmdb_ci_nutanix_storage_container	Nutanix Storage Container	Subset of Nutanix storage pool used to apply policies such as reserved capacity, replication factor, and storage optimization options.
cmdb_ci_nutanix_storage_pool	Nutanix Storage Pool	Grouping of physical disks in a Nutanix cluster that is typically used to create physical separation between virtual machines.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table name	Label (Display name)	Table description
cmdb_ci_nutanix_vm_instance	Nutanix Virtual Machine Instance	A virtual machine that runs on Nutanix infrastructure.
cmdb_ci_oe	Operational Equipment	This class is for industrial and manufacturing equipment, machines and tools that are directly involved in the production process of goods and services. These CIs are sometimes controlled by Operational Technology (OT) CIs.
cmdb_ci_operational_process_service_instance	Operational Process Service Instance	An Operational Process Service Instance extends a Service Instance, representing a logical instance of an operational process involving interconnected devices and equipment. The process may be autonomous but typically includes front-line employees.
cmdb_ci_optical_carrier_transport_node	Optical Carrier Transport Node	An Optical Carrier Transport Node transmits and switches high-capacity optical signals in transport networks. It facilitates efficient and reliable transport of data, voice, and video traffic. Enhances network performance and scalability
cmdb_ci_optical_fiber_cable	Optical Fiber Cable	Entity representing a connection medium that is made by a set of Optical Fiber. This class shall capture all cables made of Optical Fiber strands.
cmdb_ci_optical_fiber_strand	Optical Fiber Strand	Entity representing a connection medium that is made of a single fibre strand. This class shall capture all strands made of optical fiber.
cmdb_ci_optical_line_amplifier	Optical Line Amplifier	An Optical Line Amplifier is a device that amplifies optical signals in fiber-optic systems for long-distance transmission. It enhances signal strength without electrical conversion, ensuring efficient and reliable data transfer.
cmdb_ci_optical_line_terminal	OLT	An Optical Line Terminal (OLT) is an endpoint device in passive optical networks. It aggregates and distributes data, voice, and video signals. It also provides high-speed fiber connectivity to multiple subscribers.
cmdb_ci_optical_network_terminal	ONT	An Optical Network Terminal (ONT) is a device used in fiber optic networks to convert optical signals into electrical signals, enabling the delivery of high-speed internet, phone, and television services to end-users.
cmdb_ci_optical_network_unit	ONU	An Optical Network Unit (ONU) is a customer-end device in fiber optic networks. Converts optical signals to electrical signals, providing connectivity for devices to access high-speed internet, voice, and video services in homes or businesses.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table name	Label (Display name)	Table description
cmdb_ci_optical_splitter	Optical Splitter	An Optical Splitter also known as beam splitter divides incoming optical signals into multiple outputs. It enables signal distribution to multiple devices or network branches. It facilitates efficient sharing of optical bandwidth in fiber-optic networks.
cmdb_ci_ot	Operational Technology (OT)	Base class for OT technology used for industrial control, for instance in manufacturing.
cmdb_ci_ot_cnc	CNC	Computer Numerical Control — automated control of machining tools (such as drills, lathes, mills) and 3D printers
cmdb_ci_ot_control	OT Control System	Base class for industrial control systems (ICS), usually at Purdue Model Level 1 or 2.
cmdb_ci_ot_control_module	OT Control Module	Module connected to an OT Control System like a PLC or DCS.
cmdb_ci_ot_dcs	DCS	Distributed Control System — control achieved by intelligence that is distributed about the process to be controlled, rather than by a centrally located single unit
cmdb_ci_ot_dpu	DPU	Distributed Processing Units — ICS on a dedicated network with each DPU handling thousands of points of I/O
cmdb_ci_ot_ews	EWS	Engineering Workstation — computing platform for configuration, maintenance, and diagnostics of ICS applications and other control system equipment.
cmdb_ci_ot_field_device	OT Field Device	OT Input and Output Devices at Purdue Model Level 0
cmdb_ci_ot_historian	Historian	Data Historian — a centralized database supporting data analysis for industrial processes
cmdb_ci_ot_hmi	HMI	Human-Machine Interface — hardware or software through which an operator interacts with a controller
cmdb_ci_ot_ied	IED	Intelligent Electronic Device — receive or send data/control from or to an external source — for Power Grids
cmdb_ci_ot_industrial_3d_printer	Industrial 3D Printer	Device used in additive manufacturing for the construction of a three-dimensional object from a CAD model or a digital 3D model
cmdb_ci_ot_industrial_actuator	Industrial Actuator	Component of a machine that is responsible for moving and controlling a mechanism, like opening a valve.
cmdb_ci_ot_industrial_drive	Industrial Drive	Equipment used to control the speed of machinery — may be mechanical electromechanical, hydraulic, or electronic.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table name	Label (Display name)	Table description
cmdb_ci_ot_industrial_robot	Industrial Robot	Robotic system used for manufacturing.
cmdb_ci_ot_industrial_sensor	Industrial Sensor	Sensor that monitors the health of equipment.
cmdb_ci_ot_opc_client	OPC Client	Software module that enables applications to acquire data from an OPC Server or conduct supervisory control using an OPC Server.
cmdb_ci_ot_opc_server	OPC Server	Software module that enables applications to provide their data to the outside world using OPC.
cmdb_ci_ot_plc	PLC	Programmable Logic Controller — used to control OT devices
cmdb_ci_ot_qics	Quality Inspection Control System	Control systems that assist specifically in quality and inspection functions.
cmdb_ci_ot_rtu	RTU	Remote Terminal Unit — special purpose data acquisition and control unit designed to support DCS and SCADA remote stations
cmdb_ci_ot_scada_client	SCADA Client	Supervisory Control and Data Acquisition — client that allows an operator to manage a SCADA server
cmdb_ci_ot_scada_server	SCADA Server	Supervisory Control and Data Acquisition — system capable of gathering and processing data and applying operational controls over long distance
cmdb_ci_ot_supervisory	OT Supervisory System	Base class for supervisory systems, usually at Purdue Model Level 2 or 3
cmdb_ci_ot_system_service	OT System Service	Category of technology and systems that are used to manage, control, and monitor physical processes, machinery, and industrial operations.
cmdb_ci_payment	Payment Device	Connected Device that allows for purchasing goods or services.
cmdb_ci_plc	Programmable Logic Controller [DEPRECATED]	DEPRECATED class — OT assets moved to cmdb_ci_ot to support broader use cases. Instead, use cmdb_ci_ot_plc
cmdb_ci_power_over_ethernet_device	Power Over Ethernet Device	A Power Over Ethernet (PoE) device allows the transmission of power and data over a single Ethernet cable, simplifying installation and reducing the need for separate power sources.
cmdb_ci_primary_flexibility_point	Primary Flexibility Point	A Primary Flexibility Point (PFP) is a central location in a network where multiple cables or conduits converge, allowing for flexible redistribution and reconfiguration of network connections, optimizing network management and scalability.
cmdb_ci_private_branch_exchange	Private Branch Exchange	A Private Branch Exchange (PBX) is a telephone system that enables internal communication within an organization,

Table name	Label (Display name)	Table description
		allowing users to make calls, share extensions, and manage incoming/outgoing calls without relying on individual phone lines.
cmdb_ci_processing_unit	Processing Unit	Base class for various processing units in a computing system. It encapsulates core attributes and functionalities common to all units, serving as a foundation for specialized subclasses like GPUs, CPUs, and other processors.
cmdb_ci_processor_pool	IBM HMC Processor pool	IBM shared pool used to allocate processors to a group of LPARs.
cmdb_ci_protocol_converter	Protocol Converter	Device used to convert standard or proprietary protocol of one device to the protocol suitable for the other device or tools to achieve the interoperability.
cmdb_ci_provider_device	Provider Device	The point of connectivity connecting the SD WAN Edge Port and the service providers core network.
cmdb_ci_radio_access_network	Radio Access Network	A part of a mobile system connecting user devices to the core network. It comprises base stations, antennas, enabling wireless communication, and access to mobile services.
cmdb_ci_radio_control_hardware	Radio Control Hardware	Device that helps in managing radio communication systems. It includes transceivers, antennas, amplifiers, and switches, ensuring efficient and reliable wireless connectivity.
cmdb_ci_radio_network_controller	Radio Network Controller (RNC)	The RNC is a functional element of the UMTS RNS (Radio Network System) which controls a number of NodeBs. Responsibilities of the RNC include radio resource management and control, air interface security, mobility procedures, and system synchronization.
cmdb_ci_radio_transmission_hardware	Radio Transmission Hardware	An equipment for wireless signal transmission that facilitates wireless communication over various frequencies and ranges. It includes transmitters, receivers, antennas, amplifiers, and related components.
cmdb_ci_remote_radio_unit	Remote Radio Unit	A Remote Radio Unit also known as Remote Radio Head (RRH) is a device placed at the antenna site, connects to baseband unit via fiber. Converts baseband signals to radio signals for wireless transmission, enhancing network flexibility and performance.
cmdb_ci_repeater	Repeater	A Repeater is a device that amplifies and retransmits wireless signals to extend coverage range. It receives weak signals, boosts them, and rebroadcasts, enhancing

Table name	Label (Display name)	Table description
		signal strength and improving communication reliability in areas with limited reception.
cmdb_ci_residential_gateway	Residential Gateway	A Residential Gateway is a device that combines modem, router, and firewall functionalities in a single device, enabling internet access, local network connectivity, and security for home users.
cmdb_ci_rj45_patch_panel	RJ45 Patch Panel	A RJ45 Patch Panel is a hardware component that organizes and manages Ethernet connections, serving as a central hub for terminating and patching network cables, simplifying network configuration, maintenance, and troubleshooting.
cmdb_ci_sap_sid		
cmdb_ci_sbc	Single Board Computing	Single Board Computing device such as a Raspberry Pi.
cmdb_ci_sdwan_controller	SDWAN Controller	Device that provides physical or virtual device management for all SD-WAN Edges.
cmdb_ci_sdwan_edge	SDWAN Edge	Network functions (physical or virtual) that are located between the Underlay Connectivity Service and SD-WAN Service.
cmdb_ci_sdwan_port	SDWAN Port	The socket on a network device that connects to an external network.
cmdb_ci_security	Security Device	Connected Device that serves a Security function such as a badge reader.
cmdb_ci_service_aggregation_router	Service Aggregation Router	A Service Aggregation Router is a network device that centralizes network services in one device, simplifying management by aggregating traffic from multiple sources, improving efficiency and reducing complexity.
cmdb_ci_service_control_point	Service Control Point (SCP)	SCPs in the Signaling System 7 (SS7) network are responsible for routing calls and managing special features.
cmdb_ci_service_switching_point	Service Switching Point (SSP)	Switch in a telecommunications network that sends a query to a central database called a service control point (SCP) via the SS7 network to determine how a TDM call can be routed. SSPs can be part of a voice switch or a separate computer connected to it.
cmdb_ci_serving_area_interface	Serving Area Interface	A Serving Area Interface (SAI) is the connection point between a service provider's network and customer premises, enabling the delivery of services like internet, telephony, and television, ensuring efficient communication and connectivity.
cmdb_ci_serving_gprs_support_node	Serving GPRS Support Node	Serving General Packet Radio Service (GPRS) Support Node (SGSN). S4 is the interface

Table name	Label (Display name)	Table description
		between the SGSN and Serving Gateway (SGW).
cmdb_ci_session_border_controller	Session Border Controller (SBC)	Protects and regulates IP communication. Deployed at the network borders between IP networks like a service provider and its customers. Regulates real-time communications include VoIP, IP video, and text chat. Examples: Oracle 6350, Oracle 4250
cmdb_ci_signal_transfer_point	Signal Transfer Point	A Signal Transfer Point (STP) is a telecommunications network element that routes signaling messages in telecommunication networks, facilitating smooth communication between service providers and enabling seamless connectivity for different services.
cmdb_ci_sim_card	SIM Card	SIM Cards used in mobility devices including phones, tablets, and mobility gateways.
cmdb_ci_small_cell_radio_gateway	Small Cell Radio Gateway	A device that connects small cell base stations to the core network. It manages signal transmission, integrating and enhancing wireless communication in densely populated areas or indoor environments.
cmdb_ci_small_cell_radio_node	Small Cell Radio Node	A compact wireless communication device that enhances network capacity and coverage by providing localized cellular connectivity in areas with high user density or weak signal strength
cmdb_ci_splice_closure	Splice Closure	A device that seals and protects a communications splice, such as a fiber optic splice. For example joining two fiber strands into a single, continuous, physical fiber optic strand.
cmdb_ci_strand	Strand	A tangible entity that defines the capacity of a cable. One or more strands are used to form a physical connection. Strands can be spliced to create longer or extended physical connections. Strands shall be connected to an interface or left open.
cmdb_ci_telco_control_component	Control Component	Device in a computer hardware component that creates an interface between a computer main system motherboard and other telecom components. Some will be integrated directly into the motherboard, while others may be added on as expansion devices.
cmdb_ci_topology	Topology	Generic class to represent the arrangement of a set of CIs (equipment or connections).
cmdb_ci_transmission_control_unit	Transmission Control Unit (TCU)	In a 2G radio network the transmission control unit (TCU) encodes and decodes speech as well as handling data rate adaptation. The TCU

Table name	Label (Display name)	Table description
		handles translation between 13 kbits/s and 64 kbits/s.
cmdb_ci_transport	Transport Type	Types of transportation that contain interconnected technology.
cmdb_ci_tyk_api_gateway	Tyk API Gateway	An API Gateway service provided by Tyk for hosting and managing APIs.
cmdb_ci_unclassified_hardware	Unclassified Hardware	Hardware Devices that lack enough information to classify properly.
cmdb_ci_universal_customer_premises_equipment	Universal Customer Premises Equipment (uCPE)	General purpose network devices located at the customer edge. Platform that enables virtual functions. Contrast with purpose-built CPE devices provided by the same hardware vendor. Examples: Juniper NFX250-S2, Silicom Connectivity Solutions 80500-015
cmdb_ci_unmatched_api_endpoint	Unmatched API Endpoint	An API endpoint that doesn't have sufficient information for populating the API and API Component classes.
cmdb_ci_v35_patch_panel	V.35 Patch Panel	A V.35 Patch Panel is a centralized termination point for V.35 connections. Organizes, tests, and maintains V.35 interfaces. Enables efficient connectivity and management of V.35 networks, ensuring reliable data transmission and streamlined operations.
cmdb_ci_vms_appl	Video Management System	A Video Management System (VMS) is a software-based platform designed to manage and control video surveillance cameras, recording devices, and other security components. It is commonly used in large-scale surveillance and security monitoring.
cmdb_ci_voice_activity_detection_equipment	Voice Activity Detection Equipment	A Voice Activity Detection Equipment detects presence or absence of human speech in audio signals. It enables efficient utilization of resources and enhances audio processing by activating or deactivating specific functions based on voice activity.
cmdb_ci_voice_gateway	Voice Gateway	A Voice Gateway is a device that connects traditional phone systems to IP networks, enabling voice communication. It converts analog voice signals to digital data, integrating voice services with IP-based systems.
cmdb_ci_voice_switch	Voice Switch	Represents a large-scale computer system that is used to switch Time Division Multiplexer (TDM)-based, circuit-switched telephone calls. An example is a Class-5 telephone switch in the public switched telephone network (PSTN) that serves calling features.
cmdb_ci_voicemail_equipment	Voicemail Equipment	A Voicemail Equipment refers to hardware that stores and retrieves voice messages in telecom networks, allowing users to receive

Table name	Label (Display name)	Table description
		and save messages when unavailable, enhancing communication efficiency and preventing missed messages.
cmdb_ci_wdm	WDM	A Wavelength Division Multiplexing (WDM) transmits multiple signals of different wavelengths on a single fiber. It increases data capacity and optimizes bandwidth. It enables efficient and high-speed communication in optical networks.
cmdb_ci_wearable	Wearable Technology	Connected Device that is worn by a person. For example, a smart watch.
cmdb_ci_web_acl	Web ACL	The WebACL class represents ACLs for CloudFront, API Gateway REST APIs, Application Load Balancers, AppSync GraphQL APIs, Cognito user pools, App Runner services, AWS Verified Access, and Azure Front Door Application Gateway.
cmdb_ci_webseal_backend_server	Webseal Backend Server	Discovered IBM WebSEAL Backend Servers. Represent servers used by WebSEAL for serving the web content.
cmdb_ci_webseal_junction	Webseal Junction	Discovered IBM WebSEAL Junctions. A WebSEAL Junction is an HTTP or HTTPS connection between a front-end WebSEAL server and a back-end Web application server.
cmdb_ci_webseal_reverse_proxy	Webseal Reverse Proxy	Discovered IBM WebSEAL Reverse Proxies. Generally WebSEAL acts as a reverse web proxy by receiving HTTP/HTTPS requests from a web browser and delivering content from its own web server or from junctioned back-end web application servers.
cmdb_ci_wireless_sector	Wireless Sector	A unit of cellular coverage area.

CMDB APIs (CMDB SDK)

Use CMDB APIs to create, update, and read operations on the CMDB. Domain separation is supported in CMDB APIs.

CMDB APIs (CMDB SDK)

Use the following CMDB APIs to create, update, and read operations on the CMDB:

- CMDBGroupAPI - Scoped
- CMDBTransformUtil - Global
- CMDBUtil - Global
- IdentificationEngineScriptableApi
- IdentificationEngine - Scoped

Domain separation in CMDB APIs

Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

CMDB APIs are used for accessing the CMDB from a script. CMDB stores the CI and relation information; CMDB is domain separated.

CMDB APIs support the following operations:

- Create a new CI:

  This operation goes through the Identification and Reconciliation Engine which supports domain separation when creating a CI. The domain of the caller is used for this operation.

- Update an existing CI:

  This operation goes through the Identification and Reconciliation Engine which supports domain separation when creating a CI. The domain of the caller is used for this operation.

- Create/Delete relations:

  The cmdb_rel_ci table is not domain separated.

- Query CMDB CI/Query CMDB table:

  Results are filtered by the domain(s) visible to the caller.

- Query CMDB metadata table:

  Metadata information is not domain separated.

Setting up domain separation for CMDB APIs

If domain separation is enabled for CMDB, then it is also available for CMDB APIs.

Data separation

Data is stored and domain separated in CMDB. There is no additional work needed from the CMDB API perspective.

Configuring a domain-separated environment

The configuration is done at the CMDB level.

If a domain column is present for base system application tables

See the Domain separation in CMDB Health topic.

Tenant domains and application data

There is no application-specific data to manage with CMDB.

Quick start tests for Configuration Management Database (CMDB)

Validate that Configuration Management Database (CMDB) still works after you make any configuration change such as apply an upgrade or develop an application. Copy and customize these quick start tests to pass when using your instance-specific data.

Configuration Management Database (CMDB) quick start tests require activating the Configuration Management (CMDB) plugin (com.snc.cmdb) and the CMDB - ATF Tests plugin (com.snc.cmdb.atf).

CMDB BSM: Dependency Views test suite

Test suite to check functionality of Dependency Views APIs.

Test	Description	Release version
CMDB BSM: Dependency Views	Test functionality of Dependency Views APIs. These APIs retrieve Dependency Views map and associated map items such as context menu items, for a given CI sys_id and using itil user role.	New York

CMDB HEALTH: CMDB Health Dashboard test suite

Test suite to check whether CMDB CMDB Health Dashboard is functional at a basic level.

Test	Description	Release version
CMDB HEALTH: Health Job Status	Checks whether any CMDB Health dashboard jobs, which were started 30 or more days ago, are still in progress.	New York
CMDB HEALTH: CMDB Health Completeness/ Recommended	Checks whether the recommended metric (included in the CMDB Health completeness KPI) is fully functional. This test validates: • Creation of a health inclusion rule for the recommend metric. • Creation of a recommended field that satisfies the health inclusion rule. • Validate that the health inclusion rule is correctly applied to a test record with missing data in the recommended field.	New York

CMDB IRE: Identification Reconciliation Engine test suite

Test suite to check Identification and Reconciliation Engine (IRE) functionality.

Test	Description	Release version
CMDB IRE: IRE Validation	Validate CI identifiers and reconciliation definitions and check indexes for CI identifiers.	Madrid
CMDB IRE: Reconciliation Rule	Check operations on a reconciliation rule, in CI Class Manager, using itil and itil_admin roles. Operations include create, edit, and delete a reconciliation rule. Also, check for active and not active setting, and derived rules.	Paris
CMDB IRE: Identification Rule	Check operations on an identification rule, in CI Class Manager, using itil and itil_admin roles. Operations include create, edit, and delete an identification rule. Also, check for active and not active setting, and derived rules.	Paris

CMDB QB: Query Builder test suite

Test suite to verify CMDB Query Builder functions such as create query, read query, and execute query using two related user roles - cmdb_query_builder and cmdb_query_builder_read.

Test	Description	Release version
CMDB QB: Query Builder - cmdb_query_builder Role	Verify that cmdb_query_builder user role can save queries, and access and run all saved queries, in CMDB Query Builder.	New York
CMDB QB: Query Builder - cmdb_query_builder_read Role	Verify that cmdb_query_builder_read user role can access and run all saved queries, and cannot save any query, in CMDB Query Builder.	New York

CMDB REL: Relationship Editor and Formatter test suite

Test suite to verify functionality of Relationship Editor and Relationship Formatter.

Test	Description	Release version
CMDB REL EDITOR:Relationship Editor	Check addition of relations to a CI and deletion of relations from a CI using itil user role.	New York
CMDB REL FORMATTER:Relationship Formatter	Check accuracy of CI information, relationship types, relationships, associated records such as change tickets, and settings such as CMDB views (relationship filters), displayed for a specific CI in relationship formatter using itil user role.	New York

CMDB SDK: SDK REST API test suite

Test suite to verify functionality of CMDB SDK Rest APIs.

Test	Description	Release version
CMDB SDK: Query CMDB Metadata	Test querying CMDB metadata.	New York
CMDB SDK: Create a relation for a CI using REST APIs	Test creation of a relationship for a CI in the CMDB using the CMDB REST APIs.	New York
CMDB SDK: Delete a relation for a CI using REST APIs	Test deletion of a relationship for a CI using CMDB REST APIs.	New York
CMDB SDK: Create a CI using REST API	Test creation of a CI using CMDB REST APIs.	New York
CMDB SDK: Query CMDB using REST APIs	Test querying the CMDB using CMDB REST APIs.	New York
CMDB SDK: Update a CI using REST APIs	Test updating of a CI using CMDB REST APIs.	New York
CMDB SDK: Query for a CI using REST APIs	Test querying a CI using CMDB REST APIs.	New York

CMDB glossary

Texts associated with CMDB, such as UI text and core CMDB documentation, use many terms that are important to understand in the context of CMDB.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CMDB hierarchy

The CMDB hierarchy is a structured, tree-like, data store where all data related to CMDB is stored, used, and managed. The following terms are best explained in the context of the CMDB hierarchy:

Class/Table

Stores data about a specific IT physical, logical, or conceptual item, such as a computer, in your organization. The CMDB hierarchy contains many classes where each class stores a set of similar IT infrastructure items that share similar attributes. Each class in the CMDB hierarchy has a set number of attributes that are common for the IT items stored in that class, such as CPU of a computer. A class consists of rows, where each row represents a single IT item referred to as a Configuration Item (CI). Initially, a class has no rows until actual IT items are stored in the class using one of the methods of populating the CMDB. The number of rows (CIs) in a class dynamically changes, reflecting on the number of IT items of that type in your organization. A class can be specified as independent or dependent, which determines the dependency of the class CIs on one another within the CMDB hierarchy.

