You can use the Now Assist for Configuration Management Database (CMDB) application to resolve any issues or perform a general analysis on a connector installed on your instance. See Fix SGC import set issues with the Now Assist SGC diagnosis skill.

Service Graph Connectors

You can use a Service Graph Connector to import and integrate third-party data into CMDB and non-CMDB tables.

Important:
Visit the ServiceNow Store website to view the latest list of all Service Graph Connectors.

To learn more, see Getting started with Service Graph Connectors.

Select an application to learn about the Service Graph Connector available for ingesting data from the application into your CMDB.

Service Graph Connector for Active Directory

The Service Graph Connector for Active Directory retrieves computer and software information from the Microsoft Active Directory (AD) product and imports it into the Configuration Management Database (CMDB) in your instance using Lightweight Directory Access Protocol (LDAP).

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Supported versions

- Microsoft Active Directory version: Last tested on
- Supported ServiceNow® versions:
  - Utah
  - Vancouver
  - Washington

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use cases

Import computer and software details about your assets from the Microsoft Active Directory product into your CMDB.

Guided setup

The guided setup for the Service Graph Connector for Active Directory provides an organized sequence of tasks to configure the integration on your instance. To access the guided setup, Configure Service Graph Connector for Active Directory.

CMDB integrations dashboard

The Integration Commons for CMDB store app provides a dashboard with a central view of the status, processing results, and processing errors of all installed integrations. You can see metrics for all integration runs. You can filter the view to a specific CMDB integration, a specific time duration, or a specific integration run. For more details about monitoring Microsoft Active Directory integrations in the CMDB Integrations Dashboard, see Using the CMDB Integrations Dashboard.

Data mapping

Data from the Service Graph Connector for Active Directory data sources is mapped and transformed into the ServiceNow CMDB Configuration Item (CI) class definitions using the Robust Transform Engine (RTE). Data is inserted into the ServiceNow CMDB using the Identification and Reconciliation Engine (IRE).

After you complete the guided setup, you configure the integration to periodically pull data from the Active Directory. The data is loaded into the following tables.

You can use the Integration Hub ETL application to view the data maps.

Data sources and staging tables for Active Directory

Data source	Staging table
SGC Active Directory Import	SGC Active Directory Import [sn_sec_sgc_ad_active_directory_import]
Computer	Computer [cmdb_ci_computer]
Software	Software [cmdb_ci_spkg], [cmdb_software_instance], [cmdb_sam_sw_install]
SGC Active Directory Computer	SGC Active Directory Computer [sn_sec_sgc_ad_active_directory_computer]

Configure Service Graph Connector for Active Directory

Configure your Lightweight Directory Access Protocol (LDAP) connections and verify them, set up scheduled imports, and optionally add multiple instances with the Guided Setup.

Before you begin

To use this Service Graph Connector, you need a subscription to a Subscription Unit that is based in the IT Operations Management (ITOM) Visibility application or in the ITOM Discovery application. As defined in the section titled "Managed IT Resource Types" in ServiceNow Subscription Unit Overview for your subscription, for managed IT resources that are created or modified in the CMDB by this Service Graph Connector, but that aren't yet managed by ITOM

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Visibility or ITOM Discovery, these resources will increase Subscription Unit consumption from that application. Review your current Subscription Unit consumption within ITOM Visibility or ITOM Discovery to ensure available capacity.

- The Integration Commons for CMDB store app, which is automatically installed.
- The CMDB CI class models store app, which is automatically installed. See CMDB CI Class Models.
- The ITOM Discovery License plugin (com.snc.itom.discovery.license). You must activate this plugin.
- ITOM Licensing plugin (com.snc.itom.license). For more information, see Request Discovery.
- The Datastream Action plugin (com.glide.hub.action_type.datastream), which is automatically installed.
- Observability Commons for CMDB (sn_observability), which is only required for event ingestion. This app must be installed prior to installing the connector for Event Management to work. For more information, see Observability Commons for CMDB on the ServiceNow Store.

After you have followed the instructions provided to you to download and activate the Service Graph Connector for Active Directory application, refer to Download an application from the ServiceNow Store for the first time and Install a Security Operations integration. There are a few steps you need to complete before you configure this integration.

Role required: admin

Procedure

1. Navigate to **All** > **Service Graph Connectors** > **Active Directory** > **Setup**.
2. On the Welcome to Guided Setup Home page, select **Continue**.
3. On the Experience page, select **Best Experience** followed by **Continue**.
   The Service Graph Connector for Active Directory (AD) page is displayed with the following tasks:
   - Configure LDAP Server
   - Add Multiple Instances
   - Set up scheduled import jobs
4. Select **Configure LDAP Server** to expand it.
   The following steps are displayed in the left navigation panel:
   - Configure Inactive threshold
   - Update LDAP OU definition
   - Configure LDAP Server Details
   - Test LDAP Server Connection

   A single LDAP server is supplied along with the application. This server includes a computer organizational (OU) unit that retrieves a computer's object information from the computers OU.
5. **Optional:** Select **Configure Inactive threshold** to open the record.
   The System Property sn_sec_sgc_ad.inactive_threshold form is displayed.
6. Select the **here** link in the message at the top of the form to edit the record.
7. **Optional:** Alternatively, you can select the **Globe** icon in the upper right of the screen and select **Service Graph Connector for Active Directory** from the list to change the application scope so you can edit the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

As you progress through the Guided Setup, follow any instructions you see at the top of the pages in for modifying the application scope so you can open, edit, and save the record.

8. Enter a threshold in the **Value** field.
   The default value is 90 days. Before you modify this value, refer to the information about the threshold setting at the top of the page. With this setting, assets that match the day threshold value are excluded from import.
9. Right-click in the gray header titled System Property sn_sec_sgc_ad.inactive_threshold of the record and select **Save**.
10. Select **Mark as complete** followed by **Continue**.
    The LDAP OU Definition Access record is displayed.
11. Update LDAP OU Definition Access.

    a. Follow the steps listed at the top of the page and on the LDAP OU Definition record to verify or switch the application scope to 'Global' with the application picker.

    b. Select the **LDAP OU Definition** record on the table to open it.

    c. On the record, if not selected, select the **Application Access** tab.

    d. If displayed, select the link to edit the record followed by the check boxes for the permission settings you want.

    e. Right-click in the gray header of the Table LDAP OU Definition record and select **Save**.

    f. Select **Mark as complete** followed by **Continue**.
    The Configure LDAP Server Details page is displayed.

12. Provide the details for LDAP server connection.

    a. Verify values or fill in the fields.

Field	Value
Name	Read-only: Unique name for the LDAP server for example SGC-AD-computer.
Application	Read-only: Service Graph Connector for Active Directory (AD).
Active	Check box selected.
Login distinguished name	Login name for the AD server.
Login password	Password for the AD server.
Starting search directory	Directory you want to search for example `DC=Ops`.
(Optional) MID Server	Dedicated MID Server for the connection, if available.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
	Note: A MID Server is required for on-premise connections if the instance is not publicly accessible.
LDAP Server URLs	Add the URL for the server for example `ladp://host-name:389/`.

b. Right-click in the gray header titled LDAP Server and select **Save**.

c. Select **Mark as complete** followed by **Continue**.
The Test LDAP Server Connection page is displayed.

13. Test the LDAP Server Connection.

a. Scroll to the Related links section on the form and select the **Test Connection** link
If the connection is successful, a Connected Successfully message is displayed. If your connection test fails, a message is displayed with information about why the connection failed. Review the Message field for how to proceed.

b. If you edit the record to fix the connection, right-click in the gray header titled LDAP Server and select **Save**.

c. Select **Mark as complete** followed by **Continue**.
Add Multiple Instances is displayed in the top header the tasks.

Adding Multiple instances is optional. If you don't want to add multiple instances, you can proceed to step 14 and the Set scheduled import jobs task.

14. Optional: Add multiple instances.
To add multiple instances, you must update data source access. You must edit the permissions on the Datasource [sys_data_source] table to create a data source for the new connection in the Service Graph Connector for Active Directory.

15. Select **Add Multiple Instances** from the top header drop down list.
The following tasks are displayed:

- Update Data Source Access
- Update Scheduled Data Import Access
- Add Another LDAP Server
- List of configured LDAP servers

16. Select **Update Data Source Access**.

a. Follow the steps listed at the top of the page to switch the application scope with the application picker to open, edit, and save the record.

b. Select the Data Import record from the list to open it.

c. With the **Application Access** tab selected, follow the instructions to edit the record and modify the check boxes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Right-click in the gray header titled Table Data Source and select **Save**.

e. Select **Mark as complete** followed by **Continue**.
The Update scheduled data import access page is displayed.

17. Update scheduled data import access.

a. Select the **Scheduled Data Import** record from the list to open it.

b. **Optional:** With the **Application Access** tab selected, follow the instructions to edit the record and modify the check boxes.

c. Right-click in the gray header titled Table Scheduled Data Import and select **Save**.

d. Select **Mark as complete** followed by **Continue**.
The Add Another LDAP Server page is displayed. There are two steps for this task:

- LDAP server configuration
- Basic LDAP server information

18. Provide LDAP server configuration information.

a. Fill out the fields.

Field	Value
Type of LDAP server	Active Directory
Server name	Unique name of the LDAP server.
Server URL	URL for example `ldap://host-name:389/`.
Start search directory	Directory you want to search for example `DC=SecOps`.

b. Select **Submit**.
After you submit these edits, complete the second configuration step.

c. Fill in the fields for the basic LDAP server information.

Field	Value
Application	Read-only Service Graph Connector for Active Directory.
Active	Check box selected.
Login distinguished name	Login name for the AD server.
Login password	Password for the AD server.
Starting search directory	Directory you want to search for example `DC=SecOps`.
MID Server	Dedicated MID Server for the connection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
	Note: A MID Server is not required for the LDAP server.

d. Right-click in the gray header titled LDAP Server and select **Save**.

e. Select **Mark as complete** followed by **Continue**.
The List of configured LADP server page is displayed.

f. Select your new record from the list to open it and test the connection.

g. Optional: Edit information on the form.

h. When you are satisfied with the information, scroll to the Related links and select the **Test Connection** link.
If the connection is successful, a message is displayed. If your connection test fails, review the Message and Suggestion fields for how to proceed.

i. After a successful connection, right-click in the gray header titled LDAP Server and select **Save**.

j. Select **Mark as complete** followed by **Continue**.

19. To set up scheduled jobs, select **Set up scheduled import jobs** from the drop down list in the top header.
You must activate a scheduled job from the configuration page.

a. On the Configure the scheduled jobs page, select a record from the Scheduled Data Imports list to open it.

b. Select the **Active** check box and fill in the fields.

Field	Value
Name	Unique name for the LDAP server, SGC-AD-computer.
Application	Read-only Service Graph Connector for Active Directory (AD).
Run	How often you want the job to run. If you want to run a test import prior to scheduling it, you might prefer to set this to **Once**.
Run as	Run the scheduled job with the credentials of another specified user.
Time	When you want the job to run.
Active	Select the check box.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
Conditional	Specific conditions under which this job is run.
Use connection	Leave this deactivated for the first run. Specifies another connection and credentials for this job.
Concurrent import	Leave activated. Splits data into multiple imports sets. See the message for more information.
Partition Method	Leave as Custom size.
Partition size	15,000. Import set size for early scheduling.
Execute pre-import script	Leave activated. Specifies a script to run before the import is performed.
Execute post-import script	Leave activated. Specifies a script to run after the import is performed.

c. **Optional:** Select **Execute now** to run the job.
If you do not choose to run the job on-demand, the next job runs according to the schedule you set.

d. Right-click in the gray Scheduled Data Imports header and select **Save**.

e. Select **Mark as complete** followed by **Continue**.

20. On the Home page for Guided Setup, select **Complete** to finish the configuration.

CMDB classes targeted in Service Graph Connector for Active Directory

When you complete setting up the connection, you can configure the integration to periodically pull data. The data is saved in tables that extend from the Configuration item [cmdb_ci] table.

Computer [cmdb_ci_computer]

The following attributes in the Computer [cmdb_ci_computer] table are populated by collected data.

Attribute label	Attribute name
Name	name
Category	category
Object ID	object_id
Fully qualified domain name	fqdn
Checked out	check_out
Check in	check_in
First discovered	first_discovered
Operating System	os

Service Graph Connector for Akamai API Security

Use the Service Graph Connector for Akamai API Security to integrate the APIs discovered by Akamai into your ServiceNow instance to support various API management use cases.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Supported versions

- Supported ServiceNow versions:
  - Xanadu
  - Yokohama
  - Zurich
- Supported Akamai API Security REST APIs:
  - /api/v3/apis
  - /api/v3/sources
  - /auth/token

Use cases

The Service Graph Connector for Akamai API Security brings data into the new API Insights capability of the ServiceNow platform, enabling the management of different APIs in one instance. The connector adds information discovered by Akamai API Security to the API Component CI class.

The Service Graph Connector for Akamai API Security populates attributes that are security- and risk-related, such as the request and response data types, whether an API endpoint is internet-facing, and the type of authentication used for the endpoint. These data points enable risk and security use cases to be implemented for API security.

Configuring a connection for the connector

Use the SGC Central view in the Service Graph Workspace or CMDB Workspace to install the connector and configure the connection. The view enables you to install and discover connectors and to manage the full life cycle of creating, editing, monitoring, and debugging connections. For instructions, see Configure Service Graph Connector for Akamai API Security using SGC Central.

CMDB integrations dashboard

The Integration Commons for CMDB store app provides a dashboard with a central view of the status, processing results, and processing errors of all installed integrations. You can see metrics for all integration runs. You can filter the view to a specific CMDB integration, a specific time duration, or a specific integration run. For more details about monitoring Akamai API Security integrations in the CMDB Integrations Dashboard, see Using the CMDB Integrations Dashboard.

Data mapping

Data from the Akamai API Security data sources is mapped and transformed into the ServiceNow CMDB Configuration Item (CI) class definitions using the Robust Transform Engine (RTE). Data is inserted into the ServiceNow CMDB using the Identification and Reconciliation Engine (IRE).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following table lists the data sources, the staging tables, and the target tables as CMDB CI and non-CMDB classes for Akamai API Security.

Data mapping for Akamai API Security

Data source	Staging table	Target tables
Sources	sn_akamai_api_sec_akamai_sources	Akamai API Security Sources [sn_akamai_source]
API Component	sn_akamai_api_sec_sga_akamai_api_component	API Component [cmdb_ci_api_component] Key Value [cmdb_key_value]

You can use the IntegrationHub ETL app to view the data maps. See IntegrationHub ETL for more information.

Scheduled script for full data load

The Service Graph Connector for Akamai API Security supports both full load and delta load data ingestion methods. A full data load retrieves all API-related data and populates the corresponding CMDB tables. Delta loads fetch only the data that changed since the previous execution.

During the initial scheduled data import, a full data load is executed. Subsequent data imports perform delta loads.

To run a full data load on a recurring basis, customize the execution schedule of the *`Reset Last Run Datetime for SG-Akamai`* scheduled script based on your requirements. To open the Scheduled Script Executions table, enter `sysauto_script.list` in the navigation filter.

Configure Service Graph Connector for Akamai API Security using SGC Central

Use the playbook available with the SGC Central application to set up the Service Graph Connector for Akamai API Security for pulling in Akamai API Security data into the CMDB.

Before you begin

- Install Service Graph Connector for Akamai API Security version 1.0.0 from the ServiceNow Store.

  For ServiceNow Store installation steps, see Install a ServiceNow Store application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Create a service account on the Akamai platform and generate client credentials to enable data retrieval using the Service Graph Connector for Akamai API Security.

  The Akamai API Security platform supports client credentials-based authentication. Client credentials are required to authenticate and securely access API data.

Role required: The following table shows the roles required for each stage of the playbook.

Role required for each playbook stage

Stage	Role
Prerequisites	admin
Setup	SGC-Admin (sn_cmdb_int_util.sgc_admin) or admin

Note:
The admin user role is required to run background scripts and to provide access to global tables to the SGC-Admin user. For information about the user roles for Service Graph Connectors, see Service Graph Connector user roles.

About this task

The playbook experience for onboarding connectors is activated with SGC Central in the Service Graph Workspace or CMDB Workspace. To configure the SGC Central application, see Configuring SGC Central and for more information on how to interact with a playbook, see Interact with Playbook.

Procedure

1. Use one of the following methods to open SGC Central:
   - Navigate to **Workspaces** > **Service Graph Workspace**, and from the left navigation panel, select the Ingestion icon to open the SGC Central view.
   - Navigate to **Workspaces** > **CMDB Workspace** > **SGC Central**.
2. On the Overview page, select **Create connection**.

   Tip:
   Alternatively, you can select **Create connection** on the All connections page.

3. On the Create connection window, select the Akamai connector type, and then select **Create connection**.
4. Complete the initial prerequisites when setting up a connection for the first time using a connector.

   Note:
   This step is required only during the first-time setup. See Perform initial setup tasks when creating a connection in SGC Central.

5. Complete the setup for configuring the connector for importing data.

   a. Create and test a connection.

      i. In the **Setup** stage of the playbook, select the **Create and test connection** activity.

      ii. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create and test connection form

Field	
Akamai Connection Name	Name to identify the Akamai connection record. For example, `Akamai`.
Connection URL	URL of the connection.
OAuth Client ID	Application (client) ID of your Akamai client application.
OAuth Client Secret	Client secret of your Akamai client application.
OAuth Token URL	Token URL of your Akamai client application.

iii. Select **Create and test connection**.

iv. After the connection test is complete, select **Continue**.

b. Set the configuration properties to import tags and to configure source-based filtering.

i. In the **Setup** stage of the playbook, select the **Set configuration properties** activity.

ii. (Optional) In the **Data retrieval configuration** section, specify the **Source name** or **Source alias** as a comma-separated list to fetch API Component data from specific sources or gateways, respectively.

> **Note:**
> When a value is specified or updated in the **Source name** or **Source alias** field, the last_run_datetime field for SG-Akamai data sources is reset. This triggers full data ingestion during the next scheduled import. Subsequent runs perform delta loads based on the configured filters.

iii. In the **Tags settings** section, select the **Import tags** check box to import tags for the records.

iv. In the **Tags value separator** field, specify `=` as the key-value pair separator.

v. Select **Continue**.

c. Configure the import schedule to import data at regular intervals.

i. In the **Setup** stage of the playbook, select the **Configure import schedule** activity.

ii. Expand the Parent scheduled data import within the Import schedules list, and select the Sources import schedule.

iii. In the Configure import schedule dialog box, select the **Active** check box, and then fill in the run schedule and time details.

For more information, see Schedule a data import.

iv. Select **Save**.

Alternatively, select **Execute Now** to execute the import schedule immediately.

v. Select **Continue**.

d. In the **Setup** stage of the playbook, select the **Confirm connection setup** activity to verify whether the connection was created.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

Select **View all connections** to review the connection details. The configured connection appears in the Installed connections list.

Service Graph Connector for Akamai API Security

Accessing the connection details of Service Graph Connector for Akamai API Security

You can access the connection details of the Service Graph Connector for Akamai API Security in a single view using the common connection framework (CCF) included within the Integration Commons for CMDB (sn_cmdb_int_util) store app.

With the CCF, you can access all the connections used by the Service Graph Connector for Akamai API Security. The connection details include the connection alias, connection properties, data sources, and scheduled data imports associated with a connection. You can also test the connection. For more information, see Accessing the connection details of Service Graph Connectors.

Access the details of an Akamai API Security connection

Access the details of an Akamai API Security connection configured for the Service Graph Connector for Akamai API Security.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Service Graph Connectors** > **Akamai API Security** > **Connections**.
2. From the **Name** column of the Service Graph Connections list, select a connection.
3. On the Service Graph Connections page, view the connection details such as the connection name, alias, and data sources.
4. Select a related list to view further details of the connection.
5. **Optional:** Select the **Test Connection** related link to test the connection.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
To open the Service Graph Connection Properties [sn_cmdb_int_util_service_graph_connection_property] table for the connector, navigate to **All** > **Service Graph Connectors** > **Akamai API Security** > **Connections**, and select the connection name. The connection properties are displayed in the Service Graph Connection Properties related list.

Connection properties for Service Graph Connector for Akamai API Security

Property	Description
Import tags	Set the property to `true` to import API tags. • Type: true | false • Default value: `false`
Tags storage type	Specify whether the tag values should be stored in the Key Value [cmdb_key_value] table or in the *`Attributes`* field of the API Component [cmdb_ci_api_component] table. • Type: cmdb_key_value | attributes • Default value: `cmdb_key_value`
Tags value separator	Specify the delimiter to parse tag strings into key-value pairs. • Type: custom • Default value: null

Service Graph Connector for AWS

Use the Service Graph Connector for AWS to securely bring in Amazon Web Services (AWS) data into your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

The integration uses AWS native technologies and AWS security best practices to enable cloud teams to connect the data within their ServiceNow workflow. For more information about the Service Graph Connector for AWS, see the Service Graph Connector for AWS - Introduction article on the ServiceNow Community site.

Supported ServiceNow versions

- Yokohama
- Zurich
- Australia

Use cases

The following are examples on how you can use the Service Graph Connector for different ServiceNow applications:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Visibility into cloud resources, relationships, and state.
- Deep discovery of applications for ITAM or SAM outcomes.
- Governance and compliance outcome.

Important information for upgrading Service Graph Connector for AWS

Before you begin the upgrade process, complete the following tasks:

- If there are any customizations, delete the records associated with the Service Graph Connector for AWS from the Customer Updates [sys_update_xml] table. See Customer Updates table.
- Upgrade any dependencies.

After you've installed the latest version of the Service Graph Connector for AWS:

- Perform a full import of data from your AWS instance. Verify that the **Use last run datetime** field value is cleared for all the AWS data sources in the Data Source [sys_data_source] table.
- Download and rerun the AWS scripts. See Configure the AWS environment.

Configuring a connection for the connector

You can configure a connection for the connector by using the SGC Central view in the Service Graph Workspace or CMDB Workspace. The view enables you to discover and install connectors, and then effectively manage the full life cycle of creating, editing, monitoring, and debugging connections. To configure the connector using SGC Central, see Configure Service Graph Connector for AWS using SGC Central.

Important:
Unless there are configuration issues, use the SGC Central view in the Service Graph Workspace or CMDB Workspace to configure the connection for the connector, as the guided setup method is planned for deprecated.

CMDB integrations dashboard

The Integration Commons for CMDB store app provides a dashboard with a central view of the status, processing results, and processing errors of all installed integrations. You can see metrics for all integration runs. You can filter the view to a specific CMDB integration, a specific time duration, or a specific integration run. For more details about monitoring AWS integrations in the CMDB Integrations Dashboard, see Using the CMDB Integrations Dashboard.

BYOL support

Bringing your own licenses (BYOL) is the process of bringing previously purchased on-premises licenses to Amazon AWS Cloud. The connector supports the BYOL of the Image CIs for Oracle Database servers on Amazon AWS Cloud by populating the Key Value [cmdb_key_value] table with the licensing information. When the licensing information is found, the key is set to `Windows_OS_License_Type_automatic` and the key value is set to `BYOL` in the Key Value [cmdb_key_value] table.

To support BYOL, the *`sn_aws_integ.load_all_images`* system property is enabled during the initial pull to import the metadata of all Image CIs included in the SG-AWS-Image-Id data source. After the initial pull, the property is deactivated automatically. The SG-AWS-Image-Id data source then imports the metadata of the Image CIs without names only.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Event-based discovery

The Service Graph Connector for AWS works with event-based discovery. Events that are pulled from AWS can create and update CIs that were brought by the Service Graph Connector for AWS.

Managing retired CIs in EKS components

If the Amazon Elastic Kubernetes Services (EKS) CIs are deleted in EKS components such as pods, services, and volumes, the corresponding CI entries are automatically set to **Retired** in the following CMDB CI classes:

Kubernetes Cluster, Kubernetes Node, Kubernetes Pod, Kubernetes Service, Kubernetes DaemonSet Kubernetes Namespace, Kubernetes Deployment, Docker Container, Kubernetes Volume

Shared VPC and subnets support

Import CI relationships established between virtual private clouds (VPCs), subnets, and network interfaces hosted in different AWS accounts. For example, a VPC in one AWS account can be connected to a subnet in the same account, which can then link to a network interface and a virtual machine in another AWS account.

Additional resources

See the following articles on the ServiceNow Community site for any additional information on the AWS set up:

- Service Graph Connector for AWS - Introduction
- How do I configure the AWS Service Graph Connector?

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure the AWS environment for the Service Graph Connector for AWS

Configure your Amazon Web Services (AWS) environment to import data using the Service Graph Connector for AWS.

Before you begin

Install the Service Graph Connector for AWS application (sn_aws_integ). For more information, see Install a ServiceNow Store application.

Role required: application administrator

Procedure

1. Learn about the AWS resources used by the connector.
   Get familiar with the AWS concepts to learn how the Service Graph Connector for AWS is integrated with AWS.
2. Download the AWS scripts.
   Download the AWS scripts included within the guided setup of the Service Graph Connector for AWS.
3. Review the requirements before executing the AWS scripts.
   Complete the prerequisites before you execute the AWS scripts.
4. Execute the AWS scripts.
   Execute scripts provided with the Service Graph Connector for AWS to set up the AWS environment for importing data.

AWS resources used by the Service Graph Connector for AWS

Get familiar with the AWS concepts to learn how the Service Graph Connector for AWS is integrated with Amazon Web Services (AWS).

AWS Config service and configuration recorder

Important:
The AWS Config service and AWS configuration recorder are required for setting up the connector.

The AWS Config service monitors and records changes to your AWS resource configurations.

The AWS configuration recorder detects changes in resource configurations and captures these changes as configuration items (CIs). The is required for setting up the connector. The configuration recorder enables recording all hardware data in AWS Config. See What Is AWS Config? on the AWS Documentation site.

The Service Graph Connector for AWS includes the *`EnableAWSConfig.yml`* script to enable the AWS Config service that instead enables the configuration recorder. See Executing scripts required for setting up AWS.

Note:
Ensure that the AWS Config service is enabled for all applicable AWS accounts and regions.

AWS Config aggregator

Important:
The AWS Config aggregator is optional for setting up the connector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The AWS Config aggregator collects the AWS Config configuration and compliance data from the following sources:

- Multiple accounts and multiple regions
- Single account and multiple regions
- An organization in AWS organizations and all the accounts within the organization that have AWS Config enabled.

The advantages of using an AWS Config aggregator with the Service Graph Connector for AWS are:

- Gets all the data from a single location.
- Gets the bootstrap updates (baseline configurations) and the incremental updates (new configurations added after the last update).
- Doesn't require looping into each account and region.
- Accelerates pulling data.

Due to these advantages, consider leveraging the AWS Config aggregator for pulling data from multiple accounts or multiple regions.

Note:
For detecting any deleted resources, the connector uses the `config:ListDiscoveredResources` API to loop through each AWS account and region and update the CMDB CI accordingly. As a date range for selecting resources can't be specified in the `ListDiscoveredResources` API, the connector might make multiple API calls to gather all the data that might impact the performance of the connector.

For more information on setting up an AWS Config aggregator, see Multi-Account Multi-Region Data Aggregation and Setting Up an Aggregator Using the Console on the AWS Documentation site.

AWS Systems Manager and AWS Systems Manager Inventory

Important:
AWS Systems Managerand AWS Systems Manager Inventory are required for setting up the deep discovery feature.

The AWS Systems Manager enables fetching server data, also called as deep discovery data, from EC2 instances across AWS accounts and regions through SSM documents. The deep discovery data includes host name, serial number, CPU data, TCP data, and process information.

The AWS Systems Manager Inventory imports the software data installed on the EC2 instances. The Inventory resource group in AWS Systems Manager collects information about the EC2 instances and the software applications installed on them.

Ensure that the following items are configured in all AWS accounts:

- The AWS Systems Manager Agent (SSM Agent) is installed on all managed EC2 instances.
- The AmazonSSMForInstancesRole IAM instance profile role is attached as the instance profile on EC2 instances.
- The AWS Systems Manager Inventory is configured in each AWS region.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The AWS Systems Manager has access to the managed EC2 instances.

> **Note:**
> By default, AWS Systems Manager doesn't have permission to perform actions on EC2 instances. You can grant access by attaching the AmazonSSMForInstancesRole IAM instance profile role to the EC2 instance. See Setting up AWS Systems Manager on the AWS Documentation site.

The advantages of using AWS Systems Manager and AWS Systems Manager Inventory are:

- The AWS Systems Manager enables getting the detailed server data such as host name, serial number, CPU data, TCP data, and process information.
- The AWS Systems Manager Inventory enables the server classification and getting the software data.

Download the AWS scripts

Download the AWS scripts included within the guided setup of the Service Graph Connector for AWS.

Before you begin

- Ensure that you have installed the Service Graph Connector for AWS application (sn_aws_integ). For more information, see Install a ServiceNow Store application.
- Ensure that you've selected the **Service Graph Connector for AWS** application scope by using the application picker. See Application picker.

Role required: admin

Procedure

1. Navigate to **All** > **Service Graph Connector for AWS** > **Setup**.
2. On the Getting started page, select **Get Started**.
3. In the Configure the AWS environment section of the Service Graph Connector for AWS page, select **Get Started**.
4. For the Download the scripts task, select **Configure**.
5. When you download all the scripts onto your local machine, select **Close** to close the Download the scripts dialog box and return to the guided setup.
6. Set the Download the scripts task to complete by selecting **Mark as Complete**.

Prerequisites for executing scripts

Complete the prerequisites before you execute the AWS scripts.

> **Important:**
> Ensure that you have downloaded the scripts available within the Service Graph Connector for AWS. See Download the AWS scripts.

Decide the following details to be used later during the execution of the AWS scripts:

- ServiceNow IAM role
- ServiceNow IAM username

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- S3 bucket for the ServiceNow IAM role

Note:
Define an S3 bucket only when you are using deep discovery scripts.

Determine the ServiceNow IAM role

Determine the identity and access management (IAM) role that performs read-only operations in member accounts to fetch the configuration items (CIs) from the AWS environment.

By default, the *CreateSnowOrganizationAccountAccessRoleInMemberAccount.yml* script creates the SnowOrganizationAccountAccessRole IAM role. You can use the default name created by the script or create a new IAM role. However, when required as an input parameter, you must enter the same IAM role across scripts. See Executing scripts required for setting up AWS.

Determine the ServiceNow IAM username

Determine the name of the IAM user that assumes the ServiceNow IAM role in the member accounts.

By default, the *CreateServiceNowUser.yml* script creates the NOWSGCUser IAM user. You can use the default name created by the script or create a new IAM user. However, when required as an input parameter, you must enter the same IAM username across scripts. See Executing scripts required for setting up AWS.

Define the S3 bucket for deep discovery

Set up an S3 bucket with read and delete privileges for the ServiceNow IAM role to store and delete the *SendCommand* API responses when importing AWS data.

Before you begin
Role required: Application administrator

About this task
Create an S3 bucket for the Service Graph Connector for AWS application and enable the ServiceNow IAM role to have access to this bucket in the organization.

Note:
Use an S3 bucket only when you want to perform deep discovery on EC2 instances.

Procedure

1. Create an S3 bucket in an AWS account region.
   See Creating a bucket on the AWS documentation site.

   Note:
   The S3 bucket must have the following permission settings.

   S3 bucket permissions and their settings

Permission	Setting
Access	Bucket and objects not public
S3 Block Public Access	Block public access to S3 buckets and objects

   For more information, see S3 Block Public Access on the AWS documentation site.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Add a bucket policy.

   See Bucket policies on the AWS documentation site.

   To access the S3 bucket you created in step 1, its bucket policy must allow the IAM instance profile role attached to the managed EC2 instances. You can either create a bucket policy or grant access to your AWS member account in the bucket access control list (ACL). The member account must include the EC2 instances.

   Note:
   Adding an AWS member account to the bucket ACL allows all users and roles in the member account to access the S3 bucket.

   Refer to the following sample code when adding a bucket policy.

```
{
    "Version": "2012-10-17",
    "Id": "S3PolicyforServiceNowIAMrole",
    "Statement": [
        {
            "Sid": "EC2S3Access",
            "Effect": "Allow",
            "Principal": {
                "AWS":
 "arn:aws:iam::AWS-ACCOUNT:role/INSTANCE-PROFILE-ROLE-NAME"
            },
            "Action": [
                "s3:GetObject",
                "s3:PutObject",
                "s3:PutObjectAcl"
            ],
            "Resource": "arn:aws:s3:::DOC-EXAMPLE-BUCKET/*"
        }
    ]
}
```

   Where

   - *SOURCE-AWS-ACCOUNT* is the AWS account ID of the member account that includes the EC2 instances.
   - *INSTANCE-PROFILE-ROLE-NAME* is the IAM instance profile that is attached to the EC2 instances.

     By default, the *AmazonSSMForInstancesRoleSetup.yml* script creates the AmazonSSMForInstancesRole IAM instance profile role and attaches the role to the AmazonSSMManagedInstanceCore bucket policy. See Executing scripts required for setting up AWS.

   - *DOC-EXAMPLE-BUCKET* is the S3 bucket name.

   The following example bucket policy shows the effect, principal, action, and resource elements. The policy allows AmazonSSMRoleForInstances, an IAM instance profile role in an account with ID `123456789000`, `s3:GetObject`, `s3:PutObject`, and `s3:PutObjectAcl` S3 permissions on the `myS3Bucket` bucket.

```
{
    "Version": "2012-10-17",
    "Id": "S3PolicyforServiceNowIAMrole",
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    "Statement": [
        {
            "Sid": "EC2S3Access",
            "Effect": "Allow",
            "Principal": {
                "AWS": [

 "arn:aws:iam::123456789000:role/AmazonSSMRoleForInstances",

 "arn:aws:iam::123456789001:role/AmazonSSMRoleForInstances",

 "arn:aws:iam::123456789002:role/AmazonSSMRoleForInstances",

 "arn:aws:iam::123456789003:role/AmazonSSMRoleForInstances",

 "arn:aws:iam::123456789004:role/AmazonSSMRoleForInstances"
                ]
            },
            "Action": [
                "s3:GetObject",
                "s3:PutObject",
                "s3:PutObjectAcl"
            ],
            "Resource": "arn:aws:s3:::myS3Bucket/*"
        }
    ]
}
```

3. Attach IAM permissions to the instance profile role for EC2 instances to publish the *SendCommand* API responses to the S3 bucket you created in step 1.
See Using instance profiles and Attach an IAM role to an instance on the AWS documentation site.

   The IAM instance profile role attached to the managed EC2 instances must have the `s3:GetObject`, `s3:PutObject`, and `s3:PutObjectAcl` S3 permissions to allow access to the S3 bucket as shown in the following sample policy.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
        "Sid": "PublishTerminalOutputToS3",
            "Effect": "Allow",
            "Action": [
                "s3:PutObject",
                "s3:GetObject",
                "s3:PutObjectAcl"
            ],
            "Resource": "arn:aws:s3:::DOC-EXAMPLE-BUCKET/*"
        }
    ]
}
```

   Where, *DOC-EXAMPLE-BUCKET* is the S3 bucket name.

   Note:
   Make sure you add the suffix `/*` at the end of the bucket name to enable creating files under the bucket name.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Executing scripts required for setting up AWS

You must execute scripts provided with the Service Graph Connector for AWS to set up the AWS environment for importing data.

Important:
Before executing an AWS script, ensure that you have completed the prerequisites. See Prerequisites for executing scripts.

The AWS scripts provided with the connector configure AWS resources to import the configuration items (CIs) data into the CMDB. To learn more, see AWS resources used by the Service Graph Connector for AWS.

Based on the AWS environment requirements, the scripts provided with the Service Graph Connector for AWS are categorized as described in the following table.

Basic scripts	Deep discovery scripts	Amazon EKS scripts
Scripts for configuring the AWS environment to import data by using the connector.	Scripts for setting up deep discovery on Amazon Elastic Compute Cloud (Amazon EC2) instances.	Scripts for setting up Amazon Elastic Kubernetes Service (EKS) clusters.

Basic scripts

Use the basic scripts to configure the AWS environment for importing data using the Service Graph Connector for AWS.

The following table describes the basic AWS scripts available with the connector, the input parameters entered when executing a script, the conditions to execute the scripts, and the script execution results.

Basic script details

Script	Input parameters
EnableAWSConfig.yml	None
CreateServiceNowUser.yml	**SNUserName** Name of the ServiceNow IAM user t created as part of the setup. See Pre for executing scripts. Default value: `NOWSGCUser` **MbrActRoleName**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Basic script details (continued)

Script	Input parameters
	Name of the ServiceNow IAM role th created as part of the setup. See Pre for executing scripts. Default value: `SnowOrganizationAccountA`
CreateSnowOrganizationAccountAccessRoleInMemberAccount.yml	**ACNNBR** Management account ID when the S IAM user is in a management accou Or Designated member account ID whe ServiceNow IAM user is in a designa member account. **S3Bucket** Amazon S3 bucket name to get the `SendCommand` output. **ServiceNowUserName** Name of the ServiceNow IAM user t created as part of the setup. See Pre for executing scripts. Default value: `NOWSGCUser`
SnowDesignatedAccountAccessRoleInManagementAccount.yml	**MEMBERACTNBR** Member account ID where the Servi user was created.
AWS-SystemsManager-AutomationExecutionRole.yml	None

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Basic script details (continued)

Script	Input parameters
AWS-SystemsManager-AutomationAdministrationRole.yml	None

Deep discovery scripts

Use the deep discovery scripts to set up deep discovery on Amazon EC2 instances.

Note:
Execute the deep discovery scripts only when you want to perform deep discovery on EC2 instances.

The following table describes the deep discovery scripts, the input parameters entered when executing a script, the conditions to execute the scripts, and the script execution results.

Deep discovery script details

Script	Input parameters	Execution condition	Result
AmazonSSMForInstancesRoleSetup.yml	**S3Bucket** S3 bucket name that collects the details from EC2 instances. See Prerequisites for executing scripts.	Execute the script in all the AWS accounts by creating a CloudFormation StackSet in the management account. See Create a stack set on the AWS	Creates the AmazonSSMForInstance IAM instance profile role to be attached to the EC instances.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Amazon EKS scripts

Use the Amazon EKS scripts to set up Amazon Elastic Kubernetes Service (EKS) clusters.

Note:
Execute the Amazon EKS scripts only when the Amazon EKS service for Kubernetes clusters is required.

The following table describes the Amazon EKS scripts, the conditions to execute the scripts, and the script execution results.

Amazon EKS script details

Script	Execution condition	Result
SG-AWS-RunKubeCtlEKSNamesShellScript.yml	Execute the script in all the AWS accounts and the AWS regions where the EC2 Bastion hosts are located by creating a CloudFormation StackSet in the management account. See Create a stack set on the AWS documentation site.	Creates an AWS SSM document to discover EKS clusters associated with EC2 Bastion hosts. **Note:** An AWS Cloud administrator can update the SSM document in their AWS setup.
SG-AWS-RunKubeCtlShellScript.yml	Execute the script in all the AWS accounts and the AWS regions where the EC2 Bastion hosts are located by creating a CloudFormation StackSet in the management account. See Create a stack set on the AWS documentation site.	Creates an AWS SSM document to fetch CIs related to Kubernetes components, such as pods, services, and deployments, from EKS clusters. **Note:** An AWS Cloud administrator can update the SSM document in their AWS setup.

Configure Service Graph Connector for AWS using SGC Central

Use the playbook available with the SGC Central application to set up the Service Graph Connector for AWS for pulling in AWS data into the CMDB

Before you begin

- Install Service Graph Connector for AWS version 2.7.0 or later from the ServiceNow Store. For ServiceNow Store installation steps, see Install a ServiceNow Store application.
- Verify that you've completed the prerequisites for setting up AWS. See Configure the AWS environment.

Role required: The following table shows the roles required for each stage of the playbook.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required for each playbook stage

Stage	Role
Prerequisites	admin
Setup	SGC-Admin (sn_cmdb_int_util.sgc_admin) or admin

Note:
The admin user role is required to run background scripts and to provide access to global tables to the SGC-Admin user. For information about the user roles for Service Graph Connectors, see Service Graph Connector user roles.

About this task

The playbook experience for onboarding connectors is activated with SGC Central in the Service Graph Workspace or CMDB Workspace. To configure the SGC Central application, see Configuring SGC Central and for more information on how to interact with a playbook, see Interact with Playbook.

Procedure

1. Use one of the following methods to open SGC Central:
   - Navigate to **Workspaces** > **Service Graph Workspace**, and from the left navigation panel, select the Ingestion icon to open the SGC Central view.
   - Navigate to **Workspaces** > **CMDB Workspace** > **SGC Central**.
2. On the Overview page, select **Create connection**.

   Tip:
   Alternatively, you can select **Create connection** on the All connections page.

3. On the Create connection window, select the AWS connector type and then select **Create connection**.
4. Complete the initial prerequisites when setting up a connection for the first time using a connector.

   Note:
   This step is required only during the first-time setup. See Perform initial setup tasks when creating a connection in SGC Central.

5. Complete the prerequisites for setting up the AWS environment.

   a. Configure the basic setup in the AWS environment required for importing data using the connector.

      i. In the **Prerequisites** stage of the playbook, select the **Download basic scripts** activity.

      ii. Execute the scripts to configure the AWS environment.

      For more information on executing scripts, see Basic scripts.

      iii. Select the **I have read the instructions and executed the script accordingly** check box to confirm that you have executed the scripts.

      iv. Select **Continue**.

   b. Set up deep discovery on Amazon Elastic Compute Cloud (Amazon EC2) instances.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Complete this step only to perform deep discovery on EC2 instances. Else, select **Skip**.

i. In the **Prerequisites** stage of the playbook, select the **Download deep discovery scripts** activity.

ii. Execute the scripts to configure Amazon EC2 instances for deep discovery.

For more information on executing scripts, see Deep discovery scripts.

iii. Select **Continue**.

c. Set up Amazon Elastic Kubernetes Service (EKS) clusters.

Note:
Complete this step only when the Amazon EKS service for Kubernetes clusters is required. Else, select **Skip**.

i. In the **Prerequisites** stage of the playbook, select the **Download Amazon EKS scripts** activity.

ii. Execute the scripts to set up Amazon EKS clusters.

For more information on executing scripts, see Amazon EKS scripts.

iii. Select **Continue**.

6. Complete the setup for configuring the connector for importing data.

a. Create and test connection.

i. In the **Setup** stage of the playbook, select the **Create and test connection** activity.

ii. On the form, fill in the fields.

Create and test connection form

Field	
Connection name	Name to identify the AWS connection record. For example, `SG_AWS_CredentialAlias_Org`.
Access Key ID	Access key ID of the IAM user that has permissions to interact with the AWS resources.
Secret Access Key	Secret access key that corresponds to the Access key ID required for authenticating the connection securely.
Use MID Server	Option to use a MID Server. **Note:** Use of a MID Server is optional.
Mid Selection	Name of the MID Server used by the connector. This field appears only when the **Use MID Server** check box is selected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

iii. Select **Create and test connection**.

iv. Once the connection test is complete, select **Continue**.

b. Set configuration properties for the connection to access the AWS resources.

i. In the **Setup** stage of the playbook, select the **Set configuration properties** activity.

ii. In the Organization details section, fill in the organization details including the account identifier, name and description of the AWS organization.

iii. In the S3 account details section, fill in the details.

S3 account details

Field	Description
S3 account ID	Numeric identifier of the AWS account that hosts the Amazon Simple Storage Service (Amazon S3) bucket.
S3 bucket name	Name of the Amazon S3 bucket that collects the details from Amazon EC2 instances.
S3 region	Region where the Amazon S3 bucket resides.

iv. In the **AWS regions** field of the AWS regions and STS assume role name section, enter the AWS regions to collect the CI data.

By default, the Service Graph Connector for AWS runs through all the AWS regions to collect the CI data.

You can enter AWS specific regions to speed up the CI data import process. For example, `us-east1, us-east-2`.

If you update the **AWS regions** field value later, clear the value of the **Last run datetime** field in all the data sources related to the Service Graph Connector for AWS to import a new set of data.

v. In the **STS assume role name** field of the AWS regions and STS assume role name section, enter the AWS Identity and Access Management (IAM) role name.

The AWS IAM role name is obtained by the ServiceNow user by calling the *`AssumeRole`* API offered by the AWS Security Token Service (STS). The *`AssumeRole`* API returns a set of temporary security credentials for the ServiceNow user to access the AWS resources.

Note:
Enter the IAM role name but don't prefix `arn` in the name. If you leave this field is empty, the value of this field is automatically set to **SnowOrganizationAccountAccessRole**, which is the default IAM role name for the ServiceNow user.

vi. In the SSM SendCommand document details section, enter the name of the document that defines the actions run by the AWS Systems Manager (SSM) on a Linux-based Amazon EC2 instance or a Windows-based Amazon EC2 instance in their respective fields.

vii. In the **Management account ID** field of the Management account ID and standalone account ID section, enter the management account ID in the AWS organization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Enter a value for this field when the ServiceNow user was created in an AWS member account.

The account calls the `ListAccounts` API associated with the AWS organization to collect CI information from all the accounts. For more information, see ListAccounts on the AWS documentation site.

viii. In the **Standalone account ID** field of the Management account ID and standalone account ID section, enter the ID of a member account in the AWS organization.

> **Note:**
> When specifying a standalone account, the AWS organization-related data such as the organization name, organization units, organization ID, and service accounts are not imported. To import the full data later, clear any value mentioned in the **Standalone account ID** field. See the Service Graph Connector for AWS - Standalone Setup [KB1642159] article in the Now Support Knowledge Base.

ix. In the AWS config aggregator details section, enter the AWS account details for the aggregator resource type.

AWS config aggregator details

Field	Description
Config aggregator account	AWS account where the aggregator resource type in the AWS Config service has been configured. Enter a value in this field when you're using an AWS Config aggregator.
Config aggregator name	Name of the aggregator resource type. This field is available only when you enter a value in the **Config aggregator account** field.
Config aggregator region	Region where the aggregator resource type resides. This field is available only when you enter a value in the **Config aggregator account** field.

x. In the AWS key rotation setup section, enter the key rotation process details.

AWS key rotation setup

Field	Description
AWS rotate keys	Option to enable the key rotation process.
AWS key rotation date	Key rotation date. Set the value to the required key rotation date for the first run. For subsequent runs, this field is automatically set to the rotation date. This field is available only when you select the **AWS Rotate Keys** check box.
AWS key rotation period (in days)	Key rotation period in days. This field is available only when you select the **AWS rotate keys** check box.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
AWS key rotation status	Status message of a key rotation displaying whether the rotation was a success or a failure. This field is automatically set to display the key rotation status message. This field is available only when you select the **AWS rotate keys** check box. If the rotation status is a failure, an email notification is triggered, if configured.
Email accounts for receiving error notifications	Comma-separated list of the email addresses of recipients who receive notifications about the AWS key rotation errors.
Email account groups for receiving error notifications	Comma-separated list of the ServiceNow groups who receive notifications about the AWS key rotation errors.

xi. Select the **Is gov cloud** check box in the Gov cloud setup section to indicate that the connection setup is for the AWS GovCloud.

xii. In the SSM EKS SendCommand document details section, enter the AWS SSM document details.

SSM EKS SendCommand document details

Field	Description
EKS cluster names document	Name of the AWS SSM document to discover EKS clusters associated with EC2 Bastion hosts.
EKS shell script document	Name of the AWS SSM document to fetch CIs related to Kubernetes components, such as pods, services, and deployments, from EKS clusters.

xiii. Select **Save properties**.

xiv. Select **Continue**.

c. Configure the required EC2 resources for Amazon Elastic Kubernetes Service (EKS) to import EKS cluster data.

Note:
Complete this step only when EC2 resources are needed. Else, select **Skip** for the **Configure EKS EC2 resources** activity.

An EKS EC2 resource is a bastion host that has network access to EKS clusters. The EKS clusters aren't directly accessible to the connector. Therefore, you must provide the EKS EC2 resource details. For importing EKS cluster data, the connector uses the SSM Send Command on EKS EC2 resources to run kubectl commands remotely.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Ensure that you've configured your AWS environment for the EKS integration. For more information, see the Service Graph Connector for AWS - Amazon EKS Integration [KB1437138] article in the Now Support Knowledge Base.

i. In the **Setup** stage of the playbook, select the **Configure EKS EC2 resources** activity.

ii. On the Configure EKS EC2 resources page, select **New**.

iii. On the Configure EKS EC2 resources window that appears, fill in the fields.

Configure EKS EC2 resources fields

Field	Description
EKS EC2 Resource Id	Identifier of the EKS EC2 resource.
EC2 Region	AWS region where the EKS EC2 resource is located.
EC2 Account	User name assigned to the EKS EC2 resource account.
Connection Alias	Connection alias associated with the AWS environment setup and configured in step 6.a.ii.
Connection	Connection name associated with the AWS environment setup and configured in step 6.a.ii.
Active	Option to activate the EKS EC2 resource.

iv. Select **Save**.

v. Repeat steps from 6.c.ii to 6.c.iv to add more EKS EC2 resources.

vi. Select **Continue**.

d. Run the AWS diagnostic tool before running a scheduled import job to identify any issues in the AWS environment setup.

i. In the **Setup** stage of the playbook, select the **Run diagnostic tests** activity.

ii. On the Run diagnostic test page, select an option to exclude the corresponding test results from the diagnostic summary.

Skip SSM setup tests

Excludes the software inventory data from the summary results by not calling the `GetInventory` API. Select this option when you've opted out or not set up the configuration for SSM.

Skip SSM Deep Discovery tests

Excludes the deep discovery data from the summary results. Select this option when you've opted out or not set up the configuration for SSM deep discovery.

Skip EKS setup tests

Excludes the EKS data from the summary results by not running the kubectl commands.

Note:
This check box appears only when you've configured EC2 resources in the **Configure EKS EC2 resources** activity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

iii. Select **Run diagnostic test** and wait for the test to complete.

iv. Review the diagnostic summary, the API access results, and the IAM permission validation logs.

v. When the test results are successful, select **Continue**.

e. Configure the import schedule to import data at regular intervals.

i. In the **Setup** stage of the playbook, select the **Configure import schedule** activity.

ii. Expand the Parent scheduled data import within the Import schedules list to select the **SG-AWS-Organization** import schedule.

iii. In the Configure import schedule dialog box, select the **Active** check box, and then fill in the run schedule and time details.

For more information, see Schedule a data import.

iv. Select **Save**.

Alternatively, select **Execute Now** to execute the import schedule immediately.

v. Select **Continue**.

f. In the **Setup** stage of the playbook, select the **Confirm connection setup** activity to verify whether the connection was created.

What to do next

Select **View all connections** to review the connection details. The configured connection appears in the Installed connections list.

Configure Service Graph Connector for AWS using the guided setup

Set up the AWS environment and scheduled jobs to pull in AWS data into the CMDB.

Before you begin

Important:
Unless there are configuration issues, use the SGC Central view in the Service Graph Workspace or CMDB Workspace to configure the connection for the connector, as the guided setup method is planned for deprecated.

To use this Service Graph Connector, you need a subscription to a Subscription Unit that is based in the IT Operations Management (ITOM) Visibility application or in the ITOM Discovery application. As defined in the section titled "Managed IT Resource Types" in ServiceNow Subscription Unit Overview for your subscription, for managed IT resources that are created or modified in the CMDB by this Service Graph Connector, but that aren't yet managed by ITOM Visibility or ITOM Discovery, these resources will increase Subscription Unit consumption from that application. Review your current Subscription Unit consumption within ITOM Visibility or ITOM Discovery to ensure available capacity.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dependencies and requirements:

- The Integration Commons for CMDB store app, which is automatically installed.
- The CMDB CI class models store app, which is automatically installed. See CMDB CI Class Models.
- Discovery Core plugin (com.snc.discovery.core), which is automatically installed by Discovery.
- The ITOM Discovery License plugin (com.snc.itom.discovery.license). You must activate this plugin.
- ITOM Licensing plugin (com.snc.itom.license). For more information, see Request Discovery.

Ensure that you've completed the prerequisites for setting up AWS. See Configure the AWS environment.

Note:
When upgrading from an earlier version, ensure that you've updated the SSM documents and IAM permissions in your AWS instance.

- For updating SSM documents, run the SG - AWS - `RunShellScript - Setup . yml`, SG - AWS - `RunPowerShellScript - Setup . yml`, and SG - AWS - `RunKubeCtlShellScript . yml` scripts.
- For updating the IAM permissions assigned to the SnowOrganizationAccountAccessRole role, run the `CreateSnowOrganizationAccountAccessRoleInMemberAccount . yml` script.

Role required: SGC-Admin (sn_cmdb_int_util.sgc_admin) or admin

Note:
The admin user role is required to run background scripts and to provide access to global tables to the SGC-Admin user. For information about the user roles for Service Graph Connectors, see Service Graph Connector user roles.

About this task

For more information on the **Service Graph Connector for AWS** setup instructions, see the following articles:

- Service Graph Connector for AWS - Setup Instructions [KB1220597] article on the Now Support Knowledge Base.
- Service Graph Connector for AWS - Introduction on the ServiceNow Community site.
- SGC-AWS - Release 2.0 Features on the ServiceNow Community site.

If you upgrade the connector, complete the following tasks before the upgrade process:

- If there are any customizations, delete the records associated with the Service Graph Connector for AWS from the Customer Updates [sys_update_xml] table. See Customer Updates table.
- Upgrade any dependencies.

After you've installed the latest version of the Service Graph Connector for AWS:

- Perform a full import of data from your AWS instance. Verify that the **Use last run datetime** field value is cleared for all the AWS data sources in the Data Source [sys_data_source] table.
- Download and rerun the AWS scripts. See Configure the AWS environment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Ensure that you've selected the **Service Graph Connector for AWS** application scope by using the application picker.
   For more information, see Application picker.
2. Navigate to **All** > **Service Graph Connectors** > **AWS** > **Setup**.
3. Configure the AWS environment.

   Note:
   For the Download the scripts task, select **Configure** to download the scripts.

   After you've downloaded the scripts and configured the AWS environment, set the Download the scripts and AWS Setup Instructions tasks to complete.
4. Configure the authentication credentials to authenticate requests sent to the AWS APIs.

   a. Configure your AWS credentials.
      i. For the Configure the connection section of the Service Graph Connector for AWS page, select **Get Started**.
      ii. For the Configure the credentials task, select **Configure**.
      iii. In the **Name** field, enter a name for the authentication.

      `SG-AWS-Credentials-Org` is the default credential alias name. You can add multiple AWS instances. However, don't modify the default connection alias.

      iv. Enter the access key ID and the secret access key in the **Access Key ID** and **Secret Access Key** fields respectively.

      The AWS access keys are long-term credentials for the IAM user and include two parts: an access key ID and a secret access key. You must use both the access key ID and the secret access key together to authenticate requests.

      v. Return to the Configure the connection task page by selecting the back icon (<).
      vi. Set the Configure the credentials task to complete by selecting **Mark as Complete**.

   b. Test the AWS API connection to import data from the AWS application.
      i. For the Test the connection task in the Configure the connection section, select **Configure**.
      ii. Select the **Test Connection** related link.
      iii. When the **Status** field is set to **Success**, select the back icon (<) to return to the guided setup.
      iv. Set the Test the connection task to complete by selecting **Mark as Complete**.

   c. Update the required configuration properties for an AWS instance.
      i. For the Update configuration properties for instance task, select **Configure**.
      ii. On the SG-AWS Configuration Properties form that opens in a new tab, review, and modify the fields.

© 2026 ServiceNow, Inc. All rights reserved.

SG-AWS Configuration Properties form

Field	Description
Connection Details	
Connection Alias	Name to identify the AWS connection record. For example, `SG_AWS_CredentialAlias_Org`. You can add multiple AWS instances. However, don't modify the name for the default connection alias `SG_AWS_CredentialAlias_Org`.
Organization Details	
Organization Account	Numeric account identifier of the AWS organization.
Organization Name	Name of the AWS organization.
Organization Description	Description of the AWS organization.
AWS Regions	
Regions	AWS regions to collect the CI data. By default, the Service Graph Connector for AWS runs through all the AWS regions to collect the CI data. You can enter AWS specific regions to speed up the CI data import process. For example, `us-east1, us-east-2`. If this field is left empty, the Service Graph Connector for AWS pulls the resources from all the AWS regions. However, for the AWS GovCloud regions, don't leave the **Regions** field empty. The supported AWS GovCloud regions are `us-gov-east-1` and `us-gov-west-1`. If you update the **Regions** field value later, clear the value of the **Last run datetime** field in all the data sources related to the Service Graph Connector for AWS to import a new set of data.
STS Assume Role Name	
STS Role	AWS Identity and Access Management (IAM) role name that is obtained by the ServiceNow user by calling the *`AssumeRole`* API offered by the AWS Security Token Service (STS). The *`AssumeRole`* API returns a set of temporary security credentials for the ServiceNow user to access the AWS resources. **Note:** Enter the IAM role name but don't prefix `arn` in the name. If you leave this field is empty, the value of this field is automatically set to **SnowOrganizationAccountAccessRole**, which is the default IAM role name for the ServiceNow user.
S3 Account Details	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
S3 Account Id	Numeric identifier of the AWS account that hosts the Amazon Simple Storage Service (Amazon S3) bucket.
S3 Bucket Name	Name of the Amazon S3 bucket that collects the details from Amazon EC2 instances.
S3 Region	Region where the Amazon S3 bucket resides.
SSM SendCommand Document Details	
SSM Send Command Linux Name	Name of the document that defines the actions run by the AWS Systems Manager (SSM) on a Linux-based Amazon EC2 instance.
SSM Send Command Windows Name	Name of the document that defines the actions run by the AWS SSM on a Windows-based Amazon EC2 instance.
Management Account ID	
Management Account ID	Management account in the AWS organization. The account calls the *`ListAccounts`* API associated with the AWS organization to collect CI information from all the accounts. For more information, see ListAccounts on the AWS documentation site. Enter a value for this field when the ServiceNow user was created in an AWS member account.
Standalone Account ID Details	
Standalone Account ID	ID of a member account in the AWS organization. **Note:** When specifying a standalone account, AWS organization-related data such as the organization name, organization units, organization ID, and service accounts are not imported. If you want to import the full data later, clear any value mentioned in the **Standalone Account ID** field. See the Service Graph Connector for AWS - Standalone Setup [KB1642159] article in the Now Support Knowledge Base.
AWS Config Aggregator Details	
Config Aggregator Account	AWS account where the aggregator resource type in the AWS Config service has been configured. Enter a value in this field when you're using an AWS Config aggregator.
Config Aggregator Name	Name of the aggregator resource type. This field is available only when you enter a value in the **Config Aggregator Account** field.
Config Aggregator Region	Region where the aggregator resource type resides. This field is available only when you enter a value in the **Config Aggregator Account** field.
AWS Key Rotation Setup	
AWS Rotate Keys	Option to enable the key rotation process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
AWS Key Rotation Date	Key rotation date. Set the value to the required key rotation date for the first run. For subsequent runs, this field is automatically set to the rotation date. This field is available only when you select the **AWS Rotate Keys** check box.
AWS Key Rotation Period (in Days)	Key rotation period in days. This field is available only when you select the **AWS Rotate Keys** check box.
AWS Key Rotation Status	Status message of a key rotation displaying whether the rotation was a success or a failure. This field is automatically set to display the key rotation status message. This field is available only when you select the **AWS Rotate Keys** check box. If the rotation status is a failure, an email notification is triggered, if configured.
Email accounts for receiving error notifications	Comma-separated list of the email addresses of recipients who receive notifications about the AWS key rotation errors.
Email account groups for receiving error notifications	Comma-separated list of the ServiceNow groups who receive notifications about the AWS key rotation errors.
Gov Cloud Setup	
Is Gov Cloud	Option to indicate that the connection setup is for the AWS GovCloud.
SSM EKS SendCommand Document Details	
EKS Cluster Names Document	Name of the AWS SSM document to discover EKS clusters associated with EC2 Bastion hosts.
EKS Shell Script Document	Name of the AWS SSM document to fetch CIs related to Kubernetes components, such as pods, services, and deployments, from EKS clusters.

iii. Select **Save** and then **Close** to close the tab and return to the guided setup tab.

iv. Set the Update configuration properties for instance task to complete by selecting **Mark as Complete**.

5. Configure the required EC2 resources for Amazon Elastic Kubernetes Service (EKS) to import EKS cluster data.
An EKS EC2 resource is a bastion host that has network access to EKS clusters. The EKS clusters aren't directly accessible to the connector. Therefore, you must provide the EKS EC2 resource details. For importing EKS cluster data, the connector uses the SSM Send Command on EKS EC2 resources to run kubectl commands remotely.

Note:
Ensure that you've configured your AWS environment for the EKS integration. For more information, see the Service Graph Connector for AWS - Amazon EKS Integration [KB1437138] article in the Now Support Knowledge Base.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. For the Configure the EKS Resource Details section of the Service Graph Connector for AWS page, select **Get Started**.

b. For the Enter the EKS EC2 Resource Details task, select **Configure**.

c. On the form that opens in a new tab, fill in the fields.

SG-AWS-EKS-EC2-Resource form

Field	Description
EKS EC2 Resource Id	Identifier of the EKS EC2 resource.
EC2 Account	User name assigned to the EKS EC2 resource account.
EC2 Region	AWS region where the EKS EC2 resource is located.
Active	Option to activate the EKS EC2 resource. **Note:** Set to false, if you are not using the EKS EC2 resource resource.
Connection	Connection alias associated with the AWS environment setup and configured in step 4.a.

d. Select **Submit** to return to the guided setup.

e. Repeat steps from 5.b to 5.d to add multiple EKS EC2 resources.
All the EKS EC2 resources are added to the SG-AWS-EKS-Master [sn_aws_integ_sg_aws_eks_master] table.

f. Set the Enter the EKS EC2 Resource Details task to complete by selecting **Mark as Complete**.

6. Run the AWS diagnostic tool before running a scheduled import job to identify any issues in the AWS environment setup.

a. For the Service Graph AWS Diagnostic Tool section of the Service Graph Connector for AWS page, select **Get Started**.

b. For the AWS Setup Diagnostic Tool task, select **Configure**.

c. Select the organization ID from the text field.

d. Select **Run Diagnostic Test**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tip:
Select one of the following options to exclude the corresponding test results from the diagnostic summary:

Skip SSM setup tests

Excludes the software inventory data from the summary results by not calling the *GetInventory* API. Select this option when you've opted out or not set up the configuration for SSM.

Skip SSM Deep Discovery tests

Excludes the deep discovery data from the summary results. Select this option when you've opted out or not set up the configuration for SSM deep discovery.

Skip EKS setup tests

Excludes the EKS data from the summary results by not running the kubectl commands. Select this option when you've opted out or not set up the EKS integration.

e. **Optional:** View only EKS cluster test results by selecting **View EKS Test Details**.

f. **Optional:** Preview any previous diagnostic tool results by selecting **Load DT Results**, selecting a diagnostic ID, and then selecting **Load Results**.

g. When you finish reviewing the diagnostic summary results, select the back button of your browser to return to the guided setup.

h. Set the AWS Setup Diagnostic Tool task to complete by selecting **Mark as Complete**.

7. Configure the scheduled jobs to import data from the AWS application.

a. In the Configure the scheduled import jobs section of the Service Graph Connector for AWS page, select **Get started**.

b. For the Configure the scheduled job task, select **Configure**.

c. Select the scheduled job that you want to activate.

d. On the Scheduled Data Import form, verify the field values for the scheduled job. For more information, see Schedule a data import.

e. Select **Update**.

f. Repeat the steps 7.c to 7.e for each scheduled job for data import.

g. Select the back icon (<) to return to the guided setup page.

h. Set the Configure the scheduled job task to complete by selecting **Mark as Complete** in the guided setup.

8. **Optional:** Add multiple AWS instances.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the Add Multiple Instances section of the Service Graph Connector for AWS page, select **Get Started**.

b. Ensure that you have edit permissions for the Datasource [sys_data_source] table to create data sources for the new instance.

   i. Select the **Global** application scope by using the application picker.

   ii. For the Update Data Source Access task, select **Configure**.

   iii. In the Application Access related list, select the **Can create**, **Can update**, and **Can delete** check boxes, if not already selected.

   iv. Select **Update** to close the tab and return to the guided setup.

   v. Modify the application scope again to **Service Graph Connector for AWS** by using the application picker.

   vi. Set the Update Data Source Access task to complete by selecting **Mark as Complete**.

c. Update access for scheduled import jobs.

   i. Select the **Global** application scope by using the application picker.

   ii. For the Update Scheduled Data Import Access task, select **Configure**.

   iii. In the Application Access related list, select the **Can create**, **Can update**, and **Can delete** check boxes, if not already selected.

   iv. Select **Update** to close the tab and return to the guided setup tab.

   v. Set the Update Scheduled Data Import Access task to complete by selecting **Mark as Complete**.

   vi. Modify the application scope again to **Service Graph Connector for AWS** by using the application picker.

d. Clear the cache of the Data Source [sys_data_source] and Scheduled Data Imports [scheduled_import_set] tables to enable creating a data source for the new connection in the Service Graph Connector for AWS.

   i. For the Clear Cache for Data Source and Scheduled Data Imports tables task, select **Configure**.

   ii. In the **Run script** text box of the background script page, enter the following script:

```
GlideTableManager.invalidateTable("sys_data_source");
      GlideCacheManager.flushTable("sys_data_source");

 GlideTableManager.invalidateTable("scheduled_import_set");
      GlideCacheManager.flushTable("scheduled_import_set");

      GlideTableManager.invalidateTable("sys_db_object");
      GlideCacheManager.flushTable("sys_db_object");
```

   iii. Select **Run Script** to run the background script in the **global** scope.

   The script may take several minutes to execute.

   iv. After the script is executed, select **Close**.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

v. Set the Clear Cache for Data Source and Scheduled Data Imports tables task to complete by selecting **Mark as Complete**.

vi. Modify the application scope again to **Service Graph Connector for AWS** by using the application picker.

e. Create a credential alias for the new AWS connection in the Service Graph Connector for AWS.

i. For the Create new Connection & Credentials Alias Record task, select **Configure**.

ii. On the Connection & Credential Aliases form that opens in a new tab, fill in the connection details.

iii. Select **Submit** and close the tab and return to the guided setup tab.

iv. Set the Create new Connection & Credentials Alias Record task to complete by selecting **Mark as Complete**.

f. Create credentials for the new AWS credential alias.

i. For the Create new Connection & Credentials Alias Record task, select **Configure**.

ii. On the Connections page of the Workflow Studio, select **Add Connection**.

iii. In the Create Connection window, fill in the connection name, access key, and secret key details.

iv. Select **Create Connection**.

v. Close the Workflow Studio and return to the guided setup tab.

vi. Set the Create new Connection & Credentials Alias Record task to complete by selecting **Mark as Complete**.

g. Update properties for the new instance for the Service Graph Connector for AWS by selecting **Configure** for the Configure AWS environment for the new Instance task.
For more information, follow the step 4.c discussed earlier for configuring the properties of the AWS connection available by default.

When you're done updating the properties, set the Configure AWS environment for the new Instance task to complete by selecting **Mark as Complete**.

h. Enter the EKS EC2 Resource details by selecting **Configure** for the Update EKS Resource Details task.
For more information, follow the step 5 discussed earlier for configuring the EKS EC2 Resource details for the AWS connection available by default.

When you're done updating the properties, set the Update EKS Resource Details task to complete by selecting **Mark as Complete**.

i. Configure the scheduled imports for the new AWS instance.

i. For the Configure the Scheduled Imports task, select **Configure**.

ii. In the Scheduled Data Imports list that opens in a new tab, select the organization of the AWS instance that you want to configure.

iii. Select the scheduled data import that you want to activate.

iv. On the Scheduled Data Import form, modify the field values for the scheduled job.

v. Select **Update**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

vi. Repeat the steps 8.i.iii to 8.i.v for each scheduled job for data import.

vii. Close the tab for the Scheduled Data Imports list and return to the guided setup tab.

viii. Set the Configure the Scheduled Imports task to complete by selecting **Mark as Complete** in the guided setup.

Data from the AWS data sources is mapped and transformed into the ServiceNow CMDB Configuration Item (CI) class definitions using the Robust Transform Engine (RTE). Data is inserted into the ServiceNow® CMDB using the Identification and Reconciliation Engine (IRE).

Data mapping for AWS

Data from the AWS data sources is mapped and transformed into the ServiceNow CMDB Configuration Item (CI) class definitions using the Robust Transform Engine (RTE). Data is inserted into the ServiceNow CMDB using the Identification and Reconciliation Engine (IRE).

Note:
If the **Use last run datetime** field for an AWS data source in the Data Source [sys_data_source] table is empty, the connector imports all available initial data. If the **Use last run datetime** field includes a date stamp, the connector imports incremental data that has been newly added since the previous run.

The following table lists the import schedule order, the data sources and import schedules of the same name, the staging tables, the target tables as CMDB CI classes, the import schedule requirement type, and the import schedule dependencies for AWS.

Data mapping for AWS

Order	Name (data source or import schedule)	Staging table	CMDB CI classes

For more information on where data is saved when pulling data from AWS, see CMDB classes targeted in Service Graph Connector for AWS and Supported AWS resource types.

You can use the IntegrationHub ETL app to view the data maps. See IntegrationHub ETL for more information.

For more information about how CI information is pulled from AWS, see the Service Graph Connector for AWS - Functional Spec and CI article on the ServiceNow Community site.

Additional information about AWS data sources:

- The SG-AWS-Generic-Resources data source imports data for generic resources that aren't tracked by other data sources. The connector uses the Service Graph Resource Inclusion Whitelist [sn_cmdb_int_util_service_graph_resource_inclusion_whitelist] table to differentiate between generic and other supported resource types.

  The connector first populates all supported resources in the Service Graph Resource Inclusion Whitelist [sn_cmdb_int_util_service_graph_resource_inclusion_whitelist] table. These resources, categorized under their respective supported resource types, have specific data sources designated for ingestion within the connector. When the SG-AWS-Generic-Resources data source is executed and retrieves unsupported resource types, they are added to the Service Graph Resource Inclusion Whitelist [sn_cmdb_int_util_service_graph_resource_inclusion_whitelist] table and categorized as generic.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- In Service Graph Connector for AWS version 2.13.0 and later, parallel loading is enabled for SG-AWS-Generic-Resources data source if the AWS Config aggregator is used for discovery. Partitions are created for the SG-AWS-Generic-Resources data source based on the Resource Types in the Service Graph Resource Inclusion Whitelist [sn_cmdb_int_util_service_graph_resource_inclusion_whitelist] table. Additionally, delete jobs aren't created for a full data load.

  If the AWS Config aggregator isn't used for discovery, API calls are made to multiple accounts and the **Partition info** field is populated with Account and Region details.

- To import global generic resources such as IAM user and IAM group, specify a standard AWS region that has `Config` enabled with *`includeGlobalResourceTypes`* set to `true` by updating the value of the *`sn_aws_integ.global_generic_resource_region`* system property for the SG-AWS-Generic-Resources data source.

  If an aggregator is configured, and the *`sn_aws_integ.global_generic_resource_region`* value is not specified, the aggregator region is assigned as the value of this system property for importing global generic resources.

- If the AWS Systems Manager (SSM) service isn't enabled, the connector populates the server records in the Server [cmdb_ci_server] class. If the AWS SSM service is enabled, then based on the platform type obtained through the SSM service, the server records are populated in either the Linux Server [cmdb_ci_linux_server] class or the Windows Server [cmdb_ci_win_server] class. The Server [cmdb_ci_server] class is the parent class of the Linux Server [cmdb_ci_linux_server] and the Windows Server [cmdb_ci_win_server] classes.
- All labels associated with an AWS resource are added to the Key Value [cmdb_key_value] table.

  Note:
  You can use the CMDB Data Manager to delete tag data from retired CIs in the Key Value [cmdb_key_value] table based on conditions like retention time and discovery source. A scheduled job runs the policy, which can be configured to execute during off-peak hours.

- The basic information about an AWS resource is stored in the SG-AWS Extension Attributes [sn_aws_extension_attributes] table.
- In Service Graph Connector for AWS version 2.10.0 and later, the SG-AWS-Get-Inventory data source runs before the SG-AWS-EC2 data source and creates a Server [cmdb_ci_server] CI with the host name mapped to the Name attribute, instead of being mapped to the VM name.
- The SG-AWS-GenericTags data source imports tag data only for generic resources that have an ARN key. You can use the SG-AWS Extension Attributes [sn_aws_extension_attributes] table to verify which generic resources have an ARN key.

  Note:
  The SG-AWS-GenericTags data source doesn't import tag data for Amazon CloudFront resources.

- The AWS configuration data for each connection is stored in the SG AWS Application Properties [sn_aws_integ_sg_aws_application_properties] table.
- When you run the diagnostic test, the data is loaded in the following tables:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- SG AWS Diagnostic Details [sn_aws_integ_sg_aws_diagnostic_details]
- SG-AWS Diagnostic Summary [sn_aws_integ_sg_aws_diagnostic_summary]
- SG AWS Diagnostic Summary Notes [sn_aws_integ_sg_aws_diagnostic_summary_notes]

- In Service Graph Connector for AWS version 2.13.0 and later, the SG-AWS-Image-Id data source doesn't access cross-account records during lookup.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Attribute label	Attribute name	Data source
Model ID	model_id	SG-AWS-SSM-GetS3Object
Object ID	object_id	SG-AWS-EC2
Operating System	os	SG-AWS-EC2 SG-AWS-Software-Inventory
Operational status	operational_status	SG-AWS-EC2
OS Version	os_version	SG-AWS-Software-Inventory
RAM (MB)	ram	SG-AWS-SSM-GetS3Object SG-AWS-EC2
Serial Number	serial_number	SG-AWS-SSM-GetS3Object

Note:

- If the AWS Systems Manager (SSM) service isn't enabled, the connector populates the server records in the Server [cmdb_ci_server] class. If the AWS SSM service is enabled, then based on the platform type obtained through the SSM service, the server records are populated in either the Linux Server [cmdb_ci_linux_server] class or the Windows Server [cmdb_ci_win_server] class. The Server [cmdb_ci_server] class is the parent class of the Linux Server [cmdb_ci_linux_server] and the Windows Server [cmdb_ci_win_server] classes.
- If the AWS SSM service is enabled, the *name* field is populated by the SG-AWS-Get-Inventory data source, and the *sys_class_name* field is populated by the SG-AWS-Software-Inventory data source. If the AWS SSM service isn't enabled, the *name* field is populated by the SG-AWS-EC2 data source, and the *sys_class_name* field isn't populated.

Quick start tests for Service Graph Connector for AWS

Validate that Service Graph Connector for AWS still works after you make any configuration change such as applying an upgrade or developing an application. Copy and customize these quick start tests to pass when using your instance-specific data.

Danger:
By default, the system property that is used to run automated tests is disabled to prevent you from accidentally running these tests on a production system. To avoid data corruption or an outage, run tests only on development, test, and other non-production instances. See Enable or disable executing Automated Test Framework tests.

SG-AWS: Service Graph Connector for AWS Validation test suite

Test suite to verify the integrity of an integration using multiple tests.

Test	Description	Release version
SG-AWS API Gateway	Validate the ingestion of multiple CI records in the Cloud Gateway.	Utah
SG-AWS DynamoDb	Validate the ingestion of multiple CI records in the DynamoDB table.	Utah
SG-AWS EC2	Loads data in the CMDB such as all dependent CIs such as Organizations, Service-Accounts, Networks, Subnets, and Network-Interfaces, after which mock data for SG-AWS-EC2 is prepared.	Utah
SG-AWS EKS Cluster	Validates the ingestion of multiple CI records in the Kubernetes Cluster table.	Utah
SG-AWS ELB V1	Validates the ingestion of multiple CI records in the Cloud Load Balancer.	Utah
SG-AWS ELB V2	Validates the ingestion of multiple CI records in the Cloud Load Balancer.	Utah
SG-AWS Generic Resource	Validates the ingestion of multiple CI records in the Cloud Resource table.	Utah
SG-AWS Hardware Type	Validates the ingestion of multiple CI records in the Hardware Type table.	Utah
SG-AWS Image Id	Validates the ingestion of multiple CI records in the Image table.	Utah
SG-AWS Image Private	Validates the ingestion of multiple CI records in the Image table.	Utah

Accessing the connection details of Service Graph Connector for AWS

You can access the connection details of the Service Graph Connector for AWS in a single view using the common connection framework (CCF) included within the Integration Commons for CMDB (sn_cmdb_int_util) store app.

With the CCF, you can access all the connections used by the Service Graph Connector for AWS. The connection details include the connection alias, connection properties, data sources, and scheduled data imports associated with a connection. You can also test the connection. For more information, see Accessing the connection details of Service Graph Connectors.

Access the details of an AWS connection

Access the details of an AWS connection configured for the Service Graph Connector for AWS.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Service Graph Connectors** > **AWS** > **Connections**.
2. From the **Name** column of the Service Graph Connections list, select a connection.
3. On the Service Graph Connections page, view the connection details such as the connection name, alias, and data sources.
4. Select a related list to view further details of the connection.
5. **Optional:** Select the **Test Connection** related link to test the connection.

Additional features within the Service Graph Connector for AWS

Use the additional features available within the Service Graph Connector for AWS to maximize its use for importing data.

The following features are available within the Service Graph Connector for AWS:

Enabling optimized deletion of retired CIs in AWS

Enable the *sn_aws_integ.enableOptimizedDeletion* system property for the optimized deletion of retired configuration items (CIs) in AWS during delta import of data.

Enabling optimized SG-AWS-SendCommand data source performance

When using the SG-AWS-Software-Inventory data source, enable the *sn_aws_integ.is_software_inventory_enabled* system property for optimizing the performance of the SG-AWS-SendCommand and SG-AWS-SSM-GetS3Object data sources.

Handling import failures for large AWS resources

Manage the data source failure when importing resources from AWS.

Handling memory utilization errors for Service Graph Connector for AWS

Avoid the memory utilization errors when using the Service Graph Connector for AWS to import a large number of CIs from an AWS instance.

Setting up partition size with parallel loading enabled

Optimize the performance of the SG-AWS-Image-Private, SG-AWS-Tags, SG-AWS-SendCommand, and AWS-SSM-GetS3Object data sources by configuring the partition size setting in the *aws_account_partition_size* connection property.

Disable parallel loading for Service Graph Connector for AWS data sources

Disable parallel loading for specific data sources in the Service Graph Connector for AWS.

Handling parallel deletion of CIs in Service Graph Connector for AWS

Optimize performance when using the Service Graph Connector for AWS by enabling the parallel deletion of CIs.

Enable mapping for Cloud Os Image in AWS

Enable mapping of AWS Cloud Os Image data to the Cloud Image [cmdb_ci_cloud_os_image] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Enable optimized deletion of retired CIs in AWS

Enable the *sn_aws_integ.enableOptimizedDeletion* system property for the optimized deletion of retired configuration items (CIs) in AWS during full import of data.

Before you begin

Set the application scope to Service Graph Connector for AWS using the application picker. For more information, see Application picker.

Role required: admin

About this task

By default, the *ListDiscoveredResources* API is used in batches of 20 to ascertain deleted resource data as there's no other API in AWS that provides deleted resource deltas. This action adversely impacts performance, particularly with a large number of resources, as the majority of time is dedicated to API calls.

When your AWS instance has a large number of CIs to import, you can enable the *sn_aws_integ.enableOptimizedDeletion* property to accelerate the import time. The property enables deleting any retired CI classes with an improved logic. In this optimized deletion approach, a complete pull is conducted. Without depending on AWS API calls, the deleted CI is determined by comparing imported resources from the last run with the resources imported in the current run. By default, the value of the property is set to `false`.

Procedure

1. Enter `sys_properties.list` in the navigation filter, and then open the *sn_aws_integ.enableOptimizedDeletion* property.
2. In the **Value** field, enter `true`.
3. Select **Update**.

Enable optimized SG-AWS-SendCommand data source performance

When the SG-AWS-Software-Inventory data source is being used, enable the *sn_aws_integ.is_software_inventory_enabled* system property for optimizing the performance of the SG-AWS-SendCommand and SG-AWS-SSM-GetS3Object data sources.

Before you begin

Important:
The *sn_aws_integ.is_software_inventory_enabled* system property is not supported in Service Graph Connector for AWS version 2.10.0 and later.

Set the application scope to Service Graph Connector for AWS using the application picker. For more information, see Application picker.

Role required: admin

About this task

The SG-AWS-SendCommand and SG-AWS-SSM-GetS3Object data sources use *SSM GetInventory* API calls for importing software data, impacting performance. To enhance the performance of the SG-AWS-SendCommand and SG-AWS-SSM-GetS3Object data sources, consider leveraging the SG-AWS-Software-Inventory data source by enabling the *sn_aws_integ.is_software_inventory_enabled* system property.

This optimization skips a substantial number of *SSM GetInventory* API calls, enhancing the performance of the SG-AWS-SendCommand and SG-AWS-SSM-GetS3Object data sources. However, the SG-AWS-SendCommand and SG-AWS-SSM-GetS3Object data sources import data from the same servers that are configured for the SG-AWS-Software-Inventory data source.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

By default, the *sn_aws_integ.is_software_inventory_enabled* property is set to `false`. To enhance the performance of the SG-AWS-SendCommand and SG-AWS-SSM-GetS3Object data sources, set the *sn_aws_integ.is_software_inventory_enabled* property to `true`.

Procedure

1. Enter `sys_properties.list` in the navigation filter, and then open the *sn_aws_integ.is_software_inventory_enabled* property.
2. In the **Value** field, enter `true`.
3. Select **Update**.

Handling import failures for large AWS resources

Manage the data source failure when importing resources from AWS.

When importing large AWS resources, the data sources in the Service Graph Connector for AWS might fail because of a Direct REST response exceeding the 1024-MB limit. For more information, see REST step.

You can save the response as an attachment to handle the REST response size limitation error in the Service Graph Connector for AWS.

Save the response as an attachment

With the save response as an attachment feature, the response of each data source is temporarily stored as an attachment and after the response is read, the attachment is deleted automatically. The save response as an attachment feature is activated by default and is triggered by the *sn_aws_integ.save_payload_as_attachment* system property.

As a user with the admin role, you can deactivate the save response as an attachment feature by setting the *sn_aws_integ.save_payload_as_attachment* property to `false`. When the feature is deactivated and the response size is within the limit, the data sources run normally.

Handling memory utilization errors for Service Graph Connector for AWS

You can use the `SgAwsApplicationProperties` script include to avoid memory utilization errors when importing a large number of configuration items (CIs) from an AWS instance via the Service Graph Connector for AWS.

By making multiple database calls to ingest AWS data in smaller batches, the `SgAwsApplicationProperties` script include avoids overloading of the Robust Transform Engine (RTE) and results in reduced memory usage. However, for the script include to function properly, verify that the AWS Config aggregator is enabled on your AWS instance.

To access the script include, navigate to **All** > **System Definitions** > **Script Includes**, and then search for and select `SgAwsApplicationProperties`. For more information, see Script includes.

In the `SgAwsApplicationProperties` script include, you can modify the functions as described in the following table to resolve memory utilization errors.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SgAwsApplicationProperties script include functions

Functionality	Implementation
Enable multiple database calls to import the AWS Config data.	Set the value of the *isConfigDbLoadEnabled* function to `true`. For the function to work correctly, verify that the AWS Config aggregator is enabled. **Note:** Enabling *isConfigDbLoadEnabled* might impact the import set load time as multiple database calls are being made instead of a single database call. Enabling the *isConfigDbLoadEnabled* function resolves the memory utilization error for the following data sources: • SG-AWS-API-Gateway • SG-AWS-DynamoDb • SG-AWS-EC2 • SG-AWS-EKS-Cluster • SG-AWS-ELB-V1 • SG-AWS-ELB-V2 • SG-AWS-Generic-Resources • SG-AWS-Lambda • SG-AWS-Network-Interface • SG-AWS-RDS • SG-AWS-S3 • SG-AWS-Security-Group • SG-AWS-Storage-Volume • SG-AWS-Subnets • SG-AWS-VPC
Enable multiple database calls to import the tag-related data from your AWS service account.	Set the value of the *isConfigTagsDbLoadEnabled* function to `true`. For the function to work correctly, verify that both the AWS Config aggregator and the *isConfigDbLoadEnabled* function are enabled. Enabling the *isConfigTagsDbLoadEnabled* function facilitates the AWS Config aggregator to reduce the load time for tag-related data in the following data sources: • SG-AWS-Lambda • SG-AWS-DynamoDb • SG-AWS-ELB-V1 • SG-AWS-ELB-V2

Set partition size for parallel loading-enabled AWS accounts

When using the SG-AWS-Image-Private, SG-AWS-Tags, SG-AWS-SendCommand, and AWS-SSM-GetS3Object data sources, you can optimize their performance by setting the partition size in the *aws_account_partition_size* connection property.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Set the application scope to Service Graph Connector for AWS using the application picker. For more information, see Application picker.

Role required: admin

About this task

The parallel loading feature is available for the SG-AWS-Image-Private, SG-AWS-Tags, SG-AWS-SendCommand, and AWS-SSM-GetS3Object data sources from the *Washington DC* Patch 5 release. This feature determines the number of AWS accounts that can be executed as parallel jobs to retrieve configuration item (CI) data. Partition size determines how many AWS accounts a single parallel-thread evaluates for data retrieval. For example, if you set the *aws_account_partition_size* property to 5 and there are 25 AWS accounts, the application generates 5 parallel jobs during data loading.

Note:
If the *aws_account_partition_size* property isn't configured, the partition size computation feature of the Integration Commons for CMDB application automatically determines the partition size for parallel loading at runtime. See Partition size computation for parallel loading in Integration Commons for CMDB.

Procedure

1. Navigate to **All** > **Service Graph Connectors** > **AWS** > **Connections**.
2. From the **Name** column of the Service Graph Connections list, select a connection.
3. From the **Property** column of the Service Graph Connection Properties related list, select **aws_account_partition_size**.
4. In the **Value** field, enter a numeric value greater than 0 for the partition size.
5. Select **Update**.

Disable parallel loading for Service Graph Connector for AWS data sources

You can disable parallel loading for specific data sources in the Service Graph Connector for AWS.

Before you begin

Set the application scope to Service Graph Connector for AWS using the application picker. For more information, see Application picker.

Role required: admin

Procedure

1. Navigate to **All** > **Service Graph Connectors** > **AWS** > **Data sources**.
2. From the list of data sources, open the data source for which you want to disable parallel loading.
3. Clear the **Enable parallel loading** check box.
4. Select **Update**.

Handling parallel deletion of CIs in Service Graph Connector for AWS

Parallel deletion of configuration items (CIs) in the Service Graph Connector for AWS optimizes performance.

The parallel deletion feature is available for the following data sources from Washington DC patch 5 after the parallel job plugin is activated:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- SG-AWS-API-Gateway
- SG-AWS-DynamoDb
- SG-AWS-EC2
- SG-AWS-ELB-V1
- SG-AWS-ELB-V2
- SG-AWS-Generic-Resources
- SG-AWS-Lambda
- SG-AWS-Network-Interface
- SG-AWS-RDS
- SG-AWS-S3
- SG-AWS-Security-Group
- SG-AWS-Storage-Volume
- SG-AWS-Subnets
- SG-AWS-VPC

Note:
If you upgraded to Service Graph Connector for AWS version 2.9.1 before the parallel job plugin was activated, you must run the SGC - `Parallel Loading Fix` script to enable parallel deletion.

Multiple jobs are created for deleting CIs based on the number of accounts in your configuration. You can modify the number of jobs that are created by setting the partition size in the *`aws_account_partition_size`* connection property. See Set partition size for parallel loading-enabled AWS accounts.

Note:
Only one job is created to import new and updated CIs.

Enable mapping for Cloud Os Image in AWS

Enable the *`sn_cmdb_ci_class.use_single_cloud_os_image`* system property to add Cloud Os Image data to the Cloud Image [cmdb_ci_cloud_os_image] table instead of adding the data to the Image [cmdb_ci_os_template] table.

Before you begin

Set the application scope to Service Graph Connector for AWS using the application picker. For more information, see Application picker.

Role required: admin

About this task

In Service Graph Connector for AWS version 2.9.1 and earlier, the Cloud Os Image data was added to the Image [cmdb_ci_os_template] table. Multiple records were created for the same image because the Image [cmdb_ci_os_template] table is a dependent class. In Service Graph Connector for AWS version 2.10.0 and later, Cloud Os Image data is added to the Cloud Image [cmdb_ci_cloud_os_image] table, which is an independent class, when the *`sn_cmdb_ci_class.use_single_cloud_os_image`* system property is enabled.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Enter `sys_properties.list` in the navigation filter, and then open the *`sn_cmdb_ci_class.use_single_cloud_os_image`* property.
2. In the **Value** field, enter `true`.
3. Select **Update**.

Service Graph Connector for AWS reference

Reference topics provide additional information about Service Graph Connector for AWS components.

Supported AWS resource types

Several AWS resource types are imported as CMDB data by the Service Graph Connector for AWS.

AWS Config resources

When the AWS Config aggregator is enabled, the following APIs are invoked:

- ListDiscoveredResources
- BatchGetAggregateResourceConfig
- SelectAggregateResourceConfig

When the AWS Config aggregator is disabled, the following APIs are invoked:

- ListDiscoveredResources
- SelectResourceConfig
- BatchGetResourceConfigAction

Note:
For a list of AWS resource types supported by AWS Config, see Supported Resource Types on the AWS documentation site.

CMDB CI classes and AWS Config resources

AWS discovery solutions comparison

ITOM Visibility applications discover a variety of AWS resources and populate the relevant configuration item (CI) classes in the Configuration Management Database (CMDB) with their attributes.

ITOM Visibility solutions

ITOM Visibility can offer you comprehensive visibility into your organization's cloud infrastructure. Each application offers unique strengths and capabilities, and by comparing them you can gain holistic insights on their capabilities and benefits.

ITOM Visibility solutions for discovering AWS

ITOM Visibility solution	Overview	Configuration
Discovery and Service Mapping Patterns and Visibility Content	Discovery patterns used by ITOM Visibility	• You must update your store apps to the latest release version. • You must provide ITOM Visibility with access permissions. For more information, see Set up AWS service accounts
Service Graph Connector for AWS	Service Graph Connector for AWS	Configure Service Graph Connector for AWS using the guided setup

Note:

The CI class, in most cases, is applicable to both solutions. If it's not applicable to one of the solutions, the solution is marked "N/A".

Life cycle management of records in Service Graph Connector for AWS

Life cycle management in the Service Graph Connector for AWS monitors and updates the statuses of AWS resources throughout their entire life cycle, from creation to deletion.

The life cycle management process helps maintain the accuracy and integrity of data in the Configuration Management Database (CMDB).

In life cycle management, the record removal process involves systematically deleting obsolete or unnecessary resources. This step ensures that outdated entries are cleared, keeping the CMDB accurate and up-to-date. See Record removal process in Service Graph Connector for AWS.

Life cycle management for CIs in Service Graph Connector for AWS

The following table lists the configuration items (CIs) in CMDB and other non-CMDB tables for which life cycle management is available in Service Graph Connector for AWS.

Supported tables for life cycle management

Data source	CMDB CI classes	Life cycle management available
SG-AWS-Organization	Cloud Organizations [cmdb_ci_cloud_org]	Yes
SG-AWS-Org-Units	AWS Organizational Unit [cmdb_ci_aws_org_unit]	Yes
SG-AWS-Service-Account	Cloud Service Account [cmdb_ci_cloud_service_account]	Yes
SG-AWS-Service-Account-Tags	Key Value [cmdb_key_value]	No
SG-AWS-Org-Unit-Accounts	None	No
SG-AWS-Datacenters	AWS Datacenter [cmdb_ci_aws_datacenter]	No
SG-AWS-VPC	Network Adapter [cmdb_ci_network_adapter]	Yes
SG-AWS-Subnets	Availability Zone [cmdb_ci_availability_zone]	No
	Cloud Subnet [cmdb_ci_cloud_subnet]	Yes

SG-AWS-Generic-Tags	Key Value [cmdb_key_value]	No
SG-AWS-Get-Inventory	Server [cmdb_ci_server]	Yes

Record removal process in Service Graph Connector for AWS

The Service Graph Connector for AWS uses the optimized deletion approach to manage removal of records.

Record removal is the process of handling data that is no longer needed. For any discovered resources deleted later after pulling data, the Service Graph Connector for AWS automatically updates the **Install Status** field of the associated CMDB CI classes to indicate any retired or deleted records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Deletion of records in Service Graph Connector for AWS involves marking the install status of a record as **retired** rather than permanently deleting it from the system. The record remains in the database, making it possible to reference or restore it later. Deletion for Service Graph Connector for AWS relies on the Source [sys_object_source table], which can become inefficient with large datasets.

To enhance the deletion process, you can enable the optimized deletion method that leverages the SG-AWS Extension Attributes [sn_aws_extension_attributes] table. This table is regularly purged of obsolete records, improving performance and efficiency. The process still marks the install status of a record as **retired** but the streamlined data structure reduces overhead, ensuring quicker processing and better system performance. See Enable optimized deletion of retired CIs in AWS.

Optimized deletion is enabled for all tables in the Service Graph Connector for AWS, except for the following tables:

- Hardware Type [cmdb_ci_compute_template]
- Availability Zone [cmdb_ci_availability_zone]
- AWS Datacenter [cmdb_ci_aws_datacenter]
- Running Process [cmdb_running_process]
- TCP Connections [cmdb_tcp]
- Application [cmdb_ci_appl]

Service Graph Connector for AWS properties

Service Graph Connector for AWS properties control the behavior of the connector.

Connection properties

These connection properties are available for the Service Graph Connector for AWS.

Note:
To open the Service Graph Connection Properties [sn_cmdb_int_util_service_graph_connection_property] table for the connector, navigate to **All** > **Service Graph Connectors** > **AWS** > **Connections**, and select the connection name. The connection properties are displayed in the Service Graph Connection Properties related list.

Connection properties for Service Graph Connector for AWS

Property	Description
aws_lookback_time_in_days	This property is used for record removal. Time in days in which the sys_object_source records are queried for the deletion of CIs. The value is automatically updated to 15 after the initial run. Set the value of this property to empty to include all the older records populated by SG-AWS as removal candidates. **Note:** Do not modify this property if the value is empty.

Connection properties for Service Graph Connector for AWS (continued)

Property	Description
	• Type: integer • Default value: empty
config_aggregator_name	Enter the name of the configuration aggregator. • Type: string • Default value: empty
config_aggregator_account	Enter the AWS account where the configuration aggregator is configured. • Type: string • Default value: empty
config_aggregator_region	Enter the AWS region in which the configuration aggregator is configured. • Type: string • Default value: empty
sts_role	Enter the AWS STS role name. • Type: string • Default value: empty
aws_rotate_keys	Set the property to `true` to enable the AWS key rotation process. • Type: true | false • Default value: `false`
aws_rotate_keys_status	The AWS key rotation status. • Type: string • Default value: empty
aws_rotate_keys_date	Enter the AWS key rotation date. • Type: string • Default value: empty
aws_rotate_keys_period	Enter the AWS key rotation period (in days). • Type: integer • Default value: 90

Connection properties for Service Graph Connector for AWS (continued)

Property	Description
aws_rotate_keys_error_notify_user	Enter the comma-separated list of the email addresses of recipients to be sent notifications about AWS key rotation errors. • Type: string • Default value: empty
aws_rotate_keys_error_notify_group	Enter the comma-separated list of the ServiceNow email groups to be sent notifications about AWS key rotation errors. • Type: string • Default value: empty
org_name	Enter the name of the AWS organization. • Type: string • Default value: <ORG_NAME>
org_description	Enter the description of AWS organization. • Type: string • Default value: empty
org_account_id	Enter the AWS account ID that is used to identify the AWS organization. • Type: string • Default value: <ORG_ID>
management_account_id	Enter the AWS account ID that is used for the management account. This property is required only if the ServiceNow user is created in a designated account. • Type: string • Default value: empty
u_connection_alias_id	The ServiceNow sys_id for the connection alias. • Type: string • Default value: empty
standalone_account_id	Enter the AWS account ID for standalone setup. This property is required only if you set up AWS on a standalone account.

Property	Description
	• Type: string • Default value: empty
gov_cloud	Set the property to `true` to enable AWS GovCloud. • Type: true | false • Default value: empty
aws_account_partition_size	Enter the partition size for AWS accounts if parallel loading is enabled. The value must be a numeric value greater than zero. • Type: integer • Default value: empty
ssm_sendcommand_windows_name	Enter the SSM document name for the SendCommand for Windows. • Type: string • Default value: empty
ssm_sendcommand_linux_name	Enter the SSM document name for the SendCommand for Linux. • Type: string • Default value: empty
ssm_eks_names_document	Enter the SSM document name for the EKS data source. • Type: string • Default value: empty
ssm_eks_shell_document	Enter the SSM document name for EKS-Full data source. • Type: string • Default value: empty
regions	Enter the comma-separated list of AWS regions. • Type: string • Default value: empty
s3_account_id	Enter the numeric identifier of the AWS account that hosts the Amazon Simple Storage Service (Amazon S3) bucket.

Connection properties for Service Graph Connector for AWS (continued)

Property	Description
	• Type: integer • Default value: empty
s3_bucket_name	Enter the name of the Amazon S3 bucket that collects the details from Amazon EC2 instances. • Type: string • Default value: empty
s3_region	Enter the region where the Amazon S3 bucket is set up. • Type: string • Default value: empty

Default system properties

These default system properties are available for the Service Graph Connector for AWS.

Note:
To open the System Properties [sys_properties] table, enter `sys_properties.list` in the navigation filter.

Default system properties for Service Graph Connector for AWS

Property	Description
sn_aws_integ.create_server_record_even_if_SSM_disabled	This property controls server creation with or without SSM enabled on the instance. Set the property to `true` to create server records when SSM is disabled on the instance. • Type: true | false • Default value: `false` • Location: System Property [sys_properties] table
sn_aws_integ.eks_document_processing_time	Enter the time (in milliseconds) required to process the EKS SendCommand document, during which time the data source thread waits.

Default system properties for Service Graph Connector for AWS (continued)

Property	Description
	• Type: integer • Default value: `100` • Location: System Property [sys_properties] table
sn_aws_integ.enableOptimizedDeletion	Set the property to `true` to enable optimized deletion using the Integration Commons record removal API. During parallel data loading, delete jobs are created only for delta loads, not for full data loads. • Type: true | false • Default value: `false` • Location: System Property [sys_properties] table
sn_aws_integ.global_generic_resource_region	Set the region that has the configuration recorder that can record global resources such as IAM user and IAM group. Global generic resources are imported only when the region is set. • Type: string • Default value: empty • Location: System Property [sys_properties] table
sn_aws_integ.is_software_inventory_enabled	**Important:** This property is not supported in Service Graph Connector for AWS version 2.10.0 and later. Set the property to `true` if SG-AWS-Software-Inventory is enabled to improve the performance of SG-AWS-SendCommand.

Default system properties for Service Graph Connector for AWS (continued)

Property	Description
	• Type: true | false • Default value: `false` • Location: System Property [sys_properties] table
sn_aws_integ.load_all_images	Set the property to `true` to run the DescribeImages API for all images that are included in the SG-AWS-Image-Id data source. Set the property to `false` to run the DescribeImages API only for images without names. • Type: true | false • Default value: `false` • Location: System Property [sys_properties] table
sn_aws_integ.save_payload_as_attachment	Option to save the REST responses as attachments. Set this property to `true` if the payload size is greater than 10 MB. • Type: true | false • Default value: `false` • Location: System Property [sys_properties] table
sn_aws_integ.sgaws_config_list_discovered_resource_count	Set the number of resource IDs for the list discovered API. The default value is 20, and the maximum value is 769. • Type: integer • Default value: 20 • Location: System Property [sys_properties] table
sn_aws_integ.sgaws_config_list_discovered_retry_count	Set the retry count after a failure of the list discovered API. • Type: integer • Default value: 100 • Location: System Property [sys_properties] table

Data mapping for Service Graph Connector for AWS

CMDB classes targeted in Service Graph Connector for AWS

Service Graph Connector for ExtraHop

Use the Service Graph Connector for ExtraHop to pull data from the ExtraHop application into your ServiceNow instance.

Important:
ServiceNow hosted Service Graph Connector for ExtraHop is now deprecated and no longer supported or available for new activation. ExtraHop hosted Service Graph Connector for ExtraHop provides the latest experience for this functionality. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

The Service Graph Connector for ExtraHop provides real-time network visibility across your enterprise by implementing stream processing, so that you can transform your network data into structured wire data.

The Service Graph Connector for ExtraHop pulls network visibility data into the ServiceNow® Configuration Management Database (CMDB) application. The connector enriches discovered device data and establishes relationships between devices based on network traffic flow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

System requirements and supported versions

Dependencies and requirements:

- MID Server that is installed on Linux or Windows, unless the ExtraHop appliance is publicly accessible.
- ExtraHop Discover appliance with firmware version 7.2 or later with a user account that has unlimited privileges.

- Supported versions: ExtraHop v7.9.
- Supported ServiceNow versions:
  - Tokyo
  - Utah
  - Vancouver
  - Washington DC

Use cases

The following are examples on how you can use the Service Graph Connector:

- Identification of network interactions between CIs.
- Discovery of network traffic flow data between computers or other types of hardware.
- Creation of relationships between devices. The relationships are based on network traffic flow.

Guided setup

The guided setup for the Service Graph Connector for ExtraHop provides an organized sequence of tasks to configure the integration on your instance. To access the guided setup, see Configure Service Graph Connector for ExtraHop.

CMDB Integrations Dashboard

The Integration Commons for CMDB store app provides a dashboard with a central view of the status, processing results, and processing errors of all installed Service Graph Connectors. You can see metrics for all integration runs. You can also filter the view to a specific CMDB integration, a specific time duration, or a specific integration run. For more details about monitoring ExtraHop integrations in the CMDB Integrations Dashboard, see Using the CMDB Integrations Dashboard.

Data mapping

Data from data sources in the ExtraHop application is mapped and transformed into the ServiceNow CMDB Configuration Item (CI) class definitions using the Robust Transform Engine (RTE). Data is inserted into the ServiceNow CMDB using the Identification and Reconciliation Engine (IRE).

When you complete setting up the connection, you can configure the integration to periodically pull data from the ExtraHop application. The data is loaded into the following staging tables:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- ExtraHop Computer [sn_extrahop_integr_computer]
- ExtraHop Network Activity [sn_extrahop_integr_activity]

The data is then inserted into the following target tables:

- CI Relationship [cmdb_rel_ci]
- Hardware [cmdb_ci_hardware]
- IP Address [cmdb_ci_ip_address]
- Network Adapter [cmdb_ci_network_adapter]

Service Graph Connectors

Configure Service Graph Connector for ExtraHop

Set up a REST message and scheduled jobs to import ExtraHop data into your CMDB.

Before you begin

Important:
ServiceNow hosted Service Graph Connector for ExtraHop is now deprecated and no longer supported or available for new activation. ExtraHop hosted Service Graph Connector for ExtraHop provides the latest experience for this functionality. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

To use this Service Graph Connector, you need a subscription to a Subscription Unit that is based in the IT Operations Management (ITOM) Visibility application or in the ITOM Discovery application. As defined in the section titled "Managed IT Resource Types" in ServiceNow Subscription Unit Overview for your subscription, for managed IT resources that are created or modified in the CMDB by this Service Graph Connector, but that aren't yet managed by ITOM Visibility or ITOM Discovery, these resources will increase Subscription Unit consumption from that application. Review your current Subscription Unit consumption within ITOM Visibility or ITOM Discovery to ensure available capacity.

Dependencies and requirements:

- The Integration Commons for CMDB store app, which is automatically installed.
- The CMDB CI class models store app, which is automatically installed. See CMDB CI Class Models.
- ITOM Licensing plugin (com.snc.itom.license). For more information, see Request Discovery.
- ITOM Discovery License plugin (com.snc.itom.discovery.license). You must activate this plugin.
- MID Server that is installed on Linux or Windows, unless the ExtraHop appliance is publicly accessible.
- ExtraHop Discover appliance with firmware version 7.2 or later, with a user account that has unlimited privileges.
- To connect to the ExtraHop application, configure an API key. For more information, see ExtraHop REST API Guide, specifically, see the "ExtraHop API requirements" section.

Roles required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Service Graph Connector ExtraHop** > **Setup**.
2. On the Getting started page, click **Get Started**.
3. On the Service Graph Connector for the ExtraHop page, in the Configure REST message section, select the task **Configure ExtraHop REST message**.
4. Configure a REST message to use when sending requests to the ExtraHop API.

   a. On the next page, in the Configure ExtraHop REST message task section, click **Configure**.

   b. On the form, fill in the fields.

   REST Message form

Field	Description
Name	Descriptive name for this REST Message. This field is automatically set.
Endpoint	URL to the web service API endpoint. Set the field to a base URL. For example, `https://myextrahop.com`. **Note:** Updating the Endpoint base URL also updates the base URLs for all HTTP methods that are associated with the ExtraHop REST message. In the **HTTP Request** tab, update the Authorization header to use your API key in the **Value** field.
Description	Description for this REST Message. This field is automatically set.
Application	Application that contains this message. The field is automatically set.
Authentication type	Type of authentication to apply to HTTP requests. The field is automatically set.
Use mutual authentication	Option to use multiple authentication by authenticating HTTP requests. Mutual authentication cannot be used with a MID Server.

   c. Click **Update** if necessary.

   d. In the Configure ExtraHop REST message task section, click **Mark as Complete**.

5. Test the connection to the ExtraHop Computer API.

   a. In the Test Computer connection task section, click **Configure**.

   b. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

HTTP Method form

Field	Description
Name	Unique identifier for this HTTP method. This field is automatically set.
Endpoint	URL to the web service API endpoint
Use MID Server	MID Server that sends this HTTP request. Using a MID Server is not compatible with mutual authentication.
REST Message	REST message record that this method is based on. This field is automatically set.
HTTP method	HTTP method that is implemented by this method. This field is automatically set.
Application	Application that contains this method. This field is automatically set.
Authentication type	Type of authentication to apply to HTTP requests.
Use mutual authentication	Option to use multiple authentication by authenticating HTTP requests. Mutual authentication cannot be used with a MID Server.

c. Select the **HTTP Request** tab and fill out the **Use MID Server** field.

d. Click the **Authentication** tab and then click the **Test** related link.
Testing the connection takes a few moments. When the test is complete, the page is refreshed and shows the test results.

e. Select **Mark as Complete**.

> **Note:**
> The connection is successful if the **HTTP Status** field is set to **200**. If there are any errors in the **Error Message** field, then the connection failed and further troubleshooting is required.

f. Click **Update** if necessary.

g. In the Test Computer connection task section, click **Mark as Complete**.

6. Test the connection to the ExtraHop Network Activity Create API.

a. In the Test Network Activity Create connection task section, click **Configure**.

b. On the form, fill in the fields.

HTTP Method form

Field	Description
Name	Unique identifier for this HTTP method.
Endpoint	URL to the web service API endpoint
Use MID Server	MID Server that sends this HTTP request. Using a MID Server is not compatible with mutual authentication.
REST Message	REST message that this method is based on. This field is automatically set.
HTTP method	HTTP method that is implemented by this method. This field is automatically set.
Application	Application that contains this record. This field is automatically set.
Authentication type	Type of authentication to apply to HTTP requests. This field is automatically set.
Use mutual authentication	Option to use multiple authentication by authenticating HTTP requests. Mutual authentication cannot be used with a MID Server.

c. Click the **Authentication** tab and then click the **Test** related link.
Testing the connection takes a few moments. When the test is complete, the page is refreshed and shows the test results.

d. Select **Mark as Complete**.

Note:
The connection is successful if the **HTTP Status** field is set to **200**. If there are any errors in the **Error Message** field, then the connection failed and further troubleshooting is required.

e. Click **Update** if necessary.

f. In the Test Network Activity Create connection task section, click **Mark as Complete**.

7. Set up the scheduled import jobs.

a. On the Service Graph Connector for ExtraHop page, in the Set up scheduled import jobs section, select the task **Configure Computer scheduled job**.

b. In the Configure Computer scheduled job task section, click **Configure**.

c. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scheduled Data Import form

Field	Description
Name	Name of the scheduled job.
Data source	Data source record that defines the data to import.
Run as	Option to run the scheduled job with the credentials of the specified user.
Active	Option to activate the scheduled job. Select this option.
Concurrent Import	Function that loads the data from multiple import sets. The function then processes and transforms the data concurrently.
Partition Method	Partition method for the concurrent import set.
Partition Size	Import set size for early scheduling.
Execute pre-import script	Option to specify a script to run before the import is performed.
Execute post-import script	Option to specify a script to run after the import is performed.
Application	Application that contains this scheduled job.
Run	Frequency of running the import.
Conditional	Conditions under which this job is executed.

d. Click **Update** if necessary.

e. In the Configure Computer scheduled job task section, click **Mark as Complete**.

8. Configure the Network Activity scheduled job.

a. On the Service Graph Connector for ExtraHop page, in the Set up scheduled import jobs section, select the task **Configure Network Activity scheduled job**.

b. In the Configure Network Activity scheduled job task section, click **Configure**.

c. On the form, fill in the fields.

Scheduled Data Import form

Field	Description
Name	Name of the scheduled job.
Data source	Data source record that defines the data to import.
Run as	Option to run the scheduled job with the credentials of the specified user.

Field	Description
Active	Option to activate the scheduled job. Select this option.
Concurrent Import	Function that loads the data from multiple import sets. The function then processes and transforms the data concurrently.
Partition Method	Partition method for the concurrent import set.
Partition Size	Import set size for early scheduling.
Execute pre-import script	Option to specify a script to run before the import is performed.
Execute post-import script	Option to specify a script to run after the import is performed.
Application	Application that contains this scheduled job.
Run	Frequency of running the import.
Conditional	Conditions under which this job is executed.

d. Click **Update** if necessary then **Mark as Complete**.

CMDB classes targeted in Service Graph Connector for ExtraHop

When you complete setting up the connection, you can configure the integration to periodically pull data from ExtraHop. The data is saved in tables that extend from the Configuration item [cmdb_ci] table.

Important:
ServiceNow hosted Service Graph Connector for ExtraHop is now deprecated and no longer supported or available for new activation. ExtraHop hosted Service Graph Connector for ExtraHop provides the latest experience for this functionality. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Service Graph Connector for GCP

Use the Service Graph Connector for GCP to ingest CMDB data from a Google Cloud Platform (GCP) project using the REST APIs.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Key features

- Get started quickly with a streamlined onboarding process.
- Use only the credentials you need.
- No MID Server required.
- Get end-to-end data coverage.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- No agents or individual scanning needed.
- Performant at scale.

Supported versions

Versions

GCP	ServiceNow
Last tested on February 26, 2026	• Yokohama • Zurich • Australia

Use cases

You can use the Service Graph Connector for GCP to get visibility into cloud resource identities, relationships, and state in real-time.

Important information for upgrading Service Graph Connector for GCP

After you've installed the latest version of the Service Graph Connector for GCP, you must synchronize the newly added data sources. Use the Advanced Setup section in the guided setup to synchronize data sources. For more information, see Configure Service Graph Connector for GCP.

Configuring a connection for the connector

You can configure a connection for the connector by using the SGC Central view in the Service Graph Workspace or CMDB Workspace. The view enables you to discover and install connectors, and then effectively manage the full life cycle of creating, editing, monitoring, and debugging connections. To configure the connector using SGC Central, see Configure Service Graph Connector for GCP using SGC Central.

Important:
Unless there are configuration issues, use the SGC Central view in the Service Graph Workspace or CMDB Workspace to configure the connection for the connector, as the guided setup method is planned for deprecated.

CMDB integrations dashboard

The Integration Commons for CMDB store app provides a dashboard with a central view of the status, processing results, and processing errors of all installed integrations. You can see metrics for all integration runs. You can filter the view to a specific CMDB integration, a specific time duration, or a specific integration run. For more details about monitoring GCP integrations in the CMDB Integrations Dashboard, see Using the CMDB Integrations Dashboard.

BYOL and BYOS support

Bringing your own licenses (BYOL) or bringing your own subscriptions (BYOS) is the process of bringing previously purchased on-premises licenses or subscriptions to Google Cloud. The connector supports the BYOL and BYOS of the Image CIs for the Red Hat Enterprise Linux (RHEL) and SUSE Linux Enterprise Server (SLES) services on Google Cloud. The connector populates the Key Value [cmdb_key_value] table with the licensing information. Depending on

Configure Service Graph Connector for GCP using SGC Central

Use the playbook available with the SGC Central application to set up the Service Graph Connector for GCP for pulling in GCP project data into the CMDB.

Before you begin

Install Service Graph Connector for GCP version 1.8.0 or later from the ServiceNow Store. For ServiceNow Store installation steps, see Install a ServiceNow Store application.

About this task

The playbook experience for onboarding connectors is activated with SGC Central in the Service Graph Workspace or CMDB Workspace. To configure the SGC Central application, see Configuring SGC Central and for more information on how to interact with a playbook, see Interact with Playbook.

Procedure

1. Use one of the following methods to open SGC Central:
   - Navigate to **Workspaces** > **Service Graph Workspace**, and from the left navigation panel, select the Ingestion icon to open the SGC Central view.
   - Navigate to **Workspaces** > **CMDB Workspace** > **SGC Central**.
2. On the Overview page, select **Create connection**.

   Tip:
   Alternatively, you can select **Create connection** on the All connections page.

3. On the Create connection window, select the GCP connector type and then select **Create connection**.
4. Complete the initial prerequisites when setting up a connection for the first time using a connector.

   Note:
   This step is required only during the first-time setup. See Perform initial setup tasks when creating a connection in SGC Central.

5. Complete the prerequisites for setting up the GCP environment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Set up the GCP environment and create a Java KeyStore (JKS) certificate to encrypt the security certificates obtained from a GCP application.

i. In the **Prerequisites** stage of the playbook, select the **Review setup instructions** activity.

ii. Select **Service Graph connector for GCP - Setup Instructions** link to view the setup instructions included in the Service Graph connector for GCP - Setup Instructions [KB1220598] article in the Now Support Knowledge Base.

iii. Make a note of the destination keystore password. You need to specify this password while importing the JKS certificate into the Service Graph Connector for GCP application.

iv. Select the **I have read the setup instructions** check box to confirm that you have set up the GCP environment according to the instructions.

v. Select **Continue**.

vi. After completing the **Review setup instructions** activity, select **Continue**.

b. Create an X.509 certificate to associate the JKS certificate for the GCP application with the Service Graph Connector for GCP.

Note:
You can skip this step if you're reusing an existing certificate by selecting **Skip**.

i. In the **Prerequisites** stage of the playbook, select the **Create X.509 certificate** activity.

ii. Select **New**.

iii. On the form, fill in the fields.

Create new X.509 Certificate form

Field	Description
Name	Name of the X.509 certificate. For example, `SG-GCP-509Certificate-Org1`.
Key store password	Password to access the JKS certificate as noted down in the step 5.a.iii.
Short description	Description of the X.509 certificate.

iv. In the Attachments section, select **Add File** to browse and upload the keystore.p12 file for the JKS certificate you created in step 5.a.

v. Select the **I have read the setup instructions** check box after you have completed the setup.

vi. After completing the **Create X.509 certificate** activity, select **Continue**.

6. **Optional:** Download the scripts that are required to enable deep discovery for the Service Graph Connector for GCP.

a. In the **Prerequisites** stage of the playbook, select the **Download GCP deep discovery scripts** activity.

b. Download the deep discovery scripts for Linux and Windows VMs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information about deep discovery for the Service Graph Connector for GCP, see the Service Graph Connector for GCP - Deep Discovery Setup Instructions [KB2213095] article in the Now Support Knowledge Base.

c. After completing the **Download GCP deep discovery scripts** activity, select **Continue**.

7. Enter connection details and test the API connection for importing GCP data.

a. In the **Setup** stage of the playbook, select the **Create and test connection** activity.

b. On the form, fill in the fields.

Create and test connection form

Field	Description
Connection Name	Name to identify the GCP connection record.
Service Account Email	ServiceNow service account associated with the GCP application.
Keystore	Name of the X.509 certificate that you created in step 5.b.
Keystore Password	Password to access the JKS certificate as noted down in the step 5.a.iii.
Organization Id	ID of the organization associated with the GCP application.
Discovery Scope	Discovery scope of the GCP application. The available options are: **Organization** Select **Organization** when the ServiceNow service account has access to data within the GCP organization. **Projects** Select **Projects** when the ServiceNow service account has access to data within GCP projects only.

c. Select **Update and test connection**.

d. Once the connection test is complete, select **Continue**.

8. **Optional:** Configure the deep discovery connection properties.

a. In the **Setup** stage of the playbook, select the **Configure connection properties** activity. If deep discovery is already configured on the connection, the values are pre-populated on the Deep Discovery properties form. For more information about the deep discovery connection properties for GCP, see Deep discovery connection properties.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. Review the pre-populated fields on the Deep Discovery properties form.

c. After completing the **Configure connection properties** activity, select **Continue**.

9. Configure the import schedule to import data at regular intervals.

a. In the **Setup** stage of the playbook, select the **Configure import schedule** activity.

b. Select **Configure import schedule**.

c. Expand the Parent scheduled data import within the Import schedules list to select the **SG-GCP Organization** import schedule.

d. In the Configure import schedule dialog box, select the **Active** check box, and then fill in the run schedule and time details.

For more information, see Schedule a data import.

e. Select **Save**.
Alternatively, select **Execute Now** to execute the import schedule immediately.

f. Select **Continue**.

10. In the **Setup** stage of the playbook, select the **Confirm connection creation** activity to verify whether the connection was configured.

What to do next

Select **View all connections** to review the connection details. The configured connection appears in the Installed connections list.

Configure Service Graph Connector for GCP using the guided setup

Set up scheduled import jobs to pull in data from a GCP project into your CMDB.

Before you begin

Important:
Unless there are configuration issues, use the SGC Central view in the Service Graph Workspace or CMDB Workspace to configure the connection for the connector, as the guided setup method is planned for deprecated.

To use this Service Graph Connector, you need a subscription to a Subscription Unit that is based in the IT Operations Management (ITOM) Visibility application or in the ITOM Discovery application. As defined in the section titled "Managed IT Resource Types" in ServiceNow Subscription Unit Overview for your subscription, for managed IT resources that are created or modified in the CMDB by this Service Graph Connector, but that aren't yet managed by ITOM Visibility or ITOM Discovery, these resources will increase Subscription Unit consumption from that application. Review your current Subscription Unit consumption within ITOM Visibility or ITOM Discovery to ensure available capacity.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dependencies and requirements:

- The Integration Commons for CMDB store app, which is automatically installed.
- The CMDB CI class models store app, which is automatically installed. See CMDB CI Class Models.
- The ITOM Discovery License plugin (com.snc.itom.discovery.license). You must activate this plugin.
- ITOM Licensing plugin (com.snc.itom.license). For more information, see Request Discovery.
- The Datastream Action plugin (com.glide.hub.action_type.datastream), which is automatically installed.
- Observability Commons for CMDB (sn_observability), which is only required for event ingestion. This app must be installed prior to installing the connector for Event Management to work. For more information, see Observability Commons for CMDB on the ServiceNow Store.

Note:
If you have an earlier version of the Service Graph Connector for GCP, then don't migrate data from the old connector. You must uninstall the previous version and run the new integration.

Role required: SGC-Admin (sn_cmdb_int_util.sgc_admin) or admin

Note:
The admin user role is required to run background scripts and to provide access to global tables to the SGC-Admin user. For information about the user roles for Service Graph Connectors, see Service Graph Connector user roles.

Procedure

1. Ensure that the application scope is set to the Service Graph Connector for GCP application by using the application picker.
   For more information, see Application picker.
2. Navigate to **All** > **Service Graph Connectors** > **GCP** > **Setup**.
3. On the Getting started page, select **Get Started**.
4. Configure the connection to send requests to the GCP application.

   a. In the Configure the Connection and Credentials section of the Service Graph Connector for GCP page, select **Get Started**.

   b. Set up the GCP environment and create a Java KeyStore (JKS) certificate to encrypt the security certificates obtained from a GCP application.

   Make a note of the destination keystore password. You need to specify this password while importing the JKS certificate into the Service Graph Connector for GCP application.

   For instructions, see the Service Graph Connector for GCP - Setup Instructions [KB1220598] article in the Now Support Knowledge Base.

   Note:
   After you have set up the GCP environment, return to the guided setup and set the GCP Setup Instructions task in the Configure the Connection and Credentials section to complete by selecting **Mark as Complete**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Create an X.509 certificate to associate the JKS certificate for the GCP application with the Service Graph Connector for GCP.

i. For the Create X.509 certificate task, select **Configure**.

ii. On the form that opens in a new tab, fill in the fields.

X.509 Certificate form

Field	Description
Name	Name of the X.509 certificate. For example, `SG-GCP-509Certificate-Org1`.
Notify on expiration	Users to be notified when the certificate expires. If no users are selected, the logged-in user is added by default, along with the last two logged-in users with the administrator role.
Warn in days to expire	Number of days to send a notification before the certificate expires.
Active	Option to activate the certificate.
Type	Certificate container that is automatically set to **Java Key Store**. Leave the field value set to **Java Key Store**.
Expires in days	Number of days until the certificate expires.
Key store password	Password to access the JKS certificate as noted down in the previous step.
Short description	Description of the X.509 certificate.

iii. Select the manage attachments icon ( ).

iv. Select **Choose file** to browse and upload the keystore.p12 file for the JKS certificate you created in step 4.b.

v. Close the dialog box.

vi. Select the **Validate Stores/Certificates** related link.

vii. On successful validation, select **Update** to return to the guided setup page.

viii. Set the Create X.509 certificate task to complete by selecting **Mark as Complete**.

d. Edit the default connection.

i. For the Edit Default Connection task, select **Configure**.

ii. In the Flow Designer, select **SG-GCP Default Connection**, and then select **Edit**.

iii. On the form that opens in the Edit Connection dialog box, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Edit Connection form

Field	Description
Service Account Email	Service account created in and associated with the GCP application.
Keystore	Name of the keystore that you created in step 4.b.
Key Password	Destination keystore password associated with the keystore.
Organization Id	ID of the organization associated with the GCP application.
Discovery Scope	Discovery scope of the GCP application. The available options are: **organizations** Select **organizations** when the ServiceNow service account has access to data within the GCP organization. **projects** Select **projects** when the ServiceNow service account has access to data within GCP projects only.

iv. Select **Edit and Get OAuth Token**.

v. After the OAuth token flow is completed successfully, close the dialog box and the browser tab, and return to the guided setup page.

vi. Set the Edit Default Connection task to complete by selecting **Mark as Complete**.

e. Test the GCP API connection to import data from the GCP application.

i. For the Test the Connection task, select **Configure** to open the SG-GCP Default Connection page in a new browser tab.

ii. Test the connection by selecting the **Test Connection** related link.

Testing the connection may take a few moments. The page is refreshed to show the test results.

iii. When the **Status** field is set to **Success**, close the browser tab and return to the guided setup page.

If any of the tests have an error code or message or error sign, the connection failed and further troubleshooting is required.

iv. Set the Test the Connection task to complete by selecting **Mark as Complete**.

f. Configure the scheduled jobs to import data from the GCP application.

i. For the Configure the Scheduled Imports task, select **Configure** to open the Scheduled Data Imports list in a new browser tab.

ii. Select the SG-GCP Organization scheduled job.

iii. On the Scheduled Data Import form, verify the field values for the scheduled job.

For more information, see Schedule a data import.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

iv. Select **Active** check box to activate the SG-GCP Organization scheduled job.

v. In the **Run** field, select **Periodically** to specify how often the job will run.

vi. Select **Update**.

vii. Return to the guided setup page.

viii. Set the Configure the Scheduled Imports task to complete by selecting **Mark as Complete**.

5. **Optional:** Add multiple GCP instances.

a. In the Add Multiple Instances section of the Service Graph Connector for GCP page, select **Get Started**.

b. Create data sources for the new GCP connection.

i. Ensure that you have edit permissions for the Datasource [sys_data_source] table.

ii. For the Update Data Source Access task, select **Configure**.

iii. To edit the record, select the **Global** application scope from the application picker.

iv. In the Application Access related list of the Data Source form that opens in a new tab, select the **Can create**, **Can update**, and **Can delete** check boxes.

v. Select **Update**.

vi. Return to the guided setup page.

vii. From the application picker, select the **Service Graph Connector for GCP** application scope.

viii. Set the Update Data Source Access task to complete by selecting **Mark as Complete**.

c. Create a scheduled import job for the new GCP connection.

i. Ensure that you have edit permissions for the Scheduled data import [scheduled_import_set] table.

ii. For the Update Scheduled Data Import Access task, select **Configure**.

iii. To edit the record, select the **Global** application scope from the application picker.

iv. In the Application Access related list of the Scheduled Data Import form that opens in a new tab, select the **Can create**, **Can update**, and **Can delete** check boxes.

v. Select **Update**.

vi. Return to the guided setup page.

vii. From the application picker, select the **Service Graph Connector for GCP** application scope.

viii. Set the Update Scheduled Data Import Access task to complete by selecting **Mark as Complete**.

d. Clear the cache on the Data Source [sys_data_source] and Scheduled Data Imports [scheduled_import_set] tables.

i. For the Clear Cache for Data Source and Scheduled Data Imports tables task, select **Configure**.

ii. In the **Run script** text box of the background script page, enter the following script:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
GlideTableManager.invalidateTable("sys_data_source");
GlideCacheManager.flushTable("sys_data_source");
GlideTableManager.invalidateTable("scheduled_import_set");
GlideCacheManager.flushTable("scheduled_import_set");
GlideTableManager.invalidateTable("sys_db_object");
GlideCacheManager.flushTable("sys_db_object");
```

iii. Select **Run Script** to run the background script in the **global** scope.

The script may take several minutes to execute.

iv. After the script is executed, select **Close**.

v. Return to the guided setup page.

vi. From the application picker, select the **Service Graph Connector for GCP** application scope.

vii. Set the Clear Cache for Data Source and Scheduled Data Imports tables task to complete by selecting **Mark as Complete**.

e. To create an X.509 certificate for the new GCP instance, repeat the step 4.c, and then set the Create X.509 certificate task to complete by selecting **Mark as Complete**.

f. Add a new connection.

i. For the Add New Connection task, select **Configure**.

ii. In the Flow Designer, select **Add Connection**.

iii. On the form that opens in the Create Connection dialog box, fill in the fields.

Edit Connection form

Field	Description
Connection Name	Unique name for the new connection.
Service Account Email	ServiceNow service account associated with the GCP application.
Keystore	Name of the keystore that you created in step 5.e.
Key Password	Destination keystore password associated with the keystore.
Organization Id	ID of the organization associated with the GCP application.
Discovery Scope	Discovery scope of the GCP application. The available options are: **organizations** Select **organizations** when the ServiceNow service account has access to data within the GCP organization. **projects** Select **projects** when the ServiceNow service account has access to data within GCP projects only.

g. Test the new connection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

i. For the Test New Connection task, select **Configure**.

ii. In Service Graph Connections page that opens in a new browser tab, select the new connection that you want to test from the list of available connections.

iii. Test the connection by selecting the **Test Connection** related link.

Testing the connection may take a few moments. The page is refreshed to show the test results.

iv. When the **Status** field is set to **Success**, close the browser tab and return to the guided setup page.

If any of the tests have an error code or message or error sign, the connection failed and further troubleshooting is required.

v. Set the Test New Connection task to complete by selecting **Mark as Complete**.

h. To configure the scheduled jobs to import data from the new GCP instance, repeat step 4.f, and then set the Configure the Scheduled Imports task to complete by selecting **Mark as Complete**.

6. Synchronize new data sources to import data from GCP instances.

a. In the Advanced Setup section of the Service Graph Connector for GCP page, select **Get Started**.

b. Synchronize new data sources for creating all the required credentials to make the new data sources work correctly.

i. For the Sync New Data source task, select **Configure**.

ii. Select **Synchronize Datasources**.

iii. Return to the guided setup page by closing the Sync New Data source window.

iv. Set the Sync New Data source task to complete by selecting **Mark as Complete**.

7. Set up OS Config Patch Jobs to enable deep discovery.

a. In the Setup OS Config Patch Jobs for extended discovery section of the Service Graph Connector for GCP page, select **Get Started**.

b. For the Download script files task, select **Configure**.

c. Save the Shell script and PowerShell script files.

The Shell script contains commands that run on Linux VMs. The PowerShell script contains commands that run on Windows VMs.

d. In the Shell script and PowerShell script files, specify the name of and the path in the Cloud Storage Bucket where the output of the commands are to be uploaded.

e. Upload the deep discovery scripts to the Cloud Storage Bucket.

f. Navigate back to the guided setup page, and set the Download script files task to complete by selecting **Mark as Complete**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

g. For the Configure GCP Cloud Storage Bucket for running Patch Jobs task, select **Configure**.

h. To configure the GCP Cloud Storage Bucket to run patch jobs, follow the deep discovery setup instructions in the Service Graph Connector for GCP - Deep Discovery Setup Instructions [KB2213095] article in the Now Support Knowledge Base.

i. Navigate back to the guided setup page, and set the Configure GCP Cloud Storage Bucket for running Patch Jobs task to complete by selecting **Mark as Complete**.

j. For the Configure connection properties task, select **Configure**.

k. On the SG-GCP Configuration Properties form, select the connection for which you want to run deep discovery from the **Connection** list.

In the Properties section of the SG-GCP Configuration Properties form, the following fields are populated with the values for the connection that you selected. If required, update the field values.

Field	Description
Name of the Cloud Storage Bucket where the .sh and .ps1 files are uploaded in Google Cloud Platform	Name of the Cloud Storage Bucket where the deep discovery scripts are saved.
Path to the .sh file uploaded to Cloud Storage Bucket	Path of the deep discovery Shell script file.
Generation number of the .sh file uploaded to Cloud Storage Bucket	Number used to identify the versioning of the cloud storage object.
Path to the.ps1 file uploaded to Cloud Storage Bucket	Path of the deep discovery PowerShell script file.
Generation number of the .ps1 file uploaded to Cloud Storage Bucket	Number used to identify the versioning of the cloud storage object.
Name of the Cloud Storage Bucket provided in .sh and .ps1 files where the outputs of the commands have to be stored	Name of the output Cloud Storage Bucket.
Folder path provided in .sh and .ps1 files where the outputs are uploaded in the Storage Bucket	Path of the output storage folder in the Cloud Storage Bucket.

l. Select **Save**.

m. Navigate back to the guided setup, and set the Configure connection properties task to complete by selecting **Mark as Complete**.

Data mapping for Service Graph Connector for GCP

Data from the GCP data sources is mapped and transformed into the ServiceNow CMDB Configuration Item (CI) class definitions using the Robust Transform Engine (RTE). Data is inserted into the ServiceNow CMDB using the Identification and Reconciliation Engine (IRE).

Data mapping for GCP

When you complete setting up the connection, you can configure the integration to periodically pull data from the GCP application.

The following table lists the data sources, the staging tables, the target tables as the CMDB CI classes, and the resource types imported for a GCP project.

Data mapping for GCP

Data mapping for GCP (continued)

Data source	Staging table	CMDB CI classes	Resource types
		SG-GCP Extension Attributes	
SG-GCP Generic Resource	SG-GCP Generic Resource [sn_gcp_integ_sg_gcp_generic_resource] **Note:** The SG-GCP Generic Resource data source only works with a service account that has organization-level access.	Cloud Resource	Resource
SG-GCP Annotation	SG-GCP Annotation [sn_gcp_integ_sg_gcp_annotation]	Key Value	Annotation
SG-GCP Get Patch Job	SG-GCP Get Patch Job [sn_gcp_integ_sg_gcp_get_patch_job]	Not applicable	Not applicable
SG-GCP Generic Resource Annotation	SG-GCP Generic Resource Annotation [sn_gcp_integ_sg_gcp_generic_resource_annotation]	Key Value	Annotation

For more information on where data is saved when pulling data from a GCP project, see CMDB classes targeted in Service Graph Connector for GCP.

You can use the IntegrationHub ETL app to view the data maps. See IntegrationHub ETL for more information.

Additional information about GCP data sources:

- The SG-GCP Annotation data source populates all labels and tags associated with GCP supported resources to the Key Value table.
- The SG-GCP Generic Resource Annotation data source populates the tags and labels for Generic resources to the Key Value table from Service Graph Connector for GCP version 1.10.0.
- The basic information about a GCP resource is stored in the SG-GCP Extension Attributes [sn_gcp_integ_extension_attributes] table.
- After all the data sources are executed, the Server [cmdb_ci_server] class is updated with the class entry, and then based on the Windows or Linux class, the records are created in the Windows Server [cmdb_ci_win_server] and Linux Server [cmdb_ci_linux_server] classes, respectively.
- The SG-GCP Generic Resource data source imports data for resources that are categorized as `Generic` in the Service Graph Resource Inclusion Whitelist [sn_cmdb_int_util_service_graph_resource_inclusion_whitelist] table.
- For any discovered resources that are deleted after pulling data, the Service Graph Connector for GCP automatically updates the **Install Status** field of the associated CMDB CI classes to indicate any retired or deleted records. For more information, see Life cycle management of records in Service Graph Connector for GCP and Record removal process in Service Graph Connector for GCP.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- When the *sn_itom_pattern.use a single hardware type for cloud data centers* system property is set to `true`, hardware type data is added to the Cloud Hardware Type [cmdb_ci_cloud_hardware_type] table, instead of being added to the Hardware Type [cmdb_ci_compute_template] table from Service Graph Connector for GCP version 1.9.0. For more information, see the Service Graph Connector For GCP - Migrating to a new hardware type model [KB1899584] article in the Now Support Knowledge Base.
- When the *sn_cmdb_ci_class.use_single_cloud_os_image* system property is set to `true`, image type data is added to the Cloud Image [cmdb_ci_cloud_os_image] table, instead of being added to the Image [cmdb_ci_os_template] table from Service Graph Connector for GCP version 1.9.0. For more information, see the Service Graph Connector For GCP - Migrating to a new Cloud OS Image model [KB1983751] article in the Now Support Knowledge Base.
- The list API calls return only the information that is required to make batch calls and not the entire resource response from Service Graph Connector for GCP version 1.9.0.
- Parallel data loading is enabled for the SG-GCP Annotation, SG-GCP Generic Resource, and SG-GCP Generic Resource Annotation data sources.
- You can configure the *AppScript Folder IDs* connection property to exclude AppScript folder information from imports starting from Service Graph Connector for GCP version 1.10.0. For more information, see Service Graph Connector for GCP properties.
- The SG-GCP Software Inventory scheduled import runs before the SG-GCP VM Instance scheduled import from Service Graph Connector for GCP version 1.10.0. The SG-GCP Software Inventory scheduled job populates the operating system information for the Server records, which determines the script that needs to be run for deep discovery (Shell script for Linux VMs or PowerShell script for Windows VMs).
- The SG-GCP Get Patch Job scheduled import supports deep discovery by running commands on VMs from Service Graph Connector for GCP version 1.10.0. For information about deep discovery for the Service Graph Connector for GCP, see the Enabling deep discovery for Service Graph Connector for GCP article in the Now Support Knowledge Base.

Server [cmdb_ci_server]

The following attributes in the Server [cmdb_ci_server] table are populated by collected data:

Attribute label	Attribute name
Name	name
Object ID	object_id
Class	sys_class_name
CPU count	cpu_count
Disk space (GB)	disk_space
Host name	host_name
Install Status	install_status
IP Address	ip_address
Is Virtual	virtual
Operating System	os
Operational status	operational_status
OS Version	os_version
RAM (MB)	ram

Note:
If the GCP Systems Manager (SSM) service isn't enabled, the connector populates the server records in the Server [cmdb_ci_server] class. If the GCP SSM service is enabled, then based on the platform type obtained through the SSM service, the server records are populated in either the Linux Server [cmdb_ci_linux_server] class or the Windows Server [cmdb_ci_win_server] class. The Server [cmdb_ci_server] class is the parent class of the Linux Server [cmdb_ci_linux_server] and the Windows Server [cmdb_ci_win_server] classes.

Data mapping for Service Graph Connector for GCP

Service Graph Connector for GCP properties

Accessing the connection details of Service Graph Connector for GCP

You can access the connection details of the Service Graph Connector for GCP in a single view using the common connection framework (CCF) included within the Integration Commons for CMDB (sn_cmdb_int_util) store app.

With the CCF, you can access all the connections used by the Service Graph Connector for GCP. The connection details include the connection alias, connection properties, data sources, and scheduled data imports associated with a connection. You can also test the connection. For more information, see Accessing the connection details of Service Graph Connectors.

Access the details of a GCP connection

Access the details of a GCP connection configured for the Service Graph Connector for GCP.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Service Graph Connectors** > **GCP** > **Connections**.
2. From the **Name** column of the Service Graph Connections list, select a connection.
3. On the Service Graph Connections page, view the connection details such as the connection name, alias, and data sources.
4. Select a related list to view further details of the connection.
5. **Optional:** Select the **Test Connection** related link to test the connection.

Handling import failures for large GCP resources

Manage the data source failure when importing resources from GCP.

When importing large GCP resources, the data sources in the Service Graph Connector for GCP might fail because of a Direct REST response exceeding the 1024-MB limit. For more information, see REST step.

You can use one or more of the following options to handle the REST response size limitation error in the Service Graph Connector for GCP:

- Save the response as an attachment
- Modify the batch size

Save the response as an attachment

With the save response as an attachment feature, the response of each data source is temporarily stored as an attachment and after the response is read, the attachment is deleted automatically. The save response as an attachment feature is activated by default and is triggered by the *sn_gcp_integ.save_rest_response_as_attachment* system property.

As a user with the admin role, you can deactivate the save response as an attachment feature by setting the *sn_gcp_integ.save_rest_response_as_attachment* property to

`false`. When the feature is deactivated and the response size is within the limit, the data sources run normally.

Modify the batch size

By default, the maximum batch size of the environment variable for a data source is set to 100 records. You can reduce or increase the batch size based on the data volume. To manage the batch size of a data source, you must add a system property of integer type for the data source as described in the following table.

System properties for handling the batch size of Service Graph Connector for GCP data sources

Data source	System property
SG-GCP Cloud Database	sg_gcp_cloud_db_batch_size
SG-GCP Cloud Function	sg_gcp_cloud_function_batch_size
SG-GCP Cloud Object Storage	sg_gcp_object_storage_batch_size

ITOM Visibility solutions for discovering GCP (continued)

ITOM Visibility solution	Overview	Configuration
Service Graph Connector for GCP	Service Graph Connector for GCP	Configure Service Graph Connector for GCP using the guided setup

Note:

The CI class, in most cases, is applicable to both solutions. If it's not applicable to one of the solutions, the solution is marked "N/A".

