   Make sure you create a unique and descriptive name for each MID Server, such as MIDServer_SMS_Int or MIDServer_Disc1.

3. Extract the downloaded MID Server archive file into each MID Server directory.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When the extract completes, there should be a directory path similar to the following for each MID Server: `ServiceNow<MID Server name>\agent`.

4. For each MID Server, run the installer appropriate to the host's operating system.

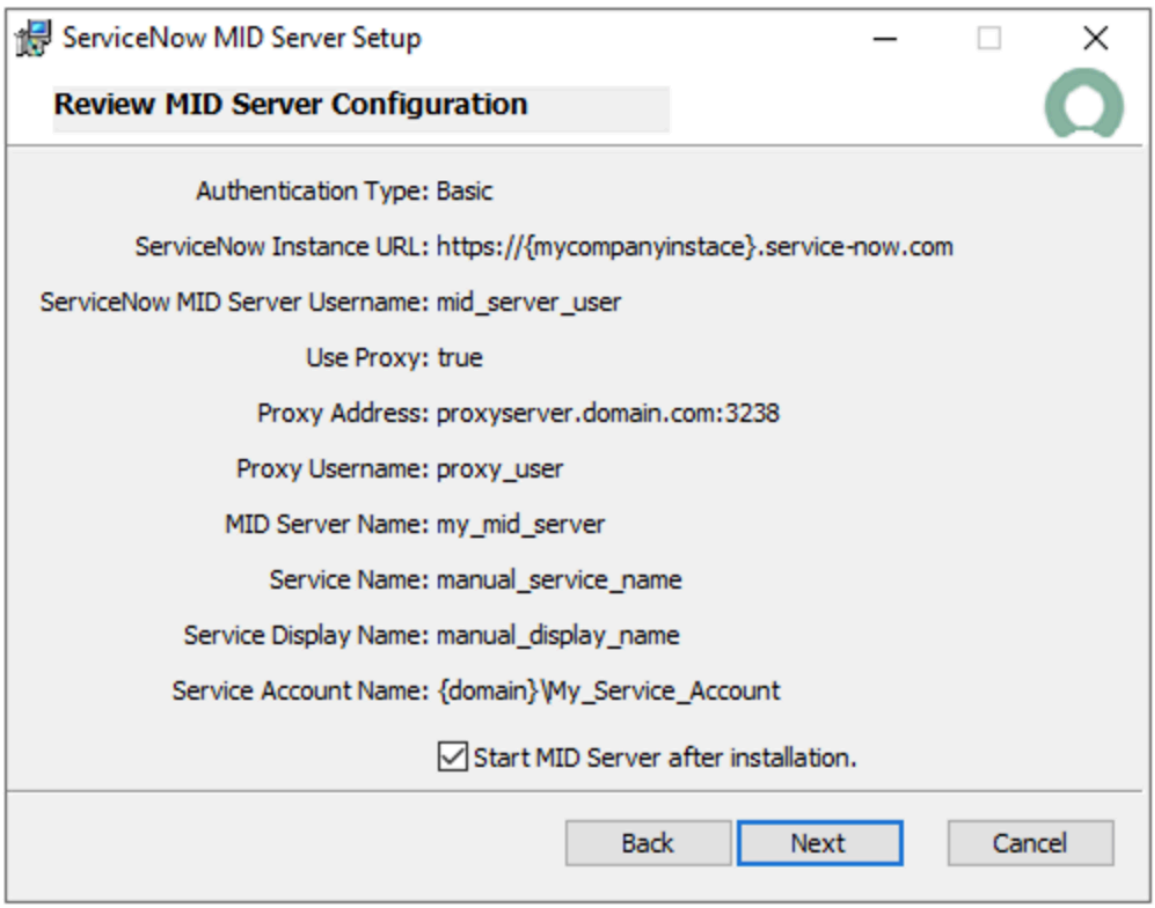
MID Server installers

Operating System	Installer path
Windows	`/agent/start.bat`
Linux	`/agent/installer.sh`

5. Use the installer to enter the following information.
   - URL to your instance
   - User credentials to run the MID Server
   - Proxy server connection details
   - MID server name
   - MID server service wrapper name and display name (Windows systems only)

Note:
The MID Server user must have the mid_server role.

6. From the installer, click **Start MID Server**.



The local host starts the MID Server.

7. Click **Mid Servers List Page**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The installer opens the MID Server list from your instance.

8. Select the MID Server name from the list.

   Note:
   It may take a few seconds for the MID Server time to establish a connection with your instance.

   The system displays the MID Server record.

9. From **Related Links**, click **Validate**.
   The MID Server **Validated** changes to **Yes**.

What to do next

All MID Server installation procedures are complete. Proceed to configure your MID Server.

Multiple MID Server deployments

Depending upon how you use the MID Server (for an external integration, Discovery, Service Mapping, or Orchestration) and the load placed on it, you might find it necessary to deploy multiple MID Servers in your network.

Factors determining the number of MID Servers your network will require to support external applications that integrate with ServiceNow include the following:

- The security constraints in your network.
- Your network policies.
- The amount of traffic between ServiceNow and the integrations.
- The reliability of the MID Server machines.

Network policies and security

Security policies in your network (firewalls between network segments, for example) might make direct communication impossible between your instance and an integration's data source (JDBC, LDAP, etc.). To retrieve data for the instance, you can install a MID Server that has access to both the data source and the instance.

These network policies can determine if you need to install multiple MID Servers in your environment:

- **Access control lists (ACL)**: If your security policy controls access to network devices (e.g. switches and routers) with an ACL, it might be necessary to install one or more MID Servers on a machine in the network that is already on the ACL.
- **DMZ**: Your network policy might require you to install one or more MID Servers in your DMZ to probe the devices there. This is common in networks that tightly regulate the ports that are opened on the inside firewall.
- **Probe types**: If you are conducting probes of different operating systems, your network policy might require a separate MID Server for each type of probe (e.g., one MID server for Windows WMI probes and another for SSH probes on UNIX).

Load balancing

Deploy multiple MID Servers where capacity is an issue, as when Discovery has to gather information about thousands of configuration items quickly. In a high volume environment, it might be necessary to deploy multiple MID Servers as load balancers for certain transactions. For example, JDBC data transfers can tie up the resources of a MID Server, making it unable to respond to other requests. The following operations between an integration might require separate MID Servers in a busy network:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- File exports
- Running scripts
- JDBC data sources
- Reading files

High availability model

Avoid installing MID Servers for critical integrations on a machine that might experience any type of planned outage or an outage caused by overloaded processes. If necessary for reliability, consider deploying these types of MID Servers to dedicated machines for high reliability

Note:
Do not integrate with an external application on a MID Server provisioned for ServiceNow Discovery or Orchestration.

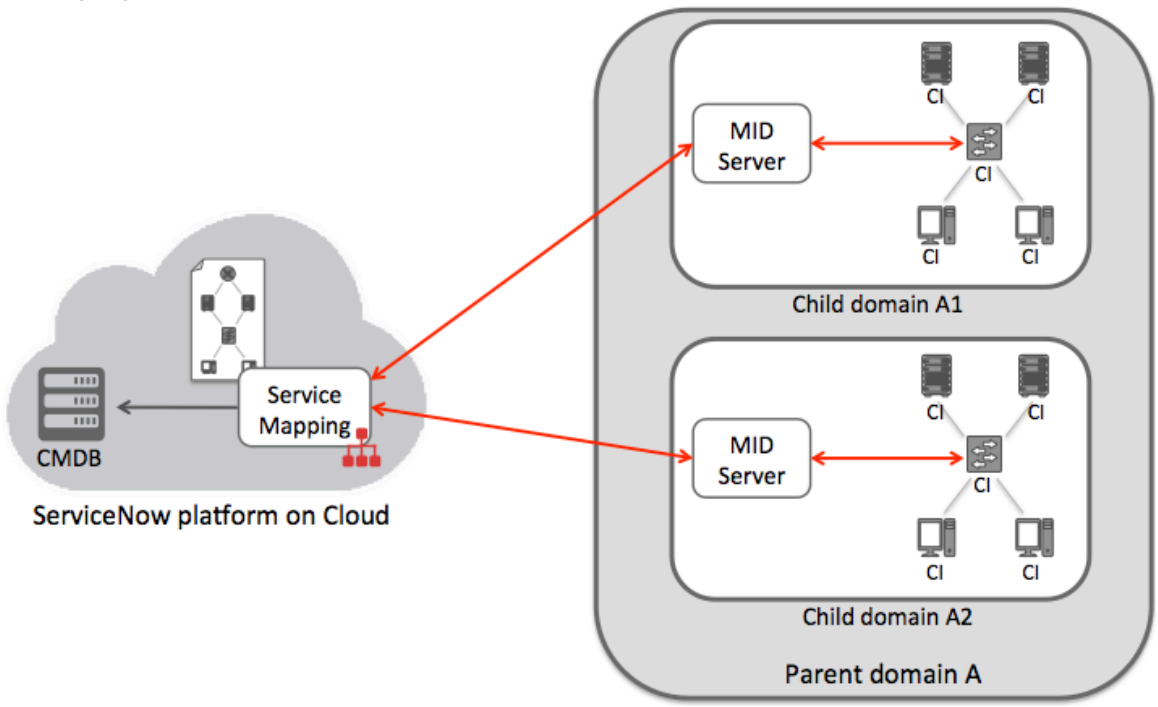
Wide area network (WAN)

When determining where to deploy MID Servers in a WAN, consider the bandwidth available between your local area networks. In most cases, install a MID Server on each LAN to probe devices locally, rather than deploying MID Servers that must probe devices across slow WAN connections. An alternative to this type of deployment is to install MID Servers that probe other LANs via VPN connections that take advantage of fast Internet connections. If the bandwidth of your WAN connections is comparable to that of your Internet connection, then there is no performance impact in running MID Server probes across WAN connections.

Domain separation

In deployments where domain separation is enabled and domains are configured to form a hierarchy, place the MID Servers at the lowest domain level.

Deploying MID Servers with domain separation



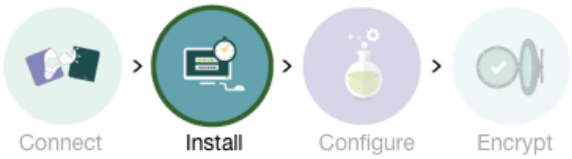
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use MID Server guided setup

MID Server guided setup provides a sequence of tasks that help you install a MID Server with the proper user account and validate the MID Server. If you are setting up a MID Server for the first time, this is a good way to get one up and running in your environment quickly.

Before you begin

Role required: admin



1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

About this task

You are guided through a series of configuration activities that create a fully qualified MID Server. A progress indicator on each screen allows you to monitor your progress on each task.
Each configuration activity provides the following resources to help you:

- Contextual embedded help.
- Links to comprehensive documentation on the ServiceNow product documentation site.

Important:
You must complete MID Server configuration before you can launch any other IT Operations Management guided setup.

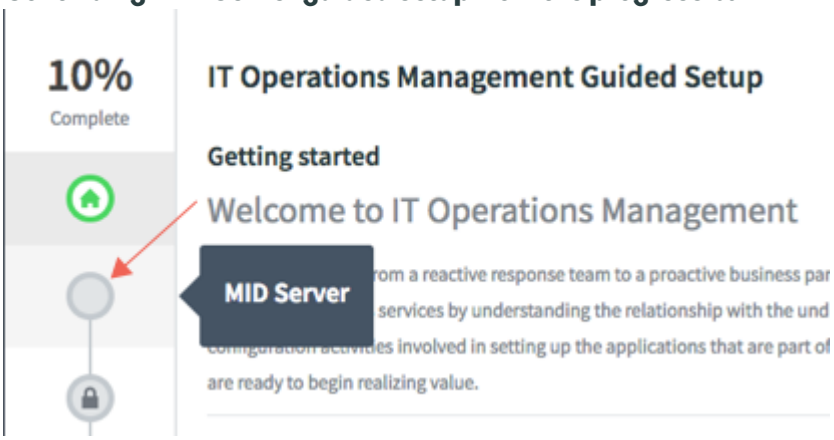
Procedure

1. Navigate to **All** > **Guided Setup** > **ITOM Guided Setup**.
   The IT Operations Management Guided Setup welcome screen appears.
2. Take one of the following actions:
   - If none of the MID Server installation and configuration tasks are complete, select **Get Started**.
   - If you have completed any of the MID Server installation and configuration tasks, select **Continue** to return to the task list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

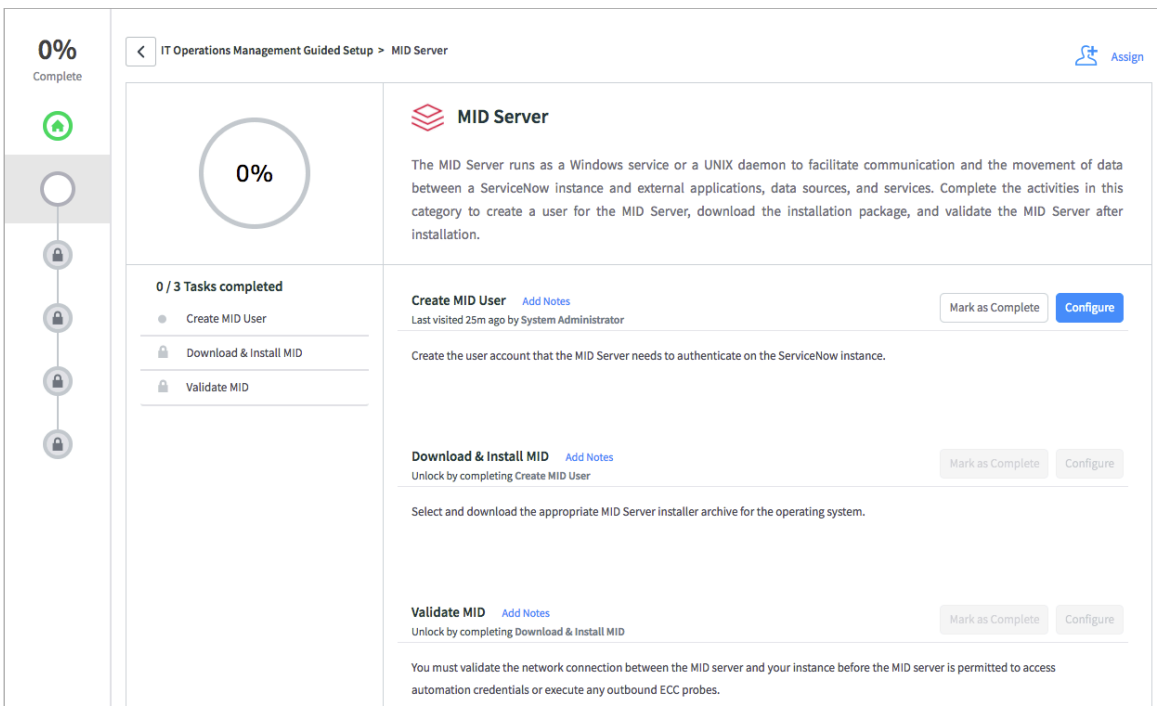
- Select the MID Server icon in the progress bar on the left side of the category screen to display the MID Server category pane at any time.

Continuing MID Server guided setup from the progress bar



3. Select **Continue**.
   The IT Operations Management Guided Setup category screen appears. The controls for starting the MID Server tasks are at the top of the list. Complete these tasks before setting up other applications that rely on the MID Server.

4. In the MID Server pane, select **Get Started**.
   The MID Server task list appears with a description of each task.

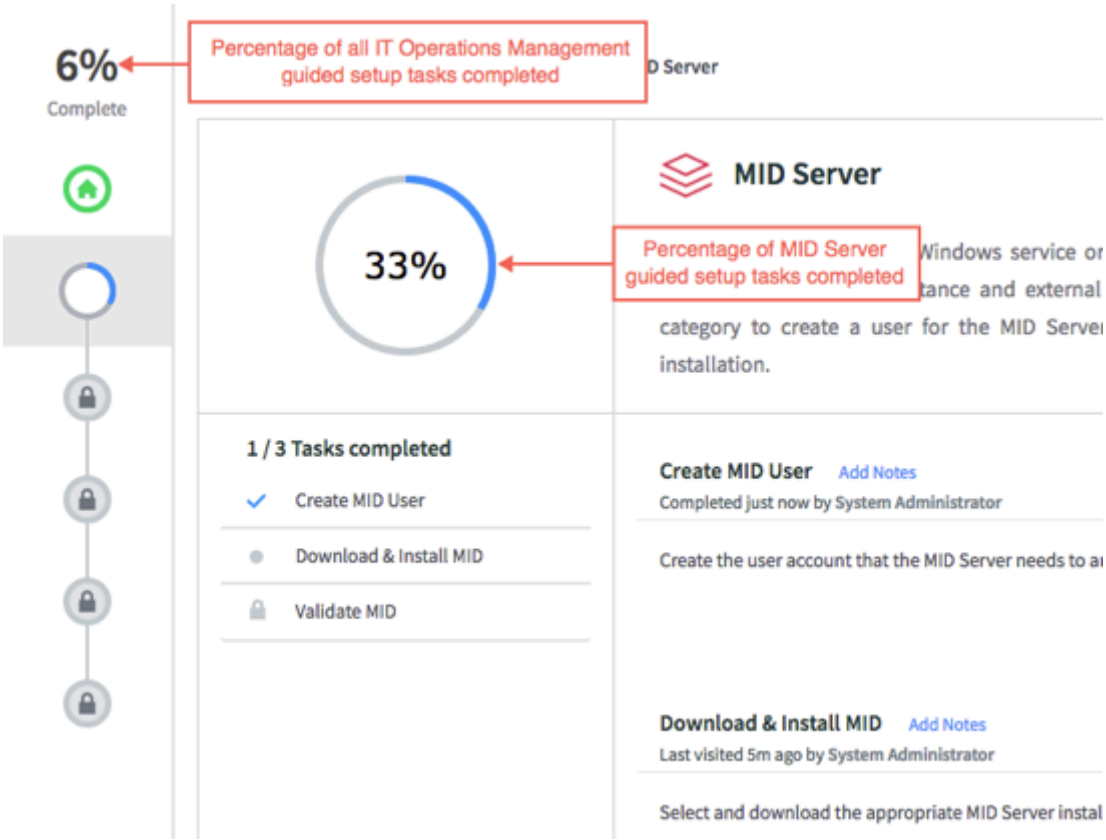


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select **Configure** to create the MID Server user and follow the instructions in the help pane that appears on the right side of the screen.

> **Important:**
> If you configured MID Servers manually before starting Guided Setup, select from that information to complete each specific task.

6. When you have provided the requested information for the MID Server user, select **Submit**, and then select **Mark as Complete** at the bottom of the help pane.
The view returns to the task list. Notice that the circular progress indicator for the category shows 33% of the MID Server configuration complete. The progress indicator on the left side of the screen shows the completion percentage for all the IT Operations Management tasks.



7. Select **Configure** for the next task, **Download & Install MID**.

   - Java 17.0.12 is bundled with the MID Server installer package and is installed on the host for all new MID Servers. The installer automatically configures Java 17.0.12 to run in your environment. No additional configuration is required. This version supports both 64-bit Windows MID Servers and 64-bit Linux MID Servers. The MID Server requires a minimum JRE version 17.0.10, and recommended version 17.0.12. If you are using a lower version than 17.0.10, you may see encryption related issues.

   - For information about the system requirements to host MID Servers, see MID Server system requirements

8. Validate your new MID Server.

What to do next

If necessary, deploy multiple MID Servers from a single host in your network. Otherwise, proceed to configure your MID Server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuring MID Servers

After installing and validating your MID Servers, ensure that they have access to sufficient system resources, probe the proper targets, and communicate with the instance as expected. Configure MID Server selection criteria, create clusters for failover protection, and set up MID Servers in different domains to protect data.

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

Some of these configuration procedures rely on data found in the MID Server references home page. See that page for links to the parameters, properties, and privileged commands you need to fine tune the behavior of your MID Servers. You can apply controls to individual MID Servers or to all the MID Servers in your environment. Remember to restart the MID Server after any configuration change for those changes to take effect.

MID Server selection

MID Servers are selected for use based on three criteria: applications, IP address or range, and capabilities. You can designate specific applications for a given MID Server, such as Discovery or Orchestration. You can specify an IP address or a range that a MID Server is allowed to work within. Some applications require specific capabilities, and so are restricted to MID Servers with those capabilities.

MID Server selection

Configure the way your instance selects a MID Server, either by application, IP address ranges, network capability, or behavior.

MID Server capabilities

Create capabilities that define the specific functions of a MID Server within an IP address range.

MID Server IP range auto-assignment

Configure the system to automatically assign a qualified MID Server to a subnet by that subnet's IP address range.

Map an IP address to a DNS name

Map host server DNS names to IP addresses if your MID Server manages resources within defined IP ranges.

Configure MID Server as WinRM trusted host

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add servers, which are part of WinRM, as trusted hosts on all MID Servers that Discovery or Service Mapping use for discovery.

File permission enforcement for Windows MID Servers

To improve security, Windows MID Servers will enforce Windows file permission restrictions. This will prevent compromised accounts from accessing unauthorized files by restricting their permissions to the minimum necessary for their role.

MID Server clusters

MID Server clusters are groups of MID Servers which provide support to each other in the forms of load balancing and fail-over protection. Work sent to a MID Server that is part of a cluster is automatically balanced between all the MID Servers in that cluster. MID Servers in a fail-over cluster each have a configured order that the platform uses to determine which MID Server to use next in case of failure.

Create a MID Server cluster

Create a MID Server cluster for load balancing and fail-over protection.

Set thread use

Set the number of threads your MID Server uses for the desired MID Server speed, based on hardware capabilities and competing applications running on the host.

Domain separation

Domain separation segregates MID Servers based on the records they can access. The credentials configured in a MID Server's config.xml file determine which records that MID Server can read, update, or create. You can specify MID Server policy records that only MID Servers from the same domain can use.

MID Server domain separation

Set up your MID Servers in different domains to restrict the records and credentials that a MID Server can access.

Synchronize a JAR file to MID Servers

Upload a JAR file to an instance and synchronize it to all MID Servers connected to that instance. Use JAR file synchronization to create policies that only a MID Server from the same domain can use.

MID Servers used for credential-less Discovery

MID Servers that are used for credential-less Discovery require special configuration to run Network Mapper (Nmap) commands on target computers.

Install and uninstall Nmap on a MID Server

You must install Nmap on each MID Server running on a Windows host. When given the proper capability, those MID Servers can discover some basic information about CIs in your network if normal authentication fails.

MID Server extensions

vCenter event collector

The vCenter event collector listens for vCenter-related events and updates the CMDB accordingly. The event collector allows the CMDB to be updated with changes to virtual machines (VMs), in addition to the updates detected by Discovery. A change to a VM is sent as an event from the vCenter server to the vCenter event collector. When an event is received, the CMDB is updated

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

accordingly. Full vCenter Discovery does not need to rerun. For some events, such as powered on and powered off events, Discovery does not need to run again at all. For most events, Discovery runs only on the necessary vCenter resource.

SNMP trap collector extension

The SNMP trap collector is a MID Server extension that listens for SNMP traps from the devices on your network. Upon receiving a trap, the MID Server sends the trap to the instance for further processing by Event Management. If Event Management is not active, traps are not processed and are discarded by the instance.

MID Server selection

You can configure MID Server selection by application, IP address ranges, network capability, or behavior. Specific MID Servers can be assigned to particular tasks, or the MID Server can be selected automatically. MID Servers can use domain separation to limit the scope of discoveries and event management.

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

The MID Selector used by most applications has three modes to select a MID Server:

- **Auto-select MID Server**: Selects from MID Servers based on MID Server criteria, regardless of whether they are members of a cluster.
- **Use specific MID Server**: Automatic reassignment to another MID Server is not supported.
- **Use specific MID Server cluster**: Automatic reassignment to another MID Server only selects from members of the specified cluster.

For Agent Client Collector, refer to Automatic MID Server selection.

MID Server criteria

MID Servers offer these types of criteria that help an application determine which MID Server to use:

- **Application**: The application that you specify on the MID Server. You can designate these applications for a specific MID Server:
  - Discovery
  - Orchestration
  - Service Mapping

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Event Management
- Operational Intelligence
- Cloud Management

An **ALL** application option is also available. By default, this option includes all applications. You can configure which applications are included in the **ALL** designation.

- **IP address or range**: The IP address or the IP ranges that the MID Server is allowed to work within. You can specify an IP address or IP range in the application, such as on a Discovery schedule or an Orchestration activity, and for the MID Server. If the IP configured in the application matches the IP address or falls within the allowable IP range configured on the MID Server, a match is possible, and that MID Server passes this criteria. To have the instance automatically assign IP ranges (subnets) to available MID Servers, see Using MID Server IP range auto-assignment.
- **Capabilities**: The network capability an application needs to use, such as the PowerShell Orchestration activity or the Workflow Studio PowerShell step. Some applications, like Cloud Management, require a specific capability.

Note:
Discovery and Service Mapping can also use behaviors, which determine the type of port probes used during the port scan phase of Discovery. Both Discovery and Service Mapping use a behavior to discover Create a discovery behavior for Unix-based load balancers. Other applications do not use behaviors. Behaviors are not used for auto-selection, default MID Servers, or specific MID Servers as described below. See Discovery behaviors for more information.

How an application selects a MID Server

If you do not specify a specific MID Server for an application to use, the application tries to select one. Each application relies on different criteria to select an appropriate MID Server.

Application	Supported Application on the MID Server	IP address range	Capability
Discovery (Select **Auto-Select MID Server** on the Discovery schedule)	The **Discovery** or **ALL** application must be specified on the MID Server.	Discovery uses IP ranges that you configure on the Discovery Schedule form to see if they fall within the IP ranges that you configure on the MID Server, or the **ALL** IP ranges option must be selected on the MID Server.	N/A **Note:** Any configured behaviors are ignored.
Orchestration	The **Orchestration** or **ALL** application must be specified on the MID Server.	The target IP address that you configure in an Orchestration activity must fall within the IP ranges that you configure on the MID Server, or the **ALL** option must be selected on the MID Server.	The capability that is required for an Orchestration activity must match the capabilities you configure on the MID Server, or the MID Server capability must be set to **ALL**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Application	Supported Application on the MID Server	IP address range	Capability
Service Mapping	The **Service Mapping** or **ALL** application must be specified on the MID Server.	The endpoint IP address must fall within the IP range that you configure on the MID Server, or the **ALL** option must be selected on the MID Server.	One of the supported Service Mapping capabilities (for new installs) must be configured on the MID Server, or the MID Server capability must be set to **ALL**.
Event Management	The **Event Management** or **ALL** application must be specified on the MID Server.	The IP configured in the event connector instances, such as Configure event collection from HPOM, must fall within the IP range configured on the MID Server.	
Cloud Management	N/A	N/A	The **Cloud Management** or **ALL** capability must be added.

Mode: Auto-select MID Server

During initial work assignment to a MID Server, or when failing over existing work from a down MID Server to another MID Server, the MID selector picks a set of suitable MID from a given status level by traversing the steps below once. If at any step it finds at least one server, all remaining steps are skipped.

1. Suitable MID Servers with status = Up.
2. Default MID Server (if it was defined) with status = Up.
3. Suitable MID Servers with status = Upgrading or Paused.
4. Default MID Server (if it was defined) with status = Upgrading or Paused.
5. Suitable MID Servers with status = Upgrade Failed, Draining, Drained, Drain Failed, or Down.
6. Default Mid Server (if was defined).

All steps which are below an application's minimum status level are skipped. Many applications (such as Discovery) allow Up or Degraded MID Servers, other applications only allow Up MID Servers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Mode: Use specific MID Server cluster

During initial work assignment to a MID Server, or when failing over existing work from a down MID Server to another MID Server, the MID selector picks a set of suitable MID from a given status level by traversing the steps below once. If at any step it finds at least one server, all remaining steps are skipped.

1. Suitable Mid Servers with status = Up.
2. Suitable Mid Servers with status = Upgrading or Paused.
3. Suitable Mid Servers with status = Upgrade Failed, Draining, Drained, Drain Failed, or Down.

All steps which are below an application's minimum status level are skipped. Many applications (such as Discovery) allow Up or Degraded MID Servers, other applications only allow Up MID Servers.

A MID server is picked from set of MID servers at the highest status level as follows depending on cluster type:

- **Load Balance Cluster**: picks a MID Server within the status level randomly.
- **Fail-over Cluster**: picks a MID Server with best cluster records' order number (0 = best).

Mode: Use a specific MID Server

Discovery and Event Management can use a MID Server that you specifically call out.

Note:
Selecting a specific MID Server is not the same as specifying the default MID Server for an application. A specific MID Server is always used. If it is **Down** or not validated, the application does not execute commands against the MID Server. A default MID Server is fallback that is used when the auto-selection of MID Servers does not find any eligible MID Server.

Application	How you specify a specific MID Server	Criteria that the default MID Server must mee
Discovery	Choose the MID Server on the Discovery schedule. **Note:** You can also specify a cluster of MID Servers.	If you select a MID Server without the **Disc** **ALL** application, it automatically adds the I application.
Orchestration	N/A	N/A
Service Mapping	N/A	N/A
Event Management	Choose one or more MID Servers on the connector instance event collection, such as Configure event collection from HPOM.	N/A
Cloud Management	N/A	N/A

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If a MID Server manages resources within defined IP ranges for Orchestration, you must map the fully-qualified domain name (FQDN) of a server with its IP address to run certain activities, such as Exchange activities.

Domain separation

If you are using domain separation, you can configure MID Servers to be in separate domains. The domain that the MID Server is in affects how the application selects the domain:

Discovery and Service Mapping: On the Discovery schedule, the MID Servers and clusters that available for selection are limited to the same domain of the user who is configuring the schedule. This also applies to the auto-selection option: only MID Servers in the same domain as the user can be automatically selected.

MID Server selection test for Service Mapping

If Service Mapping is active, you can preview which MID Server that Service Mapping uses for a specific target device or computer. To do this, navigate to **Service Mapping** > **MID Servers** and click **MID Selection Test**. Enter the IP address and an optional application and capability, and then click **OK**. The name of the MID Server that Service Mapping will use appears in the window.

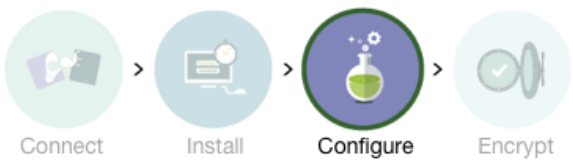
Related topics

Configure a default MID Server for each application

You can configure a default MID Server that an application can use if all other possible MID Servers are unavailable. You can narrow down the list of applications that are included in the definition of ALL.

Before you begin

Role required: agent_admin or admin



1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

About this task

Applications are only available when their respective plugins are activated.

The default MID Server is used when applications fail to find a suitable MID Server that matches configured criteria during auto-select. The default MID Server for the **ALL** application is used if the default MID Server for the specific application is not available. Some applications also offer a property to set the default MID Server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:
If you configure a MID Server for ALL IP ranges (type **Include**) and also create an IP range of type: **Exclude** for the same MID Server, the system ignores the excluded IP range for that MID Server.

The default MID Server does not need to meet any criteria (application, IP range, behavior, or capability) to be used. Specifying a default MID Server is optional, and you can use a MID Server as the default for more than one application.

Application	Additional notes
Discovery	Discovery attempts to use the default MID Server when the Discovery schedule specifies **Auto-Select MID Server** and Discovery cannot find any MID Servers with the correct application and IP range.
Orchestration	Orchestration attempts to use the default MID Server when it cannot find any MID Servers with the capabilities that you define in the Orchestration activity. You can also specify a default MID Server. The value in that property automatically synchronizes with the default MID Server you select in the Orchestration application.
Alert aggregation and RCA	Not applicable. The MID Server is selected if it has the RCA capability. Route to right MID by domain.
Service Mapping	If there are no MID Servers with matching application, capability, or IP range, Service Mapping uses the default MID Server.
Event Management	You can specify a default MID Server for Event Management using the mid.server.connector_default system property. Event Management does not use the default MID Server in the application record.
Cloud Management	N/A

Procedure

1. Navigate to **All** > **MID Server** > **Applications**.
   The list of installed applications that can use MID Servers appears.
2. Click the name of an installed application.
3. Select a MID Server from the list in the **Default MID Server** field.
4. To select additional MID Servers for this application, click **Edit** in the **MID Servers** related list and select alternate MID Servers that this application is allowed to use.
5. Click **Update**.

Select applications to include in the definition of ALL for a MID Server

You can narrow down the list of applications that are included in the definition of ALL.

Before you begin
Role required: agent_admin or admin

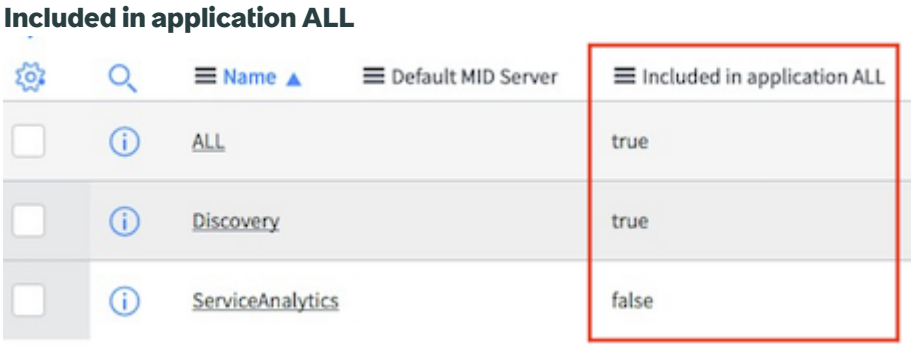
About this task
You can specify the ALL application for a MID Server, which means that the MID Server is allowed to work with any of the applications that require MID Servers, such as Discovery, Event Management, Service Mapping, and so on. But you might not want all applications to be included

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

in the definition of ALL. For example, you might want to exclude Service Mapping from the ALL definition if you already have a dedicated MID Server to work with Service Mapping.

Procedure

1. Navigate to **All** > **MID Server** > **Applications**.
   The list of installed applications that can use MID Servers appear.
2. If you do not see the **Included in application ALL** column, you can personalize the list and add it.



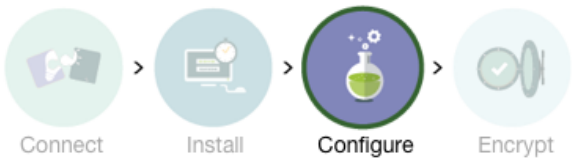
3. For each application, double-click the value in the **Included in application ALL** column.
4. Change the value to **true** (to include) or **false** (to exclude).

Configure an IP address range for the MID Server

You can manually configure an IP address range for the MID Server to explore.

Before you begin

Role required: agent_admin or admin



1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

About this task

Applications, such as Discovery and Orchestration, can specify an IP range or the specific IP address of a target. When the application looks for a MID Server to use during auto-selection, it chooses a MID Server whose IP range includes the application's range or specific IP address. Applications also use other criteria, such as the MID Server's supported application or capability. See MID Server selection for more information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
This is a manual configuration procedure. To learn how the system can assign IP address ranges to selected MID Servers automatically, see Using MID Server IP range auto-assignment.

These applications use IP ranges as follows:

- **Orchestration**: Use the IP address of the target machine (together with the capability) to select the correct MID Server for Orchestration activities. See the procedure in this topic to configure the IP address.
- **Service Mapping**: Select the MID Server whose IP address range matches the IP in the discovery request. See MID Server configuration for Service Mapping for more information.
- **Discovery**: Can select an IP address range using the same criteria as Service Mapping. Discovery can also use a quick IP range that you specify in the Discovery schedule.

Tip:
You can also use the **ALL** IP range, which allows the MID Server to be used with any range of IP addresses that an application specifies. This only allows the MID Server to access IP ranges, it does not mean that the MID Server can actually reach all of the IP ranges. To function with an application, the MID server must have access to the IP ranges that the application needs.

Valid IP address ranges can be as follows:

An IP address in dotted decimal or hexadecimal format. The hexadecimal format can be explicitly prefixed with 0x, this is not mandatory. Here are examples:

- 10.11.144.155
- 0x0A0B909B
- 0A0B909B

An IP address range in dotted decimal or hexadecimal format. Here are examples:

- 10.11.144.150-10.11.144.160
- 0x0A0B9096-0x0A0B90A0
- 10.11.144.150-0x0A0B90A0

An IP network address with the net mask specified after a slash (/) in regular notation (0-32 inclusive) or in IP address notation. Here are examples:

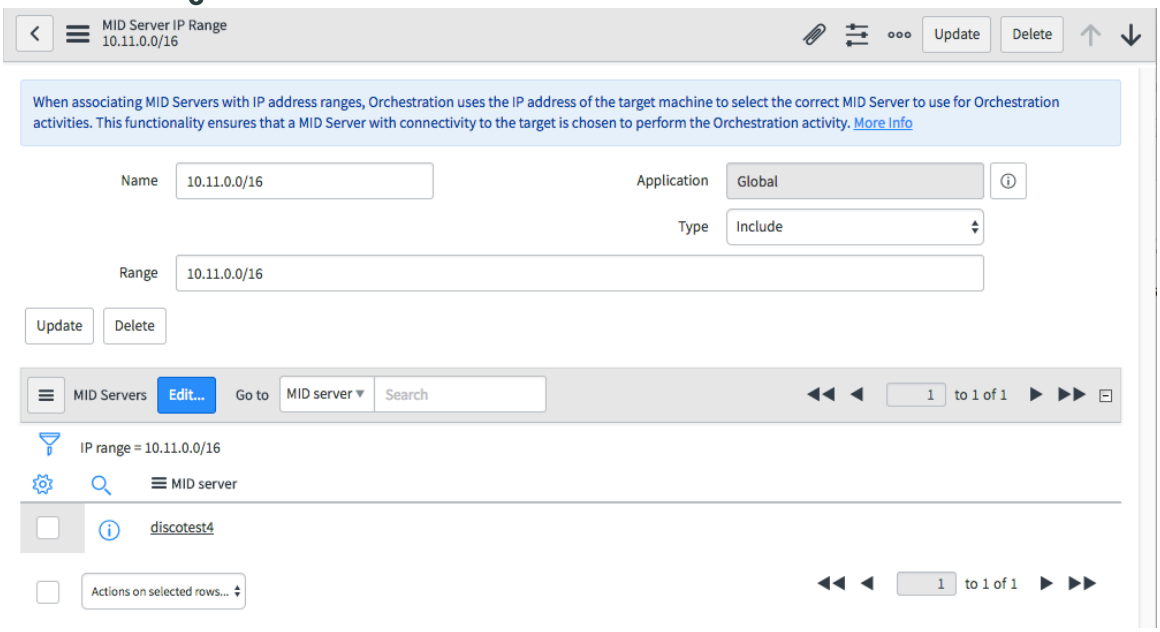
- 10.11.144.0/24 10.11.144.0/255.255.255.0
- 10.11.144.0/0xFFFFFF00
- 0x0A0B9000/24
- 0x0A0B9000/0xFFFFFF00

Procedure

1. Navigate to **All** > **MID Server** > **IP Ranges**.
2. Click **New**.
3. Complete the form, using the fields in the table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

IP address ranges



Field	Description
Name	Enter a descriptive name.
Application	Application scope for this IP range. The default is **Global**.
Type	Select the type of range: ○ **Include**: Include the specified IP range. ○ **Exclude**: Exclude the IP address range. **Note:** If a MID Server is configured for **ALL** applications, any IP addresses configured for exclusion are ignored by the system. If your goal is to configure default MID Servers for separate applications in your system, see Configure a default MID Server for each application.
Range	Enter the range in a valid format.
Related list	
MID Servers	The MID Servers that can use this IP address range.

4. Click **Save**.

Important:
IP ranges assigned manually prior to using auto-assignment in the Discovery Quick Start are affected as follows:

- Individual IP ranges are retained and appended to the ranges assigned automatically by the system for the designated MID Server.
- If the MID Server was configured with the **ALL** ranges selection, the auto-assignment feature overwrites that designation with the ranges it finds.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next
Open the **ALL** IP range record and configure the MID Servers that you want to use with any set of IP addresses.

Override the MID Server selection filter

Use the override feature to write your own filter condition that overrides the normal MID Server selection criteria for an application. An override has precedence over the default filter and can be defined for a specific selection condition.

Before you begin
Before attempting to create an override filter, be sure you understand the criteria the platform uses to select MID Servers. See MID Server selection for details.

Role required: admin

---

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

About this task
Note:
The override feature is intended for Cloud Management and Cloud Discovery only. The **Override by capability** filter is provided by default.

There are four MID Server selection filters included in the base ServiceNow system. These filters are applied to all MID Servers in order until the system finds a matching condition:

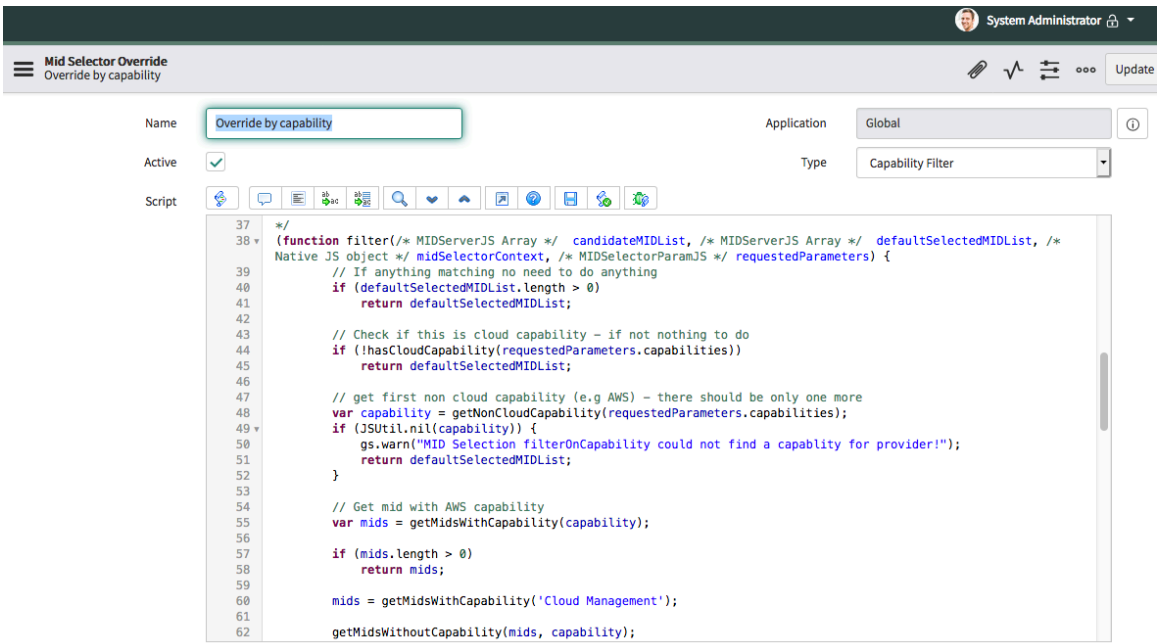
- Status Filter
- App Filter
- Capability Filter
- IP Filter

Important:
The override feature allows multiple filter types but only one override filter for each filter type. The **Override selector** filter type overrides all other filters and takes complete control of the MID Server selection. If this type is active, it is the only filter applied.