Attribute/Column

A class table is defined by a set number of columns, each designed for storing a specific attribute of IT items using a specific data type such as string or integer. A column in a class table contains the attribute values of actual IT items.

Configuration Item (CI)

A basic unit of data, stored as a row in a class, and that represents an actual IT infrastructure item in your organization, such as a computer. The number of rows in a class is the number of CIs of that class. All CIs of a specific class, have the same collection of columns, where each column holds the actual value of the respective attribute for the IT item. For example, the computer class has an operating system attribute, therefore a Computer CI has an operating system attribute, which can have the value of Windows 10.0 for a specific computer in your organization. Any CI that is being added to a class has all of the class attributes where you can then enter the actual values of the CI.

CI class/CI type

The actual table name in the instance database that a CI belongs to. CI type is a friendly name for a CI's class, such as computer, router, or printer.

Relationship

Type of connection between a CI and either another CI, a user, or a group. Relationship types are defined twice, once from the perspective of the child CI and once from the parent CI's perspective. For example, a parent CI that powers a child CI uses the relationship type Powers::Is Powered By.

Parent class/Child class

Each class in the CMDB hierarchy is created as a child of another class (parent class), creating a parent-child relationship between classes. A child class automatically derives all the columns specified at the parent class, as well as some other feature-specific definitions. In addition to the derived attributes, you can add to the child class unique attributes which don't exist at the parent class.

The CMDB hierarchy is the entire collection of pre-defined and user-defined classes that serve as a detailed map of all IT items in your organization, including their attributes and the relationships between them. Throughout the CMDB hierarchy, classes derive attributes from each other and are connected by relationships to form a web of classes in a tree-like structure. The class at the top of the CMDB hierarchy is the Configuration Item [cmdb_ci] class, which

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

holds the basic attributes that are common to all classes in the CMDB hierarchy. Hundreds of classes are fully defined in the base system and are ready to be populated with CIs that represent actual IT items in your environment.

Key terms

The following terms are key in CMDB:

Configuration Management Database (CMDB)

ServiceNow® application that stores the logical configuration of your organization's infrastructure and gives you full visibility into your IT environment to support needed services. This application lets you monitor your network and support stability and best performance.

Dependent CI

CIs that depend on a relationship to another CI and can't exist on their own in the absence of the dependent relationship. A class can be independent or dependent, which determines the dependency or independence of the class CIs.

Independent CI

CIs, such as Server CIs, which exist on their own and aren't dependent on any other CIs.

Principal Class

Class who's CIs are included in various CI list views. A Principal Class designation is used to restrict the list of CIs in list views across CMDB features, to only specific classes that you need.

For more information, see Update the list of classes in the Principal Class filter.

Related table

A table that isn't part of the CMDB hierarchy but which still qualifies as CMDB data, such as the Serial Number [cmdb_serial_number] table. A related table doesn't derive from the Configuration Item [cmdb_ci] table, but has at least one column that references a CMDB CI. Information about related tables is stored in the Related Entries [cmdb_related_entry] table.

Duplicate CI

One or more CIs in which key attributes have identical values and can occur, for example, when multiple discovery sources attempt to import the same CI. Duplicate CIs in the CMDB interfere with its integrity and efficiency and therefore, as a general guideline, should be avoided.

For more information, see Detecting duplicate CIs and Duplicate CIs remediation.

Orphan CI

In the context of CMDB Health, an orphan CI is a CI that matches CMDB Health orphan rules. Orphan CIs are typically CIs that are missing key attribute values, or key relationships and therefore, as a general guideline, must be remediated or removed.

In the context of Data Manager, an orphan dependent CI belongs to a dependent class, and is missing the dependent relationship.

Some scenarios that involve related tables, can result in orphan CIs in related tables. A CI in a related table can, for example, become orphan if the referenced CI in the CMDB is deleted.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information about orphan CIs in the context of CMDB Health, seeCMDB Health KPIs and metrics.

For more information about orphan dependent CIs, see Dependent CIs management.

Related list

Information about additional components contained by a CI, such as disk drives on a server and the rules that control the behavior of a network router.

A related list can show, for example, active incidents, problems, changes, and outages against the CI. For example, a router can have several Related Lists affected by these filter conditions, including routing rules, disk drives, interfaces, and network adapters. Only those components found during the last Discovery appear in these Related Lists.

CMDB group

Collection of CIs that lets you apply actions collectively to all the CIs that are members in the group. There are several methods for populating a CMDB group with CI members. Depending on the group type, you can populate a CMDB group by manually adding individual CIs, selecting saved CMDB queries, or building encoded queries in the CMDB group itself. CI members in a CMDB group of type 'health' can be monitored by CMDB Health, and a CMDB group of type 'CMDB Workspace' appears in CMDB Workspace views.

For more information, see CMDB groups.

Features, tools, store apps

The following terms are for essential features and tools that CMDB provides, some of which are implemented as store apps:

CMDB Identification and Reconciliation (IRE)

Feature that provides a centralized framework for identifying and reconciling data from different data sources as the data is being imported into the CMDB. Using IRE helps maintain the integrity of the CMDB and some non-CMDB tables when multiple data sources are used to create and update CI records. IRE identification processes extensively use CIs dependency classification.

For more information, see CMDB Identification and Reconciliation (IRE).

CMDB Health

Feature that lets you monitor the health of the CMDB by using health indicators such as duplicate CIs, required CI fields, and audits, and that provides a framework for applying standardized CI remediation. CMDB Health evaluates and aggregates those health indicators into health scores at the class, health group, and service levels, which are then shown on dashboards.

For more information, see CMDB Health.

CMDB Query Builder

Tool that lets you build complex infrastructure and service queries that span multiple CMDB classes, non-CMDB tables, and that involve many CIs that are connected by different relationships. Query elements are represented by UI building blocks that you connect and structure on a canvas to query the CMDB and Service Mapping.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information, see CMDB Query Builder.

CMDB Data Manager

An essential comprehensive and integrated solution where you can create, publish, and manage policies that reflect organizational needs for data management. CMDB Data Manager supports bulk management of CI life cycle operations such as deletion, archival, and attestation. The CMDB Data Manager lets you automate and govern those CI life cycle operations to help maintain the CMDB in a healthy and reliable operational state.

For more information, see Working with CMDB Data Manager.

CI Class Manager

Tool where you can centrally view, create, and edit basic class definitions. You can also view, create, or edit class settings that are used in core CMDB functions such as identification, reconciliation, and essential features such as CMDB Health.

For more information, see CI Class Manager.

CMDB Workspace

A central, comprehensive, and modernized solution that provides access to a wide range of applications, features, and key CMDB dashboards and tools to support tasks in your organization. CMDB Workspace lets you manage, search, explore, and examine the health state and recent activities in CMDB. CMDB Workspace views and dashboards show high-priority tasks that require your immediate attention, which were generated by various CMDB features such as CMDB Health.

For more information, see CMDB Workspace store app.

Service Graph Connectors

Collection of pre-defined integrations that ingest data into the CMDB from third-party sources such as Tanium, Jamf, and Microsoft SCCM. Service Graph Connectors help maintain the quality and consistency of third-party data in your CMDB by verifying that the imported data is mapped correctly into your CMDB as specified by the Common Service Data Model (CSDM). Service Graph Connectors are delivered as store apps.

For more information, see Service Graph Connectors.

CMDB CI Class Models

Store app that adds class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and dependent relationships if applicable. You can use the added classes as any other CMDB class in the base system. Applications such as Discovery and Service Mapping can use these class extensions to populate CIs and discover various technologies and software.

For more information, see CMDB CI Class Models.

CSDM and the CMDB Data Foundations Dashboards

Store app containing a set of dashboards, complementing each other that together provide insights into key foundational metrics of your CMDB and Common Service Data Model (CSDM). In addition, these dashboards provide recommendations to verify that the CMDB and CSDM are properly configured for optimal usage and to mitigate any potential risks.

For more information, see Monitor system foundations in the CSDM and the CMDB Data Foundations Dashboards.

CMDB classifications and class dependency

CMDB classifications are groups of CIs that share attributes and are stored in their own class table. Classifications let administrators to define a class hierarchy for the CIs within the CMDB.

A CI class refers to the actual table name in the instance database. In that context, 'CI type' is a friendly name that a CI is known by, such as computer, router, or printer.

One of the characteristics of a CMDB class is its dependency on other classes. A class can be independent or dependent, which determines the dependency or independence of the class CIs.

Independent CIs

CIs from an independent class, such as Linux Server CIs, have their own identity, exist by themselves, and aren't dependent on any other CIs.

Dependent CIs

CIs from a depended class have relationships with CIs from other classes and exist meaningfully only if these relationships exist. Dependent CIs don't exist on their own in the absence of the dependent relationship. For example:

- Network Adapter CIs don't exist meaningfully without the Hardware CIs that contain them.
- Application CIs don't exist on their own without the Server CI they are hosted on.

Identification processes in the Identification and Reconciliation engine (IRE) CMDB feature extensively use CIs dependency classification. To find out the dependency classification of a class, open the Identification Rule page for a class in CI Class Manager. To establish CI dependency, use the CI Class Manager to specify dependent relationship rules for a CI class.

For more information, see Identification rules.

Dependent CIs management

A life cycle update for a CI affects its dependent CIs. For example, when the CI that a dependent CI depends on is deleted, the dependent CI becomes orphan with no further use. To maintain the integrity and health of the CMDB, the system applies cascade-cleanup processes to dependent CIs that are affected by a life cycle update.

For information about independent and dependent CIs, see CMDB classifications and class dependency.

To ensure that dependent CIs are properly managed after deleting or archiving CIs, you must:

1. Enable dependent CIs management as described on this page.
2. Manually approve the CMDB Data Manager tasks that dependent CIs management generates, or configure those tasks to not require a review or an approval.

Note:
An Orphan dependent CI in the context of Data Manager is different from an orphan CI in the context of CMDB Health. An orphan dependent CI within the context of Data Manager belongs to a dependent class, and is missing the dependent relationship. The definition of an orphan CI in the context of CMDB Health is broader, and includes any CI that matches CMDB Health orphan rules. For more information about orphan CIs in CMDB Health, see CMDB Health KPIs and metrics.

Examples of dependent CIs needing cascade-cleanup:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Tomcat application (T1) runs on a Linux Server (L1) and contains a WAR file (W1). When L1 is deleted, T1 and W1 become orphan dependent CIs.
- Network Adapters become orphan dependent CIs when the hardware itself is deleted.
- A Linux Server has retired and is set with end of life, the assumption is that if the server is no longer operational then applications which depend on it shouldn't be operational either.

Enable dependent CIs management

To enable dependent CIs management:

- Configure your environment for CMDB Data Manager. For details about how to configure the environment for CMDB Data Manager and the CMDB Data Manager own prerequisites, see Working with CMDB Data Manager.
- Ensure that the *cmdb.dependent.ci.cascade.op.enabled* system property is set to **true** (true by default). This property enables cascade operations and doesn't exist in the base system. Therefore, to view or modify the property value, you must first add it to the System Properties [sys_properties] table.
- To enable cascade-retirement processes, ensure that the system property *cmdb.dependent.ci.cascade.retire.enabled*, which is used to manage cascade-retirement of CIs, is set to true (false by default). The business rule *After BR: Track "Retired" CIs*, that checks for downstream CI dependencies, runs only if this property is set to true. This property doesn't exist in the base system and to view or modify it, you must first add it to the System Properties [sys_properties] table.

Cascade-cleanup operations apply only from when you enable the dependent CIs management feature. To apply cascade-cleanup to orphan dependent CIs that already existed in the CMDB before enabling the feature, see Cascade-cleanup existing orphan dependent CIs.

Use of CMDB Data Manager to perform cascade-cleanup operations

Dependent CIs management processes use the CMDB Data Manager to process the life cycle updates for the dependent CIs in the CMDB Dependent CI Ledger [cmdb_dependent_ci_ledger] table in the following ways:

1. Requesting and getting approvals from users for the life cycle updates for the CIs.
2. Performing the actual delete, archive, or retire CI updates after these operations are approved.

The system generates tasks for the 'Dependent CI - Deletion', 'Dependent CI - Archive', and 'Dependent CI - Retire' Data Manager policies, with the CIs that are ready to be deleted, archived, or retired as target CIs. These policies are set with the respective 'On Demand' policy types. Then, a Data Manager admin or user, according to the *Managed By Group* setting, must review and approve these tasks before the Data Manager applies the respective subflow to the dependent CIs.

To automatically approve those tasks, use the CMDB Data Manager to clear the **Needs Review** flag of the respective Data Manager policies. Those tasks will then run without requiring any user intervention.

Cascade-retire dependent CIs

When a CI is set to retire, dependent CIs management data processes attempt to cascade-update all the CIs depending on that CI, also to retire.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. CI is updated to retire as the CI's *Life Cycle Stage* attribute is set to **End of Life** according to CSDM standards.

2. Business rule *After BR: Track "Retired" CIs* runs (only if the system property *cmdb.dependent.ci.cascade.retire.enabled* is **true**) to check if the CI belongs to a class which has any downstream dependencies.

   If yes: The CI is added to the CMDB CI End Of Life Ledger [cmdb_ci_end_of_life_ledger] table.

3. For each CI in the CMDB CI End Of Life Ledger [cmdb_ci_end_of_life_ledger] table, the scheduled job *CMDB Cascade Retire Dependent CIs* checks the CI's relationships in the CI Relationship [cmdb_rel_ci] table. If there is a dependent relationship with a dependent CI, then that dependent CI is added to the CMDB Dependent CI Ledger [cmdb_dependent_ci_ledger] table with the **Retire** action.

   For more information about dependent relationship rules, see CMDB dependent relationship rules.

4. Scheduled Job *CMDB DependentCI Policy Processor* runs (if the system property *cmdb.dependent.ci.cascade.retire.enabled* is true) to process the CIs in the CMDB Dependent CI Ledger [cmdb_dependent_ci_ledger] table. Those CIs are set as being ready to retire upon approval using the CMDB Data Manager. A task is created in the CMDB Data Manager against the Dependent CI Retire policy to actually retire the CIs.

Cascade-archive dependent CIs

Archiving a CI can leave its dependent CIs as orphans in the CMDB. To prevent the accumulation of stale data, the system applies cleanup processes that cascade-archive those orphan dependent CIs.

Orphan dependent CIs are not immediately archived. When a CI is archived, all the CI relationship records for that CI in the [cmdb_rel_ci] table, are also archived. The system then checks for any dependent CIs that were orphaned as a result of this archiving. Any CIs in the dependency chain that are identified as orphan dependent CI, are checked for any of the following conditions. CIs that meet any of these conditions are not orphan dependent CIs and therefore will not be archived:

- The CI is an unhandled duplicate CI (the CI is associated with an unresolved de-duplication task).
- The CI has multiple parent CIs.
- The CI belongs to an excluded class. Excluded classes are stored in the CMDB Dependent CI Class Exclusion [cmdb_dependent_ci_class_exclusion] table. In the base system, that table is pre-populated with some classes such as *cmdb_ci_vm*, *cmdb_ci_vmware_instance*, and other VMware-related classes. You can manage the set of classes that are exempt from management of orphan dependent CIs, by adding or removing records to that table.

Eventually, only those CIs that these conditions do not apply to are added to the CMDB Dependent CI Ledger [cmdb_dependent_ci_ledger] table. Those CIs are set as being ready for archival using the CMDB Data Manager, upon approval.

Cascade-delete dependent CIs

Deleting a CI can leave its dependent CIs as orphans in the CMDB. To prevent the accumulation of stale data, the system applies cleanup processes that cascade-delete those orphan dependent CIs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. CI is updated to be deleted as the CI's Life Cycle Stage attribute is set to End of Life according to CSDM standards.

2. All relationships in the cmdb_rel_ci table, associated with the deleted CI, are deleted.

3. Business rule *After BR: CMDB Dependent CI Delete* runs (only if the system property *cmdb.dependent.ci.cascade.op.enabled* is **true**) to check each of the deleted relationships in the CI Relationship [cmdb_rel_ci] table, whether the other CI (parent or child) in the relationship is an orphan dependent CI.

   If yes: Those orphan dependent CIs are added to the CMDB Dependent CI Ledger [cmdb_dependent_ci_ledger] table and set with Action = Delete.

4. Scheduled Job *CMDB DependentCI Policy Processor* runs (if the system property *cmdb.dependent.ci.cascade.retire.enabled* is true) to process the CIs in the CMDB Dependent CI Ledger [cmdb_dependent_ci_ledger] table. Those CIs are set as being ready to be deleted upon approval using the CMDB Data Manager. A task is created in the CMDB Data Manager against the Dependent CI Delete policy to actually delete the CIs.

Orphan dependent CIs aren't immediately deleted. Prior to deleting each of the CIs relationship in the CI Relationship [cmdb_rel_ci] table, the system checks if other CI in the relationship belongs to a dependent class. Any CIs in the dependency chain that are identified as dependent on the deleted CI, are checked for any of the following conditions. CIs that meet any of these conditions aren't orphan dependent CIs and therefore aren't marked for deletion:

- The CI is an unhandled duplicate CI (the CI is associated with an unresolved de-duplication task).
- The CI has multiple parent CIs.
- The CI belongs to an excluded class. Excluded classes are stored in the CMDB Dependent CI Class Exclusion [cmdb_dependent_ci_class_exclusion] table. In the base system, that table is pre-populated with some classes such as *cmdb_ci_vm*, *cmdb_ci_vmware_instance*, and other VMware-related classes. You can manage the set of classes that are exempt from management of orphan dependent CIs, by adding or removing records to that table.

Eventually, only those CIs that these conditions don't apply to are added to the CMDB Dependent CI Ledger [cmdb_dependent_ci_ledger] table. Those CIs are set as being ready for deletion using the CMDB Data Manager, upon approval.

Extraneous relationships

For the delete and archive operations, the system also tracks CIs' extraneous relationships in the Dependent CI Relations Evaluation Config [cmdb_dependent_ci_extra_rels_config] table. Extraneous relationships are those relationships that aren't in the CI's chain of dependency and deleting or archiving them depends on the value of the *cmdb.dependent.ci.extra.rel.check* system property. This property is set to **true** by default, in which case extraneous relationships aren'tt deleted or archived. You can set the property to **false** to delete and archive extraneous relationships.

The *cmdb.dependent.ci.extra.rel.check* property doesn't exist in the base system and to view or modify the property value, you must first add it to the System Properties [sys_properties] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cascade-cleanup existing orphan dependent CIs

When enabling the dependent CIs management feature, the cascade-cleanup operations apply only from when the feature is enabled. However, it might be necessary to apply a similar cascade-cleanup operation to orphan dependent CIs that already existed in the CMDB before the feature was enabled.

Activate the Cleanup Orphan CIs scheduled job to perform a one-time cascade-cleanup of orphan dependent CIs across the CMDB. The Cleanup Orphan CIs scheduled job checks throughout the entire CMDB to identify any orphan dependent CIs. These CIs are then processed in the same manner that CIs that are cascade-deleted are processed. CIs that are ready to be deleted are added to the CMDB Dependent CI Ledger [cmdb_dependent_ci_ledger] table. The CMDB Data Manager is then leveraged as described in the Use of CMDB Data Manager to perform cascade-cleanup operations section.

The Cleanup Orphan CIs scheduled job is intended to run only once, after which the job deactivates itself. Depending on the size of the CMDB, it might take the Cleanup Orphan CIs scheduled job several days to complete.

Configure automatic recovery settings

You can use the system property *cmdb.dependent.ci.stale.record.cleanup.duration* to control the automatic recovery mechanism for stuck CI records in the CMDB Dependent CI Ledger [cmdb_dependent_ci_ledger] and CMDB CI End Of Life Ledger [cmdb_ci_end_of_life_ledger] tables. This property defines how many days a CI record can remain in **PROCESSING** state before being automatically reset to **NEW** for reprocessing.

About the property:

- Type: Integer
- Default value:
  - 2: For the CMDB Dependent CI Ledger table processing
  - 1: For the CMDB CI End Of Life Ledger table processing
- Other values: The general guideline for most environments is to set the property to 1-3 days. For high-volume environments where quick recovery is critical, set to a shorter duration (such as 1 day), and for environments with long-running CI processing jobs, set to a longer duration (such as 3-5 days).

> **Note:**
> If *cmdb.dependent.ci.stale.record.cleanup.duration* is set to zero or a negative value, the system uses the default value (2 days). Setting too low may reset legitimately long-running processes, and setting too high may delay recovery of genuinely stuck records.

When the CMDB Data Manager processes dependent CIs (for retire, archive, or delete operations), the state of records is set to **PROCESSING**. If processing fails due to system errors, crashes, or timeouts, these records can become stuck and processing never completes.

The cleanup job:

1. Identifies records in **PROCESSING** state that haven't been updated in the number of days specified in the *cmdb.dependent.ci.stale.record.cleanup.duration* property.
2. Sets the state of those records to **NEW**.
3. Assigns those records to the current cluster node for reprocessing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This property is used in the following two scenarios:

Dependent CI Policy Processing

- Location: CMDBDataManagementPolicyProcessor.java:561-571
- Default: 2 days
- Triggered by: Scheduled job for dependent CI management policies
- Purpose: Cleans stuck records in the cmdb_dependent_ci_ledger table

End-of-Life CI Ledger Processing

- Location: CMDBCiEndOfLifeLedger
- Processor.java:57
- Default: 1 day
- Triggered by: Scheduled job for EOL CI processing
- Purpose: Cleans stuck records in the CI end-of-life ledger table

For monitoring purposes, check the system logs for cleanup activity. Log messages such as "Completed cleaning cis which are stuck in processing state, updated X CIs from PROCESSING to NEW state", indicate how many records were reset from **PROCESSING** to **NEW** state.

Sample scenario: cascade-retire

1. Enable dependent CIs management.
2. In CMDB Data Manager, create and publish a Retire policy. For example, retire an independent Linux Server CI with relationships to the dependent CIs Network Adapter and File System.
3. Wait for the scheduled job *`CMDB Data Manager Retire Policy Processor`* to run, or run it manually.
4. In the Data Manager overview page, select the Open task card and approve the retirement task (Approval=Approved). Change the state of the task to 'Work in progress' if it doesn't change automatically. This will retire the Linux Server CI and add it to the cmdb_ci_end_of_life_ledger table.
5. Run the scheduled job *`CMDB Cascade Retire Dependent CIs`*.

   This scheduled job processes each CI in the cmdb_ci_end_of_life_ledger table, and queries the relationships in the cmdb_rel_ci table for this CI. If a relationship exists with other dependent CI, then those dependent CI are added to the cmdb_dependenct_ci_ledger table with the settings of state = 'Ready' and action = 'Retire'.
6. Wait for the scheduled job *`CMDB DependentCI Policy processor`* to run, or run it manually. This scheduled job creates a task against the OOB Dependent CI Retire policy, targeting the CIs in the cmdb_dependenct_ci_ledger table.
7. In the Data Manager overview page, select the Open task card and approve the task described with “Dependent CI – Retire..”.