If an entry is marked with one asterisk, the resource type is supported by Patterns only by utilizing the **Google Asset inventory** pattern's inclusion list. For more information, see Google Cloud Platform (GCP) resource inventory discovery.

If an entry is marked with two asterisks, the resource type is supported by Service Graph Connecters only by utilizing the [sn_cmdb_int_util_service_graph_resource_inclusion_whitelist] table.

Deep discovery for Service Graph Connector for GCP

The SG-GCP Execute Patch Job and SG-GCP Get Patch Job scheduled import jobs enable deep discovery by running patch jobs at the GCP project level.

Deep discovery involves fetching server data. The deep discovery data populates host name, serial number, CPU data, TCP connections, and running processes data into the CMDB.

The Service Graph Connector for GCP uses OS Config Patch jobs on GCP projects to execute the deep discovery commands on the VMs. These patch jobs run independently on Linux and Windows VMs.

The following scheduled imports execute the OS Config Patch jobs, and then read and delete the output:

- SG-GCP Execute Patch Job
- SG-GCP Get Patch Job

Deep discovery connection properties

Deep discovery connection properties

Connection property name	Connection property value
Scripts Bucket Name	Name of the Cloud Storage Bucket where the deep discovery scripts are saved.
Outputs Bucket Name	Name of the output Cloud Storage Bucket.
Outputs Storage Path	Path of the output Cloud Storage Bucket.
Shell Script Object Path	Path of the deep discovery Shell script file.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Deep discovery connection properties (continued)

Connection property name	Connection property value
Shell Script Generation Number	Number that is used to identify the versioning of the cloud storage object.
PowerShell Script Object Path	Path of the deep discovery PowerShell script file.
PowerShell Script Generation Number	Number that is used to identify the versioning of the cloud storage object.

SG-GCP Execute Patch Job

The SG-GCP Execute Patch Job scheduled import reads the path of the Shell and PowerShell scripts uploaded to the Cloud Storage Bucket and the generation numbers from the deep discovery connection properties. The scheduled import then runs the commands on Linux and Windows VMs separately.

In the Import Set table for the SG-GCP Execute Patch Job import schedule, each project will have two rows, one for Linux VMs and the other for Windows VMs. The **Import Set** rows remain in `Pending` state because no transformations are required for these rows. The **Import Set** rows include the patch job ID and the list of instances on which the deep discovery script is run. The output is stored in the Cloud Storage Bucket with the Object ID of the VMs on which the deep discovery commands are run.

SG-GCP Get Patch Job

The SG-GCP Get Patch Job scheduled import reads the output of the commands that are run on the Linux and Windows VMs. The scheduled import reads the output from the output bucket and folder path that are specified in the deep discovery connection properties. The SG-GCP Get Patch Job scheduled import then deletes the output from the Cloud Storage Bucket. The **Import Set** rows are processed using Application Dependency Mapping (ADM) to populate the Server records with the data of the VMs on which deep discovery was run. The **Import Set** rows include VM data such as running processes, TCP connections, and CPU information.

Application Dependency Mapping

Using the deep discovery information, Application Dependency Mapping (ADM) creates and classifies the following applications from the imported middleware information:

- Apache Web Server
- MongoDB Instance
- MSFT SQL Instance
- MySQL Instance
- Nginx Web Server
- Oracle Database Listener
- Oracle Instance
- PostgreSQL Instance
- Tomcat

Life cycle management of records in Service Graph Connector for GCP

Life cycle management in the in the Service Graph Connector for GCP monitors and updates the statuses of GCP resources throughout their entire life cycle, from creation to deletion.

The life cycle management process helps maintain the accuracy and integrity of data in the Configuration Management Database (CMDB).

In life cycle management, the record removal process involves systematically deleting obsolete or unnecessary resources. This step ensures that outdated entries are cleared, keeping the CMDB accurate and up-to-date. See Record removal process in Service Graph Connector for GCP.

Life cycle management for CIs in Service Graph Connector for GCP

The following table lists the configuration items (CIs) for which life cycle management is available in Service Graph Connector for GCP.

Supported CIs for life cycle management

Data source	CMDB CI classes	Life cycle management available
SG-GCP Organization	Cloud Organizations [cmdb_ci_cloud_org]	Yes
SG-GCP Folder	Google Organization Folder [cmdb_ci_gcp_folder]	Yes
SG-GCP Project	Google Organization Project [cmdb_ci_gcp_project]	Yes
	Cloud Service Account [cmdb_ci_cloud_service_account]	Yes
SG-GCP Network	Cloud Network [cmdb_ci_network]	Yes
SG-GCP Machine Image	Image [cmdb_ci_os_template]	Not applicable
SG-GCP Subnet	Cloud Subnet [cmdb_ci_cloud_subnet]	Yes

Record removal process in Service Graph Connector for GCP

The Service Graph Connector for GCP uses soft deletion and hard deletion to manage the removal of records.

Record removal is the process of handling data that is no longer needed. For any discovered resources that are deleted later after pulling data, the Service Graph Connector for GCP automatically updates the **Install Status** field of the associated CMDB CI classes to indicate any retired or deleted records.

- Soft deletion
- Hard deletion

Soft deletion

Soft deletion involves marking the install status of a record as **retired** rather than permanently deleting it from the system. The record remains in the database, making it possible to reference or restore it later.

Integration Commons Record Removal is implemented from Service Graph Connector for GCP version 1.11.0 to mark the Install Status and Operational Status of configuration items (CIs) as retired if they aren't discovered during the latest pull. This implementation verifies the Last Scan attribute of the CIs in the Source [sys_object_source] table to identify CIs that aren't discovered during the latest pull. Additionally, the source native keys (SNKs) for all CIs are modified to include the connection alias ID to identify the connection that discovered specific CIs.

Soft deletion for the Service Graph Connector for GCP 1.11.0 version relies on the Source [sys_object_source] table and the *`Use Record Removal`* and *`lookback_time_in_days`* connection properties. Soft deletion for the Service Graph Connector for GCP 1.10 version and earlier relied on the SG-GCP Extension Attributes [sn_gcp_integ_extension_attributes] table.

After upgrading to version 1.11.0, the value of the *`Use Record Removal`* connection property is set to `true` when the import is run for the first time. Consequently, the latest SNKs for the CIs are included in the Source [sys_object_source] table. Record removal is implemented from the subsequent run.

After upgrading to version 1.11.0, the value of the *`lookback_time_in_days`* connection property is set to null by default. During the initial run after the upgrade, the Source [sys_object_source] table is queried for all records that the connection discovered. By default, the value is set to 15 after the initial run. Two weeks after the initial run, the Source [sys_object_source] table is queried for all records that weren't discovered in the past 15 days. All records that weren't discovered in the past 15 days are marked as retired.

Soft deletion is enabled for the following data sources in Service Graph Connector for GCP:

- SG-GCP Folder
- SG-GCP Project
- SG-GCP Network
- SG-GCP Subnet
- SG-GCP Storage Volume
- SG-GCP Storage Volume Snapshot
- SG-GCP Security Group
- SG-GCP VM Instance
- SG-GCP Load Balancer Pool
- SG-GCP Load Balancer Pool Member
- SG-GCP Load Balancer Health Service
- SG-GCP Load Balancer
- SG-GCP Load Balancer Service
- SG-GCP Cloud Database
- SG-GCP Cloud Function

- SG-GCP Cloud Object Storage
- SG-GCP Kubernetes Cluster
- SG-GCP Kubernetes Node
- SG-GCP Kubernetes Pod
- SG-GCP Kubernetes Service
- SG-GCP Kubernetes Namespace
- SG-GCP Kubernetes Deployment
- SG-GCP Kubernetes Replicaset
- SG-GCP Kubernetes Cluster Roles
- SG-GCP Kubernetes Cluster Role Binding
- SG-GCP Kubernetes Node Pool

From Service Graph Connector for GCP version 1.10.0, the SG-GCP Generic Resource data source uses the post-script method for soft deletion, which relies on the Source [sys_object_source] table. For more information about the post-script method, see Post-script method.

Hard deletion

Hard deletion involves permanently deleting a record from the system. The record is removed from the CMDB and can't be referenced or restored later. The SG-GCP Software Inventory data source uses the hard deletion method for the deletion of records.

Connection properties

These connection properties are available for the Service Graph Connector for GCP.

Note:
To open the Service Graph Connection Properties [sn_cmdb_int_util_service_graph_connection_property] table for the connector, navigate to **All** > **Service Graph Connectors** > **GCP** > **Connections**, and select the connection name. The connection properties are displayed in the Service Graph Connection Properties related list.

Connection properties for Service Graph Connector for GCP

Property	Description
Organization Id	Enter the organization ID of the SG-GCP account. • Type: integer • Default value: empty

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection properties for Service Graph Connector for GCP (continued)

Property	Description
Service Account	Service principal used by the Service Graph Connector for GCP to access the GCP organization, projects, and resources.
Discovery Scope	Enter the discovery scope of the SG-GCP account. • Type: choice list • Default value: empty • Choices: organizations | projects
JWT Provider	The JWT Provider sys_id created for the SG-GCP connection. The value is automatically populated after the connection details are added. • Type: string • Default value: empty
AppScript Folder IDs	Enter the GCP AppScript folder IDs as a comma-separated list to exclude the AppScript folders and projects information from being added to the CMDB during import. Automations are run on AppScript folders, which contain multiple projects that include meta information. AppScript folders don't contain any resources such as networks, subnets, and VMs. • Type: string • Default value: empty
Properties used for soft deletion	
Use Record Removal	This property is used for soft deletion and life cycle handling using the Integration Commons record removal API. The value is automatically updated to `true` after the initial run. **Note:** Do not modify this property. • Type: true | false • Default value: true For more information about soft deletion for the Service Graph Connector for GCP, see Soft deletion.
lookback_time_in_days	This property is used for soft deletion. Time in days in which the sys_object_source records are queried for the soft deletion of CIs. The value is automatically updated to 15 after the initial run. Set the value of this property to empty to include all the older records populated by SG-GCP as removal candidates for soft deletion.

Service Graph Connector for Google Console

Use the Service Graph Connector for Google Console to import device details from Chromebooks into the Configuration Management Database (CMDB).

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Key features

- Get visibility across Chromebook devices.
- Get started quickly with a streamlined onboarding process.
- Use only the credentials you need.

Supported versions

Versions

Google Console	ServiceNow
Last tested on July 05, 2024	• Xanadu • Washington DC

© 2026 ServiceNow, Inc. All rights reserved.

Versions (continued)

Google Console	ServiceNow
	• Vancouver • Utah

Use cases

You can use the Service Graph Connector for Google Console to get visibility into Google ChromeOS devices, enabling administrators to centrally manage enrollment, configuration, and monitoring these devices.

Guided setup

The guided setup for the Service Graph Connector for Google Console provides an organized sequence of tasks to configure the integration on your instance. To access the guided setup, see Configure Service Graph Connector for Google Console.

CMDB integrations dashboard

The Integration Commons for CMDB store app provides a dashboard with a central view of the status, processing results, and processing errors of all installed integrations. You can see metrics for all integration runs. You can filter the view to a specific CMDB integration, a specific time duration, or a specific integration run. For more details about monitoring Google Console integrations in the CMDB Integrations Dashboard, see Using the CMDB Integrations Dashboard.

Data mapping

Data from the Google Console data source is mapped and transformed into the ServiceNow CMDB Configuration Item (CI) class definitions using the Robust Transform Engine (RTE). Data is inserted into the ServiceNow CMDB using the Identification and Reconciliation Engine (IRE).

When you complete setting up the connection, you can configure the integration to periodically pull data from the Google Console application.

Note:
For any discovered resources that were deleted later, the Service Graph Connector for Google Console automatically marks the corresponding records as no longer active or valid in CMDB.

The following table lists the data sources, the staging tables, and the target tables as CMDB CI classes as where data is stored for a Chromebook device within Google Console.

Data mapping for Google Console

Data source	Staging table	CMDB CI classes	Resource type
SG-GoogleConsole-ChromeDevices	SG-GoogleConsole-ChromeDevices [sn_googleconsole_i_sg_googleconsole_chromedevices]	Computer IP Address Network Adapter	Chrome OS devices

Service Graph Connectors

Configure Service Graph Connector for Google Console

Set up scheduled import jobs to pull in Chromebook device data from the Google Console into your CMDB.

Before you begin

To use this Service Graph Connector, you need a subscription to a Subscription Unit that is based in the IT Operations Management (ITOM) Visibility application or in the ITOM Discovery application. As defined in the section titled "Managed IT Resource Types" in ServiceNow Subscription Unit Overview for your subscription, for managed IT resources that are created or modified in the CMDB by this Service Graph Connector, but that aren't yet managed by ITOM Visibility or ITOM Discovery, these resources will increase Subscription Unit consumption from that application. Review your current Subscription Unit consumption within ITOM Visibility or ITOM Discovery to ensure available capacity.

Role required: admin

Procedure

1. Verify that the application scope is set to the Service Graph Connector for Google Console application by using the application picker.
   For more information, see Application picker.
2. Navigate to **All** > **Service Graph Connectors** > **Google Console** > **Setup**.
3. On the Service Graph Connector for Google Console page, verify that the **Quick Start** option is selected and then select **Continue**.
4. Configure the authentication credentials to send requests to the Google Console API.

   a. In the Configure the Connection and Credentials section of the Service Graph Connector for Google Console page, select **Start**.

   b. Set up the Google Console environment.

      i. Select the Google Console Setup Instructions task.

      ii. Select the link to the Service Graph connector for Google Console - Setup Instructions [KB1516892] article in the Now Support Knowledge Base and follow the instructions to set up the Google Console environment.

      > **Note:**
      > Make a note of the destination keystore password. You need to specify this password while importing the Java Keystore (JKS) certificate into the Service Graph Connector for Google Console application.

      iii. Set the Google Console Setup Instructions task to complete by selecting the **Mark as complete** check box and then select **Continue**.

   c. Create an X.509 certificate to associate the JKS certificate for the Google Console application with the Service Graph Connector for Google Console.

      i. Select the Create X.509 certificate task.

      ii. In the X.509 Certificates list, select **New**.

      iii. On the form, fill in the fields.

X.509 Certificate form

Field	Description
Name	Name of the X.509 certificate. For example, `SG-GoogleConsole-509Certificate`.
Type	Certificate container. Select **Java Key Store**.
Key store password	Password to access the JKS certificate as noted down in the previous step.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
You can leave the value of other fields as-is.

iv. Select the manage attachments icon ( ).

v. Select **Choose file** to browse and upload the keystore.p12 file for the JKS certificate you created in the previous step.

vi. Close the dialog box.

vii. Select the **Validate Stores/Certificates** related link.

viii. On successful validation, select **Update** to return to the guided setup page.

ix. Set the Create X.509 certificate task to complete by selecting the **Mark as complete** check box and then select **Continue**.

d. Configure the connection.

i. Verify that the application scope is set to the Service Graph Connector for Google Console application by using the application picker.

ii. Select the Configure the Connection task and then select **Click Here**.

iii. On the Connections page that opens in another browser tab, select **Edit** for the **SG-GoogleConsole** connection that is available by default.

iv. On the form, fill in the fields.

Edit Connection form

Field	Description
Connection Name	Name to identify the connection record. For example, `SG-GoogleConsole`. Don't modify the name for the default connection alias `SG-GoogleConsole`.
Service Account Email	Email address of the service account in Google Console.
Keystore Password	The password that you used when you created the JKS file in the previous step.
Keystore	Select the name of the JKS file you created in the previous step.

v. Select **Edit and Get OAuth Token**.

vi. After the OAuth token is generated, return to the guided setup.

vii. Set the Configure the Connection task to complete by selecting the **Mark as complete** check box and then select **Continue**.

e. Set up the configuration properties.

i. Select the Add configuration properties task.

ii. In the Service Graph Connections section, review and modify the property details by selecting a property from the **Property** column in the Service Graph Connection Properties related list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can configure the *Customer ID* property to pull Chromebook devices for the specified customer ID.

iii. Select **Update** in the Service Graph Connection Properties section.

iv. Set the Add connection properties task to complete by selecting the **Mark as complete** check box and then select **Continue**.

f. Test the Google Console API connection to import data from the Google Console application.

i. Select the Test Connection task.

ii. Test the connection by selecting the **Test Connection** related link.

Testing the connection might take a few moments. The page is refreshed to show the test results.

iii. When the **Status** field is set to **Success**, select **Update**.

If any of the tests have errors, follow the suggestions for remediation.

iv. Set the Test Connection task to complete by selecting the **Mark as complete** check box and then select **Continue**.

5. **Optional:** Integrate with multiple Google Console instances.

a. Follow the instructions in the Service Graph connector for Google Console - Setup Instructions [KB1516892] article in the Now Support Knowledge Base to set up the Google Console environment.

Note:
Make a note of the destination keystore password.

b. In the Add Multiple Instances section of the Service Graph Connector for Google Console page, select **Start**.

c. Create data sources for the new Google Console connection.

i. Ensure that you have edit permissions for the Datasource [sys_data_source] table.

ii. Select the Update Data Source Access task.

iii. To edit the record, select the **Global** application scope from the application picker.

iv. In the Application Access related list of the Data Source form that opens in a new tab, select the **Can create**, **Can update**, and **Can delete** check boxes.

v. Select **Update**.

vi. From the application picker, select the Service Graph Connector for Google Console application scope.

vii. Set the Update Data Source Access task to complete by selecting the **Mark as complete** check box and then select **Continue**.

d. Create a scheduled import job for the new Google Console connection.

i. Ensure that you have edit permissions for the Scheduled data import [scheduled_import_set] table.

ii. Select the Update Scheduled Data Import task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

iii. To edit the record, select the **Global** application scope from the application picker.

iv. In the Application Access related list of the Scheduled Data Import form, select the **Can create**, **Can update**, and **Can delete** check boxes.

v. Select **Update**.

vi. From the application picker, select the Service Graph Connector for Google Console application scope.

vii. Set the Update Scheduled Data Import task to complete by selecting the **Mark as complete** check box and then select **Continue**.

e. Create an X.509 certificate for the new Google Console instance by repeating the step 4.c, and then mark the Create X.509 certificate task to complete by selecting the **Mark as complete** check box and then select **Continue**.

f. Add another connection for the new Google Console instance.

i. Verify that the application scope is set to the Service Graph Connector for Google Console application by using the application picker.

ii. Select the Add Another Connection task and then select **Click Here**.

iii. On the Connections page that opens in another browser tab, select **Add Connection**.

iv. On the form, fill in the fields.

Create Connection form

Field	Description
Connection Name	Name to identify the connection record.
Service Account Email	Email address of the service account in Google Console.
Keystore Password	The password that you used when you created the JKS file in the previous step.
Keystore	Select the name of the JKS file you created in the previous step.

v. Select **Create and Get OAuth Token**.

vi. After the OAuth token is generated, return to the guided setup.

vii. Set the Add Another Connection task to complete by selecting the **Mark as complete** check box and then select **Continue**.

g. Add the configuration properties for the new Google Console instance.

i. Select the Add configuration properties task.

ii. Select the connection record you created in the previous step.

iii. In the Service Graph Connections section, review and modify the property details by selecting a property from the **Property** column in the Service Graph Connection Properties related list.

You can configure the *`Customer ID`* property to pull Chromebook devices for the specified customer ID.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

iv. Select **Update** in the Service Graph Connection Properties section.

v. Set the Add connection properties task to complete by selecting the **Mark as complete** check box and then select **Continue**.

h. Test the Google Console API connection to import data from new Google Console instance.

i. Select the Test New Connections task.

ii. Select the connection record you created in the previous step.

iii. Test the connection by selecting the **Test Connection** related link.

Testing the connection might take a few moments. The page is refreshed to show the test results.

iv. When the **Status** field is set to **Success**, select **Update**.

If any of the tests have errors, follow the suggestions for remediation.

v. Set the Test New Connections task to complete by selecting the **Mark as complete** check box and then select **Continue**.

6. Configure the scheduled job for the import of Google Console data.

a. In the Configure the scheduled jobs section of the Service Graph Connector for Google Console page, select **Start**.

b. Select the **SG-GoogleConsole-ChromeDevices** scheduled job.
For a multiple instance setup, select the scheduled job created with the scheduled import in step 5.d for the new connection.

c. On the Scheduled Data Import form, verify the field values.

For more information, see Schedule a data import.

d. Select the **Active** check box to activate the scheduled job.

e. In the **Run** field, select **Periodically** to specify how often the job will run.

f. Select **Update**.

g. Set the Configure the scheduled jobs task to complete by selecting the **Mark as complete** check box and then select **Continue**.

7. On the Service Graph Connector for Google Console page, select **Complete** to save your changes.
8. In the Complete setup dialog box, select **Complete** to complete the setup.
9. In the message box that appears, select **Done**.

CMDB classes targeted in Service Graph Connector for Google Console

When you complete setting up the connection, you can configure the integration to periodically pull Google Console data from Chromebook devices. The data is saved in tables that extend from the Configuration item [cmdb_ci] table.

Service Graph Connector for Infoblox

Use the Service Graph Connector for Infoblox to pull data from an Infoblox instance into your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Supported versions

- Supported versions: Infoblox API v2.11.2
- Supported ServiceNow versions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Yokohama
- Zurich
- Australia

Use cases

The following example use cases describe how you can use the Service Graph Connector for Infoblox for different ServiceNow® applications:

- Configure the Infoblox connection for connecting to an Infoblox instance.
- Create IP address management (IPAM) tasks when subnets are added or deleted.
- Schedule periodic synchronization of IPAM CIs by configuring scheduled data imports jobs.
- View imported IPAM CIs and IPAM tasks.

Important information for upgrading Service Graph Connector for Infoblox

You must run a full data load after upgrading to Service Graph Connector for Infoblox version 1.5.0. After the full data load, all CIs from Service Graph Connector for Infoblox version 1.4.0 and earlier are marked as `retired`. You can decide whether to delete or retain the retired CIs.

You can create table cleanup jobs to automate the cleanup of retired CIs based on your organization's data retention requirements and integration dependencies. For more information, see Create table cleanup jobs for Service Graph Connector for Infoblox.

The source native keys (SNKs) for all CIs in Service Graph Connector for Infoblox version 1.5.0 and later include the Managed Network information to identify the connection that discovered specific CIs and to prevent duplicate records. All new CIs that are created after the initial full data load have updated SNKs.

Configuring a connection for the connector

You can configure a connection for the connector by using the SGC Central view in the Service Graph Workspace or CMDB Workspace. The view enables you to discover and install connectors, and then effectively manage the full life cycle of creating, editing, monitoring, and debugging connections. To configure the connector using SGC Central, see Configure Service Graph Connector for Infoblox using SGC Central.

Important:
Unless there are configuration issues, use the SGC Central view in the Service Graph Workspace or CMDB Workspace to configure the connection for the connector, as the guided setup method is planned for deprecated.

CMDB integrations dashboard

The Integration Commons for CMDB store app provides a dashboard with a central view of the status, processing results, and processing errors of all installed integrations. You can see metrics for all integration runs. You can filter the view to a specific CMDB integration, a specific time duration, or a specific integration run. For more details about monitoring Infoblox integrations in the CMDB Integrations Dashboard, see Using the CMDB Integrations Dashboard.

Configure Service Graph Connector for Infoblox using SGC Central

Use the playbook available with the SGC Central application to set up the Service Graph Connector for Infoblox for pulling in Infoblox data into the CMDB.

Before you begin

Install Service Graph Connector for Infoblox version 1.2.0 or later from the ServiceNow Store. For ServiceNow Store installation steps, see Install a ServiceNow Store application.

Role required: The following table shows the roles required for each stage of the playbook.

Role required for each playbook stage

Stage	Role
Prerequisites	admin
Setup	SGC-Admin (sn_cmdb_int_util.sgc_admin) or admin

Note:
The admin user role is required to run background scripts and to provide access to global tables to the SGC-Admin user. For information about the user roles for Service Graph Connectors, see Service Graph Connector user roles.

About this task

The playbook experience for onboarding connectors is activated with SGC Central in the Service Graph Workspace or CMDB Workspace. To configure the SGC Central application, see Configuring SGC Central and for more information on how to interact with a playbook, see Interact with Playbook.

Procedure

1. Use one of the following methods to open SGC Central:
   - Navigate to **Workspaces** > **Service Graph Workspace**, and from the left navigation panel, select the Ingestion icon to open the SGC Central view.
   - Navigate to **Workspaces** > **CMDB Workspace** > **SGC Central**.
2. On the Overview page, select **Create connection**.

   Tip:
   Alternatively, you can select **Create connection** on the All connections page.

3. On the Create connection window, select the Infoblox connector type and then select **Configure connection**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A default connection, SG_Infoblox_Connection, for Infoblox is available within the application. As the Service Graph Connector for Infoblox supports only a single instance, you can configure the default connection for the first time or resume editing it thereafter.

4. Complete the initial prerequisites when setting up a connection for the first time using a connector.

   Note:
   This step is required only during the first-time setup. See Perform initial setup tasks when creating a connection in SGC Central.

5. Enter connection details and test the API connection for importing Infoblox data.

   a. In the **Setup** stage of the playbook, select the **Configure and test connection** activity.

   b. On the form, fill in the fields.

   Configure and test connection form

Field	Description
Connection name	Name to identify the Infoblox connection record.
Connection URL	Infoblox base URL in the following format: `<base-URL>`.
User name	User name for authenticating the HTTP request.
Password	Password for the user name used for authenticating the HTTP request.
Use MID Server	Option to use the MID Server for connecting to the Infoblox instance. **Note:** A MID Server is required only if a direct connection between the ServiceNow and Infoblox instances isn't possible.
Mid Selection	MID Server for the connection. This field appears only when you select the **Use MID Server** check box.

   c. Select **Update and test connection**.

   d. Once the connection test is complete, select **Continue**.

6. **Optional:** Specify network views and the API version for connecting to the Infoblox instance by setting the configuration properties.

   Note:
   To skip this step, select **Continue** for the **Set configuration properties** activity. If you skip this step, the default values of the *Network view* and *API version* properties are considered.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the **Setup** stage of the playbook, select the **Set configuration properties** activity.

b. In the **Network view** field, enter the network views for which data is to be imported. For multiple views, separate them with commas. For example: `view1,view2`.

   If you leave this field empty or set it to `Default`, the data sources within the connector import data from all the network views.

c. In the **API version** field, enter the version of WAPI you're using.

   (Optional) For more information about the Infoblox API, see the Infoblox Developer documentation.

d. Select **Save properties**.

e. Select **Continue**.

7. **Optional:** Opt for task creation on network insertion or deletion.

   Note:
   To skip this step, select **Continue** for the **Configure task preferences** activity.

   a. In the **Setup** stage of the playbook, select the **Configure task preferences** activity.
   b. Select the **Create task on network insertion** check box to enable creating a task when a network is inserted.
   c. Select the **Create task on network deletion** to enable creating a task when a network is deleted.
   d. In the Task user group list, select the user group assigned to tasks created on network insertion or deletion.
   e. Select **Save preferences**.
   f. Select **Continue**.

8. Configure the import schedule to import data at regular intervals.

   a. In the **Setup** stage of the playbook, select the **Configure import schedule** activity.

   b. Select **Configure import schedule**.

   c. Expand the Parent scheduled data import within the Import schedules list to select the **SG-Infoblox IP Pool** import schedule.

   d. In the Configure import schedule dialog box, select the **Active** check box, and then fill in the run schedule and time details.

      For more information, see Schedule a data import.

   e. Select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alternatively, select **Execute Now** to execute the import schedule immediately.

f. Select **Continue**.

9. In the **Setup** stage of the playbook, select the **Confirm connection setup** activity to verify whether the connection was configured.

What to do next

Select **View all connections** to review the connection details. The configured connection appears in the Installed connections list.

Service Graph Connector for Infoblox

CMDB classes targeted in Service Graph Connector for Infoblox

Accessing the connection details of Service Graph Connector for Infoblox

Configure Service Graph Connector for Infoblox using the guided setup

Pull in data from Infoblox into your CMDB.

Before you begin

Important:
Unless there are configuration issues, use the SGC Central view in the Service Graph Workspace or CMDB Workspace to configure the connection for the connector, as the guided setup method is planned for deprecated.

To use this Service Graph Connector, you need a subscription to a Subscription Unit that is based in the IT Operations Management (ITOM) Visibility application or in the ITOM Discovery application. As defined in the section titled "Managed IT Resource Types" in ServiceNow Subscription Unit Overview for your subscription, for managed IT resources that are created or modified in the CMDB by this Service Graph Connector, but that aren't yet managed by ITOM Visibility or ITOM Discovery, these resources will increase Subscription Unit consumption from that application. Review your current Subscription Unit consumption within ITOM Visibility or ITOM Discovery to ensure available capacity.

Dependencies and requirements:

- The Integration Commons for CMDB store app, which is automatically installed.
- The CMDB CI class models store app, which is automatically installed. See CMDB CI Class Models.
- The ITOM Discovery License plugin (com.snc.itom.discovery.license). You must activate this plugin.
- ITOM Licensing plugin (com.snc.itom.license). For more information, see Request Discovery.
- The Datastream Action plugin (com.glide.hub.action_type.datastream), which is automatically installed.
- Observability Commons for CMDB (sn_observability), which is only required for event ingestion. This must be installed prior to installing the connector for Event Management to work. For more information, see Observability Commons for CMDB on the ServiceNow Store.

Note:
If you have an earlier version of the Service Graph Connector for Infoblox, then don't migrate data from the old connector. You must uninstall the previous version and run the new integration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: SGC-Admin (sn_cmdb_int_util.sgc_admin) or admin

Note:
The admin user role is required to run background scripts and to provide access to global tables to the SGC-Admin user. For information about the user roles for Service Graph Connectors, see Service Graph Connector user roles.

Procedure

1. Ensure that the application scope is set to the Service Graph Connector for Infoblox application by using the application picker.
   For more information, see Application picker.
2. Navigate to **All** > **Service Graph Connectors** > **Infoblox** > **Setup**.
3. On the Getting started page, select **Get Started**.
4. Configure the authentication credentials and HTTP connection details for sending requests to the Infoblox API.

   a. Configure your Infoblox authentication credentials.

      i. In the Configure the connection section of the Service Graph Connector for Infoblox page, select **Get Started**.

      ii. For the Configure Infoblox authentication credentials task, select **Configure** to open the Basic Auth Credentials page opens in a new browser tab.

      iii. In the **Name** field, enter a name for the authentication.

      For example, `Infoblox Credential`.

      iv. In the **User name** field, enter the user name that is used to authenticate the HTTP request when this authentication profile is enabled.

      v. In the **Password** field, enter the password for the user name that is used to authenticate the HTTP request.

      vi. Select **Update** to return to the guided setup page.

      vii. Set the Configure Infoblox authentication credentials task to complete by selecting **Mark as Complete**.

   b. Configure the Infoblox connection settings.

      i. For the Configure Infoblox HTTP connection task, select **Configure** to open the HTTP(s) Connection page in a new browser tab.

      ii. Review the fields and in the **Name** field and enter the Infoblox instance name.

      iii. Use the URL builder to build the connection string or in the **Connection URL** field, enter the Infoblox base URL in the following format: `https://<base-URL>`.

      iv. In the **api_version** field of the Attributes section, enter the version of WAPI you're using.

      v. In the **network_view** field of the Attributes section, enter the network views for which data is to be imported.

      For multiple views, separate the views with commas. For example: `view1,view2`. If you leave this field empty, the data sources import data from all the network views.

      vi. Select **Update** to return to the guided setup page.

      vii. Set the Configure Infoblox HTTP connection task to complete by selecting **Mark as Complete**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information about the Infoblox API, see the Infoblox Developer documentation.

c. Configure the connection properties.

i. For the Configure connection properties task, select **Configure** to open the Service Graph Connections page in a new browser tab.

ii. To review and modify the property details, select a property from the **Property** column in the Service Graph Connection Properties related list.

iii. Select **Update** on the Service Graph Connection Properties page.

iv. Select **Update** on the Service Graph Connections page to return to the guided setup page.

v. Set the Configure connection properties task to complete by selecting **Mark as Complete**.

d. Test the Infoblox API connection to import data from the Infoblox application.

i. In the Configure the connection section of the Service Graph Connector for Infoblox page, select **Continue**.

ii. For the Test the connection task, select **Configure** to open the Service Graph Connections page in a new browser tab.

iii. Select **Test Connection**.

iv. When the **Status** field is set to **Success**, select **Update** to close the Test the connection dialog box and return to the guided setup page.

If any of the tests have errors, follow the suggestions for remediation.

v. Set the Test the connection task to complete by selecting **Mark as Complete**.

5. **Optional:** Add multiple instances.

Note:
If you don't need to add multiple instances, you can skip this step.

a. In the Add Multiple Instances section of the Service Graph Connector for Infoblox page, select **Get Started**.

b. For the Update Data Source Access task, select **Configure**.

c. Select the Data Source [sys_data_source] table.

d. Select the **Global** application scope by using the application picker.

e. In the Application Access related list, select the **Can create**, **Can update**, and **Can delete** check boxes, if not already selected.

f. Select **Update** to close the tab and return to the guided setup.

g. Modify the application scope again to **Service Graph Connector for Infoblox** by using the application picker.

h. Set the Update Data Source Access task to complete by selecting **Mark as Complete**.

i. For the Update Scheduled Data Import Access task, select **Configure**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

j. Select the Scheduled data import [scheduled_import_set] table.

k. Repeat steps 5.d to 5.g.

l. Set the Update Scheduled Data Import Access task to complete by selecting **Mark as Complete**.

m. Clear the cache for the new connection.

i. For the Clear Cache for Data Source and Scheduled Data Imports tables task, select **Configure**.

ii. Select the **Global** application scope by using the application picker.

iii. In the **Run script** text box of the background script page, enter the following script:

```
GlideTableManager.invalidateTable("sys_data_source");
GlideCacheManager.flushTable("sys_data_source");

GlideTableManager.invalidateTable("scheduled_import_set");
GlideCacheManager.flushTable("scheduled_import_set");

GlideTableManager.invalidateTable("sys_db_object");
GlideCacheManager.flushTable("sys_db_object");
```

iv. Select **Run Script** to run the background script.

The script may take several minutes to execute.

v. After the script is executed, select **Close**.

vi. Modify the application scope again to **Service Graph Connector for Infoblox** by using the application picker.

vii. Set the Clear Cache for Data Source and Scheduled Data Imports tables task to complete by selecting **Mark as complete**.

n. Add a basic authentication connection to the new Infoblox instance.

i. For the Add Another Basic Auth Connection task, select **Configure**.

ii. To create a new connection, select **Add Connection**.

iii. In the Connection Information section of the Create Connection window, fill in the fields.

Connection Information

Field	Description
Connection name	Name to identify the Infoblox connection record.
Connection URL	Infoblox base URL in the following format: `<base-URL>`.
Use MID Server	Option to use a MID Server. **Note:** Use of a MID Server is optional.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
MID Selection	Name of the MID Server used by the connector. (Optional) This field appears only when the **Use MID server** check box is selected.
MID Application	Name of the MID application used by the connector. (Optional) This field appears only when the **Use MID server** check box is selected.

iv. In the Credential Information section of the Create Connection window, fill in the fields.

Credential Information

Field	Description
Username	Infoblox account user name that is used to authenticate the connection request.
Password	Password that is used to authenticate the connection request.

v. Select **Create Connection**.

vi. Navigate back to the guided setup, and set the Add Another Basic Auth Connection task to complete by selecting **Mark as Complete**.

o. Test the newly added connections.

i. For the Test connections task, select **Configure**.

ii. From the **Name** column, select the new connection.

iii. Select the **Test Connection** related link to start the testing process.

iv. When the **Status** field is set to **Success**, return to the guided setup page.

> **Note:**
> If any of the tests have errors, follow the suggestions for remediation.

v. Set the Test connections task to complete by selecting **Mark as Complete**.

6. Configure the IP address management tasks and user groups.

a. Enable properties to create an IP address management task when deleting or inserting a network.

i. In the Configure IP address management tasks section of the Service Graph Connector for Infoblox page, select **Get Started**.

ii. For Enable creating a task, select **Configure** to open the Enable create Task page in a new browser tab.

iii. Select the **Create a task when a network is deleted** and **Create a task when a network is inserted** check boxes to enable properties for creating IP address management tasks when deleting and inserting a network, respectively.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

iv. Select **Save**.

v. Close the Enable create Task page tab and return to the guided setup page.

vi. Set Enable creating a task to complete by selecting **Mark as Complete**.

b. Configure the user group for IP address management tasks.

i. For the Configure the user group for IP address management tasks task, select **Configure** to open the SG Infoblox Connection page in a new browser tab.

ii. In the **Connection alias** field, review and change the connection alias.

iii. In the **Task user group** field, change the assignment group for the connection alias.

> **Note:**
> By default, the user group for the IP address management tasks is assigned to the IP Address Management user group. To change the default assignment group, change the task user group for the connection alias.

iv. Select **Update** to return to the guided setup page.

v. Set the Configure the user group for IP address management tasks task to complete by selecting **Mark as Complete**.

7. Configure the scheduled jobs to import data from the Infoblox application.

a. In the Set up scheduled import jobs section of the Service Graph Connector for Infoblox page, select **Get started**.

b. For the Configure the scheduled jobs task, select **Configure** to open the Scheduled Data Imports page in a new browser tab.

c. From the **Name** column, select the scheduled job that you want to activate.

d. On the Scheduled Data Import form, verify the field values for the scheduled job.
For more information, see Schedule a data import.

e. Select **Update**.

f. Repeat the steps 7.c to 7.e for each scheduled job for data import.

g. Close the Scheduled Data Imports page tab and return to the guided setup page.

h. Set the Configure the scheduled jobs task to complete by selecting **Mark as Complete** in the guided setup.

Data mapping for Service Graph Connector for Infoblox

Data from the Infoblox data source is mapped and transformed into the ServiceNow CMDB configuration item (CI) class definitions using the Robust Transform Engine (RTE). Data is inserted into the ServiceNow CMDB using the Identification and Reconciliation Engine (IRE).

When you complete setting up the connection, you can configure the integration to pull data periodically from Infoblox. The data is loaded into staging tables and then inserted into the target tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following table lists the data sources, the staging tables, and the target tables as CMDB CI and non-CMDB classes for Infoblox.

Data mapping for Infoblox

Data source	Description	Staging table	Target tables
SG-Infoblox IP Pool	Imports all the network containers from the Infoblox instance. **Note:** The SG-Infoblox IP Pool data source runs before the SG-Infoblox Network data source does.	SG-Infoblox IP Pool [sn_infoblox_integ_sg_infoblox_ip_pool]	Managed IP Pool [cmdb_ci_ip_pool]
SG-Infoblox Network	Imports the IPv4 and IPv6 networks and subnets data from the Infoblox instance. **Note:** The SG-Infoblox Network data source runs after the SG-Infoblox IP Pool data source does.	SG-Infoblox Detailed Subnetwork [sn_infoblox_integ_sg_infoblox_detailed_subnetwork]	Managed IP Network Subnet [cmdb_ci_ip_network_subnet] Managed Network [cmdb_ci_managed_network]
SG-Infoblox	Imports the IPv4	SG-Infoblox IP Address [sn_infoblox_integ_sg_infoblox_ip_address]	Allocated IP Address [cmdb_ci_allocated_ip_addres

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data mapping for Infoblox (continued)

Data source	Description	Staging table	Target tables
IP Address	and IPv6 IP addresses from the Infoblox instance. **Note:** The SG-Infoblox IP Address data source runs after the SG-Infoblox Network data source does.		Managed IP Network Subnet [cmdb_ci_ip_network_subnet] Managed Network [cmdb_ci_managed_network]
SG-Infoblox DNS Alias	Imports all the canonical name (CNAME) records from the Infoblox instance.	SG-Infoblox DNS Alias [sn_infoblox_integ_sg_infoblox_dns_alias]	DNS Alias [cmdb_ci_dns_alias]

For the SG-Infoblox IP Address data source, the Detailed Subnetwork [sn_infoblox_integ_sg_infoblox_detailed_subnetwork] table determines which IP addresses are imported based on the value of the *Get Ip Address* field.

A global default value can be set for the *Get Ip Address* option by setting the value of the *sn_infoblox_integ.default_get_ip_address* system property in Service Graph Connector for Infoblox version 1.5.0 and later. Alternatively, you can update either the *sn_infoblox_integ.included_network_regex* system property to specify the list of IP addresses to be imported or the *sn_infoblox_integ.excluded_network_regex* system property to specify the list of IP addresses to be excluded from the import. For more information, see Service Graph Connector for Infoblox properties.

For more information on where data is saved when pulling data from Infoblox, see CMDB classes targeted in Service Graph Connector for Infoblox.

You can use the IntegrationHub ETL app to view the data maps. See IntegrationHub ETL for more information.

Service Graph Connector for Infoblox properties

CMDB classes targeted in Service Graph Connector for Infoblox

When you complete setting up the connection, you can configure the integration to pull data periodically from Infoblox. The data is saved in tables that extend from the Configuration item [cmdb_ci] table.

Allocated IP Address [cmdb_ci_allocated_ip_address]

The following attributes in the Allocated IP Address [cmdb_ci_allocated_ip_address] table are populated by collected data:

Attribute label	Attribute name
IP Address	ip_address
Managed Network	managed_network
IP Version	ip_version
Is Broadcast	is_broadcast
Is Conflict	is_conflict
Is DHCP	is_dhcp
Is DNS	is_dns
Is Reserved	is_reserved
Name	name
Operational status	operational_status
Subnet	subnet

Relationship created for Allocated IP Address

Parent class	Relationship type	Child class
Allocated IP Address [cmdb_ci_allocated_ip_address]	Reference	Key Value [cmdb_key_value]

DNS Alias [cmdb_ci_dns_alias]

The following attribute in the DNS Alias [cmdb_ci_dns_alias] table is populated by collected data:

Attribute label	Attribute name
Name	name

Key Value [cmdb_key_value]

The following attributes in the Key Value [cmdb_key_value] table are populated by collected data:

Attribute label	Attribute name
Key	key

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Attribute label	Attribute name
Value	value

The Key Value table is populated with Infoblox extensible attributes for all IPAM tables.

Managed IP Network Subnet [cmdb_ci_ip_network_subnet]

The following attributes in the Managed IP Network Subnet [cmdb_ci_ip_network_subnet] table are populated by collected data:

Attribute label	Attribute name
Managed Network	managed_network
Name	name
Parent Pool	parent_pool
CIDR	cidr
Correlation ID	correlation_id
IP Version	ip_version
Operational status	operational_status

Relationships created for Managed IP Network Subnet

Parent class	Relationship type	Child class
Managed IP Network Subnet [cmdb_ci_ip_network_subnet]	Reference	SG-Infoblox Detailed Subnetwork [sn_infoblox_integ_sg_infoblox_detailed_subne
Managed IP Network Subnet [cmdb_ci_ip_network_subnet]	Reference	Key Value [cmdb_key_value]

Note:
The IP Network Subnet table is renamed as Managed IP Network Subnet in Service Graph Connector for Infoblox version 1.5.0. The table is renamed to differentiate managed entities from discovered entities (network subnets).

Managed IP Pool [cmdb_ci_ip_pool]

The following attributes in the Managed IP Pool [cmdb_ci_ip_pool] table are populated by collected data:

Attribute label	Attribute name
Managed Network	managed_network
Name	name
Parent Pool	parent_pool
CIDR	cidr
Correlation ID	correlation_id

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Attribute label	Attribute name
IP Version	ip_version
Operational status	operational_status

Relationship created for Managed IP Pool

Parent class	Relationship type	Child class
Managed IP Pool [cmdb_ci_ip_pool]	Reference	Key Value [cmdb_key_value]

Note:
The IP Pool table is renamed as Managed IP Pool in Service Graph Connector for Infoblox version 1.5.0. The table is renamed to differentiate managed entities from discovered entities (IP pools).

Managed Network [cmdb_ci_managed_network]

The following attributes in the Managed Network [cmdb_ci_managed_network] table are populated by collected data:

Attribute label	Attribute name
Correlation ID	correlation_id
Name	name
Operational status	operational_status

Relationship created for Managed Network

Parent class	Relationship type	Child class
Managed Network [cmdb_ci_managed_network]	Reference	Key Value [cmdb_key_value]

Note:
In Service Graph Connector for Infoblox version 1.5.0 and later, the Managed Network [cmdb_ci_managed_network] table imports Infoblox Network View data.

SG-Infoblox Detailed Subnetwork [sn_infoblox_integ_sg_infoblox_detailed_subnetwork]

The following attributes in the SG-Infoblox Detailed Subnetwork [sn_infoblox_integ_sg_infoblox_detailed_subnetwork] table are populated by collected data:

Attribute label	Attribute name
Network	network
Get Ip Address	list_ip_address
Network Type	network_type
Network View	network_view

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Attribute label	Attribute name
Operational status	operational_status
Connection ID	connection_id

Accessing the connection details of Service Graph Connector for Infoblox

You can access the connection details of the Service Graph Connector for Infoblox in a single view using the common connection framework (CCF) included within the Integration Commons for CMDB (sn_cmdb_int_util) store app.

With the CCF, you can access all the connections used by the Service Graph Connector for Infoblox. The connection details include the connection alias, connection properties, data sources, and scheduled data imports associated with a connection. You can also test the connection. For more information, see Accessing the connection details of Service Graph Connectors.

Access the details of an Infoblox connection

Access the details of an Infoblox connection configured for the Service Graph Connector for Infoblox.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Service Graph Connectors** > **Infoblox** > **Connections**.
2. From the **Name** column of the Service Graph Connections list, select a connection.
3. On the Service Graph Connections page, view the connection details such as the connection name, alias, and data sources.
4. Select a related list to view further details of the connection.
5. **Optional:** Select the **Test Connection** related link to test the connection.

Handling parallel data loading in Service Graph Connector for Infoblox

Parallel data loading in the Service Graph Connector for Infoblox optimizes performance.

Parallel data loading is supported in Service Graph Connector for Infoblox version 1.3.0 and later. Parallel data loading can be enabled for the SG-Infoblox Network and SG-Infoblox IP Address data sources by setting the partition size in the *sn_infoblox_integ.parallel_loading_partition_size* system property. This system property determines the maximum number of networks that each partition processes. The maximum value that you can set for the partition size is `150`.

- For the SG-Infoblox Network data source, the partition size is based on network views.
- For the SG-Infoblox IP Address data source, the partition size is based on the number of networks.

Create table cleanup jobs for Service Graph Connector for Infoblox

Create table cleanup jobs to automate the cleanup of retired CIs from Service Graph Connector for Infoblox version 1.4.0 and earlier based on your organization's data retention requirements and integration dependencies.

Before you begin

Note:
Creating table cleanup jobs for deleting outdated data is an optional procedure.

Dependencies and requirements:

- Upgrade to Service Graph Connector for Infoblox version 1.5.0.
- Verify that the initial full data load is complete after upgrading to Service Graph Connector for Infoblox version 1.5.0.
- Verify that active integrations do not use any of the old data and that the retired CIs can be safely deleted.

Role required: admin

Procedure

1. Set the application scope to **CMDB CI Class Models** by using the application picker.
   The IPAM tables (Managed Network, IP Pool, Subnet, and Allocated IP Address) belong to the CMDB CI Class Models scope. For more information, see Application picker.
2. Navigate to **All** > **System Maintenance** > **Table Cleanup**.
3. Select **New** to create a new table cleanup job.
4. Configure a table cleanup job for the IPAM tables.

Field	Description
Table name	Enter the name of the IPAM table from which outdated data is to be cleaned up. You can create table cleanup jobs for the following IPAM tables: ○ cmdb_ci_managed_network ○ cmdb_ci_ip_pool ○ cmdb_ci_ip_network_subnet ○ cmdb_ci_allocated_ip_address
Age in seconds	Set the value to either `0` or `86400` (24 hours). ○ `0`: All records updated from now are deleted (immediate cleanup). ○ `86400`: Records older than 24 hours are cleaned up (recommended). **Note:** Setting this value to less than 24 hours (86400 seconds) could result in missing session statistics data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Add filters for the table cleanup job.
   a. Select **Discovery source** is **SG-Infoblox**.
   b. Select **AND**.
   c. Select **Operational status** is **retired**.

> **Important:**
> Incorrect configuration of these filters might delete operational CIs or CIs from other discovery sources.

6. Select **Submit**.

   The job runs automatically in the next available maintenance window.

7. Repeat step 4 to step 6 for the remaining IPAM tables.
8. Configure a table cleanup job for the Detailed Network [sn_infoblox_integ_sg_infoblox_detailed_subnetwork] table.

   a. Switch the application scope to **Service Graph Connector for Infoblox** by using the application picker.

   b. Navigate to **All** > **System Maintenance** > **Table Cleanup**.

   c. Select **New**.

   d. Configure a table cleanup job for the Detailed Network [sn_infoblox_integ_sg_infoblox_detailed_subnetwork] table.

Field	Description
Table name	Enter `sn_infoblox_integ_sg_infoblox_detailed_sub` as the table name.
Age in seconds	Set the value to either `0` or `86400` (24 hours). ▪ `0`: All records updated from now are deleted (immediate cleanup). ▪ `86400`: Records older than 24 hours are cleaned up (recommended). **Note:** Setting this value to less than 24 hours (86400 seconds) could result in missing session statistics data.

   e. Select **Operational status** is **retired**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:
Incorrect configuration of this filter might delete operational CIs or CIs from other discovery sources.

f. Select **Submit**.

Service Graph Connector for Infoblox reference

Reference topics provide additional information about Service Graph Connector for Infoblox components.

Life cycle management of records in Service Graph Connector for Infoblox

Life cycle management in the Service Graph Connector for Infoblox monitors and updates the statuses of Infoblox resources throughout their life cycle, from creation to deletion.

The life cycle management process helps maintain the accuracy and integrity of data in the Configuration Management Database (CMDB).

Soft deletion of Infoblox configuration items (CIs) is implemented in Service Graph Connector for Infoblox version 1.5.0 and later. The *operational_status* attribute of CIs is updated from `operational` to `retired` for CIs that aren't discovered during the latest pull. You can decide whether to delete or retain the retired CIs.

Life cycle management is supported for the following tables:

- Managed Network [cmdb_ci_managed_network]
- IP Pool [cmdb_ci_ip_pool]
- Subnet [cmdb_ci_ip_network_subnet]
- Detailed Network [sn_infoblox_integ_sg_infoblox_detailed_subnetwork]
- Allocated IP Address [cmdb_ci_allocated_ip_address]

Service Graph Connector for Infoblox properties

Service Graph Connector for Infoblox properties control the behavior of the connector.

Connection properties

These connection properties are available for the Service Graph Connector for Infoblox.

Note:
To open the Service Graph Connection Properties [sn_cmdb_int_util_service_graph_connection_property] table for the connector, navigate to **All** > **Service Graph Connectors** > **Infoblox** > **Connections**, and select the connection name. The connection properties are displayed in the Service Graph Connection Properties related list.

Connection properties for Service Graph Connector for Infoblox

Property	Description
api_version	Version of the Infoblox API.
network_view	Enter the names (as a comma-separated list) of the Infoblox Network Views from which data is to be imported.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Connection properties for Service Graph Connector for Infoblox (continued)

Property	Description
	Note: If a value isn't specified for this property, data is imported from all Infoblox network views. • Type: string • Default value: empty

System properties

These system properties are available for the Service Graph Connector for Infoblox.

Note: To open the System Properties [sys_properties] table, enter `sys_properties.list` in the navigation filter.

System properties for Service Graph Connector for Infoblox

Property	Description
sn_infoblox_integ.parallel_loading_partition_size	Set the maximum number of networks that each partition processes. The maximum value that can be set for this property is `150`. • Type: integer • Default value: empty • Location: System Property [sys_properties] table
sn_infoblox_integ.default_get_ip_address	Set a global default value for the *`Get IP Address`* option. When the value is set to `true`, all newly imported networks automatically retrieve IP address details. You can specify which IP addresses are to be excluded from the import by using the *`sn_infoblox_integ.excluded_network_regex`* system property. When the value is set to `false`, networks don't retrieve IP addresses by default. You can specify which IP addresses are to be imported by using the *`sn_infoblox_integ.included_network_regex`* system property. • Type: true | false • Default value: `false` • Location: System Property [sys_properties] table

CMDB classes targeted in Service Graph Connector for Infoblox

Service Graph Connector for Jamf

Use the Service Graph Connector for Jamf to pull data from Jamf into your ServiceNow instance.

The Service Graph Connector for Jamf pulls data from computers, disks, networks, and software applications into the ServiceNow® Configuration Management Database (CMDB) application.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Supported versions

Supported ServiceNow versions:

- Xanadu
- Yokohama
- Zurich

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use cases

The following are examples on how you can use the Service Graph Connector for different ServiceNow® applications:

- IT Operations Management (ITOM) Visibility
  - Detailed hardware and software inventory tracking for macOS hardware and apps. The tracking can be done with or without Software Asset Management (SAM).
  - Detailed hardware and software inventory tracking for hardware and apps for both iPhones and iPads. The tracking can be done with or without Software Asset Management (SAM).
  - Compliance tracking for mobile devices and end-user computers.
  - Duplicate data detection on imports to improve performance of nightly imports.
- Software Asset Management (SAM) and IT Asset Management (ITAM)
  - Software package and installation tracking.
  - License reclamation by detecting removed software.
  - Software Usage tracking.
- IT Service Management (ITSM)
  - Incidents, problems, and changes on discovered configuration items (CI).
  - Automatic ownership assignment based on top users.

Configuring a connection for the connector

You can configure a connection for the connector by using the SGC Central view in the Service Graph Workspace or CMDB Workspace. The view enables you to discover and install connectors, and then effectively manage the full life cycle of creating, editing, monitoring, and debugging connections. To configure the connector using SGC Central, see Configure Service Graph Connector for Jamf using SGC Central.

Important:
Unless there are configuration issues, use the SGC Central view in the Service Graph Workspace or CMDB Workspace to configure the connection for the connector, as the guided setup method is planned for deprecated.

CMDB integrations dashboard

The Integration Commons for CMDB store app provides a dashboard with a central view of the status, processing results, and processing errors of all installed integrations. You can see metrics for all integration runs. You can filter the view to a specific CMDB integration, a specific time duration, or a specific integration run. For more details about monitoring Jamf integrations in the CMDB Integrations Dashboard, see Using the CMDB Integrations Dashboard.

Data mapping

Data from the Jamf data source is mapped and transformed into the ServiceNow CMDB Configuration Item (CI) class definitions using the Robust Transform Engine (RTE). Data is inserted into the ServiceNow CMDB using the Identification and Reconciliation Engine (IRE).

When you complete setting up the connection, you can configure the integration to periodically pull data from Jamf.

The delta data synchronization feature is available in Jamf version 2.14 and higher. You can configure the `is_delta_enabled_for_computers` and

is_delta_enabled_for_mobiles connection properties for synchronizing only delta data from a Jamf instance. See Configuring data synchronization in Service Graph Connector for Jamf.

The following data sources are included for the Jamf application:

SG-Jamf Computers

Imports data from computers and loads the imported data in the SG-Jamf Computers [sn_jamf_integrate_sg_jamf_computers] staging table.

SG-Jamf Lookup Mac Software Bundle Ids

Imports data from software applications installed on macOS devices and loads the imported data in the SG-Jamf Lookup Mac Software Bundle Ids [sn_cmdb_int_util_mac_software_bundleid_lookup] staging table.

Note:
To view the publisher information for applications installed on macOS devices, run the SG-Jamf Lookup Mac Software Bundle Ids data source before running the SG-Jamf Computers or SG-Jamf Mobile Devices data sources.

SG-Jamf Mobile Devices

Imports data from mobile devices and loads the imported data in the SG-Jamf Mobile Devices [sn_jamf_integrate_sg_jamf_mobile_devices] staging table.

SG-Jamf Remove Computers Software

Removes the imported computer software data that were later deleted from the source and updates the information in the SG-Jamf Remove Computers Software [sn_jamf_integrate_jamf_remove_software] staging table.

SG-Jamf Remove Mobile Software

Removes the imported mobile software data that were later deleted from the source and updates the information in the SG-Jamf Remove Mobile Software [sn_jamf_integrate_remove_mobile_software] staging table.

SG-Jamf Software Usage

Imports the software usage details from the Jamf environment to track which software data is being used infrequently, hasn't been used recently enough, or isn't being used at all and loads the imported data in the SG-Jamf Software Usage [sn_jamf_integrate_jamf_software_usage] staging table. Based on the software usage information, you can add a reclamation rule to aggregate usage records and to identify unused software devices. See Software reclamation rules.

Note:
The SG-Jamf Software Usage data source is available only when the Software Asset Management Professional plugin (com.snc.samp) is activated on your ServiceNow instance. See Request Software Asset Management.

The imported data is then inserted into the following target tables:

- CI Relationship [cmdb_rel_ci]
- Computer [cmdb_ci_computer]
- Disk [cmdb_ci_disk]
- Handheld Computing device [cmdb_ci_handheld_computing]
- IP Address [cmdb_ci_ip_address]
- Network Adapter [cmdb_ci_network_adapter]
- Printer [cmdb_ci_printer]

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Serial Number [cmdb_serial_number]
- Software Installation [cmdb_sam_sw_install] (If the SAM application is installed.)
- Software Instance [cmdb_software_instance] (If the SAM application is not installed.)
- Software [cmdb_ci_spkg] (If the SAM application is not installed.)
- Software Usage [samp_sw_usage]

Note:
For the Computer [cmdb_ci_computer] and Handheld Computing device [cmdb_ci_handheld_computing] data sources, if you created multiple Jamf instances and want to know where the CIs originated from, you can identify the origins from the **Key** and **Value** columns. Additionally, you can view the Jamf Extension Attributes [sn_jamf_integrate_extension_attribute] and Most recent discovery [last_discovered] fields in both data sources. If you want to configure multiple instances, follow the steps in Configure Service Graph Connector for Jamf using the guided setup in step 4.

For more information on where data is saved when pulling data from a Jamf application, see CMDB classes targeted in Service Graph Connector for Jamf.

You can use the IntegrationHub ETL app to view the data maps. See IntegrationHub ETL for more information.

Service Graph Connectors

Configure Service Graph Connector for Jamf using SGC Central

Use the playbook available with the SGC Central application to set up the Service Graph Connector for Jamf for pulling in Jamf data into the CMDB.

Before you begin

Install Service Graph Connector for Jamf version 2.13.0 or later from the ServiceNow Store. For ServiceNow Store installation steps, see Install a ServiceNow Store application.

When using client credentials for authentication, obtain the OAuth credentials from your Jamf administrator. Make a note of the following details:

- Application (client) ID
- Client Secret

If using Client Credentials authentication in Jamf Pro, you need to use the API Roles and Clients functionality. For more details, refer to the API Roles and Clients section in the Jamf documentation. When creating a new API client in the Jamf environment, the **Access token lifetime** field on the form for creating a client enables setting how long the token remains valid. The default is 60 seconds, but due to ServiceNow AI Platform limitations, the value must be set to more than 60 seconds. Setting the token lifetime to 3600 seconds (1 hour) helps prevent potential issues.

Role required: admin

About this task

The playbook experience for onboarding connectors is activated with SGC Central in the Service Graph Workspace or CMDB Workspace. To configure the SGC Central application, see Configuring SGC Central and for more information on how to interact with a playbook, see Interact with Playbook.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Use one of the following methods to open SGC Central:
   - Navigate to **Workspaces** > **Service Graph Workspace**, and from the left navigation panel, select the Ingestion icon to open the SGC Central view.
   - Navigate to **Workspaces** > **CMDB Workspace** > **SGC Central**.
2. On the Overview page, select **Create connection**.

   Tip:
   Alternatively, you can select **Create connection** on the All connections page.

3. On the Create connection window, select the Jamf connector type and then select **Create connection**.
4. Complete the initial prerequisites when setting up a connection for the first time using a connector.

   Note:
   This step is required only during the first-time setup. See Perform initial setup tasks when creating a connection in SGC Central.

5. Determine the type of authentication for the Jamf connection.

   a. In the **Setup** stage of the playbook, select the **Select alias template** activity.
   If needed, expand the **Setup** stage to select an activity.

   b. Select an alias template for the connection.
   - **SG-Jamf OAuth Connection**: Select when using OAuth or client credentials for authentication.
   - **SG-Jamf Basic Connection**: Select when using Basic authentication or Bearer token.

   c. Select **Continue**.

6. Enter connection details and test the API connection for importing data.

   a. In the **Setup** stage of the playbook, select the **Configure and test connection** activity.

   b. On the form, fill in the fields.
   - When the **SG-Jamf OAuth Connection** template is selected, fill in the details as shown in the following table.

OAuth connection information

Field	Description
Connection Name	Name to identify the Jamf connection record.
Connection URL	Base URL to connect to the Jamf API.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: This field is automatically set to the URL to connect to the application. Leave the field value as is.
OAuth Client ID	Application (client) ID of your Jamf client application as noted in the Before you begin section. **Note:** Verify that the Jamf client has read privileges for the **Computers** and **Mobile Devices** categories in Jamf.
OAuth Client Secret	Client Secret of your Jamf client application as noted in the Before you begin section.
Use MID Server	Option to use a MID Server. **Note:** Use of a MID Server is optional.
Mid Selection	Name of the MID Server used by the connector. This field appears only when the **Use MID Server** check box is selected.

- When the **SG-Jamf Basic Connection** template is selected, fill in the details as shown in the following table.

Basic connection information

Field	Description
Connection Name	Name to identify the Jamf connection record.
Connection Host	Target host value used by the connection. **Note:** Update the **Host** field with your Jamf base URL or IP address. For example, `demojamfhost.com` or `127.0.0.1`.
User Name	User name that is used to authenticate the HTTP or HTTPS request when this Basic authentication profile is enabled.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: Verify that the Jamf user has read privileges for the **Computers** and **Mobile Devices** categories in Jamf.
Password	Password that is used to authenticate the HTTP or HTTPS request when this Basic authentication profile is enabled.
Use MID Server	Option to use a MID Server. **Note:** Use of a MID Server is optional.
Mid Selection	Name of the MID Server used by the connector. This field appears only when the **Use MID Server** check box is selected.

c. Select **Create and test connection**.

d. Once the connection test is complete, select **Continue**.

7. **Optional:** Set configuration properties for the connection to access Jamf resources.

Note:
To skip this step, select **Continue** for the **Set configuration properties** activity. If you skip this step, the default values of the properties are considered.

a. In the **Setup** stage of the playbook, select the **Set configuration properties** activity.

b. Set the fields for configuration properties as described in the following table.

Configuration properties

Field	Description
Import managed application records only	Option to limit the import to managed application records only. **Note:** If the **Import managed application records only** check box is cleared, the default behavior is to import all application records.
Use JAMF Pro API	Option to enable the use of the Jamf Pro API for querying computer records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: When the **Use JAMF Pro API** check box is selected, the connector uses the Jamf Pro API, which offers pagination of response data and improved performance over the Jamf Classic API.

c. Select **Continue**.

8. Configure the import schedule to import data at regular intervals.

a. In the **Setup** stage of the playbook, select the **Configure import schedule** activity.

b. Select **Configure import schedule**.

c. Select the **Active** check box, and then fill in the run schedule and time details.

For more information, see Schedule a data import.

d. Select **Save**.

e. Repeat steps from 8.b to 8.d for each job displayed on the page.

f. Select **Continue**.

9. In the **Setup** stage of the playbook, select the **Confirm connection creation** activity to verify whether the connection was created.

What to do next

Select **View all connections** to review the connection details. The configured connection appears in the Installed connections list.

Related topics

Service Graph Connector for Jamf

CMDB classes targeted in Service Graph Connector for Jamf

Accessing the connection details of Service Graph Connector for Jamf

Configure Service Graph Connector for Jamf using the guided setup

Set up authentication credentials and scheduled jobs to import Jamf data into your Configuration Management Database (CMDB).

Before you begin

Important:
Unless there are configuration issues, use the SGC Central view in the Service Graph Workspace or CMDB Workspace to configure the connection for the connector, as the guided setup method is planned for deprecated.

To use this Service Graph Connector, you need a subscription to a Subscription Unit that is based in the IT Operations Management (ITOM) Visibility application or in the ITOM Discovery application. As defined in the section titled "Managed IT Resource Types" in ServiceNow Subscription Unit Overview for your subscription, for managed IT resources that are created

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

or modified in the CMDB by this Service Graph Connector, but that aren't yet managed by ITOM Visibility or ITOM Discovery, these resources will increase Subscription Unit consumption from that application. Review your current Subscription Unit consumption within ITOM Visibility or ITOM Discovery to ensure available capacity.

Dependencies and requirements:

- The Integration Commons for CMDB store app, which is automatically installed.
- The CMDB CI class models store app, which is automatically installed. See CMDB CI Class Models.
- ITOM Licensing plugin (com.snc.itom.license). An unlicensed plugin that contains computation logic for SU consumption as necessary. For more information, see Request Discovery.
- Jamf Classic API version 10.x.

When using client credentials for authentication, obtain the OAuth credentials from your Jamf administrator. Make a note of the following details:

- Application (client) ID
- Client Secret

If using Client Credentials authentication in Jamf Pro, you need to utilize the API Roles and Clients functionality. For more details, refer to the API Roles and Clients section in the Jamf documentation. When creating a new API client in the Jamf environment, the **Access token lifetime** field on the form for creating a client enables setting how long the token remains valid. The default is `60` seconds, but due to ServiceNow AI Platform limitations, the value must be set to more than `60` seconds. Setting the token lifetime to `3600` seconds (1 hour) helps prevent potential issues.

Role required: admin

Procedure

1. Navigate to **All** > **Service Graph Connectors** > **Jamf** > **Setup**.
2. On the Getting Started page, select **Get started**.
3. Set configuration properties.

   a. On the Service Graph Connector for Jamf page, in the Set configuration properties section, select **Configure JSON data size limit**.

   b. For the Configure JSON data size limit task, select **Configure**.

   c. Select the **Global** application scope from the application picker.

   d. Set the `com.glide.transform.json.max-partial-length` system property value.

      - To create a system property, select **New** and enter `com.glide.transform.json.max-partial-length` as the name and `65536` as the value of the property.
      - If the *`com.glide.transform.json.max-partial-length`* property already exists, verify that its value is set to `65536`.

   e. Set the Configure JSON data size limit task to complete by selecting **Mark as Complete**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Configure the authentication credentials and HTTP connection for sending requests to the Jamf API.

   a. Enter Basic or Bearer token authentication details.

   > **Important:**
   > Skip this step if using Client credentials for authentication, and instead go to step 4.c.

   i. For the Configure Jamf authentication: Basic or Bearer token authentication task, select **Configure**.

   ii. On the form, fill in the fields.

   Basic Auth Credentials form

Field	Description
Name	Descriptive name of this authentication configuration.
User name	User name that is used to authenticate the HTTP or HTTPS request when this Basic authentication profile is enabled. **Note:** Verify that the Jamf user has read privileges for the **Computers** and **Mobile Devices** categories in Jamf.
Password	Password that is used to authenticate the HTTP or HTTPS request when this Basic authentication profile is enabled.

   iii. Select **Update**.

   iv. Set the Configure Jamf authentication: Basic or Bearer token authentication task to complete by selecting **Mark as Complete**.

   b. Configure the Jamf HTTP connection.

   > **Important:**
   > Skip this step if using Client credentials for authentication, and instead go to step 4.c.

   i. For the Configure Jamf HTTP connection task, select **Configure**.

   ii. On the form, fill in the fields.

   HTTP(s) Connection form

Field	Description
Name	Name of the connection.
Credential	Credential value used by this connection.
Connection alias	Connection value that is used to refer to the connection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Active	Option to activate the HTTP connection.
Domain	Domain that contains the connection.
URL builder	Option to enable the system to build the connection URL.
Connection URL	Connection URL for the connection. You can either manually enter a URL or use the URL builder to build the connection string. **Note:** You can't modify the **Connection URL** field if you select the **URL builder** check box.
Mutual authentication	Option to set the connection with mutual authentication. This field appears only when the **URL builder** check box is selected.
Protocol	Underlying protocol used by the connection. This field appears only when the **URL builder** check box is selected. **Note:** Update the **Protocol** field if you are using anything other than `https`.
Use MID server	Option to select a MID Server that sends this HTTP connection. Using a MID Server is not compatible with mutual authentication.
Connection timeout	Number of milliseconds the system waits for a successful host connection. If a successful connection doesn't occur during this time, the connection request times out. Leave this field empty to use the system default connection timeout value.
Host	Target host value used by the connection. This field appears only when the **URL builder** check box is selected. **Note:** Update the **Host** field with your Jamf base URL or IP address. For example, `demojamfhost.com` or `127.0.0.1`.
Override default port	Target value port that is used by the connection. This field appears only when the **URL builder** check box is selected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Base path	Base path for HTTPS connection. This field appears only when the **URL builder** check box is selected. **Note:** To use the Jamf Pro API, the **Base path** field must be empty. Therefore, clear any value in the **Base path** field.

iii. Select **Update**.

iv. Set the Configure Jamf HTTP connection task to complete by selecting **Mark as Complete**.

c. Configure the client authentication credentials.

Important:
Skip this step if using basic token for authentication, and instead go to step 4.a.

i. For the Configure Jamf authentication: Client credentials task, select **Configure**.

ii. Select **Edit** for the SG-Jamf OAuth Connection, the default connection.

iii. In the Connection Information section of the Edit Connection window, fill in the fields.

Connection Information

Field	Description
Connection Name	Name to identify the Jamf connection record. `SG-Jamf OAuth Connection` is the default credential alias name and is read-only.
Connection URL	Base URL to connect to the Jamf API. **Note:** This field is automatically set to the URL to connect to the application. Leave the field value as is.

iv. (Optional) If a MID Server is required for the Jamf server connection, select the **Use MID Server** check box. Then, select the MID Server-related fields accordingly.

v. In the Credential Information section of the Edit Connection window, fill in the fields.

Credential Information

Field	Description
OAuth Client ID	Application (client) ID of your Jamf client application as noted in the Before you begin section.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: Verify that the Jamf client has read privileges for the **Computers** and **Mobile Devices** categories in Jamf.
OAuth Client Secret	Client Secret of your Jamf client application as noted in the Before you begin section.

d. Test the connection.

i. For the Test connection task, select **Configure**.

ii. Review the properties in the Service Graph Connection Properties related list.

Note:
The properties in the Service Graph Connection Properties related list of the connection record are modifiable. Be sure to complete the guided setup, review the property descriptions, and follow the instructions carefully before making any changes to them.

- For Basic authentication, set the *auth_type* property value to `basic` (applicable only for Jamf versions lower than 10.35. Note that Jamf no longer supports Basic authentication, and it will be disabled for all instances starting with Jamf version 11.5).
- For Bearer token authentication, set the *auth_type* property value to `bearer` (available in Jamf version 10.35 or higher).
- For Client credentials (OAuth 2.0) authentication, set the *auth_type* property value to `oauth` (available in Jamf version 10.49 or higher).
- If no authentication type is selected, the connector defaults to Bearer token authentication.

iii. Test the connection by selecting the **Test Load 20 Records** related link.

Testing the connection might take a few moments. The page is refreshed to show the test results.

Note:
The connection is successful if the **HTTP Status** is **200**. If there is anything displayed in the **Error Code** and **Error Message** fields, then the connection failed and further troubleshooting is required. Do not select **Load All Records** during this setup.

iv. Set the Test the connection task to complete by selecting **Mark as Complete**.

5. Optional: Add multiple instances.

Note:
If you don't need to add multiple instances, you can skip this step.

a. In the Add Multiple Instances section of the Service Graph Connector for Jamf page, select **Get Started**.

b. Enable creating data sources for the new Jamf connection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

i. Ensure that you have edit permissions for the Datasource [sys_data_source] table.

ii. For the Update data source Access task, select **Configure**.

iii. To edit the record, select the **Global** application scope from the application picker.

iv. In the Application Access related list of the Data Source form that opens in a new tab, select the **Can create**, **Can update**, and **Can delete** check boxes.

v. Select **Update**.

vi. Select the back icon (<) to return to the guided setup page.

vii. From the application picker, select the **Service Graph Connector for Jamf** application scope.

viii. Set the Update data source Access task to complete by selecting **Mark as Complete**

c. Enable creating a scheduled data import job for the new Jamf connection.

i. Ensure that you have edit permissions for the Scheduled data import [scheduled_import_set] table.

ii. For the Update scheduled data import access task, select **Configure**.

iii. To edit the record, select the **Global** application scope from the application picker.

iv. In the Application Access related list of the Scheduled Data Import form that opens in a new tab, select the **Can create**, **Can update**, and **Can delete** check boxes.

v. Select **Update**.

vi. Select the back icon (<) to return to the guided setup page.

vii. From the application picker, select the **Service Graph Connector for Jamf** application scope.

viii. Set the Update scheduled data import access task to complete by selecting **Mark as Complete**.

d. Select authentication type for new connection.

> **Note:**
> From the application picker, select the **Service Graph Connector for Jamf** application scope.

i. For the Select authentication type for new connection task, select **Configure**.

ii. Select **sn_jamf_integrate.auth_type** from the **Name** column.

iii. Set the *sn_jamf_integrate.auth_type* property to one of the following values:

- `basic`: Basic authentication that uses a user name and password.
- `bearer`: Bearer token authentication that uses a user name and password to retrieve a bearer token.
- `oauth`: Client credentials authentication that uses a client ID and client secret to authenticate via OAuth 2.0.

iv. Navigate back to the guided setup.

v. Set the Select authentication type for new connection task to complete by selecting **Mark as Complete**.

e. Add another connection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Verify that the **Service Graph Connector for Jamf** application scope is selected in the application picker.

i. For the Add another connection task, select **Configure**.

ii. In the Workflow Studio, select **Add Connection**.

iii. On the form, based on the authentication type fill in the fields.

Note:

- For Basic or Bearer token authentication-based connection, don't include `https://` in the **Connection Host** field. Example connection host value: `test.jamfcloud.com`.
- For Client credentials authentication-based connection, include `https://` in the **Connection URL** field. Example connection URL value: `https://test.jamfcloud.com`.

iv. Depending on the authentication type, select the button to create the connection.

v. Navigate back to the guided setup.

vi. Set the Add another connection task to complete by selecting **Mark as Complete**.

f. When using the Jamf Pro API, the Jamf Pro 10.35 or higher version, or both, specify the Jamf Pro version and API.

i. For the Select JAMF Pro version and API task, select **Configure**.

ii. In the **Use JAMF Pro API** column, for the connection you created, modify the value from **false** to **true** to use the Jamf Pro API instead of the Classic API.

iii. Update the **Jamf Pro 10.35 or higher** column value to **true** when using the Jamf Pro 10.35 or higher version.

Note:
With the **Jamf Pro 10.35 or higher** column value set to **true**, the Bearer Token authentication is used to authenticate the Jamf API. Else, the basic authentication is used.

iv. Set the Select JAMF Pro version and API task to complete by selecting **Mark as Complete**.

g. Test the new connections.

i. For the Test new connections task, select **Configure**.

ii. Select the name of the connection you want to test.

iii. To validate the data source configuration, select **Test Load 20 Records**.

Note:
If any of the tests have an error code or message or error sign, the connection failed and further troubleshooting is required.

iv. Set the Test new connections task to complete by selecting **Mark as Complete**.

6. Set up the scheduled import jobs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. For the Configure scheduled jobs task in the Set up scheduled import jobs section, select **Configure**.

b. Select the scheduled job that you want to activate.

> **Note:**
> By default, the SG-Jamf Mobile Devices scheduled job is automatically set as **Active** and runs the SG-Jamf Computer scheduled job as a parent.

c. On the Scheduled Data Import form, verify the field values for the scheduled job and select the **Active** check box to activate the scheduled job.

For more information, see Schedule a data import.

d. Select **Update**.

e. Repeat the steps 6.b to 6.d for each scheduled job for data import.

f. Set the Configure scheduled jobs task to complete by selecting **Mark as Complete** in the guided setup.

CMDB classes targeted in Service Graph Connector for Jamf

When you complete setting up the connection, you can configure the integration to periodically pull data from Jamf. The data is saved in tables that extend from the Configuration item [cmdb_ci] table.

Accessing the connection details of Service Graph Connector for Jamf

You can access the connection details of the Service Graph Connector for Jamf in a single view using the common connection framework (CCF) included within the Integration Commons for CMDB (sn_cmdb_int_util) store app.

With the CCF, you can access all the connections used by the Service Graph Connector for Jamf. The connection details include the connection alias, connection properties, data sources, and scheduled data imports associated with a connection. You can also test the connection. For more information, see Accessing the connection details of Service Graph Connectors.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Access the details of a Jamf connection

Access the details of a Jamf connection configured for the Service Graph Connector for Jamf.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Service Graph Connectors** > **Jamf** > **Connections**.
2. From the **Name** column of the Service Graph Connections list, select a connection.
3. On the Service Graph Connections page, view the connection details such as the connection name, alias, and data sources.
4. Select a related list to view further details of the connection.
5. **Optional:** Select the **Test Connection** related link to test the connection.

Configuring data synchronization in Service Graph Connector for Jamf

You can configure the connection properties for synchronizing only delta data from a Jamf instance.

The delta data synchronization feature is available in Jamf version 2.14 and higher. The connector provides the ability to import only delta data from a Jamf instance. With delta synchronization enabled, the importing process of Jamf data is quicker because the connector imports only the changes in Jamf data. The **Last success import time** field of a data source displays the timestamp of the most recent successful pull run. The delta pull period is calculated by subtracting the last successful run date and time from the current date and time that is Delta period = Current date timestamp - Last success import date timestamp.

The application includes the *`is_delta_enabled_for_computers`* and *`is_delta_enabled_for_mobiles`* connection properties to enable delta synchronization for computers and mobile devices, respectively. By default, the *`is_delta_enabled_for_computers`* and *`is_delta_enabled_for_mobiles`* properties are set to `false`. To enable delta data synchronization, set these properties to `true`.

Note:

- The *`is_delta_enabled_for_computers`* connection property is available only if the *`use_jamf_pro_api`* property is set to `true`.
- The *`is_delta_enabled_for_mobiles`* connection property is available only if the *`use_jamf_mobile_pro_api`* property is set to `true`.

See Service Graph Connector for Jamf properties.

When you want to import full data from your Jamf instance, you must disable the *`is_delta_enabled_for_computers`* and *`is_delta_enabled_for_mobiles`* properties by setting these properties to `false`. See Disable delta synchronization.

Note:
When the full import of data is completed, set the *`is_delta_enabled_for_computers`* and *`is_delta_enabled_for_mobiles`* properties back to `true` to pull delta data later. If you leave the properties set to `false`, full data is imported with every pull, which takes considerable time.

Disable delta synchronization

Disable delta synchronization to import all the Jamf data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

About this task
The delta data synchronization feature is available in Jamf version 2.14 and higher.

Procedure
1. Navigate to **All** > **Service Graph Connectors** > **Jamf** > **Connections**.
2. From the list of connections, open the connection for which you want to disable delta synchronization.

   The connection properties are displayed in the Service Graph Connection Properties related list.

   - To disable delta synchronization for computers, open the *is_delta_enabled_for_computers* property.
   - To disable delta synchronization for mobile devices, open the *is_delta_enabled_for_mobiles* property.
3. In the **Value** field, enter `false`.
4. Select **Update**.

Service Graph Connector for Jamf properties
Service Graph Connector for Jamf properties control the behavior of the connector.

Connection properties
These connection properties are available for the Service Graph Connector for Jamf.

Note:
To open the Service Graph Connection Properties [sn_cmdb_int_util_service_graph_connection_property] table for the connector, navigate to **All** > **Service Graph Connectors** > **Jamf** > **Connections**, and select the connection name. The connection properties are displayed in the Service Graph Connection Properties related list.

Connection properties for Service Graph Connector for Jamf

Property	Description
auth_type	Set the property to `basic` to use Basic authentication for the connection. This authentication type uses a user name and password. Set the property to `oauth` to use Client credentials (OAuth 2.0) authentication for the connection. This authentication type uses a client ID and client secret. The default Bearer token authentication type uses a user name and password to retrieve a token for subsequent connection requests. • Type: basic | bearer | oauth • Default value: `bearer`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection properties for Service Graph Connector for Jamf (continued)

Property	Description
	Note: • For an OOB default connection, any of the three authentication types can be used. • For additional connections (multi-instance), only the Basic and Bearer authentication types can be used. To use the Client credentials (OAuth 2.0) authentication type, follow the guided setup to configure client authentication credentials for the connection. See Configure Service Graph Connector for Jamf using the guided setup.
import_managed_apps_only	Set the property to `true` to import only managed application records. When the property is set to `false`, all application records are imported. • Type: true | false • Default value: `false`
is_delta_enabled_for_computers	Set the property to `true` to enable the SG-Jamf Computers data source to pull only the changes (delta) between consecutive imports. When the property is set to `false`, a full import is performed with every pull. **Note:** This property is available only if the *`use_jamf_pro_api`* property is set to `true`. • Type: true | false • Default value: `false` See Configuring data synchronization in Service Graph Connector for Jamf.
is_delta_enabled_for_mobiles	Set the property to `true` to enable the SG-Jamf Mobile Devices data source to pull only the changes (delta) between consecutive imports. When the property is set to `false`, a full import is performed with every pull. **Note:** This property is available only if the *`use_jamf_mobile_pro_api`* property is set to `true`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection properties for Service Graph Connector for Jamf (continued)

Property	Description
	• Type: true | false • Default value: `false` See Configuring data synchronization in Service Graph Connector for Jamf.
use_jamf_mobile_pro_api	Set the property to `true` to use the Jamf Pro API for querying Jamf mobile device records. Set the property to `false` to use the Jamf Classic API. **Note:** The Jamf Pro API is supported by Jamf version 11.4 and higher. The Jamf Pro API supports pagination of response data and provides performance improvement compared to the Jamf Classic API. • Type: true | false • Default value: null
use_jamf_pro_api	Set the property to `false` to use the Jamf Classic API instead of the Jamf Pro API for querying Jamf mobile device records. When the property is set to `true`, the Jamf Pro API is used for querying Jamf mobile device records. **Note:** The Jamf Pro API is supported by Jamf version 11.4 and higher. The Jamf Pro API supports pagination of response data and provides performance improvement compared to the Jamf Classic API. • Type: true | false • Default value: `true`

Service Graph Connector for Microsoft Azure

Use the Service Graph Connector for Microsoft Azure to pull data from Microsoft Azure into your CMDB.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Supported versions

Supported ServiceNow versions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Yokohama
- Zurich
- Australia

Use cases

The following are examples on how you can use the Service Graph Connector:

- Visibility into cloud resources, relationships, and state.
- Service ITAM/SAM outcomes through deep discovery of applications.

Configuring a connection for the connector

You can configure a connection for the connector by using the SGC Central view in the Service Graph Workspace or CMDB Workspace. The view enables you to discover and install connectors, and then effectively manage the full life cycle of creating, editing, monitoring, and debugging connections. To configure the connector using SGC Central, see Configure Service Graph Connector for Microsoft Azure using SGC Central.

Important:
Unless there are configuration issues, use the SGC Central view in the Service Graph Workspace or CMDB Workspace to configure the connection for the connector, as the guided setup method is planned for deprecated.

Important information for upgrading Service Graph Connector for Microsoft Azure

After you upgrade to the latest version of the Service Graph Connector for Microsoft Azure, you must run a full data load.

CMDB integrations dashboard

The Integration Commons for CMDB store app provides a dashboard with a central view of the status, processing results, and processing errors of all installed integrations. You can see metrics for all integration runs. You can filter the view to a specific CMDB integration, a specific time duration, or a specific integration run. For more details about monitoring Microsoft Azure integrations in the CMDB Integrations Dashboard, see Using the CMDB Integrations Dashboard.

Event-based discovery

The Service Graph Connector for Microsoft Azure works with event-based discovery. Events that are pulled from Azure can create and update CIs that were brought by the Service Graph Connector for Microsoft Azure.

Configure Service Graph Connector for Microsoft Azure using SGC Central

Use the playbook available with the SGC Central application to set up the Service Graph Connector for Microsoft Azure for pulling in Microsoft Azure data into the CMDB.

Before you begin

Install Service Graph Connector for Microsoft Azure version 1.9.0 or later from the ServiceNow Store. For ServiceNow Store installation steps, see Install a ServiceNow Store application.

Important:
After the initial import of Azure data, the application performs a delta import of data. However, you can perform a full pull of data anytime later by disabling the delta synchronization and setting the *sn_sg_azure_integ.is_delta_sync_enabled* property to `false`. For more information, see Configuring data synchronization in Service Graph Connector for Microsoft Azure.

Role required: The following table shows the roles required for each stage of the playbook.

Role required for each playbook stage

Stage	Role
Prerequisites	admin
Setup	SGC-Admin (sn_cmdb_int_util.sgc_admin) or admin

Note:
The admin user role is required to run background scripts and to provide access to global tables to the SGC-Admin user. For information about the user roles for Service Graph Connectors, see Service Graph Connector user roles.

About this task

The playbook experience for onboarding connectors is activated with SGC Central in the Service Graph Workspace or CMDB Workspace. To configure the SGC Central application, see Configuring SGC Central and for more information on how to interact with a playbook, see Interact with Playbook.

The connector uses the Azure Management APIs for the complete pull of data from Azure. However, to pull delta changes from Azure, the Azure Resource Graph APIs are used. The domain name system (DNS) is Microsoft Azure Management, but the path is a resource graph.

Procedure

1. Use one of the following methods to open SGC Central:
   - Navigate to **Workspaces** > **Service Graph Workspace**, and from the left navigation panel, select the Ingestion icon to open the SGC Central view.
   - Navigate to **Workspaces** > **CMDB Workspace** > **SGC Central**.
2. On the Overview page, select **Create connection**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tip:
Alternatively, you can select **Create connection** on the All connections page.

3. On the Create connection window, select the Microsoft Azure connector type and then select **Create connection**.
4. Complete the initial prerequisites when setting up a connection for the first time using a connector.

Note:
This step is required only during the first-time setup. See Perform initial setup tasks when creating a connection in SGC Central.

5. Complete the prerequisites for setting up the Azure environment.

   a. Complete the instructions required for setting up the Azure environment.

      i. In the **Prerequisites** stage of the playbook, select the **Review setup instructions** activity.

      ii. Obtain the OAuth credentials including client ID, client secret, and token URL from your Microsoft Azure administrator.

      iii. For importing hardware data, grant the `User.Read` permission on the *`Microsoft Graph`* API in the Azure environment. Also, ensure that the IAM policy for the Azure subscription has the Reader role. See Assign a user as an administrator of an Azure subscription with conditions on the Microsoft Azure documentation site.

      iv. For importing software data, grant the `Data.Read` permission on the *`Log Analytics`* API in the Azure environment. In addition, set up a Log Analytics workspace in the Azure environment.

      v. After completing the **Review setup instructions** activity, select **Continue**.

6. Determine whether to import only hardware data or both hardware and software data.

   a. In the **Setup** stage of the playbook, select the **Select services** activity.
   If needed, expand the **Setup** stage to select an activity.

   b. **Optional:** To import both hardware and software data, select the **Hardware and software** check box.

   Note:
   Importing software data requires a hardware connection.

   (Optional) If you need to import only hardware data, the **Hardware only** check box is already selected by default.

   c. Select **Continue**.

7. Enter the connection details and test the API connection for importing hardware data.

   a. In the **Setup** stage of the playbook, select the **Create and test hardware connection** activity.

   b. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create and test hardware connection form

Field	Description
Connection name	Name to identify the hardware connection record. For example, `SG-Azure hardware connection`.
Connection URL	Base URL to connect to your Azure client application. **Note:** This field is automatically set to the URL to connect to the application. Leave the field value as is.
OAuth client ID	Application (client) ID of your Azure client application as noted in step 5.a.
OAuth client secret	Client secret of your Azure client application as noted in step 5.a.

OAuth token URL	Callback URL for the Azure client application.
	
	Based on the region of your Azure client application, enter the token URL in one of the following formats:
	▪ Global
	`https://login.microsoftonline.com/<tenantid>/oauth2/v2.0/token`
	▪ US Government
	`https://login.microsoftonline.us/<tenantid>/oauth2/v2.0/token`
	▪ China
	`https://login.partner.microsoftonline.cn/<tenantid>/oauth2/v2.0/token`
	▪ Germany
	`https://login.microsoftonline.de/<tenantid>/oauth2/v2.0/token`
	Where *<tenantid>* is the tenant ID of your Azure client application as noted in step 5.a.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Select **Create and test connection**.

d. Once the connection test is complete, select **Continue**.

8. Configure the import schedule to import hardware data at regular intervals.

a. In the **Setup** stage of the playbook, select the **Configure hardware import schedule** activity.

b. Select **Configure import schedule**.

c. Expand the Parent scheduled data import within the Import schedules list to select the *`Connection name`*-**SG-Azure Subscriptions** import schedule.

d. In the Configure import schedule dialog box, select the **Active** check box, and then fill in the run schedule and time details.

For more information, see Schedule a data import.

e. Select **Save**.
Alternatively, select **Execute Now** to execute the import schedule immediately.

f. Select **Continue**.

9. Enter the connection details and test the API connection for importing software data.

The **Create and test software connection** activity for importing software data appears only when the **Hardware and software** check box is selected in step 6.b.

a. In the **Setup** stage of the playbook, select the **Create and test software connection** activity.

b. On the form, fill in the fields.

Create and test software connection form

Field	Description
Software connection name	Name to identify the software connection record. For example, `SG-Azure software connection`.
Hardware connection name	Name of the hardware connection record. **Note:** This field is automatically set to the hardware connection name specified in step 7.b.
Connection URL	Base URL to connect to the Log Analytics workspace in the following format:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	`https://api.loganalytics.io/v1/workspaces/<workspace_id>` Where `<workspace_id>` is the ID of the Log Analytics workspace as noted in step 5.a. **Note:** This field is automatically set to the URL to connect to the Log Analytics workspace. Replace the `<workspace_id>` variable in the auto-generated URL with the workspace ID of your Log Analytics workspace.
OAuth client ID	Application (client) ID of your Azure client application as noted in step 5.a.
OAuth client secret	Client secret of your Azure client application as noted in step 5.a.

OAuth token URL	Token URL of your Azure client application.
	
	Based on the region of your Azure client application, enter the token URL in one of the following formats:
	
	▪ Global
	`https://login.microsoftonline.com/<tenantid>/oauth2/v2.0/token`
	
	▪ US Government
	`https://login.microsoftonline.us/<tenantid>/oauth2/v2.0/token`
	
	▪ China
	`https://login.partner.microsoftonline.cn/<tenantid>/oauth2/v2.0/token`
	
	▪ Germany
	`https://login.microsoftonline.de/<tenantid>/oauth2/v2.0/token`
	
	Where *<tenantid>* is the tenant ID of your Azure client application as noted in step 5.a.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Select **Create and test connection**.

d. Once the connection test is complete, select **Continue**.

10. Configure the import schedule to import software data at regular intervals.

    The **Configure software import schedule** activity for importing software data appears only when the **Hardware and software** check box is selected in step 6.b.

    a. In the **Setup** stage of the playbook, select the **Configure software import schedule** activity.

    b. Expand the Parent scheduled data import within the Import schedules list to select the *Connection name*-**SG-Azure TCP** import schedule.

    c. In the Configure import schedule dialog box, select the **Active** check box, and then fill in the run schedule and time details.

    For more information, see Schedule a data import.

    d. Select **Save**.
    Alternatively, select **Execute Now** to execute the import schedule immediately.

    e. Repeat steps 10.b to 10.d for any other parent import schedule if not already set to active.

    f. Select **Continue**.

11. In the **Setup** stage of the playbook, select the **Connection setup complete** activity to verify whether the connection was created.

What to do next

Select **View all connections** to review the connection details. The created connection appears in the Installed connections list.

Configure Service Graph Connector for Microsoft Azure using the guided setup

Set up data sources and scheduled import jobs to pull in data from Azure into your CMDB.

Before you begin

Important:
Unless there are configuration issues, use the SGC Central view in the Service Graph Workspace or CMDB Workspace to configure the connection for the connector, as the guided setup method is planned for deprecated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To use this Service Graph Connector, you need a subscription to a Subscription Unit that is based in the IT Operations Management (ITOM) Visibility application or in the ITOM Discovery application. As defined in the section titled "Managed IT Resource Types" in ServiceNow Subscription Unit Overview for your subscription, for managed IT resources that are created or modified in the CMDB by this Service Graph Connector, but that aren't yet managed by ITOM Visibility or ITOM Discovery, these resources will increase Subscription Unit consumption from that application. Review your current Subscription Unit consumption within ITOM Visibility or ITOM Discovery to ensure available capacity.

Dependencies and requirements:

- The Integration Commons for CMDB store app, which is automatically installed.
- The CMDB CI class models store app, which is automatically installed. See CMDB CI Class Models.
- Discovery Core plugin (com.snc.discovery.core), which is automatically installed by Discovery.
- The Datastream Action plugin (com.glide.hub.action_type.datastream), which is automatically installed.
- The ITOM Discovery License plugin (com.snc.itom.discovery.license). You must activate this plugin.
- ITOM Licensing plugin (com.snc.itom.license). For more information, see Request Discovery.

Important:
After the initial import of Azure data, the application performs a delta import of data. However, you can perform a full pull of data anytime later by disabling the delta synchronization and setting the *sn_sg_azure_integ.is_delta_sync_enabled* property to `false`. For more information, see Configuring data synchronization in Service Graph Connector for Microsoft Azure.

Role required: SGC-Admin (sn_cmdb_int_util.sgc_admin) or admin

Note:
The admin user role is required to run background scripts and to provide access to global tables to the SGC-Admin user. For information about the user roles for Service Graph Connectors, see Service Graph Connector user roles.

About this task

The connector uses the Azure Management APIs for the complete pull of data from Azure. However, to pull delta changes from Azure, the Azure Resource Graph APIs are used. The domain name system (DNS) is Microsoft Azure Management, but the path is a resource graph.

For more information on the Azure setup instructions, see the Service Graph Connector for Azure - Overview and How do I configure the Azure Service Graph Connector? articles on the ServiceNow Community site.

Procedure

1. Navigate to **All** > **Service Graph Connectors** > **Azure** > **Setup**.
2. On the Getting started page, select **Get Started**.
3. Create data sources and scheduled imports for the new connection.

   a. On the Service Graph Connector for Microsoft Azure page, in the Update Data Sources and Scheduled Imports Access, select the task **Update Scheduled Data Import Access**.

   b. In the Update Scheduled Data Import Access section, select **Configure** and do the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

i. For the Update Scheduled Data Import access task, select **Configure**.

ii. Select the **Global** application scope by using the application picker.

iii. In the Application Access related list, select the **Can create**, **Can update**, and **Can delete** check boxes, if not already selected.

iv. Select **Update** to close the tab and return to the guided setup.

v. Modify the application scope again to **Service Graph Connector for Microsoft Azure** by using the application picker.

vi. Set the Update Scheduled Data Import access task to complete by selecting **Mark as Complete**.

vii. Repeat the steps 3.b.ii to 3.b.v for the Update Data Source Access task with the Data Source [sys_data_source] table and set the task to complete by selecting **Mark as Complete**.

c. Clear the cache for the new connection.

i. In the Clear Cache for Datasource and Import set section, select **Configure**.

ii. In the **Run script** text box of the background script page, enter the following script:

```
GlideTableManager.invalidateTable("sys_data_source");
      GlideCacheManager.flushTable("sys_data_source");

 GlideTableManager.invalidateTable("scheduled_import_set");
      GlideCacheManager.flushTable("scheduled_import_set");

      GlideTableManager.invalidateTable("sys_db_object");
      GlideCacheManager.flushTable("sys_db_object");
```

iii. Select **Run Script** to run the background script in the **global** scope.

The script may take several minutes to execute.

iv. After the script is executed, select **Close**.

v. From the application picker, select the **Service Graph Connector for Microsoft Azure** application.

vi. Select **Mark as Complete**.

4. Create a connection to import hardware configuration items (CIs) from the Azure client application.

Note:
Ensure that you have the `User.Read` permission on the *`Microsoft Graph`* API for the hardware import. Also, ensure that the IAM policy for the Azure subscription has the Reader role. See Assign a user as an administrator of an Azure subscription with conditions on the Microsoft Azure documentation site.

a. Obtain the OAuth credentials from your Azure administrator.
Make a note of the following details:

- Application (client) ID
- Client Secret

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Directory (tenant) ID
- Connection URL

Note:
After getting the OAuth credentials, in the guided setup for Service Graph Connector for Microsoft Azure, go to the Create connection for the hardware import section of the Service Graph Connector for Microsoft Azure page and set the Get the OAuth credentials task to complete by selecting **Mark as Complete**.

b. Configure your Azure hardware connection and credentials.

i. In the Create connection for the hardware import section of the Service Graph Connector for Microsoft Azure page, select **Continue**.

ii. For the Create or Edit connection task, select **Configure**.

iii. On the Connections page of the Workflow Studio, select **Configure** for the **SG-Azure Hardware Connection** connection that is available by default for the hardware import.

You can create multiple connections by selecting **Add Connection**.

iv. On the form, review and modify the fields.

Configure Connection form

Field	Description
Connection Information	
Connection Name	Name to uniquely identify the hardware connection record. For example, `SG-Azure Hardware Connection`.
Connection URL	Base URL to connect to your Azure client application. **Note:** This field is automatically set to the URL to connect to the application. Leave the field value as is.
Credential Information	
OAuth Client ID	Application (client) ID of your Azure client application as described in step 4.a.
OAuth Client Secret	Client Secret of your Azure client application as described in step 4.a.
OAuth Token URL	Token URL of your Azure client application. Based on the region of your Azure client application, enter the token URL in one of the following formats: ▪ Global `https://login.microsoftonline.com/<tenantid>/oauth2/v2.0/token`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description

	▪ US Government
	`https://login.microsoftonline.us/<tenantid>/oauth2/v2.0/token`
	▪ China
	`https://login.partner.microsoftonline.cn/<tenantid>/oauth2/v2.0/token`
	▪ Germany
	`https://login.microsoftonline.de/<tenantid>/oauth2/v2.0/token`
	Where *<tenantid>* is the tenant ID of your Azure client application as described in step 4.a.

v. Select **Configure and Get OAuth Token**.

vi. When the OAuth token flow is successfully completed, return to the Create connection for the hardware import task page using the back button for your browser.

vii. Set the Create or Edit connection task to complete by selecting **Mark as Complete**.

c. Test the *Microsoft Graph* API connection to import hardware data from the Azure client application.

i. For the Test Connection task, select **Configure**.

ii. Select the data source associated with the newly created connection in the **Name** column of the Data Sources list.

iii. Select the **Test Load 20 Records** related link.

iv. When the state changes to **Complete**, return to the setup by selecting **Back to Guided Setup** in the Help panel.

v. Set the Test Connection task to complete by selecting **Mark as Complete**.

d. Review the scheduled data imports configuration.

i. For the Set up scheduled import jobs task, select **Configure**.

ii. Select the *SG-Azure Subscriptions* scheduled job.

iii. On the Scheduled Data Import form, verify the field values for the scheduled job and select the **Active** check box.

For more information, see Schedule a data import.

iv. Select **Update**.

v. Set the Set up scheduled import jobs task to complete by selecting **Mark as Complete** in the Help panel.

5. Create a connection to import software information from the Azure client application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Ensure that you have the `Data.Read` permission on the *`Log Analytics`* API for the software import.

a. Obtain the OAuth credentials and set up the Log Analytics workspace in the Azure.

i. Ensure that you have the OAuth credentials from step 4.a.

ii. Configure the Log Analytics workspace in the Azure client application.

- Use an existing workspace, if available.
- Create another workspace.

For more information, see Create Log Analytics workspace in the Azure documentation.

Note:
Make a note of the Workspace ID.

iii. Deploy Azure Monitor Agent (AMA), and then enable change tracking and inventory using AMA.

For more information, see Enable Change Tracking and Inventory using Azure Monitoring Agent in the Azure documentation and the Configuring Azure for monitoring your Azure VMs section of the How do I configure the Azure Service Graph Connector? [KB2226163] article in the Now Support Knowledge Base.

Note:
After obtaining the OAuth credentials, in the guided setup for Service Graph Connector for Microsoft Azure, go to the Create connection for the software import section of the Service Graph Connector for Microsoft Azure page and set the Get the OAuth credentials task to complete by selecting **Mark as Complete**.

b. Configure your Azure software connection and credentials.

i. In the Create connection for the software import section of the Service Graph Connector for Microsoft Azure page, select **Continue**.

ii. For the Create or Edit connection task, select **Configure**.

iii. On the Connections page of the Workflow Studio, select **Configure** for the **SG-Azure log analytics connection** connection that is available by default for the software import.

You can create multiple connections by selecting **Add Connection**.

iv. On the form, review and modify the fields.

Configure Connection form

Field	Description
Connection Information	
Software Connection Name	Name to uniquely identify the software connection record. For example, `SG-Azure log analytics connection`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Hardware Connection Name	Name of the hardware connection associated with the software as described in step 4.b.iv. You add a hardware connection name to associate the software connection with the respective hardware.
Connection URL	Base URL to connect to the Log Analytics workspace in the following format: `https://api.loganalytics.io/v1/workspaces/<workspace_id>` Where `<workspace_id>` is the ID of the Log Analytics workspace as described in step 5.a.ii. **Note:** This field is automatically set to the URL to connect to the Log Analytics workspace. Replace the `<workspace_id>` variable in the auto-generated URL with the workspace ID of your Log Analytics workspace.
Credential Information	
OAuth Client ID	Application (client) ID of your Azure client application as described in step 4.a.
OAuth Client Secret	Client Secret of your Azure client application as described in step 4.a.

OAuth Token URL	Token URL of your Azure client application.
	
	Based on the region of your Azure client application, enter the token URL in one of the following formats:
	
	▪ Global
	
	`https://login.microsoftonline.com/<tenantid>/oauth2/v2.0/token`
	
	▪ US Government
	
	`https://login.microsoftonline.us/<tenantid>/oauth2/v2.0/token`
	
	▪ China
	
	`https://login.partner.microsoftonline.cn/<tenantid>/oauth2/v2.0/token`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	▪ Germany `https://login.microsoftonline.de/<tenantid>/oauth2/v2.0/token` Where *<tenantid>* is the tenant ID of your Azure client application as described in step 4.a.

v. Select **Configure and Get OAuth Token**.

vi. When the OAuth token flow is successfully completed, return to the Create connection for the software import task page using the back button for your browser.

vii. Set the Create or Edit connection task to complete by selecting **Mark as Complete**.

c. Test the *Log Analytics* API connection to import software data from the Azure client application.

i. For the Test Connection task, select **Configure**.

ii. Select the data source associated with the newly created connection in the **Name** column of the Data Sources list.

iii. Select the **Test Load 20 Records** related link.

iv. When the state changes to **Complete**, return to the setup by selecting **Back to Guided Setup** in the Help panel.

v. Set the Test Connection task to complete by selecting **Mark as Complete**.

d. Review the scheduled data imports configuration.

i. For the Set up scheduled import jobs task, select **Configure**.

ii. Select the *SG-Azure Software* scheduled data import.

iii. On the Scheduled Data Import form, verify the field values for the scheduled job and select the **Active** check box.

For more information, see Schedule a data import.

iv. Select **Update**.

v. Set the Set up scheduled import jobs task to complete by selecting **Mark as Complete** in the Help panel.

6. **Optional:** Enable extended discovery using the `run` command.

(Optional) The `run` command is used to run a set of commands on the VMs to fetch server information such as CPU count, cores, model, and manufacturer. For information about extended discovery using the `run` command, see the Extended discovery with Run Command on Service Graph connector for Microsoft Azure [KB2210811] article in the Now Support Knowledge Base.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Download the scripts that are required to enable extended discovery.
   i. For the Download the scripts task, select **Configure**.
   ii. After the scripts are downloaded, select **Mark as Complete** to set the Download the scripts task to complete.

b. Configure an Azure storage account for extended discovery.
   i. For the Configure Azure Storage account for Run Command task, select **Configure**.

      For information about configuring an Azure storage account for extended discovery, see the Instructions for setting up Run Command in Service Graph Connector for Azure [KB2001668] article in the Now Support Knowledge Base.

   ii. Set up a new Azure storage account.
   iii. Set up a container to upload the script files.
   iv. Set up another container to store the results.
   v. Provide `run` command access to the service principal.
   vi. Select **Mark as Complete** to set the Configure Azure Storage account for Run Command task to complete.

c. Configure the connection properties for the new instance that you created for Service Graph Connector for Microsoft Azure.
   i. For the Configure connection properties task, select **Configure**.
   ii. In the **Connection*** field of the SG-Azure Configuration Properties section, select the new instance that you created.

      The fields in the Properties section are populated with the details of the instance.

   iii. In the Properties section, provide the following details for the instance that you created:
      - Name of the storage account where the containers are created
      - Subscription ID where the storage account is created
      - Resource group of the storage account
      - Name of the container where the `sh` and `ps1` files are uploaded in Azure
      - Name of the container where the results of the commands are to be stored
      - URI of the `sh` file that has to be run on Linux machines
      - URI of the `ps1` file that has to be run on Windows machines

   iv. Select **Save**.
   v. Select **Mark as Complete** to set the Configure connection properties task to complete.

Result
The data from Azure is pulled into your CMDB.

Data mapping for Service Graph Connector for Microsoft Azure

Data from the Azure data sources is mapped and transformed into the ServiceNow CMDB Configuration Item (CI) class definitions using the Robust Transform Engine (RTE). Data is inserted into the ServiceNow® CMDB using the Identification and Reconciliation Engine (IRE).

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data mapping for Azure

When you complete setting up the connection, you can configure the integration to periodically pull data from Azure. The data is loaded into staging tables and then inserted into the target tables.

The following table lists the data sources, the staging tables, and the target tables as CMDB CI and non-CMDB classes for Azure.

Data mapping for Azure

Data source	Staging table	Target tables
SG-Azure Subscriptions	SG Azure Subscriptions [sn_sg_azure_integ_subscriptions]	Cloud Service Account Key Value
SG-Azure Datacenter Updation	SG-Azure Datacenter Updation [sn_sg_azure_integ_datacenter_updation]	Azure Datacenter
SG-Azure Resource Group	SG-Azure Resource Group [sn_sg_azure_integ_resource_groups]	Resource Group Key Value
SG-Azure Availability Zone	SG-Azure Availability Sets [sn_sg_azure_integ_availability_sets]	Availability Zone Key Value
SG-Azure Storage Volume	SG-Azure Storage Volume [sn_sg_azure_integ_storage_volume]	Storage Volume Key Value
SG-Azure Load Balancers	SG-Azure Load Balancers [sn_sg_azure_integ_load_balancers]	Cloud Load Balancer Cloud LB IPAddress Key Value
SG-Azure Network	SG-Azure Network [sn_sg_azure_integ_network]	Cloud Network Cloud Service Account

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data mapping for Azure (continued)

Data source	Staging table	Target tables
		Windows Server Key Value
SG-Azure Software	SG-Azure Software [sn_sg_azure_integ_software] **Note:** The SG-Azure Software data source imports the software data from the ConfigurationData table in the Log Analytics workspace of Azure. The SG-Azure Software import is set to inactive by default.	When the Software Asset Management (SAM) application isn't installed: Software Software Instance When the SAM application is installed: Software Installation
SG-Azure Software Remove	SG-Azure Software Remove [sn_sg_azure_integ_software_remove] The SG-Azure Software Remove import is set to inactive by default.	When the SAM application isn't installed: Software Software Instance When the SAM application is installed: Software Installation
SG-Azure TCP	SG-Azure TCP [sn_sg_azure_integ_tcp]	TCP Connection

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data mapping for Azure (continued)

Data source	Staging table	Target tables
	Note: The SG-Azure TCP data source imports the TCP and processes data from the VMConnection and VMProcess tables in the Log Analytics workspace of Azure. To populate the tables, you must first enable the VM insights feature in the Azure portal. For more information, see Enabling VM insights for collecting Azure data.	Running Process
SG-Azure Hardware Template Updation	Hardware templates [sn_sg_azure_integ_hardware_templates]	Hardware Type
SG-Azure HW Consolidation	SG-Azure HW Consolidation [sn_sg_azure_integ_hw_consolidation]	Virtual Machine Instance Computer
SG-Azure Run Command	SG-Azure Run Command [sn_sg_azure_integ_run_command]	No data created
SG-Azure Get Run Command	SG-Azure Get Run Command [sn_sg_azure_integ_get_run_command]	Application TCP Connection Running Process
SG-Azure Kubernetes Cluster	SG-Azure Kubernetes Cluster [sn_sg_azure_integ_kubernetes_cluster]	Kubernetes Cluster

For more information on where data is saved when pulling data from Azure, see CMDB classes targeted in Service Graph Connector for Microsoft Azure and Supported Microsoft Azure resource types.

You can use the IntegrationHub ETL app to view the data maps. See IntegrationHub ETL for more information.

Additional information about Azure data sources:

- The Service Graph Connector for Microsoft Azure utilizes the Service Graph Resource Inclusion Whitelist [sn_cmdb_int_util_service_graph_resource_inclusion_whitelist] table to differentiate between generic resources and other supported resource types.

  Any resource that is not populated in the Service Graph Resource Inclusion Whitelist [sn_cmdb_int_util_service_graph_resource_inclusion_whitelist] table is populated in the Cloud Inventory Resource Inclusion Lists [sa_cloud_inventory_resource_whitelist_list] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The SG-Azure Hardware Template Updation and SG-Azure HW Consolidation import schedules replace the SG-Azure Hardware Template import schedule from the Service Graph Connector for Microsoft Azure 1.12.0 version. The SG-Azure Hardware Template Updation and SG-Azure HW Consolidation data sources fetch only the data of the hardware templates that are used for VMs in Azure, instead of fetching all hardware templates.
- The SG-Azure SQL data source populates the `microsoft.dbformysql/flexibleservers` and `microsoft.dbforpostgresql/flexibleservers` resource types in the Cloud Database [cmdb_ci_cloud_database] table instead of the Cloud Resource [cmdb_ci_cmp_resource] table from the Service Graph Connector for Microsoft Azure 1.14.0 version.

  After upgrading to version 1.14.0, run a full data load to migrate all active flexible servers from the Cloud Resource [cmdb_ci_cmp_resource] table to the Cloud Database [cmdb_ci_cloud_database] table.
- All data sources except SG-Azure Scale Sets VMs are migrated from Azure Resource Manager (ARM) APIs to Resource Graph APIs for a full data load from the Service Graph Connector for Microsoft Azure 1.14.0 version. Microsoft Azure doesn't support uniform orchestration-type Scale Set VMs on Resource Graph APIs.
- The import set rows for the SG-Azure Run Command scheduled import job [sn_sg_azure_integ_run_command] remain in Pending state even after the import set is processed.

Quick start tests for Service Graph Connector for Microsoft Azure

Validate that Service Graph Connector for Microsoft Azure still works after you make any configuration change such as applying an upgrade or developing an application. Copy and customize these quick start tests to pass when using your instance-specific data.

Danger:
By default, the system property that is used to run automated tests is disabled to prevent you from accidentally running these tests on a production system. To avoid data corruption or an outage, run tests only on development, test, and other non-production instances. See Enable or disable executing Automated Test Framework tests.

Quick start tests

Accessing the connection details of Service Graph Connector for Microsoft Azure

You can access the connection details of the Service Graph Connector for Microsoft Azure in a single view using the common connection framework (CCF) included within the Integration Commons for CMDB (sn_cmdb_int_util) store app.

With the CCF, you can access all the connections used by the Service Graph Connector for Microsoft Azure. The connection details include the connection alias, connection properties, data sources, and scheduled data imports associated with a connection. You can also test the connection. For more information, see Accessing the connection details of Service Graph Connectors.

Access the details of an Azure connection

Access the details of an Azure connection configured for the Service Graph Connector for Microsoft Azure.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Service Graph Connectors** > **Azure** > **Connections**.
2. From the **Name** column of the Service Graph Connections list, select a connection.
3. On the Service Graph Connections page, view the connection details such as the connection name, alias, and data sources.
4. Select a related list to view further details of the connection.
5. **Optional:** Select the **Test Connection** related link to test the connection.

Additional features within the Service Graph Connector for Microsoft Azure

Use the additional features available within the Service Graph Connector for Microsoft Azure to maximize its use for importing data.

The following features are available within the Service Graph Connector for Microsoft Azure:

Configure multiple Azure connections

Follow the guided setup to establish a hardware or software connection, or configure a workspace when adding a software connection.

Set partition size for parallel loading-enabled Azure accounts

Optimize the performance of data sources by enabling parallel data loading.

Disable delta synchronization

Import full data from your Azure instance when needed.

Enabling VM insights for collecting Azure data

Enable the VM insights feature for all the VMs in your Log Analytics workspace to populate the VMConnection and VMProcess tables in Azure.

Setting up multiple connections in Service Graph Connector for Microsoft Azure

The Service Graph Connector for Microsoft Azure supports multiple Azure connections.

Important:
Add multiple connections by selecting **Add connection** on the Connections page of the Workflow Studio in the guided setup. For more information, see Configure Service Graph Connector for Microsoft Azure.

Setting up multiple connections

You can set up a hardware or software connection by using the guided setup. The Service Graph Connector for Microsoft Azure supports only one-to-one mapping between hardware and software connections. Therefore, when configuring multiple software connections, you must also configure an equivalent number of hardware connections. You can differentiate multiple connections using their respective connection aliases.

For example, if you add 10 software connections for 10 different workspaces, you must also add 10 hardware connections for each corresponding software connection.

Setting up multiple workspaces

You can set up a workspace when adding a software connection using the guided setup. To set up multiple workspaces, you must configure that many different software connections in the Service Graph Connector for Microsoft Azure as there are workspaces and an equivalent number of hardware connections.

For example, if you have 10 workspaces, you must add 10 software connections for each workspace and 10 hardware connections for each corresponding software connection.

Set partition size for parallel loading-enabled Azure accounts

Optimize the performance of data sources by setting the partition size in the *azure_full_pull_partition_size* system property.

Before you begin
Set the application scope to Service Graph Connector for Microsoft Azure using the application picker. For more information, see Application picker.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: admin

About this task

The parallel loading feature is available for the following data sources:

- Starting with the Service Graph Connector for Microsoft Azure 1.13.0 version:
  - SG-Azure Functions
  - SG-Azure Generic Resources
  - SG-Azure Get Run Command
  - SG-Azure Hardware Template Updation
  - SG-Azure HW Consolidation
  - SG-Azure Kubernetes Cluster
  - SG-Azure Load Balancers
  - SG-Azure Network Interface
  - SG-Azure Public IP Address
  - SG-Azure Run Command
  - SG-Azure Scale Sets VMs
- Starting with the Service Graph Connector for Microsoft Azure 1.11.0 version:
  - SG-Azure Network
  - SG-Azure Virtual Machines
  - SG-Azure Storage Volume

For a full data pull, the *azure_full_pull_partition_size* property determines the number of Azure subscriptions that can be executed as parallel jobs to retrieve configuration item (CI) data. Partition size determines how many Azure subscriptions a single parallel-thread evaluates for data retrieval. If you set the *azure_full_pull_partition_size* property to 100, the partition size is 100 subscriptions.

Note:
If the *azure_full_pull_partition_size* property isn't configured, the partition size computation feature of the Integration Commons for CMDB application automatically determines the partition size for parallel loading at runtime. See Partition size computation for parallel loading in Integration Commons for CMDB.

Procedure

1. Navigate to **All** > **Service Graph Connectors** > **Azure** > **Connections**.
2. From the **Name** column of the Service Graph Connections list, select a connection.
3. From the **Property** column of the Service Graph Connection Properties related list, select **azure_full_pull_partition_size**.
   The *azure_full_pull_partition_size* system property determines the number of subscriptions that each partition processes for a full pull. For more information, see Service Graph Connector for Microsoft Azure properties.
4. In the **Value** field, enter a numeric value greater than 0 for the partition size.

5. Select **Update**.

> **Note:**
> After you enable parallel data loading for a data source, the **Test Load 20 Records** and **Load All Records** options don't work for executing the data source. You must select **Execute Now** from **Scheduled Data Import** to execute the data source for which parallel loading is enabled.

Configuring data synchronization in Service Graph Connector for Microsoft Azure

You can configure the system property for synchronizing only delta data from an Azure instance.

The connector provides the ability to import only delta data from an Azure instance. With delta synchronization enabled, the importing process of Azure data is quicker because the connector imports the changes in Azure data only.

For data sources discovered by a software connection, the **Last Run Datetime** field displays the timestamp of the most recent delta pull run. The **Last Run Datetime** field is updated only when the last delta pull run was a success. An empty **Last Run Datetime** field indicates no previous delta pull run for the data source, but either a full pull run or no run at all. The delta pull period is calculated by subtracting the last run date and time from the current date and time; that is, Delta period = Current date timestamp - Last run date timestamp.

For data sources discovered by a hardware connection, the **Last Success Import Time** field displays the timestamp of the most recent delta pull run. The **Last Success Import Time** field is updated only when the last delta pull run was a success. An empty **Last Success Import Time** field indicates no previous delta pull run for the data source, but either a full pull run or no run at all. The delta pull period is calculated by subtracting the last successful import date and time from the current date and time; that is, Delta period = Current date timestamp - Last success import date timestamp.

The application includes the *sn_sg_azure_integ.is_delta_sync_enabled* system property to enable delta synchronization. By default, the property is set to `true`. To import full data from your Azure instance, disable the *sn_sg_azure_integ.is_delta_sync_enabled* property. See Disable delta synchronization.

For a delta pull, you can also configure the grace time, page size, preceding time period, and API call duration using system properties. For more information, see Service Graph Connector for Microsoft Azure properties.

Disable delta synchronization

Disable delta synchronization to import all the Microsoft Azure data.

Before you begin

Set the application scope to Service Graph Connector for Microsoft Azure using the application picker. For more information, see Application picker.

Role required: admin

Procedure

1. Enter `sys_properties.list` in the navigation filter, and then open the *sn_sg_azure_integ.is_delta_sync_enabled* property.
2. In the **Value** field, enter `false`.
3. Select **Update**.

Enabling VM insights for collecting Azure data

You must enable the VM insights feature in the Azure portal for collecting TCP and processes data using the Service Graph Connector for Microsoft Azure.

Requirements for enabling the VM insights feature

- Ensure that you've created the Log Analytics workspace to push the logs from virtual machines (VMs) via insights in Azure Monitor. See Insights in Azure Monitor on the Microsoft Azure documentation site.
- Note down the subscription name associated with your Log Analytics workspace.

Collecting the TCP and processes data

The SG-Azure TCP and SG-Azure VM Config Data data sources in the Service Graph Connector for Microsoft Azure import data from the VMConnection and VMProcess tables in Azure, respectively. To fetch data correctly from the VMConnection and VMProcess tables in Azure, you must enable the VM insights feature for all the VMs in your Log Analytics workspace. To learn how to populate these tables via insights, see Enable VM insights in the Azure portal on the Microsoft Azure documentation site.

There are several methods available for enabling VM insights. For more information, see Enable VM insights overview on the Microsoft Azure documentation site.

Note:
In the data collection rule, ensure that you've selected the **Enable guest performance** and **Enable processes and dependencies (Maps)** check boxes on the rule form.

Service Graph Connector for Microsoft Azure reference

Reference topics provide additional information about Service Graph Connector for Microsoft Azure components.

Supported Microsoft Azure resource types

Several Microsoft Azure resource types are imported as CMDB data.

Microsoft Azure resource types refer to the names included in delta queries used for filtering data using the Azure Resource Graph API for a specific data source.

Note:
Delta pulls include data from a specific time period that is defined by the condition within a delta query.

The following table lists the Service Graph Connector for Microsoft Azure data sources, Microsoft Azure resource types they import, and indicates whether they support both full pull and delta pull of data during import. ✓ indicates supported and # indicates not supported.

Resource types supported in Service Graph Connector for Microsoft Azure

Data source	CMDB CI classes	Microsoft Azure resource type	Full pull	Delta pull
SG-Azure Subscriptions	Cloud Service Account [cmdb_ci_cloud_service_account]	Microsoft.Resources/ subscriptions	#	#

Microsoft Azure discovery solutions comparison

ITOM Visibility applications discover a variety of Microsoft Azure resources and populate the relevant configuration item (CI) classes in the Configuration Management Database (CMDB) with their attributes.

ITOM Visibility solutions

ITOM Visibility can offer you comprehensive visibility into your organization's cloud infrastructure. Each application offers unique strengths and capabilities, and by comparing them you can gain holistic insights on their capabilities and benefits.

ITOM Visibility solutions for discovering Azure

ITOM Visibility solution	Overview	Configuration
Discovery and Service Mapping Patterns and Visibility Content	Discovery patterns used by ITOM Visibility	• You must update your store apps to the latest release version. • You must provide ITOM Visibility with access permissions. For more information, see Set up Azure service accounts

Life cycle management of records in Service Graph Connector for Microsoft Azure

Life cycle management in the Service Graph Connector for Microsoft Azure monitors and updates the statuses of Azure resources throughout their entire life cycle, from creation to deletion.

The life cycle management process helps maintain the accuracy and integrity of data in the Configuration Management Database (CMDB).

Life cycle management for CIs in Service Graph Connector for Microsoft Azure

The following table lists the configuration items (CIs) in CMDB and other non-CMDB tables for which life cycle management is available in Service Graph Connector for Microsoft Azure.

Supported tables for life cycle management

Data source	CMDB CI classes	Life cycle management available
SG-Azure Availability Zone	Availability Zone [cmdb_ci_availability_zone]	Yes
	Key Value [cmdb_key_value]	No
SG-Azure Datacenter Updation	Azure Datacenter [cmdb_ci_azure_datacenter]	Not applicable
SG-Azure Functions	Cloud Function [cmdb_ci_cloud_function]	Yes

	Virtual Machine Instance [cmdb_ci_vm_instance]	Yes

Record removal process in Service Graph Connector for Microsoft Azure

The Service Graph Connector for Microsoft Azure uses the Integration Commons record removal process for life cycle management during full data loads. For delta loads, life cycle management of records is based on updates from Microsoft Azure.

Record removal is the process of handling data that is no longer needed. For any discovered resources deleted later after pulling data, the Service Graph Connector for Microsoft Azure automatically updates the **Install Status** field of the associated CMDB CI classes to indicate any retired or deleted records.

The record removal process in the Service Graph Connector for Microsoft Azure involves marking the **Install Status** of a record as **retired** rather than permanently deleting it from the system. The record remains in the database, making it possible to reference or restore it later. Record removal for Service Graph Connector for Microsoft Azure relies on the Source [sys_object_source table].

Starting with the Service Graph Connector for Microsoft Azure 1.14.0 version, life cycle management is supported for the following data sources in full data load and delta load:

- SG-Azure Kubernetes Cluster
- SG-Azure Scale Sets
- SG-Azure Generic Resources
- SG-Azure Functions
- SG-Azure SQL
- SG-Azure Network Interface
- SG-Azure Virtual Machines
- SG-Azure Storage Accounts

- SG-Azure Security Group
- SG-Azure Public IP Address
- SG-Azure Network
- SG-Azure Load Balancers
- SG-Azure Storage Volume
- SG-Azure Availability Zone
- SG-Azure Resource Group
- SG-Azure Subscriptions

When you run a full data load for the first time after upgrading to version 1.14.0, the Install Status of all the records that aren't discovered is set to retired.

Service Graph Connector for Microsoft Azure properties

Service Graph Connector for Microsoft Azure properties control the behavior of the connector.

Connection properties

These connection properties are available for the Service Graph Connector for Microsoft Azure hardware connections.

Note:
To open the Service Graph Connection Properties [sn_cmdb_int_util_service_graph_connection_property] table for the connector, navigate to **All** > **Service Graph Connectors** > **Azure** > **Connections**, and select the hardware connection name. The connection properties are displayed in the Service Graph Connection Properties related list.

Connection properties for Service Graph Connector for Microsoft Azure

Property	Description
vmGraphQuery	Specify the resource graph query on which the Run command should be executed. By default, the Run command is executed on all running VMs. • Type: string • Default value: empty
filter_databricks	This property is used to filter Azure Databricks CIs using the Vendor tag provided by Azure. Azure Databricks virtual machines (VMs), Network Interface Controllers (NICs), and storage volumes (collectively called Azure Databricks CIs) have the value of the Vendor tag set to `Databricks`. Starting with the Service Graph Connector for Microsoft Azure 1.14.0 version, all Azure Databricks CIs that have the value of the Vendor tag set to `Databricks` are filtered out from discovery during a full data load. During delta loads, set the value of the *`insert_short_lived_vms`* custom system property to `false` to filter Azure Databricks CIs that are marked as retired during discovery

Connection properties for Service Graph Connector for Microsoft Azure (continued)

Property	Description
	(see Custom system properties). Additionally, for each Hardware connection, set the *filter_databricks* connection property to `true`. • Type: true | false • Default value: false
Properties used for the Run command	
scriptsContainerName	Enter the name of the container where the `.sh` and `.ps1` files are uploaded in Azure. • Type: string • Default value: empty
storageAccountName	Enter the name of the storage account where the containers are created. • Type: string • Default value: empty
storageSubsription	Enter the subscription ID where the storage account is created. • Type: string • Default value: empty
storageContainerName	Enter the name of the container where the results of the commands are to be stored. • Type: string • Default value: empty
storageResourceGroup	Enter the resource group of the storage account. • Type: string • Default value: empty
powershellScriptURI	Enter the URI of the `.ps1` file that is to be run on Windows machines. • Type: URI • Default value: empty
shellScriptURI	Enter the URI of the `.sh` file that is to be run on Linux machines. • Type: URI • Default value: empty

Connection properties for Service Graph Connector for Microsoft Azure (continued)

Property	Description
lookback_time_in_days	This property is used for record removal. Time in days in which the sys_object_source records are queried for the deletion of CIs. The value is automatically updated to 15 after the initial run. Set the value of this property to empty to include all the older records populated by SG-Azure as removal candidates for the Integration Commons record removal API. **Note:** Do not modify this property if the value is empty. • Type: integer • Default value: empty

For more information about the Run command for the Service Graph Connector for Microsoft Azure, see Instructions for setting up Run Command in Service Graph Connector for Azure [KB2001668]

Default system properties

These default system properties are available for Service Graph Connector for Microsoft Azure.

Note: To open the System Properties [sys_properties] table, enter `sys_properties.list` in the navigation filter.

Default system properties for Service Graph Connector for Microsoft Azure

Property	Description
api_retry_max	Enter the maximum retry limit for a Microsoft Azure API call made from the data sources within the connector. • Type: integer • Default value: 3 • Location: System Property [sys_properties] table
api_retry_max_without_backoff	Enter the maximum retry limit for a Microsoft Azure API call made from the data sources within the connector, without using exponential backoff to increase the waiting time between consecutive retries. • Type: integer • Default value: 3 • Location: System Property [sys_properties] table
azure_full_pull_partition_size	Set the partition size for Azure full data pull. This property determines the number of subscriptions that each

Property	Description
	partition processes. The value must be set to a numeric value greater than 0. • Type: integer • Default value: null • Location: System Property [sys_properties] table **Note:** If no value is specified, the property value is determined based on the number of active threads in the instance. See Set partition size for parallel loading-enabled Azure accounts.
delta_grace_time	Enter the additional time period in hours added to the current delta pull period when fetching incremental changes. • Type: integer • Default value: 0 • Location: System Property [sys_properties] table
delta_page_size	Enter the page size, that is, the maximum number of records fetched per page in a data pull for the data sources within the connector. • Type: integer • Default value: 500 • Location: System Property [sys_properties] table
is_delta_sync_enabled	Set the property to `false` to deactivate delta synchronization. • Type: true | false • Default value: `false` • Location: System Property [sys_properties] table See Configuring data synchronization in Service Graph Connector for Microsoft Azure.
LDC_status	Set the property to `true` to enable populating the passive status of an Azure datacenter (also known as a logical datacenter) in the Comments attribute of the Azure Datacenter [cmdb_ci_azure_datacenter] CI class when the `regionType` attribute is `Logical` or the service account for the datacenter is deactivated .

Default system properties for Service Graph Connector for Microsoft Azure (continued)

Property	Description
	• Type: true | false • Default value: `false` • Location: System Property [sys_properties] table
load_balancer_page_limit	Enter the maximum number of records per page to be fetched in a delta pull for the SG-Azure Load Balancers data source. • Type: integer • Default value: `500` • Location: System Property [sys_properties] table
maximum_delta_total_period	Enter the maximum time period in days preceding the current run time during delta pull. • Type: integer • Default value: `7` • Location: System Property [sys_properties] table
maximum_delta_window_period	Enter the maximum time duration in hours for each API call to repeat within the total delta period during delta pull. • Type: integer • Default value: `24` • Location: System Property [sys_properties] table
network_interface_page_limit	Enter the maximum number of records per page to be fetched in a delta pull for the SG-Azure Network Interface data source. • Type: integer • Default value: `500` • Location: System Property [sys_properties] table
pull_disabled_subscriptions	Set the property to `false` to deactivate the import of resources associated with deactivated Azure subscriptions. • Type: true | false • Default value: `true` • Location: System Property [sys_properties] table
save_rest_response_as_attachment	Set the property to `true` to save the response from Azure Resource Graph API calls as an attachment and

Supported versions

- Supported Microsoft Defender for Endpoint versions:
  - Microsoft Defender for Endpoint Plan 1
  - Microsoft Defender for Endpoint Plan 2
- Supported ServiceNow versions:
  - Washington DC
  - Xanadu
  - Yokohama

Use cases

The ServiceNow Security Operations applications have features that interact with the Service Graph Connector to gain insights into machines utilizing the Microsoft Defender for Endpoint security solution.

Important Information for upgrading Service Graph Connector for Microsoft Defender Endpoint

After you upgrade to Service Graph Connector for Microsoft Defender Endpoint 1.2.0, migrate data from the Server [cmdb_ci_server] CI class to the Computer [cmdb_ci_computer] CI class. For more information, see the Service Graph Connector for Microsoft Defender Endpoint - Data migration after upgrade to version 1.2.0 [KB2096769] article in the Now Support Knowledge Base.

Configuring a connection for the connector

Use the SGC Central view in the Service Graph Workspace or CMDB Workspace to install the connector and configure the connection. The view enables you to install and discover connectors and to manage the full life cycle of creating, editing, monitoring, and debugging connections. For instructions, see Configure Service Graph Connector for Microsoft Defender Endpoint using SGC Central.

Important:
Unless there are configuration issues, use SGC Central to configure the connection. The guided setup method for configuration is being deprecated.

CMDB integrations dashboard

The Integration Commons for CMDB store app provides a dashboard with a central view of the status, processing results, and processing errors of all installed integrations. You can see metrics for all integration runs. You can filter the view to a specific CMDB integration, a specific time duration, or a specific integration run. For more details about monitoring Microsoft Defender for Endpoint integrations in the CMDB Integrations Dashboard, see Using the CMDB Integrations Dashboard.

Data mapping

Data from the Microsoft Defender for Endpoint data source is mapped and transformed into the ServiceNow CMDB configuration item (CI) class definitions using the Robust Transform Engine (RTE). Data is inserted into the ServiceNow CMDB using the Identification and Reconciliation Engine (IRE).

© 2026 ServiceNow, Inc. All rights reserved.

When you complete setting up the connection, you can configure the integration to pull data periodically from the machines utilizing the Microsoft Defender for Endpoint security solution.

The following data source is included for the Microsoft Defender for Endpoint security solution:

SG-Defender Machines

Imports all the machine-related data from the machines utilizing the Microsoft Defender for Endpoint security solution, loads the imported data in the SG-Defender Machines [sn_defender_integ_sg_defender_machines] staging table, and then populates the following target tables:

- IP Address [cmdb_ci_ip_address]
- Software Installation [cmdb_sam_sw_install] (If the Software Asset Management (SAM) application is installed.)
- Software Instance [cmdb_software_instance] (If the SAM application is not installed.)
- Software [cmdb_ci_spkg] (If the SAM application is not installed.)
- SG-Defender Machines Related [sn_defender_integ_sg_defender_machines_related]
- Network Adapter [cmdb_ci_network_adapter]
- Computer [cmdb_ci_computer]
- Windows Server [cmdb_ci_win_server]

Note:
Only operating system details are populated in the Software Installation [cmdb_sam_sw_install], Software Instance [cmdb_software_instance], and Software [cmdb_ci_spkg] tables.

For more information on where data is saved when pulling data from the Microsoft Defender for Endpoint security solution, see CMDB classes targeted in Service Graph Connector for Microsoft Defender Endpoint.

You can use the IntegrationHub ETL app to view the data maps. See IntegrationHub ETL for more information.

Service Graph Connectors

Configure Service Graph Connector for Microsoft Defender Endpoint using SGC Central

Set up scheduled import jobs to pull in Microsoft Defender for Endpoint data into your Configuration Management Database (CMDB).

Before you begin

Complete the following tasks:

- Install Service Graph Connector for Microsoft Defender Endpoint version 1.1.0 or later from the ServiceNow Store. For ServiceNow Store installation steps, see Install a ServiceNow Store application.
- Verify that you have an active subscription to Microsoft Defender for Endpoint.
- Verify that you have created an Azure application to get programmatic access to Microsoft Defender for Endpoint. See Create an app to access Microsoft Defender for Endpoint without a user in the Microsoft 365 documentation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Obtain the tenant ID, client ID, and client secret details for the Microsoft Defender for Endpoint administrator account.
- Enable the Machine.Read.All and Machine.ReadWrite.All permissions in Microsoft Defender for Endpoint. See Permissions for the `List machines` API in the Microsoft 365 documentation.

Role required: The following table shows the roles required for each stage of the playbook.

Role required for each playbook stage

Stage	Role
Prerequisites	admin
Setup	SGC-Admin (sn_cmdb_int_util.sgc_admin) or admin

Note:
The admin user role is required to run background scripts and to provide access to global tables to the SGC-Admin user. For information about the user roles for Service Graph Connectors, see Service Graph Connector user roles.

About this task

The playbook experience for onboarding connectors is activated with SGC Central in the Service Graph Workspace or CMDB Workspace. To configure the SGC Central application, see Configuring SGC Central and for more information on how to interact with a playbook, see Interact with Playbook.

Procedure

1. Use one of the following methods to open SGC Central:
   - Navigate to **Workspaces** > **Service Graph Workspace**, and from the left navigation panel, select the Ingestion icon to open the SGC Central view.
   - Navigate to **Workspaces** > **CMDB Workspace** > **SGC Central**.
2. On the Overview page, select **Create connection**.

   Tip:
   Alternatively, you can select **Create connection** on the All connections page.

3. On the Create connection window, select the Microsoft Defender connector type, and then select **Configure connection**.
   A default connection, SG Defender OAuth2.0 connection, for Microsoft Defender for Endpoint is available within the application. As the Service Graph Connector for Microsoft Defender Endpoint supports only a single instance, you can configure the default connection for the first time or resume editing it thereafter.
4. Complete the initial prerequisites when setting up a connection for the first time using a connector.

   Note:
   This step is required only during the first-time setup. See Perform initial setup tasks when creating a connection in SGC Central.

5. Enter connection details and test the API connection for importing Microsoft Defender for Endpoint data.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the **Setup** stage of the playbook, select the **Configure and test connection** activity.

b. On the form, fill in the fields.

Configure and test connection form

Field	Description
Connection Name	Name to identify the Microsoft Defender for Endpoint connection record. **Note:** This field is automatically set to `SG Defender OAuth2.0 connection`. Leave the field value as is.
OAuth Client ID	Application (client) ID of your Microsoft Defender for Endpoint as described in the Before you begin section.
OAuth Client Secret	Client Secret of your Microsoft Defender for Endpoint as described in the Before you begin section.
OAuth token URL	Token URL of your Microsoft Defender for Endpoint. Enter the token URL in the following format: `https://login.microsoftonline.com/<tenantid>/oauth2/v2.0/token` Where *<tenantid>* is the tenant ID of your Microsoft Defender for Endpoint as described in the Before you begin section.
Use MID Server	Option to use a MID Server. **Note:** Use of a MID Server is optional.
Mid Selection	Name of the MID Server used by the connector. This field appears only when the **Use MID Server** check box is selected.

c. Select **Update and test connection**.

d. Once the connection test is complete, select **Continue**.

6. Configure the import schedule to import data at regular intervals.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the **Setup** stage of the playbook, select the **Configure import schedule** activity.

b. Select **Configure import schedule**.

c. Expand the Parent scheduled data import within the Import schedules list to select the **SG-Defender Machines** import schedule.

d. In the Configure import schedule dialog box, select the **Active** check box, and then fill in the run schedule and time details.

   For more information, see Schedule a data import.

e. Select **Save**.
   Alternatively, select **Execute Now** to execute the import schedule immediately.

f. Select **Continue**.

7. In the **Setup** stage of the playbook, select the **Confirm connection setup** activity to verify whether the connection was configured.

What to do next

Select **View all connections** to review the connection details. The configured connection appears in the Installed connections list.

Configure Service Graph Connector for Microsoft Defender Endpoint using the guided setup

Pull in data from machines using the Microsoft Defender for Endpoint security solution into your Configuration Management Database (CMDB).

Before you begin

Important:
Unless there are configuration issues, use the SGC Central view in the Service Graph Workspace or CMDB Workspace to configure the connection for the connector, as the guided setup method is planned for deprecated.

To use this Service Graph Connector, you need a subscription to a Subscription Unit that is based in the IT Operations Management (ITOM) Visibility application or in the ITOM Discovery application. As defined in the section titled "Managed IT Resource Types" in ServiceNow Subscription Unit Overview for your subscription, for managed IT resources that are created or modified in the CMDB by this Service Graph Connector, but that aren't yet managed by ITOM Visibility or ITOM Discovery, these resources will increase Subscription Unit consumption from that application. Review your current Subscription Unit consumption within ITOM Visibility or ITOM Discovery to ensure available capacity.

Dependencies and requirements:

- The Integration Commons for CMDB store app, which is automatically installed.
- The CMDB CI class models store app, which is automatically installed. See CMDB CI Class Models.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The ITOM Discovery License plugin (com.snc.itom.discovery.license). You must activate this plugin.
- ITOM Licensing plugin (com.snc.itom.license). For more information, see Request Discovery.
- The Datastream Action plugin (com.glide.hub.action_type.datastream), which is automatically installed.
- Observability Commons for CMDB (sn_observability), which is only required for event ingestion. For Event Management to work, the Observability Commons for CMDB (sn_observability) app must be installed prior to installing the connector. For more information, see Observability Commons for CMDB on the ServiceNow Store.

Complete the following tasks:

- Install the Service Graph Connector for Microsoft Defender Endpoint application (sn_defender_integ). For more information, see Install a ServiceNow Store application.
- Ensure that you have an active subscription to Microsoft Defender for Endpoint.
- Ensure that you have created an Azure application to get programmatic access to Microsoft Defender for Endpoint. See Create an app to access Microsoft Defender for Endpoint without a user in the Microsoft 365 documentation.
- Obtain the tenant ID, client ID, and client secret details for the Microsoft Defender for Endpoint administrator account.
- Enable the Machine.Read.All and Machine.ReadWrite.All permissions in Microsoft Defender for Endpoint. See Permissions for the `List machines` API in the Microsoft 365 documentation.