Procedure
1. Navigate to **All** > **MID Server** > **Mid Selector Override**.
   The list of MID Server overrides appears.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Select **New** to create a new filter.
3. Complete these fields:
   - **Name**: Unique name for this override. Ensure that you can identify the override type by the name.
   - **Script**: Condition for this filter. Create the MID Server selection logic for your override in this field, using the directions provided in the function template. Look at the **Override by capability** filter as an example before starting to create your filter.
   - **Type**: Type of override being configured. Select one of the four default filters to override with your condition, or select **Override selector** to create a filter that overrides all the others.
4. Select **Submit**.



Example:
The Cloud Discovery schedule selects MID Servers based on Applications and Capabilities. To select different MID Servers for different service accounts, you can customize the **MID Selector Override**. After the line `(function filter(/* MIDServerJS Array */ candidateMIDList, /* MIDServerJS Array */ defaultSelectedMIDList, /* Native JS object */ midSelectorContext, /* MIDSelectorParamJS */ requestedParameters)` { add the following code with your information:

```
var result = [];

 if (JSON.parse(midSelectorContext).service_account_id ==
 '[example-account-id]') {
  for (var mid in defaultSelectedMIDList) {
   if (defaultSelectedMIDList[mid].sysId == '[example-MID-1]' ||
 defaultSelectedMIDList[mid].sysId == '[example-MID-2]')
    result.push(defaultSelectedMIDList[mid]);
  }
  return result;
 }
```

© 2026 ServiceNow, Inc. All rights reserved.

Using MID Server IP range auto-assignment

Discovery Quick Start can automatically assign ranges of IP addresses, called subnets, to qualified MID Servers. This subnet auto-assignment requires SNMP credentials for read-only access to routers Discovery uses. The Automation Status Set form shows summary details of subnet Discoveries and the IP range assignments for associated MID Servers.

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

To be automatically assigned to a subnet, a MID Server must be:

- In a running **(Up)** state.
- Successfully validated.
- Able to access one or more subnets in your network.

The subnet assignments that the instance makes for your MID Servers are stored in the Automation Status Set [automation_status_set] table. For details about MID Server auto-assignment, see Discovery Quick Start.

Important:
You must auto-assign at least one MID Server to create a schedule automatically.

Required SNMP OIDs for MID Server IP range auto-assignment

Customers who use network service providers must request specific SNMP access to use MID Server IP range auto-assignment.

IP range auto-assignment requires SNMP credentials for read-only access to all routers that Discovery uses to identify subnets. In addition, your service provider must grant the following SNMPWALK access:

- iso.org.dod.internet.mgmt.mib-2.ip.ipRouteTable (1.3.6.1.2.1.4.21)
  - ipRouteDest (1.3.6.1.2.1.4.21.1.1)
  - ipRouteNextHop (1.3.6.1.2.1.4.21.1.7)
  - ipRouteType (1.3.6.1.2.1.4.21.1.8)
  - ipRouteMask (1.3.6.1.2.1.4.21.1.11)
- iso.org.dod.internet.mgmt.mib-2.ip.ipForward.ipCidrRouteTable (1.3.6.1.2.1.4.24.4)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- ipCidrRouteDest (1.3.6.1.2.1.4.24.4.1.1)
- ipCidrRouteMask (1.3.6.1.2.1.4.24.4.1.2)
- ipCidrRouteNextHop (1.3.6.1.2.1.4.24.4.1.4)
- ipCidrRouteType (1.3.6.1.2.1.4.24.4.1.6)

View automation status sets and IP range assignments

The Automation Status Set form shows summary details of a subnet Discovery and the subsequent IP range assignments for MID Servers selected for automatic subnet assignment.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **MID Server** > **Automation Status Sets**.
2. Select a status record for a subnet Discovery you want to view.
   The form contains read-only status information about the selected Discovery, the subnets found, and the range assignment process for the MID Servers you selected for auto assignment.

> **Important:**
> IP ranges assigned manually prior to using auto-assignment in the Discovery Quick Start are affected as follows:
>
> - Individual IP ranges are retained and appended to the ranges assigned automatically by the system for the designated MID Server.
> - If the MID Server was configured with the **ALL** ranges selection, the auto-assignment feature overwrites that designation with the ranges it finds.

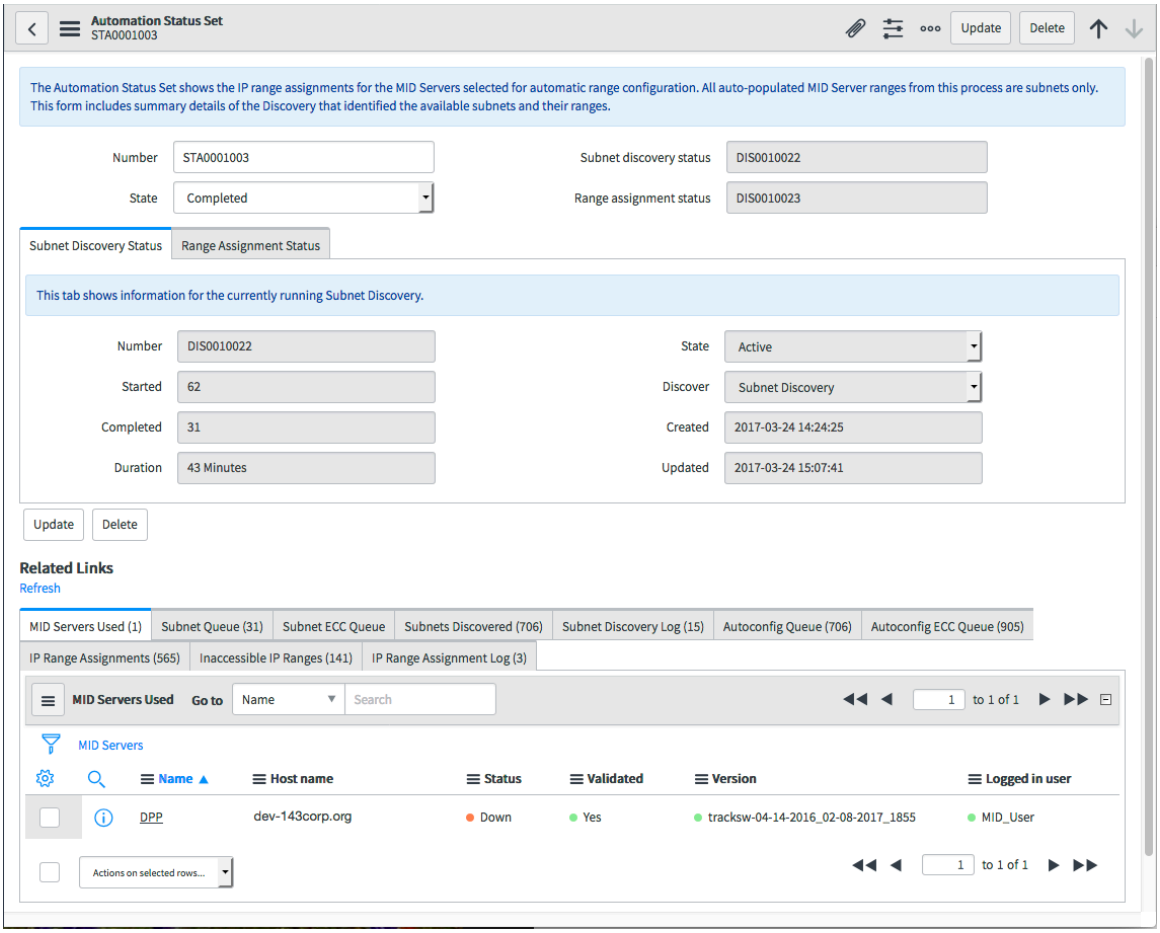
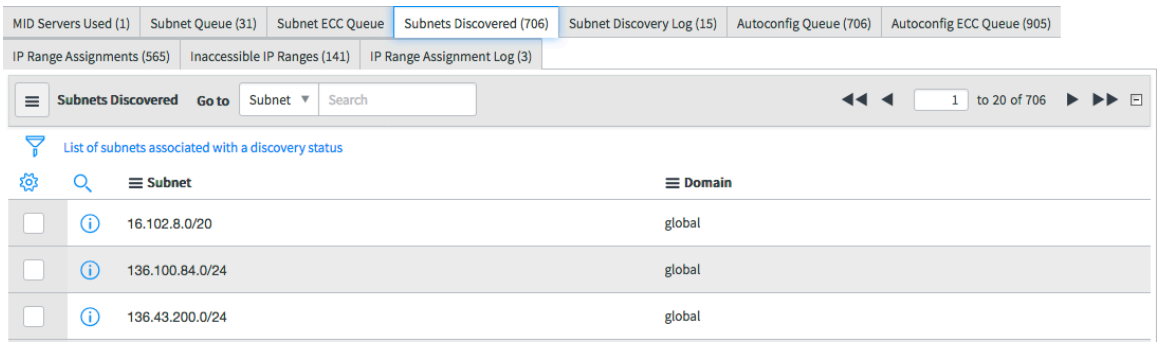
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Automation Status Set form



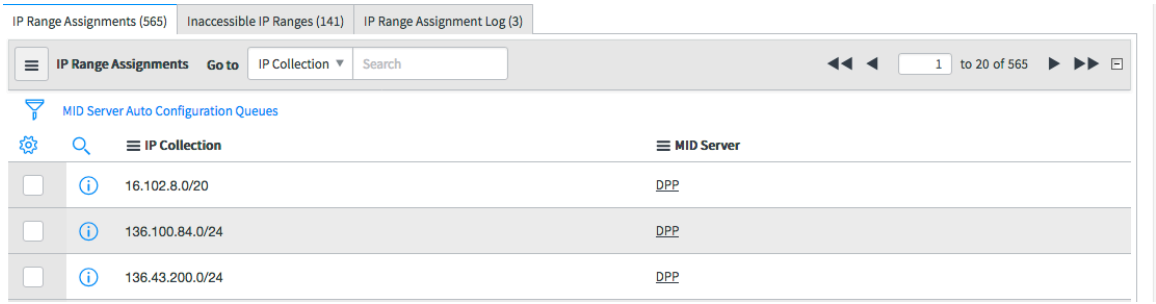
3. Select the **Subnets Discovered** related list to view the list of subnets available for assignment.



4. Select the **IP Range Assignments** related list to view the IP ranges that were assigned to a MID Server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Warning:
IP ranges identified by Discovery are stored in the IP collection [ip_address_collection] table, which is only used for MID Server IP range auto-assignment in the Jakarta release. This table is intended for future development and **should not** be used in any customizations, including column additions, business rules, or scripting actions.



File permission enforcement for Windows MID Servers

To improve security, Windows MID Servers enforce Windows file permission restrictions. The enforcement limits access to the MID Server files to a restricted allow list of users and groups.

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

File permission enforcement for Windows MID Servers goes into effect on the MID Server on start up in Orlando. By default the agent folder is locked to four user accounts and groups: the local admin group, the system account, creator owner, and the user account the Windows MID Server is using. The list of permitted user accounts is managed by a allow list, which is controlled by the MID Server parameter *`mid.windows_host.file_permissions.allow_list`*. This parameter takes a string of comma separated group names, user names, and security identifiers (SID). Group and user names must follow SAM account naming requirements. Domain accounts must be specified by using the SID.

Roll back file permission changes

Changes to the file permissions are recorded, and the last used settings are saved in the `/etc` folder as a backup. The file is `fileperm.aclsave`. Open a command prompt and run the command `icacls <agent_folder> /restore <agent_folder>/etc/fileperm.aclsave` where <agent_folder> is name of your agent folder.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

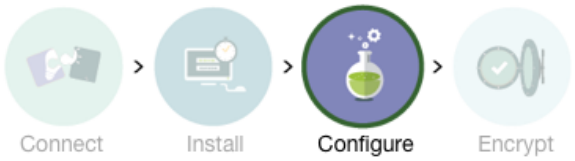
Run a MID Server as a non-admin

To run a MID Server as a non-admin user, it must first be installed using an admin account. Then add the non-admin user to allow list and restart the MID Server. Once the new enforcement rules run, the MID Server can be switched to the non-admin service account. See Manually install a MID Server on Windows for more information on setting up non-admin Windows MID Servers, or Run Linux MID Servers as non-root users for Linux MID Servers.

Map an IP address to a DNS name

Associate the IP address to a DNS name to ensure the appropriate MID Server is selected. The IP Address range configuration determines which MID Server is selected. If the MID Server manages resources within defined IP ranges, all host servers must have their DNS names mapped to an IP address.

Before you begin
Role required: admin



1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

The association of an IP address to a DNS name ensures that the appropriate MID Sever is selected based on the IP Address range configuration. If this is not done, Orchestration reverts to the default MID Server.

If Discovery cannot discover the server and resolve the DNS name to an IP address, you must create the mapping manually.

Important:
The platform does not map **localhost** to 127.0.0.1 automatically. You must create that mapping using this procedure.

Procedure

1. Enter **cmdb_ci_dns_name.list** in the navigation filter.

   A list of DNS names appears.

2. Check the list for your host server.

   If the server does not appear in the list, continue with this procedure.

3. Click **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

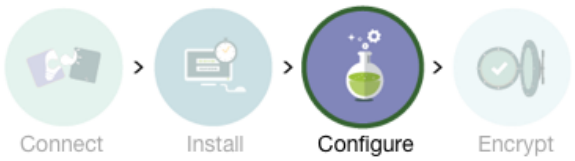
4. Enter the fully-qualified domain name (FQDN) of the host server in the **Name** field.
5. Right-click in the form header and select **Save** from the context menu.
6. In the **IP Address** related list, click **New**.
7. In the **IP Address** field, enter the IP address of your host server.
8. In the **Nic** field, select **eth0** or your preferred network interface controller.
9. Leave the **Netmask** field blank.
10. Click **Submit**.

Configure MID Server capabilities

MID Server capabilities define the specific functions of a MID Server within an IP address range, allowing an application to select the most appropriate MID Server. Configure capabilities on MID Servers for applications like Orchestration, Cloud Management, and Service Mapping.

Before you begin

Role required: admin or sm_admin



1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

About this task

Several applications use capabilities, IP ranges, and MID Server selection to narrow the pool of MID Servers the applications need.

Note:
At least one capability is required for each MID Server used by Orchestration. See MID Servers for Orchestration for more information.

The following capabilities are available by default with Discovery:

All	IBM	Resolve DNS
Ansible	JDBC	REST
AWS	NetApp	SNMP
Azure	Nmap	SOAP
Chef	OpenStack	SSH

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cloud Management	PowerShell	VMware
Google	RCA	WMI

Procedure

1. Navigate to **All** > **MID Server** > **Capabilities**.
2. Select an existing capability or select **ALL** to include all capabilities.

   Note:
   Ensure that each IP address range has MID Servers with the necessary capabilities to complete the Orchestration activities on that network segment.

3. Create a new capability:

   a. Select **New**.

   b. Configure the value for a custom capability.

   Example
   An example is a capability for **DOMAIN**, with a value of **service-now**.

   c. Select **Submit**.

4. Select **Edit** in the MID Servers related list to add MID Servers to the capability.
5. Select one or more MID Servers for this capability from the **Available** list.
6. Select **Save**.

   The capability defined here also appears in the primary record for this MID Server.

MID Server capabilities

MID Server capabilities define the specific functions of a MID Server within an IP address range.

Nmap capability

The **Nmap** capability is only assigned to MID Servers for which the Network Mapper (Nmap) scanner has been installed for credential-less Discovery. This capability cannot be added to or removed from any MID Server manually. For instructions on installing or uninstalling Nmap, see Install and uninstall Nmap on a MID Server

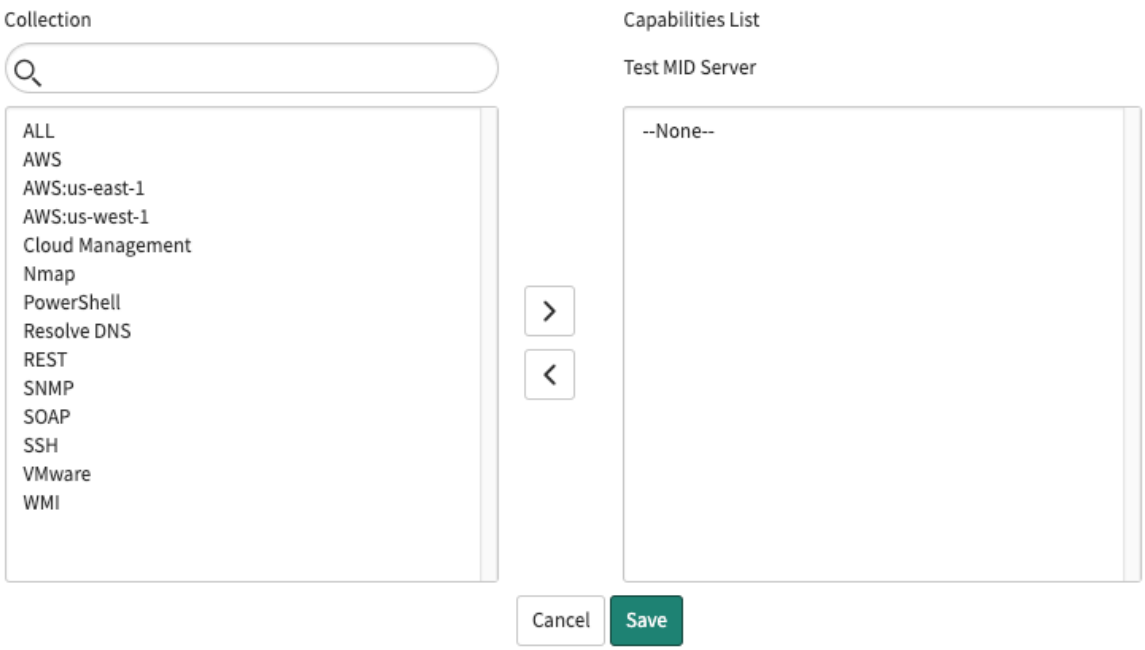
MID Server capability values

Capabilities provided in the base system do not have a defined value string. The capability value can be blank, a single value, or a * (wildcard). A MID Server configured to use a capability that has no value can locate any device using that capability's protocol. If a capability has a defined value, the MID Server using that capability finds only those devices using that protocol that match the value string exactly. The exception to this is the Resolve DNS capability, which is configured to resolve any DNS name into an IP address using a partial string match. The * (wildcard) will match a request capability specifying any non-blank value.

Starting with the Madrid release, the **[capability name]:[value]** combination appears in the slushbucket when you add a capability to a MID Server. This combination allows you to see all the capabilities that have different values, even if the capability name is the same. For example, if you are using the Cloud Management capability, and you use the value field to specify the us-

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

west logical datacenter on one of the capability records, you can see the combination in the **Collection** list.



MID Server selection

The MID Server is selected using an algorithm based on the capabilities available. The selector produces a list of suitable MIDs using filters in the following order: **server status** > **applications** > **IP range** > **capabilities**. The algorithm searches the capabilities in the following sequence and, if a step finds at least one MID server, the remaining steps are skipped:

1. **Exact value match:** Find each MID Server containing capabilities with name/value pairs with an exact match to all requested capability name/value pairs. Blank is a valid value. * (wildcard) values are ignored.
2. **Wildcard value match:** The same as an exact value match, but also allows a non-blank request value to match MID server capability records containing value *.
3. **Special capability name ALL:** Find each MID Server containing the special capability name ALL, ignoring capability's value field.

Note:
If the requested capability name does not exist in the ecc_agent_capability table, **BadArgumentException** is thrown rather than falling back to the ALL capability.

Scripted MID Server capability value matching

You can use value tests to create capabilities that find devices using values without requiring exact string matching. Action on these values is controlled by a user-defined script.

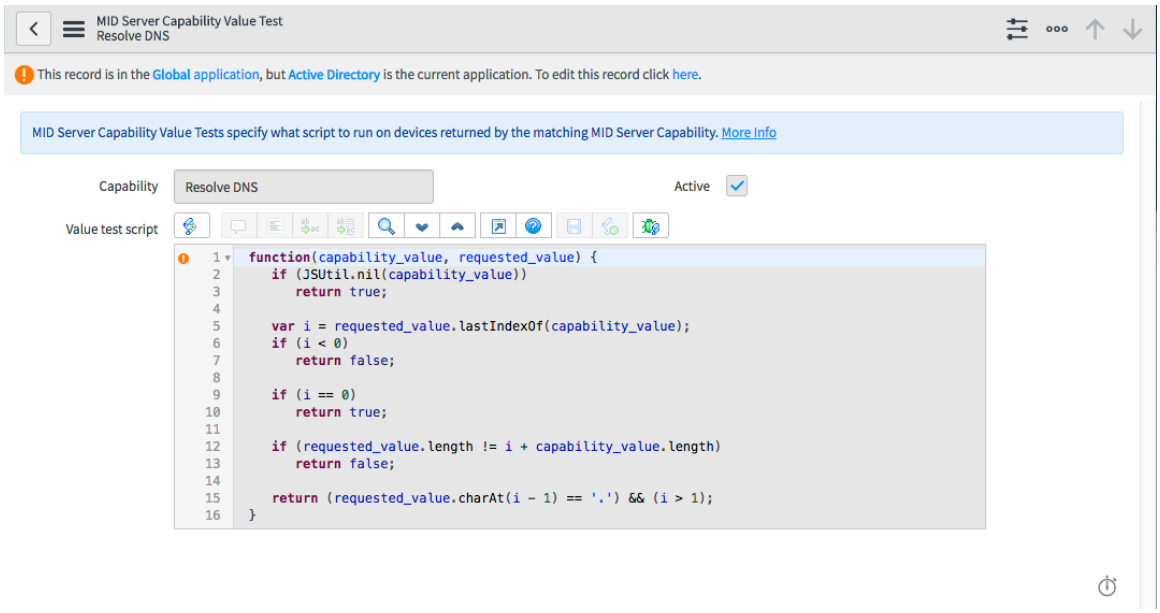
The Resolve DNS capability is provided in the base system and is configured to resolve DNS names into IP addresses for devices whose names end with a specified domain name. The capability **Value** entered is automatically prefaced with a dot during processing to match domain syntax. This value can contain one or more sub-domains, but must include the end of the domain string. Matching devices must end with the identical syntax. The script for the Resolve DNS capability determines if a device name matches the criteria defined by **Value**. If a match exists, the platform performs the address resolution automatically. For example, if the value for the Resolve DNS capability is `service-now.com`, the MID Server with this capability finds `lnxlab01.sandiego.service-now.com` and `dbsrv101.sanjose.service-`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

now.com. If the value is changed to `sandiego.service-now.com`, then the MID Server finds only `lnxlab01`.

Note:
If **Value** in the Resolve DNS capability is blank, then all domains match.

To view the script for evaluating this capability, navigate to **MID Server** > **Capability Value Tests** and select **Resolve DNS** from the list.



Configure a MID Server cluster

Group multiple MID Servers to form clusters, then configure clusters for fail-over protection or load balancing. Load-balancing clusters automatically balance work between each MID Server to improve stability and performance, as well as handle fail-over. Fail-over clusters have a configured order used to determine which MID Server to use next if a failure occurs.

Before you begin

Ensure that all MID Servers in the cluster have the same capabilities (Supported Applications, IP Ranges, and Capabilities). A MID Server should not belong to more than one cluster.

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

About this task

Create a new cluster or edit an existing cluster.

Procedure

1. Navigate to **All** > **MID Server** > **Clusters**.
2. Click **New** to create a new cluster, or open an existing cluster's record to edit.
3. Name the cluster and select the cluster type: **Failover** or **Load Balance**.
4. Right click in the header bar and select **Save** from the context menu.
5. Click **Edit** in the **Includes MID Servers** Related List.
6. Select appropriate MID Servers for this cluster from the slushbucket.

MID Server clusters

MID Server clusters enable multiple MID Servers with the appropriate capabilities to be grouped together for load balancing and fail-over protection.

External data sources

For performance and reliability reasons, these data sources should not be used with MID Server clusters. These external data sources should only be used with dedicated MID Servers.

- LDAP
- Export sets
- JDBC data sources

Note:
If a MID Server in a cluster fails, the fail-over MID Server starts over at the beginning of the ECC queue task even if much of the information from the JDBC data source was already returned. This can result in duplicate data. For more details, see the Using MID Server clusters for JDBC data sources can cause duplicate and out-of-date data [KB0727739] article in the HI Knowledge Base.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

How clusters work

MID Servers in clusters must be able to connect to the instance and to all the devices with which they are expected to communicate. If all MID Servers in a cluster are down, the discovery is canceled. Make sure all the MID Servers are added to any Access Control List (ACL) in use. MID Server clusters are managed by a business rule called MID Server Cluster Management, which checks to see if the MID Server assigned to a job in the ECC Queue belongs to a cluster.

Load balancing

If the cluster business rule determines that a MID Server is part of a load balancing cluster, the application using the MID Server automatically balances the work between the MID Servers in that cluster. It is good practice to put MID Servers with the same capabilities in a load balancing cluster.

Fail-over protection

MID Servers in a fail-over cluster each have a configured order that the platform uses to determine which MID Server to use next in case of failure. MID Servers in a fail-over cluster work independently and do not load balance with other MID Servers in that cluster (although they might also be members of load balancing clusters). When a MID Server fails, the MID Server Cluster Management business rule selects the highest available MID Server in the order to take over the work. The selected MID Server checks the ECC Queue and starts with jobs that are either Processing or Ready.

Note:
MID Server clustering does not support the ECC queue topics `Command` or `SystemCommand`. If these commands are received, the clustered MID Servers do not redirect the ECC queue to another MID Server. The ECC queue records stay on the ECC queue without being processed.

Configure a fail-over MID Server with at least the same capabilities as the MID Server it is intended to relieve.

Note:
If a MID Server fails while the Shazzam probe is running and auto-selection is configured, failover is not available. The Shazzam discovery stops. Discovery does not automatically choose another MID Server.

MID Server cluster event

The following event is triggered when the platform cannot find a MID Server with the appropriate capabilities to replace a MID Server in a fail-over cluster. Use this event to create an email to notify appropriate users that the cluster has failed.

MID Server cluster event

Event	Table	Description	Business Rule
mid_server.cluster.down	MID Server Cluster [ecc_agent_cluster]	A MID Server cluster has failed	MID Server Cluster Management

Specifying a specific MID Server cluster

You can specify a specific MID Server cluster for a Discovery schedule. The discovery process uses that cluster only. You cannot chain clusters or specify a single MID Server that belongs to multiple clusters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Distributed MID Server clusters for Operational Intelligence

The distributed MID Server cluster type is used exclusively in Operational Intelligence, which analyzes Event Management events and generates anomaly alerts. These MID Servers communicate with one another to distribute and balance the workload. For details, see MID Server distributed clusters for Operational Intelligence

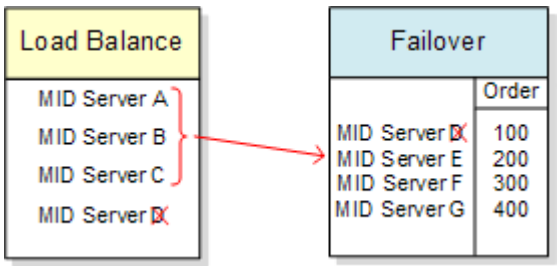
Smart Workload Manager

Using Smart Workload Manager, an application assigns jobs to MID Servers based on true load. The application may used cluster based MID Server selection. In cases where some MID Servers in the cluster slow in processing jobs, the MID Servers which are processing records faster are assigned more jobs.

The instance is aware of individual MID Servers in the cluster and their work load capacity. Work assignments are dynamically distributed based on the real-time performance and metric data of each MID Server. By considering key factors such as current task queue size, processing speed, and system load, tasks will be assigned more efficiently to prevent overloading any single server and enhance overall system stability. MID Servers with lower workload and higher processing speed receive more tasks.

Combining legacy clusters

Combining MID Server Clusters is only for use with legacy selection methods. A MID Server can be added to both types of clusters at the same time. This diagram shows a scenario in which a MID Server from a load balancing cluster (MID Server D) is also present in a fail-over cluster. If MID Server D fails, MID Server E in the failover cluster is available to the load balancing cluster to perform the tasks previously assigned to MID Server D.



Set MID Server thread use

Change the number of threads used by the MID Server according to performance requirements. MID Servers which compete with other programs for CPU time can use fewer threads than the default. MID Servers which need more speed, and have a host computer powerful enough, can use more threads.

Before you begin
Role required: admin

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

About this task

The three parameters define the maximum numbers of worker threads that can run simultaneously in each pool: *threads.interactive.max*, *threads.expedited.max*, and *threads.max*. Changing the thread parameters can affect the MID Server performance.

The interactive thread pool is designed for executing interactive messages including system commands and heartbeats. They are typically lightweight, so usually there is no need to change the default value. The expedited thread pool is designed for executing messages that have higher priority than the standard ones but less than interactive ones. Unless you have applications that produce a lot of expedited messages, there is no need to change the default value for *threads.expedited.max*.

The standard thread pool is the busiest pool. Most probes are using it and they can take a lot of system resources such as CPU, memory, and so on. You can set the MID Server to use as few as five threads without issue. To increase the speed of the MID Server if the host is powerful enough or lightly loaded with other programs, you can increase the threads setting.

The threads setting depends on the limitation of the CPU speed, memory, and operating system of the host machine. You might have to experiment to find the optimal threads count that works best when the MID Server is busy so it does not exhaust the host machine's hardware limitations. This means you may have to refine the thread count to best meet your situation. The following general observations may be useful:

- PowerShell is resource intensive and threads may not scale linearly.
- Most MID Server tasks require file handles to do their job.
  - Windows: On the Windows operating system, file handles are available in a fixed quantity. If you configure too many MID Server threads on a Windows host, the MID Server can consume all the file handles before approaching maximum CPU usage. This situation appears as an *Out of file handles* error in the MID Server log and indicates that the MID Server is trying to use too many threads.
  - UNIX and Linux: UNIX and Linux hosts have a much different scheme for allocating file handles. Generally, you can increase MID Server thread use on these operating systems until the CPU of the host is overloaded. See your OS documentation for monitoring CPU usage.
- Each thread on the MID Server requires some memory. Exactly how much memory varies considerably from task to task and depends on the equipment being discovered. To increase

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

the number of threads, you might have to increase the amount of memory that Java uses. If you configure insufficient memory, an *Out of memory* error appears in the MID Server log.

- You can set threads.max as high as 200, however, this setting may need to be changed depending on the OS. For example, Windows-based MID Servers running Discovery uses Powershell which is resource intensive. In this case, you may exhaust the CPU power of the host machine with just 50 threads count.

Follow the steps below to change the `config.XML` file. Alternatively, use the `threads.max` connection parameter. See MID Server Connection parameters for more details.

Procedure

1. Open the **\agent\config.xml** file using any text editor.
2. Locate the following lines:

```
<!-- MID Server Threads --><parameter name="threads.max"
 value="25"/>
```

3. Edit the value.
   Keep in mind the cautions described above.
4. Save the record.
5. Restart the MID Server service.

Install and uninstall Nmap on a MID Server

If you decide to use credential-less Discovery in your network, you must install Nmap on each Windows MID Server that you want to use for this purpose. Self-hosted customers whose network security does not permit downloads from `install.service-now.com` must use a specific manual process to install and configure Nmap.

Before you begin

Role required: agent_admin

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

- Assign MID Server IP ranges to all deployed MID Servers. The quickest and most reliable way to do this is with the Using MID Server IP range auto-assignment feature available in the Discovery Quick Start wizard. This method ensures that the set of MID Servers configured to access an IP address range is comprehensive.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Identify the IP ranges you want to explore with credential-less Discovery. Ensure that these ranges can only be accessed by MID Servers with Nmap installed, running on supported Windows hosts.
- Use the **All** option for selecting IP ranges and observe these requirements:
  - Restrict the use of this feature to Windows MID Servers only.
  - Ensure that Nmap is installed on each of these MID Servers.
  - Ensure that the MID Servers can access the entire customer network.
- When you create a Discovery schedule with Nmap enabled, observe these requirements for the MID Server selection options:
  - **Specific MID Cluster**: Verify that Nmap is installed on all MID Servers in the cluster, where each MID Server in the cluster is configured to access the same set of IP ranges.
  - **Auto-Select Mid Server**: When running horizontal Discovery, verify that Nmap is installed on at least one of the MID Servers that can access the Discovery schedule's configured MID Server IP ranges.
  - **Specific MID Server**: Verify that Nmap is installed on each MID Server that can access the schedule's configured MID Server IP Ranges.

Note:
To use credential-less Discovery for Service Mapping, install Nmap on all MID Servers that can access the Discovery schedule's configured MID Server IP ranges.

Role required: agent_admin

About this task

The Discovery - IP Based [com.snc.discovery.ip_based] plugin provides connection to the installer for Nmap and the programming elements that allow a Windows MID Server to run approved scripts on target CIs for credential-less Discovery. MID Servers on which Nmap is installed can execute an Nmap command configured to perform reverse DNS name resolution, discover MAC addresses, or gather OS information on target CIs without using credentials. The Discovery - IP Based plugin is activated automatically when the Discovery [com.snc.discovery] or Event Management and Service Mapping Core [com.snc.service-watch] plugins are activated.

Service Mapping and Nmap

Service Mapping does not check for the presence of the **Nmap** capability and selects the MID Server based on the IP address only. To ensure that Service Mapping does not select a MID Server without the **Nmap** capability, install Nmap on all MID Servers assigned to the IP address ranges for which you want credential-less Discovery to be available. If Service Mapping selects a MID Server for credential-less Discovery that does not have Nmap capabilities, this error message appears in the map at the site of the CI being discovered: `Nmap is not installed on MID Server. Verify all MIDs configured to handle selected IP Address have Nmap Capability. Nmap root directory path does not exist: <path>`

Amazon Web Service AWS

Running Nmap scans to or from any resource within the Amazon Web Service AWS environment is tightly regulated and requires the permission of AWS through the AWS Vulnerability/Penetration Testing Request form. AWS only permits testing of EC2 and RDS instances that you own. Tests against any other AWS services or AWS-owned resources are prohibited. In addition, any Nmap scan of a permitted instance must be performed within an approved time window. For these reasons, credential-less Discovery within an AWS environment is not appropriate, and if a violation of their policy occurs, could result in expulsion from the service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported operating systems

Nmap is supported on all editions of these operating systems, including virtual machines and 64 bit systems:

- Windows 2012
- Windows 2016

MID Server requirements

Nmap can be installed on MID Servers that meet these requirements:

- Status is **Up**.
- MID Server is validated.
- MID Server does not already have the **Nmap** capability.
- MID Server must be logged in as a local admin if Nmap is not already installed. Administrative privleges are only necessary for the installation process. Once Nmap is installed, non-admin users can use and run credential-less discovery.

Note:
If there are multiple MID Servers installed on the same host machine and one of them has already installed Nmap using an admin user, the other MID Servers can enable credential-less discovery using a non-admin user.

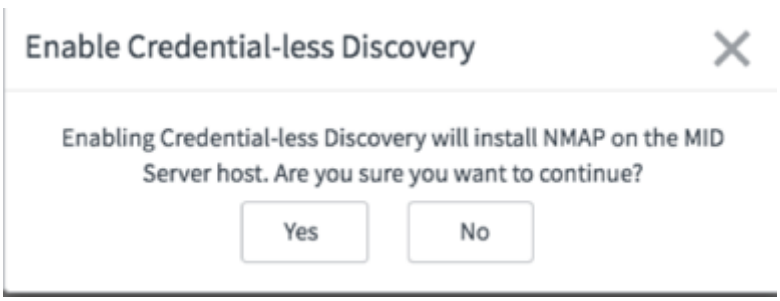
Warning:
The MID Server installation path must not contain the following characters:

- **( )**
- **{ }**
- **[ ]**

The Nmap installer replaces these characters with spaces. This prevents the installer from finding the correct path, and the installation fails. An example of a path that will fail is `C:\MIDServers\MID(1)\agent`.

Procedure

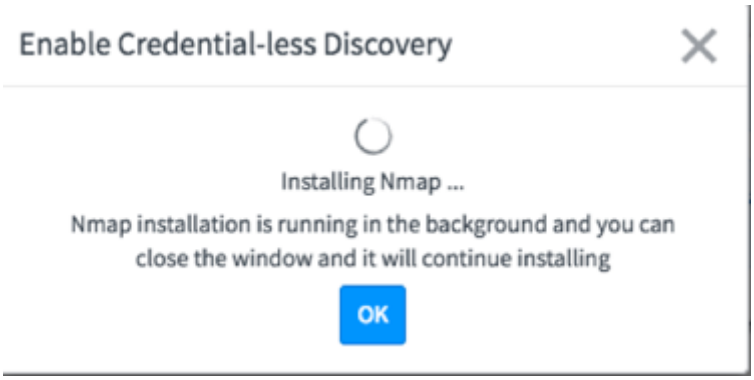
1. Navigate to **All** > **MID Server** > **Servers**.
2. Open the desired MID Server record.
3. Under **Related Links**, select **Enable Credential-less Discovery**.
   A confirmation dialog box appears.



4. Click **Yes** to continue with the installation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The instance runs the Nmap installer from `https://install.service-now.com`, a site within a ServiceNow datacenter that contains installers for the platform. This progress notice appears during installation:



The **Logs** tab in the MID Server record shows the message: `Running system command: installNmap`.

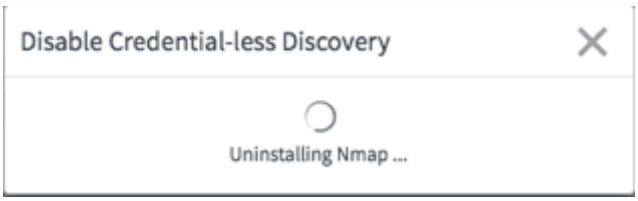
5. Click **OK** if you want to hide the dialog box while the installer continues to run in the background.
   Installing Nmap also installs Npcap on the host, if it is not already installed. Npcap is Nmap's packet capture library for Windows that allows Nmap to perform port scans quickly and to identify the family of the operating system running on the target. Npcap is installed once on the host and can be used by any other application that requires it, such as Wireshark.

   Note:
   If a more recent version of Npcap is already installed on the Windows MID Server host, Nmap is installed without Npcap. If an older version of Npcap is installed on the host, the Nmap installer upgrades it to the newer version.

   The installation process has either of these outcomes:

   - **Success**: These conditions indicate a successful installation:
     - The version of Nmap that is installed appears in the **Nmap version** field in the MID Server record
     - The **Related Link** changes to **Disable Credential-less Discovery**.
     - The **Nmap** capability is assigned to the MID Server and appears in the **Capabilities** tab of the MID Server record.
   - **Failure**: If the installation fails, an error message is logged to the MID Server Issue [ecc_agent_issue] table. If you run the installer again with success, the issue is marked as **Resolved**.

6. To uninstall Nmap for a selected MID Server, select **Disable Credential-less Discovery** under **Related Links** in the MID Server record.
   This dialog appears during the uninstallation process:



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **Logs** tab in the MID Server record shows the message: `Running system command: uninstallNmap`.

> **Important:**
> Because Npcap can be used by other applications, uninstalling Nmap does not automatically uninstall Npcap. You must uninstall Npcap manually, after determining that no other dependencies exist.

Credential-less Discovery

Install Nmap on a self-hosted system

Use this procedure to install Nmap on MID Server host machines in a self-hosted environment that does not allow network access to the ServiceNow® `install.service-now.com` download site.

Before you begin

Role required: admin, maint

About this task

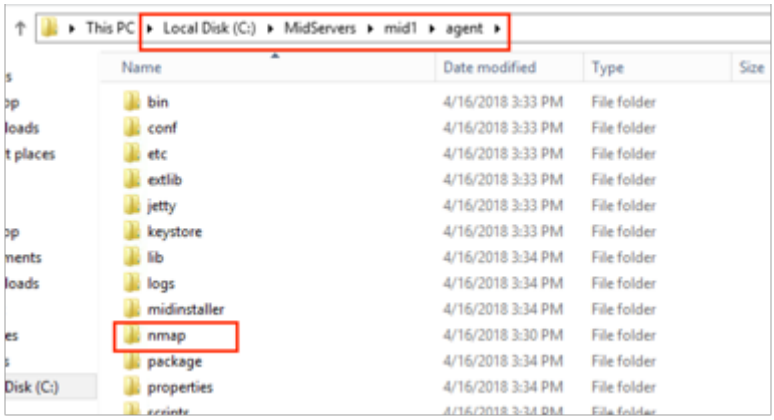
You must install Nmap manually on each MID Server host and then configure the instance to execute credential-less Discovery.

> **Note:**
> This procedure does not apply to self-hosted customers whose MID Server hosts can access `install.service-now.com` from within their network.

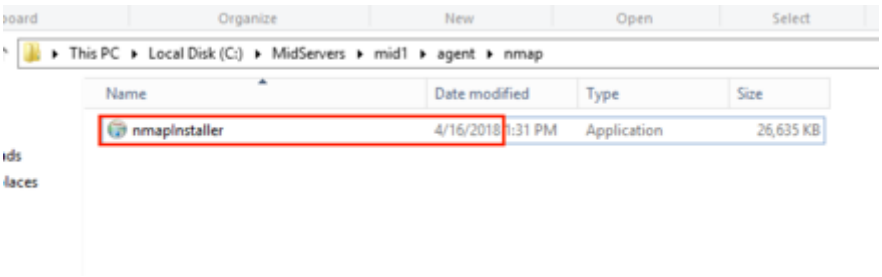
Procedure

1. Navigate to **All** > **MID Server** > **Properties** (MID Server Property [ecc_agent_property] table) and open the record for the *`mid.nmap.version`* property.
   This property contains the version of Nmap that you must install. Record the version number.
2. Download the correct installer executable from one of these URLs:
   - https://nmap.org/dist/: If the Nmap version in the property is 7.94, the executable you need is `https://nmap.org/dist/nmap-7.94-setup.exe`.
   - `https://install.service-now.com/glide/distribution/builds/package/thirdparty/nmap/nmap-setup-xxx-windows.exe`. If the Nmap version in the property is 7.94, the executable you need is `https://install.service-now.com/glide/distribution/builds/package/thirdparty/nmap/nmap-setup-7.94-windows.exe`
3. Create a folder called `nmap` in the MID Server `agent` folder of every MID Server you want to use for credential-less Discovery.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Copy the Nmap installer file that you downloaded to the `nmap` folder and rename it to `nmapInstaller.exe`.