CMDB record types

The CMDB contains the following major record types.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CMDB record types

Record types	Description
Configuration Item (CI)	Any computer, device, or service in the CMDB. A CI's record includes all of the relevant data, such as manufacturer, vendor, location, etc. Configuration items can be created or maintained either using tables, lists, and forms within the platform, or using the Discovery application.
Relation Type	A defined relationship between a CI and either another CI, a user, or a group. Relation types are defined twice, once from the perspective of the child CI and once from the parent CI's perspective. For example, a parent CI that powers a child CI uses relation type **Powers::Is Powered By**. Example relation types include **In Rack::Rack contains**, **Log Reviewed by::Reviews logs** for, or **Backup done by::Does backups** for. CMDB relationships can be established using Discovery or using the tables, lists, and forms within the platform. The CMDB form has a specific Related Items toolbar optimized for modifying relationships.

Related Lists of CI components

Related lists in CI records display additional components contained by that CI, such as disk drives on a server and the rules that control the behavior of a network router.

When Discovery runs, the Related List is populated with the components that Discovery finds running on the CI. The CI record might show different lists from scan to scan, depending on whether or not Discovery found the component.

By default, the Related Lists only display those components that are associated with that CI in the CMDB that has been discovered by the last scan. Components that are recorded in the CMDB but are not discovered in a scan, are deemed absent and do not appear in the list.

There are two types of components that appear in the Related List: components that are CIs themselves (such as hard disks), and components that are not (serial numbers and rules). The default filter condition in the breadcrumbs for components that are CIs is **[Status] [!=] [Absent]**. The filter condition for components that are not CIs is **[Absent] [=] [false]**.

For example, a router can have several Related Lists affected by these filter conditions, including routing rules, disk drives, interfaces, and network adapters. Only those components found during the last Discovery appear in these Related Lists.

Icons in related lists

Any of the following icons may appear in lists of CI related items.

	For currently active incidents against this configuration item
	For currently active problems against the configuration item
	For currently active changes against the configuration item that are not covered in the past, current, pending changes. For example, a request to update the operating system on a

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

	server that is currently in progress may display this icon.
	For changes that were recently completed against the configuration item. changes with an "Actual_end_date" in the past.
	For changes that are planned soon against the configuration item. changes with an "Actual start date" in the future.
	For currently active changes against the configuration item that have an "Actual start date"
	For outages that were recently completed against the configuration item. outages with an "end" date in the past.
	For outages that are planned soon against the configuration item. outages with a "begin" date in the future.
	For currently active outages against the configuration item that have a "begin" date in the past and no "end" date
	This will only show up in the Tree view and indicates that a configuration item that is downstream has at least one of the above issues against it.

The system looks five calendar days into the past and seven calendar days into the future when looking at recent outages and changes.

Teams related list

The Teams related list associates a user group to a CI based on group type, providing flexibility in tracking the different types of groups assigned to a CI. The Teams related list appears on CI forms for CIs of the Service [cmdb_ci_service] class and its descendent classes such as the Service Instance [cmdb_ci_service_auto] class.

Using the Teams related list can be useful if many data sources are used in the organization, and when using the IntegrationHub ETL.

In the base system, the Teams related list contains group types that match the fields:

- *Approval Group*
- *Change Group*
- *Managed by Group*
- *Support Group*

When you set a group assignment on a CI form of one of those classes, that group assignment is automatically synchronized with the Teams related list. If you set an assignment group for an application service, a relationship record is created to represent the new group assignment for the CI. The Teams related list on such CI forms, always shows the current settings for the various group assignments for the CI.

If there are multiple groups assigned to a CI, then on the **Teams** related list on a CI form, you can designate one of those groups as primary. When an incident involving that CI is created, the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

incident is assigned to that primary group. Only one group type can be designated as primary for a CI at any given moment.

As an example, use the Teams related list for an application service with the following characteristics:

- Requires access to a database
- Runs on Linux servers
- Has a group assigned to manage the software portion of the actual application

In that example, you can track all of these group assignments by adding the appropriate group types and setting CIs with the new custom group types.

By-directional synchronization

When you set or modify the value of one of the assignment group fields on a Service CI form, then the Teams related list is updated with that change, adding a Teams related record if a corresponding one doesn't exist. For example, when you set an empty **Support group** field to **Database San Diego** and save the form, then the system adds a Teams record in which *Group type* is **Support Group** and **User group** is **Database San Diego**.

In the opposite direction, any change in a Teams related record, where *Group type* corresponds one of the group assignment fields in the CI, is synchronized to the corresponding field. For example, if you set *User group* to **CAB Approval** in the *Support Group* group type, the **Support group** field on the CI form is updated with the **CAB Approval** value.

Deleting a Teams record doesn't affect the group assignment fields in the CI.

Add the Teams related list to a Service CI form

By default, the tab for the Teams related list doesn't appear in the Related Lists section on Service CI forms. You can add the Teams related list by selecting the form's Additional actions menu, selecting **Configure** and then **Related Lists**. In the Available list that appears, move **Teams** to the Selected list and then select **Save**.

Add a custom group type to the Teams related list

The Teams related list lets you add custom group types that are needed in your organization, extending the initial list of supported group types.

Before you begin

Role required: itil_admin, asset, or cmdb_admin

About this task

To add a group type, you must modify the dictionary definition of the *group_type* column in the *cmdb_rel_team* table.

Procedure

1. On a Service CI form, select the **Teams** related list.
2. In the **Columns** tab, select the **Group type** column.
3. On the Dictionary Entry form, in the **Choices** related list tab, insert a new row for a new Teams choice such as **Datacenter Group**.
4. Save your changes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a CI class

Create a CI class (table) that is an extension of an existing CI class. Then create identification and reconciliation rules for the new class.

Before you begin

The class that is being extended must have its *Is_Extendable* field checked, indicating that the class is extendable.

Role required:

- Itil_admin and personalize_dictionary: Required for editing the dictionary table
- admin: Full access

About this task

The CI Class Manager is a centralized location for managing CMDB tables and for creating a class that is derived from another CMDB class. Creating a class requires basic details such as a label and a name. Identification and reconciliation rules are also required to ensure that the class can be successfully identified by the identification engine.

For more information about extending a class and how attributes are derived from a parent class in that process, see Table extension and classes.

Procedure

1. Navigate to **All** > **Configuration** > **CI Class Manager**.
2. Click **Hierarchy** to expand the CI Classes list.
3. Select the class that the new class is extended from.
4. Click **Add Child Class**.
   The **Add Child Class** option appears only if the selected class is extendable.
5. On the **Provide Basic Info** tab, fill out the information and then click **Next**.

Field	Description
Display name	A unique label for the class (such as Laptops or Thin Clients). The label appears on list and form views for the class. Updating the **Label** field also updates the label record in the language file for the current language. See Field Labels in Data dictionary tables. Maximum string length is 80 characters.
Table name	Automatically populated based on the table label and the prefix string 'u_cmdb_ci'. You cannot modify the prefix; however, you can modify the rest of the table name. The name can contain only lowercase, alphanumeric ASCII characters and underscores (_). Maximum string length is 80 characters.
Description	Explanation of the use purpose of the class.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Icon	The icon associated with the class.
Extensible	Indicator of whether this class can be extended.
Principal Class	Denotes whether this class is included in the Principal Class filter. If this class is included in the Principal Class filter, then CIs from this class appear in CI list views when the Principal Class filter is applied.

6. On the **Add Attributes** tab, click the + sign and enter details for each new class column.
7. Click **Next**.
   For description of the different columns in the list view, see Dictionary entry form. To designate an attribute as a CI identifier for class identification, double-click the attribute's Identification Rule column and set it to **true**.
8. On the **Set Identification Rule** tab, examine the **Derived** identification rule and its **Identifier Entries**.
   You can click **Replace** to replace the derived rule with a new identification rule and new identifier entries specific to the new class. See Identification rules for details about identification rules and identifier entries.
9. On the **Dependencies** tab, click **Add dependency** to add dependent rules.
   The **Dependencies** tab appears only if there are dependent identification rules for the selected class.
10. On the **Add Reconciliation Rules** tab, click **Add** to create the following rules:
    a. Reconciliation Rules
    b. Data Refresh Rules
11. On the **Add Suggested Relationships** tab, review the diagram of the class derived suggested relationships.
12. Use the filter to display only inbound, outbound, or specific relationship types.
13. To add a suggested relationship for the class:
    a. Click **New**.
    b. In the Add Suggested Relationship dialog box, select a **Relationship** and a **Target Class** for the relationship. **This Class** and the **Target Class** become parent or child in the suggested relationship, based on your selection of the **Relationship**.
    c. Click **Save**.
    When building relationships for the class in the Query Builder, the list of suggested relationships is updated.
14. Click **Done**.

Related topics

CMDB Identification and Reconciliation (IRE)

Reclassify a CI

You can upgrade, downgrade, or switch the class of a CI by modifying its **Class** attribute.

Before you begin

Role required: itil or asset (In general, the roles required to update a CI)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Each class is defined with a unique set of attributes. This set consists of attributes that were derived from the parent class, and additional attributes defined for the class.

When you reclassify a CI, the following occurs.

1. The set of attributes is adjusted to match the set of attributes of the newly assigned class. Attributes are added or removed as needed.
2. If any attributes are unique to the current class and are not defined in the newly reclassified class, they are lost.
3. A new record with the CI's current sys_id is inserted to the table of the new class, with the appropriate set of attributes for the class (the sys_id of the CI is retained).

Depending on the reclassification, the following occurs.

Downgrade

The CI class is updated to a class that is higher in the class hierarchy, and the newly assigned class is a parent of the current class. For example, reclassifying a CI from the *cmdb_ci_server* class to the *cmdb_ci_computer* class.

For example, the *cmdb_ci_server* class has attributes that the *cmdb_ci_computer* class does not have. During the downgrade, these attributes and their respective values are not included in the new CI record that is inserted into the *cmdb_ci_computer* class.

Upgrade

The CI class is updated to a class that is lower in the class hierarchy, and the newly assigned class is a derived child of the current class and has additional attributes. For example, reclassifying a CI from the *cmdb_ci_computer* class to the *cmdb_ci_server*.

Switch

The newly assigned class is in a different branch in the class hierarchy and has a different set of attributes than the current class. For example, reclassifying a CI from the *cmdb_ci_linux_server* class to the *cmdb_ci_win_server* class.

A switch is a combination of a downgrade and an upgrade. For example if the CI is downgraded to the *cmdb_ci_server*, and then upgraded to the *cmdb_ci_win_server* class. Therefore, attributes are lost in the same manner as in a downgrade operation.

Note:
Avoid the CI class downgrade and CI class switch operations as those can lead to data loss. When automatic CI reclassification is enabled (which is by default), the identification process can result in some automatic reclassifications which lead to data loss.

For information about CI reclassification by the Identification and Reconciliation Engine (IRE) and related system properties that control the behavior of automatic CI reclassification, see Configure CI reclassification during IRE processing.

Procedure

1. Locate the CI that you want to reclassify and display it in a list view.
   You can use the application navigator. Or for example, if the CI is a server, then in the navigation search box, type `cmdb_ci_server.list` to display the CI in the **Servers** view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Ensure that the **Class** field is displayed in the list.
   If you do not see this attribute, personalize the list to add the **Class** field.
3. Double-click the **Class** value for the CI, and select a new class.
4. Click the green check box to confirm your selection.

Delete CIs

You can use the CI Class Manager to delete CIs that are no longer needed.

Before you begin
Role required: itil_admin

About this task
For information about policy-based, large scale automated CI deletions, see Working with CMDB Data Manager.

Note:
You can't delete base system tables. For information about deleting custom tables, see Deleting custom tables.

Procedure
1. Navigate to **All** > **Configuration** > **CI Class Manager**.
2. Click **Hierarchy** to expand the CI Classes list and then select the class from which you want to delete CI records.
3. In the class navigation bar on the left, click **CI List**.
4. On the CI List form view, select the CIs that you want to delete.
   Select the check box in the header to select all the CIs that are visible.
5. Click **Actions on selected rows** and then click **Delete**.
6. Click **Delete** in the **Confirmation** dialog box.

Result
After deleting CIs that a dependent CI depends on, the dependent relationship is also deleted. The dependent CI becomes an orphan and is not immediately deleted. In this situation, the system attempts to cascade delete such orphan dependent CIs to prevent the accumulation of stale data and maintain the health of the CMDB. For information about how the system manages orphan dependent CIs, see Management of orphan dependent CIs.

View and edit class definitions and metadata

Use the CI Class Manager as a central location to explore the CMDB class hierarchy, CI table definitions, and class CIs. View the details of each table such as its label and fields, relationships, and all related metadata definitions.

Before you begin
Role required: none

About this task
The CI Class Manager shows the entire CMDB class hierarchy in a tree-view format, consolidating class definitions into a central location. It lets you display metadata information for a class, such as reconciliation rules, mandatory and recommended fields, and audit templates. You can also select a specific class to view, to modify, or to extend its definition to create a derived class. For each class, you can directly access CMDB Health settings, identification and reconciliation rules, orphan scorecard, and certificate template, defined for the class.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information about extending a class and how attributes are derived from a parent class in that process, see Table extension and classes.

Procedure

1. Navigate to **All** > **Configuration** > **CI Class Manager**.
2. Click **Hierarchy** to expand the CI Classes list and then select a class to display details for.
3. On the class navigation bar, expand the following items to display further details for the class.
   - **Class Info**:
     - **Basic Info**: Displays details for the selected class, such as the display and table name, description, and class icon. Lets you edit some of the class definitions, and prevents editing of some details such as the table name.

       Role required: itil for reading, and itil_admin and personalize_dictionary for writing.

     - **Attributes**: Displays table attributes (columns). Lets you edit those attributes and add new ones. For description of the different attributes in the list view, see Dictionary entry form.

       Role required: personalize_dictionary for reading and writing

       To add an attribute:

       a. Click the **Added** tab and scroll to the bottom of the list.
       b. Double-click **Insert new column**, and enter details for each new class attribute. Set **Identification** to true to designate an attribute as a CI identifier for class identification.
       c. Click **Save**, and fix any errors that appear.

     - **Identification** and **Reconciliation**: Displays and lets you edit, create, and delete identification and inclusion rules, reconciliation and data refresh rules for the class.

       See CMDB Identification and Reconciliation (IRE) for more information.

       Role required: itil for reading, and itil_admin (on top of itil) for writing.

     - **Dependent Relationships**: Displays and lets you edit, create, and delete hosting and containment relationships for the class. See CMDB dependent relationship rules for more information.

       Role required: itil for reading and itil_admin (on top of itil) for writing.

     - **Suggested Relationships**: Displays a diagram of all suggested relationships for the class, and lets you delete or add suggested relationships for the class. Use the navigation tools to increase or decrease the diagram, and to move the diagram on the page. Use the filter to display specific relationship types. See Suggested class relationships for more information.

       Role required: itil.

   - **All Relationship Rules**: Displays a combined diagram of all suggested relationships and all dependent relationships for the class. Use the navigation tools to zoom in or out, and to move or center the diagram on the page. Use the filter to display specific relationship categories.
   - **Health**: Lets you review and configure CMDB Health-related system properties, scorecards, and rules and settings for all CMDB health KPI and metrics, at the class level. See CMDB Health for information about enabling and configuring CMDB Health, and displaying health reports.

Update the list of classes in the Principal Class filter

Manage the list of classes that are included in the Principal Class filter to restrict the CIs that appear in CIs list views to only specific classes that you need. You can add or remove CMDB classes from the Principal Class filter.

Before you begin

Role required: itil_admin and personalize_dictionary

About this task

Apply the CMDB Principal Class filter in list views of CMDB CIs so that only CIs that belong to the classes in the filter, appear. In a base system, the Principal Class filter doesn't contain any classes. The principal class setting applies only to the current class and is not derived by child classes. For more information about list view filters, see Save and use filters in a list view.

You can also use the Principal Class filter in the Discovery sources card in the CMDB 360 dashboard in CMDB Workspace. For more information about using the Principal Class filter, see CMDB 360 experience in CMDB Workspace.

Procedure

1. Navigate to **All** > **Configuration** > **CI Class Manager**.
2. Select **Hierarchy** to expand the CI Classes list and then select a class to add or remove from the Principal Class filter.
3. On the class navigation bar, navigate to **Class Info** > **Basic Info**.
4. On the Basic Info form, select or clear **Principal Class**.
5. Select **Save**.

Result

The Principal Class filter is updated with the addition or the removal of the class from the list of classes in the filter. When you apply the Principal Class filter to a Configuration Items list view, only CIs from classes included in the filter, appear.

What to do next

In both of the following scenarios, the list of CIs refreshes to show only CIs whose class is included in the Principal Class filter:

- **1.** In the **Filter navigator**, type `cmdb_ci.list` and then press the Enter key.
- **2.** In the Configuration Items list view, select the **List controls** menu icon, select **Filters** and then select **Principal Class**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Open a Change Request form.
2. Scroll down and select the **Affected CIs** tab. Select **Add**.
3. In the **Add Affected CIs** form, select the **List controls** menu icon, select **Filters** and then select **Principal Class**.

For more information about adding affected CIs to change requests, see Associated CIs on a change request.

CI relationships in the CMDB

The CMDB, in contrast to a static asset list, helps you track not only the configuration items (CIs) within your system, but also the relationships between those items.

A relationship in the CMDB consists of two CIs and a relationship type:

- Parent CI
- Child CI
- Type of the relationship that links both CIs

For example, in the [Server1] [Managed by] [Server2] relationship:

- Server1 is the child CI
- Server2 is the parent CI
- [Managed by] is the relationship type

For example, a web application might read data from an instance of Oracle, which in turn might depend on a piece of underlying hardware. Most CIs in a CMDB have multiple relationships to other CIs, users, and groups.

The relationships between CIs can be automatically discovered. If you use Discovery, many relationships can be automatically loaded into the system through the discovery process. If you import your data from another system, you get some form of relationships.

You can add to automatically discovered relationships, create relationships, or edit relationships for a CI by launching the CI relationship editor from the CI form. As an alternative to the CI relationship editor, Unified Map in the CMDB Workspace store app provides the latest functionality for editing CI relationships. For more information, see Edit relationships in Unified Map.

Dependent and non-dependent relationships

Dependent relationships, such as tomcat RunsOn Hardware, are used by the Identification and Reconciliation Engine (IRE) to identify dependent CIs. The IRE avoids duplicate entries of CIs into your Configuration Management Database (CMDB) by leveraging these relationships to determine if a recently discovered CI is already in the CMDB.

For non-dependent relationships, the CMDB tracks the discovery source and the last scanned time in the Relationship Sources [sys_rel_source] table. Non-dependent relationships aren't used for CI identification, and can be deleted when no longer needed.

To avoid burdening your IRE with excessive load, by default, the Relationship Sources [sys_rel_source] table doesn't auto-populate. If you want to track full information on non-dependent relationships, you can change the default using the glide.identification_engine.populate_sys_rel_source property.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dependent relationships are used for CI identification, so they shouldn't be directly deleted as they aren't tracked.

Information in the Relationship Sources [sys_rel_source] table can be used to decide if it's safe to delete a potentially non-dependent relationship. For example, a discovery source, which is attempting to delete a non-dependent relationship can confirm that:

- There are no other data sources for that relationship.
- The relationship wasn't updated for some specified length of time and therefore is no longer needed.

When a non-dependent relationship is deleted from the CI Relationship [cmdb_rel_ci] table, all cascading corresponding records in the Relationship Sources [sys_rel_source] table are deleted.

Key relationships

The following table contains descriptions for some key CMDB relationships.

Parent	Child	Description
Applicative Flow To	Applicative Flow From	Connections between endpoint CIs. **Note:** For internal use only (service model).
Connects to	Connected by	Network Connections between elements that are talking to each other. Examples: Workstation to switch, switch to switch, kubernetes workload to service.
Contains	Contained by	Typically a containment relationship (CI to contained CI). The child CI typically has a single parent CI with this relationship type. Examples: Tomcat to Tomcat WAR, VMware Datacenter contains Network.
Defines resources for	Gets resources from	Parent CI defines/gets resources from a child CI. Example: VMware - Resource pool gets resources from ESX Server.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parent	Child	Description
Depends on	Used by	Parent CI depends on child CI. Meaning that problem/change in the child CI may impact the parent CI.
Hosted on	Hosts	Hosting relationship between an element and its host. Examples: Cloud resource to logical data center, k8s workload to k8s cluster.
Implement End Point To	Implement End Point From	Endpoint to CI that exposes this endpoint. **Note:** For internal use only (service model).
Manages	Managed by	Typically used where one CI manages one or more other CIs. Example: vCenter manages vCenter Datacenter.
Members	Member of	Typically used with clusters where a cluster node is a member of a cluster. Example: ESXi Server is a member of vCenter Cluster.
Owns	Owned by	Usually a containment relationship (CI to owned CI). The child CI typically has a single parent with this relationship type.
Runs on	Runs	Typically between a CI that represents a software application, to the hosting hardware/VM. Example: Tomcat 'Runs on' Linux server.
Use End Point To	Use End Point From	From the CI to an outgoing endpoint.

Create a CI relation rollup

Suggested class relationships

The system keeps a table (Suggested Relationship [cmdb_rel_type_suggest]) of relationship types that are appropriate for a CI type, based on its class. You can manage suggested relationships by navigating to **Configuration** > **Suggested Relationships**, or in the CI Class Manager.

Suggestion model

The relationship editor has a base CI. The base CI designates the CI that a user was on before launching the editor, as the base CI in the new relationship. If you launched the relationship editor from the lnux100 CI, then lnux100 becomes the base CI. Also, every CI in the system has a type (class). For example, bond lnux100 is of the Linux server type.

Many CI types are children of other types in the hierarchy. For example, the class hierarchy for a Linux server is:

`cmdb_ci` -> `cmdb_ci_hardware` ->`cmdb_ci_computer` -> `cmdb_ci_server` -> `cmdb_ci_linux_server`

The suggestion model works by analyzing the suggested relationship table for all relationships whose base class is the current base class or any one of its parent classes. For example, looking at a Linux server, the suggestion model would retrieve any relationships whose base class was:

`cmdb_ci_linux_server`, `cmdb_ci_server`, `cmdb_ci_computer`, `cmdb_ci_hardware`, or `cmdb_ci`

ITOM Visibility, if available, uses enhanced discovery patterns to identify and add CI relationships to the Suggested Relationships table.

Suggested CI relationships in the relationship editor

The CI relationship editor uses the suggestion model to help users select reasonable relationships for configuration items.

For example, consider these relationship types in the system:

- Provides Power for :: Receives Power From
- Runs on :: Hosts

Typically, a user uses these relationships to define the following reasonable relationships between two items as follows:

- a database runs on a server
- a rack provides power for a server

Typically, neither of the following definitions would be appropriate:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- a rack runs on a server
- a server runs on a database

For descriptions of some key relationships, see CI relationships in the CMDB.

CI Class Manager

Add a suggested relationship

Add a suggested relationship for a class. The list of suggested relationships for a class is available when you create a new relationship for a CI of that class.

Before you begin

Role required: To view — itil. To create, update, or delete suggested relationships — itil_admin.

Procedure

1. Use the CI Class Manager (Role required: itil_admin):
   a. Navigate to **All** > **Configuration** > **CI Class Manager**.
   b. Click **Hierarchy** to expand the CI Classes list.
   c. Select the class to add a suggested relationship to.
   d. In the class navigation bar, click **Suggested Relationships**.
   e. Click **New**.
   f. In the Add Suggested Relationship dialog box, select a **Relationship** and a **Target Class** for the relationship. **This Class** and the **Target Class** become parent or child in the suggested relationship, based on your selection of the **Relationship**.
   g. Click **Save**.
2. Or, navigate to **All** > **Configuration** > **Relationships** > **Suggested Relationships** (Role required: admin):
   a. Click **New**.
   b. Complete the form.