Role required: SGC-Admin (sn_cmdb_int_util.sgc_admin) or admin

Note:
The admin user role is required to run background scripts and to provide access to global tables to the SGC-Admin user. For information about the user roles for Service Graph Connectors, see Service Graph Connector user roles.

Procedure

1. Ensure that the application scope is set to the Service Graph Connector for Microsoft Defender Endpoint application by using the application picker.
   For more information, see Application picker.
2. Navigate to **All** > **Service Graph Connectors** > **Microsoft Defender** > **Setup**.
3. On the Getting started page, select **Get Started**.
4. Configure the authentication credentials details for sending requests to the `List machines` API in Microsoft Defender for Endpoint.

   a. Configure your Microsoft Defender for Endpoint authentication credentials.

      i. In the Configure the connection section of the Service Graph Connector for Microsoft Defender page, select **Get Started**.

      ii. For the Configure the credentials task, select **Configure**.

      iii. On the form, review and modify the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Application Registries form

Field	Description
Connection Name	Name to identify the connection record. **Note:** This field is automatically set to the `SG Defender OAuth` connection record. Leave the field value as is.
Client ID	Application (client) ID of your Microsoft Defender for Endpoint as described in the Before you begin section.
Client Secret	Client Secret of your Microsoft Defender for Endpoint as described in the Before you begin section.
OAuth Token URL	Token URL of your Microsoft Defender for Endpoint. Enter the token URL in the following format: `https://login.microsoftonline.com/<tenantid>/oauth2/v2.0/token` Where *<tenantid>* is the tenant ID of your Microsoft Defender for Endpoint as described in the Before you begin section.

iv. Select **Update** to return to the guided setup page.

v. Set the Configure the credentials task to complete by selecting **Mark as Complete**.

b. Test the *`List machines`* API connection to import machine-related data from Microsoft Defender for Endpoint.

i. For the Test the connection task, select **Configure**.

ii. On the Service Graph Connections page, select **Test Connection**.

iii. When the **Status** field is set to **Success**, select **Update** to close the Test the connection dialog box and return to the guided setup page.

If any of the tests have errors, follow the suggestions for remediation.

iv. Set the Test the connection task to complete by selecting **Mark as Complete**.

5. Configure the scheduled jobs to import machine-related data from Microsoft Defender for Endpoint.

a. In the Set up scheduled import jobs section of the Service Graph Connector for Microsoft Defender page, select **Get Started**.

b. For the Configure scheduled jobs task, select **Configure**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. From the **Name** column, select the scheduled job that you want to activate.
By default, the SG-Defender Machines scheduled job is available to run the SG-Defender Machines data source.

d. On the Scheduled Data Import form, verify the field values for the scheduled job.
For more information, see Schedule a data import.

e. Select **Update**.

f. Select the back button of your browser to return to the guided setup page.

g. Set the Configure the scheduled jobs task to complete by selecting **Mark as Complete** in the guided setup.

Service Graph Connector for Microsoft Defender Endpoint properties

Service Graph Connector for Microsoft Defender Endpoint properties control the behavior of the connector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

System properties

These system properties are available for Service Graph Connector for Microsoft Defender Endpoint.

Note:
To open the System Properties [sys_properties] table, enter `sys_properties.list` in the navigation filter.

System properties for Service Graph Connector for Microsoft Defender Endpoint

Property	Description
sn_defender_integ.pagination_record_count	Enter the maximum number of rows fetched in the *`List machines`* API response from the machine resource type. • Type: integer • Default value: `500` • Location: System Property [sys_properties] table

Accessing the connection details of Service Graph Connector for Microsoft Defender Endpoint

You can access the connection details of the Service Graph Connector for Microsoft Defender Endpoint in a single view using the common connection framework (CCF) included within the Integration Commons for CMDB (sn_cmdb_int_util) store app.

With the CCF, you can access all the connections used by the Service Graph Connector for Microsoft Defender Endpoint. The connection details include the connection alias, data sources, and scheduled data imports associated with a connection. You can also test the connection.

Access the details of a Microsoft Defender for Endpoint connection

Access the details of a Microsoft Defender for Endpoint connection configured for the Service Graph Connector for Microsoft Defender Endpoint.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Service Graph Connectors** > **Microsoft Defender** > **Connections**.
2. From the **Name** column of the Service Graph Connections list, select a connection.
3. On the Service Graph Connections page, view the connection details such as the connection name, alias, and data sources.
4. Select a related list to view further details of the connection.
5. **Optional:** Select the **Test Connection** related link to test the connection.

Life cycle management of records in Service Graph Connector for Microsoft Defender Endpoint

Life cycle management in the Service Graph Connector for Microsoft Defender Endpoint monitors and updates the statuses of Microsoft Defender for Endpoint resources throughout their entire life cycle, from creation to deletion.

The life cycle management process helps maintain the accuracy and integrity of data in the Configuration Management Database (CMDB).

Life cycle management for CIs in Service Graph Connector for Microsoft Defender Endpoint

The following table lists the configuration items (CIs) in CMDB and other non-CMDB tables for which life cycle management is available in the Service Graph Connector for Microsoft Defender Endpoint. The Install Status [install_status] attribute of the CIs is updated to installed or retired according to the state of the CI.

Supported tables for life cycle management

Data source	CIs	Life cycle management available
SG-Defender Machines	Windows Server [cmdb_ci_win_server]	Yes
SG-Defender Machines	IP Address [cmdb_ci_ip_address]	Yes
SG-Defender Machines	Network Adapter [cmdb_ci_network_adapter]	Yes
SG-Defender Machines	Computer [cmdb_ci_computer]	Yes

Service Graph Connector for Microsoft Intune

Use the Service Graph Connector for Microsoft Intune to pull data from the Microsoft Intune application into your ServiceNow instance.

The Service Graph Connector for Microsoft Intune pulls data from mobile devices, computers and software applications into the ServiceNow® Configuration Management Database (CMDB) application. The integration provides greater visibility into mobile devices, computers and related software applications that run on them.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported versions

Versions

Microsoft Intune	ServiceNow
• Microsoft Intune Graph API v1.0 • Microsoft Intune Graph API Beta	• Yokohama • Zurich • Australia

Use cases

The following are examples on how you can use the Service Graph Connector for different ServiceNow® applications:

- IT Operations Management (ITOM) Visibility
  - Detailed hardware and application inventory for Android, Apple, and Windows mobile devices. The inventory can be used with or without Software Asset Management (SAM).
  - Compliance tracking for mobile devices. You can build your own device (BYOD) or use corporate-owned devices.
- IT Service Management (ITSM)
  - Incidents, problems, and changes on discovered configuration items (CI).
  - Ownership tracking and assignment for mobile devices.

You can also do the following types of administrative actions:

- Device Management: You can report on various aspects of the device.
- Integration with Azure Monitor: Delta notification.

Configuring a connection for the connector

You can configure a connection for the connector by using the SGC Central view in the Service Graph Workspace or CMDB Workspace. The view enables you to discover and install connectors, and then effectively manage the full life cycle of creating, editing, monitoring, and debugging connections. To configure the connector using SGC Central, see Configure Service Graph Connector for Microsoft Intune using SGC Central.

Important:
The guided setup method is deprecated from version 2.7.0 of the Service Graph Connector for Microsoft Intune. Use the SGC Central view in the Service Graph Workspace or CMDB Workspace to configure the connection for the connector.

CMDB integration dashboards

The Integration Commons for CMDB store app provides a dashboard with a central view of the status, processing results, and processing errors of all installed integrations. You can see metrics for all integration runs. You can filter the view to a specific CMDB integration, a specific time duration, or a specific integration run. For more details about monitoring Microsoft Intune integrations in the CMDB Integrations Dashboard, see Using the CMDB Integrations Dashboard.

Data mapping

Data from data sources in the Microsoft Intune application is mapped and transformed into the ServiceNow CMDB Configuration Item (CI) class definitions using the Robust Transform Engine (RTE). Data is inserted into the ServiceNow CMDB using the Identification and Reconciliation Engine (IRE).

The following table describes the data sources, the staging tables, and the target tables as CMDB CI classes, and the resource types imported for a Microsoft Intune application.

Data mapping for Microsoft Intune

Data source	Staging table	CMDB CI classes	Resource types	Data source type
SG-Intune Computer	SG-Intune Computer [sn_intune_integrat_computer]	Computer SG-Intune Computer Related IP Address Serial Number When the Software Asset Management (SAM) application isn't installed: Software Software Instance When the SAM application is installed: Software Installation	Computers	Regular
SG-Intune Devices	SG-Intune Devices [sn_intune_integrat_devices]	Handheld Computing Device Serial Number Network Adapter SG-Intune Device Related IP Address When the Software Asset Management (SAM) application isn't installed:	Mobile devices	Regular

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data mapping for Microsoft Intune (continued)

Data source	Staging table	CMDB CI classes	Resource types	Data source type
		Software Software Instance When the SAM application is installed: Software Installation		
SG-Intune Software	SG-Intune Software [sn_intune_integrat_software]	Software	Discovered apps	Regular
SG-Intune Device Reports	SG-Intune Device Reports [sn_intune_integrat_device_reports]	Computer or Handheld Computing Device Serial Number Network adapter SG-Intune Computer Related SG-Intune Device Related IP Address **Note:** Imports Wireless (Wi-Fi) IPv4 Address of a device only. When the Software Asset Management (SAM) application isn't installed: Software Software Instance When the SAM application is installed: Software Installation	Computers and mobile devices	Advanced

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data mapping for Microsoft Intune (continued)

Data source	Staging table	CMDB CI classes	Resource types	Data source type
SG-Intune Software Reports	SG-Intune Software Reports [sn_intune_integrat_software_reports]	When the Software Asset Management (SAM) application isn't installed: Software Software Instance When the SAM application is installed: Software Installation	Discovered apps	Advanced

Starting with the Service Graph Connector for Microsoft Intune 2.7.0 version, the SG-Intune Device Reports and SG-Intune Software Reports advanced data sources are not available by default. To use these advanced data sources, you must select the **Advanced data sources** option while configuring the connection using SGC Central. See Configure Service Graph Connector for Microsoft Intune using SGC Central.

Configure the SG-Intune Device Reports and SG-Intune Software Reports advanced data sources for faster data import, better performance, and inclusion of software publisher details. Compared to the regular data sources (SG-Intune Computer, SG-Intune Devices, and SG-Intune Software), the advanced data sources help resolve server errors and performance issues caused by having a large number of Microsoft Intune devices.

For more information, see Service Graph Connector For Microsoft Intune - Advanced (Configure advanced Data sources) [KB1641546] .

Note:
The SG-Intune Device Reports advanced data source is an alternative to the SG-Intune Computer and SG-Intune Devices regular data sources. The SG-Intune Software Reports advanced data source is an alternative to the SG-Intune Software data source. The data imported by the advanced data sources is similar to the data imported by the corresponding regular data sources.

After you complete setting up the connection, you can configure the integration to periodically pull data from the Microsoft Intune application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- For any discovered software applications that were deleted later in the Microsoft Intune application, the Service Graph Connector automatically deletes the corresponding records in CMDB.
- To view more details about a handheld computing device or computer in the Computer [cmdb_ci_computer] class, enable the related lists SG-Intune Device Related and SG-Intune Computer Related.

  You can add these related lists by configuring the Related Lists view on the form that opens when you select a handheld computing device or computer configuration item (CI) in the Computer [cmdb_ci_computer] class. Computer CIs are displayed in the Computers list, accessed by navigating to **All** > **Configuration** > **Base Items** > **Computers**. For more information about adding related lists to a form, see Configuring the form layout.

For more information on where data is saved when pulling data from a Microsoft Intune application, see CMDB classes targeted in Service Graph Connector for Microsoft Intune.

You can use the IntegrationHub ETL app to view the data maps. See IntegrationHub ETL for more information.

Service Graph Connectors

Configure Service Graph Connector for Microsoft Intune using SGC Central

Configure Service Graph Connector for Microsoft Intune using SGC Central

Use the playbook available with the SGC Central application to set up the Service Graph Connector for Microsoft Intune for pulling in Microsoft Intune data into the CMDB.

Before you begin

Install Service Graph Connector for Microsoft Intune version 2.5.0 or later from the ServiceNow Store. For ServiceNow Store installation steps, see Install a ServiceNow Store application.

Obtain the following information from your Microsoft Intune administrator:

- Client ID
- Client Secret
- Token URL

For the connector to access the data in Microsoft Intune, the credential information is required to use the Microsoft Graph API. Therefore, you must grant the following Graph API permissions from the App registrations page in the Microsoft portal:

- DeviceManagementManagedDevices.Read.All (Type: Application)
- DeviceManagementApps.Read.All (Type: Application)
- User.Read.All (Type: Application)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dependencies and requirements:

- The Integration Commons for CMDB store app, which is automatically installed.
- The CMDB CI class models store app, which is automatically installed. See CMDB CI Class Models.
- Datastream Action plugin (com.glide.hub.action_type.datastream), which is automatically installed.
- ITOM Licensing plugin (com.snc.itom.license). For more information, see Request Discovery.
- ServiceNow IntegrationHub Zip step (com.glide.hub.action_step.zip), which is automatically installed.
- ServiceNow IntegrationHub JSON Parser step (com.glide.hub.action_step.jsonparser), which is automatically installed.
- The SGC Central application (sn_sgc_central), which is automatically installed.

Role required: The following table shows the roles required for each stage of the playbook.

Role required for each playbook stage

Stage	Role
Prerequisites	admin
Setup	SGC-Admin (sn_cmdb_int_util.sgc_admin) or admin

Note:
The admin user role is required to run background scripts, to provide access to global tables to the SGC-Admin user, and to configure advanced data sources. For information about the user roles for Service Graph Connectors, see Service Graph Connector user roles.

About this task

The playbook experience for onboarding connectors is activated with SGC Central in the Service Graph Workspace or CMDB Workspace. To configure the SGC Central application, see Configuring SGC Central and for more information on how to interact with a playbook, see Interact with Playbook.

For more details on permissions, see Service Graph Connector for Microsoft Intune - Troubleshooting connection issues on ServiceNow Community and Microsoft Graph permissions reference on the Microsoft documentation site.

Procedure

1. Use one of the following methods to open SGC Central:
   - Navigate to **Workspaces** > **Service Graph Workspace**, and from the left navigation panel, select the Ingestion icon to open the SGC Central view.
   - Navigate to **Workspaces** > **CMDB Workspace** > **SGC Central**.
2. On the Overview page, select **Create connection**.

   Tip:
   Alternatively, you can select **Create connection** on the All connections page.

3. On the Create connection window, select the Microsoft Intune connector type and then select **Create connection**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Complete the initial prerequisites when setting up a connection for the first time using a connector.

   Note:
   This step is required only during the first-time setup. See Perform initial setup tasks when creating a connection in SGC Central.

5. Select the data source type.

   a. In the **Setup** stage of the playbook, select the **Select data source type** activity.

   b. Select a data source type:

   - **Advanced data sources**: Advanced data sources offer faster data import and better performance, and include software publisher details. Select this option if you have a large number of Microsoft Intune devices.

     Note:

     - The admin role is required to configure advanced data sources.
     - To enable the creation of attachments, the *`glide.attachment.extensions`* system property must be set to either null or `zip, json`.

       For more information, see the Service Graph Connector For Microsoft Intune – Advanced [KB1641546] article in the Now Support Knowledge Base.

   - **Regular data sources**: The standard option, which doesn't include software publisher details.

   c. Select **Continue**.

6. Enter connection details and test the API connection for importing Microsoft Intune data.

   a. In the **Setup** stage of the playbook, select the **Create and test connection** activity.

   b. On the form, fill in the fields.

Create and test connection form

Field	Description
Connection Name	Name to identify the Microsoft Intune connection record. For example, `SG-Intune connection`.
Connection URL	Base URL to connect to your Microsoft Intune application. Based on the region of your Microsoft Intune application, enter the connection URL in one of the following formats: ▪ Global `https://graph.microsoft.com`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description

	▪ US Government
	`https://graph.microsoft.us`
	▪ China
	`https://microsoftgraph.chinacloudapi.cn`
	▪ Germany
	`https://graph.cloudapi.de/`

OAuth Client ID	Client ID of the Microsoft Intune application as noted in the Before you begin section.
OAuth Client Secret	Client secret of the Microsoft Intune application as noted in the Before you begin section.

OAuth Token URL	Callback URL for the Microsoft Intune application.
	Based on the region of your Microsoft Intune application, enter the token URL in one of the following formats:
	▪ Global
	`https://login.microsoftonline.com/<tenantid>/oauth2/v2.0/token`
	▪ US Government
	`https://login.microsoftonline.us/<tenantid>/oauth2/v2.0/token`
	▪ China
	`https://login.partner.microsoftonline.cn/<tenantid>/oauth2/v2.0/token`
	▪ Germany
	`https://login.microsoftonline.de/<tenantid>/oauth2/v2.0/token`
	Where *<tenantid>* is the tenant ID of your Microsoft Intune application.

Use MID server	Option to use the MID Server for connecting to the Microsoft Intune instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: A MID Server is required only if a direct connection between the ServiceNow and Microsoft Intune instances isn't possible.
Mid Selection	MID Server for the connection. This field appears only when you select the **Use MID Server** check box.

c. Select **Create and test connection**.

d. Once the connection test is complete, select **Continue**.

7. Configure the connection properties to enable the connector to access resources.
   a. In the **Setup** stage of the playbook, select the **Configure properties** activity.
   b. In the **Configure properties** section, update the connection properties for advanced and regular data sources if required.
   c. Select **Continue**.
8. Configure the report trigger job for advanced data sources.
   The **Activate report trigger job** activity appears only if you selected **Advanced data sources** in step 5.b. The advanced data sources require device reports and software reports to be triggered in the Microsoft environment before related jobs and scheduled imports are run.

   a. In the **Setup** stage of the playbook, select the **Activate report trigger job** activity.

   b. Fill in the fields on the **Scheduled Script Execution** form.

Scheduled Script Execution form

Field	Description
Name	Specify a name for the report trigger job.
Active	Select this check box to activate the report trigger job.
Run	Specify the schedule for the job to be run.
Time	Specify the time when the job should run.
Run as	Specify the user role required to run the report trigger job.

Note:
After you configure the report trigger job, all related jobs and the device and software reports scheduled imports are automatically scheduled to run in a specific sequence a few hours later (typically 3–4 hours). You can review the scheduled imports that are already activated and their scheduled time in step 9.

c. Select **Continue**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. Configure the import schedule to import data at regular intervals.

   a. In the **Setup** stage of the playbook, select the **Configure import schedule** activity.

   b. Expand the Parent scheduled data import within the Import schedules list to select the *Connection Name*-**SG-Intune Devices** import schedule.

   c. Select the **Active** check box, and then fill in the run schedule and time details.

      For more information, see Schedule a data import.

   d. Select **Save**.
   Alternatively, select **Execute Now** to execute the import schedule immediately.

   e. Select **Continue**.

10. In the **Setup** stage of the playbook, select the **Confirm connection setup** activity to verify whether the connection was configured.

What to do next

Select **View all connections** to review the connection details. The configured connection appears in the Installed connections list.

Related topics

Service Graph Connector for Microsoft Intune

CMDB classes targeted in Service Graph Connector for Microsoft Intune

Accessing the connection details of Service Graph Connector for Microsoft Intune

Configure Service Graph Connector for Microsoft Intune using the guided setup

Set up authentication credentials and a scheduled job to import Microsoft Intune data into your CMDB.

Before you begin

Important:
The guided setup method is deprecated from version 2.7.0 of the Service Graph Connector for Microsoft Intune. Use the SGC Central view in the Service Graph Workspace or CMDB Workspace to configure the connection for the connector.

To use this Service Graph Connector, you need a subscription to a Subscription Unit that is based in the IT Operations Management (ITOM) Visibility application or in the ITOM Discovery application. As defined in the section titled "Managed IT Resource Types" in ServiceNow Subscription Unit Overview for your subscription, for managed IT resources that are created or modified in the CMDB by this Service Graph Connector, but that aren't yet managed by ITOM Visibility or ITOM Discovery, these resources will increase Subscription Unit consumption from that application. Review your current Subscription Unit consumption within ITOM Visibility or ITOM Discovery to ensure available capacity.

Obtain the following information from your Microsoft Intune administrator:

- Client ID
- Client Secret
- Token URL

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For the connector to access the data in Microsoft Intune, the credential information is required to use the Microsoft Graph API. Therefore, you must grant the following Graph API permissions from the App registrations page in the Microsoft portal:

- DeviceManagementManagedDevices.Read.All (Type: Application)
- DeviceManagementApps.Read.All (Type: Application)
- User.Read.All (Type: Application)

For more details on permissions, see Service Graph Connector for Microsoft Intune - Troubleshooting connection issues on ServiceNow Community and Microsoft Graph permissions reference on the Microsoft documentation site.

Dependencies and requirements:

- The Integration Commons for CMDB store app, which is automatically installed.
- The CMDB CI class models store app, which is automatically installed. See CMDB CI Class Models.
- Datastream Action plugin (com.glide.hub.action_type.datastream), which is automatically installed.
- ITOM Licensing plugin (com.snc.itom.license). For more information, see Request Discovery.
- ServiceNow IntegrationHub Zip step (com.glide.hub.action_step.zip), which is automatically installed.
- ServiceNow IntegrationHub JSON Parser step (com.glide.hub.action_step.jsonparser), which is automatically installed.

Multi-instance is supported for importing data from multiple Microsoft Intune instances in Service Graph Connector for Microsoft Intune version 2.1.1 and later. This feature involves dynamically creating data sources and scheduled imports, which requires the granting of additional permissions. The guided setup includes additional steps for this feature.

Role required: SGC-Admin (sn_cmdb_int_util.sgc_admin) or admin

Note:
The admin user role is required to run background scripts and to provide access to global tables to the SGC-Admin user. For information about the user roles for Service Graph Connectors, see Service Graph Connector user roles.

Procedure

1. Navigate to **All** > **Service Graph Connectors** > **Intune** > **Setup**.
2. On the Getting Started page, select **Get started**.
3. Configure the credentials.

   a. On the Service Graph Connector for Microsoft Intune page, in the Configure the connection section, select the task **Configure credentials**.

   b. On the next page, in the Configure credentials task section, select **Configure**.

   c. On the form, fill in the fields.

Edit Connection form

Field	Description
Connection Name	Name of the Microsoft Intune application. This field is automatically set.

Connection URL	Connection URL for the connection.
	
	Based on the region of your Microsoft Intune application, enter the connection URL in one of the following formats:
	▪ Global
	`https://graph.microsoft.com`
	▪ US Government
	`https://graph.microsoft.us`
	▪ China
	`https://microsoftgraph.chinacloudapi.cn`
	▪ Germany
	`https://graph.cloudapi.de/`

OAuth Client ID	The client ID of the Microsoft Intune application.
OAuth Client Secret	The client secret of the Microsoft Intune application.

OAuth Token URL	Callback URL for the Microsoft Intune application.
	
	Based on the region of your Microsoft Intune application, enter the token URL in one of the following formats:
	▪ Global
	`https://login.microsoftonline.com/<tenantid>/oauth2/v2.0/token`
	▪ US Government
	`https://login.microsoftonline.us/<tenantid>/oauth2/v2.0/token`
	▪ China
	`https://login.partner.microsoftonline.cn/<tenantid>/oauth2/v2.0/token`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	▪ Germany `https://login.microsoftonline.de/<tenantid>/oauth2/v2.0/token` Where *<tenantid>* is the tenant ID of your Microsoft Intune application.

d. Select **Edit and Get OAuth Token**.

e. Go back to the guided setup page and for the Configure credentials task, select **Mark as Complete**.

4. **Optional:** If needed, configure the MID Server.
   a. In the Configure MID Server section, select **Configure**.
   b. Select the **Use MID server** check box.
   c. Select **Update** to save the record.

   Note:
   You do not need to update the other fields.

5. Test the connection to the Microsoft Intune API.
   a. In the Test the connection section, select **Configure**.
   b. On the form, review the fields.

Data Source form

Field	Description
Name	Unique name for this data source.
Import set table label	Label of the table that will be created for this data source.
Import set table name	Name of the table that will be created for this data source.
Data in single column	Option to set to data in single column.
Type	Data storage type of the data to be imported.
Application	Application containing this record.

   c. **Optional:** Modify the properties in the Service Graph Connection Properties related list of the connection record.

   Note:
   Try to retain the default value of the *software_path* property to ensure the proper retrieval of software details.

   d. Select the **Test Connection** related link to start the testing process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. When the **Status** field is set to **Success**, return to the guided setup page.
If any of the tests have errors, follow the suggestions for remediation.

f. In the Test the connection task section, select **Mark as Complete**.

6. Add multiple instances.

a. On the left sidebar, select the Add Multiple Instances icon ( ).

b. On the Service Graph Connector for Microsoft Intune page, in the Add Multiple Instances section, select the Update Data Source Access task.

c. Select the **Global** application scope by using the application picker.

d. In the Application Access related list, select the **Can create**, **Can update**, and **Can delete** check boxes, if not already selected.

e. Select **Update** to close the tab and return to the guided setup.

f. Modify the application scope again to **Service Graph Connector for Microsoft Intune** by using the application picker.

g. Set the Update Data Source Access task to complete by selecting **Mark as Complete**.

h. Repeat the steps 6.c to 6.f for the Update Scheduled data import access task with the Scheduled data import [scheduled_data_set] table and set the task to complete by selecting **Mark as Complete**.

7. Clear the cache for the new connection.

a. In the Clear Cache for Datasource and Import set section, select **Configure**.

b. In the **Run script** text box of the background script page, enter the following script:

```
     GlideTableManager.invalidateTable("sys_data_source");
     GlideCacheManager.flushTable("sys_data_source");

GlideTableManager.invalidateTable("scheduled_import_set");
     GlideCacheManager.flushTable("scheduled_import_set");

     GlideTableManager.invalidateTable("sys_db_object");
     GlideCacheManager.flushTable("sys_db_object");
```

c. Select **Run Script** to run the background script in the **global** scope.
The script may take several minutes to execute.

d. After the script is executed, select **Close**.

e. From the application picker, select the **Service Graph Connector for Microsoft Intune** application.

f. Select **Mark as Complete**.

8. To either add or save the connection, select **Configure** for the Create or Edit connection task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To add a connection, select **Add Connection**.
- To save the edits for the existing connection, select **Edit**.

Note:
Obtain the following information from your Microsoft Intune administrator:

- Client ID
- Client Secret
- Token URL

When a Microsoft Intune administrator registers an application, the Client ID, Client Secret, and Token URL will be available. To get more information about how to register an application, see the Microsoft Intune documentation site.

a. On the form, fill in the fields or edit as needed.

Create Connection form

Field	Description
Connection Name	Display name for the connection.

Connection URL	Connection URL for the new connection.
	
	Based on the region of your Microsoft Intune application, enter the connection URL in one of the following formats:
	▪ Global
	`https://graph.microsoft.com`
	▪ US Government
	`https://graph.microsoft.us`
	▪ China
	`https://microsoftgraph.chinacloudapi.cn`
	▪ Germany
	`https://graph.cloudapi.de/`

OAuth Client ID	Client ID for the Microsoft Intune application.
OAuth Client Secret	Client Secret for the Microsoft Intune application.
OAuth Token URL	Callback URL for the Microsoft Intune application. Based on the region of your Microsoft Intune application, enter the token URL in one of the following formats:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description

	▪ Global
	`https://login.microsoftonline.com/<tenantid>/oauth2/v2.0/token`
	▪ US Government
	`https://login.microsoftonline.us/<tenantid>/oauth2/v2.0/token`
	▪ China
	`https://login.partner.microsoftonline.cn/<tenantid>/oauth2/v2.0/token`
	▪ Germany
	`https://login.microsoftonline.de/<tenantid>/oauth2/v2.0/token`
	Where *<tenantid>* is the tenant ID of your Microsoft Intune application.

b. Either add or save the connection.

- To create the new connection, select **Create and Get OAuth Tokens**.
- To save the edits for the existing connection, select **Edit and Get OAuth Token**.

c. Navigate back to the guided setup and select **Mark as Complete**.

d. Optional: Set up the MID Server for the connection you created.

i. In the Configure Mid Servers section, select **Configure**.

ii. Select the name of the connection you created.

iii. Select the **Use MID server** check box.

iv. Select **Update**.

v. When you're finished with the task, select **Mark as Complete**

9. Test the API connection to import data from the Microsoft Intune application.

a. Test the connection, in the Test New Connections section, by selecting **Configure**.

i. Select the name of the data source associated with the newly created connection.

ii. Select the **Test Connection** related link to start the process.

iii. Optionally modify the properties in the Service Graph Connection Properties related list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Microsoft Intune connection properties

Property	Description
api_version	The version of the Microsoft Intune Graph API.
software_path	The path of the software code for finding apps and associated devices or vice versa. Leave the property value as is.
include_primary_user_details	Enable retrieving the details of the primary user during import and populating the **assigned_to** attribute in the records of the cmdb_ci table by setting the property value to `true`. For retrieving the enrolled user details, set the property value to `false`. Retrieving primary user details increases the time for importing data because of additional API calls. **Note:** When a user is assigned to a device initially, the enrolled and primary users are the same. If the device is reassigned to another user, the primary user name is reassigned to the new user, but the enrolled user is still the original enrolled user name.
include_ip_address_details	Enable retrieving the IP addresses of devices during import and populate the records in the cmdb_ci_ip_address table by setting the property value to `true`. To skip retrieving IP addresses, set the property to `false`. Retrieving IP addresses increases the time for importing data because of additional API calls.

Note:
The properties in the Service Graph Connection Properties related list of the connection record are modifiable. However, try to retain the default value of the *`software_path`* property to ensure the proper retrieval of software details.

iv. When the **Status** field is set to **Success**, return to the guided setup page.

Note:
If any of the tests have errors, follow the suggestions for remediation.

v. Return to the guided setup and select **Mark as Complete** for the Test New Connections task.

10. Set up the scheduled import jobs.

a. For the Configure scheduled jobs task in the Set up scheduled import jobs section, select **Configure**.

b. Select the name of the scheduled import you want to run.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. On the Scheduled Data Import form, verify the field values for the scheduled job and select the **Active** check box.

   For more information, see Schedule a data import.

d. Select **Update**.

e. Set the Configure scheduled jobs task to complete by selecting **Mark as Complete**.

11. Use advanced options to resolve server errors and improve performance with the SG-Intune Computer, SG-Intune Devices, and SG-Intune Software data sources while importing a large number of devices into the Microsoft Intune portal.

Note:

- The SG-Intune Device Reports data source serves as an alternative to the SG-Intune Computer and SG-Intune Devices data sources, importing the same information while optimizing the data retrieval process by minimizing API calls and reducing import time.
- The SG-Intune Software Reports data source serves as an alternative to the SG-Intune Software data source.
- Both the SG-Intune Device Reports and SG-Intune Software Reports data sources require the paid ServiceNow IntegrationHub Professional Pack Installer (com.glide.hub.integrations.professional) plugin.
- To enable the creation of attachments, the *`glide.attachment.extensions`* system property must be set to either null or `zip, json`.

  For more information, see the Service Graph Connector For Microsoft Intune – Advanced [KB1641546] article in the Now Support Knowledge Base.

a. Configure the scheduled jobs to import data using the SG-Intune Device Reports and SG-Intune Software Reports data sources.

   i. In the Advanced [Beta] section, for the Configure scheduled jobs for advanced data sources task, select **Configure**.

   ii. In the Scheduled jobs list, select **SG-Intune Trigger Device Reports** job.

   iii. On the Scheduled Script Execution form, verify the field values for the scheduled job and select the **Active** check box.

   For more information, see Schedule script execution form.

   iv. Select **Update**.

   v. To activate the scheduled job for the SG-Intune Software Reports data source, repeat steps 11.a.ii to 11.a.iv by selecting the **SG-Intune Trigger Software Reports** scheduled job.

   vi. Return to the guided setup page and set the Configure scheduled jobs for advanced data sources task to complete by selecting **Mark as Complete**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

- Deactivate the SG-Intune Computer and SG-Intune Devices scheduled imports after setting up the SG-Intune Trigger Device Reports scheduled job for the SG-Intune Device Reports data source.
- Deactivate the SG-Intune Software scheduled import after setting up the SG-Intune Trigger Software Reports scheduled job.
- Activate the ServiceNow IntegrationHub Professional Pack Installer (com.glide.hub.integrations.professional) plugin on your instance.

For more information, see the Service Graph Connector For Microsoft Intune – Advanced [KB1641546] article in the Now Support Knowledge Base.

b. Configure the scheduled import for the SG-Intune Device Reports and SG-Intune Software Reports data sources.

i. In the Advanced [Beta] section, for the Configure the scheduled import for advanced data sources task, select **Configure**.

ii. In the Scheduled Data Imports list, select the **SG-Intune Device Reports** scheduled import.

iii. On the Scheduled Data Import form, verify the field values for the scheduled data import and select the **Active** check box.

For more information, see Schedule a data import.

iv. Select **Update**.

v. Return to the guided setup page and set the Configure the scheduled import for advanced data sources task to complete by selecting **Mark as Complete**.

Important:
Verify that the SG-Intune Device Reports scheduled import is configured to run 3 hours after the SG-Intune Trigger Device Reports and SG-Intune Trigger Software Reports scheduled jobs.

Example: If the SG-Intune Trigger Device Reports job is set for 9 a.m. and SG-Intune Trigger Software Reports for 10 a.m. daily, schedule the SG-Intune Device Reports scheduled import for 1 p.m. daily.

c. When using multiple instances, update the permissions on the Scheduled Script Execution [sys_autoscript] table so that you can add scheduled jobs for the new connections.

i. For the Update scheduled job access task, select **Configure**.

ii. Select the **Global** application scope from the application picker.

iii. In the Application Access related list, select the **Can create**, **Can update**, and **Can delete** check boxes.

iv. Select#**Update**.

v. Switch back to the Service Graph Connector for Microsoft Intune application scope using the application picker.

vi. Return to the guided setup page and set the Update scheduled job access task to complete by selecting **Mark as Complete**.

d. When using multiple instances, clear the Scheduled Script Execution (sysauto_script) table cache to configure scheduled jobs for the new connections.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

i. For the Clear cache for scheduled job task, select **Configure**.

ii. Select the **Global** application scope from the application picker.

iii. In the **Run script** field, enter the following code:

```
GlideTableManager.invalidateTable("sysauto_script");
GlideCacheManager.flushTable("sysauto_script");
GlideTableManager.invalidateTable("sys_db_object");
GlideCacheManager.flushTable("sys_db_object");
```

iv. Select#**Run Script**.

v. Switch back to the Service Graph Connector for Microsoft Intune application scope using the application picker.

vi. Return to the guided setup page and set the Clear cache for scheduled job task to complete by selecting **Mark as Complete**.

e. When using multiple instances, create advanced data sources, scheduled jobs, and scheduled imports for the new connections.

> **Tip:**
> You can create additional connections for multiple instances by following the instructions in the Add Multiple Instances section of the guided setup.

i. For the Set up advanced data sources for multiple instances task, select **Configure**.

ii. On the form, fill in the fields to configure your scheduled job details for the new connection.

Field	Description
Instance Prefix to Data source and Scheduled data import sets	Identifier that is used in all of the data source and scheduled import names for this distinct SG-Intune connection. In a multiple instance deployment, keep prefix short, meaningful identifier that enables you to identify a set of related data sources. **Note:** Try to keep the prefix the same as your connection name.
Connection and Credentials Alias	Connection alias that was created in the previous step.
Run Scheduled Import as User	User to populate the field on the scheduled data import.

iii. Select **Submit** to create scheduled imports for your new connection.

iv. To activate any newly created scheduled jobs, repeat steps 11.a.ii to 11.a.iv.

v. To activate any newly created parent scheduled import, repeat steps 11.b.ii to 11.b.iv.

vi. Return to the guided setup page and set the Set up advanced data sources for multiple instances task to complete by selecting **Mark as Complete**.

CMDB classes targeted in Service Graph Connector for Microsoft Intune

When you complete setting up the connection, you can configure the integration to periodically pull data from Microsoft Intune. The data from the regular data sources (SG-Intune Computer, SG-Intune Devices, and SG-Intune Software) and the advanced data sources (SG-Intune Device Reports and SG-Intune Software Reports) is saved in tables that extend from the Configuration item [cmdb_ci] table.

Computer [cmdb_ci_computer]

The following attributes in the Computer [cmdb_ci_computer] table are populated by collected data:

Attribute label	Attribute name
Name	name
Serial number	serial_number
Description	short_description
Disk space (GB)	disk_space
Manufacturer	manufacturer
Operating System	os
OS Version	os_version
Model ID	model_id
Assigned to	assigned_to
Chassis type	chassis_type

Relationships created for Computer

Accessing the connection details of Service Graph Connector for Microsoft Intune

You can access the connection details of the Service Graph Connector for Microsoft Intune in a single view using the common connection framework (CCF) included within the Integration Commons for CMDB (sn_cmdb_int_util) store app.

With the CCF, you can access all the connections used by the Service Graph Connector for Microsoft Intune. The connection details include the connection alias, connection properties, data sources, and scheduled data imports associated with a connection. You can also test the connection. For more information, see Accessing the connection details of Service Graph Connectors.

Access the details of a Microsoft Intune connection

Access the details of a Microsoft Intune connection configured for the Service Graph Connector for Microsoft Intune.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Service Graph Connectors** > **Intune** > **Connections**.
2. From the **Name** column of the Service Graph Connections list, select a connection.
3. On the Service Graph Connections page, view the connection details such as the connection name, alias, and data sources.
4. Select a related list to view further details of the connection.
5. **Optional:** Select the **Test Connection** related link to test the connection.

Service Graph Connector for Microsoft Intune properties

Service Graph Connector for Microsoft Intune properties control the behavior of the connector.

Connection properties

These connection properties are available for Service Graph Connector for Microsoft Intune.

Note:
To open the Service Graph Connection Properties [sn_cmdb_int_util_service_graph_connection_property] table for the connector, navigate to **All** > **Service Graph Connectors** > **Intune** > **Connections** and select the connection name. The connection properties are displayed in the Service Graph Connection Properties related list.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection properties for Service Graph Connector for Microsoft Intune

Property	Description	Data source type
include_primary_user_details	Set the property to `true` to retrieve primary user details during import and add the assigned_to attribute to the Configuration item [cmdb_ci] table. Set the property to `false` to retrieve the enrolled user details. Retrieving primary user details increases the time for importing data because of additional API calls. **Note:** When a user is assigned to a device initially, the enrolled and primary users are the same. If the device is reassigned to another user, the primary user name is reassigned to the new user, but the enrolled user is still the original enrolled user name. • Type: true | false • Default value: `true`	Regular data sources (SG-Intune Computer, SG-Intune Devices, and SG-Intune Software)
include_ip_address_details	Set the property to `true` to retrieve IP address details during import and add the records to the IP Address [cmdb_ci_ip_address] table. Set the property to `false` to skip retrieving IP addresses. Retrieving IP addresses increases the time for importing data because of additional API calls. • Type: true | false • Default value: `true`	Regular data sources (SG-Intune Computer, SG-Intune Devices, and SG-Intune Software)
api_version	Enter the version of the Microsoft Intune Graph API. **Note:** This property is specific to the regular data sources (SG-Intune Computer, SG-Intune Devices, and SG-Intune Software).	Regular data sources (SG-Intune Computer, SG-Intune Devices, and SG-Intune Software)

Connection properties for Service Graph Connector for Microsoft Intune (continued)

Property	Description	Data source type
	• Type: string • Default value: `v1.0`	
software_path	Set the path of the software code for finding apps and associated devices for regular data sources (SG-Intune Computer, SG-Intune Devices, and SG-Intune Software). Set the property to null value to enable the logic to determine the path of the software code. • Type: device | app • Default value: `device`	Regular data sources (SG-Intune Computer, SG-Intune Devices, and SG-Intune Software)
device_report_chunks_count	Set the number of device report chunks. The value must be a power of 16 (1, 16, or 256). • Type: integer • Default value: `1`	Advanced data sources (SG-Intune Device Reports and SG-Intune Software Reports)
software_report_chunks_count	Set the number of software report chunks. The value must be a power of 16 (1, 16, or 256). • Type: integer • Default value: `16`	Advanced data sources (SG-Intune Device Reports and SG-Intune Software Reports)
export_apis_max_calls_before_wait	Set the maximum number of API calls that can be made consecutively before a waiting period is enforced. • Type: integer • Default value: `8`	Advanced data sources (SG-Intune Device Reports and SG-Intune Software Reports)
export_apis_wait_time_in_ms	Set the duration (in milliseconds) for the waiting period after the specified number of consecutive API calls is reached. • Type: integer • Default value: `120000`	Advanced data sources (SG-Intune Device Reports and SG-Intune

Service Graph Connector for Microsoft SCCM

Use the Service Graph Connector for Microsoft SCCM to pull data from Microsoft System Center Configuration Manager (SCCM) into your ServiceNow instance.

The Service Graph Connector for Microsoft SCCM (SG-SCCM) imports SCCM data into the ServiceNow® Configuration Management Database (CMDB) application. The integration does not write to the SCCM database and supports the Microsoft Endpoint Configuration Manager (MECM). The integration pulls data from computers, processors, operating systems, disks, networks, and software.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Supported versions

- Supported Microsoft SCCM/MECM versions:
  - 2503
  - 2409
- Supported ServiceNow versions:
  - Xanadu
  - Yokohama
  - Zurich

Use cases

The following ServiceNow applications have features that interact with the Service Graph Connector:

- IT Operations Management (ITOM) Visibility
  - Ability to get visibility into your infrastructure.
  - Detailed hardware and software inventory tracking. The tracking can be done with or without Software Asset Management (SAM).
  - Ability to detect delta changes for efficient incremental imports from SCCM to the ServiceNow AI Platform.
- IT Service Management (ITSM)
  - Incidents, problems, and changes on discovered configuration items (CI).
  - Automatic device ownership assignment.
- Software Asset Management (SAM) and IT Asset Management (ITAM)

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Tight integration with Software Asset Management Professional and client software distribution workflows.
- Inventory Software package and installation tracking.
- Software Usage tracking.
- License reclamation by detecting removed software.
- Support for software editions, normalizing publisher information, and normalizing product Information.
- Support for SCCM Asset Intelligence.

Important information for upgrading Service Graph Connector for Microsoft SCCM

After you've installed the latest version of the Service Graph Connector for Microsoft SCCM, ensure that you have removed the **last_run_datetime** field value from the Data Source [sys_data_source] table for the SCCM data sources.

Configuring a connection for the connector

You can configure a connection for the connector by using the SGC Central view in the Service Graph Workspace or CMDB Workspace. The view enables you to discover and install connectors, and then effectively manage the full life cycle of creating, editing, monitoring, and debugging connections. To configure the connector using SGC Central, see Configure Service Graph Connector for Microsoft SCCM using SGC Central.

Important:
Unless there are configuration issues, use the SGC Central view in the Service Graph Workspace or CMDB Workspace to configure the connection for the connector, as the guided setup method is planned for deprecated.

CMDB integrations dashboard

The Integration Commons for CMDB store app provides a dashboard with a central view of the status, processing results, and processing errors of all installed integrations. You can see metrics for all integration runs. You can filter the view to a specific CMDB integration, a specific time duration, or a specific integration run. For more details about monitoring Microsoft SCCM integrations in the CMDB Integrations Dashboard, see Using the CMDB Integrations Dashboard.

Data mapping

Data from the SCCM data sources is mapped and transformed into the ServiceNow CMDB Configuration Item (CI) class definitions using the Robust Transform Engine (RTE). Data is inserted into the ServiceNow® CMDB using the Identification and Reconciliation Engine (IRE).

The SCCM data sources include the following:

- SG-SCCM Computer Identity

  You can see the following data if it is available in SCCM:

  - Asset Tag. If the Asset Tag data is available, the mapping can be optionally enabled via the guided setup.
  - Assigned
  - DNS Domain

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- SG-SCCM Computer OU. This data source imports data about the Organizational Unit (OU) name. The data is stored in the SG-SCCM Computer Related [sn_sccm_integrate_sccm_2019_computer_related] table. To add the view, open the computer record, click the top header, and select **View** > **SG-SCCM Computer Related**.
- SG-SCCM Disk
- SG-SCCM Last Discovered Update. This data source will run at the end of the import schedules to update the last_discovered date on the Computer CI. The source will conduct a full pull of all the computers and bring in only the ResourceID and the LastHWScan columns to update the CMDB Computer table.
- SG-SCCM Network
- SG-SCCM Operating System
- SG-SCCM Processor
- SG-SCCM Removed Software. Ensure the **Use last run datetime** option is cleared for every run.
- SG-SCCM Removed Software AI. Ensure the **Use last run datetime** option is cleared for every run.
- SG-SCCM Software
- SG-SCCM Software AI

Note:
If you have Asset Intelligence on your Microsoft SCCM instance, you have to run SG-SCCM Removed Software AI and SG-SCCM Software AI. If you do not have Asset Intelligence on your instance, you have to run SG-SCCM Removed Software and SG-SCCM Software.

When you complete setting up the connection, you can configure the integration to periodically pull data from SCCM. The data is loaded into staging tables and then inserted into the following target tables:

- CI Relationship [cmdb_rel_ci]
- Computer [cmdb_ci_computer] (required)
- Disk [cmdb_ci_disk]
- IP address [cmdb_ci_ip_address]
- Network Adapter [cmdb_ci_network_adapter]
- Serial Number [cmdb_serial_number]
- Software Installation [cmdb_sam_sw_install] (If the SAM application is installed.)
- Software Instance [cmdb_software_instance] (If the SAM application is not installed.)
- Software [cmdb_ci_spkg] (If the SAM application is not installed.)
- Software Usage [samp_sw_usage]

For more information on where data is saved when pulling data from a Microsoft SCCM application, see CMDB classes targeted in Service Graph Connector for Microsoft SCCM.

You can use the IntegrationHub ETL app to view the data maps. See IntegrationHub ETL for more information.

Resolving the missing IP address or MAC address issue

By default, network adapters that are missing an IP address or MAC address are not imported. To include these network adapters in the import, do the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Navigate to **Service Graph Connector for Microsoft SCCM** > **Data Sources**.
2. Select **SG-SCCM Network**.
3. Remove the where clause from the **SQL statement** field.

Service Graph Connectors

Configure Service Graph Connector for Microsoft SCCM using SGC Central

Use the playbook available with the SGC Central application to set up the Service Graph Connector for Microsoft SCCM for pulling in Microsoft SCCM data into the CMDB.

Before you begin

Install Service Graph Connector for Microsoft SCCM version 3.5.0 or later from the ServiceNow Store. For ServiceNow Store installation steps, see Install a ServiceNow Store application.

To access Microsoft SCCM data, you must have appropriate access to the Microsoft SCCM database. You must have sufficient credentials to query the SQL Server that contains the Microsoft SCCM database. You must do the following:

1. Create a SQL Server account to connect to the Microsoft SCCM database on the MID Server to use the data sources.
2. Connect to your Microsoft SCCM SQL Server and configure the following:
   a. Add a new login user name and password for SQL authentication.
   b. Choose the Microsoft SCCM database that ServiceNow data sources will connect to.
   c. Assign the db_datareader role membership to the Microsoft SCCM user.

Air gap connections are available from version 3.7.0 of the Service Graph Connector for Microsoft SCCM. You can add either standard data sources or air gap data sources. Before you set up air gap data sources, you must configure the air gap solution for the Service Graph Connector for Microsoft SCCM in your high-secure server and low-secure server. See Configuring air gap connections for Microsoft SCCM.

Role required: The following table shows the roles required for each stage of the playbook.

Role required for each playbook stage

Stage	Role
Prerequisites	admin
Setup	SGC-Admin (sn_cmdb_int_util.sgc_admin) or admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The admin user role is required to run background scripts and to provide access to global tables to the SGC-Admin user. For information about the user roles for Service Graph Connectors, see Service Graph Connector user roles.

About this task

The playbook experience for onboarding connectors is activated with SGC Central in the Service Graph Workspace or CMDB Workspace. To configure the SGC Central application, see Configuring SGC Central and for more information on how to interact with a playbook, see Interact with Playbook.

Procedure

1. Use one of the following methods to open SGC Central:
   - Navigate to **Workspaces** > **Service Graph Workspace**, and from the left navigation panel, select the Ingestion icon to open the SGC Central view.
   - Navigate to **Workspaces** > **CMDB Workspace** > **SGC Central**.
2. On the Overview page, select **Create connection**.

   Tip:
   Alternatively, you can select **Create connection** on the All connections page.

3. On the Create connection window, select the Microsoft SCCM connector type, and then select **Create connection**.
4. Complete the initial prerequisites when setting up a connection for the first time using a connector.

   Note:
   This step is required only during the first-time setup. See Perform initial setup tasks when creating a connection in SGC Central.

5. Select an air gap template or a template that matches the credentials for establishing a Java Database Connectivity (JDBC) connection to the SCCM database.

   a. In the **Setup** stage of the playbook, select the **Select alias template** activity.

   b. Select one of the following templates.
   - **SCCM JDBC Connection Credentials**: Select this option to use a user name and password to establish a JDBC connection to the SCCM database.

     Note:
     The new user must be assigned the db_datareader role membership. For more information, see Create a database user.

   - **SCCM Air Gap**: Select this option to use an air gap connection if you're working with restricted environments that don't have direct internet access (see Configuring air gap connections for Microsoft SCCM).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **SCCM JDBC Conn Cred (Integrated Auth)**: Select this option to use Windows JDBC-integrated authentication, which uses domain credentials, for authenticating a JDBC connection to the SCCM database.

  Note:
  The account that runs the MID Server agent must have the db_datareader role to access the SCCM DB.

c. Select **Continue**.

- If you selected **SCCM Air Gap** in step 5.b, proceed to step 6.
- If you selected either **SCCM JDBC Connection Credentials** or **SCCM JDBC Conn Cred (Integrated Auth)** in step 5.b, proceed to step 7.

6. Download and run the PowerShell scripts to set up an air gap connection.

The **PowerShell Script Download** activity appears only when you select **SCCM Air Gap** as the template in step 5.b.

Note:
Before you add an air gap connection, you must configure the air gap solution for the Service Graph Connector for Microsoft SCCM in your high-secure and low-secure servers. See Configuring air gap connections for Microsoft SCCM.

a. In the **Setup** stage of the playbook, select the **PowerShell Script Download** activity.

b. Select **Download Airgap Scripts**.

c. Run the PowerShell scripts.

d. After configuring the air gap connection, select the **I have read the instructions and executed the scripts accordingly** check box.

e. Select **Continue**.

7. Enter connection details and test the API connection for importing Microsoft SCCM data.

a. In the **Setup** stage of the playbook, select the **Create and test connection** activity.

b. On the form, fill in the fields on the form depending on the template you selected in step 5.b: SCCM JDBC Connection Credentials, SCCM JDBC Conn Cred (Integrated Auth), or SCCM Air Gap.

- For the SCCM JDBC Connection Credentials and SCCM JDBC Conn Cred (Integrated Auth) templates:

Create and test connection form

Field	Description
Connection name	Name to identify the Microsoft SCCM connection record. For example, `SG-SCCM connection`.
Query timeout	Number of seconds the JDBC driver waits for a query to complete.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	0 indicates no timeout. If the timeout is exceeded, the integration considers the JDBC result inaccessible and marks the result as an error.
Connection timeout	Number of seconds before the MID Server connection cache pool closes the connection and removes the connection. 0 indicates no timeout.
Host	Network address of the server where the Microsoft SQL Server database is located.
Database name	Name of the Microsoft SQL Server database that SCCM uses.
Override default port	Custom port of the Microsoft SQL Server instance. The default port for Microsoft SQL Server is 1433
Instance name	Microsoft SQL Server instance.
MID Server	MID Server for the connection. Mandatory for an Integrated Authentication connection; recommended for all JDBC connections.
Note: The following fields appear only when you select the **SCCM JDBC Connection Credentials** template in step 5.	
Format	JDBC driver used for connecting to the SCCM database. SCCM uses Microsoft SQL Server as its database backend. This field is automatically set to **com.microsoft.sqlserver.jdbc.SQLServerDriver**. Leave the field value as is.
Username	User name for connecting to the JDBC server.
Password	Password for the JDBC server.
Use MID Server	Option to use the MID Server for accessing the JDBC server.

- For the SCCM Air Gap template:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create and test connection form

Field	Description
Connection name	Display name for the connection.
Parent directory	Path of the Microsoft SCCM directory where the data is stored in your low-secure server.
Archive data after retrieval	Option to archive data after retrieval.
Archive path [Optional]	Folder where the data is to be archived if the **Archive data after retrieval** check box is selected.
MID server	Name of the MID Server that you deployed in your low-secure server. See Configure air gap solution for Microsoft SCCM in a low-secure server.

c. Select **Create and test connection**.

d. Once the connection test is complete, select **Continue**.

8. **Optional:** Configure the connection and connector properties to map attributes and manage data imports.

   Note:
   To skip this step, select **Continue** for the **Configure properties** activity.

   a. In the **Setup** stage of the playbook, select the **Configure properties** activity.

   b. To map the asset tags from Microsoft SCCM to the asset tag attribute in the Computer [cmdb_ci_computer] class, in the Connection properties section of the Configure properties page, select the **Map asset tags** check box.

   c. To avoid creating duplicate records in the CMDB Disks [cmdb_ci_disk] table when the Discovery application is running, in the Connector properties section of the Configure properties page, select the **Avoid creating duplicate records** check box.

   d. To set the import disk name to the format starting with Disk #[*disknumber*], in the Connector properties section of the Configure properties page, select the **Transform disk name to disk number** check box.
   Where the *disknumber* is the number extracted from the disk name

   e. Select **Continue**.

9. **Optional:** Modify the SQL statement for a data source.

   Note:
   To skip this step, select **Skip** for the **Customize data source SQL statement** activity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the **Setup** stage of the playbook, select the **Customize data source SQL statement** activity.

b. Double-click (or use the keyboard shortcut) the **Custom SQL statement** column value for a data source and enter the custom SQL statement.

c. Repeat the step 9.b for each data source where you want to modify the SQL statement.

d. Select **Mark Complete**.

10. Configure the import schedules to import data at regular intervals.

a. In the **Setup** stage of the playbook, select the **Configure import schedule** activity.

b. Expand the Parent scheduled data import within the Import schedules list to select the *`Connection Name`*-**SCCM Computer Identity** import schedule.

c. Select the **Active** check box, and then fill in the run schedule and time details.

For more information, see Schedule a data import.

d. Select **Save**.
Alternatively, select **Execute Now** to execute the import schedule immediately.

e. Select **Continue**.

11. In the **Setup** stage of the playbook, select the **Confirm connection creation** activity to verify whether the connection was created.

What to do next

Select **View all connections** to review the connection details. The created connection appears in the Installed connections list.

Enable Software Editions in Service Graph Connector for Microsoft SCCM

Accessing the connection details of Service Graph Connector for Microsoft SCCM

Configuring air gap connections for Microsoft SCCM

Configure Service Graph Connector for Microsoft SCCM using the guided setup

Set up and validate data source connection credentials to import Microsoft SCCM data into your CMDB.

Before you begin

Important:
Unless there are configuration issues, use the SGC Central view in the Service Graph Workspace or CMDB Workspace to configure the connection for the connector, as the guided setup method is planned for deprecated.

Confirm that you are in the Service Graph Connector for Microsoft SCCM application scope by using the application picker.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If you're currently using a version of the Microsoft SCCM plugin, see .

Dependencies and requirements:

- The Integration Commons for CMDB store app, which is automatically installed.
- The CMDB CI class models store app, which is automatically installed. See CMDB CI Class Models.
- Integration - JDBC (com.snc.integration.jdbc)
- Windows MID Server required for access to the SCCM environment.

To access Microsoft SCCM data, you must have appropriate access to the Microsoft SCCM database. You must have sufficient credentials to query the SQL Server that contains the Microsoft SCCM database. You must do the following:

1. Create a SQL Server account to connect to the Microsoft SCCM database on the MID Server to use the data sources.
2. Connect to your Microsoft SCCM SQL Server and configure the following:
   a. Add a new login user name and password for SQL authentication.
   b. Choose the Microsoft SCCM database that ServiceNow data sources will connect to.
   c. Assign the db_datareader role membership to the Microsoft SCCM user.

Note:
If you have the Service Graph Connector for Microsoft SCCM version 2.1.6 or earlier versions installed in your production environment, contact Customer Service and Support for additional steps to remove the SCCM Discovery Source from being included when calculating the subscription unit consumption.

Starting with Service Graph Connector for Microsoft SCCM version 3.0.4, support for multi-instance is introduced, enabling Service Graph Connector for Microsoft SCCM to connect to and import data from multiple Microsoft SCCM instances. This feature involves dynamically creating data sources and scheduled imports, requiring the granting of additional permissions. For more information about how to complete these steps, see Service Graph Connector for Microsoft 3.0 Setup Guidelines [KB1001248] in Now Support .

Air gap connections are available from version 3.7.0 of the Service Graph Connector for Microsoft SCCM. You can add either standard data sources or air gap data sources by using SGC Central. See Configure Service Graph Connector for Microsoft SCCM using SGC Central.

Role required: SGC-Admin (sn_cmdb_int_util.sgc_admin) or admin

Note:
The admin user role is required to run background scripts and to provide access to global tables to the SGC-Admin user. For information about the user roles for Service Graph Connectors, see Service Graph Connector user roles.

Procedure

1. Navigate to **All** > **Service Graph Connectors** > **SCCM** > **Setup**.
2. On the Getting Started page, select **Get Started**.
3. On the Service Graph Connector for Microsoft SCCM page, in the Configure Data source and Scheduled data import access section, select the task **Configure Data source access**.
4. Update the data source access to enable creating data sources and scheduled data imports for a new connection in the Service Graph Connector for Microsoft SCCM.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. For the Configure Data source access task, select **Configure**.

b. Select the **Global** application scope by using the application picker.

c. In the Application Access related list, select the **Can create**, **Can update**, and **Can delete** check boxes, if not already selected.

d. Select **Update** to close the tab and return to the guided setup.

e. Modify the application scope again to **Service Graph Connector for Microsoft SCCM** by using the application picker.

f. Set the **Update Data Source Access** task to complete by selecting **Mark as Complete**.

g. Repeat the steps 4.b to 4.e for the Update Scheduled data import access task with the Scheduled data import [scheduled_data_set] table and set the task to complete by selecting **Mark as Complete**.

5. Configure the authentication credentials and configuration used for connecting to the Microsoft SCCM database.
   - To establish a JDBC connection to the SCCM database, proceed to step 5.a.
   - To use Windows JDBC-integrated authentication, proceed to step 5.b.

a. Use a user name and password to establish a JDBC connection to the SCCM database.

> **Note:**
> Perform this step only when you want to use a user name and password to establish a JDBC connection. Otherwise, select **Skip** to skip the step.

i. For the Configure connection task in the Configure the connection section, select **Configure**.

ii. Configure the connection.

- To configure the connection available by default, select **Configure** for the SCCM JDBC Connection Credentials connection.
- To create another connection, select **Add Connection**.

> **Note:**
> You can create multiple connections by selecting **Add Connection**. If not redirected to the connection setup, on the Workflow Studio Integrations page search for SCCM JDBC Connection Credentials to modify the default connection or add another connection.

iii. On the form, fill in the fields.

Configure Connection or Create Connection form

Field	Description
Connection Information	
Connection name	Name to identify the Microsoft SCCM connection record. For example, `SG-SCCM connection`.
Query timeout	Number of seconds the JDBC driver waits for a query to complete.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	0 indicates no timeout. If the timeout is exceeded, the integration considers the JDBC result inaccessible and marks the result as an error.
Connection timeout	Number of seconds before the MID Server connection cache pool closes the connection and removes the connection. 0 indicates no timeout.
Format	JDBC driver used for connecting to the Microsoft SCCM database. Microsoft SCCM uses Microsoft SQL Server as its database backend. This field is automatically set to **com.microsoft.sqlserver.jdbc.SQLServerDriver**. Leave the field value as is.
Host	Network address of the server where the Microsoft SQL Server database is located.
Database name	Name of the Microsoft SQL Server database that Microsoft SCCM uses.
Override default port	Custom port of the Microsoft SQL Server instance. The default port for Microsoft SQL Server is 1433
Instance name	Microsoft SQL Server instance.
Use MID Server	Option to use the MID Server for accessing the JDBC server.
MID Server	MID Server for the connection. **Note:** It's required to select a MID Server for an Integrated Authentication connection. For the **SCCM JDBC Connection Credentials** option.
Credential Information	
Username	User name for connecting to the JDBC server.
Password	Password for the JDBC server.

Note:
The new user must be assigned the db_datareader role membership. For more information, see Create a database user.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

iv. Save your changes.

- For the default connection, select **Configure Connection**.
- For a new connection, select **Create Connection**.

v. Navigate back to the guided setup and set the Configure connection task to complete by selecting **Mark as Complete**.

b. Use Windows JDBC-integrated authentication, which uses domain credentials, for authenticating a JDBC connection to the SCCM database.

> **Note:**
> Perform this step if you need the JDBC connection with integrated authentication. Otherwise, select **Skip** to skip the step.

i. For the Configure connection (Integrated authentication) task in the Configure the connection section, select **Configure**.

ii. Configure the connection.

- To configure the connection available by default, select **Configure** for the SCCM JDBC Conn Cred (Integrated Auth) connection.
- To create another connection, select **Add Connection**.

> **Note:**
> You can create multiple connections by selecting **Add Connection**. If not redirected to the connection setup, on the Workflow Studio Integrations page section search for SCCM JDBC Conn Cred (Integrated Auth) to modify the default connection or add another connection.

iii. On the form, fill in the fields.

Configure Connection or Create Connection form

Field	Description
Connection name	Name to identify the Microsoft SCCM connection record.
Query timeout	Number of seconds the JDBC driver waits for a query to complete. 0 indicates no timeout. If the timeout is exceeded, the integration considers the JDBC result inaccessible and marks the result as an error.
Connection timeout	Number of seconds before the MID Server connection cache pool closes the connection and removes the connection. 0 indicates no timeout.
Host	Network address of the server where the Microsoft SQL Server database is located.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Database name	Name of the Microsoft SQL Server database that Microsoft SCCM uses.
Override default port	Custom port of the Microsoft SQL Server instance. The default port for Microsoft SQL Server is 1433
Instance name	Microsoft SQL Server instance.
MID Server	MID Server for the connection.

Note:
The account that runs the MID Server agent must have the db_datareader role to access the SCCM DB.

iv. Save your changes.

- For the default connection, select **Configure Connection**.
- For a new connection, select **Create Connection**.

v. Navigate back to the guided setup and set the Configure connection (Integrated authentication) task to complete by selecting **Mark as Complete**.

6. Configure the connection and connector properties to map attributes and manage data imports.

a. Optional: Enable mapping asset tags from Microsoft SCCM to the asset tag attribute in the Computer [cmdb_ci_computer] class.

i. For the Configure Connection Properties task in the Configure Data Source and Scheduled Data Import section, select **Configure**.

ii. In the Name column, select the connection.

iii. In the Service Graph Connection Properties related list, select **asset_tag** in the Property column.

iv. In the **Value** field, enter `true` to enable mapping asset tags.

v. Select **Update**.

vi. Navigate back to guided setup and set the Configure Connection Properties task to complete by selecting **Mark as Complete**.

b. Test the Computer Identity data source to verify that all data sources are properly connected.

i. For the Validate Data Sources task in the Configure Data Source and Scheduled Data Import section, select **Configure**.

ii. In the Name column, select the Computer Identity data source associated with the connection.

iii. Select **Test Load 20 Records**.

iv. When the **State** field is set to **Complete** and the **Completion code** field is set to **Success**, select the **Return to data source** link.

v. Navigate back to guided setup and set the Validate Data Sources task to complete by selecting **Mark as Complete**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Ensure that all data from the Computer Identity source is imported without the date time filtering during the next test load.

i. For the Reset 'Last run datetime' in test load data source task in the Configure Data Source and Scheduled Data Import section, select **Configure**.

ii. In the Name column, select the Computer Identity data source associated with the connection.

iii. Clear the **Use last run datetime** check box.

iv. Select **Update**.

v. Navigate back to guided setup and set the Reset 'Last run datetime' in test load data source task to complete by selecting **Mark as Complete**.

7. **Optional:** Configure the process for importing disk data when the Discovery application is running.

a. Avoid creating duplicate records in the CMDB Disks [cmdb_ci_disk] table.

Note:
You can avoid creating duplicate records in the CMDB Disks [cmdb_ci_disk] table when the Discovery application is running by configuring the *sn_sccm_integrate.sccm_disks_managed* property and setting its value to `true`. By default, the property value is set to `false`.

i. For the Configure Disk Data Imports task in the Configure Disk Data Imports section, select **Configure**.

ii. On the System Property page, set the value of the *sn_sccm_integrate.sccm_disks_managed* property to `true`.

iii. Select **Update**.

iv. Set the Configure Disk Data Imports task to complete by selecting **Mark as Complete**.

Note:
Any existing disk records are updated only after the next hardware scan is executed in the Microsoft SCCM instance.

b. **Optional:** Transform imported disk name to disk number format.

Note:
You can set the imported disk name to the format `Disk #<disknumber>`. Where *<disknumber>* is the number extracted from the imported disk name.

i. Select the **Integration Commons for CMDB** application scope from the application picker.

ii. For the Configure Disk Name Transformation task in the Configure Disk Data Imports section, select **Configure**.

iii. On the System Property page, set the value of the *sn_cmdb_int_util.transform_disk_name_to_discovery_format* property to `true`.

iv. Select **Update**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

v. From the application picker, select the Service Graph Connector for Microsoft SCCM application scope.

vi. Set the Configure Disk Name Transformation task to complete by selecting **Mark as Complete**.

8. Configure the scheduled data imports.

> **Note:**
> If the **Use Integrated Authentication** check box is selected for the data source, the run as user for the scheduled data import job must have the import_admin role. For more information, see the "Use Integrated Authentication" is being unchecked when you run the scheduled import related to SG-SCCM or SG-SCCM Computer Identity Data Source [KB1312810] article in the Now Support Knowledge Base.

a. For the Configure scheduled jobs task in the Configure scheduled jobs task section, select **Configure**.

b. On the Scheduled Data Import form, verify the field values for the scheduled job.
For more information, see Schedule a data import.

All other Service Graph Connector for Microsoft SCCM scheduled jobs that are active will run in their specified order after the Computer Identity scheduled job is finished running.
Select the **Active** check box for a scheduled job to activate the job.

> **Important:**
> If you are upgrading to the Service Graph Connector for Microsoft SCCM, deactivate the existing 'SG-SCCM Computer Identity scheduled data import'. Additionally, you cannot use the baseline scheduled data import or data sources that have a name starting with 'SG-SCCM' because they are used as templates for creating an instance of data sources and scheduled data imports.

c. Select **Update**.

d. Set the Configure Scheduled data imports task to complete by selecting **Mark as Complete**.

e. **Optional:** When upgrading the Service Graph Connector for Microsoft SCCM, deactivate the existing SG-SCCM Computer Identity scheduled data import.
For the Deactivate Legacy Scheduled Data Imports task, select **Configure**.

f. In the Name column, select the SG-SCCM Computer Identity scheduled data import and clear the **Active** check box.

g. Set the Deactivate Legacy Scheduled Data Imports task to complete by selecting **Mark as Complete**.

9. **Optional:** Customize the Instance Data source SQL statement.

a. For the Customizing Data source SQL statement task in the Customize Instance Data source SQL statement section, select **Configure**.

b. Select the name of the instance in which you want to customize the SQL statement.

c. Select **Update**.

d. Set the Customizing Data source SQL statement task to complete by selecting **Mark as Complete**.

Upgrade to the latest version of Service Graph Connector for Microsoft SCCM

Upgrade your Service Graph Connector for Microsoft SCCM. When you upgrade versions, you can select the files that you want to transfer from the earlier version to the later version of the Service Graph Connector for Microsoft SCCM.

Before you begin

To avoid any serious upgrade issues, perform the upgrade in a test or development instance prior to upgrading in a production environment.
Role required: admin

About this task

When you upgrade from an earlier version to the latest version of the Service Graph Connector for Microsoft SCCM, there are Skipped Updates. The original SCCM data source files that were installed have the last run date updated as part of the data source runs. The files will be treated as custom files by the platform. When the newer version is installed, the newer data sources will not be automatically upgraded.

After you have upgraded to the newer version, you can check the upgrade status.

Procedure

1. Review all the updates from the upgrade center and select the data source files from the newer version.
   You can access the upgrade history and review the updates from the Skipped Changes to Review related list. See Review skipped records using related lists.
2. If you have customized the earlier version, select the changes that you need from the older file and migrate them to the new file.

> **Note:**
> Repeat this migration process for all the other skipped update files.

What to do next

After the upgrade, if there are changes to the SQL in the data source files or mapping, then do the following:

1. Clear the **Use last run datetime** check box in all the data sources.
2. Perform a full pull of data from all the data sources.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Upgrading from Service Graph Connector for Microsoft SCCM v2.3 to v2.3.1 requires a minimum pull of Computer and Software, because the Source Native Key for the software within the SQL was changed in the SG-SCCM Removed Software data source. Without the correct Source Native Keys, it will not be able find the software in the CMDB.

For more information on resolving any conflicts, see the following topics:

- Revert a customization
- Resolve a skipped update and set a resolution status
- Skipped Changes to Review related list

Enable Software Editions in Service Graph Connector for Microsoft SCCM

Enable software editions so that you can gather edition information for products such as Adobe Acrobat, Microsoft SQL Server, and Windows Exchange Server into the Service Graph Connector for Microsoft SCCM.

Before you begin

Note:
There are two types of setup that are required, one on the SCCM Manager and the other on the ServiceNow Instance. For more information on how to set up the SCCM Manager, see the SCCM Manager Setup section of the Custom solution to gather editions in SCCM [KB0721360] article on the HI Knowledge Base. When you're finished setting up the SCCM Manager, refer back to this task and complete the steps.

Role required: admin

About this task

You can set up the ServiceNow Instance on the Service Graph Connector for Microsoft SCCM.

Procedure

1. Navigate to **All** > **Service Graph Connector Microsoft SCCM** > **Import Schedules**.
2. Select the Software Edition scheduled import you created to edit this import record.
3. Select the **Active** check box.
4. Click **Update**.
5. Navigate to **Service Graph Connector Microsoft SCCM** > **Data Sources**.
6. Select the Software Edition data source you created.
7. Under the Transforms list, select **Update software install with edition**.
8. Edit the data source and select the **Active** check box.
9. Click **Update**.

What to do next

You can verify that the edition information has been gathered by doing the following:

1. Navigate to **Service Graph Connector Microsoft SCCM** > **Data Sources** and the Software Edition data source you want to verify.
2. Select **Load All Records**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If the displayed completion code is `Success`, then the software edition data source was executed successfully. If the displayed completion code is `Error`, then there is an error that must be fixed.

Accessing the connection details of Service Graph Connector for Microsoft SCCM

You can access the connection details of the Service Graph Connector for Microsoft SCCM in a single view using the common connection framework (CCF) included within the Integration Commons for CMDB (sn_cmdb_int_util) store app.

With the CCF, you can access all the connections used by the Service Graph Connector for Microsoft SCCM. The connection details include the connection alias, connection properties, data sources, and scheduled data imports associated with a connection. You can also test the connection. For more information, see Accessing the connection details of Service Graph Connectors.

Access the details of a Microsoft SCCM connection

Access the details of a Microsoft SCCM connection configured for the Service Graph Connector for Microsoft SCCM.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Service Graph Connectors** > **SCCM** > **Connections**.
2. From the **Name** column of the Service Graph Connections list, select a connection.
3. On the Service Graph Connections page, view the connection details such as the connection name, alias, and data sources.
4. Select a related list to view further details of the connection.
5. **Optional:** Select the **Test Connection** related link to test the connection.

Configuring air gap connections for Microsoft SCCM

The Service Graph Connector for Microsoft SCCM supports an air gap solution for networks that are configured in a manner that doesn't support a MID agent.

An air gap is a security measure that involves isolating a computer or network and preventing it from establishing an external connection. Air-gapped networks keep critical systems secure by isolating them from external connections to protect the systems from cyber threats. Air gap connections for the Service Graph Connector for Microsoft SCCM enable controlled data transfer for Microsoft SCCM instances that are deployed to a subnet that neither has internet access nor is reachable by a MID Server agent.

Air gap connections are available from version 3.7.0 of the Service Graph Connector for Microsoft SCCM. You can add either standard data sources or air gap data sources by using SGC Central. To access the SGC Central setup, see Configure Service Graph Connector for Microsoft SCCM using SGC Central.

The air gap solution for the Service Graph Connector for Microsoft SCCM is presented in the architecture diagram.

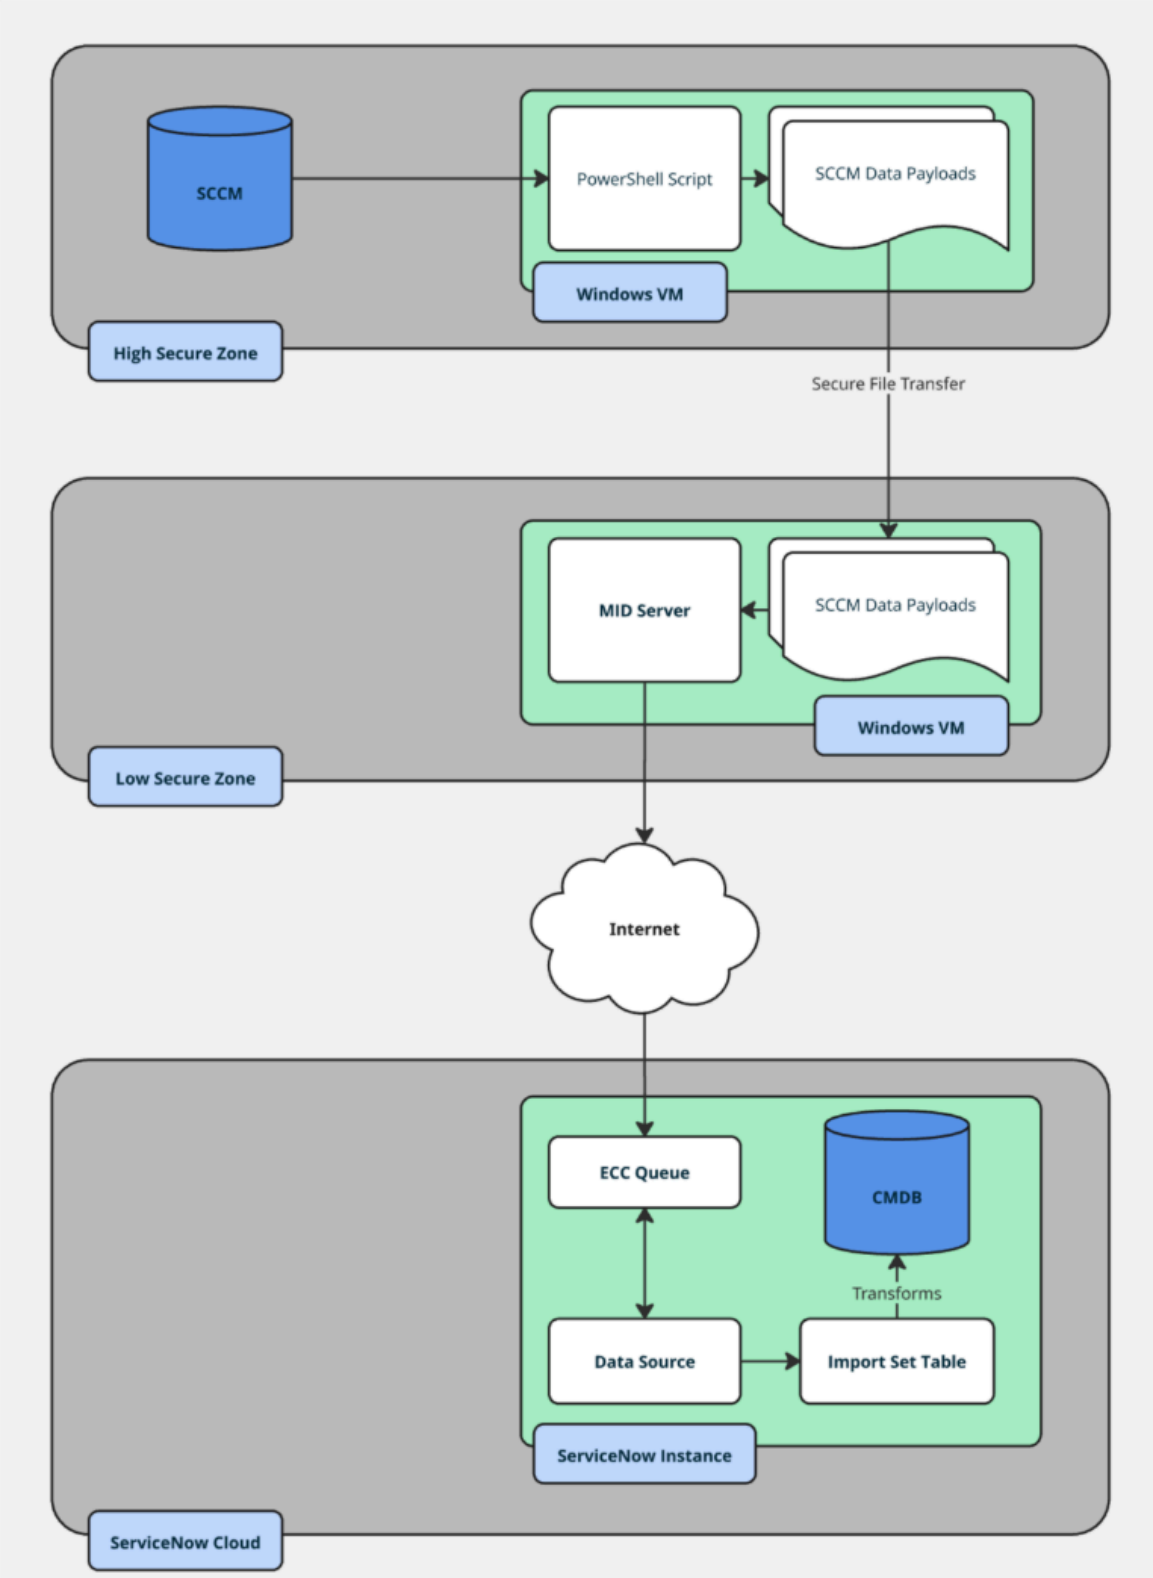
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Perform the following sequence of tasks to configure the air gap solution before you add air gap data sources:

1. Configure air gap solution for Microsoft SCCM in a high-secure server
2. Configure air gap solution for Microsoft SCCM in a low-secure server
3. Configure air gap solution for Microsoft SCCM in a ServiceNow instance

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Perform a test data load for the air gap solution for Microsoft SCCM
5. Perform a full data load for the air gap solution for Microsoft SCCM

Configure air gap solution for Microsoft SCCM in a high-secure server

Configure the air gap solution for the Service Graph Connector for Microsoft SCCM in your high-secure server.

Before you begin

Role required: admin

Procedure

1. Navigate to **Workspaces** > **CMDB Workspace** > **SGC Central** > **Create connection**.
2. Select the air gap template.
   a. In the **Setup** stage of the playbook, select the **Select alias template** activity.
   b. Select **SCCM Air Gap**.
   c. Select **Continue**.
3. Download and run the PowerShell scripts to set up an air gap connection.
   a. In the **Setup** stage of the playbook, select the **PowerShell Script Download** activity.
   b. Select **Download Airgap Scripts**.
   c. Download the `SgSCCMHighSecureSetup.ps1` and `GetSCCMData.ps1` PowerShell scripts from the link provided in the Download Airgap Scripts section.
4. Log on to your high-secure server.
5. Create a Microsoft SCCM directory.

   All the configurations required for the air gap solution are created in the Microsoft SCCM directory.

6. Copy the `GetSCCMData.ps1` and `SgSCCMHighSecureSetup.ps1` PowerShell scripts that you downloaded in step 3.c to the Microsoft SCCM directory.
7. Start a PowerShell session, and run the `SgSCCMHighSecureSetup.ps1` script to generate the JSON configuration file that is used by the `GetSCCMData.ps1` script.

   a. At the prompt, enter the path for the Microsoft SCCM data directory that you created in step 5.

   b. Enter a name for the configuration file, or press the Return key to accept the default value.

   c. Enter the values for the global properties, or press the Return key to accept the default values.
      - *`logDirectory`*: Specify the location to store the log file from the `GetSCCMData.ps1` script.
      - *`host`*: Specify the host name for your Microsoft SCCM instance.
      - *`dbname`*: Specify the SCCM database name.
      - *`port`*: Specify the port on which the Microsoft SCCM instance allows API calls.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- *pageSize*: Specify the number of records to be fetched in a Microsoft SCCM API call.
- *credentialsPath*: Specify the location to store the Microsoft SCCM credentials XML file.

d. Specify names for the data source data directories, or press the Return key to accept the default values.

The directories are created if they don't already exist.

e. Enter the Microsoft SCCM credentials in the **Windows PowerShell credential request** pop-up window.

f. Exit the PowerShell session.

8. Provide write and delete permissions for the Microsoft SCCM data directory and the child directories (created in step 5) to the account that will run the `GetSCCMData.ps1` script.

Delete permissions are required for old records to be cleaned up.

Configure air gap solution for Microsoft SCCM in a low-secure server

Configure the air gap solution for the Service Graph Connector for Microsoft SCCM in your low-secure server after you finish the configuration in your high-secure server.

Before you begin

Role required: admin

Procedure

1. Navigate to **Workspaces** > **CMDB Workspace** > **SGC Central** > **Create connection**.

2. Select the air gap template.

a. In the **Setup** stage of the playbook, select the **Select alias template** activity.

b. Select **SCCM Air Gap**.

c. Select **Continue**.

3. Download and run the PowerShell scripts to set up an air gap connection.

a. In the **Setup** stage of the playbook, select the **PowerShell Script Download** activity.

b. Select **Download Airgap Scripts**.

c. Download the `SgSCCMLowSecureSetup.ps1` PowerShell script from the link provided in the Download Airgap Scripts section.

4. Log on to your low-secure server.

5. Create a Microsoft SCCM directory.

All the configurations required for the air gap solution are created in the Microsoft SCCM directory.

6. Copy the `SgSCCMLowSecureSetup.ps1` PowerShell script that you downloaded in step 3.c to the Microsoft SCCM directory.

7. Start a PowerShell session, and run the `SgSCCMLowSecureSetup.ps1` script.

Configure air gap solution for Microsoft SCCM in a ServiceNow instance

Configure the air gap solution for the Service Graph Connector for Microsoft SCCM in your ServiceNow instance after you finish the configuration in your high-secure and low-secure servers.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Plugins**, and download the `ServiceNow IntegrationHub Action Step – PowerShell` plugin.
2. Navigate to **Workspaces** > **CMDB Workspace** > **SGC Central** > **Create connection**.
3. Download and run the PowerShell scripts to set up an air gap connection.
   a. In the **Setup** stage of the playbook, select the **Select alias template** activity.
   b. Select **SCCM Air Gap**, and then select **Continue**.
   c. In the **Setup** stage of the playbook, select the **PowerShell Script Download** activity.
   d. Download the scripts and configure the air gap connection.
   e. Select the **I have read the instructions and executed the scripts accordingly** check box, and then select **Continue**.
4. In the **Setup** stage of the playbook, select the **Create and test connection** activity.
5. Fill in the fields on the Create Connection form.

Create Connection form

Field	Description
Connection Name	Display name for the connection.
MID Server	Name of the MID Server that you deployed in your low-secure server. You can obtain the *sys_id* of the MID Server from the ecc_agent table.
Parent Directory	Path of the Microsoft SCCM directory where the data is stored in your low-secure server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	See Configure air gap solution for Microsoft SCCM in a low-secure server.
Archive Data After Retrieval	Option to archive data after retrieval.
Archive Path [Optional]	Folder where the data is to be archived if the **Archive Data After Retrieval** check box is selected.

6. Select **Create and test connection**.

Related topics

Perform a test data load for the air gap solution for Microsoft SCCM

Perform a test data load for the air gap solution for Microsoft SCCM

After you configure the air gap solution for the Service Graph Connector for Microsoft SCCM, test whether the Microsoft SCCM endpoint is accessible from the high-secure server.

Before you begin

Role required: admin

Procedure

1. Navigate to the Microsoft SCCM directory in your high-secure server.
2. Run the `.\GetSCCMData.ps1 -configFilePath` *`CONFIG_PATH`* script, where *`CONFIG_PATH`* is the location of the JSON configuration file that is generated by the setup script.
   The script accesses the Microsoft SCCM API, and creates a sample file in the ComputerIdentity directory and a log file in the Logs directory.
   - If the test data load is successful, the log file contains the `Test Load status` SUCCESS! message.
   - If the test data load fails, the log file contains the `Error occurred while processing ComputerIdentity StatusCode 403` message.

     If the test data load fails, verify the Microsoft SCCM user credentials and ensure that the user has the required permissions to pull the data from Microsoft SCCM. If the credentials need to be updated, you must run the `SgSCCMHighSecureSetup.ps1` PowerShell script again. See Configure air gap solution for Microsoft SCCM in a high-secure server.

Related topics

Perform a full data load for the air gap solution for Microsoft SCCM

Perform a full data load for the air gap solution for Microsoft SCCM

After you verify that the test data load for the air gap solution for the Service Graph Connector for Microsoft SCCM is successful, you can perform a full data load.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the Microsoft SCCM directory in your high-secure server.
2. Run the `.\GetSCCMData.ps1 -completeLoad $true -configFilePath` *`CONFIG_PATH`* script, where *`CONFIG_PATH`* is the location of the JSON configuration file that is generated by the setup script.

   By default, the existing files in the data source data directories are deleted each time the `.\GetSCCMData.ps1 -completeLoad $true -configFilePath` *`CONFIG_PATH`* script is run. You can add the *`-clean $false`* parameter to the script if you want to retain the existing files.

   The script fetches data from the Microsoft SCCM DB, and stores the data in the respective `data_source` directories, as defined in the `SgSCCMConfigFile.json` file.
3. After the data is loaded in your high-secure server, transfer the `data_source` directories and contents to the corresponding directories in your low-secure server using a method of your choice (such as SFTP or SCP).
4. Verify that the data is loaded in your low-secure server.
5. Set the full data load job (using the `.\GetSCCMData.ps1 -completeLoad $true -configFilePath` *`CONFIG_PATH`* script) to run on a schedule based on that of the Scheduled Import Job on your Service Graph Connector for Microsoft SCCM instance.
6. Set the data transfer job (from your high-secure server to your low-secure server) on a schedule based on that of the Scheduled Import Job on your Service Graph Connector for Microsoft SCCM instance.
7. Test the air gap connection in your ServiceNow instance.

   a. Navigate to **All** > **Service Graph Connectors** > **SCCM** > **Connections**.

   b. Select the air gap connection that you created.

   c. Select the **Test Connection** related link.
   When the connection is successful, the **Status** field is set to `Success`. If the connection fails, follow the suggestions for remediation.

Service Graph Connector for Netskope

The Service Graph Connector for Netskope pulls in asset inventory data (hardware and software) from the Netskope database into the Configuration Management Database (CMDB) application in your ServiceNow AI Platform® instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Supported versions

- Netskope API version: Get Client Data v1.
- Netskope client version: 112.
- Washington, Xanadu, Yokohama ServiceNow® family releases.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use cases

- Import Netskope Client information and store it in appropriate configuration item (CI) classes in your CMDB.
- Configure multiple instances of Netskope in the Service Graph Connector.

Guided setup

Use the guided setup feature to help you configure your integration in an organized sequence of tasks.

CMDB integrations dashboard

The Integration Commons for CMDB store app provides a dashboard with a central view of the status, processing results, and processing errors of all installed integrations. You can see metrics for all integration runs. You can filter the view to a specific CMDB integration, a specific time duration, or a specific integration run. For more details about monitoring SentinelOne integrations in the CMDB Integrations Dashboard, see Using the CMDB Integrations Dashboard.

Configure the Service Graph Connector for Netskope

The guided setup for the Service Graph Connector for Netskope provides an organized sequence of tasks to configure the integration on your ServiceNow AI Platform instance.

Before you begin
To use this Service Graph Connector, you need a subscription to a Subscription Unit that is based in the IT Operations Management (ITOM) Visibility application or in the ITOM Discovery application. As defined in the section titled "Managed IT Resource Types" in ServiceNow Subscription Unit Overview for your subscription, for managed IT resources that are created or modified in the CMDB by this Service Graph Connector, but that aren't yet managed by ITOM Visibility or ITOM Discovery, these resources will increase Subscription Unit consumption from that application. Review your current Subscription Unit consumption within ITOM Visibility or ITOM Discovery to ensure available capacity.

Dependencies and requirements:

- The Integration Commons for CMDB store app, which is automatically installed.
- The CMDB CI Class Models store app store app, which is automatically installed.
- Discovery Core plugin (com.snc.discovery.core), which is automatically installed by Discovery.
- The ITOM Discovery License plugin (com.snc.itom.discovery.license). You must activate this plugin.
- ITOM Licensing plugin (com.snc.itom.license). For more information, see Request Discovery.

Roles required:

- Netskope Role - Viewer
- ServiceNow AI Platform® Role - admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Service Graph Connectors** > **Netskope** > **Setup**.
2. On the Home page, select **Continue**.
3. On the Experience page, select the **Best Experience** from it.
4. On the Service Graph Connector for Netskope page in the Configure the connection page, select the **Configure Netskope Authentication Credentials** task and follow these steps:
   a. In the API Key field, enter your Netskope API Key and update the credential record.
   b. Select the **Mark as Complete** checkbox and select **Continue**.
5. In the **Configure** *Netskope* **HTTP Connection** task follow these steps:
   a. Add the Netskope base URL (Uniform Resource Locator).
   b. Select the **Mark as Complete** checkbox and select **Continue**.
6. In the **Test Connection** task follow these steps:
   a. Select the **Test Connection** link.

      The Status code field displays 200 if the connection is successful.

   b. Select the **Mark as Complete** checkbox and select **Continue**.
7. **Optional:** To create another connection, select the **Update Data Source Access** section and follow these steps:
   a. Give permission to create and update the data source.
   b. Select the **Mark as Complete** checkbox and select **Continue**.
   c. Give permission to create and update the Scheduled Import Sets.
   d. Select the **Mark as Complete** checkbox and select **Continue**.
   e. Clear the cache with the code snippet mentioned previously using Scripts-Background.
   f. Select the **Mark as Complete** checkbox and select **Continue**.
   g. Add a new connection by clicking the link.
   h. After you add a new connection, select the **Mark as Complete** checkbox and select **Continue**.
   i. Select the new connection record and select the **Test Connection link**.

      The Status code field displays 200 if the connection is successful.

   j. Select the **Mark as Complete** checkbox and select **Continue**.
8. Fill out the fields on the Scheduled Data Import form:

Field	Description
Name	Name of the scheduled job.
Data source	Data source record that defines the data to import, for example, SG-Netskope-Client.
Run as	Option to run the scheduled job with the credentials of the specified user.
Active	Option to activate the scheduled job. Select this option.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Concurrent Import	Function that loads the data from multiple import sets. The function then processes and transforms the data concurrently.
Partition Method	Partition method for the concurrent import set. Select **Custom Size**.
Partition Size	Import set size for early scheduling. Set 1000 as a value.
Execute pre-import script	Option to specify a script to run before the import is performed. Leave this field with its default setting.
Execute post-import script	Option to specify a script to run after the import is performed. Leave this field with its default setting.
Application	Application that contains this scheduled job.
Run	Frequency of running the import.
Conditional	Conditions under which this job is executed.

9. Click **Execute Now**.
10. In the Help task bar, select **Mark as Complete** and select **Continue**.

Service Graph Connector for Observability - AppDynamics

Use the Service Graph Connector for Observability - AppDynamics to ingest CMDB data from an AppDynamics installation using REST APIs. Push events from AppDynamics into ServiceNow with Event Management.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Supported versions

- Supported versions: AppDynamics version 20.3
- Supported ServiceNow versions:
  - Xanadu
  - Yokohama
  - Zurich

Configuring a connection for the connector

Use the SGC Central view in the Service Graph Workspace or CMDB Workspace to install the connector and configure the connection. The view enables you to install and discover connectors and to manage the full life cycle of creating, editing, monitoring, and debugging connections. For instructions, see Configure Service Graph Connector for Observability - AppDynamics using SGC Central.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:
Unless there are configuration issues, use SGC Central to configure the connection. The guided setup method for configuration is being deprecated.

CMDB integrations dashboard

The Integration Commons for CMDB store app provides a dashboard with a central view of the status, processing results, and processing errors of all installed integrations. You can see metrics for all integration runs. You can filter the view to a specific CMDB integration, a specific time duration, or a specific integration run. For more details about monitoring AppDynamics integrations in the CMDB Integrations Dashboard, see Using the CMDB Integrations Dashboard.

Data mapping

Data from the AppDynamics data sources is mapped and transformed into the ServiceNow CMDB Configuration Item (CI) class definitions using the Robust Transform Engine (RTE). Data is inserted into the ServiceNow CMDB using the Identification and Reconciliation Engine (IRE).

The AppDynamics data sources include the following:

- SG-AppDynamics Application Services
- SG-AppDynamics Servers and Applications
- SG-AppDynamics Server Tags
- SG-AppDynamics Tier to Tier Relationship

For more information on where data is saved when pulling data from AppDynamics, see CMDB classes targeted in Service Graph Connector for Observability - AppDynamics.

You can use the IntegrationHub ETL app to view the data maps. See IntegrationHub ETL for more information.

Service Graph Connectors

Configure Service Graph Connector for Observability - AppDynamics using SGC Central

Set up scheduled import jobs to pull in AppDynamics data into your Configuration Management Database (CMDB).

Before you begin

- Install Service Graph Connector for Observability - AppDynamics version 1.4.0 or later from the ServiceNow Store. For ServiceNow Store installation steps, see Install a ServiceNow Store application.
- Install Observability Commons for CMDB (sn_observability), which is only required for event ingestion. This application must be installed prior to installing the connector for Event Management to work. For more information, see Observability Commons for CMDB on the ServiceNow Store.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: The following table shows the roles required for each stage of the playbook.

Role required for each playbook stage

Stage	Role
Prerequisites	admin
Setup	SGC-Admin (sn_cmdb_int_util.sgc_admin) or admin

Note:
The admin user role is required to run background scripts and to provide access to global tables to the SGC-Admin user. For information about the user roles for Service Graph Connectors, see Service Graph Connector user roles.

About this task

The playbook experience for onboarding connectors is activated with SGC Central in the Service Graph Workspace or CMDB Workspace. To configure the SGC Central application, see Configuring SGC Central and for more information on how to interact with a playbook, see Interact with Playbook.

Procedure

1. Use one of the following methods to open SGC Central:
   - Navigate to **Workspaces** > **Service Graph Workspace**, and from the left navigation panel, select the Ingestion icon to open the SGC Central view.
   - Navigate to **Workspaces** > **CMDB Workspace** > **SGC Central**.
2. On the Overview page, select **Create connection**.

   Tip:
   Alternatively, you can select **Create connection** on the All connections page.

3. On the Create connection window, select the AppDynamics connector type, and then select **Configure connection**.
   A default connection for AppDynamics is available within the application. As the Service Graph Connector for Observability - AppDynamics supports only a single instance, you can configure the default connection for the first time or resume editing it thereafter.
4. Complete the initial prerequisites when setting up a connection for the first time using a connector.

   Note:
   This step is required only during the first-time setup. See Perform initial setup tasks when creating a connection in SGC Central.

5. Enter connection details and test the API connection for importing AppDynamics data.

   a. In the **Setup** stage of the playbook, select the **Configure and test connection** activity.

   b. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure and test connection form

Field	Description
Connection name	Name to identify the AppDynamics connection record.
Connection URL	Base URL of your AppDynamics controller.
OAuth Client ID	Application (client) ID of your AppDynamics client application. **Note:** Verify that Server Visibility is active for the AppDynamics account and the AppDynamics user has the Applications and Dashboards Viewer (Default) and Server Monitoring User (Default) roles.
OAuth Client Secret	Client secret of your AppDynamics client application.
Use MID server	Option to use a MID Server. **Note:** Use of a MID Server is optional.
MID selection	Name of the MID Server used by the connector. This field appears only when the **Use MID server** check box is selected.

c. Select **Update and test connection**.

d. Once the connection test is complete, select **Continue**.

6. **Optional:** Enable real-time event integration by creating an HTTP request template to receive real-time health-check alerts and events from AppDynamics to your ServiceNow instance.

   Note:
   To skip this step, select **Skip** for the **Enable real-time event integration** activity.

   a. In the **Setup** stage of the playbook, select the **Enable real-time event integration** activity.

   b. Select **Continue** to create an HTTP request template automatically.

   (Optional) After you enable real-time event integration, multiple API calls are executed to start the event ingestion service in AppDynamics. For more information, see the Service Graph Connector for Observability AppDynamics article on the ServiceNow Community site.

7. Configure duplicate detection rules.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AppDynamics uses duplicate detection rules to insert only new or updated rows into the CMDB. To insert all rows, deactivate the rule and run the **Clean AppDynamics Duplicate Row Hashes** scheduled job for a full data import.

a. In the **Setup** stage of the playbook, select the **Configure duplicate detection rules** activity.

b. In the Duplicate detection rules list, select the rule from the **Name** column.

c. On the Edit duplicate detection rule window, select the **Active** check box to activate the rule.

> **Note:**
> To remove fields from being evaluated, add the field names in the **Ignore Fields** field for a rule. To ignore multiple fields, separate the fields with commas.

d. Select **Save**.

e. Repeat steps from 7.b to 7.d for each rule you want to activate.

f. Select **Continue**.

8. Configure the import schedule to import data at regular intervals.

a. In the **Setup** stage of the playbook, select the **Configure import schedule** activity.

b. Expand the Parent scheduled data import within the Import schedules list to select the **SG-AppDynamics Servers and Applications** import schedule.

c. Select the **Active** check box, and then fill in the run schedule and time details.

For more information, see Schedule a data import.

d. Select **Save**.
Alternatively, select **Execute Now** to execute the import schedule immediately.

e. Select **Continue**.

9. In the **Setup** stage of the playbook, select the **Confirm connection setup** activity to verify whether the connection was configured.

What to do next

Select **View all connections** to review the connection details. The configured connection appears in the Installed connections list.

Configure Service Graph Connector for Observability - AppDynamics using the guided setup

Set up scheduled import jobs to pull in data from AppDynamics into your Configuration Management Database (CMDB).

Before you begin

Important:
Unless there are configuration issues, use the SGC Central view in the Service Graph Workspace or CMDB Workspace to configure the connection for the connector, as the guided setup method is planned for deprecated.

To use this Service Graph Connector, you need a subscription to a Subscription Unit that is based in the IT Operations Management (ITOM) Visibility application or in the ITOM Discovery application. As defined in the section titled "Managed IT Resource Types" in ServiceNow Subscription Unit Overview for your subscription, for managed IT resources that are created or modified in the CMDB by this Service Graph Connector, but that aren't yet managed by ITOM Visibility or ITOM Discovery, these resources will increase Subscription Unit consumption from that application. Review your current Subscription Unit consumption within ITOM Visibility or ITOM Discovery to ensure available capacity.

Dependencies and requirements:

- The Integration Commons for CMDB store app, which is automatically installed.
- The CMDB CI class models store app, which is automatically installed. See CMDB CI Class Models.
- The ITOM Discovery License plugin (com.snc.itom.discovery.license). You must activate this plugin.
- ITOM Licensing plugin (com.snc.itom.license). For more information, see Request Discovery.
- The Datastream Action plugin (com.glide.hub.action_type.datastream), which is automatically installed.
- Observability Commons for CMDB (sn_observability), which is only required for event ingestion. This must be installed prior to installing the connector for Event Management to work. For more information, see Observability Commons for CMDB on the ServiceNow Store.

When using client credentials for authentication, obtain the OAuth credentials from your AppDynamics administrator. Make a note of the following details:

- Application (client) ID
- Client Secret

Note:
If you have an earlier version of the Service Graph Connector for Observability - AppDynamics, then do not migrate data from the old connector. You must uninstall the previous version and run the new integration.

Role required: SGC-Admin (sn_cmdb_int_util.sgc_admin) or admin

Note:
The admin user role is required to run background scripts and to provide access to global tables to the SGC-Admin user. For information about the user roles for Service Graph Connectors, see Service Graph Connector user roles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Ensure that the application scope is set to the Service Graph Connector for Observability - AppDynamics application by using the application picker.
   For more information, see Application picker.
2. Navigate to **All** > **Service Graph Connectors** > **AppDynamics** > **Setup**.
3. On the Getting started page, select **Get Started**.
4. Configure the authentication credentials and establish an HTTP connection to send requests to the AppDynamics API.

   a. In the Configure API authentication section of the Service Graph Connector for Observability - AppDynamics page, select **Get Started**.

   b. Configure the connection for AppDynamics by editing the default connection.

   You can configure either a Basic Auth connection or an OAuth connection.

   Note:
   As the connector supports only single instance, edit the **AppDynamicsConnectionAlias** connection, available by default.

   - Configure a Basic Auth connection.

     i. For the Configure Basic Auth Connection task, select **Configure**.

     ii. Select **Edit** for AppDynamicsConnectionAlias.

     Note:
     If not redirected to the connection setup, search for **AppDynamicsConnectionAlias** on the Integrations page, and then select **View Details** to edit the default connection.

     iii. In the Connection Information section of the Edit Connection window, fill in the fields.

     Connection Information

Field	Description
Connection name	Name to identify the AppDynamics connection record. `AppDynamicsConnectionAlias` is the default credential alias name and is read-only.
Host name	Host name of your AppDynamics controller.

     iv. (Optional) If a MID Server is required for the AppDynamics server connection, select the **Use MID server** check box. Then, select the MID Server-related fields accordingly.

     v. In the Credential Information section of the Edit Connection window, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Credential Information

Field	Description
Username	AppDynamics account user name that is used to authenticate the connection request. **Note:** Verify that Server Visibility is active for the AppDynamics account and the AppDynamics user has the Applications and Dashboards Viewer (Default) and Server Monitoring User (Default) roles.
Password	Password that is used to authenticate the connection request.

vi. Select **Edit Connection**.

vii. Return to the guided setup page.

viii. Set the Configure Basic Auth Connection task to complete by selecting **Mark as Complete**.

- Configure an OAuth connection.

i. For the Configure OAuth Authentication: Client Credentials task, select **Configure**.

ii. Select **Edit** for AppDynamicsConnectionAlias.

> **Note:**
> If not redirected to the connection setup, search for **AppDynamicsConnectionAlias** on the Integrations page, and then select **View Details** to edit the default connection.

iii. In the Connection Information section of the Edit Connection window, fill in the fields.

Connection Information

Field	Description
Connection name	Name to identify the AppDynamics connection record. `AppDynamicsConnectionAlias` is the default credential alias name and is read-only.
Connection URL	Base URL of your AppDynamics controller.

iv. (Optional) If a MID Server is required for the AppDynamics server connection, select the **Use MID server** check box. Then, select the MID Server-related fields accordingly.

v. In the Credential Information section of the Edit Connection window, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Credential Information

Field	Description
OAuth Client ID	Application (client) ID of your AppDynamics client application as noted in the Before you begin section. **Note:** Verify that the API client has a role with the required privileges and sufficient Token Expiration Time.
OAuth Client Secret	Client secret of your AppDynamics client application as noted in the Before you begin section.

vi. Select **Edit Connection**.

vii. Return to the guided setup page.

viii. Set the Configure OAuth Authentication: Client Credentials task to complete by selecting **Mark as Complete**.

c. Test the connection.

i. For the Test connection task, select **Configure**.

ii. Select the **Test Connection** related link to start the testing process.

iii. When the **Status** field is set to **Success**, return to the guided setup page.

Note:
If any of the tests have errors, follow the suggestions for remediation.

iv. Set the Test the connection task to complete by selecting **Mark as Complete**.

d. Enable AppDynamics event integration with your ServiceNow instance by pushing a default HTTP Request Template to AppDynamics.

Note:
To push HTTP requests, verify that the Observability Commons for CMDB application (sn_observability) is installed for events ingestion on your ServiceNow instance. Also, on your AppDynamics instance, as the ServiceNow user, you must have the account-level Configure HTTP Request Templates permission to create or modify HTTP Request Templates.

i. For the Push HTTP Request Template task, select **Configure**.

ii. Select the **Push HTTP Request Template** related link.

iii. Return to the guided setup page.

iv. Set the Push HTTP Request Template task to complete by selecting **Mark as Complete**.

After you push the HTTP request template, multiple API calls are executed to start the event ingestion service in AppDynamics. For more information, see the Service Graph Connector for Observability AppDynamics article on the ServiceNow Community site.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Configure duplicate detection rules.

   a. For the Configure duplicate detection rules task in the Duplicate detection rules section, select **Configure**.

   b. In the CMDB Duplicate Row Rules list, set the **Active** column value for a rule to **true** to activate the rule.

   > **Note:**
   > To remove fields from being evaluated, add the field names in the **Ignore Fields** column for a rule. To ignore multiple fields, separate the fields with commas.

   c. Return to the guided setup page.

   d. Set the Configure duplicate detection rules task to complete by selecting **Mark as Complete**.

6. Configure advanced settings.

   a. For the Advanced Settings task in the Advanced section, select **Configure**.

   b. Review and modify the advanced properties.

   Advanced properties

Property	Description
Toggle to populate relationships between tiers	Option to enable the import of relationships between AppDynamics tiers in the CI Relationship [cmdb_rel_ci] table.
The number of minutes of metrics to fetch in order to generate tier to tier relationships	Number of minutes of metrics to fetch for generating tier-to-tier relationships. For example, 60 retrieves the last hour's relationships.
Toggle to import business transactions from AppDynamics	Option to enable the import of business transactions into the Calculated Application Service [cmdb_ci_service_calculated] table.
Toggle to populate tags for imported servers	Option to enable the import of server tags into the Key Value [cmdb_key_value] table.
Toggle to import node data from AppDynamics and map to the cmdb_ci_appl hierarchy	Option to enable the import of nodes into the Application [cmdb_ci_appl] table hierarchy.

   c. Select **Save**.

   d. Set the Advanced Settings task to complete by selecting **Mark as Complete**.

7. Set up the SG-AppDynamics Servers and Applications scheduled job available by default.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. For the Configure scheduled job task in the Set up scheduled import jobs section, select **Configure**.

b. On the Scheduled Data Import form, verify the field values for the SG-AppDynamics Servers and Applications scheduled job and select the **Active** check box.

   For more information, see Schedule a data import.

c. Select **Update**.

d. Set the Configure scheduled job task to complete by selecting **Mark as Complete**.

CMDB classes targeted in Service Graph Connector for Observability - AppDynamics

When you complete setting up the connection, you can configure the integration to periodically pull data from AppDynamics. The data is saved in tables that extend from the Configuration item [cmdb_ci] table.

AppDynamics Extension [sn_sg_appd_extension]

The following attributes in the AppDynamics Extension [sn_sg_appd_extension] table are populated by collected data:

Attribute label	Attribute name

Accessing the connection details of Service Graph Connector for Observability - AppDynamics

You can access the connection details of the Service Graph Connector for Observability - AppDynamics in a single view using the common connection framework (CCF) included within the Integration Commons for CMDB (sn_cmdb_int_util) store app.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

With the CCF, you can access all the connections used by the Service Graph Connector for Observability - AppDynamics. The connection details include the connection alias, connection properties, data sources, and scheduled data imports associated with a connection. You can also test the connection. For more information, see Accessing the connection details of Service Graph Connectors.

Access the details of an AppDynamics connection

Access the details of an AppDynamics connection configured for the Service Graph Connector for Observability - AppDynamics.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Service Graph Connectors** > **AppDynamics** > **Connections**.
2. From the **Name** column of the Service Graph Connections list, select a connection.
3. On the Service Graph Connections page, view the connection details such as the connection name, alias, and data sources.
4. Select a related list to view further details of the connection.
5. **Optional:** Select the **Test Connection** related link to test the connection.

Service Graph Connector for Observability - Datadog

Use the Service Graph Connector for Observability - Datadog to ingest CMDB data from a Datadog installation using REST APIs. Push events from Datadog into ServiceNow with Event Management.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Supported versions

Supported ServiceNow versions:

- Yokohama
- Zurich
- Australia

Guided setup

The guided setup for the Service Graph Connector for Observability - Datadog provides an organized sequence of tasks to configure the integration on your instance. To access the guided setup, see Configure Service Graph Connector for Observability - Datadog.

CMDB integrations dashboard

The Integration Commons for CMDB store app provides a dashboard with a central view of the status, processing results, and processing errors of all installed integrations. You can see metrics for all integration runs. You can filter the view to a specific CMDB integration, a specific time duration, or a specific integration run. For more details about monitoring Observability Datadog integrations in the CMDB Integrations Dashboard, see Using the CMDB Integrations Dashboard.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data mapping

Data from the Datadog data sources is mapped and transformed into the ServiceNow CMDB Configuration Item (CI) class definitions using the Robust Transform Engine (RTE). Data is inserted into the ServiceNow CMDB using the Identification and Reconciliation Engine (IRE).

The Datadog data source includes SGO-Datadog Hosts [sn_datadog_integra_datadog_hosts].

For more information on where data is saved when pulling data from Datadog, see CMDB classes targeted in Service Graph Connector for Observability - Datadog.

When you complete setting up the connection, the data from Datadog is automatically loaded into staging tables and then inserted into the following target tables:

- Cloud DataBase [cmdb_ci_cloud_database]
- Cloud Load Balancer [cmdb_ci_cloud_load_balancer]
- Cloud Service Account [cmdb_ci_cloud_service_account]
- IP Address [cmdb_ci_ip_address]
- Key Value [cmdb_key_value]
- Logical Datacenter [cmdb_ci_logical_datacenter]
- Network Adapter [cmdb_ci_network_adapter]
- Server [cmdb_ci_server]

You can use the IntegrationHub ETL app to view the data maps. See IntegrationHub ETL for more information.

Accessing the connection details of Service Graph Connector for Observability - Datadog

Configure Service Graph Connector for Observability - Datadog

Pull in data from Datadog into your Configuration Management Database (CMDB).

Before you begin

To use this Service Graph Connector, you need a subscription to a Subscription Unit that is based in the IT Operations Management (ITOM) Visibility application or in the ITOM Discovery application. As defined in the section titled "Managed IT Resource Types" in ServiceNow Subscription Unit Overview for your subscription, for managed IT resources that are created or modified in the CMDB by this Service Graph Connector, but that aren't yet managed by ITOM Visibility or ITOM Discovery, these resources will increase Subscription Unit consumption from that application. Review your current Subscription Unit consumption within ITOM Visibility or ITOM Discovery to ensure available capacity.

Dependencies and requirements:

- The Integration Commons for CMDB store app, which is automatically installed.
- The CMDB CI class models store app, which is automatically installed. See CMDB CI Class Models.
- The ITOM Discovery License plugin (com.snc.itom.discovery.license). You must activate this plugin.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- ITOM Licensing plugin (com.snc.itom.license). For more information, see Request Discovery.
- The Datastream Action plugin (com.glide.hub.action_type.datastream), which is automatically installed.
- Observability Commons for CMDB (sn_observability), which is only required for event ingestion. This must be installed prior to installing the connector for Event Management to work. For more information, see Observability Commons for CMDB on the ServiceNow Store.

Note:
If you have an earlier version of the Service Graph Connector for Observability - Datadog, then don't migrate data from the old connector. You must uninstall the previous version and run the new integration.

Role required: SGC-Admin (sn_cmdb_int_util.sgc_admin) or admin

Note:
The admin user role is required to run background scripts and to provide access to global tables to the SGC-Admin user. For information about the user roles for Service Graph Connectors, see Service Graph Connector user roles.

Procedure

1. Navigate to **All** > **Service Graph Connectors** > **Observability Datadog** > **Setup**.
2. On the Getting started page, select **Get Started**.
3. Configure the authentication credentials and the host name to send requests to the Datadog API.

   a. Configure your Datadog credentials.

      i. In the Configure the Connection section of the Datadog Integration with CMDB page, select **Get Started**.

      ii. For the Configure the Credentials task, select **Configure**.

      iii. In the **Connection name** field, enter a name for the connection.

      Note:
      Do not modify the name of the default connection.

      iv. In the **Connection URL** field, enter the base URL or IP address for Datadog.

      v. In the **API key** field, enter the Datadog API token.

      vi. In the **Application key** field, enter the application key used for connecting to the Datadog API.

      vii. Select **Update**.

      viii. Set the Configure the Credentials task to complete by selecting **Mark as Complete**.

   b. Test the connection.

      i. For the Test Connection task, select **Configure**.

      ii. Test the connection by selecting the **Test Connection** related link.

      Testing the connection might take a few moments. The page is refreshed to show the test results.

      iii. When the **Status** field is set to **Success**, select **Update**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If any of the tests have errors, follow the suggestions for remediation.

iv. Set the Test Connection task to complete by selecting **Mark as complete**.

c. **Optional:** Add a filter for the SGO-Datadog Hosts [sn_datadog_integra_datadog_hosts] data source.

i. For the Create Hosts Filter task, select **Configure**.

ii. Enter a comma-separated list of host tags in `key:value` format in the **Value** field to define a filter for pulling host data from Datadog.

For example, `datadog:monitored,env:production`.

iii. Select **Update**.

iv. Set the Create Hosts Filter task to complete by selecting **Mark as complete**.

4. Configure the webhook and monitors for Observability Datadog.

a. In the Configure Observability section of the Datadog Integration with CMDB page, select **Get started**.

b. For the Configure the Webhooks and Monitors task, select **Configure**.

c. In the Datadog Webhooks list, select **New** to add a Datadog webhook.

d. Fill in the fields.

New record form

Field	Description
Name	Name of the Datadog webhook.
Connection Alias	Search for and select the connection and credential alias that you created in step 3.

e. Select **Submit**.

f. Populate the Datadog Webhooks list by selecting the **Synchronize Monitors** related link on the Datadog Webhook page.

Note:
In the Datadog Webhooks list, don't select **New** to add a monitor as this option is not used in this scenario.

g. In the **Name** column of the Datadog Webhooks list, select a monitor.

h. On the Datadog Monitors page, select the **Webhook Active** check box, and then select **Update**.

i. Repeat steps 4.g and 4.h for all the monitors in the Datadog Webhooks list.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

j. On the Datadog Webhook page, select **Update** to save your changes.

k. Set the Configure the Webhooks and Monitors task to complete by selecting **Mark as Complete**.

5. Set up scheduled import jobs.

a. Navigate to **All** > **Service Graph Connectors** > **Observability Datadog** > **Import Schedules**.

b. Select the name of the scheduled import that you want to activate.

c. On the Scheduled Data Import form, verify the field values for the scheduled job and select the **Active** check box.

For more information, see Schedule a data import.

d. Select **Update**.

Service Graph Connector for Observability - Datadog

Accessing the connection details of Service Graph Connector for Observability - Datadog

You can access the connection details of the Service Graph Connector for Observability - Datadog in a single view using the common connection framework (CCF) included within the Integration Commons for CMDB (sn_cmdb_int_util) store app.

With the CCF, you can access all the connections used by the Service Graph Connector for Observability - Datadog. The connection details include the connection alias, connection properties, data sources, and scheduled data imports associated with a connection. You can also test the connection. For more information, see Accessing the connection details of Service Graph Connectors.

Access the details of a Datadog connection

Access the details of a Datadog connection configured for the Service Graph Connector for Observability - Datadog.

Before you begin

Role required: admin

Service Graph Connector for Observability - Datadog

Service Graph Connector for Observability - Dynatrace

Use the Service Graph Connector for Observability - Dynatrace to ingest CI data, events, metrics, and logs from Dynatrace into your ServiceNow instance.

Note:
The Service Graph Connector for Observability - Dynatrace provided by ServiceNow is different from the Service Graph Connector for Dynatrace provided by Dynatrace.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Supported versions

- Supported versions:
  - Minimum version supported: Dynatrace SaaS; Version 1.284
- Supported ServiceNow versions:
  - Yokohama
  - Zurich
  - Australia

Important information for upgrading Service Graph Connector for Observability - Dynatrace

Before upgrading the Service Graph Connector for Observability - Dynatrace to version 1.10.0 or later, disable the reconciliation rules for tables extending the Application [cmdb_ci_appl] table. See the Reconciliation rules(ServiceNow, ServiceWatch) on multiple table like Apache web server stopping other discovery source to update fields on those tables [KB1649455] article in the Now Support Knowledge Base.

Configuring a connection for the connector

You can configure a connection for the connector by using the SGC Central view in the Service Graph Workspace or CMDB Workspace enables you to discover and install connectors, and then effectively manage the full life cycle of creating, editing, monitoring, and debugging connections. To configure the connector using SGC Central, see Configure Service Graph Connector for Observability - Dynatrace using SGC Central.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:
Unless there are configuration issues, use the SGC Central view in the Service Graph Workspace or CMDB Workspace to configure the connection for the connector, as the guided setup method is planned for deprecated.

CMDB integrations dashboard

The Integration Commons for CMDB store app provides a dashboard with a central view of the status, processing results, and processing errors of all installed integrations. You can see metrics for all integration runs. You can filter the view to a specific CMDB integration, a specific time duration, or a specific integration run. For more details about monitoring Dynatrace integrations in the CMDB Integrations Dashboard, see Using the CMDB Integrations Dashboard.

Data mapping

Data from the Dynatrace data sources is mapped and transformed into the ServiceNow CMDB Configuration Item (CI) class definitions using the Robust Transform Engine (RTE). Data is inserted into the ServiceNow CMDB using the Identification and Reconciliation Engine (IRE).

The following table describes the data sources, the staging tables, the target tables as CMDB CI classes, and the Dynatrace entities imported by each data source.

Data mapping for Dynatrace entities

Data source	Description	Staging table	CMDB CI classes	Entities
SGO-Dynatrace Hosts V2	Ingests host data from Dynatrace. Contains computer data.	SGO-Dynatrace Hosts [sn_dynatrace_integ_sg_dynatrace_hosts]	Computer IP Address [cmdb_ci_ip_address] Key value When the Software Asset Management (SAM) application isn't installed: Software Software Instance When the SAM application is installed: Software Installation	Host

When you complete setting up the connection, you can configure the integration to pull data from Dynatrace periodically. The data is loaded into the staging tables, and then inserted into the target tables.

For more information on where data is saved when pulling data from Dynatrace, see CMDB classes targeted in Service Graph Connector for Observability - Dynatrace.

You can use the IntegrationHub ETL app to view the data maps. See IntegrationHub ETL for more information.

Service Graph Connectors

Service Graph Connector for Observability - Dynatrace properties

Configure Service Graph Connector for Observability - Dynatrace using SGC Central

Set up scheduled import jobs to pull in Dynatrace data into your Configuration Management Database (CMDB).

Before you begin

Install Service Graph Connector for Observability - Dynatrace version 1.11.0 or later from the ServiceNow Store. For ServiceNow Store installation steps, see Install a ServiceNow Store application.

Role required: The following table shows the roles required for each stage of the playbook.

Role required for each playbook stage

Stage	Role
Prerequisites	admin
Setup	SGC-Admin (sn_cmdb_int_util.sgc_admin) or admin

Note:
The admin user role is required to run background scripts and to provide access to global tables to the SGC-Admin user. For information about the user roles for Service Graph Connectors, see Service Graph Connector user roles.

About this task

The playbook experience for onboarding connectors is activated with SGC Central in the Service Graph Workspace or CMDB Workspace. To configure the SGC Central application, see Configuring SGC Central and for more information on how to interact with a playbook, see Interact with Playbook.

Procedure

1. Use one of the following methods to open SGC Central:
   - Navigate to **Workspaces** > **Service Graph Workspace**, and from the left navigation panel, select the Ingestion icon to open the SGC Central view.
   - Navigate to **Workspaces** > **CMDB Workspace** > **SGC Central**.
2. On the Overview page, select **Create connection**.

   Tip:
   Alternatively, you can select **Create connection** on the All connections page.

3. On the Create connection window, select the Dynatrace connector type, and then select **Configure connection**.
4. Complete the initial prerequisites when setting up a connection for the first time using a connector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. **Optional:** Install the Observability Commons for CMDB application (sn_observability) for event ingestion.

> **Note:**
> The **Install Observability Commons for CMDB** activity appears only when the Observability Commons for CMDB application (sn_observability) isn't already installed. If event ingestion isn't needed, you can skip this step by selecting **Continue** for the **Install Observability Commons for CMDB** activity.

i. In the **Prerequisites** stage of the playbook, select the **Install Observability Commons for CMDB** activity.

ii. Install the Observability Commons for CMDB application (sn_observability) from the ServiceNow Store.

iii. After you have installed the application, select **Continue**.

b. Create data sources for the connection.

> **Note:**
> This step is required when configuring the connector for the first time only.

i. Verify that you have edit permissions for the Datasource [sys_data_source] table.

ii. In the **Prerequisites** stage of the playbook, select the **Update data source access** activity.

iii. Select **Update access**.

iv. To edit the record, select the **Global** application scope from the application picker.

v. In the Application Access related list of the Data Source form, select the **Can create**, **Can update**, and **Can delete** check boxes.

vi. Select **Update**.

vii. From the application picker, select the application scope of the connector.

viii. After completing the **Update data source access** activity, select **Continue**.

c. Enable creating scheduled jobs for the connection by updating the scheduled data import access.

> **Note:**
> This step is required when configuring the connector for the first time only.

i. Verify that you have edit permissions for the Scheduled Data Import [scheduled_import_set] table.

ii. In the **Prerequisites** stage of the playbook, select the **Update scheduled data import access** activity.

iii. Select **Update access**.

iv. To edit the record, select the **Global** application scope from the application picker.

v. In the Application Access related list of the Data Source form, select the **Can create**, **Can update**, and **Can delete** check boxes.

vi. Select **Update**.

vii. From the application picker, select the application scope of the connector.

viii. After completing the **Update scheduled data import access** activity, select **Continue**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Enable creating values for the connection by updating the variable value access.

> **Note:**
> This step is required when configuring the connector for the first time only.

i. Verify that you have edit permissions for the Value [sys_variable_value] table.

ii. In the **Prerequisites** stage of the playbook, select the **Update variable value access** activity.

iii. Select **Update access**.

iv. To edit the record, select the **Global** application scope from the application picker.

v. In the Application Access related list of the Data Source form, select the **Can create**, **Can update**, and **Can delete** check boxes.

vi. Select **Update**.

vii. From the application picker, select the application scope of the connector.

viii. After completing the **Update variable value access** activity, select **Continue**.

e. Clear the cache on the Data Source [sys_data_source] table.

> **Note:**
> This step is required when configuring the connector for the first time only.

i. In the **Prerequisites** stage of the playbook, select the **Clear cache** activity.

ii. Select **Run clear cache**.

iii. In the **Run script** text box of the background script page, enter the following script:

```
GlideTableManager.invalidateTable("sys_data_source");
     GlideCacheManager.flushTable("sys_data_source");

 GlideTableManager.invalidateTable("scheduled_import_set");
     GlideCacheManager.flushTable("scheduled_import_set");

 GlideTableManager.invalidateTable("sys_variable_value");
     GlideCacheManager.flushTable("sys_variable_value");

     GlideTableManager.invalidateTable("sys_db_object");
     GlideCacheManager.flushTable("sys_db_object");
```

iv. Select **Run Script** to run the background script in the **global** scope.

The script may take several minutes to execute.

v. After the script is executed, select **Close**.

vi. From the application picker, select the application scope of the connector.

vii. After completing the **Clear cache** activity, select **Continue**.

f. Verify that the Event Management application works properly with the Dynatrace environment by copying the `EvtMgmtImpactManagerMediator` script to the Global application scope.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
This step is displayed only when the Observability Commons for CMDB plugin (sn_observability) is already installed and is required when configuring the connector for the first time only.

i. In the **Prerequisites** stage of the playbook, select the **Enable script access for event management** activity.
ii. Select **Enable script access**.
iii. Select the **Global** application scope from the application picker.
iv. From the context menu, select **Insert and Stay**.
v. Verify that the `EvtMgmtImpactManagerMediator` script was copied to the Global application scope and the **Accessible from** field was set to `All application scopes`.
vi. Select **Update**.
vii. From the application picker, select the application scope of the connector.
viii. After completing the **Enable script access for event management** activity, select **Continue**.

5. Enter connection details and test the API connection for importing Dynatrace data.

a. In the **Setup** stage of the playbook, select the **Create and test connection** activity.

b. On the form, fill in the fields.

Create and test connection form

Field	Description
Connection name	Name to identify the Dynatrace connection record.
Hostname	Hostname of your Dynatrace environment.
API Key	Dynatrace API Key. **Note:** The API Key must be prefixed with `api-token`.

c. Select **Create and test connection**.

d. Once the connection test is complete, select **Continue**.

6. **Optional:** Configure the connection and connector properties to map attributes and manage data imports.

Note:
To skip this step, select **Continue** for the **Set configuration properties** activity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the **Setup** stage of the playbook, select the **Set configuration properties** activity.

b. Fill in the form.

Configuration properties

Field	Description
Management zone Ids	List of the management zone IDs to fetch from your Dynatrace environment. For multiple entries, separate the zone IDs with commas.
Management zone names	List of the management zones to fetch from your Dynatrace environment. For multiple entries, separate the zone names with commas.
Service types	List of the Dynatrace service types from where to ingest the data into the CMDB. For multiple entries, separate the service types with commas. **Note:** All service types except for DATABASE_SERVICE are mapped to the Calculated Application Service [cmdb_ci_service_calculated] CMDB table. The DATABASE_SERVICE service type is mapped to the Database Instance [cmdb_ci_db_instance] CMDB table. Valid values are: ▪ BACKGROUND_ACTIVITY ▪ CICS_SERVICE ▪ CUSTOM_SERVICE ▪ DATABASE_SERVICE ▪ ENTERPRISE_SERVICE_BUS_SERVICE ▪ EXTERNAL ▪ IBM_INTEGRATION_BUS_SERVICE ▪ IMS_SERVICE ▪ MESSAGING_SERVICE ▪ QUEUE_LISTENER_SERVICE ▪ RMI_SERVICE ▪ RPC_SERVICE ▪ WEB_REQUEST_SERVICE ▪ WEB_SERVICE
Tags	List of the tag names to fetch from your Dynatrace environment. For multiple entries, separate the tags with commas.

c. To manage data source failures during import, select the **Save REST response as attachment** check box to save each response as an attachment temporarily.

d. Select **Continue**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. **Optional:** To enable Dynatrace notifications as events in your ServiceNow instance, trigger the workflow to create a problem notification and alerting profile in your Dynatrace environment.

   Note:
   This step is displayed only when the Observability Commons for CMDB plugin (sn_observability) is already installed. To skip this step, select **Skip** for the **Configure observability** activity.

   a. In the **Setup** stage of the playbook, select the **Configure observability** activity.

   b. Select **Create problem notification**.

   Note:
   The created records appear in the Dynatrace application under the display name `ServiceNow default Problem notification` and can be customized.

   c. Dismiss any success alerts and select **Continue**.

8. Configure the import schedule to import data at regular intervals.

   a. In the **Setup** stage of the playbook, select the **Configure import schedule** activity.

   b. Expand the Parent scheduled data import within the Import schedules list to select the **SGO-Dynatrace Hosts -** *`Connection Name`* import schedule.

   c. Select the **Active** check box, and then fill in the run schedule and time details.

      For more information, see Schedule a data import.

   d. Select **Save**.
   Alternatively, select **Execute Now** to execute the import schedule immediately.

   e. Select **Continue**.

9. In the **Setup** stage of the playbook, select the **Confirm connection creation** activity to verify whether the connection was created.

What to do next

Select **View all connections** to review the connection details. The created connection appears in the Installed connections list.

Configure Service Graph Connector for Observability - Dynatrace using guided setup

Use the Service Graph Connector for Observability - Dynatrace to ingest Configuration Management Database (CMDB) data from Dynatrace using REST APIs. This connector is the second generation of the Service Graph Connector for Observability - Dynatrace application developed by ServiceNow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Important:
Unless there are configuration issues, use the SGC Central view in the Service Graph Workspace or CMDB Workspace to configure the connection for the connector, as the guided setup method is planned for deprecated.

To use this Service Graph Connector, you need a subscription to a Subscription Unit that is based in the IT Operations Management (ITOM) Visibility application or in the ITOM Discovery application. As defined in the section titled "Managed IT Resource Types" in ServiceNow Subscription Unit Overview for your subscription, for managed IT resources that are created or modified in the CMDB by this Service Graph Connector, but that aren't yet managed by ITOM Visibility or ITOM Discovery, these resources will increase Subscription Unit consumption from that application. Review your current Subscription Unit consumption within ITOM Visibility or ITOM Discovery to ensure available capacity.

Dependencies and requirements:

- The Integration Commons for CMDB store app, which is automatically installed.
- The CMDB CI class models store app, which is automatically installed. See CMDB CI Class Models.
- The ITOM Discovery License plugin (com.snc.itom.discovery.license). You must activate this plugin.
- ITOM Licensing plugin (com.snc.itom.license). For more information, see Request Discovery.
- The Datastream Action plugin (com.glide.hub.action_type.datastream), which is automatically installed.
- The Observability Commons for CMDB (sn_observability) plugin, which is only required for event ingestion and must be installed before installing the connector for Event Management to work. For more information, see Observability Commons for CMDB on the ServiceNow Store .

Note:
To access the Dynatrace API, you need an access token with Read entities (entities.read) scope.

Role required: SGC-Admin (sn_cmdb_int_util.sgc_admin) or admin

Note:
The admin user role is required to run background scripts and to provide access to global tables to the SGC-Admin user. For information about the user roles for Service Graph Connectors, see Service Graph Connector user roles.

Procedure

1. Navigate to **All** > **Service Graph Connectors** > **Dynatrace Observability** > **Setup**.
2. On the Getting started page, select **Get Started**.
3. Set impact values for clusters and have the connector get access to the `SNC.ImpactManager` API.

   Note:
   This step appears when Observability Commons is installed.

   a. On the Setup page, in the Enable Access To SNC.Impact Manager section, select the **Copy Script to Global Scope** task.

   b. In the Copy Script to Global Scope section, copy the script.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

i. Select **Configure**.

ii. Switch to the global scope.

iii. Select the Additional actions icon ( ).

iv. Select **Insert and Stay**.

v. Select **Mark as Complete**.

c. In the Verify script is copied properly section, verify the script.

i. Select **Configure**.

ii. Select the *EvtMgmtImpactManagerMediator* script and verify it was copied to the global scope.

iii. In the **Accessible from** field, ensure it is set to **All application scopes**.

iv. Select **Mark as Complete**.

4. Configure the basic setup.

a. On the Setup page, in the Basic section, select the **Configure Auth Token for Dynatrace** task.

b. On the next page, in the Configure Auth Token for Dynatrace section, configure the authentication token.

i. Select **Configure**.

ii. In the **API Key** field, enter `api-token <your api token>`.

For example, `api-token mytokenid`.

iii. Select **Mark as Complete**.

c. In the Configure HTTP Connection for Dynatrace section, configure the HTTP connection.

i. Select **Configure**.

ii. Update the **Host** field with a fully qualified hostname for your Dynatrace instance.

For example, `abc123.live.dynatrace.com`.

The hostname is automatically filled in the **Connection URL** field.

iii. Enable the use of a MID Server, select the **Use MID Server** check box.

Note:
The HTTP connection will be pre-configured to use the API key that was configured during the previous setup task.

iv. Select **Mark as Complete**.

d. Test the HTTP connection.

i. In the Test Connection section, select **Configure**.

ii. To test the connection configuration, select **Test Connection**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If any of the tests have errors, follow the suggestions for remediation.

iii. Set the Test Connection task to complete by selecting **Mark as Complete**.

e. In the Create Default Notification Payload Template section, select **Configure**.

Note:
You need an access token with the following scopes:

- Read configuration (ReadConfig)
- Write configuration (WriteConfig)
- Read log content (LogExport)
- Read metrics (metrics.read)
- Read settings (settings.read)
- Write settings (settings.write)
- Read logs (logs.read)

i. Update the name of the payload template, if needed.

ii. Select **Problem Notification Setup**.

iii. Set the Create Default Notification Payload Template task to complete by selecting **Mark as Complete**.

f. Optional: If you want to support multiple instances, in the Upgrade Source Native Keys section, select **Configure**.

i. In the **Run script** text box of the background script page, enter the following script:

```
var gr = new GlideRecord("sys_object_source");
gr.addQuery("name", "SGO-Dynatrace");
var grOR = gr.addQuery("id", "STARTSWITH", "HOST-");
grOR.addOrCondition("id", "STARTSWITH",
 "PROCESS_GROUP_INSTANCE-");
grOR.addOrCondition("id", "STARTSWITH", "PROCESS_GROUP-");
grOR.addOrCondition("id", "STARTSWITH", "SERVICE-");
grOR.addOrCondition("id", "STARTSWITH", "APPLICATION-");
gr.query();
while (gr.next()) {
    gr.setValue("id", "f379137e075820107add6a77c4a93538|||"
 + gr.getValue("id"));
    gr.update();
}
```

ii. Select **Run Script** to run the background script in the **global** scope.

The script may take several minutes to execute.

iii. After the script is executed, select **Close**.

iv. From the application picker, select the **Service Graph Connector for Observability Dynatrace** application.

v. Select **Mark as Complete**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. For a Grail-enabled tenant, configure the OAuth 2.0 client credentials and test the connection. For more information on Dynatrace OAuth credentials, see Authentication for the Account Management API on the Dynatrace documentation site.

   a. Set the Dynatrace Grail status to indicate whether using the Grail-enabled tenant.

   Note:

   You can check Grail enablement by contacting your Dynatrace administrator.

      i. In the Configure Dynatrace Grail OAuth section of the Service Graph Connector for Observability Dynatrace Setup page, select **Get Started**.
      ii. For the Set Dynatrace Grail status task, select **Configure** and review or modify the property settings for a Grail-enabled tenant.
      iii. If you've Grail-enabled tenant, set the **Value** field of the *grailEnabled* property to `true`.

      Else, leave the value set to `false`.

      iv. Set the Configure Dynatrace Grail OAuth task to complete by selecting **Mark as Complete**.

   b. Add a new OAuth connection.

   Note:
   You need an OAuth token with the following scope permissions in Grail:

   - storage:logs:read
   - storage:buckets:read

      i. In the Configure OAuth credentials section, select **Configure**.
      ii. On the Workflow Studio page that opens in a new browser tab, select **Add Connection**.
      iii. Enter a name, the connection URL, OAuth client ID, and OAuth client secret details.
      iv. Select **Create and Get OAuth Token**.
      v. Return to the guided setup page.
      vi. Set the Configure OAuth credentials task to complete by selecting **Mark as Complete**.

   c. Test the new OAuth connection.
      i. In the Test Connection section, select **Configure**.
      ii. To test the connection configuration, select **Test Connection**.
      iii. When the **Status** field is set to **Success**, select **Update** to close the Test the connection dialog box and return to the guided setup page.

      If any of the tests have errors, follow the suggestions for remediation.

      iv. Set the Test Connection task to complete by selecting **Mark as Complete**.

6. Set up the additional configurations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. On the Guided setup page, in the Advanced section, select the **Advanced settings** task.

b. In the Advanced Settings section, select **Configure** and review or modify the existing settings for a custom configuration.
You can configure the following settings:

- Review the page size used in REST API requests to fetch Dynatrace entities.
- Define number of days a configuration item (CI) can be inactive before it is ignored.
- Enter the percentage of an application cluster's nodes that need to be in a state to raise that state to its parent in the service map.

  For example, you can define the percentage of nodes that need to go critical for the parent of a cluster to be in a critical state. If there are 10 nodes in a cluster, setting the property value to `70` would require at least 7 out of the 10 nodes in the cluster to go into a critical state to reflect up to the parent service of the cluster.

- Enable ingesting events that do not have a matching CI in the CMDB.
- Enable populating the Application (cmdb_ci_appl) CIs from Dynatrace (Dynatrace processes) during scheduled imports.

c. Select **Save**.

d. Select **Mark as Complete** for the Advanced Settings task.

e. Configure connection properties for the Dynatrace connection.

i. In the Configure Instance Settings section, select **Configure**.

ii. In the Service Graph Connection Properties related list, configure the properties of the connection record.

Dynatrace connection properties

Property	Description
managementZoneNames	Enter the name of the management zone to fetch from your Dynatrace environment. For multiple entries, separate the zone names with commas.
tags	Enter the name of the tags to fetch from your Dynatrace environment. For multiple entries, separate the tags with commas.
serviceTypes	Enter the list of Dynatrace service types from where to ingest the data into CMDB. For multiple entries, separate the service types with commas.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	Note: All service types except for DATABASE_SERVICE are mapped to the Calculated Application Service [cmdb_ci_service_calculated] CMDB table. The DATABASE_SERVICE service type is mapped to the Database Instance [cmdb_ci_db_instance] CMDB table. Valid values are: ▪ BACKGROUND_ACTIVITY ▪ CICS_SERVICE ▪ CUSTOM_SERVICE ▪ DATABASE_SERVICE ▪ ENTERPRISE_SERVICE_BUS_SERVICE ▪ EXTERNAL ▪ IBM_INTEGRATION_BUS_SERVICE ▪ IMS_SERVICE ▪ MESSAGING_SERVICE ▪ QUEUE_LISTENER_SERVICE ▪ RMI_SERVICE ▪ RPC_SERVICE ▪ WEB_REQUEST_SERVICE ▪ WEB_SERVICE
managementZoneIds	Enter the management zone ID to fetch from your Dynatrace environment. For multiple entries, separate the zone IDs with commas.

iii. Select **Update**.

iv. Complete the Configure Instance Settings task by selecting **Mark as Complete**.

f. Execute the *`Fix Older Ids`* fix script to migrate the IDs of the imported data from the previous format to the latest format of the object IDs.

Note:
Beginning with the 1.9.0 version of the Service Graph Connector for Observability - Dynatrace, the latest format of the object IDs, which is Base64 Encoding, is used for data import. The *`Fix Older Ids`* fix script migrates any existing data with previous object IDs to the latest format.

g. Configure the notification settings.

The setup enables pulling ITOM events from Dynatrace into the ServiceNow instance.

i. In the Configure Problem Notification section, select **Configure**.

ii. To push the configuration to Dynatrace, select **Problem Notification Setup**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

iii. To receive the configuration from Dynatrace, select **Fetch Notification Setup**.

iv. Complete the Configure Problem Notification task by selecting **Mark as Complete**.