5. Run the `agent\scripts\PowerShell\NmapInstallation.ps1` script and pass it the following parameters in the order in which they appear.
   This script runs the `nmapInstaller.exe` file.

   a. *$operation*: Task that `NmapInstallations.ps1` will process. To install Nmap, the task is **install**.

   b. *$nmap_root_path*: Complete path for the `nmap` folder that you create in step 4.

   c. *$nmap_self_installer*: Complete path for `nmapInstaller.exe` file that you copied in step 5.

   d. *$nmap_command*: Complete path for the Nmap install command. The `NmapInstallations.ps1` script installs Nmap in the `nmap` folder created in step 4. This parameter is *$nmap_root_path*|*nmap.exe*.

   e. *$nmap_uninstall_command*: Complete path for the Nmap uninstall command. This command is *$nmap_root_path*|*Uninstall.exe*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

f. *$nmap_npcap_version*: The Npcap version installed with Nmap. This value must be the same as the value of the *mid.nmap.npcap.version* property in the MID Server Property [ecc_agent_property] table.

g. *$nmap_safe_scripts*: List of safe scripts that Nmap uses. You can retrieve this list from the *mid.nmap.safe.scripts* property in the MID Server Property [ecc_agent_property] table.

6. Set up the parameters in the `NmapInstallation.ps1` script in this order: *./NmapInstallations.ps1 $operation $nmap_root_path $nmap_self_installer $nmap_command $nmap_uninstall_command $nmap_npcap_version $nmap_safe_scripts*

   For example, the script might look like this:

```
PS
 C:\MidServers\mid1\agent\scripts\PowerShell> .
\NmapInstallation.ps1 "install"
"C:\MidServers\mid1\agent\nmap"
 "C:\MidServers\mid1\agent\nmap\nmapInstaller.exe"
"C:\MidServers\mid1\agent\nmap\nmap.exe"
"C:\MidServers\mid1\agent\nmap\Uninstall.exe" "0.91"
"allseeingeye-info.nse,amqp-info.nse,db2-das-info.nse,drda-info
.nse,freelancer-info.nse,
ike-version.nse,mcafee-epo-agent.nse,mqtt-subscribe.nse,openloo
kup-info.nse,oracle-tns-version.nse,
quake1-info.nse,quake3-info.nse,rfc868-time.nse,rpcinfo.nse,snm
p-info.nse,ventrilo-info.nse,
weblogic-t3-info.nse,xmpp-info.nse"
```

7. After installation is complete, add the **Nmap** capability to each MID Server you want to use for credential-less Discovery.

   Important:
   Only a **maint** user can add the **Nmap** capability to a MID Server. Contact Customer Service and Support to request temporary **maint** access to your instance.

   a. On the instance, open the MID Server record.

   b. Select the **Capabilities** related list.

   c. Click **Edit**.

   d. Select **Nmap** from the list of available capabilities and click **Save**.

Uninstall Nmap on a self-hosted system

Use this procedure to uninstall Nmap in a self-hosted environment that does not allow network access to the ServiceNow `install.service-now.com` download site.

Before you begin
Role required: admin, maint

About this task
Nmap must be manually uninstalled from each MID Server host machine and then disabled on the ServiceNow instance.

Procedure

1. Run *`Uninstall.exe`* in the `nmap` folder on each MID Server host configured for credential-less Discovery.
2. After uninstallation is complete, delete the `nmap` folder from the `agent` folder.
3. Remove the **Nmap** capability from each MID Server record.

> **Warning:**
> Only a **maint** user can remove the **Nmap** capability from a MID Server. Contact Customer Service and Support to request temporary **maint** access to your instance.

   a. On the instance, open the MID Server record.
   b. Select the **Capabilities** related list.
   c. Click **Edit**.
   d. Remove **Nmap** from the active capabilities list and click **Save**.

Configure MID Server as WinRM trusted host

In environments using Windows Remote Management (WinRM), Discovery or Service Mapping can discover servers using the WinRM protocol. Add servers, which are part of WinRM, as trusted hosts on all MID Servers that Discovery or Service Mapping use for discovery.

Before you begin
Role required: mid_admin

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

MID Server cannot access servers using the WinRM protocol unless these servers are configured as trusted hosts for this MID Server.

Perform this procedure on each MID Server used by Service Mapping or Discovery.

Procedure

1. On the MID Server, open the command-line shell.
2. To add all servers to the TrustedHosts lists, run the following command:
   `winrm s winrm/config/client '@{TrustedHosts="*"}'`

   The command requires different syntax depending on the shell: use single quotation marks around `@{TrustedHosts="*"}` in Windows PowerShell, and do not use quotation marks in Command Prompt.
3. To add specific servers to the TrustedHosts list, run the command with the comma-separated hosts instead of the asterisk (*), for example:
   `winrm s winrm/config/client '@{TrustedHosts="serverA,serverB,serverC"}'`

MID Server domain separation

Use the MID Server user role to configure MID Servers to access separate domains. The credentials in the `config.xml` file of a MID Server determine which domains it can access. Specific MID Server policy records can be restricted for use only by MID Server from the same domain.

---

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

The records that can be read, updated, or created by a MID Server are determined by the credentials configured for that MID Server in the `config.xml` file. These are the user credentials that a MID Server uses to access the instance and specify which domain's records that MID Server can access.

You can create versions of these specific MID Server policy records that only a MID Server from the same domain can use. This process separation is supported for records in tables that extend MID Server Synchronized Files [ecc_agent_sync_file]:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- MID Server MIB File [ecc_agent_mib]
- MID Server JAR File [ecc_agent_jar]
- MID Server Script File [ecc_agent_script_files]

Note:
Attachments on MIB or JAR file records might not appear as they did in a non-domain separated environment. The attachments do not appear because the **Attachments** [sys_attachment] table is data separated. When data is separated between domains, a record in a child domain cannot access records in a parent domain.

Set up domain separation for MID servers

Set up domain separation through the MID server user role and the MID Server configuration file.

Before you begin
Role required: agent_admin or admin

Procedure

1. Configure a MID Server user within a specified domain with the proper *mid_server* role.
2. Specify this user within the MID Server **config.xml** file.
   When you set the MID Server user credentials in the `config.xml` file, make sure they are in the proper domain.

What to do next
If you must change the MID Server domain:

1. Stop the MID Server and delete the ecc_agent record.
2. Update the MID Server `config.xml` with the new user in the new domain and restart the MID Server service.

If you need to create versions of specific MID Server files that only MID Servers in your domain can use:

1. Open or create a record in one of these MID Server modules:
   - **SNMP MIBs**
   - **JAR Files**
   - **Script Files**
2. Update an existing domain policy or submit a new record.

Note:
Attachments on MIB or JAR file records might not appear as they did in a non-domain separated environment. The attachments do not appear because the **Attachments** [sys_attachment] table is data separated. When data is separated between domains, a record in a child domain cannot access records in a parent domain.

Configure a multi-domain MID Server

You can create a MID Server in the global domain that can explore targets in other domains.

Before you begin
Before configuring a multi-domain MID Server:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Activate the Domain Support - Domain Extensions Installer [com.glide.domain.msp_extensions.installer] plugin.
- Ensure that your instance is domain separated.

Role required: admin

Procedure

1. Type **sys_properties.list** in the navigation filter and press **Enter**.
2. Locate the **glide.ecc.enable_multidomain_mid** property.
3. Set the value of the property to **true**.

> **Note:**
> Enabling this property has no effect on existing MID Servers. MID Servers in a domain prior to setting this property, remain in that domain.

4. Create a MID Server in the global domain.
   A MID Server created in the global domain after this property is set to **true** can explore any domain for which it has the credentials. However, this MID Server is restricted to trying only the credentials for the target domains requested by ECC Queue inputs.

> **Warning:**
> If you reset the **glide.ecc.enable_multidomain_mid** property to **false** after creating a multi-domain MID Server in the global domain, that MID Server writes all the data it receives to the global domain and not to the correct domains.

Synchronize a JAR file to MID Servers

You can upload a JAR file to an instance and synchronize it to all MID Servers, or write custom probes that use the synchronized JAR file.

Before you begin

Role required: admin, agent_admin

---

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

The MID Server JAR File [ecc_agent_jar] table is domain separated. You can create versions of these policies that only a MID Server from the same domain can use. For instructions, see Set up domain separation for MID servers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Warning:
Synchronizing a JAR file with this procedure causes all MID Servers connected to the instance to restart automatically.

Procedure

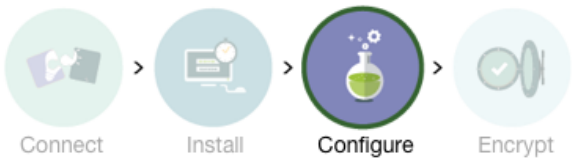
1. Navigate to **All** > **MID Server** > **JAR Files**.
2. Click **New**.
3. Complete the following fields:
   - **Name:**A unique and descriptive name for identifying the file in the instance.
   - **Version:** A version number for the file, if one is available.
   - **Source:** Location of the JAR file for reference purposes. Source information is not used by the system.
   - **Description:** Short description of the JAR file and its purpose in the instance.
4. Click the paper clip icon in the banner.

5. In the Attachments dialog box, click **Browse** and select the file you want to attach.

   The platform attaches the JAR file to the record and restarts the MID Servers to synchronize the file. It is not necessary to update the record to attach the file.

vCenter event collector

The vCenter event collector is a MID Server extension that listens for vCenter-related events and updates the CMDB accordingly.



1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

The event collector allows the CMDB to be updated with changes to virtual machines (VMs), in addition to the updates detected by Discovery. A change to a VM is sent as an event from the vCenter server to the vCenter event collector. When an event is received, the CMDB is updated accordingly. Full vCenter Discovery does not need to rerun. For some events, such as powered on and powered off events, Discovery does not need to run again at all. For most events, Discovery runs only on the necessary vCenter resource.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, if a VM is turned off, the vCenter server sends the event `VmPoweredOffEvent`. The vCenter event collector receives and processes the event and the CMDB is updated to reflect that the state of the corresponding VM is set to **off**.

Important:

With this extension, Discovery can only modify the state of a VM which exists in the CMDB. When an event with "CreatedEvent" occurs in its name, such as VmCreatedEvent, Discovery scans that VM and then creates the CI using the data it collects. When a new event occurs involving that CI, Discovery can update the existing record without launching another scan.

vCenter event collector supports domain separation by inheriting the domain of the specified Mid Server in the event collector context. However, it does not support multi-domain Mid Server configuration.

See Discovery for VMware vCenter for supported versions of vCenter.

How vCenter events are processed

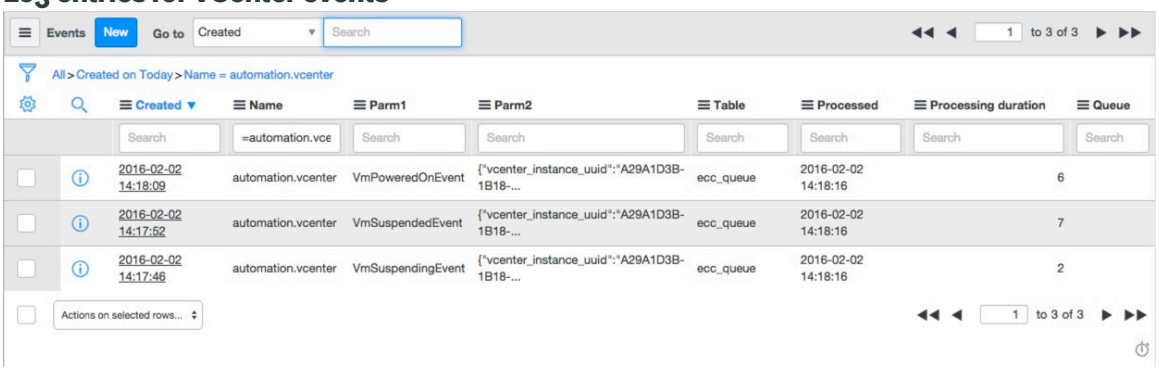
The MID Server listens for the vCenter events configured in the vCenter Event Collector form. When one of these events is returned from vCenter, the instance parses the payload with a business rule that converts the vCenter event into a system event (sysevent). The instance then uses that sysevent to perform tasks, such as email notification.

Note:
If the MID server is paused when a vCenter event occurs, the MID server still processes the event. In this case, it is possible for the event collector to display a status of **Started**.

The resulting sysevents contain these values:

- **Name**: Name of the system event created from the vCenter event. This value is always *`automation.vcenter`*.
- **Parm1**: vCenter event that was returned. This event must be associated with an event collector record.
- **Parm2**: Event data provided by vCenter, in JSON format.

Log entries for vCenter events



Supported vCenter events

The following events are the only vCenter events handled by the base system when Discovery is activated. If you have upgraded your instance from an earlier version, you might not have the default events added with later releases. To use the missing events, manually add them.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

vCenter events

Event name	Description	Launches probe
VM events		
VmPoweredOnEvent	The VM has been powered on from the powered off state or resumed from the suspended state. This event is sent when the VM is powered on. It does not account for the time it may take to boot the host operating system.	None
DrsVmPoweredOnEvent	The VM has been powered on by a distributed resource schedule (DRS), which balances workload between available resources.	None
VmRestartedOnAlternateHostEvent	The VM was restarted on another host because the original host failed.	None
VmPoweredOffEvent	The VM has been powered off. If the host OS is shut down, this event is sent after the host OS shuts down and the VM enters the powered off state.	None
VmPowerOffOnIsolationEvent	The VM has been powered off on an isolated host in an HA cluster.	None
VmShutdownOnIsolationEvent	The VM has been shut down on an isolated host in an HA cluster.	None
VmSuspendedEvent	The VM is suspended. This event is sent after the VM suspension is complete.	None
VmRelocatedEvent	The VM has been relocated while offline (either suspended or powered off). A VM migration of the VM to a different host, or the migration of any storage used by the VM triggers the event. Moves relationships.	None
VmMigratedEvent	One or both of the following occurs: • The VM has been hot-migrated, with vMotion, to another ESX server. • The storage for the VM has been hot migrated.	None

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

vCenter events (continued)

Event name	Description	Launches probe
	Only Updates relationship and Deep Discovery.	
DrsVmMigratedEvent	Migration of a VM recommended by a DRS. Moves relationships.	None
VmRemovedEvent	The VM instance has been deleted from vCenter.	None
VmClonedEvent	The VM was cloned successfully. Creates new records and performs Quick Discovery.	VMWare - vCenter VMs
VmCreatedEvent	The VM was successfully created. Creates new records and performs Quick Discovery.	VMWare - vCenter VMs
VmDeployedEvent	The VM was deployed successfully. Creates new records and performs Quick Discovery.	VMWare - vCenter VMs
VmDiscoveredEvent	The vCenter successfully discovers the VM. Creates new records and performs Quick Discovery.	VMWare - vCenter VMs
VmRegisteredEvent	The VM was successfully registered. Creates new records and performs Quick Discovery.	VMWare - vCenter VMs
VmReconfiguredEvent	The VM was reconfigured. Creates new records and performs Quick Discovery.	VMWare - vCenter VMs
VmInstanceUuidAssignedEvent	A new instance UUID was assigned to the VM. Updates VM instance UUID.	None
VmRenamedEvent	The VM was successfully renamed. Changes the name.	None
VmUuidAssignedEvent	A new BIOS UUID was assigned to the VM. Adds the UUID of the VM.	None

DatacenterRenamedEvent	A datacenter was renamed.	None

Configure and run the vCenter event collector extension

Configure the vCenter event collector extension in the MID Server module, and then add or remove supported events.

Before you begin

Before configuring event collectors, perform these tasks:

- Deploy and start a MID Server.
- Ensure that the MID Server has access to the vCenter.
- Run discovery on the vCenter.

Role required: agent_admin, admin

About this task

Multiple MID Servers can listen to the same vCenter instance, and you can add multiple Event Collectors for different vCenters to a single MID Server. Make sure you configure the events on the event collector record that specify the correct MID Server.

Note:
You can add events to the vCenter event collector. However, not every event is supported by the base system event handlers. If you want to handle events other than those supported in the base Discovery system, you must create a script action to process the events. For instructions, see Script actions. As a reference, the instance processes the vCenter events in the base system with a script action called `Discovery: Process vCenter events`. Do not edit or delete this script action.

To configure the vCenter event processor extension:

Procedure

1. Navigate to **All** > **MID Server** > **Extensions** > **vCenter Event Collectors**.
2. Click **New** or open an existing extension.
3. Fill in the fields, as appropriate from the table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Right-click in the header bar and click **Save** in the context menu.
   The **vCenter Event** related list appears, containing the default events that the system is configured to handle.
5. To select a different vCenter event, click **Edit** in the **vCenter Event** related list and browse for the event.

   The slushbucket does not display all the available events in the opening list. Use the filter to browse for events not displayed.

6. Under **Related Links** click **Start** to save the events in this collection and start the collector.
   The Related Links in this form work as follows:

Commands available in the vCenter event processor extension

Related Link	Description
Start	Starts the collector if it is not running. The extension connects to the specified vCenter server by enumerating the VMware credentials in the credential set until a connection can be made. Next, the extension tells the vCenter server to supply the events specified in the Collector Context.
Stop	Stops the running collector on the configured MID Server. No action is taken if the extension is not running.
Restart	Stops, then starts the collector on the configured MID Server.
Test	Tests the parameters for validity. If the IP address, hostname, and the set of events is valid then the test returns a successful status. If any of the parameters are incorrect, an error is shown. Running a test does not affect any extensions that are currently running.
Update parameters	Sends updated parameters to the collector. Any changes you make to the collector while the MID Server is running do not take effect immediately when they are saved. If you click this control when the collector is not running, no update is made. In the case of the vCenter extension, the collector first tests the parameters for validity. If the parameters are valid, the extension disconnects from the vCenter server and reconnects with the new parameters.

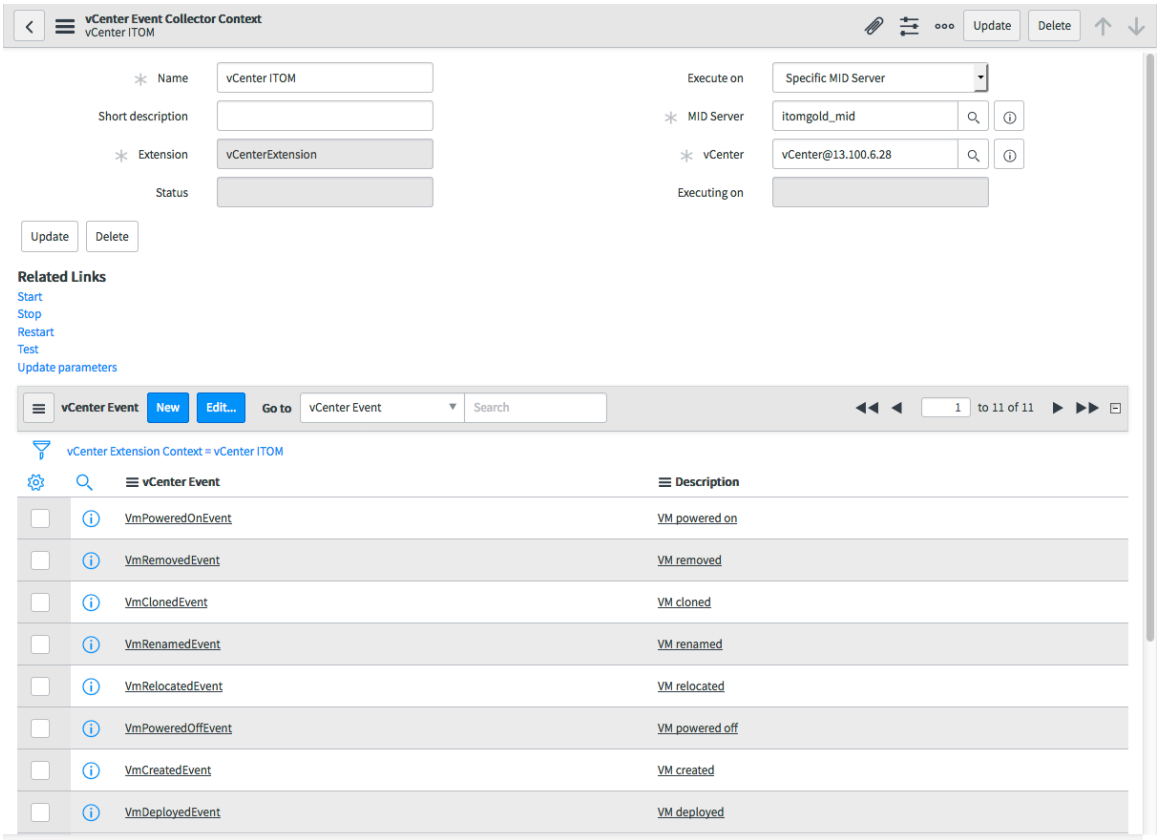
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Field	Description
Name	A unique name for this vCenter event collector extension for easy identification.
Short description	A description of this collector.
Extension	[Read-Only] The collector type is automatically set to **vCenterExtension**.
Status	This field auto-populates with the status of the collector. This field is blank until the collector is started. After issuing a command to the collector, you see one of these values: ○ **Started**: The collector is running. ○ **Stopped**: The collector is not running. ○ **Offline**: The MID Server is down. ○ **Error**: The collector failed with an error.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: The MID Server continues to process vCenter events, even if it is paused. The status of the event collector may show as **Started**.
Error Message	Message describing any error that causes a command, such as **Start** or **Stop**, to fail. This field only appears when the value in the **Status** field is **Error**.
Execute on	Location for running this collection. The possible options are **Specific MID Server** or **Specific MID Server Cluster**.
MID Server	The name of the designated MID Server if you selected **Specific MID Server** in the **Execute on** field. The name of the designated MID Server cluster if you selected **Specific MID Server Cluster**. If you selected the MID Server cluster option, an algorithm determines which server in the cluster runs the collector.
vCenter	The IP address or hostname of the vCenter server.
Executing on	[Read-Only] The name of the MID Server on which the collector is running. This field shows the name of the MID Server even if the MID Server is down. If the collector is stopped by the user, this field is empty.

SNMP trap collector extension

The SNMP trap collector is a MID Server extension that listens for SNMP traps from the devices on your network.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

Upon receiving a trap, the MID Server sends the trap to the instance for further processing by Event Management. If Event Management is not active, traps are not processed and are discarded by the instance.

For the SNMP trap collector extension to receive traps from network devices, each device must designate the MID Server that runs the SNMP trap collector extension as a recipient of the trap. See the documentation for the network device to configure your hardware to do this. Generally, the SNMP trap collector extension should run on only one MID Server per VLAN. Multiple MID Server recipients on the same VLAN causes duplicate data in the CMDB. If network devices are separated by VLANs, multiple MID Servers may have trap collectors installed.

To configure multiple SNMP trap collector extensions, configure each in a separate record, with a unique name, and a designated MID Server.

Configure the SNMP Trap Collector Extension

For the SNMP trap collector extension to receive traps from network devices, each device must designate the MID Server that runs the SNMP trap collector extension as a recipient of the trap.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **MID Server** > **Extensions.** > **MID SNMP Trap Listener**
2. Click **New** or open an existing extension.
3. Fill in the fields from the table, as appropriate.
4. Click **Submit** or **Update**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field name	Description
Name	A unique name for this SNMP trap collector extension for easy identification.
Short description	A description of the MID Server extension, if more description than the **Name** is necessary.
Extension	[Read-Only] The extension type is automatically set to **TrapExtension**.
UDP port	The port number that your network hardware uses when sending a trap to the designated MID Server. Port numbers 1024 and above are recommended. Port numbers 1023 and lower may be system reserved and can result in access violations for MID Servers that are not running with administrative credentials.
Status	[Read-Only] The status of the trap collector extension. This field is blank until the extension is run. After it is run, the value may be: ○ **Started:** The extension is running. ○ **Stopped:** The extension is not running. ○ **Offline:** The MID Server is down. ○ **Error:** The extension failed with an error.
Execute on	The location for running this extension: a **Specific MID Server** or a **Specific MID Server Cluster**. The recommended setting is **Specific MID Server**. Network hardware typically has to be configured to send to a specific IP address. If the listener moved to a different MID Server in the cluster, the trap would not be received.
MID Server	The name of the designated MID Server if you selected **Specific MID Server** in the **Execute on** field. The name of the designated MID Server cluster if you selected **Specific MID Server Cluster** in the **Execute on** field. If you selected **Specific MID Server Cluster**, a ServiceNow algorithm determines which server in the cluster runs the extension.
Executing on	[Read-Only] The name of the MID Server on which the extension is running. This field shows the name of the MID Server even if the MID Server is down. If the extension is stopped by the user, this field is empty.

5. In **Related Links**, run any of the following actions against the SNMP trap collector extension:

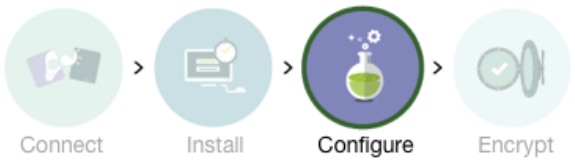
Related Link	Description
Start	Starts the extension if it is currently not running. The extension is started on the configured MID Server and port number.
Stop	Stops the running extension on the configured MID Server. No action is taken if the extension is not running.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related Link	Description
Restart	Stops, then starts the extension on the configured MID Server and port number.
Test	Verifies that the configured MID Server can run the SNMP trap collector extension on the specified port. Running a test does not affect any extensions that are currently running.
Update parameters	If you make changes to the extension configuration, use this option to update the parameters of the currently running extension. First, the parameters are tested for validity. If the parameters are valid, the extension disconnects and reconnects with the new parameters.

MID Server Resource Reservation

This feature allows resources to be reserved before a task is assigned to a thread. If the resources the task needs aren't available, then that task waits in the MID Server work queue while other tasks are assigned to the thread.



1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

For Discovery, the MID Server tasks are the probes or patterns it executes. While probes are waiting to be executed on the MID Server, they provide resource requirements (CPU, memory, and so on) and if they cannot be met, the probe waits in the work queue until the resources are available.

Note:
MID Server Resource Reservation delays probe execution until resources are available. This is based on extremely flexible criteria. The MID Server Resource Reservation feature is for advanced users and should not be configured until a problem is identified. This configuration depends entirely on the problem details.

Using the MID Server Resource Reservation allows for better use of threads since the threads are not assigned a task it cannot complete.

Features:

- Resource reservations apply to a single MID Server only
- Resources can depend on system or MID Server properties
- Resources can depend on probe parameters, allowing you to limit the number of active probes and patterns against a given IP

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Reports resource usage
- Extensible (the customer defines their own resources)
- Scriptable

Benefits:

- Keeps PowerShell probes from impacting execution of other probes
- Can be used to limit the impact Discovery has on a target system
- Can be used to limit the number of "large" probes being executed by a MID Server at the same time
- Can be used to throttle Discovery (to minimize impact on the instance)

Use MID Server Resource Reservation

A resource is just a name and a count. Define the name of the resource, which probes use it, and how many of the resources those probes should use.

Before you begin

Role required: admin

- Make sure the MID Server property **mid.probe.wait.resources** is set to true to enable MID Server Resource Reservation. Changing this property requires restarting the MID Server.
- Choose a resource name. Anything in { } in the name is replaced by the probe parameter with that name. This name is typically used for per-host resources, for example, ssh{source} means a separate resource named "ssh" is available on every host being discovered. ("source" is the name of the probe parameter that contains the IP address being probed.)
- Decide how to specify the number of the resource used by probes or patterns.
  - Every probe uses a constant number of the resource: Create a "simple value" resource.
  - The number of resources used depends on a system property: Create an "expanding" resource.
  - The number depends on multiple factors: Create a "scripted" resource.
  - Expanding: Anything in { } is replaced by the system or MID Server property with that name. Logical operators are allowed, for example, "{mid.windows.management_protocol}".toLowerCase() == "winrm" ? 1:0
  - Scripted: the script is evaluated. The return value is expanded.

Procedure

1. Create a new resource.
   a. Navigate to **Discovery Definition** > **Limited Resources**> **Simple Value** and click **New**.
   b. Enter a resource name.
   c. Enter the number of resources used and click **Save**.
2. Define which probes use the resource.
3. Navigate to the desired tab and select from the list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Used by Topic** tab: Includes all probes with that topic. Click **Invert Topic** to include all probes without that topic. For example: SSHCommand with Invert Topic, means all probes except for SSH. Heartbeat and queue messages are always excluded.
- **Used by probes** tab: Includes a list of probes. Click **Invert Probes List** to include all probes without that probe. Horizontal Discovery probe means apply to all patterns.
- **Used by patterns** tab: Includes a list of patterns. You can also click Invert Pattern list.

4. Define availability on the MID Server.
5. Navigate to **Discovery Definition** > **Limited Resources** > **MID Resources**.
   - Resource: This is the reference to the resource.
   - Available: Number available. Anything inside brackets, is replaced by the system or MID Server property.
   - MID Server: MID Server to apply this to. (Empty) means all.
6. Set the resource order.
   a. Click in the **Order** field of each resource.
   b. Type in the number.
   c. Click the check mark to Save.

Note:
Less valuable resources should have a lower order – these resources are reserved and held until higher order resources can be obtained. For example, both the total PowerShell sessions (resource is "PowerShell") and the number of simultaneous sessions to any host (resource is "PowerShell{host}") are limited. Therefore, PowerShell{host} resource should have a lower order. Obtaining PowerShell first would impact all other PowerShell probes. Obtaining "PowerShell{host}" first only impacts other PowerShell probes to that host.

7. Review the Resource State that you have set up.
   a. Run a Discovery.
   b. Observe Resource State.
   c. Click **Get resource state** from the MID Server page or view in an ECC input payload.

   Result of Get resource state:

   - PowerShell{source} has additional entries for every {source} with a current allocation.
   - "Reserved by" may show multiple resources if the probe requires more than one resource.

   Result of ECC input payload:

   - The resource_wait attribute only exists if the probe had to wait for a resource.
   - The time displayed is in milliseconds.
   - The probe may have waited on multiple resources, with different wait time for each.

How MID Server Resource Reservation works

In addition to the work queue, the MID Server contains a waiting queue. When picking a task for execution, the waiting queue is always checked first. If no task in the waiting queue can execute, then the work queue is tried. Probes and patterns in the waiting queue reserve all necessary resources until they're able to execute.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The first probe or pattern in the queue is offered available resources. It takes any of the lowest order resource that is available. After getting the required number of lowest order resources, the probe or pattern goes to the next lowest order resources, and so on. The order allows the user to configure which resources are more or less important. Lowest order resources are gathered first because holding these resources has less impact on execution of other probes and patterns.

Tables

mid_limited_resource

- Defines the resources used by a probe or pattern.
- Extended by mid_limited_resource_value, mid_limited_resource_expanded, and mid_limited_resource_script each containing a single additional field.
  - mid_limited_resource_value adds a single field named “value” to the base table.
  - mid_limited_resource_expanding adds a field named “expanding.”
  - mid_limited_resource_script adds a field named “script”.

mid_resource

- Sets the resources available on a MID Server.
- Values from this table are copied to ecc_agent_property.
- A business rule on this table creates the corresponding MID Server properties.
- It has a reference to a resource and the number available. If the number available is inside { } then it’s the name of a system property, MID Server config, or MID Server property (all three places are checked). So {mid.powershell_api.session_pool.max_size} is the value of that MID Server config that sets the size of the PowerShell session pool.

Base: mid_limited_resource table

Label	Column	Type	Size	Information
Resource Name	name	String	100	Unexpanded name of the resource
Active	active	Boolean		Allows temporary disable
Invert Topic	invert_topic	Boolean		
Invert Probe List	invert_probe_list	Boolean		
Invert Pattern List	invert_pattern_list	Boolean		

Note:
There are m2m tables that associate a mid_limited_resource record with topics, probes, and patterns. The “invert_” fields change the list from inclusion to exclusion.

Extensions: mid_limited_resource_value, mid_limited_resource_expanding, and mid_limited_resource_script tables

Label	Column	Type	Size	Information
Value	value	Integer		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Extensions: mid_limited_resource_value, mid_limited_resource_expanding, and mid_limited_resource_script tables (continued)

Label	Column	Type	Size	Information
Expanding	expanding	String	1000	A slightly extended version of the availability number because it accepts logical and ternary operations, for example, "{mid.windows.management_proto == "WinRM" ? 1 : 0. If the management protocol is WinRM this evaluates to 1, otherwise it's 0.
Script	script	String	4000	The script is evaluated. If the result is a string, then it's expanded

mid_resource table

Label	Column	Type	Size	Information
Active	active	Boolean		Allows temporary disable
Available	available	String	255	Number of this resource available on MID Server
MID Server	ecc_egent	Reference		Reference to MID Server or empty for all
Order	order	Integer		Order in which resources are allocated
Resource	resource	Reference		Reference to the resource

Containerized MID Server

Containerized MID Server uses a Docker image of the MID Server that allows you to quickly deploy MID Servers at scale. MID Servers are deployed using orchestration tools like OpenShift or Kubernetes. Orchestration tools can automate their deployment and maintenance and add new containers on demand or replace failed containers automatically.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

To use Containerized MID Servers, you can download Docker recipes for Linux from the MID Server download page. Use the recipes to build the Docker images for the current release. The recipes are zipped and signed. Some features have been deprecated for the Washington DC family release. See [KB1559617] Deprecated Containerized MID Server Features in Washington DC for more information.

Containerized MID Server system requirements:

- AlmaLinux is supported.
- The recipes cannot be used to build images for previous MID Server versions.
- Discovery of NMAP and CyberArk are not supported.
- Other applications such as Orchestration and Integration Hub are not certified.

Once the Docker images are available, you can create new MID Server containers and configure them with configuration parameters passed through environment variables or secret files. Docker, Openshift, and Kubernetes secrets are supported. The MID Server application inside the container is run as a process by a non-admin user.

When a containerized MID Server record is first created on the instance, a random UUID is created and set to the **container_id** column. During the start-up sequence, this value is replaced by the actual container ID. The container ID can be used to differentiate between containerized and regular MID Servers. Non-containerized MID Servers' container ID have a null or empty value.

In order to automatically clean up the down MID Servers on Instance, a scheduled job called Purge Orphaned Containerized MID Servers is scheduled to run daily. This job removes orphaned containerized MID Servers if they are down longer than the value set by the **max_retention_days** property. The job also creates a warning MID Server issue each day before the removal day, if there are equal to or less than the value of **warn_days** remaining. The default values for **max_retention_days** and **warn_days** are 30 and 7, respectively.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Auto-upgrade

Auto-upgrade works the same way for containerized MID Servers as it does for regular MID Servers. However, it is recommended to disable the auto-upgrade for containerized MID Servers. Whenever a new image is needed, build a new image and deploy it by updating the deployment YAML file then re-apply it.

Containerized MID Server auto-upgrade is controlled by the **mid.container.autoupgrade.enabled** config parameter and is set to true by default. The config parameter is read-only, therefore it can not be synced down from the instance.

Add the config parameter to a MID Server profile and use it with new deployment requests. The settings are then included in deployment YAML file when the deployment request is exported, or when it is manually added to an existing deployment YAML file and re-applied.

HealthCheck

A HEALTHCHECK rule is implemented to check MID Server health status based on heartbeat every 5 minutes. If there was no heartbeat activity in last 30 minutes, it is considered a failure. After 3 consecutive failures, it becomes unhealthy in the docker ps command output.

To see more HealthCheck details, run the following docker inspection command: `docker inspect --format='{{json .State.Health}}' <container-id>`

Basic Container Operations

Basic operations are supported on container side. For example, you can stop, start, or restart a running container using Docker commands.

docker stop <container_id>

This command shuts down the containerized MID Server.

docker start <container_id>

This command starts a containerized MID Server if it is stopped.

docker restart <container_id>

This command shuts down a MID Server and restarts it.

Build MID Server Docker Image

Build a MID Server Docker Image with the provided recipes to deploy a Containerized MID Server. Containerized MID Server uses a Docker image of the MID Server that allows you to quickly deploy MID Servers at scale.

Containerized MID Server Deployment and Auto-configuration

With the deployment and auto-configuration feature, an agent admin can enter all required MID Server #settings in a MID Server Profile on the instance and then submit a deployment request to K8s cluster. After the request is#processed, the new MID servers are automatically created and auto-configured. They are ready#to use in seconds. #If the MID Server profile is changed, the related Containerized MID Servers can also be updated on demand.

Build MID Server Docker Image for Linux

Deploy Containerized MID Servers on Linux by creating a Docker image with the provided recipes. Containerized MID Server uses a Docker image of the MID Server that allows you to quickly deploy MID Servers at scale.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

Prerequisites:

The host must use Docker engine and command-line interface (CLI) 20.10.4 or later.

Update the library to the newest version available, or at least the highest version with a security fix. If issues identified are part of a transitive dependency, find a version of the dependent library which includes a newer transitive version. If the transitive dependency cannot be upgraded by upgrading the dependent library, consider excluding the dependency and directly including a secure version.

Note:
Check docker availability by running the docker version command as administrator. See the the docker version command documentation for more information.

Procedure

1. Download the Linux Docker recipe ZIP file from the MID Server download page and verify its signature.
   For more information about the MID Server download page and signature verification, see Download MID Server files.
2. Unzip the ZIP file to a folder.
3. **Optional:** You can change the current directory to the new folder.
4. To build an image, run the build command: `> docker build <path-to-docker-recipe> [ --tag <docker-tag> ]`

   For more information on the command, see the Docker build command documentation. The path to the Docker file can be a relative path or the current directory if the file is in the Docker recipe directory.

   The default image tag is provided out-of-the box in the .env file with the **DOCKER_TAG** parameter. You can export this parameter before executing any docker command by running the command: `> export $(grep DOCKER_TAG .env)`. You can replace `<docker-tag>` with the **DOCKER_TAG** value in all the following commands.

   The build command takes the following build arguments:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
MID_INSTALLATION_URL	The link to download the MID Server installation file. By default, it is set to the download link for the Linux 64 bit Installation ZIP file provided on the MID Server download page.
MID_INSTALLATION_FILE	The name of a local MID Server installation file. The default value is empty. If this parameter is not empty, the recipe uses the local file instead of downloading from the installation server. This parameter uses the file name only, not the full path. Before the build, the local file must be copied to the `asset/` sub-folder of the recipe directory. MID Server releases prior to Rome are not supported. For example: `> docker build <path-to-dockerfile> --build-arg MID_INSTALLATION_FILE=<mid.installation.fi --tag <docker-tag>`
MID_SIGNATURE_VERIFICATION	The signature of the MID Server installation file must be verified. The default value is TRUE. If it is TRUE, the build process always verifies the digital signature of the MID Server installation file whether it is downloaded from the remote server or a local file. Otherwise, the signature verification is skipped. For example: `> docker build <path-to-dockerfile> --build-arg MID_SIGNATURE_VERIFICATION=false --tag <docker-tag>`
USER_ID and GROUP_ID	By default, when not specified, Docker creates a#MID Server user with user id = 1001 and group id = 1001. You may pass a custom user id and group id into container by using the#USER_ID#and#GROUP_ID#build arguments. Docker creates an user for the #MID Server #with the provided user id and group id. Inside the container image, all files under the MID Server installation folder are owned by this user and the root group (id=0). When the image is deployed on Kubernetes platform, this MID Server user becomes the container user who runs the MID Server. When the image is deployed on an OpenShift#platform, OpenShift may assign an arbitrary non-admin user id as the container user who runs the MID Server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	However, that user always belongs to the root group. In both cases, the container user has full access to the MID Server files. That way, the same image can be deployed on Kubernetes as well as on OpenShift.

5. **Optional:** After the image is built successfully, you can list the image built with command: > `docker image ls`

What to do next

To save disk space, if there are unused or intermediate images, run the following commands to remove those dangling images:

```
$ docker rmi $(docker images --filter "dangling=true" -q
 --no-trunc)
```

For example, before removing dangling images, the command `docker image ls` may show something similar to the following:

```
REPOSITORY                                    TAG
                        IMAGE ID       CREATED              SIZE
mid
 trackdiscocopper-10-09-2020_10-14-2021_2200   4542b6ab34af   21
 seconds ago       1.01GB
<none>                                        <none>
                           1cdae087a970   About a minute ago
 1.38GB
```

After removing the dangling images, the command `docker image ls` shows the following:

```
REPOSITORY                                    TAG
                        IMAGE ID       CREATED              SIZE
mid

 About a minute ago   1.01GB
```

Launch Containerized MID Server

Containerized MID Server uses a Docker image of the MID Server that allows you to quickly deploy MID Servers at scale. MID Servers are deployed using orchestration tools like Docker Swarm.

Before you begin

Role required: admin

Prerequisites:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Linux hosts must use AlmaLinux distribution 64 bit architecture, and AlmaLinux distro is recommended.

- The host must use Docker engine and command-line interface (CLI) 20.10.4 or later.

> **Note:**
> Check docker availability by running the docker version command as administrator. See the the docker version command documentation for more information.

Procedure

1. Once the image is available, launch the new MID Server using the docker run command and specify an env file or env variable options: `docker run --env-file <env_file_name_here> <docker_tag or image_id>`

> **Note:**
> Do not pass sensitive data using this command, as there may be security vulnerabilities. To pass sensitive data, use the procedures Pass sensitive data to a containerized MID Server with Docker Secrets and Pass sensitive data to a containerized MID Server with Kubernetes Secrets.

For more information, see the Docker documentation pages for the docker image ls command, the docker run command, and specifying an env file or env variable options. The env file is a simple text file using the name=value format. If a variable is specified in both env file and in the `--env` option, the variable defined in the command line takes precedence.

While deployment requests are the recommended method to launch containerized MID Servers, they can be alternatively configured with environmental variables. When the container is first started, the initialization script will take the environment variables and configure the MID Server application using the following environment variables:

MID_INSTANCE_URL

This variable sets the 'url' config parameter.

MID_INSTANCE_USERNAME

This variable sets the 'mid.instance.username' config parameter.

MID_INSTANCE_PASSWORD

This variable sets the 'mid.instance.password' config parameter.

MID_SERVER_NAME

This variable sets the 'name' config parameter.

MID_PROXY_HOST

This variable sets the 'mid.proxy.host' config parameter. This variable is not mandatory and is only necessary when a proxy is set up.

MID_PROXY_PORT

This variable sets the 'mid.proxy.port' config parameter.

MID_PROXY_USERNAME

This variable sets the 'mid.proxy.username' config parameter.

MID_PROXY_PASSWORD

This variable sets the 'mid.proxy.password' config parameter.

MID_SECRETS_FILE

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This variable specifies the full secret filename that contains sensitive data like passwords or certificate.

MID_MUTUAL_AUTH_PEM_FILE

This variable specifies the full filename of the client certificate file used for auto validation setup.

2. **Optional:** To see a list of containers, run the docker container ls command: `docker container ls [-a]`

Pass sensitive data to a containerized MID Server with Docker Secrets

You can configure containerized MID Servers with configuration parameters passed through environment variables or secret files.

Before you begin

Role required: Docker Swarm admin

About this task

You can pass sensitive data, such passwords or certificates, into a containerized MID Server using Docker Secret. Setup and start Docker Swarm before using this procedure.