Suggested Relationship fields

Field	Description
Base class	The base class in the relationship, which depending on the relationship type, is either the parent or the child in the relationship.
Relationship	Relationship type.
Dependent class	The dependent class in the relationship, which depending on the relationship type, is either the parent or the child in the relationship.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: Suggested relationship you can add

Base Class	Relationship	Dependent/Target Class
Oracle	Is Hosted On	Linux Server
Oracle	Is Hosted On	Solaris Server

Note:
The same parent class and relationship can appear more than once.

What to do next

You may need to delete a suggested relationship, for example, to limit the choice of available relationships in the CI relationship editor. Removing a suggested relationship does not affect relationships that are created or updated by Discovery.

Relationship governance rules

Relationship governance rules is a set of relationship rules used to ensure consistency and validity in modeling relationships between configuration items (CIs) in the CMDB. Use relationship governance rules to prevent the selection of relationship types or directions that are not allowed between specific CI types.

Different applications such as Discovery and Service Mapping create relationships between CIs. Each application might use inconsistent relationship type or direction to represent the same entity, resulting in multiple views of the same CIs. Relationship governance rules define what are valid relationship types and valid directions between pairs of CI types resulting in valid and consistent relationships in the CMDB.

Relationship governance rules consist of:

- CMDB dependent relationship rules: Rules (hosting and containment rules) that are used for CI identification. You can view and modify dependent relationship rules in the CI Class Manager, after selecting a class from the class hierarchy and clicking **Dependent Relationship**.
- Suggested relationships: Rules that are based on existing suggested relationships in the Suggested Relationship [cmdb_rel_type_suggest] table. Suggested relationships are used in the CI relationship editor. You can view and modify suggested relationships in the CI Class Manager, after selecting a class from the class hierarchy and clicking **Suggested Relationships**.
- Reference rules: Rules that are used mostly by Cloud Management to represent all the possible valid combinations of pairs of referencing and referenced CIs in the service definition.
- Built-in valid relationships: The following relationships are pre-defined in the base system as valid relationships:
  - cmdb_ci_endpoint -> Applicative Flow To::Applicative Flow From -> cmdb_ci_endpoint
  - cmdb_ci_endpoint -> Implement End Point To::Implement End Point From -> cmdb_ci
  - cmdb_ci -> Use End Point To::Use End Point From -> cmdb_ci_endpoint

General behavior

- Relationship governance rules support inheritance.

  For example, suppose that the suggested relationship cmdb_ci_appl Runs On::Runs cmdb_ci_hardware exists. Then a Runs On::Runs relationship between a cmdb_ci_appl_dot_net CI and a cmdb_ci_windows_server CI is valid. That is because .Net

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Application class inherits from the Application class and the Windows Server class inherits from the Hardware class.

- Duplicate relationship governance rules are not allowed.
- Relationship governance rules are not domain separated.
- It is allowed to have more than one relationship type between the same two CI types.

  For example, the following relationships are valid:

  - cmdb_ci_appl Depends On::Used by cmdb_ci_service
  - cmdb_ci_appl Receives data from::Sends data to cmdb_ci_service

Reports

A relationship between CIs is considered valid if it conforms to any of the relationship governance rules. Use the Relationship Health dashboard to view reports about relationships health including relationships compliance with relationship governance rules. The 'Relationships not compliant with all relationship rules' report shows CI relationships that are not compliant with any of the relationship governance rules.

CI relations formatter

The default CI form includes a CI relations formatter from which you can examine a CI and its relationships in various views. From the CI relations formatter, you can also launch the CI relationship editor for the CI.

If the domain separation plugin is activated, then only relationships in which the logged on user is authorized to view both CIs, are displayed.

The CI relations formatter contains a list of related CIs and a toolbar with controls for viewing the relationships between the current CI and related CIs. You can configure the controls in this formatter to modify varying aspects of the view. For more information about formatters, see Create a formatter and add it to the form .

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- If an endpoint is a child in one relationship and the same endpoint is a parent in another relationship, then that endpoint is hidden and does not appear in the relations formatter view. Similarly, relationship qualifier chains are also hidden and do not appear in the relationship formatter view.
  - Example: CI1 > endpoint > CI2

    In this example, CI1 is related to CI2 through relationships with endpoint. A single relationship appears in the relations formatter:

    CI1 > CI2 (These relationships appear as a direct relationship without endpoint, because endpoint is a parent in one relationship and a child in another relationship).
  - Example: CI1 > endpoint1 > CI2 > endpoint2

    Two relationships appear in the relations formatter:

    CI1 > CI2 (endpoint1 is hidden because it is a parent in one relationship and a child in another relationship).

    CI1 > CI2 > endpoint2 (appears as level 2 relationship – endpoint1 is hidden and endpoint2 appears as it a child and not a parent in any other relationship).
- On instances that do not meet the internet browser requirements for the CI relations formatter, the default CI form includes the legacy CI relations formatter instead. For more information, see Legacy CI relations formatter.
- CIs not extended from the Configuration Item [cmdb_ci] table, are not displayed in Dependency Views maps and in CI relation formatters.
- The *Applicative Flow To::Application Flow From* relationship is a special relationship type used only between Service Mapping endpoints. This relationship type is not intended for use in the CMDB as a relationship between CIs and therefore it is not displayed in the relations formatter.

Controls for viewing related CIs

Control	Definition
Add CI relationship	Starts the relationship editor to manually create CI relationships. For more information (including about roles required for the '+' control to appear), see Create or edit a CI relationship.
Show dependency views	Launches a Dependency Views map in another window or tab. The CI is the central node in the map, with a configurable number of levels above and below that node in the hierarchy. Map indicators next to the nodes indicate the number of tasks, incidents, problems, changes, or outages related to that node. Right-click to expand collapsed nodes or display a list of related tasks or problems. For more information, see Dependency Views map.
Search for CI	Filters the CIs included in the display.

Click the Settings icon ( ) to configure additional view settings that filter the data displayed. Settings are preserved through logging out and logging back in.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related items settings

Setting	Description
Show Relations in Flat/Tree Layout	To view a flat list of related CIs that are grouped by relationship type in alphabetical order, click **Flat** (default value). To view groups of related CIs in a hierarchical tree, click**Tree**. If you select the tree view, you cannot configure any other settings for viewing related CIs. A single list of upstream and downstream relationships is displayed.
Show Relations in Split/Merge Layout	To view a single list that includes both upstream and downstream relationships, click **Merge** (default value). Relationships are grouped by relationship type. To view separate lists for upstream and downstream relationships, click **Split**.
Filter Relations by Max Level	Select the number of downstream and upstream levels in the hierarchy to include when displaying CIs in a flat view. Default value is 3.
Filter Relations by Relationship Type	Select the types of relationships to view. Default value is 'All Relationship Types'.
Filter Relations by CMDB View	Filter by tables specified in CMDB views, if any relationship filters exist.

The relations formatter uses the following icons to provide additional information about changes, problems, and outages related to CIs in the relationship:

Icons related to CIs

Icon	Description
	Recently closed changes
	Planned changes
	Currently open changes
	Recently closed outages
	Problems
	Incidents
	Planned outages
	Currently open outages

In large networks, a list of related CIs might be excessively long, which can slow performance when a CI form is rendered. You can configure these properties to control the amount of data that

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

is displayed. To find a property, enter `sys_properties.list` in the left navigation filter and search for the property.

Properties related to performance

Property	Description
glide.ecmdb.find_relationship_issues	Hides or displays an icon in the CI relations formatter that links to open issues for the CI. This property defaults to true (displays the icon).
glide.ui.max_relation_levels	Specifies the maximum level for displaying CIs in flat view before reaching the maximum relations limit. The default value is 5.
glide.ui.max_relations	Specifies the maximum number of related CIs to display. When exceeded: • A notification appears indicating that the limit has been reached, and that not all relations are displayed. The default value is 1000. • Flat layout reverts to the tree layout view.

Create or edit a relationship filter

Domain separation and the relations formatter and the CI relationship editor

Domain separation is supported in the relations formatter and the CI relationship editor. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Overview

How domain separation works in the relations formatter and relationship editor

- **Relations formatter**

  The relations formatter is domain-separation supported. The relations formatter is used to display CMDB relationships in the UI in different views. Since the CI Relationship (cmdb_rel_ci) table is not domain separated, relationships are visible in the relations formatter only if both parent and child CIs (cmdb) are visible in the domain.

  The CI Relationship Type (cmdb_rel_type) table is not domain separated. Therefore, in the relations formatter, all the relationship types are available to be selected as a filter.

  By default domain separation is supported in the relations formatter.

- **Relationship editor**

  The relationship editor is domain-separation supported. You can use the relationship editor to add new relationships or delete existing relationships for the current CI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The CI relationship editor displays a list of CIs to add or remove from relationships. Since they are domain separated, the CI list view in the relationship editor displays the CIs that are visible to the current domain.
- The CI relationship editor displays a list of relationships to add or remove. Since the CI Relationship [cmdb_rel_ci] table is not domain separated, the relationships list view displays all the relationships of the current CI.

The Suggested Relationship (cmdb_rel_type_suggest) table is not domain separated, which means that all the suggested relationship types in the relationship editor are visible for all domains.

By default domain separation is supported in the relationship editor.

Create or edit a relationship filter

Create a custom relationship filter to display CI relationships from selected tables in the CI relations formatter.

Before you begin
Role required: ecmdb_admin

About this task
The CI relations formatter displays related CIs for the base CI, and the relationships between the CIs. You can use relationship filters on the CI relations formatter to customize CI relationship views.

Procedure
1. Navigate to **All** > **Configuration** > **Relationships** > **Relationship Filters**.
2. Click **New** or select a filter to edit.
3. Enter or edit the relationship filter name.
4. Right-click the form header and click **Save**.
5. In the **Configuration Types** section, click **Edit**.
6. On the **Edit Members** form, select the tables of the CIs that you want to show with the filter and then move the tables to the **Configuration Types list**.
7. Click **Save**.

Result
On a CI form, in the relations formatter settings, you can select the newly defined relationship filter from the **Filter Relations by CMDB View** list.

In the legacy CI relations formatter, you can click **View** and select the newly defined relationship filter.

After you select a filter, the relations formatter displays only CIs from the tables specified in the filter or from descending tables.

Exclude relationships from the relations formatter view

Create a list of relationships that should not appear in the relations formatter view on CI forms.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required:

- To view the relationship type exclusion list — itil
- To create, update, or delete the relationship type exclusion list — itil_admin

Procedure

1. Navigate to **All** > **Configuration** > **Relationships** > **Relationship Type Exclusion List**.
2. In the CI Relation Filters list view, click **New**.
3. Fill out the CI Relation Filter form to specify the relationship that you want to exclude from view.
4. Click **Submit**.
   Excluded relationships do not appear in the relations formatter view on CI forms.

Legacy CI relations formatter

On instances that do not meet the internet browser requirements for the latest CI relations formatter, the default CI form includes the legacy CI relations formatter instead.

This element contains the list of related CIs and a toolbar with controls for viewing the relationships between the current CI and related CIs. For information about the latest CI relations formatter, see CI relations formatter.

Related items field

Note:
The legacy BSM map provides a more complete view of CI relationships.

Configure the controls in this formatter with two properties that restrict varying aspects of the view.

Flat layout

Click the flat layout icon ( ) to group related CIs by relationship.

Flat layout view

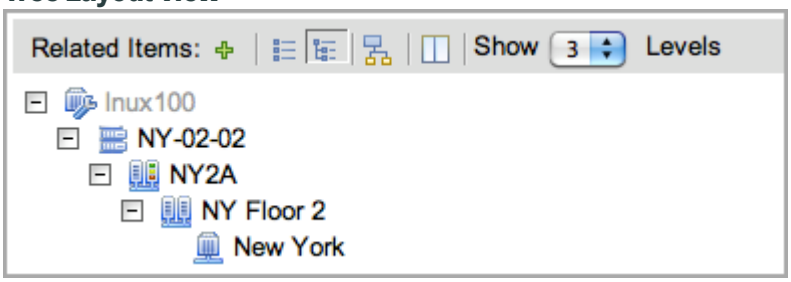
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tree layout

Click the tree layout icon ( ) to group related CIs in a hierarchical tree.

Tree Layout view



CI relationship editor

Use the relationship editor to view, create, modify, or delete CI relationships. Open the relationship editor from the CI Relations formatter.

As an alternative to the CI relationship editor, Unified Map in the CMDB Workspace store app provides the latest functionality for editing CI relationships. For more information, see Edit relationships in Unified Map.

When you use the relationship editor, the CI from which the editor was launched is designated as the base CI. You can then select one or more CIs as a second CI for the relationship. Depending on the selected relationship type, the base CI can become the parent CI or the child CI in the new relationship.

The relationship editor operates differently, depending on whether you select the **Use suggested relationship** check box.

- With suggested relationships, the relationship editor lists all available relationship types for the base CI. To define a new relationship, select a relationship type, and then select a second CI for the relationship.

  Suggested relationships are highlighted for you. These relationships are displayed in blue with a prefix of [Suggested].

- Without suggested relationships, you define a new relationship by first selecting a second CI for the relationship and then selecting a parent or a child relationship type.

Note:
The following relationship types are used only for Service Mapping endpoints, and you cannot use them as a relationship type between two CIs:

- *Implement End Point To:Implement End Point From*
- *Use End Point To: Use End Point From*
- *Applicative Flow To:Applicative Flow From*

Suggested relationships

If you select the **Use suggested relationship** check box in the editor, the **Suggested relationship** list appears. It displays all available CI, user and group relationship types for the base CI. Relationship types have a suffix of **(Parent)** or **(Child)** to note the relationship descriptor, and suggested relationship types are displayed in blue and have a "*" prefix.

When you select a relationship, you are also designating the base CI as being the parent or the child CI in the new relationship. For example, if you select the 'Feeds' relationship type, the base

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CI becomes the designated parent CI, and the second CI that you select becomes the child CI in this relationship.

Downstream relationships

If you do not select the **Use suggested relationship** check box in the editor, the **Downstream relationships** list appears. It displays all relationships in which the base CI is the parent CI. The child CI of the relationship is displayed in the **Child** column.

Upstream relationships

If you do not select the **Use suggested relationship** check box in the editor, the **Upstream relationships** list appears. It displays all relationships in which the base CI is the child CI. The parent CI in each relationship is displayed in the **Parent** column.

Related topics

Add a suggested relationship

Create or edit a CI relationship

Legacy CI relationship builder

Create or edit a CI relationship

Use the relationship editor to view, create, or modify CI relationships. You can open the relationship editor from the CI Relations formatter.

About this task

As an alternative to the CI relationship editor, Unified Map in the CMDB Workspace store app provides the latest functionality for editing CI relationships. For more information, see Edit relationships in Unified Map.

Before you begin

Role required:

- To create relationships: ITIL or asset
- To view relationships, depending on the state of the Table API ACL:
  - If inactive (default): ITIL or asset
  - If active: ITIL or asset, and snc_platform_rest_api_access

  For more information, see CI relationship security, REST API, and Table API.

About this task

The relationship editor operates differently, depending on whether you check the **Use suggested relationship** option or not.

Procedure

1. Launch the relationship editor:

   a. Open a CI form.
   For example:

      i. Navigate to **All** > **Configuration** > **CI Class Manager**.

      ii. On the CI Class Manager page, select **Open Hierarchy**.

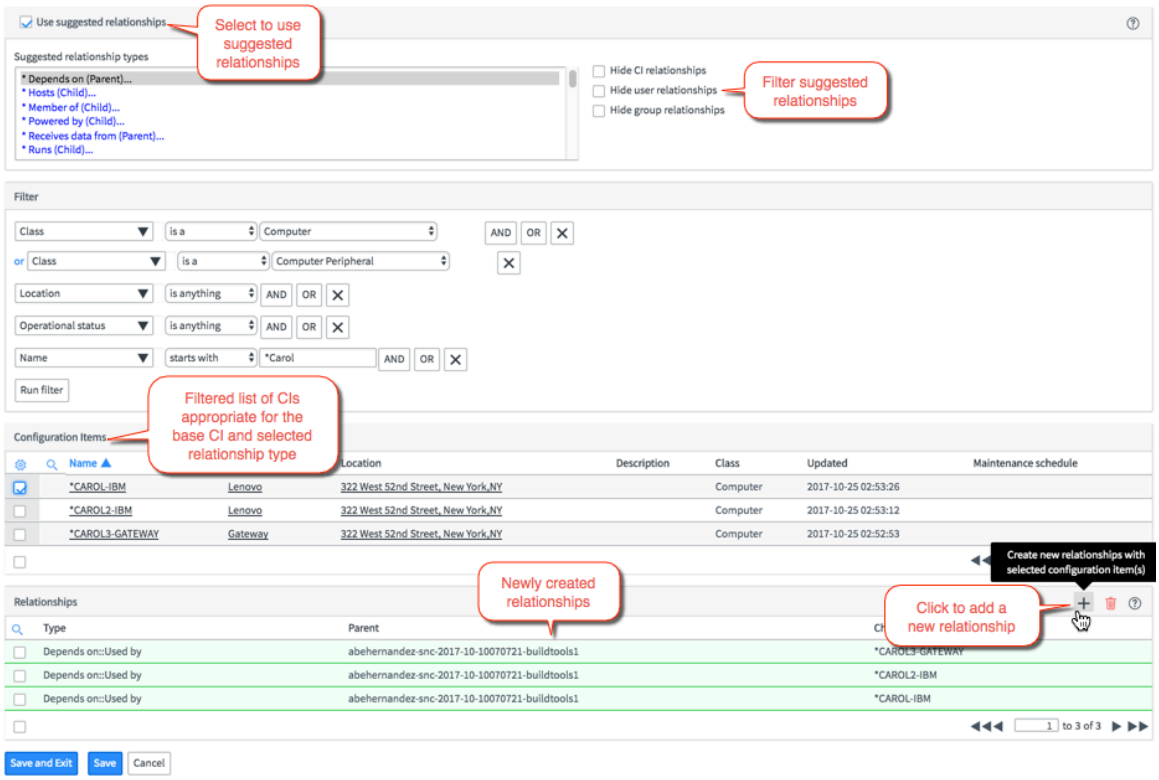
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

iii. On the CI Class panel search and select the class of the CI for which you want to create or edit relationships.

iv. Select **CI List** in the left-side panel and then in the list view, select the CI.

b. On the CI form, scroll down as needed to select the Add CI relationship icon (+ sign) in the Related Items section.

2. To use suggested relationships, first select a relationship type, and then select one or more CIs to be the child CIs in the relationship:



a. Select **Use suggested relationship**.

b. From the **Suggested relationship type** list, select a relationship type.
You can filter the list of suggested relationships by using the filter check boxes.

Filter option	Description
Hide CI relationship	Hides any relationships between the base CI and another CI (such as "Receives data from"). Default filter is stored in the ci_manage_relationships_filter_hint.cmdb_ci user preference.
Hide user relationship	Hides any relationships between the base CI and a user (such as "Logs reviewed by"). The default filter is stored in the ci_manage_relationships_filter_hint.sys_user preference.
Hide group relationship	Hides any relationships between the base CI and a group (such as "Backups done by"). Default filter is stored in the ci_manage_relationships_filter_hint.sys_user_group user preference.

The **Configurations Items** list displays all the CIs that are appropriate for the base CI and the selected relationship type. The **Relationships** list at the bottom of the editor, displays all

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

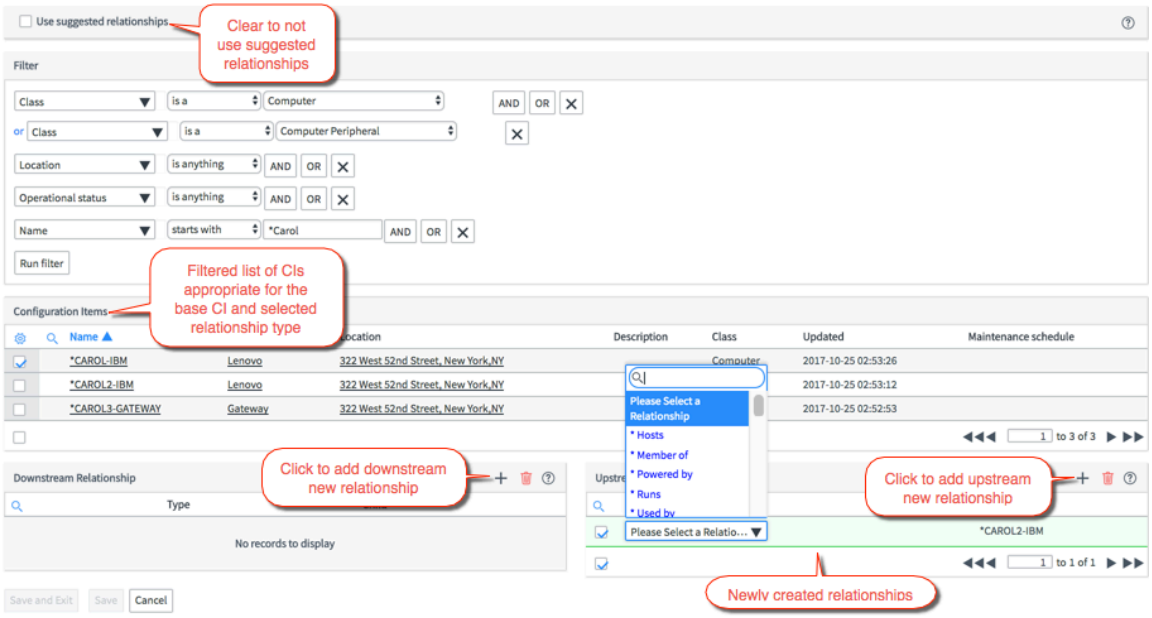
existing relationships of the selected relationship type, in which the base CI is a parent CI or a child CI.

c. From the **Configuration Items** list, select one or more CIs as a second CI for the relationship. You can filter the list of **Configurations Items** by adding conditions in the **Filter** section and clicking **Run filter**.

If you selected a parent relationship type, these CIs becomes the child CI in the relationship, and if you selected a child relationship type, then the selected CIs become the parent CI in the relationship.

d. In the **Relationships** section, click the plus icon (+) to add the new relationships. Alternatively, you can drag the selected CIs to the **Relationships** list. Each new relationship will consist of the base CI, the selected relationship type, and a selected second CI.

3. To not use suggested relationships, first select one or more CIs to be the child CIs in the relationship, and then select the relationship type:



a. Clear **Use suggested relationship**.

b. In the **Configuration Items** list, select one or more CIs as a second CI for the relationship. You can filter the list of **Configurations Items** by adding conditions in the **Filter** area and clicking **Run filter**. Depending on the relationship type that you will select, the selected CIs might become a parent or a child CI in the relationship.

c. With at least one CI selected in the **Configuration Items** list, click the '+' sign in the **Downstream Relationships** section or the **Upstream Relationships** section to create the relationship.