7. Clean up records from the previous instance.

Note:
If you are not migrating from the previous Dynatrace version, you can skip this step.

a. On the Setup page, in the Clean Up Records From Previous Integration section, select the **Execute the New Integration** task.

b. On the next page, in the Execute the New Integration section, select **Configure** and select **Update**.

c. Select **Mark as Complete**.

d. In the Verify Integration Execution Has Completed section, verify the integration execution.

i. Select **Configure**.

ii. In the **State** field, wait for the field to change to **Complete** or **Complete with errors**.

It is normal to have errors during the migration from an older version.

iii. To refresh the list, select and hold (or right-click) the header and select **Refresh List**.

iv. Select **Mark as Complete**.

e. In the Delete Application Services Left Over From Previous Version section, select **Configure** to delete any application services that you no longer need from the previous integration.

f. Select **Mark as Complete**.

g. In the Cleanup Identification Remnants - Copy Script section, copy the script.

i. Select **Configure**.

ii. Change the current scope to **Global**.

iii. Select the menu icon ( ).

iv. Select **Insert and Stay**.

v. Select **Mark as Complete**.

h. In the Cleanup Identification Remnants - Execute Script section, execute the script.

i. Select **Configure**.

ii. Select the record of the script you copied.

iii. Select **Update**.

8. **Optional:** Add multiple instances.

Note:
If you do not need to add multiple instances, you can skip this step.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the Add Multiple Instances section of the Service Graph Connector for Observability - Dynatrace page, select **Get Started**.

b. Update the data source access to create a data source for the new connection.
   i. Ensure that you have edit permissions for the Datasource [sys_data_source] table.
   ii. For the Update Data Source Access task, select **Configure**.
   iii. To edit the record, select the **Global** application scope from the application picker.
   iv. In the Application Access related list of the Data Source form that opens in a new tab, select the **Can create**, **Can update**, and **Can delete** check boxes.
   v. Select **Update** to return to the guided setup page.
   vi. Select the **Service Graph Connector for Observability Dynatrace** application scope from the application picker.
   vii. Set the Update Data Source Access task to complete by selecting **Mark as Complete**.

c. Update the scheduled data import access to create a scheduled import for the new connection.
   i. Ensure that you have edit permissions for the Scheduled data import [scheduled_import_set] table.
   ii. For the Update Scheduled Data Import Access task, select **Configure**.
   iii. To edit the record, select the **Global** application scope from the application picker.
   iv. In the Application Access related list of the Data Source form that opens in a new tab, select the **Can create**, **Can update**, and **Can delete** check boxes.
   v. Select **Update** to return to the guided setup page.
   vi. Select the **Service Graph Connector for Observability Dynatrace** application scope from the application picker.
   vii. Set the Update Scheduled Data Import Access task to complete by selecting **Mark as Complete**.

d. Update the value access to create the data source for the new connection.
   i. Ensure that you have edit permissions for the Value [sys_variable_value] table.
   ii. For the Update Value Access task, select **Configure**.
   iii. To edit the record, select the **Global** application scope from the application picker.
   iv. In the Application Access related list of the Data Source form that opens in a new tab, select the **Can create**, **Can update**, and **Can delete** check boxes.
   v. Select **Update** to return to the guided setup page.
   vi. Select the **Service Graph Connector for Observability Dynatrace** application scope from the application picker.
   vii. Set the Update Value Access task to complete by selecting **Mark as Complete**.

e. Clear the data source and import set cache for the new connection.
   i. For the Clear Cache for Datasource and Import set task, select **Configure**.
   ii. In the **Run script** text box of the background script page, enter the following script:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
     GlideTableManager.invalidateTable("sys_data_source");
     GlideCacheManager.flushTable("sys_data_source");

GlideTableManager.invalidateTable("scheduled_import_set");
     GlideCacheManager.flushTable("scheduled_import_set");

GlideTableManager.invalidateTable("sys_variable_value");
     GlideCacheManager.flushTable("sys_variable_value");

     GlideTableManager.invalidateTable("sys_db_object");
     GlideCacheManager.flushTable("sys_db_object");
```

iii. Select **Run Script** to run the background script in the **global** scope.

The script may take several minutes to execute.

iv. After the script is executed, select **Close**.

v. Select the **Service Graph Connector for Observability Dynatrace** application scope from the application picker.

vi. Set the Clear Cache for Datasource and Import set task to complete by selecting **Mark as Complete**.

f. Add another connection.

i. Ensure that the application scope is set to **Service Graph Connector for Observability** in the application picker.

ii. For the Add Another Connection task, select **Configure**.

iii. On the Workflow Studio page that opens in a new browser tab, select **Add Connection**.

iv. On the form, fill in the fields.

Connection form

Field	Description
Connection Name	Display name for the connection.
Connection Hostname	Host name of the Dynatrace instance.
API Key	Dynatrace API Key. **Note:** The API Key must be prefixed with `api-token`.

v. Select **Create Connection**.

vi. Return to the guided setup page.

vii. Set the Add Another Connection task to complete by selecting **Mark as Complete**.

g. If using a Grail-enabled tenant, configure additional OAuth 2.0 connections.

i. For the Add another OAuth connection task, select **Configure**.

ii. On the Workflow Studio page that opens in a new browser tab, select **Add Connection**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

iii. Enter a name, the connection URL, OAuth client ID, and OAuth client secret details.

iv. Select **Create and Get OAuth Token**.

v. Return to the guided setup page.

vi. Set the Add another OAuth connection task to complete by selecting **Mark as Complete**.

h. If using a Grail-enabled tenant, select the OAuth 2.0 client credentials alias created earlier in the Add another OAuth connection task.

i. For the Link connection record with OAuth client credentials task, select **Configure**.

ii. In the **OAuth 2.0 Connection and Credentials Alias** field, search for and select the OAuth connection alias you created in the step 8.g.

iii. In the **Service Graph connection record**, search for and select the connection record you created in step 8.f.

iv. Select **Submit**.

v. Return to the guided setup page.

vi. Set the Link connection record with OAuth client credentials task to complete by selecting **Mark as Complete**.

i. **Optional:** Set up the MID Server for the connection you created.

i. For the Configure Mid Servers task, select **Configure**.

ii. Select the name of the connection you created.

iii. Select the **Use MID server** check box.

iv. Select **Update**.

v. Set the Configure Mid Servers task to complete by selecting **Mark as Complete**.

j. Configure the instance settings.

i. In the Configure Instances section, select **Configure**.

ii. Select the name of the connection you want to configure and then select **Update**.

iii. Set the Configure Instances task to complete by selecting **Mark as Complete**.

k. Test the new connections.

i. For the Test Connections task, select **Configure**.

ii. Select the name of the connection you want to test.

iii. To validate the data source configuration, select **Test Load 20 Records**.

iv. When the **Status** field is set to **Success**, select **Update** to close the Test the connection dialog box and return to the guided setup page.

If any of the tests have errors, follow the suggestions for remediation.

v. Set the Test Connections task to complete by selecting **Mark as Complete**.

l. Create default notification payload templates.

i. Ensure that you have the access token with the following scopes:

- Read configuration (ReadConfig)
- Write configuration (WriteConfig)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Read log content (LogExport)
- Read metrics (metrics.read)

ii. For the Create Default Notification Payload Templates task, select **Configure**.

iii. Select the connection you want to create a default notification payload template for.

iv. Update the name of the payload template, if needed.

v. Select **Problem Notification Setup**.

The notification is created with the payload parameters as described in the following table.

Notification payload paramters

Parameter	Description
name	Name of the notification. The name is automatically prefixed with `ServiceNow Default Problem Notification` and the instance name is added to it.
alertingProfile	ID of the alerting profile in Dynatrace.
type	Type of payload that is automatically set to `webhook`.
url	Webhook URL in the format `https://https://<instance name>.service-now.com/ /api/sn_em_connector/em/inbound_event?source=SGO-Dynatrace`.
payload	Custom payload created for notification in the following format:

```
{
  "ImpactedEntities": {ImpactedEntities},
  "ImpactedEntity": "{ImpactedEntity}",
  "PID": "{PID}",
  "ProblemDetailsHTML": "{ProblemDetailsHTML}",
  "ProblemDetailsJSON": {ProblemDetailsJSON},
  "ProblemDetailsMarkdown":
 "{ProblemDetailsMarkdown}",
  "ProblemDetailsText": "{ProblemDetailsText}",
  "ProblemID": "{ProblemID}",
  "ProblemImpact": "{ProblemImpact}",
  "ProblemSeverity": "{ProblemSeverity}",
  "ProblemTitle": "{ProblemTitle}",
  "ProblemURL": "{ProblemURL}",
  "State": "{State}",
  "Tags": "{Tags}"
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Description
	}

vi. Repeat the steps for each connection.

vii. Set the Create Default Notification Payload Templates task to complete by selecting **Mark as Complete**.

9. Set up scheduled import jobs.

   a. In the Set up scheduled import jobs section of the Service Graph Connector for Observability - Dynatrace page, select **Get Started**.

   b. For the Configure the scheduled import jobs task, select **Configure**.

   c. Select the name of the scheduled import you want to run.

   d. On the Scheduled Data Import form, verify the field values for the scheduled job and select the **Active** check box.

      For more information, see Schedule a data import.

   e. Select **Update**.

   f. Set the Set up scheduled import jobs task to complete by selecting **Mark as Complete**.

CMDB classes targeted in Service Graph Connector for Observability - Dynatrace

When you complete setting up the connection, you can configure the integration to periodically pull data from Dynatrace. The data is saved in tables that extend from the Configuration item [cmdb_ci] table.

Application [cmdb_ci_appl]

The following attributes in the Application [cmdb_ci_appl] table are populated by collected data.

Attribute label	Attribute name
Class	sys_class_name
Configuration file	config_file
Installation directory	install_directory
Name	name
Operational status	operational_status
Running process command	running_process_command
Running process key parameters	running_process key parameters
Version	version

Set up push notifications from Dynatrace

Set up push notifications of events from Dynatrace into a ServiceNow instance that has the Service Graph Connector for Observability - Dynatrace installed.

Before you begin

If you don't have an alerting profile in Dynatrace, then complete the following steps to create one:

1. Navigate to **Settings** > **Alerting** > **Alerting Profiles**.
2. Set up an alerting profile according to your business needs.

> **Note:**
> For more information about how to set up an alerting profile, see Alerting profiles on the Dynatrace documentation site.

You must have Observability Commons for CMDB installed.

Role required: admin

Procedure

1. In the Dynatrace instance, navigate to **Settings** > **Integration** > **Problem notifications**.
2. Click **Add Notification**.
3. On the form, fill in the fields.

Field	Value
Notification Type	Custom Integra

Service Graph Connector for Observability - Dynatrace properties

Service Graph Connector for Observability - Dynatrace properties control the behavior of the connector.

Connection properties

These connection properties are available for Service Graph Connector for Observability - Dynatrace.

Note:
To open the Service Graph Connection Properties [sn_cmdb_int_util_service_graph_connection_property] table for the connector, navigate to **All** > **Service Graph Connectors** > **Dynatrace Observability** > **Connections** and select the connection name. The connection properties are displayed in the Service Graph Connection Properties related list.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection properties for Service Graph Connector for Observability - Dynatrace

Property	Description
managementZoneIds	Enter a list of management zone IDs to fetch from Dynatrace. For multiple entries, separate the IDs with commas.
managementZoneNames	Enter a list of management zones to fetch from Dynatrace. For multiple entries, separate the names with commas.
tags	Enter a list of tags to fetch from Dynatrace. For multiple entries, separate the tags with commas.
grailEnabled	Set the property to `true` for a Grail-enabled tenant.
OAuth Connection	View the Sys ID of the OAuth connection and credential alias linked to the Service Graph connection record.
serviceTypes	Enter a list of Dynatrace service types from where to ingest the data into CMDB. For multiple entries, separate the service types with commas. Valid values are: • BACKGROUND_ACTIVITY • CICS_SERVICE • CUSTOM_SERVICE • DATABASE_SERVICE • ENTERPRISE_SERVICE_BUS_SERVICE • EXTERNAL • IBM_INTEGRATION_BUS_SERVICE • IMS_SERVICE • MESSAGING_SERVICE • QUEUE_LISTENER_SERVICE • RMI_SERVICE • RPC_SERVICE • WEB_REQUEST_SERVICE • WEB_SERVICE
saveRESTResponseAsAttachment	Set the property to `true` to use the SGO-Dynatrace Fetch Entities For Larger Payload action flow and save the response from Dynatrace as an attachment with a `.json` extension. Set the property to `false` to use the dedicated action flow and consume the response from Dynatrace as a data stream for processing.

Connection properties for Service Graph Connector for Observability - Dynatrace (continued)

Property	Description
	• Type: true | false • Default value: `false`
flowDesignerTimeout	Set the timeout value (in milliseconds) for a Dynatrace flow, subflow, or action execution. • Type: integer • Default value: `600000`

System properties

These system properties are available for Service Graph Connector for Observability - Dynatrace.

Note:
To open the System Properties [sys_properties] table, enter `sys_properties.list` in the navigation filter.

System properties for Service Graph Connector for Observability - Dynatrace

Property	Description
sn_dynatrace_integ.append_environment_id_to_service_name	Set the property to `true` to append the Dynatrace Environment ID to the Service name. Set the property to `false` to retain the Service name as is. • Type: true | false • Default value: `false` • Location: System Property [sys_properties] table
sn_dynatrace_integ.createUnmatchedApplicationCIs	Set the property to `true` to add unclassified processes to the Application [cmdb_ci_appl] table. Set the property to `false` to ignore unclassified processes. • Type: true | false • Default value: `true` • Location: System Property [sys_properties] table

System properties for Service Graph Connector for Observability - Dynatrace (continued)

Property	Description
	Note: Classified processes are added to the corresponding child application classes in the Application [cmdb_ci_appl] table regardless of the value of this property.
sn_dynatrace_integ.default_from_value_days	Enter the number of days a configuration item (CI) can be inactive before it is ignored. • Type: integer • Default value: `300` • Location: System Property [sys_properties] table
sn_dynatrace_integ.page_size	Enter the page size used in REST requests to fetch Dynatrace entities. • Type: integer • Default value: `50` • Location: System Property [sys_properties] table
sn_dynatrace_integ.populate_applications	Set the property to `true` to populate the Application [cmdb_ci_appl] CIs from Dynatrace processes. Set the property to `false` to ignore the Application [cmdb_ci_appl] CIs. • Type: true | false • Default value: `false` • Location: System Property [sys_properties] table

System properties for Service Graph Connector for Observability - Dynatrace (continued)

Property	Description
	Note: This property is read via scheduled imports. The manual execution of the SGO-Dynatrace Processes and SGO-Dynatrace Process Groups data sources will not consider this property.
sn_dynatrace_integ.critical_cluster_threshold	Enter the percentage of an application cluster's nodes that need to be in a state to raise that state to its parent in the service map. **Note:** This system property is available only if the Observability Commons for CMDB (sn_observability) plugin is installed. For more information, see Observability Commons for CMDB on the ServiceNow Store. • Type: integer • Default value: `75` • Location: System Property [sys_properties] table
sn_dynatrace_integ.events_for_unmatched_ci.enabled	Set the property to `true` to ingest events that don't have a matching CI in CMDB. **Note:** This system property is available only if the Observability Commons for CMDB (sn_observability) plugin is installed. For more information, see Observability Commons for CMDB on the ServiceNow Store.

Accessing the connection details of Service Graph Connector for Observability - Dynatrace

You can access the connection details of the Service Graph Connector for Observability - Dynatrace in a single view using the common connection framework (CCF) included within the Integration Commons for CMDB (sn_cmdb_int_util) store app.

With the CCF, you can access all the connections used by the Service Graph Connector for Observability - Dynatrace. The connection details include the connection alias, connection properties, data sources, and scheduled data imports associated with a connection. You can also test the connection.

Access the details of a Dynatrace connection

Access the details of a Dynatrace connection configured for the Service Graph Connector for Observability - Dynatrace.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Service Graph Connectors** > **Dynatrace Observability** > **Connections**.
2. From the **Name** column of the Service Graph Connections list, select a connection.
3. On the Service Graph Connections page, view the connection details such as the connection name, alias, and data sources.
4. Select a related list to view further details of the connection.
5. **Optional:** Select the **Test Connection** related link to test the connection.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported versions

- New Relic version: Last tested on July 01, 2025
- Supported ServiceNow versions:
  - Xanadu
  - Yokohama
  - Zurich

Configuring a connection for the connector

Use the SGC Central view in the Service Graph Workspace or CMDB Workspace to install the connector and configure the connection. The view enables you to install and discover connectors and to manage the full life cycle of creating, editing, monitoring, and debugging connections. For instructions, see Configure Service Graph Connector for Observability - New Relic using SGC Central.

Important:
Unless there are configuration issues, use SGC Central to configure the connection. The guided setup method for configuration is being deprecated.

CMDB integrations dashboard

The Integration Commons for CMDB store app provides a dashboard with a central view of the status, processing results, and processing errors of all installed integrations. You can see metrics for all integration runs. You can filter the view to a specific CMDB integration, a specific time duration, or a specific integration run. For more details about monitoring Observability New Relic integrations in the CMDB Integrations Dashboard, see Using the CMDB Integrations Dashboard.

Data mapping

Data from the New Relic data sources is mapped and transformed into the ServiceNow CMDB Configuration Item (CI) class definitions using the Robust Transform Engine (RTE). Data is inserted into the ServiceNow CMDB using the Identification and Reconciliation Engine (IRE).

The following data sources are included for New Relic:

- SG-New Relic Application Services
- SG-New Relic Applications
- SG-New Relic Disks
- SG-New Relic Hosts
- SG_New Relic Networks

When you complete setting up the connection, you can configure the integration to periodically pull data from the New Relic application. The data is loaded into the following staging tables:

- SG-New Relic Applications [sn_newrelic_integ_sg_new_relic_applications]
- SG-New Relic Application Services [sn_newrelic_integ_application_services]
- SG-New Relic Disks [sn_newrelic_integ_disks]
- SG-New Relic Hosts [sn_newrelic_integ_hosts]
- SG_New Relic Networks [sn_newrelic_integ_networks]

The data is then inserted into the following target tables:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Application [cmdb_ci_appl]
- Application service [cmdb_ci_service_calculated]
- Disk [cmdb_ci_disk]
- IP Address[cmdb_ci_ip_address]
- Network Adapter [cmdb_ci_network_adapter]
- Running Process [cmdb_running_process]
- Server [cmdb_ci_server]
- Software Installation [cmdb_sam_sw_install] (If the Software Asset Management (SAM) application is installed.)
- Software Instance [cmdb_software_instance] (If the SAM application is not installed.)
- Software [cmdb_ci_spkg] (If the SAM application is not installed.)

For more information on where data is saved when pulling data from New Relic, see CMDB classes targeted in Service Graph Connector for Observability - New Relic.

You can use the IntegrationHub ETL app to view the data maps. See IntegrationHub ETL for more information.

System property

The *sn_newrelic_integ.alerts_for_unmatched_ci.enabled* system property determines whether to ingest events that don't have a matching CMDB CI class. Set the value of this system property to `true` to ingest unmatched events. The default value is `false`.

Service Graph Connectors

Configure Service Graph Connector for Observability - New Relic using SGC Central

Use the playbook available with the SGC Central application to set up the Service Graph Connector for Observability - New Relic for pulling in New Relic project data into the CMDB.

Before you begin

Dependencies and requirements:

- Install Service Graph Connector for Observability - New Relic version 1.3.0 or later from the ServiceNow Store. For ServiceNow Store installation steps, see Install a ServiceNow Store application.
- Install Observability Commons for CMDB (sn_observability), which is only required for event ingestion. This must be installed prior to installing the connector for Event Management to work. For more information, see Observability Commons for CMDB on the ServiceNow Store.

Role required: The following table shows the roles required for each stage of the playbook.

Role required for each playbook stage

Stage	Role
Prerequisites	admin
Setup	SGC-Admin (sn_cmdb_int_util.sgc_admin) or admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The admin user role is required to run background scripts and to provide access to global tables to the SGC-Admin user. For information about the user roles for Service Graph Connectors, see Service Graph Connector user roles.

About this task

The playbook experience for onboarding connectors is activated with SGC Central in the Service Graph Workspace or CMDB Workspace. To configure the SGC Central application, see Configuring SGC Central and for more information on how to interact with a playbook, see Interact with Playbook.

Procedure

1. Use one of the following methods to open SGC Central:
   - Navigate to **Workspaces** > **Service Graph Workspace**, and from the left navigation panel, select the Ingestion icon to open the SGC Central view.
   - Navigate to **Workspaces** > **CMDB Workspace** > **SGC Central**.
2. On the Overview page, select **Create connection**.

   Tip:
   Alternatively, you can select **Create connection** on the All connections page.

3. On the Create connection window, select the New Relic connector type, and then select **Create connection**.
4. Complete the initial prerequisites when setting up a connection for the first time using a connector.

   Note:
   This step is required only during the first-time setup. See Perform initial setup tasks when creating a connection in SGC Central.

5. Enter connection details and test the API connection for importing New Relic data.

   a. In the **Setup** stage of the playbook, select the **Create and test connection** activity.

   b. On the form, fill in the fields.

Configure and test connection form

Field	Description
Connection Name	Name to identify the New Relic connection record.
Connection URL	New Relic base URL in the following format: `<base-URL>`.
API Key	New Relic API key or tenant code.
Account ID	New Relic account ID.

   c. Select **Update and test connection**.

   d. After the connection test is complete, select **Continue**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. For the Configure Observability activity, select **Continue**.
   New Relic creates the destination, channel, and workflow required to enable alerts for all configuration items (CIs).
7. Configure the import schedule to import data at regular intervals.
   a. In the **Setup** stage of the playbook, select the **Configure import schedule** activity.
   b. Select **Configure import schedule**.
   c. Expand the Parent scheduled data import within the Import schedules list to select the **SG-New Relic Hosts** import schedule.
   d. In the Configure import schedule dialog box, select the **Active** check box, and then fill in the run schedule and time details.
      For more information, see Schedule a data import.
   e. Select **Save**.
      Alternatively, select **Execute Now** to execute the import schedule immediately.
   f. Select **Continue**.
8. In the **Setup** stage of the playbook, select the **Confirm connection creation** activity to verify whether the connection was configured.
9. Enable alerts for configuration items (CIs) that aren't available in the CMDB.
   a. Navigate to **Workspaces** > **CMDB Workspace** > **SGC Central**.
   b. Select **Settings**.
   c. Select **New Relic system properties**.
   d. On the System Properties form, select the *sn_newrelic_integ.alerts_for_unmatched_ci.enabled* system property.
   e. Set the **Value** of the system property to `true`.
   f. Select **Submit**.

What to do next

Select **View all connections** to review the connection details. The configured connection appears in the Installed connections list.

Service Graph Connector for Observability - New Relic

Configure Service Graph Connector for Observability - New Relic using the guided setup

Set up scheduled import jobs to pull in data from New Relic into your CMDB.

Before you begin

To use this Service Graph Connector, you need a subscription to a Subscription Unit that is based in the IT Operations Management (ITOM) Visibility application or in the ITOM Discovery application. As defined in the section titled "Managed IT Resource Types" in ServiceNow Subscription Unit Overview for your subscription, for managed IT resources that are created or modified in the CMDB by this Service Graph Connector, but that aren't yet managed by ITOM Visibility or ITOM Discovery, these resources will increase Subscription Unit consumption from

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

that application. Review your current Subscription Unit consumption within ITOM Visibility or ITOM Discovery to ensure available capacity.

Dependencies and requirements:

- The Integration Commons for CMDB store app, which is automatically installed.
- The CMDB CI class models store app, which is automatically installed. See CMDB CI Class Models.
- The ITOM Discovery License plugin (com.snc.itom.discovery.license). You must activate this plugin.
- ITOM Licensing plugin (com.snc.itom.license). For more information, see Request Discovery.
- The Datastream Action plugin (com.glide.hub.action_type.datastream), which is automatically installed.
- Observability Commons for CMDB (sn_observability), which is only required for event ingestion. This must be installed prior to installing the connector for Event Management to work. For more information, see Observability Commons for CMDB on the ServiceNow Store.

Note:
If you have an earlier version of the Service Graph Connector for Observability - New Relic, then don't migrate data from the old connector. You must uninstall the previous version and run the new integration.

Role required: SGC-Admin (sn_cmdb_int_util.sgc_admin) or admin

Note:
The admin user role is required to run background scripts and to provide access to global tables to the SGC-Admin user. For information about the user roles for Service Graph Connectors, see Service Graph Connector user roles.

Procedure

1. Ensure that the application scope is set to the Service Graph Connector for Observability - New Relic application by using the application picker.
   For more information, see Application picker.
2. Navigate to **All** > **Service Graph Connectors** > **New Relic** > **Setup**.
3. On the Getting started page, select **Get Started**.
4. Configure the authentication credentials to send requests to the New Relic application.

   a. Configure your New Relic connection and credentials.

      i. In the Configure the Connection section of the New Relic Integration with CMDB page, select **Get Started**.

      ii. For the Configure connection and credentials task, select **Configure**.

      iii. On the Connections page of the Workflow Studio, select **Configure** for the **NewRelicConnectionAlias** connection that is available by default.

      iv. On the form, review and modify the fields.

Configure Connection form

Field	Description
Connection Information	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Connection Name	Name to uniquely identify the connection record. For example, `NewRelicConnectionAlias`.
Connection URL	Base URL to connect to the New Relic application in the following format: `https://api.newrelic.com/graphql` **Note:** This field is automatically set to the URL to connect to the *NerdGraph* API in the New Relic application. Leave the field value as is.
Credential Information	
API Key	*NerdGraph* API token used for authentication on the New Relic application.
Account ID	Account ID associated with the New Relic credential.

v. Select **Configure Connection**.

Note:
The Service Graph Connector for Observability - New Relic supports connection to a single New Relic instance only. So, you can use the single default connection only.

vi. Return to the Configure the connection task page using the back button for your browser.

vii. Set the Configure connection and credentials task to complete by selecting **Mark as Complete**.

b. Test the *NerdGraph* API connection to import data from the New Relic application.

i. In the Configure the Connection section of the New Relic Integration with CMDB page, select **Continue**.

ii. For the Test Connection task, select **Configure**.

iii. Test the connection by selecting the **Test Connection** related link.

Testing the connection might take a few moments. The page is refreshed to show the test results.

iv. When the **Status** field is set to **Success**, select **Update**.

If any of the tests have errors, follow the suggestions for remediation.

v. Set the Test Connection task to complete by selecting **Mark as Complete**.

5. Configure the destination, channel, and workflow for Observability New Relic and turn on alerts for unmatched configuration items (CIs).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Configure the destination, channel, and workflow for Observability New Relic.

i. In the Configure Observability section of the New Relic Integration with CMDB page, select **Get started**.

ii. For the Configure destination, channel and workflow task, select **Configure**.

iii. In the SG-New Relic Webhooks list, select **New**.

iv. On the form, fill in the fields.

New record form

Field	Description
Name	Name of the New Relic configuration. The `destination`, `channel`, and `workflow` strings are appended to the configuration name when the configuration is created.
Connection and Credential Alias	Select the connection alias that you created in step 4.

v. Select **Submit**.

vi. Set the Configure destination, channel and workflow task to complete by selecting **Mark as Complete**.

b. Enable alerts for configuration items (CIs) that aren't available in the CMDB.

i. In the Configure Observability section of the New Relic Integration with CMDB page, select **Continue**.

ii. For the Turn on alerts for unmatched CI task, select **Configure**.

iii. On the System Properties form, select the *`sn_newrelic_integ.alerts_for_unmatched_ci.enabled`* system property.

iv. Set the **Value** of the system property to `true`.

v. Select **Submit**.

vi. Set the Turn on alerts for unmatched CI task to complete by selecting **Mark as Complete**.

6. Configure the scheduled jobs to import data from the New Relic application.

a. In the Set up scheduled data imports section of the New Relic Integration with CMDB page, select **Get started**.

b. For the Configure Scheduled Data Imports task, select **Configure**.

c. Select the scheduled job that you want to activate.

d. On the Scheduled Data Import form, verify the field values for the scheduled job. For more information, see Schedule a data import.

e. Select the **Active** check box to activate the scheduled job.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

f. Select **Update**.

g. Repeat steps 6.c to 6.f for each scheduled job for data import.

h. Navigate back to the guided setup page.

i. Set the Configure Scheduled Data Imports task to complete by selecting **Mark as Complete**.

CMDB classes targeted in Service Graph Connector for Observability - New Relic

When you complete setting up the connection, you can configure the integration to periodically pull data from New Relic. The data is saved in tables that extend from the Configuration item [cmdb_ci] table.

Server [cmdb_ci_server]

The following attributes in the Server [cmdb_ci_server] table are populated by collected data:

Attribute label	Attribute name
CPU core count	cpu_core_count
Disk space (GB)	disk_space
DNS Domain	dns_domain
Fully qualified domain name	fqdn
Host name	host_name
Operating System	os

Relationships created for Server

Parent class	Relationship type	Child class
Server [cmdb_ci_server]	Contains::Contained by	Disk [cmdb_ci_disk]
Server [cmdb_ci_server]	Owns::Owned by	IP Address [cmdb_ci_ip_address]
Server [cmdb_ci_server]	Owns::Owned by	Network Adapter [cmdb_ci_network_adapter]

Calculated Application Service [cmdb_ci_service_calculated]

The following attributes in the Calculated Application Service [cmdb_ci_service_calculated] table are populated by collected data:

Attribute label	Attribute name
Name	name
Metadata	metadata
Service Populator Status	populator_status
Service Type	type

Accessing the connection details of Service Graph Connector for Observability - New Relic

You can access the connection details of the Service Graph Connector for Observability - New Relic in a single view using the common connection framework (CCF) included within the Integration Commons for CMDB (sn_cmdb_int_util) store app.

With the CCF, you can access all the connections used by the Service Graph Connector for Observability - New Relic. The connection details include the connection alias, connection properties, data sources, and scheduled data imports associated with a connection. You can also test the connection. For more information, see Accessing the connection details of Service Graph Connectors.

Access the details of a Service Graph Connector for Observability - New Relic connection

Access the details of a New Relic connection configured for the Service Graph Connector for Observability - New Relic.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Service Graph Connectors** > **New Relic** > **Connections**.
2. From the **Name** column of the Service Graph Connections list, select a connection.
3. On the Service Graph Connections page, view the connection details such as the connection name, alias, and data sources.
4. Select a related list to view further details of the connection.
5. **Optional:** Select the **Test Connection** related link to test the connection.

Service Graph Connector for OpenTelemetry

Use the Service Graph Connector for OpenTelemetry to ingest Configuration Management Database (CMDB) data from the ServiceNow Cloud Observability (formerly Lightstep) application using REST APIs. Push events from the Cloud Observability application into ServiceNow with Event Management.

Important:
Starting with the Australia release, Service Graph Connector for OpenTelemetry is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Supported ServiceNow versions

- Utah
- Vancouver
- Washington DC

Use cases

The following examples describe how you can use the Service Graph Connector for OpenTelemetry:

- Import project topologies from Cloud Observability so that the site reliability engineering (SRE) teams can have a single view for triage with other ServiceNow data points (such as a change request, an incident) from a single view.
- Import events created by Cloud Observability against monitored projects to pinpoint SRE triage activities.

Guided setup

The guided setup for the Service Graph Connector for OpenTelemetry provides an organized sequence of tasks to configure the integration on your instance. To access the guided setup, see Configure Service Graph Connector for OpenTelemetry.

CMDB integrations dashboard

The Integration Commons for CMDB store app provides a dashboard with a central view of the status, processing results, and processing errors of all installed integrations. You can see metrics for all integration runs. You can filter the view to a specific CMDB integration, a specific time duration, or a specific integration run. For more details about monitoring Cloud Observability integrations in the CMDB Integrations Dashboard, see Using the CMDB Integrations Dashboard.

Data mapping

Data from the Cloud Observability data sources is mapped and transformed into the ServiceNow CMDB configuration item (CI) class definitions using the Robust Transform Engine (RTE). Data is inserted into the ServiceNow CMDB using the Identification and Reconciliation Engine (IRE).

When you complete setting up the connection, you can configure the integration to pull data from the application periodically.

The following table describes the data sources, the scheduled jobs, the staging tables, and the target tables as CMDB CI classes for the Cloud Observability application.

Data mapping for Cloud Observability (continued)

Data source	Description	Scheduled job	Staging table	C cl
OpenTelemetry Container Images	Imports all the container images from the OpenTelemetry traces.	OpenTelemetry Container Images OpenTelemetry Delta Container Images	Opentelemetry container images [sn_sg_lightstep_container_images]	D Ir
OpenTelemetry Services	Imports all the Kubernetes services from the OpenTelemetry traces.	OpenTelemetry Delta Services OpenTelemetry Services	OpenTelemetry K8s Services [sn_sg_lightstep_kubernetes_services]	K S
OpenTelemetry Dependency Map	Imports the dependency maps to get an aggregate view of the traced data. The data source also imports and loads any inferred services and their related services data in the Inferred service [sn_sg_lightstep_inferred_service] staging table. **Note:** You need to link the imported inferred services with a CI manually. See Inferred service linking.	OpenTelemetry Dependency Map	OpenTelemetry Dependency Map [sn_sg_lightstep_dependency_map]	C A S

For more information on where data is saved when pulling data from Cloud Observability, see CMDB classes targeted in Service Graph Connector for OpenTelemetry.

You can use the IntegrationHub ETL app to view the data maps. See IntegrationHub ETL for more information.

Inferred service linking

The ServiceNow Cloud Observability application can infer the presence of an inferred service when the span calling the remote service has the necessary information. Service Graph Connector for OpenTelemetry provides the linking of inferred services and their related services with CIs in the CMDB. For more information, see Linking inferred services with CIs.

Service Graph Connectors

Configure Service Graph Connector for OpenTelemetry

Set up scheduled import jobs to pull in data from ServiceNow Cloud Observability (formerly Lightstep) into your Configuration Management Database (CMDB).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Important:
Starting with the Australia release, Service Graph Connector for OpenTelemetry is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

To use this Service Graph Connector, you need a subscription to a Subscription Unit that is based in the IT Operations Management (ITOM) Visibility application or in the ITOM Discovery application. As defined in the section titled "Managed IT Resource Types" in ServiceNow Subscription Unit Overview for your subscription, for managed IT resources that are created or modified in the CMDB by this Service Graph Connector, but that aren't yet managed by ITOM Visibility or ITOM Discovery, these resources will increase Subscription Unit consumption from that application. Review your current Subscription Unit consumption within ITOM Visibility or ITOM Discovery to ensure available capacity.

Dependencies and requirements:

- The Integration Commons for CMDB store app, which is automatically installed.
- The CMDB CI class models store app, which is automatically installed. See CMDB CI Class Models.
- The ITOM Discovery License plugin (com.snc.itom.discovery.license). You must activate this plugin.
- ITOM Licensing plugin (com.snc.itom.license). For more information, see Request Discovery.
- The Datastream Action plugin (com.glide.hub.action_type.datastream), which is automatically installed.
- Observability Commons for CMDB (sn_observability), which is only required for event ingestion. For Event Management to work, the Observability Commons for CMDB app must be installed prior to installing the connector. For more information, see Observability Commons for CMDB on the ServiceNow Store.

Note:
If you have an earlier version of the Service Graph Connector for OpenTelemetry, then don't migrate data from the old connector. You must uninstall the previous version and run the new integration.

Role required: admin

Procedure

1. Ensure that the application scope is set to Service Graph Connector for OpenTelemetry by using the application picker.
   For more information, see Application picker.
2. Navigate to **All** > **Service Graph Connectors** > **OpenTelemetry** > **Setup**.
3. On the Getting started page, select **Get Started**.
4. Configure the application properties to set up your organization and authentication credentials for sending requests to the ServiceNow Cloud Observability APIs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the Configure the connection section of the Service Graph Connector for OpenTelemetry page, select **Get started**.

b. For the Use OpenTelemetry task, ensure that the Cloud Observability application meets the conditions as discussed in the ServiceNow Cloud Observability setup [KB1527588] article in the Now Support Knowledge Base.

> **Important:**
> Note down your projects, organization, and API key details of the Cloud Observability application to be used later during the installation of the connector.

After you have set up the OpenTelemetry environment in the Cloud Observability application, return to the guided setup and mark the Use OpenTelemetry task to complete by selecting **Mark as Complete**.

c. Enter your Cloud Observability organization details from where you want to retrieve the projects, resources, and dependency-mapping information.

i. For the Set up your organization task, select **Configure**.

ii. In the **Value** field of the Service Graph Connection Properties form, enter the name of your Cloud Observability organization.

iii. Select **Update**.

iv. Mark the Set up your organization task to complete by selecting **Mark as Complete**.

d. Enter the API key details associated with the Cloud Observability application.

i. For the Set up the API key task, select **Configure**.

ii. In the **API Key** field of the API Key Credentials form, enter the API key associated with the Cloud Observability application that you noted down in step 4.b.

iii. Select **Update**.

iv. Set the Set up the API key task to complete by selecting **Mark as Complete**.

e. Test the Cloud Observability API connection to import data from the Cloud Observability application.

i. For the Test the connection task, select **Configure**.

ii. Select the **Test Connection** related link.

iii. When the **Status** field is set to **Success**, select **X** to close the Test the connection dialog box and return to the guided setup page.

If any of the tests have errors, follow the suggestions for remediation.

iv. Set the Test the connection task to complete by selecting **Mark as Complete**.

f. Retrieve all the projects included in your Cloud Observability organization.

i. For the Get projects task, select **Configure**.

ii. Select **Get Projects**.

iii. When the Project properties related list is populated with all the projects included in the organization you specified in step 4.c.ii, select **X** to close the Get projects dialog box and return to the guided setup page.

iv. Set the Get projects task to complete by selecting **Mark as Complete**.

5. **Optional:** Configure additional configurations to set up lookback time, add excluded projects, run project diagnostics, and configure integration settings for service maps and stale configuration items (CIs).

   a. In the Advanced settings section of the Service Graph Connector for OpenTelemetry page, select **Continue**.

   b. Set up the lookback time from when you want to retrieve resources from the projects.

      (Optional) Lookback time is used to calculate the start and end time for retrieving resources from a project of an organization and should match the scheduled job frequency setting. For example, if the lookback time is set to 12 hours, resources are retrieved from the start time calculated as the current time minus 12 hours and until the end time that is the current time.

      i. For the Set up lookback time task, select **Configure**.

      ii. In the **Value** field of the Service Graph Connection Properties form, enter the lookback time in hours.

      iii. Select **Update**.

      iv. Set the Set up lookback time task to complete by selecting **Mark as Complete**.

   c. Select the projects from which you don't want to retrieve resources.

      i. For the Add excluded projects task, select **Configure**.

      ii. Select a project from the **Project** column.

      iii. Select the **Exclude project** check box.

      iv. Select **Update**.

      v. Repeat steps from 5.c.ii to 5.c.iv for each project that you want to exclude.

      vi. Select **X** to close the Add excluded projects dialog box and return to the guided setup page.

      vii. Set the Add excluded projects task to complete by selecting **Mark as Complete**.

   d. Run project diagnostics to test the Resource API response and ensure that the API contains the Kubernetes cluster name, Kubernetes namespace, and Kubernetes nodes.

      i. For the Run project diagnostics task, select **Configure**.

      ii. Select a project from the **Project** column.

      iii. Select **Run diagnostics**.

      iv. When the **Diagnostics status** field set to **Success**, select **X** to close the Run project diagnostics dialog box and return to the guided setup page.

      If any of the Diagnostic tests have errors, follow the instructions in the **Diagnostics message** field to resolve the errors.

      v. Repeat the steps 5.d.ii to 5.d.iv for each project that you want to run diagnostics.

      vi. Set the Run project diagnostics task to complete by selecting **Mark as Complete**.

   e. Configure the system properties for service maps and stale CIs.

      i. For the Configure system properties for the connector task, select **Configure**.

      ii. Verify the default values for the properties or fill in the values for a custom configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

iii. Select **Save**.

iv. Set the Configure system properties for the connector task to complete by selecting **Mark as Complete**.

6. Configure the scheduled jobs to import complete or incremental data from the Cloud Observability application.

a. In the Configure the scheduled import jobs section of the Service Graph Connector for OpenTelemetry page, select **Continue**.

b. Activate the scheduled job for full data import.

By default, the *`OpenTelemetry Resources`* scheduled job is available for full data import. However, you must activate the job.

i. For the Configure the scheduled job for full import task, select **Configure**.

ii. On the Scheduled Data Import form for the *`OpenTelemetry Resources`* scheduled job, verify the field values for the scheduled job and select the **Active** check box.

For more information, see Schedule a data import.

iii. Select **Update**.

iv. Set the Configure the scheduled job for full import task to complete by selecting **Mark as Complete** in the guided setup.

c. **Optional:** Activate the scheduled job for delta data import.

(Optional) By default, the *`OpenTelemetry Delta Resources`* scheduled job is available for delta data import. However, you must activate the job.

Note:
The delta data pull doesn't occur in the following scenarios:

- The full data import is scheduled at the same time.
- The **Last Run Datetime** field of a data source is empty.
- The last delta data pull period is more than 3 days.

i. For the Configure the scheduled job for delta import task, select **Configure**.

ii. On the Scheduled Data Import form for the *`OpenTelemetry Delta Resources`* scheduled job, verify the field values for the scheduled job and select the **Active** check box.

For more information, see Schedule a data import.

iii. Select **Update**.

iv. Set the Configure the scheduled job for delta import task to complete by selecting **Mark as Complete** in the guided setup.

Note:
When adding a new project to retrieve resources, be sure to perform a full import before running a delta import to avoid partial data and populate the CMDB accurately.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Manage alerts and events by sending events from the Cloud Observability application to the ServiceNow Event Management application.
   You can manage alerts and events only when the Observability Commons for CMDB application is installed.

   Note:
   Enabling this feature requires a paid Cloud Observability license, but the feature is also available to free accounts for the purpose of evaluating the product in non-production environments. You can reach out to your ServiceNow account representative for more information.

   a. In the Manage alerts and events section of the Service Graph Connector for OpenTelemetry page, select **Continue**.

   b. Create a webhook destination for a project.

      i. For the Create a webhook task, select **Configure**.

      ii. Select a project that is not excluded from the **Project** column.

      iii. Select **Create Webhook** to create a webhook destination in the Cloud Observability application.

      iv. After a success message appears, select **X** to close the Create a webhook dialog box and return to the guided setup page.

      When the webhook is created successfully:

      - The system automatically creates a user record for each webhook destination in your ServiceNow instance.
      - The user name of the user record starts with `ls_api_<project_name>` and the user is assigned the evt_mgmt_integration role.

      v. Repeat the steps 7.b.ii to 7.b.iv for each project for which you want to create a webhook.

      vi. Set the Create a webhook task to complete by selecting **Mark as Complete** in the guided setup.

   c. Configure the system property for ingesting events that don't have matching CIs in the CMDB.

      i. For the Configure the property for unmatched CIs task, select **Configure**.

      ii. In the **Value** field, enter **true**.

      iii. Select **Update**.

      iv. Set the Configure the property for unmatched CIs task to complete by selecting **Mark as Complete** in the guided setup.

Service Graph Connector for OpenTelemetry properties

Service Graph Connector for OpenTelemetry properties control the behavior of the connector.

Important:
Starting with the Australia release, Service Graph Connector for OpenTelemetry is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Connection properties

These connection properties are available for Service Graph Connector for OpenTelemetry.

Note:
To open the Service Graph Connection Properties [sn_cmdb_int_util_service_graph_connection_property] table for the connector, navigate to **All** > **Service Graph Connectors** > **OpenTelemetry** > **Connections** and select the connection name. The connection properties are displayed in the Service Graph Connection Properties related list.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection properties for Service Graph Connector for OpenTelemetry

Property	Description
Organization	Enter the name of an OpenTelemetry organization. • Type: string • Default value: None • Location: Service Graph Connection Properties [sn_cmdb_int_util_service_graph_connection_property] table
Lookback Time	Enter time in hours to retrieve OpenTelemetry resources. • Type: integer • Default value: `12` • Location: Service Graph Connection Properties [sn_cmdb_int_util_service_graph_connection_property] table

System properties

These system properties are available for Service Graph Connector for OpenTelemetry.

Note:
To open the System Properties [sys_properties] table, enter `sys_properties.list` in the navigation filter.

System properties for Service Graph Connector for OpenTelemetry

Property	Description
sn_sg_lightstep.classes_to_inactivate_stale_records	Enter a list of configuration item (CI) classes to be inactivated as stale records. For multiple entries, separate the CI classes with commas. • Type: string • Default value: None • Location: System Property [sys_properties] table
sn_sg_lightstep.events_for_unmatched_ci.enabled	Set the property to `true` to ingest events that don't have a matching CI in CMDB. • Type: true | false • Default value: `false` • Location: System Property [sys_properties] table
sn_sg_lightstep.resource_api_num_rows	Enter the maximum number of rows fetched in the

System properties for Service Graph Connector for OpenTelemetry (continued)

Property	Description
	Resource API response from OpenTelemetry resources. • Type: integer • Default value: 2500 • Location: System Property [sys_properties] table
sn_sg_lightstep.service_map_classes_to_exclude	Enter a list of CI classes to be excluded from the service map. For multiple entries, separate the CI classes with commas. • Type: string • Default value: None • Location: System Property [sys_properties] table
sn_sg_lightstep.service_map_max_levels	Enter the maximum hierarchy level of CIs to be included in the service map. • Type: integer • Default value: 5 • Location: System Property [sys_properties] table
sn_sg_lightstep.service_map_relationship_types_to_exclude	Enter a list of CI relationship types to be excluded from the service map. For multiple entries, separate the CI relationship types with commas. • Type: string • Default value: None • Location: System Property [sys_properties] table

Linking inferred services with CIs

Create inferred services relationships in your ServiceNow instance with other Cloud Observability application services as originally configured in the application by linking an inferred service configuration item (CI) in CMDB with an inferred service from the Cloud Observability application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:
Starting with the Australia release, Service Graph Connector for OpenTelemetry is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Inferred services

The inferred services in the Cloud Observability application are referred to as external services, libraries, or dependencies such as a database or a third-party API that haven't been instrumented with OpenTelemetry. These types of technologies are manually defined in the Cloud Observability application, and you can import them into your ServiceNow instance through the Service Graph Connector for OpenTelemetry.

For information about adding inferred services in the Cloud Observability application, see Add inferred services in the Cloud Observability documentation.

Storing inferred services data

The OpenTelemetry Dependency Map [sn_sg_lightstep_dependency_map] data source available with the Service Graph Connector for OpenTelemetry iterates through all the included projects in a Cloud Observability organization and pulls in the inferred services details. Inferred services details include mapping of related services. The data source saves these details in the Inferred service [sn_sg_lightstep_inferred_service] table.

The following attributes in the Inferred service [sn_sg_lightstep_inferred_service] table are populated by the OpenTelemetry Dependency Map [sn_sg_lightstep_dependency_map] data source.

Attribute label	Attribute name
Project	project
Organization	organization
ID	id
Inferred service	inferred_service
Inferred service CI	inferred_service_ci
Active	active
Last scan	last_scan
Cloud Observability CI	cloud_observability_ci

Due to insufficient information for defining identification rules, the pulled in inferred services don't automatically bind to a CI in CMDB. However, as a user with the cmdb_inst_admin role, you can manually link a CI to an inferred service. The linking creates appropriate relationships with the related services and generates the inferred service mapping in the respective application service maps of your ServiceNow instance.

Link an inferred service

Link a Cloud Observability inferred service with a CI to create relationships between the inferred service and other Cloud Observability services in your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Important:
Starting with the Australia release, Service Graph Connector for OpenTelemetry is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Role required: cmdb_inst_admin

Procedure

1. Navigate to **All** > **Service Graph Connectors** > **OpenTelemetry** > **Inferred services**.
2. Review the inferred services available from the Cloud Observability app in the **Inferred service** column.
3. For an inferred service, double-click the **Inferred service CI** column cell.
4. Select the lookup using list icon ( ) to search for and select an inferred service CI available within the Configuration item [cmdb_ci] table.
5. Select the save icon ( ).
6. Repeat the steps 3 to 5 for each inferred service that you want to link with a CI.

Result

The *Update CI relationship* business rule is triggered that creates appropriate relationships for the inferred service with the related services and generates the inferred service mapping in the respective application service maps.

Note:

- If you remove any mapping later, the *Delete CI relationship* business rule is triggered to delete any relationships between the inferred service CIs and the Cloud Observability inferred services.
- For any inferred services that were not last scanned in the Cloud Observability app, the Service Graph Connector automatically deactivates the corresponding records in CMDB and deletes the relationship for the inactive records.

Accessing the connection details of Service Graph Connector for OpenTelemetry

You can access the connection details of the Service Graph Connector for OpenTelemetry in a single view using the common connection framework (CCF) included within the Integration Commons for CMDB (sn_cmdb_int_util) store app.

Important:
Starting with the Australia release, Service Graph Connector for OpenTelemetry is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

With the CCF, you can access all the connections used by the Service Graph Connector for OpenTelemetry. The connection details include the connection alias, connection properties, data sources, and scheduled data imports associated with a connection. You can also test the connection.

Access the details of an OpenTelemetry connection

Access the details of an OpenTelemetry connection configured for the Service Graph Connector for OpenTelemetry.

Before you begin

Important:
Starting with the Australia release, Service Graph Connector for OpenTelemetry is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Role required: admin

Procedure

1. Navigate to **All** > **Service Graph Connectors** > **OpenTelemetry** > **Connections**.
2. From the **Name** column of the Service Graph Connections list, select a connection.
3. On the Service Graph Connections page, view the connection details such as the connection name, alias, and data sources.
4. Select a related list to view further details of the connection.
5. **Optional:** Select the **Test Connection** related link to test the connection.

Accessing the connection details of Service Graph Connectors

Service Graph Connector for Qualys

The Service Graph Connector for Qualys pulls in asset inventory data (hardware and software) from the Qualys database into the Configuration Management Database (CMDB) application in your ServiceNow AI Platform® instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Supported versions

Use this data to manage your Qualys resources directly from your ServiceNow AI Platform® instance.

Supported Qualys APIs:

- Qualys Global Asset API v2. You might prefer to use this API if you are importing data for the Security Posture Control Security Posture Control application.
- Qualys Asset Management API v2. This API is deactivated by default. You should only activate this API if you don't have access to the Qualys Cybersecurity Asset Management (CSAM) product. ServiceNow uses a different API (Asset management and tagging) for this API but the data returned is not comprehensive.

Supported ServiceNow® versions:

- Utah
- Vancouver
- Washington

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use cases

The following are examples on how you can use the Service Graph Connector for Qualys for different ServiceNow applications:

- Complements the Qualys Asset Discovery.
- Import data with the Global Asset API or the Asset Management API.
- Multi-instance support.

Guided Setup

The guided setup for the Service Graph Connector for Qualys provides you with an organized sequence of tasks to configure the integration on your instance.

CMDB integrations dashboard

The Integration Commons for CMDB store app provides a dashboard with a central view of the status, processing results, and processing errors of all installed integrations. You can see metrics for all integration runs. You can filter the view to a specific CMDB integration, a specific time duration, or a specific integration run. For more details about monitoring Qualys integrations in the CMDB Integrations Dashboard, see Using the CMDB Integrations Dashboard.

Hardware CI Rules

The hardware Configuration item (CI) mapping rule table is equipped with hardware category1, hardware category2 and corresponding target CI class. Following a Qualys API call, the system checks the hardware category1 and hardware category2 to determine their satisfaction, if hardware category1 and hardware category2 is match with the table record then the associated target CI class is added to the import set table data. During the mapping process, this designated target CI class is then utilized.

Computer CI Rules

The Computer CI Mapping Rule table is equipped with predefined rules, including criteria such as OS name, OS category, OS category 2, OS Publisher, OS Product name, and the corresponding target CI class. Following a Qualys API call, the system checks these rules to determine their satisfaction. If a rule is met, the associated target CI class is added to the import set table data. During the mapping process, this designated target CI class is then utilized.

If you want to update CI attributes, you must create new reconciliation rules to determine which discovery sources can update CI attributes. See 'Reconciliation rules' in the online product documentation and the Identification and Reconciliation Fundamentals article in the ServiceNow Support Knowledge base for more information.

Asset Management CI Rules

The Asset Management CI Mapping Rule table is equipped with predefined rules, including criteria such as Operating System, Is Volume Info Present, Is processor Present, Cloud Provider and the corresponding target CI class. Following a Qualys API call, the system checks these rules to determine their satisfaction. If a rule is met, the associated target CI class is added to the import set table data. During the mapping process, this designated target CI class is then utilized.

Configure the Service Graph Connector for Qualys

Set up the Qualys environment and scheduled jobs to import in Qualys data into your Configuration Management Database (CMDB).

Before you begin

To use this Service Graph Connector, you need a subscription to a Subscription Unit that is based in the IT Operations Management (ITOM) Visibility application or in the ITOM Discovery application. As defined in the section titled "Managed IT Resource Types" in ServiceNow Subscription Unit Overview for your subscription, for managed IT resources that are created or modified in the CMDB by this Service Graph Connector, but that aren't yet managed by ITOM Visibility or ITOM Discovery, these resources will increase Subscription Unit consumption from that application. Review your current Subscription Unit consumption within ITOM Visibility or ITOM Discovery to ensure available capacity.

Dependencies and requirements:

- The Integration Commons for CMDB store app, which is automatically installed.
- The CMDB CI class models store app, which is automatically installed. See CMDB CI Class Models.
- The ITOM Discovery License plugin (com.snc.itom.discovery.license). You must activate this plugin.
- ITOM Licensing plugin (com.snc.itom.license). For more information, see Request Discovery.
- The Datastream Action plugin (com.glide.hub.action_type.datastream), which is automatically installed.
- Observability Commons for CMDB (sn_observability), which is only required for event ingestion. This app must be installed prior to installing the connector for Event Management to work. For more information, see Observability Commons for CMDB on the ServiceNow Store.

There are two supported Qualys APIs:

- Qualys Global Asset API v2. You might prefer to use this API if you are importing data for the Security Posture Control application.
- Qualys Asset Management API v2. This API is deactivated by default. You should only activate this API if you don't have access to the Qualys Cybersecurity Asset Management (CSAM) product. ServiceNow® uses a different API (Asset management and tagging) for this API but the data returned is not comprehensive.

For more information, see Service Graph Connector for Qualys APIs.

Role required: admin

Procedure

1. Navigate to **All** > **Service Graph Connectors** > **Qualys** > **Setup**.
2. Select **Continue** on the Home page.
3. Select **Best Experience** and **Continue** on the Experience page.
   On the Service Graph Connector for Qualys page in the Configure the connection page, three tasks are displayed:
   - Configure the connection
   - Add multiple instances
   - Set up scheduled import jobs
4. Select **Start** for the **Configure the Connection** task to expand it.
   The following steps are displayed:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Configure Qualys authentication credentials
- Configure Qualys HTTP Connection
- Test Connection

5. Select **Configure Qualys authentication credentials**.

   a. In the Username and Password field, enter your Qualys username and password.

   b. Select the **Active** check box to activate the record.

   c. Right-click in the gray header titled Basic Auth Credentials and select **Save**.

   d. Select **Mark as complete** followed by **Continue**.
   The Configure Qualys HTTP Connection page is displayed.

6. Fill in the fields.

   a. Add the Qualys base URL or Host details.

   Domain part of the URL without the 'https'. An example might be `qualysapi.qualys.com`.

   b. **Optional:** If the API is accessible through a MID Server, activate the **Use MID Server** check box.

   c. In the advanced MID Server configuration section select the appropriate MID Server from the MID Selection list.

   d. Right-click in the gray header titled HTTP(s) Connection and select **Save**.

   e. Select **Mark as complete** followed by **Continue**.
   The Test Connection page is displayed.

7. Test the connection.

   a. Update the **use_asset_management_and_tagging_api** property in the 'Service Graph Connection Properties' section.

Option	Description
true	Set the property **use_asset_management_and_tagging_api** flag to `true` if you are using the asset management and tagging API in the configuration.
false	Set the property **use_asset_management_and_tagging_api** to `false` if you are not using the asset management and tagging API in the configuration.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. In the Related links section select the **Test Connection** link.
If the connection is successful, the status code field displays 200 or 201 and a message is displayed. If your connection test fails, review the Message and Suggestion fields for how to proceed.

c. Right-click in the gray header titled Service Graph Connections and select **Save**.

d. Select **Mark as complete** followed by **Continue**.
The Update Data Source Access page is displayed.

8. Update the data source.

a. Follow the steps listed at the top of the page to switch the application scope with the application picker to open, edit, and save the record.

b. Select a record from the list to open it.

c. Select the **Application Access** tab.

d. Select the check boxes to set the permissions you want.

e. Right-click in the gray header titled Tables and select **Save**.

f. Select **Mark as complete** followed by **Continue**.
The Update Scheduled Data Import page is displayed.

9. Update the Scheduled Data Import record.

a. Follow the steps listed at the top of the page to switch the application scope with the application picker as required to open, edit, and save the record.

b. Select the **Application Access** tab.

c. Select the check boxes to set the permissions you want.

d. Right-click in the gray header titled Table and select **Save**.

e. Select **Mark as complete** followed by **Continue**.
The Add Another Connection task is displayed.

10. Follow the instructions at the top of the page to add a connection.

a. Follow the steps listed at the top of the page to switch the application scope with the application picker to open, edit, and save the record.

b. Select the link.
The SG-Qualys Connections page is displayed.

c. Select **Add Connection** and fill out the fields.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Connection name	Unique name for your connection
Connection URL	Connection URL
User name	Qualys account user name
Password	Qualys account password

d. Select **Create Connection**.

e. Navigate back to the Add Another Connection page in the Setup Assistant.

f. Select **Mark as complete** followed by **Continue**.
The Configure MID Server for new HTTP connection page is displayed.

11. Configure the MID Server

a. Select a record to open it.

b. Select the Use MID server check box.

c. Select the search icon in the MID Server field and choose one from the list.

d. Right-click in the gray header titled HTTP(s) Connection and select **Save**.

e. Select **Mark as complete** followed by **Continue**.
The Test New Connections page is displayed.

12. Test the connection.

a. Select the record for the connection you want to test.

b. Scroll to the Related links section and select the **Test Connection** link.
If the connection is successful, the status code field displays 200 or 201 and a message is displayed. If your connection test fails, review the Message and Suggestion fields for how to proceed.

c. Right-click in the gray header titled, Service Graph Connections and select **Save**.

d. Select **Mark as complete** followed by **Continue**.
The Configure the scheduled jobs page is displayed.

13. Configure the scheduled jobs.

a. Select a record to open it.

b. Fill out the scheduled data import from.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Name	Name of the scheduled job.
Application	Read-only application name.
Data source	Data source record that defines the data to import.
Run	How often you want the job to run. If you want to run a test import prior to scheduling it, you might prefer to select **Once**.
Run as	Option to run the scheduled job with the credentials of the specified user.
Conditional	Specific conditions under which this job is run.
Active	Option to activate the scheduled job. Select this option.
Use connection	Leave this deactivated for the first run. Specifies another connection and credentials for this job.
Concurrent Import	Leave check box activated. Splits data into multiple imports sets. See the field message for more information.
Partition Method	Leave set as `Custom size`.
Partition Size	Leave set as 1 , 000. Import set size for early scheduling.
Execute pre-import script	Leave check box selected. Specifies a script to run before the import is performed.
Execute post-import script	Leave check box selected. Specifies a script to run after the import is performed.

c. Right-click in the gray header titled Scheduled Data Import and select **Save**.

d. Optional: Select **Execute Now**.
If you do not choose to run the job on-demand, the next job runs according to the schedule you set.

e. Select **Mark as complete** followed by **Continue**.
The Home page of the Setup Assistant is displayed.

14. Optional: Add Multiple Instances

a. Select Add Multiple Instances to expand it.
The following steps are displayed:

- Update Data Source Access
- Update Scheduled Data Import
- Add Another Connection
- Configure MID Server for New HTTP connection
- Test New Connections

b. To update the Data Source, follow the steps listed in step 8.

c. To update the Scheduled Data Import, follow the steps in step 9.

d. To add another connection, follow the steps listed in step 10.

e. To configure a MID Server, follow the steps listed in step 11.

f. To test connections, follow the steps listed in step 12.

15. On the Service Graph Connector for Qualys page for Guided Setup, select **Complete** to finish the configuration.

Service Graph Connector for Qualys APIs

Data from the Qualys data source fields is imported with the Global Asset API and the Asset Management and Tagging API.

Global Asset API

- A Qualys Cybersecurity Asset Management (CSAM) license is required.
- Asset information includes details such as Hardware Category and OS Category.

Asset Management and Tagging API

- A CSAM license is not required
- Asset information does not include details about Hardware Category and OS Category.

Mapped attributes

The following table compares what data is imported by the two APIs. The sections after the table list data imported by the Global asset API that is not supported by the Asset Management and Tagging API.

Global Asset API	Asset Management and Tagging API
Mapped attributes	Mapped attributes
assetId	created
assetUUID	name

CMDB classes targeted in the Service Graph Connector for Qualys

When you complete setting up the connection, you can configure the integration to periodically pull data. The data is saved in tables that extend from the Configuration item [cmdb_ci] table. The Service Graph Connector for Qualys identifies and classifies information about various configuration Items (CIs).

SGC Qualys Asset Cloud Tag

The following attributes in the SGC Qualys Asset Cloud Tag [sn_sec_sgc_qualys_asset_cloud_tag] table are populated by collected data.

Service Graph Connector for Rapid7

The Service Graph Connector for Rapid7 pulls in asset inventory data (hardware and software) from the Rapid7 database into the Configuration Management Database (CMDB) application in your ServiceNow AI Platform® instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Supported versions

- Version 4.0 of the Rapid7 InsightVM application.
- Utah, Vancouver, and Washington ServiceNow® family releases.

Use cases

- Complement the data from the Rapid7 InsightVM discovery product.
- Import hardware data and details about your assets from the Rapid7 InsightVM integration and store them in appropriate configuration item (CI) classes in your CMDB.

CMDB integrations dashboard

The Integration Commons for CMDB store app provides a dashboard with a central view of the status, processing results, and processing errors of all installed integrations. You can see metrics for all integration runs. You can filter the view to a specific CMDB integration, a specific time duration, or a specific integration run. For more details about monitoring Rapid7 integrations in the CMDB Integrations Dashboard, see Using the CMDB Integrations Dashboard.

Guided setup

Use the guided setup feature for the Service Graph Connector for Rapid7 to help you configure your integration in an organized sequence of tasks.

Note:
The API token requires the InsightIDR viewer role.

Configure the Service Graph Connector for Rapid7

After you have followed the instructions provided to you to download and activate the Service Graph Connector for Rapid7 application, refer to Download an application from the ServiceNow Store for the first time and Install a Security Operations integration. There are a few steps you need to complete before you configure this integration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure the Service Graph Connector for Rapid7

Configure your connections, set up scheduled imports, verify successful connections and optionally add multiple instances in the Guided Setup.

Before you begin

To use this Service Graph Connector, you need a subscription to a Subscription Unit that is based in the IT Operations Management (ITOM) Visibility application or in the ITOM Discovery application. As defined in the section titled "Managed IT Resource Types" in ServiceNow Subscription Unit Overview for your subscription, for managed IT resources that are created or modified in the CMDB by this Service Graph Connector, but that aren't yet managed by ITOM Visibility or ITOM Discovery, these resources will increase Subscription Unit consumption from that application. Review your current Subscription Unit consumption within ITOM Visibility or ITOM Discovery to ensure available capacity.

- The Integration Commons for CMDB store app, which is automatically installed.
- The CMDB CI class models store app, which is automatically installed. See CMDB CI Class Models.
- The ITOM Discovery License plugin (com.snc.itom.discovery.license). You must activate this plugin.
- ITOM Licensing plugin (com.snc.itom.license). For more information, see Request Discovery.
- The Datastream Action plugin (com.glide.hub.action_type.datastream), which is automatically installed.
- Observability Commons for CMDB (sn_observability), which is only required for event ingestion. This app must be installed prior to installing the connector for Event Management to work. For more information, see Observability Commons for CMDB on the ServiceNow Store.

Roles required:

- admin for tasks in the Guided Setup
- insightIDR viewer role for the API token

Procedure

1. Navigate to **All** > **Service Graph Connectors** > **Rapid7** > **Setup** in the navigation panel in your instance.
2. On the Welcome to Guided Setup Home page, select **Continue**.
3. On the Experience page that is displayed, select **Best Experience** followed by **Continue**.
   On the Service Graph Connector for Rapid7 page, there are three tasks displayed:
   - Configure the connection
   - Add multiple instances
   - Set up scheduled imports
4. Select **Configure the connection** to expand it.
   There are three steps:
   - Configure Rapid7 authentication credentials
   - Configure Rapid7 HTTP Connection
   - Test Connection
5. Select **Configure Rapid7 authentication credentials** and fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Enter a name for the credentials, for example **SGRapid7.Credential**.

b. Verify the **Active** check box is selected.

c. In the API Key field, enter your Rapid7 InsightVM API key.

d. Leave the other field values in their current settings.

e. Right-click in the gray header titled API Key Credentials and select **Save**.

f. Select **Mark as complete** followed by **Continue**.
The Configure Rapid7 HTTP Connection page is displayed.

6. Configure Rapid7 HTTP Connection.

a. Fill in the fields,

Field	Value
Name	Connection name, `SGRapid7`, for example.
Active	Selected.
Credential	Credentials to use for the connection. Select one from the list.
Connection alias	Select one from the list. **sn_sec_sgc_rapid7.SGRapid7**, for example
URL builder	Select the check box. Fill in the new fields.
Connection URL	URL that includes 'https', for example, https://us.api.insight.rapid7.com
Host	Rapid7 domain part of the URL without the 'https'. An example might be `us.api.insight.rapid7.com`.
Protocol	`https`

b. Right-click in the gray header titled HTTP(s) Connection and select **Save**.

c. Select **Mark as complete** followed by **Continue**.
The Test Connection page is displayed.

7. Test the connection.

a. Select the **Test Connection** link under Related Links.
If the connection is successful, 200 is displayed in the Status Code field and a message is displayed. If your connection test fails, review the Message and Suggestion fields for how to proceed.

b. Right-click in the gray header titled Service Graph Connections and select **Save**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Select **Mark as complete** followed by **Continue**.
The steps for Add Multiple Instances is displayed. This step is optional and you might prefer to wait after you confirm you can import data before setting up multiple instances.

8. To configure the scheduled job, navigate back to the Guided Setup page and select **Set up scheduled import jobs**.

a. Follow the steps listed at the top of the page to switch the application scope with the application picker to open, edit, and save the record.
You must select the Active check box to activate the scheduled job.

b. Select a record.

c. Fill in the fields.

Field	Value
Name	Unique Name for scheduled job.
Application	Read-only: Service Graph Connector for Rapid7.
Data source	Data source used.
Run	How often you want the job to run. If you want to run a test import prior to scheduling it, you might prefer to select **Once**.
Run as	Run the scheduled job with the credentials of another specified user.
Time	When you want the job to run.
Active	Select the check box to activate the job.
Conditional	Specific conditions under which this job is run.
Use connection	Leave this check box deactivated for the first run. Specifies another connection and credentials for this job.
Concurrent import	Leave check box activated. Splits data into multiple imports sets. See the field message for more information.
Partition Method	Leave as `Custom size`.
Partition size	15,000. Leave this value for the import set size for early scheduling.
Execute pre-import script	Leave check box activated. Specifies a script to run before the import is performed.
Execute post-import script	Leave check box activated. Specifies a script to run after the import is performed.

d. **Optional:** Select **Execute now** to run the job.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you do not choose to run the job on-demand, the next job runs according to the schedule you set.

e. Right-click in the gray header titled Scheduled Data Imports and select **Save**.

f. Select **Mark as complete** followed by **Continue**.

9. **Optional:** Return to Guided setup and add multiple instances.
When indicated, follow the steps listed at the top of the page to switch the application scope with the application picker to open, edit, and save the record.
10. Select **Update Data Sources**.

a. On the Update Data Source Access page, select **Data Source**.

b. On the page that is displayed, select the **Application Access** tab.

c. Review the access settings and update as needed.

d. Right-click in the gray header titled Table and select **Save**.

e. Select **Mark as complete** followed by **Continue**.

f. Select Schedule **Update Schedule Data Import**.

g. Select the **Application Access** tab to view the permission settings.

h. When you are satisfied with the settings, right-click in the gray header titled Tables and select **Save**.

i. Select **Mark as complete** followed by **Continue**.

j. Follow the steps listed at the top of the page to switch the application scope with the application picker to open, edit, and save the record.

k. On the Add Another Connection page, select the **Click here** link.
The Workflow Studio connection page is displayed and you can create a new connection.

l. From this page, select **Add Connection**.

m. Fill in the fields with your connection information.

Field	Description
Rapid7 Connection name	Unique name for your connection.
Rapid7 Connection URL	Connection URL.
API Key	Rapid7 API key.

n. Select **Create Connection**.
Your connections are displayed on the Rapid7 page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

o. Select **Mark as complete** followed by **Continue**.
The Test New Connections page is displayed. Locate your new connection and note the status is 'Pending'.

p. Scroll and select the **Test Connection** link.
If the connection is successful, 200 is displayed in the Status Code field and a message is displayed. If your connection test fails, review the Message and Suggestion fields for how to proceed.

q. Right-click in the gray header titled Service Graph Connections and select **Save**.

r. Select **Mark as complete** followed by **Continue**.
The Configure the scheduled jobs page is displayed.

s. Repeat the steps listed previously in step 8.

t. On the Service Graph Connector for Rapid7 page for Guided Setup, select **Complete** to finish the configuration.

CMDB classes targeted in the Service Graph Connector for Rapid7

When you complete setting up the connection, you can configure the integration to periodically pull data. The data is saved in tables that extend from the Configuration item [cmdb_ci] table.

Hardware [cmdb_ci_hardware]

The following attributes in the Hardware [cmdb_ci_hardware] table are populated by collected data.

Attribute label	Attribute name
Name	name
Correlation ID	correlation_id
MAC Address	mac_address
Install Status	install_status
Operational Status	operational_status

IP Address [cmdb_ci_ip_address]

The following attributes in the IP Address [cmdb_ci_ip_address] table are populated by collected data.

Attribute label	Attribute name
Name	name
IP Address	ip_address
Owned By Configuration Item	owned_by_cmdb_ci

Service Graph Connector for SentinelOne

The Service Graph Connector for SentinelOne pulls in asset inventory data (hardware and software) from the SentinelOne database into the Configuration Management Database (CMDB) application in your ServiceNow AI Platform® instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Supported Versions

- Supported SentinelOne API versions: Get Agents- V2.1
- Supported ServiceNow AI Platform® versions:
  - Xanadu
  - Washington
  - Vancouver

Use cases

- Import SentinelOne agent information and store it in appropriate configuration item (CI) classes in your CMDB.
- Configure multiple instances of SentinelOne in the Service Graph Connector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Guided setup

Use the guided setup feature to help you configure your integration in an organized sequence of tasks.

CMDB integrations dashboard

The Integration Commons for CMDB store app provides a dashboard with a central view of the status, processing results, and processing errors of all installed integrations. You can see metrics for all integration runs. You can filter the view to a specific CMDB integration, a specific time duration, or a specific integration run. For more details about monitoring SentinelOne integrations in the CMDB Integrations Dashboard, see Using the CMDB Integrations Dashboard.

Configure the Service Graph Connector for SentinelOne

The guided setup for the Service Graph Connector for SentinelOne provides an organized sequence of tasks to configure the integration on your ServiceNow AI Platform instance.

Before you begin

To use this Service Graph Connector, you need a subscription to a Subscription Unit that is based in the IT Operations Management (ITOM) Visibility application or in the ITOM Discovery application. As defined in the section titled "Managed IT Resource Types" in ServiceNow Subscription Unit Overview for your subscription, for managed IT resources that are created or modified in the CMDB by this Service Graph Connector, but that aren't yet managed by ITOM Visibility or ITOM Discovery, these resources will increase Subscription Unit consumption from that application. Review your current Subscription Unit consumption within ITOM Visibility or ITOM Discovery to ensure available capacity.

Dependencies and requirements:

- The Integration Commons for CMDB store app, which is automatically installed.
- The CMDB CI Class Models store app store app, which is automatically installed.
- Discovery Core plugin (com.snc.discovery.core), which is automatically installed by Discovery.
- The ITOM Discovery License plugin (com.snc.itom.discovery.license). You must activate this plugin.
- ITOM Licensing plugin (com.snc.itom.license). For more information, see Request Discovery.
- Guided Setup (com.sn.ads.setup).
- Data Stream (com.glide.hub.action_type.datastream).
- ITOM Patterns.

Roles required:

- SentinelOne Role - viewer
- ServiceNow AI Platform® Role - admin

Guided Setup

The guided setup for the Service Graph Connector for SentinelOne provides an organized sequence of tasks to configure the integration on your instance.

Procedure

1. Navigate to **Service Graph Connectors** > **SentinelOne** > **Setup**.
2. On the Home page, select **Continue**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the Experience page, select the **Best Experience** from it.
4. On the Service Graph Connector for SentinelOne page in the Configure the connection page, select the **Configure SentinelOne Authentication Credentials** task and follow these steps:
   a. In the API Key field, enter your SentinelOne API Key and update the credential record.
   b. Select the **Mark as Complete** checkbox and select **Continue**.
5. In the **Configure SentinelOne HTTP Connection** task follow these steps:
   a. Add the SentinelOne base URL (Uniform Resource Locator).
   b. Select the **Mark as Complete** checkbox and select **Continue**.
6. In the **Test Connection** task follow these steps:
   a. Select the **Test Connection** link.

      The Status code field displays 200 if the connection is successful.

   b. Select the **Mark as Complete** checkbox and select **Continue**.
7. **Optional:** To create another connection, select the **Update Data Source Access** section and follow these steps:
   a. Give permission to create and update the data source.
   b. Select the **Mark as Complete** checkbox and select **Continue**.
   c. Give permission to create and update the Scheduled Import Sets.
   d. Select the **Mark as Complete** checkbox and select **Continue**.
   e. Clear the cache with the code snippet mentioned previously using Scripts-Background.
   f. Select the **Mark as Complete** checkbox and select **Continue**.
   g. Add a new connection by clicking the link.
   h. After you add a new connection, select the **Mark as Complete** checkbox and select **Continue**.
   i. Select the new connection record and select the **Test Connection link**.

      The Status code field displays 200 if the connection is successful.

   j. Select the **Mark as Complete** checkbox and select **Continue**.
8. Fill out the fields on the Scheduled Data Import form:

Field	Description
Name	Name of the scheduled job.
Data source	Data source record that defines the data to import.
Run as	Option to run the scheduled job with the credentials of the specified user.
Active	Option to activate the scheduled job. Select this option.
Concurrent Import	Function that loads the data from multiple import sets. The function then processes and transforms the data concurrently.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Partition Method	Partition method for the concurrent import set.
Partition Size	Import set size for early scheduling.
Execute pre-import script	Option to specify a script to run before the import is performed.
Execute post-import script	Option to specify a script to run after the import is performed.
Application	Application that contains this scheduled job.
Run	Frequency of running the import.
Conditional	Conditions under which this job is executed.

9. Click **Execute Now**.
10. In the Help task bar, select **Mark as Complete**.

CMDB classes targeted in the Service Graph Connector for SentinelOne

When you complete setting up the connection, you can configure the integration to periodically pull data. The data is saved in tables that extend from the Configuration item [cmdb_ci] table.

Service Graph Connector for SentinelOne Properties

Property	Description
sn_sec_sgc_sntlone.api_page_size	Enter the number of records per page to retrieve. • Type: string • Default value: 1000 • Location: System Property [sys_properties] table

Note:
To open the System Properties [sys_properties] table, enter sys_properties.LIST in the navigation filter.

Service Graph Connector for Splunk

The Service Graph Connector for Splunk pulls in asset inventory data (hardware and software) from the Splunk database into the Configuration Management Database (CMDB) application in your ServiceNow AI Platform® instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Supported versions

Supported versions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Xanadu
- Washingtondc
- Vancouver

Use cases

By default, the Service Graph Connector for Splunk pulls the following basic forwarding details:

- Forwarder's version
- Forwarder's type
- Forwarder's last check-in time
- OS
- Host
- Host IP address

With the Service Graph Connector for Splunk add-on, you have the option to import extended data for your Windows and Linux assets with the Service Graph Connector for Splunk that includes the following details:

- MAC address
- Operating system details
- Asset name
- Software details
- File system
- Last logon date
- Open ports

This data is stored in the Configuration Management Database (CMDB) and Splunk Asset Details extension attributes custom tables. To import these extended asset details, the add-on is required. See Install the add-on for the Service Graph Connector for Splunk.

Guided setup

The guided setup for the Service Graph Connector for Splunk provides an organized sequence of tasks to configure the integration on your instance. To access the guided setup, see the section titled Configure the Service Graph Connector for Splunk.

CMDB integrations dashboard

The Integration Commons for CMDB store app provides a dashboard with a central view of the status, processing results, and processing errors of all installed integrations. You can see metrics for all integration runs. You can filter the view to a specific CMDB integration, a specific time duration, or a specific integration run. For more details about monitoring integrations in the CMDB Integrations Dashboard, see Using the CMDB Integrations Dashboard.

Configure the Service Graph Connector for Splunk

Configure your connections, set up scheduled imports, verify successful connections and optionally add multiple instances in the Guided Setup.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

To use this Service Graph Connector, you need a subscription to a Subscription Unit that is based in the IT Operations Management (ITOM) Visibility application or in the ITOM Discovery application. As defined in the section titled "Managed IT Resource Types" in ServiceNow Subscription Unit Overview for your subscription, for managed IT resources that are created or modified in the CMDB by this Service Graph Connector, but that aren't yet managed by ITOM Visibility or ITOM Discovery, these resources will increase Subscription Unit consumption from that application. Review your current Subscription Unit consumption within ITOM Visibility or ITOM Discovery to ensure available capacity.

- The Integration Commons for CMDB store app, which is automatically installed.
- The CMDB CI class models store app, which is automatically installed. See CMDB CI Class Models.
- The ITOM Discovery License plugin (com.snc.itom.discovery.license). You must activate this plugin.
- ITOM Licensing plugin (com.snc.itom.license). For more information, see Request Discovery.
- The Datastream Action plugin (com.glide.hub.action_type.datastream), which is automatically installed.
- Optional: Only required for event ingestion. Observability Commons for CMDB (sn_observability). If used, this app must be installed prior to installing the connector for Event Management to work. For more information, see Observability Commons for CMDB on the ServiceNow Store.

Role required: admin

Procedure

1. Navigate to **All** > **Service Graph Connectors** > **Splunk** > **Setup** in the navigation panel in your instance.
2. On the Welcome to Guided Setup Home page, select **Continue**.
3. On the Experience page that is displayed, select **Best Experience** followed by **Continue**.
   On the Service Graph Connector for Splunk page, there are three tasks displayed:
   - Configure the connection
   - Add multiple instances
   - Set up scheduled import jobs
4. Select **Configure the connection** to expand it.
   There are three tasks:
   - Configure Splunk authentication credentials
   - Configure Splunk HTTP Connection
   - Test Connection
5. Select **Configure Splunk authentication credentials** and fill in the fields.

   a. Enter a name for the credentials, for example **SG-Splunk Credentials**.

   b. Verify the **Active** check box is selected.

   c. Enter your User name and Password for your Splunk instance.

   d. Leave the other field values in their current settings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. Right-click in the gray header titled Basic Auth Credentials and select **Save**.

f. Select **Mark as complete** followed by **Continue**.
The Configure Splunk HTTP Connection page is displayed.

6. Configure the Splunk HTTP connection.

a. Fill in the fields.

Field	Value
Name	Connection name, `SG-Splunk Connection`, for example.
Active	Selected.
Credential	Credentials to use for the connection. Select one from the list.
Domain	global.
Connection alias	Select one from the list. **sn_sec_sgc_splunk.SGSplunk**, for example
URL builder	Select the check box. Fill in the new fields.
Host	Splunk domain part of the URL without the 'https'. An example might be `splunk3.com` or an IP address.
Override default port	The Splunk instance port,`8089`, for example.
Protocol	https.
(Optional) Use MID server	Select the check box for a dedicated MID Server for the connection, if available. i. Select **Specific MID Server** from the MID Selection drop down list. ii. Select a MID Server from the list. **Note:** A MID Server is required for on-premise connections if the connection is not publicly accessible.

b. Right-click in the gray header titled HTTP(s) Connection and select **Save**.

c. Select **Mark as complete** followed by **Continue**.
The Test Connection page is displayed.

d. **Optional:** Set the flag for the **is the servicenow addon installed** (*is_snow_addon_installed*).
By default, the property on the Service Graph Connection Properties tab is set to **false**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
false	The default query is set to extract only essential information about the forwarder that includes the host name and the operating system.
true	The query offers more information about the forwarder along with extensive asset details via the ServiceNow add-on. (Optional) This data is imported only if the add-on is installed on the Splunk instance.

7. Test the connection.

   a. Select the **Test Connection** link under Related Links.
   If the connection is successful, 201 is displayed in the Status Code field and a message is displayed after a few moments. If your connection test fails, review the Message and Suggestion fields for how to proceed.

   b. After a successful test, right-click in the gray header titled Service Graph Connections and select **Save**.

   c. Select **Mark as complete** followed by **Continue**.
   The steps for Add Multiple Instances is displayed. To add multiple instances, proceed to step 9. This step is optional and you might prefer to wait after you confirm you can import data before setting up multiple instances. To set the import schedule, follow the steps below.

8. To configure the scheduled job, select **Set up scheduled import jobs** from the drop down list under Add Multiple Instances in the header.

   a. On the Configure the scheduled jobs page, select a record under Scheduled Data Imports.

   b. Select the frequency from the list for the Run field.
   If you want to run a test import prior to scheduling it, you might prefer to select **Once**.

   c. Select the **Active** box to activate the scheduled job.

   d. **Optional:** Edit the fields as required.

   (Optional) You might prefer to leave these fields in their default settings for the first few runs to confirm data imports.

Field	Value
Name	Unique Name for scheduled job.
Application	Read-only: Service Graph Connector for Splunk
Data source	Data source used.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
Run as	Run the scheduled job with the credentials of another specified user.
Time	When you want the job to run.
Conditional	Specific conditions under which this job is run.
Use connection	Leave this check box deactivated for the first run. Specifies another connection and credentials for this job.
Concurrent import	Leave check box activated. Splits data into multiple imports sets. See the field message for more information.
Partition Method	Leave as `Custom size`.
Partition size	15,000. Leave this value for the import set size for early scheduling.
Execute pre-import script	Leave check box activated. Specifies a script to run before the import is performed.
Execute post-import script	Leave check box activated. Specifies a script to run after the import is performed.

e. **Optional:** Select **Execute now** to run the job.
If you do not choose to run the job on-demand, the next job runs according to the schedule you set.

f. Right-click in the gray header titled Scheduled Data Import and select **Save**.

g. Select **Mark as complete** followed by **Continue**.
The main task page is displayed.

9. **Optional:** To add multiple instances, select **Update Data Sources**.

(Optional) When indicated, follow the steps listed at the top of the page to switch the application scope with the application picker to open, edit, and save the record.

a. On the Update Data Source Access page, select **Data Source**.

b. On the page that is displayed, select the **Application Access** tab.

c. Review the access settings and update as needed.

d. Right-click in the gray header titled Table and select **Save**.

e. Select **Mark as complete** followed by **Continue**.

f. On the **Update Schedule Data Import** record, select **Schedule Data Import** to open it.

g. Select the **Application Access** tab to view the permission settings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

h. When you are satisfied with the settings, right-click in the gray header titled Tables and select **Save**.

i. Select **Mark as complete** followed by **Continue**.

j. Follow the steps listed at the top of the page to switch the application scope with the application picker to open, edit, and save the record.

k. On the Add Another Connection page, select the **Click here** link.
The Flow Designer connection page is displayed and you can create a new connection.

l. From this page, select **Add Connection**.

m. Fill in the fields with your connection information.

Field	Description
Splunk Connection name	Unique name for your connection.
Splunk Connection URL	Connection URL in https format.
User name	Splunk user name.
Password	Splunk password.

n. Select **Create Connection**.
Your connections are displayed on the page.

o. On the Add Multiple Instance page, select **Mark as complete** followed by **Continue**.
The Configure MID Server for New HTTP Connection page is displayed.

p. Locate your new connection and select it to open the record.
The connection URL is displayed in the Connection URL field.

q. **Optional:** Select the Use MID server check box to add a MID Server.

i. Select **Specific MID Server** from the MID Selection drop down list.

ii. Select a MID Server from the list.

r. Right-click in the gray header titled HTTP(s) Connection and select **Save**.

s. Select **Mark as complete** followed by **Continue**.
The Test New Connections page is displayed.

10. Test the new connection.

a. Scroll and select the connection you want to test.

b. Select the **Test Connection** link under Related Links.
If the connection is successful, 201 is displayed in the Status Code field and a message is displayed after a few moments. If your connection test fails, review the Message and Suggestion fields for how to proceed.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. After a successful test, right-click in the gray header titled Service Graph Connections and select **Save**.

d. Select **Mark as complete** followed by **Continue**.
The Configure the scheduled jobs page is displayed

e. On the Service Graph Connector for Splunk page for Guided Setup, select **Complete** to finish the configuration.

Service Graph Connector for Splunk add-on

Import more detailed asset data with the Service Graph Connector for Splunk with an add-on developed by ServiceNow engineering. The add-on permits you to import data about your Windows and Linux assets.

Service Graph Connector for Splunk

The Service Graph Connector for Splunk retrieves computer and software information from the Splunk product and imports it into the Configuration Management Database (CMDB) in your instance. By default, the following basic data is imported:

- Forwarder's version (agent)
- Forwarder's type (agent)
- Forwarder's last check-in time (agent)
- OS
- Host
- Host IP address

The service graph connector for Splunk is available on the ServiceNow® Store.

The ServiceNow Add-on for Windows and Linux assets

With the Windows and Linux Assets add-on, you have the option to import more detailed asset data with the Service Graph Connector for Splunk that includes the following data:

- MAC address
- Operating system details
- Asset name
- Installed software details
- File system
- Last logon date
- Open ports
- Running processes
- Running services

This add-on is available for download into your Splunk console from splunkbase.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Downloading and installing the add-on

Prior to installing this add-on, you must verify you have installed and activated the following applications and add-ons:

- Service Graph Connector Splunk
- Splunk_TA_nix version 9.0.0 (Linux) or later
- Splunk_TA_windows version 8.9.0 or later add-ons available from splunkbase.

These add-ons permit you to identify and import more specific data related to your Linux and Windows assets with your imports with the Splunk Service Graph Connector API.

For example, searches from these add-ons might provide you with data you want about Windows drivers, Windows Network Adaptors, Linux Hardware, and other OS Details.

Target workloads

In the app.manifest, individual agents on a specific machine send information to a central hub (server) where data is collected, stored, and managed. This central machine is where the apps are installed.

To adjust workloads to specify resources for a search, indexing, or other workloads, in Splunk Web, select **Settings** > **Workload Management** > **Workload Rules**.

In the Status column, select the toggle to activate or deactivate individual workload rules.

Supported deployments

This add-on supports the following types of deployments:

- standalone
- distributed
- search head clustering

See Splunk documentation for more information about their supported workloads.

Install the add-on for the Service Graph Connector for Splunk

Install the Splunk add-on developed by ServiceNow® engineering from splunkbase to search for Windows and Linux Assets.

Before you begin
Role required: admin or security_admin

Procedure

1. Navigate to **splunkbase** (splunkbase) and log in.
2. In your Splunk console, select **Apps** > **FInd More Apps**.
3. Locate the **ServiceNow Add-on for Windows and Linux Assets** app and select **Install**.

   Note:
   You can upgrade from within the app.

4. Follow the prompts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. **Optional:** Navigate to **Settings** > **Searches, reports and alerts** to view when searches are scheduled.

   Note:

   (Optional) You can change the schedules, but since the schedules run in a specific order and require successful completion before the next search in the list is initiated, you might prefer to leave the settings in their defaults.

   After all the searches are completed, the data is grouped from each search into a few coalesced key-value parings (kvstores) for import into your instance: asset details, asset process details, asset service details, and asset software details.

6. Select **App: Search and Reporting (search)** > **ServiceNow Add-on for Windows and Linux Assets.**

   By default, search data is stored in the following key definitions:

   - Asset_index_macro: Index="internal"
   - Asset_linex_Index_macro: index="main"
   - Asset_windows_index="main"

   If you are storing the search data for Linux and Windows in custom indexes, you must update your search macros.

7. To update your search macros, navigate to **Settings** > **Advanced search** > **Search macros** > **Search & Reporting (Search)** > **ServiceNow Add-on for Windows and Linux Assets ServiceNow_TA_windows_linux_assets**
8. On the Search macros page, update the index as required in the Definition column.
9. **Optional:** Adjust workloads to specify resources for search, indexing, and other workloads.
   a. In Splunk Web, select **Settings** > **Workload Management** > **Workload Rules**.
   b. In the Status column, select the toggle to activate or deactivate individual workload rules. See Service Graph Connector for Splunk add-on for more information about target workloads and supported deployments.

CMDB classes targeted in the Service Graph Connector for Splunk

When you complete setting up the connection, you can configure the integration to periodically pull data. The data is saved in tables that extend from the Configuration item [cmdb_ci] table.

Computer [cmdb_ci_computer]

The following attributes in the Hardware [cmdb_ci_computer] table are populated by collected data.

Attribute label	Attribute name
Name	name
Serial Number	serial_number
Operating System	os
OS Version	os_version
CPU name	cpu_name

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Attribute label	Attribute name
CPU manufacturer	cpu_manufacturer
CPU type	cpu_type
CPU speed (MHz)	cpu_speed
CPU core count	cpu_core_count
CPU count	cpu_count
Manufacturer	manufacturer

IP Address [cmdb_ci_ip_address]

The following attributes in the IP Address [cmdb_ci_ip_address] table are populated by collected data.

Attribute label	Attribute name
Name	name
IP Address	ip_address

Network Adapter [cmdb_ci_network_adapter]

The following attributes in the Network Adapter [cmdb_ci_network_adapter] table are populated by collected data.

Attribute label	Attribute name
Name	name
MAC Address	mac_address
Manufacturer	manufacturer

Software [cmdb_ci_spkg]

The following attributes in the Software [cmdb_ci_spkg] table are populated by collected data.

Attribute label	Attribute name
Name	name
Version	version

Software Instance [cmdb_software_instance]

The following attributes in the Software Instance [cmdb_software_instance] table are populated by collected data.

Attribute label	Attribute name
Name	name
Product name	software

Service Graph Connector for SolarWinds

Use the Service Graph Connector for SolarWinds to pull in data from the SolarWinds software into your ServiceNow instance.

The Service Graph Connector for SolarWinds pulls in asset inventory data (hardware and software) from the SolarWinds database into the ServiceNow® Configuration Management Database (CMDB) application.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Supported versions

- Supported SolarWinds Orion minimum versions:
  - 2019.4 HF6
  - 2020.2.1. HF2
- Supported ServiceNow versions:
  - Washington DC
  - Xanadu
  - Yokohama

Use cases

The following are examples on how you can use the Service Graph Connector:

- Automatic normalization of asset information for hardware, virtualization and cloud resources, and software.
- Ability to configure and save synchronization schedules.

Configuring a connection for the connector

You can configure a connection for the connector by using the SGC Central view in the Service Graph Workspace or CMDB Workspace. The view enables you to discover and install connectors, and then effectively manage the full life cycle of creating, editing, monitoring, and debugging connections. To configure the connector using SGC Central, see Configure Service Graph Connector for SolarWinds using SGC Central.

Important:
Unless there are configuration issues, use the SGC Central view in the Service Graph Workspace or CMDB Workspace to configure the connection for the connector, as the guided setup method is planned for deprecated.

CMDB integrations dashboard

The Integration Commons for CMDB store app provides a dashboard with a central view of the status, processing results, and processing errors of all installed Service Graph Connectors. You can see metrics for all integration runs. You can filter the view to a specific integration, a specific time duration, or a specific integration run. For more details about monitoring SolarWinds integrations in the CMDB Integrations Dashboard, see Using the CMDB Integrations Dashboard.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data mapping

Data from data sources in the SolarWinds software is mapped and transformed into ServiceNow CMDB tables using the Robust Transform Engine (RTE). Data is inserted into ServiceNow CMDB using the Identification and Reconciliation Engine (IRE).

When you complete setting up the connection, you can configure the integration to periodically pull data from the SolarWinds software.

The data is loaded into staging tables and then inserted into the following CMDB target tables:

- AIX Server [cmdb_ci_aix_server]
- Availability Zone [cmdb_ci_availability_zone]
- CI Relationship [cmdb_rel_ci]
- Cloud Network [cmdb_ci_network]
- Cloud Service Account [cmdb_ci_cloud_service_account]
- Cloud Subnet [cmdb_ci_cloud_subnet]
- Computer [cmdb_ci_computer]
- Disk [cmdb_ci_disk]
- Hardware [cmdb_ci_hardware]
- Hardware Type [cmdb_ci_compute_template]
- Hyper-V Server [cmdb_ci_hyper_v_server]
- IIS Virtual Directory [cmdb_ci_iisdirectory]
- Image [cmdb_ci_os_template]
- IP Address [cmdb_ci_ip_address]
- Linux Server [cmdb_ci_linux_server]
- Logical Datacenter [cmdb_ci_logical_datacenter]
- Microsoft iis Web Server [cmdb_ci_microsoft_iis_web_server]
- MS SQL Server [cmdb_ci_db_mssql_server]
- MS SQL DataBase [cmdb_ci_db_mssql_database]
- Network Adapter [cmdb_ci_network_adapter]
- Network Gear [cmdb_ci_netgear]
- Serial Number [cmdb_serial_number]
- Server [cmdb_ci_server]
- Software Installation [cmdb_sam_sw_install] (If the Software Asset Management (SAM) application is installed.)
- Software Instance [cmdb_software_instance] (If the SAM application is not installed.)
- Software [cmdb_ci_spkg] (If the SAM application is not installed.)
- Solaris Server [cmdb_ci_solaris_server]
- Storage Volume [cmdb_ci_storage_volume]
- UNIX Server [cmdb_ci_unix_server]
- VM Instance [cmdb_ci_vm_instance]
- Windows Server [cmdb_ci_win_server]

Service Graph Connectors

Configure Service Graph Connector for SolarWinds using SGC Central

Use the playbook available with the SGC Central application to set up the Service Graph Connector for SolarWinds for pulling in SolarWinds data into the CMDB.

Before you begin

Install Service Graph Connector for SolarWinds version 2.6.0 or later from the ServiceNow Store. For ServiceNow Store installation steps, see Install a ServiceNow Store application.

Air gap connections are available from version 2.5.0 of the Service Graph Connector for SolarWinds. You can set up either standard data sources or air gap data sources. Before you set up air gap data sources, you must configure the air gap solution for the Service Graph Connector for SolarWinds in your high-secure server and low-secure server. See Configuring air gap connections for Service Graph Connector for SolarWinds.

Role required: admin

About this task

The playbook experience for onboarding connectors is activated with SGC Central in the Service Graph Workspace or CMDB Workspace. To configure the SGC Central application, see Configuring SGC Central and for more information on how to interact with a playbook, see Interact with Playbook.

Procedure

1. Use one of the following methods to open SGC Central:
   - Navigate to **Workspaces** > **Service Graph Workspace**, and from the left navigation panel, select the Ingestion icon to open the SGC Central view.
   - Navigate to **Workspaces** > **CMDB Workspace** > **SGC Central**.
2. On the Dashboard page, select **Create connection**.

   Tip:
   Alternatively, you can select **Create connection** on the All connections page.

3. On the Create connection window, select the SolarWinds connector type, and then select **Create connection**.
4. Complete the initial prerequisites when setting up a connection for the first time using a connector.

   Note:
   This step is required only during the first-time setup. See Perform initial setup tasks when creating a connection in SGC Central.

5. Complete the setup for configuring the connector for importing data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select the data source type.

i. In the **Setup** stage of the playbook, select the **Select data source type** activity.

- Select **Standard data sources** if you're working with environments that have direct internet access.

  Proceed to step 5.c.

- Select **Air gap data sources** if you're working with restricted environments that don't have direct internet access.

ii. Select **Continue**.

b. Download and run the PowerShell scripts to set up an air gap connection.

> **Note:**
> Before you add an air gap connection, you must configure the air gap solution for the Service Graph Connector for SolarWinds in your high-secure and low-secure servers. See Configuring air gap connections for Service Graph Connector for SolarWinds.

i. In the **Setup** stage of the playbook, select the **Download PowerShell scripts** activity.

The **Download PowerShell scripts** activity appears only when you select **Air gap data sources** as the data source type in step 5.a.

ii. Select **Download PowerShell scripts**.

iii. Run the PowerShell scripts.

For more information on configuring an air gap connection, see Configuring air gap connections for Service Graph Connector for SolarWinds.

iv. After configuring the air gap connection, select **Continue**.

c. Create and test a connection.

i. In the **Setup** stage of the playbook, select the **Create and test connection** activity.

ii. On the form, fill in the fields.

- For standard data sources:

Create and test connection form

Field	Description
Connection Name	Display name for the connection.
Connection URL	Connection host name for SolarWinds.
User name	User name for SolarWinds authentication.
Password	Password for SolarWinds authentication.
Use MID server	Option to use a MID Server. Select this check box.
MID selection	Select a MID Server from the list. This field appears only when the **Use MID Server** check box is selected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
MID application	Select a MID Server application from the list. This field appears only when the **Use MID Server** check box is selected.

- For air gap data sources:

Create and test connection form

Field	Description
Connection name	Display name for the connection.
Parent directory	Path of the SolarWinds directory where the data is stored in your low-secure server.
Archive data after retrieval	Option to archive data after retrieval.
Archive path [Optional]	Folder where the data is to be archived if the **Archive data after retrieval** check box is selected.
MID server	Name of the MID Server that you deployed in your low-secure server. See Configure air gap solution for Service Graph Connector for SolarWinds in a low-secure server.

iii. Select **Create and test connection**.

iv. Once the connection test is complete, select **Continue**.

d. Configure the properties of the connector to access resources.

i. In the **Setup** stage of the playbook, select the **Set configuration properties** activity.

- Select **SAM installed** if a Service & Application Monitor (SAM) module is installed on the SolarWinds instance.
- Select **NPM installed** if a Network Performance Monitor (NPM) module is installed on the SolarWinds instance.

ii. Select **Continue**.

e. Configure the import schedule to import data at regular intervals.

i. In the **Setup** stage of the playbook, select the **Configure import schedule** activity.

ii. Expand the Parent scheduled data import within the Import schedules list, and select the SG-Solarwinds Hardware import schedule.

iii. In the Configure import schedule dialog box, select the **Active** check box, and then fill in the run schedule and time details.

For more information, see Schedule a data import.

iv. Select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alternatively, select **Execute Now** to execute the import schedule immediately.

v. Select **Continue**.

f. In the **Setup** stage of the playbook, select the **Confirm connection creation** activity to verify whether the connection was created.

What to do next

Select **View all connections** to review the connection details. The configured connection appears in the Installed connections list.

- Configuring air gap connections for Service Graph Connector for SolarWinds

Configure Service Graph Connector for SolarWinds

Set up authentication credentials and scheduled jobs to import SolarWinds data into your CMDB.

Before you begin

Important:
Unless there are configuration issues, use the SGC Central view in the Service Graph Workspace or CMDB Workspace to configure the connection for the connector, as the guided setup method is planned for deprecated.

To use this Service Graph Connector, you need a subscription to a Subscription Unit that is based in the IT Operations Management (ITOM) Visibility application or in the ITOM Discovery application. As defined in the section titled "Managed IT Resource Types" in ServiceNow Subscription Unit Overview for your subscription, for managed IT resources that are created or modified in the CMDB by this Service Graph Connector, but that aren't yet managed by ITOM Visibility or ITOM Discovery, these resources will increase Subscription Unit consumption from that application. Review your current Subscription Unit consumption within ITOM Visibility or ITOM Discovery to ensure available capacity.

Before you start the configuration, navigate to **System Definition** > **Business Rules**, and deactivate the *`ValidateServiceAccountID`* business rule.

Air gap connections are available from version 2.5.0 of the Service Graph Connector for SolarWinds. You can set up either regular data sources or air gap data sources. Before you set up air gap data sources, you must configure the air gap solution for the Service Graph Connector for SolarWinds in your high-secure server and low-secure server. See Configuring air gap connections for Service Graph Connector for SolarWinds.

Dependencies and requirements:

- The Integration Commons for CMDB store app, which is automatically installed.
- The CMDB CI class models store app, which is automatically installed. See CMDB CI Class Models.
- Discovery Core plugin (com.snc.discovery.core), which is automatically installed by Discovery.
- ITOM Discovery License plugin (com.snc.itom.discovery.license). You must activate this plugin.
- ITOM Licensing plugin (com.snc.itom.license). For more information, see Request Discovery.

- SolarWinds Orion Platform.
- SolarWinds Server & Application Monitor and/or Network Performance Monitor.

Roles required:

- To configure the ServiceNow platform: admin
- To access SolarWinds data: User with SWIS (SolarWinds Information Service) access (the same as through the Orion website, not database users).

About this task

Note:
SolarWinds Integration can work with or without Service & Application Monitor (SAM) and Network Performance Monitor (NPM) being installed.

Procedure

1. Navigate to **All** > **Service Graph Connectors** > **SolarWinds** > **Setup**.
2. On the Getting started page, select **Get Started**.
3. Configure your authentication credentials used to connect to the SolarWinds SWIS API.

   a. On the Service Graph Connector for SolarWinds page, in the Configure the connection section, select the **Configure the authentication credentials used to connect to SolarWinds SWIS API** task.

   b. For the Configure the authentication credentials used to connect to SolarWinds SWIS API task, select **Configure**.

   c. Fill in the fields on the Basic Auth Credentials form.

Basic Auth Credentials form

Field	Description
Name	Human-readable name for this credential. This field is automatically set. You can optionally change this setting.
User name	SolarWinds user name. **Note:** The SolarWinds user must have a role with read privileges to the SolarWinds Information Service API for all SolarWinds data sources that the integration can pull data.
Password	SolarWinds password that is stored in the database in encrypted form.
Active	Option to check whether this credential is active.
Credential alias	Advanced selection criteria for this credential.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Order	Order in which credentials are tried. Smaller numbers are tried first.

d. Select **Update** if required.

e. Set the Configure the authentication credentials used to connect to the SolarWinds SWIS API task to complete by selecting **Mark as Complete**.

4. Configure the SolarWinds HTTP connection.

a. For the Configure SolarWinds HTTP connection task, select **Configure**.

b. Review the HTTP(s) Connection form, and fill in the fields as required.

HTTP(s) Connection form

Field	Description
Name	Name of the connection. This field is automatically set. You can optionally change the name.
Use MID server	Option to enable the connection to use a MID server.
Host	Target host value used by the connection. This field is automatically set by the connection URL.
Credential	Credential value used by the connection.
Connection alias	Connection alias value with which the connection can be referred.
URL builder	URL builder that is used to build the connection URL.
Mutual authentication	Option to enable mutual authentication.
Protocol	Underlying protocol used by the connection.
Active	Option to activate the HTTP connection.
Domain	Domain to which the connection belongs.
Override default port	Target port value used by the connection.
Base path	Base path for HTTP(S) connection that is required but should not be modified.

c. Select **Update**, if required.

d. Set the Configure SolarWinds HTTP connection task to complete by selecting **Mark as Complete**.

5. Configure the SolarWinds modules.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. For the Configure SolarWinds Modules task, select **Configure**.

b. Update the **Value** for the *sn_solarwinds_inte.npm_installed* and the *sn_solarwinds_inte.sam_installed* properties in one of the following ways:

- If the respective module is installed on the SolarWinds instance, then set the fields to **true**.
- If the respective module is not installed on the SolarWinds instance, then set the fields to **false**.

Note:
This update changes the API class and the data that is returned from them.

c. Set the Configure SolarWinds Modules task to complete by selecting **Mark as Complete**.

6. Test the connection.

a. For the Test the connection task, select **Configure**.

b. Review the fields on the Data Source form, which are automatically set.

Data Source form

Field	Description
Name	Unique name for this data source.
Import set table label	Label of the table that will be created for this data source.
Import set table name	Name of the table that will be created for this data source.
Type	Data storage type of the data to be imported.
Data in single column	Data in single column.
Application	Application containing this record.
Data stream action	The Data Source request action that will be invoked to get data.

c. Test the connection by selecting the **Test Load 20 Records** related link.

Testing the connection takes a few moments, after which the page refreshes to show the test results.

This step tests the SG-Solarwinds Hardware data source, and verifies that data is loaded into the staging table. A successful connection for the SG-Solarwinds Hardware data source means that all SolarWinds data sources connect successfully, so you do not need to individually test all data sources.

The connection is successful if the **HTTP Status** is **200**. If there is an **Error Code** and **Error Message**, the connection failed and further troubleshooting is required.

d. Navigate back to the guided setup, and set the Test the connection task to complete by selecting **Mark as Complete**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Add multiple instances.

   Note:
   If you do not need to add multiple instances, you can skip this step.

   a. On the Service Graph Connector for SolarWinds page, in the Add Multiple Instances section, select the **Update Data Source Access** task.

   b. For the Update Data Source Access task, select **Configure**.

   c. Select the Data Source [sys_data_source] table.

   d. Select the **Global** application scope by using the application picker.

   e. In the Application Access related list, select the **Can create**, **Can update**, and **Can delete** check boxes, if not already selected.

   f. Select **Update** to close the tab and return to the guided setup.

   g. Modify the application scope again to **Service Graph Connector for SolarWinds** by using the application picker.

   h. Set the **Update Data Source Access** task to complete by selecting **Mark as Complete**.

   i. Repeat the steps 7.d to 7.g for the Update Scheduled Data Import Access task with the Scheduled data import [scheduled_data_set] table and for the Update Value Access task with the Value [sys_variable_table] table, and set the tasks to complete by selecting **Mark as Complete**.

8. Clear the cache for the new connection.

   a. Select the **Clear Cache for Datasource and Import set** task, and then select **Configure**.

   b. Clear the cache by selecting **Global** from the Scope menu.

   c. Enter the following script.

```
     GlideTableManager.invalidateTable("sys_data_source");
     GlideCacheManager.flushTable("sys_data_source");

GlideTableManager.invalidateTable("scheduled_import_set");
     GlideCacheManager.flushTable("scheduled_import_set");

GlideTableManager.invalidateTable("sys_variable_value");
     GlideCacheManager.flushTable("sys_variable_value");

     GlideTableManager.invalidateTable("sys_db_object");
     GlideCacheManager.flushTable("sys_db_object");
```

   d. Select **Run Script**.

   e. From the Scope menu, select **Service Graph Connector for SolarWinds**.

   f. Set the Clear Cache for Datasource and Import set task to complete by selecting **Mark as Complete**.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. Add a connection to another SolarWinds instance.

Note:
Confirm that the current scope is **Service Graph Connector for SolarWinds**.

a. Select the **Add Another Connection** task, and then select **Configure**.

b. In the Select Data Source Type section, select either regular data sources or air gap data sources.

- To add or edit regular data sources, select **Regular Data Sources**.
- To add or edit air gap data sources, select **Airgap Data Sources**.

Note:
Before you add an air gap data source, you must configure the air gap solution for the Service Graph Connector for SolarWinds in your high-secure and low-secure servers. See Configuring air gap connections for Service Graph Connector for SolarWinds.

c. Either create or edit a connection.

- To create a new connection, select **Add Connection**.
- To edit an existing connection, select **Edit**.

d. Fill in or edit the fields on the form, as required.

- For regular data sources:

Create Connection form

Field	Description
Connection Name	Display name for the connection.
Connection URL	Connection host name for SolarWinds.
User name	User name for SolarWinds authentication.
Password	Password for SolarWinds authentication.

- For air gap data sources:

Create Connection form

Field	Description
Connection Name	Display name for the connection.
MID Server	Name of the MID server that you deployed in your low-secure server. See Configure air gap solution for Service Graph Connector for SolarWinds in a low-secure server.
Parent Directory	Path of the SolarWinds directory where the data is stored in your low-secure server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Archive Data After Retrieval	Option to archive data after retrieval.
Archive Path [Optional]	Folder where the data is to be archived if the **Archive Data After Retrieval** check box is selected.

e. Either add or save the connection.
   - To add a new connection, select **Create Connection**.
   - To save the edits for the existing connection, select **Edit Connection**.

f. Navigate back to the guided setup, and select **Mark as Complete** to set the Add Another Connection task to complete.

g. If required, set up the MID Server for the connection you created.
   i. For the Configure Mid Servers task, select **Configure**.
   ii. Select the name of the connection you created.
   iii. Select the **Use MID server** check box.
   iv. Select **Update**.
   v. Set the Configure Mid Servers task to complete by selecting **Mark as Complete**.

h. If required, configure the connections in the Configure SolarWinds Modules section by selecting **Configure**.

i. When you're finished, close the window, and navigate back to the guided setup.

j. Set the Configure SolarWinds Modules task to complete by selecting **Mark as Complete**.

k. For the Test New Connections task, select **Configure**.
   i. Select the name of the data source associated with the newly created connection.
   ii. Select the **Test Load 20 Records** related link.

   Note:
   If the displayed completion code is `Success`, then the sources are validated. But if the displayed completion code is `Error`, then there is an error that you must fix.

   iii. Navigate back to the guided setup, and set the Test New Connections task to complete by selecting **Mark as Complete**.

10. Set up scheduled import jobs.

a. On the Service Graph Connector for SolarWinds page, in the Set up scheduled import jobs section, select the **Configure the scheduled import jobs** task.

b. For the Configure the scheduled import jobs task, select **Configure**.

c. Review the fields on the Scheduled Data Import form, which are automatically set.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scheduled Data Import form

Field	Description
Name	Name of the scheduled job.
Data source	Data source record that defines the data to import.
Run as	Option to run the scheduled job with the credentials of the specified user.
Active	Option to activate the scheduled job. Select this option.
Concurrent Import	Function that loads the data from multiple import sets. The function then processes and transforms the data concurrently.
Partition Method	Partition method for the concurrent import set.
Partition Size	Import set size for early scheduling.
Execute pre-import script	Option to run a pre-import script before the import is performed.
Execute post-import script	Option to run a post-import script after the import is performed.
Application	Application containing this record.
Run	Frequency of running the import.
Conditional	Conditions under which this job is executed.

Note:
All active SolarWinds scheduled jobs will run in their specified order after the SG-Solarwinds Hardware scheduled job runs. You can modify the **Active** setting for each SolarWinds scheduled job as appropriate for your integration.

d. Select **Update** if required, and then select **Mark as Complete** to set the Set up scheduled import jobs task to complete.

Service Graph Connector for SolarWinds

Accessing the connection details of Service Graph Connector for SolarWinds

You can access the connection details of the Service Graph Connector for SolarWinds in a single view using the common connection framework (CCF) included within the Integration Commons for CMDB (sn_cmdb_int_util) store app.

With the CCF, you can access all the connections used by the Service Graph Connector for SolarWinds. The connection details include the connection alias, connection properties, data sources, and scheduled data imports associated with a connection. You can also test the connection. For more information, see Accessing the connection details of Service Graph Connectors.

Access the details of a SolarWinds connection

Access the details of a SolarWinds connection configured for the Service Graph Connector for SolarWinds.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Service Graph Connectors** > **SolarWinds** > **Connections**.
2. From the **Name** column of the Service Graph Connections list, select a connection.
3. On the Service Graph Connections page, view the connection details such as the connection name, alias, and data sources.
4. Select a related list to view further details of the connection.
5. **Optional:** Select the **Test Connection** related link to test the connection.

Configuring air gap connections for Service Graph Connector for SolarWinds

Air gap connections for the Service Graph Connector for SolarWinds enable safe and controlled data transfer without compromising security.

An air gap is a security measure that involves isolating a computer or network and preventing it from establishing an external connection. Air-gapped networks keep critical systems secure by isolating them from external connections to protect the systems from cyber threats. Air gap connections for the Service Graph Connector for SolarWinds facilitate controlled data exchange between the air-gapped networks and external systems while maintaining the integrity of the air-gapped environment.

Air gap connections are available from version 2.5.0 of the Service Graph Connector for SolarWinds. You can add either regular data sources or air gap data sources during the guided setup. To access the guided setup, see Configure Service Graph Connector for SolarWinds.

Perform the following sequence of tasks to configure the air gap solution before you add air gap data sources during the guided setup:

1. Configure air gap solution for Service Graph Connector for SolarWinds in a high-secure server
2. Configure air gap solution for Service Graph Connector for SolarWinds in a low-secure server
3. Configure air gap solution for Service Graph Connector for SolarWinds in a ServiceNow instance

4. Perform a test data load for the air gap solution for Service Graph Connector for SolarWinds
5. Perform a full data load for the air gap solution for Service Graph Connector for SolarWinds

Configure air gap solution for Service Graph Connector for SolarWinds in a high-secure server

Configure the air gap solution for the Service Graph Connector for SolarWinds in your high-secure server.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Service Graph Connectors** > **SolarWinds** > **Setup** > **Add Multiple Instances** > **Add Another Connection**.
2. Download the `SgSolarWindsHighSecureSetup.ps1` and `GetSolarWindsData.ps1` PowerShell scripts from the link provided in the Add Another Connection section.
3. Log on to your high-secure server.
4. Create a SolarWinds directory.

   All the configurations required for the air gap solution are created in the SolarWinds directory.
5. Copy the `GetSolarWindsData.ps1` and `SgSolarWindsHighSecureSetup.ps1` PowerShell scripts that you downloaded in step 2 to the SolarWinds directory.
6. Start a PowerShell session, and run the `SgSolarWindsHighSecureSetup.ps1` script to generate the JSON configuration file that is used by the `GetSolarWindsData.ps1` script.

   a. At the prompt, enter the path for the SolarWinds directory that you created in step 4.

   b. Enter a name for the configuration file, or press the Return key to accept the default value.

   c. Enter the values for the global properties, or press the Return key to accept the default values.

   - *`npmInstalled`*: Set the value to `true` if the module is installed on the SolarWinds instance. Set the value to `false` if the module isn't installed on the SolarWinds instance.
   - *`samInstalled`*: Set the value to `true` if the module is installed on the SolarWinds instance. Set the value to `false` if the module isn't installed on the SolarWinds instance.
   - *`pageSize`*: Enter the number of records to be fetched in a SolarWinds API call.
   - *`endpoint`*: Update the **Host** field with the host name for your SolarWinds instance.
   - *`port`*: Specify the port on which the SolarWinds instance allows API calls.
   - *`credentialsPath`*: Specify the location to store the SolarWinds credentials XML file.
   - *`logDirectory`*: Specify the location to store the log file from the `GetSolarWindsData.ps1` script.

   d. Specify names for the data source data directories, or press the Return key to accept the default values.

   The directories are created if they don’t already exist.

   e. Enter the SolarWinds credentials.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
You can either use Windows credential manager to store the user name and password, or implement your own mechanism for storing the credentials. The `GetSolarWindsData.ps1` script must have access to the credentials to trigger REST calls.

f. Exit the PowerShell session.

7. Provide write and delete permissions for the SolarWinds directory and the child directories.

   You must provide delete permissions for old records to be cleaned up.

Configure air gap solution for Service Graph Connector for SolarWinds in a low-secure server

Configure air gap solution for Service Graph Connector for SolarWinds in a low-secure server

Configure the air gap solution for the Service Graph Connector for SolarWinds in your low-secure server after you finish the configuration in your high-secure server.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Service Graph Connectors** > **SolarWinds** > **Setup** > **Add Multiple Instances** > **Add Another Connection**.
2. Download the `SgSolarWindsLowSecureSetup.ps1` PowerShell script from the link provided in the Add Another Connection section.
3. Log on to your low-secure server.
4. Create a SolarWinds directory.

   All the configurations required for the air gap solution are created in the SolarWinds directory.

5. Copy the `SgSolarWindsLowSecureSetup.ps1` PowerShell script that you downloaded in step 2 to the SolarWinds directory.
6. Start a PowerShell session, and run the `SgSolarWindsLowSecureSetup.ps1` script.

   a. At the prompt, enter the path for the SolarWinds directory that you created in step 4.

   b. Specify names for the data source data directories, or press the Return key to accept the default values.

      The directories are created if they don't already exist.

   c. Exit the PowerShell session.

7. Provide read and delete permissions for the SolarWinds directory.

Configure air gap solution for Service Graph Connector for SolarWinds in a ServiceNow instance

Configure the air gap solution for the Service Graph Connector for SolarWinds in your ServiceNow instance after you finish the configuration in your high-secure and low-secure servers.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Plugins**, and download the `ServiceNow IntegrationHub Action Step – PowerShell` plugin.
2. Navigate to **All** > **Service Graph Connectors** > **SolarWinds** > **Setup** > **Add Multiple Instances** > **Add Another Connection**.
3. Select the **Add Another Connection** task, and then select **Configure**.
4. In the Select Data Source Type section, select **Airgap Data Sources**, and then select **Add Connection**.
5. Fill in the fields on the Create Connection form.

Create Connection form

Field	Description
Connection Name	Display name for the connection.
MID Server	Name of the MID Server that you deployed in your low-secure server. You can obtain the *sys_id* of the MID Server from the ecc_agent table.
Parent Directory	Path of the SolarWinds directory where the data is stored in your low-secure server. See Configure air gap solution for Service Graph Connector for SolarWinds in a low-secure server.
Archive Data After Retrieval	Option to archive data after retrieval.
Archive Path [Optional]	Folder where the data is to be archived if the **Archive Data After Retrieval** check box is selected.

6. Select **Create Connection**.

Perform a test data load for the air gap solution for Service Graph Connector for SolarWinds

Perform a test data load for the air gap solution for Service Graph Connector for SolarWinds

After you configure the air gap solution for the Service Graph Connector for SolarWinds, test whether the SolarWinds endpoint is accessible from the high-secure server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: admin

Procedure

1. Navigate to the SolarWinds directory in your high-secure server.
2. Run the `.\GetSolarWindsData.ps1 -configFilePath` *`CONFIG_PATH`* script, where *`CONFIG_PATH`* is the location of the JSON configuration file that is generated by the setup script.
   The script accesses the SolarWinds Hardware API, and creates a sample file in the Hardware directory and a log file in the Logs directory.
   - If the test data load is successful, the log file contains the `Test Load status` SUCCESS! message.
   - If the test data load fails, the log file contains the `Error occurred while processing hardware StatusCode 403` message.

     If the test data load fails, verify the SolarWinds user credentials and ensure that the user has the required permissions to pull the data from SolarWinds. If the credentials need to be updated, you must run the `SgSolarWindsHighSecureSetup.ps1` PowerShell script again. See Configure air gap solution for Service Graph Connector for SolarWinds in a high-secure server.

Related topics

Perform a full data load for the air gap solution for Service Graph Connector for SolarWinds

Perform a full data load for the air gap solution for Service Graph Connector for SolarWinds

After you verify that the test data load for the air gap solution for the Service Graph Connector for SolarWinds is successful, you can perform a full data load.

Before you begin

Role required: admin

Procedure

1. Navigate to the SolarWinds directory in your high-secure server.
2. Run the `.\GetSolarWindsdata.ps1 -completeLoad $true -configFilePath` *`CONFIG_PATH`* script, where *`CONFIG_PATH`* is the location of the JSON configuration file that is generated by the setup script.

   By default, the existing files in the data source data directories are deleted each time the `.\GetSolarWindsdata.ps1 -completeLoad $true -configFilePath` *`CONFIG_PATH`* script is run. You can add the *`-clean $false`* parameter to the script if you want to retain the existing files.

   The script fetches data from all the SolarWinds APIs, and stores the data in the respective directories.
3. After the data is loaded in your high-secure server, transfer the data to your low-secure server using a method of your choice, such as SFTP.
4. Verify that the data is loaded in your low-secure server.
5. Set the full data load job (using the `.\GetSolarWindsdata.ps1 -completeLoad $true -configFilePath` *`CONFIG_PATH`* script) to run on a schedule based on that of the Scheduled Import Job on your Service Graph Connector for SolarWinds instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Set the data transfer job (from your high-secure server to your low-secure server) on a schedule based on that of the Scheduled Import Job on your Service Graph Connector for SolarWinds instance.
7. Test the air gap connection in your ServiceNow instance.
   a. Navigate to **All** > **Service Graph Connectors** > **SolarWinds** > **Connections**.
   b. Select the air gap connection that you created.
   c. Select the **Test Connection** related link.
   When the connection is successful, the **Status** field is set to `Success`. If the connection fails, follow the suggestions for remediation.

Service Graph Connector for Tanium

Use the Service Graph Connector for Tanium to bring in hardware, software, and software usage data from a Tanium environment into your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Supported versions

Versions

Tanium	ServiceNow
• Tanium 1.9 or later versions for hardware and software • Tanium 1.17 or later versions for software usage	• Washington DC • Xanadu • Yokohama

Important information for upgrading Service Graph Connector for Tanium

Tanium Platform 7.6.2 or later versions support token-based authorization only. After you have installed the latest version of the Service Graph Connector for Tanium, verify the following configurations to use Tanium Platform 7.6.2 or later versions in your on-premise setups:

- For a single instance, reconfigure the authentication type of an existing connection to use token-based authorization.
- For multiple instances, deactivate the existing scheduled jobs for previously configured instances that used basic authorization, and then create and configure new instances to use token-based authorization.

Configuring a connection

Use the SGC Central view in the Service Graph Workspace or CMDB Workspace to install the connector and configure the connection. The view enables you to install and discover connectors and to manage the full life cycle of creating, editing, monitoring, and debugging connections. For instructions, see Configure Service Graph Connector for Tanium using SGC Central.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:
Unless there are configuration issues, use SGC Central to configure the connection. The guided setup method for configuration is being deprecated.

CMDB integrations dashboard

The Integration Commons for CMDB store app provides a dashboard with a central view of the status, processing results, and processing errors of all installed integrations. You can see metrics for all integration runs. You can filter the view to a specific CMDB integration, a specific time duration, or a specific integration run. For more details about monitoring Tanium integrations in the CMDB Integrations Dashboard, see Using the CMDB Integrations Dashboard.

Data mapping

Data from the Tanium data sources is mapped and transformed into the ServiceNow CMDB Configuration Item (CI) class definitions using the Robust Transform Engine (RTE). Data is inserted into the ServiceNow CMDB using the Identification and Reconciliation Engine (IRE).

The following table describes the data sources, the staging tables, and the target tables including CMDB CI and non-CMDB CI classes for the Tanium application.

Data mapping for Tanium

Data source	Staging table	Target tables	Resource types
SG-Tanium Applications	SG-Tanium Applications [sn_tanium_integ_sg_tanium_applications]	Application Running Process TCP	Applications
SG-Tanium Hardware and Software	SG Tanium Import [sn_tanium_integ_sg_tanium_import]	Computer File System Disk IP Address When the Software Asset Management (SAM) application isn't installed: Software Software Instance When the SAM application is installed: Software Installation	Server and software

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data mapping for Tanium (continued)

Data source	Staging table	Target tables	Resource types
SG-Tanium Usage	SG Tanium Usage Import [sn_tanium_integ_sg_tanium_usage_import]	Software Usage [samp_sw_usage]	None
SG-Tanium Remove Software	Integration Commons Remove Record [sn_cmdb_int_util_remove_record]	None	None

Note:

- The SG-Tanium Usage data source is available only when the Software Asset Management Professional plugin (com.snc.samp) plugin is activated on your ServiceNow instance. See Request Software Asset Management.
- The SG-Tanium Remove Software data source creates import sets and uses the transform map-based method for removing any target records for software data that weren't updated in the last delta query check. See Managing CMDB data deletion.
- Starting with the Service Graph Connector for Tanium 1.8.0 release, a buffer time is added for software removal when the *buffer_days_from_last_scan_for_hardware* system property is enabled. When this system property is enabled, the software removal candidate is removed only if the last scan time of the hardware on which the software removal candidate is installed is earlier than the last success import time + buffer time. To enable this property, set the value of the *buffer_days_from_last_scan_for_hardware* system property to a non-zero numeral value according to the number of days of buffer that you require. To disable this property, set the value to 0.

You can use the IntegrationHub ETL app to view the data maps. See IntegrationHub ETL for more information.

Service Graph Connectors

Configure Service Graph Connector for Tanium using SGC Central

Set up scheduled import jobs to pull in Tanium data into your Configuration Management Database (CMDB).

Before you begin

Install Service Graph Connector for Tanium version 1.7.0 or later from the ServiceNow Store. For ServiceNow Store installation steps, see Install a ServiceNow Store application.

Role required: admin

About this task

The playbook experience for onboarding connectors is activated with SGC Central in the CMDB Workspace. To configure the SGC Central application, see Configuring SGC Central and for more information on how to interact with a playbook, see Interact with Playbook.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **CMDB Workspace**.
2. In the CMDB Workspace, select **SGC Central**.
3. On the Overview page, select **Create connection**.

   Tip:
   Alternatively, you can select **Create connection** on the All connections page.

4. On the Create connection window, select the Tanium connector type, and then select **Create connection**.
5. Complete the initial prerequisites when setting up a connection for the first time using a connector.

   Note:
   This step is required only during the first-time setup. See Perform initial setup tasks when creating a connection in SGC Central.

6. Complete the prerequisites for setting up the Tanium environment.

   a. Create a custom view on your Tanium instance.

      i. In the **Prerequisites** stage of the playbook, select the **Create custom view** activity.

      ii. Create a custom view on your Tanium instance to be used in the **Select view** activity later by referring to the Tanium Asset User Guide for Cloud.

      Note:
      Copy the unmodifiable **ServiceNow (reserved)** view from the Tanium instance to create the custom view.

      iii. After creating a view, select the **I have created a custom view for this connection according to the instructions** check box.

      iv. After completing the **Select view** activity, select **Continue**.

7. Determine the type of authentication for the Tanium connection.

   a. In the **Setup** stage of the playbook, select the **Select alias template** activity.
   If needed, expand the **Setup** stage to select an activity.

   b. Select an alias template for the connection.

   - **Basic authentication**: Select when using Basic authentication that grants access to the Tanium data.
   - **Token-based authentication**: Select when using an authentication token for the Tanium API to grants access to the Tanium data.

   c. Select **Continue**.

8. Enter connection details and test the API connection for importing Tanium data.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the **Setup** stage of the playbook, select the **Configure and test connection** activity.

b. On the form, fill in the fields.

Create and test connection form

Field	Description
Connection name	Name to identify the Tanium connection record.
Host name	Base URL or IP address of the Tanium server.
Username	Tanium account user name that is used to authenticate the connection request. This field appears only when the **Basic authentication** alias template was selected in the **Select alias template** activity.
Password	Password associated with the user name required for authenticating requests. This field appears only when the **Basic authentication** alias template was selected in the **Select alias template** activity.
Token	Authentication token for the Tanium API that grants access to the Tanium data. This field appears only when the **Token-based authentication** alias template was selected in the **Select alias template** activity.
Use MID Server	Option to use a MID Server. **Note:** Use of a MID Server is optional.
MID selection	Name of the MID Server used by the connector. This field appears only when the **Use MID Server** check box is selected.

c. Select **Update and test connection**.

d. Once the connection test is complete, select **Continue**.

9. Select the view created on your Tanium instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the **Setup** stage of the playbook, select the **Select view** activity.

b. In the **View** field, select the custom view you created on the Tanium instance in the Prerequisites activity.

c. Select **Continue**.

10. Configure the import schedule to import data at regular intervals.

a. In the **Setup** stage of the playbook, select the **Configure import schedule** activity.

b. Expand the Parent scheduled data import within the Import schedules list to select the *`Connection name`* **- SG-Tanium Usage** import schedule.

c. In the Configure import schedule dialog box, select the **Active** check box, and then fill in the run schedule and time details.

For more information, see Schedule a data import.

d. Select **Save**.
Alternatively, select **Execute Now** to execute the import schedule immediately.

e. Repeat steps 10.b to 10.d for the *`Connection name`* **- SG-Tanium Hardware and Software** parent import schedule.

f. Select **Continue**.

11. In the **Setup** stage of the playbook, select the **Confirm connection creation** activity to verify whether the connection was created.

What to do next

Select **View all connections** to review the connection details. The configured connection appears in the Installed connections list.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

that application. Review your current Subscription Unit consumption within ITOM Visibility or ITOM Discovery to ensure available capacity.

Dependencies and requirements:

- The Integration Commons for CMDB store app, which is automatically installed.
- The CMDB CI class models store app, which is automatically installed. See CMDB CI Class Models.
- The Datastream Action plugin (com.glide.hub.action_type.datastream), which is automatically installed.

Note:
If you have an earlier version of the Service Graph Connector for Tanium, then do not migrate data from the old connector. You must uninstall the previous version and run the new integration.

Role required: admin

About this task

For more information on the Service Graph Connector for Tanium setup, see How do I configure the Tanium Service Graph Connector? article on the ServiceNow Community site.

Procedure

1. Ensure that the application scope is set to the Service Graph Connector for Tanium application by using the application picker.
   For more information, see Application picker.
2. Navigate to **All** > **Service Graph Connectors** > **Tanium** > **Setup**.
3. On the Getting started page, select **Get Started**.
4. Configure the authentication credentials and HTTP connection.

   a. On the Service Graph Connector for Tanium page, in the Configure the Connection and Credentials section, select **Set authentication type**.

   b. For the Set authentication type task, select **Configure**.

   c. Specify the system property details for the authentication type.

      i. In the **Value** field, enable either token-based authentication or basic authentication.

      - To enable the basic authorization, enter `basic`.
      - To enable the token-based authorization, enter `token`.

      Note:
      Tanium Platform 7.6.2 supports only token-based authorization for an on-premise setup. To use Tanium Platform 7.6.2 or later versions, enable the token-based authorization type and enter the details for the token-based authorization in the next step.

      ii. Select **Update**.

      iii. Set the Set authentication type task to complete by selecting **Mark as Complete**.

   d. Configure the connection based on the authentication type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

i. For the basic authorization type:

1. For the Configure the Basic auth Credentials task, select **Configure**.

> **Note:**
> The Configure the Basic auth Credentials task appears only when you have specified `basic` as the value in the step 4.c.i.

2. Select **Edit** for Basic authentication within the sn_tanium_integ scope.
3. In the Connection Information section of the Edit Connection window, fill in the fields.

Connection Information

Field	Description
Connection name	Name to identify the Tanium connection record. `Token-based authentication` is the default credential alias name and is read-only.
Host name	Base URL or IP address of the Tanium server. **Note:** This field is automatically set to the URL to connect to the application. Leave the field value as is.

4. (Optional) If a MID Server is required for the Tanium server connection, select the **Use MID Server** check box. Then, select the MID Server-related fields accordingly.
5. In the Credential Information section, enter the Tanium account user name in the **Username** field and the password in the **Password** field.
6. Select **Edit connection**.
7. Return to the guided setup page.
8. Set the Configure the Basic auth Credentials task to complete by selecting **Mark as Complete**.

ii. For the token-based authorization type:

1. For the Configure the Token auth Credentials task, select **Configure**.

> **Note:**
> The Configure the Token auth Credentials task appears only when you have specified `token` as the value in the step 4.c.i.

2. Select **Edit** for Token-based authentication within the sn_tanium_integ scope.
3. In the Connection Information section of the Edit Connection window, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection Information

Field	Description
Connection name	Name to identify the Tanium connection record. `Token-based authentication` is the default credential alias name and is read-only.
Host name	Tanium base URL or IP address. **Note:** This field is automatically set to the URL to connect to the application. Leave the field value as is.

4. (Optional) If a MID Server is required for the Tanium server connection, select the **Use MID Server** check box. Then, select the MID Server-related fields accordingly.
5. In the Credential Information section of the Edit Connection window, enter the authentication token for the Tanium API in the **Token** field to grants access to Tanium data.
6. Select **Edit connection**.
7. Return to the guided setup page.
8. Set the Configure the Token auth Credentials task to complete by selecting **Mark as Complete**.

e. Test the connection.

i. For the Test connection task, select **Configure**.

ii. Select the **Test Connection** related link to start the testing process.

iii. When the **Status** field is set to **Success**, return to the guided setup page.

Note:
If any of the tests have errors, follow the suggestions for remediation.

iv. Set the Test the connection task to complete by selecting **Mark as Complete**.

f. Create a custom view.

Note:
The integration depends on a custom view from Tanium.

i. Configure the view on your Tanium instance.

1. On your Tanium instance, navigate to **Modules** > **Asset**.
2. Select **Views**.
3. If you have not done so already, create the ServiceNow (reserved) view by selecting **Create View** > **Create ServiceNow view**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
By default, the ServiceNow (reserved) view is non-editable.

4. Create a copy of the view to edit it.
5. Edit the copy.
   a. Add all fields from the **SIU Product Usage** bucket.
   b. Add **Asset** to the **Last Seen** field.
   c. Add **Network Adapter** to the **Model** field.
6. Save the view.

ii. Select the view on your ServiceNow instance.
1. In the guided setup, for the Configure the View task, select **Configure**.
2. In the ServiceNow instance, select the view you created in step 4.f.i.
3. Select **Set View**.
4. Set the Configure the View task to complete by selecting **Mark as Complete**.

g. In the ADM setup instruction section, ignore the instructions as application dependency mapping is not supported currently.

5. Configure the Tanium scheduled jobs.

a. For the Configure the Scheduled Import task, select **Configure**.

b. Select the scheduled job that you want to activate.

c. On the Scheduled Data Import form, verify the field values for a scheduled job and select the **Active** check box to activate the scheduled job.

Note:
When using a token-based authentication, the user you specify in the **Run as** field for a scheduled job must have the connection_admin role.

For more information, see Schedule a data import.

d. Select **Update**.

e. Repeat the steps 5.b to 5.d for each scheduled job for data import.

f. Set the Configure the Scheduled Import task to complete by selecting **Mark as Complete**.

6. **Optional:** Add multiple instances.

Note:
If you don't need to add multiple instances, you can skip this step.

a. On the Service Graph Connector for Tanium page, in the Add Multiple Icons section, select the **Update Data Source Access** task.

b. On the next page, in the Update Data Source Access section, select **Configure**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Select the Data Source [sys_data_source] table.

d. Select the **Global** application scope by using the application picker.

e. In the Application Access related list, select the **Can create**, **Can update**, and **Can delete** check boxes, if not already selected.

f. Select **Update** to close the tab and return to the guided setup.

g. Modify the application scope again to **Service Graph Connector for Tanium** by using the application picker.

h. Set the Update Data Source Access task to complete by selecting **Mark as Complete**.

i. Repeat the steps 6.d to 6.g for the Update Scheduled data import access task with the Scheduled data import [scheduled_data_set] table and set the task to complete by selecting **Mark as Complete**.

a. Clear the cache for the new connection.

i. For the Clear Cache for Datasource and Import set task, select **Configure**.

ii. In the **Run script** text box of the background script page, enter the following script:

```
GlideTableManager.invalidateTable("sys_data_source");
      GlideCacheManager.flushTable("sys_data_source");

 GlideTableManager.invalidateTable("scheduled_import_set");
      GlideCacheManager.flushTable("scheduled_import_set");

      GlideTableManager.invalidateTable("sys_db_object");
      GlideCacheManager.flushTable("sys_db_object");
```

iii. Select **Run Script** to run the background script in the **global** scope.

The script may take several minutes to execute.

iv. After the script is executed, select **Close**.

v. From the application picker, select the **Service Graph Connector for Tanium** application.

vi. Set the Clear Cache for Datasource and Import set task to complete by selecting **Mark as complete**.

b. Add a basic authorization connection to another Tanium instance.

Note:
Tanium Platform 7.6.2 supports only token-based authorization for an on-premise setup. To use Tanium Platform 7.6.2 or later versions, use the token-based authorization.

i. For the Add Another Basic Auth Connection task, select **Configure**.

ii. To create a new connection, select **Add Connection**.

iii. Enter the connection details on the Create Connection form.

iv. Select **Create Connection**.

v. Navigate back to the guided setup and set the Add Another Basic Auth Connection task to complete by selecting **Mark as Complete**.

c. Add a token-based authorization connection to another Tanium instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

i. For the Add Another Token Auth Connection task, select **Configure**.

ii. To create a new connection, select **Add Connection**.

iii. Enter the connection details on the Create Connection form.

iv. Select **Create Connection**.

v. Navigate back to the guided setup and set the Add Another Token Auth Connection task to complete by selecting **Mark as Complete**.

d. Set configuration properties for newly added connections.

i. For the Set configuration properties task, select **Configure**.

ii. From the **Name** column, select the new connection.

iii. In the Service Graph Connection Properties related list, review and modify the following properties.

Field	Value
max_retry_count	Determines the number of retry attempts triggered for a Tanium Asset REST action in case of failure.
pagination_record_count	Specifies the page size for each API call made during a Tanium Application Data REST action.
rest_action_limit	Specifies the page size for each API call made during a Tanium Asset REST action.
view_id	Specifies the identifier used to fetch hardware and software data from a specific Tanium view. To modify the view identifier, access the SG Tanium Connection [sn_tanium_integ_connection] table.

iv. Return to the guided setup page.

v. Set the Set configuration properties task to complete by selecting **Mark as Complete**.

e. Test the newly added connections.

i. For the Test connections task, select **Configure**.

ii. From the **Name** column, select the new connection.

iii. Select the **Test Connection** related link to start the testing process.

iv. When the **Status** field is set to **Success**, return to the guided setup page.

> **Note:**
> If any of the tests have errors, follow the suggestions for remediation.

v. Set the Test connections task to complete by selecting **Mark as Complete**.

f. Set the Tanium view for the connection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

i. For the Set view task, select **Configure**.

ii. In the **Connection and Credentials Alias** field, search for and select the alias created earlier in the Add Another Basic Auth Connection or Add Another Token Auth Connection task.

iii. In the **View** field, search for and select the corresponding Tanium view associated with the connection.

iv. Select **Set View**.

v. Set the Set view task to complete by selecting **Mark as Complete**.

g. Skip the ADM setup for multi instance task as ADM is not supported currently.

h. Configure the Tanium scheduled job.

i. For the Configure the Scheduled Imports task, select **Configure**.

ii. Select the scheduled data import that you want to activate.

iii. On the Scheduled Data Import form, verify the field values for the scheduled job and select the **Active** check box.

> **Note:**
> When using a token-based authentication, the user you specify in the **Run as** field for a scheduled job must have the connection_admin role.