When creating deployments, ensure that the replicas are kept to 1.

Procedure

1. Place the sensitive data in `mid-secrets.properties`
2. Create a docker secret using the docker secret create command: `docker secret create mid-secrets mid-secrets.properties`

   The first `mid-secrets` represents the secret in docker swarm, while the second `mid-secrets.properties` parameter represents the file path to read the secret on the host machine's filesystem. You can list all created secrets by running the command `docker secret ls`.

   For more information on the docker secret command, see the docker secret documentation.
3. Update the **MID_SECRETS_FILE** environment variable with the path to the secret file inside the container.
   The default path for Docker Swarm secrets on Linux is `/run/secrets/mid-secrets.properties`.
4. Deploy the MID Server Image Container to Swarm using the docker service create command: `docker service create --name mid-service --secret mid-secrets.properties --env-file mid.env <docker-tag or image-id>`

   Make sure that the `--secret flag` is provided for the container service to associate with the specified secrets.

Pass sensitive data to a mutual authenticated containerized MID Server with Docker Secrets

You can configure containerized MID Servers with configuration parameters passed through environment variables or secret files.

Before you begin

Role required: admin

Role required: Docker Swarm admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

If certificate based authentication is enabled on the instance, the MID Server can be configured to auto-validate using a mutual authentication client certificate (PEM file). This can be done via setting the full path to the PEM certificate file inside container with the *MID_MUTUAL_AUTH_PEM_FILE* environment variable. For example, you can update variable to *MID_MUTUAL_AUTH_PEM_FILE= /run/secrets/certificate.pem* in the `mid.env` file.

You can pass the PEM certificate file into a container using Docker or Kubernetes secret. The following is an example command to pass the PEM certificate file into a container: `docker service create --name mid-service --secret mid-secrets.properties --secret <certificate-secret-name> --env-file mid.env <docker-tag or image-id>`

The mutual PEM certificate is installed on the MID Server during initialization. MID Server then connects to the instance and auto-validates. When the MID Server connects to the instance with mutual authentication successfully enabled, you might observe some of the following entries in the MID agent log:

- Installed custom certificate into the MID keystore
- Configured MID to use mutual authentication

Procedure

1. Prepare the mutual authentication PEM bundle.
2. Create a docker secret using the docker secret create command: `docker secret create mutual-auth-secret <mutual-auth-pem-file-on-local-filesystem> .`

   You can list all created secrets by running the command `docker secret ls`.
3. Update the **MID_MUTUAL_AUTH_PEM_FILE** environment variable with the path to the secret file inside the container.

   The default path for Docker Swarm secrets on Linux is `/run/secrets/<mutual-auth-pem-file-name>`.
4. Deploy the MID Server Image Container to Swarm using the docker service create command: `docker service create --name mid-service --secret mutual-auth-secret --env-file mid.env <docker-tag or image-id>`

   Ensure the `--secret` flag is provided for the container service to associate with the specified secrets.
5. Deploy the containerized MID Server to the pod with the **deployment.yml** and run the command: `kubectl create -f deployment.yml`

Pass sensitive data to a containerized MID Server with Kubernetes Secrets

You can configure containerized MID Servers with configuration parameters passed through environment variables or secret files.

Before you begin

Role required: Kubernetest admin

Setup and start Kubernertes cluster before using this procedure. For more information on Kubernetes Secrets, see the Kubernertes secrets documentation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Kubernetes doesn't work directly with a local image. Upload the MID Server image to a public registry or setup a local registry. See the official Docker instruction on building a docker registry.

When creating deployments, ensure that the replicas are kept to 1.

Procedure

1. Place the sensitive data in mid-secrets.properties accordingly.
2. Create a Kubernetes secret with the command: `kubectl create secret generic mid-secret --from-file=mid-secrets.properties`
3. **Optional:** You can list all created secrets by running the command: `kubectl get secrets`
4. Update the **MID_SECRETS_FILE** environment variable with the path to the secret file inside container.
   The path is defined in data field when creating a configuration file for a Secret.
5. Create a deployment with the following sample YML content:

```
apiVersion: apps/v1
kind: Deployment
metadata:
  name: basic-example
spec:
  selector:
    matchLabels:
      app: MIDServerManagement
      provider: ServiceNow
  replicas: 1
  template:
    metadata:
      labels:
        app: MIDServerManagement
        provider: ServiceNow
    spec:
      containers:
        - name: basic-example-container
          imagePullPolicy: IfNotPresent
          image: "mid:imageTag"
          env:
            - name: MID_INSTANCE_URL
              value: "
 https://exampleinstance.service-now.com/"
            - name: MID_INSTANCE_USERNAME
              value: "mid_server_user_name”
            - name: MID_SECRETS_FILE
              value:
 "/opt/snc_mid_server/secrets/mid-secrets.properties“
            - name: MID_SERVER_NAME
              value: "Basic-Example-MID"
          volumeMounts:
            - mountPath: "/opt/snc_mid_server/secrets"
              name: "mid-mount-secret"
              readOnly: true
      volumes:
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      - name: "mid-mount-secret"
        secret:
          secretName: "mid-secret"
```

Note:
There are many ways to create a deployment or pod. For more information, see the Kubernetes deployment instructions.

6. Deploy the containerized MID Server to the pod with the deployment.yml and run the command: `kubectl create -f deployment.yml`

Pass sensitive data to a mutual authenticated containerized MID Server with Kubernetes Secrets

You can configure containerized MID Servers with configuration parameters passed through environment variables or secret files.

Before you begin
Role required: Kubernetest admin

Prerequisites:

If certificate based authentication is enabled on the instance, the MID Server can be configured to auto-validate using a mutual authentication client certificate (PEM file). This can be done via setting the full path to the PEM certificate file inside container with the *MID_MUTUAL_AUTH_PEM_FILE* environment variable. You can pass the PEM certificate file into a container using Kubernetes secret.

The mutual PEM certificate is installed on the MID Server during initialization. MID Server then connects to the instance and auto-validates. When the MID Server connects to the instance with mutual authentication successfully enabled, you might observe some of the following entries in the MID agent log:

- Installed custom certificate into the MID keystore
- Configured MID to use mutual authentication

Procedure

1. Prepare the mutual authentication PEM bundle.
2. Create a Kubernetes secret with the command: `kubectl create secret generic mutual-auth-secret --from-file=<mutual-auth-pem-file>`
3. **Optional:** You can check all created secrets by running the command: `kubectl get secrets`
4. Update the **MID_MUTUAL_AUTH_PEM_FILE** environment variable with the path to the secret file inside container.
5. Create a deployment with the following sample YML content:

```
6. apiVersion: apps/v1
7. kind: Deployment
8. metadata:
9.   name: mutual-auth-example
10. spec:
11.   selector:
12.     matchLabels:
13.       app: MIDServerManagement
14.       provider: ServiceNow
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
15.   replicas: 1
16.   template:
17.     metadata:
18.       labels:
19.         app: MIDServerManagement
20.         provider: ServiceNow
21.     spec:
22.       containers:
23.         - name: mutual-auth -container
24.           imagePullPolicy: IfNotPresent
25.           image: "mid:imageTag”
26.           env:
27.             - name: MID_INSTANCE_URL
28.               value:
 "https://exampleinstance.service-now.com/"
29.             - name: MID_INSTANCE_USERNAME
30.               value: "mid_server_user_name”
31.             - name: MID_SERVER_NAME
32.               value: "Mutual-Auth-Deployment-MID"
33.             - name: MID_MUTUAL_AUTH_PEM_FILE
34.               value:
 "/opt/snc_mid_server/mutual-auth/yourpemfile.pem"
35.           volumeMounts:
36.             - mountPath: "/opt/snc_mid_server/mutual-auth"
37.               name: "mid-mount-mutual-auth"
38.               readOnly: true
39.       volumes:
40.       - name: "mid-mount-mutual-auth"
41.         secret:
42.           secretName: "mid-mutual-auth-secret"
```

6. Deploy the containerized MID Server to the pod with the **deployment.yml** and run the command: `kubectl create -f deployment.yml`

Containerized MID Server Deployment and Auto-configuration

An agent admin can enter a MID Server Profile and create a deployment request on the instance. She/he can then export the deployment request to a YAML file and use it to deploy MID Servers to Kubernetes or OpenShift cluster.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

Containerized MID Servers use a Docker image of the MID Server that allows you to quickly deploy MID Servers. The documentation for Build MID Server Docker Image for Linux provides steps for manually preparation and deployment. The following Containerized MID Server auto-configuration simplifies the process and makes it scalable.

MID Server profile

A MID Server profile contains all the settings required to configure a new MID Server, excluding sensitive data such as passwords and certificates. Sensitive data should be passed through Secrets created on the K8s cluster. The user only enters secret names and locations in the deployment request. An **agent_admin** role is required to create or change profiles. MID Server profiles are stored in the following tables:

- mid_server_profile
- mid_profile_config
- mid_profile_wrapper_config
- mid_profile_property
- mid_profile_application_m2m
- mid_profile_capability_m2m
- mid_profile_ip_range_m2m
- mid_profile_cluster_m2m

During deployment, the **mid_profile_config** and **mid_profile_wrapper_config** parameters are sent to the K8s cluster. These parameters populate the `config.xml` and `wrapper-override.conf` of the new MID Server. The other parameters are used by the auto-configuration on the instance. The user can access the MID Server profile from the module **MID Server Profiles** on the instance.

The MID Server name is not required in a profile because a profile can be used to deploy multiple MID Servers. Instead, the user is asked to enter MID Server names as part of a new deployment request. For the **mid_profile_wrapper_config**, the user can enter any parameters that they want to see in `wrapper-override.conf`. For example:

Name	Value

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

wrapper.java.maxmemory	2048
wrapper.java.additional.3	-Djavax.net.debug=ssl:handshake

Other profile settings can be entered the same way as on a MID Server record.

MID Server Deployment Request

After creating a MID server profile, the user can make a new deployment request to prepare the deployment process. A deployment request can be different for different container orchestrators. See MID Server Deployment Request for more information.

Export MID Deployment Request for Manual Deployment

The user can export it to a K8s deployment YAML file. The user can download the YAML file to the K8s cluster and deploy new MID Servers with the following command: `kubectl apply -f <yaml_file>`

Docker image preparation

To prepare a Docker image, first build a MID Server image on a K8s cluster as explained in Build MID Server Docker Image. Upload the built image to an image registry and pull the image to a local image with the command: `docker pull registry/mid:<tag>`. Refer to Docker Registry Setup for Containerized MID Server II: Auto Configuration [KB1001380] for information on limitations on pulling an image directly from a remote registry.

Kubernetes preparation

See also How to build and deploy Containerized MID Servers in Kubernetes using StatefulSets [KB1325173].

Kubernetes service account setup

Ensure the service account has the proper RBAC set up to create, delete, and list permission for resources. The following example YAML file uses the default service account:

```
apiVersion: rbac.authorization.k8s.io/v1
 kind: ClusterRoleBinding
 metadata:
    name: default-service-acccount-as-cluster-admin
 subjects:

  - kind: ServiceAccount
    # Reference to upper's `metadata.name`
    name: default
    # Reference to upper's `metadata.namespace`
    namespace: default
 roleRef:
    kind: ClusterRole
    name: cluster-admin
    apiGroup: rbac.authorization.k8s.io
```

You may choose a custom service account and assign a **ClusterRole** to that service account and name space. The default name space is **default**. The following example YAML file uses a custom name space, **mynamespace**.

```
apiVersion: rbac.authorization.k8s.io/v1
 kind: ClusterRoleBinding
 metadata:
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    name: custom-serviceacccount-as-cluster-admin
subjects:

  - kind: ServiceAccount
    # Reference to upper's `metadata.name`
    name: mycustomserviceaccount
    # Reference to upper's `metadata.namespace`
    namespace: mynamespace
roleRef:
    kind: ClusterRole
    name: cluster-admin
    apiGroup: rbac.authorization.k8s.io
```

Kubernetes Secret setup

Secrets are created for **mid-secrets.properties** or PEM files for mutual authentication. For more information about how to create a Secret, see the section in Containerized MID Server.

Auto-configure new Containerized MID Servers

When a MID server is connected to the instance for the first time, a MID Server record is created. The MID Server record is populated with the container ID, profile ID and deployment name. The **Auto-Configure MID from profile** business rule is triggered when the new MID Server record is updated with a profile ID in the **profile_id** field. The business rule looks up the profile settings associated with that profile ID and configures the new MID server accordingly.

Sync MID Server Profile to existing MID Servers

The MID Server profile can be out-of-sync with the settings of existing MID Servers if the user updates the profile long after the related MID Servers were auto-configured. The user can synchronize the profile settings to the existing MID Server by selecting **Sync to MID Servers** on the instance.

Note:
When applying cluster settings from MID Server profile to a MID Server, the cluster assignment will fail if the MID Server doesn't have any capability assigned. It is controlled by the "validate MID server capability" business rule on the ecc_agent_cluster_member_m2m table. If you want to assign a MID server to a cluster, please make sure it has some capabilities.

MID Server Deployment Request

After creating a MID server profile, the user can make a new deployment request to prepare the deployment process. A deployment request can be different for different container orchestrators.

Before you begin
Role required: agent_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

About this task

The user can access MID Server deployment request from the app module **MID Deployment Requests**.

Currently, only K8s deployment is supported. The K8s deployment request includes a reference to a MID Server profile, information about a MID Server docker image, K8s secrets, K8s deployment labels, and a list of MID Server names to assign to the new MID Servers.

Procedure

1. Enter information about the container image.

   In this section, you will specify which image is used with this deployment request and where it can be pulled from.

   Image Registry Path and Repository

   Enter a registry address and port, as well as a repository name where the image is stored. The syntax is `my.registry.address:port/repositoryname`.

   Image Tag

   Enter a tag that identifies the container image.

2. Specify the MID Server names.

   A deployment request can be made to create multiple MID Servers. You can choose to enter the MID Server names manually, otherwise the system automatically generates them. If you enter the names manually, each MID Server name must be unique.

3. Enter the Kubernetes cluster Information.

   K8s Namespace

   Enter a K8s namespace where the new MID servers are located. The default value is **default**.

   K8s Service Account

   Enter a K8s service account name that processes this deployment request. The default value is **default**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MID Secrets Name

Enter the name of a K8s secrets object that holds MID Server secrets.

MID Secrets File Path

Enter the absolute path of the MID Server secrets file inside the container.

MID Mutual Auth PEM Secrets Name

Enter the name of a K8s secrets object that holds the MID Mutual Auth PEM certificate.

MID Mutual Auth PEM File Path

Enter the absolute path of the MID Mutual Auth PEM file inside container.

K8s Deployment Label

Enter a deployment label which is a list of key/value pairs. The label is attached to K8s deployment. A valid label must be 63 characters or less and can be empty. Unless the label is empty, it must begin and end with an alphanumeric character and contain only dashes, underscores, dots, and alphanumeric characters.

What to do next

When a request is ready, the user can choose **Export to YAML file** to generate a K8s deployment YAML file and attach it to the same record. Once a request is processed, the entire record is set to read-only. There is a scheduled job that removes deployment requests older than 365 days.

Containerized MID Server Autoscaling

MID Servers can be deployed via StatefulSet with any number of replicas. They can scale automatically by leveraging Kubernetes Horizontal Pod Autoscaler (HPA). Horizontal Pod Autoscaler automatically updates a workload resource (such as a Deployment or StatefulSet) to match demand.

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

Kubernetes can add or remove any numbers of stateful MID Server replicas as required by the workload. HPA only supports CPU and memory metrics. MID Servers can be deployed as a stateful application by providing the following information in the StatefulSet section of the deployment request form:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Name
- Headless service name
- Persistent volume claim (PVC)
- Parameters, such as storage class, access modes, and storage request
- The resource request/limit

The PVC declares the desired persistent volume where the MID Server stores config.xml, meta data files, and several of its sub-folders.

During workload fluctuations, a pod with a running MID Server container can be removed and replaced by a new one. StatefulSet ensures the same persistent volume is attached to the new pod, which allows the MID Server to resume its state.

The only sub-folders that can be mounted to the persistent volume are those that are initially empty with a new MID Server installation. The **config.xml** file and other meta data files must be backed up when the pod is shut down and restored during start-up.

Deployment requests exported as YAML files can be used to create a StatefulSet workload and new MID Server pods in the Kubernetes cluster.

When you make changes to the deployment YAML file and re-apply it, the existing pods of the deployment are recreated. With StatefulSet deployment, the configuration files are restored from the backup folder. The init script must detect the deployment environment changes and apply them to the configuration files before MID server is started.

HPA Autoscaling activation

HPA Autoscaling can be activated for any existing StatefulSet workload by creating an HPA controller.

When you create a deployment request, you can choose either HPA version 1 or version 2.

When creating a deployment request on the instance with an HPA configuration, apply the exported YAML file and HPA autoscaling begins working immediately.

Configure a MID Server for IPv6

A MID Server configured for IPv6 can connect to ServiceNow and use Discovery over IPv6 for specific addresses.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

About this task

A pure IPv6 MID Server does not need to be configured for IPv6. It connects to IPv6 by default, and the **ecc_agent** record for the MID Server is automatically populated with IPv6. Contact Support to ensure your instance is IPv6 enabled.

On a dual stack host, the MID Server defaults to using IPv4. The following procedure configures a dual stack MID Server to use IPv6. The following tables are automatically updated during upgrade to Tokyo to support IPv4 and IPv6:

- **ecc_agent**
- **ecc_agent_router**
- **ecc_agent_ip_address**
- **ecc_agent_command_audit_log**

When using Discovery over IPv6, the following requirements apply:

Windows Discovery

Only WinRM is supported as of the Yokohama release. The requirements for WinRM over IPv6 are the same as IPv4. WinRM must be running on both the MID Server host and target, and the target must be configured as a trusted host on that MID Server.

Unix Discovery

Only SNC SSH is supported as of the Yokohama release. No additional configuration is needed to use SNC SSH over IPv6. J2SSH and Maverick are not supported but, if their protocols are used over IPv6, the command is executed without guaranteeing the correct results. In that case, the following error message is reported in the MID Server logs: `IPv6 is currently not supported for MID Server using Maverick (J2SSH), however the command will be executed.`

Procedure

1. Navigate to the Java VM configuration wrapper in `agent/conf/wrapper-override.conf`.
2. Open the file, then uncomment and change the following line of code to true:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
#wrapper.java.additional.109=-Djava.net.preferIPv6Addresses=fa
lse
```

Change the previous line to read as follows:

```
wrapper.java.additional.109=-Djava.net.preferIPv6Addresses=true
```

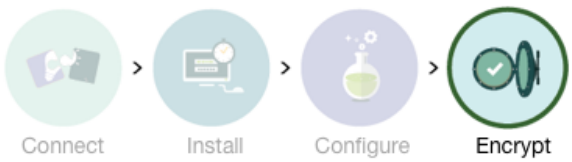
3. Restart the MID Server.
   The MID Server is now configured to connect to the instance over IPv6.

   Note:
   For dual stack MID Servers, changing the wrapper does not affect the data populated in the **ecc_agent** record, which is IPv4 by default.

4. To update the **ecc_agent** record to prefer IPv6 over IPv4, specify the following MID Server configuration parameter and set it to true: **mid.prefer_ipv6_addresses**.
5. Restart the MID Server.
   The dual stack MID Server populates the relevant fields in the **ecc_agent** record with IPv6 addresses. The tables **ecc_agent_router** and **ecc_agent_ip_address** are populated with both IPv4 and IPv6 entries on a dual stack host.

Securing and encrypting MID Server data

After configuring your MID Server, you can add security by encrypting MID Server parameter values in the `config.xml` file. Encryption protects data that the MID Server returns to the ECC Queue. Other available security options include the authorization of SOAP requests, restricting access to the MID Server configuration file, and establishing secure socket layer (SSL) connections.



1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

How MID Server password encryption works

The *username* and *password* are initially set in the `config.xml` file on the MID Server. When the MID Server retrieves the credentials, it replaces the clear-text password with an encrypted password automatically, using an AES256 encryption algorithm. In continued efforts to improve MID Server security, the encryption algorithm has been enhanced. The MID Server also maintains an encryption key that is generated each time it starts and remains in memory

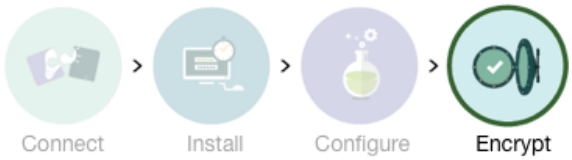
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

and not on the hard disk. When credentials need to be sent from the instance to the MID Server, the following process takes place:

1. The instance retrieves the encrypted *password* and the unencrypted *username* from the instance database table.
2. The instance decrypts the encrypted *password*, and then re-encrypts it using the MID Server encryption key.
3. The *username* and re-encrypted *password* are sent to the MID Server through the encrypted TLS session was already established between the MID server and the instance.
4. The MID Server receives the credentials and decrypts the *password* in memory before using the credentials for remote operations. At no point is the credential password stored on the disk in an unencrypted format.

MID Server certificate check policies

MID Server uses three kinds of security checks to secure external traffic. The security checks use TLS/SSL certificate validation, hostname validation, and OCSP validation to improve security. Control these security checks with the MID Server certificate check policies table.



1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

TLS/SSL certificate validation

TLS/SSL encryption security uses asymmetric encryption, also called public-key encryption. This encryption uses two cryptographic keys: the public key and the private key. The public key is used for encryption of data and is publicly visible. The private key is used for decryption of data and its security is essential to verifying authenticity. For more information about preparing your network, see MID Server TLS/SSL certificate check policy Quebec upgrade information [KB0867397].

In TLS/SSL certificate validation, the MID Server attempts to connect to a web server secured with a TLS or SSL certificate. The web server sends a copy of its TLS/SSL certificate to the MID Server. The MID Server checks the authenticity of the certificate and sends a message to the webserver. The webserver responds with a digitally signed acceptance for initiating an TLS/SSL encrypted session. After which the MID Server can begin encrypted communication with the web server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Hostname validation

Hostname verification is a part of HTTPS that involves a server identity check to ensure that the client is talking to the correct server. This check prevents sending information to a server after being redirected by a man in the middle attack.

The check involves verifying that the `dnsName` of the certificate sent by the server matches the URL used to make the request. According to RFC 6125, hostname verification should be done against the certificate's subjectAlternativeName's dNSName field. In some legacy implementations, the check is done against the certificate's commonName field. If the names don't match, the connection is terminated.

Note:
Hostname validation derives the hostname from the validated certificate presented by the server. Therefore, TLS certificate validation is a pre-requisite for hostname validation.

Online Certificate Status Protocol (OCSP)

OCSP involves contacting the remote certificate authority server and verifying the certificate before the MID Server communicates further with the target server. Compromised certificates can be a security vulnerability, especially if those certificates have the ability to sign other certificates. If certificates have been broken or forged, then a certificate authority can inform a client which certificates are invalid and should not be used.

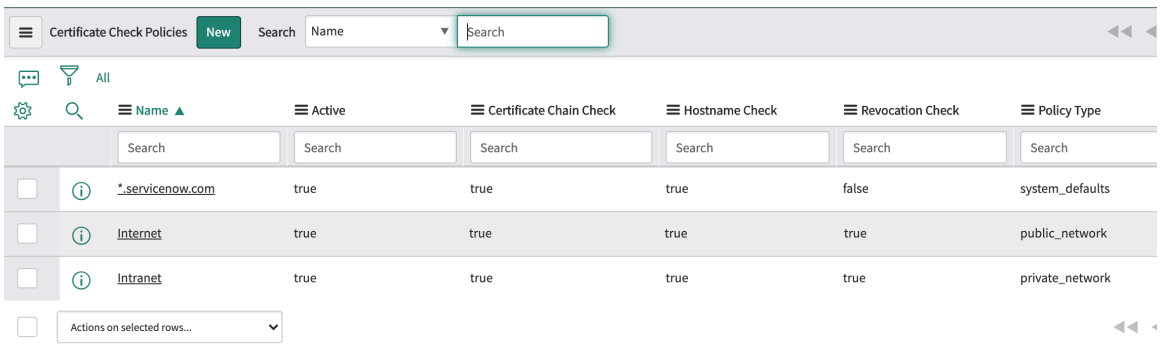
An OCSP responder (a server typically run by the certificate issuer) returns a signed response that the certificate is 'good', 'revoked', or 'unknown'. If it cannot process the request, it may return an error code.

The certificate's issuer may delegate another authority to be the OCSP responder. This creates a chain of certificates that must be verified. The responder's certificate must be issued by the issuer of the certificate in question. The responder’s certificate must include a certain extension that marks it as an OCSP signing authority.

Note:
OCSP checks are secondary HTTP calls made to an OCSP responder. The primary call may discontinue the connection based on the response from the OCSP responder.

MID Server security policy

MID Server security policies control all HTTPS traffic originating from the MID Server. This includes HTTPS connections from the MID Server to an internet endpoint, ServiceNow URLs, intranet endpoints, as well as cloud endpoints.



These connections can be further classified into 4 security policies:

ServiceNow endpoint policy

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This policy is the system default exclusively for ServiceNow URLs. On the MID Server `config.xml`, there are bootstrap properties which are only used to make first connection to the instance and will get updated with the system_default policy.

Internet policy

These policies cover all HTTPS connections initiated from MID Server to any endpoint on the internet.

Intranet policy

These policies cover the reserved IP subnets, such as self-hosted networks.

Overridden policy

You can override specific endpoints or URLs with this policy definition. Overridden policies take the highest order of precedence during operation.

Both tables are editable to include or exclude IP ranges, as well as control what kind of certificate validation checks need to be done. Enable all certificate validation checks to maximize security. The Quebec version has all policies and checks turned on by default for fresh installations.

For upgrading customers, the intranet policy has the certificate validation checks disabled by default. To improve security, configure and enable the policy for endpoints within the internal network.

Note:
Internal endpoints or URLs need to possess a valid CA signed certificate for a successful connection.

For endpoints that host a self-signed certificate, either import the certificate to the MID Server trust store or disable the policy checks which validate that host. For more information about adding certificates, see Add SSL certificates for the MID Server.

After upgrading to Quebec, go to the certificate check policies table and make changes to policy configuration if necessary. Once the MID Server starts up and connects to the instance, any subsequent HTTPS connection originating from the MID server will start applying these certificate checks at runtime. Insecure connections are broken with appropriate error messages.

Use Instance Security Policy

The MID Server configuration parameter **mid.ssl.use.instance.security.policy** controls whether the MID Server uses its bootstrap parameters rather than the security policy from the instance. By default, **mid.ssl.use.instance.security.policy** is set to false in the **config.xml** so the bootstrap policies are not overwritten by the instance's.

This default setting can prevent some problems during MID Server setup. For example if the host is unable to reach the OCSP responder, then a new MID Server installation is not disrupted by an instance's policy of requiring OCSP connection.

The configuration parameter **mid.ssl.use.instance.security.policy** can be set for each MID Server. When set to true, the MID Server syncs all policies with the instance and the bootstrap configuration parameters are overwritten by the ***.servicenow.com** policy on the instance **mid_cert_check_policy** table. The final policies update the policy map in the MID Server memory as well as the **config.xml**.

The default parameters in the **config.xml** are:

- `<parameter name="mid.ssl.bootstrap.default.check_cert_hostname" value="true"/>`
- `<parameter name="mid.ssl.bootstrap.default.check_cert_chain" value="true"/>`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- `<parameter name="mid.ssl.bootstrap.default.check_cert_revocation" value="false"/>`
- `<parameter name="mid.ssl.use.instance.security.policy" value="false"/>`

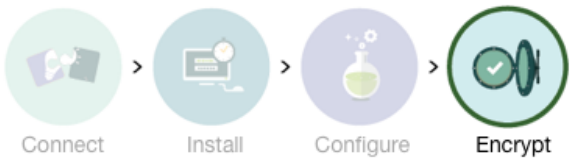
Self-hosted or on-prem instances must add the following parameter for the **config.xml**: `<parameter name="mid.ssl.bootstrap.default.target_endpoint" value="FQDN_OF_THE_INSTANCE"/>`

Encrypt or decrypt MID Server configuration file values

The value of any MID Server parameter in the `config.xml` file can be encrypted. The attributes for all encrypted values are managed from within the configuration file, including the security attribute of the login password.

Before you begin

Role required: admin



1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

Procedure

1. Navigate to the `agent` directory that was created when the MID Server was installed and open the `config.xml` file using a text editor such as WordPad.
2. Locate or add the parameter you want to encrypt.
   For example, you might want to protect your proxy server passwords by configuring this parameter:

   ```
   <parameter name="mid.proxy.password" value="securepassw0rd"/>
   ```

3. Add the encryption attribute **secure="true"**.

   ```
   <parameter name="mid.proxy.password" secure="true"
    value="securepassw0rd"/>
   ```

4. Restart the MID Server.
5. Open the `config.xml` file.
   The encrypted password appears as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

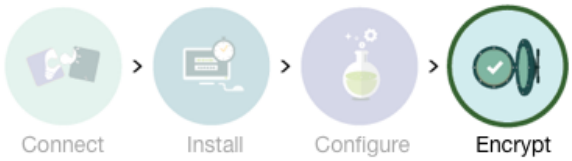
```
<parameter name="mid.proxy.password" secure="true"
 value="encrypted:rhrfUNYRzZAI8/BkTtZmNA==" />
```

.

6. To decrypt this or any other value in the `config.xml` file and display the value in clear text:
   a. Stop the MID Server.
   b. Set the **secure="true"** attribute to **false**.
   c. Replace the encrypted value with the clear text value.
   d. Restart the MID Server.

MID Server configuration file security

Sensitive MID Server configuration data can be protected using several different schemes, including internal and external data encryption and external data storage.



1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

The MID Server provides the following built-in security options for content in the **config.xml** file:

- **Default security provider**: Secures the data in the **config.xml** file by encryption. When the MID Server is restarted, any unencrypted data is encrypted and written to the **config.xml** file. The default security provider offers these encryption options:
  - **Default encryptor**: Default process for encrypting data in the MID Server **config.xml** file. See Encrypt or decrypt MID Server configuration file values for details.
  - **Windows Data Protection API (DPAPI)**: The operating system performs the data encryption, rather than the MID Server. DPAPI encryption is based on the logged in user's account. When this scheme is used, the data can only be decrypted by the same user account. If the account changes, the data must be re-encrypted.
  - **Custom encryption**: Implement the IMidServerEncrypter interface to create your own custom encryption scheme to manage sensitive **config.xml** data.
-
- **CyberArk**: Data security is provided by CyberArk integration configuration, which moves sensitive data from the **config.xml** file to a secure CyberArk vault. This solution does not encrypt the data.
- **Custom external storage**: Implement the ISecuredConfigProvider interface to create your own custom external storage system to manage sensitive **config.xml** data.

© 2026 ServiceNow, Inc. All rights reserved.

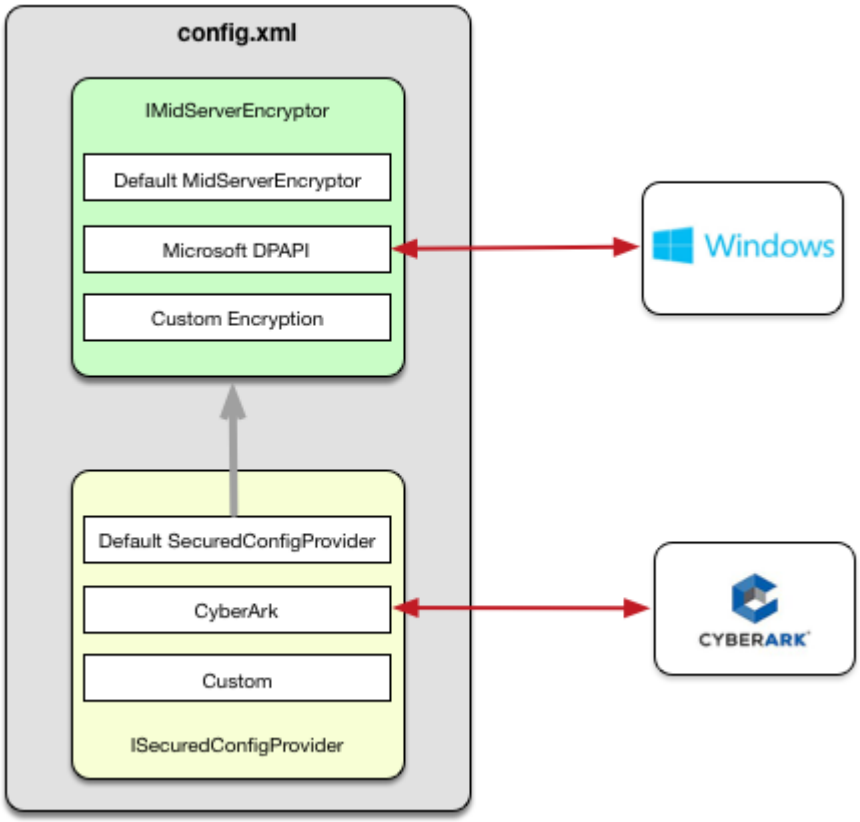
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Secured content and encryption schemes



Encrypt MID Server configuration data with DPAPI

Windows Data Protection API (DPAPI) encrypts sensitive data from the **config.xml** file, based on the MID Server user account.

Before you begin

Role required: admin

About this task

DPAPI encryption provides another level of security for data such as credentials, IP addresses, and URLs in the MID Server **config.xml** file. The operating system performs the data encryption, rather than the MID Server. DPAPI encryption is based on the logged in user's account. When this scheme is used, the data can only be decrypted by the same user account. If the account changes, the data must be re-encrypted.

Procedure

1. Open the **config.xml** file in a text editor.
   This file is located in the **/agent** folder in your MID Server installation path.
2. Enable this parameter and value:
   ```
   <parameter name="mid.secure_encrypter"
   value="com.service_now.mid.services.config.WindowsDPAPIEncrypter"/
   >
   ```
3. Save the configuration file.
4. Restart the MID Server.
   Any values in clear text in the **config.xml** file are encrypted by the operating system.
5. Follow this procedure if you need to change the MID Server user account that is used for encryption.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Stop the MID Server service.

b. Open the **config.xml** file in a text editor.
This file is located in the **/agent** folder in your MID Server installation path.

c. Re-enter all the encrypted values in clear text.

d. Make the changes to the MID Server user account in the ServiceNow® instance.

e. Restart the MID Server service.
The data is re-encrypted by the operating system, based the new MID Server user account.

Use CyberArk as a secure configuration provider

You can use a CyberArk vault to secure any sensitive data from the MID Server **config.xml** file.

Before you begin

Role required: admin

Before configuring CyberArk as secured config provider, make sure that **JavaPasswordSDK.jar** is available in the `<mid_installation_folder>/agent/extlib` folder.

To configure the MID Server to connect to CyberArk using AIM, see CyberArk JAR import.

About this task

CyberArk is commonly used to secure credentials in its external vault. However, a MID Server parameter in the **config.xml** file enables you to store other types of data in CyberArk.

Procedure

1. Open the **config.xml** file in a text editor.
This file is located in the **/agent** folder in your MID Server installation path.
2. Enable this parameter and value:
`<parameter name="mid.secure_config.provider" value="com.service_now.mid.services.config.CyberArkSecuredConfigProvider"/>`
3. Configure specific data to secure in the CyberArk vault.
Use the following example as a guide.

   a. Secure the MID Server credentials by setting this parameter to match the **ID** and **Type** for that data in your CyberArk integration configuration.

```
<parameter name="mid.instance.username" secure="true"
 value="cyberark: id=<CyberArk ID>, type=<CyberArk type>"/>
<parameter name="mid.instance.password" secure="true"
 value="cyberark: id=<CyberArk ID>, type=<CyberArk type>"/>
```

   b. Secure the URL of the instance by setting this parameter to match the **ID** and **Type** for that data in your CyberArk configuration.
`<parameter name="url" secure="true" value="cyberark: id=<CyberArk ID>, type=<CyberArk type>"/>`

4. Save the configuration file.
5. Restart the MID Server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Change MID Server configuration file security schemes

The MID Server provides several schemes for securing sensitive data in the **config.xml** file and allows you to switch between these options to suit your security requirements.

Before you begin

Role required: admin

Procedure

1. Stop the MID Server service.
2. Open the **config.xml** file in a text editor.
   This file is located in the **/agent** folder in your MID Server installation path.
3. Re-enter all the encrypted values in clear text.
4. Disable the previous security scheme and configure the MID Server to use the new provider.
5. Restart the MID Server service.
   The data is re-secured or encrypted, based on the security scheme you have selected.

MID Server ISecuredConfigProvider interface

Use the methods in this interface to create custom providers that manage secured parameter values in the MID Server **config.xml** file.

Note:
These methods are contained in the **snc-automation-api.jar** file, located in the MID Server installation folder.

initialize

This method initializes the provider with additional configuration parameters and does not return a value.

Example

```
void intialize(java.util.Properties properties,
               IMidServerEncrypter encrypter)
       throws java.lang.Exception
```

Parameters

Parameters	Description
properties	Initialization properties.
encrypter	Encrypter to use if the provider is encryption based.

Exception

`java.lang.Exception`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

isParameterValueSecured

This method checks to see if the parameter value has been secured or not. This method returns a **boolean** type value.

Example

```
boolean isParameterValueSecured(java.lang.String paramValue)
```

Parameters

Parameter	Description
paramValue	The parameter value.

Returns

The parameter returns **true** if the parameter value is secured.

secureParameterValue

This method secures the parameter value if it has not been secured. This method returns a **string** type value.

Example

```
java.lang.String secureParameterValue(java.lang.String
 unsecuredParameterValue)
                                throws java.lang.Exception
```

Parameters

Parameter	Description
unsecuredParameterValue	The unsecured parameter value.

Returns

This method returns the unsecuired parameter value.

Exception

`java.lang.Exception`

unsecuredParameterValue

This method returns the unsecured value of the parameter. This method returns a **string** type value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example

```
java.lang.String unsecuredParameterValue(java.lang.String
 parameterName)
                                    throws java.lang.Exception
```

Parameters

Parameter	Description
parameterName	The parameter name.

Returns

This parameter returns the unsecured value.

Exception

`java.lang.Exception`

MID Server IMidServerEncrypter interface

Use the methods in this interface to create a custom external encrypter for the MID Server **config.xml** file.

Note:
These methods are contained in the **snc-automation-api.jar** file, located in the MID Server installation folder.

initialize

This method initializes the encrypter with additional configuration parameters and does not return a value.

Example

```
void intialize(java.util.Properties properties)
       throws java.lang.Exception
```

Parameters

Parameter	Description
properties	Initialization properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Exception

`java.lang.Exception`

encrypt

This method encrypts the unencrypted data and returns a **byte[ ]** type value.

Example

```
byte[] encrypt(byte[] unencryptedData)
        throws java.lang.Exception
```

Parameters

Parameter	Description
unencryptedData	The data unencrypted.

Returns

Encrypted data

Exception

`java.lang.Exception`

decrypt

This method decrypts encrypted data and returns a **byte[ ]** type value.

Example

```
byte[] decrypt(byte[] encryptedData)
        throws java.lang.Exception
```

Parameters

Parameters	Description
encryptedData	The data decrypted.

Returns

Decrypted data.

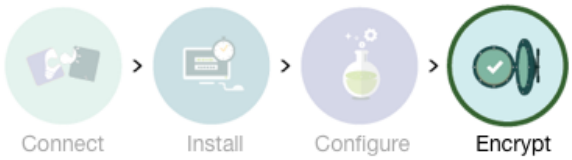
Exception
`java.lang.Exception`

MID Server authentication credentials and SOAP requests

Set basic authentication credentials to update the web service invocation data. For added security, you can enforce basic authentication on each incoming SOAP request to the MID Server.



1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

Basic authentication credentials and SOAP requests

You can enforce basic authentication on each request. The MID Server is not able to communicate through a proxy server if the proxy server supports only NTLM authentication. You can use basic authentication with a proxy server or create an exception for the MID server host.

Supplying basic authentication information, regardless of whether it is required, has an added advantage. The web service invocation creates or updates data using the supplied credentials. For example, when you create an incident record, the journal fields have the user id of the basic authenticated user instead of the default Guest user. This behavior allows you to identify data added by a specific MID Server.

You can set basic authentication credentials for SOAP requests. Each SOAP request contains an Authorization header as specified in the Basic Authentication protocol.

The setting for enforcing strict security controls how the instance uses the credentials you provide for the MID Server. When the setting is enabled, you must provide a user ID with access to the tables the MID Server is trying to access. When the setting is disabled, any valid user ID allows the MID Server to access to all tables.

Require basic authorization for incoming SOAP requests

Enforce basic authentication on each incoming SOAP request to the MID Server.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Properties** > **Web Services**.
2. Select the check box for **Require basic authorization for incoming SOAP requests**.
3. Click **Save**.
4. To provide basic authentication credentials for a MID Server, navigate to C:\Program Files \ServiceNow\<MID Server name>\agent and edit the `config.xml` file, as follows:

   a. Find the element *`<parameter name="mid.instance.username" value=""/>`* and enter the instance administrator user name as the value.

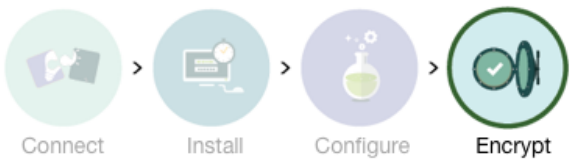
   Example
   For example, you might enter *`<parameter name="mid.instance.username" value="admin"/>`*.

   b. Find the element *`<parameter name="mid.instance.password" value=""/>`* and enter the configured password for this instance as the value.

   Example
   For example, you might enter *`<parameter name="mid.instance.password" value="abc123"/>`*.

MID Server unified key store

The MID Server unified key store allows all products on the MID Server to use common certificates and key pairs. This feature allows applications to use the same secure communication channel to the MID Server that the MID Server uses to connect to the instance.



1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

When the MID Server starts, the common name (CN) of the certificate is inspected to identify if a custom certificate has been installed. If a custom certificate is detected, the creation of the certificate/keypair will be skipped and an attribute is set on the ecc_agent record to indicate the usage of a custom certificate.

When a custom certificate is used, the **Re-key** UI-action is disabled on the instance for the MID Server. A new UI action called **Remove custom keypair** is available to switch back to using a self-signed certificate. Using this action will cause the MID Server to remove the custom certificate and generate a new self-signed certificate, similar to the re-key option.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When a MID is upgraded, any custom certificates that were installed will be retained.

PEM bundle support

MID Server unified key store supports PEM bundle certificate and key pairs.

Sample PEM bundle

```
-----BEGIN PRIVATE KEY-----

MIIEvQIBADANBgkqhkiG9w0BAQEFAASCBKcwggSjAgEAAoIBAQC0pj5O8QKFpHy9

...