- Add the relationship to **Downstream Relationships** to create a relationship in which the base CI is the parent CI and the selected CI is the child CI.
- Add the relationship to **Upstream Relationships** to create a relationship in which the base CI is the child CI and the selected CI is the parent CI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. For each newly created relationship in either the **Downstream Relationships** or the **Upstream Relationships** lists, click **Please select a relationship** and select a relationship type.
   - The list of available relationship types in the **Downstream Relationships** list contains parent relationships only, in which the base CI is the parent CI.
   - The list of available relationship types in the **Upstream Relationships** list contains child relationships only, in which the base CI is the child CI.

e. Click **Save** or **Save and Exit**.
Only after you enter all the information that is necessary for creating the relationship, these buttons light up indicating that there are pending updates that require saving.

CI relationships in the CMDB

CI relationship security

Delete a CI relationship

Maintain the integrity of the CMDB by deleting any CI relationships that are no longer relevant or needed for a CI. Use the relationship editor to delete CI relationships.

About this task

As an alternative to the CI relationship editor, Unified Map in the CMDB Workspace store app provides the latest functionality for editing CI relationships. For more information, see Edit relationships in Unified Map.

Before you begin

Role required: ITIL or asset

Note:
Deleting a relationship to a dependent CI can result in identification problems as the dependent CI will no longer have a relationship to the CI it depends on.

Procedure

1. Launch the relationship editor:
   a. Open the CI form of the CI for which you want to delete a relationship.
   b. Locate the **Related Items** section near the center of the form.
   c. Click the plus (+) icon on the **Related items** section.
2. In the Relationship Editor, in the Relationships section, select the relationships that you want to delete for the CI.
3. Click the **Delete selected relationships** icon.
4. Click **Save** or **Save and Exit**.

Legacy CI relationship builder

Used to define CI relationships manually, this page is a sophisticated version of the standard list collector. In the legacy CI relations formatter, click the CI relationship builder icon ( ) to display the legacy Define Relationships page.

For information about the latest CI relationship editor, see CI relationship editor.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Select a CI relationship type

The top half of the legacy relationship editor contains a large option box that allows you to select which type of relationship you want to manipulate. Click the particular type of relationship you are interested in working with.

Filter the list of CI relationships

In the legacy relationship editor, the check boxes along the right hand edge of the select box provide a quick way to filter down the list of available relationships.

By default, the system displays a list of all suggested relationships for the type of CI you selected. For example, if you selected a Database instance, a relationship of "Runs on" makes sense, but a relationship of "Provides HVAC for" does not. The default filter is stored in the user preferences ci_manage_relationships_filter_hint.cmdb_cici_manage_relationships_filter_hint.sys_user, and ci_manage_relationships_filter_hint.sys_user_group.

- **Hide CI relationship** -- Hides any relationships between this CI and another CI (e.g. "Receives data from").
- **Hide user relationships** -- Hides any relationships between this CI and a user (e.g. "Logs reviewed by").
- **Hide group relationships** -- Hides any relationships between this CI and a group (e.g. "Backups done by").
- **Show all relationships** -- If you have the appropriate role (out of the box this is itil_admin) you will have an additional check box labeled "Show all relationships." If you click that check box, the system will let you choose any relationship defined in the system, regardless of where it is on the "suggested" list for this type of CI.

Select CI relationship targets

In the legacy relationship editor, users can link or unlink CIs for a relationship type.

As soon as you pick a relationship type, the system will fill in the two select boxes at the bottom of the screen with CI's that are appropriate for the relationship you suggested. The left hand select box will contain a list of CI's that might reasonably be linked via this relationship, while the right hand box contains a list of those CI's which are already linked.

1. Link or unlink items.

Link new items	Move that CI from the left hand box to the right hand box.
Unlink existing items	Move them from the right hand box to the left.

When you make either type of change, a message appears indicating that you have pending changes.

2. Apply or cancel your changes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Click the Save button.	This will save your set of changes, and go back to the previous screen (either a CI or the BSM map depending on how you got here).
Click the Cancel button.	This causes you to exit without saving your changes.

CI relationships in the CMDB

Relation qualifier

A relation qualifier, which is a CI of the Qualifier [cmdb_ci_qualifier] type, stores important information about the CI relationships.

In a relation qualifier, you can annotate arbitrary unique information about the relationship between two CIs. You can define multiple qualifiers for a single relationship, resulting in a qualifier chain. But, there can be only a single qualifier chain for a specific relationship type between two CIs.

For example, for a relationship between a parent CI and a child CI, you can add a relation qualifier to note that the relationship was discovered based on traffic (such as *cmdb_ci_qualifier_traffic_based_connection*). This results in having two records in the CI Relationship [cmdb_rel_ci] table for the relationship.

- A record that links the parent CI and the new qualifier
- A record that links the new qualifier and the child CI

For this relationship, there is a parent CI and a child CI, and a relation qualifier of type *cmdb_ci_qualifier_trafficbased*.

For information about usage of relation qualifiers in the identification process, see Identification rules.

CI relationship security

When applying security to CI relationships, it is important to apply the access controls both to the CI Relationship (cmdb_rel_ci) table and to create an operation editCIRelations to the * table as well.

If the current instance has defined security for editCIRelations, it will be applied to edit_ci_relations automatically in the process of upgrading, and the out-of-date security will be removed.

CI relationships in the CMDB

Create a CI relation rollup

Create a CI relation rollup

A CI relation rollup allows you to sum, count, max, min, or mean a relationship type. You can create CI relation rollups.

Before you begin

Role required: ecmdb_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

CI relation rollup can be useful for tracking and for receiving notifications. For example:

- In a sum roll up, add up fields from multiple CIs and display the result on another CI to which they are related. So, if you have four configuration items in a rack that are all consuming power, create a CI relation rollup to add all the power usage together and display the result in one field on the rack CI form.
- If a certain level of power consumption in a rack is exceeded, send a notification.
- With a rack that has 10 slots, send a notification when 9 slots are filled.

CI relation rollups use the *cmdb synch event* business rule on the [cmdb_ci] table. Although this business rule is active by default, you must modify the rule slightly before it will run.

Procedure

1. Navigate to **All** > **Configuration** > **Relationships** > **CI Relation Rollups**.
2. Click **New**.
3. Complete the form.

CI Relationship Rollup fields

Field	Description
CI Relationship Type	Select a relationship type from the list to use with the rollup. For example, **Members::Member** of contains the parent descriptor **Members** and the child descriptor **Member of**.
Type	Select the type of rollup from the drop-down list: COUNT, MAX, MEAN, MIN, or SUM.
Parent field	The target field on which the operation will be done.
Child field	The input to the equation type. The Parent field is affected by the selections in the child field.
Rollup class	The classes that can use the relationship. For example, you can specify that the relationship only applies to racks.

4. To run the *cmdb synch event* business rule, navigate to **Business Rules**.
5. Use the search box to find the [cmdb synch event] table.
6. Click the *cmdb synch event* business rule to go to the **Business Rule** page.
7. Select the **Update**, **Delete**, and **Query** check boxes.
   Additionally, if you wish CI relation rollups to recalculate when there is a change to a relationship, use a similar procedure to select the **Active** check box on the *cmdb_rel_ci synch event* business rule.

CI relationships in the CMDB

CMDB CI Class Models

The CMDB contains base-system classes that store data about configuration items (CIs). The CMDB CI Class Models ServiceNow® Store app adds class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and dependent relationships if applicable.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Classes added by the CMDB CI Class Models app

For the full list of added classes, see List of classes added by the CMDB CI Class Models app.

The app adds classes, columns, and associated metadata as related records in the following tables:

- CMDB Class Information [cmdb_class_info]: Class descriptions
- Identifier [cmdb_identifier]: Identification rules
- Identifier Entry [cmdb_identifier_entry]: Identification entries
- CMDB Metadata Hosting Rules [cmdb_metadata_hosting]: Dependent relationships

Using the classes

You can use the added classes like any other class. Applications such as Discovery and Service Mapping can use class extensions to populate CIs and to discover technologies and software.

Related ServiceNow® Store apps and reference information:

- Configuration Management database: A collection of class diagrams and class attributes for key CMDB classes.
- CMDB tables descriptions: Descriptions of key CMDB tables in the base system.
- Populating the CMDB: Information about the various options for populating the CMDB.
- Discovery patterns: A ServiceNow Store app that provides a library of Discovery patterns for discovering specific devices and applications in the industry.
- Service Graph Connectors: ServiceNow Store apps that provide predefined integrations for importing and integrating common third-party data into CMDB classes. Also includes the IntegrationHub ETL wizard for creating new ETL transform maps.

Discover using extension classes

The following table lists the software and technologies that applications can discover using the extension classes. It provides links to documentation for CMDB CI Class Models and the corresponding discovery patterns.

Software/Technology	CMDB CI Class Models Store app	Discovery patterns
Avi load balancer	Avi load balancer extension classes	Avi Vantage load balancer discovery
BYOL Model of RDS for Oracle	BYOL model of RDS for Oracle extension classes	
Firewall	Firewall extension classes	
IBM Hardware Management Console (HMC)	IBM Hardware Management Console (HMC) extension classes	IBM Virtualization and Hardware Management Console discovery
Internet of Things (IoT)	Internet of Things (IoT) extension classes	N/A
Nutanix	Nutanix extension classes	Nutanix Acropolis discovery

Software/Technology	CMDB CI Class Models Store app	Discovery patterns
OpenStack	OpenStack extension classes	OpenStack resource discovery
Red Hat Virtualization (RHV)	Red Hat Virtualization (RHV) extension classes	Red Hat Virtualization discovery
Transport Layer Security (TLS)	Transport Layer Security (TLS) extension classes	Discovery procedures provided by Certificate Inventory and Management ServiceNow Store app
VMware NSX load balancer	VMware NSX load balancer extension classes	VMware NSX Advanced load balancer discovery

Install the CMDB CI Class Models app

Install the app and then make sure that the new classes were installed successfully.

Before you begin
Role required: admin

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Procedure

Verify successful installation of the app.

After installing the app, make sure that the new classes were installed successfully:

a. Navigate to **Configuration** and then select **CI Class Manager**.

b. Select **Hierarchy** in the CI Class Manager to display the CI Classes list. The list contains the added classes, as described in List of classes added by the CMDB CI Class Models app.

c. Select a class to view the corresponding class descriptions, identification rules, identifier entries, and dependent relationships if applicable.

Warning:
Uninstalling the CMDB CI Class Models app might compromise the integrity of the CMDB and result in unexpected behavior.

API extension classes

The CMDB CI Class Models ServiceNow Store app adds or updates classes for APIs (application programming interface).

The CMDB CI Class Models app adds class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and, if applicable, dependent relationships. You can use the added classes just like any other CMDB class. Applications such as Discovery and Service Mapping Patterns can use the class extensions to populate CIs and discover technologies and software.

See the full release notes for all CMDB CI Class Models.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

APIs

APIs are a set of definitions and protocols that enable computer programs to communicate with each other, which enables you to build or integrate application software. APIs typically use web-based technology to communicate with other APIs. APIs are generally used to programmatically perform jobs or tasks, or to view, import, export, delete, or modify data.

The classes added in this release extend the CMDB data model and provide a foundation for the representation of API CI classes. You can use this foundation to do the following:

- Gain greater visibility into your APIs.
- Identify security issues and vulnerabilities associated with an API endpoint.

Classes

This section lists the classes that the CMDB CI Class Models store app adds or updates. For additional detail, see the Community article titled "New Data Model in CMDB for APIs".

CMDB CI Class Models: The following classes for API are available. For the list of classes in the base system, including classes that this app might extend, see CMDB tables descriptions.

Class	Extends	Description
API [cmdb_ci_api]	Configuration Item [cmdb_ci]	APIs that enable two computer programs to communicate with each other, typically using web-based technologies. Example: ChatAPI (https://[apiID].execute-api.use-east-2.amazonaws.com).
API Component [cmdb_ci_api_component]	Configuration Item [cmdb_ci]	Reusable objects related to your API definition that facilitate functionality or exchange of data. API Headers related list. Example: GET https://[instance].service-now.com/api/now/table/{tablename}.
API Frontend [cmdb_ci_api_frontend]	API Component [cmdb_ci_api_component]	The part of an API from which a client or user interacts or makes requests. Example: GET https://[apiID].execute-api.us-east-2.amazonaws.com/{proxy+}.
API Backend [cmdb_ci_api_backend]	API Component [cmdb_ci_api_component]	The part of an API that fulfills requests by interacting with backend services,

Class	Extends	Description
		such as servers. Example: Lambda:Chat-API-Proxy.
API Gateway [cmdb_ci_api_gateway]	Application [cmdb_ci_appl]	API infrastructure that centralizes client API requests and manages backend processes and services. Example: Kong Gateway.
Managed API [cmdb_ci_managed_api]	Configuration Item [cmdb_ci_api]	API discovered from a gateway or management service. You can enforce a dependency on a gateway for APIs in this class.

Class attributes

CMDB CI Class Models: Release 1.49.0 adds the following attributes to the respective classes.

API [cmdb_ci_api]

Attribute	Data type	Description
Base URL	String (1024)	Base address from which all API components extend.
ID	String (1024)	Unique identifier from the source system.
Type	Choice list	Type of API. You can specify: • REST • SOAP • HTTP • gRPC • GraphQL • Websocket
Version	Numeric	Version of the API.
Spec Location	URL	URL to the location of the API specification. Example: OpenAPI spec definition.
Technical Specification Location	String	Location of the technical specification repository for an API. Example: GitHub repository containing the deployed API code.
Design Specification Location	String	URL to the location of the API design or documentation. Example: SwaggerHub API Design Specification URL.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The API [cmdb_ci_api] class supports mapping of tags and labels to the Key Value [cmdb_key_value] table to enable key-value storage for API metadata.

API Component [cmdb_ci_api_component]

Attribute	Data type	Description
Method	String	REST API methods. Examples: • GET • POST • DELETE
Protocol	String	Communication protocol. Example: HTTP, HTTPS.
Host	String (100)	System that hosts the API.
Path	String (1024)	Specific route the API follows.
Port	String	Communication port. Example: 80, 443, and so on.
URL	String (1024)	URL of the resource being called.
ID	String (1024)	Unique identifier from the source system.
Internet Facing	Boolean	Boolean that denotes whether the component is reachable from the public internet. Specify 1 or "true" if the component is reachable.
Authorization	String	Type of authorization or authentication method. Example: • Basic • Key • OAuth • None
Request data types	String (255)	List of data types in the request. Examples: • CC • Email • Address
Response data types	String (255)	List of data types in the response. Examples:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

API Component [cmdb_ci_api_component] (continued)

Attribute	Data type	Description
		• CC • Email • Address

The API Component [cmdb_ci_api_component] class supports mapping of tags and labels to the Key Value [cmdb_key_value] table to enable key-value storage for API component metadata.

API Frontend [cmdb_ci_api_frontend]

Attribute	Data type	Description
Parent ID	Reference to [cmdb_ci_api_frontend]	Reference to a parent API component.

API Backend [cmdb_ci_api_backend]

Attribute	Data type	Description
Type	String	Backend protocol types of the API. Examples: • Lambda • HTTP • Logic App

API Gateway [cmdb_ci_api_gateway]

Attribute	Data type	Description
ID	String (255)	Unique identifier from the source system.

The API Gateway [cmdb_ci_api_gateway] class supports mapping of tags and labels to the Key Value [cmdb_key_value] table. The mapping enables key-value storage for API gateway metadata.

The following marker classes are available for API gateways. These classes inherit all attributes from the API Gateway [cmdb_ci_api_gateway] parent class.

- Anypoint API Gateway [cmdb_ci_api_gateway_anypoint] (provided by MuleSoft)
- Tyk API Gateway [cmdb_ci_api_gateway_tyk]
- Boomi API Gateway [cmdb_ci_api_gateway_boomi]

The marker classes follow the existing class structure and do not require changes to Identification and Reconciliation engine (IRE) rules.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The Managed API [cmdb_ci_managed_api] class is specific to APIs discovered from gateways and other managed services, and does not introduce new attributes.

API Product Bundle [cmdb_ci_api_product_bundle]

Attribute	Data type	Description
ID	String (255)	Unique identifier of the API product bundle.
Discovered Approval Type	String	Type of request approval as discovered from the source system.
Discovered Access Type	String	Access configuration as discovered from the source system. For example, public or internal.
Creation Date	Date/Time	Date and time when the API product bundle was initially discovered or recorded.
Last Modified Date	Date/Time	Date and time of the most recent update to the API product bundle.
Discovered State	String	Current state of the product bundle as reported by the source. For example, published or deprecated.

API Consumer Subscription [cmdb_ci_api_consumer_subscription]

Attribute	Data type	Description
Discovered Scope	String	Scope of access as discovered from the source system. For example, all APIs or specific APIs.
API Consumer	Reference	Reference to the API consumer record. For example, cmdb_ci_api_consumer.
ID	String (255)	Unique identifier of the API consumer subscription.
Discovered State	String	Subscription status as discovered from the source system. For example, active or inactive.
Creation Date	Date/Time	Date and time when the API consumer subscription was created in the source system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

API Consumer Subscription [cmdb_ci_api_consumer_subscription] (continued)

Attribute	Data type	Description
Last Modified Date	Date/Time	Date and time of the most recent update to the API consumer subscription.

Key relationship structures

There are a number of key relationships that must be defined for API and Kong classes.

API relationships

Parent class	Relationship	Child class	Relationship type
API [cmdb_ci_api]	Uses::Used by	API Component [cmdb_ci_api_component]	Suggested
API Gateway [cmdb_ci_api_gateway]	Provides::Provided By	Managed API [cmdb_ci_managed_api]	Dependent
API Frontend [cmdb_ci_api_frontend]	Use End Point To::Use End Point From	API Backend [cmdb_ci_api_backend]	Suggested
API Backend [cmdb_ci_api_backend]	Uses::Used By	Kong Load Balancer [cmdb_ci_kong_lb]	Suggested
API Gateway [cmdb_ci_api_gateway]	Provides::Provided By	API Product Bundle [cmdb_ci_api_product_bundle]	Dependent
API Gateway [cmdb_ci_api_gateway]	Provides::Provided By	API Consumer Subscription [cmdb_ci_api_consumer_subscription]	Dependent
API Product Bundle	Contains::Contained by	API [cmdb_ci_api]	Suggested
API Product Bundle	Used by::Uses	API Consumer Subscription [cmdb_ci_api_consumer_subscription]	Suggested

Related non-CMDB tables

CMDB CI Class Models v 1.49.0 introduces the following non-CMDB tables as related lists for the following API extension classes:

API related list

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

API Deployment [api_deployment]

Attribute	Data type	Description
Name	String (100)	Name of the API deployment.
API	Reference	Reference to the deployed API (cmdb_ci_api).
Unmatched API Endpoint	Reference	Reference to the unmatched API endpoint, if the API doesn't match an existing API (cmdb_ci_unmatched_api_endpoint).
Configuration Item	Reference	Reference to the Configuration Item. This is typically manually specified as a reference, if you know what CI the API is deployed to.

Note:
The API Deployment non-CMDB table relates to both the API [cmdb_ci_api] and Unmatched API Endpoint [cmdb_ci_unmatched_api_endpoint] classes.

API Component related list

API Header [api_header]

Attribute	Data type	Description
Name	String (100)	Name of the API header.
API Component	Reference	Reference to the component where the API header is defined (cmdb_ci_api_component).
Unmatched API Endpoint	Reference	Reference to the unmatched API when the endpoint can't be matched to an existing API or component (cmdb_ci_unmatched_endpoint).

API Gateway related lists

API Consumer [api_consumer]

Attribute	Data type	Description
Username	String (100)	Name of the API consumer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

API Consumer [api_consumer] (continued)

Attribute	Data type	Description
		Note: The **Consumer** field in the api_policy table is a reference field. To display the username in the **Username** field on the API Policies list, you must set the *display* attribute of **Username** to `true`. If the attribute is not set to `true`, then the list displays the Sys ID instead.
ID	String (255)	Unique identifier from the source system.
Custom ID	String (100)	Alternate display name of the user.
API Gateway	Reference	Reference to the gateway where the consumer is defined (cmdb_ci_api_gateway).
API Consumer Type	Choice list	API user type (user_type). You can specify: • Internal • External • Unknown
Discovered State	String	Represents the current status of the API consumer's account.
Provider	String	Name of the identity management provider responsible for authenticating the API consumer.
Email	String	Email address of the API consumer.
Registration Date	Date/Time	Date the consumer registered with the providing platform.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

API Consumer Access [api_consumer_access]

Attribute	Data type	Description
API Consumer	Reference	Reference to the API consumer record. For example, cmdb_ci_api_consumer.
API	Reference	Reference to the API [cmdb_ci_api] to which the consumer is requesting access.
Auth Method	String	Authentication method used by the API consumer to access the API. For example, API key or OAuth.
State	Choice	Indicates whether the access is currently active or inactive.
Last used	Date/Time	Last date and time the API consumer accessed the API.
Valid to	Date/Time	Expiration date of the consumer's access to the API.

API Policy [api_policy]

Attribute	Data type	Description
Name	String (100)	Name of the API policy.
ID	String (255)	Unique identifier from the source system.
Frontend	Reference	Reference to the API Frontend (cmdb_ci_api_frontend).
Managed API	Reference	Reference to the Managed API (cmdb_ci_managed_api).
Consumer	Reference	Reference to the API Consumer (api_consumer) non-CMDB table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

API Policy [api_policy] (continued)

Attribute	Data type	Description
		Note: **Consumer** is a reference field. To display the api_consumer (Username) in the API Policies list, you must set the *display* attribute to `true` for **Username** field on the api_consumer table. If the attribute is not set to `true`, then the list displays the Sys ID instead.
Protocols	String	Array of protocols that this API policy can apply to.
Active	Boolean	Determines if this non-CMDB table is considered active or inactive.
API Gateway	Reference	Reference to the gateway where the consumer is defined (cmdb_ci_api_gateway).

Unmatched API extension classes

The CMDB CI Class Models store app adds or updates classes for unmatched APIs (application programming interface).

The CMDB CI Class Models app adds class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and, if applicable, dependent relationships. You can use the added classes just like any other CMDB class. Applications such as Discovery and Service Mapping Patterns can use the class extensions to populate CIs and discover technologies and software.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Unmatched APIs

API endpoints that are not structured well enough to populate the API [cmdb_ci_api] and API Component [cmdb_ci_api_component] classes instead populate the Unmatched API Endpoint [cmdb_ci_unmatched_api_endpoint] class. Unmatched APIs are typically used by integrations like security scanners or observability tools.

Classes

This section lists the classes that the CMDB CI Class Models store app adds or updates.

CMDB CI Class Models: Release 1.49.0 adds the following class for unmatched API endpoints. For the list of classes in the base system, including classes that this app might extend, see CMDB tables descriptions.

Class	Extends	Description
Unmatched API Endpoint [cmdb_ci_unmatched_api_endpoint]	Configuration Item [cmdb_ci]	APIs with unstructured endpoints that cannot populate cmdb_ci_api or cmdb_ci_api_component.

Class attributes

CMDB CI Class Models: Release 1.49.0 adds the following attributes to the Unmatched API Endpoint [cmdb_ci_unmatched_api_endpoint] class.