For more information, see Schedule a data import.

iv. Select **Update**.

v. Repeat steps 6.h.ii to 6.h.iv for each scheduled job for data import.

vi. Set the Configure the Scheduled Imports task to complete by selecting **Mark as Complete**.

7. **Optional:** Use the advanced settings to manage excluding the serial number population on the IBM AIX and Oracle Solaris operating system (OS) platforms.

a. In the Advanced section of the guided setup, for the Advanced Settings task, select **Configure**.

b. To exclude the serial number population, enter `false` in the **Exclude the serial number population** field.

c. Select **Save**.

d. Close the window and set the Advanced Settings task to complete by selecting **Mark as Complete**.

CMDB classes targeted in Service Graph Connector for Tanium

When you complete setting up the connection, you can configure the integration to periodically pull data from Tanium. The data is saved in tables that extend from the Configuration item [cmdb_ci] table.

Application [cmdb_ci_appl]

The following attributes in the Application [cmdb_ci_appl] table are populated by collected data:

Attribute label	Attribute name
Display name	display_name
Publisher	publisher
Version	version
Discovery source	discovery_source
Last scanned	last_scanned

Software Instance [cmdb_software_instance]

The following attributes in the Software Instance [cmdb_software_instance] table are populated by collected data when the SAM application isn't installed:

Attribute label	Attribute name
Name	name
Installed on	installed_on

Relationship created for Software Instance

Parent class	Relationship type	Child class
Software Instance [cmdb_software_instance]	Reference	Computer [cmdb_ci_computer]

Virtual Machine Instance [cmdb_ci_vm_instance]

The following attribute in the Virtual Machine Instance [cmdb_ci_vm_instance] table is populated by collected data:

Attribute label	Attribute name
Sys ID	sys_id

Note:
Service Graph Connector for Tanium doesn't create a Virtual Machine Instance CI. During look-up in the Virtual Machine Instance [cmdb_ci_vm_instance] table, if a VM instance is found that has an object ID that matches the cloud instance ID of a server instance, a relationship is created between that VM instance and the server instance.

Accessing the connection details of Service Graph Connector for Tanium

You can access the connection details of the Service Graph Connector for Tanium in a single view using the common connection framework (CCF) included within the Integration Commons for CMDB (sn_cmdb_int_util) store app.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

With the CCF feature, you can access all connections for a connector. Connection details include the alias, properties, data sources, and associated scheduled data imports. In addition, you can test a connection. Additional details may appear depending on the connector type. For more information, see Accessing the connection details of Service Graph Connectors.

Access the details of a Tanium connection

Access the details of a Tanium connection configured for the Service Graph Connector for Tanium.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Service Graph Connectors** > **Tanium** > **Connections**.
2. From the **Name** column of the Service Graph Connections list, select a connection.
3. On the Service Graph Connections page, view the connection details such as the connection name, alias, and data sources.
4. Select a related list to view further details of the connection.
5. **Optional:** Select the **Test Connection** related link to test the connection.

Service Graph Connector for Trellix

Use the Service Graph Connector for Trellix to bring in device, server, and network data from a Trellix environment into your ServiceNow instance to streamline your incident response and asset management use cases.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Supported versions

Supported ServiceNow versions:

- Washington DC
- Xanadu
- Yokohama

Use cases

The following examples describe how you can use the Service Graph Connector for Trellix for security operations management:

- Identify cybersecurity risks in the environment.
- Assess dependencies between configuration items (CI).
- Enable effective security incident response and endpoint management systems.
- Identify data quality issues, reconcile inconsistencies, and manage incidents and changes on discovered CIs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuring a connection for the connector

Use the SGC Central view in the Service Graph Workspace or CMDB Workspace to install the connector and configure the connection. The view enables you to install and discover connectors and to manage the full life cycle of creating, editing, monitoring, and debugging connections. For instructions, see Configure Service Graph Connector for Trellix using SGC Central.

Important:
Unless there are configuration issues, use SGC Central to configure the connection. The guided setup method for configuration is being deprecated.

CMDB integrations dashboard

The Integration Commons for CMDB store app provides a dashboard with a central view of the status, processing results, and processing errors of all installed integrations. You can see metrics for all integration runs. You can filter the view to a specific CMDB integration, a specific time duration, or a specific integration run. For more details about monitoring Trellix integrations in the CMDB Integrations Dashboard, see Using the CMDB Integrations Dashboard.

Data mapping

Data from the Trellix data sources is mapped and transformed into the ServiceNow CMDB Configuration Item (CI) class definitions using the Robust Transform Engine (RTE). Data is inserted into the ServiceNow CMDB using the Identification and Reconciliation Engine (IRE).

The following data source is included for the Trellix application:

SG-Trellix-Devices

Imports data from devices and loads the imported data in the SGC Trellix Device Import [sn_trellix_integ_sgc_trellix_device_import] staging table.

The imported data is then inserted into the following target tables:

- File System [cmdb_ci_file_system]
- IP Address [cmdb_ci_ip_address]
- Network Adapter [cmdb_ci_network_adapter]
- Server [cmdb_ci_server]
- Software Installation [cmdb_sam_sw_install] (if the Software Asset Management (SAM) application is installed)
- Software [cmdb_ci_spkg] (if the SAM application isn't installed)
- Software Instance [cmdb_software_instance] (if the SAM application isn't installed)
- Storage Disk [cmdb_ci_storage_disk]

You can use the IntegrationHub ETL app to view the data maps. See IntegrationHub ETL for more information.

System property

The following system property is available for Service Graph Connector for Trellix: `sn_trellix_integ.getdevices_count`. This property sets the pagination size for the records that are fetched from the Trellix API.

- Type: integer
- Default value: `100`

CMDB classes targeted in Service Graph Connector for Trellix

Configure Service Graph Connector for Trellix using SGC Central

Use the playbook available with the SGC Central application to set up the Service Graph Connector for Trellix for pulling in Trellix data into the CMDB.

Before you begin

Install Service Graph Connector for Trellix version 1.0.0 from the ServiceNow Store. For ServiceNow Store installation steps, see Install a ServiceNow Store application.

Role required: admin

About this task

The playbook experience for onboarding connectors is activated with SGC Central in the Service Graph Workspace or CMDB Workspace. To configure the SGC Central application, see Configuring SGC Central and for more information on how to interact with a playbook, see Interact with Playbook.

Procedure

1. Use one of the following methods to open SGC Central:
   - Navigate to **Workspaces** > **Service Graph Workspace**, and from the left navigation panel, select the Ingestion icon to open the SGC Central view.
   - Navigate to **Workspaces** > **CMDB Workspace** > **SGC Central**.
2. On the Dashboard page, select **Create connection**.

   Tip:
   Alternatively, you can select **Create connection** on the All connections page.

3. On the Create connection window, select the Trellix connector type, and then select **Create connection**.
4. Complete the initial prerequisites when setting up a connection for the first time using a connector.

   Note:
   This step is required only during the first-time setup. See Perform initial setup tasks when creating a connection in SGC Central.

5. Complete the setup for configuring the connector for importing data.

   a. Create and test a connection.

      i. In the **Setup** stage of the playbook, select the **Create and test connection** activity.

      ii. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create and test connection form

Field	
Connection name	Name to identify the Trellix connection record. For example, `SGTrellix`.
Connection url	URL of the connection.
User name	User name of your Trellix account.
Password	Password of your Trellix account.
Use MID server	Option to use a MID Server. Select this check box if you're using an on-premises instance of Trellix. **Note:** A MID Server must be configured on your ServiceNow instance before you select this option.
Mid Selection	Name of the MID Server used by the connector. This field appears only when the **Use MID Server** check box is selected.

iii. Select **Create and test connection**.

iv. Once the connection test is complete, select **Continue**.

b. Configure the import schedule to import data at regular intervals.

i. In the **Setup** stage of the playbook, select the **Configure import schedule** activity.

ii. Expand the Parent scheduled data import within the Import schedules list, and select the SG-Trellix-Devices import schedule.

iii. In the Configure import schedule dialog box, select the **Active** check box, and then fill in the run schedule and time details.

For more information, see Schedule a data import.

iv. Select **Save**.

Alternatively, select **Execute Now** to execute the import schedule immediately.

v. Select **Continue**.

c. In the **Setup** stage of the playbook, select the **Confirm connection setup** activity to verify whether the connection was created.

What to do next

Select **View all connections** to review the connection details. The configured connection appears in the Installed connections list.

Configure Service Graph Connector for Trellix using guided setup

Set up scheduled import jobs to pull in data from a Trellix project into your CMDB.

Before you begin

Important:
Unless there are configuration issues, use the SGC Central view in the Service Graph Workspace or CMDB Workspace to configure the connection for the connector, as the guided setup method is planned for deprecated.

To use this Service Graph Connector, you need a subscription to a Subscription Unit that is based in the IT Operations Management (ITOM) Visibility application or in the ITOM Discovery application. As defined in the section titled "Managed IT Resource Types" in ServiceNow Subscription Unit Overview for your subscription, for managed IT resources that are created or modified in the CMDB by this Service Graph Connector, but that aren't yet managed by ITOM Visibility or ITOM Discovery, these resources will increase Subscription Unit consumption from that application. Review your current Subscription Unit consumption within ITOM Visibility or ITOM Discovery to ensure available capacity.

Dependencies and requirements:

- The Integration Commons for CMDB store app, which is automatically installed. See Integration Commons for CMDB.
- The CMDB CI class models store app, which is automatically installed. See CMDB CI Class Models.
- The ITOM Licensing plugin (com.snc.itom.license). See Request Discovery.

Role required: admin

Procedure

1. Verify that the application scope is set to the Service Graph Connector for Trellix application by using the application picker.
   For more information, see Application picker.
2. Navigate to **All** > **Service Graph Connectors** > **Trellix** > **Setup**.
3. On the Service Graph Connector for Trellix page, verify that the **Quick Start** option is selected, and then select **Continue**.
4. Configure the connection to send requests to the Trellix application.
   a. On the Service Graph Connector for Trellix page, in the Configure the Connection and Credentials section, select **Start**.
   b. Configure the authentication credentials.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

i. For the Configure Trellix authentication credentials task, fill in the fields on the Basic Auth Credentials form.

Basic Auth Credentials form

Field	Description
Name	Credentials to use for the connection. For example, `SGTrellix.Credentials`.
Order	The sequence in which the records are processed. The default value is `100`.
User name	User name of your Trellix account.
Password	Password of your Trellix account.
Active	Verify that the check box is selected.

ii. Select **Update** to save the authentication credentials.

iii. Set the Configure Trellix authentication credentials task to complete by selecting **Mark as complete**, and then select **Continue**.

c. Configure the HTTP connection.

i. For the Configure Trellix HTTP Connection task, fill in the fields on the HTTP(s) Connection form.

HTTP(s) Connection form

Field	Description
Name	Name to identify the Trellix connection record. For example, `SGTrellix`. Don't modify the name for the default connection `SGTrellix`.
Active	Verify that the check box is selected.
Credential	Credentials to use for the connection.
Domain	Domain that contains the connection.
Connection alias	Connection alias that resolves your connection and credentials at runtime. **Note:** Only one connection is active per connection alias at a time.
Connection URL	Base URL of the connection. The base URL is the hostname of your Trellix instance. For example, `https://`*`subdomain`*`.`*`domain`*`.com:`*`port`*.
Use MID server	Option to use a MID Server. Select this check box if you're using an on-premises instance of Trellix. Complete the **Advanced MID Server Configuration**. **Note:** A MID Server must be configured on your ServiceNow instance before you select this option.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
MID selection	Select a MID Server from the list. This field appears only when the **Use MID Server** check box is selected.
MID application	Select a MID Server application from the list. This field appears only when the **Use MID Server** check box is selected.
Connection timeout	The maximum time (in seconds) the system waits while attempting to establish a connection.

ii. Select **Update** to save the HTTP connection details.

iii. Set the Configure Trellix HTTP Connection task to complete by selecting **Mark as complete**, and then select **Continue**.

d. Test the Trellix API connection to import data from the Trellix application.

i. Test the connection by selecting the **Test Connection** related link in the Test Connection task.

Testing the connection might take a few moments. The page is refreshed to show the test results.

ii. When the **Status** field is set to **Success**, set the Test Connection task to complete by selecting **Mark as complete**, and then select **Continue**.

If any of the tests have errors, follow the suggestions for remediation.

5. Optional: Add multiple instances.

Note:
If you don't need to add multiple instances, you can skip this step.

a. On the Service Graph Connector for Trellix page, in the Add Multiple Instances section, select **Start**.

b. In the Update Data Source Access section, select the Data Source [sys_data_source] table.

c. Select the **Global** application scope by using the application picker.

d. In the Application Access related list, select the **Can create**, **Can update**, and **Can delete** check boxes, if not already selected.

e. Modify the application scope again to **Service Graph Connector for Trellix** by using the application picker.

f. Select **Update** to save the data source access details.

g. Set the Update Data Source Access task to complete by selecting **Mark as Complete**, and then select **Continue**.

h. Repeat steps 5.c to 5.e for the Update Scheduled Data Import Access task with the Scheduled data import [scheduled_data_set] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

i. Select **Update** to save the scheduled data import access details.

j. Set the Update Scheduled Data Import Access task to complete by selecting **Mark as Complete**, and then select **Continue**.

k. In the Add Another Connection section, modify the application scope to **Service Graph Connector for Trellix** by using the application picker.

l. Select **Click Here**.

m. On the Workflow Studio page, select **Add Connection** in the SGTrellix section.

n. Fill in the fields on the Create Connection form, and then select **Create Connection**.

Create Connection form

Field	Description
Connection name	Name to identify the Trellix connection record.
Connection url	URL of the connection.
Use MID server	Option to use a MID Server. Select this check box if you're using an on-premises instance of Trellix. Complete the **Advanced MID Server Configuration**. **Note:** A MID Server must be configured on your ServiceNow instance before you select this option.
MID selection	Select a MID Server from the list. (Optional) This field appears only when the **Use MID Server** check box is selected.
MID application	Select a MID Server application from the list. (Optional) This field appears only when the **Use MID Server** check box is selected.
User name	User name of your Trellix account.
Password	Password of your Trellix account.

o. Close the Workflow Studio page, and navigate back to the guided setup.

p. Set the Add Another Connection task to complete by selecting **Mark as Complete**, and then select **Continue**.

q. In the Test New Connections section, select the newly created connection record, and then select the **Test Connection** related link.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

(Optional) Testing the connection might take a few moments. The page is refreshed to show the test results.

r. When the **Status** field is set to **Success**, set the Test New Connections task to complete by selecting **Mark as complete**, and then select **Continue**.

(Optional) If any of the tests have errors, follow the suggestions for remediation.

6. Configure the scheduled jobs to import data from the Trellix application.

a. On the Service Graph Connector for Trellix page, in the Set up scheduled import jobs section, select **Start**.

b. For the Configure the scheduled jobs task, select the connection.

Note:
The SG-Trellix-Devices scheduled import job is set to inactive by default.

c. On the Scheduled Data Import form, verify the field values for the scheduled job.

For more information, see Schedule a data import.

d. Select the **Active** check box to activate the SG-Trellix-Devices scheduled import job.

e. In the **Run** field, select **Periodically** to specify how often the job runs.

f. Select **Execute Now** to execute the import schedule.

g. Set the Configure the scheduled jobs task to complete by selecting **Mark as complete**, and then select **Continue**.

7. On the Service Graph Connector for Trellix page, select **Exit** to exit the guided setup.

Service Graph Connector for Trellix

Accessing the connection details of Service Graph Connector for Trellix

You can access the connection details of the Service Graph Connector for Trellix in a single view using the common connection framework (CCF) included within the Integration Commons for CMDB (sn_cmdb_int_util) store app.

With the CCF, you can access all the connections used by the Service Graph Connector for Trellix. The connection details include the connection alias, connection properties, data sources, and scheduled data imports associated with a connection. You can also test the connection. For more information, see Accessing the connection details of Service Graph Connectors.

Access the details of a Trellix connection

Access the details of a Trellix connection configured for the Service Graph Connector for Trellix.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Service Graph Connectors** > **Trellix** > **Connections**.
2. From the **Name** column of the Service Graph Connections list, select a connection.
3. On the Service Graph Connections page, view the connection details such as the connection name, alias, and data sources.
4. Select a related list to view further details of the connection.
5. **Optional:** Select the **Test Connection** related link to test the connection.

Service Graph Connector for VMware Workspace ONE UEM

Use the Service Graph Connector for VMware Workspace ONE UEM to pull data from VMware Workspace ONE Unified Endpoint Management (UEM) into your ServiceNow Instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

The integration imports different hardware assets into the ServiceNow® Configuration Management Database (CMDB) application.

Supported versions

- Supported versions:
  - VMware Workspace ONE UEM version 25.6.961.16 (2506)
  - Application Discovery Manager (ADM) API version 2
- Supported ServiceNow versions:
  - Yokohama
  - Zurich
  - Australia

Use cases

The following are examples on how you can use the Service Graph Connector for different ServiceNow applications:

- IT Operations Management (ITOM) Visibility
  - Detailed hardware and application inventory for Android, Apple, and Windows mobile devices. The inventory can be used with or without Software Asset Management (SAM).
  - Compliance tracking for mobile devices. You can build your own device (BYOD) or use corporate-owned devices.
- IT Service Management (ITSM)
  - Incident, problem, change on discovered configuration items (CI).
  - Ownership tracking and assignment for mobile devices.

Guided setup

The guided setup for the Service Graph Connector for VMware Workspace ONE UEM provides an organized sequence of tasks to configure the integration on your instance. To access the guided setup, see Configure Service Graph Connector for VMware Workspace ONE UEM.

CMDB integrations dashboard

The Integration Commons for CMDB store app provides a dashboard with a central view of the status, processing results, and processing errors of all installed integrations. You can see metrics for all integration runs. You can filter the view to a specific CMDB integration, a specific time duration, or a specific integration run. For more details about monitoring Workspace ONE integrations in the CMDB Integrations Dashboard, see Using the CMDB Integrations Dashboard.

Data mapping

Data from the VMware Workspace ONE UEM Devices and Apps data sources is mapped and transformed into the ServiceNow CMDB Configuration Item (CI) class definitions using the Robust Transform Engine (RTE). Data is inserted into the ServiceNow CMDB using the Identification and Reconciliation Engine (IRE).

When you complete setting up the connection, you configure the integration to periodically pull data from VMware Workspace ONE UEM.

The data is loaded into the SG-Workspace ONE UEM Devices and Apps staging [sn_vmwoneuem_integ_devices_and_apps] table.

The data is then inserted into the following target tables:

- Computer [cmdb_ci_computer]
- Handheld Computing Device [cmdb_ci_handheld_computing]
- Media Player [cmdb_ci_media_player]
- Network Adapter [cmdb_ci_network_adapter]
- Printer [cmdb_ci_printer]
- SAM Software Installation [cmdb_sam_sw_install], if com.snc.sams plugin is installed.
- Serial Number [cmdb_serial_number]
- Software Instance [cmdb_software_instance], if com.snc.sams plugin is not installed.
- Software Package [cmdb_ci_spkg], if com.snc.sams plugin is not installed.

Note:
To view any additional information such as the device owner, type of ownership, or compliance status, you need to switch to the SG-Workspace ONE UEM view. This view displays a **SG-Workspace ONE UEM Device Related** tab in the related list tabs with the additional information.

For more information on where data is saved when pulling data from VMware Workspace ONE Unified Endpoint Management (UEM), see CMDB classes targeted in Service Graph Connector for VMware Workspace ONE UEM.

You can use the IntegrationHub ETL app to view the data maps. See IntegrationHub ETL for more information.

Service Graph Connectors

Configure Service Graph Connector for VMware Workspace ONE UEM

Use the Service Graph Connector for VMware Workspace ONE UEM to pull mobile and computing devices data from VMware Workspace ONE Unified Endpoint Management (UEM) into your ServiceNow instance.

Before you begin

To use this Service Graph Connector, you need a subscription to a Subscription Unit that is based in the IT Operations Management (ITOM) Visibility application or in the ITOM Discovery application. As defined in the section titled "Managed IT Resource Types" in ServiceNow Subscription Unit Overview for your subscription, for managed IT resources that are created or modified in the CMDB by this Service Graph Connector, but that aren't yet managed by ITOM Visibility or ITOM Discovery, these resources will increase Subscription Unit consumption from

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

that application. Review your current Subscription Unit consumption within ITOM Visibility or ITOM Discovery to ensure available capacity.

Dependencies and requirements:

- The Integration Commons for CMDB store app, which is automatically installed.
- The CMDB CI class models store app, which is automatically installed. See CMDB CI Class Models.
- The ITOM Discovery License plugin (com.snc.itom.discovery.license). You must activate this plugin.
- ITOM Licensing plugin (com.snc.itom.license). For more information, see Request Discovery.
- The Datastream Action plugin (com.glide.hub.action_type.datastream), which is automatically installed.

Role required: SGC-Admin (sn_cmdb_int_util.sgc_admin) or admin

Note:
The admin user role is required to run background scripts and to provide access to global tables to the SGC-Admin user. For information about the user roles for Service Graph Connectors, see Service Graph Connector user roles.

When using client credentials for authentication, obtain the OAuth credentials from your VMware Workspace ONE UEM administrator. Make a note of the following details:

- Application (client) ID
- Client Secret
- Token URL

For information about how to get OAuth credentials, see the VMware documentation site.

About this task

To configure the Service Graph Connector for VMware Workspace ONE UEM, you must configure either OAuth authentication credentials or basic authentication credentials.

Procedure

1. Navigate to **All** > **Service Graph Connectors** > **Workspace ONE UEM** > **Setup**.
2. On the Getting started page, select **Get Started**.
3. In the Configure the Connection and Credentials section of the Service Graph Connector for VMware Workspace ONE UEM page, select **Get Started**.
4. Configure authentication credentials for the connection.
   You can configure either a basic authentication connection or an OAuth connection.

   a. For the Set authentication type task, select **Configure**.
      - To enable basic authentication, set the value of the *auth_type* connection property to `basic`.
      - To enable OAuth authentication, set the value of the *auth_type* connection property to `oauth`.

   b. Select **Update**, and navigate back to the guided setup page.

   c. Set the Set authentication type task to complete by selecting **Mark as Complete**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Configure the credentials for authentication.
   - Configure a basic authentication connection.
     a. For the Configure the Basic Auth Credentials task, select **Configure**.
     b. On the form, fill in the fields.

Field	Description
Name	Name of the authentication. For example, `WorkspaceOneUEM Basic Auth Credentials`.
User name	Your VMware Workspace ONE UEM user name.
Password	Your VMware Workspace ONE UEM password.

     c. Select **Update**, and navigate back to the guided setup page.
     d. Set the Configure the Basic Auth Credentials task to complete by selecting **Mark as Complete**.
     e. For the Configure API key task, select **Configure** to configure an API key for the basic authentication connection.
     f. In the **API Key** field, enter your VMware Workspace ONE UEM API key or tenant code.
     g. Select **Update**, and navigate back to the guided setup page.
     h. Set the Configure API key task to complete by selecting **Mark as Complete**.
   - Configure an OAuth connection.
     a. For the Configure the OAuth Credentials task, select **Configure**.
     b. On the form, fill in the fields.

Field	Description
Name	Name of the authentication. For example, `WorkspaceOneUEM OAuth Provider`.
Client ID	Application (client) ID of your VMware Workspace ONE UEM client application as noted in the Before you begin section.
Client Secret	Client secret of your VMware Workspace ONE UEM client application as noted in the Before you begin section.

     c. Select **Update**, and navigate back to the guided setup page.
     d. Set the Configure the OAuth Credentials task to complete by selecting **Mark as Complete**.
6. Establish an HTTP connection to send requests to the VMware Workspace ONE UEM API.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. For the Configure HTTP connection task, select **Configure**.

b. On the HTTP(s) Connection form, specify the host name of your VMware Workspace ONE UEM instance in the **Host** field.

> **Note:**
> The HTTP connection is pre-configured to use the authentication credentials that were configured in steps 4 and 5.

c. Select **Update**.

d. Set the Configure HTTP Connection task to complete by selecting **Mark as Complete**.

7. Test the connection.

a. For the Test the Connection task, select **Configure**.

b. Select the **Test Connection** related link to start the testing process.

c. When the **Status** field is set to **Success**, navigate back to the guided setup page.
If any of the tests have errors, follow the suggestions for remediation.

d. Set the Test the Connection task to complete by selecting **Mark as Complete**.

8. Set up the scheduled import job.

a. For the Configure the scheduled job task, select **Configure**.
The SG-Workspace ONE UEM Devices and Apps scheduled job is set to inactive by default.

b. Select the **SG-Workspace ONE UEM Devices and Apps** scheduled job.

c. On the Scheduled Data Import form, verify the field values for the scheduled job.
For more information, see Schedule a data import.

d. Select the **Active** check box to activate the SG-Workspace ONE UEM Devices and Apps scheduled job.

e. In the **Run** field, select **Periodically** to specify how often the job should run.

f. Select **Update**.
Alternatively, select **Execute Now** to execute the import schedule immediately.

g. Set the Configure the scheduled job task to complete by selecting **Mark as Complete**.

9. **Optional:** Add multiple instances.

> **Note:**
> If you don't need to add multiple instances, you can skip this step.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the Add multiple instances section of the Service Graph Connector for VMware Workspace ONE UEM page, select **Get Started**.

b. For the Update scheduled data import access task, select **Configure**.

c. Select the Scheduled data import [scheduled_import_set] table.

d. Select the **Global** application scope by using the application picker.

e. In the Application Access related list, select the **Can create**, **Can update**, and **Can delete** check boxes, if not already selected.

f. Select **Update**, and then navigate back to the guided setup.

g. Modify the application scope again to **Service Graph Connector for VMware Workspace ONE UEM** by using the application picker.

h. Set the Update scheduled data import access task to complete by selecting **Mark as Complete**.

i. For the Update Data Source Access task, select **Configure**.

j. Select the Data Source [sys_data_source] table.

k. Repeat steps 9.d to 9.g.

l. Set the Update Data Source Access task to complete by selecting **Mark as Complete**.

m. Clear the cache for the new connection.

i. For the Clear cache for Data Source and Import Set tables task, select **Configure**.

ii. Select the **Global** application scope by using the application picker.

iii. In the **Run script** text box of the background script page, enter the following script:

```
GlideTableManager.invalidateTable("sys_data_source");
      GlideCacheManager.flushTable("sys_data_source");

 GlideTableManager.invalidateTable("scheduled_import_set");
      GlideCacheManager.flushTable("scheduled_import_set");
      GlideTableManager.invalidateTable("sys_db_object");
      GlideCacheManager.flushTable("sys_db_object");
```

iv. Select **Run Script** to run the background script.

The script may take several minutes to execute.

v. After the script is executed, select **Close**.

vi. Modify the application scope again to **Service Graph Connector for VMware Workspace ONE UEM** by using the application picker.

vii. Set the Clear cache for Data Source and Import Set tables task to complete by selecting **Mark as complete**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

n. Configure the connection for the VMware Workspace ONE UEM instance.

(Optional) You can configure either a basic authentication connection or an OAuth connection.

- Configure a basic authentication connection.
  - **i.** For the Add basic authentication connection task, select **Configure**.
  - **ii.** To create a new connection, select **Add Connection**.
  - **iii.** In the Connection Information section of the Create Connection window, fill in the fields.

Connection Information

Field	Description
Connection name	Name to identify the VMware Workspace ONE UEM connection record.
Connection URL	Connection URL of your VMware Workspace ONE UEM connection. Use the format `https://host-name/API` for the connection URL.

  - **iv.** In the Credential Information section of the Create Connection window, fill in the fields.

Credential Information

Field	Description
Username	VMware Workspace ONE UEM account user name that is used to authenticate the connection request.
Password	Password that is used to authenticate the connection request.

  - **v.** Select **Create Connection**.
  - **vi.** Navigate back to the guided setup, and set the Add basic authentication connection task to complete by selecting **Mark as Complete**.
  - **vii.** For the Configure API key task, select **Configure** to configure an API key for the basic authentication connection.
  - **viii.** Select the **API Key** record that corresponds to the connection alias for the new basic authentication connection.
  - **ix.** Set the API key, and then select **Update**.
  - **x.** Navigate back to the guided setup, and set the Configure API key task to complete by selecting **Mark as Complete**.
- Configure an OAuth connection.
  - **i.** For the Add an OAuth connection task, select **Configure**.
  - **ii.** To create a new connection, select **Add Connection**.
  - **iii.** In the Connection Information section of the Create Connection window, fill in the fields.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection Information

Field	Description
Connection Name	Name to identify the VMware Workspace ONE UEM connection record.
Connection URL	Connection URL of your VMware Workspace ONE UEM controller. Use the format `https://host-name/API` for the connection URL.

iv. In the Credential Information section of the Create Connection window, fill in the fields.

Credential Information

Field	Description
OAuth Client ID	Application (client) ID of your VMware Workspace ONE UEM client application as noted in the Before you begin section.
OAuth Client Secret	Client secret of your VMware Workspace ONE UEM client application as noted in the Before you begin section.

For information about how to get OAuth credentials, see the VMware documentation site.

v. Select **Create and Get OAuth Token**.

vi. Navigate back to the guided setup, and set the Add an OAuth connection task to complete by selecting **Mark as Complete**.

o. Test the newly added connections.

i. For the Test connections task, select **Configure**.

ii. From the **Name** column, select the new connection.

iii. Select the **Test Connection** related link to start the testing process.

iv. When the **Status** field is set to **Success**, return to the guided setup page.

Note:
If any of the tests have errors, follow the suggestions for remediation.

v. Set the Test connections task to complete by selecting **Mark as Complete**.

p. Configure the scheduled job to import data from the VMware Workspace ONE UEM application.

(Optional) The SG-Workspace ONE UEM Devices and Apps scheduled job is set to inactive by default.

i. For the Configure import schedule task, select **Configure**.

ii. Select the **SG-Workspace ONE UEM Devices and Apps** scheduled job.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

iii. On the Scheduled Data Import form, verify the field values for the scheduled job.

(Optional) For more information, see Schedule a data import.

iv. Select the **Active** check box to activate the SG-Workspace ONE UEM Devices and Apps scheduled job.

v. In the **Run** field, select **Periodically** to specify how often the job should run.

vi. Select **Update**.

Alternatively, select **Execute Now** to execute the import schedule immediately.

10. **Optional:** Configure additional settings.

a. In the Configure additional settings (optional) section of the Service Graph Connector for VMware Workspace ONE UEM page, select **Get Started**.

b. For the Configure duplicate detection rules task, select **Configure**.

c. On the CMDB Duplicate Row Rule form, select **Active**.

d. Update the Value field to `true` to activate the duplicate detection rule during data import.

e. Select **OK**, and navigate back to the guided setup.

f. To remove fields from being evaluated, add the field names as a comma-separated list in the Ignore Fields column on the CMDB Duplicate Row Rules form.
Use this option for fields that change with every import.

g. Set the Configure duplicate detection rules task to complete by selecting **Mark as Complete**.

h. For the Enable software import task, select **Configure**.

i. Select the connection record for which you want to enable the import of software data.
The *turn_off_software_import* connection property is set to `true` by default.

j. Set the *turn_off_software_import* connection property value to `false` to import software data.

k. Set the Enable software import task to complete by selecting **Mark as Complete**.

l. For the Import non-managed software task, select **Configure**.

m. Select the connection record for which you want to import non-managed software data.
By default, software records that have the **IsManaged** field set to `false` aren't imported.

n. Set the *managed_apps_only* connection property value to `false` to import non-managed software data.

o. Set the Import non-managed software task to complete by selecting **Mark as Complete**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

p. For the Import apps based on software status value task, select **Configure**.
By default, the connector imports applications that have the status value 2, 3, or 5.

Status values of applications

Status	Value
Pending Install	1
Installed	2
Pending Removal	3
Removed	4
Unknown	5

q. Select the connection record for which you want to update the set of imported applications.

r. Set the *import_apps_with_status* connection property value to the required software status values (as a comma-separated list).

s. Set the Import apps based on software status value task to complete by selecting **Mark as Complete**.

CMDB classes targeted in Service Graph Connector for VMware Workspace ONE UEM

Accessing the connection details of Service Graph Connector for VMware Workspace ONE UEM

You can access the connection details of the Service Graph Connector for VMware Workspace ONE UEM in a single view using the common connection framework (CCF) included within the Integration Commons for CMDB (sn_cmdb_int_util) store app.

With the CCF, you can access all the connections used by the Service Graph Connector for VMware Workspace ONE UEM. The connection details include the connection alias, connection properties, data sources, and scheduled data imports associated with a connection. You can also test the connection. For more information, see Accessing the connection details of Service Graph Connectors.

Access the details of a VMware Workspace ONE UEM connection

Access the details of a VMware Workspace ONE UEM connection configured for the Service Graph Connector for VMware Workspace ONE UEM.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Service Graph Connectors** > **Workspace ONE UEM** > **Connections**.
2. From the **Name** column of the Service Graph Connections list, select a connection.
3. On the Service Graph Connections page, view the connection details such as the connection name, alias, and data sources.
4. Select a related list to view further details of the connection.
5. **Optional:** Select the **Test Connection** related link to test the connection.

Service Graph Connector for Wiz

Use the Service Graph Connector for Wiz to ingest CMDB data from projects within the Wiz platform using the REST APIs.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Key features

- Get started quickly with a streamlined onboarding process.
- Use only the credentials you need.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Be instantly aware of any modifications with near real-time discovery of changes.
- Get visibility across multiple cloud environments.
- Identify risks in the environment through Wiz.
- Assess application dependencies.
- Get the most out of your security incident response and endpoint management with the ServiceNow AI Platform.

Supported versions

Versions

Wiz	ServiceNow
Last tested on February 20, 2026	• Yokohama • Zurich • Australia

Use cases

You can use the Service Graph Connector for Wiz to get visibility into cloud resource identities, relationships, and state in real-time.

Configuring a connection

Use the SGC Central view in the Service Graph Workspace or CMDB Workspace to install the connector and configure the connection. The view enables you to install and discover connectors and to manage the full life cycle of creating, editing, monitoring, and debugging connections. For instructions, see Set up the Wiz environment.

Important:
Starting with the Service Graph Connector for Wiz version 1.4.0, the guided setup method is deprecated. Use the SGC Central view in the CMDB Workspace to configure the connection for the connector.

CMDB integrations dashboard

The Integration Commons for CMDB store app provides a dashboard with a central view of the status, processing results, and processing errors of all installed integrations. You can see metrics for all integration runs. You can filter the view to a specific CMDB integration, a specific time duration, or a specific integration run. For more details about monitoring Wiz integrations in the CMDB Integrations Dashboard, see Using the CMDB Integrations Dashboard.

Data mapping

Data from the Wiz data sources is mapped and transformed into the ServiceNow CMDB Configuration Item (CI) class definitions using the Robust Transform Engine (RTE). Data is inserted into the ServiceNow CMDB using the Identification and Reconciliation Engine (IRE).

When you complete setting up the connection, you can configure the integration to periodically pull data from the Wiz application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
For any discovered resources that were deleted later, the Service Graph Connector for Wiz automatically marks the corresponding records as retired or absent in CMDB.

The following table lists the data sources, the staging tables, and the target tables CMDB CI classes and non-CMDB classes where data is stored for a Wiz project.

Data sources mapping for Wiz

Service Graph Connectors

Set up the Wiz environment

You must obtain the credentials associated with the Wiz service account to configure Wiz for use with the Service Graph Connector for Wiz.

Before you begin

Role required: Wiz user with a role that has Write (W) permission on service accounts

About this task

To create a service account, you must be logged in as a Wiz user with Write (W) permission on service accounts. Project-scoped roles can create service accounts only on their own projects.

For more information on obtaining Wiz details, see Add a Service Account on the Wiz documentation site (requires Wiz login).

Procedure

1. Log in to your Wiz dashboard.
2. Obtain the Wiz URL.
   a. Navigate to your user profile and copy the API Endpoint URL.

   Note:
   The Service Graph Connector for Wiz uses the following token URL:

   ```
   https://auth.app.wiz.io/oauth/token
   ```

3. Obtain the client ID and client secret.
   a. Navigate to **Settings** > **Service Accounts**.
   b. Select **Add Service Account**.
   c. Name the new service account.
   d. **Optional:** In the Projects list, select projects to limit access of the service account.
   e. In the **API Scopes** field, select the permissions `read:resources` and `read:projects`.
   f. Select **Add Service Account**.
   g. From the Copy your secret credentials dialog box that appears, copy the client secret and client ID from their respective fields.
   h. Select **Finish** to return to the Wiz dashboard.

Configure Service Graph Connector for Wiz using SGC Central

Set up scheduled import jobs to pull in data from a Wiz project into your Configuration Management Database (CMDB).

Before you begin

- Install Service Graph Connector for Wiz version 1.3.0 or later from the ServiceNow Store. For ServiceNow Store installation steps, see Install a ServiceNow Store application.
- You must obtain the OAuth credentials associated with the Wiz service account and make a note of the following details:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Client ID
- Client secret
- OAuth token URL
- Connection URL

For more information, see Set up the Wiz environment.

- You must have the following permissions for the Wiz service account:
  - read:resources
  - read:projects

Role required: The following table shows the roles required for each stage of the playbook.

Role required for each playbook stage

Stage	Role
Prerequisites	admin
Setup	cmdb_inst_admin or admin

About this task

The playbook experience for onboarding connectors is activated with SGC Central in the Service Graph Workspace or CMDB Workspace. To configure the SGC Central application, see Configuring SGC Central and for more information on how to interact with a playbook, see Interact with Playbook.

Procedure

1. Use one of the following methods to open SGC Central:
   - Navigate to **Workspaces** > **Service Graph Workspace**, and from the left navigation panel, select the Ingestion icon to open the SGC Central view.
   - Navigate to **Workspaces** > **CMDB Workspace** > **SGC Central**.
2. On the Overview page, select **Create connection**.

   Tip:
   Alternatively, you can select **Create connection** on the All connections page.

3. On the Create connection window, select the Wiz connector type, and then select **Configure connection**.
   A default connection, SG-Wiz, for Wiz is available within the application. As the Service Graph Connector for Wiz supports only a single instance, you can configure the default connection for the first time or resume editing it thereafter.
4. Complete the initial prerequisites when setting up a connection for the first time using a connector.

   Note:
   This step is required when configuring the connector for the first time only. See Perform initial setup tasks when creating a connection in SGC Central.

5. Enter connection details and test the API connection for importing Wiz data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the **Setup** stage of the playbook, select the **Create and test connection** activity.

b. On the form, fill in the fields.

Create and test connection form

Field	Description
Connection name	Name to identify the Wiz connection record.
Connection URL	Base URL to connect to your Wiz application. **Note:** Based on the region of your Wiz application, enter the connection URL in the following format: `https://api.<region>.app.wiz.io` Where *<region>* is the region where the Wiz tenant is located. For example, us1, us2, eu1, or eu2.
Client ID	Client ID of your Wiz application as described in Before you begin.
Client secret	Client secret of your Wiz application as described in Before you begin.
OAuth token URL	Token generation URL. This field is automatically set to the following URL: `https://auth.app.wiz.io/oauth/token`

c. Select **Update and test connection**.

d. Once the connection test is complete, select **Continue**.

6. **Optional:** Configure properties of the connector to access resources.

Note:
To skip this step, select **Continue** for the **Set configuration properties** activity.

a. In the **Setup** stage of the playbook, select the **Set configuration properties** activity.

b. On the form, fill in the fields.

Configuration properties

Field	Description
Projects	List of project IDs for which the resources are to be imported. (Optional) Separate multiple entries with a comma.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Exclude projects	List of project IDs for which the resources are excluded only when the **Projects** property isn't set. In this case, all the resources except for the specified projects are imported. Separate multiple entries with a comma.

c. Select **Continue**.

7. Configure the import schedule to import data at regular intervals.

a. In the **Setup** stage of the playbook, select the **Configure import schedule** activity.

b. Expand the Parent scheduled data import within the Import schedules list to select the **SG-Wiz-Organization** import schedule.

c. Select the **Active** check box, and then fill in the run schedule and time details.

For more information, see Schedule a data import.

d. Select **Save**.
Alternatively, select **Execute Now** to execute the import schedule immediately.

8. **Optional:** Enable the `Reset Last Run Datetime for SG-Wiz` script to retrieve full data periodically.

Note:
To skip this step, select **Skip** for the **Enable full data retrieval** activity.

a. In the **Setup** stage of the playbook, select the **Enable full data retrieval** activity.

b. Select the **Active** check box, and then fill in the run schedule and time details.

Note:
When active, the script clears the **Last Run Date Time** field value in a data source, ensuring that the SG-Wiz Organization scheduled job retrieves all Wiz-related data sources periodically.

c. Select **Continue**.

9. In the **Setup** stage of the playbook, select the **Confirm connection creation** activity to verify whether the connection was created.

What to do next

Select **View all connections** to review the connection details. The created connection appears in the Installed connections list.

Supported Wiz types

Accessing the connection details of Service Graph Connector for Wiz

Configure Service Graph Connector for Wiz using guided setup

Set up scheduled import jobs to pull in data from a Wiz project into your CMDB.

Before you begin

Important:
Starting with the Service Graph Connector for Wiz version 1.4.0, the guided setup method is deprecated. Use the SGC Central view in the CMDB Workspace to configure the connection for the connector.

To use this Service Graph Connector, you need a subscription to a Subscription Unit that is based in the IT Operations Management (ITOM) Visibility application or in the ITOM Discovery application. As defined in the section titled "Managed IT Resource Types" in ServiceNow Subscription Unit Overview for your subscription, for managed IT resources that are created or modified in the CMDB by this Service Graph Connector, but that aren't yet managed by ITOM Visibility or ITOM Discovery, these resources will increase Subscription Unit consumption from that application. Review your current Subscription Unit consumption within ITOM Visibility or ITOM Discovery to ensure available capacity.

Dependencies and requirements:

- Wiz advanced or standard license
- The Integration Commons for CMDB store app, which is automatically installed. See Integration Commons for CMDB.
- The CMDB CI class models store app, which is automatically installed. See CMDB CI Class Models.
- ITOM Licensing plugin (com.snc.itom.license). See Request Discovery.
- Discovery and Service Mapping Patterns (sn_itom_pattern). See Install Discovery and Service Mapping Patterns.
- Discovery Core (com.snc.discovery.core)

You must obtain the OAuth credentials associated with the Wiz service account and make a note of the following details:

- Client ID
- Client Secret
- OAuth Token URL
- Connection URL

See Set up the Wiz environment.

You must have the following permissions for the Wiz service account:

- read:resources
- read:projects

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Verify that the application scope is set to the Service Graph Connector for Wiz application by using the application picker.
   For more information, see Application picker.
2. Navigate to **All** > **Service Graph Connectors** > **Wiz** > **Setup**.
3. On the Service Graph Connector for Wiz page, verify that the **Quick Start** option is selected and then select **Continue**.
4. Configure the connection to send requests to the Wiz application.

   a. In the Configure the Connection and Credentials section of the Service Graph Connector for Wiz page, select **Start**.

   b. Configure the connection.

      i. Select the Configure the Connection task and then select **Click Here**.

      ii. On the Connections page that opens in another browser tab, select **Edit** for the **SG-Wiz** connection that is available by default.

      iii. On the form, fill in the fields.

Edit Connection form

Field	Description
Connection Name	Name to identify the connection record. For example, `SG-Wiz`. Don't modify the name for the default connection alias `SG-Wiz`.
Connection URL	Base URL to connect to your Wiz application. **Note:** Based on the region of your Wiz application, enter the connection URL in the following format: `https://api.<region>.app.wiz.io` Where *<region>* is the region where the Wiz tenant is located. For example, us1, us2, eu1, or eu2.
Client ID	Client ID of your Wiz application as described in Before you begin.
Client Secret	Client secret of your Wiz application as described in Before you begin.
OAuth Token URL	Token generation URL. This field is automatically set to the following URL: `https://auth.app.wiz.io/oauth/token`

      iv. Select **Edit and Get OAuth Token**.

      v. Return to the guided setup.

      vi. Set the Configure the Connection task to complete by selecting the **Mark as complete** check box and then select **Continue**.

   c. Configure the connection properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

i. Select the Add configuration properties task.

ii. In the Service Graph Connections section, review and modify the property details by selecting a property from the **Property** column in the Service Graph Connection Properties related list.

You can configure the following properties:

Projects

A list of comma-separated project IDs for which the resources are to be pulled.

Exclude Projects

A list of comma-separated project IDs for which the resources are excluded only when the **Projects** property isn't set. In this case, all the resources except for the specified projects are imported.

Note:
If no property is configured, data from all the Wiz projects are fetched.

iii. Select **Update** in the Service Graph Connection Properties section.

iv. Set the Add connection properties task to complete by selecting the **Mark as complete** check box and then select **Continue**.

d. Test the Wiz API connection to import data from the Wiz application.

i. Select the Test Connection task.

ii. Test the connection by selecting the **Test Connection** related link.

Testing the connection might take a few moments. The page is refreshed to show the test results.

iii. When the **Status** field is set to **Success**, select **Update**.

If any of the tests have errors, follow the suggestions for remediation.

iv. Set the Test Connection task to complete by selecting the **Mark as complete** check box and then select **Continue**.

5. Configure the scheduled jobs to import data from the Wiz application.

a. Configure the scheduled job for the complete (full) import of data during the initial execution, and then incremental (delta) import of data on subsequent executions.

i. Select the Configure the scheduled jobs task.

ii. Select the **SG-Wiz-Organization** scheduled job.

iii. On the Scheduled Data Import form, verify the field values for the scheduled job.

For more information, see Schedule a data import.

iv. Select the **Active** check box to activate the SG-Wiz-Organization scheduled job.

v. In the **Run** field, select **Periodically** to specify how often the job will run.

vi. Select **Update**.

vii. Set the Configure the scheduled jobs task to complete by selecting the **Mark as complete** check box and then select **Continue**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. Configure the Reset Last Run Datetime for SG-Wiz scheduled script to enable full pull for subsequent execution of the scheduled job.

> **Note:**
> To fetch the complete data using a data source on subsequent executions, you must remove the **Last Run Date Time** field value from a data source. The Reset Last Run Datetime for SG-Wiz scheduled script provided with the connector resets the **Last Run Date Time** field value automatically. Therefore, confirming that the SG-Wiz Organization scheduled job executes all data sources for a full pull.

i. Select the Configure the scheduled script for full data retrieval task.

ii. Select the **Active** check box to activate the SG-Wiz scheduled script.

iii. In the **Run** field, select **Periodically** to specify how often the script will run.

For more information, see Automatically run a script of your choosing.

iv. Select **Update**.

v. Set the Configure the scheduled script for full data retrieval task to complete by selecting the **Mark as complete** check box and then select **Continue**.

6. On the Service Graph Connector for Wiz page, select **Complete** to save your changes.
7. In Complete setup dialog box, select **Complete** to complete the setup.
8. In the message box that appears, select **Done**.

Target tables for storing Service Graph Connector for Wiz data

When you complete setting up the connection, you can configure the integration to periodically pull data from a Wiz project. The data is saved in tables that extend from the CMDB CI classes and other non-CMDB classes.

AWS Datacenter [cmdb_ci_aws_datacenter]

The following attributes in the AWS Datacenter [cmdb_ci_aws_datacenter] table are populated by collected data:

Attribute label	Attribute name	Wiz attribute
Name	name	name
Object ID	object_id	externalId
Region	region	externalId

Relationships created for AWS Datacenter

Parent class	Relationship type	Child class
AWS Datacenter [cmdb_ci_aws_datacenter]	Hosted on::Hosts	Cloud Service Account [cmdb_ci_cloud_service_account]
AWS Datacenter [cmdb_ci_aws_datacenter]	Reference	SG-Wiz Extension Attributes [sn_wiz_integ_extension_attributes]

Azure Datacenter [cmdb_ci_azure_datacenter]

The following attributes in the Azure Datacenter [cmdb_ci_azure_datacenter] table are populated by collected data.

Attribute label	Attribute name	Wiz attribute
Name	name	name
Object ID	object_id	externalId
Region	region	externalId

Relationships created for Azure Datacenter

Parent class	Relationship type	Child class
Azure Datacenter [cmdb_ci_azure_datacenter]	Hosted on::Hosts	Cloud Service Account [cmdb_ci_cloud_service_account]
Azure Datacenter [cmdb_ci_azure_datacenter]	Contains::Contained by	Resource Group [cmdb_ci_resource_group]
Azure Datacenter [cmdb_ci_azure_datacenter]	Reference	SG-Wiz Extension Attributes [sn_wiz_integ_extension_attributes]

Cloud DataBase [cmdb_ci_cloud_database]

The following attributes in the Cloud DataBase [cmdb_ci_cloud_database] table are populated by collected data:

Attribute label	Attribute name	Wiz attribute
Name	name	name
Object ID	object_id	externalId
Install Status	install_status	None
Type	type	nativeType

Relationships created for Cloud DataBase

Parent class	Relationship type	Child class
Cloud DataBase [cmdb_ci_cloud_database]	Hosted on::Hosts	Cloud Service Account [cmdb_ci_cloud_service_account]
Cloud DataBase [cmdb_ci_cloud_database]	Reference	SG-Wiz Extension Attributes [sn_wiz_integ_extension_attributes]
Cloud DataBase [cmdb_ci_cloud_database]	Reference	Key Value [cmdb_key_value]

Cloud DataBase Cluster [cmdb_ci_cloud_db_cluster]

The following attributes in the Cloud DataBase Cluster [cmdb_ci_cloud_db_cluster] table are populated by collected data:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Attribute label	Attribute name	Wiz attribute
Cluster ID	cluster_id	externalId
Name	name	name
Cluster Type	cluster_type	kind
Install Status	install_status	None
Vendor	vendor	None

Relationships created for Cloud DataBase Cluster

Parent class	Relationship type	Child class
Cloud DataBase Cluster [cmdb_ci_cloud_db_cluster]	Hosted on::Hosts	AWS Datacenter [cmdb_ci_aws_datacenter]
Cloud DataBase Cluster [cmdb_ci_cloud_db_cluster]	Reference	Key Value [cmdb_key_value]
Cloud DataBase Cluster [cmdb_ci_cloud_db_cluster]	Reference	SG-Wiz Extension Attributes [sn_wiz_integ_extension_attributes]

Cloud Disk Type [cmdb_ci_disk_type]

The following attributes in the Cloud Disk Type [cmdb_ci_disk_type] table are populated by collected data:

Attribute label	Attribute name	Wiz attribute
Name	name	properties.volumeType, zone
Object ID	object_id	properties.volumeType, zone

Relationship created for Cloud Disk Type

Parent class	Relationship type	Child class
Cloud Disk Type [cmdb_ci_disk_type]	Hosted on::Hosts	Google Datacenter [cmdb_ci_google_datacenter]

Cloud Function [cmdb_ci_cloud_function]

The following attributes in the Cloud Function [cmdb_ci_cloud_function] table are populated by collected data:

Attribute label	Attribute name	Wiz attribute
Name	name	name
Object ID	object_id	externalId
CodeSha256	codesha256	awsLambda_codeSha256
Install Status	install_status	None
Language	language	runtime

Service Graph Connector for Wiz properties

Service Graph Connector for Wiz properties control the behavior of the connector.

Connection properties

These connection properties are available for Service Graph Connector for Wiz.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
To open the Service Graph Connection Properties [sn_cmdb_int_util_service_graph_connection_property] table for the connector, navigate to **All** > **Service Graph Connectors** > **Wiz** > **Connections** and select the connection name. The connection properties are displayed in the Service Graph Connection Properties related list.

Connection properties for Service Graph Connector for Wiz

Property	Description
Projects	Enter a list of comma-separated Project IDs for which the resource data should be collected. For multiple entries, separate the IDs with commas.
Exclude Projects	Enter a list of comma-separated Project IDs for which the resources are excluded only when the Projects property isn't set. In this case, all the resources except for the specified projects are imported. For multiple entries, separate the names with commas.
Server Bypass	Set the value to `true` to link VM data to existing Server records instead of creating new records. If the value is set to `false`, new Server and VM records are created.
Fetch Scaleset VMs	Set the value to `true` to import Scale Set VM records. If the value is set to `false`, Scale Set VMs aren't imported.

System properties

These system properties are available for Service Graph Connector for Wiz.

Note:
To open the System Properties [sys_properties] table, enter `sys_properties.list` in the navigation filter.

System properties for Service Graph Connector for Wiz

Property	Description
sn_wiz_integ.list_resources_action.page_size	Enter the page size used in REST requests to fetch Wiz entities. • Type: string • Default value: `100` • Location: System Property [sys_properties] table

Supported Wiz types

The Wiz types and corresponding native types are imported as CMDB data and saved in tables that extend from the Configuration item [cmdb_ci] table.

For information on Wiz types and Wiz native types, see Security Graph Object Normalization on the Wiz documentation site (requires Wiz login).

Accessing the connection details of Service Graph Connector for Wiz

You can access the connection details of the Service Graph Connector for Wiz in a single view using the common connection framework (CCF) included within the Integration Commons for CMDB (sn_cmdb_int_util) store app.

With the CCF, you can access all the connections used by the Service Graph Connector for Wiz. The connection details include the connection alias, connection properties, data sources, and scheduled data imports associated with a connection. You can also test the connection. For more information, see Accessing the connection details of Service Graph Connectors.

Access the details of a Wiz connection

Access the details of a Wiz connection configured for the Service Graph Connector for Wiz.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Service Graph Connectors** > **Wiz** > **Connections**.
2. From the **Name** column of the Service Graph Connections list, select a connection.
3. On the Service Graph Connections page, view the connection details such as the connection name and alias.
4. Select a related list to view further details of the connection.
5. **Optional:** Select the **Test Connection** related link to test the connection.

Domain separation and Service Graph Connectors

Domain separation is supported for Service Graph Connectors. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Standard*

The support level is Standard but has some exceptions or special conditions.

- Includes all aspects of **Basic** level support.
- Business logic: The service provider (SP) creates or modifies processes per customer. The use cases reflect proper use of the application by multiple SP customers in a single instance.
- The instance owner must be able to configure minimum viable product (MVP) business logic and data parameters. This configuration is done per tenant, as expected for the specific application.

Sample use case: An admin must be able to make comments required when a record closes for one tenant, but not for another.

For more information on support levels, see Application support for domain separation.

How domain separation works in Service Graph Connectors

Domain separation is supported only for multi-instance Service Graph Connectors.

Note:
The Identification and Reconciliation Engine (IRE) uses strict domain separation in releases prior to San Diego. That is, hierarchical domains are not supported.

You must install the Domain Support - Domain Extensions Installer (`com.glide.domain.msp_extensions.installer`) plugin before working with the Service Graph Connectors tables. See Request domain separation.

Tables that do not have a Domain (sys_domain) column are not domain-separated. You can add a Domain (sys_domain) column to an existing table. See Add a domain field to a table.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- The import set tables are not domain-separated.
- Transform histories are not domain-separated.
- The Key Value [cmdb_key_value] and Software Instance [cmdb_software_instance] tables, which are related to the Configuration Management Database (CMDB), are not domain-separated.

For more information about domain separation for Service Graph Connectors, see the Service Graph Connector Domain Separation article in the Now Support Knowledge Base.

Domain separation for service providers

Cloud discovery solutions comparison

Comparing cloud discovery solutions provides insights on the relative strengths of each solution. The comparison showcases the number of resource types supported by the solutions across AWS, Azure, and GCP. The comparison can help you understand the capabilities of each solution and better manage your CMDB when using one or multiple methods.

Discovery and Service Mapping Patterns vs. Service Graph Connectors

ITOM Visibility offers two primary solutions for discovering cloud resources and mapping them into the Configuration Management Database (CMDB): Cloud Discovery and Service Mapping Patterns and Cloud Service Graph Connectors.

Patterns are the core of ITOM Visibility's native discovery capabilities. They provide a deeper, more dynamic, and holistic view of your infrastructure. Patterns use a variety of discovery methods: Agentless, agent-based, and cloud-native, to create a unified, business-aware view of your services. By leveraging machine learning, patterns automatically map technical components to their business context, creating rich relationships, and a comprehensive knowledge graph.

Service Graph Connectors, on the other hand, provides fast, point-in-time data ingesting from existing systems. They assist you quickly ingest data from specific sources like public cloud providers (AWS, Azure, GCP), endpoint management systems, and security or network tools.

While Service Graph Connectors provides rapid data import, Patterns provide the foundation for ongoing, automated service mapping and deeper operational insights based on regular updates from the ServiceNow Store. This difference is crucial for solving complex challenges like certificate management, firewall auditing, and a wide range of other service and operation use cases.

The choice between patterns and connectors affects coverage, level of detail, the way data is modeled in the CMDB and the frequency of update. While some resource types are supported by both solutions, the data might be populated in different CMDB CI Classes. Understanding these differences helps you plan a consistent and effective discovery strategy.

By reviewing the coverage tables for AWS, Azure, and GCP, you can

- Identify which resources are supported by patterns, by connectors, or both.
- Understand how the same resource type may be handled differently (for example, patterns may bring in all zone data, while connectors may only bring in zones tied to an instance).
- Decide on a solution per provider, considering its CI coverage or data model. For example: Use connectors to discover your GCP resources, but use patterns for AWS and Azure.

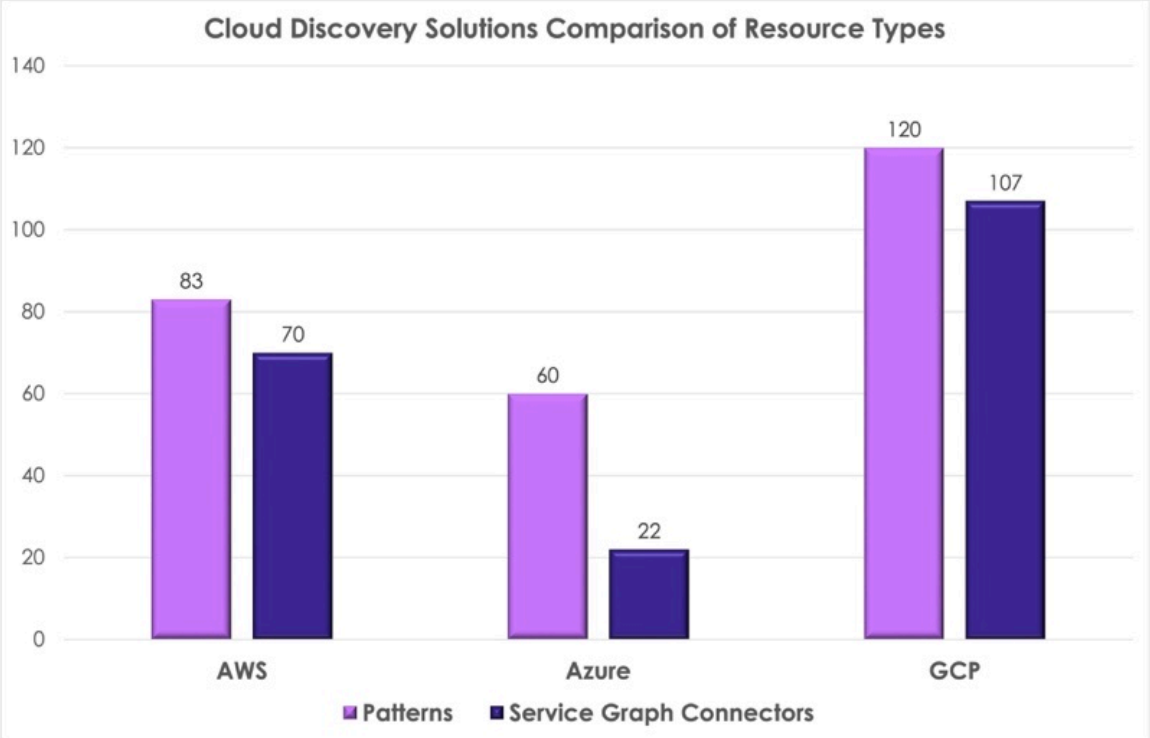
Discovery and Service Mapping Patterns and Service Graph Connectors comparison



Service Graph Connector Support Tools

You can use the ServiceNow® Service Graph Connector Support Tools application to resolve any issues or perform a general analysis on a Service Graph Connector installed on your instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Key features

The Service Graph Connector Support Tools application includes prebuilt conversations as a response to an issue type and enables resolving Service Graph Connector issues and to perform a general analysis.

The application provides capability to debug and resolve the following types of issues:

Connection issues

Depending on the data source selected, asks to update or set required properties, enables to run the Workflow Studio action corresponding to the connector manually, and provides a link to HTTP logs for verifying the response from the data source.

Data issues

Checks for customizations in Identification and Reconciliation engine (IRE) rules, reconciliation rules, business rules, and mappings. Reviews the field and import causing the issue, reprocesses the import row, and provides the complete transformation information. Also, provides additional troubleshooting steps.

Performance issues

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Depending on the data source and import set selected, makes a basic performance check and reviews the history of the Configuration Management Database (CMDB) integration executions.

Mapping issues

Reviews mappings for input and output fields using the IntegrationHub ETL store app.

The chatbot conversation also directs to the knowledge articles landing page in the Now Support knowledge base, if available for a connector.

Install Service Graph Connector Support Tools

You can install Service Graph Connector Support Tools if you have the admin role. The application installs related ServiceNow® Store applications and plugins if they are not already installed.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.

Role required: admin

About this task

The following applications or plugins are installed with Service Graph Connector Support Tools:

Integration Commons for CMDB (sn_cmdb_int_util)

Contains the CMDB Integrations Dashboard and a set of Robust Transform Engine (RTE) transforms and script includes.

Glide Virtual Agent Lite (com.glide.cs.chatbot.lite)

Provides IT service assistance using several prebuilt IT Service Management (ITSM) conversations.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Service Graph Connector Support Tools application (sn_sgc_support) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

   Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.
3. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
4. Select **Install**.

Resolving Service Graph Connector issues

You can use the Service Graph Connector Support Tools application to initiate a chatbot conversation with a virtual agent and resolve an issue or perform a general analysis on a Service Graph Connector installed on your instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If a user with the admin role has installed the Service Graph Connector Support Tools application, you can initiate a chat conversation with a virtual agent to resolve Service Graph Connector issues. The application includes prebuilt conversations as a response to an issue type.

You can use the prebuilt conversations to debug and resolve the following types of issues:

Connection issues

Depending on the data source selected, the virtual agent suggests you to update or set required properties, run the Workflow Studio action corresponding to the connector manually, and verify the response from the data source using HTTP logs.

Data issues

The virtual agent suggests you to check for customizations in Identification and Reconciliation engine (IRE) rules, reconciliation rules, business rules, and mappings. Review the field and import causing the issue, reprocess the import row, and view the complete transformation information. Also, suggests to perform additional troubleshooting steps.

Performance issues

Depending on the data source and import set selected, the virtual agent suggests you to make a basic performance check and review the history of the Configuration Management Database (CMDB) integration executions.

Mapping issues

The virtual agent suggests you to review mappings for input and output fields using the IntegrationHub ETL store app.

Resolve a Service Graph Connector issue

Resolve the Service Graph Connector issues or perform a general analysis using the Troubleshooting module available for Service Graph Connectors.

Before you begin

Install Service Graph Connector Support Tools

Role required: admin

Procedure

1. Navigate to **All** > **Service Graph Connectors** > **Troubleshooting**.
2. In the Now Support window, select **Click here to start a new conversation**.
3. Select **Show me everything**.
4. Select **Service Graph Connector Help**.
5. Select a help option.
6. Based on the selected help option, follow the help instructions to resolve an issue or perform a general analysis.
7. **Optional:** Close the conversation by selecting **End the chat**.

API Service Graph Connectors

You can use an API Service Graph Connector to import and integrate third-party API data into CMDB tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:
Visit the ServiceNow Store website to view the latest list of all API Service Graph Connectors.

Select a technology to learn about the API Service Graph Connector available for ingesting data from an application using the technology into your CMDB.

Apigee X	AWS API Gateway	Azure API Management
Boomi Cloud API Management	Kong Gateway	Kong Konnect
MuleSoft		

API Service Graph Connector for Apigee X

Use the ServiceNow® API Service Graph Connector for Apigee X to import API proxy details from an Apigee X application into the Configuration Management Database (CMDB).

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Key features

Import data into a normalized data model for consistency across other technologies.

The API Insights workspace provides a centralized interface where you can analyze and interact with API data, without needing direct access to Apigee X, enhancing visibility, governance, and collaboration across the API estate. To learn more, see API Insights.

Supported ServiceNow versions

- Yokohama
- Zurich
- Australia

Use cases

You can use the API Service Graph Connector for Apigee X to:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Maintain an end-to-end inventory of exposed and backend APIs, identifying what APIs are published, used, and by whom.
- Track APIs from customer-facing endpoints to the underlying services, identifying impacted endpoints when services change or fail and creating incidents for reported issues.
- Address vulnerabilities and security incidents related to API endpoints, and create compliance requirements to measure against.

Important information for upgrading API Service Graph Connector for Apigee X

If you're an existing customer using production instances, reach out to Now Support before upgrading to API Service Graph Connector for Apigee X v2.3.0. This upgrade alters source native keys that can impact Source [sys_object_source] table records. Coordinating with Now Support helps to prevent duplicate record creation.

Configuring a connection for the connector

You can configure a connection for the connector by using the SGC Central view in the CMDB Workspace. The view enables you to discover and install connectors, and then effectively manage the full life cycle of creating, editing, monitoring, and debugging connections. To configure the connector using SGC Central, see Configure API Service Graph Connector for Apigee X using SGC Central.

Data mapping

Data from the Apigee X data sources is mapped and transformed into the CMDB Configuration Item (CI) class definitions using the Robust Transform Engine (RTE). Data is inserted into the CMDB using the Identification and Reconciliation Engine (IRE).

When you complete setting up the connection, you can configure the integration to periodically pull data from an Apigee X application.

The following table lists the data sources in the order that they run, the staging tables, and the target tables as CMDB CI and non-CMDB classes for an Apigee X application.

Data mapping for Apigee X

Data source	Staging table	Target tables
Apigee Organization	SGA Apigee X Apigee Organization [sn_apigee_x_apigee_organization]	Google Organization Project Apigee API Gateway
Managed API	SGA Apigee X Managed API [sn_apigee_x_sga_apigee_x_managed_api]	Managed API API Deployment Apigee API Gateway
API Consumer	SGA Apigee X API Consumer [sn_apigee_x_sga_apigee_x_api_consumer]	API Consumer
API Frontend Backend	SGA Apigee X Frontend Backend [sn_apigee_x_sga_apigee_x_frontend_backend]	API Frontend

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data mapping for Apigee X (continued)

Data source	Staging table	Target tables
		API Backend
API Product	SGA Apigee X API Product [sn_apigee_x_sga_apigee_x_api_product]	API Product Bundle Key Value
API Consumer Subscription	SGA Apigee X API Consumer Subscription [sn_apigee_x_sga_apigee_x_api_consumer_subscription]	API Consumer Subscription Key Value
API Consumer Access	SGA Apigee X API Consumer Access [sn_apigee_x_sga_apigee_x_api_consumer_access]	API Consumer Access
GCP Organization	SGA Apigee X Organization [sn_apigee_x_sga_apigee_x_organization]	Cloud Organizations
GCP Folder	SGA Apigee X Folder [sn_apigee_x_sga_apigee_x_folder]	Google Organization Folder
GCP Project	SGA Apigee X Project [sn_apigee_x_sga_apigee_x_project]	Google Organization Project

For more information on where data is saved when pulling data from an Apigee X application, see Target tables for storing API Service Graph Connector for Apigee X data.

You can use the IntegrationHub ETL app to view the data maps. See IntegrationHub ETL for more information.

Record removal process

The connector supports soft deletion for CMDB CI classes only, meaning records aren't permanently removed from the system. Instead, any CMDB CI records not discovered during the last scheduled job run are marked as **Non-Operational**.

Configure API Service Graph Connector for Apigee X using SGC Central

Set up scheduled import jobs to pull in Apigee X data into your CMDB.

Before you begin

Install API Service Graph Connector for Apigee X version 1.0.0 or later from the ServiceNow Store. For ServiceNow Store installation steps, see Install a ServiceNow Store application.

Role required: The following table shows the roles required for each stage of the playbook.

Role required for each playbook stage

Stage	Role
Prerequisites	admin
Setup	SGC-Admin (sn_cmdb_int_util.sgc_admin) or admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The admin user role is required to run background scripts and to provide access to global tables to the SGC-Admin user. For information about the user roles for Service Graph Connectors, see Service Graph Connector user roles.

About this task

The playbook experience for onboarding connectors is activated with SGC Central in the Service Graph Workspace or CMDB Workspace. To configure the SGC Central application, see Configuring SGC Central and for more information on how to interact with a playbook, see Interact with Playbook.

Note:
Alternatively, you can configure a default connection already available from the installed or draft connections in SGC Central. Go to **All** > **Service Graph Connectors**, then select **Setup** for the connector from the menu. To learn about installed and draft connections, see Managing connections added for Service Graph Connectors in SGC Central.

Procedure

1. Navigate to **Workspaces** > **CMDB Workspace**.
2. In the CMDB Workspace, select **SGC Central**.
3. On the Overview page, select **Create connection**.

   Tip:
   Alternatively, you can select **Create connection** on the All connections page.

4. On the Create connection window, select the Apigee X connector type, and then select **Create connection**.
5. Complete the initial prerequisites when setting up a connection for the first time using a connector.

   Note:
   This step is required only during the first-time setup. See Perform initial setup tasks when creating a connection in SGC Central.

6. Complete the prerequisites for setting up the Apigee X environment.

   a. Set up the Apigee X environment and create a Java KeyStore (JKS) certificate to encrypt the security certificates obtained from an Apigee X application.

      i. In the **Prerequisites** stage of the playbook, select the **Review setup instructions** activity.

      ii. Review and complete the setup instructions on the API Service Graph connector for Apigee X - Setup Instructions [KBB0010364] article in the Now Support Knowledge Base.

      You must create a service account, assign roles, bind roles to the service account, enable APIs, create a P12 file, and register it in your ServiceNow instance.

      Make a note of the destination keystore password. You need to specify this password while importing the JKS certificate into the API Service Graph Connector for Apigee X application.

      iii. Select the **I have read the setup instructions** check box to confirm that you have set up the Apigee X environment according to the instructions.

      iv. Select **Continue**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. Create an X.509 certificate to associate the Java KeyStore (JKS) certificate for the Apigee X application with the connector.

> **Note:**
> You can skip this step if you're reusing a previously created certificate.

i. In the **Prerequisites** stage of the playbook, select the **Create X.509 certificate** activity.

ii. On the form, fill in the fields.

X.509 Certificate form

Field	Description
Name	Name of the X.509 certificate. For example, `ApigeeX-509Certificate`.
Key store password	Password to access the JKS certificate as noted down in the previous step.
Short description	Description of the X.509 certificate.

iii. In the Attachments section, select **Add File**.

iv. Browse and select the P12 file for the JKS certificate you created in the previous step.

v. On the Upload a file dialog box, select **Upload**.

vi. Select **Continue**.

7. Enter connection details and test the API connection for importing Apigee X data.

a. In the **Setup** stage of the playbook, select the **Create and test connection** activity.

b. On the form, fill in the fields.

Configure and test connection form

Field	Description
Connection name	Name to identify the Apigee X connection record.
Service account email	Email address associated with the ServiceNow service account used for authentication with Apigee X as noted in the previous step.
X.509 certificate	Name of the X.509 certificate as noted in the previous step.
Keystore password	Password associated with the keystore as noted in the previous step.

c. Select **Create and test connection**.

d. Once the connection test is complete, select **Continue**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Set the configuration properties for the connection.

   a. In the **Setup** stage of the playbook, select the **Set configuration properties** activity.

   b. Enter the properties.

Service Graph Connection Properties

Property	Description
Apigee identification	
Apigee organization name/GCP project id	Apigee X organization names or GCP project IDs from which data should be fetched. If left blank, data is retrieved from all permitted Apigee X organizations. For multiple values, separate them with commas.
Data retrieval configuration	
Include environments	Apigee X environments to include in the connection. For multiple environments, separate them with commas. Only API proxies in the environments listed in the *`Include environments`* property are imported. If you leave this field empty, the data sources within the connector import API proxies from all environments.
Collection period (in days)	Duration in days for collecting API usage data.
Collect usage data	Option to enable usage data collection to retrieve API usage data over a specified duration.
Expand HTTP method types	HTTP methods including `GET`, `POST`, `PUT`, `PATCH`, `DELETE`, `OPTIONS`, `HEAD`, `CONNECT`, and `TRACE`, to consider for routes. For multiple methods, separate them with commas.If left blank, results in a single API Frontend being created with the `ALL` method, indicating support for all standard HTTP methods.
GCP identification	
GCP Organization id	GCP organization ID for retrieving data from GCP Organization, GCP Folder, and GCP Project data sources.

   c. Select **Continue**.

9. Configure the import schedule to import data at regular intervals.

   a. In the **Setup** stage of the playbook, select the **Configure import schedule** activity.

   b. Expand the Parent scheduled data import within the Import schedules list to select the **Apigee Organization** import schedule associated with your connection.

> **Note:**
> The connection name is prefixed to the schedule name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. In the Configure import schedule dialog box, select the **Active** check box, and then fill in the run schedule and time details.

   For more information, see Schedule a data import.

d. Select **Save**.
   Alternatively, select **Execute Now** to execute the import schedule immediately.

e. Select **Continue**.

10. In the **Setup** stage of the playbook, select the **Confirm connection creation** activity to verify whether the connection was created.

What to do next

Select **View all connections** to review the connection details. The configured connection appears in the Installed connections list.

You can then manage connections from the SGC Central view of the CMDB Workspace. For more information, see Managing connections added for Service Graph Connectors in SGC Central.

Accessing the connection details of API Service Graph Connector for Apigee X

You can access the connection details of the API Service Graph Connector for Apigee X in a single view using the common connection framework (CCF) included within the Integration Commons for CMDB (sn_cmdb_int_util) store app.

With the CCF, you can access all the connections used by the API Service Graph Connector for Apigee X. The connection details include the connection alias, connection properties, data sources, and scheduled data imports associated with a connection. You can also test the connection. For more information, see Accessing the connection details of Service Graph Connectors.

Access the details of an Apigee X connection

Access the details of an Apigee X connection configured for the API Service Graph Connector for Apigee X.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Service Graph Connectors** > **Apigee X** > **Connections**.
2. From the **Name** column of the Service Graph Connections list, select a connection.
3. On the Service Graph Connections page, view the connection details such as the connection name and alias.
4. Select a related list to view further details of the connection.
5. **Optional:** Select the **Test Connection** related link to test the connection.

API Service Graph Connector for AWS API Gateway

Use the ServiceNow® API Service Graph Connector for AWS API Gateway to import API details from an AWS API Gateway service into the Configuration Management Database (CMDB).

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Key features

Import data into a normalized data model for consistency across other technologies.

The API Insights workspace provides a centralized interface where you can analyze and interact with API data, without needing direct access to AWS API Gateway, enhancing visibility, governance, and collaboration across the API estate. To learn more, see API Insights.

Supported ServiceNow versions

- Xanadu
- Yokohama
- Zurich

Use cases

You can use the API Service Graph Connector for AWS API Gateway to:

- Maintain an end-to-end inventory of defined APIs, identifying what APIs are published, used, and by whom.
- Track APIs from customer-facing endpoints to the underlying services, identifying impacted endpoints when services change or fail and creating incidents for reported issues.
- Address vulnerabilities and security incidents related to API endpoints, and create compliance requirements to measure against.

Configuring a connection for the connector

You can configure a connection for the connector by using the SGC Central view in the CMDB Workspace. The view enables you to discover and install connectors, and then effectively manage the full life cycle of creating, editing, monitoring, and debugging connections. To configure the connector using SGC Central, see Configure API Service Graph Connector for AWS API Gateway using SGC Central.

Data mapping

Data from the AWS API Gateway data sources is mapped and transformed into the CMDB Configuration Item (CI) class definitions using the Robust Transform Engine (RTE). Data is inserted into the CMDB using the Identification and Reconciliation Engine (IRE).

The following table lists the data sources in the order they run, the staging tables, and the target tables as CMDB CI and non-CMDB classes for an AWS API Gateway service.

Data mapping for AWS API Gateway

Data source	Staging table	Target tables
Managed API Rest	SGA-AWS Managed API Rest [sn_aws_api_gw_int_api_gateway_managed_api_import_set]	AWS API Gateway DNS Alias Managed API Key Value
Managed API V2	SGA-AWS Managed API V2 [sn_aws_api_gw_int_sga_aws_managed_api_v2]	Managed API AWS API Gateway DNS Alias Key Value
Frontend Backend REST	SGA-AWS Frontend-Backend REST [sn_aws_api_gw_int_sga_aws_frontend_backend_rest]	API Backend API Frontend
Backend V2	SGA-AWS Backend V2 [sn_aws_api_gw_int_sga_aws_backend_v2]	API Backend
Frontend V2	SGA-AWS Frontend V2 [sn_aws_api_gw_int_sga_aws_frontend_v2]	API Frontend
Deployment Rest	SGA-AWS API Gateway Deployment Rest [sn_aws_api_gw_int_sga_aws_api_gateway_deployment_rest]	API Deployment
Deployment V2	SGA-AWS API Gateway Deployment V2 [sn_aws_api_gw_int_sga_aws_api_gateway_deployment_v2]	API Deployment
Consumer	SGA-AWS Consumers [sn_aws_api_gw_int_sga_aws_consumers]	API Consumer
Policies	SGA-AWS API Gateway Policies [sn_aws_api_gw_int_sga_aws_api_gateway_policies]	API Policy
API Consumer Access	SGA-AWS-API-Consumer-Access [sn_aws_api_gw_int_sga_aws_api_consumer_access]	API Consumer Access

When you complete setting up the connection, you can configure the integration to periodically pull data from an AWS API Gateway service. For information on where data is saved when

pulling data from an AWS API Gateway service, see Target tables for storing API Service Graph Connector for AWS API Gateway data.

You can use the IntegrationHub ETL app to view the data maps. See IntegrationHub ETL for more information.

Record removal process

The connector supports soft deletion for CMDB CI classes only, meaning records are not permanently removed from the system. Instead, any CMDB CI records not discovered during the last scheduled job run are marked as **Non-Operational**.

Configure API Service Graph Connector for AWS API Gateway using SGC Central

Set up scheduled import jobs to pull in AWS API Gateway data into your CMDB.

Before you begin

Install API Service Graph Connector for AWS API Gateway version 1.0.0 or later from the ServiceNow Store. For ServiceNow Store installation steps, see Install a ServiceNow Store application.

The authentication mechanism used by the connector is AWS Signature Type (HMAC Authentication Technique) with AWS Security Token Service (STS) token. For information about permissions, see the API Service Graph Connector for AWS API Gateway - Setup Instructions [KB1962734] article in the Now Support Knowledge Base.

Role required: The following table shows the roles required for each stage of the playbook.

Role required for each playbook stage

Stage	Role
Prerequisites	admin
Setup	SGC-Admin (sn_cmdb_int_util.sgc_admin) or admin

Note:
The admin user role is required to run background scripts and to provide access to global tables to the SGC-Admin user. For information about the user roles for Service Graph Connectors, see Service Graph Connector user roles.

About this task

The playbook experience for onboarding connectors is activated with SGC Central in the Service Graph Workspace or CMDB Workspace. To configure the SGC Central application, see Configuring SGC Central and for more information on how to interact with a playbook, see Interact with Playbook.

Note:
Alternatively, you can configure a default connection already available from the installed or draft connections in SGC Central. Go to **All** > **Service Graph Connectors**, then select **Setup** for the connector from the menu. To learn about installed and draft connections, see Managing connections added for Service Graph Connectors in SGC Central.

Procedure

1. Navigate to **Workspaces** > **CMDB Workspace**.
2. In the CMDB Workspace, select **SGC Central**.
3. On the Overview page, select **Create connection**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tip:
Alternatively, you can select **Create connection** on the All connections page.

4. On the Create connection window, select the AWS API Gateway connector type, and then select **Create connection**.
5. Complete the initial prerequisites when setting up a connection for the first time using a connector.

Note:
This step is required only during the first-time setup. See Perform initial setup tasks when creating a connection in SGC Central.

6. Enter connection details and test the API connection for importing AWS API Gateway data.

   a. In the **Setup** stage of the playbook, select the **Create and test connection** activity.

   b. On the form, fill in the fields.

Create and test connection form

Field	Description
AWS API Gateway Connection Name	Name to identify the AWS API Gateway connection record. For example, `SG-AWS-API-Gateway connection`.
Access Key	Access key ID of the IAM user that has permissions to interact with the AWS resources.
Secret Key	Secret access key that corresponds to the Access key ID required for authenticating the connection securely.

   c. Select **Create and test connection**.

   d. Once the connection test is complete, select **Continue**.

7. **Optional:** Copy configuration properties from an existing AWS connection.

Note:
The Copy configuration properties activity is displayed only when an AWS connection is already set up on your instance.

   a. In the **Setup** stage of the playbook, select the **Copy configuration properties** activity.

   b. In the **AWS Connection** field, select the connection.
   The values of the following properties are copied from the selected AWS connection:

   - Standalone account ID
   - Management account ID

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Gov cloud
- STS assume role
- AWS regions
- Config aggregator name
- Config aggregator account
- Config aggregator region

c. Select **Continue**.

d. Once the connection test is complete, select **Continue**.

8. Set the configuration properties for the connection.

a. In the **Setup** stage of the playbook, select the **Set configuration properties** activity.

b. Fill in the property details.

> **Note:**
> If you select to copy the configuration properties from an existing AWS connection, the properties listed in the step 7.b are copied from the existing connection automatically.

AWS API Gateway configuration properties

Property	Description
Management account ID or standalone account ID	
Management account ID	Management account ID associated with the AWS API Gateway account.
Standalone account ID	ID of a member account associated with the AWS API Gateway account.
STS assume role name and AWS regions	
STS assume role name	STS Assume Role name of the AWS account that is used for querying the `STS Assume Role` API to obtain the API credentials.
AWS regions	List of comma-separated regions where the AWS API Gateway resides.
Config aggregator setup	
Config aggregator account ID	AWS account ID where the aggregator resource type in the AWS Config service has been configured.
Config aggregator name	Name of the aggregator resource type in the AWS Config service.
Config aggregator region	Region where the aggregator resource type resides.
API usage data	
Collect Usage Data	Option to enable usage data collection to retrieve API usage data over a specified duration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
Management account ID or standalone account ID	
Collection period in days	Duration in days for collecting API usage data.
Gov cloud setup	
Is gov cloud	Option to indicate that the connection setup is for the AWS GovCloud.

c. Select **Continue**.

9. Configure the import schedule to import data at regular intervals.

a. In the **Setup** stage of the playbook, select the **Configure import schedule** activity.

b. Expand the Parent scheduled data import within the Import schedules list to select the **Managed API Rest** import schedule associated with your connection.

Note:
The connection name is prefixed to the schedule name.

c. In the Configure import schedule dialog box, select the **Active** check box, and then fill in the run schedule and time details.

For more information, see Schedule a data import.

d. Select **Save**.
Alternatively, select **Execute Now** to execute the import schedule immediately.

e. Select **Continue**.

10. In the **Setup** stage of the playbook, select the **Confirm connection creation** activity to verify whether the connection was configured.

What to do next

Select **View all connections** to review the connection details. The configured connection appears in the Installed connections list.

You can then manage connections from the SGC Central view of the CMDB Workspace. For more information, see Managing connections added for Service Graph Connectors in SGC Central.

Additional features within the API Service Graph Connector for AWS API Gateway

Use the additional features available within the API Service Graph Connector for AWS API Gateway to maximize its use for importing data.

The following features are available within the API Service Graph Connector for AWS API Gateway:

Set partition size for AWS API Gateway accounts

Optimize the performance of parallel-loading supported data sources by configuring the partition size setting in the *PartitionSize* connection property.

Set page size for AWS API Gateway accounts

Control the number of records fetched per API call by setting the *PageSize* connection property.

Set partition size for AWS API Gateway accounts

You can optimize their performance of AWS API Gateway data sources by setting the partition size in the *PartitionSize* connection property.

Before you begin

Set the application scope to API Service Graph Connector for AWS API Gateway using the application picker. For more information, see Application picker.

Role required: admin

About this task

The parallel loading feature is available for the following AWS API Gateway data sources:

- Frontend Backend REST
- Frontend V2
- Backend V2

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Deployment Rest
- Deployment V2

This feature determines how many Managed APIs execute as parallel jobs to retrieve configuration item (CI) data. The partition size specifies how many Managed APIs a single parallel thread evaluates for data retrieval. For example, if you set the *PartitionSize* property to 5 and there are 25 Managed APIs, the application generates 5 parallel jobs during data loading.

Note:
If the *PartitionSize* property isn't configured, the partition size computation feature of the Integration Commons for CMDB application automatically determines the partition size for parallel loading at runtime. See Partition size computation for parallel loading in Integration Commons for CMDB.

Procedure

1. Navigate to **All** > **Service Graph Connectors** > **AWS API Gateway** > **Connections**.
2. From the **Name** column of the Service Graph Connections list, select a connection.
3. From the **Property** column of the Service Graph Connection Properties related list, select **PartitionSize**.
4. In the **Value** field, enter a numeric value greater than 0 for the partition size.
5. Select **Update**.

Set page size for AWS API Gateway accounts

When retrieving data from an AWS API Gateway service, you can control the number of records fetched per API call by setting the *PageSize* connection property. This affects pagination behavior when calling APIs.

Before you begin

Set the application scope to API Service Graph Connector for AWS API Gateway using the application picker. For more information, see Application picker.

Role required: admin

About this task

The *PageSize* property controls how many records are retrieved in each API request to AWS. This property affects pagination behavior across all data sources.

Example: If you set the *PageSize* property to 50 and there are 200 REST APIs in your API Service Graph Connector for AWS API Gateway account, the connector makes 4 API calls to retrieve all records.

Note:
For AWS Config Aggregator setups, the page size must not exceed 100 due to AWS API limitations on the *SelectAggregateResourceConfig* API.

Procedure

1. Navigate to **All** > **Service Graph Connectors** > **AWS API Gateway** > **Connections**.
2. From the **Name** column of the Service Graph Connections list, select a connection.
3. From the **Property** column of the Service Graph Connection Properties related list, select **PageSize**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the **Value** field, enter a numeric value depending on the configuration type.

5. Select **Update**.

Accessing the connection details of API Service Graph Connector for AWS API Gateway

You can access the connection details of the API Service Graph Connector for AWS API Gateway in a single view using the common connection framework (CCF) included within the Integration Commons for CMDB (sn_cmdb_int_util) store app.

With the CCF, you can access all the connections used by the API Service Graph Connector for AWS API Gateway. The connection details include the connection alias, connection properties, data sources, and scheduled data imports associated with a connection. You can also test the connection. For more information, see Accessing the connection details of Service Graph Connectors.

Access the details of an AWS API Gateway connection

Access the details of an AWS API Gateway connection configured for the API Service Graph Connector for AWS API Gateway.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Service Graph Connectors** > **AWS API Gateway** > **Connections**.
2. From the **Name** column of the Service Graph Connections list, select a connection.
3. On the Service Graph Connections page, view the connection details such as the connection name and alias.
4. Select a related list to view further details of the connection.
5. **Optional:** Select the **Test Connection** related link to test the connection.

API Service Graph Connector for Azure API Management

Use the ServiceNow® API Service Graph Connector for Azure API Management to import API details from an Azure API Management application into the Configuration Management Database (CMDB).

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Key features

Import data into a normalized data model for consistency across other technologies.

The API Insights workspace provides a centralized interface where you can analyze and interact with API data, without needing direct access to Azure API Management, enhancing visibility, governance, and collaboration across the API estate. To learn more, see API Insights.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported ServiceNow versions

- Yokohama
- Zurich
- Australia

Use cases

You can use the API Service Graph Connector for Azure API Management to:

- Maintain an end-to-end inventory of exposed and backend APIs, identifying what APIs are published, used, and by whom.
- Track APIs from customer-facing endpoints to the underlying services, identifying impacted endpoints when services change or fail and creating incidents for reported issues.
- Address vulnerabilities and security incidents related to API endpoints, and create compliance requirements to measure against.

Configuring a connection for the connector

You can configure a connection for the connector by using the SGC Central view in the CMDB Workspace. The view enables you to discover and install connectors, and then effectively manage the full life cycle of creating, editing, monitoring, and debugging connections. To configure the connector using SGC Central, see Configure API Service Graph Connector for Azure API Management using SGC Central.

Important:
Unless there are configuration issues, use SGC Central to configure the connection. The guided setup method for configuration is being deprecated.

Data mapping

Data from the Azure API Management data sources is mapped and transformed into the CMDB Configuration Item (CI) class definitions using the Robust Transform Engine (RTE). Data is inserted into the CMDB using the Identification and Reconciliation Engine (IRE).

When you complete setting up the connection, you can configure the integration to periodically pull data from an Azure API Management application.

The following table lists the data sources in the order they run, the staging tables, and the target tables as CMDB CI and non-CMDB classes for an Azure API Management application.

Data mapping for Azure API Management

Data source	Staging table	Target tables
API Management Services	SGA Azure API Management [sn_azure_api_gw_sga_azure_api_management]	Azure API Management Azure Subscription Cloud Service Account

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data mapping for Azure API Management (continued)

Data source	Staging table	Target tables
		Resource Group DNS Alias
Managed API	SGA Azure Managed API [sn_azure_api_gw_sga_azure_managed_api]	Managed API
API Frontend Backend	SGA Azure API Frontend Backend [sn_azure_api_gw_sga_azure_api_frontend_backend_import]	API Frontend API Backend
API GraphQL Frontend Backend	SGA Azure API GraphQL Frontend Backend [sn_azure_api_gw_sga_azure_api_graphql_frontend_backend]	API Frontend API Backend
API Consumer	SGA Azure API Consumer [sn_azure_api_gw_sga_azure_api_consumer]	API Consumer
API Product	SGA Azure API Product [sn_azure_api_gw_sga_azure_api_product]	API Product Bundle
API Consumer Subscription	SGA Azure API Consumer Subscription [sn_azure_api_gw_sga_azure_api_subscription]	API Consumer Subscription
API Tag	API Tag [sn_azure_api_gw_api_tag]	Key Value
API Consumer Access	SGA Azure API Consumer Access [sn_azure_api_gw_sga_azure_managed_api]	API Consumer Access

For more information on where data is saved when pulling data from an Azure API Management application, see Target tables for storing API Service Graph Connector for Azure API Management data.

You can use the IntegrationHub ETL app to view the data maps. See IntegrationHub ETL for more information.

Record removal process

The connector supports soft deletion for CMDB CI classes only, meaning records are not permanently removed from the system. Instead, any CMDB CI records not discovered during the last scheduled job run are marked as **Non-Operational**.

Configure API Service Graph Connector for Azure API Management using SGC Central

Set up scheduled import jobs to pull in Azure API Management data into your CMDB.

Before you begin

Install API Service Graph Connector for Azure API Management version 1.0.0 or later from the ServiceNow Store. For ServiceNow Store installation steps, see Install a ServiceNow Store application.

Obtain the OAuth credentials from your Azure administrator. Make a note of the following details:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Application (client) ID
- Client Secret
- Directory (tenant) ID
- Connection URL

Role required: The following table shows the roles required for each stage of the playbook.

Role required for each playbook stage

Stage	Role
Prerequisites	admin
Setup	SGC-Admin (sn_cmdb_int_util.sgc_admin) or admin

Note:
The admin user role is required to run background scripts and to provide access to global tables to the SGC-Admin user. For information about the user roles for Service Graph Connectors, see Service Graph Connector user roles.

About this task

The playbook experience for onboarding connectors is activated with SGC Central in the Service Graph Workspace or CMDB Workspace. To configure the SGC Central application, see Configuring SGC Central and for more information on how to interact with a playbook, see Interact with Playbook.

Note:
Alternatively, you can configure a default connection already available from the installed or draft connections in SGC Central. Go to **All** > **Service Graph Connectors**, then select **Setup** for the connector from the menu. To learn about installed and draft connections, see Managing connections added for Service Graph Connectors in SGC Central.

Procedure

1. Navigate to **Workspaces** > **CMDB Workspace**.
2. In the CMDB Workspace, select **SGC Central**.
3. On the Overview page, select **Create connection**.

   Tip:
   Alternatively, you can select **Create connection** on the All connections page.

4. On the Create connection window, select the Azure API Management connector type, and then select **Create connection**.
5. Complete the initial prerequisites when setting up a connection for the first time using a connector.

   Note:
   This step is required only during the first-time setup. See Perform initial setup tasks when creating a connection in SGC Central.

6. Enter connection details and test the API connection for importing Azure API Management data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the **Setup** stage of the playbook, select the **Create and test connection** activity.

b. On the form, fill in the fields.

Create and test connection form

Field	Description
Azure API Management Connection Name	Name to identify the Azure API Management connection record. For example, `Azure API Management Connection`.
Connection URL	Base URL to connect to the Azure API Management service. **Note:** This field is automatically set to the URL to connect to the application. Leave the field value as is.
OAuth Client ID	Application (client) ID of your Azure client application as noted in the Before you begin section.
OAuth Client Secret	Client Secret of your Azure client application as noted in the Before you begin section.

OAuth Token URL	Token URL of your Azure client application.
	
	Based on the region of your Azure client application, enter the token URL in one of the following formats:
	▪ Global
	`https://login.microsoftonline.com/<tenantid>/oauth2/v2.0/token`
	▪ US Government
	`https://login.microsoftonline.us/<tenantid>/oauth2/v2.0/token`
	▪ China
	`https://login.partner.microsoftonline.cn/<tenantid>/oauth2/v2.0/token`
	▪ Germany
	`https://login.microsoftonline.de/<tenantid>/oauth2/v2.0/token`

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Where *<tenantid>* is the tenant ID of your Azure client application as noted in the Before you begin section.

c. Select **Create and test connection**.

d. Once the connection test is complete, select **Continue**.

7. Optional: Set the configuration properties for the connection.

> **Note:**
> To skip this step, select **Continue** for the **Set configuration properties** activity.

a. In the **Setup** stage of the playbook, select the **Set configuration properties** activity.

b. Fill in the property details.

Azure API Management configuration properties

Property	Description
Azure API Management connection	
Discovery Scope	Discovery scope of the Azure client application. The available options are: **Management Group** Select **Management Group** when the ServiceNow service account has access to data within the Azure management group. **Subscription** Select **Subscription** when the ServiceNow service account has access to data within the Azure subscription only.
Subscription	
Subscription Id(s)	Subscription IDs of Azure API Management services. For multiple subscription IDs, separate them with commas. If the discovery scope is set to **Subscription** and this field is left blank, all subscriptions for the specified tenant in the credentials are discovered.
Management Group	
Management Group Id(s)	Management group IDs of Azure API Management services. For multiple management groups, separate them with commas.
Get Nested Group Subscriptions	Option to enable retrieving data from all nested child subscriptions when **Management Group** is set as the discovery scope. Disable the property to exclude nested child subscriptions.
Optional Exclusive Configuration	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
Azure API Management connection	
ExcludeServices	Azure API Management services that should be excluded from the connection. For multiple services, separate them with commas. All gateways except those listed in the *ExcludeServices* property are fetched.
ResourceGroups	Resource group name of Azure API Management services. For multiple resource groups, separate their names with commas. If you leave this field empty, the data sources within the connector import data from all the available resource groups.
Usage Data Configuration	
CollectUsageData	option to enable usage data collection to retrieve API usage data over a specified duration.

c. Select **Continue**.

8. Configure the import schedule to import data at regular intervals.

   a. In the **Setup** stage of the playbook, select the **Configure import schedule** activity.

   b. Expand the Parent scheduled data import within the Import schedules list to select the **API Management Services** import schedule associated with your connection.

   > **Note:**
   > The connection name is prefixed to the schedule name.

   c. In the Configure import schedule dialog box, select the **Active** check box, and then fill in the run schedule and time details.

   For more information, see Schedule a data import.

   d. Select **Save**.
   Alternatively, select **Execute Now** to execute the import schedule immediately.

   e. Select **Continue**.

9. In the **Setup** stage of the playbook, select the **Confirm connection creation** activity to verify whether the connection was created.

What to do next

Select **View all connections** to review the connection details. The created connection appears in the Installed connections list.

You can then manage connections from the SGC Central view of the CMDB Workspace. For more information, see Managing connections added for Service Graph Connectors in SGC Central.

Accessing the connection details of API Service Graph Connector for Azure API Management

You can access the connection details of the API Service Graph Connector for Azure API Management in a single view using the common connection framework (CCF) included within the Integration Commons for CMDB (sn_cmdb_int_util) store app.

With the CCF, you can access all the connections used by the API Service Graph Connector for Azure API Management. The connection details include the connection alias, connection properties, data sources, and scheduled data imports associated with a connection. You can also test the connection. For more information, see Accessing the connection details of Service Graph Connectors.

Access the details of an Azure API Management connection

Access the details of an Azure API Management connection configured for the API Service Graph Connector for Azure API Management.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Service Graph Connectors** > **Azure API Management** > **Connections**.
2. From the **Name** column of the Service Graph Connections list, select a connection.
3. On the Service Graph Connections page, view the connection details such as the connection name and alias.
4. Select a related list to view further details of the connection.
5. **Optional:** Select the **Test Connection** related link to test the connection.

API Service Graph Connector for Boomi Cloud API Management

Use the ServiceNow® API Service Graph Connector for Boomi Cloud API Management to import API details from a Boomi Cloud API Management application into the Configuration Management Database (CMDB).

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Key features

Import data into a normalized data model for consistency across other technologies.

The API Insights workspace provides a centralized interface where you can analyze and interact with API data, without needing direct access to a Boomi Cloud API Management application, enhancing visibility, governance, and collaboration across the API estate. To learn more, see API Insights.

Supported ServiceNow versions

- Yokohama
- Zurich
- Australia

Use cases

You can use the API Service Graph Connector for Boomi Cloud API Management to:

- Maintain an end-to-end inventory of exposed and backend APIs, identifying what APIs are published, used, and by whom.
- Track APIs from customer-facing endpoints to the underlying services, identifying impacted endpoints when services change or fail and creating incidents for reported issues.
- Address vulnerabilities and security incidents related to API endpoints and create compliance requirements to measure against.

Configuring a connection for the connector

You can configure a connection for the connector by using the SGC Central view in the CMDB Workspace. The SGC Central view enables you to discover and install connectors, and then effectively manage the full life cycle of creating, editing, monitoring, and debugging connections. To configure the connector using SGC Central, see Configure API Service Graph Connector for Boomi Cloud API Management using SGC Central.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data mapping

Data from the Boomi Cloud API Management data sources is mapped and transformed into the CMDB Configuration Item (CI) class definitions using the Robust Transform Engine (RTE). Data is inserted into the CMDB using the Identification and Reconciliation Engine (IRE).

When you complete setting up the connection, you can configure the integration to periodically pull data from a Boomi Cloud API Management application.

The following table lists the data sources in the order they run, the staging tables, and the target tables as CMDB CI and non-CMDB classes for a Boomi Cloud API Management application.

Data mapping for Boomi Cloud API Management

Data source	Staging table	Target tables
APIs	API Component [sn_boomi_api_component]	Managed API Boomi API Gateway API Frontend API Backend
API Consumer	API Consumer [sn_boomi_api_consumer]	API Consumer

For more information on where data is saved when pulling data from a Boomi Cloud API Management application, see Target tables for storing API Service Graph Connector for Boomi Cloud API Management data.

You can use the IntegrationHub ETL app to view the data maps. See IntegrationHub ETL for more information.

Configure API Service Graph Connector for Boomi Cloud API Management using SGC Central

Set up scheduled import jobs to pull in Boomi Cloud API Management data into your CMDB.

Before you begin

Install API Service Graph Connector for Boomi Cloud API Management version 1.0.0 or later from the ServiceNow Store. For ServiceNow Store installation steps, see Install a ServiceNow Store application.

Obtain the API credentials from your Boomi Cloud API Management administrator. Make a note of the following details:

- Client ID: The unique identifier for your Boomi Cloud API Management application.
- Client Secret: The secret key for authenticating your Boomi Cloud API Management application.
- Area ID: The Boomi area identifier from which data is imported.
- Area Name: The Boomi area name for your instance.

Role required: The following table shows the roles required for each stage of the playbook.

Role required for each playbook stage

Stage	Role
Prerequisites	admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required for each playbook stage (continued)

Stage	Role
Setup	SGC-Admin (sn_cmdb_int_util.sgc_admin) or admin

Note:
The admin user role is required to run background scripts and to provide access to global tables to the SGC-Admin user. For information about the user roles for Service Graph Connectors, see Service Graph Connector user roles.

About this task

The playbook experience for onboarding connectors is activated with SGC Central in the CMDB Workspace. To configure the SGC Central application, see Configuring SGC Central and for more information on how to interact with a playbook, see Interact with Playbook.

Note:
Alternatively, you can configure a default connection already available from the installed or draft connections in SGC Central. Go to **All** > **Service Graph Connectors**, then select **Setup** for the connector from the menu. To learn about installed and draft connections, see Managing connections added for Service Graph Connectors in SGC Central.

Procedure

1. Navigate to **Workspaces** > **CMDB Workspace**.
2. In the CMDB Workspace, select **SGC Central**.
3. On the Overview page, select **Create connection**.

   Tip:
   Alternatively, you can select **Create connection** on the All connections page.

4. On the Create connection window, select the Boomi connector type, and then select **Create connection**.
5. Complete the initial prerequisites when setting up a connection for the first time using a connector.

   Note:
   This step is required only during the first-time setup. See Perform initial setup tasks when creating a connection in SGC Central.

6. Enter connection details and test the API connection for importing Boomi Cloud API Management data.

   a. In the **Setup** stage of the playbook, select the **Create and test connection** activity.

   b. On the form, fill in the fields.

Create and test connection form

Field	Description
Connection name	Name to identify the Boomi connection record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	For example, `Boomi connection`.
Connection URL	Base URL to connect to the Boomi Cloud API Management service. **Note:** This field is automatically set to the URL to connect to the application. Leave the field value as is.
OAuth client ID	Client ID of your Boomi Cloud API Management application as noted in the Before you begin section.
OAuth Client secret	Client secret of the Boomi Cloud API Management application as noted in the Before you begin section.
Area ID	Boomi area identifier from which data is imported as noted in the Before you begin section.

c. Select **Create and test connection**.

d. Once the connection test is complete, select **Continue**.

7. Set the configuration properties for the connection.
   a. In the **Setup** stage of the playbook, select the **Set configuration properties** activity.
   b. In the **Area Name** field, enter the area name for your **Boomi** instance as noted in the Before you begin section.
   c. Select **Continue**.
8. Configure the import schedule to import data at regular intervals.

   a. In the **Setup** stage of the playbook, select the **Configure import schedule** activity.

   b. Expand the Parent scheduled data import within the Import schedules list to select the **APIs** import schedule associated with your connection.

   Note: The connection name is prefixed to the schedule name.

   c. In the Configure import schedule dialog box, select the **Active** check box, and then fill in the run schedule and time details.

   For more information, see Schedule a data import.

   d. Select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alternatively, select **Execute Now** to execute the import schedule immediately.

e. Select **Continue**.

9. In the **Setup** stage of the playbook, select the **Confirm connection setup** activity to verify whether the connection was created.

What to do next

Select **View all connections** to review the connection details. The created connection appears in the Installed connections list.

You can then manage connections from the SGC Central view of the CMDB Workspace. For more information, see Managing connections added for Service Graph Connectors in SGC Central.

Target tables for storing API Service Graph Connector for Boomi Cloud API Management data

When you complete setting up the connection, you can configure the integration to periodically pull data from a Boomi Cloud API Management application. The data is saved in tables that extend from the Configuration item [cmdb_ci] classes and other non-CMDB tables.

Boomi API Gateway [cmdb_ci_boomi_api_gateway]

Accessing the connection details of API Service Graph Connector for Boomi Cloud API Management

You can access the connection details of the API Service Graph Connector for Boomi Cloud API Management in a single view using the common connection framework (CCF) included within the Integration Commons for CMDB (sn_cmdb_int_util) store app.

With the CCF feature, you can access all connections for a connector. Connection details include the alias, properties, data sources, and associated scheduled data imports. In addition, you can test a connection. Additional details may appear depending on the connector type. For more information, see Accessing the connection details of Service Graph Connectors.

Access the details of a Boomi connection

Access the details of a Boomi connection configured for the API Service Graph Connector for Boomi Cloud API Management.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Service Graph Connectors** > **Boomi** > **Connections**.
2. From the **Name** column of the Service Graph Connections list, select a connection.
3. On the Service Graph Connections page, view the connection details such as the connection name and alias.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select a related list to view further details of the connection.
5. **Optional:** Select the **Test Connection** related link to test the connection.

API Service Graph Connector for Kong Gateway

Use the ServiceNow® API Service Graph Connector for Kong Gateway to import API details from a Kong Gateway application into the Configuration Management Database (CMDB).

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Key features

Import data into a normalized data model for consistency across other technologies.

The API Insights workspace provides a centralized interface where you can analyze and interact with API data, without needing direct access to Kong Gateway, enhancing visibility, governance, and collaboration across the API estate. To learn more, see API Insights.

Supported ServiceNow versions

- Yokohama
- Zurich
- Australia

Use cases

You can use the API Service Graph Connector for Kong Gateway to:

- Maintain an end-to-end inventory of exposed and backend APIs, identifying what APIs are published, used, and by whom.
- Track APIs from customer-facing endpoints to the underlying services, identifying impacted endpoints when services change or fail and creating incidents for reported issues.
- Address vulnerabilities and security incidents related to API endpoints, and create compliance requirements.

Configuring a connection for the connector

You can configure a connection for the connector by using the SGC Central view in the CMDB Workspace. The SGC Central view enables you to discover and install connectors, and then effectively manage the full life cycle of creating, editing, monitoring, and debugging connections. To configure the connector using SGC Central, see Configure API Service Graph Connector for Kong Gateway using SGC Central.

Note:
You can also include a Prometheus connection and map it to the Kong Gateway connection during setup for importing Kong Gateway metrics data using the Prometheus plugin.
To learn more about the Prometheus plugin, see Prometheus on the Kong Developer documentation site.

Data mapping

Data from the Kong Gateway data sources is mapped and transformed into the CMDB Configuration Item (CI) class definitions using the Robust Transform Engine (RTE). Data is inserted into the CMDB using the Identification and Reconciliation Engine (IRE).

When you complete setting up the connection, you can configure the integration to periodically pull data from a Kong Gateway application.

The following table lists the data sources in the order they run, the staging tables, and the target tables as CMDB CI and non-CMDB classes for a Kong Gateway application.

Data mapping for Kong Gateway

Data source	Staging table	Target tables
SG-Kong Gateway	SG-Kong Gateway [sn_kong_integ_sg_kong_gateway]	Kong Gateway
SG-Kong Workspaces	SG-Kong Workspaces [sn_kong_integ_sg_kong_workspaces]	Kong Workspace
SG-Kong Load Balancers	SG-Kong Load Balancers [sn_kong_integ_sg_kong_lbs]	Kong Load Balancer
SG-Kong Targets	SG-Kong Targets [sn_kong_integ_sg_kong_targets]	Kong Target Key Value
SG-Kong Services	SG-Kong Services [sn_kong_integ_sg_kong_services]	Managed API API Backend Key Value
SG-Kong Routes	SG-Kong Routes [sn_kong_integ_sg_kong_routes]	API Frontend
SG-Kong Consumers	SG-Kong Consumers [sn_kong_integ_sg_kong_consumers]	API Consumer
SG-Kong Plugins	SG-Kong Plugins [sn_kong_integ_sg_kong_plugins]	API Policy

For more information on where data is saved when pulling data from a Kong Gateway application, see Target tables for storing API Service Graph Connector for Kong Gateway data.

You can use the IntegrationHub ETL app to view the data maps. See IntegrationHub ETL for more information.

Configure API Service Graph Connector for Kong Gateway using SGC Central

Set up scheduled import jobs to pull in Kong Gateway data into your Configuration Management Database (CMDB).

Before you begin

Install API Service Graph Connector for Kong Gateway version 2.0.0 or later from the ServiceNow Store. For ServiceNow Store installation steps, see Install a ServiceNow Store application.

If setting up the Prometheus connection, enable the Prometheus plugin on Kong Gateway and verify that any required credentials are available. To learn more about the Prometheus plugin, see Prometheus on the Kong Developer documentation site.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: The following table shows the roles required for each stage of the playbook.

Role required for each playbook stage

Stage	Role
Prerequisites	admin
Setup	SGC-Admin (sn_cmdb_int_util.sgc_admin) or admin

Note:
The admin user role is required to run background scripts and to provide access to global tables to the SGC-Admin user. For information about the user roles for Service Graph Connectors, see Service Graph Connector user roles.

About this task

The playbook experience for onboarding connectors is activated with SGC Central in the Service Graph Workspace or CMDB Workspace. To configure the SGC Central application, see Configuring SGC Central and for more information on how to interact with a playbook, see Interact with Playbook.

Note:
Alternatively, you can configure a default connection already available from the installed or draft connections in SGC Central. Go to **All** > **Service Graph Connectors**, then select **Setup** for the connector from the menu. To learn about installed and draft connections, see Managing connections added for Service Graph Connectors in SGC Central.

Procedure

1. Navigate to **Workspaces** > **CMDB Workspace**.
2. In the CMDB Workspace, select **SGC Central**.
3. On the Overview page, select **Create connection**.

   Tip:
   Alternatively, you can select **Create connection** on the All connections page.

4. On the Create connection window, select the Kong connector type, and then select **Create connection**.
5. Complete the initial prerequisites when setting up a connection for the first time using a connector.

   Note:
   This step is required only during the first-time setup. See Perform initial setup tasks when creating a connection in SGC Central.

6. Select a template for the authentication type to create a connection.

   a. In the **Setup** stage of the playbook, select the **Select alias template** activity.

   b. Select a template type.

   - **Kong RBAC Authentication**: Select when using token-based authentication.
   - **Kong Basic Authentication**: Select when using basic authentication.

7. Enter connection details and test the API connection for importing Kong Gateway data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the **Setup** stage of the playbook, select the **Create and test connection** activity.

b. On the form, fill in the fields.

Create and test connection form

Field	Description
Connection Name	Name to identify the Kong Gateway connection record.
Host Name	Admin URL address of the *Kong Admin* API server.
Protocol	Protocol used for the connection ensuring secured communication between the client and the Kong server.
Override default port	Port used by the *Kong Admin* API.
API Key	Authentication secret to connect to the Kong Gateway service. This field appears only when **Kong RBAC Authentication** is selected in the **Select alias template** activity.
User Name	User name required for authenticating requests to the *Kong Gateway Admin* API. This field appears only when **Kong Basic Authentication** is selected in the **Select alias template** activity.
Password	Password associated with the user name required for authenticating requests. This field appears only when **Kong Basic Authentication** is selected in the **Select alias template** activity.

c. Select **Create and test connection**.

d. Once the connection test is complete, select **Continue**.

8. **Optional:** Set the configuration properties for the connection.

a. In the **Setup** stage of the playbook, select the **Set configuration properties** activity.

b. In the *Expand HTTP Method Types* field available in the Data retrieval configuration section, enter the HTTP methods including GET, POST, PUT, PATCH, DELETE, OPTIONS, HEAD, CONNECT, and TRACE, to consider for routes.
For multiple methods, separate them with commas. If left blank, results in a single API Frontend being created with the ALL method, indicating support for all standard HTTP methods.

c. In the *Exclude workspaces* field available in the Property settings section, enter the workspace that must be excluded from import.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

(Optional) For multiple workspaces, separate them with commas. For example: `workspace1,workspace2`. If you leave this field empty, the data sources within the connector import data from all the workspaces.

d. Select the **Import tags** check box available in the tag settings section, to ingest tags from the Kong Gateway service.
When selected, specify the key-value pair separator for tags in the **Tags value separator** field. If not selected, tags won't be fetched.

e. In the **Tags value separator** field available in the tag settings section, enter the separator for key and value in tags.
For example, if the tag value separator is set to `=`, the tag `env=prod` is saved with `env` as the key and `prod` as the value.

If left empty, no tags will be ingested.

f. Select the **Collect Usage Data** check box available in the Metric Settings section to enable usage data collection to retrieve API usage data over a specified duration.

g. In the **Collection period (in days)** field available in the Metric Settings section, enter the duration in days for collecting API usage data.

h. Select **Continue**.

9. Optional: Enter Prometheus connection details and test the API connection for importing Kong Gateway metrics data using the Prometheus plugin.

> **Note:**
> You can skip this step if API usage monitoring with Prometheus isn't required or if you're using an existing Prometheus instance. To skip this step, select **Skip** for the **Create and Test Prometheus Connection** activity.

a. In the **Setup** stage of the playbook, select the **Create and Test Prometheus Connection** activity.

b. On the form, fill in the fields.

Create and Test Prometheus Connection form

Field	Description
Connection Name	Name to identify the Prometheus connection record.
Connection URL	Base URL of the Prometheus HTTP API, used for fetching metrics.
User Name	User name required for authenticating requests to the Prometheus server.
Password	Password associated with the user name required for authenticating requests to the Prometheus server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Select **Create and test connection**.

d. Once the connection test is complete, select **Continue**.

10. **Optional:** Associate the Prometheus connection with a Kong Gateway connection.

> **Note:**
> You can skip this step if API usage monitoring with Prometheus isn't required. To skip this step, select **Skip** for the **Kong Prometheus Mapping** activity.

a. In the **Setup** stage of the playbook, select the **Kong Prometheus Mapping** activity.

b. In the **Prometheus Connections** field, search for and select a Prometheus connection to associate.
You can select the Prometheus connection created in step 9 or select any existing Prometheus connection during this step. If you skip step 9, select any existing Prometheus connection.

c. Select **Submit**.

A Prometheus connection can be associated with multiple Kong Gateway connections. You can update the Prometheus mapping in the Kong Gateway connection from the SGC Central view at any time. See Update a connection for a Service Graph Connector in SGC Central.

11. Configure the import schedule to import data at regular intervals.

a. In the **Setup** stage of the playbook, select the **Configure import schedule** activity.

b. Select **Configure import schedule**.

c. Expand the Parent scheduled data import within the Import schedules list to select the **SG-Kong Gateway** import schedule associated with your connection.

> **Note:**
> The connection name is prefixed to the schedule name.

d. In the Configure import schedule dialog box, select the **Active** check box, and then fill in the run schedule and time details.

For more information, see Schedule a data import.

e. Select **Save**.
Alternatively, select **Execute Now** to execute the import schedule immediately.

f. Select **Continue**.

12. In the **Setup** stage of the playbook, select the **Confirm connection creation** activity to check whether the connection was configured.

What to do next

Select **View all connections** to review the connection details. The configured connections, including the Kong Gateway connection and the Prometheus connection, if created, appear in the Installed connections list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can then manage connections from the SGC Central view of the CMDB Workspace. For more information, see Managing connections added for Service Graph Connectors in SGC Central.

Accessing the connection details of API Service Graph Connector for Kong Gateway

You can access the connection details of the API Service Graph Connector for Kong Gateway in a single view using the common connection framework (CCF) included within the Integration Commons for CMDB (sn_cmdb_int_util) store app.

With the CCF, you can access all the connections used by the API Service Graph Connector for Kong Gateway. The connection details include the connection alias, connection properties, data sources, and scheduled data imports associated with a connection. You can also test the connection. For more information, see Accessing the connection details of Service Graph Connectors.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Access the details of a Kong Gateway connection

Access the details of a Kong Gateway connection configured for the API Service Graph Connector for Kong Gateway.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Service Graph Connectors** > **Kong Gateway** > **Connections**.
2. From the **Name** column of the Service Graph Connections list, select a connection.
3. On the Service Graph Connections page, view the connection details such as the connection name and alias.
4. Select a related list to view further details of the connection.
5. **Optional:** Select the **Test Connection** related link to test the connection.

API Service Graph Connector for Kong Konnect

Use the ServiceNow® API Service Graph Connector for Kong Konnect to import API details from a Kong Konnect service into the Configuration Management Database (CMDB).

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Key features

Import data into a normalized data model for consistency across other technologies.

The API Insights workspace provides a centralized interface where you can analyze and interact with API data, without needing direct access to Kong Konnect, enhancing visibility, governance, and collaboration across the API estate. To learn more, see API Insights.

Supported ServiceNow versions

- Xanadu
- Yokohama
- Zurich

Use cases

You can use the API Service Graph Connector for Kong Konnect to:

- Maintain an end-to-end inventory of defined APIs, identifying what APIs are published, used, and by whom.
- Track APIs from customer-facing endpoints to the underlying services, identifying impacted endpoints when services change or fail and creating incidents for reported issues.
- Address vulnerabilities and security incidents related to API endpoints and create compliance requirements to measure against.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuring a connection for the connector

You can configure a connection for the connector by using the SGC Central view in the CMDB Workspace. The view enables you to discover and install connectors, and then effectively manage the full life cycle of creating, editing, monitoring, and debugging connections. To configure the connector using SGC Central, see Configure API Service Graph Connector for Kong Konnect using SGC Central.

Data mapping

Data from the Kong Konnect data sources is mapped and transformed into the CMDB Configuration Item (CI) class definitions using the Robust Transform Engine (RTE). Data is inserted into the CMDB using the Identification and Reconciliation Engine (IRE).

When you complete setting up the connection, you can configure the integration to periodically pull data from a Kong Konnect service.

The following table lists the data sources in the order they run, the staging tables, and the target tables as CMDB CI classes and non-CMDB tables for a Kong Konnect service.

Data mapping for Kong Konnect

Data source	Staging table	Target tables
Gateway	Gateway [sn_kong_konnect_gateway]	Kong Gateway DNS Alias Logical Datacenter Cloud Service Account Key Value
Data Plane Node	Data Plane Node [sn_kong_konnect_data_plane_node]	Kong Data Plane Node
Load Balancer	Load Balancer [sn_kong_konnect_load_balancer]	Kong Load Balancer
Target	Target [sn_kong_konnect_target]	Kong Target
Services	Services [sn_kong_konnect_services]	Managed API API Backend Key Value
Routes	Routes [sn_kong_konnect_routes]	API Frontend
Consumer	Consumer [sn_kong_konnect_consumer]	API Consumer
Policy	Policy [sn_kong_konnect_policy]	API Policy
Developers	Developers [sn_kong_konnect_developers]	API Consumer
Applications	Applications [sn_kong_konnect_applications]	API Consumer Subscription
API Consumer Access	API Consumer Access [sn_kong_konnect_api_consumer_access]	API Consumer Access

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information on where data is saved when pulling data from a Kong Konnect service, see Target tables for storing API Service Graph Connector for Kong Konnect data.

You can use the IntegrationHub ETL app to view the data maps. See IntegrationHub ETL for more information.

Record removal process

The connector supports soft deletion for CMDB CI classes only, meaning records are not permanently removed from the system. Instead, any CMDB CI records not discovered during the last scheduled job run are marked as **Non-Operational**.

Configure API Service Graph Connector for Kong Konnect using SGC Central

Set up scheduled import jobs to pull in Kong Konnect data into your CMDB.

Before you begin

Install API Service Graph Connector for Kong Konnect version 1.0.0 or later from the ServiceNow Store. For ServiceNow Store installation steps, see Install a ServiceNow Store application.

Role required: The following table shows the roles required for each stage of the playbook.

Role required for each playbook stage

Stage	Role
Prerequisites	admin
Setup	SGC-Admin (sn_cmdb_int_util.sgc_admin) or admin

Note:
The admin user role is required to run background scripts and to provide access to global tables to the SGC-Admin user. For information about the user roles for Service Graph Connectors, see Service Graph Connector user roles.

About this task

The playbook experience for onboarding connectors is activated with SGC Central in the CMDB Workspace. To configure the SGC Central application, see Configuring SGC Central and for more information on how to interact with a playbook, see Interact with Playbook.

Note:
Alternatively, you can configure a default connection already available from the installed or draft connections in SGC Central. Go to **All** > **Service Graph Connectors**, then select **Setup** for the connector from the menu. To learn about installed and draft connections, see Managing connections added for Service Graph Connectors in SGC Central.

Procedure

1. Navigate to **Workspaces** > **CMDB Workspace**.
2. In the CMDB Workspace, select **SGC Central**.
3. On the Overview page, select **Create connection**.

   Tip:
   Alternatively, you can select **Create connection** on the All connections page.

4. On the Create connection window, select the Kong Konnect connector type, and then select **Create connection**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Complete the initial prerequisites when setting up a connection for the first time using a connector.

   Note:
   This step is required only during the first-time setup. See Perform initial setup tasks when creating a connection in SGC Central.

6. Enter connection details and test the API connection for importing Kong Konnect data.

   a. In the **Setup** stage of the playbook, select the **Create and test connection** activity.

   b. On the form, fill in the fields.

   Create and test connection form

Field	Description
Connection name	Name to identify the Kong Konnect connection record. For example, `Kong Konnect connection`.
Personal access token	Token used to securely authenticate your identity and authorize access to your Kong Konnect account via the API

   c. Select **Create and test connection**.

   d. Once the connection test is complete, select **Continue**.

7. Set the configuration properties for the connection.

   a. In the **Setup** stage of the playbook, select the **Set configuration properties** activity.

   b. Fill in the property details.

   Kong Konnect configuration properties

Property	Description
Data retrieval configuration	
Gateway group IDs	Group IDs associated with a Kong Konnect gateway representing control plane groups consisting of self-managed control planes. For multiple IDs, separate them with commas. **Note:** The **Gateway group IDs** property is used if specified, and it overrides the Gateway IDs.
Gateway IDs	IDs of individual Kong Konnect gateways, each representing a control plane. For multiple IDs, separate them with commas.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
Data retrieval configuration	
	Note: The **Gateway IDs** property value is ignored if Gateway group IDs are specified.
Regions	List of comma-separated regions where the Kong Konnect gateway resides.
Expand HTTP method types	HTTP methods including `GET`, `POST`, `PUT`, `PATCH`, `DELETE`, `OPTIONS`, `HEAD`, `CONNECT`, and `TRACE`, to consider for routes. For multiple methods, separate them with commas. If left blank, results in a single API Frontend being created with the `ALL` method, indicating support for all standard HTTP methods.
Collect usage data	Enable usage data collection to retrieve API usage data over a specified duration.
Collection period duration	Duration for collecting API usage data. Valid values include: ▪ `15m` (Last 15 minutes) ▪ `1h` (Last 1 hour) ▪ `6h` (Last 6 hours) ▪ `12h` (Last 12 hours) ▪ `24h` (Last 24 hours) ▪ `7d` (Last 7 days) ▪ `30d` (Last 30 days) ▪ `current_week` (Current week) ▪ `previous_week` (Previous week) ▪ `current_month` (Current month) ▪ `previous_month` (Previous month)
Performance configuration	
Page size	Number of records per page. Default is `100`.
Partition size	Partition size for Kong Konnect managed APIs if parallel loading is enabled. Accepts a numeric value greater than zero. If left empty, the value is automatically calculated. **Note:** Parallel loading is available for the following data sources only: ▪ Routes ▪ Target
Tags settings	
Import tags	Option to ingest tags from the Kong Konnect gateway.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
Data retrieval configuration	
Tags value separator	Separator for key and value in tags.

c. Select **Continue**.

8. Configure the import schedule to import data at regular intervals.

   a. In the **Setup** stage of the playbook, select the **Configure import schedule** activity.

   b. Expand the Parent scheduled data import within the Import schedules list to select the **Gateway** import schedule associated with your connection.

   Note:
   The connection name is prefixed to the schedule name.

   c. In the Configure import schedule dialog box, select the **Active** check box, and then fill in the run schedule and time details.

   For more information, see Schedule a data import.

   d. Select **Save**.
   Alternatively, select **Execute Now** to execute the import schedule immediately.

   e. Select **Continue**.

9. In the **Setup** stage of the playbook, select the **Confirm connection creation** activity to verify whether the connection was created.

What to do next

Select **View all connections** to review the connection details. The configured connection appears in the Installed connections list.

You can then manage connections from the SGC Central view of the CMDB Workspace. For more information, see Managing connections added for Service Graph Connectors in SGC Central.

Accessing the connection details of API Service Graph Connector for Kong Konnect

You can access the connection details of the API Service Graph Connector for Kong Konnect in a single view using the common connection framework (CCF) included within the Integration Commons for CMDB (sn_cmdb_int_util) store app.

With the CCF, you can access all the connections used by the API Service Graph Connector for Kong Konnect. The connection details include the connection alias, connection properties, data sources, and scheduled data imports associated with a connection. You can also test the connection. For more information, see Accessing the connection details of Service Graph Connectors.

Access the details of a Kong Konnect connection

Access the details of a Kong Konnect connection configured for the API Service Graph Connector for Kong Konnect.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Service Graph Connectors** > **Kong Konnect** > **Connections**.
2. From the **Name** column of the Service Graph Connections list, select a connection.
3. On the Service Graph Connections page, view the connection details such as the connection name and alias.
4. Select a related list to view further details of the connection.
5. **Optional:** Select the **Test Connection** related link to test the connection.

API Service Graph Connector for MuleSoft

Use the ServiceNow® API Service Graph Connector for MuleSoft to import API details from a MuleSoft Anypoint Platform application into the Configuration Management Database (CMDB).

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Key features

Import data into a normalized data model for consistency across other technologies.

The API Insights workspace provides a centralized interface where you can analyze and interact with API data, without needing direct access to a MuleSoft Anypoint Platform application, enhancing visibility, governance, and collaboration across the API estate. To learn more, see API Insights.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported ServiceNow versions

- Xanadu
- Yokohama
- Zurich

Use cases

You can use the API Service Graph Connector for MuleSoft to:

- Maintain an end-to-end inventory of exposed and backend APIs, identifying what APIs are published, used, and by whom.
- Create relationships between API managers, runtime deployments, and gateway instances to understand service dependencies and identify impact when services change or fail.
- Track all managed APIs across multiple MuleSoft organizations and environments, identifying which APIs are active, deployed, and their operational status.
- Address vulnerabilities and security incidents related to API endpoints and create compliance requirements.
- Identify impacted endpoints when backend services change or fail, enabling proactive incident management and faster resolution times.

Configuring a connection for the connector

You can configure a connection for the connector by using the SGC Central view in the CMDB Workspace. The SGC Central view enables you to discover and install connectors, and then effectively manage the full life cycle of creating, editing, monitoring, and debugging connections. To configure the connector using SGC Central, see Configure API Service Graph Connector for MuleSoft using SGC Central.

Data mapping

Data from the MuleSoft Anypoint Platform data sources is mapped and transformed into the CMDB Configuration Item (CI) class definitions using the Robust Transform Engine (RTE). Data is inserted into the CMDB using the Identification and Reconciliation Engine (IRE).

When you complete setting up the connection, you can configure the integration to periodically pull data from a MuleSoft Anypoint Platform application.

The following table lists the data sources in the order they run, the staging tables, and the target tables as CMDB CI and non-CMDB classes for a MuleSoft Anypoint Platform application.

Data mapping for MuleSoft Anypoint Platform

Data source	Staging table	Target tables
Gateway	Gateway [sn_mulesoft_gateway]	Anypoint API Gateway
API Manager	Managed API [sn_mulesoft_managed_api]	Managed API Key Value [cmdb_key_value]
Frontend And Backend	Frontend And Backend [sn_mulesoft_frontend_and_backend]	Frontend

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data mapping for MuleSoft Anypoint Platform (continued)

Data source	Staging table	Target tables
		Backend
API Deployments	API Deployments [sn_mulesoft_api_deployments]	API Deployment Data Service Instance

For more information on where data is saved when pulling data from a MuleSoft Anypoint Platform application, see Target tables for storing API Service Graph Connector for MuleSoft data.

You can use the IntegrationHub ETL app to view the data maps. See IntegrationHub ETL for more information.

Configure API Service Graph Connector for MuleSoft using SGC Central

Set up scheduled import jobs to pull in MuleSoft Anypoint Platform data into your CMDB.

Before you begin

Install API Service Graph Connector for MuleSoft version 1.0.0 or later from the ServiceNow Store. For ServiceNow Store installation steps, see Install a ServiceNow Store application.

Obtain the Connected App credentials from your MuleSoft Anypoint Platform administrator. Make a note of the following details:

- Client ID: The unique identifier for your Connected App.
- Client Secret: The secret key for authenticating your Connected App.
- Directory (tenant) ID: The MuleSoft organization identifier from which data is imported.

For more information on connector setup, see the API Service Graph connector for MuleSoft - Setup Instructions [KB2560348] article in the Now Support Knowledge Base.

Role required: The following table shows the roles required for each stage of the playbook.

Role required for each playbook stage

Stage	Role
Prerequisites	admin
Setup	SGC-Admin (sn_cmdb_int_util.sgc_admin) or admin

Note:
The admin user role is required to run background scripts and to provide access to global tables to the SGC-Admin user. For information about the user roles for Service Graph Connectors, see Service Graph Connector user roles.

About this task

The playbook experience for onboarding connectors is activated with SGC Central in the CMDB Workspace. To configure the SGC Central application, see Configuring SGC Central and for more information on how to interact with a playbook, see Interact with Playbook.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Alternatively, you can configure a default connection already available from the installed or draft connections in SGC Central. Go to **All** > **Service Graph Connectors**, then select **Setup** for the connector from the menu. To learn about installed and draft connections, see Managing connections added for Service Graph Connectors in SGC Central.

Procedure

1. Navigate to **Workspaces** > **CMDB Workspace**.
2. In the CMDB Workspace, select **SGC Central**.
3. On the Overview page, select **Create connection**.

   Tip:
   Alternatively, you can select **Create connection** on the All connections page.

4. On the Create connection window, select the MuleSoft connector type, and then select **Create connection**.
5. Complete the initial prerequisites when setting up a connection for the first time using a connector.

   Note:
   This step is required only during the first-time setup. See Perform initial setup tasks when creating a connection in SGC Central.

6. Enter connection details and test the API connection for importing MuleSoft data.

   a. In the **Setup** stage of the playbook, select the **Create and test connection** activity.

   b. On the form, fill in the fields.

Create and test connection form

Field	Description
Connection name	Name to identify the MuleSoft connection record. For example, `MuleSoft connection`.
Connection URL	Base URL to connect to the MuleSoft Anypoint Platform API service. **Note:** This field is automatically set to the URL to connect to the application. Leave the field value as is.
OAuth client ID	Client ID of your MuleSoft Connected App as noted in the Before you begin section.
OAuth Client Secret	Client secret of the MuleSoft Connected App as noted in the Before you begin section.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
OAuth Token URL	Token endpoint URL used to securely authenticate your identity and authorize access to your MuleSoft Anypoint Platform API account via the API.

c. Select **Create and test connection**.

d. Once the connection test is complete, select **Continue**.

7. Set the configuration properties for the connection.

a. In the **Setup** stage of the playbook, select the **Set configuration properties** activity.

b. Fill in the property details.

MuleSoft configuration properties

Property	Description
Data retrieval configuration	
Organization id	MuleSoft organization identifier from which API data is imported. If you have multiple organizations, create separate connections for each. For multiple organizations, create separate connections for each.
Environment filter	MuleSoft environments to include in the connection. For multiple environments, separate them with commas. Only API proxies in the environments listed in the *`Environment filter`* property are imported. If you leave this field empty, the data sources within the connector import API proxies from all environments.
API Manager filter	API manager instance status filter. Accepts a single value: `active`, `inactive`, or `unregistered`. When specified, only APIs matching that status are imported. If you leave this field empty, all APIs are imported regardless of status.
Only deployed API managers	Option to import only APIs currently deployed to runtime instances.
Import deployed applications	Option to collect deployed applications from runtime manager as Data Service Instances.
Collection period (in days)	Duration in days for collecting API usage data.
Collect usage data	Option to enable usage data collection to retrieve API usage metrics over a specified duration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
Data retrieval configuration	
Tags settings	
Import tags	Option to ingest tags from the MuleSoft API Manager.
Tag key/ value indicator	Separator for key and value in tags.

c. Select **Continue**.

8. Configure the import schedule to import data at regular intervals.

a. In the **Setup** stage of the playbook, select the **Configure import schedule** activity.

b. Expand the Parent scheduled data import within the Import schedules list to select the **Gateway** import schedule associated with your connection.

> **Note:**
> The connection name is prefixed to the schedule name.

c. In the Configure import schedule dialog box, select the **Active** check box, and then fill in the run schedule and time details.

For more information, see Schedule a data import.

d. Select **Save**.
Alternatively, select **Execute Now** to execute the import schedule immediately.

e. Select **Continue**.

9. In the **Setup** stage of the playbook, select the **Confirm connection creation** activity to verify whether the connection was created.

What to do next

Select **View all connections** to review the connection details. The created connection appears in the Installed connections list.

You can then manage connections from the SGC Central view of the CMDB Workspace. For more information, see Managing connections added for Service Graph Connectors in SGC Central.

Target tables for storing API Service Graph Connector for MuleSoft data

When you complete setting up the connection, you can configure the integration to periodically pull data from a MuleSoft Anypoint Platform application. The data is saved in tables that extend from the Configuration item [cmdb_ci] classes and other non-CMDB tables.

Anypoint API Gateway [cmdb_ci_anypoint_api_gateway]

Accessing the connection details of API Service Graph Connector for MuleSoft

You can access the connection details of the API Service Graph Connector for MuleSoft in a single view using the common connection framework (CCF) included within the Integration Commons for CMDB (sn_cmdb_int_util) store app.

With the CCF feature, you can access all connections for a connector. Connection details include the alias, properties, data sources, and associated scheduled data imports. In addition, you can test a connection. Additional details may appear depending on the connector type. For more information, see Accessing the connection details of Service Graph Connectors.

Access the details of a MuleSoft connection

Access the details of a MuleSoft connection configured for the API Service Graph Connector for MuleSoft.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Service Graph Connectors** > **MuleSoft** > **Connections**.
2. From the **Name** column of the Service Graph Connections list, select a connection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the Service Graph Connections page, view the connection details such as the connection name and alias.
4. Select a related list to view further details of the connection.
5. **Optional:** Select the **Test Connection** related link to test the connection.

SGC Central

The ServiceNow® Service Graph Connector Central view also called as the SGC Central view in the Service Graph Workspace or CMDB Workspace enables you to discover and install connectors, and then effectively manage the full life cycle of creating, editing, monitoring, and debugging connections.

Get started

Explore Learn about the benefits of SGC Central and how it is used.	Configure Plan and configure your implementation.
Onboard  Onboard Service Graph Connectors to import third-part data into CMDB.	Reference Get details about installed components.

Troubleshoot and get help

- Search the Known Error Portal for known error articles
- Contact Customer Service and Support

Exploring SGC Central

Learn about the SGC Central application with a sample workflow and review the benefits it can provide for different users in your organization.

SGC Central overview

With the SGC Central application you can discover and install integration-ready Service Graph Connectors, monitor their connection performance and insights, ensure complete visibility into discovered sources and processed data, and access tools and resources for diagnosing and resolving connection issues. You access the application from the SGC Central view in the Service Graph Workspace or CMDB Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SGC Central users

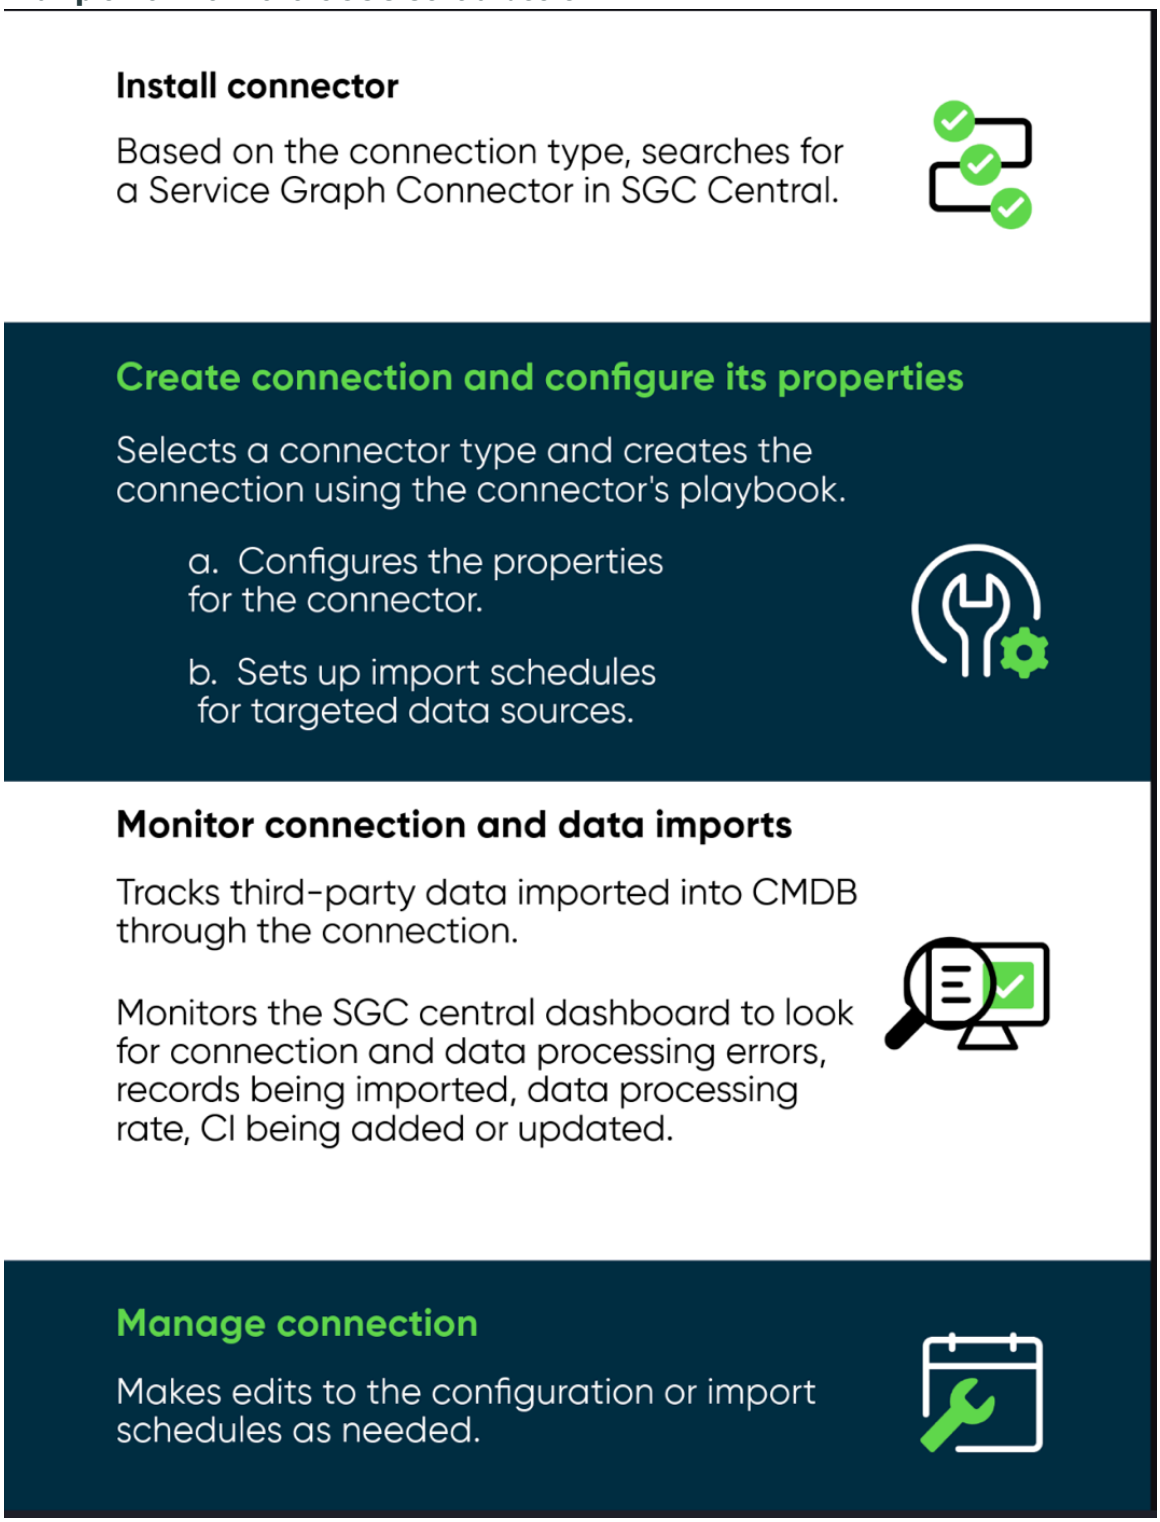
User roles

User role	Description
Administrator	Users with the admin role can install and upgrade Service Graph Connectors, including API Service Graph Connectors. Administrators can perform the following tasks: • Create a connection and configure connection properties. • Monitor connections and data imports. • Manage connections. • Upgrade the connector. • Run background scripts. • Provide access to tables in the global scope.
SGC-admin	The sn_cmdb_int_util.sgc_admin user role has the second-highest level of permissions for Service Graph Connectors. SGC-admin users can perform the following tasks: • Create, update, and delete connections. • Configure connectors using the guided setup. • Read and write the system properties that are used by the connectors. • Perform all operations that are allowed by other user roles that have lower levels of permission.
CMDB installation administrator	Users with the cmdb_inst_admin role can use IntegrationHub ETL to create and customize integrations. CMDB installation administrators can perform the following tasks: • Read all Service Graph Connector application modules. • Read and write the system properties that are used by the connectors. • Create, update, and delete custom tables. • Create, update, and delete scheduled imports and data sources. • Read records that are owned by other applications and are related to the functionality of Service Graph Connectors (for instance, records in the em_event table).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SGC Central workflow

Example workflow for the SGC Central users



A user with the SGC-admin or admin role uses SGC Central to perform the following tasks:

1. Based on the connection type, searches for a Service Graph Connector within the SGC Central view in Service Graph Workspace or CMDB Workspace.
2. Selects a connector type and creates the connection using the playbook available for the connector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Configures the properties for the connection.

b. Sets up import schedules for targeted data sources.