oPdU+h0grs9SJp6rFx0PzDY=

-----END PRIVATE KEY-----

Bag Attributes

    friendlyName: <myCustomCert>

    localKeyID: 54 69 6D 65 20 31 35 39 35 33 35 34 32 30 38 30
 35 31

subject=/C=US/ST=CA/L=Santa Clara/CN=epic1016883

issuer=/C=US/ST=CA/L=Santa Clara/CN=epic1016883

-----BEGIN CERTIFICATE-----

MIIDKzCCAhOgAwIBAgIEPqMQqDANBgkqhkiG9w0BAQsFADBGMQswCQYDVQQGEwJV

-----END CERTIFICATE-----
```

Install custom certificates in the MID Server unified key store

Install custom certificates to unify the security channels for various applications.

Before you begin
Role required: admin

When installing the certificate on a MID Server hosted in Linux, `install-certificate.sh` can be unresponsive if the Linux entropy pool count is less than a few hundred. Check the entropy count of the Linux pseudo random number generator (PRNG) with the following command:

```
cat /proc/sys/kernel/random/entropy_avail
```

If the entropy count is too low, you can install an entropy generator such as RNGD or Haveged. For more information about installing Haveged for CentOS and Ubuntu, see How to Setup Additional Entropy for Cloud Servers Using Haveged.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. If the MID Server is running, stop the MID Server.

   Note:

   If the entry for alias **DefaultSecurityKeyPairHandle** is being modified, you must invalidate the MID Server before stopping it.

2. Create a PEM bundle certificate and keypair by running one of the following commands in the MID Server install folder.
   - Generate self-signed certificates for non-MTLS use cases with the command:

     ```
     openssl req -newkey rsa:2048 -nodes -keyout key.pem -x509
      -days 365 -out certificate.pem
     ```

   - Export the key store to a PEM bundle using the command:

     ```
     openssl pkcs12 -in <myCustomCert>.p12 -nodes -out
      <myCustomCert>.pem
     ```

   - Get only certificates in the PEM format with the command:

     ```
     openssl pkcs12 -in <myCustomCert>.p12 -out <myCustomCert>.pem
      -clcerts -nokeys
     ```

   - Get only keys in the PKCS#8 format with the command:

     ```
     openssl pkcs12 -in <myCustomKey>.p12 -out <myPrivateKey>.key
      -nocerts -nodes
     ```

   - Install the certificate, or certificate chain, and private key for Windows hosts using the command:

     ```
     bin/scripts/manage-certificates.bat -a <alias> <file path to
      PEM bundle>
     ```

   - Install the certificate, or certificate chain, and private key for Linux hosts using the command:

     ```
     bin/scripts/manage-certificates.sh -a <alias> <file path to
      PEM bundle>
     ```

   Note:

   The header and footer of the PEM syntax must be the following:

   ```
   -----BEGIN CERTIFICATE-----
   ```

   ```
   -----END CERTIFICATE-----
   ```

   The header and footer of the PKCS#8 syntax must be the following:

   ```
   -----BEGIN PRIVATE KEY-----
   ```

   ```
   -----END PRIVATE KEY-----
   ```

3. Start the MID Server.
4. Validate the MID Server with the instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. **Optional:** To revert the MID Server to use a self-generated certificate, select the MID Server in the instance and use the UI action **Remove custom certificate**.

Note:
The MID Server can also be reverted using the **Invalidate** UI action. Invalidating a MID Server removes any custom certificates that are installed and creates a new self-signed certificate for the MID Server.

What to do next

The *manage-certificates* has the following functions and the scripts must be run from the agent folder.

Enable mutual authentication

For Windows, use the command: `bin\scripts\manage-certificates.bat -m`

For Linux, use the command: `./bin/scripts/manage-certificates.sh -m`

Remove mutual authentication and restore back basic authentication

For Windows, use the command: `bin\scripts\manage-certificates.bat -b <myUserName myPassword>`

For Linux, use the command: `./bin/scripts/manage-certificates.sh -b <myUserName myPassword>`

Add new certificates and certificate chains with a specified alias

For Windows, use the command: `bin\scripts\manage-certificates.bat -a <alias> <fileName>`

For Linux, use the command: `./bin/scripts/manage-certificates.sh -a <alias> <fileName>`

The `alias` is a unique name given to the certificate being imported. The MID Server requires a custom certificate for mutual authentication, with the default alias name `defaultsecuritykeypairhandle`. To configure MTLS communication between the MID Server and instance, the certificate entry must be added to the key store using the alias name `defaultsecuritykeypairhandle`.

The `fileName` is a file path that can contain a PEM certificate, or certificate chain, and a PCKS#8 private key. The file path to the PEM bundle can contain multiple certificates and a single private key. The header and footer of each PEM certificate must be the following:

```
-----BEGIN CERTIFICATE-----
```

```
-----END CERTIFICATE-----
```

The header and footer of the PKCS#8 syntax must be the following:

```
-----BEGIN PRIVATE KEY-----
```

```
-----END PRIVATE KEY-----
```

An exception is thrown if the certificate chain fails validation. If the file contains multiple certificates, they must be ordered: leaf certificate, intermediate certificates, then root certificates.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Display certificate details for the specified alias

For Windows, use the command: `bin\scripts\manage-certificates.bat -g <alias>`

For Linux, use the command: `./bin/scripts/manage-certificates.sh -g <alias>`

This command displays information such as subject distinguished name, issuer name, and expiry date from the certificate.

List all existing aliases

For Windows, use the command: `bin\scripts\manage-certificates.bat -l`

For Linux, use the command: `./bin/scripts/manage-certificates.sh -l`

This command lists all the alias names available in the *agent_keystore*.

Delete certificates using an alias

For Windows, use the command: `bin\scripts\manage-certificates.bat -d <alias>`

For Linux, use the command: `./bin/scripts/manage-certificates.sh -d <alias>`

This command deletes the alias and record from the keystore. The entry for alias *DefaultSecurityKeyPairHandle* can be deleted using this command.

Remove all entries from the keystore

For Windows, use the command: `bin\scripts\manage-certificates.bat -r`

For Linux, use the command: `./bin/scripts/manage-certificates.sh -r`

This command deletes the existing entries from the keystore, except alias *DefaultSecurityKeyPairHandle*.

Enable MID Server mutual authentication

Restore the MID Server key store with a backup

If the key store becomes corrupted or is accidentally deleted you can restore a backup of the MID Server key store. This is especially useful for key stores with custom key-pairs, because otherwise recreating custom key-pair data can be difficult and time consuming.

Before you begin

Role required: Agent admin

About this task

Starting with the Tokyo release, the MID Server automatically makes a backup of the **agent_keystore** file when it is changed. Backups are stored in **security_backup** under the agent folder. They are stored outside the security folder to protect against accidental deletions or corruptions of the security folder.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In the backup folder, there is a dedicated backup log file: **keystore_backup_audit_trail.log**. This log keeps track of backup files and backup activities. Each backup log entry has backup file name with a time stamp, a matching **keypairs.mid_id**, and a list of aliases of key-pairs in the backup.

Note:
For security purposes, the backup key store should have the same attributes as the original key store, such as owner, group, and permissions. Those attributes ensure the MID Server has the same protection at file system level.

The key store backups can be modified with the MID Server properties **mid.keystore.max_backups**, **mid.keystore.max_live_backups**, and **mid.keystore.backup_overwrite_timespan**. See MID Server properties for more information.

Procedure

1. Stop MID Server.
2. Navigate to the **security_backup** and view the **keystore_backup_audit_trail.log** to choose which backup to restore.
3. Copy that backup to the **agent_keystore** file in the security folder.
   Check the file permissions to make sure that it has the same owner and permissions as the original one. If **agent_keystore** already exists in that location, overwrite it with the backup.
4. Check **config.xml** to make sure that the **keypairs.mid_id** matches the one in the audit log file.
5. **Optional:** If the **keypairs.mid_id** do not match, update **config.xml** to match them.
6. Navigate to the instance and invalidate the MID server.
   This will create a **delete_mid_keypair** system command in the **ecc_queue**.
7. Find all **delete_mid_keypair** output messages for the MID Server and mark them as processed.
   The goal is to mark the MID Server as invalidated without triggering the key-pair deletion. Unless the system commands are marked as processed, MID Server deletes the **defaultsecuritykeypairhandle** key-pair regardless of whether it is custom or auto-generated.
8. Restart MID Server.
9. Navigate to the instance and validate the MID Server.

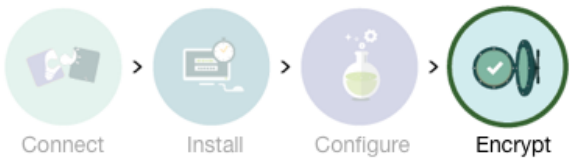
Enable MID Server mutual authentication

Configure the MID Server to use a client certificate for authenticating to the instance. This avoids the need to create a basic authentication credentials in the Key Store for the MID Server's configuration.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

About this task

MID Server mutual authentication removes the MID Server user name and password and provides a client certificate for authentication. Whenever a server requests authentication, this certificate is sent instead. To use mutual authentication, certificate based authentication must be enabled. See Set up Certificate-based authentication for the procedure.

If a new MID Server is created with mutual authentication, it does not add capabilities automatically. An administrator must add capabilities to its record on the instance. However, existing MID Servers using basic authentication with capabilities are preserved when switching to mutual authentication.

A MID Server using mutual authentication cannot be re-keyed or validated as a UI action on the instance.

Self-signed certificates are not supported with mutual authentication. Internally signed certificates are only supported when signed by a private certificate authority. Commercially signed certificates are supported when signed by a commonly trusted certificate authority, such as those trusted by browsers and operating systems.

In the Quebec release, a MID Server using the Health Log Analytic application cannot be configured with mutual authentication.

Procedure

1. Contact ServiceNow support to request mutual authentication on the MID Server.

   For additional technical details and troubleshooting information, see https://support.servicenow.com/kb?id=kb_article_view&sysparm_article=KB1116112.

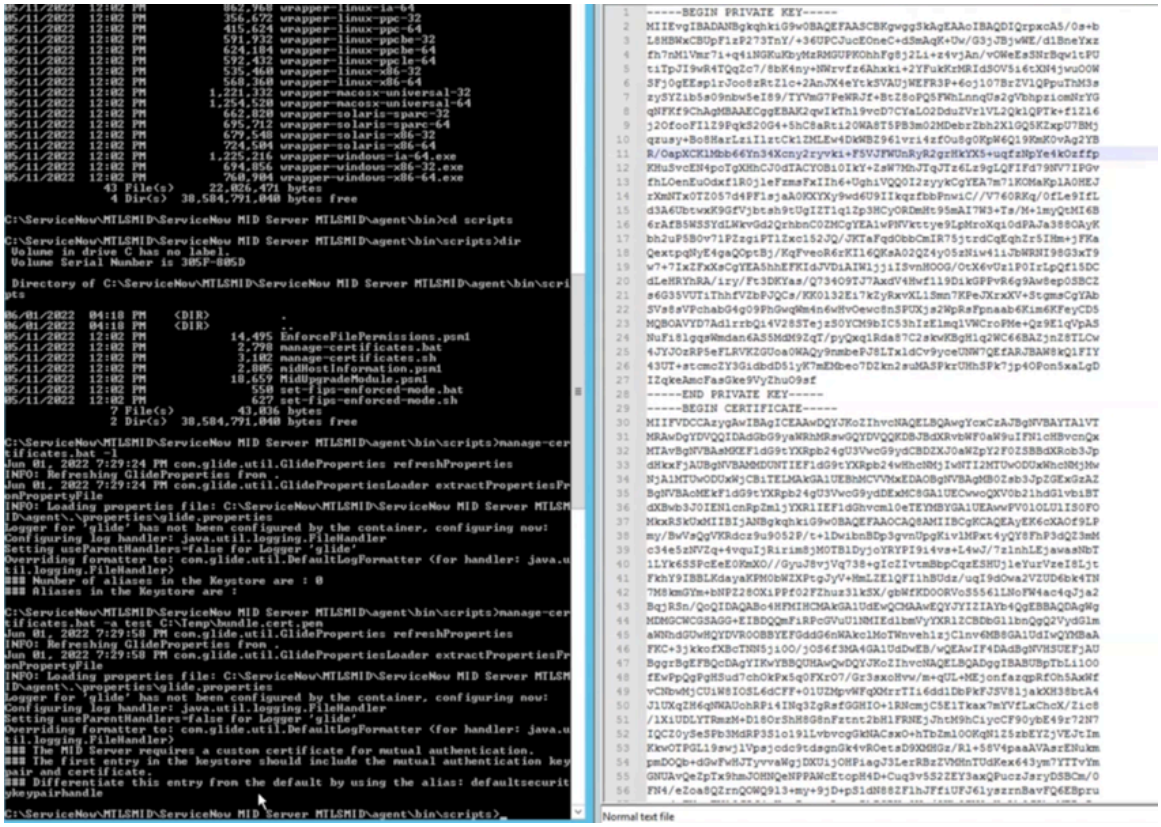
2. Obtain a certificate and private key from a respected certificate authority.

   MID Server mutual authentication only supports the PEM bundle format and private key in PCKS#8 format. The bundle must have both the private key and certificate. Open the certificate using a text editor and see if it is in text format. The header and footer of the PEM syntax is the following:

   ```
   -----BEGIN CERTIFICATE-----
   ```

   ```
   -----END CERTIFICATE-----
   ```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



You can read the contents of a PEM certificate using the `openssl` command on Linux or Windows as follows: `openssl x509 -in cert.crt -text` . The private key must be in the PKCS#8 format. The header and footer of the PKCS#8 syntax is the following:

```
-----BEGIN PRIVATE KEY-----
```

```
-----END PRIVATE KEY-----
```

#You can check the contents of a private key using the `openssl` command on Linux or Windows as follows: `openssl rsa -in private.key -check`

> **Note:**
> If your certificate is not in PKCS#8 format, you get an error: `- main SEVERE *** ERROR *** Could not find valid private key`

3. Split up the PEM certificate into 3 different PEM files.
   a. File 1: Private key and leaf certificate
   b. File 2: Leaf certificate
   c. File 3: Intermediate certificates and root certificate
4. On the instance, navigate to the CA Certificate Chain table (**sys_ca_certificate**) and upload File 3.

> **Note:**
> If uploading individually instead of a bundle, start with the root certificate, and then the intermediate certificate(s). It is preferrable to uploade this file as a PEM bundle, whose type is set to CA Cert, instead of splitting it into multiple files.

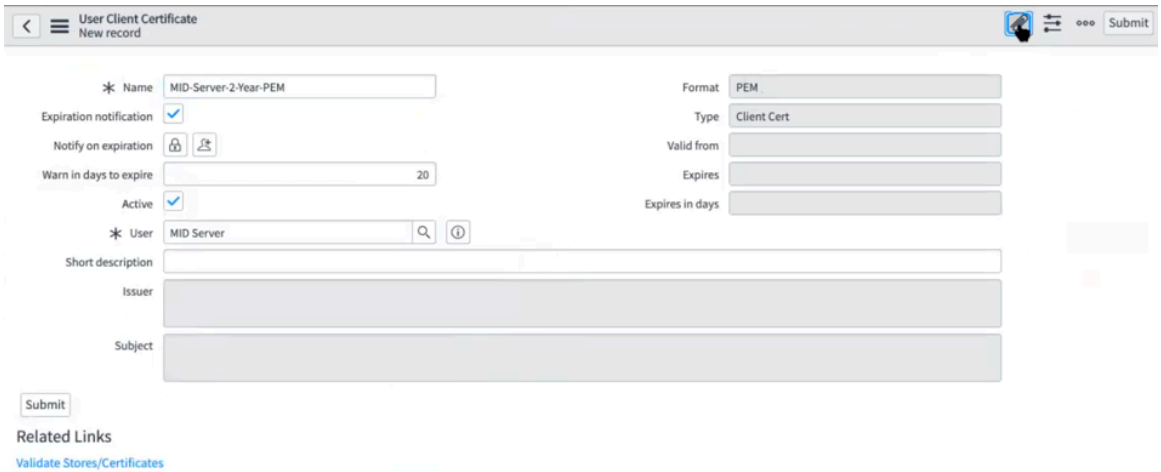
5. Check the uploaded CA Cert record on the instance and wait for the **Publish Status** to change to **Exists**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Do not proceed until the publish status is updated to **Exists**.

6. On the instance, navigate to the **sys_user_certificate** table.
7. Create a new record to map the MID Server user to the leaf certificate.

   In the **User** field, select a user with the MID Server role



8. Attach File 2 to the record.
9. Click **Submit**.
10. If the MID Server is validated, invalidate the MID Server before continuing.
11. If the MID Server is running, stop the MID Server.
12. Copy File 1 to a location on the MID Server host machine.
13. Import File 1 into the MID Server keystore.
    To configure mutual authentication between the MID Server and the instance, the certificate entry must be added to the `keystore` using the alias name `defaultsecuritykeypairhandle`.

    For Windows, use the command: `bin\scripts\manage-certificates.bat -a defaultsecuritykeypairhandle <path_to_File_1>`

    For Linux, use the command: `./bin/scripts/manage-certificates.sh -a defaultsecuritykeypairhandle <Path to File 1>`

14. Enable mutual authentication.

    For Windows, use the command: `bin\scripts\manage-certificates.bat -m`

    For Linux, use the command: `./bin/scripts/manage-certificates.sh -m`

15. On the MID Server host machine, run the following commands to install and manage the certificate and private key.

    Run the script from the root of the agent directory because it requires the jar files in the class path. The security directory is then created in the agent root folder and is used by MID Server. For example: `bin/scripts/manage-certificates.bat -m.`

    The *`manage-certificates`* has the following functions and the scripts must be run from the agent folder.

    Enable mutual authentication

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For Windows, use the command: `bin\scripts\manage-certificates.bat -m`

For Linux, use the command: `./bin/scripts/manage-certificates.sh -m`

Remove mutual authentication and restore back basic authentication

For Windows, use the command: `bin\scripts\manage-certificates.bat -b <myUserName myPassword>`

For Linux, use the command: `./bin/scripts/manage-certificates.sh -b <myUserName myPassword>`

Add new certificates and certificate chains with a specified alias

For Windows, use the command: `bin\scripts\manage-certificates.bat -a <alias> <fileName>`

For Linux, use the command: `./bin/scripts/manage-certificates.sh -a <alias> <fileName>`

The `alias` is a unique name given to the certificate being imported. The MID Server requires a custom certificate for mutual authentication, with the default alias name `defaultsecuritykeypairhandle`. To configure MTLS communication between the MID Server and instance, the certificate entry must be added to the key store using the alias name `defaultsecuritykeypairhandle`.

The `fileName` is a file path that can contain a PEM certificate, or certificate chain, and a PCKS#8 private key. The file path to the PEM bundle can contain multiple certificates and a single private key. The header and footer of each PEM certificate must be the following:

```
-----BEGIN CERTIFICATE-----
```

```
-----END CERTIFICATE-----
```

The header and footer of the PKCS#8 syntax must be the following:

```
-----BEGIN PRIVATE KEY-----
```

```
-----END PRIVATE KEY-----
```

An exception is thrown if the certificate chain fails validation. If the file contains multiple certificates, they must be ordered: leaf certificate, intermediate certificates, then root certificates.

Display certificate details for the specified alias

For Windows, use the command: `bin\scripts\manage-certificates.bat -g <alias>`

For Linux, use the command: `./bin/scripts/manage-certificates.sh -g <alias>`

This command displays information such as subject distinguished name, issuer name, and expiry date from the certificate.

List all existing aliases

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For Windows, use the command: `bin\scripts\manage-certificates.bat -l`

For Linux, use the command: `./bin/scripts/manage-certificates.sh -l`

This command lists all the alias names available in the *agent_keystore*.

Delete certificates using an alias

For Windows, use the command: `bin\scripts\manage-certificates.bat -d <alias>`

For Linux, use the command: `./bin/scripts/manage-certificates.sh -d <alias>`

This command deletes the alias and record from the keystore. The entry for alias *DefaultSecurityKeyPairHandle* can be deleted using this command.

Remove all entries from the keystore

For Windows, use the command: `bin\scripts\manage-certificates.bat -r`

For Linux, use the command: `./bin/scripts/manage-certificates.sh -r`

This command deletes the existing entries from the keystore, except alias *DefaultSecurityKeyPairHandle*.

16. Start the MID Server.

Install custom certificates in the MID Server unified key store

MID Server unified key store

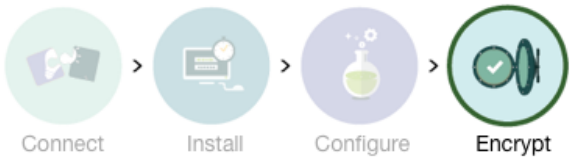
MID Server Azure Key Vault integration

The MID Server integration with the Azure Key vault enables Orchestration, Discovery, and Service Mapping to run without storing any credentials on the instance.

Before you begin

To install the required application on the instance, navigate to **Plugin Manager** > **External Credential Storage and Management**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

Role required: External Credential Storage and Management application Scope ID is required: com.sn_mid_extcredstrg

About this task

When setting up access to the Azure Key Vault, the MID Server is either within the Azure environment or it is on an external virtual machine. This procedure covers setting up the Azure Key Vault for a MID Server within the Azure environment.

For more information about specific Azure and Azure Key Vault procedures, see the Azure Key Vault documentation.

Procedure

1. Within the Azure cloud environment, create a virtual machine.
2. Navigate to the Identity section of that virtual machine.
3. Enable system assigned identity.
   Once it is enabled, you have the option to assign a role for that identity.
4. Navigate to the **Add role assignment** menu.
5. Set the scope to your Subscription.
6. Add the Key Vault administrator role.
7. Set the resource to the key vault that you want to integrate with the MID Server.

Azure Key Vault Integration for External Virtual Machine MID Servers

The MID Server integration with the Azure Key vault enables Orchestration, Discovery, and Service Mapping to run without storing any credentials on the instance.

Before you begin

Role required: External Credential Storage and Management application (Scope ID:**com.sn_mid_extcredstrg**) is required.

About this task

When setting up access to the Azure Key Vault, the MID Server is either within the Azure environment or it is on an external virtual machine. This procedure covers setting up the Azure Key Vault for a MID Server that is on an external virtual machine.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information about specific Azure and Azure Key Vault procedures, see the Azure Key Vault documentation.

MID servers can use the Vault Credential Resolver to consume secrets directly from Vault for the purpose of performing discovery. The External Credential Storage and Management Application offers out-of-the-box integration to external credential providers. MID Servers support certificate-based authentication when connecting to Azure Key Vault. This provides a more secure and flexible way to authenticate, especially for enterprise environments that prefer certificate credentials over client secrets. For more information on managing certificates, see MID Server unified key store.

Procedure

1. In the Azure portal, navigate to App registrations.
2. Create a new application for the MID Server.
3. Take a note of the **tenant id** and **client id** because these are used later.
4. Provide API Permission for Azure Key Vault to the application.
5. Navigate to **Certificates and Secrets** for the new application.
6. Generate a new client secret and take a note of that client secret.
   At this point, you should have the **client_id**, **tenant_id**, and **secret_key** for the application registration.
7. Add the following parameters to the MID Server **config.xml** using the recorded values.

```
<parameter name="ext.cred.azure.vault_name" secure="false"
 value="<azure_key_vault_name>"/> (optional)
<parameter name="ext.cred.azure.tenant_id" secure="true"
 value="<tenant_id_value>"/>
<parameter name="ext.cred.azure.client_id" secure="true"
 value="<client_id_value>"/>
<parameter name="ext.cred.azure.secret_key" secure="true"
 value="<secret_key_value>"/>
```

Supported Credentials for Azure Key Vault Integration

The MID Server supports specified credentials for integration with the Azure Key vault.

List of Credentials

SNMPV3 Credentials

```
 {
   "type": "snmpv3",
   "user": "<user_value>",
   "authentication_key": "<authentication_key_value>",
   "privacy_protocol": "<privacy_protocol_value>",
   "privacy_key": "<privacy_key_value>",
   "authentication_protocol":
"<authentication_protocol_value>",
   "snmp_context": "<snmp_context_value>"
 }
```

VMWare Credentials

```
 {
   "type": "vmware",
   "password": "<password_value>",

Gov Cloud Support for Azure Key Vault Integration

You may need to override authentication and the vault URL when operating in government cloud environments. The following examples are for US government clouds.

Auth endpoint:

For US government clouds: https://login.microsoftonline.us/%s/oauth2/v2.0/token

For US government cloud support: `<paramter name="ext.cred.azure.vault_auth_endpoint" value="https://login.microsoftonline.us/%s/oauth2/v2.0/token"/>`

Scope:

For US government clouds: https://vault.usgovcloudapi.net/.default

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

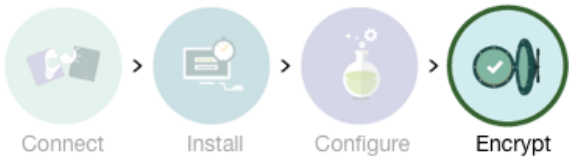
```
<paramter name="ext.cred.azure.endpoint_scope"
value="https://vault.usgovcloudapi.net/.default"/>
```

For Germany government clouds: https://vault.microsoftazure.de/.default

For Chinese government clouds: https://vault.azure.cn/.default

MID Server command audit log

The command audit log records the commands run by the MID Server for the Discovery application. Review the commands to check for anomalies or errors.



1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

The MID Server command audit log is a record of the commands the MID Server runs during discovery. For example, executing one pattern may run many separate commands. The MID Server command audit log supports Powershell commands for WMI and WinRM. For SSH commands, the audit log supports SSNC but not J2SSH. In Quebec, the command audit log only supports recording the commands run during discovery.

Enable the command audit log

The MID Server audit log is enabled with the MID Server property *mid.log.command_audit.enable*, which is set to false by default. Add the property in the **MID Server Properties** table [ecc_agent_property_list.do]. Once enabled, the MID Server command audit logs are accessed in the instance by navigating to **MID Server** > **Command Audit Logs** [ecc_agent_command_audit_log_list.do]. To see or change this table, the user must have the role **agent_security_admin**.

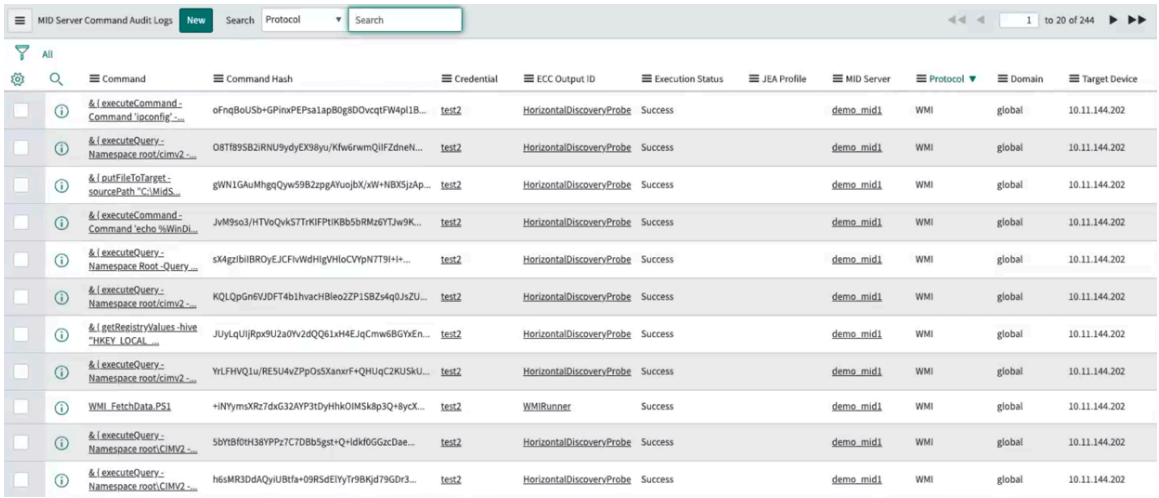
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Data recorded in the command audit logs

The MID Server command audit log records the name of the command and the command hash. If, for example, during discovery a probe does not run a command but instead runs a script then the script name is recorded. The command hash is calculated based on the content of the script, regardless of the name. Therefore, changing the name does not affect the command hash.

When a probe, such as a WMIRunner, runs a command with multiple WMI fields then WMI creates one script to query those fields. The script is created temporarily on the MID Server host in the temp folder. After the script is run, it is removed from the temp folder. The script is given a name based on the fields and a random number. However, the hash key is always the same given the same contents.

The command audit log reports the execution status as either a success or failure. The record entry is a success if the command was run, or a failure if it was unable to run. The command audit log does not consider the result of the command being run. For example, a command which runs but fails gather data is still listed in the execution status as a success.

Discovery supports JEA profiles for WinRM. The MID Server command audit log records the JEA profile of the discovery command, if it is available. See Microsoft Just Enough Administration (JEA) for Discovery for more information on JEA profiles.

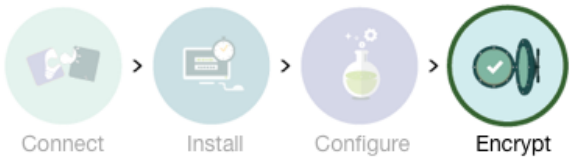
By default, the table is rotated every seven days. For more information, see Table Rotation.

Rekey a MID Server

Rekey a MID Server to generate a new private key. Private keys are used to decrypt automation credentials, so that MID Servers can transmit information securely. Key pairs are initially generated when a MID Server is validated, and MID Servers should be rekeyed periodically to meet security requirements.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

About this task

When the MID Server comes back online, the system automatically validates the new key, and the MID Server resumes processing automation tasks.
Automation credentials are secured by encrypting them in the instance with the MID Server's trusted public key prior to transmission. When the MID Server is created, it generates a keypair, consisting of a public and private key. After the MID Server is validated, it can use the private key to decrypt automation credentials. You should occasionally rekey the MID Server to meet your organizations security requirements.

Procedure

1. Navigate to **All** > **MID Server** > **Servers**.
2. Open the MID Server whose keypairs you want to rotate.
3. Under **Related Links**, click **Rekey**.

Related topics

Validate the MID Server

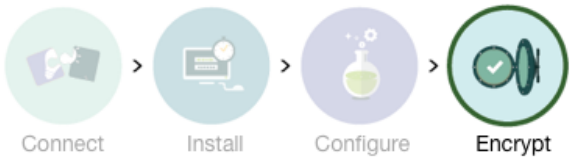
Add SSL certificates for the MID Server

Configure the MID Server to connect to a source over SSL.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

About this task

You can add certificates to the MID Server to communicate over SSL/TLS in one of two ways:

- Add certificates directly to the bundled JRE TrustStore file, using the following procedure.
- Specify a different TrustStore file for the MID Server to use. For more information, see Specify an external TrustStore for the MID Server.

Review both methods to evaluate which best meets your needs.

During MID upgrade the bundled TrustStore is overwritten. The MID Server attempts to migrate certificates from the existing TrustStore to the incoming one. To be migrated, certificates must meet the following criteria:

Quebec (backported to Orlando Patch 10 and Paris Patch 4)

- X.509 v3 certificates
- Basic Constraints Extension evaluates to false (or is not present)

Rome (backported to Paris Patch 7 and Quebec Patch 2)

- X.509 certificates
- Any certificate present in the source, but not the destination TrustStore

Certificates that do not meet the criteria are overwritten. Alternatively, you can specify an external TrustStore file which is unaffected by MID Server upgrades. For more information, see Specify an external TrustStore for the MID Server

In Rome and later families, the migration strategy utilized during upgrade is configurable via the MID Server configuration parameter *`mid.truststore.migration.strategy`*. It can take the following values:

- **migrate_delta**: the default strategy (outlined above for Rome)
- **migrate_non_ca**: a strategy matching the one outlined above for the Quebec family
- **do_not_migrate**: disables the TrustStore migration during upgrade, though a backup of the original TrustStore is made in the event of overwrite

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

During this migration process, a backup of the original and upgrade TrustStores are made and stored in the agent's work directory: ...`\agent\work\truststore_migration\<time epoch seconds>\`. The original TrustStore is renamed to `cacerts_before` and the upgrade TrustStore is renamed to `cacerts_from_upgrade`.

Procedure

1. Open a command prompt and navigate to the folder containing the JRE keytool.
   This is the location of the JRE you installed. An example path might be: `C:\Program Files\Java\jre1.8.0_161\bin`
2. Import a certificate into the MID Server's cacerts keystore, using this command:
   `keytool -import -alias <certificate alias> -file "<path to certificate>" -keystore "<path to the JRE>\lib\security\cacerts"`

   For example, you might enter: `keytool -import -alias MyCA -file "C:\myca.cer" -keystore "C:\Program Files\Java\jre1.8.0_161\lib\security\cacerts"`

   Note:
   The keytool prompts you for a certificate password. If the certificate is for a CA, the keytool also asks whether to trust the certificate authority. To add a certificate to an instance, see Upload a certificate to an instance.

3. **Optional:** Display a list of the current certificates by running the command: `keytool.exe -list -keystore "C:\Mid Server\agent\jre\lib\security\cacerts"`

Specify an external TrustStore for the MID Server

The MID Server JVM can utilize a TrustStore external to the MID installation directory so any certificates added to the TrustStore are not overwritten during an upgrade. It is important that this TrustStore file reside outside of the MID installation directory, and the Truststore location can be specified by adding additional parameters to the MID Server's `wrapper-override.conf` file.

Before you begin
Role required: admin

Procedure

1. In the MID Server host, navigate to the `wrapper-override.conf` file.
2. Specify an external TrustStore by appending a custom parameter to the end of your MID's `wrapper-override.conf` file.
   For example, on a Windows MID with an external TrustStore found at `C:\external_truststore\cacerts`, the end of the file would appear similar to:

```
# Add additional custom parameters below

wrapper.java.additional.3=-Djavax.net.ssl.trustStore=C:\external_truststore\cacerts

wrapper.java.additional.4=-Djavax.net.ssl.trustStorePassword=<truststore's password>
```

   Note:
   If you have specified other additional parameters in this file then the numerical identifier, in this case 3 and 4, may differ.

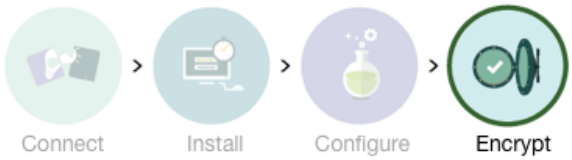
MID Server SSH cryptographic algorithms

The MID Server utilizes SSH clients to perform many discovery actions. During the SSH handshake, both the client and server first determine which algorithms both parties support, then client picks the highest priority algorithm. For the Host Key Algorithm, the client picks highest priority algorithm which both parties support that matches the key type.



1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

Default supported SSH algorithms by priority

Key Exchange Algorithm

1. ecdh-sha2-nistp256
2. ecdh-sha2-nistp384
3. ecdh-sha2-nistp521
4. diffie-hellman-group-exchange-sha256
5. diffie-hellman-group14-sha256
6. diffie-hellman-group16-sha512
7. diffie-hellman-group14-sha1
8. diffie-hellman-group1-sha1
9. diffie-hellman-group-exchange-sha1

Host Key Algorithm (used for public key signature during authentication)

1. ssh-ed25519-cert-v01@openssh.com
2. rsa-sha2-512-cert-v01@openssh.com
3. rsa-sha2-256-cert-v01@openssh.com
4. ssh-ed25519
5. ecdsa-sha2-nistp256
6. ecdsa-sha2-nistp384
7. ecdsa-sha2-nistp521
8. rsa-sha2-512
9. rsa-sha2-256

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

10. ssh-rsa-cert-v01@openssh.com
11. ssh-rsa
12. ssh-dss

Cipher Algorithm

1. aes128-ctr
2. aes192-ctr
3. aes256-ctr
4. aes128-cbc
5. aes192-cbc
6. aes256-cbc

MAC Algorithm

1. hmac-sha2-256
2. hmac-sha1
3. hmac-sha2-512
4. hmac-sha1-96
5. hmac-md5-96
6. hmac-md5

Customize the SSH algorithms priority list

The MID Server SSH algorithm priorities can be customized based on security needs. Each algorithm is controlled by one of the following MID Server properties.

Note:
Glide Import on the instance uses the default algorithm list. The four MID Server properties do not affect Glide Import because it is not run on the MID server. SNCSSH is used for Glide Import on instance for SFTP and SCP.

- Key Exchange algorithms: **mid.ssh.algorithms.kex**
- Host Key algorithms: **mid.ssh.algorithms.host_key**
- Cipher algorithms: **mid.ssh.algorithms.cipher**
- MAC algorithms: **mid.ssh.algorithms.mac**

The properties accept comma separated lists with operators. The first name in the list is highest priority, last name in list is lowest priority. Adding a comma separated list without any operators replaces the default algorithm list. The following operators are based on the OpenSSH standard syntax and modify the algorithm priority list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

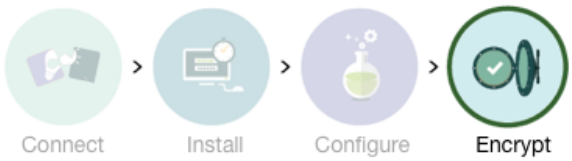
- The **+** operator appends the comma separated list of algorithms to the default algorithm list.
- The **-** operator removes the comma separated list of algorithms from the default algorithm list.
- The **^** operator places the comma separated list of algorithms at the front of the default algorithm list.

mid.ssh.algorithms.cipher	-aes128-ctr
mid.ssh.algorithms.host_key	+ssh-rsa
mid.ssh.algorithms.kex	diffie-hellman-group1-sha1, diffie-hellm...
mid.ssh.algorithms.mac	^hmac-md5

Attach a script file to a file synchronized MID Server

You can attach a script file to synchronize to a connected MID Server.

Before you begin
Role required: **admin**



1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

About this task
Use file synchronization to make script files available on a connected MID Server. The files on the instance and the MID Server stay synchronized, so there is no need for the MID Server to download the whole file. File synchronization also helps prevent updates you make in those script files from being overwritten during an instance upgrade.
You can attach multiple files, but the last attached file gets synchronized to the MID Server. If you delete the attachment, the script file becomes inactive, and the synchronized file is deleted from the MID Server.

Procedure

1. Navigate to **All** > **MID Server** > **Script Files**.
2. Open the file to which you would like to attach the script file, or click **New** to create a new file.
3. Select **Use attachment**, and then click the paperclip icon to add the attachment.
   When **Use attachment** is checked, an attached script file overrides the script contained in the **Script** field. If this check box is cleared, the script in the **Script** field is used instead of the attachment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The script file attachment name must match the MID Server script file name, since the record can contain other attachments.

4. Click **Update** to initiate the synchronization process.
   Ensure that the file name matches the script name. If you receive the error message: `File type not permitted or mime type does not match the file content`, request that your administrator turn off mime type validation on attachments. The system property **glide.security.file.mime_type.validation** controls this setting.

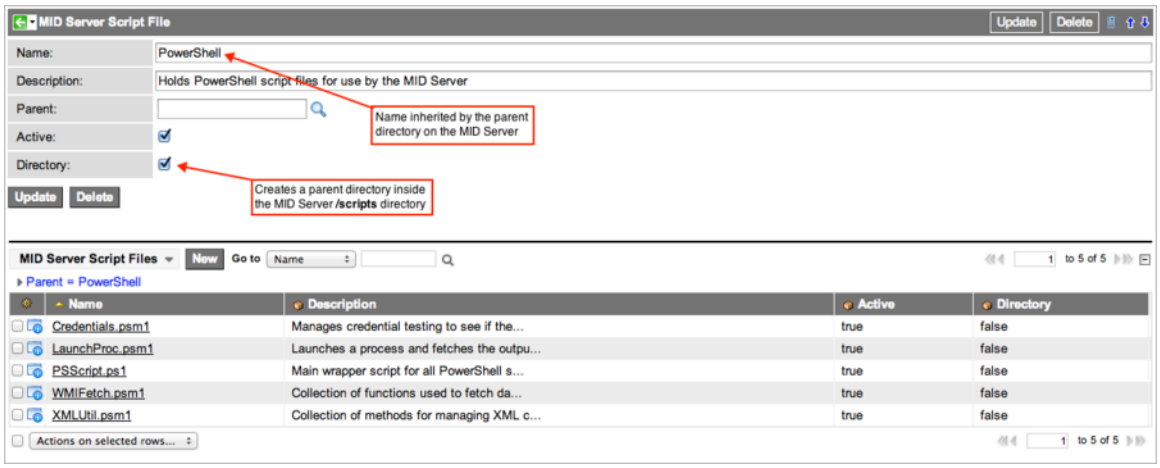
How script file synchronization works on the MID Server

Script files attached to a record stay synchronized with a connected MID Server.

Script files synchronized with the MID Server are stored on the instance in the MID Server Script File `[ecc_agent_script_file]` table, which you can access in the **MID Server** > **Script Files** module.

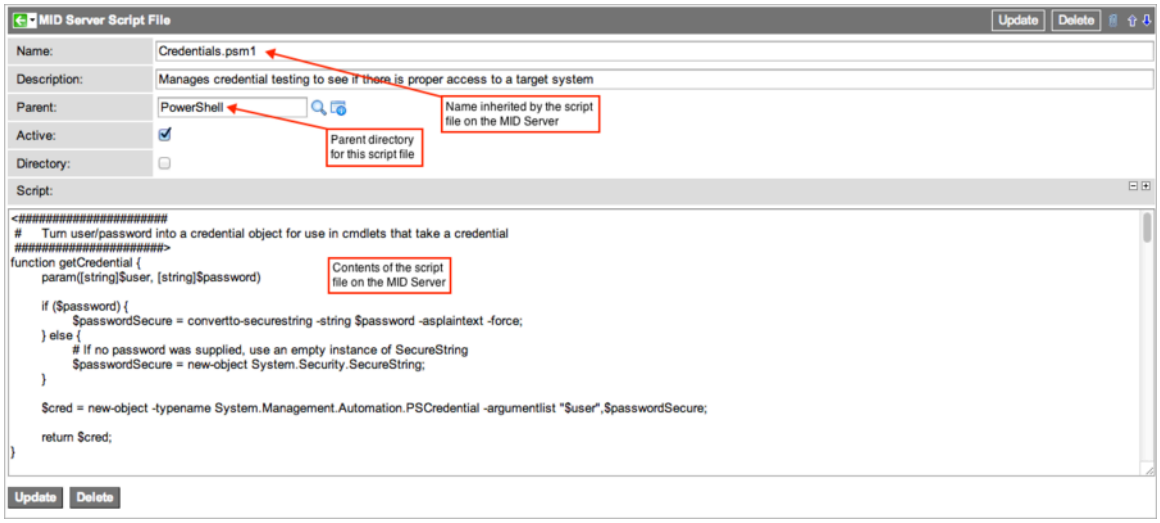
When the MID Server first connects to the instance, the instance creates a directory called `\scripts` in the MID Server root. The instance then creates a parent directory in the path `\scripts\<parent name>` using definitions from the ecc_agent_script_file table. Finally, the instance creates the script files themselves inside the parent directory using the records from the ecc_agent_script_file table.