Unmatched API Endpoint [cmdb_ci_unmatched_api_endpoint]

Attribute	Data type	Description
Method	String	Backend protocol types of the API. Examples: • Lambda • HTTP • Logic App
Protocol	String	Communication protocol. Example: HTTP, HTTPS.
URL	String (1024)	URL of the resource being called.
ID	String (1024)	Unique identifier from the source system.
Internet Facing	Boolean	Boolean that denotes whether the component is reachable from the public internet. Specify 1 or "true" if the component is reachable.
Authorization	String	Type of authorization or authentication method. Example: • Basic • Key • Oauth • None

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Unmatched API Endpoint [cmdb_ci_unmatched_api_endpoint] (continued)

Attribute	Data type	Description
Request data types	String (255)	List of data types in the request. Examples: • CC • Email • Address
Response data types	String (255)	List of data types in the response. Examples: • CC • Email • Address

Key Relationship Structures

The Unmatched API Endpoint [cmdb_ci_unmatched_api_endpoint] CMDB class and API Endpoint Discovered [api_endpoint_discovered] non-CMDB table are intended for scenarios where unstructured API data is ingested and needs to be processed beyond the capabilities of IntegrationHub-ETL.

API Endpoint Discovered [api_endpoint_discovered] can serve as a staging table for raw data for the API [cmdb_ci_api] and API Component [cmdb_ci_api_component] classes. API data that does not come from a well-structured data source or cannot have standard identification rules applied can first populate the API Endpoint Discovered [api_endpoint_discovered] table. You can then use a customer-defined integration to ensure that well-formed data that matches the quality and condition requirements for API [cmdb_ci_api] and API Component [cmdb_ci_api_component] populates the most appropriate table.

In cases where the data cannot be correctly parsed or is structured in an unexpected fashion, you can instead use a customer-defined integration to populate the Unmatched API Endpoint [cmdb_ci_unmatched_api_endpoint] table.

Data that populates the API Endpoint Discovered [api_endpoint_discovered] table is purged every 30 days.

API Endpoint Discovered [api_endpoint_discovered]

Attribute	Data type	Description
Name	String (100)	Name of the API endpoint.
Method	String	REST API methods. Examples: • GET • POST • DELETE
URL	String (1024)	URL of the resource being called.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

API Endpoint Discovered [api_endpoint_discovered] (continued)

Attribute	Data type	Description
Type	Choice list	Type of API. You can specify: • REST • SOAP • HTTP • gRPC • GraphQL • Websocket
Authorization	String	Type of authorization or authentication method. Example: • Basic • Key • OAuth • None
Internet Facing	Boolean	Boolean that denotes whether the component is reachable from the public internet. Specify 1 or "true" if the component is reachable.
Request Datatypes	String (255)	List of data types in the request. Examples: • CC • Email • Address
Response Datatypes	String (255)	List of data types in the response. Examples: • CC • Email • Address
Headers	String (255)	Comma-separated list of header names.
Configuration Item	Reference	Reference to a matching CMDB CI (API Component or Unmatched API Endpoint).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related non-CMDB tables

The Unmatched API extension class uses the API Deployment [api_deployment] non-CMDB table as a related list:

API Deployment [api_deployment]

Attribute	Data type	Description
Name	String (100)	Name of the API deployment.
API	Reference	Reference to the deployed API (cmdb_ci_api).
Unmatched API Endpoint	Reference	Reference to the unmatched API endpoint, if the API doesn't match an existing API (cmdb_ci_unmatched_api_endpoint).
Configuration Item	Reference	Reference to the Configuration Item. This is typically manually specified as a reference, if you know what CI the API is deployed to.

Avi load balancer extension classes

The CMDB CI Class Models store app adds or updates classes for the Avi load balancer.

The CMDB CI Class Models app adds class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and, if applicable, dependent relationships. You can use the added classes just like any other CMDB class. Applications such as Discovery and Service Mapping Patterns can use the class extensions to populate CIs and discover technologies and software.

See the full release notes for all CMDB CI Class Models.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Avi load balancer

The Avi Vantage platform is built on software-defined principles, enabling a next-generation architecture to deliver the flexibility and simplicity expected by IT and lines of business. The Avi Vantage platform architecture separates the data and control planes to deliver application services beyond load balancing, such as application analytics, predictive autoscaling, micro-segmentation, and self-service for app owners in on-premises or cloud environments. The platform provides a centrally managed, dynamic pool of load balancing resources on commodity x86 servers, virtual machines, or containers, to deliver granular services close to individual applications. Providing these services allows network services to scale near infinitely without the added complexity of managing hundreds of disparate appliances.

Discovery uses the Avi Vantage load balancer discovery pattern to find Avi load balancer resources.

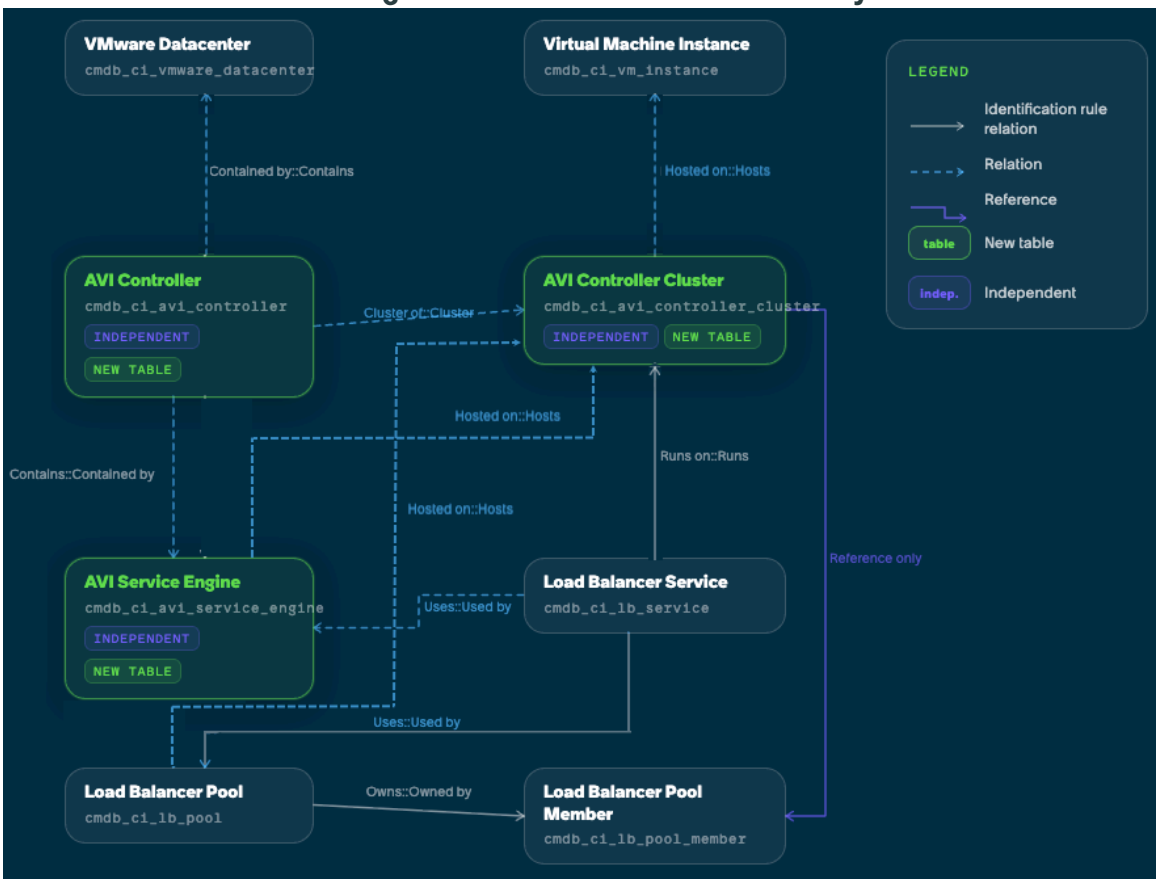
Avi load balancer classes integrated with the CMDB class hierarchy



Classes

This section lists the classes that the CMDB CI Class Models store app adds or updates. CMDB CI Class Models: Release 1.6.0 adds the following classes for the Avi load balancer. For the list of classes in the base system, including classes that this app might extend, see CMDB tables descriptions.

Class	Extends	Description
Avi Controller [cmdb_ci_avi_controller]	Virtual Machine Object [cmdb_ci_vm_object]	Avi Controller is a single point of management and control that is the 'brain' of the entire Avi Vantage system, and typically deployed as a redundant three-node cluster.
Avi Controller Cluster [cmdb_ci_avi_controller_cluster]	Virtual Machine Object [cmdb_ci_vm_object]	Avi Controller cluster uses big data analytics to analyze the data and present actionable insights to administrators on intuitive dashboards on the Avi Admin Console.
Avi Service Engine [cmdb_ci_avi_service_engine]	Virtual Machine Object [cmdb_ci_vm_object]	Avi Service Engines (SEs) handle all data plane operations within Avi Vantage by receiving and executing

BYOL model of RDS for Oracle extension classes

The CMDB CI Class Models store app adds or updates classes for the BYOL Model of RDS for Oracle.

The CMDB CI Class Models app adds class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and, if applicable, dependent relationships. You can use the added classes just like any other CMDB class. Applications such as Discovery and Service Mapping Patterns can use the class extensions to populate CIs and discover technologies and software.

See the full release notes for all CMDB CI Class Models.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

BYOL Model of RDS for Oracle

The Amazon RDS for Oracle is a fully managed commercial database that makes it easy to set up, operate, and scale Oracle deployments in the cloud. You can run Amazon RDS for Oracle in one of two different licensing models: “License Included” and “Bring-Your-Own-License (BYOL)“. In the “License Included” service model, you do not need separately purchased Oracle licenses; the Oracle Database software has been licensed by AWS.

The base system supports discovery of the RDS Databases and their licenses.

Classes

This section lists the classes that the CMDB CI Class Models store app adds or updates. CMDB CI Class Models: Release 1.23.0 adds the following classes for the BYOL Model of RDS for Oracle. For the list of classes in the base system, including classes that this app might extend, see CMDB tables descriptions.

Class	Description
cmdb_ci_cloud_database	The cloud databases.
cmdb_ci_serverless_hardware	Hardware type information of the databases.

Class Columns

CMDB CI Class Models: Release 1.23.0 adds the following column to the respective class.

Serverless Hardware [cmdb_ci_serverless_hardware]

Added column	Description
cloud_vendor	The cloud vendor.
host_type	The host type such as PaaS/IaaS.
cpu_core_count	Amount of CPU cores.
cpu_core_thread	Amount of CPU threads.
cpu_count	Amount of CPUs.
object_id	ID of the CI.

Cloud Database [cmdb_ci_cloud_database]

Added column	Description
multi_az	Determines if the database is deployed on multiple availability zones (true/false).
replication_enabled	Determines if replication is enabled (true/false).
replication_type	Replication type.
replica_source	Database name of the replication source.

Cassandra extension classes

The CMDB CI Class Models store app adds or updates classes for Cassandra databases.

The CMDB CI Class Models app adds class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and, if applicable, dependent relationships. You can use the added classes just like any other CMDB class. Applications such as Discovery and Service Mapping Patterns can use the class extensions to populate CIs and discover technologies and software.

See the full release notes for all CMDB CI Class Models.

DNS resource record classes

The CMDB CI Class Models ServiceNow Store app adds or updates classes for DNS records, also known as a DNS resource records (RR).

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

The CMDB CI Class Models app adds class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and, if applicable, dependent relationships. You can use the added classes just like any other CMDB class. Applications such as Discovery and Service Mapping Patterns can use the class extensions to populate CIs and discover technologies and software.

See the full release notes for all CMDB CI Class Models.

DNS zone resource records

A DNS record is an entry in the domain name system (DNS) database that provides information about a specific aspect of a domain name. Each DNS record contains data associated with a domain name, such as IP addresses, mail server addresses, or other resources. Each type of record serves a specific purpose, such as mapping domain names to IP addresses (A records), identifying mail servers for a domain (MX records), and providing aliases for domain names (CNAME records), among others. DNS resource records are essential for the proper functioning of the DNS infrastructure on the internet.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
In CMDB CI Class Models release 1.57, existing classes in the CMDB schema that represent DNS resource records like A, AAAA, CName, and so on are deprecated. The following classes are defined with an ideal base, child class, and identification rule.

Supported DNS resource record types

- A Record: Holds the IP address of a domain.
- AAAA Record: Contains the IPv6 address of a domain.
- CNAME Record: Forwards one domain or subdomain to another domain. Does not provide an IP address.
- MX Record: Directs mail to an email server.

The supported record types enable actions like the following:

- Capture domain name registration in the CMDB and create workflow to request, approve, and track life cycle.
- Auto-populate the data from integration to the registrar.
- Connect the data to an IPAM record.
- Connect the data to the certificate on the DNS.
- Connect the data to the CDN provider.

DNS resource record classes integrated with the CMDB class hierarchy

Table: cmdb_ci_dns_resource_record

This section lists the classes that the CMDB CI Class Models store app adds or updates. For the list of classes in the base system, including classes that this app might extend, see CMDB tables descriptions.

DNS record detail from Domain Name Server (DNS) for a WWW domain.

Column	Description	Details
DNS Service Provider [service_provider] Replaces the deprecated column: DNS Service Provider [name]	Defines which DNS service provider supplied this value, examples like Cloudflare,Google DNS, OpenDNS, Local DNS,Private DNS,empty, and so on.	Identification Rule (name +service_provider) allow null String (255)
Time to Live [ttl]	Time, in seconds, that a DNS record will be cached by an outside DNS server or resolver.	integer
Record Class [record_class]	Class of DNS record.	• IN (Internet) (default) • CH (Chaosnet) • HS (Hesiod)

Table: cmdb_ci_dns_zone_a_record

A records hold only IPv4 addresses.

Column	Description	Details
A IP Address [ip_address]	IPv4 address	ip_addr Identification Rule (name+service_provider +ip_address) allow null

Table: cmdb_ci_dns_zone_aaaa_record

AAAA records hold only IPv6 addresses.

Column	Description	Details
AAAA IP Address [ip_address]	IPv6 address	ip_addr Identification Rule (name+service_provider +ip_address) allow null

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table: cmdb_ci_dns_zone_cname_record

A canonical name (CNAME) record points from an alias domain to a canonical domain.

Column	Description	Details
Canonical Name [cname]	Fully qualified domain name / Canonical Name.	String (255) Identification Rule (name +service_provider+cname) allow null

Table: cmdb_ci_dns_zone_alias_record

An ALIAS record points domain name to a hostname instead of an IP address.

Column	Description	Details
Alias Name [alias_name]	Alias name of the DNS record.	String (255) Identification Rule (name+service_provider +alias_name) allow null

Table: cmdb_ci_dns_domain_info

Domain Name enables you to trace ownership and tenure of domain name details using DNS lookup tools like whois.

Column	Description	Details
Domain Name [domain_name]	WWW Domain Name value from the DNS lookup tool.	String (255) Identification Rule (Name)
Registry Domain ID [registry_domain_id]	Registry Domain ID value from the DNS lookup tool.	String (255)
Registrar [registrar]	Registrar value from the DNS lookup tool.	String (255)
Domain Creation Date [domain_creation_date]	Creation Date of the domain from the DNS lookup tool.	glide_date_time
Domain Updated Date [domain_updated_date]	Updated Date of the domain from the DNS lookup tool.	glide_date_time
Registrar Registration Expiration Date [registrar_registration_expiration_date]	Registrar Registration Expiration Date value from the DNS lookup tool.	glide_date_time

Firewall extension classes

The CMDB CI Class Models store app adds or updates classes for firewall devices.

The CMDB CI Class Models app adds class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and, if applicable, dependent

Firewalls

A firewall is a network security system that, based on security policies, monitors and controls incoming and outgoing network traffic. Firewalls typically form a barrier between an internal network and an untrusted external network such as the internet. It usually consists of security policies that help secure an organization from external threats and cyberattacks. Firewall vendors may provide a centralized firewall manager to manage many firewall devices and the security policies residing on them. For example, Panorama™ is the centralized management system for Palo Alto Networks firewalls.

Class	Extends	Description
IBM HMC Server [cmdb_ci_hmc_server]	Server [cmdb_ci_server]	IBM console that manages frames and assigns logical partitions (LPARs) to pools.
IBM Frame [cmdb_ci_ibm_frame]	Server [cmdb_ci_server]	IBM physical machine with considerable resources that can be virtualized.
IBM LPAR Instance [cmdb_ci_lpar_instance]	Virtual Machine Instance [cmdb_ci_vm_instance]	IBM logical partition representing the virtual aspect of the operating system.
LPAR Resource [cmdb_ci_lpar_resource]	Configuration Item [cmdb_ci]	Resource of an LPAR instance.
IBM HMC Processor pool [cmdb_ci_processor_pool]	Virtual Machine Object [cmdb_ci_vm_object]	IBM shared pool used to allocate processors to a group of LPARs.

Class columns

CMDB CI Class Models: Release 1.3.0 adds the following columns to the respective classes.

IBM Frame [cmdb_ci_ibm_frame] class

Added columns	Description
Current available processor units	Current available processor units.
Configurable processor units	Configurable processor units.
Configurable memory units	Configurable memory units.
Installed processor units	Installed processor units.
Current available memory units	Current available memory units.
Installed memory units	Installed memory units.

IBM HMC Processor pool [cmdb_ci_processor_pool] class

Added columns	Description
LPAR IDs	LPAR IDs.
LPAR names	LPAR names.
Frame name	Frame name.

CMDB CI Class Models: Release 1.2.0 adds the following columns to the respective classes.

IBM HMC Server [cmdb_ci_hmc_server] class

Added columns	Description
Frame count	Count of frames.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Added columns	Description
Is VIO	Flags whether this VM is a (VIO) virtual input/ output server in the HMC topology.
High Watermark VCPU	Peak in the utilization of virtual CPU assigned to during the reporting period.
Frame Serial Number	Serial number of a frame (frame being a physical machine such as ESX).
VIO Servers	List of VIO servers.

LPAR Resource [cmdb_ci_lpar_resource] class

Added columns	Description
Node name	Name of the node.
Partition Name	Name of the partition.
Partition Number	Number of the partition.
Type	Type of LPAR Resource.
Mode	Mode of LPAR Resource.
Entitled Capacity	Allotted capacity granted.
Partition Group-ID	ID of a group of partitions.
Shared Pool ID	ID of a pool of shared processors.
Online Virtual CPUs	A virtual CPU.
Maximum Memory	Maximum amount of memory.
Minimum Memory	Minimum amount of memory.
Variable Capacity Weight	Logical partition processor capacity weight.
Minimum Capacity	Minimum number of processes.
Capacity Increment	Increments of process.
Maximum Physical CPUs in system	Maximum CPUs allotted in system.
Active Physical CPUs in system	Current CPUs in system.
Active CPUs in Pool	Number of active CPUs within a pool.
Shared Physical CPUs in system	Number of shared CPUs within a system.
Maximum Capacity of Pool	Maximum capacity of processes within a pool.
Entitled Capacity of Pool	Number of processes that are entitled.
Unallocated Capacity	Number of free spaces.
Physical CPU Percentage	Number of CPUs allocated to system.
Unallocated Weight	At no extra charge resources on instance.
Desired Virtual CPUs	Target number of virtual CPUs.
Desired Memory	Target amount of memory.
Desired Variable Capacity Weight	Targeted processor load.

LPAR Resource [cmdb_ci_lpar_resource] class (continued)

Added columns	Description
Desired Capacity	Target resources used within instance.
High Watermark VCPU	Peak in the utilization of virtual CPU assigned to during the reporting period.

IBM HMC Processor pool [cmdb_ci_processor_pool] class

Added columns	Description
Pool ID	ID of pool of processors.
CPU Core count	Number of CPU cores.
Memory count	Amount of memory used.
Unassigned cores	Number of unused cores.
Unassigned memory	Amount of unassigned memory.

The following class has no added columns: IBM Frame [cmdb_ci_ibm_frame].

Internet of Things (IoT) extension classes

The CMDB CI Class Models store app adds or updates classes for the Internet of Things (IoT).

The CMDB CI Class Models app adds class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and, if applicable, dependent relationships. You can use the added classes just like any other CMDB class. Applications such as Discovery and Service Mapping Patterns can use the class extensions to populate CIs and discover technologies and software.

See the full release notes for all CMDB CI Class Models.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Internet of Things (IoT)

IoT is a system of interrelated computing devices, mechanical and digital machines, objects, animals or people that are provided with unique identifiers and the ability to transfer data over a network without requiring human-to-human or human-to-computer interaction. The classes added in this release, extend the Data Model to provide a foundation for the representation of IoT CI classes. This foundation underpins workflows for Enterprise Asset Management (EAM), Governance Risk Compliance (GRC), Component Supply Management (CSM), and Field Service Management (FSM) surrounding the management of IoT devices and the transport vehicles that some reside in.

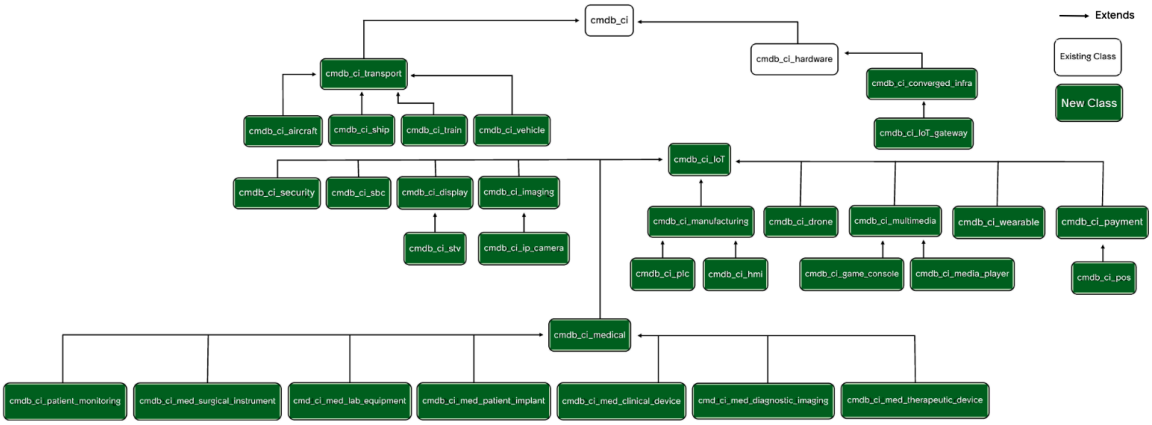
IoT extension classes integrated with the CMDB class hierarchy



Classes

This section lists the classes that the CMDB CI Class Models store app adds or updates. For the list of classes in the base system, including classes that this app might extend, see CMDB tables descriptions.

CMDB CI Class Models: Release 1.6.0 adds the following classes for IoT.