3. Tracks the third-party data imported by the system using the connection into CMDB.
4. Monitors the SGC Central dashboard for any errors in the connection or the data processing pipeline.
5. Makes edits to the configuration or import schedules if needed.

SGC Central benefits

SGC Central benefits

Benefit	Feature	Users
Visualize connection status	Integrated dashboard to gain instant insights into the connection status of your connectors and performance, keeping your connections running smoothly. In addition, quickly debug for seamless integration.	Administrator, SGC-admin, CMDB installation administrator
Discover integration-ready connectors	Explore and install connectors based on the connection type requirements. See which connectors have new versions available and are eligible for upgrade.	Administrator
Manage connections intuitively	Create or modify connections to your needs.	Administrator, SGC-admin

What to explore next

To learn more about configuring and using SGC Central, see:

- Configuring SGC Central
- Managing connections added for Service Graph Connectors in SGC Central
- SGC Central reference

Configuring SGC Central

Set up the SGC Central application for onboarding and maintaining Service Graph Connectors and monitoring the errors related to connections added using Service Graph Connectors.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuration checklist

1. Install SGC Central.

> **Note:**
> If you don't see the SGC Central view in the Service Graph Workspace or CMDB Workspace, clear the browser cache and try accessing the view again.

2. Configure scheduled jobs for data collection.

> **Note:**
> If you don't see data on the SGC Central dashboard, run scheduled jobs to display data on the SGC Central dashboard.

3. Onboard Service Graph Connectors within SGC Central.
4. Configure the Service Graph Connector settings within SGC Central.

Install SGC Central

You can install the SGC Central application (sn_sgc_central) if you have the admin role. The application installs related ServiceNow® Store applications and plugins if they are not already installed.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the SGC Central application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.
- Review the supported CMDB Workspace versions for the corresponding ServiceNow versions as listed in the following table.

ServiceNow versions and supported CMDB Workspace versions

ServiceNow versions	Supported CMDB Workspace versions
Australia	8.0.0 or later
Zurich	7.4.1 or later
Yokohama	7.3.0 or later

Role required: admin

About this task

The following items are installed with SGC Central:

- Plugins
- Store applications
- Scheduled jobs
- Tables

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information, see Components installed with SGC Central.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the SGC Central application (sn_sgc_central) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

   In the list next to the **Install** button, the versions that are available to you are displayed.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.
4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data are sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.
6. Select **Install**.

Configuring scheduled jobs for SGC Central

You can configure scheduled jobs to automate data collection for tracking integration performance, errors, and processing status of Service Graph Connectors within the SGC Central application.

Scheduled jobs ensure that integration performance data is consistently gathered and available for reporting and analysis within SGC Central. For more information on configuring a scheduled job, see Scheduled jobs.

Types of scheduled jobs in SGC Central

SGC Central provides different scheduled jobs to meet various data collection needs:

SGC central collection

Collects score and metric data displayed on the SGC Central dashboard for the latest integration activity. This job runs daily automatically or as configured.

> **Note:**
> As a user with the admin role, you must run this scheduled job immediately after installing SGC Central and update its schedule based on your preferences to reflect the latest integration activity.

SGC central collection onDemand with lookback

Enables on-demand collection of historical integration data for analysis. The job collects scores for a lookback period of 30 days, meaning it gathers data from 30 days ago to today (0 days ago), enabling historical data collection for performance analysis.

> **Note:**
> As a user with the admin role, you can run this scheduled job on demand, rather than on a daily schedule.

Exploring Service Graph Connectors in SGC Central

You can explore available options for onboarding and maintaining Service Graph Connectors within the SGC Central view of the Service Graph Workspace or CMDB Workspace.

Service Graph Connectors are integrations that facilitate data ingestion into the Configuration Management Database (CMDB) from various third-party sources. To learn more, see Getting started with Service Graph Connectors.

Options for maintaining Service Graph Connectors in SGC Central include:

- Updating an installed Service Graph Connector.
- Installing a Service Graph Connector using an available entitlement.
- Installing a Service Graph Connector from the ServiceNow Store.

Update an installed Service Graph Connector in SGC Central

Keep a Service Graph Connector up-to-date within SGC Central.

Before you begin

Role required: admin

Procedure

1. Use one of the following methods to open SGC Central:
   - Navigate to **Workspaces** > **Service Graph Workspace**, and from the left navigation panel, select the Ingestion icon to open the SGC Central view.
   - Navigate to **Workspaces** > **CMDB Workspace** > **SGC Central**.
2. Select **Explore connectors**.
3. In the Updates available section, review the updates that are available for a Service Graph Connector.
4. Update the connector.
   - Select a connector to access the connector in Application Manager and then install any updates.
   - Select **Install updates** to open Application Manager, and then view and install updates for a connector from the **Updates** tab.

   For more information, see Application Manager.

Install a Service Graph Connector with an available entitlement in SGC Central

Install a Service Graph Connector that matches an entitlement available in Application Manager from within the SGC Central view of the Service Graph Workspace or CMDB Workspace.

Before you begin

Role required: admin

Procedure

1. Use one of the following methods to open SGC Central:
   - Navigate to **Workspaces** > **Service Graph Workspace**, and from the left navigation panel, select the Ingestion icon to open the SGC Central view.
   - Navigate to **Workspaces** > **CMDB Workspace** > **SGC Central**.
2. Select **Explore connectors**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the Entitlements available section, select **Explore in Application Manager**.
4. In Application Manager, review the entitlements and install a connector.
   For more information, see Application Manager.

Install a Service Graph Connector from ServiceNow Store in SGC Central

Explore ServiceNow Store to request and use a Service Graph Connector with no available entitlements from within the SGC Central view of the Service Graph Workspace or CMDB Workspace.

Before you begin
Role required: admin

Procedure
1. Use one of the following methods to open SGC Central:
   - Navigate to **Workspaces** > **Service Graph Workspace**, and from the left navigation panel, select the Ingestion icon to open the SGC Central view.
   - Navigate to **Workspaces** > **CMDB Workspace** > **SGC Central**.
2. Select **Explore connectors**.
3. In the Available from ServiceNow Store section, select **Explore in ServiceNow Store**.
4. On ServiceNow Store, review the list of Service Graph Connectors and install a connector.
   For more information, see the ServiceNow Store website.

Configuring Service Graph Connector settings in SGC Central

You can view and configure settings for your Service Graph Connectors within the SGC Central view of the Service Graph Workspace or CMDB Workspace.

In SGC Central, you can configure Service Graph Connector settings related to system properties. See Configure system properties for a Service Graph Connector in SGC Central.

Configure system properties for a Service Graph Connector in SGC Central

Configure system properties for a Service Graph Connector within the SGC Central view of the Service Graph Workspace or CMDB Workspace.

Before you begin
Role required: admin

Procedure
1. Use one of the following methods to open SGC Central:
   - Navigate to **Workspaces** > **Service Graph Workspace**, and from the left navigation panel, select the Ingestion icon to open the SGC Central view.
   - Navigate to **Workspaces** > **CMDB Workspace** > **SGC Central**.
2. Select **Settings**.
3. In the Browse system properties by connector section, select an available Service Graph Connector.

> **Note:**
> When you select a connector type, the application scope changes to the selected type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. On the system properties page of the Service Graph Connector, select a property from the **Name** column.
5. Review and modify the system property.
6. Select **Save**.
7. Repeat steps from 4 to 6 for any other property.

Managing connections added for Service Graph Connectors in SGC Central

You can create and update connections added for Service Graph Connectors within the SGC Central view of the Service Graph Workspace or CMDB Workspace to ingest data into Configuration Management Database (CMDB) from third-party sources.

You can create and manage the connections for the following connectors:

- API Service Graph Connector for Apigee X
- API Service Graph Connector for AWS API Gateway
- API Service Graph Connector for Azure API Management
- API Service Graph Connector for Boomi Cloud API Management
- API Service Graph Connector for Kong Gateway
- API Service Graph Connector for Kong Konnect
- API Service Graph Connector for MuleSoft
- Service Graph Connector for Akamai API Security
- Service Graph Connector for AWS
- Service Graph Connector for GCP
- Service Graph Connector for Infoblox
- Service Graph Connector for Jamf
- Service Graph Connector for Microsoft Azure
- Service Graph Connector for Microsoft Defender Endpoint
- Service Graph Connector for Microsoft Intune
- Service Graph Connector for Microsoft SCCM
- Service Graph Connector for Observability - AppDynamics
- Service Graph Connector for Observability - Dynatrace
- Service Graph Connector for Observability - New Relic
- Service Graph Connector for SolarWinds
- Service Graph Connector for Tanium
- Service Graph Connector for Trellix
- Service Graph Connector for Wiz

What to do next

- Create a connection.

  Create a connection added for a Service Graph Connector within SGC Central.

- Update a connection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Update a connection using a Service Graph Connector within SGC Central.

- View a connection.

  View installed and draft connections that were added using Service Graph Connectors within SGC Central.

- Monitor and analyze connections.

  Monitor the installation, performance, and error handling of Service Graph Connectors from the Overview page in the Service Graph Connector Central view of the Service Graph Workspace or CMDB Workspace.

- Access IntegrationHub ETL to create and manage ETL transform maps.

  Access the IntegrationHub ETL dashboard within SGC Central to manage ETL transform maps.

Perform initial setup tasks when creating a connection in SGC Central

Complete the prerequisites for setting up a connection for the first time using a Service Graph Connector within the SGC Central view of the Service Graph Workspace or CMDB Workspace.

Before you begin

Role required: admin

About this task

During the initial connection setup with a Service Graph Connector, a few tasks appear in the Prerequisites stage. Complete these tasks before proceeding to the next steps.

Procedure

1. Create data sources for the connection.
   a. Ensure that you have edit permissions for the Datasource [sys_data_source] table.
   b. In the **Prerequisites** stage of the playbook, select the **Update data source access** activity.
   c. Select **Update access**.
   d. To edit the record, select the **Global** application scope from the application picker.
   e. In the Application Access related list of the Data Source form, select the **Can create**, **Can update**, and **Can delete** check boxes.
   f. Select **Update**.
   g. From the application picker, select the application scope of the connector.
   h. After completing the **Update data source access** activity, select **Continue**.
2. Clear the cache on the Data Source [sys_data_source] table.
   a. In the **Prerequisites** stage of the playbook, select the **Clear cache** activity.
   b. Select **Run clear cache**.
   c. In the **Run script** text box of the background script page, enter the following script:

```
GlideTableManager.invalidateTable("sys_data_source");
GlideCacheManager.flushTable("sys_data_source");
GlideTableManager.invalidateTable("sys_db_object");
GlideCacheManager.flushTable("sys_db_object");
```

   d. Select **Run Script** to run the background script in the **global** scope.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The script may take several minutes to execute.

e. After the script is executed, select **Close**.

f. From the application picker, select the application scope of the connector.

g. After completing the **Clear cache** activity, select **Continue**.

Create a connection for a Service Graph Connector in SGC Central

Create a connection added for a Service Graph Connector within the SGC Central view of the Service Graph Workspace or CMDB Workspace.

Before you begin

Role required: SGC-admin or admin

Procedure

1. Use one of the following methods to open SGC Central:
   - Navigate to **Workspaces** > **Service Graph Workspace**, and from the left navigation panel, select the Ingestion icon to open the SGC Central view.
   - Navigate to **Workspaces** > **CMDB Workspace** > **SGC Central**.
2. On the Overview page, select **Create connection**.

   Tip:
   Alternatively, you can select **Create connection** on the All connections page.

3. On the Create connection window, select a connector type and then follow the playbook instructions to create a connection.

   If the playbook experience isn't supported for a connector, follow the guided setup instructions.

   Note:
   - When you select a connector type, the application scope changes to the selected type.
   - When setting up a connection using a Service Graph Connector for the first time, you might need to complete the initial setup tasks. See Perform initial setup tasks when creating a connection in SGC Central.

Update a connection for a Service Graph Connector in SGC Central

Update a connection configured for a Service Graph Connector within the SGC Central view of the Service Graph Workspace or CMDB Workspace.

Before you begin

Role required: SGC-admin or admin

Procedure

1. Use one of the following methods to open SGC Central:
   - Navigate to **Workspaces** > **Service Graph Workspace**, and from the left navigation panel, select the Ingestion icon to open the SGC Central view.
   - Navigate to **Workspaces** > **CMDB Workspace** > **SGC Central**.
2. Select **All connections**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select the **Installed** tab.
4. Select a connection from the **Connection** column.

> **Note:**
> When you select a connection, the application scope changes to the selected connector type.

5. On the **Details** tab, review and modify the details for a connection.
6. Select **Update and test connection**.
7. **Optional:** Select a tab to view further details of the connection, such as data sources, import schedules, and any errors.
   Additional tabs might appear depending on the connector type.

What to do next

If there are any errors and the Service Graph Connector diagnosis skill is enabled, you can diagnose the error using Now Assist. To learn more, see Diagnose a processing error in SGC Central;

Viewing connections for a Service Graph Connector in SGC Central

You can view installed and draft connections that were added using Service Graph Connectors within the SGC Central view of the Service Graph Workspace or CMDB Workspace.

The following connection types are available for viewing:

- Installed connection (see View an installed connection in SGC Central.)
- Draft connection (see View a draft connection in SGC Central.)

View an installed connection in SGC Central

View the details of an installed connection that was added using a Service Graph Connector within the SGC Central view of the Service Graph Workspace or CMDB Workspace.

Before you begin

Role required: SGC-admin or admin

Procedure

1. Use one of the following methods to open SGC Central:
   - Navigate to **Workspaces** > **Service Graph Workspace**, and from the left navigation panel, select the Ingestion icon to open the SGC Central view.
   - Navigate to **Workspaces** > **CMDB Workspace** > **SGC Central**.
2. Select **All connections**.
3. Select the **Installed** tab.
4. Review the list of installed connections.
5. Select a connection from the **Connection** column to view the details, data sources, import schedules, and errors associated with the connection.

> **Note:**
> When you select a connection, the application scope changes to the selected connector type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

View a draft connection in SGC Central

View the details and resume setting up draft connections.

Before you begin

Role required: SGC-admin or admin

Procedure

1. Use one of the following methods to open SGC Central:
   - Navigate to **Workspaces** > **Service Graph Workspace**, and from the left navigation panel, select the Ingestion icon to open the SGC Central view.
   - Navigate to **Workspaces** > **CMDB Workspace** > **SGC Central**.
2. Select **All connections**.
3. Select the **Drafts** tab.
4. Review the list of draft connections.
5. Complete setting up the draft connections.
   - Select **Configure** to continue where a Service Graph Connector was last configured within SGC Central.
   - Select **Resume setup** to set up a single instance connector for the first time.

Note:
When you select a connection, the application scope changes to the selected connector type.

Monitoring and analyzing connections added for Service Graph Connectors in SGC Central

The Overview page in the Service Graph Connector Central (SGC Central) view of the Service Graph Workspace or CMDB Workspace provides a centralized dashboard view for administrators to monitor the installation, performance, and error handling of Service Graph Connectors.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Access the SGC Central Overview page

To open the dashboard, navigate to either **Service Graph Workspace** > **SGC Central** or **CMDB Workspace** > **SGC Central**.

Required roles

- SGC-admin
- admin

Use cases

For examples of how different people in your organization would use this dashboard, see these use cases.

User	Dashboard use
Administrators or SGC-admin	Proactively monitor, analyze, and optimize data imports to identify issues and track performance.

Overview page features

Use the Overview page to monitor and troubleshoot your Service Graph Connectors connections through dedicated sections, filters, indicators, and visual reports and gain insights on the performance of Service Graph Connectors.

Feature description

Feature	Description
Connections overview	Displays the current state of your configured Service Graph Connector connections, including status, execution results, and error summaries.
Ingested and processed data	Displays key metrics related to the data imported and processed from third-party applications.
Data processing performance	Displays how many configuration items (CIs) were added or updated over time, in addition to the number of processing errors.
Filters	Enables narrowing the data shown in graphs and metrics based on connector type, connection, data source, or date range.
Indicators	Enables viewing of high-level metrics that reflect the volume and quality of imported data and help identify issues such as incomplete or failed import set processing.
Reports	Enables real-time visualizations that provide insights into data ingestion, processing trends, and error categorization across your Service Graph Connector connections.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connections overview

Displays the current state of your configured Service Graph Connector connections, including status, execution results, and error summaries.

Connections overview section

Card	Description	Card summary table
Connection status	Percentage of connections tested successfully based on connection status, with the count of success, error, and unknown statuses.	The connection status summary table displays the following details: **Connection** Displays the name of the configured Service Graph Connector. Each entry links to more details about the connection. **Connector type** Displays the Service Graph Connector type as the integration source or platform for the connection. **Connection status** Displays the current state of each connection. Valid values include: **Success** All connections were configured and tested without errors. **Error** Connection configuration issues encountered during setup. **Error summary** Provides a short description of the most recent connection error, if any. **Updated on** Displays the timestamp of the last connection status update for each connection in the following format: `YYYY-MM-DD HH:MM:SS`.
Processing status	Percentage of connections for which all data import runs in the last import execution were successful, with the count of success and error statuses.	The processing status summary table displays the following details: **Connection** Displays the name of the configured Service Graph Connector. Each entry links to more details about the connection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connections overview section (continued)

Card	Description	Card summary table
	Note: Only import sets that encountered errors during their last execution are counted as processing errors and shown on the card.	**Last processing status** Indicates the result of the most recent processing run. Valid values include: **Success** All scheduled jobs completed without errors. **Error** One or more jobs encountered issues during processing. **Activated schedules** Indicates the number of scheduled jobs that are activated for importing the data using the connection. **Processed** Indicates the total number of import set runs that were executed for the connection. **Success** Indicates how many of the processed import set runs completed successfully. **Error** Displays the number of import set runs that ended in an error, including those import sets that were canceled. **Error summary** Provides a short description of the most recent error, if any. The summary includes error type and cause. A **View details** link may be available for diagnosing a processing error. To learn more, see Diagnose a processing error in SGC Central. **Last processed on** Displays the timestamp of the last processing activity for the import set of the connection, including both successful and failed runs in the following format: `YYYY-MM-DD HH:MM:SS`.
Ongoing executions	Number of connections where data import execution is in progress.	The ongoing execution status summary table displays the following details: **Connection**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connections overview section (continued)

Card	Description	Card summary table
		Displays the name of the configured Service Graph Connector. Each entry links to more details about the connection. **Activated schedules** Indicates the number of scheduled jobs that are activated for importing the data using the connection. **In progress** Displays how many scheduled jobs are currently running for the connection. **Processed** Displays the number of completed executions, where data has been collected and processed according to the configured scheduled job. **Processing time** Indicates the total duration taken by the most recent completed import set execution in the following format `YYYY-MM-DD HH:MM:SS`.

Ingested and processed data

Displays key metrics related to the data imported and processed from third-party applications.

Ingested and processed data section

Card	Description	Indicators
Import sets	Number of import sets processed by data sources based on the selected filters, with the count of success, partial, and error statuses. Select the **View all import sets** link to view a complete list of processed import sets.	SGC.Integrations.ImportSet SGC.Fully.successful.ImportSet SGC.Part.success.ImportSet SGC.Fully.error.ImportSet
Imported rows	Count of rows imported across all import sets based on the selected filters. Select the **View all latest import set rows ingested** link to view a complete list of import set rows ingested.	SGC.Integrations.Importset.rows.ingested

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Ingested and processed data section (continued)

Card	Description	Indicators
CIs	Total CIs processed based on the selected filters, with the count of added and updated CIs. Select the **View all inserted and updated records** link to view a complete list of inserted and updated CIs.	None
Partial or incomplete CIs	Total CIs that are partial payloads based on the selected filters, with the count of partial and incomplete categories. Select the **View all partial and incomplete records** link to view a complete list of partial and incomplete CIs.	None

Data processing performance

Displays how many configuration items (CIs) were added or updated over time, in addition to the number of processing errors.

Data processing performance section

Card	Description	Indicators
CIs and errors trends	Daily trends for CIs that were added, updated, and any data processing errors occurred during data import process based on the selected filters.	Records added Records updated Errors
Processing time	Top 10 connections by the latest import set processing time. Select the **View all latest import sets** link to view a complete list of import sets.	None
Processing errors	Top 10 connections with the highest number of data processing errors, with a breakup by data source, connection, and credential issues. Select the **View all latest errors** link to view a complete list of processing errors.	None

Filters

Enables narrowing the data shown in graphs and metrics based on connector type, connection, data source, or date range.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Type	Description
Connector type	List	Filters a list of installed Service Graph Connectors.
Connection	List	Filters a list of connection records for the Service Graph Connectors.
Data source	List	Filters a list of data sources for the Service Graph Connectors.
Date range	Date	Filters the SGC Central dashboard data based on the date range selected.

Indicators

Enables viewing of high-level metrics that reflect the volume and quality of imported data and help identify issues such as incomplete or failed import set processing.

Records added

Total number of records that were inserted into the system on the previous day, as recorded in the sn_cmdb_int_util_cmdb_integration_execution_audit table. The score is calculated by counting the number of records updated on the specified day, based on operations that were marked as inserted in the audit log.

Records updated

Total number of records that were updated in the system on the previous day, as recorded in the sn_cmdb_int_util_cmdb_integration_execution_audit table. The score is calculated by counting the number of records updated on the specified day, based on operations that were marked as Updated in the audit log.

Records added or updated

Total number of records that were added or updated in the system on the previous day, as recorded in the sn_cmdb_int_util_cmdb_integration_execution_audit table. The score is calculated by counting the number of records inserted or updated on the specified day, based on operations that were marked as Inserted or Updated in the audit log.

Errors

Total number of errors categorized under credentials, data source, or connection issues that occurred during integration executions on the previous day, as recorded in the sn_cmdb_int_util_cmdb_integration_execution_error table. The score is calculated by counting the number of errors on the specified day.

SGC.processing.errors

Number of processing errors categorized under data source issues that occurred during integration executions on the previous day, as recorded in the sn_cmdb_int_util_cmdb_integration_execution_error table. The score is calculated by counting the number of errors on the specified day.

SGC.connection.errors

Total number of errors categorized under credentials or connection issues that occurred during integration executions on the previous day, as recorded in the sn_cmdb_int_util_cmdb_integration_execution_error table. The score is calculated by counting the number of errors on the specified day.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SGC.Integrations.ImportSet

Total number of import sets that were either completed successfully or encountered errors during their transformation process on the previous day, as recorded in the sn_cmdb_int_util_cmdb_integration_execution_import_set table. The score is calculated by counting the total number of import sets on the specified day.

SGC.Fully.successful.ImportSet

Total number of import sets that were completed successfully during their transformation process on the previous day, as recorded in the sn_cmdb_int_util_cmdb_integration_execution_import_set table. The score is calculated according to this formula: `Count of import sets with Errors = 0`.

SGC.Fully.error.ImportSet

Total number of import sets that completed with errors during their transformation process on the previous day, as recorded in the sn_cmdb_int_util_cmdb_integration_execution_import_set table. The score is calculated according to this formula: `Count of import sets with Errors ≠ 0 and Rows = Errors`.

SGC.Part.success.ImportSet

Total number of import sets that completed with some errors where the number of rows processed differs from the number of errors reported on the previous day, as recorded in the sn_cmdb_int_util_cmdb_integration_execution_import_set table. The score is calculated according to this formula: `Count of import sets with Errors ≠ 0 and Rows ≠ Errors`.

SGC.Integrations.Importset.rows.ingested

Total number of rows ingested for the import sets on the previous day, as recorded in the sn_cmdb_int_util_cmdb_integration_execution table. The score is calculated according to this formula: `Sum of rows ingested`.

SGC.Integrations.Processing Rate

Average processing rate of import sets based on the total number of rows processed and the total processing time (in hours) for the import sets that either completed successfully or encountered errors on the previous day, as recorded in the sn_cmdb_int_util_cmdb_integration_execution table. The score is calculated according to this formula: `Sum of rows processed/Total time (in hours)`.

Reports

Enables real-time visualizations that provide insights into data ingestion, processing trends, and error categorization across your Service Graph Connector connections.

Title	Type	Source table	Description
Affected CIs and errors	Relative compare ( )	CMDB Integration Execution Error [sn_cmdb_int_util_cmdb_integration_execution_error]	Displays configuration items (CIs) added, updated, and cumulative errors occurred during data import over time.
Error breakdown	Column ( )	CMDB Integration Execution Error [sn_cmdb_int_util_cmdb_integration_execution_error]	Displays the count of errors grouped over time

Title	Type	Source table	Description
Import set rows ingested	Single score (42)	CMDB Integration Execution Import Set [sn_cmdb_int_util_cmdb_integration_execution_import_set]	Displays the number of import set rows ingested in a day.
Import set processing rate	Single score (42)	CMDB Integration Execution [sn_cmdb_int_util_cmdb_integration_execution]	Displays the average rate at which an import set processes data within an hour.
Records added or updated	Single score (42)	CMDB Integration Execution Audit [sn_cmdb_int_util_cmdb_integration_execution_audit]	Displays the number of records that were added or updated in CI classes.
Total import sets	Single score (42)	CMDB Integration Execution Import Set [sn_cmdb_int_util_cmdb_integration_execution_import_set]	Displays the number of import sets initiated by data sources in the given time frame and the count of import sets categorized by their status.
Updated classes	Column ( )	CMDB Integration Execution Audit [sn_cmdb_int_util_cmdb_integration_execution_audit]	Displays the breakdown of updated and ingested CIs for a class.

Diagnose a processing error in SGC Central

Diagnose processing errors in connections configured for a Service Graph Connector and resolve them within the SGC Central view of the Service Graph Workspace or CMDB Workspace using recommendations from Now Assist.

Before you begin

Verify that the Service Graph Connector diagnosis skill is enabled. For more information, see Configure the Service Graph Connector diagnosis skill.

Role required: SGC-admin or admin

Procedure

1. Use one of the following methods to open SGC Central:
   - Navigate to **Workspaces** > **Service Graph Workspace**, and from the left navigation panel, select the Ingestion icon to open the SGC Central view.
   - Navigate to **Workspaces** > **CMDB Workspace** > **SGC Central**.
2. On the Overview page, select the **Processing status** card.

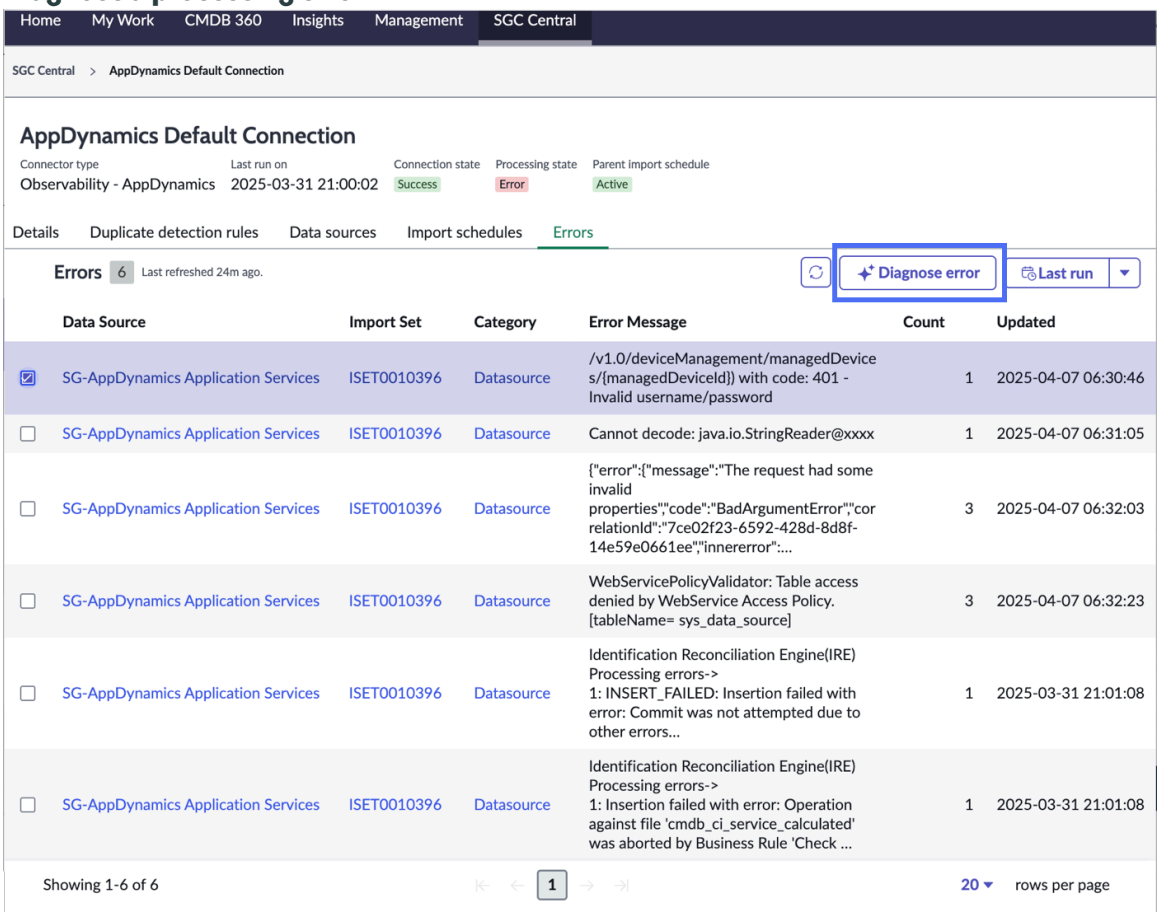
> **Note:**
> On the **Processing status** card, only import sets with errors in the last import execution are counted as processing errors, and their count is displayed. However, the Error column in the summary table, which displays more details about the processing status, also includes canceled import sets. As a result, the error count on the Processing status card might not match the number of errors displayed in the summary table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. When an error count is displayed on the **Processing status** card, select the **View details** link from the error summary for the connection.
4. On the **Errors** tab, select an error for a failed import set.

Note:
You can diagnose only one error at a time. The **Diagnose Error** button is enabled only when you select an error from the list.

Diagnose a processing error



5. Select **Diagnose error**.

Result
Now Assist triggers the diagnosis process for the processing error. The Error diagnosis window includes two key sections: Explanation and Recommendation, each focused on explaining the error and providing a solution to resolve it. The recommendation is based on a knowledge article matched using AI Search. A link to the knowledge article is provided in the Source section for additional guidance.

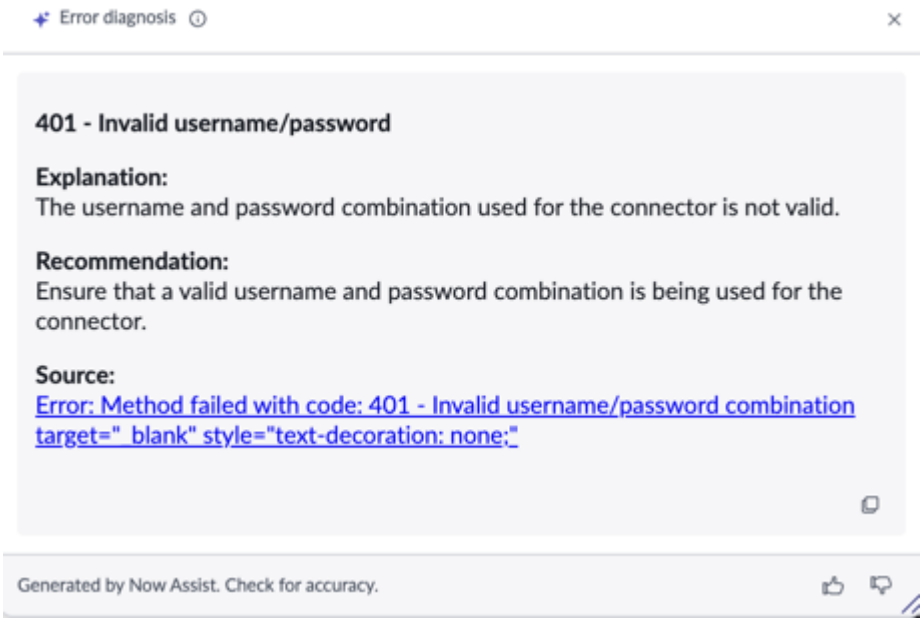
Error diagnosis result



Accessing the IntegrationHub ETL dashboard in SGC Central

You can access the IntegrationHub ETL dashboard within the SGC Central view of the Service Graph Workspace or CMDB Workspace to manage ETL transform maps.

IntegrationHub ETL is a tool for creating and managing ETL transform maps to integrate third-party data into the CMDB or non-CMDB tables. Select **Go to IntegrationHub ETL Home** to view the IntegrationHub ETL home page.

To learn about the IntegrationHub ETL store app, see IntegrationHub ETL.

Access IntegrationHub ETL in SGC Central

The IntegrationHub ETL dashboard provides a centralized platform for monitoring ETL processes within the SGC Central view of the Service Graph Workspace or CMDB Workspace.

Before you begin

Role required: admin

Procedure

1. Use one of the following methods to open SGC Central:
   - Navigate to **Workspaces** > **Service Graph Workspace**, and from the left navigation panel, select the Ingestion icon to open the SGC Central view.
   - Navigate to **Workspaces** > **CMDB Workspace** > **SGC Central**.
2. Select **IntegrationHub ETL**.
3. In the ETL definitions section of the IntegrationHub ETL page, select a category to view more details about the selected ETL definition.

ETL definitions

Category	Description
Total	Total number of ETL definitions configured within the system.
Active	Number of ETL processes that are currently active and running.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Description
Scheduled	Number of ETL processes that are scheduled for future execution.

4. To open the home page of the IntegrationHub ETL store app, select **Go to IntegrationHub ETL Home**.

SGC Central reference

Reference topics provide additional information about SGC Central components.

Components installed with SGC Central

Several types of components are installed with activation of the SGC Central (sn_sgc_central) plugin, including tables, user roles, and scheduled jobs.

Scheduled jobs installed

Scheduled job	Description
SGC central collection	Reads from the imports brought in by the connectors and updates the dashboard data.
SGC central collection onDemand with lookback	Collects historical data for the lookback period from when the data is retrieved for connectors. The default lookback period is set to 30 days.

Tables installed

Table	Description
Connection Record Tabs [sn_sgc_central_connection_record_tabs]	Includes the tabs displayed on the page to edit connection, including default tabs like Details, Data Sources, Scheduled Imports, and Errors, and additional tabs specific to individual connectors, arranged by order.
Connection property config [sn_sgc_central_conn_prop_config]	Stores the connection property fields for the Connection Properties tab displayed on the page to create or edit a connection, including group ordering, descriptions, mandatory fields, and default values for auto-population.
Service Graph Connection Trigger [sn_sgc_central_service_graph_connection_trigger]	Stores the trigger record to initialize playbook context in the create connection flow when a new record is inserted. The playbook is selected based on the referred metadata record's

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
	application scope field that is the Service Graph Connector scope.
Service Graph Connector [sn_sgc_central_service_graph_connector]	Stores Service Graph Connector details such as scope, app ID, and associated provider.
SGC Installed Connection [sn_sgc_central_st_installed_connection]	Stores all installed or draft connections, including details such as connection, processing status, last run, and import frequency information.
SGC IntegrationHub ETL [sn_sgc_central_st_integrationhub_etl]	Stores the Extract Transform Load (ETL) list for display under the IntegrationHub ETL list view in SGC Central.

ServiceNow Store applications installed

Application	Description
Integration Commons for CMDB (sn_cmdb_int_util)	Contains the CMDB Integrations Dashboard and a set of Robust Transform Engine (RTE) transforms and script includes.
CMDB Workspace (sn_cmdb_ws)	Provides a single place to access CMDB-focused features including SGC Central.

Domain separation and SGC Central

Domain separation is unsupported for SGC Central. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: No support

- The domain field may exist on data tables but there is no business logic to manage the data.
- This level is not considered domain-separated.

For more information on support levels, see Application support for domain separation.

Domain separation for service providers

Manage instance data sources

Data management is critical to success in all aspects of your business. Platform tools give you full control over your data, whether in instances, databases, or third-party applications.

Instance Data Replication IDR Synchronize data between instances in one-to-one or one-to-many database relationships.	**MetricBase** Simplify working with large amounts of data and create time-based analyses.	**MID Server** Communicate and transmit data between ServiceNow instances and external applications.
Financial Services Remote Tables Connect your instance on the ServiceNow AI Platform to third-party sources.	**Entity View Action Mapper (EVAM)**  Standardize and chart out all data from multiple sources.	

Instance Data Replication (IDR)

Keep your records consistent across any instances or organizations in your business. Instance Data Replication lets you transfer data from one producer instance to one or more consumer instances. Bidirectional (consumer-to-producer) replication is available with IDR, along with specific data table selection, localization or translation, and other options.

MetricBase

Make large data easier to handle with MetricBase. This app summarizes information from larger data sources, and provides time-based records, analytics, and timed or event-based actions. Create graphs of data over time with Reporting to analyze system trends or incidents, or use Workflow Studio to trigger automated data flows.

MID Server

Communicate and share data with external servers, databases, and applications. The Java-based Management, Instrumentation, and Discovery (MID) Server handles various communications from your instance to third-party systems. Maintain optimum performance with automated upgrades, active server monitoring, and a full troubleshooting knowledge base—all included in the MID Server package.

Financial Services Remote Tables

Bring external data into your instance and process it to your specifications with Financial Services Remote Tables. Retrieve data from third-party servers or other ServiceNow AI Platform

Exploring Entity View Action Mapper

The Entity View Action Mapper (EVAM) is an application that standardizes how different data sources display in cards and lists.

EVAM overview

EVAM enables you to show information as a card grid view or as a list of information in a list view. Users can page through large data sets of search results and see different views based on filtering.

Prior to EVAM, lists were restricted to a single type of data source. If there were more data sources, you would have to write a custom implementation. EVAM enables you ingest multiple

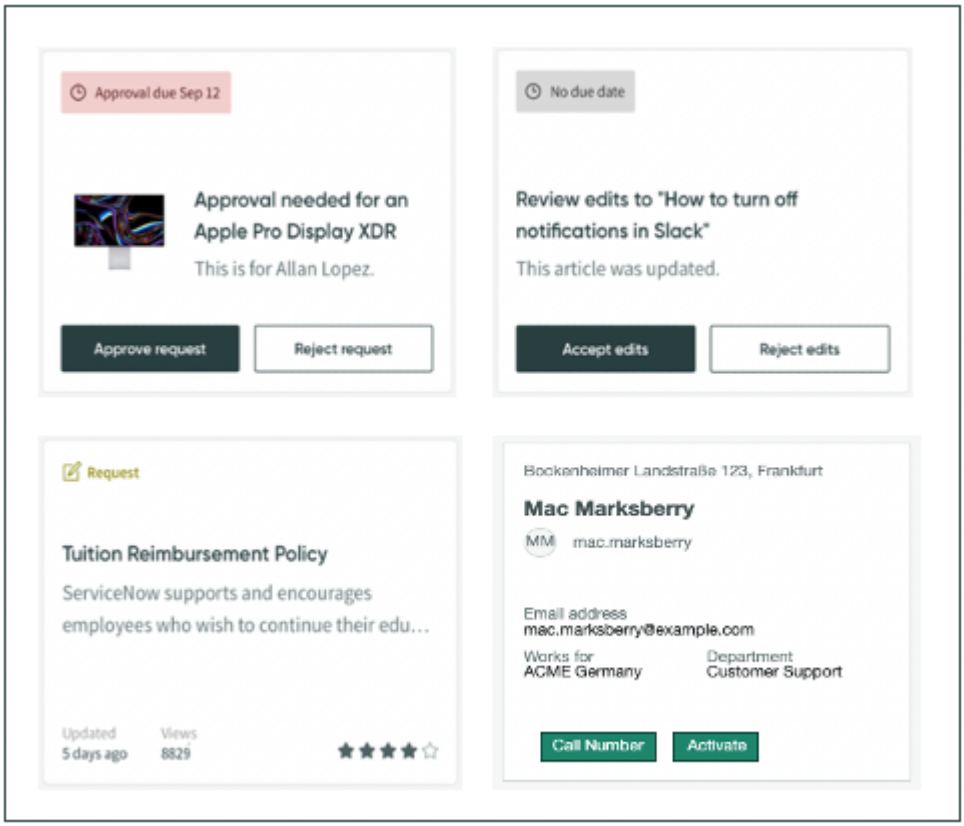
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

lists from different data sources, and then configure specific views without the need for customization.



Features of EVAM

Use multiple data sources for a single list view

EVAM can accept multiple disparate data sources and configure the data through sorting and filtering to return the data as a single list.

Define view templates

Map the data source output to a UX component view by using view templates. You can configure multiple view templates per data source based on a condition to customize how data displays for users.

Create view configurations to combine conditions, database fields, and declarative actions

Create a view configuration to combine conditions, database fields, and declarative actions with an associated view template. You can also group view configurations together to create configuration bundles.

Enable user interactions to trigger actions

EVAM enables user interactions to trigger a server script or UXF client action.

EVAM users

User	Description
Service desk agents	Service desk agents need a streamlined way to view and manage incidents, requests, and tasks across different tables. EVAM allows them to filter, sort, and take action on records quickly.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

User	Description
IT support staff	IT teams use EVAM to monitor and manage IT assets, service requests, and incidents by consolidating information into a structured, actionable interface.
Managers and team leads	Supervisors overseeing teams or operations benefit from EVAM's ability to present key performance indicators and open tasks and team workloads in an easy-to-navigate format.
Customer service representatives	Customer support teams interact with cases, accounts, and customer information efficiently, improving response times and service quality through EVAM.
Business analysts and process owners	Analysts use EVAM to configure views that bring together data from multiple sources, enabling better decision-making and process optimization.
Developers and admins	Developers and system administrators configure EVAM to create custom views, ensuring the right data is surfaced to the right users for improved usability.

EVAM workflow

EVAM consists of the following:

- Entity (data source) - The entity that has associated data that you intend to display. For example, a community post or a user.
- View – A view is how a card displays data and actions.
- Actions – An entity can have an action that performs on the card. For example, you can activate a user into your system.
- Map – The mapping process maps the data source data to component properties that display on the card. You can also associate actions that trigger from the card view.

What to explore next

To learn more about configuring and using EVAM, see:

- Configuring entity view action mapper
- Managing Entity View Action Mapper
- Entity View Action Mapper reference

View configurations, view templates, and configuration bundles for EVAM

A view configuration combines conditions, database fields, and declarative actions with an associated view template. You can also group view configurations together to create configuration bundles.

EVAM has pre-defined view configurations, view templates, and configuration bundles to make it easier to use the feature. The base system configuration bundles include:

- Service Portal Search Bundle
- Service Portal bundle (sp_bundle)

These bundles have view configurations attached that are anticipated to fit the business unit associated. You can also create or edit configuration bundles to meet your needs.

View configurations have an associated view template, tables and conditions, designated table field with data, and associated declarative actions. You can look at the demo_evam_dataset for examples of base system configuration views. These view configurations are ready to use and are meant to work with many use cases. You can also create or edit view configurations to meet specific needs.

The base system view templates match an associated view configuration. The templates contain the JSON used to give the necessary information for the card display and use. For example, the Attachment Search Template contains the following:

```
{
    "component": "sn-search-result-evam-card",
    "staticValues":  {
        "detailLabelType": {
            "translatable": false,
            "key": "inline"
        },
        "textHeaderLabelOne": {
            "translatable": true,
            "key": "Attachment"
        },
        "detailLabelOne": {
            "translatable": true,
            "key": "From:"
        }
    },
    "mappings": {
        "imageType": "doctype_image_type",
        "icon": "doctype_image",
        "imageURL":"doctype_image",
        "textHeaderLabelTwo": "doctype",
        "title": "ai_search_teaser_title",
        "summary": "ai_search_teaser_text",
        "detailValueOne":"parent_title"
    },
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    "actionMappings": {
        "clickAction": "navigation",
        "footerLinkAction": "navigation_to_parent_record"
    }
}
```

The JSON structure has the following sections:

Template	Description
component	The card component name.
staticValues	The static text mapping to component properties. These values have the following properties: • translatable – Determines whether the key text should be translated based on the user's language. Can be either True or False. • key – The value the property is set to.
mappings	The mapping of the data source field to the component properties.
actionMappings	The actions that you can associate with the card.

These view templates are ready to use and are meant to work with many use cases. You can also create or edit view templates to meet specific needs.

Configuring entity view action mapper

The Entity View Action Mapper (EVAM) allows you to map specific actions to entity views, enabling customized behavior and streamlined work-flows. Learn how to define, configure, and apply mappings to enhance user interactions with data in the platform.

Configuration overview

- Define a data source

  The data source is an entity that has associated data that you intend to display. For example, a community post or a user.

- Define an EVAM view template

  You can configure multiple view templates per data source based on conditions to customize how data displays for users. The view template maps fields from the view configuration to component.

- Define an EVAM configuration bundle

  Create a view configuration to combine conditions, database fields, and declarative actions with an associated view template using the Entity View Action Mapper (EVAM).

Define a data source

The data source is an entity that has associated data that you intend to display. For example, a community post or a user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin or evam_admin

Procedure
1. Navigate to **All** > **Entity View Action Mapper (EVAM)** > **Data sources**, and then select **New**.
2. On the form, fill in the fields.

Field	Description
Application	Application scope of the data source.
Active	Option to activate the data source.
Name	Name of the data source.
Table	Choose a table to use for the data source.
Condition	Condition to define how to filter the data from the selected table.
Sort By	Table column to use for sorting the table data. For example, you can select to sort knowledge articles by the creation date. **Note:** You can only use *Sort By* for datetime fields when sorting different records.

3. Select **Submit**.

Define an EVAM view template

You can configure multiple view templates per datasource based on conditions to customize how data displays for users. The view template maps fields from the view configuration to component.

Before you begin
Role required: admin or evam_admin

About this task
The view template is referenced from the Entity View Action Mapper (EVAM) view configuration record. For more information, see Define an EVAM configuration bundle.

Procedure
1. Navigate to **All** > **Entity View Action Mapper (EVAM)** > **View Definition** > **View Templates**, and then select **New**.
2. On the form, fill in the fields.

Field	Description
Name	Name of the EVAM view template.
Application	Application scope of the EVAM view template.
Active	Option to activate the EVAM view template.
Template	A JSON template that defines the view for a mapped data source. For example, the default search template contains the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description

	{
	"component": "sn-search-result-evam-card",
	"staticValues": {
	},
	"mappings": {
	"title": "ai_search_teaser_title",
	"summary": "ai_search_teaser_text"
	},
	"actionMappings": {
	"clickAction": "navigation"
	}
	}
	Use `sn-search-result-evam-card` as the component for search result pages.

3. Select **Submit**.

Define an EVAM configuration bundle

Create a view configuration to combine conditions, database fields, and declarative actions with an associated view template.

Before you begin

Role required: admin or evam_admin

Procedure

1. Navigate to **All** > **Entity View Action Mapper (EVAM)** > **View Definitions** > **View Configurations**, and then select **New**.
2. On the form, fill in the fields.

Field	Description
Name	Name of the EVAM view configuration.
Active	Option to activate the EVAM view configuration.
Required Roles	Roles to define who can view the EVAM view configuration
View Template	Template to associate with the EVAM view configuration.
Application	Application scope of the EVAM view configuration.
Order	Priority that the EVAM view configuration takes over other view configurations. To give higher priority to a view configuration, enter a lower number.
Table	Table to associate with the EVAM view configuration.
Condition	Conditions for when to use the EVAM view configuration. Select **Add Filter Condition** to select which conditions should be met.
Table Fields	Table fields to display on the EVAM view configuration. You can choose from available table fields and move them to *Selected*. You can also order the order they are shown.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Custom Fields	A custom field to display on the EVAM view configuration. You must supply a comma-separated list of table fields are required for the template.

3. Select **Submit**.

Managing Entity View Action Mapper

Optimize data presentation and interaction by defining data sources, creating Entity View Action Mapper (EVAM) configuration bundles, and setting up EVAM view templates to structure and display entity data effectively.

Overview of managing EVAM

- Create a multi-data source list display in Entity View Action Mapper

  Use the Entity View Action Mapper (EVAM) to take in different data sources, configure views, and show them in a card display view.

- Create an EVAM definition

  Define the list of data sources to render. The Entity View Action Mapper (EVAM) definition is the main record for an EVAM configuration.

- Create an EVAM action definition

  Associate a declarative action with a view template. The Entity View Action Mapper (EVAM) also enables user interactions to trigger a server script or UXF client action.

EVAM reference

For more information, see Entity View Action Mapper reference.

Create a multi-data source list display in Entity View Action Mapper

Use the Entity View Action Mapper (EVAM) to take in different data sources, configure views, and show them in a card display view.

Before you begin

Role required: admin or evam_admin

About this task

A typical scenario is showing user requests and incidents in a single display view. A user might want to see requests that can be made from a catalog, such as a computer order. They also might want to see open or closed incidents. These items come from different data sources, but need to display through a consistent standard that can be easily configured.

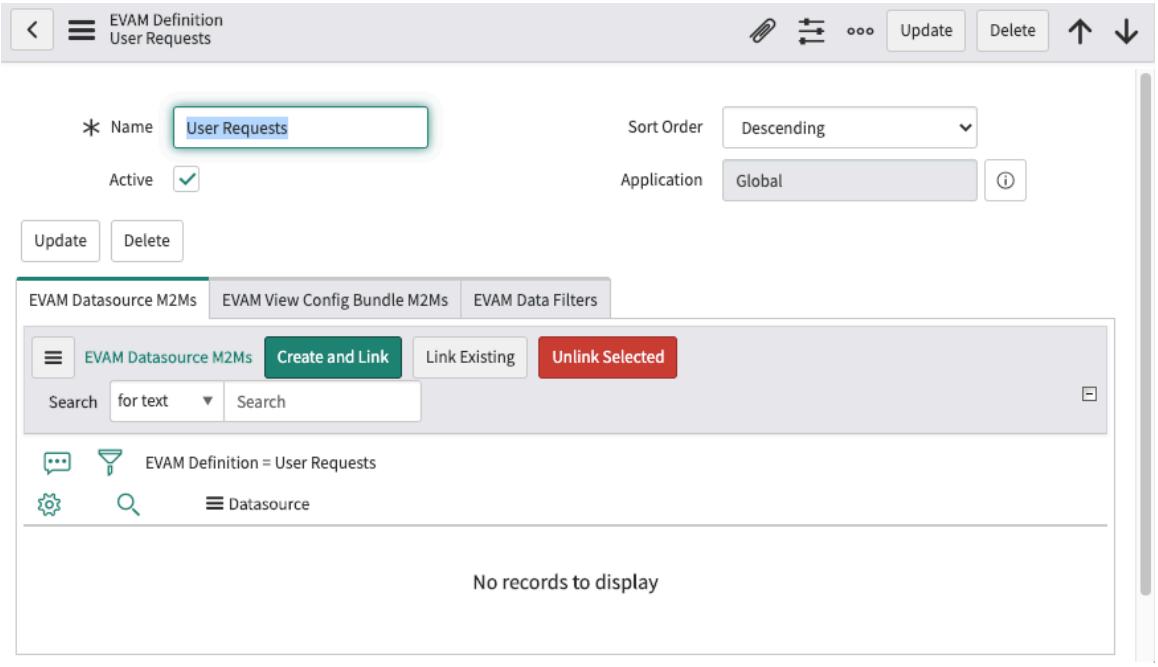
This tutorial runs through creating an EVAM definition with two data sources, a configuration bundle for each data source which contains two view configurations, and associated actions and view templates. Many tasks are repeated, instead of repeating each step, the following table lists the unique configurations and definitions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

EVAM definition	Data source [Table]	Configuration bundle	Action	Configuration view	View template
User Requests	Catalog Requests [Requested Item]	Catalog Request Bundle	Navigation	Open Requests	Open Request Template
				Closed Requests	Closed Request Template
	Incidents Submitted [Incidents]	Incidents Submitted Bundle		Open Incidents	Open Incidents Template
				Closed Incidents	Closed Incidents Template

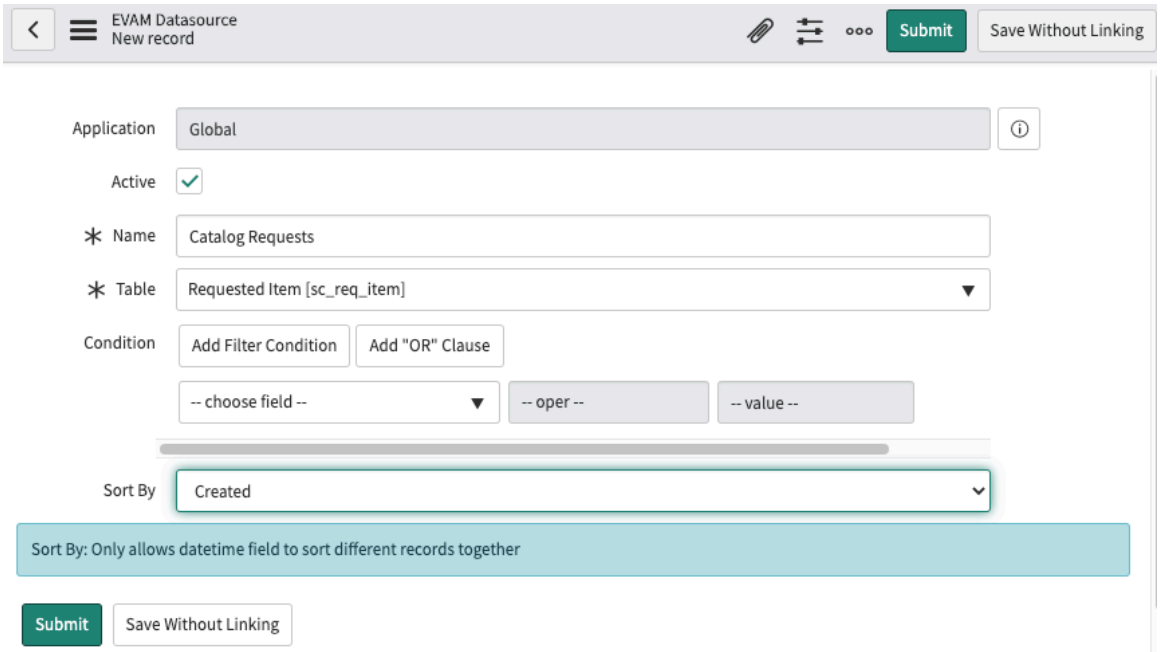
Procedure

1. Create an EVAM definition for user requests.
   An EVAM definition houses data sources, configuration bundles with associated view configurations, data filters, actions, and templates. After you initially submit your EVAM definition, you will see the related lists to add data sources, configuration bundles, and data filters.

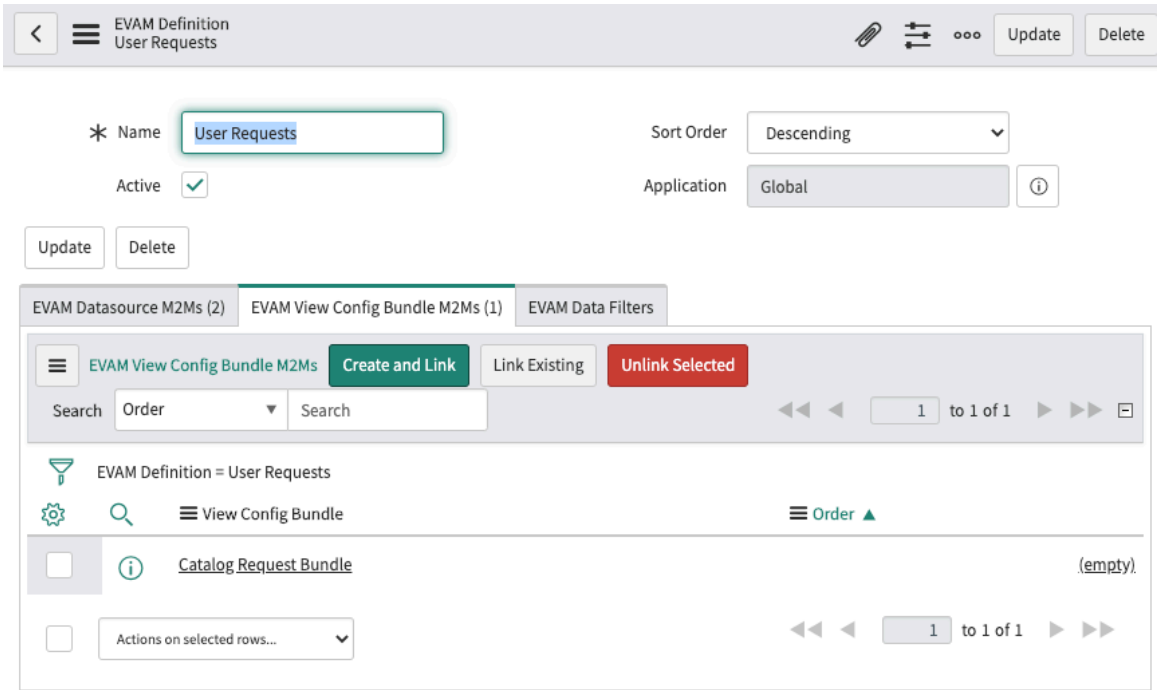


2. Define data sources for your EVAM definition.
   Create and link each data source to the User Request definition. The initial data source is for catalog requests. You can also make one for incidents submitted.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

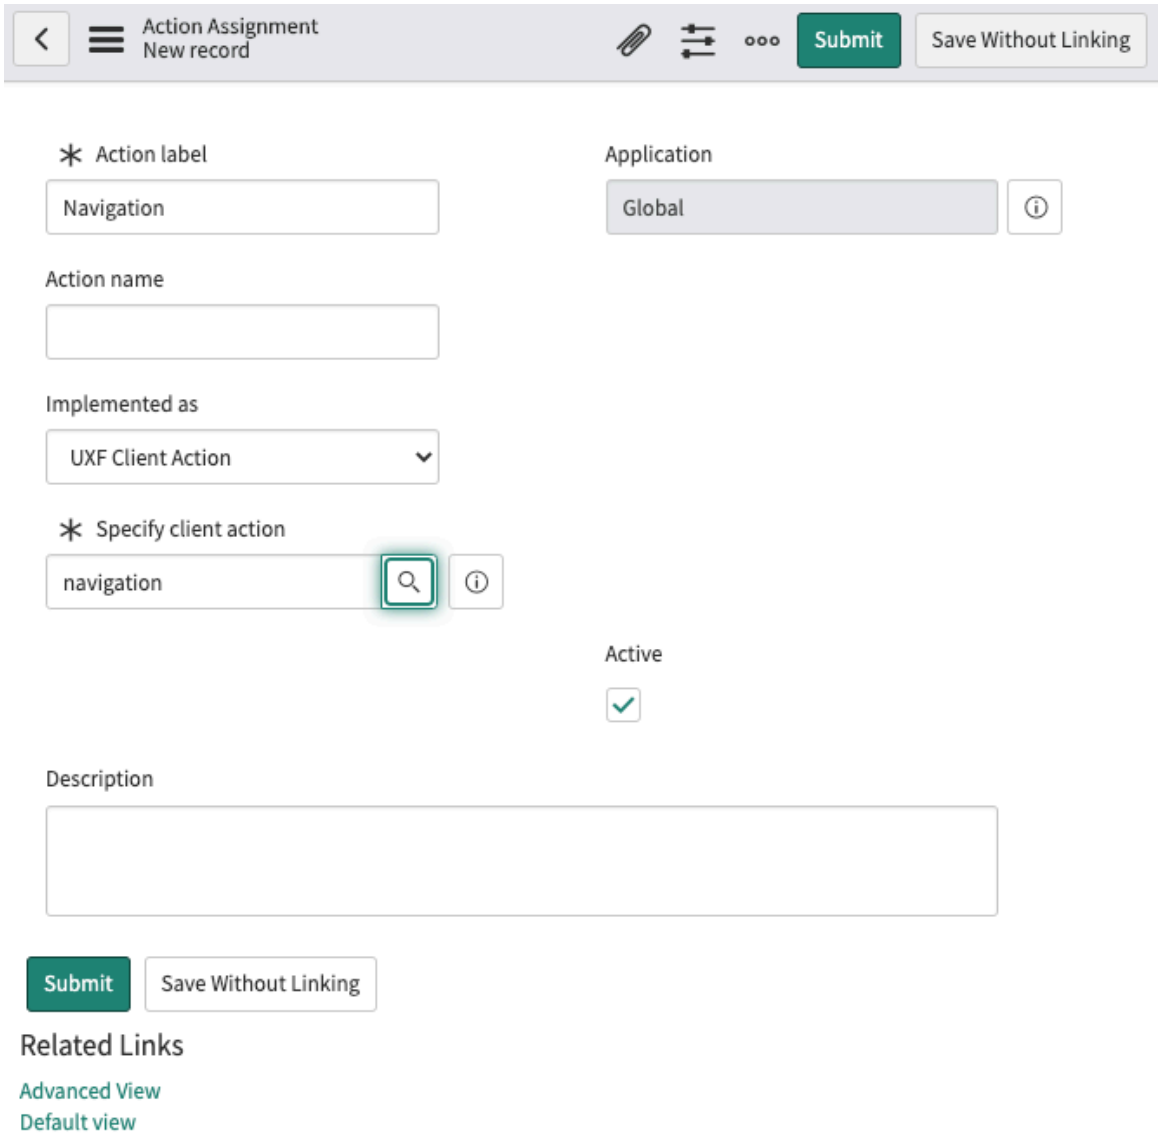


3. Create and link a view configuration bundle.
   You should create two configuration bundles, a catalog request bundle and an incidents submitted bundle.



4. Create an action definition.
   You can use the create and link related list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Create view templates for requested items and associate with the view configuration.
Here is the template info for the Requested Items Template:

```
{
 "component": "now-card-evam-record",
 "staticValues": {
  "highlightedHeaderIcon": {
   "key": "clock-outline"
  },
  "highlightedHeaderBkgColor": {
   "key": "positive"
  },
  "imageType": {
   "key": "image"
        },
  "detailLabelOne": {
   "translatable": true,
   "key": "created"
  },
  "detailLabelTwo": {
   "translatable": true,
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    "key": "number"
         }
 },
 "mappings": {
  "highlightedHeaderLabel": "state",
  "titleLabel": "cat_item.name",
  "imageURL": "cat_item.picture",
  "subtitle": "cat_item.short_description",
  "detailValueOne": "sys_created_on",
  "detailValueTwo": "number"
 },
 "actionMappings": {
  "clickAction": "navigation"
 }
}
```

6. Repeat steps 3-5 to add another view configuration for closed requests.
   You created a configuration bundle with one view configuration. Add another configuration called Closed requests. This view configuration references the same data source [requested item], but uses different conditions to show ().
7. Associate view templates to view configurations, select **Update**.
8. View your finished product.

Create an EVAM definition

Define the list of data sources to render. The Entity View Action Mapper (EVAM) definition is the main record for an EVAM configuration.

Before you begin

Role required: admin or evam_admin

Procedure

1. Navigate to **All** > **Entity View Action Mapper (EVAM)** > **EVAM Definitions**, and then select **New**.
2. On the form, fill in the fields.

Field	Description
Name	Name of the EVAM configuration.
Active	Option to activate the EVAM definition.
Sort Order	Order the data is ordered on the EVAM definition. You can select **Ascending** or **Descending**.
Application	Application scope of the EVAM definition.

3. Select **Submit** and then select your EVAM definition.
4. In the *EVAM Data source M2Ms* related list, add a data source.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
Create and Link	You can define a new data source and then link this data source to your EVAM definition.
Link Existing	You can add a pre-defined data source to your EVAM definition.
Unlink Selected	You can remove the selected data source from your EVAM definition.

5. Select **Submit**.
6. In the *EVAM View Config Bundle M2Ms* related list, add a configuration bundle.

Option	Description
Create and Link	You can define a new configuration bundle and then link this bundle to your EVAM definition.
Link Existing	You can add a pre-defined configuration bundle to your EVAM definition.
Unlink Selected	You can remove the selected configuration bundle from your EVAM definition.

After you link the configuration bundles, you can define an order to prioritize the bundles, with the lowest number receiving the higher precedence.

7. In the *EVAM Data Filters* related list, select **New** and fill in the form to add data filters:

Field	Description
Label	Label name of the EVAM data filter.
Active	Option to activate the EVAM data filter.
Order	Priority that the EVAM view configuration takes over other view configurations. To give higher priority to a view configuration, enter a lower number.
Application	Application scope of the EVAM view configuration.
EVAM Definition	Associate an EVAM definition with the data filter.

8. Select **Submit**.

Create an EVAM action definition

You can associate a declarative action with a view template. EVAM also enables user interactions to trigger a server script or UXF client action.

Before you begin

Role required: admin or evam_admin

Procedure

1. Navigate to **All** > **Entity View Action Mapper** > **Action Definition**, and then select **New**.
2. On the form, fill in the fields.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Action label	Display label of the EVAM action.
Action name	Database name for the EVAM action name.
Implemented as	Implementation of the EVAM action definition. Select one of the following: **Server Script** Executes a script on the server, for example, to assign a record to someone, or delete a record. **UXF Client Action** Takes action on the client side, such as opening a record or making a phone call.
Specify client action	You can choose a pre-defined action. For example, SC Content Items KB Article Navigation, to display KB articles. **Note:** This field appears only if you select to implement the action as a UXF client action.
Application	Application scope of the EVAM action.
Active	Option to activate the EVAM action.
Description	Description of the EVAM action.

3. Select **Submit**.

Entity View Action Mapper reference

Reference topics provide information about the Entity View Action Mapper (EVAM).

Roles required for EVAM

Learn about the roles needed to configure and manage the Entity View Action Mapper (EVAM).

Role	Description
admin or evam_admin	Grants full administrative rights, including the ability to configure and manage all aspects of the ServiceNow platform, such as creating data sources, configuring EVAM bundles, and defining view templates.
itil	Provides access to IT Service Management features, allowing users to interact with incidents, changes, and other ITSM records, which may be relevant when associating EVAM configurations with ITSM data.

Domain separation and EVAM

The Entity View Action Mapper (EVAM) in ServiceNow supports domain separation. This means you can configure EVAM to separate data, processes, and administrative tasks into logical groupings called domains, ensuring that users have access only to the data pertinent to their specific domain.

Instance Data Replication

ServiceNow® Instance Data Replication (IDR) copies data updates from one instance, called the producer instance, to one or more other instances called the consumer instances. IDR enables you to maintain consistent data across different instances. For example, you can synchronize data between different organizations in your company or even between different companies with separate instances.

Create an Instance Data Replication

Get started

Explore Learn about IDR features and concepts.	**Configure** Set up and configure IDR.	**Replicate data**  Configure IDR replication sets and settings.
Administer Maintain and monitor IDR.	**Reference** Learn about excluded tables, adapters, and data privacy in IDR.	

Exploring Instance Data Replication

Instance Data Replication (IDR) replicates data updates on one instance, called the producer instance, to one or more other instances, called the consumer instances.

IDR overview

Maintain consistent data across different instances using IDR.

- Automatically replicate data to one or more other instances.
- Synchronize data between different organizations in your company or even between different companies with separate instances.
- Data that is in transit during a crash is recoverable.

IDR users

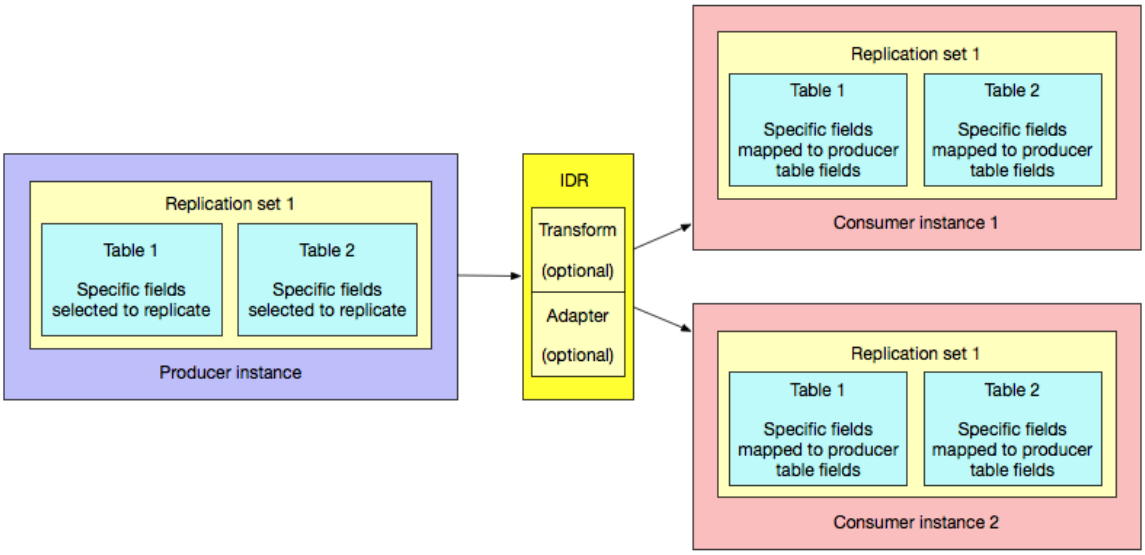
Users

User	Description
IDR admin	The IDR admin determines which tables and columns to replicate and analyzes table hierarchies and relationships. The IDR admin creates producer and consumer replication sets and monitors ongoing replication.

IDR workflow

This image shows how IDR replicates data from multiple tables on a producer instance to multiple consumer instances.

Replication overview



1. On the producer instance, the IDR admin specifies the tables and table columns to replicate by creating a producer replication set.
2. The IDR admin activates the producer replication set, which makes the producer data available for replication to consumers.
3. The IDR admin creates consumer replication sets on one or more consumer instances to receive the producer replication set data.
4. On each consumer instance, the IDR admin requests approval from the producer instance.
5. On the producer instance, the IDR admin approves or denies the requests from each consumer instance.
6. On each approved consumer instance, the IDR admin activates the consumer replication set. After the consumer replication is activated, data that is updated in a producer replication set automatically updates the corresponding data in the consumer replication sets.
7. On each consumer instance, the IDR admin can optionally replicate existing data from the producer instance by seeding data to the consumer instances.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. On either the producer or consumer instance, the IDR admin can optionally replicate data to tables or table columns that have different names on the consumer instance by configuring a transformation in the replication set.
9. On either the producer or consumer instance, the IDR admin can optionally modify producer data before replicating it to a consumer by configuring an adapter in the replication set.

IDR benefits

benefits

Benefit	Feature	Users
Continuously replicate inserts and updates from a producer instance to one or more consumer instances in near-real time, ensuring minimal delay.	Continuous replication	Administrator
Schedule replication of historical inserts and updates from a producer instance to one or more consumer instances at predefined intervals.	Scheduled replication	Administrator
Continuously replicate inserts and updates from a producer instance to a consumer instance in near-real time, with changes on either side replicated back to the other.	Bidirectional replication	Administrator
Continuously replicate inserts and updates from a producer instance to specific, distinguished consumer instances in near-real time, ensuring each consumer instance receives updates independently.	Discrete replication	Administrator
Map producer data to tables and table columns that are named differently on consumer instances. For example, you can modify and map table columns to localize data for different locales.	Transform replication data	Administrator
Modify producer data before replicating it to a consumer instance using an adapter. For example, you can configure adapters that perform string and mathematical operations, such as converting one currency to another, or converting one time zone to another.	Transform replication data	Administrator
Trigger post-replication workflows such as generating notifications or validating replication using business rules.	Triggering workflows after replication	Administrator

IDR limitations and when not to use IDR

- Do not use IDR to clone instances.

  IDR does not replicate metadata tables, child metadata tables, and most user and system tables. IDR is designed to replicate data, not to clone instances. For example, the Application File [sys_metadata] table and tables that extend [sys_metadata] (including the Business Rules

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

[sys_script], Catalog [sc_catalog], and Workflow [wf_workflow] tables) are excluded and can't be replicated. For details on cloning, see .

- Avoid using IDR to replicate a series of large attachments on a regular basis. If you need to include attachments that are larger than 10 MB regularly, monitor IDR to ensure that the lag time doesn't exceed expectations.
- Avoid continuous replication of CMDB tables. Replicating CMDB data as changes occur can create performance issues or unforeseen consequences with replication due to the number of records involved. If you must replicate CMDB tables, consider scheduling replication or use conditions to constrain the count of replicated records and ensure all required columns are included in the replication set.
- You cannot replicate Edge Encrypted, Field Encryption, and Password (2-Way Encrypted) fields.
- IDR does not synchronize data archiving between instances. For example, archiving records or restoring archive records on a producer instance doesn't affect archived records on the consumer instance (and vice versa). You must create and manage archive rules for each instance independently.
- Additional replication limitations:
  - Maximum record size is 10 MB.
  - Continuous replication supports up to approximately 1 million records per day.
  - Seeding must not take longer than seven days to complete.
  - You can only create one scheduled replication set in IDR, with only one outbound entry in that set.

Warning:
IDR overwrites data on instances and can replicate sensitive data. Avoid potential data loss and data exposure, by testing your IDR implementation in a pre-production environment. See data privacy in IDR for more information.

What to explore next

To learn more about configuring and using IDR, see:

- Configuring Instance Data Replication
- Replicating data with Instance Data Replication
- Administering Instance Data Replication
- Instance Data Replication reference

Continuous replication

Replicate inserts and updates from a producer instance to one or more consumer instances in near-real time in Instance Data Replication (IDR).

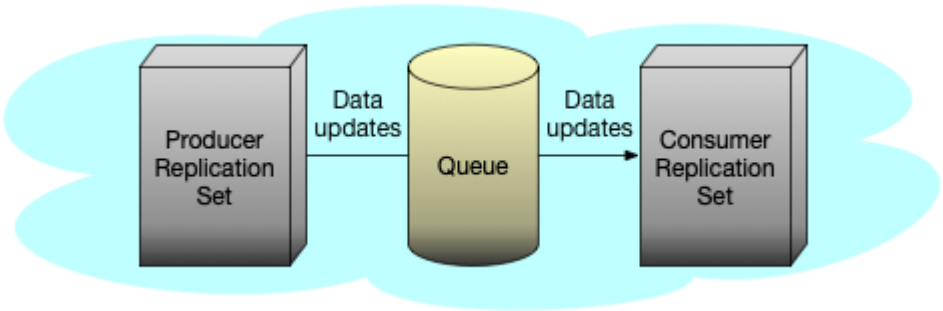
Continuous replication in IDR enables syncing of specified tables and columns between instances. With continuous replication, inserts and updates are replicated in one direction from a producer instance to one or more consumer instances.

After you set up continuous replication, the IDRProducerJob job runs on the producer instance to detect data updates. When there are updates to replicate, the producer instance sends the updates to each subscribed consumer instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The IDRConsumerJob job runs on the consumer instances to detect the data updates from the producer. When the IDRConsumerJob job detects updates, it updates the data in consumer tables.

IDR data updates flow



Inserts and updates on the producer instance are replicated in near-real time.

- Monitor how long updates from the producer to the consumer are taking in the Monitoring Dashboard. See Monitoring replication status in Instance Data Replication.
- Monitor the replication record queue, message queue, and messages processed for all replications sets by in the Queue Dashboard. See Monitoring queues in Instance Data Replication.

For more information, see Set up continuous replication.

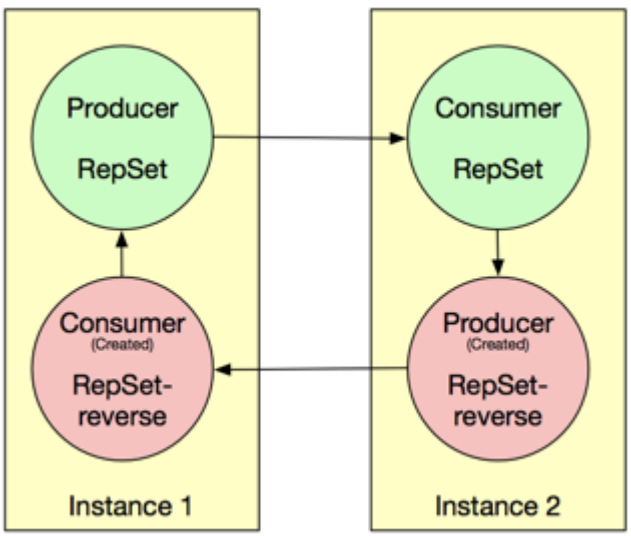
Bidirectional replication

Bidirectional replication in Instance Data Replication (IDR) enables data to flow from a producer instance to a consumer instance and accept data from a consumer instance to flow back to the producer instance.

All inserts and changes to records on either instance are sent to the other instance to keep the tables identical on both instances. For example, you can enable bidirectional replication for the Incidents table to keep incident records synchronized between two instances.

To make data flow bi-directionally, the system creates a producer replication set on the consumer instance and a consumer replication set on the producer instance.

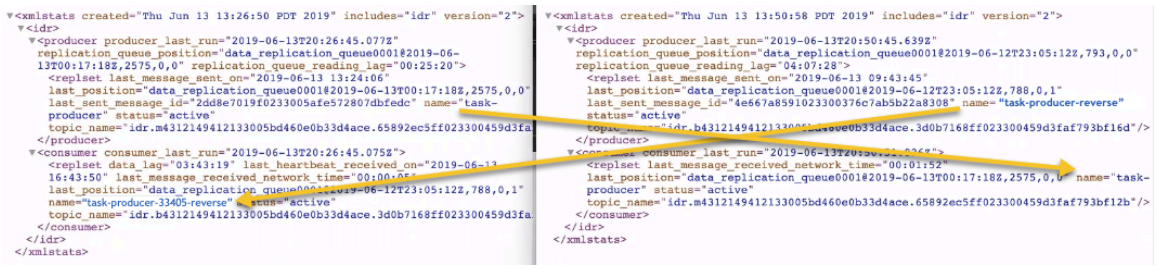
Bi-directional replication



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you look at the replication sets on the original producer instance, you see the replication set name and the automatically generated consumer instance. It has the same name appended with the suffix, `-<long-number>-reverse`, where `<long-number>` is a randomly generated number. For example, if Test is the producer replication set name, `Test-2034802-reverse` might be the name of the consumer replication set that is automatically created on the same instance. On the original consumer instance, you see the same names. Replication sets with the `reverse` suffix are read-only.

You can verify a consumer on a producer instance and a producer on a consumer instance by running `https://<producer-instance-name>/xmlstats.do?include=idr` and `https://<consumer-instance-name>/xmlstats.do?include=idr` on the producer and consumer instances. In the following image, the original producer instance is on the left and the original consumer instance is on the right.



Bidirectional replication has the following limitations:

- Auto-conflict resolution is unsupported.
- Merge conflicts happen if producer and consumer instances modify the same record at the same time.

  The most recent update wins, which means that the data on the consumer and producer tables might be different.

- Bidirectional replication supports the Number adapter but none of the other adapters.
- Bidirectional replication keeps data in sync between producer and consumer instances. However, in some scenarios, avoid using bidirectional replication and use one-way replication instead.
  - If you plan to use adapters to differentiate data replicated between two instances, use two one-way replication sets to replicate data back and forth instead of using bidirectional sets.
  - If you need to seed data from one instance to another and vice versa, use two one-way replication sets.
- With bidirectional replication, records created on the producer instance are replicated to a consumer instance and vice versa. When the record is inserted on the consumer instance and it triggers a business rule that updates the record, that update is not replicated back to the producer instance.

If you must understand the implications of bi-direction and data transfer between instances, see data privacy in IDR for more information.

Discrete replication

Distinguish consumers in Instance Data Replication (IDR) using discrete mapping in a producer replication set.

Every producer replication set has a unique relationship with each consumer subscription. One way of distinguishing this relationship is by mapping discrete field values for producer replication sets.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Once you enable discrete mapping, you can define for each outbound entry of a replication set a discrete value field. An administrator of the producer replication set can define the mapping of each consumer subscription by the setting this discrete value.

For example, you might have an ACME corporation as the producer instance, and have consumer subscribers of ACME US and ACME Europe. You could set a discrete value of **region** on the outbound replication entries for the incident table. While both of these entries reference the same company table, a rule set for the discrete value can display US for ACME US, and Europe for ACME Europe.

If you have bi-direction enabled with discrete mappings, different consumer subscriptions:

- Should never receive records sent from other consumer subscribers
- Should never receive records from a producer intended for other consumers subscribers

With bidirectional replication, records created on a consumer instance are replicated to the producer instance and vice versa. When the consumer replicates a record to the producer, the consumer's discrete field value that you defined in the producer replication set overrides the discrete field value in the consumer record if it's different. For example, say you define a discrete mapping using separate regions for each consumer instance as follows:

Discrete mapping using the Region field

Consumer instance	Region
Consumer instance A	Asia
Consumer instance B	Europe
Consumer instance C	USA

When a record is manually added to consumer instance B with the Region field set to Asia, bi-directional replication sends the record from the consumer to the producer to be inserted, but the region field is overwritten and the value is changed to Europe. The discrete value that is defined in the producer replication set is used instead.

For details on the implications with discrete mappings and data transfer between instances, see data privacy in IDR.

Scheduled replication

Replicate historical inserts and updates from a producer instance to one or more consumer instances on a scheduled basis in Instance Data Replication (IDR).

Instead of continuously replicating data as it's created or changed on your producer instance, you can schedule replication from the producer to one or more consumers at regular intervals each day. Consider scheduling replication for frequently updated, larger tables when immediate data replication to the consumer isn't required.

For example, you should avoid continuous replication of CMDB tables. Replicating CMDB data as changes occur can create performance issues or unforeseen consequences with replication due to the number of records involved. Instead, you can use scheduled replication to periodically replicate CMDB data that accumulates on the producer instance.

For more information, see Set up scheduled replication.

Configuring Instance Data Replication

Set up and configure Instance Data Replication (IDR).

Configuration overview

Request an Instance Data Replication subscription

The Instance Data Replication (IDR) plugin requires a separate subscription and must be activated by ServiceNow personnel.

Before you begin

Role required: admin

About this task

Beginning with the New York release, IDR is supported. The IDR plugin ID is com.glide.idr. When purchasing an IDR subscription, ServiceNow, Inc. personnel also activate the following plugins that IDR depends upon:

- com.snc.db.data_replicate
- com.glide.transform
- com.glide.kmf

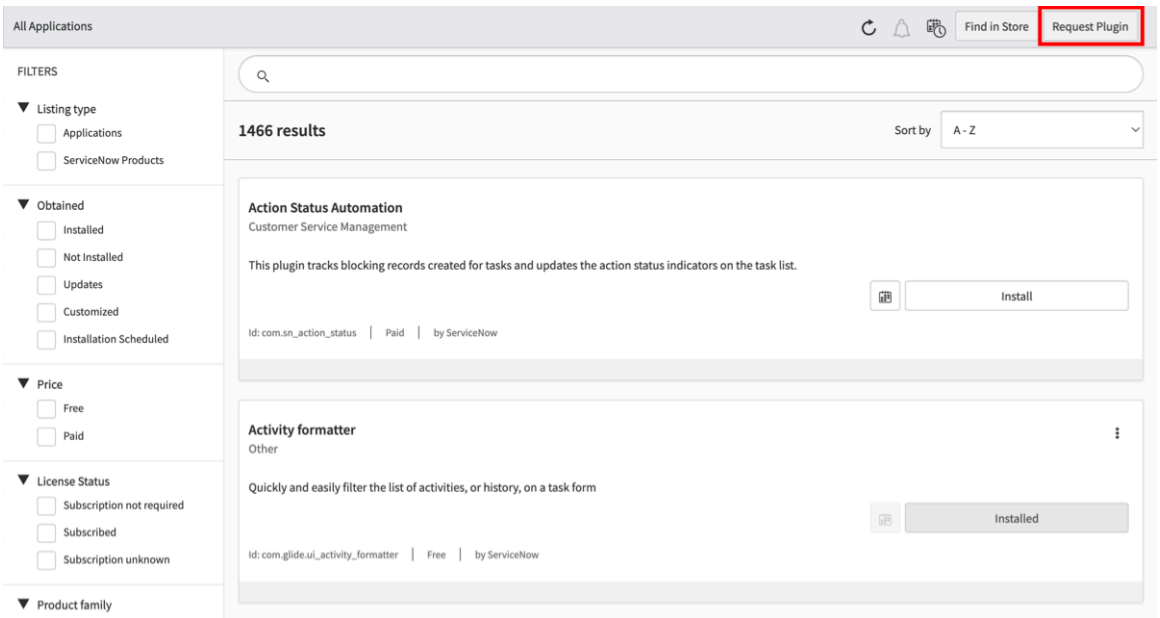
IDR runs in ServiceNow data centers only, which means there is no support for using IDR with on-premise instances.

To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization's production and subproduction instances, generally within a few days.

If you don't have an account manager, decide to delay activation after purchase, or want to evaluate the product on a subproduction instance without charge, follow these steps.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Select **Request plugin** to open the **Activate Plugin** form on Now Support.



3. On the **Activate Plugin** form, provide the following information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

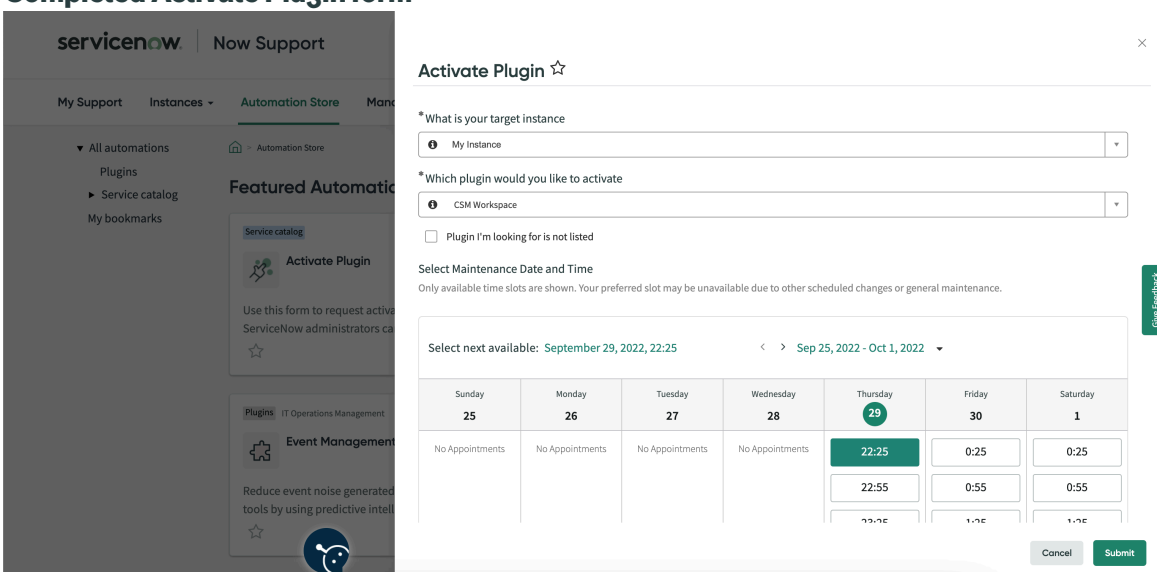
Activate Plugin form

Field	Description
What is your target instance	Select the instance that you want to activate the plugin on.
Which plugin would you like to activate	Select the name of the plugin to activate. **Note:** If the system doesn't list the plugin you want or if you're activating the plugin on an OEM or on-premise instance, select the **Plugin I'm looking for is not listed** check box and then enter the name of the plugin.
Select Maintenance Date and Time	Select the date and time to activate the plugin.

Example

For example, see the following form to activate the Event Management plugin on an instance named SNC Instance.

Completed Activate Plugin form



4. Select **Submit**.
   After the maintenance window, the system installs the plugin on your instance. To confirm the installation, go to the Installed tab in the Application Manager.

What to do next

Plan your replication strategy. See Preparing for Instance Data Replication.

Preparing for Instance Data Replication

Before you set up Instance Data Replication (IDR), analyze the tables and columns in the producer and consumer instances to replicate data successfully.

Preparing your instances

Reduce latency by ensuring that the producer and consumer instances are in the same geographic region and belong to the same customer. You can replicate data between instances across different geographic regions. However, replication latency can occur when instances are located in data centers in separate regions.

Deciding which tables to replicate

Before you create a producer replication set, decide which tables to replicate. Avoid replicating system tables (tables with a sys_ prefix). If you replicate system tables (like sys_user, sys_user_group, or sys_user_grmember) that have existing data in the consumer instance, insert and update failures can occur during replication. If you decide to replicate these tables, you may have additional work afterwards to clean these tables.

Avoid continuous replication of CMDB tables. Replicating CMDB data as changes occur can create performance issues or unforeseen consequences with replication due to the number of records involved. If you must replicate CMDB tables, consider scheduling replication or use conditions to constrain the count of replicated records and ensure all required columns are included in the replication set.

For a list of tables to avoid replicating, see Excluded tables in Instance Data Replication.

Analyzing table hierarchies

For each table you want to replicate, determine if the table is a parent or child table. If the table belongs to a parent-child hierarchy, decide if you want to preserve the hierarchy and what strategy you want to use to move the hierarchy from the producer to the consumer.

Important:
To maintain data integrity and ensure that reference fields are populated on the consumer as you'd expect, you must replicate all of the parent and child tables in the table hierarchy.

See Preserving table hierarchy in Instance Data Replication.

Analyzing table relationships

For each table you want to replicate, determine if the table has reference fields that point to other tables. If you are replicating a table with a reference field that points to another table, but you don’t include that table in your replication set, the reference field will be empty in the record on the consumer instance. Replicating table relationships maintains data integrity and ensures that reference fields are populated on the consumer as you'd expect.

Organizing replication sets

As part of the planning phase, determine how you want to organize your replication sets and the tables they contain.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Create a single replication set for each table. This option requires more setup, configuration, and time management, but allows you to pause replication for a single table without impacting other tables.
  - Replication is performed in parallel using multiple jobs.
  - Throughput metrics are easier to track with separate replication sets.
  - When an error occurs, replication for a single table is affected instead of all multiple tables.
- Create a replication set for a group of related tables. This option is easier to set up and manage, but oversight and potential issues impact all tables in the group.
  - If you need find information about replication status, the logical name you use for this replication set might be easier to find and understand compared to using distinct replication sets for each table.
  - If you want to pause replication, you can do so for the entire group of tables by pausing replication from one replication set.
  - If a replication issue occurs on one table and replication stops, this stops replication for all tables in the replication set.

  If you decide to group tables in a single replication set, try to limit it to five or fewer tables. If you have more than five tables to replicate, use multiple replication sets with five or fewer tables in each set.

Deciding which columns to replicate

For each table you want to replicate, decide which columns to include. Avoid including every column in your replication set by default. Instead, decide which columns are necessary, and exclude any sys_ columns or other columns that are updated by scripts automatically.

For example, if you include a column updated by the system automatically on a frequent basis, IDR may replicate data more often than necessary. When the system replicates this data, it can negatively impact the capacity subscription. Periodically check the **IDR License and Usage Details** dashboard to monitor the message count that is generated from the producer.

Preparing target tables on the consumer instance

By default, IDR uses a record's sys_id field as the lookup value to keep data synchronized between the producer and consumer instance. If the target table contains existing data or records from prior data imports, the sys_id values in the consumer don't match the sys_ids from the producer instance.

Always consider the producer instance as the source of truth. For optimal replication results, follow these guidelines:

- Make the producer instance the exclusive data source for the consumer instance.
- Prior to replication, ensure that the target table in the consumer instance is empty. Ideally, the initial records in the target instance are created from data sent exclusively from the producer via a replication set or a clone.
- Ensure that there are no other ongoing data imports or updates to target tables on the consumer instance after replication starts.

For example, if users from LDAP are imported to the consumer instance using a different data source, the sys_ids for those records don't match the sys_id values in the producer instance. In this scenario, existing user records in the target table on the consumer aren't updated and duplicate records are created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In situations where this cannot be avoided, clean the tables on the consumer instance prior to replication. You must delete the records in the target table or ensure the sys_id values in producer and consumer are the same.

Alternatively, you can use a custom **Coalesce** field to identify unique records (instead of the default sys_id column) for replication. Use a custom **Coalesce** column when records on the consumer instance have a different sys_id for the same records on the producer instance. For more information on using a custom **Coalesce**, see Custom coalescing.

Reviewing business rules

You can use business rules to trigger workflows after replication, such as sending a notification or validating the replicated data. Review any business rules on the consumer instance that might prevent the idr.system user from inserting, updating, or deleting records in the target table.

If failures related to business rules occur, they appear in the **Instance Data Replication** > **Replication Payload Error** table on the consumer instance. View the **Error Message** field for details on the script that is causing the failure.

With bidirectional replication, records created on the producer instance are replicated to a consumer instance and vice versa. When the record is inserted on the consumer instance and it triggers a business rule that updates the record, that update is not replicated back to the producer instance.

Reviewing ACLs

Review the ACLs in place on the target table in the consumer instance to ensure that IDR can replicate data successfully. Confirm that the idr.system user has the appropriate roles for the target table.

If failures related to ACLs occur, they appear in the **Instance Data Replication** > **Replication Payload Error** table on the consumer instance. View the **Error Message** field for details on the ACL that is causing the failure.

Reviewing data policies

Review any data policies in place on the target table in the consumer instance to ensure that IDR can replicate data successfully. Confirm that the data you are replicating satisfies the data policy.

If failures related to data policies occur, they appear in the **Instance Data Replication** > **Replication Payload Error** table on the consumer instance. View the **Error Message** field for details on the data policy that is causing the failure.

Preserving table hierarchy in Instance Data Replication

Decide if you want to replicate a parent-child table hierarchy and what strategy to use for replicating the data in Instance Data Replication (IDR).

Before you create a replication set, determine if the table that you want to replicate is part of a parent-child table hierarchy. If it is, decide if you want to preserve the hierarchy and whether to replicate the data from the parent perspective (retaining only columns belonging to the parent table) or from the child perspective (retaining all columns that belong to the child tables). Review the following available strategies.

Strategy 1: Preserve the entire hierarchy and replicate child columns

You can preserve the entire hierarchy, including all of the child table columns, by creating an outbound entry for each child table, and specifying a sys_class_name filter for each child table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, to replicate the Task table and ensure that all of the columns from all of the child tables are included, specify the following:

Outbound entries

Table	Filter
Task	sys_class_name=task
Incident	sys_class_name=incident
Problem	sys_class_name=problem
Change Request	sys_class_name=change

And so forth, for all of the child tables, including filters with each table for the sys_class_name.

With this strategy, records are inserted into each child table on the consumer, including data from the columns that belong to each child table on the producer.

Strategy 2: Preserve the hierarchy, but don't replicate child columns

To preserve the hierarchy but only replicate columns from the parent table, replicate the parent table and include the Class Name [sys_class_name] field in the **Included Fields** list. Including the Class Name field maintains the distinction between parent and child records on the consumer instance.

For example, if you want to replicate the Task table and its children (Incident, Problem, Change Request), but only replicate the columns that belong to the Task table, specify the following:

Outbound entry

Table	Included Fields
Task	Class Name

In this strategy, the sys_class_name column on the consumer Task table receives entries for the parent table (task) and child tables (incident, problem, and change), and records are inserted into the respective child tables on the consumer. However, without the sys_class_name filter, the columns that are unique to each child table are not replicated.

Strategy 3: Ignore the hierarchy, and only replicate parent table data

To ignore the hierarchy and only replicate parent records, replicate the parent table and exclude the Class Name [sys_class_name] field from the **Included Fields** list. Excluding the Class Name field removes the distinction between parent and child records on the consumer instance. All replicated records on the consumer will be parent table records.

For example, if you want to replicate records from the Task table and simply consider all records as tasks for reporting or auditing purposes, specify the following:

Outbound entry

Table	Included Fields
Task	Any fields except for Class Name

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In this strategy, when you replicate the Task table, all replicated records have a value of task in the sys_class_name column, and no columns belonging to the child tables are replicated.

Upgrading legacy replication sets to V2 in Instance Data Replication

Improve message processing and replication performance by upgrading your legacy replication sets in IDR to V2.

Legacy and V2 replication sets

Important:
Legacy replication sets are planned for deprecation by the Zurich release. To continue replicating data, you must upgrade all legacy replication sets to V2.

- Legacy replication sets use a ServiceNow Kafka message transport and delivery implementation that was created prior to the Utah release. All replication sets created prior to the Utah release are considered legacy replication sets.

  Beginning with the Washington DC release, you can no longer create legacy replication sets.

- V2 replication sets use the ServiceNow Hermes Messaging Service for Kafka message transport and delivery, which replicates data faster, at scale, and with high reliability. The Hermes Messaging Service is a ServiceNow AI Platform capability that's automatically enabled when the IDR plugin (com.glide.idr) is activated. All replication sets created after the Washington DC release are V2 replication sets.

Note:
Data sent from a V2 producer replication set is retained in the message queue for 24 hours.

Upgrading legacy replication sets

Upgrade your eligible legacy replication sets to V2 to take advantage of the benefits provided by Hermes. Upgrading replication sets from legacy to V2 is a seamless process. Active data replication from the producer to consumer continues throughout the upgrade, which means you don't need to pause replication before you begin. Replication continues using the V2 replication sets after the upgrade is finished.

You can either create new V2 replication sets or upgrade existing legacy replication sets to V2. See Upgrade legacy replication sets in Instance Data Replication.

Upgrade eligibility

Legacy replication sets are eligible for upgrade to V2 when both the producer and consumer instance are on Utah or higher. Note that some Utah legacy replication sets aren't eligible for upgrade to V2, depending on their configuration (for example, the replication set can't be bidirectional or discrete).

You can confirm upgrade eligibility by viewing the producer replication set and checking the **Upgrade Eligibility** column in the Consumer Subscriptions related list.

- If the value for each subscribed consumer is **Eligible**, you can begin the upgrade process by following the steps in Upgrade legacy replication sets in Instance Data Replication.
- If the value for a subscribed consumer is **Not eligible**, this means that either the consumer instance isn't on Utah or higher, or the consumer replication set is on Utah, but isn't eligible for upgrade to V2 because of its configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For details on which types of legacy replication sets are eligible for upgrade in Utah, refer to the "Upgrading legacy replication sets to V2" topic in the Utah version of the IDR documentation.

Compatibility

V2 producer replication sets are compatible only with V2 consumer replication sets.

If you upgrade a producer replication set to V2, you must upgrade the subscribed consumer replication sets to V2 as well to take advantage of the V2 processing improvements.

Upgrade legacy replication sets in Instance Data Replication

Replicate high volumes of data faster and more reliably by upgrading your Instance Data Replication (IDR) legacy producer and consumer replication sets to V2.

Before you begin

Role required: admin

About this task

Important:
Legacy replication sets are planned for deprecation by the Zurich release. To continue replicating data, you must upgrade all legacy replication sets to V2.

Procedure

1. On the producer instance, navigate to **Instance Data Replication** > **Producer Replication Sets**.
2. Select a producer replication set that you want to upgrade.
3. Verify that the producer replication set is eligible for upgrade by checking the **Upgrade Eligibility** column on the Consumer Subscriptions related list.
   - If the value for each consumer is **Eligible**, you can upgrade the replication set.
   - If the value for any consumer **Not eligible**, this means that either the consumer instance isn't on Utah or higher, or the consumer replication set is on Utah, but isn't eligible for upgrade to V2 because of its configuration. See Upgrade eligibility for more information.
4. Create a V2 producer replication set.

   a. On the Producer Replication Set form, select **Upgrade**.

   b. In the dialog box, either accept the default name or enter a unique replication set name. By default, the system appends -V2 to the legacy replication set name, but you can use any valid set name to differentiate the V2 version from the legacy version.

   c. Select **OK**.

   The legacy producer replication set is copied to create a V2 producer replication set. The producer instance sends metadata to the consumer instance, which enables you to upgrade the legacy consumer replication set.
5. On the consumer instance, navigate to **Instance Data Replication** > **Consumer Replication Sets**.
6. Select the legacy consumer replication set that's subscribed to the producer replication set you upgraded.
7. Upgrade the legacy consumer replication set.
   If the **Begin upgrade** button doesn't appear on the Consumer Replication Set form, resend the metadata from the producer replication set:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select **Begin upgrade**.

b. On the producer instance, navigate to **Instance Data Replication** > **Producer Replication Sets**.

c. Select the new V2 producer replication set.

d. Select the check box next to the consumer subscription in the Consumer Subscriptions related list.

e. Select the **Actions on selected rows** list.

f. Select **Resend Metadata**.

The V2 consumer replication set is created, and the producer instance sends metadata replication entries to the consumer instance. After all the entries are received, the **Start dry run** button appears on the Consumer Replication Set form.

8. Confirm that the consumer instance can connect to the Hermes Messaging Service and that replication succeeds by selecting **Start dry run**.
   Data is consumed from the Kafka topic by the consumer instance but not persisted in the database yet.
9. Complete the upgrade by activating the V2 consumer replication set with or without data integrity checks.
   - Ensure that the legacy and V2 topics are in sync by selecting **Finish upgrade**.

     This option ensures that IDR performs all necessary data integrity checks before activating the V2 consumer replication set. If any data integrity checks fail, the upgrade is automatically rolled back to prioritize data consistency.

   - Complete the upgrade without data integrity checks by selecting **Finish upgrade without sync**.

     This option allows you to complete the upgrade for replication sets where the consumer replication is lagging or no records have been replicated to the V2 topic. However, it may skip replicated records or attempt to duplicate replication. If you have concerns over missing or mismatched records, you can create a data comparison request to reseed those records.

   Note:
   If the **Finish upgrade** button doesn't appear on the Consumer Replication Set form, contact Customer Service and Support.

   The V2 consumer replication set is activated and the legacy consumer replication set is automatically deactivated.
10. After all subscribed consumers are upgraded to V2, deactivate the legacy producer replication set.

    Note:
    Legacy consumer replication sets stop consuming when you deactivate the legacy producer, so you must ensure all subscribed consumers are upgraded to V2 before you deactivate it.

    a. On the producer instance, navigate to **Instance Data Replication** > **Producer Replication Sets**.

    b. Select the legacy producer replication set that you upgraded.

    c. Select **Deactivate**.

    d. Confirm deactivation by selecting **OK**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The legacy producer and consumer replication sets are upgraded to V2 and the upgrade status changes to Up to date. Data replication continues based on the last message ID that was processed by the legacy replication set.

Rolling back an upgrade in Instance Data Replication

If a problem occurs during an upgrade to V2, the upgrade is rolled back in Instance Data Replication (IDR).

Important:
Legacy replication sets are planned for deprecation by the Zurich release. To continue replicating data, you must upgrade all legacy replication sets to V2.

If you upgrade a legacy replication set to V2 and a problem occurs with the upgrade, the upgrade is automatically rolled back to ensure data consistency. If a processing delay caused the issue, you can try the upgrade again.

For example, when the consumer instance identifies the most recent message in the legacy topic, but can't find that same message in the Hermes topic, the upgrade is rolled back. If you attempt the upgrade again and the consumer instance successfully finds the most recent message in the Hermes topic, the upgrade continues, and processing begins only from the Hermes topic.

- If the legacy consumer job is still processing records that were replicated prior to when the upgrade started replicating to both the legacy and the Hermes topics, the upgrade is rolled back. In this scenario, allow time for the consumer to process the replication backlog and then try the upgrade to V2 again. For example, if the lag persists after 30 minutes, wait another 2 hours and try again, or wait 24 hours and try again.
- If no records are being replicated from the producer to the Hermes topic after the upgrade starts, wait and retry the upgrade after allowing at least one record to replicate from the producer to the consumer. Alternatively, you can manually trigger replication by making a change to at least one record.
- If you want to complete the upgrade without data integrity checks, you can use the **Finish upgrade without sync** option after performing the dry run.

  This option allows you to complete the upgrade for replication sets where the consumer replication is lagging or no records have been replicated to the V2 topic. However, it may skip replicated records or attempt to duplicate replication. If you have concerns over missing or mismatched records, you can create a data comparison request to reseed those records.

Upgrading your instance with Instance Data Replication enabled

When upgrading your instance, IDR automatically pauses replication to maintain data replication without any manual intervention.

Upgrading your instance with Instance Data Replication (IDR) enabled is a seamless process.

- IDR doesn't consume or produce messages during an instance upgrade. IDR jobs are automatically stopped when the upgrade begins.
- The data_replication_queue tracks the timestamp of the last message sent. This ensures that replication resumes from the last change made prior to the upgrade.
- Any seeding in progress before the upgrade will be automatically paused when the upgrade starts and will resume once the upgrade is completed. To ensure that seeding completes without interruptions, avoid initiating a seeding request before an upgrade.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Seeding requests can't be initiated during an instance upgrade.
- Replication resumes immediately after the upgrade is completed. There is no need to make any adjustments to IDR for record replication to continue.

Replicating data with Instance Data Replication

Synchronize data between instances using Instance Data Replication (IDR).

Overview of replicating data

IDR enables you to replicate data from one instance, called the producer instance, to one or more other instances, called consumer instances. IDR offers several replication types and options for modifying replication data to suit different needs.

Set up continuous replication

Enable near-real time data replication from a producer instance to one or more consumer instances in Instance Data Replication (IDR).

Before you begin

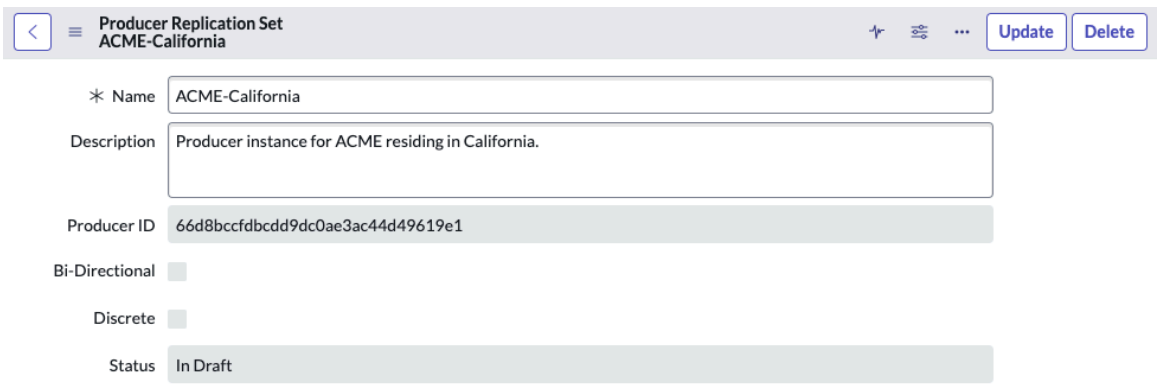
Verify that the producer and consumer instances belong to the same customer.

Plan your data replication strategy by reviewing the important considerations described in Preparing for Instance Data Replication.

Role required: idr_admin or admin

Procedure

1. On the producer instance, navigate to **Instance Data Replication** > **Producer Replication Sets**.
2. Select **New**.
3. Enter a name and description for the producer replication set.
   - The name can only contain alphanumeric characters and hyphens.
   - Avoid using a name that applies only to the producer instance. You must provide the same name in the consumer replication set, so the name shouldn't be producer-specific.
4. **Optional:** Create the producer replication set from a list of outbound entries by selecting **Entry set**.
   If you imported an update set from another instance or you created one earlier on your instance, you can choose an existing entry set.
5. Select **Submit**.
   The producer replication set is created with an auto-generated producer ID that identifies the producer instance in the system.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Specify the tables and columns on the producer instance that you want to replicate.

   a. Select the Outbound Entries related list.

   b. Select **New**.

   c. On the form, fill in the fields.

Replication entry form

Field	Description
Source Table Name	Name of one of the tables on the producer instance to replicate. For example, SAN Disk [cmdb_ci_san_disk].
Filter	Filter criteria to control the records in the table that the system is replicating. ▪ Use the filter to limit the number of records in your replication set. For example, if the table has an **Active** field, add a filter condition like **[Active] [is] [True]** to replicate only active records. ▪ If you want to replicate and preserve a parent and child table hierarchy, add a filter for the sys_class_name column to each outbound entry. This ensures that all of the child table columns are replicated, and not just the parent the columns. For example, to replicate both the Task [task] parent table and the Incident [incident] child table, you must add **[Task type] [is] [Task]** as a filter in the parent table entry and **[Task type] [is] [Incident]** as a filter in the child table entry. In this example, Task type is the label for the sys_class_name column on each table. For details, see Preserving table hierarchy in Instance Data Replication.
Include Attachments	Option to replicate the files associated with the records that you are replicating.
Included Fields	Fields to include. Move table fields into the Selected column to replicate them or into the Available column to prevent replicating them. **Note:** The system must replicate some fields, such as **sys_id (Mandatory)**. The system cannot replicate some fields, such as **Edge Encrypted** and **Password1**. They do not appear in either column.
Enable Custom Coalesce	Option to enable you to choose a field other than the default **sys_id** field to coalesce IDR.
Coalesce Field	Choose a field to use to coalesce IDR. Only unique fields are available. See Custom coalescing. This field only displays if you select **Enable Custom Coalesce**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Repeat these steps for each table that you want to include in the replication set.

Note:
If a table that you select has child tables, repeat these step and add outbound entries for each child table to maintain data integrity.

7. Select **Submit**.
8. Make the producer data available for replication to consumers by selecting **Activate**.
The producer is ready to send the data that is specified in the replication set to one or more consumer instances.
9. On a consumer instance, navigate to **Instance Data Replication** > **Consumer Replication Sets**.
10. Select **New**.
11. On the form, fill in the fields.

Consumer Replication Set form

Field	Description
Producer Instance URL	URL of the producer instance. For example, https://<producer_instance>.servicenow.com.
Producer Replication Set Name	Name of the consumer replication set. The name on the consumer must match the name on the producer. Obtain the name from the producer administrator.
Description	Description of the purpose of the replication.

12. Select **Submit**.
The list of all consumer replication sets on the consumer instance appears. The system sends a request to the producer replication set administrator to approve or deny the request.
13. Approve the consumer request.

a. On the producer instance, navigate to **Instance Data Replication** > **Producer Replication Sets**.

b. Select the producer replication set where you want to approve consumer access.

c. Under Related Links, on the **Consumer Subscriptions** tab, select the option for the consumer replication set that you want to approve.

d. On the Actions on selected rows list, select **Approve**.
The approved consumer set starts receiving replicated data.

14. Activate the consumer replication set.

a. On the consumer instance, navigate to **Instance Data Replication** > **Consumer Replication Sets**.

b. Select the consumer replication set that you want to activate.

c. Select **Activate**.
After some time, the status changes to Active Replication, and the **Partial Seeding** and **Full Seeding** buttons are displayed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
Data in the producer tables is replicated into tables and table columns of the same name on the consumer instances.

What to do next
- Seed a consumer instance
- Transform replication data
- Trigger a workflow after replication

Set up bidirectional replication

Replicate updated data on a consumer instance to the producer instance using bidirectional replication in Instance Data Replication (IDR).

Before you begin
Role required: admin

About this task
Bidirectional replication enables you to replicate data on a consumer instance to the producer instance. For example, data, such as problem requests, can be copied to consumer instances for third parties to use. The third party can update the problem issue on the consumer instance. The data can then be updated on the producer instance.

Note that seeding options are not available in bi-directional sets by design.

Procedure
1. Create a producer replication set.

   a. On the producer instance, navigate to **Instance Data Replication** > **Producer Replication Sets**.

   b. Select **New**.

   c. Enter a name and description for the producer replication set.
      - The name can only contain alphanumeric characters and hyphens.
      - Avoid using a name that applies only to the producer instance. You must provide the same name in the consumer replication set, so the name shouldn't be producer-specific.

   d. Enable changes to records that are made on the consumer instance to propagate to the producer instance by selecting **Bi-Directional**.

      Note:
      Bi-directional replication works for records that originate on the producer or consumer.

   e. **Optional:** Enable discrete mapping from a producer replication set by selecting **Discrete**. Discrete mapping distinguishes different consumer instances. For details, see Set up discrete replication.

   f. **Optional:** Create the producer replication set from a list of outbound entries by selecting **Entry set**.
   If you imported an update set from another instance or you created one earlier on your instance, you can choose an existing entry set.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

g. Select **Submit**.
The producer replication set is created with an auto-generated producer ID that identifies the producer instance in the system.

2. Specify the tables and columns on the producer instance that you want to replicate.

a. Select the Outbound Entries related list.

b. Select **New**.

c. On the form, fill in the fields.

Replication entry form

Field	Description
Source Table Name	Name of one of the tables on the producer instance to replicate. For example, SAN Disk [cmdb_ci_san_disk].
Filter	Filter criteria to control the records in the table that the system is replicating. ▪ Use the filter to limit the number of records in your replication set. For example, if the table has an **Active** field, add a filter condition like **[Active] [is] [True]** to replicate only active records. ▪ If you want to replicate and preserve a parent and child table hierarchy, add a filter for the sys_class_name column to each outbound entry. This ensures that all of the child table columns are replicated, and not just the parent the columns. For example, to replicate both the Task [task] parent table and the Incident [incident] child table, you must add **[Task type] [is] [Task]** as a filter in the parent table entry and **[Task type] [is] [Incident]** as a filter in the child table entry. In this example, Task type is the label for the sys_class_name column on each table. For details, see Preserving table hierarchy in Instance Data Replication.
Include Attachments	Option to replicate the files associated with the records that you are replicating.
Included Fields	Fields to include. Move table fields into the Selected column to replicate them or into the Available column to prevent replicating them. **Note:** The system must replicate some fields, such as **sys_id (Mandatory)**. The system cannot replicate some fields, such as **Edge Encrypted** and **Password1**. They do not appear in either column.
Enable Custom Coalesce	Option to enable you to choose a field other than the default **sys_id** field to coalesce IDR.
Coalesce Field	Choose a field to use to coalesce IDR. Only unique fields are available. See Custom coalescing.

Field	Description
	This field only displays if you select **Enable Custom Coalesce**.

d. Repeat these steps for each table that you want to include in the replication set.

> **Note:**
> If a table that you select has child tables, repeat these step and add outbound entries for each child table to maintain data integrity.

e. Select **Submit**.

3. Make the producer data available for replication to consumers by selecting **Activate**.
The producer is ready to send the data that is specified in the replication set to one or more consumer instances.

4. Create a consumer replication set.

a. On a consumer instance, navigate to **Instance Data Replication** > **Consumer Replication Sets**.

b. Select **New**.

c. On the form, fill in the fields.

Consumer Replication Set form

Field	Description
Producer Instance URL	URL of the producer instance. For example, https://<producer_instance>.servicenow.com.
Producer Replication Set Name	Name of the consumer replication set. The name on the consumer must match the name on the producer. Obtain the name from the producer administrator.
Description	Description of the purpose of the replication.

d. Select **Submit**.
The system sends a request to the producer replication set administrator to approve or deny the request.

5. Approve the consumer request.

a. On the producer instance, navigate to **Instance Data Replication** > **Producer Replication Sets**.

b. Select the producer replication set where you want to approve consumer access.

c. Under Related Links, on the **Consumer Subscriptions** tab, select the option for the consumer replication set that you want to approve.

d. On the Actions on selected rows list, select **Approve**.
The consumer set is approved and ready to receive replicated data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Activate the consumer replication set.
   a. On the consumer instance, navigate to **Instance Data Replication** > **Consumer Replication Sets**.
   b. Select the consumer replication set that you want to activate.
   c. Select **Activate**.
   After some time, the status changes to Active Replication.
7. Update the Consumer Replication Entries configuration to match the configuration on the producer by selecting **Synchronize Replication Entries**.
   If you do not see this option, refresh the page.
8. In the dialog box that appears, confirm the synchronization.

Result

Data that is updated on this consumer instance automatically replicates on the producer instance, which then replicates the updates to its other consumer instances.

Set up discrete replication

Replicate data from a producer instance to specific, distinguished consumer instances in near-real time, ensuring each consumer instance receives updates independently in Instance Data Replication (IDR).

Before you begin

Plan your data replication strategy by reviewing the important considerations described in Preparing for Instance Data Replication.

Role required: idr_admin or admin

Procedure

1. On the producer instance, navigate to **Instance Data Replication** > **Producer Replication Sets**.
2. Select **New**.
3. Enter a name and description for the producer replication set.
   - The name can only contain alphanumeric characters and hyphens.
   - Avoid using a name that applies only to the producer instance. You must provide the same name in the consumer replication set, so the name shouldn't be producer-specific.
4. Distinguish replication for different consumer instances by selecting **Discrete**.
5. **Optional:** Create the producer replication set from a list of outbound entries by selecting **Entry set**.
   If you imported an update set from another instance or you created one earlier on your instance, you can choose an existing entry set.
6. Select **Submit**.
   The producer replication set is created with an auto-generated producer ID that identifies the producer instance in the system.
7. Specify the tables and columns on the producer instance that you want to replicate.
   a. Select the Outbound Entries related list.
   b. Select **New**.
   c. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.

Replication entry form

Field	Description
Source Table Name	Name of one of the tables on the producer instance to replicate. For example, SAN Disk [cmdb_ci_san_disk].
Discrete Field	Choose a reference field that defines the mapping for each consumer subscription. For example, if you choose the **Assigned To** field in the Incident source table, you can distinguish user assignments for specific consumers.
Filter	Filter criteria to control the records in the table that the system is replicating. ▪ Use the filter to limit the number of records in your replication set. For example, if the table has an **Active** field, add a filter condition like **[Active] [is] [True]** to replicate only active records. ▪ If you want to replicate and preserve a parent and child table hierarchy, add a filter for the sys_class_name column to each outbound entry. This ensures that all of the child table columns are replicated, and not just the parent the columns. For example, to replicate both the Task [task] parent table and the Incident [incident] child table, you must add **[Task type] [is] [Task]** as a filter in the parent table entry and **[Task type] [is] [Incident]** as a filter in the child table entry. In this example, Task type is the label for the sys_class_name column on each table. For details, see Preserving table hierarchy in Instance Data Replication.
Include Attachments	Option to replicate the files associated with the records that you are replicating.
Included Fields	Fields to include. Move table fields into the Selected column to replicate them or into the Available column to prevent replicating them. **Note:** The system must replicate some fields, such as **sys_id (Mandatory)**. The system cannot replicate some fields, such as **Edge Encrypted** and **Password1**. They do not appear in either column.
Enable Custom Coalesce	Option to enable you to choose a field other than the default **sys_id** field to coalesce IDR.
Coalesce Field	Choose a field to use to coalesce IDR. Only unique fields are available. See Custom coalescing. This field only displays if you select **Enable Custom Coalesce**.

d. Repeat these steps for each table that you want to include in the replication set.

Note:
If a table that you select has child tables, repeat these steps and add outbound entries for each child table to maintain data integrity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Map discrete values for each consumer instance.

   a. Select the **Discrete Mappings** tab.

   b. Select **New**.

   c. On the form, fill in the fields.

Field	Description
Discrete Value	This field sets a rule for what displays for the selected consumer instance within the producer replication set. For example, an **Assigned To** discrete value gives choices from a designated table of a specific user to show assignments.
Outbound Replication Entry	Select an outbound replication entry that you configured with a source table for this producer replication set.
Replication Subscription	Choose the consumer instance that displays the discrete value assignment.

   Note:
   For each consumer that subscribes to a producer replication set with discrete mapping enabled, you must configure a discrete value.

   d. Repeat these steps for each consumer that you want to subscribe to the producer replication set.

9. Select **Submit**.
10. Make the producer data available for replication to consumers by selecting **Activate**.
    The producer is ready to send the data that is specified in the replication set to one or more consumer instances.
11. On a consumer instance, navigate to **Instance Data Replication** > **Consumer Replication Sets**.
12. Select **New**.
13. On the form, fill in the fields.

Consumer Replication Set form

Field	Description
Producer Instance URL	URL of the producer instance. For example, https://<producer_instance>.servicenow.com.
Producer Replication Set Name	Name of the consumer replication set. The name on the consumer must match the name on the producer. Obtain the name from the producer administrator.
Description	Description of the purpose of the replication.

14. Select **Submit**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The list of all consumer replication sets on the consumer instance appears. The system sends a request to the producer replication set administrator to approve or deny the request.

15. Approve the consumer request.
    a. On the producer instance, navigate to **Instance Data Replication** > **Producer Replication Sets**.
    b. Select the producer replication set where you want to approve consumer access.
    c. Under Related Links, on the **Consumer Subscriptions** tab, select the option for the consumer replication set that you want to approve.
    d. On the Actions on selected rows list, select **Approve**.
    e. Repeat these steps for each consumer instance.
16. Activate the consumer replication set.
    a. On the consumer instance, navigate to **Instance Data Replication** > **Consumer Replication Sets**.
    b. Select the consumer replication set that you want to activate.
    c. Select **Activate**.
    d. Repeat these steps for each consumer instance.
    After some time, the status changes to Active Replication, and the **Partial Seeding** and **Full Seeding** buttons are displayed.

Set up scheduled replication

Replicate data from a producer to a consumer at scheduled times each day in Instance Data Replication (IDR).

Before you begin

Verify that the producer and consumer instances belong to the same customer.

Plan your data replication strategy by reviewing the important considerations described in Preparing for Instance Data Replication.

Note:
You can only create one scheduled replication set, with only one outbound entry in that set.

Role required: idr_admin or admin

Procedure

1. On the producer instance, navigate to **Instance Data Replication** > **Producer Replication Sets**.
2. Select **New**.
3. Enter a name and description for the producer replication set.
    - The name can only contain alphanumeric characters and hyphens.
    - Avoid using a name that applies only to the producer instance. You must provide the same name in the consumer replication set, so the name shouldn't be producer-specific.
4. Schedule replication from your producer instance to one or more consumer instances.
    a. Select **Scheduled**.
    b. Select an interval in the **Schedule Interval** drop-down list.
    c. Select a date and time to begin scheduled replication.
    The schedule interval is added to the start date and time, and the resulting next run time is displayed in the **Next Schedule Run** field.

5. **Optional:** Create the producer replication set from a list of outbound entries by selecting **Entry set**.
   If you imported an update set from another instance or you created one earlier on your instance, you can choose an existing entry set.
6. Select **Submit**.
   The producer replication set is created with an auto-generated producer ID that identifies the producer instance in the system.
7. Specify the table and columns on the producer instance that you want to replicate.

   a. Select the Outbound Entries related list.

   b. Select **New**.

   c. On the form, fill in the fields.

Replication entry form

Field	Description
Source Table Name	Name of one of the tables on the producer instance to replicate. For example, SAN Disk [cmdb_ci_san_disk].
Filter	Filter criteria to control the records in the table that the system is replicating. ▪ Use the filter to limit the number of records in your replication set. For example, if the table has an **Active** field, add a filter condition like **[Active] [is] [True]** to replicate only active records. ▪ If you want to replicate and preserve a parent and child table hierarchy, add a filter for the sys_class_name column to each outbound entry. This ensures that all of the child table columns are replicated, and not just the parent the columns. For example, to replicate both the Task [task] parent table and the Incident [incident] child table, you must add **[Task type] [is] [Task]** as a filter in the parent table entry and **[Task type] [is] [Incident]** as a filter in the child table entry. In this example, Task type is the label for the sys_class_name column on each table. For details, see Preserving table hierarchy in Instance Data Replication.
Include Attachments	Option to replicate the files associated with the records that you are replicating.
Included Fields	Fields to include. Move table fields into the Selected column to replicate them or into the Available column to prevent replicating them. **Note:** The system must replicate some fields, such as **sys_id (Mandatory)**. The system cannot replicate some fields, such as **Edge Encrypted** and **Password1**. They do not appear in either column.
Enable Custom Coalesce	Option to enable you to choose a field other than the default **sys_id** field to coalesce IDR.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Coalesce Field	Choose a field to use to coalesce IDR. Only unique fields are available. See Custom coalescing. This field only displays if you select **Enable Custom Coalesce**.

Note:
If a table that you select has child tables, create one or more continuous replication sets and add outbound entries for each child table to maintain data integrity.

8. Select **Submit**.
9. Make the producer data available for replication to consumers by selecting **Activate**.
   The producer is ready to send the data that is specified in the replication set to one or more consumer instances.
10. On a consumer instance, navigate to **Instance Data Replication** > **Consumer Replication Sets**.
11. Select **New**.
12. On the form, fill in the fields.

Consumer Replication Set form

Field	Description
Producer Instance URL	URL of the producer instance. For example, https://<producer_instance>.servicenow.com.
Producer Replication Set Name	Name of the consumer replication set. The name on the consumer must match the name on the producer. Obtain the name from the producer administrator.
Description	Description of the purpose of the replication.

13. Select **Submit**.
    The list of all consumer replication sets appears. The system sends a request to the producer replication set administrator to approve or deny the request.

Result
Scheduled replication begins on the scheduled start date and time. Until then, continuous data replication occurs. After that point, replication occurs only at each scheduled interval.

What to do next
- Track the status of each scheduled run by viewing the Seeding Requests related list or by navigating to **Instance Data Replication** > **Seeding Requests**. If a scheduled run fails, you can try replicating records using a partial seeding request or a data comparison request that covers the failed date range. Otherwise, contact Customer Service and Support for assistance.
- Track seeding progress from the producer side by viewing the **Run Duration** and **Percent Complete** columns. Track seeding progress for the consumer portion by viewing the same details in the consumer replication set.
- View scheduled seeding runs in the IDR Data Comparison Requests related list. You can add the **Request Received From** column to the list to distinguish scheduled seeding requests from data comparison requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cancel scheduled replication

Cancel scheduled replication by deactivating or deleting a producer replication set.

Before you begin
Role required: admin

About this task
Once set, you can't disable scheduled replication on a producer replication set; the option becomes read-only. You can either deactivate the set or delete and recreate it.

Procedure

1. Navigate to **Instance Data Replication** > **Producer Replication Sets**.
2. Select the producer replication set for which you want to stop scheduled replication.
3. Stop scheduled replication before another run occurs.
   - Pause scheduled replication indefinitely by selecting **Deactivate**. This option stops replication before the next schedule run.
   - Stop scheduled replication by selecting **Delete**. This option deletes the producer replication set. If you plan to recreate the producer replication set, record the settings you configured before you delete the replication set.

Result
Scheduled replication ends. After deactivating the producer replication set, any in progress seeding requests will complete, but pending requests will not be processed.

What to do next
If you intend to resume scheduled replication, you can sync records that weren't replicated during the deactivation period by running a data comparison request. See Comparing replicated data between instances in Instance Data Replication. Alternatively, you can replicate missing records by performing a partial seeding request from the Inbound Entries related list on the consumer replication set.

Seed a consumer instance

Seed all or some of the tables in your Instance Data Replication (IDR) replication sets depending on the needs of your consumer instance.

Before you begin
Role required: idr_admin or admin

About this task
Seeding replicates existing records from the producer instance to the consumer instance. You can initiate seeding requests on a consumer instance while you are activating a consumer replication set. Seeding options are not available in bi-directional or discrete replication sets by design.

You can select either full seeding or partial seeding.

- Full seeding replicates all existing records from a table in the producer instance. Perform a full seeding when you want to replicate all existing records.
- Partial seeding enables you to filter and replicate specific records from the producer. Perform a partial seeding when you want to replicate only some of the records from the producer.

The producer instance handles one seeding request at a time. When the producer instance is busy with a seeding request, subsequent seeding requests are queued and initiated in the order that they are received.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Records that exist on the producer instance and not on the consumer instance are copied to the consumer instance.
- If the sys_id on the producer matches an existing record on the consumer instance, the entire record on the consumer instance is updated to match the producer.
- The sys_id of the record identifies the record on both instances. If you use the custom coalesce option, the field you select is used to coalesce records in both instances.
- If a replication set changes and no longer includes a table, IDR does not alter the records in the corresponding table on the consumer instances.

- The maximum record size is 10 MB.
- The maximum seeding size is 3 million records.

Note:
If your replication set contains more than 3 million records, seeding cannot start. To fix this situation, break the replication set into multiple replication sets with fewer records in each or use partial seeding.

- The maximum seeding time is 7 days.

Note:
Seeding is not a replacement for cloning. Do not use IDR to clone instances.

Procedure

1. On the consumer instance, navigate to **Instance Data Replication** > **Consumer Replication Sets** and click a consumer replication set.
2. On the **Inbound Entries** tab, select the entry or entries that you want to initiate seeding for.
3. To initiate a full seeding, click **Full Seeding**.
   A dialog box opens stating that the system is requesting all matching records.
4. To configure a partial seeding, click **Partial Seeding**.
   a. If you selected more than one entry, select the Replication entry that you want to configure and select **Configure Seeding**.
   b. Configure one or more Custom Filter conditions, operators, and values.
   c. To download the current field values and to replicate the files that are associated with the records, select **Include Attachments**.
   d. To download the current field values and the history of all field updates, select **Include History**.
   e. In the Included Fields columns, use the arrows to move table fields into the Selected column to replicate them or into the Available column to prevent replicating them.
   f. Click **Save Configuration**.
   g. Configure other Replication entries as needed.
   h. When you are ready to initiate seeding, click **Request Partial Seeding**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The Custom Filter determines which records to include in the partial seeding request.

The system must replicate some fields, such as **Sys ID**. The system cannot replicate some fields, such as **Edge Encrypted** and **Password**. They do not appear in either column.

5. To discard your seeding request before you click **Request Partial Seeding**, click **Cancel**.

Result
In a successful seeding, all selected data on a producer instance is replicated on a consumer instance. After seeding, the consumer instance maintains a history of all field updates.
If you encounter an error during seeding, see Fix seeding errors.

- Seeding continues even if errors occur on some consumer tables. You can restart seeding specifically on the tables that have errors or on all tables in a replication set.
- The maximum for a retry reseeding request is 10,000 errors. If you have more errors, perform a full seeding.

Modifying replication behavior in Instance Data Replication

Modify how data is replicated by configuring optional settings in Instance Data Replication (IDR).

Custom coalescing

Coalesce records using a different column when records on the consumer instance have a different sys_id than the same record on the producer instance in Instance Data Replication (IDR).

By default, the **sys_id** field is used to coalesce records in IDR. Beginning with the San Diego release, you can choose to use a different field.

Use the coalesce columns feature when records on the consumer instance have a different sys_id than the same record on the producer instance. For example, when a record is created by Discovery and loaded into multiple instances, the sys_id might not match. In this scenario, you can use a different unique identifier field by selecting the **Enable Custom Coalesce** option and choosing a coalesce field on the producer Replication entry form.

When you select the **Coalesce** field, you must verify the following:

- The field that you selected is in the Included Fields on the Replication Entry form on the producer instance.
- The field exists with the same name, length, and type on the consumer instance.

Note:
The **Coalesce** field can be different on the consumer instance if you create a valid transform for the field.

- The **Unique** column value for the field that you selected is set to *true* in the Dictionary Entry [sys_dictionary] table.

Don't change the value of the field after it's set as the **Coalesce** field.

To change the **Coalesce** field after it has been set, you must delete the Replication Entry on the producer instance and create a new Replication Entry.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If the **Coalesce** field doesn't exist on the consumer instance, the following error is displayed on the Consumer Replication Set form. `The consumer instance does not recognize the <column_name> coalesce field as a valid member of the <table_name> table. Create this field or enable a transformation with this table to receive updates from the producer table to the consumer instance.`

Errors when using coalesce with transformation

If transform is enabled on the producer instance, the **Coalesce** field on the target table must have the same name, type, and length. If any of those parameters don't match, an error is displayed.

If transform is enabled on the producer instance, the mapping is invalid for the **Coalesce** field, and the consumer syncs entries, the system displays an error on the Consumer Replication Set form.

If transform is enabled for a replication entry with a valid mapping of the **Coalesce** field and then the table schema for the target table is updated so that the mapping is no longer valid, the system displays an error on the Replication Entry form.

If a replication entry attempts to enable transform and a valid mapping for the **Coalesce** field doesn't exist from the source table to the target table, the system displays an error on the Replication Entry form.

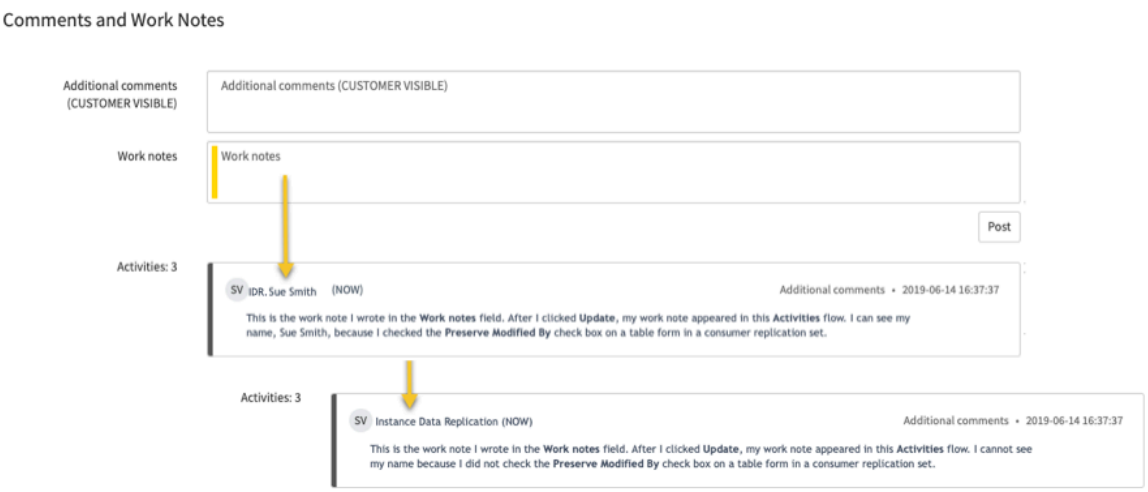
Preserving system field values

Preserve producer values in system fields when replicating data in Instance Data Replication (IDR).

To preserve the user name in an Activities entry, select the **Preserve Modified By** option on the Inbound Entry form on a consumer replication set.

For example, the **Work Notes** field is an Activity type in change request records. When a user updates a change request, the work note moves into the Activities stream.

- If you do not select **Preserve Modified By**, Instance Data Replication appears in place of the user name in the consumer records.
- If you select **Preserve Modified By**, the user who updated the change request is identified in the entry and the system prepends IDR to their name.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When replicating changes, **Preserve modified by** affects values for the **Updated by**, **Updated**, **Created**, and **Created by** system fields:

- When **Preserve modified by** is enabled and you include system fields in the producer replication entry, producer system field values are replicated to the consumer records. If you do not include system fields in the producer replication entry, default system values from the consumer instance are used instead.
- When **Preserve modified by** is disabled, default system field values from the consumer instance are used, which means they may not match the system field values in records on the producer.

When seeding data, the **Preserve modified by** setting has no effect:

- If you include system fields in the producer replication entry, producer system field values appear in the seeded records.
- If you do not include system fields in the producer replication entry, null values appear in the system fields for seeded records.

Triggering workflows after replication

Trigger workflows after replication using platform business rules.

Inserts and updates that are replicated to a consumer instance can trigger business rules configured on the target table. A business rule is a server-side script that is associated with a table. Use business rules to trigger workflows that are associated with replications, such as sending a notification or validating the replicated data.

Business rules are part of the ServiceNow AI Platform. For more information, see Business rules.

To run a business rule after replication, select the **Run Business Rule** option on the Inbound Entry form in a consumer replication set. IDR will invoke the business rules that are associated with the specified table after replicating the data to the table.

Transform replication data

Transform producer instance data for tables or table columns that are named differently on consumer instances in Instance Data Replication (IDR).

Before you begin

- Create and activate a producer replication set.
- Create, activate, and seed one or more consumer replication sets.
- Role required: idr_admin or admin

About this task

The replicated data from producer tables and table columns goes into tables and table columns of the same name on consumer instances. You can map the producer data into any table or table column on consumer instances. If existing tables or table columns have different names, you can replicate the data to a different table or table column. Adapters modify the data before storing it on consumer instances. For example, adapters can localize data from the producer instance before it is consumed by the consumer instance.