The record for the parent directory looks like this:



The instance creates each script file in the parent directory on the MID Server using the record *Name* from the ecc_agent_script_file table as the file name and the *Script* field payload as the file contents. A script file record looks like this:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



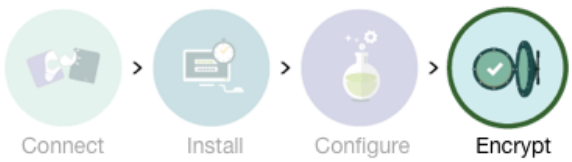
The synchronization of the script file continues to work as if the script was manually added to the form.

See Attach a script file to a file synchronized MID Server for instructions on how to attach a script file.

Note:
The MID Server Script File [ecc_agent_script_file] table is domain separated. You can create versions of these policies that only a MID Server from the same domain can use. For instructions, see Set up domain separation for MID servers.

MID Server FIPS Enforced Mode

The MID Server supports the National Security Cloud (NSC) IL-5 environment, which requires all utilized cryptography to be FIPS validated. The MID server can be run in FIPS Enforced Mode, where only cryptographic algorithms which are FIPS validated are utilized.



1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

The Federal Information Processing Standards are a group of standards compiled by the National Institute of Standards and Technology for use in computer systems. There are many FIPS publications, but for the sake of this discussion we are specifically referring to FIPS 140-2: Security Requirements for Cryptographic Modules. Cryptographic algorithms can proceed through a validation process specified by the NIST. For the purposes of our new secure cloud

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

environment, the MID server will be utilizing algorithms that have been validated by such process.

Only MID Servers of the Rome release family or later with a JRE version of 11.0.9+11 or later can be set to run in FIPS Enforced Mode.

FIPS Enforced Mode

The following algorithms are not available for use in these SSH functions by the MID Server in FIPS Enforced Mode.

Key Exchange:

diffie-hellman-group1-sha1

Mac:

- hmac-md5
- hmac-md5-96

The following restrictions are now in place for SNMP for use by the MID Server in FIPS Enforced Mode.

- SNMP v1 and v2 are completely disabled.
- For SNMP v3, the following protocol uses are not permitted by the MID Server in FIPS Enforced Mode:
  - auth protocol: none or MD5
  - privacy protocol: none or DES

Other functionality that utilizes the MID Server may be impacted when run in FIPS Enforced Mode. Please refer to that functionality's specific documentation for details.

Enable MID Server FIPS Enforced Mode

The MID server can be run in FIPS Enforced Mode, where only cryptographic algorithms which are FIPS validated are utilized.

Before you begin

Role required: admin

Procedure

1. Deploy a new MID Server or upgrade existing MID Servers to the Rome family release or later.
2. Shut down the MID Server.
3. Execute the following bundled script provided to convert the MID to run in FIPS Enforced Mode:
   - For Windows hosts: `> <MID install directory>\agent\bin\scripts\set-fips-enforced-mode.bat on`
   - For Linux hosts: `$ <MID install directory>/agent/bin/scripts/set-fips-enforced-mode.sh on`

   Success will be logged to the console including the location of modified files and any backups generated during the conversion process. If invoked programmatically, success will be indicated by a 0 return code.
4. Start the MID Server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next
The mode the MID is running in can be confirmed via two methods:

1. Check the agent logs after start-up and look for the following log line: `Running in FIPS Enforced mode`
2. Check the ecc_agent table on the instance and look for the value of the **FIPS Enforced** boolean column.

Manually convert the MID Server to FIPS Enforced Mode

The MID server can be run in FIPS Enforced Mode, where only cryptographic algorithms that are FIPS-validated are utilized.

Before you begin
Role required: admin

About this task
To manually convert the MID Server to FIPS Enforced Mode while using an external JRE, you must perform the following steps while the MID Server is shut down:

- Convert the JRE's TrustStore to BCFKS type.
- Set the JRE's default KeyStore type to be BCFKS.
- Set the FIPS Enforced Mode flag in the MID Server's configuration file.

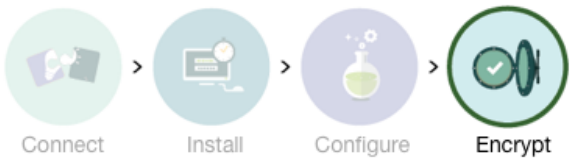
Procedure
1. Convert the JRE's cacerts file type to BCFKS by using the Java Keytool with a command similar to:
   `$ keytool -importkeystore -srckeystore` **<source keystore path>** `-srcstoretype` **<source keystore type>** `-srcstorepass changeit -destkeystore` **<destination keystore path>** `-deststoretype BCFKS -deststorepass changeit -provider org.bouncycastle.jcajce.provider.BouncyCastleFipsProvider -providerpath` **<BouncyCastle FIPS jar path>**

   Note:
   Rome and later MID installations contain a BouncyCastle jar suitable for this purpose. It can be found at: .../`agent/lib/bc-fips.jar`
2. The JRE's default KeyStore type can be set in the `<JRE installation directory>\conf\security\java.security` file.
3. In that file, find the `keystore.type` line and set its value as follows:
   `keystore.type=bcfks`
4. In the MID Server's .../`agent/conf/wrapper-override.conf` file, uncomment the FIPS line and set its value to true.
   The line should read: `wrapper.java.additional.106=-Dorg.bouncycastle.fips.approved_only=true`

MID Server Governance

Improve MID Server security by setting an automatic timeout to invalidate and shut down inactive MID Servers. You can enable this feature and set the inactivity timeout period globally and for each MID Server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

Overview of MID Server Governance

MID Server Governance prevents forgotten MID Servers connected to ServiceNow instances from being utilized if the instance is compromised. MID Server Governance keeps a record of the last status change of the MID Server validation/invalidation process.

This feature is not enabled by default, and is available out-of-the-box as part of the MID Server plugin. Once enabled, MID Server authentication is expired after a predetermined period of inactivity unless explicitly configured to never expire.

Enable and Configure MID Server Governance

MID Server Governance is enabled for all MID Servers by setting the following true/false system property: **mid.inactivity.timeout.enabled**. This property is not defined by default. The global inactivity timeout is specified by setting the following integer system property: **mid.inactivity.timeout.days**. The property takes an integer which specifies the timeout in days. The default timeout is 30 days if unspecified.

You can override the timeout for a particular MID Server by specifying **mid.inactivity.timeout.days** as a configuration parameter on that MID Server. A timeout value of 0 disables MID Server Governance on that MID Server. Therefore, you can set a global timeout and also change or disable timeouts for certain MID Servers.

You do not need to restart the MID Server after changing the Governance configuration. Governance works with either basic or mutual authentication.

Activity Tracking

The MID Server analyzes activity by tracking incoming and outgoing ECC queue messages . Once per hour, the MID Server reports the last activity to instance, which is stored in the ecc_agent record, and checks if the inactivity timeout has been reached. If the inactivity timeout has been reached and the MID Server is up, the MID Server is invalidated and shuts down. If the timeout is reached when the MID Server is down, a job on the instance determines if the MID Server is idle and invalidates it on the instance.

When MID server is approaching auto-invalidation timeout due to inactivity, the MID Server page will display a message indicating:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- An info message when 3-7 days remain before inactivity timeout.
- An error message when less than 3 days remain before inactivity timeout.
- After a MID has been auto-invalidated, an error message is displayed indicating the date the MID was auto-invalidated.

Clearing the auto-invalidated state

After a MID Server has been auto-invalidated, the auto-invalidated status must be manually cleared in order to bring the MID back up successfully. The MID Server shuts down immediately if it is restarted without clearing this state. In addition, a MID issue will be logged indicating this occurrence.

The auto-invalidated state of a MID Server can be cleared by selecting the **Clear auto invalidated** UI action from the MID Server instance page. After invoking this UI action, the user should start their MID Server and continue with the usual validation process.

Purpose field

The purpose is a text field that the customer can update at any point to indicate the intended usage for the MID Server. This field is purely descriptive and has no further interactions.

MID Server reference

MID Server reference information includes system requirements and other information you need to configure a MID Server for your specific needs.

MID Server system requirements

Use these minimum system requirements to allocate resources for computers hosting MID Servers.

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

MID Server supported systems

Windows server

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To discover Windows-based servers, run Service Mapping patterns, or execute Orchestration commands on Windows devices, the MID Server must be installed on a Windows server. The MID Server supports these Windows operating systems, including virtual machines and 64-bit systems:

- Windows Server 2012
- Windows Server 2016
- Windows Server 2019
- Windows Server 2022
- Windows Server 2025

On Windows, MID Server requires Microsoft .NET Framework 4.5 or later.

Linux

The MID Server is supported on these Linux versions for virtual machines and 64-bit systems:

- Linux Red Hat 6 and above
- Ubuntu 1404 (Ubuntu 14) and above
- CentOS 7 and above

Note:
ServiceNow no longer supports new installations of 32-bit MID Servers or upgrades to version Rome. New MID Server installation are blocked through RPM and MSI installer on the following operating systems:

- CentOS 7
- Windows server 2008
- Windows server 2008 R2
- Windows 8
- Windows 10

MID Servers can be manually installed to any operating system with the ZIP file, however Windows 10 is unsupported. Unsupported MID Servers auto-upgrading to Rome create an issue record in MID Server Issues (ecc_agent_issue). For more information, see Supported platform changes for MID Server [KB0863694].

Security requirements

To meet high security standards, the MID Server performs x.509 certificate validation on HTTPS traffic when connecting to ServiceNow®. If a network appliance or proxy exists between the MID Server and the instance, that appliance needs to present a digital certificate signed by a trusted CA. If you are using a self-signed certificate or a certificate signed by an internal CA, import the certificate to the MID Server trust store. For more information on adding SSL certificates, see Add SSL certificates for the MID Server.

OCSP connectivity requirements

The Online Certificate Status Protocol (OCSP) is the protocol used to determine the revocation status of SSL/TLS certificates. When certificates are exchanged and validated, the MID Server needs to determine if the certificate has been revoked and shouldn't be trusted.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

OCSP works by using a client, such as a MID Server, to receive a certificate from an HTTP website. The client sends a request to an OCSP responder: a server operated by the certificate authority (CA) that issued the certificate. The OCSP responder's response to the client indicates whether the certificate is valid or has been revoked.

In order to connect, the MID Server requires access to:

- *.service-now.com or <instance_name>.service-now.com
- install.service-now.com
- http://ocsp.entrust.net
- http://ocsp.digicert.com (or other CA OCSP Responder)

While SSL/TLS certificates are always issued with an expiration date, there are certain circumstances in which a certificate must be revoked before it expires (for example, if its associated private key may have been compromised). Therefore, the current validity of a website's certificate must always be checked by clients regardless of its expiry date.

Clients fail a connection when they can't check the revocation status of a certificate. Firewalls and proxy configurations may block calls to the OCSP Entrust and DigiCert servers, which prevents the MID Server from working. You may need to change your firewall permissions so that the OCSP traffic goes through. For more information and resolutions, see the HI Knowledge Base article [KB1216223].

PowerShell requirements

The MID Server requires the minimum PowerShell version 3.0 and supports versions up to PowerShell 5.1. See Microsoft's documentation for more information about PowerShell requirements. To find your current PowerShell version using the instance, go to **ecc_agent_list.do**. Using the **Update Personalize List** gear icon, add **Host PowerShell Version** to the Selected column. Then sort the list of MID Servers by their PowerShell version to find outdated MID Servers. Alternatively, you can find the PowerShell version on the host machine by using the command **$Host.Version** in the host's PowerShell console. The PowerShell version is listed as PSVersion.

Java version support

Java 17.0.12 is bundled with the MID Server installer package and is installed on the host for all new MID Servers. The installer automatically configures Java 17.0.12 to run in your environment. No additional configuration is required. This version supports both 64-bit Windows MID Servers and 64-bit Linux MID Servers. The MID Server requires a minimum JRE version 17.0.10, and recommended version 17.0.12. If you are using a lower version than 17.0.10, you may see encryption related issues.

Testing showed that the MID Server works as expected with Oracle Java 11 version 17.0.10. If you need to upgrade the JRE to a different version, then coordinate with the appropriate account representative for support.

Upgraded MID Servers might use different Java versions depending on their operating system versions.

- MID Servers upgraded from earlier versions use the OpenJDK provided with the MID Server installer. This version of the OpenJDK was tested and certified for use with these MID Servers.
- MID Servers upgraded on any other operating system versions also automatically upgrade the JRE to the version provided with the installation package.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Linux MID Servers require glibC version 2.17. The library must be updated for JRE 11. On 64-bit Linux systems, you must install the 32-bit GNU C library (glibc). The installation command for CentOS is: `yum install glibc.i686`

MID Server JRE downgrade support

If the ServiceNow® instance is downgraded from Quebec, then the MID Server is also downgraded. However, the JRE may not be downgraded unless the instance is downgraded to one of the following patches.

- New York Patch 12
- Orlando Patch 9
- Paris Patch 3

If the MID Server is downgraded from Quebec to a different patch than specified, follow the instructions in Install Java 11 on MID Servers [KB0752451].

Java Service Wrapper

The MID Server installer includes the Tanuki Software Java Service Wrapper, version 3.5.40.

Setting the JVM Memory size

The MID Server installs with 1 GB of JVM memory. If the suggested memory size for your product is greater than 1 GB, see Set the MID Server JVM memory size for the procedure to override the default setting.

Deployment types

System requirements for your instance are determined by the needs of the individual products you use that require a MID Server. Some applications, such as Health Log Analytics, have additional system requirements listed in their documentation.

Standard deployments

The following products are considered "standard" because their MID Servers share the same minimum disk space and memory requirements:

- Discovery
- Event Management
- Integrations
- Orchestration
- Service Mapping

The minimum standard requirements pertain to both a single product and a combined product deployment. You can deploy a single MID Server for multiple standard products without significantly increasing the disk or memory requirements.

High resource deployments

Cloud Management Platform (CMP) and Operational Intelligence are processing intensive and require more resources for each MID Server than the standard products. Install MID Servers for these products on dedicated hosts that do not support MID Servers for other products.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Recommended MID Server minimum requirements

MID Server performance and system requirement are driven my multiple factors including but not limited to:

- The size of the customer infrastructure and specific function (Capability) MID Server is configured to perform.
- The number of MID Servers installed on the host.
- The number of threads per MID Server.
- The number and nature of other applications running on MID Server host.
- Architectural and design enhancements over ServiceNow releases. For example, using PowerShell for Windows Discovery in Orlando or changing default Java Garbage Collection policy in Quebec.

As a result, there is no one size requirement that fits for all MID Server deployments. The following documented sizing guidelines can be a starting point for deployments. However, customers need to monitor MID Server performance and resource utilization continuously, then tune and scale up their MID Servers as needed.

MID Server minimum system requirements

The minimum CPU configuration required for a MID Server is a quad core processor with a speed of 2+ GHz for a Windows Server 2012 R2 host with a single MID Server deployed and with standard configuration of 25 concurrent threads.

MID Server CPU utilization

Most of the MID Server applications, such as Discovery, are designed for maximizing their performance which results in maximizing the resource utilization for the MID Server. As a result, some customers might observe very high CPU utilization segments in the range of 90-100% while the MID Server is running Discovery schedules or similar applications.

The very high CPU utilization segments should not be a cause for concern because it aligns with architectural design of maximizing the throughput and does not have any negative impact on the Discovery performance. The MID Server host's resource utilization automatically returns to normal after the Discovery execution successfully stops.

Customers who notice frequent and long very high CPU utilization segments should avoid:

- Running more than one MID Server on same host when these MID Servers are expected to process active workloads at the same time, such as overlapping Discovery schedules.
- Sharing the MID Server host with other applications.
- Configuring performance alerts, which are purely based on CPU utilization, on MID Server host. If required, these alerts need to be used in conjunction with other performance monitors.

Configuring additional performance monitoring on MID Server host

While CPU utilization on MID Server is a good indicator of load on the host, it gives only limited visibility. Additional monitoring with System Processor Queue Length on Windows Operating Systems and Load Averages on UNIX Operating Systems is crucial.

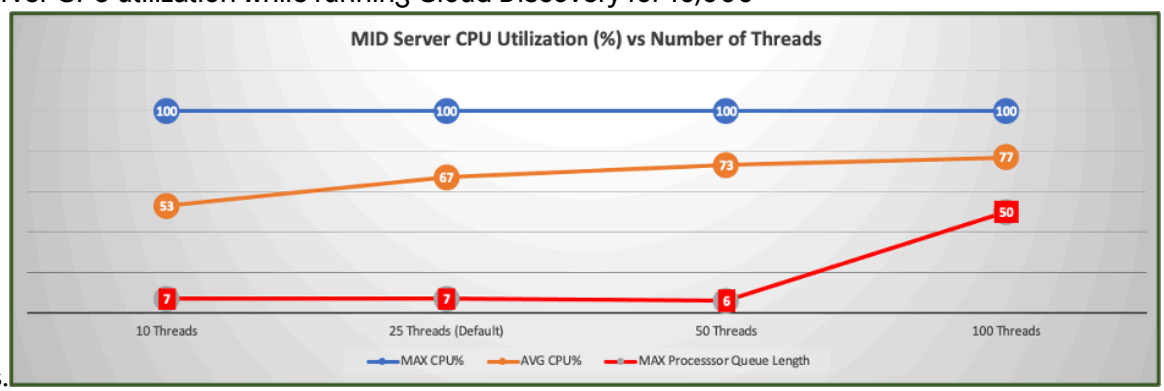
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Processor Queue Length (Windows OS):** the number of threads that are ready but currently unable to run on the processor due to another active thread. A bottleneck on the processor may occur where the number of threads in the queue is more than twice the number of processor cores over a continuous period.
- **Load Averages (Unix OS):** the average system load on a Linux server for a defined period. It is the CPU demand on a server that includes sum of the running and the waiting threads. Typically, the top or the uptime command provides the load average of the server with output.

MID Server CPU Performance Case Studies

The impact of modifying number of MAX threads on MID Server CPU utilization

Based on internal benchmarking, the following is sample data for MID Server CPU utilization while running Cloud Discovery for 10,000 servers.



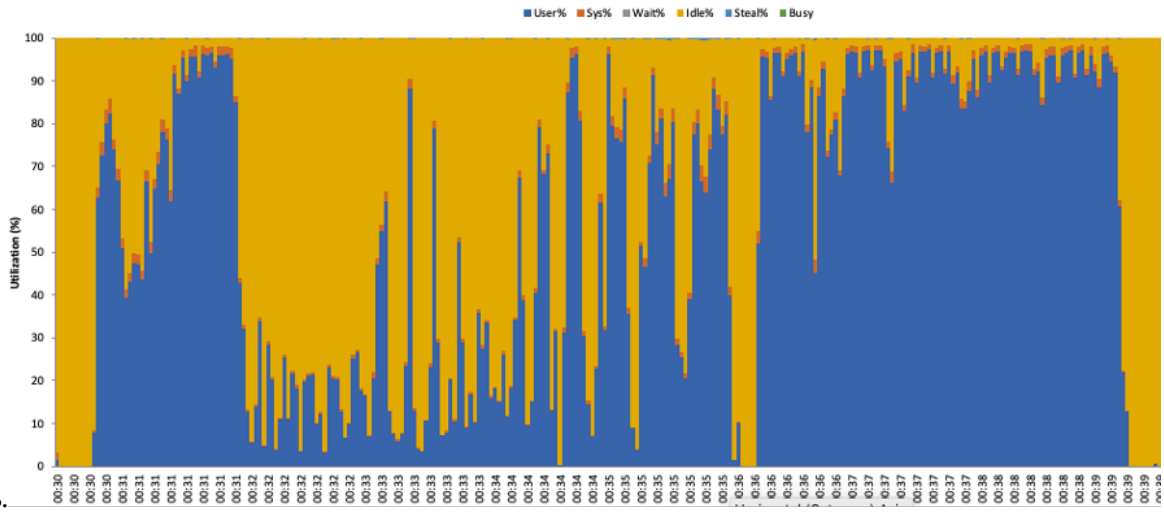
In these tests, the maximum CPU utilization was observed to be 100% independent of number of threads and OS. The average CPU utilization was observed to be proportional to number of threads. Increasing number of threads did not necessarily result in immediate CPU pressure. Increasing the number of threads from the default 25 to 50 did not create additional CPU pressure, as shown by the max processor queue length. However, increasing the max threads value to 100 caused a significant increase in processor queue length, indicating CPU pressure.

The impact of sharing MID Server with other applications or MID Servers on CPU utilization

Running Discovery is a CPU intensive operation for MID Server. Deploying other applications or MID Servers on same host creates additional CPU pressure on the host. This pressure results in a performance impact for running applications, including the MID Server. The following examples are sample CPU utilization data points for MID Server with different load patterns:

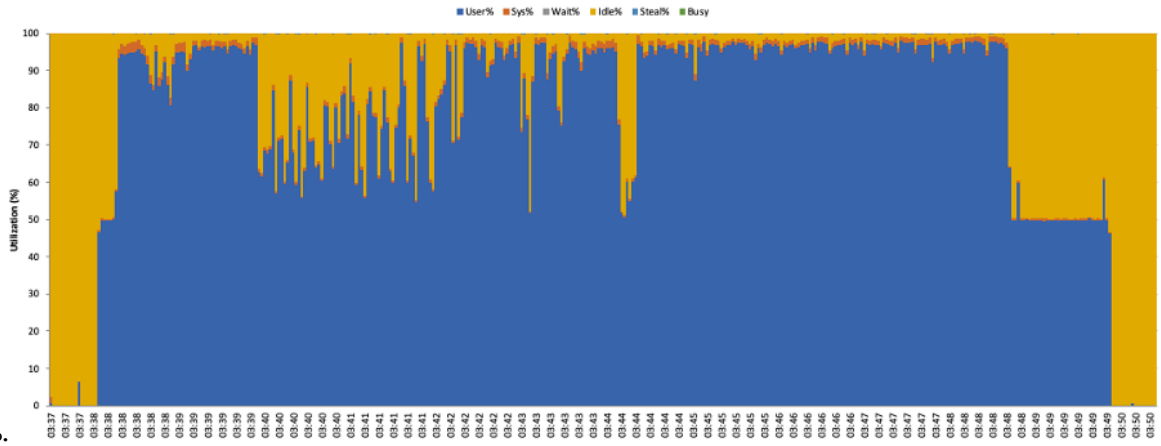
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dedicated host for a single MID Server: the average CPU usage is



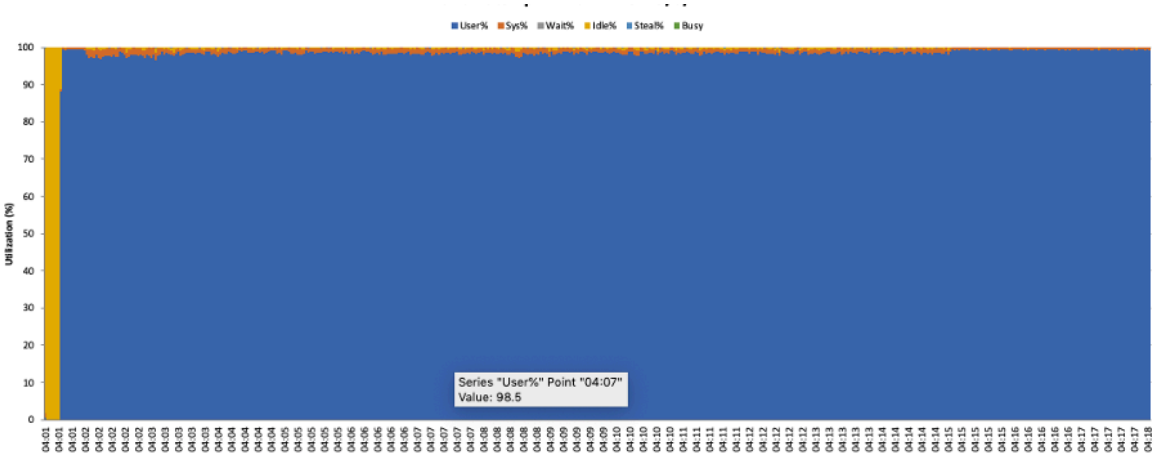
48%.

Host shared between a MID Server and another application with moderate load: the average CPU usage is



77%.

Host shared between a MID Server and another application with heavy load: the average CPU usage is 97%.



Scaling up MID Server and its impact on MID Server CPU resource utilization

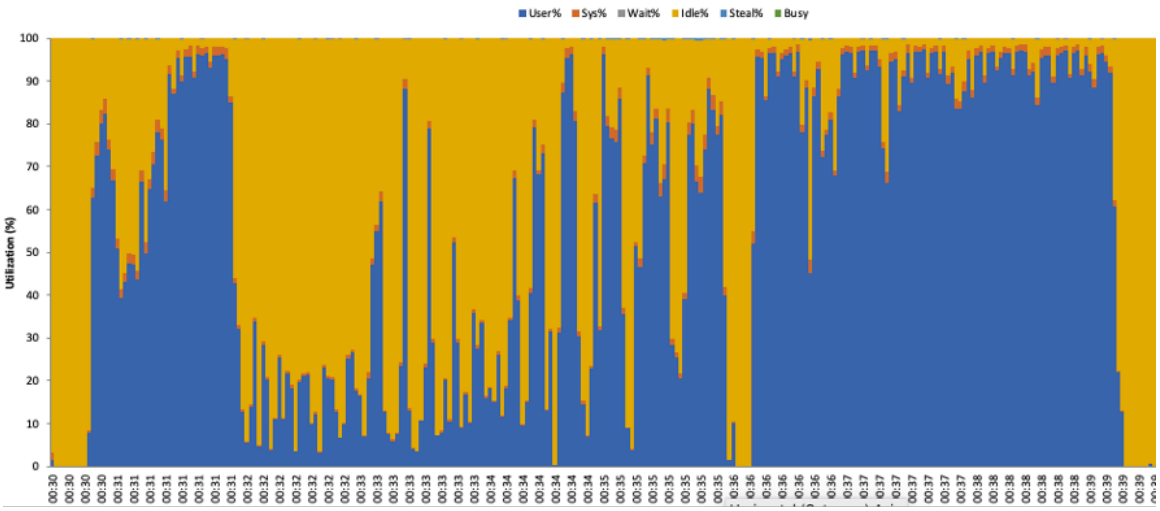
When the MID Server is heavily constrained on CPU resources, scaling up the MID Server host, by adding more CPUs, helps ease resource pressure. However, this may not necessarily eliminate the very high CPU usage segments. MID Server applications like Discovery, which are designed for maximizing the performance,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

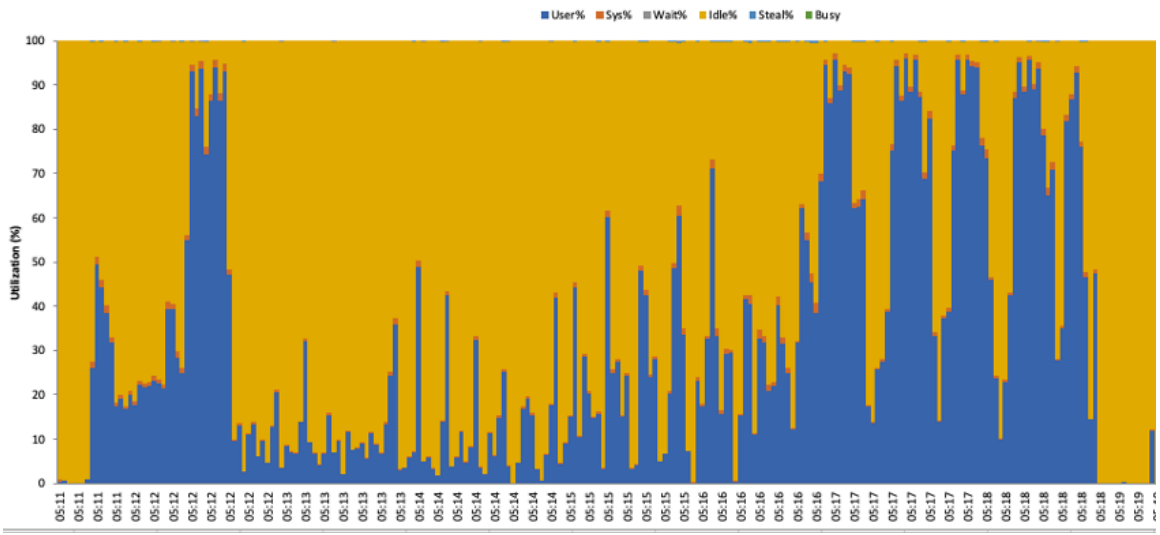
will continue to use additional available CPU resources. The following examples are sample CPU utilization data points for a 4 CPU MID Server host and an 8 CPU MID Server host running same Discovery schedules:

Parameter	4 CPU	8 CPU
Average CPU%	48%	28%
Max CPU %	98%	98%

MID Server CPU utilization when deployed on a 4 CPU host:



MID Server CPU utilization when deployed on an 8 CPU host:



Monitoring performance

To ensure that the MID Server resource allocations are sufficient for your environment, monitor performance during peak periods of product execution from the MID Server dashboard.

MID Server upgrades

Upgrade MID Servers manually, or automatically through the instance. MID Server automatic upgrade is triggered when the instance upgrades and the MID Server no longer has the same version. The new MID Server package is downloaded from install.service-now.com, replaces the old one, and the MID Server starts with the new version.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Warning:
The MID Server can't auto-upgrade on a Windows host if the Windows Application Experience service is turned off. For information on the error that is displayed and instructions for re-enabling this service, see KB0597552.

MID Server upgrade requirements

Access to the MID Server download site

The MID Server host computer must have access to the ServiceNow download site at `install.service-now.com` to upgrade automatically. If you have a self-hosted ServiceNow environment that blocks access to the download site, you must import the MID Server installer package into your MID Server hosts manually. For instructions, see KB0760123 in the Self-Hosted knowledge base.

MID Server access to OCSP blocked

Firewalls and proxy configurations may block calls to the OCSP Entrust and DigiCert servers, which prevents the MID Server from working. You may need to change your firewall permissions so that the OCSP traffic goes through. For more information and resolutions, see the HI Knowledge Base article [KB1216223].

MID Server operating system compatibility

Upgrading Windows or Linux MID Servers with 32-bit operating systems isn't supported. For more information, see [KB0863694].

The MID Server can't upgrade on a Windows host if the Windows Application Experience service is turned off. For information on the error that is displayed and instructions for re-enabling this service, see KB0597552.

The MID Server upgrade is blocked by some antiviruses running on Windows hosts. For information on the errors and list of these antiviruses, see KB0870329.

Any Linux MID Server upgrade that's service is installed under system in Madrid or lower needs to re-install the service after upgrade. If you didn't manually reinstall the service in previous upgrades and your MID Server service is still installed on Madrid or lower versions, during upgrade the MID Server automatically re-installs the service. To re-install the service MID Server needs to run as an admin user. If your MID Server upgrade needs to re-install the service, make sure that the MID Server user is admin, or you can manually re-install the service before upgrade. For information about manually re-install the service, see KB0821436.

When does the MID Server need to upgrade

Any MID Server with a version different from the instance version needs to upgrade. The following two system properties control the version of all MID Servers:

- **mid.buildstamp**: Identifies the MID Server version with an identifier based on the date of the build. This property uses the format of **mm-dd-yyyy-hhmm**. The MID Server checks for version information hourly. If no override version is configured, the MID Server looks at the **mid.buildstamp** property for the version to use. This property resets itself to the default version (the version that matches your instance version) when the instance is restarted or upgraded, so any user changes are lost at that time. The system appends the release name and patch information to the date and time format.

  Warning:
  This property is not visible by default and should not be configured.

- **mid.version.override**: Sets an override condition for the current version for all MID Servers in your environment. This action pins the MID Servers to a single version and disables the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

automatic upgrade feature. This property is not visible in the base system and must be added to the System Property [sys_properties] table when it is set. For details, see Add a system property .

When the MID Servers check the version each hour, they look at the **mid.version.override** property first. If this property is empty, the MID Servers get their version information from the **mid.buildstamp** property. If an override version is configured, the MID Servers use this value and ignore the version information in the **mid.buildstamp** property. This override value remains when the instance is restarted and is passed to the MID Servers. The value in the **mid.version.override** property is cleared during an upgrade, which forces the MID Server to reset itself to the version in the **mid.buildstamp** property.

In addition to **mid.version.override**, the MID Server version can also be controlled with the configuration parameter **mid.pinned.version** which pins the MID Server to a specific version.To pin a MID Servers, set the **mid.pinned.version** parameter with the name of that version in the **config.xml** file of each MID Server. Use the format **<version>-mm-dd-yyyy**. This setting overrides the property setting for the pinned MID Server version. For instructions, see Add a MID Server parameter. The value set in this parameter is not affected by an upgrade.

Warning:
Using **mid.version.override** and **mid.pinned.version** is not recommended. The different versions on the MID Server and instance can cause outage issues on the MID Server.

Upgrade methods

Automatic

Automatic upgrade can be triggered by the instance or the MID Server itself. This functionality is available by default. Automatic upgrade occurs:

- When the instance is upgraded and the MID Server for that version is different than the version currently on the MID Server. The instance sends **autoUpgrade**system command to the connected MID servers.
- Every hour, the MID Server checks with the instance to see if there is a different version available for upgrade. You cannot modify this time period.

Manual

Manually start the upgrade by clicking a related link on the MID Server record. Use this method when you do not want to wait until the next hourly automatic update or if your upgrade failed and you want to force an upgrade. See Upgrade the MID Server manually for instructions.

Upgrade process

1. **Pre-upgrade Check:**Before starting the actual MID Server upgrade process, the MID Server runs a set of tests to make sure that the host machine meets the minimum requirements. Any errors encountered during this automatic test prevent the upgrade from occurring until the issues are resolved. The pre-upgrade test is enabled by default but can be disabled by adding and setting a system property. See MID Server pre-upgrade check for more information.
2. **Download the packages:**The MID Server downloads upgrade packages from install.service-now.com. These packages are in zip format and are downloaded to the agent folder in the **package/incoming** folder.
3. **Digital Signature Verification**

   After downloading every package, MID Server verifies the digital signature of the package. It throws an exception if the verification fails. The error will be recorded in the agent log and the MID Server issue table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If the packages are downloaded and replaced manually you can verify the signature manually. To manually verify the signature of an installation or upgrade package, use the jarsigner tool which is available for free with JDK. The following is the jarsigner command to initiate the verification: `Jarsigner -verify -verbose -certs -strict <zip-file>`

The output should be similar to the following example:

```
- Signed by "CN=ServiceNow Inc., O=ServiceNow Inc., L=Santa
 Clara, ST=California, C=US"
Digest algorithm: SHA-256
Signature algorithm: SHA256withRSA, 2048-bit key
Timestamped by "CN=Symantec SHA256 TimeStamping Signer - G3,
 OU=Symantec Trust Network, O=Symantec Corporation, C=US" on
 Tue Nov 05 19:55:37 UTC 2019
Timestamp digest algorithm: SHA-256
Timestamp signature algorithm: SHA256withRSA, 2048-bit key

jar verified.

The signer certificate will expire on 2021-08-09.
The timestamp will expire on 2029-03-22.
```

4. **Extracting Zip Files:**After downloading all required packages, the MID Server extracts the zip files.
   - **Before Rome**: The zip files are extracted in a folder under the operating system defined temporary folder. The folder name is a randomly generated number. The operating system temporary folder is specified by system property **java.io.tmpdir**. On a UNIX host, the value for this property is typically is `/tmp` or `/var/tmp`.
   - **From Rome onward**: The MID Server avoids using operating system defined temporary folders during MID Server upgrade. The zip files are extracted in a folder in the **work/upgrade_temp** folder under the agent folder. The folder name format is a randomly generated number. If you want to switch to the previous behavior and use an operating system defined temporary folder you can add **mid.upgrade.use_os_temp_folder**to MID Server's **config.xml** file and set it to true. To switch the behavior for all MID Servers, you can add it to the MID Server property [ecc_agent_property] with MID Server field blank.

   Note:
   If you are using KB0747569 to change the**java.io.tmpdir**and you want to keep it for future upgrades from Rome, set **mid.upgrade.use_os_temp_folder**to true after upgrading to Rome. If **mid.upgrade.use_os_temp_folder** is not set to true then **java.io.tmpdir** isn't applied during the MID Server upgrade and the folder under `agent\work\upgrade_temp` will be used.

5. **Replace old packages with the upgraded packages:**After downloading and extracting the upgrade packages, the MID Server replaces old files with the new files and starts with the new version. To replace the packages, the MID Server starts a process named ServiceNow AI Platform Distribution Upgrade and shuts down. ServiceNow AI Platform Distribution Upgrade waits for the MID Server to shut down properly, then replaces the required files as follows:
   - **Before Rome:**The process deletes all files and folders in the bin, lib and jre folders and copies the new files into those folders.
   - **From Rome onward:** The process replaces the files in the bin, lib and jre only if the new version of the file is different from the old version. **ServiceNow Platform Distribution Upgrade** does not clean the upgrade files and the unchanged files are kept.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If the reinstalling service was required as a part of MID Server upgrade, ServiceNow Platform Distribution Upgrade reinstalls the service before starting the MID Server. For more information refer to KB0821436.

Note:

If the MID Server upgrade fails in this step the MID Server stays Down. Some anti-viruses block the file replacement in this step. For more information refer to KB0870329.

6. **Start the MID Server:**After replacing all required files with the new version, the ServiceNow AI Platform Distribution Upgrade starts the MID Server. When the MID Server comes Up with the new version, it cleans up all temporary folders used to extract the upgrade files.

Upgrade log messages

The MID Server log messages are available in the following log files:

- Pre-upgrade check log messages are available in agent.log file under agent/logs folder. The message **Performing pre-upgrade validation tests.** indicates that the pre-upgrade check has started. If all mandatory tests are passed, the message **Pre-upgrade validation tests successful. Continuing with upgrade process.** indicates the end of the pre-upgrade check.

- Log messages for downloading missing files are also available in agent.log. Every package download starts with **Downloading package to PACKAGENAME.ZIP from https:// install.service-now.com/ PACKAGEINFO** message. The download progress and the size of downloaded file is monitored in the log. After downloading every package, **Package was successfully downloaded from https://install.service-now.com/ PACKAGEINFO** indicates the successful download.

- Extracting the zip files is the last step available in the **agent.log**. The message **Upgrading MID server** indicates the start of this step, and the message **Extracting package PACKAGE.ZIP to EXTRACT_TMP_FOLDER** is shown for every package extraction. When all required zip files are successfully extracted, the MID Server starts the ServiceNow AI Platform Distribution Upgrade process and the message **Stopping MID server. Bootstrapping upgrade** shows the end of this step before MID Server goes Down.

ServiceNow AI Platform Distribution Upgrade logs include log messages for the process start up and for replacing files during the MID Server upgrade. The upgrade log messages are placed between the messages ************UPGRADE MAIN LOGIN START************ and ************UPGRADE MAIN LOGIN END************. ServiceNow AI Platform Distribution Upgrade log messages can be found in the following log files:

- In the **glide-dist-upgrade.log** file under temp extract folder. This file is available in upgrade-wrapper/logs folder under temp extract folder. This log file includes process log messages and upgrade log messages.
- In the **dist-upgrade.log** file in `agent\logs` folder. This file only includes the upgrade portion of log messages. If there was some issue with the process startup you need to look at **glide-dist-upgrade.log.**
- In **wrapper.log**under `agent\logs` folder. After replacing files, ServiceNow AI Platform Distribution Upgrade appends **glide-dist-upgrade.log** to the wrapper.log file.

Update the wrapper configuration with upgrade-wrapper-override.conf

The wrapper configuration for `glide-dist-upgrade` can be updated using a `upgrade-wrapper-override.conf` file. Create a file named `upgrade-wrapper-`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

`override.conf` in the `agent/conf` folder. Any configurations in the `upgrade-wrapper-override.conf` are used during the upgrade process.

By modifying the configuration with `upgrade-wrapper-override.conf`, debug logs can be enabled at the `dist-upgrade` wrapper level and changes can be tested.

For example, the default timeout may not be long enough for certain JVM level commands. The timeout can be increased with `upgrade-wrapper-override.conf` for the `dist-upgrade` wrapper configuration.

MID Server states

Upgrading

The MID Server status is changed to Upgrading while the upgrade is running. The Upgrading state is similar to the **Paused** state. This is avoids potential miscommunication between the new version of the instance and the previous version of the MID Server during upgrade. While in the Upgrading state, you cannot resume or restart the MID Server. However, you can perform the same actions that you can when the MID Server is in the Paused state.

Note:
If you are using an Istanbul instance but you are upgrading a pre-Istanbul MID Server to Istanbul, these upgrade states are not available. They are only available for MID Servers that are already on Istanbul.

Upgrade Failed

If the upgrade failed in pre-upgrade check step or download/extract packages step, failed upgrades are handled differently based on the version you are upgrading.

- Upgrade to another major release (such as Istanbul to the next full release): the status changes to **Upgrade Failed**.
- Upgrade from a minor version within a release (such as Jakarta patch 1 to patch 2): the MID Server continues using the version it is currently running. It does not perform the upgrade and the status eventually changes to **Up**, assuming the MID Server was already functioning properly.
- If the upgrade failed in last step, replacing old version of packages with the new version of packages, the MID Server stays **Down**.

MID Server upgrade history

Use the MID Server Upgrade History module for troubleshooting problems with MID Server upgrades. The module contains a record of each instance upgrade. Those records provide step-by-step status details for each MID Server's upgrade process. If an error occurs, it is noted in the step and a message is dynamically generated with further details. The table cleanup job automatically deletes issues that haven't been detected for 30 days, regardless of their state. For further information, see MID Server Upgrade History.

JRE TrustStore certificate migration during JRE updates

For JRE updates after upgrading to Quebec, the MID Server migrates existing self-signed certificates in the JRE TrustStore to the new JRE version's TrustStore. When these certificates are migrated, their aliases are prepended with the string "snc_".

In order for a certificate to be migrated it must be:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- an X509 certificate
- certificate standard v3
- have the basic constraint extension set to false (i.e. it is not CA issued)

The MID Server identifies when a JRE upgrade is about to take place and begins the migration process. Before the migration, the MID Server creates a backup of the original TrustStore as a fall-back in the event of failure. If there is a failure, the backup TrustStore can be manually restored.

MID Server pre-upgrade check

Prior to an upgrade, the MID Server runs tests to identify issues that could cause the upgrade process to fail or result in a MID Server outage.

Each MID Server contains an AutoUpgrade monitor that compares the MID Server version with that of the instance to determine if the MID Server needs to upgrade. If the AutoUpgrade monitor discovers that the MID Server version is out of date, the monitor runs pre-upgrade validation tests for that MID Server. If an issue is detected, a message is logged to the MID Server Issue [ecc_agent_issue] table, and the upgrade is blocked. The AutoUpgrade monitor continues to run every hour, until all the tests pass. If there are no blocking issues, the MID Server downloads the appropriate upgrade package and begins the upgrade process. The MID Server pre-upgrade check also runs for the upgrades triggered by the instance when the instance was upgraded, as well as for manual upgrades.