Class	Extends	Description
Transport Type [cmdb_ci_transport]	cmdb_ci	Types of transportation that contain interconnected technology.
Converged Infrastructure [cmdb_ci_converged_infra]	cmdb_ci_hardware	Devices that serve both computing and networking functions.
IoT Device [cmdb_ci_IoT]	cmdb_ci_hardware	Parent table that contains Internet of Things device types.
Aircraft [cmdb_ci_aircraft]	Transport Type [cmdb_ci_transport]	A transportation method that utilizes air or space as its primary pathway. For example, airplanes and helicopters.
Ship [cmdb_ci_ship]	Transport Type [cmdb_ci_transport]	A transportation method that utilizes water as its primary pathway. For example, ships.
Train [cmdb_ci_train]	Transport Type [cmdb_ci_transport]	A transportation method that utilizes rails as its primary pathway. For example, Amtrak.
Vehicle [cmdb_ci_vehicle]	Transport Type [cmdb_ci_transport]	A transportation method that utilizes wheels or tracks as its method of movement. For example, cars, trucks, bulldozers.
IoT Gateway	Converged Infrastructure	A device that provides the following services:

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Class	Extends	Description
[cmdb_ci_IoT_gateway]	[cmdb_ci_converged_infra]	• Forwards packets between LAN and WAN on the IP layer. • Performs application layer functions between IoT nodes and other entities. • Enables local, short-range communication between IoT devices.
Security Device [cmdb_ci_security]	IoT Device [cmdb_ci_IoT]	Connected device that serves a security function such as badge readers.
Single Board Computing [cmdb_ci_sbc]	IoT Device [cmdb_ci_IoT]	Single Board Computing device such as a Raspberry Pi.
Display Device [cmdb_ci_display]	IoT Device [cmdb_ci_IoT]	Connected device that displays images.
Imaging Device [cmdb_ci_imaging]	IoT Device [cmdb_ci_IoT]	Connected device that captures images.
Medical Device [cmdb_ci_medical]	IoT Device [cmdb_ci_IoT]	Connected device that serves a Medical Care function such as a nurse call unit.
Manufacturing Device [cmdb_ci_manufacturing]	IoT Device [cmdb_ci_IoT]	Connected device that helps a manufacturing process.
Multimedia Device [cmdb_ci_multimedia]	IoT Device [cmdb_ci_IoT]	A connected device that helps the generation or delivery of media content.
Payment Device [cmdb_ci_payment]	IoT Device [cmdb_ci_IoT]	Connected device that allows for purchasing goods or services.
Drone [cmdb_ci_drone]	IoT Device [cmdb_ci_IoT]	Unmanned connected device with mobility.
Wearable Technology [cmdb_ci_wearable]	IoT Device [cmdb_ci_IoT]	Connected device that is worn by an entity such as a smart watch.
Smart Television [cmdb_ci_stv]	Display Device [cmdb_ci_display]	A television that is network connected and can run applications.
IP Camera	Imaging Device	A camera that is network connected.

Class	Extends	Description
[cmdb_ci_ip_camera]	[cmdb_ci_imaging]	
Patient Monitoring [cmdb_ci_med_patient_monitoring]	Medical Device [cmdb_ci_medical]	Monitors and tracks various physiological parameters of a patient. Monitors heart rate, blood pressure, oxygen levels, respiratory rate, and so on.
Surgical Instrument [cmdb_ci_med_surgical_instrument]	Medical Device [cmdb_ci_medical]	Devices used during surgical interventions. Life support tools and tools to assist surgeons in precise and controlled maneuvers.
Lab Equipment [cmd_ci_med_lab_equipment]	Medical Device [cmdb_ci_medical]	Specialized tools, apparatus, and instruments used in scientific research, experiments, and analyses.
Patient Implant [cmdb_ci_med_patient_implant]	Medical Device [cmdb_ci_medical]	Medical devices or tissues that are surgically placed inside a patient's body.
Clinical Device [cmdb_ci_med_clinical_device]	Medical Device [cmdb_ci_medical]	Devices used in a clinical setting for overall management, medical staff, and patient aid.
Diagnostic Imaging [cmd_ci_med_diagnostic_imaging]	Medical Device [cmdb_ci_medical]	Specialized equipment used in medicine to visualize the internal structures of the body.
Therapeutic Device [cmdb_ci_med_therapeutic_device]	Medical Device [cmdb_ci_medical]	Specialized tools designed to aid in the treatment, rehabilitation, or management of health conditions. Can range from orthopedic supports to cardiac implants and neurostimulation devices.
Process Logic Controller [cmdb_ci_plc]	Manufacturing Device [cmdb_ci_manufacturing]	A logic controller that is network connected which is used in manufacturing. For example, devices made by Siemens and Allen Bradley.
Human Machine Interface [cmdb_ci_hmi]	Manufacturing Device [cmdb_ci_manufacturing]	An HMI that is network connected which is used in manufacturing. For example, devices made by Siemens and Allen Bradley.
Game Console [cmdb_ci_game_console]	Multimedia Device [cmdb_ci_multimedia]	A device that is network connected which is used to play games or stream media. For example, an Xbox or Playstation.

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Kong

Kong is an API management platform that enables enterprise companies to better manage client and host traffic.

Classes

This section lists the classes that the CMDB CI Class Models store app adds or updates. For the list of classes in the base system, including classes that this app might extend, see CMDB tables descriptions.

CMDB CI Class Models: Release 1.49.0 adds the following classes for Kong.

Class	Extends	Description
Kong Gateway [cmdb_ci_kong_gateway]	API Gateway [cmdb_ci_api_gateway]	The Kong gateway application that hosts and manages

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Class	Extends	Description
		individual APIs. Example: Kong Gateway instanceName.
Kong Load Balancer [cmdb_ci_kong_lb]	Load Balancer Application [cmdb_ci_lb_appl]	The default load balancer on the Kong gateway application that points to backend service instances when fulfilling API requests. Example: httpbin-upstream.
Kong Target [cmdb_ci_kong_target]	API Component [cmdb_ci_api_component]	The load-balanced backend of the gateway that fulfills API requests. Example: httpbin-target1.

Class attributes

CMDB CI Class Models: Release 1.49.0 adds the following attributes to the respective classes.

Kong Gateway [cmdb_ci_kong_gateway]

Attribute	Data type	Description
Admin URL	String (255)	URL for making admin API requests.
Database	String	Type of database used by the Kong gateway. Example: Postgres or Cassandra.

Kong Load Balancer [cmdb_ci_lb_appl]

Attribute	Data type	Description
Algorithm	String	Type of algorithm used for load balancing. Example: round robin.
ID	String (255)	Unique identifier from the source system.

Kong Target [cmdb_ci_kong_target]

Attribute	Data type	Description
Target	String (255)	URL of target integration.

Key Relationship Structures

There are a number of key relationships that must be defined for API and Kong classes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Kong relationships

Parent class	Relationship	Child class	Relationship type
API Backend [cmdb_ci_api_backend]	Uses::Used By	Kong Load Balancer	Suggested
Kong Load Balancer [cmdb_ci_lb_appl]	Contains::Contained By	Kong Target	Dependent
Kong Gateway [cmdb_ci_kong_gateway]	Provides::Provided By	Kong Load Balancer	Dependent

Related non-CMDB tables

The Kong Gateway class uses the Kong Workspace non-CMDB table as a related list:

Kong Workspace [kong_workspace]

Attribute	Data type	Description
Name	String (100)	Name of the Kong workspace.
ID	String (255)	Unique identifier from the source system.
API Gateway	Reference	Reference to the Kong API gateway.

Kong gateway example

Here is an example of a dependency view for the Kong gateway class that shows how a gateway would populate the dependent managed API-dependent class with related APIs and components. The Managed API class is considered a first-level relationship with respect to the gateway, while the frontend and backend components are considered second-level relationships. From here, you can then bind alerts to these CIs, configure dynamic CIs for service views and incidents, or establish any additional workflows that use CIs.

Kubernetes extension classes

The Discovery and Service Mapping app adds or updates classes for the Kubernetes pattern.

The CMDB CI Class Models app adds class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and, if applicable, dependent relationships. You can use the added classes just like any other CMDB class. Applications such as Discovery and Service Mapping Patterns can use the class extensions to populate CIs and discover technologies and software.

See the full release notes for all CMDB CI Class Models.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Kubernetes pattern

The Kubernetes pattern main flow helps with discovering Kubernetes core elements. The classes in this release, extend the support to discover Kubernetes workload controller components like deployments, daemonsets, and statefulsets. The Workload Share library captures information about deployments, daemonsets, and statefulsets and stores them in the respective tables. Other extensions include a YAML and service mesh extension that generates a YAML file to track configuration files and creating service to service relations by discovering service mesh information.

Network Intrusion Detection System (NIDS) CI extension class

The Network Intrusion Detection System (NIDS) [cmdb_ci_nids] class builds the relationships between passive network monitoring appliances, and the devices on the network that it discovers. A NIDS Manager manages the NIDS sensors that detect the devices and builds "detects::detected by" relationships between the NIDS records (parent) and the CIs it discovers (child).

The CMDB CI Class Models app adds class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and, if applicable, dependent relationships. You can use the added classes just like any other CMDB class. Applications such as Discovery and Service Mapping Patterns can use the class extensions to populate CIs and discover technologies and software.

This topic lists the relevant classes that the CMDB CI Class Models store app adds or updates. See the class columns table for further details about the columns added for each class.

See the full release notes for all CMDB CI Class Models.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

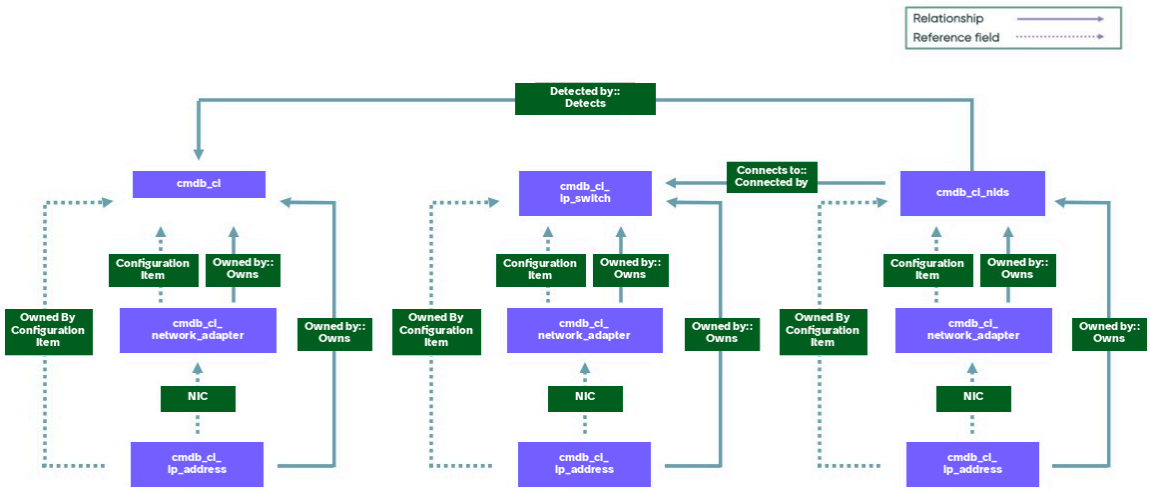
Network Intrusion Detection System (NIDS) schema structure



Classes

This section lists the classes that the CMDB CI Class Models store app adds or updates.See the class columns table for further details about the columns added for each class.

CMDB CI Class Models: Release 1.30 adds the following classes for the Network Intrusion Detection System (NIDS). For the list of classes in the base system, including classes that this app might extend, see CMDB tables descriptions.

Class	Extends	Description
Network Intrusion Detection System (NIDS) (cmdb_ci_nids)	cmdb_ci_ids_network	NIDS is an intrusion detection system within the network that examines the traffic from all devices on the network. NIDS scanners build relationships between the OT network scanning appliances, and the OT devices on the network. An NIDS Manager manages the NIDS sensors.

Class columns

CMDB CI Class Models: Release 1.30 adds the following columns to the Network Intrusion Detection System (NIDS) [cmdb_ci_nids] class.

Network Intrusion Detection System (NIDS) [cmdb_ci_nids] class

Column label	Column name	Description
NIDS source ID	Correlation_id	Identifier of the NIDS device. Uses the assigned Correlation ID for the NIDS as its nids_source_id.
NIDS source name	nids_source_name	Name of the NIDS device.
Network type assignment	network_type_assignment	Designates if the device is on an IT or OT network.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Network Intrusion Detection System (NIDS) [cmdb_ci_nids] class (continued)

Column label	Column name	Description
NIDS assignment site	isa_entity_site	ISA site assigned to the NIDS. This information is available when the logged in user has an assigned ISA Admin role.

Roles and Access Control Logic (ACLs)

The NIDS Admin (cmdb_nids_admin) role is associated with the Network Intrusion Detection System (NIDS) [cmdb_ci_nids] class: Can create, read, update, and delete Network IDS (NDIS) OT records. To view the Network IDS Application selection on the application menu, you must have this role.

Key relationship structure

For each CMDB CI record with a "Detected by" relationship with an NIDS record, a ServiceNow Operational Technology Certified Service Graph Connector does the following:

1. Assigns the following NIDS-related metadata values to the CI:
   a. Location
   b. Company
   c. Related users (Owned by, Managed by, Supported by, Assigned to)
   d. Related user groups (Approval group, Managed by Group, Support group, Change group)
2. If the NIDS network type is set to OT, it assigns the following NIDS-related metadata values to the CI:
   a. Creates an OT device (cmdb_ot_entity) record for the CI, using the cmdb_ot_entity reference on the CI.
   b. Assigns the NIDS assignment zone to the OT device record.
   c. If the Industrial Process Manager is installed, assign the NIDS assignment site to the OT device record.
3. *Life Cycle Stage* and *Life Cycle Stage Status* values for the CI are used to capture the learning mode of a sensor.
   - If *Life Cycle Stage* is **Operational** and *Life Cycle Stage Status* is **Learning Mode**, then validation is unsuccessful.
   - If *Life Cycle Stage Status* is **In Use**, validation is successful.

Network Inventory (NI) extension classes

The CMDB CI Class Models store app adds or updates classes for the Telecommunications Network Inventory application. Telecommunications Network Inventory uses the Network Inventory (NI) extension classes to extend the Configuration Management Database (CMDB) Configuration Item (CI) class hierarchy.

The CMDB CI Class Models app adds class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and, if applicable, dependent relationships. You can use the added classes just like any other CMDB class. Applications such as Discovery and Service Mapping Patterns can use the class extensions to populate CIs and discover technologies and software.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

These extensions enable the CMDB to store information about a service provider's network inventory. The store app adds class models that extend the CMDB class hierarchy, including:

- Class descriptions
- Identification rules
- Identifier entries
- Dependent relationships, if applicable.

With the ServiceNow Telecommunications Network Inventory application, you can build a digital representation of your physical and logical networks. This application uses the NI class extensions to populate CIs that form the basis of your digital network inventory model. To learn more, see Telecommunications Network Inventory.

See the full release notes for all CMDB CI Class Models.

Request apps on the Store

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NI extension classes (continued)

Class	Extends	Description
		Captures and maintains the location-specific attributes for each network site, including the network centers, buildings, floors, and rooms where equipment is located. The network site records enable you to view all the equipment at a location. You can filter the locations by the assigned type, role, or function categories.
Telco Equipment Holder [cmdb_ci_ni_equipment_holder]	Equipment Holder [cmdb_ci_equipment_holder]	Telco Equipment Holder. Represents the physical units that contain the telecommunications equipment, including the cages, bays, cabinets, slots, relay racks, and line ups. The line ups contain the individual relay racks. Each relay rack contains the equipment shelves. The equipment holders can contain the other equipment holders. The equipment holder records enable you to track and manage your network assets.
Telco Equipment [cmdb_ci_ni_telco_equipment]	Network gear [cmdb_ci_netgear]	Telco Equipment. Represents a shelf or device that provides the technical functionality in a network. Examples include the routers, modems, mobile devices, optical cables, relays, and switches. The equipment can have slots, cards, or

NI extension classes (continued)

Class	Extends	Description
		ports. The equipment can exist within an equipment holder or by itself because not all equipment is rack mounted. The equipment records enable you to track and manage your network assets.
Telco Filler Component [cmdb_ci_filler_component]	Hardware [cmdb_ci_hardware]	Filler Component. Represents a cover for empty spots/slots in a rack or device. Often made of flat metallic or plastic materials, helps separate cold and hot air zones, prevents dust from entering the chassis, and ensures proper airflow through the chassis or rack.
Telco Heat Baffle [cmdb_ci_heat_baffle]	Filler Component [cmdb_ci_filler_component]	Heat Baffle. Represents hardware used to help direct rising hot air away from equipment.
Telco Service Switching Point (SSP) [cmdb_ci_service_switching_point]	Telco Equipment [cmdb_ci_ni_telco_equipment]	Service Switching Point (SSP). Switch in a telecommunications network that sends a query to a central database called a service control point (SCP) via the SS7 network to determine how a TDM call can be routed. SSPs can be part of a voice switch or a separate computer connected to it.

NI extension classes (continued)

Class	Extends	Description
		(contains::contained by) • Kubernetes Component (contains::contained by) • Application Service (contains::contained by) Attribute of Network Port: MTU Size [mtu_size] In networking, maximum transmission unit (MTU) is a measurement representing the largest data packet that a network-connected device will accept. Measured in integer bytes. Use cases: • Optimizing network performance: Setting the right MTU size can reduce overhead and maximize data throughput. • Avoiding fragmentation: A properly configured MTU prevents packet fragmentation, reducing processing load and transmission delays. • Tuning for network type: Different networks (for example, VPNs, WANs) may require specific MTU sizes to ensure compatibility and optimal performance.

NI extension classes (continued)

Class	Extends	Description
Network Interface Card (formerly Interface Card) [cmdb_ci_interface_card]	Hardware [cmdb_ci_hardware]	Network Interface Card. Represents interface cards that are stored in a network. Cards can occupy more than one slot and can contain other cards. They can be the equipment ports that are physical or logical (virtual). Each port is assigned a bandwidth value. The bandwidths are consumed when used in network designs.
Network Service Instance [cmdb_ci_network_service_instance]		Network Service Instance represents a specific deployed, provisioned, and/or configured instance of a set of network services that, in turn, are based on network functions.
Physical Connection [cmdb_ci_ni_physical_link]	Network Link [cmdb_ci_network_link]	Physical Connection. Represents the physical port connections on the network interface cards in your networks.
Logical Connection [cmdb_ci_ni_logical_path]	Network Circuit [cmdb_ci_network_circuit]	Logical Connection. Represents the logical or virtual port connections on the network interface cards. A logical connection typically represents the multiple physical connections on an interface card.

Nutanix extension classes

The CMDB CI Class Models store app adds or updates classes for Nutanix.

The CMDB CI Class Models app adds class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and, if applicable, dependent relationships. You can use the added classes just like any other CMDB class. Applications such as Discovery and Service Mapping Patterns can use the class extensions to populate CIs and discover technologies and software.

Nutanix Enterprise Cloud platform

The Nutanix Enterprise Cloud platform is a converged, scale-out compute and storage system that hosts and stores virtual machines. All nodes in a Nutanix cluster share the management of cluster resources. The foundational unit for the cluster is a Nutanix node which runs a standard hypervisor and contains processors, memory, and local storage (SSDs and hard disks). A Nutanix Controller virtual machine runs on each node, enabling the pooling of local storage from all nodes in the cluster.

See the full release notes for all CMDB CI Class Models.

Classes

This section lists the classes that the CMDB CI Class Models store app adds or updates. See the class columns table for further details about the columns added for each class.

CMDB CI Class Models: Release 1.6.0 adds the following classes for Nutanix. For the list of classes in the base system, including classes that this app might extend, see CMDB tables descriptions.

Class	Extends	Description
Nutanix Prism Central [cmdb_ci_nutanix_prism_central]	Virtual Machine Object [cmdb_ci_vm_object]	Multi-cluster manager responsible for managing multiple Acropolis Clusters to provide a single, centralized management interface.

CMDB CI Class Models: Release 1.2.0 adds the following classes for Nutanix.

Class	Extends	Description
Nutanix Cluster [cmdb_ci_nutanix_cluster]	Virtual Machine Object [cmdb_ci_vm_object]	Cluster comprising of the physical nodes running Nutanix software.
Nutanix Controller VM [cmdb_ci_nutanix_controller_vm]	Application [cmdb_ci_appl]	Nutanix controller virtual machine that is present in each node and that provides the storage clustering and management capabilities.
Nutanix Storage Container [cmdb_ci_nutanix_storage_container]	Storage Volume [cmdb_ci_storage_volume]	Subset of Nutanix storage pool used to apply policies such as reserved capacity, replication factor, and storage optimization options.
Nutanix Storage Pool [cmdb_ci_nutanix_storage_pool]	Storage Pool [cmdb_ci_storage_pool]	Grouping of physical disks within a Nutanix cluster which is typically used to create

Class	Extends	Description
		physical separation between virtual machines.
Nutanix Host [cmdb_ci_nutanix_host]	Virtualization Server [cmdb_ci_virtualization_server]	Physical host on which all the virtual machines run.
Nutanix Virtual Machine Instance [cmdb_ci_nutanix_vm_instance]	Virtual Machine Instance [cmdb_ci_vm_instance]	A virtual machine that runs on Nutanix infrastructure.

CMDB CI Class Models: Release 1.1.5 adds the following classes for Nutanix.

Class	Extends	Description
Nutanix Cluster [cmdb_ci_nutanix_cluster]	Virtual Machine Object [cmdb_ci_vm_object]	Cluster comprising of the physical nodes running Nutanix software.
Nutanix Controller VM [cmdb_ci_nutanix_controller_vm]	Application [cmdb_ci_appl]	Nutanix controller virtual machine that is present in each node and that provides the storage clustering and management capabilities.
Nutanix Storage Container [cmdb_ci_nutanix_storage_container]	Storage Volume [cmdb_ci_storage_volume]	Subset of Nutanix storage pool used to apply policies such as reserved capacity, replication factor, and storage optimization options.
Nutanix Storage Pool [cmdb_ci_nutanix_storage_pool]	Storage Pool [cmdb_ci_storage_pool]	Grouping of physical disks within a Nutanix cluster which is typically used to create physical separation between virtual machines.
Nutanix Host [cmdb_ci_nutanix_host]	Virtualization Server [cmdb_ci_virtualization_server]	Physical host on which all the virtual machines run.
Nutanix Virtual Machine Instance [cmdb_ci_nutanix_vm_instance]	Virtual Machine Instance [cmdb_ci_vm_instance]	A virtual machine that runs on Nutanix infrastructure.

CMDB CI Class Models: Release 1.1.4 adds the following classes for Nutanix.

Nutanix Cluster [cmdb_ci_nutanix_cluster]	Virtual Machine Object [cmdb_ci_vm_object]	Cluster comprising of the physical nodes running Nutanix software.
Nutanix Controller VM	Application	Nutanix controller virtual machine that is present in

[cmdb_ci_nutanix_controller_vm]	[cmdb_ci_appl]	each node and that provides the storage clustering and management capabilities.
Nutanix Storage Container [cmdb_ci_nutanix_storage_container]	Storage Volume [cmdb_ci_storage_volume]	Subset of Nutanix storage pool used to apply policies such as reserved capacity, replication factor, and storage optimization options.
Nutanix Storage Pool [cmdb_ci_nutanix_storage_pool]	Storage Pool [cmdb_ci_storage_pool]	Grouping of physical disks within a Nutanix cluster which is typically used to create physical separation between virtual machines.
Nutanix Host [cmdb_ci_nutanix_host]	Virtualization Server [cmdb_ci_virtualization_server]	Physical host on which all the virtual machines run.
Nutanix Virtual Machine Instance [cmdb_ci_nutanix_vm_instance]	Virtual Machine Instance [cmdb_ci_vm_instance]	A virtual machine that runs on Nutanix infrastructure.

Class columns

CMDB CI Class Models: Release 1.6.0 adds no columns to the Nutanix Prism Central [cmdb_ci_nutanix_prism_central] class.

CMDB CI Class Models: Release 1.2.0 adds the following columns to the respective classes.