You can also use adapters to modify the producer data during replication. For example, you can localize the data or populate the data that has been labeled differently in consumer tables.

Transformations have the following limitations:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- sys_created, sys_created_by, sys_domain, sys_updated_by, sys_id, sys_mod_count, and other systems are automatically mapped to the consumer and can't be remapped.

  No other sys_ fields can be replicated.

- Adapters can't operate on the sys_journal field type such as Comments or Worknotes columns in a Task table.
- Calculated fields won't be transformed.

  A calculated field, such as the name field from sys_user, will replicate but cannot be transformed. Allowing a transformation breaks the calculation for the resulting field.

> **Note:**
> Calculated fields will not show as an option to transform.

Procedure

1. Choose a producer or consumer instance and navigate to the replication set.

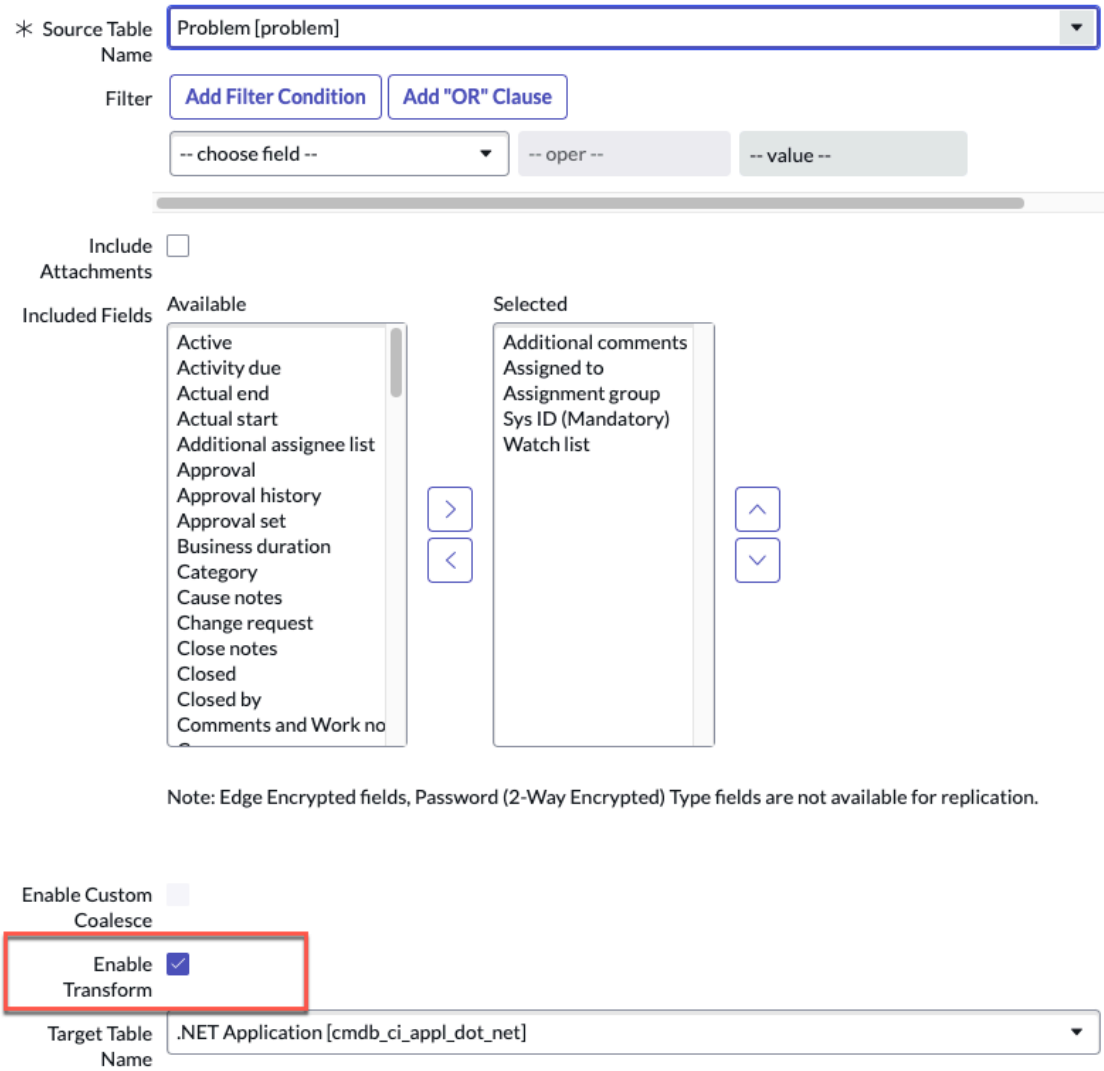
Option	Description
Consumer Instance	Navigate to **Instance Data Replication** > **Consumer Replication Sets** and click a consumer replication set.
Producer instance	Navigate to **Instance Data Replication** > **Producer Replication Sets** and click a producer replication set.

2. Choose an inbound or outbound entry.

Option	Description
Consumer Instance	On the **Inbound Entries** tab, click an inbound entry.
Producer instance	On the **Outbound Entries** tab, click an outbound entry.

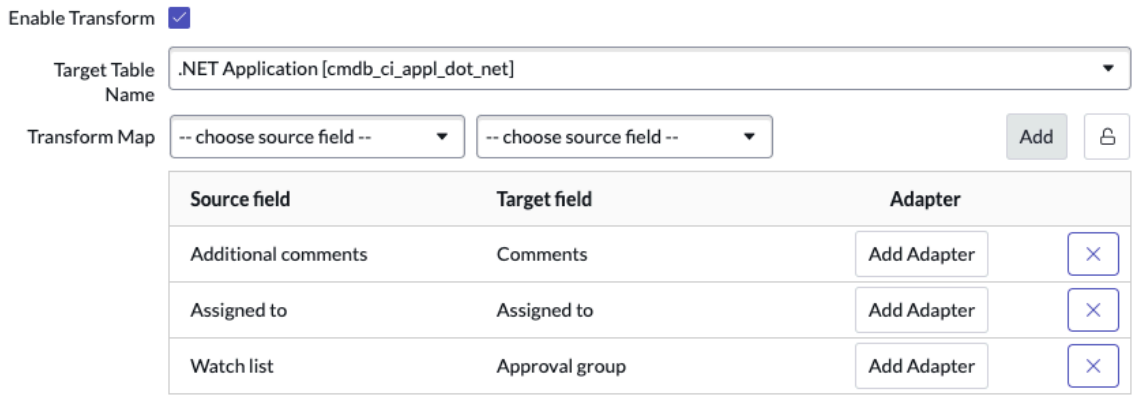
An entry appears.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



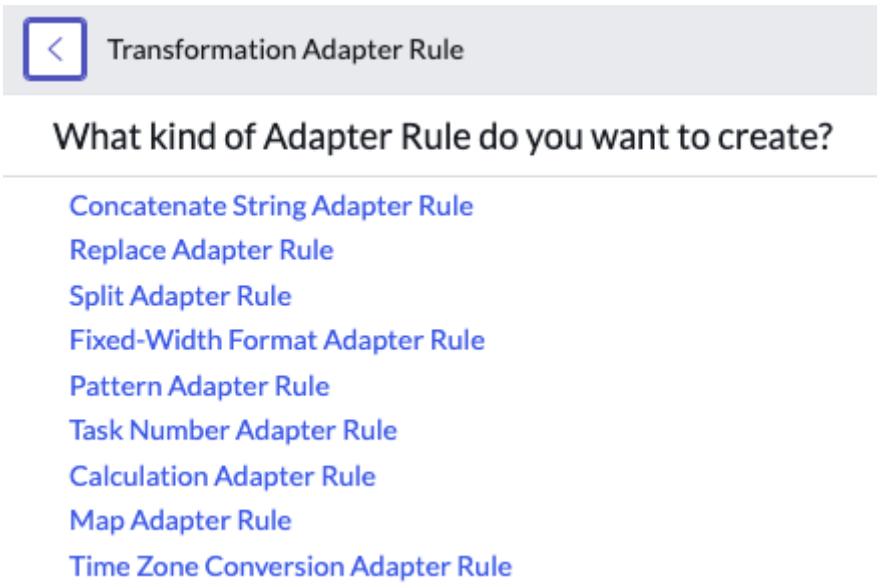
3. Select the **Enable Transform** option.
4. In the Target Table Name list, select the table into which you want to replicate the source table data and click **Update**.
5. On the **Inbound Entries** or the **Outbound Entries** tab, click the same entry.
6. Click the lock icon next to **Transform Map** to unlock it.
   The image shows a Transform Map, with the field names from the source table appearing in the left column. The middle column shows matching field names in the target table. All fields that do not have the same names in both tables appear in the – choose source field – or – choose target field – lists.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note:
If a table in a producer replication set is not on a consumer instance, the consumer instance will fill the first column with the producer schema definition sent during synchronization.

7. Map a producer column to a consumer column that has a different name:
   a. Click **– choose source field –** and select the source field that you want to map.
   b. Click **– choose target field –**, select the target field into which you want to map the data, and then click **Add**.
   c. If you want to remove a field from replicating the producer instance to the consumer instance, click the **X** at the end of the row to delete the field.
8. To modify the producer data before replicating it in the consumer instance, click **Add Adapter**. The image shows the type of Adapter rules that you can create.



9. Click the adapter that you want to use and then configure it.
   For more information about configuring adapters, see Adapter descriptions.

Note:
Adapters do not modify the data on the producer instance.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Warning and error messagesInstance Data Replication

Understand error and warning messages related to schema definitions. You can then troubleshoot or fix Instance Data Replication (IDR) replication issues.

Warning and Error Messages

Message	Type	Action
`The consumer instance does not recognize the [specified] table from the associated IDR schema.`	Error	The replication entry cannot process any messages. Please enable a transformation with this table to receive updates from this table to the consumer instance.
`The consumer instance does not recognize the [specified] column from the associated IDR schema.`	Warning	The replication entry cannot process any of the specified columns. Please enable a transformation with this table in order to receive updates from this column to the consumer instance.
`The consumer instance does not recognize the column type or length from the associated IDR schema for these columns: [specified columns].`	Warning	The consumer instance might lose data for those columns. Please enable a transformation with this table in order to receive updates from these table columns.

Reconfigure a replication set in Instance Data Replication

If you must change or update your original replication set, reconfigure Instance Data Replication (IDR) replication sets on the producer instance.

Before you begin

Role required: idr_admin or admin

About this task

After activating a revised producer replication set, update the producer replication set name, shared key, producer ID, and producer set ID on each consumer instance.
Note the following important information:

- Make sure that a seeding request is not in progress before you reconfigure a producer instance. Check the consumer replication sets seeding requests status.
- If you make a change to the producer replication set, you must re-synchronize the consumer replication set. On the consumer instance, click **Synchronize Replication Entries**, and then click **Activate**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Reconfigure a producer instance:

   a. On the producer instance, navigate to **Instance Data Replication** > **Producer Replication Sets**.

   b. Select a producer replication set and make one or more of the following changes to the set:
   - To add a table to the set, on the **Replication Entries** tab, click **New**.
   - On the **Replication Entries** tab, click a replication set. In the Replication Entry form, modify the columns that are included in the replication set, and click **Update**.
   - To remove the table from the replication set, on the **Replication Entries** tab, click a replication set and click **Delete**.
   - To change the shared encryption key, click **Generate New Shared Key**.

     Only generate new shared keys when you discover that they are compromised or if you want to stop sending data to a consumer. After changing the encryption key on the producer instance, consumers that have the Consumer Approved Status of Denied must reapply for access to the producer replication set. For more information, see Grant access to replication data.

   These changes stop replication and produce this status message on the consumer instance: `Producer Replication Set configuration has been modified`.

2. Navigate to **Instance Data Replication** > **Consumer Replication Sets** and click the consumer replication set and each consumer instance that you want to update with the changes made on the producer.
   The status of the replication set is Replication Error. The following table lists the action to take according to the status message.

3. **Optional:** Discard the entire IDR configuration and start over, delete the replication set on the producer and the consumer.
   - To delete a producer replication set from the producer instance, navigate to **Instance Data Replication** > **Producer Replication Sets**. Click the producer replication set that you want to delete, and click **Delete**.
   - To delete a consumer replication set on a consumer instance, navigate to **Instance Data Replication** > **Consumer Replication Sets**. Click the consumer replication set that you want to delete, and click **Delete**.

Administering Instance Data Replication

Perform administrative duties in Instance Data Replication (IDR).

Overview of administering IDR

After you successfully set up data replication, keep IDR running smoothly by performing important administrative tasks as needed.

Manage consumer access to replication data in Instance Data Replication

Approve a consumer's request to access replication data in Instance Data Replication (IDR).

Before you begin

Role required: admin, idr_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
You can review consumer access requests for all of your producer replication sets or for a specific producer replication set. The administrators of consumer sets must apply for access before they can receive the replication data.

Procedure
1. On the producer instance, navigate to **Instance Data Replication** > **Consumers Pending Approval**.
2. Select the option for each consumer replication set that you want to approve.
3. On the Actions on selected rows list, select **Approve**.
   The approved consumer sets start receiving the replicated data.

   Note:
   You can change the Consumer Approval Status to Denied to prevent the consumer from receiving the replicated data.

4. Approve a consumer access request for a specific producer replication set.

   a. On the producer instance, navigate to **Instance Data Replication** > **Producer Replication Sets**.

   b. Select the producer replication set where you want to approve consumer access.

   c. Under Related Links, on the **Consumer Subscriptions** tab, select the option for the consumer replication set that you want to approve.

   d. On the Actions on selected rows list, select **Approve**.
   The approved consumer set starts receiving replicated data.

   Note:
   You can change the Consumer Approval Status to Denied to prevent the consumer from receiving the replicated data.

Revoke access to replicated data for Instance Data Replication

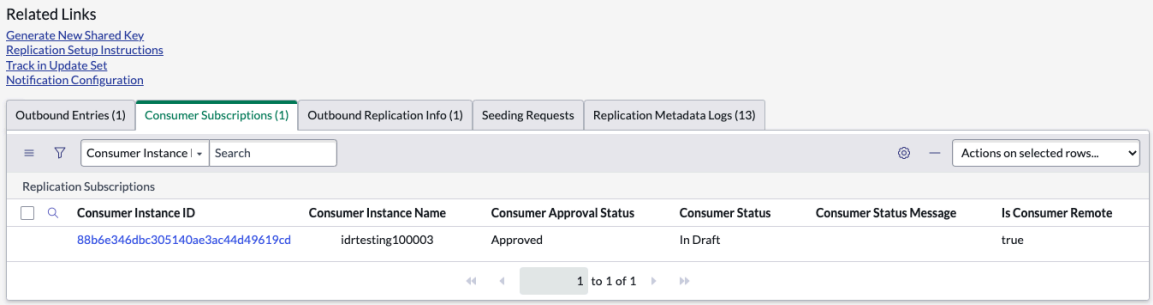
Revoke a consumer's access to replicated data if you believe that consumer instance should no longer receive data in Instance Data Replication (IDR).

Before you begin
Role required: admin, idr_admin

About this task
When you generate a new, shared encryption key, approved consumer sets automatically receive the new key and data replication is not interrupted. Any consumer set with a status of Denied or Pending Approval does not receive the new encryption key, and replication ceases.

Procedure
1. On the producer instance, navigate to **Instance Data Replication** > **Producer Replication Sets**.
2. Select the producer replication set that has consumers whose access needs to be revoked.
   The instance identifies the consumers under the **Consumer Subscriptions** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. On the **Consumer Subscriptions** tab, select the option for the consumer instance whose permissions you want to revoke.
4. In the Actions on selected rows list, select **Revoke**.
   Instance Data Replication generates a new encryption key and shares it with all approved consumer sets. All other consumer sets stop receiving replication data. Admins of those consumer replication sets must reapply to restore access to the replication data.

Restore access to replication data for Instance Data Replication

Restore Instance Data Replication (IDR) access to replicated data by sending a request to the producer replication set admin.

Before you begin

Role required: admin

About this task

When the producer replication set administrator generates a new encryption key, consumer sets with a status of Approved automatically receive the new key and data replication is uninterrupted. Consumer sets with a status of Denied or Pending Approval do not receive the new encryption key and replication stops.

Procedure

1. On the consumer instance, navigate to **Instance Data Replication** > **Consumer Replication Sets**.
2. Select the consumer replication set to restore access to.
3. Click the **Request Shared Key** related link.
   The system sends a request to the producer replication set administrator. If you are granted access, the consumer Approval Status changes to Approved.
4. If the producer replication set has changed, click the **Synchronize Replication Entries** related link.
5. To get the latest data in the producer replication set, on the **Inbound Entries** tab, select all the tables and click **Activate**.

Comparing replicated data between instances in Instance Data Replication

Find missing or mismatched records by comparing replication data between instances in Instance Data Replication (IDR).

IDR synchronizes data between a producer instance and one or more consumer instances. After you activate a producer replication set and subscribe at least one consumer, you can send existing records from the producer to the consumer by seeding records. After seeding is finished, IDR maintains data synchronization between the instances by replicating new and changed records from the producer to the consumer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If an insert fails on the consumer or when producer and consumer records don’t match after replication, you can use the data comparison feature in IDR to find these records and reseed them from the producer to the consumer.

Key benefits

- Identify records missing from the consumer instance after seeding.
- Identify mismatched records and view their differences.
- Keep data synchronized between instances by reseeding records.

Comparing transformed data

When comparing transformed data, note the following details:

- The data comparison can return mixed results if records are added to a table on the producer and then a transformation replicates to a different table on the consumer instance.
- Mapped fields with different field definitions are skipped. For example, if a field on the producer has a different column type or column length than the mapped field on the consumer, the field is skipped.
- All fields that are modified by an adapter are skipped except for modifications made by the Task number adapter. For example, if a string is appended using the Concatenate String adapter, the data comparison can't undo the concatenation and compare the data using the original string, so the field is skipped.

Compatibility

Beginning in the Washington DC release, you can compare replicated data in bidirectional replication sets, discrete replication sets, and replication sets with transformations configured on either the producer or the consumer.

When comparing data on different family releases, note the following compatibility options.

Producer to consumer compatibility

Data comparison	Producer	Consumer	Supported replication sets
Producer to consumer	Washington DC or later	Utah and earlier	None
Producer to consumer	Washington DC or later	Vancouver	Supports unidirectional replication sets, but not the following: • bidirectional replication sets • discrete replication sets • replication sets configured with transformations
Producer to consumer	Washington DC or later	Washington DC or later	All replication sets

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Consumer to producer compatibility

Data comparison	Consumer	Producer	Supported replication sets
Consumer to producer	Washington DC or later	Utah and earlier	None
Consumer to producer	Washington DC or later	Vancouver	Supports bidirectional replication sets, but not the following: • unidirectional replication sets • discrete replication sets • replication sets configured with transformations
Consumer to producer	Washington DC or later	Washington DC or later	All replication sets, but not unidirectional replication sets

Limitations

- Journal fields are excluded from the comparison due to the potential size of their content.
- Sys Audit [sys_audit] table records are excluded from the comparison.

Find missing or mismatched records in Instance Data Replication

Find records missing from the consumer instance or mismatched records after data has been replicated by creating a data comparison request in Instance Data Replication (IDR).

Before you begin

Make sure the following conditions are met:

- The producer replication set is active.
- Seeding isn't in progress.
- No other data comparison requests are running.

Role required: admin

About this task

Note the following:

- Data comparison requests are purged after three months.
- There are limitations when comparing transformed data. See Comparing replicated data between instances in Instance Data Replication.

Procedure

1. On the producer instance, navigate to **All** > **Instance Data Replication** > **Producer Replication Sets**.
2. Select an active producer replication set with replicated data that you want to compare.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Create a data comparison request.

   a. Navigate to the IDR Data Comparison Requests related list.

   b. Select **New**.

   c. On the form, fill in the fields.

   IDR Data Comparison Request form

Field	Description
Replication Set	Name of the producer replication set.
Target Instance Name	Name of the consumer instance.
Target Instance URL	URL of the consumer instance.
Table Name	Name of the table in the outbound entry of the producer replication set.
Start Date	Start date and time for comparing data. Records with a sys_updated_on value after the date you select are included in the comparison.
End Date	End date and time for comparing data. Records with a sys_updated_on value before the date you select are included in the comparison.
Auto Seed	Option to automatically seed any missing or mismatched records from the producer instance to the consumer instance. You can optionally reseed missing or mismatched records at a later time. See Reseed missing or mismatched records in Instance Data Replication.

   d. Select **Submit**.

4. View a summary of the data comparison in the IDR Data Comparison Results form.
   - Determine the percentage of missing or mismatched by viewing the pie chart.
   - View the total number of missing and mismatched records in the **Mismatched Records Count** field.
5. **Optional:** Identify records that are missing from the consumer instance after seeding through the pie chart or list.
   - View the missing records by selecting the missing records portion of the pie chart.
   - View records that have a **Missing** value in the **Record Type** column in the IDR Instance Comparison Results related list.

   Tip:
   Save copies of the missing record IDs in case you need to provide them to Customer Service and Support.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. **Optional:** View the differences between mismatched records after data replication.

   a. Navigate to the IDR Instance Comparison Results related list.

   b. Select the check box next to any record with a **Mismatched** value in the **Record Type** column.

   c. Select the **Actions on selected rows** list.

   d. Select **Compare records**.

   e. View the highlighted differences between the records in the **Compare Record Payloads** dialog box.

      Note:
      Journal fields are excluded from the comparison due to the potential size of their content.

      Save a copy of the payload difference in case you need to provide it to Customer Service and Support.

What to do next

Reseed missing or mismatched records in Instance Data Replication.

Reseed missing or mismatched records in Instance Data Replication

Synchronize data between instances by reseeding records missing from the consumer instance or mismatched records between the producer and consumer instance in Instance Data Replication (IDR).

Before you begin

Role required: admin

About this task

Data comparison results and logs are purged after five days.

Procedure

1. On the producer instance, navigate to **All** > **Instance Data Replication** > **Producer Replication Sets**.
2. Select a producer replication set with data that you want to reseed to the consumer.
3. View the data comparison results.
   a. Navigate to the IDR Data Comparison Requests related list.
   b. Select a data comparison.
4. Synchronize the data between the producer and the consumer instance by reseeding.
   - Reseed all records by selecting **All** in the **Reseed mismatched records** field.
   - Reseed only the mismatched or missing records by selecting **Mismatched** in the **Reseed mismatched records** field.
5. Select **Reseed**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
Records are reseeded from the producer to the consumer and the results are displayed when the job is finished.

What to do next
If records are still missing or mismatched, contact Customer Service and Support for assistance.

Deploying a replication configuration from one instance to another in Instance Data Replication

Copy a replication configuration from one instance to another through an update set in Instance Data Replication (IDR).

In IDR, you can capture a snapshot of a replication configuration, including selected fields, filters, or data transformations using the **Track in Update Set** option, and then copy it to another instance using an update set.

Important:
The **Track in Update Set** option in IDR is the only supported method for capturing a replication configuration that you want to copy to another instance.

Key benefits

- Save time by defining a replication configuration once and using it as a template for new replication sets on other instances.
- Minimize potential impact to your production instance by developing a replication configuration in your sub-prod instance first.
- Verify a replication configuration in a sub-prod instance before rolling it out to a production instance.

Configuration entities

The following configuration entities are captured in an active update set when you select the **Track in Update Set** option.

Entry set

An entry set is a bundle of replication entries (like a replication set), that doesn't contain any instance-specific metadata like the Producer ID. A new Producer ID is used in the target instance when you create a producer replication set based on an entry set.

Replication options that are tracked in an entry set and their status (active or inactive) include:

- Bi-directional replication
- Discrete value mapping

Replication entries

A replication entry contains configuration settings for each table that you want to replicate. Replication entries are either outbound or inbound.

- Outbound entries from a producer instance contain the source table, filter, fields you want to replicate, and data transformation settings.
- Inbound entries from a consumer instance include the target table, the option to run business rules after replication, and data transformation settings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Viewing an entry set and replication entries

When you create a replication set, a new record is added to the Entry Sets [idr_entry_set] table. New records are added to the Replication Entries [idr_replication_entry] table for each outbound entry that you add to the replication set.

After selecting **Track in Update Set**, you can view the entry set and its replication entries in the current update set by navigating to **All** > **System Update Sets** > **Local Update Sets**, selecting the update set, and then viewing the **Customer Updates** tab.

Deploy a replication configuration through an update set in Instance Data Replication

Export a replication configuration from one instance and import it on another instance through an update set in Instance Data Replication (IDR).

Before you begin

Role required: idr_admin or admin

About this task

You can copy a replication configuration from one instance to another using an update set. For details on using update sets, see Get started with update sets.

Procedure

1. On the source instance, create an update set.
   a. Navigate to **All** > **System Update Sets** > **Local Update Sets**.
   b. Select **New**.
   c. Enter a name for the update set.
   d. Select **Submit and Make Current**.
   An update set is created and selected as the current update set on the source instance.
2. Capture a producer or consumer replication configuration in the update set.

   Note:
   You can capture the following types of configurations on a producer instance:
   - Producer replication (one-way)
   - Producer replication with bi-directional replication
   - Producer replication with discrete replication

   - The replication set configuration is added to the Entry Sets [idr_entry_set] table.
   - The replication entries in the replication set are added to the Replication Entries [idr_replication_entry] table.
   - The entry set and its replication entries are captured in the current update set.
3. **Optional:** Continue modifying the replication configuration as needed.
   Additional changes that you make aren't captured until you select **Track in Update Set** again.
   a. Modify the producer replication set and select **Update**.
   b. Capture the latest changes by selecting **Track in Update Set**.
   The latest changes are captured in the update set.
4. Export the update set to XML.
   a. Navigate to **All** > **System Update Sets** > **Local Update Sets**.
   b. Select the current update set.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. In the **State** drop-down list, select **Complete**.

d. Select **Update**.

e. In the Update Sets list, select the update set that you marked as complete.

f. Select the **Export to XML** related link.
The update set is exported to an XML file on your local machine.

5. On the target instance, import the update set.

a. Navigate to **All** > **System Update Sets** > **Update Sets to Commit**.

b. Select the **Import Update Set from XML** related link.

c. Select **Choose File** and browse to the XML file that you exported.

d. Select **Upload**.

e. In the Retrieved Update Sets list, select the update set that you imported.

f. Select **Preview Update Set**.

Note:
If you receive sys_record_transform errors during the preview, select all the error records that are listed in the **Update Set Preview Problems** tab, and then select **Accept Remote Update**. Repeat this action for any additional sys_record_transform errors that appear.

g. Exit the preview by selecting **Close**.

h. On the update set form, select **Commit Update Set**.

The update set is imported on the target instance, including the entry set and replication entries that you captured from the source instance. If you exported the configuration for a uni-directional producer replication set, a new producer replication set is automatically created on the target instance.

6. On the target instance, perform the following steps based on the type of replication set that you want to set up.

Result

The replication configuration that you exported from the source instance is imported to the target instance. A new replication set based on the exported configuration is created on the target instance.

What to do next

- If you're setting up a producer replication set, create and subscribe one or more consumers.
- If you're setting up a consumer replication set, approve the consumer's request on the producer instance, and then activate the consumer replication set on the consumer instance.
- If you're setting up a bi-directional replication set, synchronize the consumer by selecting the **Synchronize Replication Entries** related link in the connected consumer replication set.
- If you're setting up a discrete replication set, create and subscribe one or more consumers.

Cloning with Instance Data Replication

Ensure that certain tables are preserved or excluded to clone your database from one instance to another successfully with Instance Data Replication (IDR).

There are multiple methods for copying an IDR configuration from one instance to another.

Capture the configuration in an update set

An update set captures a group of configuration changes that you can move from one instance to another but doesn't include data that a producer replicates to a consumer. You can capture a snapshot of an IDR replication configuration, including selected fields, filters, or data transformations using the **Track in Update Set** option, and then copy it to another instance using an update set. See Deploying a replication configuration from one instance to another in Instance Data Replication.

Copy the configuration using a clone profile

Cloning your instance copies everything in the database from one instance to another, including the data and the IDR replication configuration.

Before you clone your instance, you must determine whether to exclude or include your IDR replication configuration.

For details on cloning, see .

IDR cloning use cases

You must preserve and exclude different sets of IDR tables in your cloning profile depending on your cloning use case.

Recurring clone

In this use case, you clone your source instance regularly without affecting the existing IDR configuration on the target instance.

For example, you configure IDR to replicate data from instance A to instance B. You determine that you must clone the database from instance A to another instance called instance C. Instance A and instance C both have IDR configured with different replication configurations. When you clone the database from instance A to instance C, you don't want to clone any of the IDR replication configuration from A to C.

Note:
If you regularly clone data from your source instance to your target instance, and find that you need to copy the IDR replication configuration from the source instance to the target instance, use the **Track in update set** feature to copy the IDR to the target instance.

To clone your database from one instance to another without affecting the IDR configuration on the target instance, you must update the preserve and exclude lists in your cloning profile according to the Recurring Clone use case described in KB0965218.

True clone

In this use case, you clone your source instance to your target instance and include the complete IDR replication configuration. The target instance inherits everything from the source. After the clone is finished, you must resubscribe all consumer instances to the target instance.

For example, you decide to provision a new production instance from a non-production instance that already has IDR configured. When you clone the non-

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

production instance, the new production instance inherits everything from the non-production instance. To ensure that data replicates from the production instance and not the non-production instance, you resubscribe all consumer instances to the new production instance.

To clone your database and copy the current IDR configuration to the target instance, you must update the preserve and exclude lists in your cloning profile according to the True Clone use case described in KB0965218.

Migration clone

In this use case, you clone your source instance to the target instance, including the complete IDR replication configuration from the source instance, while preserving the target instance's replication configuration.

The migration clone involves performing a true clone, but with additional steps.

1. On the target instance, you create an update set and use the **Track in update set** feature to upload the existing replication sets on the target instance into the update set.
2. Perform a true clone.
3. After performing the true clone, you import the update set to the target instances, and you set up replication sets using entry sets to preserve the configuration.

Comparing IDR cloning use cases

Use case	Description	Prerequisites	Post requisites
Recurring clone	Clone your source instance to your target instance regularly but exclude your IDR replication configuration. When complete,replication sets on the target instance should not be changed.	Verify that IDR is configured correctly, and that replication is successful on both the source and target instances.	After performing a recurring clone, you can copy the IDR replication configuration from the source instance to the target instance using the **Track in update set** feature.
True clone	Clone your source instance to your target instance and copy your IDR configuration to the target instance. When complete, entry sets from the source instance should be cloned to the target instance.	Verify that IDR is configured correctly, and that replication is successful on the source instance.	After performing a true clone, you must perform the following actions on the target instance: 1. Re-create the replication sets using the cloned entry sets from the source instance. 2. Resubscribe each consumer to the newly-provisioned producer.

Comparing IDR cloning use cases (continued)

Use case	Description	Prerequisites	Post requisites
Migration clone	Clone your source instance to your target instance and copy your IDR configuration to the target instance, while preserving the target instance's replication configuration. When complete, entry sets from the source instance should be cloned to the target instance.	1. Capture the existing replication sets on the target instance in an update set using the **Track in update set** feature. 2. Perform a true clone.	After performing the true clone, you must perform the following actions on the target instance: 1. Import the update set. 2. Re-create the target replication sets using the entry sets captured in the update set. 3. Re-create the source replication sets using the cloned entry sets from the source instance.

Monitoring replication status in Instance Data Replication

Monitor the status of active producer and consumer replication sets, scheduled jobs, seeding requests, license usage, or scheduled replication through the Instance Data Replication (IDR) Monitoring Dashboard.

Accessing the IDR Monitoring dashboard

Users with the admin or idr_admin role can access the dashboard.

Access the IDR Monitoring dashboard in the following way:

- Navigate to **Instance Data Replication** > **Monitoring Dashboard**.
- Choose either: **IDR Overall Monitoring** or **IDR License and Usage Details** dashboard.

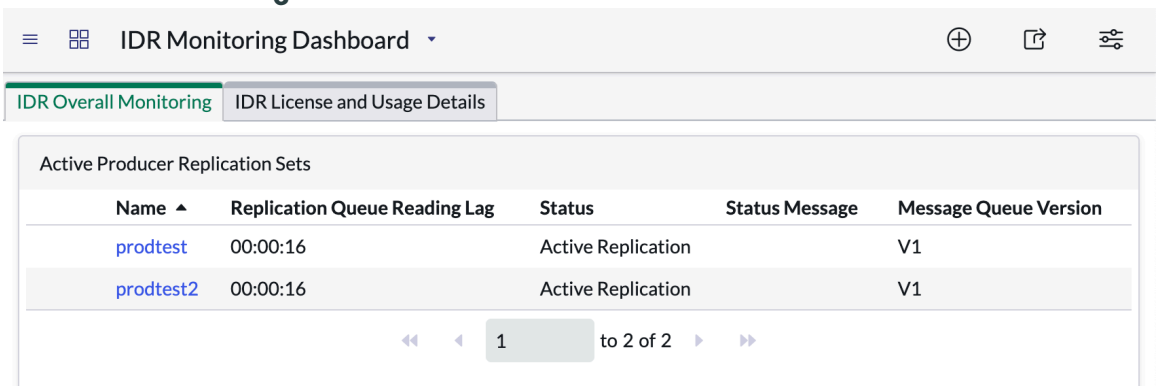
IDR Overall Monitoring dashboard

The IDR Overall Monitoring dashboard monitors the following:

- Active Producer Replication Sets
- Active Consumer Replications Sets
- Suite of IDR Scheduled Jobs
- Producer Seeding Requests Within Last 7 Days
- Consumer Seeding Requests Within Last 7 Days

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

IDR overall monitoring dashboard



Active Producer Replication Sets

The Active Producer Replication Sets monitors your producer replication set status and reports the data lag time between your instance and the replication queue.

Field	Description
Name	Name of the producer replication set
Replication Queue Reading Lag	Time between a record change on the producer instance and the moment that it's sent over the outbound replication queue
Status	Status of a replication set, either active or in error
Status Message	Message that describes the error status
Message Queue Version	Version of the Message Queue. Either V1 (Legacy) or V2 (Hermes)

Active Consumer Replication Sets

Active Consumer Replication Sets monitors your consumer replication set status, reports the network lag time, and reports the data lag time between the producer instance and consumer instance.

Field	Description
Name	Name of the consumer replication set.
Data Lag	Time between a record change on the producer instance and the moment that it's recorded in the consumer instance.
Network Lag	Time between a record change log in the outbound replication queue and the moment that it's recorded in the consumer instance.
Status	Status of a replication set, either active or in error.
Status Message	Message that describes the error status.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Message Queue Version	Version of the Message Queue. Either V1 (Legacy) or V2 (Hermes)

Suite of IDR Scheduled Jobs

The suite of IDR scheduled jobs poll for data changes, requests, and check the health of your producer and consumer instances. You can monitor the following jobs:

Jobs	Description
Hermes Metrics Collection	Collects metrics related to the Hermes Messaging Service.
Hermes Periodic Purge	Cleans obsolete cached data in the Hermes API.
Hermes Topics Util	Synchronizes topics across Hermes clusters. Initially, topics are created in a single Hermes cluster. This job detects new topics and creates the same topics in the remaining Hermes clusters.
IDRConsumerJob	Polls for record changes and seeding requests on the consumer instance in 15-second intervals.
IDRDeltaConsumerJob	Beginning in the San Diego release, when a consumer instance subscribes to a producer instance that is outside the local datacenter, the IDRDeltaConsumerJob job is created on the producer instance. The function is the same as the IDRConsumerJob. The three-letter code denotes the datacenter location.
IDRHermesDeltaConsumer	Polls for consumer record changes from the Hermes delta topic in 15-second intervals.
IDRHeartBeatJob	Updates information about the health of every active producer or consumer set.
IDRMetadataConsumerJob	Polls for metadata record changes on the consumer instance in 15-second intervals.
IDRProducerJob	Polls for new, updated, or deleted records in the data replication queue for a producer instance in 15-second intervals.
IDRSeedingProducerJob	Checks for new seeding requests coming from consumer instances.

Note:
You can set when your IDR scheduled jobs run and configure a periodic trigger that specifies how often the job runs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

IDR Scheduled Jobs field types

Field	Description
Name	Scheduled job name.
Next Action	Date and time when the job next runs.
Trigger type	Job that you can configure to run daily, weekly, monthly, periodically, once, on-demand, or business calendar start or end date. The trigger can repeat daily, hourly, by minute, or by second.
Job ID	ID of the scheduled job.
State	State of the job, for example, ready.

Producer Seeding Request Within Last 7 Days

You can monitor the status of a producer seeding request within the last seven days.

Field	Description
Replication Set	Producer set and the consumer set.
Status	Status of the seeding request. The status can be completed, in progress, or failed.
Start Time	Time that the seeding begins.
End Time	Time that the seeding ends.
Percent Complete	Percentage of the seeding request job that is complete.

Consumer Seeding Request Within Last 7 Days

You can monitor the status of a consumer seeding request within the last seven days.

Field	Description
Replication Set	Corresponding consumer set.
Status	Status of the seeding request. The status can be completed, in progress, or failed.
Start Time	Time that the seeding begins.
End Time	Time that the seeding ends.
Percent Complete	Percentage of the seeding request job that is complete.

IDR dashboard properties

You can access the IDR dashboard properties by navigating to **Instance Data Replication** > **Properties**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can change the following properties on your dashboard:

Property field	Description
Minutes of lag before the Data Lag field are highlighted in red on the IDR Monitoring Dashboard	**Data Lag** field that is part of the Active Consumer Replication set. If the actual lag time is greater than the time threshold that you set, the system highlights the field. The default is 15 minutes.
Minutes of lag before the Network Lag field is highlighted in red on the IDR Monitoring Dashboard	**Network Lag** field that is part of the Active Consumer Replication set. If the actual lag time is greater than the time threshold that you set, the system highlights the field. The default is 15 minutes.
Minutes of lag before the system highlights the Replication Queue Reading Lag field in red on the IDR Monitoring Dashboard	**Replication Queue Reading Lag** field that is part of the Active Consumer Replication set. If the actual lag time is greater than the time threshold that you set, the system highlights the field. The default is 15 minutes.

Note:
You can set the colors on the fields through the personalize list columns (v_idr_dashboard_list.do).

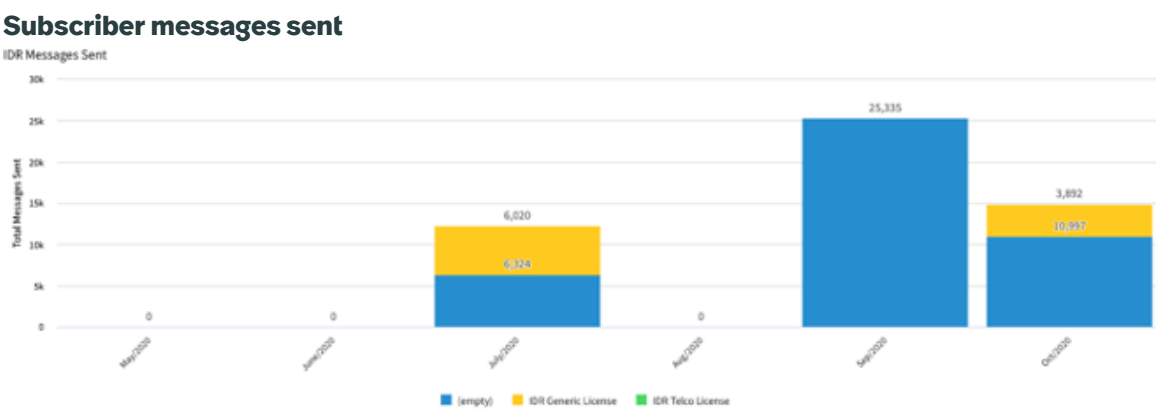
IDR License and Usage Details dashboard

The IDR License and Usage Details dashboard monitors the following:

- Subscriber Sent Messages
- Subscriber Received Messages
- IDR License Details
- IDR Messages Sent
- IDR Messages Received

Subscriber Sent Messages

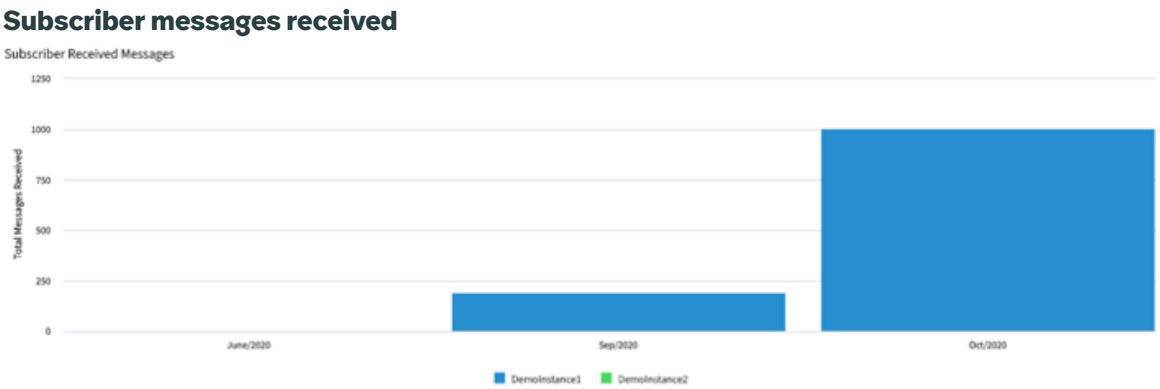
The number of messages each subscriber instance sent, by month.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Subscriber Received Messages

The number of messages each subscriber instance received, by month.



IDR License Details

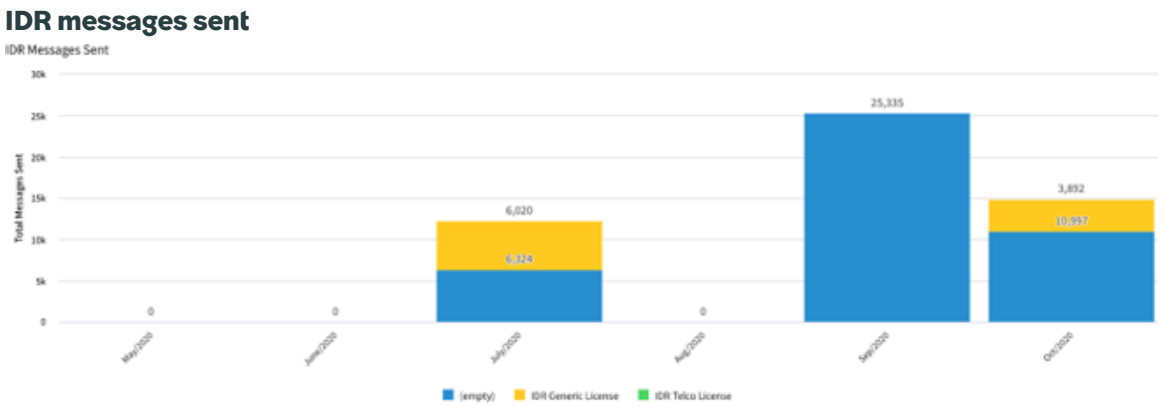
You can monitor the status of a consumer seeding request within the last seven days.

Field	Description
Name	Name of the IDR license.
Type	Type of subscription: **Per-User** for user subscriptions, **Capacity** for data driven subscriptions, or **Unrestricted User** for subscriptions capped by the maximum user count.
Category	License category: ServiceNow license or Store App license.
Start date	Start of the licensing period.
End date	End of the licensing period.
Display only	Does not support resource allocation or monitoring.
Purchased	Number of purchased licenses.
Allocated	Number of allocated licenses.

IDR Messages Sent

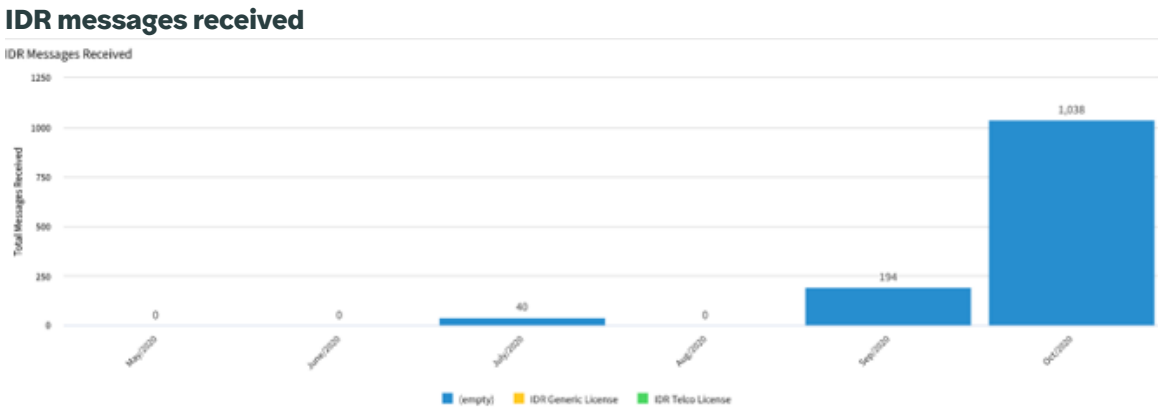
The number of messages sent, per license, monthly.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



IDR Messages Received

The number of messages received, per license, monthly.



Monitoring queues in Instance Data Replication

Monitor the replication record queue, message produced queue, message consumed queue, and the messages processed for all replications sets through the Instance Data Replication (IDR) Queue Dashboard.

Accessing the IDR Queue Dashboard

Users with the admin or idr_admin role can access the dashboard.

Access the IDR Queue Dashboard by navigating to **Instance Data Replication** > **Queue Dashboard**.

IDR Queue Dashboard

The IDR Queue Dashboard enables you to monitor the following:

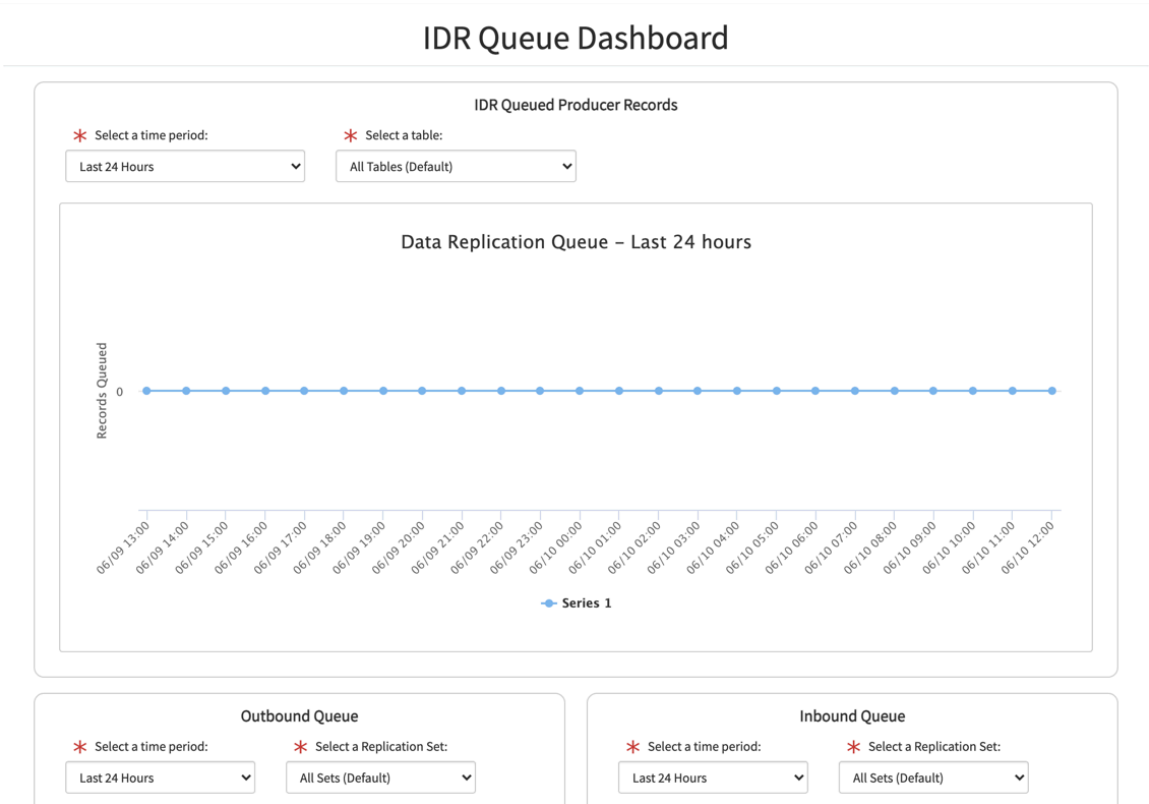
- IDR Queued Producer Records which are hourly records queued for all tables over a 24-hour time period.
- Outbound Messages Remaining which are messages remaining in the replication queue that are not yet sent to the message queue.
- Outbound Messages Processed which are messages produced from this instance to the message queue.
- Inbound Messages Remaining which are messages remaining in the message queue, that have not yet been processed.
- Inbound Messages Processed which are messages consumed on this instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In any chart, select **Last 24 Hours** or **Last 5 Days** as the time period. For the 24-hour period, the number of messages is per hour. For the 5-day period, the number of messages is per day.

Select the legend link under the chart to exclude that data source.

IDR Queue Dashboard



IDR Queued Producer Records

With the IDR Queued Producer Records chart, you can see the number of records queued for each table over an hourly or daily period. It shows which tables account for the highest amount of traffic within IDR over time. Use this chart to identify activity spikes that cause predictable performance lags on the consumer instance.

For example, if you see that a large spike of activity occurs every day at 3:00 a.m. due to a business rule on a table, you should expect a performance lag to occur on the consumer around that time.

Select **All Tables** or a specific table. Position your cursor over a point in the chart to see the queue count and tables for that point.

Outbound Messages Remaining

With the Outbound Messages Remaining chart, you can determine whether a producer instance is catching up to real-time replication after a large spike in activity.

When replication is working correctly, the messages remaining count should be very low. If there is a spike in activity, you can expect a large value. For example, when a business rule is changing tens of thousands of records within a minute.

You can also expect messages remaining to decrease over time as the jobs process the messages.

If the messages remaining count continues to grow without resolution, it might indicate:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- An issue processing the messages. For example, the *IDRProducerJob* is not running, or cannot send messages to the message queue.
- The instance is recording changes faster than IDR can produce them.

Select **All Sets** or a specific set. Position your cursor over a point in the chart to see the message count and replication set name for that point.

Outbound Messages Processed

With the Outbound Messages Processed chart, you can see the flow of records from a producer instance to the message queue over time.

Trends for messages processed and the messages remaining over time indicates if replication is recovering from a lag or if there are issues sending data to the message queue.

Along with the Data Replication Queued Producer records chart, you can see if the instance is sending data. If your instance has queued records that are not being sent, it might indicate:

- The instance is not able to run the producer job. For example, due to other resource-intensive processes running on the instance and all worker threads being busy.
- There is an issue connecting to the message queue.

To see the message count and replication set name for a graph point, select **All Sets** or a specific set and position your cursor over a point in the chart.

Inbound Messages Remaining

With the Inbound Messages Remaining chart, you can determine whether a consumer instance is catching up to real-time replication after a large spike in activity.

You can expect a temporary large value when there is a spike in activity. The value normally decreases as the messages are processed.

If this value continues to grow without resolution, it might indicate:

- An issue processing the messages. For example, the *IDRConsumerJob* is not running, or cannot read messages from the message queue.
- The instance is recording changes faster than IDR can consume them.

Select **All Sets** or a specific set. Position your cursor over a point in the chart to see the message count and replication set name for that point.

Inbound Messages Processed

With the Inbound Messages Processed chart, you can see the flow of records for each consumer set over time.

Use the inbound messages chart to determine which replication sets have the most traffic and see trends for messages processed and the messages remaining.

If the producer is sending records to the message queue and the consumer is not processing them, it might indicate issues with the producer or the consumer instance.

Position your cursor over a point in the chart to see the message count and replication set name for that point.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Avoiding insert and update errors in Instance Data Replication

You can avoid insert and update failures in Instance Data Replication (IDR) by specifying a class name filter in the producer replication set.

Important:
This topic only applies to producer replication sets created prior to the Utah release.

When you replicate a parent table and one or more child tables, you must add a sys_class_name filter to the parent table in the outbound entry of your producer replication set. If the sys_class_name filter is missing, insert and update failures appear in **Instance Data Replication** > **Replication Payload Error** in the following scenarios:

- A failed insert occurs when a record in the child table is replicated because the system attempts two inserts with the same sys_id to the parent table. Adding the sys_class_name filter to the parent prevents the unique key violation during the INSERT into the parent table.
- A new record is added to a replicated child table on the producer instance. Instance Data Replication (IDR) initially creates the record in the parent table on the consumer, but not the child table. If the child record is changed on the producer instance, during replication a failed update occurs on the child table in the consumer instance because the record only exists in the parent table.

If the table is a parent, decide if you want to replicate any of its child tables.

- If you want to replicate one or more child tables, you must identify the sys_class_name value for the parent table, and then add a corresponding sys_class_name filter to the parent table.

  For example, **Task Type** is the label for sys_class_name on the Task [task] table. To start replicating the incidents in addition to tasks, you must add **[Task Type] [is] [Task]** to the outbound entry for the Task [task] table.

- If you only want to replicate the parent table, the filter is optional.
- If the parent table is already being replicated, you must edit the parent and add the sys_class_name filter.

If the table is a child, decide if you want to replicate its parent.

- If you want to replicate the parent table as well, you must identify the sys_class_name value for the parent table, and then add a corresponding sys_class_name filter to the parent table.

  For example, **Task Type** is the label for sys_class_name on the Task [task] table. To start replicating tasks in addition to incidents, you must add **[Task Type] [is] [Task]** to the outbound entry for the Task [task] table.

- If you only want to replicate the child table, the filter is optional.
- If one or more child tables are already being replicated, you must add the sys_class_name filter to the parent.

Resolving data replication errors in Instance Data Replication

Resolve errors and monitor the status of Instance Data Replication (IDR) replication sets.

Monitoring and diagnostic checklist

When you notice that the system is not replicating data, you can use the diagnostics checks to investigate the problem. To monitor the overall health of all replication sets, see IDR Monitoring dashboard.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

IDR diagnostics checks

Check	Description
Monitor	
Check connectivity	Test your IDR instance connectivity to determine the connectivity of your instance to the message queue.
Check IDR monitoring dashboard to see if replication jobs are active	For the dashboard to properly display replication set information, these IDR scheduled jobs must be available and running on your instance: • Hermes Metrics Collection • Hermes Periodic Purge • Hermes Topics Util • IDRConsumerJob • IDRDeltaConsumerJob-<instanceid> • IDRHeartbeatJob • IDRMetadataConsumerJob • IDRProducerJob • IDRSeedingProducerJob If any of these jobs are missing or not running, contact Customer Service and Support. **Note:** The system only creates the IDRDeltaConsumerJob-<instanceid> when a consumer instance subscribes to a producer instance that is outside the local datacenter.
Producer replication set	
Check activation of the producer replication set	If the status of your producer replication set is In Draft, click **Activate**.
Check consumer subscription approval	Review the consumer access requests for your producer replication sets. A consumer replication set must request access before it can receive replication data.
Check producer replication log errors	Identify IDR errors by viewing the metadata for messages between producer and consumer instances, payload error logs, and message logs.
Consumer replication set	
Check activation status of the consumer replication set	If the status of your consumer replication set is In Draft, click **Activate**.

IDR diagnostics checks (continued)

Check	Description
Check if you need to synchronize replication sets	A synchronization issue occurs when a producer instance doesn't send data or a consumer instance doesn't receive data. Synchronization errors appear in the **Status** field on the consumer instance as **Replication Error**.
Check your consumer replication set status	Review the status of your consumer replication set and what that means for your replication.
Error and status messages	
Check replication or replication metadata log errors	Identify IDR errors by viewing the metadata for messages between producer and consumer instances, payload error logs, and message logs.
Check status messages	Review these status messages with recovery information.

Run Instance Data Replication diagnostics

Verify the status of services and the connection between your instance and the Instance Data Replication (IDR) message queue.

Before you begin

Role required: admin or idr_admin

Procedure

1. Navigate to **All** > **Instance Data Replication** > **Diagnostics**.
   The dashboard loads and the IDR diagnostic tests run automatically.
2. View the following diagnostic tests.

Option	Description
Certificate Management Service	Checks the status and setup of your certifi cate management service. **Note:** IDR requires a certificate management service to be up and running.
EJBCA Service Status	Checks the status and setup of the EJBCA service as part of the Key Management Frame work (KMF) health.

3. Test the connection to the message queue and confirm the replicator is working by running the Message Queue Connection Test.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
Test the connection to the Legacy message queue	**a.** Select **Legacy**. **b.** In the Legacy Message Queue Test Con figuration section, select **Local** or **Remote** to run diagnostics on a local or remote in stance. For a remote instance, enter the URL of the remote instance, and a user name and password for any of the following roles: ▪ idr_rest ▪ idr_read ▪ idr_admin **Note:** The local datacenter to your producer instance regional proximity is the de fault. **c.** Select **Run Legacy Message Queue Test**.
Test the connection to the V2 message queue	**a.** Select **V2**. **b.** Confirm that Hermes is enabled and that the Hermes cluster configuration is opera tional. **c.** Select **Run Message Queue Connection Test**.

Result
The resulting messages validate enabled services or the connection to the message queue.

Review synchronization errors in Instance Data Replication

Review the status field to check if synchronization is working correctly on the Instance Data Replication (IDR) consumer instance.

Before you begin
Before identifying synchronization errors, complete the tasks in check for common issues.

Role required: idr_admin or admin

About this task
Synchronization errors occur when a producer instance doesn't send data or a consumer instance doesn't receive data. Synchronization errors appear in the **Status** field on the consumer instance as **Replication Error**.

Procedure
1. Determine if the consumer successfully sent the synchronize request to the producer:

   a. On the consumer instance, navigate to **Instance Data Replication** > **Consumer Replication Sets**.

   b. Select a consumer replication set.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Click the **Replication Metadata Logs** related link.

d. Sort the logs in a descending order in the Log Sequence column.

e. Find the most recent payload with the REPL_SET_DETAIL_REQUEST type and open it.
If you do not see this payload type, refresh the log until you see a payload with the REPL_SET_DETAIL_REQUEST type.

f. Verify that you see the correct producer instance ID in the To column.
If the producer instance ID is incorrect, update the ID and select **Activate**.

g. Verify that you see Sent in the Status column.
If you don't see Sent in the Status column, the producer didn't send any updates.

2. Determine if the producer received the synchronize request from the consumer:

a. On the producer instance, navigate to **Instance Data Replication** > **Producer Replication Sets**.

b. Select a producer replication set.

c. Click the **Replication Metadata Logs** related link.

d. Sort the logs in a descending order in the Log Sequence column.

e. Find the most recent payload with the REPL_SET_DETAIL_REQUEST type and open it.
If you don't see this payload type, refresh the log until you see the REPL_SET_DETAIL_REQUEST type.

f. Verify that you see the correct consumer instance ID in the From column.
If the consumer instance ID is incorrect, update the ID.

g. Verify that you see Received in the Status column.

Discover replication delays in Instance Data Replication

Monitor possible data replication issues by using the Instance Data Replication (IDR) Monitoring Dashboard.

Before you begin
Role required: admin

About this task

Procedure

1. To view the time lag on a producer instance, navigate to **Instance Data Replication** > **Monitoring Dashboard**, and check the Active Producer Replication Sets for the following details.

Option	Description
Name	Name of the producer replication set.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
Replication Queue Reading Lag	Time between a record change on the producer instance and the moment it is sent over the outbound replication queue.
Status	Status of a replication set, either active or in error.
Status Message	Message that describes the error status.
Message Queue Version	Version of the Message Queue. Either V1 (Legacy) or V2 (Hermes)

To get additional information, view the producer instance xmlstats at `https://<producer-instance-name>/xmlstats.do?include=idr`.

The xmlstats shows:

- The *producer_last_run* indicates the last time that the replication job ran on the producer instance.
- The *last_message_sent_on* indicates the last time that the producer sent updated data to consumers.

> **Note:**
> The timestamps are GMT.

2. To view the time lag on a consumer instance, navigate to **Instance Data Replication** > **Monitoring Dashboard** and check the Active Consumer Replication Sets for the following details.

Option	Description
Name	Name of the consumer replication set.
Data Lag	Time between a record change on the producer instance and the moment it is recorded in the consumer instance.
Network Lag	Time between a record change logs in the outbound replication queue and the moment it is recorded in the consumer instance.
Status	Status of a replication set, either active or in error.
Status Message	Message that describes the error status.
Message Queue Version	Version of the Message Queue. Either V1 (Legacy) or V2 (Hermes)

To get additional information, view the consumer instance xmlstats at `https://<consumer-instance-name>/xmlstats.do?include=idr`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
<xmlstats created="Thu Jun 13 13:26:50 PDT 2019" includes="idr" version="2">
 <idr>
  <producer producer_last_run="2019-06-13T20:26:45.077Z" replication_queue_position="data_replication_queue0001@2019-06-13T00:17:18Z,2575,0,0"
   replication_queue_reading_lag="00:25:20">...</producer>
  <consumer consumer_last_run="2019-06-13T20:26:45.075Z">
    <replset data_lag="03:43:19" last_heartbeat_received_on="2019-06-13 16:43:50" last_message_received_network_time="00:00:05"
    last_position="data_replication_queue0001@2019-06-12T23:05:12Z,788,0,1" name="glide-idr-2-producer" status="active"
    topic_name="idr.b4312149412133005bd460e0b33d4ace.3d0b7168ff023300459d3faf793bf16d"/>
  </consumer>
 </idr>
</xmlstats>
```

The xmlstats shows:

- The *consumer_last_run* indicates the last time that the consumer job ran and received changes from the producer.
- The *last_heartbeat_received_on* shows the timestamp when the consumer last received a heartbeat from the producer instance.

> **Note:**
> The timestamps are GMT.

Fix seeding errors in Instance Data Replication

Retry Instance Data Replication (IDR) seeding on tables with seeding errors, which occur from network problems and failed inserts, so that you don't have to do a full seeding.

Before you begin

Role required: idr_admin or admin

About this task

The maximum for a retry reseeding request is 10,000 errors. If you have more errors, perform a full seeding.

> **Note:**
> Seeding is not a replacement for cloning. Do not use IDR to clone instances.

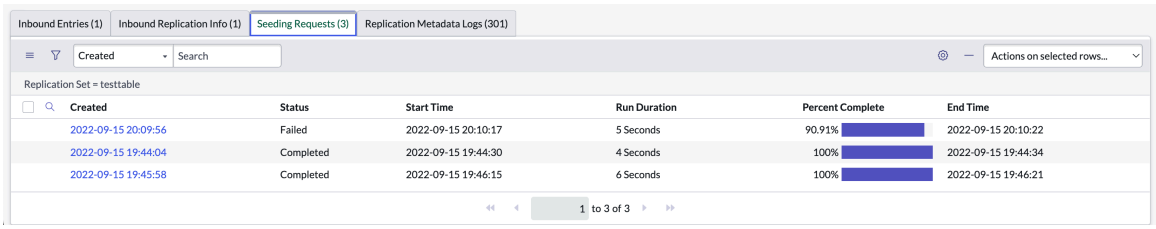
Do not retry full seeding if you exceed any of the following limitations:

- Record size exceeds 10 MB
- Replication takes longer than seven days to complete

> **Note:**
> To avoid these limitations, reduce the number of tables in the seeding request, reduce the size of the records, or use partial seeding.

Procedure

1. On the consumer instance, navigate to **Instance Data Replication** > **Consumer Replication Sets**.
2. On the **Seeding Requests** tab of the Consumer Replication Set pane, select a seeding request that failed.



3. In the Seeding Request details, select the Payload Errors related list and examine the values in the Message column.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Retry the seeding request.Click or select specific errors, and then click **Retry Selected Errors**.
   - Retry seeding for all errors by selecting **Retry All Errors**.
   - Retry seeding for specific errors by selecting the check box next to each error and then selecting **Retry Selected Errors**.

Identify Instance Data Replication errors

Identify Instance Data Replication (IDR) errors by viewing the metadata for messages between producer and consumer instances, payload error logs, and message logs.

Before you begin

Role required: idr_admin or admin

Procedure

1. View the producer or consumer metadata logs.

Option	Description
Producer	Navigate to **Instance Data Replication** > **Producer Replication Sets**, select a producer replication set and click the **Replication Metadata Logs** related link.
Consumer	Navigate to **Instance Data Replication** > **Consumer Replication Sets**, select a consumer replication set and click the **Replication Metadata Logs** related link.

2. On either the producer instance or the consumer instance, to view transformation errors and replications that failed to load:

   a. Navigate to **Instance Data Replication** > **Replication Payload Error**.
   If the **Source** value is **Seeding**, the error occurred during seeding. If the source value is different, the error occurred during a replication set update. If any column breaks during transformation, transformation for the entire table breaks and data is not replicated in the table.

   b. Select an error in the Created column.
   The **Error Message** field on the Payload Error pane describes the payload error.

3. View the replication log on either the producer instance or the consumer instance:

   a. Navigate to **Instance Data Replication** > **Replication Log**.

   b. Select an entry.
   The Instance Data Replication Log form shows the message and message level.

Configure error notifications in Instance Data Replication

Notify one or more users when errors occur in Instance Data Replication (IDR).

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the producer or consumer replication set for which you want to configure notifications.
2. Select the **Notification Configuration** related link.
3. In the **When to send** tab, configure when the notification is sent.

Option	Description
Record is inserted or updated	**a.** Select **Inserted**, **Updated**, or both **Inserted** and **Updated**. **b.** Configure the conditions under which this notification is sent using the condition builder. The default condition is **[Status] [is] [Replication Error]**
Event is fired	**a.** Select the event type that sends the notifi cation. **b.** Configure the conditions under which this notification is sent using the condition builder. The default condition is **[Status] [is] [Replication Error]**
Triggered	Select this option to trigger the notification from a Workflow Studio flow.

4. In the **Who will receive** tab, select the users, groups, or user groups who will receive the notification.
5. **Optional:** In the **What it will contain** tab, select an email template to populate the Subject and Message HTML.
   The default template is Unsubscribe and Preferences. You can override the template and customize the text as needed.
6. **Optional:** Verify that the notification contents are correct by selecting **Preview Notification**.
7. Select **Update**.

Consumer replication set status in Instance Data Replication

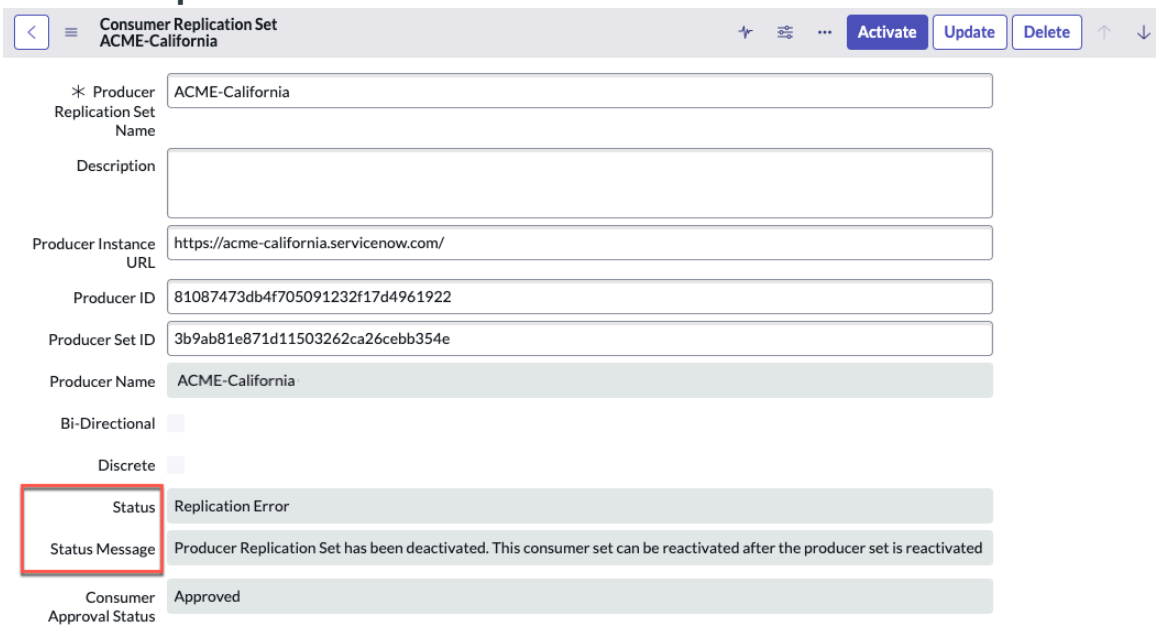
Review the status of your consumer replication set and research error messages to identify or fix Instance Data Replication (IDR) replication issues.

Consumer replication set status and status message

Navigate to **Instance Data Replication** > **Consumer Replication Sets** to access a consumer replication set, and view the status and status messages.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Consumer Replication Set



Status

Status	Description
In Draft	To use your consumer replication set, click **Activate**.
Activation Requested	After you initiate an activation, you must wait for the producer instance to respond to your request. If the wait time is excessive, then check the replication log for errors.
Seeding	The seeding job must complete before replication can resume.
Seeding Paused	The seeding job must resume before the seeding can continue.
Active	Normal status.
Replication Stopped	Check the Status Messages in the following table for a specific message and associated fix.
Replication Paused	The replication process must resume before the replication can continue.
Replication Error	Check the Status Messages in the following table for a specific message and associated fix.
Replication Deactivated	Activate the producer and consumer instances.
Subscription Requested	Approve the request for a consumer subscription on the producer instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status Messages

Message	Action
All Producer Replication Sets have been deactivated due to fatal replication error	All consumer replication sets are moved to the error state. Contact Customer Service and Support.
Consumer replication set received out of order messages	Contact Customer Service and Support.
Error while seeding data. Please refer to the Replication Payload Error table for details	On the consumer instance, more than one record failed to seed. To recover, go to the Replication Payload Error table to find and fix the error, and then activate the consumer replication set.
Error while seeding data. Please retry seeding this table	To recover, reseed the table.
Producer has encountered an error while seeding	To recover, contact the administrator of the producer instance to determine the cause of the problem.
Producer Replication Set configuration has been modified	On the consumer instance, click **Synchronize Replication Entries** and then click **Activate**.
Producer Replication Set has been deactivated due to replication error	Contact Customer Service and Support.
Producer Replication Set has been deactivated	To recover, activate the producer replication set, and then activate the consumer replication set.
Producer Replication Set has been deleted	To recover, delete the consumer replication set.
Producer Replication Set is inactive	To recover, activate the producer replication set, and then synchronize and activate the consumer replication set.
Producer Replication Set not found	To recover, delete the consumer replication set.
Replication Set Paused	To recover, click **Resume** or **Activate**.
Replication set was in pause/error/seeding pause state for more than 7 days	The consumer replication set has been in the pause state, error state, or seeding pause state for more than the timeout period. The replication set is put into the disabled state. To recover, check for seeding errors and activate the consumer replication set with seeding.
Seeding has been terminated due to timeout	To recover, retry the seeding request or contact Customer Service and Support.
Seeding request for a Producer Replication Set containing more than X number of records is not supported	To recover, change the filter criteria to reduce the number of records to be seeded or use partial seeding. The default limit is 10 million records. Contact Customer Service and Support to change the default limit.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status Messages (continued)

Message	Action
`Seeding was cancelled by a consumer admin`	To recover, activate the consumer replication set.
`Seeding was cancelled by a producer admin`	To recover, activate the consumer replication set. Only seeding requests in the queued, paused, or started states can be canceled. In this case, the consumer replication state is Replication Error.
`Shared key not matching`	The producer and consumer replication sets have different shared keys. To recover, copy the shared encryption key on the producer replication set, paste it into the consumer replication set, and activate the replication set.

Instance Data Replication XML stats

Extract Instance Data Replication (IDR)-related data from your instance to monitor replication status.

IDR XML Stats

You can view key metrics from your IDR producer and consumer instances to monitor performance and the status of IDR processing.

In a browser where the instance is running, append the following text to the instance URL: `xmlstats.do?include=idr`. The following output is an example of the IDR XML stats.

```
<idr status="enabled">
<producer producer_last_run="2020-11-06 13:45:30"

IDR Metrics

Metric	Description
idr status	Shows whether IDR is enabled for your instance.
Producer instance	
producer producer_last_run	The last time that the *IDRProducerJob* scheduled job ran (GMT).
producer replication_queue_position	Position of the cursor in the replication queue.
replication_queue_reading_lag	The time between when a change is made, and when the *IDRProducerJob* scheduled job sends that change to the network.
replset last_message_sent_on	The last time data was sent to the network from this replication set.
replset last_position	The cursor position in the data_replication_queue when the last message was sent for this replication set.
last_sent_message_id	The message ID of the last sent message from the data_replication_queue.
name	The name of the replication set.
status	The replication set status.
topic_name	The topic name in the message queue for this replication set.
Consumer instance	
consumer_last_run	The last time the *IDRConsumerJob* scheduled job (local) or *IDRDeltaConsumerJob - <instanceid>* scheduled job (remote) ran (GMT).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

IDR Metrics (continued)

Metric	Description
replset data_lag	Time since the last heartbeat was received. Heartbeats should occur every minute for a replication set.
last_heartbeat_received_on	Time of the last heartbeat for this replication set.
last_message_received_network_time	For the last received message, the time difference between when it was sent to the message queue and when it was picked up by the consumer instance.
replset last_position	The cursor position in the data_replication_queue, at which the last message was sent for this replication set.
name	The name of the replication set.
status	The replication set status.
topic_name	The topic name in the message queue for this replication set.

Instance Data Replication reference

These reference topics provide additional information about data privacy in Instance Data Replication (IDR) and domain separation.

Data privacy in Instance Data Replication

The ability of replication sets to host multiple remote consumers in Instance Data Replication (IDR) means that there are potential data privacy issues to consider.

Replications sets in IDR serve multiple instances with multiple consumers. A replication set can have a single customer or can have multiple customers. A consumer could also be located within the same geographic region as the producer or located in a different geographical region.

Depending on how you configure your replication set, you can have data sharing internally, between offices of the same company, or externally, extending across multiple companies. You can also confine data sharing to a single location or region, or you can share data across all regions.

An active replication set occurs after the producer instance administrator approves a consumer subscription. An active replication set involves data transfer, which could include transfer of personal data, between geographical regions. The data transfer between different geographical regions could subject the data to differing personal data regulations.

During the approval process, if IDR determines that the consumer and producer instances are in different geographical regions, it alerts the producer before activation. This alert should make administrators aware of the potential for differing data transfer regulations between regions.

Once a replication set is active, a replication set with multiple consumers might have specific discrete rules which direct specific data to specific consumers. Any modification of a discrete rule on an active replication set which spans multiple consumers has the potential to expose data. This data exposure can include personal data, which might be viewable by unintended consumers that subscribe to the replication set.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you set bi-direction between a producer and consumer instance, the consumer can originate data that shares back to the producer instance. This data can also potentially reach any other consumer that is part of the replication set.

Adapter descriptions for Instance Data Replication

Adapters modify the producer data before inserting the data on consumer instances in Instance Data Replication (IDR).

Adapter fields

Each adapter has **Name** and **Description** fields. The name appears in the Adapter column. Use the **Description** field to explain the purpose of the data conversion.

Calculation adapter

Use the calculation adapter on the producer data to specify the operation and the value that is used in the operation.

Parameter examples

Parameter and value	Source data	Adapter output
Operation: Multiply **Constant Value**: 1.08	10	10.80
Operation: Max **Constant Value**: 1000	1020	1000
Operation: Floor **Constant Value**: 0	5.5	5

Max specifies the highest and **Min** specifies the lowest possible values. Values above or below those limits are set to those limits. Value types such as **int** and **long** have maximum and minimum values. Values above or below those limits cause precision errors.

Concatenate String adapter

Use the concatenate string adapter to append a specified string to the source data.

Parameter example

Parameter and value	Source data	Adapter output
String: _v2	Patch10236	Patch10236_v2

Fixed-width format adapter

Use the fixed-width format adapter to reformat fixed-width input data. Use `#` to represent any positive integer, `@` to represent any character, and `\` as the literal escape character.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter examples

Parameter and value	Source data	Adapter output
Match: ########## **Output**: (###) ###-####	7605551212	(760) 555-1212
Match: ##### **Output**: ###.##	10000	100.00
Match: ##\,### **Output**: #####	10,000	10000

Map adapter

Use the map adapter for comma-separated pairs of literals to map source-to-target conversions. Matches must be exact. For example, PRB=TASK would not convert PRB1000 to TASK1000.

Parameter examples

Parameter and value	Source data	Adapter output
Map: PRB=TASK, done=complete	PRB	TASK
Map: PRB=TASK, done=complete	done	complete
Map: PRB=TASK, done=complete	PRB1000	(no mapping)

Pattern adapter

Use the pattern adapter for regular expressions to identify input patterns. Use parentheses in the **Regex** to identify groups. In **Output Pattern**, use $ to specify groups. $0 represents the entire input, $1 represents the first group, $2 represents the second group, and so on. You can also insert, prefix, and append literal characters, including spaces so they appear in the adapter output.

Parameter examples

Parameter and value	Source data	Adapter output
Regex: (.*),(.*) **Output pattern**: $2 $1	Smith, John	John Smith
Regex: (ABC[a-zA-z][a-zA-z])(ABC[a-zA-z][a-zA-z]) **Output pattern**: $1 $0	ABCDEABCFG	ABCDE ABCDEABCFG
Regex: (ABC[a-zA-z][a-zA-z])(ABC[a-zA-z][a-zA-z])	ABCDEABCFG	ABCDE release ABCDEABCFG

Parameter examples (continued)

Parameter and value	Source data	Adapter output
Output pattern: $1 release $0		

In the second example, the match is ABC followed by two letters, followed by ABC and two letters. `$1` of this input is ABCDE. `$2` of this input is ABCFG. `$0` is the entire input string. So `$1 $0` is ABCDE ABCDEABCFG.

Replace adapter

Use the replace adapter to replace a specified input string or substring with a specified string. Use `$` to replace only some of the occurrences of the string. `$1` replaces only the first occurrence; `$2` replaces only the second. Use curly braces to replace the first N occurrences. For example, `${3}` replaces the first three occurrences.

Parameter examples

Parameter and value	Source data	Adapter output
Find: London **Replace**: Madrid	The product is London. The product is London. The product is London.	The product is Madrid. The product is Madrid. The product is Madrid.
Find: $2 London **Replace**: Madrid	The product is London. The product is London. The product is London.	The product is London. The product is Madrid. The product is London.
Find: ${2} London **Replace**: Madrid	The product is London. The product is London. The product is London.	The product is Madrid. The product is Madrid. The product is London.

Split adapter

Use the split adapter to break a string into two or more strings using a specified delimiter made up of letters, numbers, or special characters (no spaces). In **Output Pattern**, use `$` to specify groups. `$0` represents the entire input, `$1` represents the first group, `$2` represents the second group, and so on. You can repeat a group in an output pattern, for example, `$2, $1, $1`. Multiple instances of a delimiter in source data create three or more groups.

Parameter examples

Parameter and value	Source data	Adapter output
Delimiter: -	John-Smith	Smith, John

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter examples (continued)

Parameter and value	Source data	Adapter output
Output Pattern: $2, $1		
Delimiter: - **Output Pattern**: $2, $1, $1	John-Harry-Smith	Harry, John, John
Delimiter: - **Output Pattern**: $3	John-Harry-Smith	Smith

Task number adapter

Use the task number adapter to add a prefix or suffix to a task number or replace the task number's prefix.

Parameter examples

Parameter and value	Source data	Adapter output
Modification: Replace **Number Prefix**: PRB **New Number Prefix**: STRY	PRB80899	STRY80899
Modification: Add Prefix **Prefix**: STRY	08099	STRY80899

Time zone conversion adapter

Use the time zone conversion adapter to convert one time zone to another.

Parameter example

Parameter and value	Source data	Adapter output
Output time zone: PDT	07:00:00 am GMT	00:00:00 am PDT

Excluded tables in Instance Data Replication

You can't replicate certain tables in Instance Data Replication (IDR). Child tables of tables in the exclusion list are also excluded.

Excluded tables

These tables are excluded from IDR:

- Tables with the prefixes V_PREFIX, SYSX_, sys, ts_, ua_, usageanalytics_, wf_, ecc_, clone_, jrobin_, rrd_, imp_, pf_, pfd_, idr_

  sys_domain is an exception.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Rotated tables, including syslog, sys_querystat, ecc_queue, ecc_event, cmdb_metric, sysevent
- Tables without a sys_id
- sso_federation
- saml2_update1_properties
- sso_properties
- digest_properties
- Instance

Child tables that extend these tables are also excluded from IDR and should not be included in replication sets because replication fails if they are included. For example, sc_cat_item extends sys_metadata, which is an excluded table. This makes sc_cat_item an excluded table due to inheritance.

Tables to avoid replicating:

- cmdb
- cmdb_ci

If you determine the CMDB tables must be replicated, you must use conditions to constrain the count of replicated records and ensure all required columns are included in the replication set.

Domain separation and IDR

Instance Data Replication (IDR) functions at the data level, which means it does not explicitly support domain separation.

For a typical use case, data moves from a producer instance to a consumer instance and back without regard to which domain the instance is in. You can use IDR to filter data, enabling you to segregate specific data between instances. If you must go beyond the IDR record-level filtering capability, you can use business rules to convert data from one domain to another. For more information, see Before Query business rules.

Instance Data Replication system properties

These system properties control the behavior of the Instance Data Replication (IDR) application.

To set IDR system properties, navigate to the System Properties [sys_properties] table and add the property.

IDR data comparison properties

Property	Description
The record batch size for data comparison results `idr.instance.comparison.batch.size`	If the data comparison results exceed 1 million records within the given date range, the request is divided into batches of 10,000 records. • Type: integer • Default value: 10,000
The maximum runtime	The maximum amount of time allowed for running a data comparison.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

IDR data comparison properties (continued)

Property	Description
`idr.instance.comparison.max.runtime`	• Type: integer • Default value: 15 minutes
Fields to skip `idr.dct.comparison.skip.fields`	The list of fields to skip when comparing records between instances. • Type: string • Default value: caller_id,sys_created_on,sys_created_by,sys_updated_on,sys

System properties

Property	Description
Stop replication if an out-of-order issue occurs `idr.message.gap.order_enforcement.enabled`	By default, IDR stops replication if an out-or-order issue occurs on the consumer. You can change the default behavior when an out of order issue occurs on the consumer by adding this property and setting it to `false`. This automatically re-queues and replicates missing messages using the most recent record details from the producer without stopping replication. • Type: string • True: Stop replication • False: Don't stop replication and re-queue **Note:** Each producer and consumer instance must be on the same family version to use this property. Both instances must be on Vancouver or higher.
Set attachment size limit `idr.cdc.replication.table.reader.attachment.size`	By default, IDR doesn't restrict the size of attachments. You can change the default behavior by adding this property and entering a maximum size for attachments. • Type: integer (size in bytes) • Default value: 100,000,000
The maximum number of records allowed in a seeding request	If this property isn't set or present, there's no limit on the number of records for seeding requests in V2 replication sets.

System properties (continued)

Property	Description
`idr.max.seeding.limit`	• Type: integer • Default value:

Instance Data Replication roles

Instance Data Replication (IDR) is installed with these roles.

To learn more about managing subscriptions, see Managing per-user subscriptions in Subscription Management and contact your account representative.

IDR administrator [idr_admin]

Admin role for accessing all IDR tables.

Contains Roles

List of roles contained within the role: idr_rest.

Groups

List of groups this role is assigned to by default.

None.

Special considerations

Note:
Avoid granting an admin role when more specialized roles are available.

IDR read [idr_read]

Read role for reviewing IDR tables.

Contains Roles

List of roles contained within the role: idr_rest.

Groups

List of groups this role is assigned to by default.

None.

Special considerations

None.

IDR rest [idr_rest]

Role required for making a diagnostic request.

Contains Roles

List of roles contained within the role.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

None.

Groups

List of groups this role is assigned to by default.

None.

Special considerations

None.

MetricBase

The MetricBase application stores time-series data, which is data that is sampled at regular intervals. You can graph the stored data or use it with triggers to execute Workflow Studio flows.

Get started

Explore Learn about MetricBase features and concepts	**Configure** Set up MetricBase and create a time-series specification	**Define and collect data** Create a time-series definition, access MetricBase data, and detect anomalies using predictive models.
Trigger flows  Create triggers that execute Workflow Studio flows.	**Manage** Manage the health and performance of MetricBase	**Reference** Access developer resources and learn about domain separation with MetricBase

Exploring MetricBase

Collect, retain, analyze, and act on time-series data using MetricBase.

MetricBase overview

MetricBase helps you work with large amounts of data by using a smaller summary of that data that is stored in the MetricBase database.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Integrate MetricBase seamlessly with ServiceNow IoT-based applications that monitor or act on large amounts of machine-generated data.
- Trigger flows in Workflow Studio based on time-series data in MetricBase.
  - Generate an email if the average CPU usage is more than 85% in the last 5 minutes.
  - Generate an email if MetricBase detects a gap in data submitted for 10 minutes or more.
  - Generate an alert if the average of the collected data is less than 10 or greater than 500 in the last 5 minutes.
  - Generate an alert if memory usage is likely to exceed 90% in the next 10 minutes.
- Visualize MetricBase data using time-series charts.
- Use the Reporting application to graph the time-series data that is stored in MetricBase.
- Detect anomalies by training a machine language model and execute a Workflow Studio trigger when an anomaly is detected.

MetricBase works with:

- An instance that stores machine-generated data
- A server that has the MetricBase application and database

MetricBase users

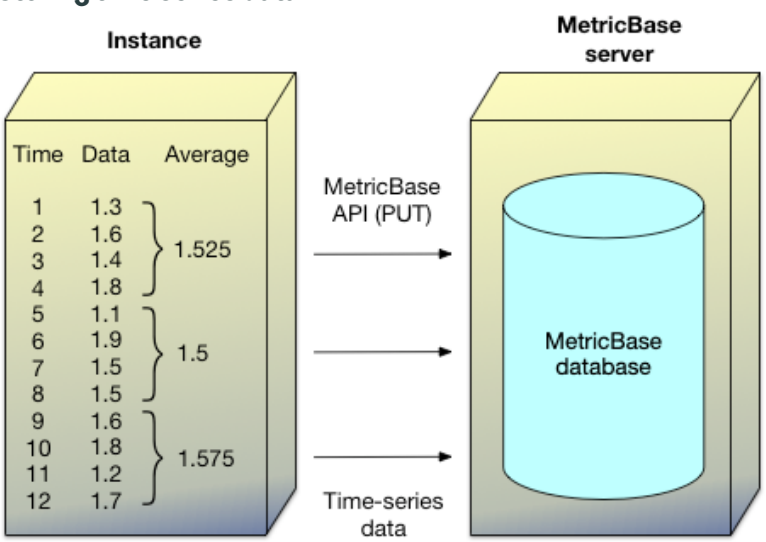
Users

User	Description
Administrator	An administrator collects, retains, analyzes, and acts on time-series data using MetricBase.

MetricBase workflow

The following figure shows that machine-generated data is sampled every 4 seconds. You send the average of the values in each sampling period to the MetricBase database, which stores the data until its expiration date.

Storing time series data



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. The administrator specifies a metric to store and how often to collect it by creating a time-series definition in MetricBase.
2. The administrator sends data from the instance to the MetricBase server using the MetricBase REST or JavaScript APIs.
3. The administrator configures trigger definitions that execute flows based on time-series data in MetricBase.
4. The administrator configures and trains predictive models in MetricBase to detect anomalies and execute flows when new data is significantly different than the trained data.
5. The administrator monitors collected data using time-series charts in MetricBase. Time-series data remains in the MetricBase database for a prescribed amount of time, after which MetricBase deletes the data.

MetricBase benefits

MetricBase benefits

Benefit	Feature	Users
Store time series summary of a large collection of data	Create a time-series definition in MetricBase	Administrator
Insert and retrieve time-series data from the MetricBase database	Developer resources	Administrator
Access and visualize time-series data in the MetricBase database	Accessing MetricBase data	Administrator
Trigger flows when new data is significantly different than the trained data	Detecting anomalies in MetricBase data using predictive models	Administrator
Trigger flows that can log incidents, send emails, and create other alerts	Triggering flows using MetricBase data	Administrator

What to explore next

To learn more about configuring and using MetricBase, see:

- Configuring MetricBase
- Defining and collecting MetricBase data
- Triggering flows using MetricBase data
- Managing MetricBase
- MetricBase reference

Configuring MetricBase

Plan and configure your MetricBase implementation.

Requesting the MetricBase product

The MetricBase plugin [com.snc.clotho] requires a separate subscription and must be activated by ServiceNow personnel. Be sure to also request the MetricBase Demo plugin [com.snc.clotho.demo], which includes sample tables, metrics, triggers, and data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization's production and subproduction instances, generally within a few days.

When ServiceNow personnel install the MetricBase Demo plugin, they also connect your instance to the server that contains the MetricBase database. A MetricBase database can connect with only one other instance. For example, a clone of the original instance can't talk to the same database as the original instance.

Working with MetricBase demo data

Familiarize yourself with MetricBase by exploring the MetricBase demo.

Overview of the MetricBase demo

With the MetricBase Demo plugin, you can experiment with MetricBase without configuring it or knowing much about it. The demo plugin is separate from the MetricBase plugin. Make sure to request both.

Use the MetricBase demo to explore MetricBase before you set it up for production purposes.

- Visualize sample time-series data.
- Access sample metrics, triggers, and a scheduled job that collects and stores data.
- Test the functionality of included triggers. The plugin includes scheduled time-series data updates, as if they had been received from an instance.
- Experiment with the MetricBase JavaScript APIs using the Data Explorer.

In the demo, a fictional fleet of drones has been outfitted with sensors that broadcast their metrics, including their speed, altitude, and battery life over time.

View demo data in MetricBase

After ServiceNow personnel install the MetricBase and MetricBase Demo plugins, you can use the demo to get familiar with MetricBase.

Prerequisites

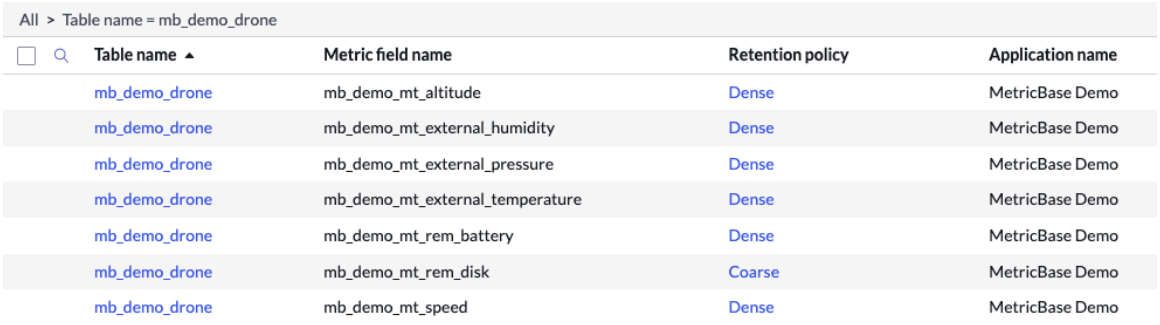
- MetricBase and the MetricBase demo plugins must be installed by ServiceNow personnel.
- Role required: admin

1. Navigate to **MetricBase Demo** > **Drones** to see the name, model, length, width, altitude, and speed for all drones in the fleet.

Name ▲	Model	Camera Model	Fleet	Length (cm)	Width (cm)	Height (cm)	Altitude (m)	Speed (kph)	Remaining Battery (%)
ASF-KP-IG3-1	Kingfisher Phantom	Imesity G3	ASF	37	37	13	165.21455	71.22602	84.44444
ASF-WT7-IC2-1	Warbler T7	Imesity C2	ASF	40	45	8	120.973076	66.827896	17.777779
ASF-WT7-IC2-2	Warbler T7	Imesity C2	ASF	40	45	8	138.80995	68.61613	26.666666

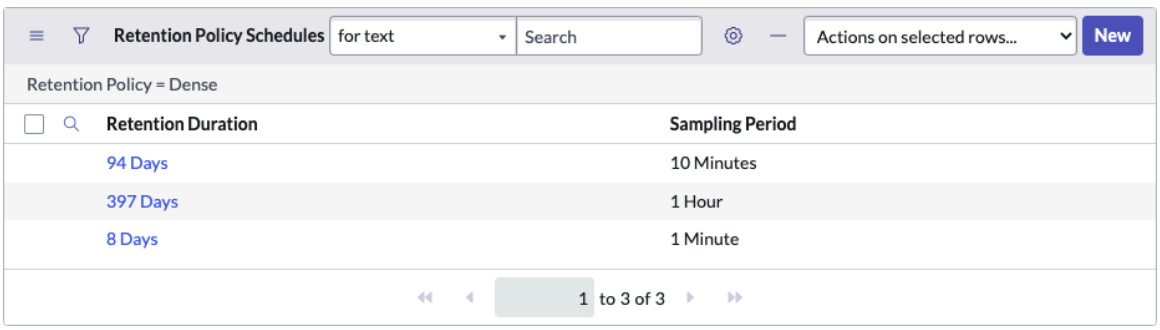
2. Select **MetricBase Demo** > **Metrics** to see how the metrics are defined. In the Time Series Metrics list, the column values specify the table where the drone's time-series metrics are stored, the names of all the metrics that are stored for each drone, and the retention policy for each metric. The retention policy specifies how frequently measurements are taken, and how long MetricBase retains that data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



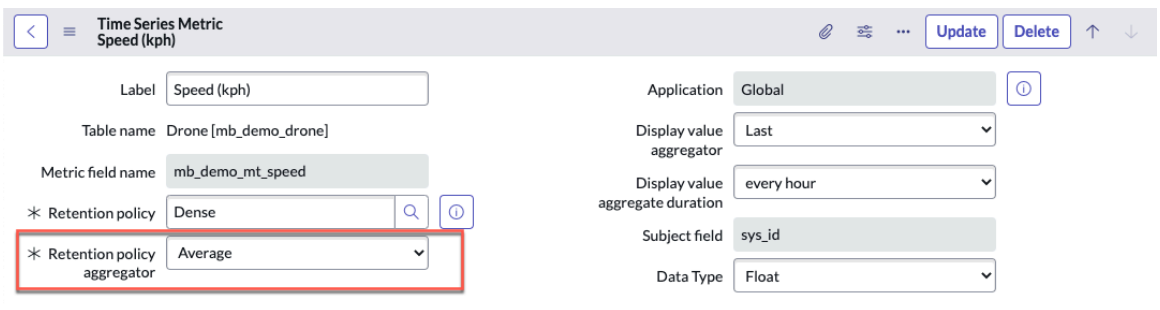
Now that you've seen the drone data and learned how to find it, let's see how the data was collected using a retention policy.

3. Select a retention policy. The Retention Policy form shows the definition for the policy. In the following example, this metric is measured once a minute for the first 8 days, then once every 10 minutes for the following 94 days, and then once an hour for the following 397 days. After that, the system discards the data.



See MetricBase retention policies.

4. To see how the data is aggregated during the Retention Durations, select the left arrow (<) at the top of the Retention Policy Schedules window to return to the Time Series Metrics list.
5. Select a table name. The Time Series Metric definition shows the **Retention policy aggregator**. This aggregator summarizes the data as, for example, the average, maximum, or minimum value in the aggregation period. In the following example, the admin clicked the table for the speed metric. The result is that MetricBase stores the speed averages during each sampling period in the MetricBase database.

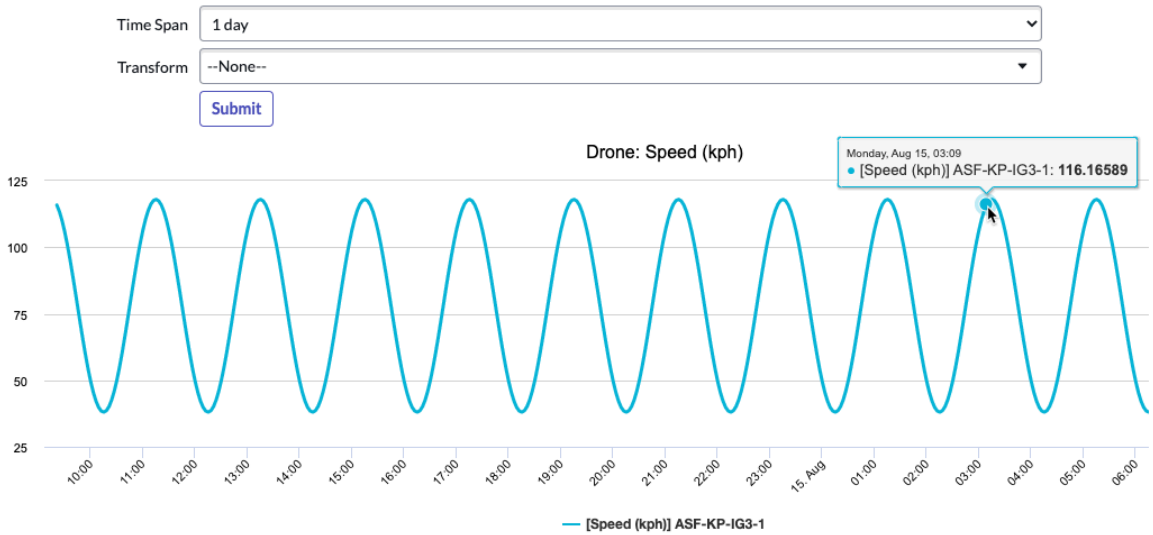


Now that you understand how the data was collected using retention policies, let's see how to display the data in lists and graphs.

6. Notice the parameter fields that start with **Display**. In this example, they mean that the speed values that are displayed in the list view of drones are the last speeds recorded in every hour interval for each drone. These **Display** fields control what appears in the list view of the drones only. They have nothing to do with the retention policy.

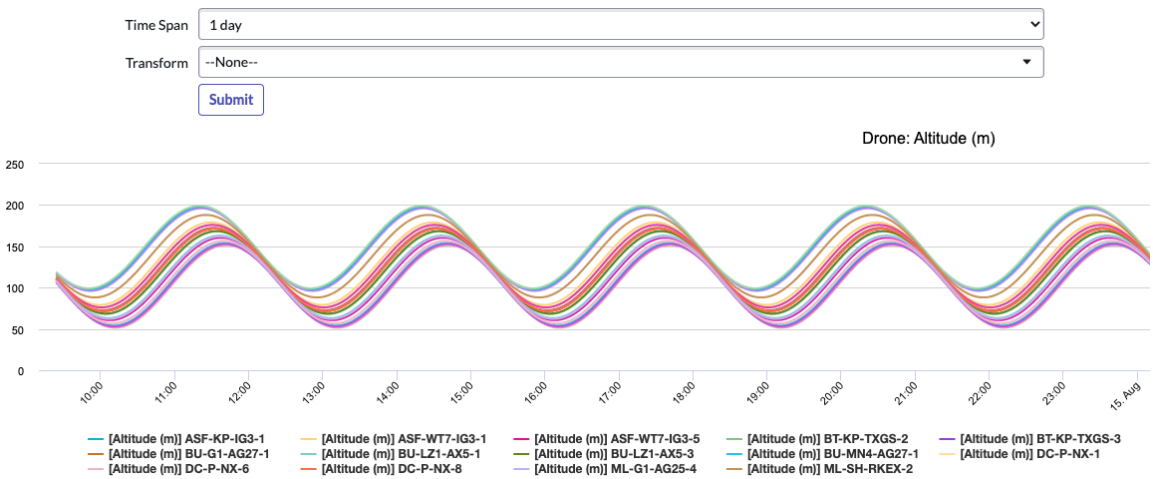
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Display the list view of a table by entering `<table-name>.list` in the **Field navigator** field. For example, `mb_demo_drone.list`. All drone data appears. In the example from the previous step, the speed column would contain the **Last** value of the sampling period.
8. Select **MetricBase Demo** > **Drones** and look at the speed (kph) column. From the previous step, you know that these values are the last speeds recorded for each drone up to an hour ago. The values are the same as you would get by using the *`.list`* command.
9. Select the speed value of the first drone. The following graph shows the speed of the drone that was measured hourly.



Note:
You might need to select a different **Time Span** field value to get a clearer graph. For example, try **1 Day**. The speed is a sine wave because it's artificially generated. Hover over the sine wave to see the actual measurements.

10. Select the left arrow (<) to return to the list of drone metrics, right-click on one drone type (**Model** column), and select **Show Matching**. Only the drones of the selected type appear.
11. Select the menu icon next to the Altitude column heading and select **Time Series Chart**. You see a graph that shows the altitude measurements of the Warbler-T7-type drones.

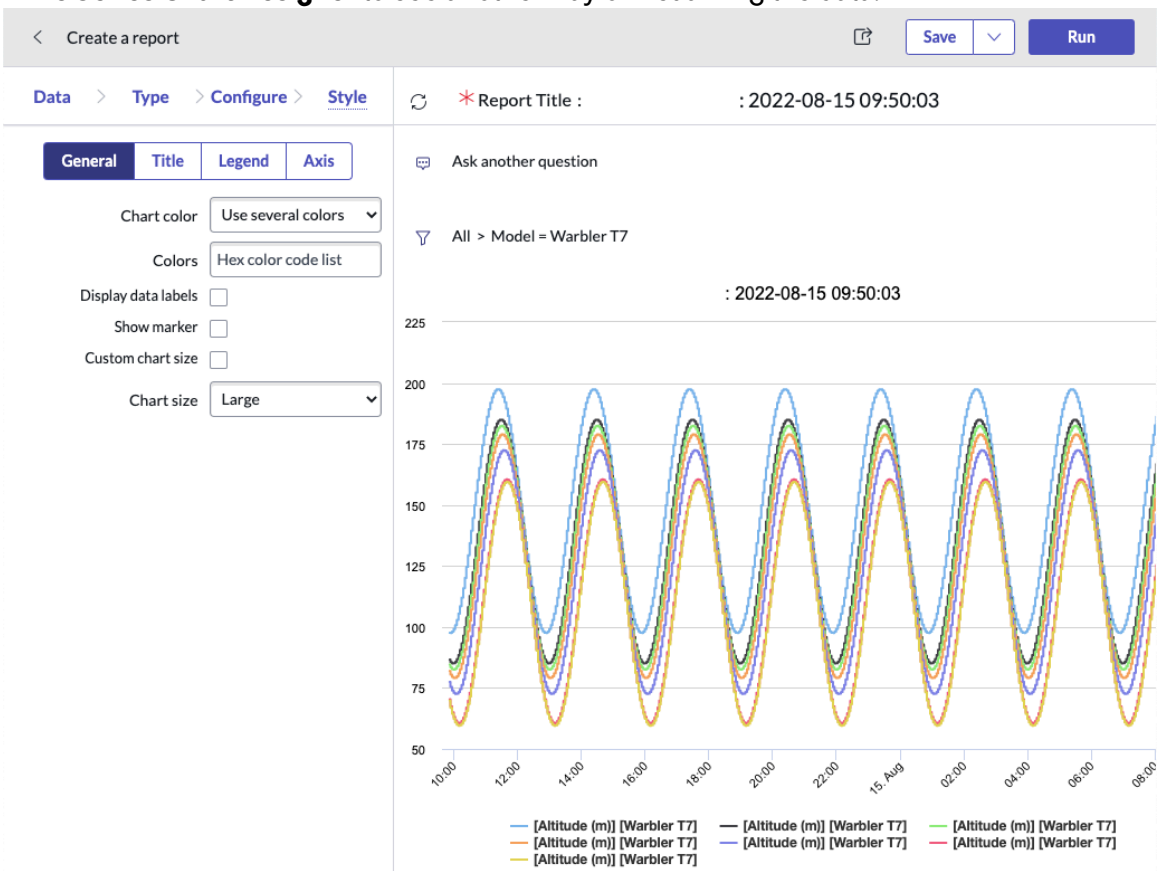


You might like to change the **Time Span** value for a clearer graph.

12. Select the left arrow (<) to return to the list of drone metrics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

13. Click the menu icon next to the Altitude column heading and select **Time Series Chart Designer** to see another way of visualizing the data.

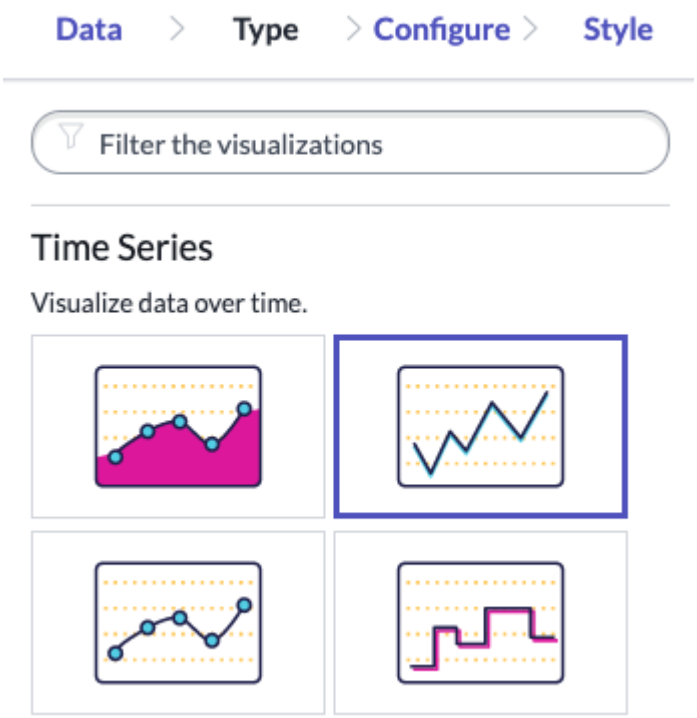


14. In the Create a Report page that displays in the Reporting application, vary the graph parameters.

> **Note:**
> In the following steps, to stay on the same page, select **Run**. To advance to the next page when designing the graph, select **Next**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the Type pane, select the kind of graph to display, and then click **Next**.



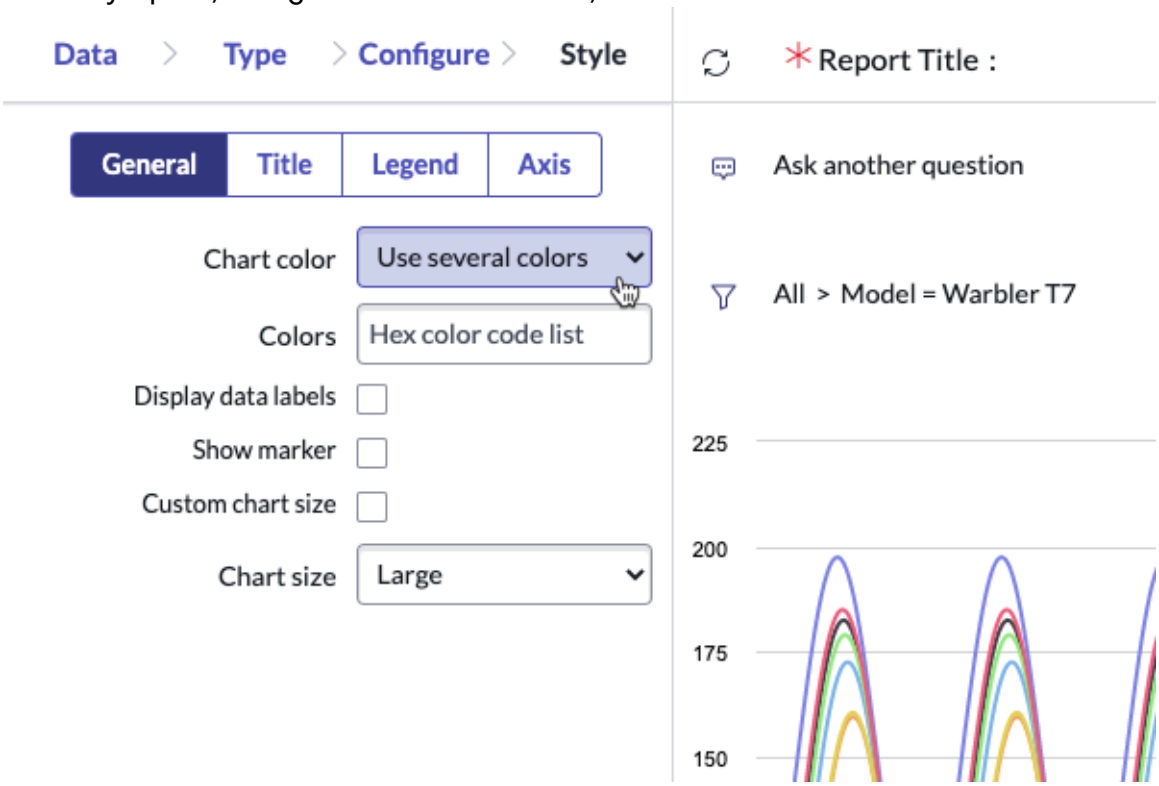
b. In the Configure pane, try changing the parameters. Click **Run** to view the results with each change.

- Change the **Report Title** to Warbler Altitude.
- Apply a condition to filter the view. For example, **[Model] [is] [Warbler T7]**.
- Change the **Last** value to **1** day.
- Select **Envelope** in the **Transform** list. You see the minimum and maximum (envelope) altitudes for the fleet of Warbler T7 drones over time.
- select the time line to display on the graph using the **Time range** list.

> **Note:**
> **Relative** uses the **Last** timespan relative to the present time. For example, if **Last** is 1 hour, the time line in the graph always spans the previous hour. You can add this report to your dashboard to show the metrics in the previous hour.

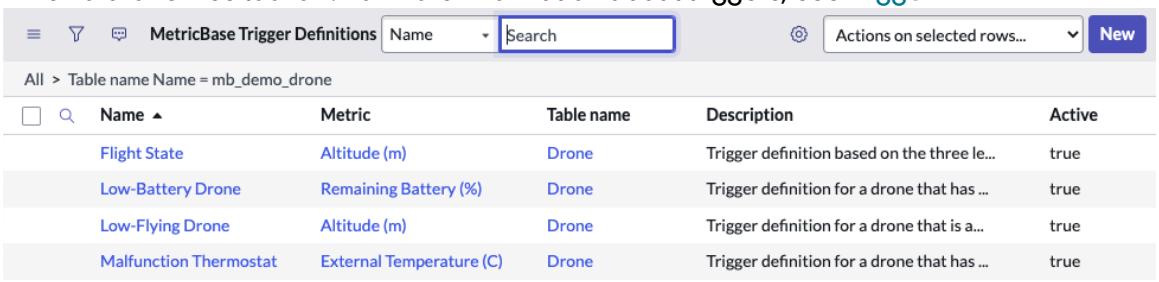
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. In the Style pane, change the **Chart color** value, and then click **Run**.



You've displayed drone data in lists and graphs. Now, let's define a trigger that executes when data that you monitor reaches a threshold value.

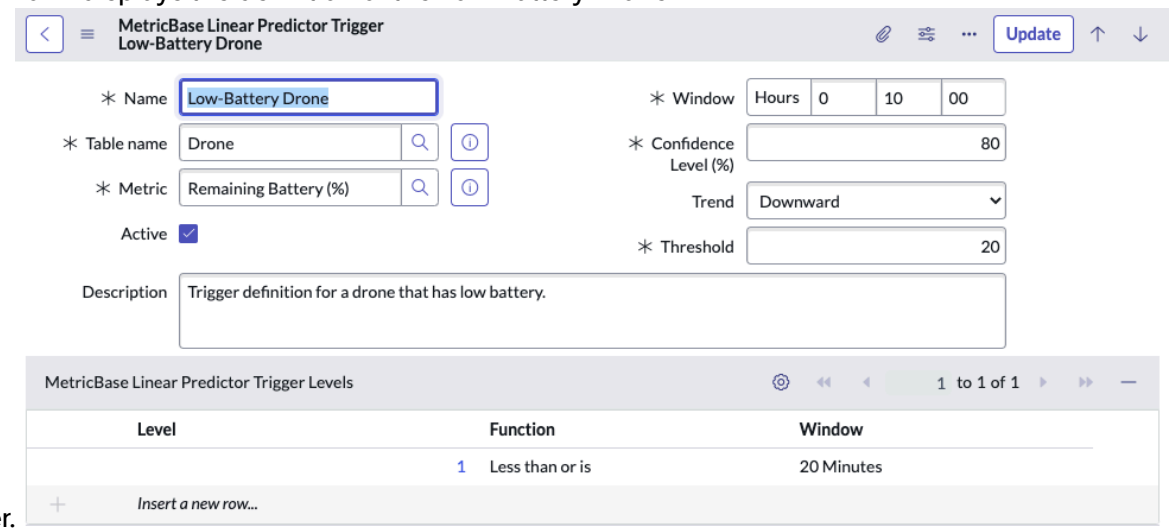
15. Select **MetricBase Demo** > **Trigger Definitions**. The MetricBase Trigger Definitions list shows the name (**Name**) of the trigger, the metric (**Metric**) the trigger monitors, the table (**Table name**) the metric that it is in, the trigger description, and whether the trigger is active. Triggers kick off flows when metrics meet trigger thresholds. An example is when a drone flies too low. For more information about triggers, see Trigger Workflows.



Name	Metric	Table name	Description	Active
Flight State	Altitude (m)	Drone	Trigger definition based on the three le...	true
Low-Battery Drone	Remaining Battery (%)	Drone	Trigger definition for a drone that has ...	true
Low-Flying Drone	Altitude (m)	Drone	Trigger definition for a drone that is a...	true
Malfunction Thermostat	External Temperature (C)	Drone	Trigger definition for a drone that has ...	true
Travel State	Speed (kph)	Drone	Trigger definition based on the three le...	true

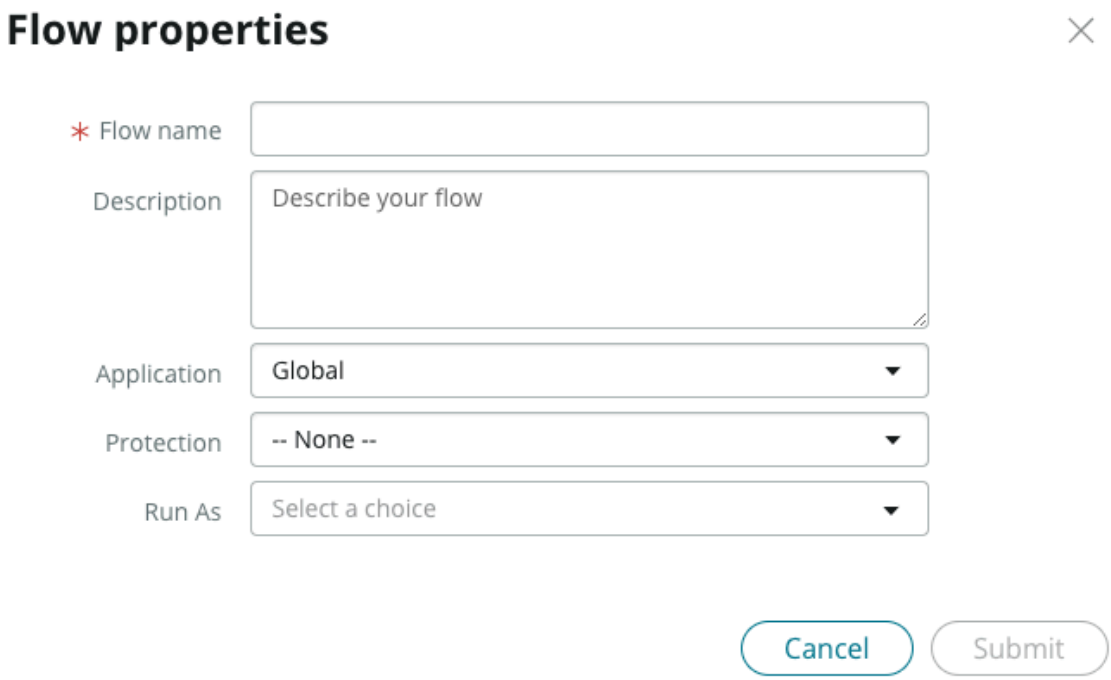
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

16. Select **Low-Battery Drone**. The MetricBase Linear Predictor trigger form displays the definition of the Low-Battery Drone trigger.



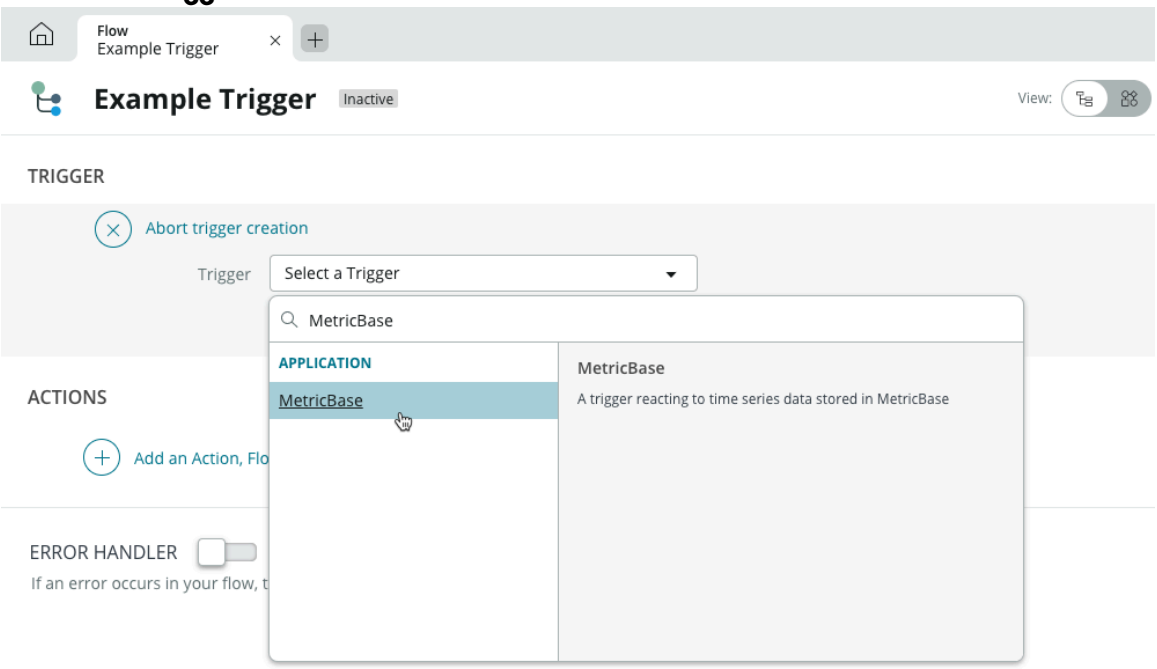
In this example, the trigger monitors the **Remaining Battery (%)** metric (**Metric**) in the Drone table (**Table name**) every 10 minutes (**Window**). If the battery life is trending downward (**Trend**) and is 80% likely (**Confidence Level**) to reach 20% (**Threshold**) within 20 minutes (under **Window** for **Level** 1), the trigger executes. Although it fires, nothing happens until you associate this trigger with a flow. The flow defines the actions to take.

17. Select **MetricBase** > **Trigger Flows**.
18. Select **New flow** to associate a trigger that is defined in the system to a flow.
19. In the **Flow name** field, name the flow and select **Submit**.

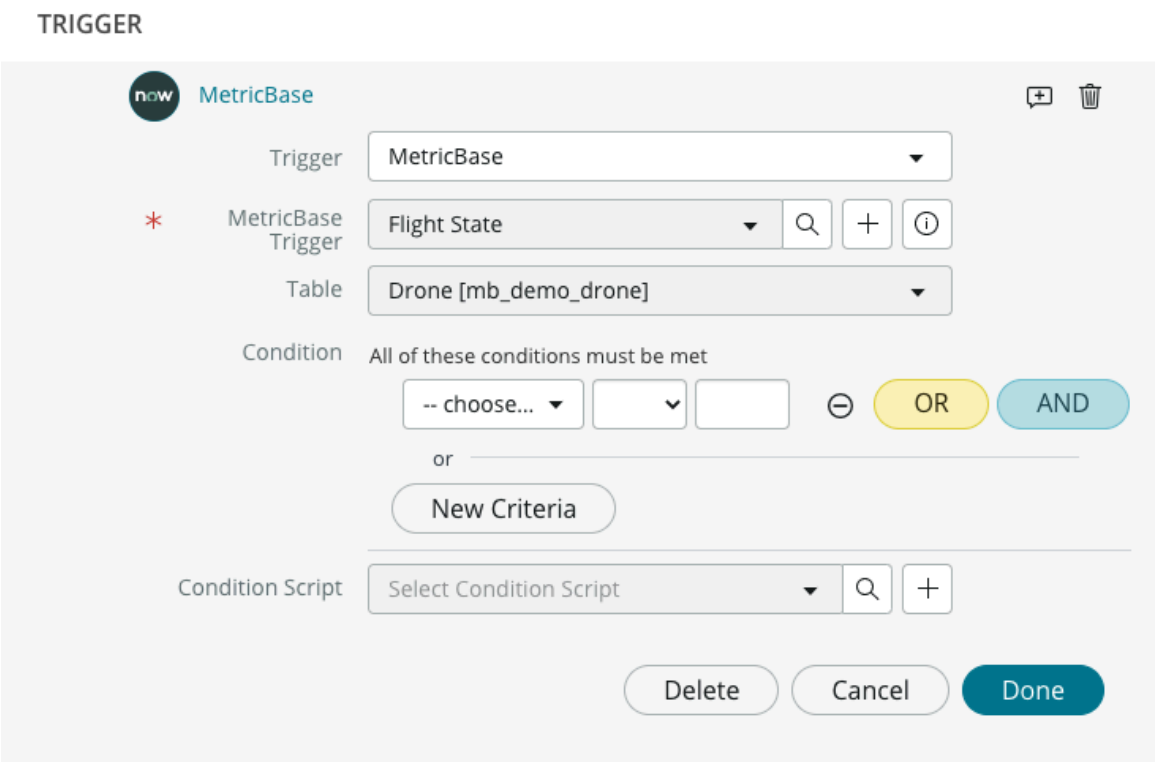


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

20. Click **Add a Trigger** and select **MetricBase** in the list.

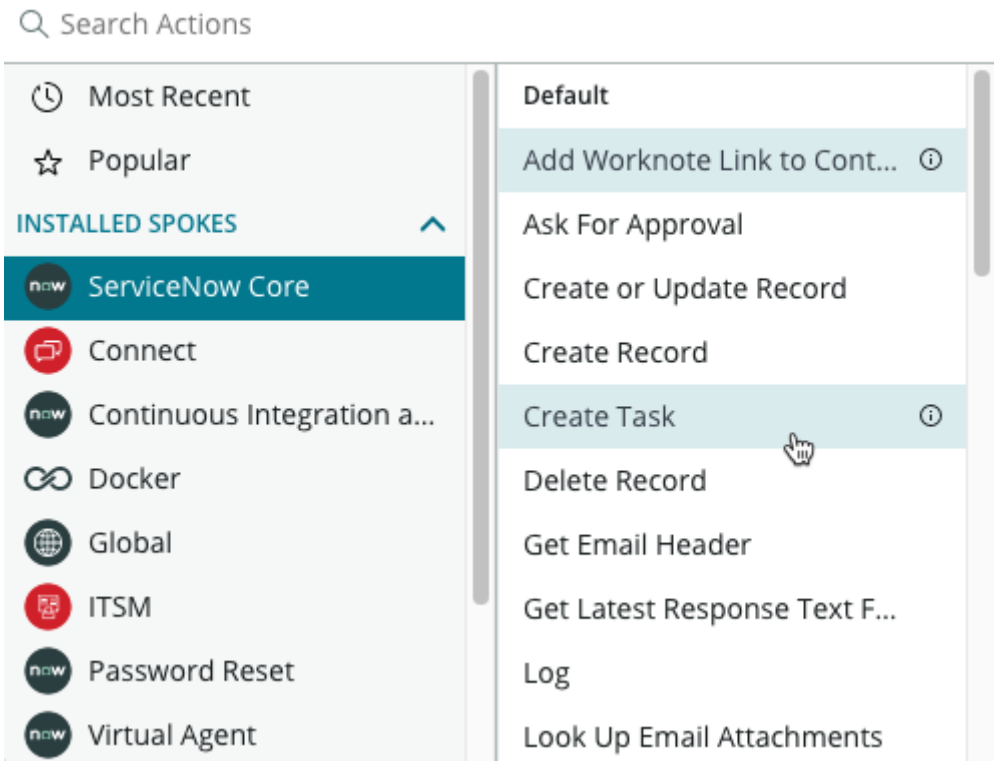


21. In **MetricBase Trigger**, select a trigger that already exists and select **Done**. Alternately, select the plus sign to the right of **MetricBase Trigger** to create a new trigger.



22. Select **Add an Action, Flow Logic, or Subflow**.
23. Select **Action** to specify the actions to take when the trigger fires. The Action dialog box appears.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



24. Select a domain of actions from the left column and the specific action to take in the right column.
25. Select **Save** and **Activate**. The flow doesn't execute unless it is activated. For more information about Workflow Studio, see Workflow Studio.

The following table summarizes the modules in the MetricBase demo.

MetricBase demo modules

Module	Description
Drones	Table that keeps metrics on drones, such as speed and altitude. Each record is a different drone. You can add records.
Fleets	Table that maintains metrics about groups of drones. Each record is a different fleet. You can add records.
Data Generators	Table that defines how data is created for the drone records. This field is provided for informational purposes. You cannot change or add records.
Metrics	List of metrics that are defined in the system. This list is the same table as **MetricBase** > **Time Series Metrics**. You can add metric fields.
Scheduled Jobs	Scheduled job that is created for the demonstration application. The job runs every five minutes to add data to the demo tables in the MetricBase database. You can change the schedule.
Trigger Definitions	List of triggers that are defined in the demo. This list is the same table as **MetricBase** > **MetricBase Triggers** > **Trigger Definitions**. You can create additional triggers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MetricBase demo modules (continued)

Module	Description
Anomaly Logs	List of logs that result from triggers firing. The **Low-Flying Drone** trigger creates the anomaly logs.
Data Explorer	Widget that enables you to experiment with MetricBase JavaScript APIs using the demonstration application data. See Get Familiar with MetricBase APIs for more information.

Get familiar with MetricBase APIs

Experiment with MetricBase APIs using Data Explorer that is part of the MetricBase Demo application. Data Explorer uses the data installed with the MetricBase Demo application.

Before you begin

Role required: clotho_admin

About this task

Data Explorer is a playground where you can see and edit example scripts that visualize data included with the MetricBase Demo application. The example scripts use the MetricBase JavaScript APIs. For information on the MetricBase JavaScript APIs, see Client, Data, DataBuilder, Transformer, TransformPart, TransformResult.

Note that the now/v1/clotho/transform/topic API endpoint is reserved for internal use only.

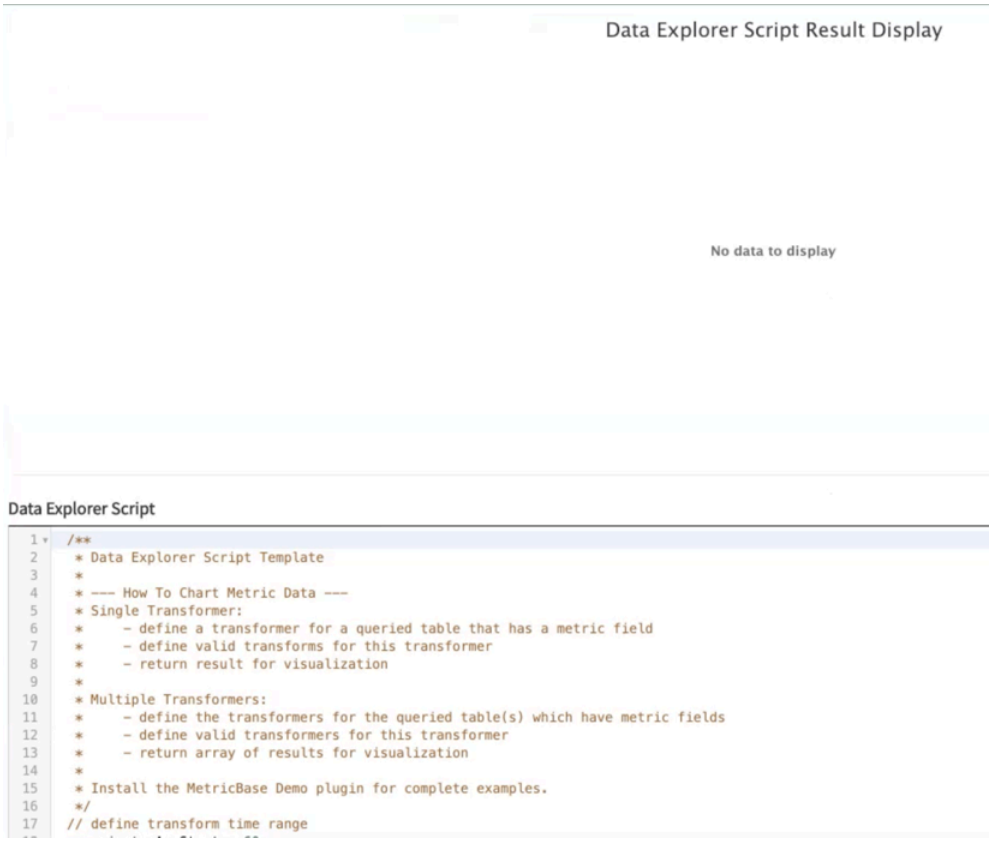
Example scripts use either:

- Transforms, which use the Transformer method.
- Machine Language, trained models that predict expected behavior. All the scripts without "Transform" in their title use Machine Language.

Procedure

1. Navigate to **All** > **MetricBase Demo** > **Data Explorer**.
   The **Data Explorer** displays.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



When you run a script, the data visualization appears under **Data Explorer Script Result Display**.

2. Select one of the sample scripts to run in the **Example Script** menu.

3. Click **Load Example**.
4. Click **Run**.
   The script displays the data visualization under **Data Explorer Script Result Display**.
5. **Optional:** Change the values or statements in the script or write an entirely new script and click **Run**.

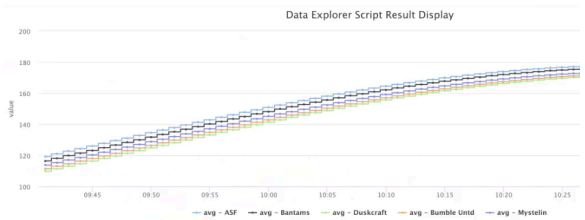
   Note:
   If you want to save the changes you made in the script, click **Save**.

6. Under **Server Output**, look at the server's response that might include error information.

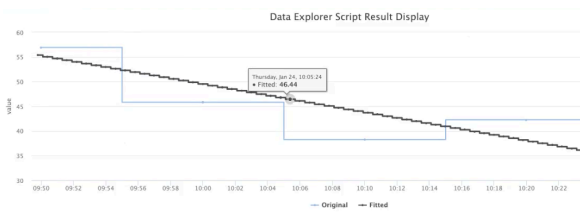
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example:

Example scripts

Example script	Definition and visualization
Simple Transform	Uses the transformer API to display a single time-series metric, the average speed of the drones: `transformer.metric('mb_demo_mt_speed').avg()`. 
Simple Transform with Grouping	Uses the transformer API to display a group of time-series metrics, the average altitude of the fleet of the drones:
	`transformer.groupBy("fleet").metric("mb_demo_mt_altitude").`
	`avg().label('avg - %g:fleet:')`
	 


Normal Model	Models normal data, which approximates a bell-shaped or Gaussian curve for distributed values.

Linear Model	Creates a line to summarize the current data and predict future values. This example, about the remaining charge in drone batteries, graphs both the trained model values and the average of the values.
	`var builder = new sn_clotho.Transformer(drones);`
	`var fit = builder.metric("mb_demo_nt_rem_battery").resample(100).`
	`fit({model:"linear"}).label("Fitted");`
	`builder.metric("nb_demp_mt_rem_battery").avg().label("Original")`
	 


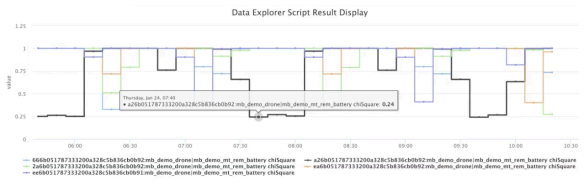
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example scripts (continued)

Example script	Definition and visualization

Seasonal Trend Decomposition Model	Uses a seasonal trend model so that data can be subtracted to reveal non-seasonal trends. This model is similar in purpose to the Holt Winters model but arrives at the result using different algorithms.
	`var builder = new sn_clotho.Transformer(drones);`
	`var metric = "nb_demo_mt_rem_battery";`
	`var fit = builder.metric(metric).fit({model:"STL", periodicity:"PT2H", innerCycles:1, outerCycles:10})`

Holt Winters Model	Uses the Holt Winters, seasonal trend model so that data can be subtracted to reveal non-seasonal trends. This model is similar in purpose to the Seasonal Trend Decomposition model but arrives at the result using different algorithms.
ARIMA Model	The most general class of models for predicting time-series data that has no trend, meaning all the data has the same value or the values fluctuate sinusoidally around the mean.

Deviation Model	Uses chisquare model to show the differences between the real data and the model's prediction.
	`var metric = "nb_demo_mt_rem_battery";`
	`builder.metric(metric).deviation(model, "chiSquare");`
	 


Defining and collecting MetricBase data

Store time-series summaries of much larger data collections.

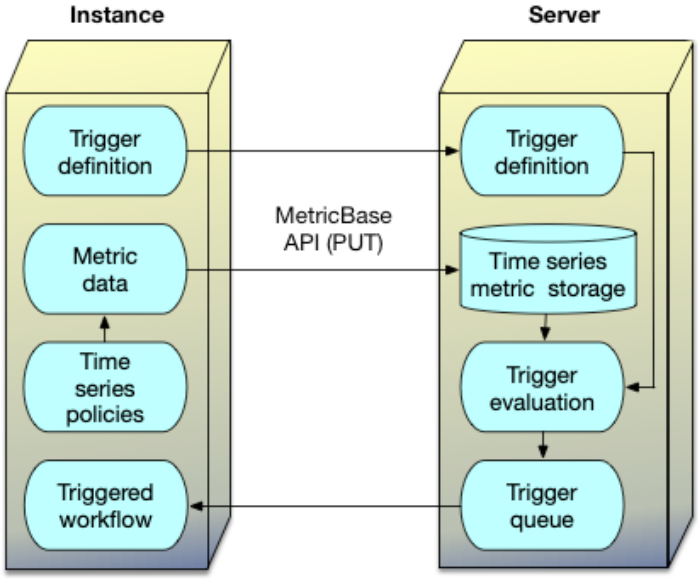
Overview of creating a time-series definition

In MetricBase, you specify the metric that you want to store and how often to collect it. You can also determine how long to store it in the MetricBase database. Then, you send the data from an instance to the MetricBase server at the rate that you define using MetricBase REST or JavaScript APIs. In this way, you can monitor a much larger data collection with MetricBase summaries of it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MetricBase collects the metrics of how often you send data and what the aggregation of that data is, for example, maximum, minimum, average, or last. This data is called time-series data. For example, if you collect drone speeds on an instance, you can send the average drone speed for every two minutes to the MetricBase database. You can also collect altitude and battery life. MetricBase stores each metric as a column in its database.

Sending information from an instance to a MetricBase server



- Create a time-series definition in MetricBase

  Specify the metric that you want to store, how often to collect it, and how long to store it in MetricBase.

- MetricBase retention policy schedules

  Specify how long MetricBase stores the time-series data in the MetricBase database.

- MetricBase retention policies

  Retain data in MetricBase according to retention policies.

- Accessing MetricBase data

  Access the time-series data that you sent to the MetricBase database in the way that is convenient to you.

- Detecting anomalies in MetricBase data using predictive models

  Distinguish normal data from anomalous data using predictive models.

Create a time-series definition in MetricBase

Specify the metric that you want to store, how often to collect it, and how long to store it in MetricBase.

Before you begin

- Install MetricBase
- Role required: clotho_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **MetricBase** > **Time Series Metrics**.
2. Select **New**.
3. On the form, fill in the fields.

Time series metric form

Field	Description
Label	Intuitive name for the **Metric field name**. For example, altitude could be the label for the metric field name, mb-altitude.
Table name	Name of the table to add the metric to in the MetricBase database. For example, in the MetricBase Demo, the mb_drone table stores the drone data. Each column in the table is a different metric, for example, altitude, length, and speed.
Metric field name	Name of the time-series metric that records. For example, mb-altitude. You can think of it as the name of a column in the MetricBase database table.
Retention policy	Sampling frequency and how long MetricBase keeps the values in the database. You cannot customize the value. For a definition of the values, click the magnifying glass and then a policy. The coarser the sampling rate, the less data that stores. Use the coarsest sampling rate that works for your dataset. For example, do not collect data every minute if collecting it once an hour suffices. See MetricBase retention policies for a description of the policies you can select.
Retention policy aggregator	Operator that aggregates the data in a sampling period. For example, last, minimum, maximum, and average.
Display value aggregator	The aggregation method in use when using *<table-name>.list* where <table-name> is a table in the MetricBase database. This value is unrelated to the retention policy. For a definition of the options, see MetricBase transforms.
Display value aggregate duration	Duration that is used to calculate the aggregation only when using the list view. For example, *<table-name>.list* where <table-name> is a table in the MetricBase database. This value is unrelated to the retention policy.
Subject field	You can select a unique table column as your subject for the metric. The unique column must be designated on the table before you select it. For example, if your metric tracks temperatures in different houses, you can make the house address column the subject of your metric. The house address column on your table must be unique before you set the subject field. **Note:** The sys_id column is the default unique column.
Data Type	You can specify the data type of the subject field.

4. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
You've created a time-series specification for a metric that you want to track.

What to do next
Sample the data according to the time-series specification and send it from an instance to the MetricBase database server.

Use the REST or JavaScript APIs to send the data to the MetricBase database at the rate that is prescribed by the time-series definition. See Developer resources.

Important:
Send the data at the rate that the time-series definition prescribes. If you send the data at a different rate or for a different duration, you receive an error. Make sure to aggregate the data according to the time-series metric definition. Also, the MetricBase database only stores values of data type float.

MetricBase retention policy schedules

Specify how long MetricBase stores the time-series data in the MetricBase database.

To create, edit, or delete retention policy schedules, navigate to **MetricBase** > **Retention Policy Schedules**.

When creating a retention policy schedule, the following limitations apply:

- Maximum retention duration: 26 months (794 days)
- Maximum sampling period: 1 day
- Maximum data points (calculated as retention duration * sampling period): 160,000 data points

In addition, the retention duration must be a multiple of the sampling period.