Pre-upgrade tests

The pre-upgrade runs two sets of tests: **Mandatory tests**and **Alert tests**. Every mandatory test is required to pass to start MID Server upgrade. If a mandatory test was not passed, the test is recorded in the agent log and a MID Server active issue is created in the MID Server issue [ecc_agent_issue] table. These errors are published before the actual MID Server upgrade occurs and must be resolved before the upgrade can continue. MID Server stops the Upgrade process and changes the status based on MID Server states. If any alert test was not passed, a message is added in the agent log and MID Server issue table, but the pre-upgrade check continues and MID Upgrade doesn't stop.

Pre-upgrade validation tests check the following mandatory tests:

- At least 2 GB of free disk space
- Access to the download site at install.service-now.com
- Verify the digital signature of a sample downloaded file
- Permission to execute, which involves the following:
  - Extract a Zip archiver to the upgrade temp folder: agent/work/upgrade_temp
  - Copy files from the upgrade temp folder to the agent folder
  - Read a text file and validate the content
  - Delete the pre-upgrade check contents
- MID Server host machine is not a 32 bit system
- On Linux MID Servers, the glibC version is at least 2.17

On Windows MID Servers, the pre-upgrade validation runs the following alert tests:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Any MID Server Upgrade blocker services is running on the host machine
- Status of Application Experience on the host machine
- For security best practice, run the MID Server as a non-administrator user. If the current **Log On As** user account for the MID Server is **LocalSystem** or is a user that is part of the Administrators group, the upgrade does not fail, but this configuration is not recommended.

Errors that block the upgrade

These messages describe failing a mandatory test and are published to the MID Server Issue [ecc_agent_issue] table. Failure of any of these tests blocks the upgrade.

Not enough free disk space. The system reports <n> bytes free

This message is displayed when less than 2 GB of free disk space is detected on the MID Server host. This error is also written to the MID Server agent log.

Unable to download updates from the install server

This message indicates that either the MID Server host does not have permission to download the installation package from install.service-now.com, or network problems prevent connection. This error is also written to the MID Server agent log.

Signature verification failed:<message>

This message indicates that a Verification Exception has occurred when pre-upgrade check tries to verify the digital signature of the downloaded check file.

Unable to verify digital signature:<message>

This message indicates that the verification signature process was interrupted by an exception.

Unable to extract contents of pre upgrade check zip

This message indicates that the service account on the MID Server host does not have permission to extract the pre-upgrade ZIP archive to the temporary folder.

Unable to create folder <upgrade check file path>

This message indicates that the MID Server service account does not have permission to create the upgradeCheck folder for the pre-upgrade checking files in the agent/package path.

Unable to verify file permissions: <message>

This message indicates an exception has occurred when checking file permissions, such as a file that does not exist or access failure.

MID Server Windows Service is not running as LocalSystem or a local Administrator

This message warns that the Windows service is not running with the desired permissions.

Upgrade Failure: The host machine does not meet the minimum system requirements to upgrade the MID server.

MID upgrade is not supported on 32-bit host. Please refer to KB0863694 for more information.

Upgrade Failure: Host does not meet the minimum system requirements to upgrade the MID server. Please refer to MID Server product documentation on GlibC library for more information

This error can only occur for Linux MID Servers. Refer to Java version support for more information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Non-blocking warnings

These warnings are displayed in the MID Server Issue [ecc_agent_issue] table and do not prevent a Windows MID Server from upgrading:

Unable to parse $logOnAsUser

This message warns that the Log On As User value for the Windows service is not in either of these expected formats:

- user@domain.company.com
- domain\user

Unable to look up Log On As user's groups

When the instance attempts to look up the logged on user's group memberships, it executes the **net user <username>** command. The instance expects a certain output structure by the Windows service from this command and issues this warning if the expected output does not match the actual output.

These PowerShell warnings are written only to the MID Server agent log. Because PowerShell is not required to use a MID Server, these configuration issues do not prevent a Windows MID Server from upgrading. However, these warnings might indicate issues in your environment that require attention.

Skipping PowerShell upgrade checks since PowerShell is not usable

PowerShell 3.0 (at a minimum) is not installed or powershell.exe is not available to the MID Server service user.

Skipping Powershell test: Target folder has not been initialized

Skipping Powershell test: Unable to detect the service name

Service CiscoAMP running on the MID Server host machine is identified as a MID Server upgrade blocker

For more information, refer to KB0870329.

The Application Experience is disabled on the MID Server host, which can cause the auto-upgrade process to fail and the MID Server to go down. Enable the service on the host to ensure successful auto-upgrade

For more information, refer to KB0597552.

Continuing with upgrade, but the following issue was encountered during upgradeCheck: <exception message>

This message indicates that there was an issue running the PowerShell portion of the pre-upgrade tests.

Disabling the pre-upgrade check

A MID Server configuration parameter called **mid.upgrade.run_precheck** is set to **true** by default, which allows the automatic pre-upgrade test to run. To disable these tests for a single MID Server, add this parameter to that MID Server's config.xml file and set it to **false**. To disable these tests for all MID Servers, add a new record to the MID Server Property [ecc_agent_property] table called **mid.upgrade.run_precheck**. Set the value of this property to **false** and leave the **MID Server** field blank.

Pinning a MID Server to a specific version

You can pin all the MID Servers in your environment to a specific version by setting a system property, or you can configure specific versions for individual MID Servers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Under most circumstances, do not pin the MID Server to a specific version. Pinning the MID server can make it out of sync with the instance, and lead to broken functionality. Instead, let the instance determine which MID Server version to use.

Version control properties

These system properties control the version for all MID Servers:

- **mid.buildstamp**: Identifies the MID Server version with an identifier based on the date of the build. This property uses the format of **mm-dd-yyyy-hhmm**. The MID Server checks for version information hourly. If no override version is configured, the MID Server looks at the *mid.buildstamp* property for the version to use. This property resets itself to the default version (the version that matches your instance version) when the instance is restarted or upgraded, so any user changes are lost at that time. The system appends the release name and patch information to the date and time format.

  Warning:
  This property is not visible by default and should not be configured.

- **mid.version.override**: Sets an override condition for the current version for all MID Servers in your environment. This action pins the MID Servers to a single version and disables the automatic upgrade feature. This property is not visible in the base system and must be added to the System Property [sys_properties] table when it is set. For details, see Add a system property.

  When the MID Servers check the version each hour, they look at the *mid.version.override* property first. If this property is empty, the MID Servers get their version information from the *mid.buildstamp* property. If an override version is configured, the MID Servers use this value and ignore the version information in the *mid.buildstamp* property. This override value remains when the instance is restarted and is passed to the MID Servers.

  Important:
  The value in the **mid.version.override** property is cleared during an upgrade, which forces the MID Server to reset itself to the version in the *mid.buildstamp* property.

Version control configuration parameter

To pin specific MID Servers on a desired version, set the **mid.pinned.version** parameter with the name of that version in the **config.xml** file of each MID Server. Use the format **<version>-mm-dd-yyyy**. This setting overrides the property setting for the pinned MID Server version. The MID Server version is checked every 20 minutes or whenever the MID Server restarts, at which point the pinned version is applied. For instructions, see Add a MID Server parameter.

Note:
The value set in this parameter is not affected by an upgrade.

Upgrade the MID Server manually

You can manually upgrade MID Servers at any time if you do not want to wait for the automatic upgrade.

Before you begin
Role required: mid_server or admin
For the upgrade to run, MID servers must be in the **Up** state and must be validated. The MID Server automatically runs the pre-upgrade test before upgrading. Any errors encountered during this test must be resolved for the upgrade to proceed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The MID Server is upgraded to the version specified by build stamp on the instance, or by the upgrade property that you specify.

Procedure

1. Navigate to **All** > **Discovery** > **MID Servers** or **Orchestration** > **MID Server Configuration** > **MID Servers**.
2. Open the record of the MID Server that you want to upgrade.
3. Click **Upgrade MID** under **Related Links**.
4. Confirm that you want to perform the upgrade.

Resolving MID Server issues

Troubleshoot problems with the MID Server to find solutions. Monitor the MID Server to receive alerts about issues as they occur. Troubleshooting procedures exist to resolve specific problems with the MID Server. The Knowledge Base on Hi contains several articles to help you troubleshoot MID Server issues.

Monitor the MID Server

Monitoring a MID Server involves verifying entries in log files, confirming network connectivity, and checking MID server status.

- If the MID Server is on a Windows host, navigate to the Windows Services console, locate the service name that matches the name that appears from the `wrapper-override.conf` file. If the MID Server process is the only Java process running on the host, monitor the memory used by java.exe and alert on less than the maximum configured memory defined in the ~\agent\conf\wrapper-override.conf folder.
- Ensure that the `agent0.log.0.lck` file appears in the ~\agent\logs folder to confirm that the MID Server running and logging system activity in the `agent0.log.0` file.
- Review the following logs for warning, critical, and severe errors: ~\agent\logs \agent0.log.0 ~\agent\logs\wrapper.txt See Manage ECC Queue content for a MID Server to see how to open log entries from the instance.
- Test MID Server connectivity to confirm that the MID Server host is able to communicate with the instance. Resolve any issues with the network connectivity such as conflicts with firewalls, access control lists, and routing errors.
- From the MID Server instance, navigate to the **MID Servers** page, and review the status of the MID Server. For additional information, click a **Name**.
- Set up email, SMS, and push notifications to alert you when issues occur with MID servers. The **MID Server Down** notification is enabled by default. See Notifications for details.

Java Flight Recorder

Java Flight Recorder (JFR) uses an articulate data model to analyze Java Virtual Machine (JVM) internal and application specific memory usage and thread related details. On hosts with Java 14 or later, Event Streaming enables analysis of specific JVM or application events.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The JFR file actions **Start JFR Recording**, **Stop JFR Recording**, or **Write JFR File**, are accessed on the instance in the MID Server's Related Links. By starting and stopping the JFR recording, you can dump JFR data to the disk on demand. While JFR recording is on, you can write to the JFR file from the MID Server instance page.

The JFR file is deleted by a scheduler to clean the data after 24 hours. This default behavior can be overridden by adding the following configuration parameter in the **config.xml**: `<parameter name="mid.jfr.data.clean.interval" value="<time in milisec>"/>`

Custom JFR events can be written to JFR file. To disable event writing, add the following configuration parameter to the **config.xml**: `<parameter name="mid.jfr.record.aprobe" value="false”/>`

Troubleshooting procedures

The following procedures provide information on resolving specific problems with the MID Server. Knowledge Base articles also cover a wide range of issues. If you are encountering problems which are not covered in these procedures, search the Knowledge Base for related articles. For instance, if you are experiencing symptoms such as the MID Server going down or not responding, or CIs being duplicated during discovery, see KB0597571 for information and recommended solutions.

MID Server active issues

The ServiceNow® instance has a dedicated table that publishes active issues with MID Servers and alerts administrators when a MID Server is in danger of exceeding its resources.

Active MID Server post-cloning credential issues

The system provides automatic processes to detect and notify you of possible MID Server credential issues after instance cloning.

MID Server resource threshold alerts

The instance displays warnings when a MID Server breaches its resource thresholds for CPU and JVM memory usage, enabling users to create email notifications or custom scripts when a breach occurs.

MID Server user connectivity issues

The instance writes issues involving MID Server user logins and network connectivity to the MID Server Issue [ecc_agent_issue] table and creates events you can use in custom scripts or to send email notifications.

Interpreting MID Server user debugging output

Debugging output from the system log is available in either a summary or detailed view for MID Server user issues, but must be enabled manually.

MID Server Upgrade History

Use this module to troubleshoot errors that occur during the MID Server upgrade process. The MID Server Upgrade Histories table contains a record of each instance upgrade. The MID Server Upgrade Stages table shows the status of each MID Server and its upgrade progress, including any errors encountered.

MID Server active issues

The ServiceNow® instance has a dedicated table that publishes active issues with MID Servers and alerts administrators when a MID Server is in danger of exceeding its resources.

The MID Server Issue [ecc_agent_issue] table displays a number of common issues that a MID Server can experience, as they occur. Error checking processes attempt to pinpoint the most

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

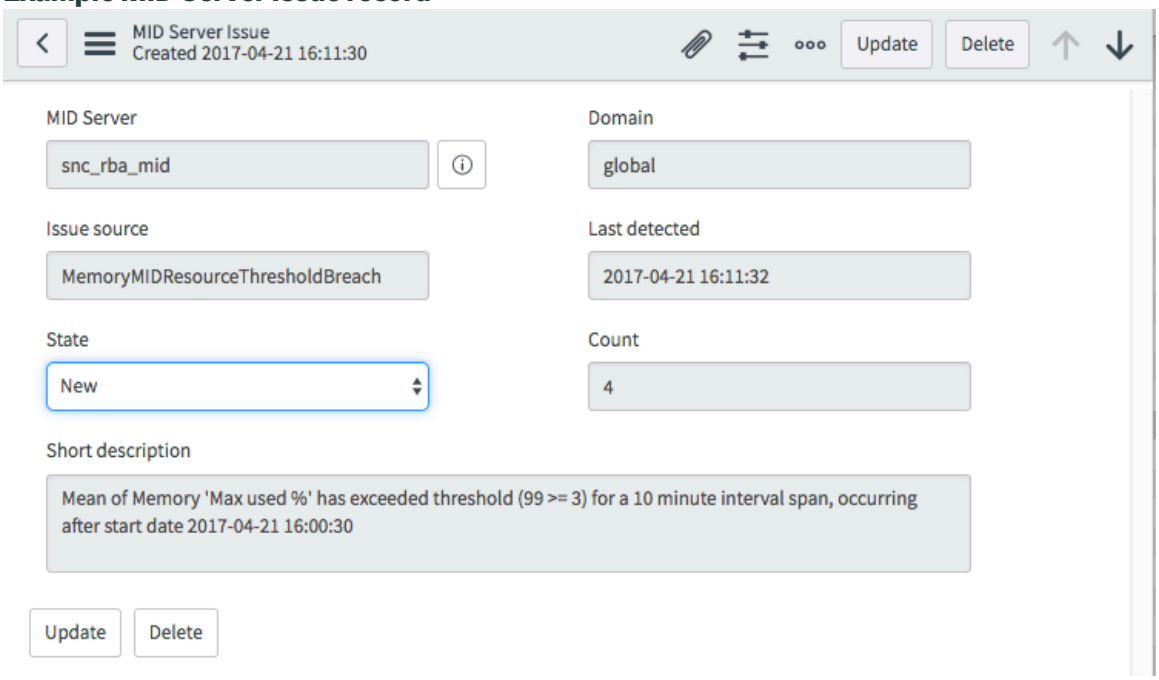
likely cause of the issue. Informative error messages name the affected MID Server and explain the possible cause of the issue. The ecc_agent_issue table retains its records for 30 days.

To access records in this table, navigate to **MID Server** > **Server Issues**.

Supported MID Server active issues:

- Bad user credentials after instance cloning.
- Unsupported Java Runtime Environment (JRE) on the MID Server host.
- Approaching resource thresholds for CPU usage and JVM memory.
- Errors detected during pre-upgrade testing.
- User authentication and authorization failures.
- Network connectivity interruptions and role configuration errors.

Example MID Server Issue record



MID Server fails to start

When a newly installed MID Server fails to start or shuts down prematurely, improper configuration could be to blame.

Duplicate MID Server names

When the MID Server service starts, it verifies that it is the only active (not down) MID Server with that name. If the MID Server discovers another active MID Server with the same name, the starting MID Server waits 5 minutes and sends another query. The MID Server repeats this query 12 times and logs each attempt in the agent log. If the IP address or home directory of an existing MID Server is changed, then that MID Server is invalidated. If the MID Server still detects a duplicate after this cycle, it creates a record in the MID Server Issue [ecc_agent_issue] table and shuts down.

Note:
The record in the MID Server Issue [ecc_agent_issue] table cannot be resolved automatically by the instance. Close this record manually for accounting purposes. Either mark the issue **Resolved** or delete it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Upgraded MID Servers running multiple services

Beginning with the New York release, a batch file in the MID Server installer package ensures that only one Windows MID Server service is configured for an executable path (MID Server installation folder). Previous versions have not checked for this configuration. Upgraded MID Servers that run multiple services with the same executable path are prevented from starting. If you experience this issue, follow this procedure to reconfigure the MID Server to use only one service:

1. Delete the unwanted Windows service by running **sc.exe delete <service name>** from the command line.
2. Open the `wrapper-override.conf` file in the MID Server installation folder.
3. Change the **wrapper.name** and **wrapper.displayname** parameters to the service name that you want to keep.
4. Restart the MID Server.

Active MID Server post-cloning credential issues

The system provides automatic processes to detect and notify you of possible MID Server credential issues after instance cloning.

During an instance clone, the MID Server [ecc_agent] table is not copied from the source instance, but the User [sys_user] table is copied. As a result, the source MID Server user credentials copied into the target instance might not match those used by the existing set of MID Servers used by the target. Bad credentials can cause those MID Servers to be down for the target instance. Processes on the instance notify you if a MID Server is down from suspected bad credentials following an instance clone.

Table for post-cloning credential issues

The MID Server Issue [ecc_agent_issue] table stores active MID Server issues after an instance clone. Records in this table show a MID Server's current state, evaluation times, and the **Issue source**. For cases in which a MID Server for a cloned instance is down because of possible bad credentials, the **Issue source** is **InstanceClone**. Data from the MID Server Issue [ecc_agent_issue] table are displayed in a related list on a MID Server record. Records in this table are removed if they have not been detected for 30 days. Ongoing issues reappear as they occur.

Post-cloning cleanup script and scheduled jobs

A cleanup script called *`Bad MID Server credentials after clone`* runs on the target instance after cloning and calls a script include called *`BadMIDCredentialAfterClone`*. This script include schedules the execution of the following jobs on the Schedule Item [sys_trigger] table:

- *`BadMIDCredentialAfterClone-1`*: Runs 15 minutes after clone execution.
- *`BadMIDCredentialAfterClone-2`*: Runs 75 minutes after clone execution.

These jobs log to the MID Server Issue [ecc_agent_issue] table any MID Servers that existed on the target instance prior to the clone that are in the **Down** state. These MID Servers are not ready for normal processing and might be down due to invalid credentials resulting from the cloning process. The state of MID Servers added to the target instance after the clone is not evaluated.

Note:
The MID Server log shows that the MID Server user associated with the target instance could not be authenticated or was missing the proper role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Business rule that checks for bad credentials

The **Check for bad MID credential after clone** business rule monitors the MID Server [ecc_agent] table for MID Servers that are transitioning from **Down** to **Up**. If the business rule finds a MID Server making that transition, the rule attempts to find a matching MID Server in the MID Server Issue [ecc_agent_issue] table that has an issue source of **InstanceClone** and a state other than **Resolved**. If a match is found, the business rule updates the state of the MID Server in the [ecc_agent_issue] table to **Resolved**.

Resolving MID Server issues

The error message in the MID Server Issue [ecc_agent_issue] table names the affected MID Server user. This message appears each time the business rule runs and finds a MID Server that is down from suspected bad credentials:`MID Server not operational (status: Down), possibly due to recent clone. Verify credentials for logged in User 'local-midserver'.`

Attempt to resolve the issue first by comparing the user's credentials with the credentials that the affected MID Server is expecting. If the credentials are incorrect, fix the problem and check the MID Server status again. If the credentials are correct, but the MID Server remains down, check the Knowledge Base for other possible causes.

MID Server resource threshold alerts

The instance displays warnings when a MID Server breaches its resource thresholds for CPU and JVM memory usage, enabling users to create email notifications or custom scripts when a breach occurs.

The MID Server Issue [ecc_agent_issue] table warns users when a MID Server exceeds configured thresholds of its allocated CPU and memory resources. These warnings are published before the MID Server experiences performance degradation or an out-of-memory error, enabling the administrator to increase resources and avoid downtime. Administrators can use a registered event to send email notification to selected recipients, advising them of any threshold breaches, or to create a custom script to do some other type of work. The instance continues to update the MID Server Issue [ecc_agent_issue] table to keep unresolved issues current.

By default, CPU and memory threshold alerts are disabled and no alerts are published to the MID Server Issue [ecc_agent_issue] table. To enable both types of alerting, add these properties to the System Property [sys_properties] table, and then set their values to **true**:

- **mid.threshold.resource.breach.enable.cpu.alerts**
- **mid.threshold.resource.breach.enable.memory.alerts**

For details on adding system properties to the platform, see Add a property using sys_properties.list.

Evaluation process

This processing occurs whether or not alerting is enabled:

1. Every 10 minutes, each MID Server transmits its CPU and memory consumption metrics to the instance. The instance inserts CPU metrics into the **Mean CPU used %** field of the ECC Agent Scalar Metrics [ecc_agent_scalar_metric] table and memory metrics into the **Max memory used %** field of the ECC Agent Memory Metrics [ecc_agent_memory_metric] table.
2. After a successful insert, the following business rules run on each table, invoking a script include that calls an appropriate function. Each function takes an average of the metric sets inserted into the tables, based on the configured sampling intervals.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Update cpu mean on MID Server Status**: Calls the *MIDResourceThresholdBreach.checkCpuUsage()* script include.
- **Update max memory on MID Server Status**: Calls the *MIDResourceThresholdBreach.checkMemoryUsage* script include.

Each function takes an average of the metric sets inserted into the tables, based on the configured thresholds and sampling intervals. The instance first looks at each MID Server for configuration parameters that set custom threshold values or sampling intervals for that MID Server. If no configuration parameters for these attributes are found, the instance looks in the System Properties [sys_properties] table for custom values to use. If no properties are found, the instance uses the default threshold and interval values from the code.

Note:
Both the threshold percentages and the sampling intervals are configurable. See Configuring thresholds and sampling intervals for details.

Alerting process

When alerting for CPU or memory thresholds is enabled, this processing occurs:

1. If the aggregated average metric value equals or exceeds the configured percent threshold, the instance triggers the *mid.threshold.resource.breach* event. Administrators can use this event to create email notifications for threshold breach alerts or to create a custom script.
2. The instance inserts a record of the breach into the MID Server Issue [ecc_agent_issue] table with a **State** value of **New** and a **Count** of 1, and then publishes a message containing all the pertinent details of the breach. An example of this message is `Mean CPU used % has exceeded threshold (96>=91) for a 40 minute interval span, occurring after start date 2017-01-11 14:25:19`. This message appears in the **Short description** field of the MID Server Issue form and in the event. You can copy any part of the message into your email notifications.

MID Server issue states

When the administrator first examines an issue in the MID Server Issue [ecc_agent_issue] table, the administrator can change the **State** of the issue to **Acknowledged** to indicate that the issue is being addressed. Each time the instance detects a breach, it attempts to match the breach with an existing issue. If a MID Server already has an issue record for that breach in a **State** of **New** or **Acknowledged**, the instance updates the **Last Detected** field with the current date/time and increments the **Count** field in the existing record. This prevents the creation of duplicate records in the MID Server Issue [ecc_agent_issue] table and records the number of times after the initial incident that the breach reoccurred. The administrator can increase MID Server resources gradually and watch the effect on the **Count** field. When the counter stops incrementing, the administrator knows that the MID Server has adequate resources. When the MID Server resource have been adjusted appropriately, the administrator sets the **State** to **Resolved**. If a new threshold breach is logged that matches a MID Server issue with a **State** of **Resolved**, the instance creates a new issue record.

Note:
Any record in the MID Server Issue [ecc_agent_issue] table that has not been updated in 30 days is deleted, regardless of its state.

Recommendations for resolving resource issues

Administrators have the opportunity to resolve any resource issues with a MID Server when they receive notification of the event. Follow these recommendations for reducing the strain on MID Server resources:

- **JVM memory**:
  - Allocate more max memory to the MID Server. For more information, see Set the MID Server JVM memory size.
  - Add additional MID Servers to share the workload. For more information, see MID Server clusters.
  - Reduce the amount of concurrent processing for the MID Server. This includes segmenting IP Address ranges into smaller segments for a Discovery schedule or loading smaller segments of data within an import job.
- **CPU**: Reduce the activity on the host or migrate the MID Server to a new host with more available resources.

> **Note:**
> MID Server can create a resource usage spike during Discovery, especially discovering against a large number of targets or executing multiple Power Shell sessions concurrently. The MID Server host's resource utilization automatically returns to normal after the Discovery execution successfully stops. To decrease CPU utilization, host the MID Server on a dedicated machine. If you encounter resource usage issues, make sure only one MID Server is run on each dedicated host machine. If the MID Server is hosted on a public cloud, add more CPU resources and avoid the noisy neighbor issue. For more information, see High CPU Usage on Host with MID Server(s) [KB0597639].

Tables used for resource threshold evaluation

Table	Description
MID Server Issue [ecc_agent_issue]	Stores data on various types of MID Server issues, including breaches of configured CPU and memory thresholds. Fields used for resource threshold breaches are: • **count**: Number of times a previously reported threshold breach occurs, if the event is not marked **Resolved**. • **last_detected**: Current date and time a threshold breach is detected. This field is updated each time a previously detected breach is found, if it is not marked **Resolved**. • **message**: Descriptive message summarizing the conditions that triggered the threshold breach event. This message includes the actual percentage of CPU and memory calculated and the configured thresholds that were breached. • **mid_server**: Name of the MID Server experiencing the resource threshold breach. • **source**: The issue source for the breach. These are the possible sources:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
	○ **CpuMIDResourceThresholdBreach**: CPU threshold issue sources. ○ **MemoryMIDResourceThresholdBreach**: Memory threshold issue sources.
MID Server Status [ecc_agent_status]	Stores the percentages used for the CPU and memory resources, averaged over configurable intervals for each resource. The fields used are: • Mean CPU used % • Max Memory used %
ECC Agent Scalar Metric [ecc_agent_scalar_metric]	Stores the CPU usage data inserted by each MID Server every 10 minutes. The table field used by resource threshold alerting is **mean**.
ECC Agent Memory Metric [ecc_agent_memory_metric]	Stores the memory usage data inserted by each MID Server every 10 minutes. The table field used by resource threshold alerting is **max_used_pct**.

Business rules that check for threshold breaches

Business rule	Description
Update cpu mean on MID Server Status	Runs after the MID Server inserts a record into the ECC Agent Scalar Metric [ecc_agent_scalar_metric] table. This business rule triggers the `MIDResourceThresholdBreach` script include function that evaluates threshold settings to determine if the MID Server has breached its configured CPU resource thresholds.
Update max memory on MID Server Status	Runs after the MID Server inserts a record into the ECC Agent Memory Metric [ecc_agent_memory_metric] table. This business rule triggers the `MIDResourceThresholdBreach` script include function that evaluates threshold settings to determine if the MID Server has breached its configured memory resource thresholds.

Configuring thresholds and sampling intervals

You can use the default threshold percentages and sampling intervals or configure custom values using either of these methods:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Add system properties to the instance and change the default values for all MID Servers.
- Add configuration parameters to change the default resource values for individual MID Servers.

The system properties and the configuration parameters use the same names.

Property/configuration parameter	Description
mid.threshold.mean_cpu.aggregate_interval_span	Number of 10 minute units in the interval for sampling CPU usage data. The default interval is 30 minutes (3 x 10 min.) **Default**: 3
mid.threshold.mean_cpu.percent	Usage percentage of the total CPU resources that initiates a threshold breach alert. **Default**: 95
mid.threshold.mean_max_memory.aggregate_interval_span	Number of 10 minute units in the interval for sampling memory usage data. The default interval is 30 minutes (3 x 10 min.) **Default**: 3
mid.threshold.mean_max_memory.percent	Usage percentage of the total memory resources that initiates a threshold breach alert. **Default**: 95

MID Server resource reporting

The MID Server dashboard contains two reports that give you views into the consumption of CPU and JVM memory resources. These reports show usage over the previous 30 days.

- **Avg Percentage of CPU Used**: Trending the daily average on CPU usage helps illustrate the amount of CPU processing that the MID Server host consumes. MID Servers deployed on the same host will report the same CPU usage.
- **Avg Percentage of Max Memory Used**: The maximum used percentage (*max_used_pct*) is a useful metric for determining if the MID Server has enough memory resources. This metric is a percentage of the max used memory over the total available memory. Trending this over time provides a visualization of how much memory is needed by the MID Server.

MID Server user connectivity issues

The instance writes issues involving MID Server user logins and network connectivity to the MID Server Issue [ecc_agent_issue] table and creates events you can use in custom scripts or to send email notifications.

Records in the MID Server Issue [ecc_agent_issue] table can provide insight into why your MID Server user cannot log in or why a MID Server cannot connect to the instance. The system displays records for connectivity problems in this table that include informative error messages suggesting possible causes. By default, a scheduled job called MIDUserConnectivity runs every four hours and launches the MIDUserConnectivity script include to evaluate MID Server

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

connection activity. Records in the MID Server Issue [ecc_agent_issue] table reflect the status of MID Server login attempts and connectivity at the time the scheduled job runs.

From the perspective of the instance, the MID Server is **Down** when:

- User authentication fails
- User authorization fails.
- Network issues prevent MID Server from establishing a TCP/IP connection.

Note:
To associate a user with a MID Server, navigate to the `servicenow/<mid server name>/agent/config.xml` file and enter the user credentials in the **mid.instance.username** and **mid.instance.password** parameters. Make sure to restart the MID Server to activate your changes.

How issues are logged

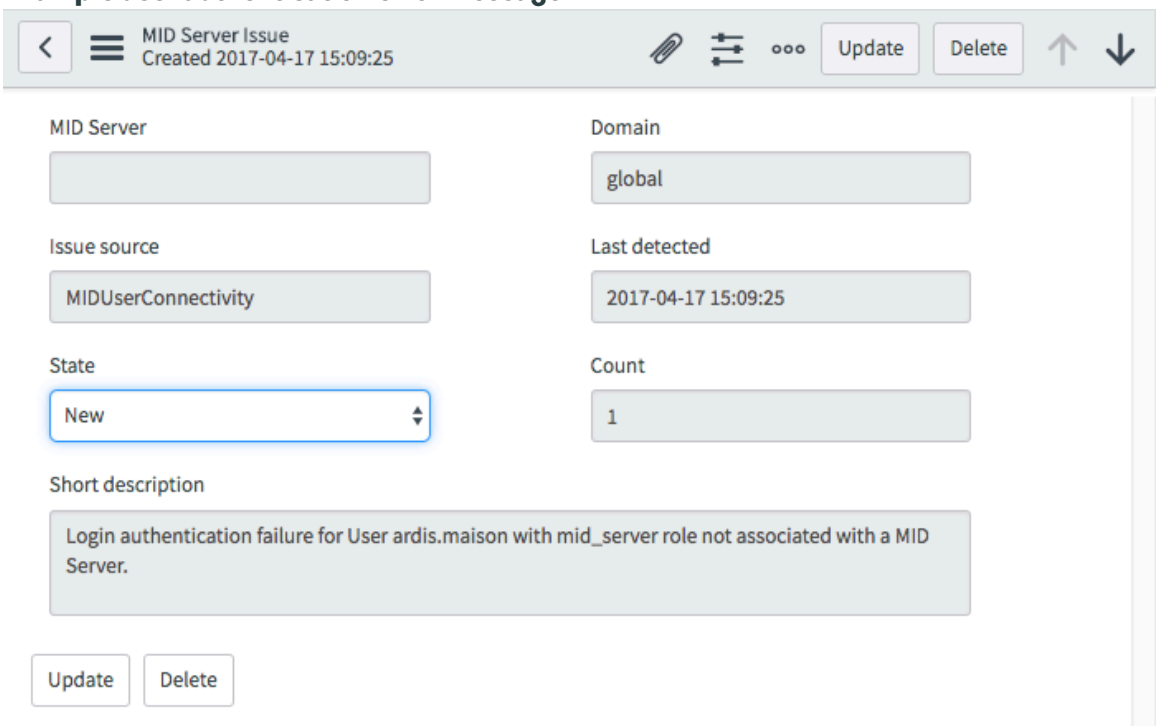
User authentication failures and authorization issues are logged automatically to the MID Server agent log file. The message for both is the same: **User cannot be authenticated or is missing the proper roles.** If the issue is related to authorization, the `agent.log` file shows the list of missing roles.

When debugging is enabled, MID Server issues are logged to the system log (syslog) and are available for display in either a summary or a detailed format. You can also change the sampling interval from the default 4 hours to something shorter for tracking your remediation efforts. For instructions on enabling and configuring debugging for MID Server user issues, see Test remediation efforts for MID Server user connectivity issues.

Data provided

When the instance encounters user connectivity issues, it opens a record in the MID Server Issue [ecc_agent_issue] table.

Example user authentication error message



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The MID Server Issue table contains these fields:

MID Server issue fields

Field	Description
Last detected	Date and time the issue was last detected.
Short description	Contents of the generated message that specifies a possible issue with the named user or the MID Server.
MID Server	Empty in the Jakarta release.
Issue source	The process that identified the issue. For all issues with MID Server user connectivity, the source is `MIDUserConnectivity`.
State	The current state of the issue. Possible states are: • **New**: Starting state when the instance creates the issue. • **Acknowledged**: State set when the administrator first examines the issue. • **Resolved**: Ending state, set by the instance, indicating that the issue has been resolved. If the scheduled job does not encounter the issue when it runs again, the instance automatically sets this value.
Domain	Domain associated with the MID Server user account.
Count	Number of times an issue has been detected. Each time the scheduled job runs and encounters the same issue, it increments this field.

User authentication failure

The credentials that the instance uses to authenticate a MID Server user are configured in the MID Server Configuration Parameters [ecc_agent_config] table. If the MID Server user attempts to log into the instance with invalid credentials, the instance rejects the connection, and writes the **login.failed** event to the Events [sysevents] table for the user. Administrators can use this event in a custom script or in email notifications for authentication failure.

Note:
If user authentication fails, user authorization is not attempted.

User accounts associated with a MID Server

Either of the following messages in the MID Server Issue [ecc_agent_issue] table indicate authentication failure for user accounts that are associated with a MID Server:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Login authentication failure for User <user name> associated with 1 down MID Server. Check password on MID server.**
- **Login authentication failure for User <user name> associated with <n> down MID Servers. Check password on MID servers.**

The necessary conditions for these messages to appear are:

- The **Status** field in the MID Servers [ecc_agent] table that is associated with the MID Server indicates that the MID Server is **Down**.
- The user identified in the MID Server Configuration Parameters [ecc_agent_config] table is the user that one or more MID Servers is configured to use for authentication and authorization when connecting to the instance. The record in the [ecc_agent_config] table must have these values:
  - Parameter name [param_name] field set to **mid.instance.username**.
  - Value [value] field set to the user's name, corresponding to the User ID [user_name] field in Users [sys_user] table.
- The Events [sysevent] table contains posts showing that the last login attempt associated with the user failed during the scheduled time period. The record created in the [sysevent] table contains these field values:
  - Event Name [name] field is set to **login.failed**.
  - Parm1 [parm1] field is set to the user's name.

Note:
The MID Server [mid_server] field in the MID Server Issues [ecc_agent_issue] table is empty (=NULL).

User accounts with the mid-server role not associated with a MID Server

The following message appears when a user with the mid_server role who is not associated with a MID Server fails to authenticate: **Login authentication failure for User <user name> with mid_server role not associated with a MID Server.**

The necessary conditions for this message to appear are:

- The User Roles [sys_user_has_role] table contains a record linking the sys_id associated with the user record stored in the [sys_user] table, with the sys_id associated with the mid_server role record stored in the [sys_user_role] table.
- The user is not identified in the MID Server Configuration Parameters [ecc_agent_config] table as the user whom one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
- The Events [sysevent] table contains posts showing that the last login attempt associated with the user failed during the scheduled time period.
  - The [sysevent] table contains a record with the Event Name [name] field set to **login.failed**.
  - The Parm1 [parm1] field is set to the user's name, corresponding to the User ID [user_name] field in Users [sys_user] table.

Note:
The MID Server [mid_server] field in the MID Server Issues [ecc_agent_issue] table is empty (=NULL).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

User authorization failure

The user authorization check occurs after the MID Server has successfully authenticated on the instance. In this step, the system ensures that the user account associated with a MID Server is granted the minimum roles required. A SOAP web service called *MIDServerCheck* performs the role checking on the instance. If the MID Server user has the proper roles, the connection is allowed and a *login* event is written to the Events [sysevents] table. If the user does not have the proper roles, the instance writes a **login.authorization.failed** event to the Events [sysevents] table. This event provides a comma separated list of the user's missing roles. Administrators can use this event in custom scripts or in email notifications for authorization failure.

Authorization can fail if a user is missing the mid_server role or any of the important SOAP roles, as in these cases:

- If the user has the soap_script role, the *MIDServerCheck* SOAP web service runs to check for the appropriate MID Server roles. If the user lacks the mid_server role or any of the other SOAP roles, authorization fails, and the **login.authorization.failed** event is created.
- If the user is missing the soap_script role, that user is not authorized to launch the *MIDServerCheck* SOAP web service, which checks for all required MID Server roles. Authorization fails, but the **login.authorization.failed** event is not created. When this occurs, the instance displays this message: **Connectivity of MID Server user <user name> cannot be detected by the instance**.

Users associated with one or more down MID Servers

Either of the following messages in the MID Server Issue [ecc_agent_issue] table indicate authorization failure for user accounts that are associated with a MID Server that is **Down**:

- **Login authorization failure for User <user name> associated with 1 down MID Server. Re-assign mid_server role to grant all required roles.**
- **Login authorization failure for User <user name> associated with <n> down MID Servers. Re-assign mid_server role to grant all required roles.**

The **MIDUserConnectivity** script include identifies active users associated with one or more down MID Servers whose last login attempt within the reporting period failed user authorization. This message is generated when user authorization failures are detected and reported by the MIDServerCheck scripted web service. However, user authorization failures are not reported for users who are not assigned the soap_script role. Should this occur, problems with the user are reported by the network connectivity message.

This message appears in the MID Server Issue [ecc_agent_issue] table when:

- The user may or may not have the mid_server role.
- The user is identified in the MID Server Configuration Parameters [ecc_agent_config] table as the user whom one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
- The Events [sysevent] table contains posts showing that the last login attempt associated with the user failed during the scheduled time period. The [sysevent] table contains a record with these settings:
  - Event Name [name] field set to **login.authorization.failed**.
  - Parm1 [parm1] field set to the user's name, corresponding to the User ID [user_name] field in Users [sys_user] table.

Note:
The MID Server [mid_server] field in the MID Server Issues [ecc_agent_issue] table is empty (=NULL).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Users with the proper role not associated with a MID Server

The following message appears when a user with the mid_server role who is not associated with a MID Server fails authorization: **Login authorization failure for User <user name> with mid_server role not associated with a MID Server.**

This message is generated when user authorization failures are detected in which the user account, with the mid_server role, is not identified as a configured MID Server user in the [ecc_agent_config] table. It is possible that the user account was associated with a MID Server at the time of the failure.

This message appears in the MID Server Issue [ecc_agent_issue] table when:

- The user has the mid_server role. The User Roles [sys_user_has_role] table has a record linking the sys_id associated with the user record stored in the [sys_user] table, with the sys_id associated with the mid_server role record stored in the [sys_user_role] table.
- The user is not identified in the MID Server Configuration Parameters [ecc_agent_config] table as the user whom one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
- The Events [sysevent] table contains posts showing that the last login attempt associated with the user failed during the scheduled time period. The [sysevent] table contains a record with these settings:
  - Event Name [name] field set to **login.authorization.failed**.
  - Parm1 [parm1] field set to the user's name, corresponding to the User ID [user_name] field in Users [sys_user] table.

Note:
The MID Server [mid_server] field in the MID Server Issues [ecc_agent_issue] table is empty (=NULL).

Network issues

A network issue can prevent the MID Server from connecting to the instance's TCP/IP server to begin a session. In this case, the instance marks the MID Server as **Down**, because the instance failed to receive the MID Server heartbeat within the prescribed 5 minute interval.

Users associated with down MID Servers who have not attempted to log in

Either of the following messages in the MID Server Issue [ecc_agent_issue] table name users associated with MID Servers who have not attempted to log in during the reporting period:

- **User <user name> is associated with 1 down MID Server. No login attempts within reporting period.**
- **User <user name> is associated with <n> down MID Servers. No login attempts within reporting period.**

The MIDUserConnectivity script include reports active users associated with down MID Servers where network connectivity cannot be detected by the instance.

This message appears in the MID Server Issue [ecc_agent_issue] table when:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The user may or may not have the mid_server role.
- The user is identified in the MID Server Configuration Parameters [ecc_agent_config] table as the user which one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
- There are no login attempts, either failed or successful, recorded in the Events [sysevent] table for the user during the scheduled reporting period.

Note:
The MID Server [mid_server] field in the MID Server Issues [ecc_agent_issue] table is empty (=NULL).

Users not associated with MID Servers who have not attempted to log in

The following message appears when a user with the mid_server role who is not associated with a MID Server has not attempted to login during the configured reporting interval: **User <user name> with mid_server role is not associated with a MID Server. No login attempts within reporting period.**

The MIDUserConnectivity script include reports active users with the mid_server role not associated with a MID Server, where connectivity cannot be detected by the instance.

This message appears in the MID Server Issue [ecc_agent_issue] table when:

- The user has the mid_server role. The User Roles [sys_user_has_role] table has a record linking the sys_id associated with the user record stored in the [sys_user] table, with the sys_id associated with the mid_server role record stored in the [sys_user_role] table.
- The user is not identified in the MID Server Configuration Parameters [ecc_agent_config] table as the user whom one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
- There are no login attempts, either failed or successful, recorded in the Events [sysevent] table for the user during the scheduled reporting period.

Note:
The MID Server [mid_server] field in the MID Server Issues [ecc_agent_issue] table is empty (=NULL).

Configuration issues

Any of the following messages, discussed above, can indicate a configuration issue:

- **Login authentication failure for User <user name> with mid_server role not associated with a MID Server.**
- **Login authorization failure for User <user name> with mid_server role not associated with a MID Server.**
- **User <user name> with mid_server role is not associated with a MID Server. No login attempts within reporting period.**

These are some common configuration errors:

- An administrator neglected to associate the user record with the MID Server record as shown in the MID Server Configuration Parameters [ecc_agent_config] table. This table is read-only and cannot be updated directly. To associate a user with a MID Server, configure the user name and password in the MID Server's `config.xml` file and restart the MID Server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- During the process of reconfiguring a MID Server to use a different account for TCP/IP connection, the administrator has not yet removed the mid_server role from the account or deleted the account.
- A multipurpose user account was created and granted a large number of roles, including the mid_server role, although this account was never intended to be used as a MID Server account.