Nutanix Cluster [cmdb_ci_nutanix_cluster] class

Added columns	Description
Block Serial Numbers	Serial numbers of blocks that are connected to the cluster.
Cluster ID	UUID (Universal Unique Identifier) of the cluster.
External Subnet	Subnet of the external IP address of the cluster.
Full Version	Full version of the cluster. For example: el7.3-release-euphrates-5.10.3.1-stable-655d4def34bf18785782f2adb8cdd5f8457d1fe3
Hypervisor Types	Types of hypervisors that are related to this cluster.
Internal Subnet	Subnet of internal IP addresses.
NCC Version	Nutanix cluster check version.
NTP Servers	NTP servers that are related to this cluster.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Nutanix Cluster [cmdb_ci_nutanix_cluster] class (continued)

Added columns	Description
Number of Nodes	Number of nodes that are connected to the cluster.
Timezone	Timezone of the cluster.
Version	Version of the cluster. For example: 5.10.3.1

Nutanix Controller VM [cmdb_ci_nutanix_controller_vm] class

Added columns	Description
Hypervisor Type	Type of hypervisor.
Memory (MB)	Amount of memory (in MB) available on the controller.
State	On/off power state of controller.
VM ID	UUID of the controller virtual machine.
Object ID	ID of the controller virtual machine.

Nutanix Storage Container [cmdb_ci_nutanix_storage_container] class

Added columns	Description
Compression	Indicates whether compression is enabled.
Container ID	UUID of the container.
Deduplication	Indicates whether on disk deduplication is enabled, that is dedup compression applied to data on hard disks (HDD). Performance tier deduplication is a prerequisite for on disk deduplication.
Erasure Code	Indicates whether erasure coding is enabled.
Replication Factor	Number of maintained data copies. The replication factor is specified (2 or 3) when the container is created.

The following classes have no added columns:

- Nutanix Storage Pool [cmdb_ci_nutanix_storage_pool]
- Nutanix Host [cmdb_ci_nutanix_host]
- Nutanix Virtual Machine Instance [cmdb_ci_nutanix_vm_instance]

CMDB CI Class Models: Release 1.1.5 adds the following columns to the respective classes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Nutanix Cluster [cmdb_ci_nutanix_cluster] class

Added columns	Description
Block Serial Numbers	Serial numbers of blocks that are connected to the cluster.
Cluster ID	UUID (Universal Unique Identifier) of the cluster.
External Subnet	Subnet of the external IP address of the cluster.
Full Version	Full version of the cluster. For example: el7.3-release-euphrates-5.10.3.1-stable-655d4def34bf18785782f2adb8cdd5f8457d1fe3
Hypervisor Types	Types of hypervisors that are related to this cluster.
Internal Subnet	Subnet of internal IP addresses.
NCC Version	Nutanix cluster check version.
NTP Servers	NTP servers that are related to this cluster.
Number of Nodes	Number of nodes that are connected to the cluster.
Timezone	Timezone of the cluster.
Version	Version of the cluster. For example: 5.10.3.1

Nutanix Controller VM [cmdb_ci_nutanix_controller_vm] class

Added columns	Description
Hypervisor Type	Type of hypervisor.
Memory	Amount of memory (in MB) available to the virtual machine.
State	On/off state of power.
VM ID	UUID of the controller virtual machine.
Object ID	ID of the controller virtual machine.

Nutanix Storage Container [cmdb_ci_nutanix_storage_container] class

Added columns	Description
Compression	Indicates whether compression is enabled.
Container ID	UUID of the container.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Nutanix Storage Container [cmdb_ci_nutanix_storage_container] class (continued)

Added columns	Description
Deduplication	Indicates whether on disk deduplication is enabled, that is dedup compression applied to data on hard disks (HDD). Performance tier deduplication is a prerequisite for on disk deduplication.
Erasure Code	Indicates whether erasure coding is enabled.
Replication Factor	Number of maintained data copies. The replication factor is specified (2 or 3) when the container is created.

The following classes have no added columns:

- Nutanix Storage Pool [cmdb_ci_nutanix_storage_pool]
- Nutanix Host [cmdb_ci_nutanix_host]
- Nutanix Virtual Machine Instance [cmdb_ci_nutanix_vm_instance]

CMDB CI Class Models: Release 1.1.4 adds the following columns to the respective classes.

Nutanix Cluster [cmdb_ci_nutanix_cluster] class

Added columns	Description
Block Serial Numbers	Serial numbers of blocks that are connected to the cluster.
Cluster ID	UUID (Universal Unique Identifier) of the cluster.
External Subnet	Subnet of the external IP address of the cluster.
Full Version	Full version of the cluster. For example: el7.3-release-euphrates-5.10.3.1-stable-655d4def34bf18785782f2adb8cdd5f8457d1fe3
Hypervisor Types	Types of hypervisors that are related to this cluster.
Internal Subnet	Subnet of internal IP addresses.
NCC Version	Nutanix cluster check version.
NTP Servers	NTP servers that are related to this cluster.
Number of Nodes	Number of nodes that are connected to the cluster.
Timezone	Timezone of the cluster.
Version	Version of the cluster.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Nutanix Cluster [cmdb_ci_nutanix_cluster] class (continued)

Added columns	Description
	For example: 5.10.3.1

Nutanix Controller VM [cmdb_ci_nutanix_controller_vm] class

Added columns	Description
Hypervisor Type	Type of hypervisor.
Memory	Amount of memory (in MB) available to the virtual machine.
State	On/off state of power.
VM ID	UUID of the controller virtual machine.
Object ID	ID of the controller virtual machine.

Nutanix Storage Container [cmdb_ci_nutanix_storage_container] class

Added columns	Description
Compression	Indicates whether compression is enabled.
Container ID	UUID of the container.
Deduplication	Indicates whether on disk deduplication is enabled, that is dedup compression applied to data on hard disks (HDD). Performance tier deduplication is a prerequisite for on disk deduplication.
Erasure Code	Indicates whether erasure coding is enabled.
Replication Factor	Number of maintained data copies. The replication factor is specified (2 or 3) when the container is created.

The following classes have no added columns:

- Nutanix Storage Pool [cmdb_ci_nutanix_storage_pool]
- Nutanix Host [cmdb_ci_nutanix_host]
- Nutanix Virtual Machine Instance [cmdb_ci_nutanix_vm_instance]

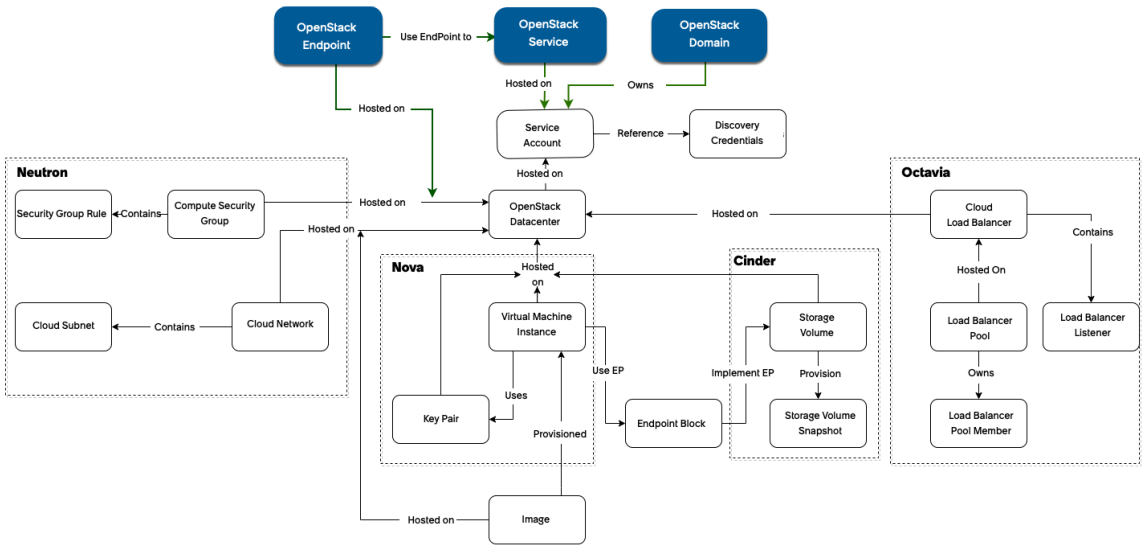
OpenStack

OpenStack is a cloud operating system that controls large pools of compute, storage, and networking resources throughout a datacenter. All of these resources are managed and provisioned through APIs with common authentication mechanisms. Other components provide services such as orchestration, fault management, and service management to ensure high availability of user applications. OpenStack is broken up into services to enable you to plug and play components depending on your needs. These components are designed for horizontal scalability, so you can easily add new resources to grow your cloud over time.

OpenStack classes integrated with the CMDB class hierarchy



Classes

This section lists the classes that the CMDB CI Class Models store app adds or updates. See the class columns table for further details about the columns added for each class.

CMDB CI Class Models: Release 1.8.0 adds the following classes for OpenStack. For the list of classes in the base system, including classes that this app might extend, see CMDB tables descriptions.

Class	Extends	Description
OpenStack Services [cmdb_ci_cloud_openstack_service]	Virtual Machine Object [cmdb_ci_vm_object]	An OpenStack web service that can be accessed via a URL.
OpenStack Endpoint [cmdb_ci_cloud_openstack_endpoint]	Virtual Machine Object [cmdb_ci_vm_object]	The access point of a Service.

Class	Extends	Description
OpenStack Domain [cmdb_ci_cloud_openstack_domain]	Virtual Machine Object [cmdb_ci_vm_object]	A collection of users, groups, and projects.

Class columns

CMDB CI Class Models: Release 1.8.0 adds the following columns to the respective classes.

OpenStack Services [cmdb_ci_cloud_openstack_service] class

Added columns	Description
type	The Service type, which describes the API implemented by the Service. Possible values: Compute, ec2, identity, image, network, or volume.
enabled	Defines if the service and its endpoints appear in the Service catalog (true/false).

OpenStack Endpoint [cmdb_ci_cloud_openstack_endpoint] class

Added columns	Description
interface	The interface type, which describes the visibility of the endpoint. Possible values: • public - Visible by end users on a publicly available network interface. • internal - Visible by end users on an unmetered internal network interface. • admin - Visible by administrative users on a secure network interface.
enabled	Defines if the Service and its endpoints appear in the Service catalog (true/false).

OpenStack Domain [cmdb_ci_cloud_openstack_domain] class

Added columns	Description
enabled	Defines if the domain is enabled (true/false).

See the full release notes for all CMDB CI Class Models.

Operational Technology (OT) data model

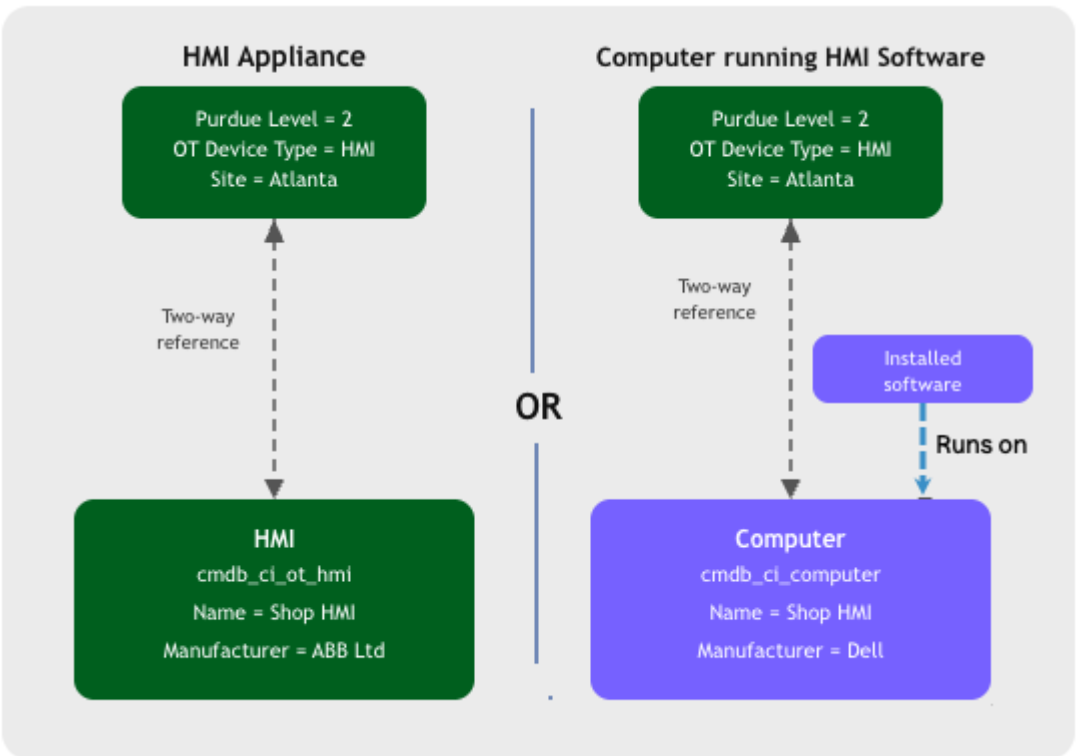
The Operational Technology (OT) data model was created to enable management of "OT Device" data. Operational Technology that controls industrial equipment can be based on IT class hardware (computers, servers, network gear, and so on), or on specific hardware profiles not included in the ServiceNow IT class model (PLCs, HMIs, Engineering Workstations, Historians, and so on). Therefore, a single OT Device in the OT data model includes two primary components:

1. A CI class record. This can be an IT or an OT class CI.
2. An OT Device details record. This describes the OT Device type (function) and other OT-specific attributes.

Each OT Device in the CMDB can be distinguished as having an "OT Device Details" reference [cmdb_ot_entity reference field] to a specific OT Device details [cmdb_ot_entity table] record. This is a bi-directional reference; the ot_device reference on the cmdb_ot_entity table references the CI record. If the cmdb_ot_entity reference of a given CI record is **not** empty, the CI is considered to be an OT Device.

For example, an HMI (Human Machine Interface) OT Device could be composed in at least two different ways.

1. A computer CI with an OT Device detail record describing its "OT Device type" as HMI.
2. An HMI CI with an OT Device detail record describing its "OT Device type" also as HMI.



In this way, a list of HMIs can be derived and a list of all computers in an enterprise can also be derived.

For more details on the OT data model, see Implementing the CSDM framework for Operational Technology.

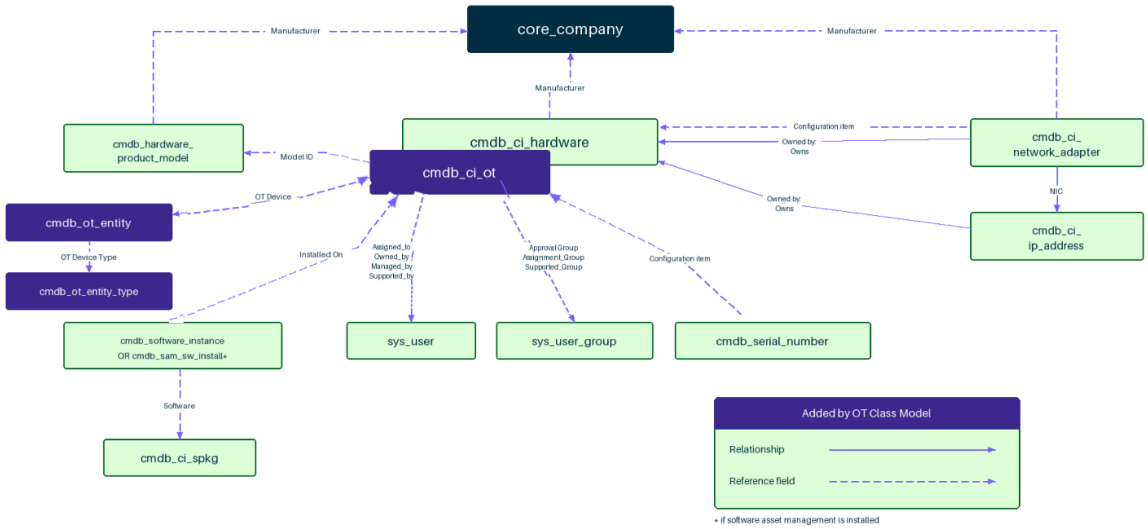
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can use the added classes as any other CMDB class. Applications such as Discovery for Operational Technology, and Service Graph Connector for Operational Technology (Excel) use these class extensions to populate CIs and discover various technologies and software. To learn more, see:

- Service Graph Connector for Microsoft Excel
- IT Discovery for OT Networks

Note:
In Operational Technology, CIs used on an OT network to automate an industrial process are often referred to as#OT Devices. This term shouldn't be confused with an Device record commonly used in the practice of Asset Management.

Operational Technology (OT) schema structure



Classes

This section lists the classes that the CMDB CI Class Models store app adds or updates. See the class columns table for further details about the columns added for each class. For the list of classes in the base system, including classes that this app might extend, see CMDB tables descriptions.

CMDB CI Class Models: Release 1.69.0 adds the following classes for Operational Technology (OT).

Class	Description
Firmware Installation [cmdb_firmware_install]	Firmware associated with the OT device.
Key Value [cmdb_key_value]	Additional information related to the OT device that's populated with the available OT integrations and captured as Key value pairs.
Software Instance [cmdb_sam_sw_install]	Captures the software installed on the OT device if Software Asset Management isn't available.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Class	Description
	Note: If Software Asset Management is installed and entitled, the software installed data is available in the Software Installation related list.

CMDB CI Class Models: Release 1.59.0 adds the following classes for OT.

Class	Extends	Description
OT System Service [cmdb_ci_ot_system_service]	cmdb_ci_ot_system	Category of technology and systems that are used to manage, control, and monitor physical processes, machinery, and industrial operations.

CMDB CI Class Models: Release 1.56.0 adds the following classes for OT.

Class	Extends	Description
Quality Inspection Control System [cmdb_ci_ot_qics]	cmdb_ci_ot_control	Control systems that assist specifically in quality and inspection functions.

CMDB CI Class Models: Release 1.30 adds the following classes for OT.

Class	Extends	Description
CNC [cmdb_ci_ot_cnc]	cmdb_ci_ot_control	Computer Numerical Control, used for automated control of machining tools such as drills, lathes, mills, and for 3D printers.
DCS [cmdb_ci_ot_dcs]	cmdb_ci_ot_control	Distributed Control System. Achieves control using intelligence distributed about the controlled process, rather than by a centrally located single unit.
DPU [cmdb_ci_ot_dpu]	cmdb_ci_ot_control	Distributed Processing Units. ICS on a dedicated network, with each DPU handling thousands of points of I/O.
EWS [cmdb_ci_ot_ews]	cmdb_ci_ot_supervisory	Engineering Workstation. A computing platform for configuration, maintenance, and diagnostics of ICS applications and other control system equipment.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Class	Extends	Description
Historian [cmdb_ci_ot_historian]	cmdb_ci_ot_supervisory	Data Historian. A centralized database supporting data analysis for industrial processes.
HMI [cmdb_ci_ot_hmi]	cmdb_ci_ot_supervisory	Human-Machine Interface. Hardware or software through which an operator interacts with a controller.
IED [cmdb_ci_ot_ied]	cmdb_ci_ot_control	Intelligent Electronic Device. Receives or sends data/ control from or to an external source for power grids.
Industrial Actuator [cmdb_ci_ot_industrial_actuator]	cmdb_ci_ot_field_device	Component of a machine that is responsible for moving and controlling a mechanism, such as opening a valve.
Industrial Drive [cmdb_ci_ot_industrial_drive]	cmdb_ci_ot_field_device	Equipment used to control the speed of machinery. It can be a mechanical electromechanical, hydraulic, or electronic device.
Industrial 3D Printer [cmdb_ci_ot_industrial_3d_printer]	cmdb_ci_ot_control	Device used in additive manufacturing for the construction of a three-dimensional object from a CAD model, or a digital 3D model.
Industrial Robot [cmdb_ci_ot_industrial_robot]	cmdb_ci_ot_field_device	Robotic system used for manufacturing.
Industrial Sensor [cmdb_ci_ot_industrial_sensor]	cmdb_ci_ot_field_device	Sensor device used to monitor the health of equipment
Network Gear [cmdb_ci_netgear]	cmdb_ci_hardware	Network gear is an electronic device which is required for communication and interaction between devices on a computer network.
Operations Technology [cmdb_ci_ot]	cmdb_ci_hardware	Base class for Operational Technology, used for industrial control. For instance, in manufacturing.
OPC Client [cmdb_ci_ot_opc_client]	cmdb_ci_ot_supervisory	Software module that enables applications to acquire data from an OPC Server or conduct supervisory control using an OPC Server.
OPC Server [cmdb_ci_ot_opc_server]	cmdb_ci_ot_control	Software module that enables applications to provide their

Class	Extends	Description
		data to the outside world using OPC.
OT Control Module [cmdb_ci_ot_control_module]	cmdb_ci_ot_control	Module such as a PLC or DCS connected to an OT Control System.
OT Control System [cmdb_ci_ot_control]	cmdb_ci_ot	Base Class for industrial control systems (ICS), usually at Purdue Model Level 1 or 2.
OT Supervisory System [cmdb_ci_ot_supervisory]	cmdb_ci_ot	Base class for supervisory systems, usually at Purdue Model Level 2 or 3.
PLC [cmdb_ci_ot_plc]	cmdb_ci_ot_control	Programmable Logic Controller. Used to control OT Devices.
Protocol Converter [cmdb_ci_protocol_converter]	cmdb_ci_hardware_network_ge	Device used to convert standard or proprietary protocol of one device to the protocol suitable for the other device or tools to achieve the interoperability.
RTU [cmdb_ci_ot_rtu]	cmdb_ci_ot_control	Remote Terminal Unit. Special purpose data acquisition and control unit designed to support DCS and SCADA remote stations
SCADA Client [cmdb_ci_ot_scada_client]	cmdb_ci_ot_supervisory	Supervisory Control and Data Acquisition. Client that enables an operator to manage a SCADA server.
SCADA Server [cmdb_ci_ot_scada_server]	cmdb_ci_ot_control	Supervisory Control and Data Acquisition. System capable of gathering and processing data and applying operational controls over long distance.

Class columns

CMDB CI Class Models: Release 1.30 adds the following columns to the respective classes.

Operational Technology (OT) [cmdb_ci_ot] class

Added columns	Description
firmware_version	Firmware version reported by discovery source.
hardware_version	Hardware version reported by discovery source.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

OT Control System [cmdb_ci_ot_control_system] class

Added columns	Description
has_module	true/false value describing if the system has modules, such as chassis / blade architecture.
backplane_name	System-reported string name or number for the backplane.
backplane_id	System-reported unique ID for the backplane

OT Control Module [cmdb_ci_ot_control_module] class

Added columns	Description
slot_number	Reported slot in the control system this module is using.
module_type	Module type reported by the discovery source.

OT Field Device [cmdb_ci_ot_field_device] class

Added columns	Description
device_type	List that describes if the device provides input, output, or both to the parent control system.

OT System Service [cmdb_ci_ot_system_service] class

Added columns	Description
display_name	Name of the OT system.
isa_entity_site	Site where the OT system is located.

Form view

All Operational Technology (OT) extension classes have a "Default view" form view that includes the OT Device Details attribute at the top of the form. The following table lists the other classes that have the **Operational Technology (OT)** view on their form context menu. This is the default form view for users with the cmdb_ot_viewer role for the following classes.

Class	Description
base hardware [cmdb_ci_hardware]	Base class for hardware.
base computer [cmdb_ci_computer]	An extension of the Hardware table, capturing computer properties.
base server [cmdb_ci_server]	Base class for all types of servers.