MetricBase retention policies

Retain data in MetricBase according to retention policies.

Retention policies include multiple retention schedules with coarser granularity the longer that the data is kept. For example, the Coarse retention policy stores sampled data every:

- Hour for one week (7 Days per 1-hour period)
- Two hours for one month (31 days per 2-hour period)
- Day for 13 months (397 Days per 1-day period)

In this policy, the specified metric is measured every hour for the first 7 days. It is then measured every other hour for the next 31 days, and once a day for the next 397 days. MetricBase deletes data that is older than 435 days.

To see the list of all supported retention policies, navigate to **MetricBase** > **Retention Policies**.

MetricBase Retention Policies

Policy	Description
Coarse	This policy retains data for 1 week at 1-hour period, 1 month at 2-hour period, and 13 months at 1-day period.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MetricBase Retention Policies (continued)

Policy	Description
	This policy is suitable for metrics that change less often or metrics that do not require high resolution, such as disk usage.
Dense	This policy retains data for 8 days at 1-minute period, 94 days at 10-minute period, and 13 months at 1-hour period. This policy is suitable for metrics that require higher resolution for longer terms.
High	This policy retains data for 1 week at 1-minute period, 1 month at 10-minute period, and 13 months at 1-hour period. This policy is suitable for metrics that require higher resolution for longer terms.
Medium	This policy retains data for 1 week at 10-minute period, 1 month at 30-minute period, and 13 months at 2-hour period. This policy is suitable for metrics that change less often such as job processing throughput.
Medium High	This policy retains data for 13 months at 1-hour period.
Operational Intelligence	Operational Intelligence (OI) policy retains data for 8 days at 1-minute period, 94 days at 10-minute period, and 13 months at 1-hour period.
Sparse	This policy retains data for 13 months at 1-day period.
Ultra Dense	This policy retains data for 1 day at 10-second period, 3 months at 1-minute period, and 1 year at 1-hour period.

Accessing MetricBase data

Access the time-series data that you sent to the MetricBase database in the way that is convenient to you.

You can access and visualize time-series data in the MetricBase database by using:

- Reporting application

  You can generate reports and graphs from the time-series data that is stored in the MetricBase database. For more information, see Create reports from MetricBase time-series data.

- Table lists using the `.list` command

  For more information, see View MetricBase data using the list command.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- REST or JavaScript APIs

  For more information, see Retrieve MetricBase data using REST and JavaScript.

Access MetricBase data using the list command

Use the list command on a table in the MetricBase database to view time-series data. The data reveals the behavior of the entity that supplies the data.

Before you begin
Role required: admin

Procedure

1. On the MetricBase instance, in the **application navigator**, type `<table-name>.list`, and press the Enter key.
   <table-name> is the name of the table in the MetricBase database that contains the metric you want to view.
2. Click the menu icon ( ) above the metric column, and select **Time Series Chart**.
3. Change the **Time Span** and **Transform** fields to evaluate the data.
4. **Optional:** Adjust the data:

   a. Select one of the transforms: **Add**, **Multiply**, or **Divide**.

   b. In the **Value** field, enter the number to add, multiply, or divide the metric data by and click **Submit**.

   Note:
   The adjusted data is not saved in the MetricBase database.

Retrieving MetricBase data using REST and JavaScript

Use JavaScript or REST APIs to insert and retrieve time-series data from the MetricBase database and to run transforms on the data. The transformations enable you to visualize time-series data in a variety of ways.

For more information about MetricBase time-series data transformations, see MetricBase transforms.

Using REST

For information about the MetricBase REST APIs that return time-series data from the MetricBase database, see MetricBase Time Series API.

Using JavaScript

For information about the MetricBase JavaScript APIs that return time-series data from the MetricBase database, see:

- Client — Execute transforms on the MetricBase database and receive the results.
- Data — Return the object that contains the result of a transform.
- DataBuilder — Create a series of data points for a metric.
- Transformer — Manipulate time-series data to prepare the data for evaluation and analysis.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- TransformPart — Specify details of the transform to be done.
- TransformResult — Return the object that contains the result of the transformation.

Experiment and get familiar with the JavaScript APIs by using the MetricBase Data Explorer that comes with the MetricBase Demo.

Detecting anomalies in MetricBase data using predictive models

MetricBase creates a model by training a representative sample of your time series data to determine the model parameters. The training process determines the model parameters that best fit your data, to distinguish normal data from anomalous data.

MetricBase supports the following model types:

- Probabilistic Exponentially Weighted Moving Average (PEWMA), a moving average algorithm that uses a probability factor to determine how it reacts to change in data
- Autoregressive Integrated Moving Average (ARIMA), a moving average algorithm that factors in previous errors and values
- Seasonal Trend decomposition using Loess (STL), a seasonal algorithm for decomposing time series data into seasonal and trend components
- Holt-Winters (HW), a seasonal algorithm that decomposes the trend and seasonal components to determine the level

Note:
MetricBase selects the most appropriate model type when you select *`Find Best Fit Model`* from the model class list.

After you have a model trained from your data, you can trigger flows when new data is significantly different than the trained data.

Create and train a predictive model

Use statistical models to determine significant anomalies in real-time using MetricBase triggers. You will need to train a model using representative data that has already been stored in MetricBase.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **MetricBase** > **MetricBase Models**.
2. Select **New**.
3. On the form, fill in the fields.

Model New Record form

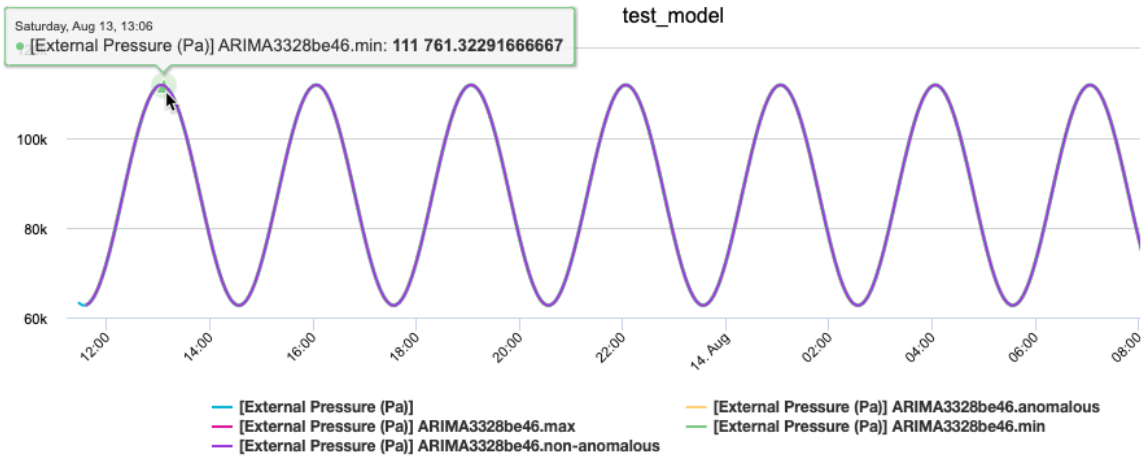
Field	Description
Model name	Name of the model. The name can be any combination of alphanumeric characters. This model name is not the same as the model class. In general, the name relates to the value in **Group by**.
Table name	Name of the table that contains the training data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Metric	Name of the metric that you use to train the model. The metric must belong to the table.
Created	Date that you trained the model.
Filter	Filters that you use to exclude some of the data in the dataset. **Note:** When choosing data to train your model, try to select data that demonstrates an expected behavior to reduce anomalies in the training set.
Group by	You can use **Group by** as a discriminator field for your model data. For example, if you want to create a data model over a group of production servers whose performance differs by role (such as database or application server roles) then you would choose role as the **Group by** field. The training process creates one model per role in the group of records selected by the filter. You do not have to manually create a model for each role.
Model Class	The algorithm to use when training data. Select a moving average algorithm (PEWMA, ARIMA), a seasonal algorithm (STL, HW), or choose **Find Best Fit Model**. The default is **Find Best Fit Model**, which tries each algorithm and selects the one which appears to have the best fit over the training set.
Training Dataset Start Date	MetricBase time series data for the metric starting with this date.
Training Dataset End Date	MetricBase time series data for the metric ending with this date.
Valid until	Date that serves as a reminder to consider retraining the model. If the model is performing well, there's no need to retrain it. The model can continue working past this date.
Active	Option to use the trained model. Once the model is active it becomes available for use as a Workflow Studio trigger.

4. Click **Submit and Train**.
   MetricBase trains the model. When complete, the model appears on the **MetricBase Model Instances** tab.
5. Click the model name.
   The modeling data appears as does the model string with the parameters optimized by the training.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. **Optional:** Click the model name and then click **Set Model** to change the model parameters. You can edit the model parameters when you want to override the settings for training your model. The graph does not update, you are saving the revised model string.

What to do next

You can create a Workflow Studio trigger for this model. For more information, see Create a model trigger.

Triggering flows using MetricBase data

Time-series data that is stored in the MetricBase database can trigger Workflow Studio flows. These triggers can log incidents, send emails, and create other alerts.

Overview of implementing triggers

A trigger definition is a set of conditions that automatically executes a Workflow Studio flow. When you create a trigger definition in MetricBase and associate it with a flow, the trigger definition transfers from your instance to the MetricBase server. After you activate the trigger and flow, MetricBase monitors time-series data in the MetricBase database. When time-series data matches the initial triggering condition, and then transitions from one condition to the next, a transition trigger is generated and added to the queue. The instance polls the queue, processes the transition trigger, and then executes the Workflow Studio flow.

For more information about time-series policies, see Create a time-series definition in MetricBase.

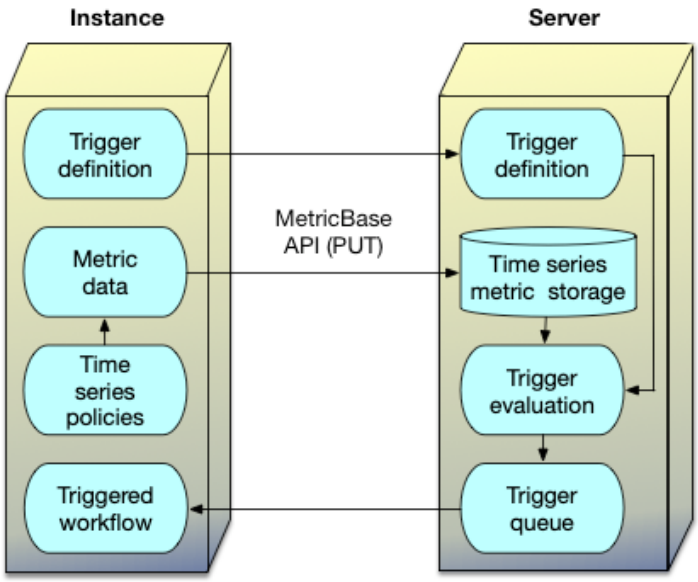
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Trigger workflow



1. Define one or more triggers on an instance.

   Create a MetricBase band trigger

   Triggers when a metric value falls within a range of values.

   Create a MetricBase linear predictor trigger

   Triggers when a series of values trend toward and are expected to reach a specified value.

   Create a MetricBase gap trigger

   Triggers when values are not received for a specified period.

   Create a MetricBase model trigger

   Triggers when a trained model detects anomalous behavior.

2. Execute triggers conditionally

   Create a trigger condition to add additional requirements for a trigger to execute a flow. For example, data often fluctuates over time. Small fluctuations can cause unwanted, duplicate triggering events. A Condition Script can prevent that erroneous duplication.

3. Assign a trigger to a flow

   Associate the trigger with the flow it executes using Workflow Studio.

4. Test the trigger and workflow.
5. Activate the trigger.

Deleting triggers

If a trigger is associated with a flow, you can't delete it in MetricBase. To delete a trigger, you must first delete the flow in Workflow Studio and then you can delete the trigger in MetricBase.

Legacy triggers

Legacy triggers are deprecated. You can't create legacy triggers; you can only carry forward legacy triggers that exist.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a MetricBase band trigger

Create a MetricBase band trigger that detects when a metric value falls within a range of values.

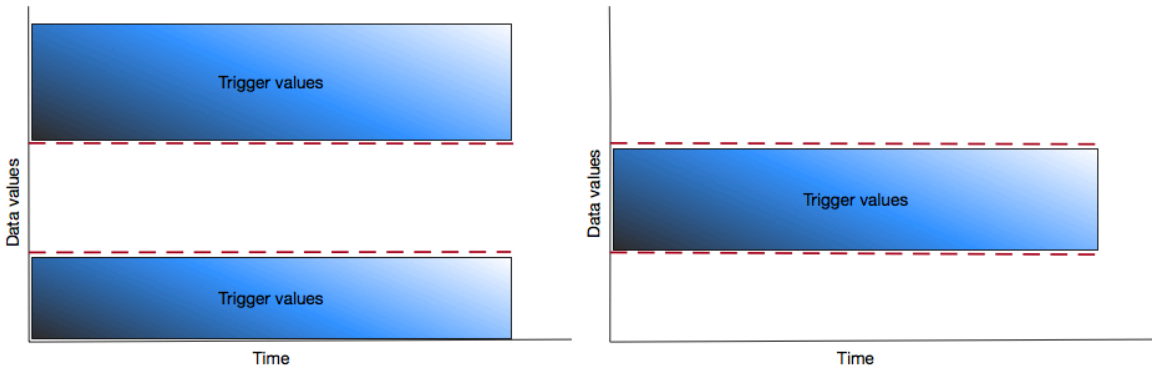
Before you begin

Role required: admin

About this task

Band triggers execute when metrics fall outside of or within a range of values.

Band trigger values



Procedure

1. Navigate to **All** > **MetricBase** > **MetricBase Triggers** > **Trigger Definitions**.
2. Select **New**.
3. On the **MetricBase** Trigger Creation form, select the **Band Trigger** option.
4. On the form, fill in the fields.
   The trigger levels are not initially visible on this form. You configure the levels later.

MetricBase Band Trigger form

Field	Description
Name	Name of the band trigger.
Table name	Table in the MetricBase database that contains the metric that you want to monitor. The only tables that appear when you click the search icon are the tables that you specified in the time-series metrics. If you select a metric before you select a table, only tables that have that metric appear in the **Table name** dialog box.
Metric	Table metric that you want to monitor that is specified by the **Table name**. The only metrics that appear when you click the search icon are the metrics in that table. If you select a metric before you specify a **Table name**, the metrics in all your time-series metrics appear. After you select a

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	metric, only the tables that contain that metric appear when you click the search icon that is next to the **Table name**.
Active	Option to activate the trigger.
Description	Description of the trigger.
Aggregator	Aggregation value that you select: **None**, **Max**, **Min**, or **Average**. **None** means that you use the last value in the collection period.
Window	Length of time used to calculate the aggregation function. For example, assume the **Window** is 1 hour and the aggregator is **Min**, and a new data point is added to the series. The system calculates the new minimum using the new data window (the last hour of data including the new data point). The new minimum is compared to the different trigger levels to determine whether to execute the trigger.

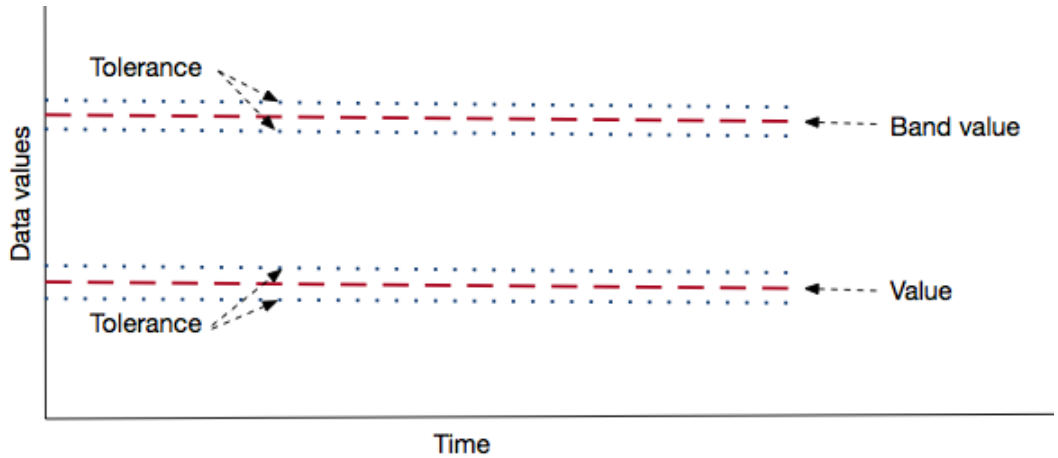
5. Select **Save**.
   A new record is created.
6. In the MetricBase Band Trigger Levels section on the record you just created, double-click each cell to add values that specify trigger parameters.

MetricBase Band Trigger Levels

Field	Description
Level	Numbers that indicate increasing severity. For example, you might define the altitude for level 1 to be less than 50 meters, but above 25 meters, and the altitude for level 2 to be less than or equal to 25. Each level should trigger a different flow. **Level** is often used in Condition Scripts. See Execute triggers conditionally.
Function	Function that makes the **Value** the maximum or minimum of the lower end of the band. Therefore, the function defines whether trigger values are inside or outside of the band. For example, if the **Function** is **Less than**, the trigger executes when the metric goes below the band value.
Value	Lower end of the band. See the following image.
Band Function	Function that makes the **Band Value** the maximum or minimum value of the upper end of the band. Therefore, the band function defines whether trigger values are inside or outside of the band. For example, if the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Band Function is **Greater than**, the trigger executes when the metric goes above the band value. See the following image.
Band Value	Upper end of the band. See the following image.
Tolerance	Sets tolerance margins around the **Value** and **Band Value** to prevent repeatedly executing a trigger for small fluctuations in the data. After a trigger executes, the data must exceed the tolerance to execute the trigger again. See the following image.



For example, assume the **Function** is **Greater than**, the **Value** is 25, and the **Band Value** is 50.

- If the **Tolerance** is 0, the trigger executes for all values that are less than 50 and greater than 25.
- If the **Tolerance** is 5, the ranges are 50 ± 5 (45-55) and 25 ± 5 (20-30).
- If the last two data points in order were 51 and 49, the trigger executes because 49 is below the **Band Value**.
- If the next two data points in order are 51 and 49, the trigger doesn't execute again because the values are within the tolerance range since the last trigger execution.

7. Add one or more rows to the table to create multi-layered triggering behavior.

   Note:
   You must define at least two levels in a band trigger so that there are levels to transition between.

   Typically, each additional row (level) indicates a more severe condition. The Workflow Studio flow associated with the level should warn with increasing severity.

8. Select **Update**.
9. **Optional:** Add a triggering condition that determines whether a trigger executes a Workflow Studio flow.
   See Execute triggers conditionally.

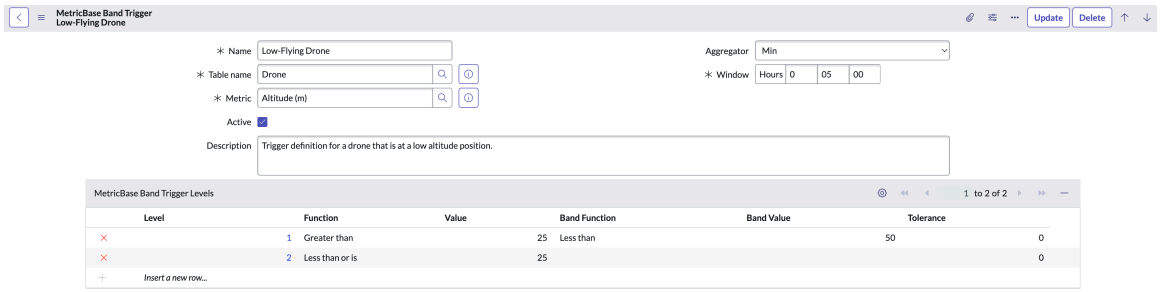
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: Band Trigger form



What to do next

Associate this trigger with a Workflow Studio flow. For more information, see Assign a trigger to a flow.

Create a MetricBase linear predictor trigger

Create a MetricBase linear predictor trigger to detect when a metric is likely to cross a specified threshold within a specified period of time.

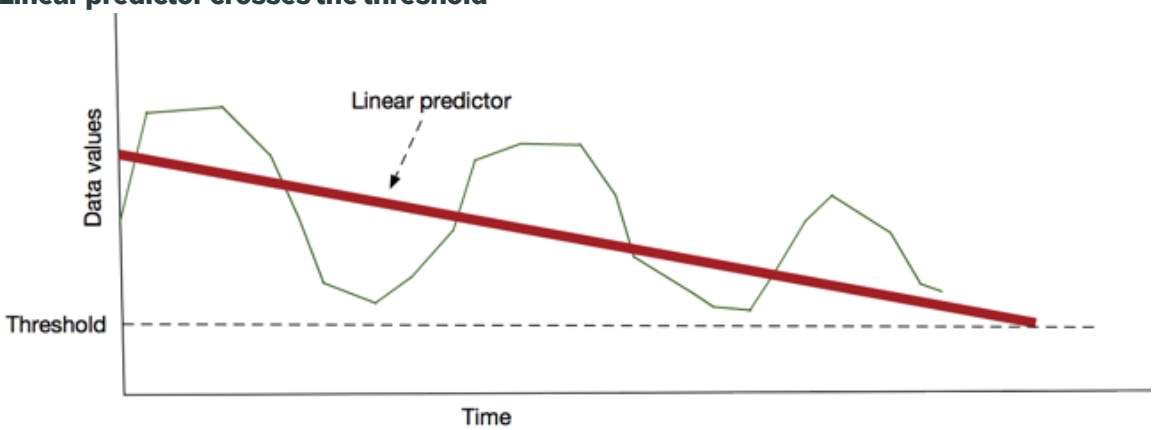
Before you begin

Role required: admin

About this task

The linear predictor trigger uses past data to generate a line that predicts future values. When MetricBase predicts that the linear value reaches a threshold, the trigger executes.

Linear predictor crosses the threshold



If the most recent data point reaches the threshold, the trigger executes regardless of the linear prediction.

Trigger parameters include how much past data to use in the calculation of the prediction, how far ahead to look, and the level of confidence that you accept.

Procedure

1. Navigate to **All** > **MetricBase** > **MetricBase Triggers** > **Trigger Definitions**.
2. Select **New**.
3. On the **MetricBase** Trigger Creation form, select the **Linear Predictor Trigger** option.
4. On the form, fill in the fields.
   The trigger levels are not initially visible on this form. You configure the levels later.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MetricBase Linear Predictor Trigger form

Field	Description
Name	Name of the linear predictor trigger.
Table name	Table in the MetricBase database that contains the metric that you want to monitor. The only tables that appear when you click the search icon are the tables that you specified in the time-series metrics. If you select a metric before you select a table, only tables that have that metric appear in the **Table name** dialog box.
Metric	Table metric that you want to monitor that is specified by the **Table name**. The only metrics that appear when you click the search icon are the metrics in that table. If you select a metric before you specify a **Table name**, the metrics in all your time-series metrics appear. After you select a metric, only the tables that contain that metric appear when you click the search icon that is next to the **Table name**.
Active	Option to activate the trigger.
Window	Length of time used to calculate the line that predicts the future course of the value. For example, you might want to use the last 10 minutes of data to calculate the linear predictor. If the value is too long, the line does not reflect current trends. If the value is too short, the line might follow the raw values too closely and not accurately reflect the overall trend of the values. The value must be at least 10 times the sampling period that is defined by the sampling rate of your **Metric**. **Warning:** Do not confuse this value with the **Window** value in the trigger level. That value specifies how far into the future that you want the linear predictor to look to see if the **Metric** is likely to cross the **Threshold**.
Confidence Level (%)	A measure of how closely the real data fits the linear prediction of the data. A confidence level of 95% means that the real value must be within 5% of the predicted value to execute a trigger. If you only want to trigger when the real values are close to the predicted values, choose a high confidence percentage. If you are willing to accept real data that varies more significantly from the predicted values as being valid, select a lower confidence level, for example, 80%.
Trend	Direction of the trend: upward or downward. For example, the value is increasing or decreasing toward the **Threshold**.
Threshold	Target value that the metric is expected to reach before the trigger executes.
Description	Description of the trigger.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select **Save**.
   A new record is created.
6. In the MetricBase Linear Predictor Trigger Levels section on the record you just created, double-click each cell to add values that specify trigger parameters.

MetricBase Linear Predictor Trigger Levels

Field	Description
Level	Numbers that indicate increasing severity. Each level should trigger a different flow. For example, you might define the following: **Level 1** Battery is predicted to reach 20% in 30 minutes. **Level 2** Battery is predicted to reach 20% in 5 minutes. **Level** is often used in Condition Scripts. See Execute triggers conditionally.
Function	Comparative function to use on the threshold value. **Less than or is** is the only available option. For example, battery life **Less than or is** 30 minutes.
Window	How far into the future that you want the linear predictor to look to see if the metric is predicted to cross the threshold. **Warning:** Do not confuse this value with the **Window** value in the trigger definition form. That value specifies how much data to use (measured in time) to calculate the slope of the predictor line.

7. **Optional:** Add rows to the table to create multi-layered triggering behavior.
   Typically, each additional row (level) indicates a more severe condition. The Workflow Studio flow associated with the level should warn with increasing severity.
8. Select **Update**.
9. **Optional:** Add a triggering condition that determines whether a trigger executes a Workflow Studio flow.
   See Execute triggers conditionally.

Example: Linear Predictor form

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next
Associate this trigger with a Workflow Studio flow. For more information, see Assign a trigger to a flow.

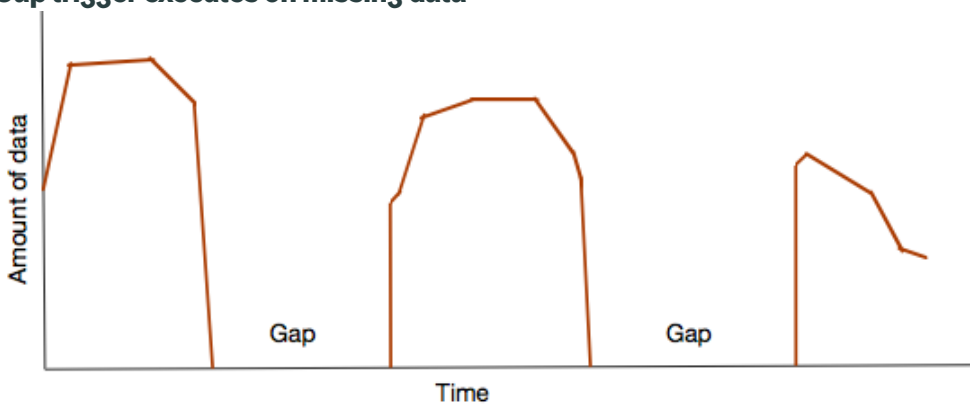
Create a MetricBase gap trigger

Create a MetricBase gap trigger to alert you when MetricBase stops receiving data.

Before you begin
Role required: admin

About this task
Gap triggers execute when MetricBase stops receiving data for a specified period.

Gap trigger executes on missing data



You can define multiple trigger levels to indicate different severities. For example, you can set a gap of 10 minutes as level 1, a gap of 20 minutes as level 2, and so on. Each level should trigger a different Workflow Studio flow. The difference between gap durations on different levels must be at least 10 minutes. For example, if you set level 1 to a gap of 10 minutes, you must set level 2 to a gap of 20 minutes or more.

Note:
If you make the gap durations between levels less than 10 minutes, MetricBase displays an error message and deletes the level that you added.

Polling frequency is calculated using the difference between gap durations on different levels and dividing by 2 (rounded down). For example, given the following:

- Level 1 triggers after 5 minutes of missing data
- Level 2 triggers after 30 minutes of missing data

The polling frequency is 12 minutes, because Floor((30-5)/2) = 12 minutes.

The maximum polling frequency is every 5 minutes, and the minimum frequency is every 30 minutes. If a trigger has only one level, the polling frequency is 30 minutes.

MetricBase searches through the data that is stored in the MetricBase database, not through incoming data. Therefore, a gap trigger might execute after the gap when data is missing. For example, if MetricBase polls every 10 minutes and the gap is 30 minutes of missing data, the trigger might execute as late as 40 minutes after the data was last received.

Procedure

1. Navigate to **All** > **MetricBase** > *Workflow Studio* > **Trigger Definitions**.
2. Select **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the **MetricBase** Trigger Creation form, select the **Gap Trigger** option.
4. On the form, fill in the fields.
   The trigger levels are not initially visible on this form. You configure the levels later.

MetricBase Gap Trigger form

Field	Description
Name	Name of the trigger.
Table name	Table in the MetricBase database that contains the metric that you want to monitor. The only tables that appear when you click the search icon are the tables that you specified in the time-series metrics. If you select a metric before you select a table, only tables that have that metric appear in the **Table name** dialog box.
Active	Option to activate the trigger.
Metric	Table metric that you want to monitor that is specified by the **Table name**. The only metrics that appear when you click the search icon are the metrics in that table. If you select a metric before you specify a **Table name**, the metrics in all your time-series metrics appear. After you select a metric, only the tables that contain that metric appear when you click the search icon that is next to the **Table name**.
Description	Description of the trigger.

5. Select **Save**.
   A new record is created.
6. In the MetricBase Gap Trigger Levels area on the record you just created, double-click each cell to add values that specify trigger parameters.

Field	Description
Level	Numbers that indicate increasing severity. For example, you might define level 1 to be no data for 10 minutes. Level 2 might be no data for 20 minutes. Each level should trigger a different flow. **Level** is often used in Condition Scripts. See Execute triggers conditionally.
Function	Function, **Greater than or is**, which means that this trigger executes when the gap in received data is greater than the value that you specify in the **Window** field. There is only one option for the function, and it cannot be left empty or MetricBase displays an error message.
Window	Length of time that no data has been received that executes the trigger. The format is hours:minutes:seconds. For example, 00:20:00 means that this trigger executes after 20 minutes of missing data.

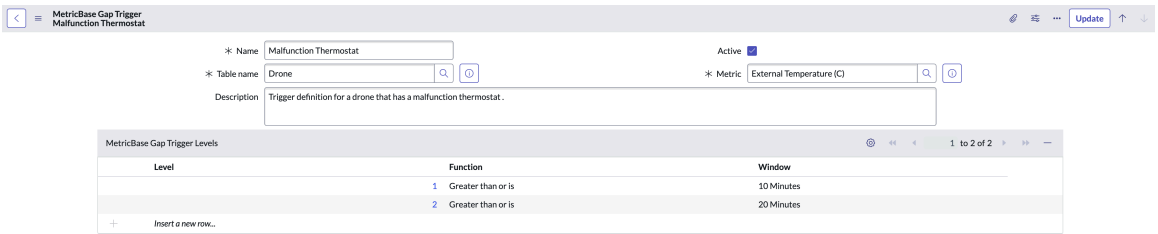
7. **Optional:** Add rows to the table to create multi-layered triggering behavior.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Typically, each additional row (level) indicates a more severe condition. The Workflow Studio flow associated with the level should warn with increasing severity.

8. Select **Update**.
9. **Optional:** Add a triggering condition that determines whether a trigger executes a Workflow Studio flow.
   See Execute triggers conditionally.

Example: Gap Trigger form



What to do next

Associate this trigger with a Workflow Studio flow. For more information, see Assign a trigger to a flow.

Create a MetricBase model trigger

Model triggers execute when the time-series data deviates from expected values.

Before you begin

Role required: admin

About this task

There are four model types supported: autoregressive integrated moving average (ARIMA), probabilistic exponentially weighted moving average (PEWMA), Holt-Winters, and seasonal trend decomposition using Loess (STL).#MetricBase #uses the model to create a definition of expected, normal values.

Procedure

1. Navigate to **All** > **MetricBase** > **MetricBase Triggers** > **Trigger Definitions**.
2. Select **New**.
3. On the **MetricBase** Trigger Creation form, select the **Model Trigger** option.
4. On the form, fill in the fields.

   The trigger levels are not initially visible on this form. You configure the levels later.

Field	Description
Name	Name the model trigger.
Model	Trained model this trigger uses. See Create and train a predictive model.
Metric	Table metric that you want to monitor. This value is set automatically based on the model, which means you cannot set it yourself.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Table name	Table in the#MetricBase #database that contains the metric that you want to monitor. This value is set automatically based on the model, which means you cannot set it yourself.
Active	Option to activate the trigger.
Description	Description of the trigger.
Spike Direction	Specify whether you want to trigger only on anomalies that occur above predicted values (upward), below predicted values (downward), or both (either).

5. Select **Save**.
   A new record is created.
6. In the MetricBase Model Trigger Levels area on the record you just created, double-click each cell to add values that specify trigger parameters.

Column	Description
Level	Numbers that indicate increasing severity. For example, you might define level 1 to be 2 standard deviations from the mean. Level 2 might be 4 standard deviations. Each level should trigger a different Workflow Studio flow. **Level** is often used in Condition Scripts. See Execute triggers conditionally.
Function	Always **Greater than or is**, meaning that in order to trigger, the time-series metric must be greater than or equal to the number of standard deviations from the mean specified in **Number of Standard Deviations**.
Number of Standard Deviation	Float value specifying the number of standard deviations the time-series metric must be away from the mean to trigger an alert at this level.

7. **Optional:** Add rows to the table to create multi-layered triggering behavior.
   Typically, each additional row (level) indicates a more severe condition. The Workflow Studio flow associated with the level should warn with increasing severity.
8. Select **Update**.
9. **Optional:** Add a triggering condition that determines whether a trigger executes a Workflow Studio flow.
   See Execute triggers conditionally.
10. Test your model and trigger on real data before deploying to production.

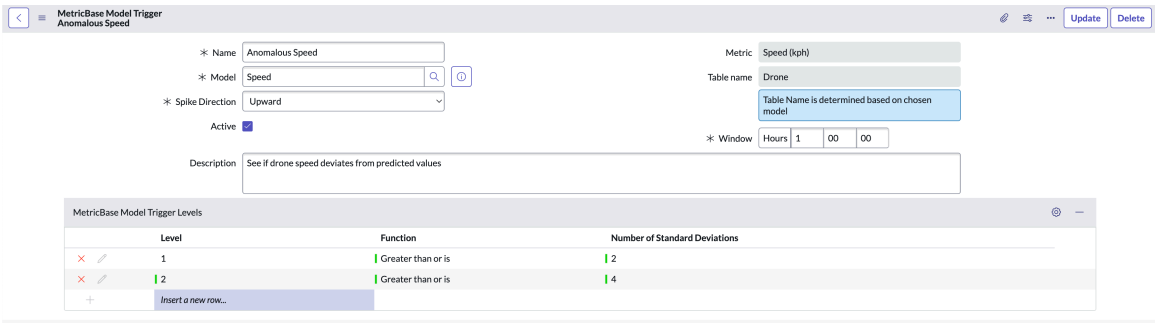
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: Model Trigger form



What to do next

Associate this trigger with a Workflow Studio flow. For more information, see Assign a trigger to a flow.

Execute triggers conditionally

MetricBase triggers execute based on a single metric. Condition Scripts impose additional requirements that determine whether a trigger kicks off a flow.

Before you begin

Role required: admin

About this task

Condition Scripts execute when conditions for a trigger are met but before the trigger executes a Workflow Studio flow. In that way, Condition Scripts can prevent triggers from executing flows even when trigger conditions are met. For example, data often fluctuates over time. Small fluctuations can cause unwanted, duplicate triggering events. A Condition Script can prevent that erroneous duplication.

Condition scripts are sometimes also referred to as moderator scripts.

Condition Scripts always return `true` (trigger) or `false` (do not trigger). To learn how to write these scripts, see Scripting in ServiceNow Fundamentals. To experiment with scripts, see Get familiar with MetricBase APIs.

Procedure

1. Navigate to **All** > **MetricBase** > **MetricBase Triggers** > **Trigger Condition Script**.
2. Select **New**.
3. On the form, fill in the fields.

Field	Description
Name	Name for the Condition Script.
Application	Scope of the Condition Script. The value, **Global**, means that the action applies to all applications.
Description	Explanation of what the Condition Script does. When does it return True or False?
Script	Field to enter the JavaScript. Make it returns `true` to execute a flow.

4. Write the Condition Script.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When writing a script, think about the conditional statements (what cases it should execute for and what cases it shouldn't). If all evaluate *true*, the script returns *true* and the flow executes, otherwise it does not. The following example script triggers a flow when a drone is traveling too fast at a low altitude (defined by level 1). The example shows a typical approach to writing a condition script.

a. Get the trigger definition, passed in as a filter function parameter.

b. Get the record (*current*) that is causing the triggering event, passed in as a filter function parameter.

c. Get the time from the record that the trigger conditions were satisfied, passed in as a filter function parameter.

d. Get the trigger level, passed in as a filter function parameter.

e. Use these parameters to return *true* if the level 1 trigger conditions are met and *travel_state* equals traveling or speeding.

```
function filter(/*GlideRecord*/
 triggerDefinition, /*GlideRecord*/
 current, /*GlideDateTime*/ start, /*int*/ level) {
 // retrieve current travel state of drone
 var travel_state = String(current.travel_state);

 // the drone is traveling at a significant speed, and the
 altitude just went below the threshold
 if (((travel_state === 'traveling') || (travel_state ===
 'speeding')) && (level === 1)){
  return true; //process this trigger
 }

 return false; // don't process this trigger
}
```

Note:
Condition Scripts must execute quickly.

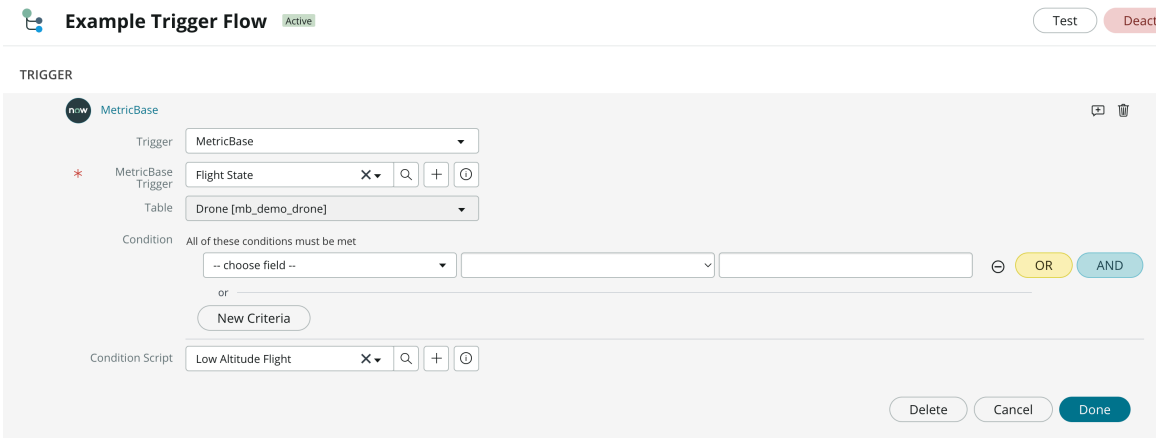
5. Select **Submit**.

What to do next

Use Workflow Studio to associate a flow with a trigger. When configuring a flow, you can select a Condition Script you created.

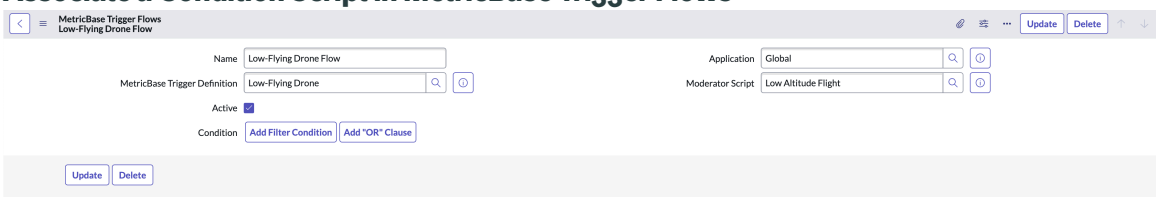
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add a Condition Script to a trigger definition in Workflow Studio



You can also associate a condition script with a trigger flow in the MetricBase Trigger Flows [sys_flow_metric_trigger] table. If you associate a condition script with a trigger flow here, it won't appear in Workflow Studio, but it will still execute with the trigger.

Associate a Condition Script in MetricBase Trigger Flows



Assign a trigger to a flow

Now that you created a trigger, use Workflow Studio to specify the flow a trigger executes. The flows can provide alerts for unexpected behavior.

Before you begin

Role required: admin

About this task

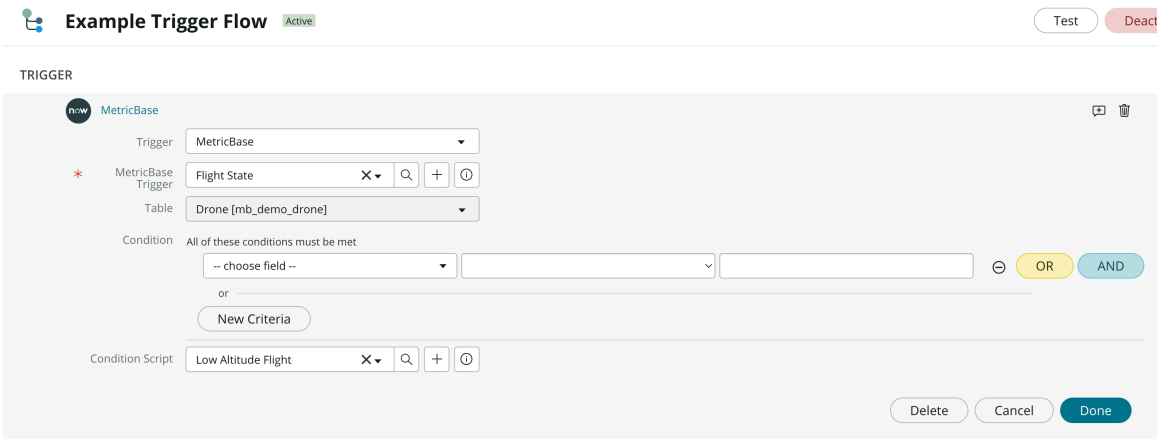
Triggers, by themselves, execute nothing. After defining a trigger in MetricBase, you use Workflow Studio to associate the trigger with a flow.

Procedure

1. Navigate to **All** > **MetricBase** > **Trigger Flows.**.
2. Select **New Flow**.
3. Fill in the fields.
4. Select **Submit**.
5. Select **Add a trigger** to specify the trigger that kicks off this flow.
6. In the dialog box that appears, scroll, and select MetricBase for the trigger type.
7. Under **TRIGGER**, fill in the form to define the trigger to associate with this flow.
   a. In the **MetricBase Trigger** list, select a trigger by either selecting the magnifying glass to select an existing trigger or selecting the plus sign (+) to define a new trigger.
   b. **Optional:** Add requirements for the flow to execute by adding filter conditions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. **Optional:** Beside **Condition Script**, select the magnifying glass to select a Condition Script or click the plus (+) to create a script.
Condition scripts add additional requirements for a trigger to execute a flow.

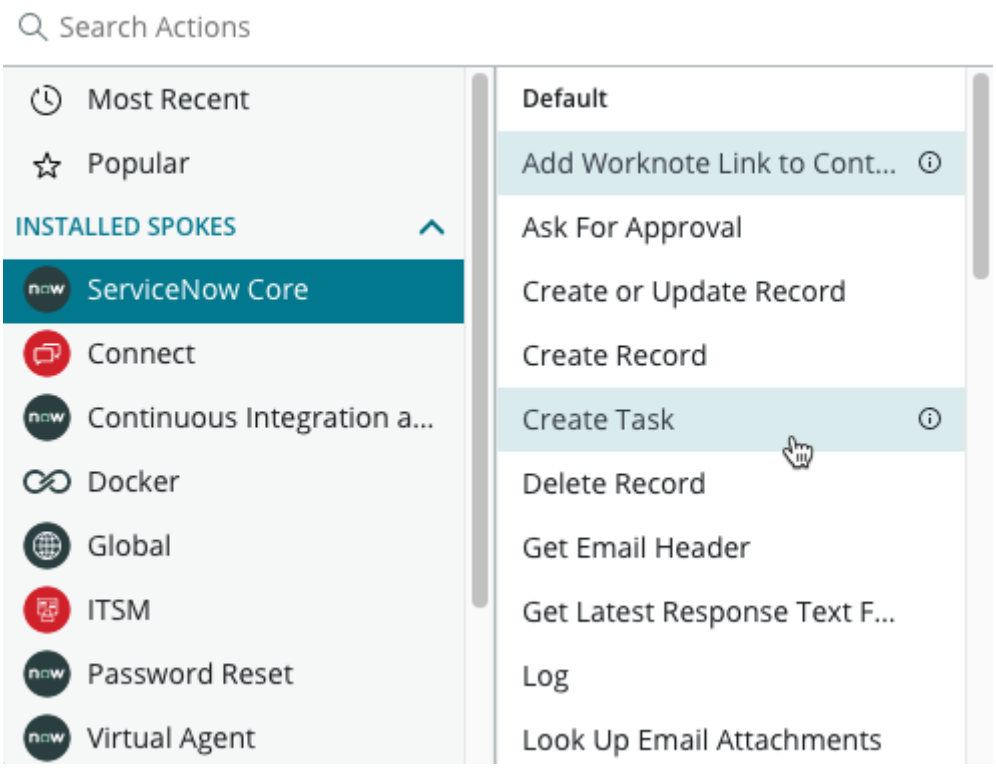


8. Under **ACTIONS**, select **Click to add an Action, Flow Logic, or Subflow**

   a. When selecting an action, select an action category in the first column of the dialog box, and a flow action in the second column.

   b. Create combinations of different actions, flow logics, and subflows to get the desired behavior.

   c. Select **Done** to complete each part of the flow action.



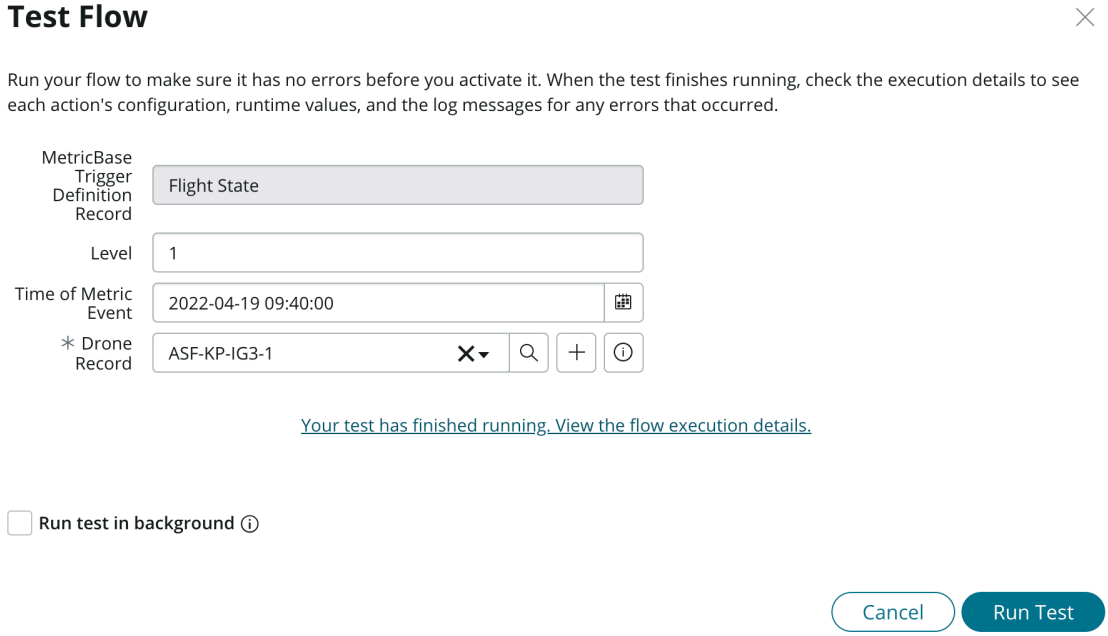
9. Select **Save**.

10. Test the flow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the flow tab in Workflow Studio, select **Test**.

b. Select the trigger **Level** to test, provide the **time of metric event**, and what **record** is triggering.
Different triggers may execute different flows.



Note:
When you test a flow, the system does not execute the trigger, and therefore does not create a record. By selecting a record in the Test flow dialog box, the system acts as if that record was just created. For more information, see Test a flow.

c. Select **Submit**.
The test completes. Select the message to view the flow execution details. Edit the settings if necessary, save again, and then retest.

11. Select **Activate** to activate the trigger.
The flow does not execute unless you activate it.

View trigger logs

Trigger logs show different levels of trigger malfunctions.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **MetricBase** > **MetricBase Triggers** > **Trigger logs**.
2. Click one of the trigger logs.
3. Under **Related Links**, click **Show Log Entries**.
4. **Optional:** Change the default values in the **Enter parameters for log file entries to browse** form to select the log entries to view and click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Managing MetricBase

View the overall health and performance of MetricBase, and debug its triggers and scripts.

Overview of managing MetricBase

View MetricBase database status

View the status and health of the connection to your MetricBase database.

Before you begin
Role required: clotho_admin

Procedure

1. Navigate to **All** > **MetricBase** > **MetricBase Health Dashboard**.
2. In the list, select **Health**.
3. View the status of the database connection.
   If the database is offline, contact Customer Service and Support.
4. Monitor the lag time between your instance and the database by viewing the **MetricBase Lag Statistics** value.
   If the lag time is reported in multiple seconds, contact Customer Service and Support.
5. **Optional:** Select **Refresh** to view the latest status.

View MetricBase data usage and efficiency

Monitor the usage and efficiency of your MetricBase time series data.

Before you begin
Role required: clotho_admin

Procedure

1. Navigate to **All** > **MetricBase** > **MetricBase Health Dashboard**.
2. In the list, select **Series**.
   The MetricBase Series Information page displays the Total Series Count, which is the total number of series registered in MetricBase.
3. Determine whether any series aren't being used by calculating the stale series ratio.
   This ratio is the percentage of series that haven't received a value within a specified number of days.
   a. Enter the number of days (greater than or equal to 1) in the **Staleness Time Period** field.
   b. Select the Refresh icon ( ).
   The closer the ratio is to 0%, the fewer unused series there are within the given time period. You determine your own threshold for an acceptable stale series ratio. To lower the ratio, adjust the metric's sampling schedule or remove unused metrics or series. For help with removing a stale series, contact Customer Service and Support.
4. Determine how efficiently your time series data is used by viewing the **Data Utilization Efficiency** value.
   The value is the percentage of data points per metric that have a non-null value. The closer this value is to 100%, the fewer null data points there are. To increase the efficiency, review each metric to ensure that data is being posted at a similar rate to the first schedule of its retention policy. See MetricBase retention policies for more information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Determine how often values are published to MetricBase by viewing the **Average Unutilized Data Gap** value.
   The gap value is the average number of entries between two non-null data points. To decrease the gap value, change the metric's schedule to publish data more often or update the metric's sampling period in its retention policy. See MetricBase retention policies.

View MetricBase statistics and metrics

You can view the status of the MetricBase database.

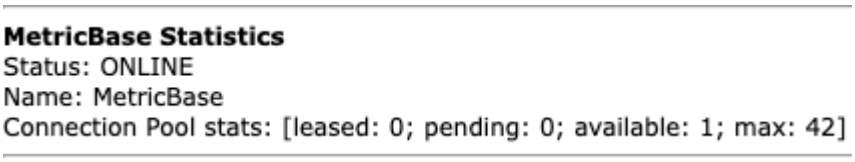
Before you begin
Role required: admin

Procedure

1. View the status of the MetricBase instance.

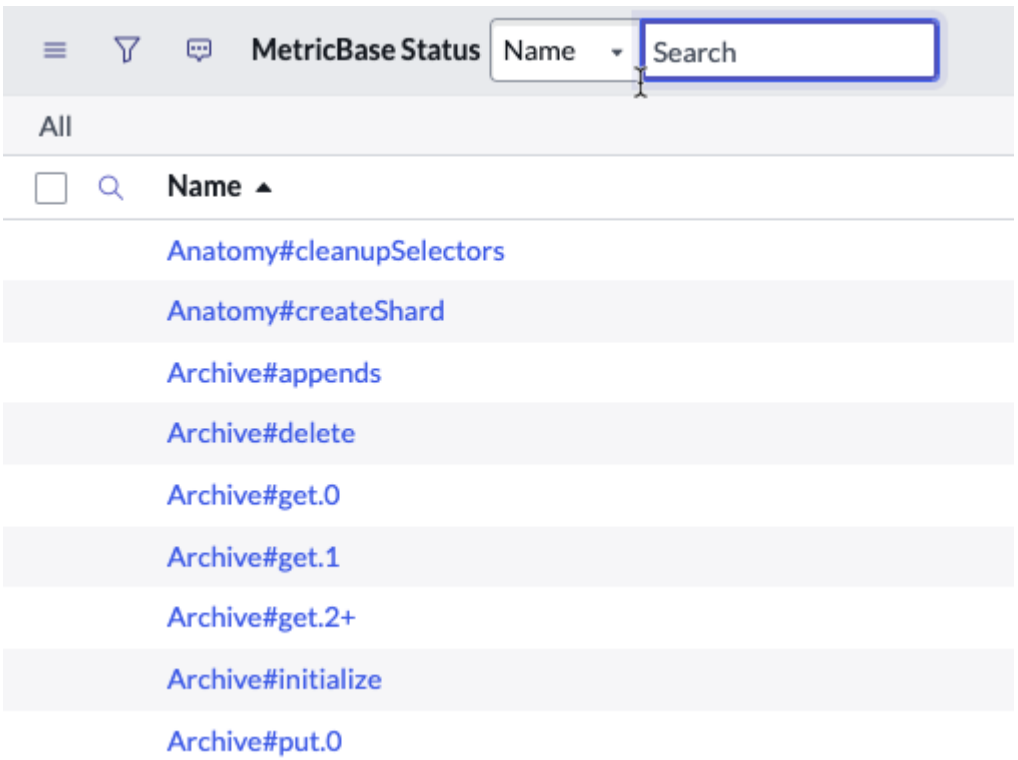
   a. Navigate to **System Diagnostics** > **Stats** > **Stats**.

   b. Scroll down to find **MetricBase Statistics**



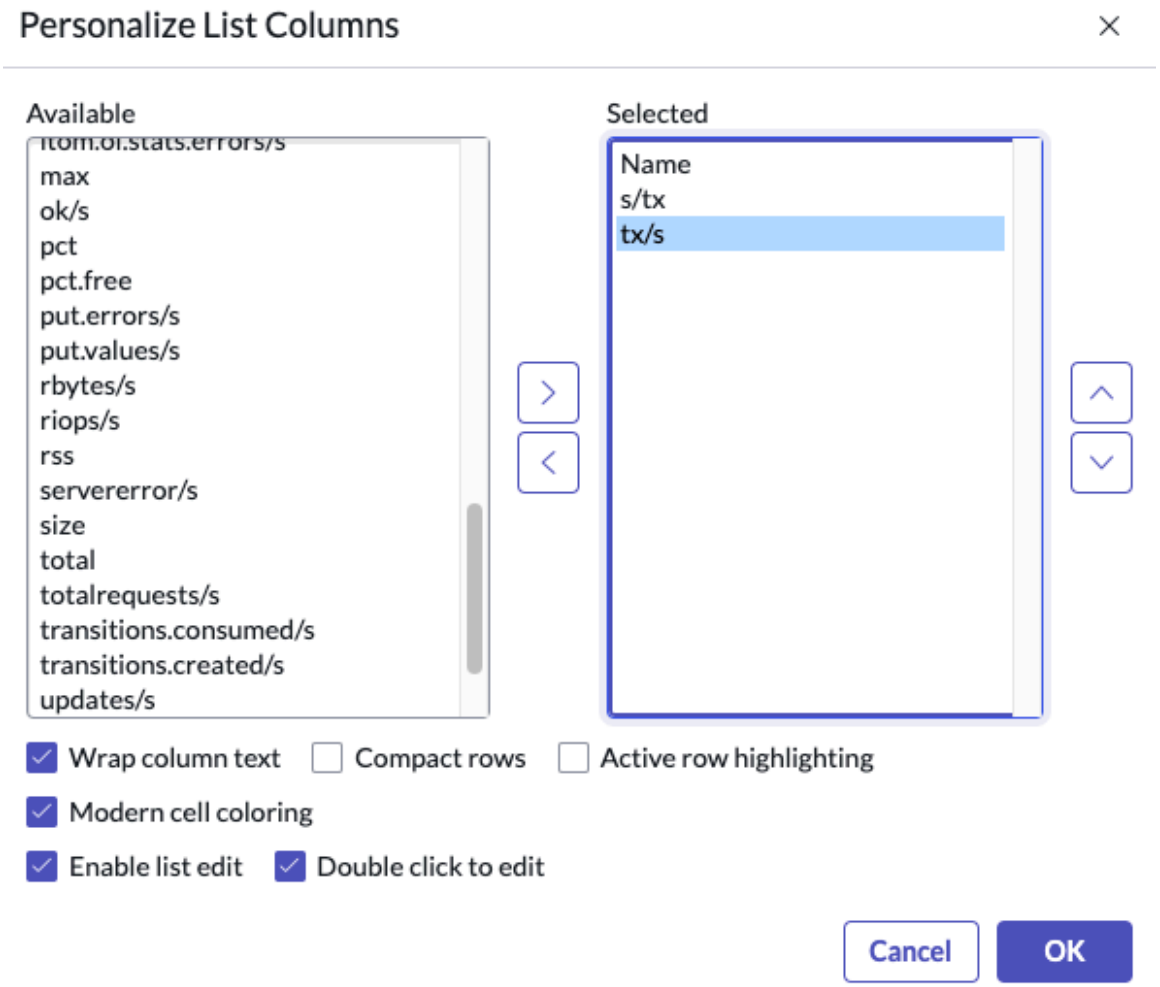
2. View the metrics monitored by MetricBase and statistics about them.

   a. Click **MetricBase** > **MetricBase Status**
   The MetricBase Status page displays all of the metrics tracked in MB.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. Click the gear icon.
The Personalize List Columns dialog box displays.



c. Select and move metrics from the **Available** column to the **Selected** column to display the metric and click **OK**.
The metrics display on the MetricBase Status page.

Name ▲	s/tx	tx/s
Anatomy#cleanupSelectors		0
Anatomy#createShard		0
Archive#appends		
Archive#delete		0
Archive#get.0	6.0E-5	0
Archive#get.1		0
Archive#get.2+		0
Archive#initialize		0

Debug MetricBase

You can display the results of debugging scripts in MetricBase.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Diagnostics** > **Session Debug** > **Debug** *MetricBase*.
   When the page you are on submits queries to MetricBase, you see the transforms and how long they took on the bottom of the page. Submitting a lot of MetricBase queries may slow down the page load time significantly.
2. To view a history of the debug script's execution, click **available here**.
3. Click **Update**.
   Session debug tracking for MetricBase activities starts and the MetricBase Status page displays.

MetricBase reference

These reference topics provide additional information about MetricBase developer resources and domain separation.

Developer resources

Developers can use JavaScript or REST APIs to insert and retrieve time-series data from the MetricBase database and to run transforms on the data. The transformations enable you to visualize time-series data in a variety of ways.

REST APIs

For information about the MetricBase REST APIs that return time-series data from the MetricBase database, see MetricBase Time Series API.

JavaScript APIs

For information about the MetricBase JavaScript APIs that return time-series data from the MetricBase database, see:

- Client — Execute transforms on the MetricBase database and receive the results.
- Data — Return the object that contains the result of a transform.
- DataBuilder — Create a series of data points for a metric.
- Transformer — Manipulate time-series data to prepare the data for evaluation and analysis.
- TransformPart — Specify details of the transform to be done.
- TransformResult — Return the object that contains the result of the transformation.

Transformations

For more information about MetricBase time-series data transformations, see MetricBase transforms.

Data Explorer

Experiment and get familiar with the JavaScript APIs by using the MetricBase Data Explorer that comes with the MetricBase Demo.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Domain separation and MetricBase

Domain separation is supported in the MetricBase application. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

MID Server

The Management, Instrumentation, and Discovery (MID) Server is a Java application that runs as a Windows service or UNIX daemon on a server in your local network. The ServiceNow® MID Server enables communication and the movement of data between a ServiceNow instance and external applications, data sources, and services.

MID Server overview

Explore Learn about MID Server deployment and uses.	Configure Prepare your network, then install and configure MID Servers.
Secure Secure and encrypt your MID Server's data.	Reference Get information about MID Server upgrades, issues, system requirements, and properties.

Exploring MID Server

MID Server acts as the mediator between the network and the instance. MID Servers are used by other applications to connect to the instance.

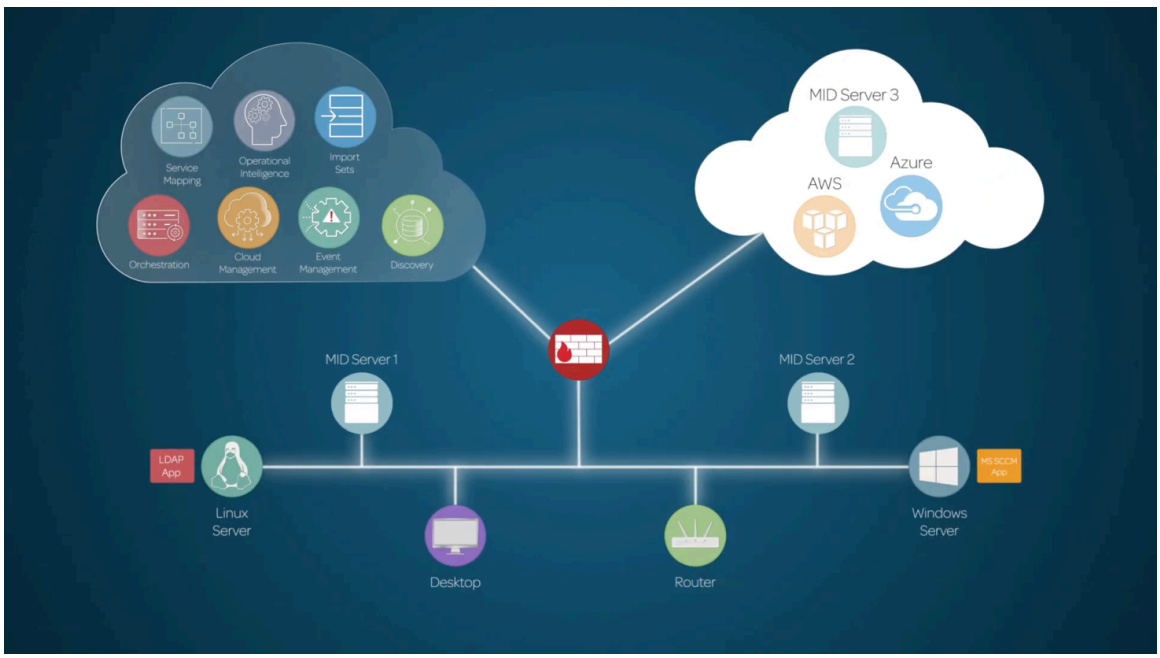
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MID Server overview

MID Servers are installed on hosts in a network by administrators, and the MID Servers are used by other applications to communicate with the instance or function within the network. For example, a MID Server configured with Discovery scans items in the network from that MID Server host. Once it collects the Discovery data, the MID Server securely transfers the data through the network firewall to the instance.

To set up a MID Server, the network must be prepared to access the instance and download site. There are several installation procedures depending on the host operating system and scale of deployment. Once installed, MID Servers can be configured with many capabilities and features to support applications.

After configuring your MID Server, you can add security by encrypting MID Server parameter values in the `config.xml` file. Encryption protects data that the MID Server returns to the ECC Queue. Other available security options include the authorization of SOAP requests, restricting access to the MID Server configuration file, and establishing secure socket layer (SSL) connections.



Upgrading the MID Server

The MID Server checks with the instance periodically to see if an upgrade is necessary. If the MID Server detects that a new version is available for upgrade, it downloads the installer from `install.service-now.com` and runs the package automatically. You can also elect to upgrade the MID Server manually. See MID Server upgrades for details.

Resolving MID Server issues

You can search the HI Knowledge Base for troubleshooting articles or monitor the MID Server status and track active issues from within the instance. Many articles on resolved MID Server issues have been collected on Servicenow MID Server Landing page [KB0960404]. For more information about common resolution procedures, see Resolving MID Server issues.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ServiceNow applications that use the MID Server

- Discovery
- Orchestration
- Service Mapping
- Event Management
- Operational Intelligence
- Cloud Management
- IntegrationHub
- Cloud Cost Management
- Agent Client Collector

External applications that use the MID Server

- Import Sets
- Microsoft SMS/SCCM
- LANDesk Maintenance Suite
- Microsoft System Center Operations Manager (SCOM)
- Microsoft MIIS

Begin MID Server installation

Continue to Configuring MID Server to find procedures on preparing the network, installing MID Servers, and configuring them.

Configuring MID Server

Before MID Server installation can begin, the network must be prepared to access the instance and download site. There are several installation procedures depending on the host operating system and scale of deployment. Once installed, MID Servers can be configured with many capabilities and features.

Prepare network connections for MID Servers

Before you install the MID Server, perform the necessary prerequisites that it needs to connect to elements inside and outside your network. This includes network privileges and security considerations.

Security considerations

Sometimes computers or devices have additional security measures configured, and these measures may interfere with the MID Server's ability to run commands or queries on those systems.

For example, a Linux server might be configured to allow only certain IP address to connect to it via SSH. Similarly, a network router might be configured to allow only certain IP address to query SNMP on it. To allow access in such cases, use one of the following methods:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Update the configuration of those computers or devices to allow the desired MID Server to run commands or query them. For example, a network router may be configured to only allow the network management systems to query SNMP on it. In that case, add the MID Server as though it were another network management system.
- Install a MID Server on a computer that already has access to the computers or network devices with such restrictions. For example, to use Discovery within a DMZ (where communication from outside the DMZ will be severely restricted), install a MID Server on a computer that is already in the DMZ.

Credential spray

The MID Server uses its host's Windows Server Message Block (SMB) client and configuration to connect to other Windows machines. If Windows is configured to use legacy protocols, the connection is vulnerable to man-in-the-middle attacks that can result in weak password disclosure and remote code execution.

Use the following host configuration to limit the impact of an attacker with a man-in-the-middle vantage point:

- Ensure that SMB Signing is configured to be **Required** on the client MID Server to limit potential attacks on the integrity.
- Ensure that SMB Signing is required by all SMB servers within the environment.
- Use strong passwords to limit offline dictionary attacks if the host machine must support legacy authentication protocols such as NetNTLM.
- Use a unique account for each relevant host to limit the impact of compromised credentials on the end systems.

External connectivity requirements

These requirements are specifically for the use of MID Servers with the ServiceNow® Discovery and Orchestration products.

The MID Server communicates securely on port 443 to the instance and requires no inbound connections. In some cases, it might be necessary to allow this communication through the firewall if the MID Server fails to register on the instance. To determine if the application or a network security restriction is to blame for connection failure, attempt to telnet to the instance on port 443 from the server that is hosting the MID Server application. If this connection fails, then the problem could be a web proxy (since 443 is an https connection) or a Firewall rule preventing external TCP connections from that host. Contact network security personnel for the proxy information to add to the config.xml file, or request that the firewall be configured to allow access using one of the following syntaxes:

- `<source IP> to <any>`
- `<source IP> to <ServiceNow> any established`
- `<source IP> to <instance_name.service-now.com> 443`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:
The MID Server host computer must have access to the ServiceNow download site at `install.service-now.com` to upgrade automatically. If you have a self-hosted ServiceNow environment that blocks access to the download site, you must import the MID Server installer package into your MID Server hosts manually. For instructions, see KB0760123 in the Self-Hosted knowledge base.

Internal connectivity requirements

These methods are used for discovering various devices on a network and are specifically for the use of MID Servers with the Discovery and Orchestration products.

- **SSH**: For UNIX-like machines, Discovery and Orchestration use SSH protocol, version 2 to access target machines. SSH is a network protocol that allows data to be exchanged using a secure channel between two networked devices. SSH communicates on port 22 within an encrypted datastream and requires a login to access the targets using two available methods of authentication: a user name and password combination and a user name and shared private key. Specify SSH authentication information and type in the **Credentials** module. If multiple credentials are entered, the platform tries one after the other until a successful connection is established or all are ultimately denied. To provide for application relationships a limited number of SUDO commands must be available to be run. Additional details to these requirements can be found in UNIX/Linux commands requiring root privileges for Discovery and Orchestration.
- **WMI**: For Windows machines, Discovery uses the Windows Management Instrumentation (WMI) interface to query devices. Due to security restrictions for WMI, the MID Server application executing the WMI queries must run as a domain user with local (target) administrator privileges. When Discovery detects activity on port 135, it launches a WMI query. The response from the Windows device is sent over a Distributed Component Object Model (DCOM) port configured for WMI on Windows machines. This can be any port. Ensure that the MID Server application host machine has access to the targets on all ports due to the unique nature of the WMI requirements.
- **Windows PowerShell**: PowerShell is built on the Windows .NET Framework and is designed to control and automate the administration of Windows machines and applications. Orchestration uses PowerShell to run Workflow activities on Windows machines. PowerShell must be installed on any MID Server that executes these activities. MID Servers using PowerShell must be installed on a supported Windows operating system. ServiceNow supports PowerShell 3.0 to 5.1. Orchestration activities for PowerShell require a credentials **Type** of Windows.
- **SNMP - Network**: For network devices, Discovery uses an SNMP scan to get device specific MIBs and OIDs. SNMP is a common protocol used on most routers, switches, printers, load balancers and various other network enabled devices. Use a community string (password) for authentication when scanning a device via SNMP. Many devices have a default community string of **public** which Discovery uses by default when querying a target. Define additional community strings in the SNMP credentials form which are tried in succession, along with **public**, until a successful query returns. In addition to the credentials, the platform also requires the ability to make SNMP requests on port 161 from the MID Server to the target. If Access Control Lists (ACLs) are in place to control the IP addresses that can make these queries, ensure that the IP address of the MID Server is in the ACL. Discovery supports SNMP versions 1, 2c, and 3.
- **WBEM:** Web-Based Enterprise Management (WBEM) defines a particular implementation of the Common Information Model (CIM), including protocols for discovering and accessing each CIM implementation. WBEM requires either of two ports, 5989 or 5988 and uses the HTTP transport protocol. WBEM supports SSL encryption and uses CIM user name/password credentials. Discovery launches a WBEM port probe to detect activity on the target ports and to append gathered data to a classification probe that explores CIM Servers.

© 2026 ServiceNow, Inc. All rights reserved.

Configure MID Server network connectivity

Prepare the network for MID Servers to connect with the instance and access the download site. The network must be prepared before installing or configuring the MID Server. If computers or devices have additional security measures, that security may interfere with MID Servers on those systems.

Before you begin

Role required: admin

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Ensure that the MID Server can connect to elements inside and outside your network
3. Configure MID Server security
4. Configure your MID Server
5. Download and install the MID Server on a Linux or Windows host
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

Make sure that the host machine meets the requirements specified in the MID Server system requirements.

About this task

The MID Server host computer must have access to the ServiceNow download site at `install.service-now.com` to upgrade automatically. If you have a self-hosted ServiceNow environment that blocks access to the download site, you must import the MID Server installer package into your MID Server hosts manually. For instructions, see KB0760123 in the Self-Hosted knowledge base.

Firewalls and proxy configurations may block calls to the OCSP Entrust and DigiCert servers, which prevents the MID Server from working. You may need to change your firewall permissions so that the OCSP traffic goes through. For more information and resolutions, see the HI Knowledge Base article [KB1216223].

The host machine must have these network privileges:

- Firewall access: Configure any firewalls between the MID Server and the target devices to allow a connection. If your network uses a DMZ, and if your network security protocols limit port access from within the network to the DMZ, you might have to deploy a MID Server to a machine within the DMZ to probe the devices there.
- Network access: Configure target devices to allow the MID Server probe to connect. If network security prevents you from configuring new machines that can connect to the targets, install the MID Server on an existing machine with connection privileges.
- Network account: Install the MID Server with the proper account, either local or domain administrator.

Additionally, for the MID Server to access your ServiceNow instance, satisfy these prerequisites:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Network access to the ServiceNow instance: Configure the network that the MID Server uses to allow traffic over TCP port 443.
- A MID user: Create a ServiceNow user record for the MID Server to use. This user record must have the mid_server and import_admin roles.

Note:
Verify that the baseline public page **InstanceInfo** is active for the MID Server to connect to the instance.

Procedure

1. Configure the network to allow MID Server network connectivity to the ServiceNow instance over TCP port 443.
2. Configure basic authentication for SOAP communications with the ServiceNow instance.
3. Navigate to **System Web Services** > **Scripted Web Services** > **Scripted SOAP Services**.
4. Confirm that the following web services are active:
   - GetMIDInfo
   - InstanceInfo
   - MIDAssignedPackages
   - MIDFieldForFileProvider
   - MIDFileSyncSnapshot
   - MIDServerCheck
   - MIDServerFileProvider
5. Type **sys_public.list** in the navigation search field and press **Enter**.
   The Public Pages record list appears.
6. Verify that the **InstanceInfo** public page is active, to allow the MID Server to validate its version.
7. Ensure that the MID Server host computer can access the download site at `install.service-now.com`.

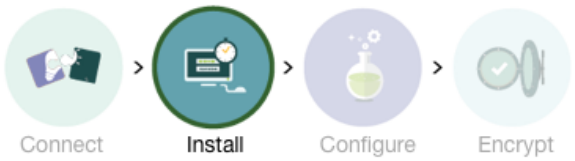
What to do next

After the network is prepared, proceed to Installing the MID Server.

Installing the MID Server

Download and install the MID Server on the host machine, test the connection, and then validate the MID Server. Use the manual procedures or the guided setup. Set up multiple MID Servers for load balancing and domain separation. These procedures prepare it for use with any application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

Prerequisites: Ensure the MID Server system requirements and MID Server connection prerequisites are met before you install the MID Server manually or use the guided setup utility.

MID Server manual installation

The manual process requires these setup tasks, performed in the order shown here:

1. Create the MID Server user account and grant the appropriate role to this user.
2. Download the installer file for the host machine.
3. Install the MID Server on a Linux or Windows host.
4. Validate the MID Server to ensure that it is trusted to access credentials used by the instance for automations.
5. Test connectivity between the MID Server and the instance for automatic upgrades.
6. Optionally, deploy multiple MID Servers in your network for load balancing or when domain separation is enabled.

MID Server guided setup

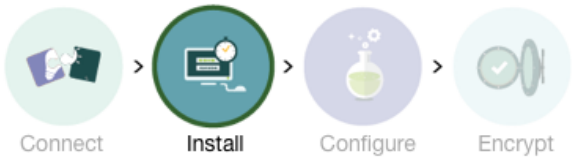
Alternatively, the MID Server Guided Setup streamlines the process and allows you to set up a basic MID Server quickly.

Create the MID Server user and grant the role

To communicate with the instance, MID Servers need a user ID and the appropriate role. Create the user ID for a MID Server and grant the ID the **mid_server** role. To prevent MID Server validation failure, the system runs business rules to monitor the settings selected for MID Server users.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

About this task

The MID Server connects to an instance by using the SOAP web service. To allow authentication with the instance, create a separate user account for each MID Server or share the same account across multiple MID Servers. Grant each MID Server user the mid_server role, which is required for the MID Server user on any instance on which basic authentication is enabled. The mid_server role allows the MID Server to access protected tables when strict SOAP security is in place. The system adds the necessary SOAP roles automatically with this role.

Note:
The strict SOAP security feature, enabled by default for any instance that uses basic authentication, protects all tables with Access Control Lists (ACL).

If multiple MID Servers are using the same logged in user, an issue record is created when more than one is **Up** at a time. It is recommended that MID Servers use a unique logged in user. See (KB1552863) MID Server Unique Logged In User for more information and remediation steps.

Important:
Improve security by using MID Server mutual authentication instead of basic authentication. See Enable MID Server mutual authentication for more information.

Procedure

1. From the instance, navigate to **User Administration** > **Users**.
2. Click **New**.
3. Complete the fields in the form.

Field	Description
User ID	User name for the MID Server user. This name is specified in the *mid.instance.username* parameter of the configuration file that the MID Server installer creates. For details, see MID Server parameters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: Avoid using the same MID Server logged in user across multiple MID Servers.
First name	The user's first name.
Last name	The user's last name.
Password	Password for the MID Server user. This password is specified in the *mid.instance.password* parameter of the configuration file that the MID Server installer creates.
Web service access only	Check this box if you are using basic authentication. The web_service_access_only field is used to restrict user access to the ServiceNow instance, ensuring that a user can only interact with the platform through web services (REST or SOAP APIs) rather than the user interface. When this field is set to true for a user with the mid_server role, it prevents that user from logging into the ServiceNow UI, which is crucial for security and proper MID server operations.

4. Right-click the header and select **Save**.
5. Under the **Roles** related list, click **Edit**.
6. Select the **mid_server** role for this user.
   Each MID Server account must have this role to access protected tables.
7. Click **Save**.
8. Confirm that the MID Server account was created successfully and the account has connectivity to the instance.

   a. On the host machine where you intend to install the MID Server, open a browser and navigate to the instance.

   b. Use your new MID Server user credentials to log in.
   If the login is successful, then any MID Servers you install on that host will be able to connect to the instance.

MID Server role validation

Real-time system validation of MID Server role assignments prevents incompatible settings.

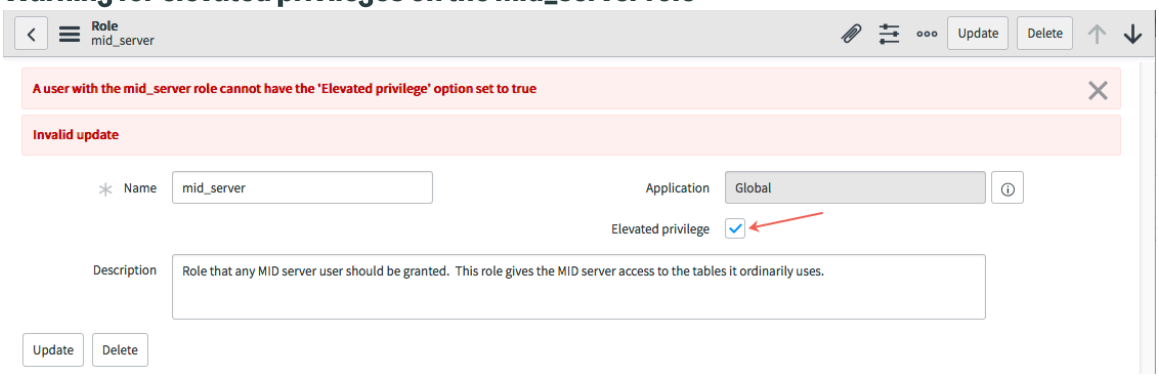
To prevent MID Server validation failure and ensure that your MID Server is configured correctly, the system runs several business rules that monitor the roles and settings you select for your MID Server user. The instance displays a warning and blocks the change when you attempt to save an incompatible configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Elevated privileges not permitted

The mid_server role cannot be configured for elevated privileges. The **Invalid MID Server settings** business rule runs on the Role [sys_user_role] table and prevents the **elevated_privileges** field from being set to true for the mid_server role.

Warning for elevated privileges on the mid_server role



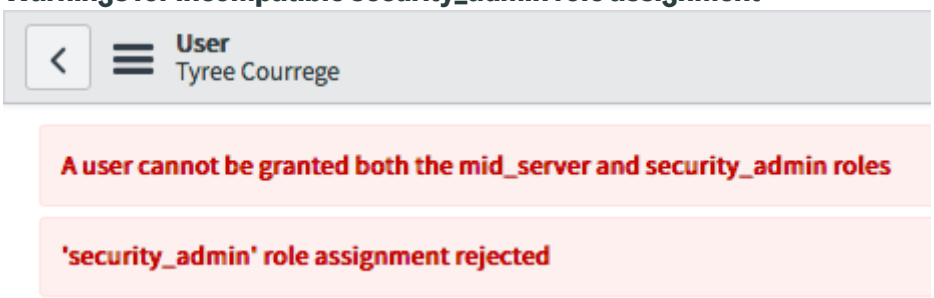
Relationship table protection

The User Role [sys_user_has_role] table creates the relationship between the User [sys_user] and the Role [sys_user_role] tables.

- **Incompatible role**

  The mid_server and security_admin roles are incompatible and cannot be assigned to the same user. The system determines the user's current role and runs the **Security Admin incompatible with MID** business rule on the User Role [sys_user_has_role] table. This rule prevents an administrator from adding the security_admin role for a user who currently has the mid_server role.

  ### Warnings for incompatible security_admin role assignment

- **Incompatible user role and user record settings**

  The **Incompatible MID Server user role** business rule runs on the User Role [sys_user_has_role] table to protect its data from incompatible configurations. Validation for this related table ensures that an administrator cannot assign the mid_server role to a user who already holds the security_admin role.

What to do next

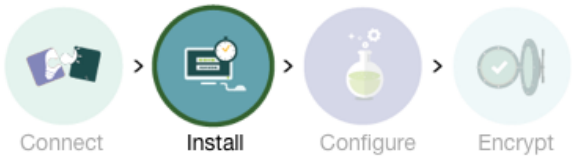
Download the MID Server files for your operating system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Download the MID Server files

Download the MID Server installer package through the instance and make it available for installation on the host. Allow the local network to access the authorized IP addresses to ensure that you can download the installation package and receive automatic upgrades.

Before you begin
Role required: admin



1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

About this task
The IP address of the MID Server download site (`install.service-now.com`) can change without notice. To ensure that you can download the MID Server installation package and receive automatic MID Server upgrades, allow local network access to these IP addresses:

- 149.96.5.98
- 149.96.6.98

A maint user can change the MID Server download site URL with the MID Server system property **mid.install_server.base_uri**. The MID Server downloads the update files from the new URL instead. Users with closed environments can direct MID Servers to update through hosts in their environment. See MID Server properties and [KB1546609] Configure Custom MID server Upgrade URL for more information.

Note:
Download the MID Server first and then enable Discovery, Orchestration, or any integration that requires the use of the MID Server.

Procedure

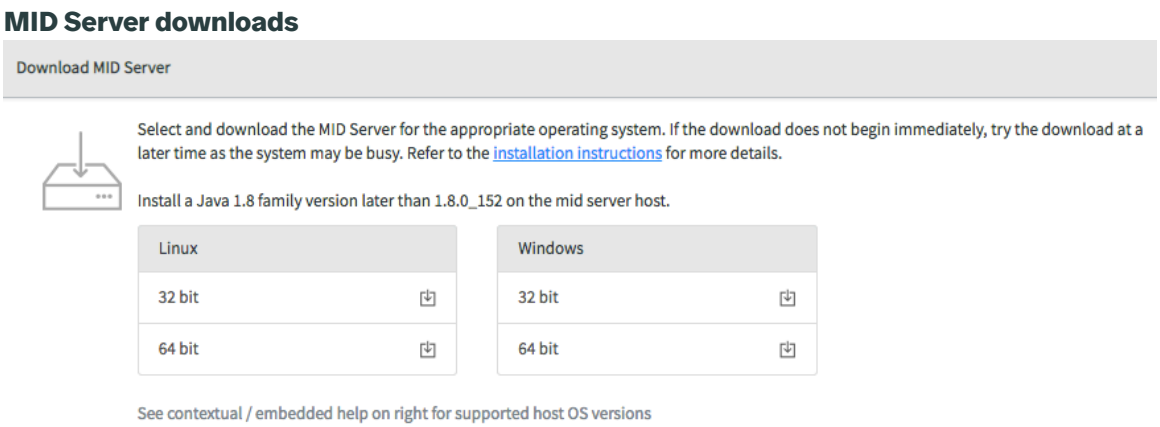
1. On the ServiceNow instance, navigate to **Mid Server** > **Downloads**.
2. Select and download the MID Server for the appropriate operating system.
   For the best performance, install the 64-bit MID Server for your operating system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
ServiceNow no longer supports new installations of 32-bit MID Servers or upgrades to version Rome. New MID Server installation are blocked through RPM and MSI installer on the following operating systems:

- CentOS 7
- Windows server 2008
- Windows server 2008 R2
- Windows 8
- Windows 10

MID Servers can be manually installed to any operating system with the ZIP file, however Windows 10 is unsupported. Unsupported MID Servers auto-upgrading to Rome create an issue record in MID Server Issues (ecc_agent_issue). For more information, see Supported platform changes for MID Server [KB0863694].



3. Save the download file to a temporary file on the local drive.
4. Move the file into the designated MID Server folder you create for your operating system and run the installer from that location.

What to do next
You can manually verify the signature of an installation package with the jarsigner tool to ensure its authenticity. For more information about verifying the signature, see the MID Server upgrades section on manual verification.

Install the MID Server on the host computer.

- Linux
- Windows

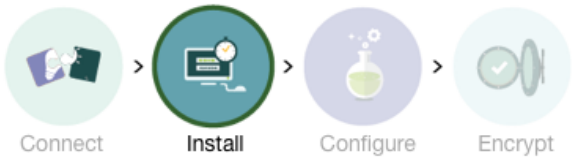
Install a MID Server on Linux

Install MID Servers with the MID Server installer and verify it is active. The package includes an installer that automatically configures JRE to run in the environment. The MID Server can use an existing JRE rather than the provided JRE. Uninstall the MID Server to redeploy it.

Before you begin
Verify that the host computer satisfies the MID Server system requirements.

Role required: admin, mid_server

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

About this task

To install Linux on MID Server, the RedHat/CentOS systems require RPM while Debian (Ubuntu) systems require DEB. The default installation location is `/opt/servicenow/mid`. Installing DEB in user defined directories is not supported.

To improve security, this procedure installs and run the MID Server service as a non-root user. Root privilege is required to deploy and configure a MID Server on a Linux server. A non-root user can manage a service only if they have the required permissions. For more details, see PolicyKit issues with Linux MID Servers using non-admin accounts [KB0815542].

Note:
ServiceNow no longer supports new installations of 32-bit MID Servers or upgrades to version Rome. New MID Server installation are blocked through RPM and MSI installer on the following operating systems:

- CentOS 7
- Windows server 2008
- Windows server 2008 R2
- Windows 8
- Windows 10

MID Servers can be manually installed to any operating system with the ZIP file, however Windows 10 is unsupported. Unsupported MID Servers auto-upgrading to Rome create an issue record in MID Server Issues (ecc_agent_issue). For more information, see Supported platform changes for MID Server [KB0863694].

Java 17.0.12 is bundled with the MID Server installer package and is installed on the host for all new MID Servers. The installer automatically configures Java 17.0.12 to run in your environment. No additional configuration is required. This version supports both 64-bit Windows MID Servers and 64-bit Linux MID Servers. The MID Server requires a minimum JRE version 17.0.10, and recommended version 17.0.12. If you are using a lower version than 17.0.10, you may see encryption related issues.

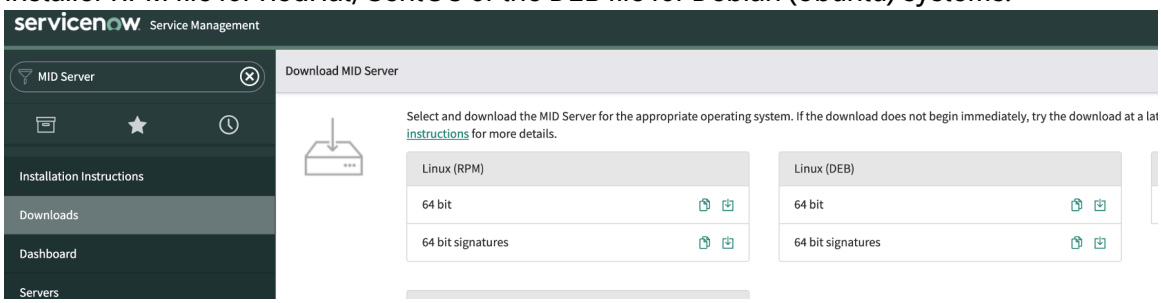
Note:
Linux MID Servers require glibC version 2.17. The library must be updated for JRE 11. On 64-bit Linux systems, you must install the 32-bit GNU C library (glibc). The installation command for CentOS is: `yum install glibc.i686`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Testing showed that the MID Server works as expected with Oracle Java 11 version 17.0.10. If you need to upgrade the JRE to a different version, then coordinate with the appropriate account representative for support.

Procedure

1. On the instance, navigate to **MID Server** > **Downloads** and download either the MID Server installer RPM file for RedHat/CentOS or the DEB file for Debian (Ubuntu) systems.



Note:
Use the copy link button to copy the download link and use the following `wget` command to directly download the installers in Linux machines.

```
wget <copied link of the installer>
```

2. **Optional:** Manually verify the authenticity and integrity of the downloaded file.

   a. Download the signature ZIP files for RPM/DEB.

   b. Run the following commands for either RPM or DEB.

   (Optional) **RPM**

   - Extract the public key, `ServiceNow_Digicert_DGST.pem`, and signature file from the downloaded signature zip file.
   - Run the following command to verify the signature of the RPM file.

```
openssl dgst -sha256 -verify <Extracted .pem file>
 -signature <Extracted bin file path> <RPM file path>
```

   DEB

   - Extract the public key, `ServiceNow_Digicert_Public.gpg`, from the downloaded signature zip files.
   - Import the public key and verify the signature of the DEB file with the following commands.

```
gpg --import <public key>
dpkg-sig --verify <DEB file path>
```

3. Use the following commands to install either the RPM or DEB installer:

   RPM

   - Install the RPM package for RedHat systems with the following command:

```
sudo rpm -ivh --nodeps package_name.rpm.
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Install the RPM package for RedHat systems in a user defined location with the following command:

```
sudo rpm -ivh --nodeps package_name.rpm
 --prefix=/path/to/user/directory.
```

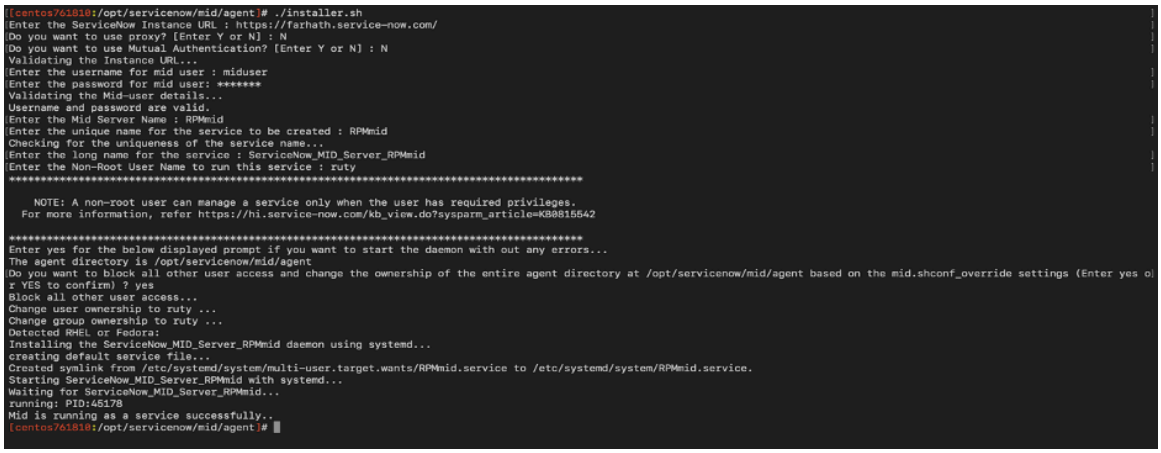
DEB

Install the DEB package for Debian systems with the following command:

```
sudo dpkg -i package_name.deb.
```

4. To configure the MID Server service, run the following command from the agent folder as a user with root privilege and provide the required inputs.

```
./installer.sh
```



5. The **installer.sh** script takes the following inputs.

Instance URL

Enter the full URL of your instance, for example: `https://mycompanyinstace.service-now.com`

MID-Server Username

Enter the user name of the MID Server user that you already created. The MID Server user must have the mid_server role.

MID-Server Password

Set the password for the current MID Server user.

MID-Server Name

Set the name of the MID Server.

Proxy Server Information (optional).

mid.proxy.use_proxy

Enables the MID Server to use a web proxy to access the ServiceNow instance.

mid.proxy.host

Set this parameter to define the web proxy's host.

mid.proxy.port

Set this parameter to define the web proxy's port.

mid.proxy.username

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If the web proxy requires a user name, set this parameter to define that username.

mid.proxy.password

If the web proxy requires a password, set this parameter to define that password.

The MID Server can bypass proxy servers whose DNS/IP address is listed in the configuration parameter **mid.cloud.discovery.proxy.exclusion.list**. See MID Server property for more information.

To run a MID Server as a daemon service, the following properties are also required.

app_name

Set a unique name for the current MID Server

app_long_name

Set a unique long name for the MID Server.

run_as_user

Set the username to run the service as a non-root user.

Result

Once all the inputs are entered, the MID Server automatically runs as a daemon service and starts the service.

Linux MID Server silent installation

Silently installing the MID Server uses predefined parameters and requires no user input after it is initiated. You can use silent installation on several machines at once to quickly set up a network and to ensure all MID Servers have the same installation settings.

To perform a silent installation with the Linux installer, run the following command:

```
./installer.sh -silent -INSTANCE_URL
 https://instance_name.service-now.com -MUTUAL_AUTH
 N -MID_USERNAME username -MID_PASSWORD password
 -USE_PROXY N -MID_NAME mid -APP_NAME mid -APP_LONG_NAME
 ServiceNow_MID_Server_Mid -NON_ROOT_USER nonrootuser
```

The following fields can be passed through the command line:

INSTANCE_URL

Enter the URL of your instance, for example: `https://mycompanyinstance.service-now.com`

MUTUAL_AUTH

Set this value to Y to use mutual authentication instead of basic authentication. Otherwise, set it to N.

> **Note:**
> If **MUTUAL_AUTH** = Y then provide the path to the certificate with **CERTIFICATE_PATH**.

CERTIFICATE_PATH

If mutual authentication is enabled, provide the path to the certificate.

MID_USERNAME

Enter the user name of the MID Server user that you already created. The MID Server user must have the mid_server role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MID_PASSWORD

Enter the password for the user.

USE_PROXY

Set this value to Y if your MID Server communicates through a proxy to connect to the instance.

Note:
If **USE_PROXY** = N then skip the other proxy details.

PROXY_HOST

Enter the proxy server host name or IP address. Do not include the protocol in the host name. For example: `proxyserver.domain.com` is correct, but `https://proxyserver.domain.com` is incorrect.

PROXY_PORT

Enter the port the proxy server uses to communicate. If this value is blank, the installer uses the proxy server's default port number.

PROXY_USERNAME

Enter the username that has administrator rights to the proxy server.

PROXY_PASSWORD

Enter the password for the username.

MID_NAME

Enter the MID Server name.

APP_NAME

Provide the service name. It must be unique for the current MID Server.

APP_LONG_NAME

Provide the service long name.

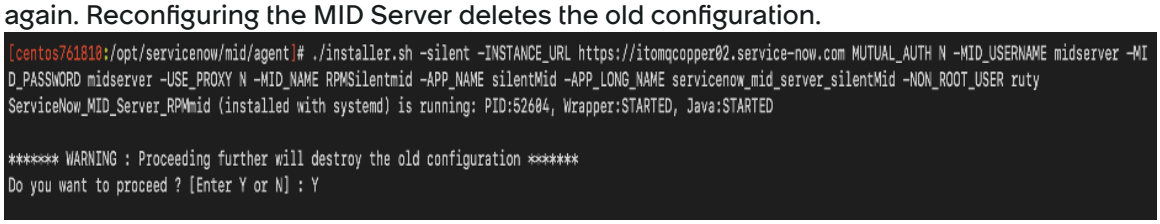
NON_ROOT_USER

Provide the username to run the service as a non-root user.

The following is an example command for a MID Server which uses a proxy and mutual authentication:

```
./installer.sh -silent -INSTANCE_URL
 https://instance_name.service-now.com MUTUAL_AUTH Y
 -CERTIFICATE_PATH <path-to-certificate> -USE_PROXY Y
 -PROXY_HOST <ip> -PROXY_PORT <port> -PROXY_USERNAME <username>
 -PROXY_PASSWORD <password> -MID_NAME proxymid -APP_NAME
 proxymid -APP_LONG_NAME servicenow_proxy_mid -NON_ROOT_USER
 nonrootuser
```

Note:
To reconfigure the MID Server, run the `installer.sh` command again. Reconfiguring the MID Server deletes the old configuration.



© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Run Linux MID Servers as non-root users

Run MID Servers as non-root user on a Linux machine to improve security. Multiple MID Server can be installed as services so they can start by themselves after system reboots.

Before you begin

Role required: root

This process is only applicable if you installed the MID Server manually using the ZIP file. If you installed the MID Server with the procedure in Install a MID Server on Linux, then the MID Server is already running as a non-root user.

Supported versions for this procedure are Linux Red Hat 6 or newer, Ubuntu 1404 or newer, and CentOS 6 or newer.

Procedure

1. Stop any MID Server running on the host with the command **bin/mid.sh stop**.
2. Remove any MID Servers on the host with the command **bin/mid.sh remove**.
3. Edit the file `mid.shconf_override`.

```
#########################################################################
# To put any changes into effect, re-install the service using the commands
# bin/mid.sh stop then bin/mid.sh remove followed by bin/mid.sh install
#########################################################################

# Uncomment the lines below and set some name for the current MID server.
# This allows multiple MID Servers to run as a service on the same host.
#APP_NAME="this_mid_app_name"
#APP_LONG_NAME="this_mid_long_app_name"

# Put a username here to run the service as a non-root user.
# The specified user will be the owner of the entire agent directory.
# If left empty, the owner is unchanged.
RUN_AS_USER=

# Put a group name here that will be the group owner of the entire agent directory.
# If left empty, the group is unchanged.
GROUP_NAME=

# Set a flag to control whether the script will prompt for confirmation before
# changing the owner or group of the agent directory
PROMPT_BEFORE_OWNERSHIP_CHANGE=true
```

4. Add the MID Server's name using the lines **APP_NAME=** and **APP_LONG_NAME=** to run it as a service.
   To prevent errors, the **APP_NAME** of each MID Server must be unique.
5. **Optional:** To run multiple MID Servers as services on the same host, add an **APP_NAME** and **APP_LONG_NAME** for each instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
[root@CentOS6 ~]# cat /opt/midservers/mid_centos6_1/bin/mid.shconf_override
APP_NAME="mid_centos6_1"
APP_LONG_NAME="ServiceNow MID Server MID_CENTOS6_1"

[root@CentOS6 ~]# cat /opt/midservers/mid_centos6_2/bin/mid.shconf_override
APP_NAME="mid_centos6_2"
APP_LONG_NAME="ServiceNow MID Server MID_CENTOS6_2"
```

6. Add the name of the non-root user to operate the account using the line **RUN_AS_USER=**.
7. **Optional:** Add the name of the group to own the entire agent directory using the line **GROUP_NAME=**.
8. Set the line **PROMPT_BEFORE_OWNERSHIP_CHANGE=** to **true** to prompt the user for confirmation before any changes to file permissions are applied.
   The file permission change is applied to the entire agent folder and everything inside recursively. The changes include blocking other users' the access to the entire agent folder, changing the owner to **$RUN_AS_USER** if specified, and changing the group to **$GROUP_NAME** if specified.
9. Reinstall the MID Server with the command **bin/mid.sh install**.

Note:

To prevent errors, make sure to stop and remove any existing MID Server services before starting new ones. During the first installation, a root user is required to call **bin/mid.sh install**. Reinstalling the MID Server applies the changes in `mid.shconf_override`. Then the non-root user specified in `mid.shconf_override` is able to start/stop/restart the service without elevated privileges.

What to do next

For more information about managing the allow list and file permission enforcement, see File permission enforcement for Windows MID Servers. Running a Linux MID Server with a non-root account may result in issues with PolicyKit in some systems. See PolicyKit issues with Linux MID Servers using non-root accounts for more information.

Configure a Linux MID Server to use an existing JRE

You can choose to use an existing JRE for your MID Server rather than the OpenJDK provided with the MID Server installer.

Before you begin

Ensure that your JRE version is supported. See MID Server system requirements for details.

Role required: admin

About this task

By electing to use your own JRE, you are responsible for upgrading it as necessary. For a detailed procedure and cautions regarding changing the JRE, see KB0778272.

Procedure

1. Navigate to this file in the MID Server installation directory:
   `agent/conf/wrapper-override.conf`
2. To specify the existing Java executable that you want to use, add this line to the file:
   `wrapper.java.command={your_java_executable}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information, see the Java service wrapper property documentation.

3. Save the file.

Uninstall a Linux MID Server

The MID Server runs as a stand-alone service. You can remove a stand-alone MID Server service to accommodate such tasks as redeploying the MID Server to another host machine or changing the unique name of a MID Server when deploying multiple MID Servers.

Before you begin

Role required: admin

Procedure

Run the **uninstall.sh** script in the agent folder to remove the service and uninstall the RPM/DEB.

```
[[centos761810:/opt/servicenow/mid/agent]# ./uninstall.sh
Uninstalling MID Server RPM package : agent-19.itomqcopper.0.268-172.el7.x86_64
Preparing packages...
Running 'mid.sh remove' to uninstall MID server
Detected RHEL or Fedora:
Stopping servicenow_mid_server_silentMid...
Waiting for servicenow_mid_server_silentMid to exit...
Stopped servicenow_mid_server_silentMid.
Removing servicenow_mid_server_silentMid daemon from systemd...
Removed symlink /etc/systemd/system/multi-user.target.wants/silentMid.service.
agent-19.itomqcopper.0.268-172.el7.x86_64
[centos761810:/opt/servicenow/mid/agent]#
```

Result

The MID Server service is uninstalled.

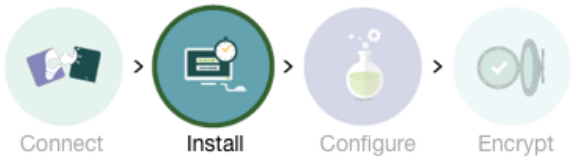
What to do next

Validate the MID Server to prepare it for use.

Install a MID Server on Windows

Install MID Servers with the MID Server guided Windows installation package. The package includes an installer that automatically configures OpenJDK to run in the environment. The MID Server can use an existing JRE rather than the provided OpenJDK. Uninstall the MID Server to redeploy it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

- Verify that the host computer satisfies the MID Server system requirements.
- The MID Server requires the minimum PowerShell version 3.0 and supports versions up to PowerShell 5.1.
- Ensure that the Microsoft Application Experience Lookup Service is enabled on the MID Server host. If this service is disabled, the MID Server auto-upgrade might fail, causing the MID Server to go down. For information on managing issues with the Application Experience service, see KB0597552.

Java 17.0.12 is bundled with the MID Server installer package and is installed on the host for all new MID Servers. The installer automatically configures Java 17.0.12 to run in your environment. No additional configuration is required. This version supports both 64-bit Windows MID Servers and 64-bit Linux MID Servers. The MID Server requires a minimum JRE version 17.0.10, and recommended version 17.0.12. If you are using a lower version than 17.0.10, you may see encryption related issues.

Note:
ServiceNow no longer supports new installations of 32-bit MID Servers or upgrades to version Rome. New MID Server installation are blocked through RPM and MSI installer on the following operating systems:

- CentOS 7
- Windows server 2008
- Windows server 2008 R2
- Windows 8
- Windows 10

MID Servers can be manually installed to any operating system with the ZIP file, however Windows 10 is unsupported. Unsupported MID Servers auto-upgrading to Rome create an issue record in MID Server Issues (ecc_agent_issue). For more information, see Supported platform changes for MID Server [KB0863694].

Testing showed that the MID Server works as expected with Oracle Java 11 version 17.0.10. If you need to upgrade the JRE to a different version, then coordinate with the appropriate account representative for support.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Upgraded MID Servers might use different Java versions depending on their operating system versions.

- MID Servers upgraded from earlier versions use the OpenJDK provided with the MID Server installer. This version of the OpenJDK was tested and certified for use with these MID Servers.
- MID Servers upgraded on any other operating system versions also automatically upgrade the JRE to the version provided with the installation package.

Install a MID Server on Windows with guided installation

Install MID Servers with the MID Server guided Windows installation package. The package includes an installer that automatically configures OpenJDK to run in the environment.

Before you begin

Role required: admin or mid_server

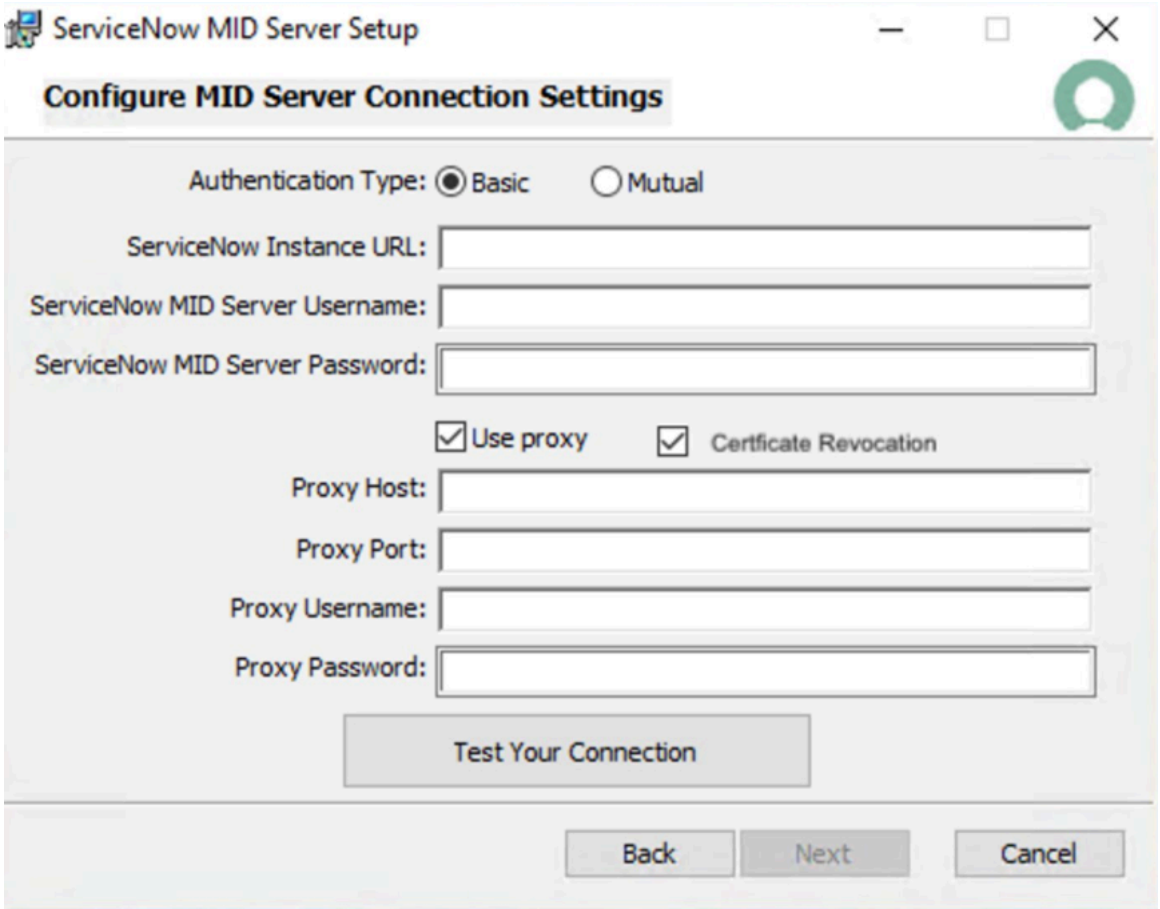
About this task

The MID Server guided native Windows installer configures the MID Server with provided settings. The installer creates the MID Server Service and assigns it to the provided user. The installer sets the file permissions on the MID Server Install folder. The installer allows for the configuration of proxy settings. Optionally, the installer can start the MID Server automatically.

Procedure

1. On the instance, download the MID Server installation .msi file from **MID Server** > **Download**.
2. Log in to the Windows host machine where you want to install the MID Server.
3. Place the installer .msi on the desired MID Server host.
4. Open the installer with Administrator level privileges.
5. Use the installer to enter the following information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Field	Description
Authentication Type	**Basic** Username and password based authentication. **Mutual** Client certificate based authentication. See MID Server unified key store for more information on mutual authentication. **Note:** Selecting mutual authentication disables the MID Server username and password fields. The disabled fields are not written to **config.xml**.
ServiceNow instance URL	Enter the full URL of your instance, for example: `https://mycompanyinstace.service-now.com`

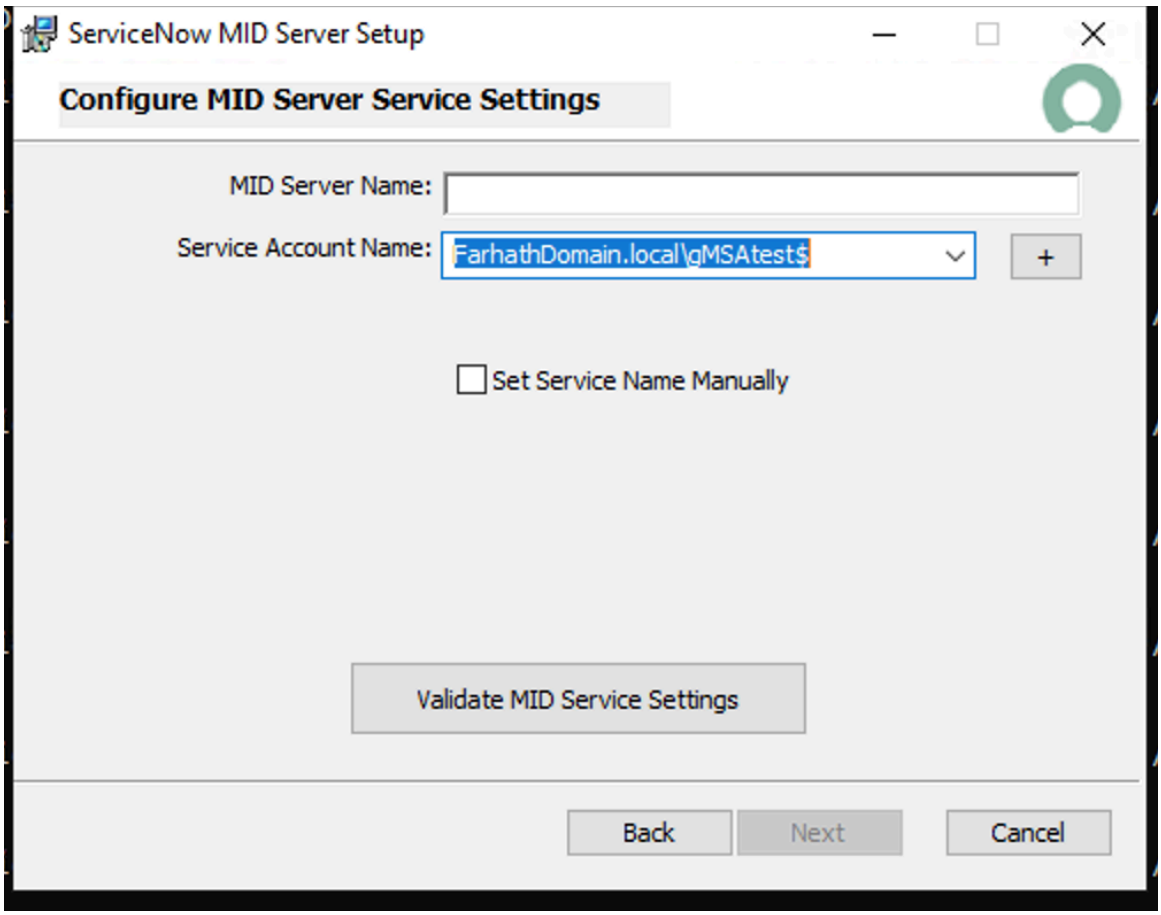
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
ServiceNow MID Server username	Enter the name of the MID Server user that you already created. The MID Server user must have the mid_server role.
ServiceNow MID Server password	Enter the password for the user in the **ServiceNow MID Server username**.
Certificate Revocation	This check box is selected by default to enable certificate revocation policies to improve security. For more information on certificate revocation, see MID Server certificate check policies. When testing a connection with certificate revocation enabled, the installer checks if OCSP port 80 is open and the entrust page is accessible. If the connection test fails due to the certificate revocation check, the error must either be corrected and re-tested or the certificate revocation check must be disabled. The certificate revocation check is not required for successful installation.
Use proxy	Select this check box if your MID Server communicates through a proxy to connect to the instance. **Note:** Your proxy server must use Basic Authentication for the MID server to connect to the instance. The MID Server can bypass proxy servers whose DNS/IP address is listed in the configuration parameter **mid.cloud.discovery.proxy.exclusion.list**. See MID Server property for more information.
Proxy Host	Enter the proxy server host name or IP address. Do not include the protocol in the host name. For example, enter `proxyserver.domain.com`, not `https://proxyserver.domain.com`.
Proxy Port	Enter the port through which the proxy server communicates. If you leave this field blank, it should use the proxy server's default port number.
Proxy Username	Enter the username for the proxy server.
Proxy Password	Enter the password for the user name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If your proxy server doesn't require authentication, leave the **Proxy Username** and **Proxy Password** fields blank.

6. Select **Test your connection** to validate the credentials and instance information.
   If you encounter any errors, verify the information that you input.
7. Select **Next**.
8. Configure the MID Server name and Service Account parameters (see table).



Field	Description
MID Server name	Enter a MID Server name. **Warning:** MID Server names cannot begin with **mid.server**.
Service Account Name	Username of the service account that will be used to run the MID Server service. For information on creating service accounts, see Create a Windows service account with "Log on as Service" [KB0867669]. The Service Account Name field is an editable drop-down menu. Either select a

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	value from the drop-down or type a new value in the text field. Only the accounts with *log on as service* policy are displayed in the drop-down. Group Managed Service Accounts (gMSA) that inherit the *log on as service* policy from their groups are not displayed in the drop-down. However, you can install the MID Server service using those accounts by manually entering the service account name in the editable drop-down. The name can follow three formats. **a.** If the service account is local to the computer, you can give just the name. Example: My_Local_Service_Account **b.** If the service account is local to the computer, you can provide "." as the domain name for the account. Example: .\My_Local_Service_Account **c.** Any account can follow the format {domain}\{username}. Example: MY-COMPUTER-DOMAIN \My_Domain_Service_Account Add a new local service account by selecting the **+** button. This button opens the **Configure New Local User** window, which has three fields. ○ **Service Account Name:** Enter the name of the new service account. ○ **Service Account Password:** Enter the password of the new service account. ○ **Re-enter Password:** Confirm the password of the new service account. When a group Managed Service Account (gMSA) user is selected, the password field is removed because passwords for gMSA users are managed by the Active Directory.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

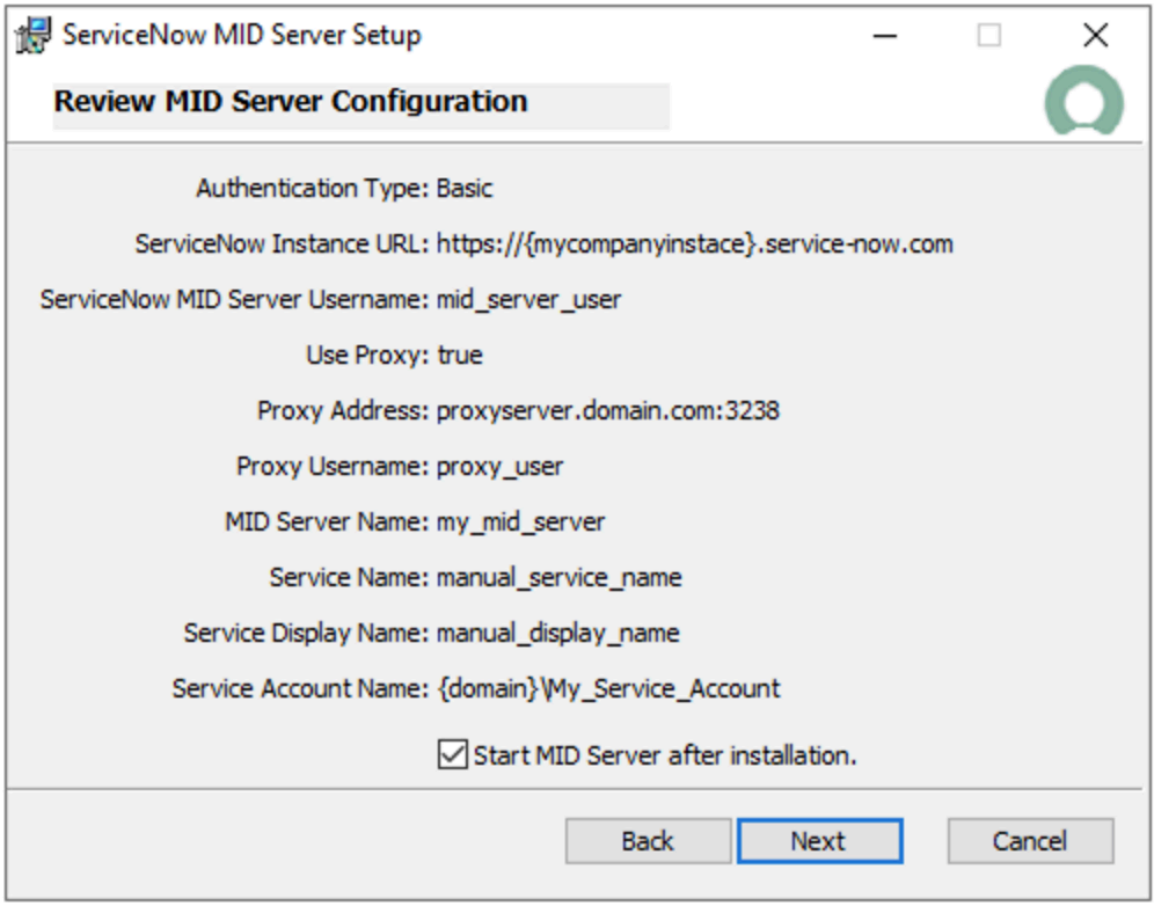
Field	Description
	Note: The provided service account credentials must meet the following requirements in addition to being a valid account. ○ The user cannot be a local system or an administrator level account (local admin, domain admin, etc.) ○ The service account provided has the *`log on as service`* right, which is required for an account to be used as the *`log on user`* for a service.
Service Account Password	Password of the service account that will be used to run the MID Server service.
Set Service Name Manually	Select this check box if you want to manual set the service name and display name for your MID Server. Note: Your proxy server must use Basic Authentication for the MID server to connect to the instance.
MID Service wrapper name	Modify this field if necessary. It is populated automatically by prefixing `snc_mid_` to the MID Server name. In most cases, you do not need to modify this.
MID Server wrapper display name	Modify this field if necessary. It is populated automatically by prefixing `ServiceNow MID Server_` to the MID Server name. In most cases, you do not need to modify this.

9. Select **Next** and select a destination folder for the installation.

   Users can manually enter an existing, valid file path, or use the “Change” button to open up a browsing page where they can choose the install location.

10. Select **Next** to view the summary.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Select **Start MID Server after installation** if you want to start the MID Server immediately after installation. If you want to make additional configuration changes, before starting the MID server, leave this box unchecked. If mutual authentication was selected, the MID Server username and password fields are removed.

Note:
If the MID Server fails to start, the cause might be a duplicate name or multiple services that point to the same executable path. This can happen when you have MID servers previously not installed through the installer. See MID Server fails to start for details.

11. Select **Mid Servers List Page**.
    The installer opens the MID Server list from your instance.
12. Select the MID Server name from the list.

Note:
It may take a few seconds for the MID Server time to establish a connection with your instance.

The system displays the MID Server record.

13. From **Related Links**, select **Validate**.
    The MID Server **Validated** changes to **Yes**.

What to do next

To upgrade the MID Server, see MID Server upgrades for procedures and requirements.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Uninstall a Windows MID Server with the guided installer

The MID Server guided native Windows installer also supports guided uninstallation of the MID Server.

Before you begin

Role required: admin

There are three ways to uninstall a MID Server after installing it with the guided native Windows installer.

Procedure

1. On the MID Server host, navigate to the **Control Panel** > **Programs** > **Programs and Features** > **Uninstall a program**.
   a. Uninstall the program with the MID Server's name.
2. **Optional:** Alternatively, navigate to **Settings** > **Apps**
   a. Uninstall the program with the MID Server's name.
3. **Optional:** The MID Server can also be uninstalled with the silent uninstall script.
   This is useful for uninstalling multiple MID Servers. For more information, see Windows MID Server silent installation and uninstallation

Configure Windows MID Server service credentials

MID Server service credentials are required to manage the MID Server service on the host machine, including its ability to successfully auto-upgrade.

Before you begin

Role required: admin

About this task

If you installed the MID Server using the native installer, you will not need to complete this procedure. However, to change the service user after the installation for any reason, use this procedure.

Windows service credentials control the level of privilege on the device. The user should not be a local system or an administrator level account (local admin, domain admin, etc.) The service account provided should have the **log on as service** right, which is a requirement for an account to be used as the **log on user** for a service.

Note:

Windows service credentials are not the same as the MID Server user credentials, which allow communication between the MID Server and the instance. You must configure both of these credentials separately. See Create the MID Server user and grant the role for instructions on MID Server user credentials.

Procedure

1. Open the Windows Services console.
2. Double-click the `ServiceNow <MID Server name>` service for each MID Server.
3. Select the **Log On** tab.
4. Choose a non-admin user and provide the password for that user.
5. In the **General** tab, set the **Startup type**.
   The field is set to **Automatic** by default.
6. Click **OK**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Restart the ServiceNow <MID Server name> service, and make sure that ServiceNow\<MID Server name>\agent\logs\agent0.log does not have error messages.
   If the MID Server does not start, see the ServiceNow knowledge article Review the agent log for MID Server errors (article KB0535148).
8. On the instance to which this MID Server is connected, navigate to **MID Server** > **Servers**.

   If Discovery is installed, alternately navigate to **Discovery** > **MID Servers**. All MID Servers connected to this instance are listed.
9. Make sure that the Status of the MID Server that you just installed is **Up**.

Windows MID Server silent installation and uninstallation

Silently installing the MID Server uses predefined parameters and requires no user input after it is initiated. You can use silent installation on several machines at once to quickly set up a network and to ensure all MID Servers have the same installation settings.

MID Server silent installation

Note:
All silent install/uninstall commands must be run with administrator level privileges.

To silently install the MID Server on a Windows system, download the script attached to the Knowledge Base article Windows MID Server silent installation and uninstallation. Place the file on the target MID Server host machine and run the following command from the command prompt. You can also run the script directly from powershell.

```
powershell -command ".\SilentInstall.ps1 -<parameter_name1>
 '<value for parameter1>' -<parameter_name2> '<value for
 parameter2>' etc..."
```

The script checks the following mandatory parameters:

- *MSI_FILE_NAME*: the name of the MSI file used for the installation.
- *INSTALL_LOCATION* : the location to install the MID Server.
- *INSTANCE_URL*: the target ServiceNow instance the MID Server will connect to.
- *MID_USERNAME*: the instance account name.
- *MID_PASSWORD*: the instance account password.
- *MID_NAME*: the name of the MID Server.
- *SERVICE_ACCOUNT_NAME*: the name of the service account.
- *SERVICE_ACCOUNT_PASSWORD*: the password of the service account.

The following parameters are optional:

- *LOG_NAME*: enables logging and puts logs into the file named by this parameter.
- *START_MID*: sets the MID Server to start automatically after the installation finishes.
- *USE_PROXY*: enables the use of a proxy. If you choose this command, the following parameters become mandatory.
  - *PROXY_HOST*: the name of the proxy host.
  - *PROXY_PORT*: the port number of the proxy.
  - *PROXY_USERNAME*: the proxy username. If there is no username, input `' '`.
  - *PROXY_PASSWORD*: the proxy password. If there is no password, input `' '`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- *MANUAL_SERVICE_NAME*: the service name. If you choose this command, the following parameters become mandatory:
  - *SERVICE_NAME*: the service name.
  - *SERVICE_DISPLAY_NAME*: the service display name.
- *MUTUAL_AUTH*: enables mutual authentication. If this switch is enabled, *MID_USERNAME* and *MID_PASSWORD* are not required. See MID Server unified key store for more information.

Note:
The parameters *START_MID*, *USE_PROXY*, *MUTUAL_AUTH*, and *MANUAL_SERVICE_NAME* are switches. They use the format **-<switch_param_name>** and are not followed by a value.

After the script runs, verify the MID Server files, service, and entry in Programs and Features are installed. If you enabled logging, verify the log info in the file specified by the *LOG_NAME* parameter.

An example MID Server silent installation command:

```
powershell -command ".\SilentInstall.ps1 -MSI_FILE_NAME
 'MID-Installer.msi' -INSTALL_LOCATION 'C:\Users\Administrator'
 -INSTANCE_URL 'https://my-instance-name.service-now.com'
 -MID_USERNAME 'mid_server' -MID_PASSWORD 'mid_password'
 -MID_NAME 'Silent_Install_MID' -SERVICE_ACCOUNT_NAME
 'DOMAIN\My_Service_Account' -SERVICE_ACCOUNT_PASSWORD
 'Service_Account_Password' -LOG_NAME 'Silent_Install_Log.txt'"
```

An example command using the *START_MID* switch:

```
powershell -command ".\SilentInstall.ps1 -MSI_FILE_NAME
 'MID-Installer-Wix.msi' -INSTALL_LOCATION
 'C:\Users\Administrator' -INSTANCE_URL
 'https://my-instance-name.service-now.com' -MID_USERNAME
 'DOMAIN\My_Service_Account' -MID_PASSWORD 'mid_password'
 -MID_NAME 'Silent_Install_MID' -SERVICE_ACCOUNT_NAME
 'DOMAIN\My_Service_Account’ -SERVICE_ACCOUNT_PASSWORD
 'Service_Account_Password' -LOG_NAME 'Silent_Install_Log.txt'
 -START_MID"
```

MID Server silent uninstallation

To silently uninstall the MID Server on a Windows system, download the script attached to the Knowledge Base article Windows MID Server silent installation and uninstallation. Then run the script using the command prompt. It can also be run directly from powershell.

```
powershell -command “.\SilentUninstall.ps1 -MID_NAME ‘<value
 for MID_NAME>’ -LOG_NAME ‘<value for LOG_NAME>’”
```

The script requires the mandatory parameter *MID_NAME*, which is the name of the MID Server you want to uninstall.

The optional parameter *LOG_NAME* enables logging of the uninstallation and puts logs into the file named by this parameter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

After the script runs, verify the MID Server files, service, and entry in Programs and Features are uninstalled. If you enabled logging, verify the log info in the file specified by the *LOG_NAME* parameter.

An example MID Server silent uninstall command:

```
powershell -command ".\SilentUninstall.ps1 -MID_NAME
 'silent_install_cmd' -LOG_NAME
      'uninstall.txt'"
```

Manually install a MID Server on Windows

Install MID Servers with the ZIP file installation package and verify it is active.

Before you begin

Role required: admin or mid_server

About this task

Click this link to view the installation video: Installing the MID Server on Linux

MID Servers can be configured to run using non-administrative accounts. Using non-admin accounts in conjunction with file permission enforcement can improve security by restricting access to MID Server files. sIf you choose to run a MID Server with a non-admin account, there are limitations that change the behavior of other applications. The following behavior changes can occur:

- The MID Server account needs appropriate credentials to run a Discovery schedule. If the credentials are insufficient, the MID Server falls back to the user account's privileges. A non-admin user account may not have the necessary privileges to access the Discovery target.
- Enhanced Application Dependency Mapping (ADME) and File Based Discovery (FBD) may not work by default. To correct this issue, non-admin users need to be given permission to read/write to the Admin Share folder.

Procedure

1. Log in to the Windows host machine where you want to install the MID Server.
2. Create a folder for the MID Server on the top level of the drive such as `ServiceNow\MID Server1`.
3. Download the MID archive file into the new folder.
4. Right-click the archive and select **Extract All**.
5. Navigate to the `service-now\`<mid server name>`\agent` folder that was created when the file was extracted.
6. To configure the MID Server manually, edit the `config.xml` file with a text editor such as WordPad:

   a. Find the element *<parameter name="url" value="https://YOUR_INSTANCE.service-now.com" />* element and change the value to the URL of your instance.

   b. Enter the MID user credentials in the `mid.instance.username` and `mid.instance.password` parameters.
   By default, the MID Server, uses basic authentication for SOAP messages. The password value is also encrypted authentication.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. **Optional:** Find the *<parameter name="name" value="YOUR_MIDSERVER_NAME_GOES_HERE" />* element and change the value for the MID Server name.

d. **Optional:** Enter connection information for the proxy server.
Remove the appropriate comment tags from the proxy configuration information.

Example
For example, you can configure these parameters:

- *mid.proxy.use_proxy*
- *mid.proxy.host*
- *mid.proxy.port*
- *mid.proxy.username*
- *mid.proxy.password*

7. **Optional:** If you want to install the MID Server as a non-admin user, follow these steps.

a. Edit the `.\conf\wrapper-override.conf` file.

b. Uncomment the `wrapper.ntservice.account` property and specify the Service Account Name.

c. Either uncomment `wrapper.ntservice.password.prompt`, or uncomment `wrapper.ntservice.password` and provide a password.
Enabling `wrapper.ntservice.password.prompt` prompts for a password when installing the service. Enabling `wrapper.ntservice.password` sets a password immediately but is less secure.

d. Uncomment the `wrapper.ntservice.permissions.1.account` and specify the Service Account Name.

e. Uncomment `wrapper.ntservice.permissions.1.allow` but do not edit it.

f. Uncomment `wrapper.name` and specify the desired service name, and uncomment `wrapper.displayname` and specify the desired display name.
The `wrapper.name` must be unique on the host and no other service can share the same name.

8. Run `start.bat` to start the MID Server.
If `wrapper.ntservice.password.prompt` was set in step 7c, enter the password when prompted. If there is no password, proceed without entering one.
9. On the instance, in the **Related Links**, select **Validate**.
The MID Server **Validated** changes to **Yes**.

Uninstall a Windows MID Server after manual installation

The MID Server runs as a stand-alone service. You can remove a stand-alone MID Server service to accommodate such tasks as redeploying the MID Server to another host machine or changing the unique name of a MID Server when deploying multiple MID Servers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

This procedure is only for users who install the MID Server using the ZIP file.

Procedure

1. Stop the running MID Server service, using either of these procedures:
   - **Windows command line**: From the MID Server home (`agent`) directory, run `stop.bat`.
   - **Windows Services console**: From the Windows Services console, right-click the **ServiceNow** *`MID Server name`* and then select **stop**.
2. From a command prompt, go to the `\agent\bin` directory in the MID Server installation directory and double-click the `UninstallMID-NT.bat` file.

What to do next
Validate the MID Server to prepare it for use.

Configure a MID Server on Windows to use an existing JRE

You can choose to use an existing JRE for your MID Server rather than the OpenJDK provided with the MID Server installer.

Before you begin
Ensure that your JRE version is supported. See MID Server system requirements for details.

Role required: admin

About this task
By electing to use your own JRE, you are responsible for upgrading it as necessary. For a detailed procedure and cautions regarding changing the JRE, see KB0778272.

Procedure

1. Navigate to this file in the MID Server installation directory:
   `agent/conf/wrapper-override.conf`
2. To specify the existing Java executable that you want to use, add this line to the file:
   `wrapper.java.command=`{your_java_executable}

   For more information, see the Java service wrapper property documentation.
3. Save the file.

Validate the MID Server

You must manually validate the MID Server after it is installed to enable it to execute automation tasks. You can invalidate a MID Server you suspect has been compromised to prevent it from accessing automation credentials in the instance or executing outbound ECC probes.

Before you begin

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

Make sure that the MID Server version is compatible with the instance.

About this task

Validation restricts access to automation credentials to trusted MID servers only.

When you validate a MID Server, you specify the capabilities it can use, the applications that use it, and the IP ranges it is allowed to explore. You will be prompted to set the initial selection criteria when you validate MID Servers that do not already have capabilities, applications, or IP ranges already configured. You do not have to set the initial selection criteria to actually validate the MID Server. See MID Server selection for more information on capabilities, applications, and IP ranges.

Note:
When you upgrade, MID Servers that are already configured in your instance are automatically validated. This prevents the interruption of automation tasks that MID Servers might be performing. See MID Server upgrades for more information.

Procedure

1. Navigate to **All** > **MID Server** > **Servers**.
2. Open the new MID Server you created from the list of MID Servers.
3. Under **Related Links** click **Validate**.
   The Set Initial Selection Criteria window appears if there are no records in the Supported Applications, IP Ranges, or Capabilities related lists.
4. On the Set Initial Selection Criteria window, use the switches to enable or disable selection criteria for this MID Server:
   - **Allow ALL capabilities**: Allow all capabilities for Orchestration and Event Management to use this MID Server.

     Note:
     Service Mapping and Event Management alert aggregation and RCA, which used capabilities in previous releases, rely on the application for MID Server selection.

   - **Allow ALL applications**: Allow all applications that use MID Servers to use this MID Server.
   - **Allow ALL IP ranges**: Make all IP ranges valid for this MID Server, meaning that it can target any IP address.

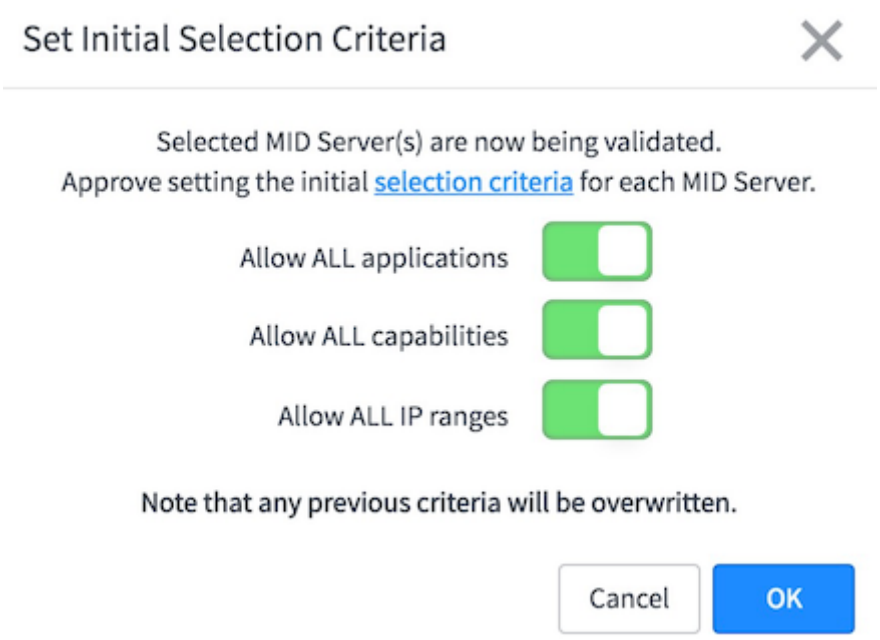
Setting initial selection criteria



If you click **Cancel**, the validation continues but none of the capabilities, applications, or IP ranges are added.

5. Click **OK**.

   The **Validated** field on the dashboard is set to **Validating**, and then set to **Yes** after the validation completes.

6. To invalidate a MID Server, open the record for the MID Server you suspect has a security issue.
7. Under **Related Links**, click **Invalidate**.
   Invalidating a MID Server forces it to clear its memory and restart. The MID Server generates a new keypair on restart.

What to do next

Test network connectivity to ensure that the MID Server can upgrade automatically.

Related topics

Rekey a MID Server

Test MID Server connectivity

Confirm that the MID Server host is able to communicate with the instance. Resolve any issues with the network connectivity such as conflicts with firewalls, access control lists, and routing errors. Successful communication is necessary for automatic upgrades.

Before you begin

Role required: admin

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

About this task

The computer that hosts the MID Server must be able to access one of these URLs to upgrade automatically:

- HTTPS: `https://install.service-now.com on the default HTTPS port (443)`
- HTTP: `http://install.service-now.com on the default HTTPS port (80)`

Procedure

1. Use PING to test connectivity with the host on the network (ping<host IP>).
2. If no ping response is returned, use TRACEROUTE to see where traffic might be stopped (traceroute<host>).
3. Use TELNET to connect to any of the TCP ports (telnet<host> <port>).
4. Use an SNMP scanning tool to determine if a potential network device is responsive.
5. Resolve the most likely issues around network connectivity:
   - *Routing:* Confirm that the MID Server host has network access to the IP ranges you are attempting to discover.
   - *Firewalls:* Confirm access to the physical firewalls that protect a large environment such as the Data Center. Confirm access to any logical firewalls that protect an individual computer. MID Server communications are initiated inside the firewall and therefore do not require any special firewall rules or VPNs.
   - *Access Control Lists (ACL):* Confirm that ACLs contain the IP addresses based list on SNMP network devices that allows communication to a particular target.
   - *Resolve all issues with your network teams to better understand your topology.* Deploy additional MID Servers if necessary to help keep your network secure. Configure access from your existing MID Server host to networking components.
6. Verify that the MID Server service is running on the host:
   - *Windows*: In the Windows Services console, locate the **ServiceNow [MID Server name]** and confirm that each MID Server has the **Started Status** value.
   - *Linux*: Ensure that the `agent0.log.0.lck` appears in the `/servicenow/ MID Server name]/agent` folder.

7. After each MID Server restart, open the `agent0.log.0` and address all error messages.
8. From the ServiceNow instance, navigate to **MID Server** > **Servers**.
9. Review and verify that all MID Servers that are connected to the instance are listed.
10. Verify that the **Status** is **Up** for the MID Servers.

What to do next

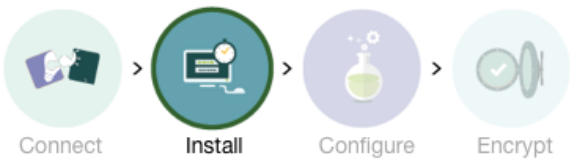
This concludes the installation of a single MID Server. If necessary, continue to deploy multiple MID Servers from a single host in your network. Otherwise, begin configuring your MID Server.

Install multiple MID Servers on a single system

Install multiple MID Servers on the same host computer. Multiple MID Servers can support each other with load balancing, as well as use domain separation. The number of MID Servers required is determined by factors like network policies, security restraints, and the reliability of the host computer.

Before you begin

Role required: admin, mid_server



1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

About this task

You can install multiple MID Servers on a Linux or Windows host or on a virtual machine. Installing multiple MID Servers may involve other setup steps depending on your network configuration.

Important:
Only one MID Server service can be a daemon on a Linux host. This is a limitation of the Tanuki wrapper service.

Procedure

1. Log in to the host system or virtual machine where you want to install multiple MID Servers.
2. Create a directory for each MID Server on the top level of the drive.