User who successfully authenticates and authorizes but might not need mid_server role

The following message appears when a user with the mid_server role who is not associated with a MID Server successfully logs in: **User <user name> with mid_server role successfully connected but not associated with a MID Server. The mid_server role should be reserved for MID Server use only.**

The MIDUserConnectivity script include reports active users with the mid_server role who are not identified as a configured MID Server user, and whose last login attempt was successful during the scheduled time period. This message suggests that the user's credentials are being used by a system administrator or a process that is not running on a MID Server. The assumption here is that the mid_server role should only be used for applications deployed to a MID Server. The presence of this message reminds the system administrator to remove extraneous mid_server roles from user accounts that do not require them.

This message appears in the MID Server Issue [ecc_agent_issue] table when:

- The user has the mid_server role.
- The user is not identified in the MID Server Configuration Parameters [ecc_agent_config] table as the user whom one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
- The Events [sysevent] table contains posts showing that the last login attempt associated with the user succeeded during the scheduled time period. The [sysevent] table contains a record with these settings:
  - Event Name [name] field set to **login**.
  - Parm1 [parm1] field set to the user's name, corresponding to the User ID [user_name] field in Users [sys_user] table.

Note:
The MID Server [mid_server] field in the MID Server Issues [ecc_agent_issue] table is empty (=NULL).

Test remediation efforts for MID Server user connectivity issues

After attempting to resolve a user connectivity issue that appears in the MID Server Issue [ecc_agent_issue] table, you can test your remediation efforts without having to wait until the next scheduled reporting period by shortening the sampling interval.

Before you begin
Role required: admin

About this task
Reconfigure the sampling interval using this procedure and then examine the results in the MID Server Issue [ecc_agent_issue] table. You can set any time span for the sample, but you should define a window of not less than 5 minutes, since this is the default interval of the MID Server heartbeat that reports its status. The recommended method for configuring a shorter sampling interval is to copy and modify the code from the MIDUserConnectivity scheduled job, and then run it manually in the background script utility.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Warning:
Avoid editing the script in the MIDUserConnectivity schedule record. If you make any change to this record, it will not be updated when you upgrade the instance.

Procedure

1. Navigate to **All** > **System Definition** > **Scheduled Jobs**.
2. Open the MIDUserConnectivity scheduled job.
3. Copy this line from the **Run this script** field:
   `MIDUserConnectivity(0).checkConnectivity(4 * (60 * 60 * 1000));`

   This code sets the 4 hour sampling interval in milliseconds and turns debugging off with the **MIDUserConnectivity(0)** value.
4. Navigate to **System Definition** > **Scripts - Background**.
5. Paste the code from the scheduled job into the **Run script** field.
6. Set the sampling interval to 5 minutes by changing the time calculation to **(5 * 60 *1000)**.
   The modified command looks like this:
   `MIDUserConnectivity(0).checkConnectivity (5 * 60 *1000);`
7. Click **Run script**.
8. Open the record of the MID Server that had the issue and select the **MID Server Issues** related list.
   The issue is updated as follows:
   - If the issue persists, the **Count** column is incremented, and the **Last detected** column shows the current date and time.
   - If the issue no longer exists, the system changes the **State** to **Resolved**.
9. **Optional:** You can enable debugging by selecting a level, and then run the script again to see the breakdown for each condition evaluated.
   Use these settings to select a debugging level:
   - For a summary view, enter **MIDUserConnectivity(1)**.
   - For a detailed view, enter **MIDUserConnectivity(2)**.

   For details about the type of debugging information provided, see Interpreting MID Server user debugging output.

Interpreting MID Server user debugging output

Debugging output from the system log is available in either a summary or detailed view for MID Server user issues, but must be enabled manually.

To enable debugging and display all connectivity issues in either of the available formats, you must run a method manually on your instance. For instructions on enabling debugging, see Test remediation efforts for MID Server user connectivity issues. For information about each error condition and how records are created in the MID Server Issue [ecc_agent_issue] table, see MID Server user connectivity issues.

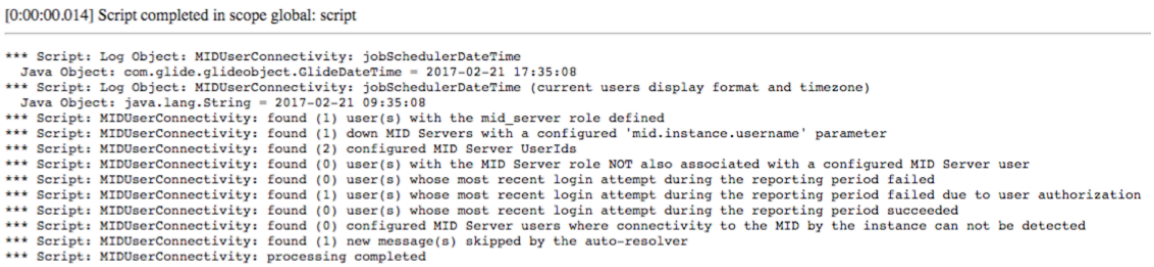
Available formats

You can configure the instance to generate a simple summary of the issue or a detailed output that identifies users and MID Servers. Summaries provide a quick look at the issue conditions, by count, while the detailed view allows you to examine roles, MID Server associations, and login activity by named users.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In this summary example of an authorization issue, the instance evaluates each condition and indicates how many users met that condition. You can see that a MID Server is down and that one of two users configured for a MID Server failed authorization. Because this is a summary, neither the MID Server nor the users are named.

Sample summary debug output



```
[0:00:00.014] Script completed in scope global: script

*** Script: Log Object: MIDUserConnectivity: jobSchedulerDateTime
  Java Object: com.glide.glideobject.GlideDateTime = 2017-02-21 17:35:08
*** Script: Log Object: MIDUserConnectivity: jobSchedulerDateTime (current users display format and timezone)
  Java Object: java.lang.String = 2017-02-21 09:35:08
*** Script: MIDUserConnectivity: found (1) user(s) with the mid_server role defined
*** Script: MIDUserConnectivity: found (1) down MID Servers with a configured 'mid.instance.username' parameter
*** Script: MIDUserConnectivity: found (2) configured MID Server UserIds
*** Script: MIDUserConnectivity: found (0) user(s) with the MID Server role NOT also associated with a configured MID Server user
*** Script: MIDUserConnectivity: found (0) user(s) whose most recent login attempt during the reporting period failed
*** Script: MIDUserConnectivity: found (1) user(s) whose most recent login attempt during the reporting period failed due to user authorization
*** Script: MIDUserConnectivity: found (0) user(s) whose most recent login attempt during the reporting period succeeded
*** Script: MIDUserConnectivity: found (0) configured MID Server users where connectivity to the MID by the instance can not be detected
*** Script: MIDUserConnectivity: found (1) new message(s) skipped by the auto-resolver
*** Script: MIDUserConnectivity: processing completed
```

Authentication failure

When a MID Server user cannot authenticate on the instance, the system displays these error messages in the detailed output:

- **Login authentication failure for User <user name> associated with 1 down MID Server. Check password on MID server.**
- **Login authentication failure for User <user name> associated with <n> down MID Servers. Check password on MID servers.**
- **Login authentication failure for User <user name> with mid_server role not associated with a MID Server.**

In this example, three users with the mid_server role, **midserver2**, **local-midserver**, and **ardis.maison**, failed to authenticate. Two of these users were configured for MID Servers that were **Down**, and the other user was not configured for any MID Servers. Each of these users has an authentication failure and is named in the appropriate error message.

MID Server ID map

The debugging output lists all MID Servers that are marked as **Down** and maps them to their user accounts by the MID Server **sys_id**. This map includes all user accounts that have the mid_server role, whether or not they are associated with a MID Server. If there are no **Down** MID Servers, the map is not displayed in the debugging output.

The map is presented in three sections:

- User accounts not associated with any MID Servers.
- User accounts associated with **Down** MID Servers, identified by their **sys_id**.
- The **sys_id** of each **Down** MID Server, identified by name.

MID Server ID map

```
*** Script: Log Object: MIDUserConnectivity: userIDMIDServerMap

Authorization failure

If a user is missing any of the required roles, the instance generates these authorization failure messages:

- **Login authorization failure for User <user name> associated with 1 down MID Server. Re-assign mid_server role to grant all required roles.**
- **Login authorization failure for User <user name> associated with <n> down MID Servers. Re-assign mid_server role to grant all required roles.**
- **Login authorization failure for User <user name> with mid_server role not associated with a MID Server.**

In this example, three users with the mid_server role, **midserver2**, **local-midserver**, and **ardis.maison** have failed authorization. One user is not associated with any MID Server, but the other two users are. The system has logged an authorization failure, indicating that the user is missing at least one critical role. To see what roles are missing, look at the comma separated list in the **Parm2** field in the **login.authorization.failed** event record. This record is the most recent login attempt in the Event [sysevent] table for the user account within the reporting period.

Detailed debugging log for authorization failure

```

```

Network issues

Network issues may exist for these users who are associated with MID Servers, but who have not attempted to log in during the reporting period:

- **User <user name> is associated with 1 down MID Server. No login attempts within reporting period.**
- **User <user name> is associated with <n> down MID Servers. No login attempts within reporting period.**

Network issues may also exist for these users who are NOT associated with MID Servers, and who have not attempted to log in during the reporting period: **User <user name> with mid_server role is not associated with a MID Server. No login attempts within reporting period.**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In this example, no login attempts have been detected for **midserver2**, **local-midserver**, and **ardis.maison**, all of whom have the mid_server role. Two of those users are associated with MID Servers that are marked **Down**. The other user is not associated with any MID Server. None of these users has attempted to log in to the system within the configured reporting interval. The system assumes that these users would make an attempt to log in unless network issues prevented them from doing so.

Note:
By default, the sampling period is 4 hours. However, during debugging or remediation, the sampling period can be reset to a value that matches the MID Server heartbeat interval of 5 minutes, or greater.

Detailed debugging log for network connection issues

```

Configuration issues

Any of the following messages can indicate a user configuration issue:

- **Login authentication failure for User <user name> with mid_server role not associated with a MID Server.**
- **Login authorization failure for User <user name> with mid_server role not associated with a MID Server.**
- **User <user name> with mid_server role successfully connected but not associated with a MID Server. The mid-server role should be reserved for MID Server use only.**
- **User <user name> with mid_server role is not associated with a MID Server. No login attempts within reporting period.**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In this example, a user with the mid_server role has logged in successfully within the configured sampling interval. However, this user is not configured for a MID Server and might have the role in error.

Detailed debugging log for MID Server user account login

MID Server Upgrade History

Use this module to troubleshoot errors that occur during the MID Server upgrade process. The MID Server Upgrade Histories table contains a record of each instance upgrade. The MID Server Upgrade Stages table shows the status of each MID Server and its upgrade progress, including any errors encountered.

MID Server Upgrade Histories

Users with admin or agent-admin roles can find detailed information for any MID Server upgrade in the Upgrade History module for MID Server. Whenever an instance is upgraded, all MID Servers in the Up state are upgraded automatically. The Upgrade History module uses the MID Server Upgrade Histories table [ecc_agent_upgrade_history]. This table shows the following information:

- The old instance version.
- The new version.
- The number of successfully upgraded MID Servers.
- The number of MID Servers with pending upgrades. MID Servers have pending upgrades if the upgrade has failed or is in progress.

MID Server Upgrade Stages

Select an instance record to see more details about the MID Servers upgraded with that instance. The Pending Upgrades and Complete Upgrade Details related lists use the MID Server Upgrade Stages table [ecc_agent_upgrade_history_stage]. MID Servers pinned to a specific version generate an entry with a blank MID Upgrade History on the MID Server Upgrade Stages table [ecc_agent_upgrade_history_stage].

MID Upgrade History	Refers to a corresponding record in the [ecc_agent_upgrade_history] table.
Stage	Shows the progress of the MID Server through each stage of the upgrade process.
State	Shows the status of each stage.
Message	Displays dynamically generated messages about the upgrade stages, such as the file path to download directories or extract folders.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

	It also displays information about any errors encountered, even if those errors do not block the upgrade.

MID Server ECC Queue

The External Communication Channel (ECC) Queue is a connection point between an instance and the MID Server. Jobs that the MID Server needs to perform are saved in this queue until the MID Server is ready to handle them.

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

Asynchronous Message Bus

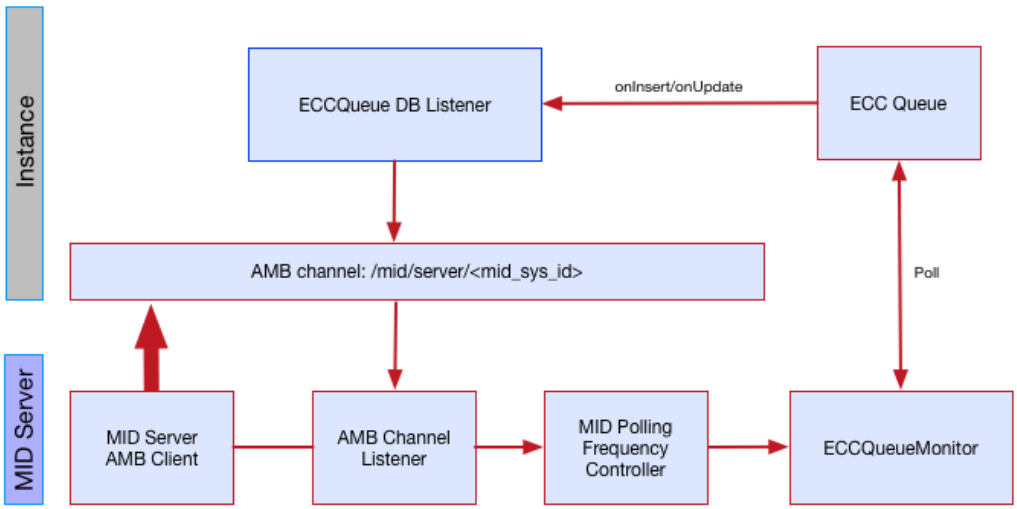
The MID Server subscribes to messages published by the Asynchronous Message Bus (AMB), which notifies the MID Server that it has pending task records in the ECC Queue. If a task exists in the ECC Queue for that MID Server, the MID Server sets the status to "Processing". When finished working on a requested job, the MID Server reports back to the ECC queue with the results.

The MID Server opens a persistent connection to the instance through the AMB Client and listens on the `/mid/server/<mid_sys_id>` AMB channel. When an output record is inserted into the Queue [ecc_queue] table, an AMB message is sent to the MID Server's channel. The MID Server receives this message and immediately polls the ecc_queue table for work, unless the MID Server is busy and the message priority level is not Interactive.

The MID Server polls the ECC queue at the maximum regular interval defined in the **mid.poll.time** configuration parameter (40 seconds by default), regardless of AMB message activity. If the MID is busy and receeives an AMB message witrh a priority level other than Interactive, the queue poll time changes to **mid.poll.time.standard** (5 seconds by default). This polling of the ECC queue at a regular interval is done in case the AMB connection is dropped.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MID Server ECC queue polling process



Note:
The AMB client on the MID Server does not work in all environments and might need to be disabled to avoid performance issues. To disable AMB in your environment, set the **mid.disable_amb** parameter to **true**. When you disable AMB, the MID Server no longer receives notifications for each new ECC queue output record. See **mid.poll.time** in#MID Server parameters for more information.

ECC Queue information

You can access the ECC Queue by navigating any of these paths:

- **Discovery** > **Output and Artifacts** > **ECC Queue**
- **Discovery** > **Discovery Schedules** > **{schedule name}** > **{Discovery status record}**
- **ECC** > **Queue**
- **{Discovery Status record}** > **ECC Queue**

An ECC Queue provides the following information:

Field	Input value
Agent	The name of the external system that this messages is either from or to. If the message is from or to a MID Server, the agent name is in the form `mid.server.xxx`, where xxx is the name of a particular MID Server.
Topic	The name of the probe the MID server ran. If you are using a pattern for discovery, the Horizontal Pattern probe Horizontal Pattern probe appears.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Input value
Name	The actual command the probe ran. For example, if **Topic** is SSHCommand, then the **Name** field contains the actual shell command to run. If you are using a pattern for discovery, the following appears: **Pattern Launcher:** followed by the name of the pattern and the multipage number.
Source	The IP address that the discovery is to run against. A few probes run against multiple IP addresses; in those cases, this field contains a human-readable description.
Response to	This optional field contains a reference (sys_id) to the ECC Queue message that this message is in response to. Discovery makes extensive use of this field to track the hierarchy of messages that result from a given scheduled Discovery. Click the record icon for the value in this field to open the ECC Queue record for the activity that spawned the current probe or sensor record.
Queue	An indicator of whether this message was is an input message or an output message.
State	The state of the current ECC queue record. States update automatically.
Processed	The time when this message was processed.
Created	The time when this message was created.
Sequence	The unique sequence number for this message. This value is automatically generated when an ECC Queue record is inserted. Its use is deprecated.
Error string	An error message, if an error occurred during processing. This field is hidden on the standard form unless there was an error.
Payload	The body of the message in XML format. The returned XML has a root tag of `<results>` containing one or more `<result>` tags and a single `<parameters>` tag. The parameters are simply an echo of those sent to the MID server in the probe; they vary from probe to probe, but in general they tell the probe the details of what it is to do and how it should behave. The result tags are the most interesting ones: they contain the actual data generated by the probe.

ECC queue controls

The ECC Queue form contains these related links:

Related link	Description
Run again	Runs the probe again. You can re-run probes when you encounter a failed discovery or other unexpected results.
Go to CMDB item	Open the CI record for the CI that was updated during the discovery.
Go to Sensor	Open the record for the associated sensor.

ECC Queue retry policy

The ECC Queue Retry Policy plugin (com.glideapp.ecc_retry_policy) needs to be activated to be able to view the ECC Queue Retry Policy and Queue Retry Activity modules.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Manage ECC Queue content for a MID Server

The ECC Queue allows you to create ECC Queue messages, access MID Server log entries, and retrieve statistics from an individual MID Server record.

Before you begin

Role required: admin, mid_server

Procedure

1. Send remote commands through a MID Server to a hosting device directly from the ECC Queue without running Discovery.

   a. Navigate to the ECC Queue and click **New**.

   b. Create a message with these settings:

   - **Agent**: The name of the MID Server that executes the command.
   - **Topic**: Command
   - **Name**: The actual command that you want to process. For Windows, this is expressed in a DOS command line structure. For Linux, the structure could be a bash command line entry.
   - **Queue**: Output
   - **Payload**: With proper XML tags, you can specify the command here instead of in the **Name** field. The advantage to this is that the command is not restricted by the **Name** field length of 120 characters. Use the following XML format for the command:

   ```
   <parameters>
      <parameter name="name" value="ACTUAL_COMMAND_LINE"/>
   </parameters>
   ```

2. Access entries in the ECC Queue that show **agent0.log.0** logs and **wrapper.log** logs for an individual MID Server.

   a. Open a MID Server record.

   b. Under **Related Links**, click **Grab MID logs, files and thread dump**.
   ECC queue records appear in the list using the following filter:

   - [Topic] [is] [SystemCommand]
   - [Source] [is] [grabLog]
   - [Agent] [is] [your MID Server]

   Only **agent0.log.0** and **wrapper.log** entries appear. These logs are also accessible in the ~\agent\logs\ file path.

   c. To open a log entry, click the link under the **Created** column.

3. Access the **queue.stats** topic for useful information about individual MID Servers, such as memory and CPU usage data.

   a. Open a MID Server record.

   b. Under **Related Links**, click **MID Statistics**.
   ECC queue records appear in the list using the following filter:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- [Topic] [is] [queue.stats]
- [Agent] [is] [your MID Server]

MID Server dashboard

The MID Server dashboard is a central place for MID Server users to monitor ongoing operations. The dashboard consists of reports and gauges that display information from the MID Server Status table.

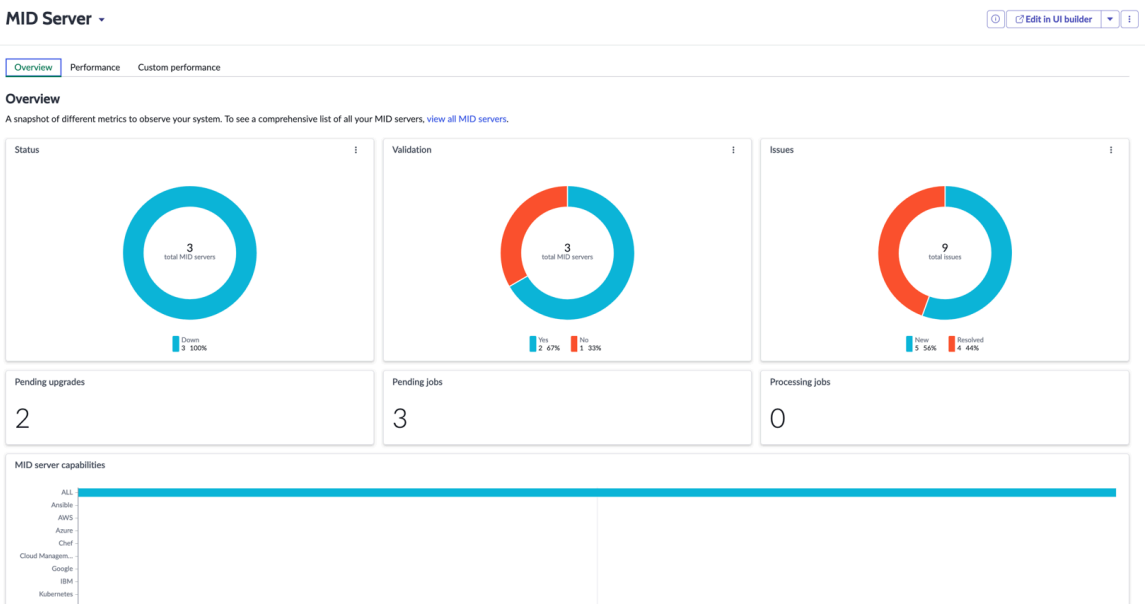
1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

The MID Server Dashboard is available from the **MID Server** > **Dashboard** module.

After upgrading to Discovery Admin Workspace version 1.3.1 (August 2024 Store), you can navigate to **Workspaces** > **Discovery Admin Workspace** > **Insights** and use the enhanced dashboard.

MID Server Overview tab

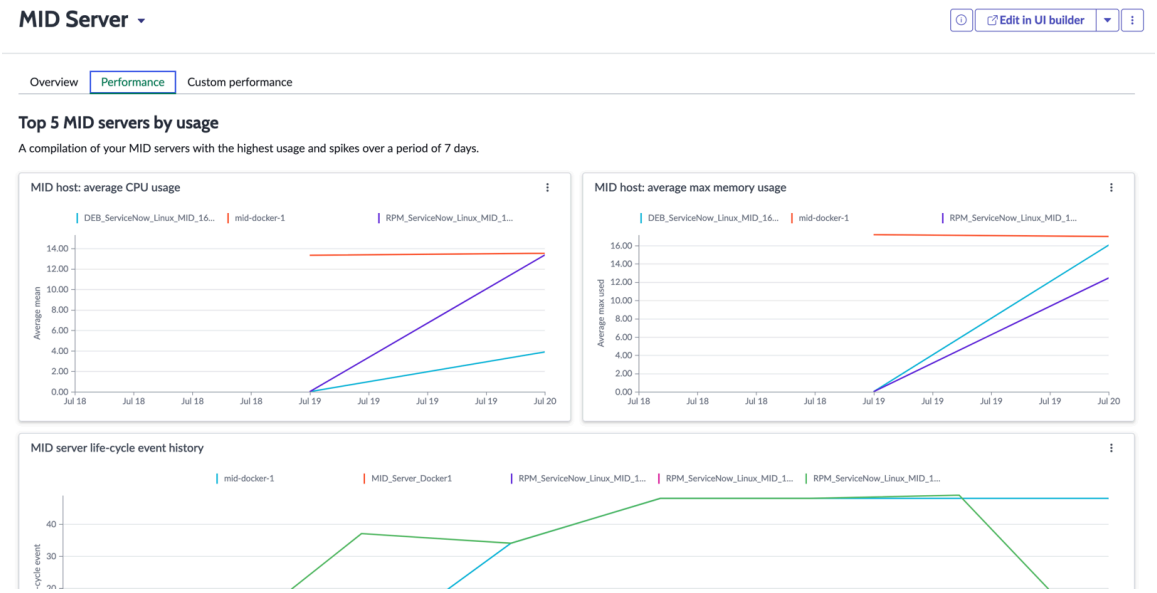
The Overview tab provides graphs showing the status of MID Servers, including any validation issues or pending upgrades and jobs. The tab also displays which MID Servers by capability.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

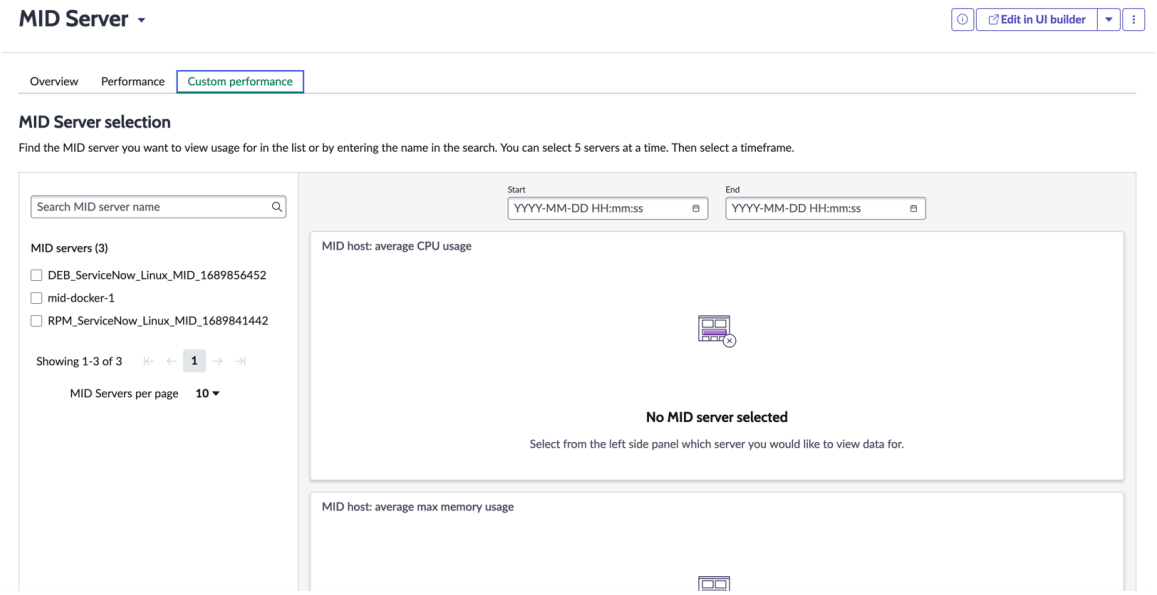
MID Server Performance tab

The Performance tab displays information relating to the MID Server CPU and memory usage, including the life-cycle event history.



MID Server Custom performance tab

The Custom performance tab enables users to set custom MID Server selection criteria to show particular MID Servers in a select time frame.

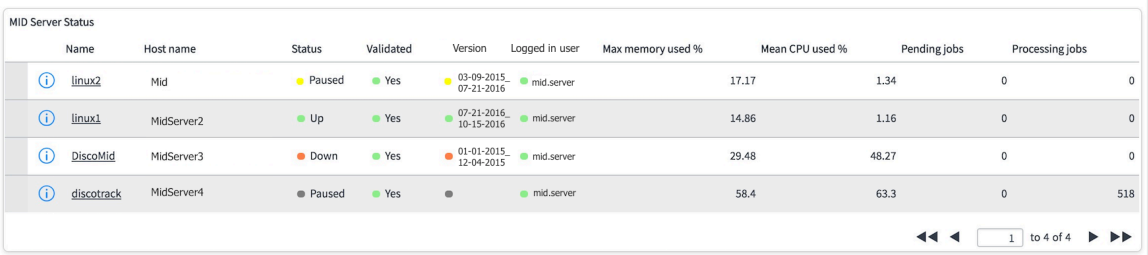


MID Server status gauge

The MID Server Status gauge on the dashboard displays basic information about each MID Server. This information comes from the MID Server Status [ecc_agent_status] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MID Server Dashboard gauge



If the version is not compatible, the MID Server status is not changed to **Down** in the MID Server dashboard. So it might still appear to be processing commands when it actually is not doing so. You must check the MID Server **Version** on the dashboard.

See KB0535181 for additional MID Server troubleshooting information.

The icons in the **Version** column indicates the following:

- **Red**: Incompatible. The MID Server and instance do not belong to the same release. You must upgrade the MID Server and verify that it is not pinned to an older version with the mid.version.override property. The MID Server will not be upgraded until the parameter is cleared.
- **Yellow**: Compatible, but an upgrade is recommended. This indicates that the MID Server version belongs to the same family as the instance, but not the same version.
- **Green**: Compatible. No upgrade necessary.
- **Gray**: Incompatible. The instance cannot detect the version.

Column	Description
Name	The name of the MID Server.
Host name	The name of the system that hosts the MID Server.
Status	The status of the MID Server.
Validated	Whether or not the MID Server was validated.
Max memory used %	The highest percent usage of memory on the system that hosts the MID Server, in the configured sampling interval. The default interval is 30 minutes, but this value is user configurable. See MID Server resource threshold alerts for details.
Mean CPU used %	The average percent usage of CPU on the system that hosts the MID Server, in the configured sampling interval. The default interval is 30 minutes, but this value is user configurable. See MID Server resource threshold alerts for details.
Pending jobs	Number of pending ECC queue jobs for that MID Server.
Processing jobs	Number of processing ECC queue jobs for that MID Server.
Version	The version of the MID Server. An icon indicates the validity of the MID Server: • **Red**: Incompatible. The MID Server and instance do not belong to the same release. You must upgrade the MID Server and verify that it is not pinned to an older version with the mid.version.override property. The MID Server will not be upgraded until the parameter is cleared.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description
	• **Yellow**: Compatible, but an upgrade is recommended. This indicates that the MID Server version belongs to the same family as the instance, but not the same version. • **Green**: Compatible. No upgrade necessary. • **Gray**: Incompatible. The instance cannot detect the version.
User	The login name of the user. An icon indicates the validity of the user: • **Red**: Incompatible. The user does not have themid_server role or the user does not match the value in the mid.instance.username parameter (in the `config.xml` configuration file). Reconfigure the MID Server user and verify that it works. • **Green**: Compatible. The user has the mid_server role and matches the user in the configuration file. **Note:** The user can also have any of the SOAP roles that the mid_server role inherits.

MID Server properties

Properties control the behavior of all MID Servers or a particular MID Server.

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

The MID Server properties are in the MID Server Property [ecc_agent_property] table and can be accessed by navigating to **MID Server** > **Properties**. To set these properties, you must add them, if they are not already present.

MID Server properties

com.glide.closure_max_rows_per_table

Sets the maximum number of rows allowed in a table. This property is not visible by default and must be added.

- Type: integer
- Default value: 200000

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

concurrent.dist.download

Sets the number of concurrent MID Server auto-upgrades permitted by the instance. The default value of this property is 2, which allows the MID Server to use 2 of the 4 semaphores available on the instance for upgrading. If your instance has more than 4 INT semaphores, you can increase the value in this property to allow more concurrent upgrades.

- Type: integer
- Default value: 2

glide.stored_proc.data_type.validation

Stops validation of data types in stored procedure parameters. Use this property if you use Orchestration to run a stored procedure on MySQL, Oracle DB, and MS-SQL databases and you want to avoid performing data type validation. Restart the MID Server service after you change the value of this property.

- Type: true | false
- Default value: false

glide.http.proxy_host

Set the proxy server hostname or IP address.

- Type: string
- Default value: none

glide.http.proxy_port

Set the port number for the proxy server.

- Type: integer
- Default value: none

glide.http.proxy_username

Set the proxy server username. If the proxy server is authenticating using user name and password, enter a value for this property.

- Type: string
- Default value: none

glide.http.proxy_password

Set the proxy server password. If the proxy server is authenticating using user name and password, enter a value for this property.

- Type: string
- Default value: none

mid.discovery.max_ci_count_per_page

Defines the maximum CI count per page.

- Type: integer (bytes)
- Default value: 500

mid.discovery.max_related_count_per_page

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: integer
- Default: 100

mid.discovery.max_relation_count_per_page

Splits the payload based on the number of relations in it.

- Type: integer
- Default: 10000

mid.discovery.max_total_items_size_per_page

Splits the payload based on the size of the items.

- Type: integer
- Default:

mid.aws.sts.assume_role.disable_credential_caching

Set this property to **true** to prevent the caching of temporary credentials for Cloud Discovery. For more information, see Access setup for AWS service accounts Access setup for AWS service accounts.

- Type: true | false
- Default: false

mid.aws.sts.assume_role.credential_ttl_minutes

Set the number of minutes you want to cache temporary credentials for Cloud Discovery. For more information, see Access setup for AWS service accounts Access setup for AWS service accounts.

- Type: integer
- Default: 60

mid.ca.certificate.api.request.retry.count

Indicates how many times the Certificate Import query will retry after the rate limit has occurred.

- Type: integer
- Default: 3

mid.ca.certificate.api.request.retry.interval

Used to delay Certificate import from CAs when the rate limit has occurred.

- Type: integer
- Default: 30000

mid.cloud.discovery.bypass.proxy

This configuration parameter accepts a comma separated list of DNS/IP addresses of proxy servers. The listed proxy servers are bypassed during Cloud Discovery. To bypass proxies on multiple cloud service providers (such as AWS or Azure), a separate MID Server must be set up for each provider. Otherwise, the MID Server proxy configuration is followed normally.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: string
- Default value: none

mid.discovery.file_transfer_protocol

Used to determine the file transfer method used for probes or patterns.

- Type: Choice (SCP or SFTP)
- Default: SCP

mid.discovery.max_pattern_payload_size

Defines the maximum overall payload size for the payload of results that come from patterns.

- Type: integer (bytes)
- Default value: 50000000

mid.discovery.max_payload_size

Specifies the maximum string length of Discovery results that the MID Server sends to the instance. If the Discovery probe results exceed the limit, the MID Server discards them and returns a warning message.

For probes, this applies only to those probes where the *Used by Discovery* field is *true*. For patterns, this applies to the Horizontal Pattern probe.

Set the value to any negative number to disable the payload limit and allow payloads of any size to be sent to the instance. For example, -1.

- Type: integer (bytes)
- Default value: 5000000

mid.discovery.multiprobe.skip_others_on_error

Prevents probes in a multi-probe from iterating through available credentials when another member probe has already failed or timed out. If this property is set to **false**, each probe in the multi-probe attempts to connect to the target with the same invalid credentials. This condition results in longer probe execution times on the MID Server.

This property is not visible by default and must be added to the sys_properties table to change the value.

- Type: true | false
- Default value: true

mid.discovery.aws_ssm.kms_key_name

Using a dedicated key enhances security by verifying that applicative credentials are encrypted and securely retrieved at runtime, without being exposed in plain text. This step is optional and only necessary if you plan to use applicative credentials during discovery. To configure the MID Server to support secure credential handling during SSM Agent discovery, set the **mid.discovery.aws_ssm.kms_key_name** property to the name of the AWS KMS key.

- Type: string
- Default value: none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

mid.discovery.aws_ssm.kms_key_region

Using a dedicated key enhances security by verifying that applicative credentials are encrypted and securely retrieved at runtime, without being exposed in plain text. This step is optional and only necessary if you plan to use applicative credentials during discovery. To configure the MID Server to support secure credential handling during SSM Agent discovery, set the **mid.discovery.aws_ssm.kms_key_region** property to the region where the key is located.

- Type: string
- Default value: none

mid.discovery.aws_ssm.s3_bucket_name

Because the SSM Run Command console has a 24,000-character limit, results that exceed this limit must be stored in and retrieved from an S3 bucket. For Put File commands, the S3 bucket also serves as a transfer point between the MID Server and the AWS environment, enabling file delivery to target devices via SSM. To configure the MID Server to support these S3-based operations, set the **mid.discovery.aws_ssm.s3_bucket_name** property to the name of the S3 bucket used for SSM Agent discovery.

- Type: string
- Default value: none

mid.discovery.aws_ssm.s3_bucket_region

Because the SSM Run Command console has a 24,000-character limit, results that exceed this limit must be stored in and retrieved from an S3 bucket. For Put File commands, the S3 bucket also serves as a transfer point between the MID Server and the AWS environment, enabling file delivery to target devices via SSM. To configure the MID Server to support these S3-based operations, set the bucket's region in the **mid.discovery.aws_ssm.s3_bucket_region** property.

- Type: string
- Default value: none

mid.discovery.aws_ssm.linux.fallback_root_user

When the **glide.discovery.enable_ssm** property is enabled, AWS SSM Discovery on Linux defaults to using the root user for command execution. If you prefer not to configure alternate user credentials on your EC2 instances, you must enable the **mid.discovery.aws_ssm.linux.fallback_root_user** property to allow fallback to root execution. When enabled, it automatically creates a record in the AWS SSM Instance Users [aws_ssm_instance_user_credentials] table with the user name root. However, if you leave this property set to false, you must configure non-root credentials to run Discovery commands.

- Type: true | false
- Default value: false

mid.eccq.max_payload_size

Specifies the maximum string length of a payload that the MID Server sends to the instance. The MID Server verifies the size of the payload before sending it to

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

the instance. If the payload size exceeds the limit, the MID Server discards it and returns an error message in the payload.

- Type: integer (bytes)
- Default value: 20000000

mid.http_classy.allow_credentials_over_http

Enables the HTTP Classify probe to send credentials over the HTTP protocol during discovery.

- Type: true | false
- Default value: false

> ⚠ **Warning:**
> Enabling this setting can expose credentials to security risks, such as man-in-the-middle (MitM) attacks. Therefore, it's strongly recommended to keep this property set to **false** and use HTTPS whenever possible.

mid.install_server.base_uri

Modifying this system property requires maint privileges. The MID Server uses the value provided as the base URL when making requests for update files.

- Type: string
- Default value: https://install.service-now.com

mid.jdbc.datastream.max.record.size

Specifies the maximum record size in KB.

- Type: integer
- Default value: 64
- Maximum value: 128

mid.jdbc.datastream.fail.when.attachement.limit.exceeded

Specifies if the data up to 4GB (four attachments, each of size 1GB) can be retrieved from the RDBMS. By default, a flow or action fails with an error, when there is data of more than 4GB to be retrieved. Set value to `false` to retrieve data of size 4GB without an error.

- Type: string
- Default: true

mid.keystore.max_backups

Specifies the maximum number of backups from manual key store operations through the **manage_certificate** script. If it is 0 or negative, no backup will be made.

- Type: Integer
- Default value: 3

mid.keystore.max_live_backups

Specifies the maximum number of live backups from running MID server. If it is 0 or negative, no backup will be made.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: Integer
- Default value: 2

mid.keystore.backup_overwrite_timespan

Specifies the number of seconds from the current backup time to determine if a the most recent backup in that time span should be replaced by the new one instead of creating a new backup and so removing the oldest backup, should the number of backups exceed the maximum limit.

- Type: Integer
- Default value: 60

mid.log.command_audit.enable

Enables the MID Server command audit log.

- Type: string
- Default value: false

mid.powershell.target_base_dir

Specifies the location of the target base folder used for Discovery using WMI. If another network share is mounted on each Window's target, the folder may be changed by updating this property.

- Type: string
- Default value: admin$\temp

mid.probe.collect_debug_info

An optional property to collect debug information. If this property is set to true, the probe collects credential debug information when it runs and puts that information in the payload of ECC input message. It doesn't affect how Discovery works.

- Type: true | false
- Default value: false

mid.probe.use_legacy_forward_dns

Enables the legacy DNSNameResolver probe and disables the default DNSNameResolver probe. See Probes used by Orchestration for more information.

- Type: true | false
- Default value: false

mid.probe.use_legacy_reverse_dns

Enables the legacy DNS probe and disables the default DNS probe. If you experience problems with the features of the default DNS probe, use this property to disable those features. The default DNS probe's features include being lightweight and faster due to executing in parallel, while the legacy probe is throttled by the MID Server because it executes in serial. The default probe utilizes DNS lookup by the MID Server host OS to make use of the OS maintained DNS cache, while the legacy probe does not. Consequently, after a DNS lookup by the default probe fails in Windows systems, the OS also tries looking up by NETBIOS name.

- Type: true | false
- Default value: false

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

mid.process_flow.log_listener.max_size

Sets the maximum size in bytes of memory available to save log messages for Workflow Studio actions running on a MID Server. The MID Server stores up to the limit in memory and discards additional log messages, then sends the messages back to the instance along with the execution plan.

- Type: integer (bytes)
- Default value: 10485760

mid.property.jdbc_operations

Tells the JDBCOrchestrationProbe what JDBC operations it is allowed to execute. Edit this property value to allow JDBC Orchestration activities to perform more operations. All operations are comma separated. Select a MID Server in the **MID server** field to define specific operations for that MID Server, or leave the field empty to apply the list of operations to all MID Servers. This property requires the Orchestration plugin.

- Type: string
- Default value: select,update,insert,delete,show,create,describe,begin,if,end,not,exists

mid.property.jms.command.allowed_factory_names

Comma delimited list of Java Messaging Service (JMS) connection factories that the MID Server requires for a custom JMS activity or action. This property requires the Orchestration plugin.

- Type: string
- Default value: connectionFactory, queueConnectionFactory, topicConnectionFactory

mid.property.ssh.use_snc

Enables the use of the SNCSSH client for Discovery and Orchestration. Change this property to **false** to use J2SSH. This property applies to all MID Servers connected to the instance.

- Type: true | false
- Default value: true

mid.property.powershell.use_base64_password

If the Credential is set to be specific to certain MID Servers, then the property can also be set to those same MID Servers. Leaving the MID Servers field empty will apply to all MID Servers.

- Type: true | false
- Default value: false

mid.sa.prefer_powershell

Enables MID Server to use PowerShell Remoting.

Note:
It is not recommended to change this property as it is being deprecated.

- Type: True | False
- Default value: true

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

mid.sa.ssh.use_sncssh

Toggles SSH between non-interactive and interactive modes. True corresponds to non-interactive mode and allows probes to open sessions with the device without waiting for a prompt. False corresponds to interactive mode, which requires interactive sessions with the device for network devices and servers.

- Type: True | False
- Default value: true

mid.sa.windows.allowable_failures

Specifies the number of allowable failures before the MID Server stops executing the pattern. Once the limit is reached, the next failure will terminate the pattern. Once the limit is reached, the next failure will terminate the pattern. A failure occurs when a PowerShell command can't complete successfully due to issues such as authentication failure, command timeout, or command execution exceptions.

- Type: integer
- Default value: 2
- Values:
  - 0: The first failure will terminate the pattern immediately.
  - 1: The first failure is tolerated; the second failure will terminate the pattern.
  - 2: Two failures are tolerated; the third failure will terminate the pattern.
  - -1: no maximum limit on failures; the pattern continues regardless of the number of failures.

mid.servicewatch.max_concurrent_connections

Defines the maximum number of concurrent tasks sent to an individual host by a single MID Server.

- Type: integer
- Default value: 7

mid.shazzam.regulator.interval_ms

Sets the interval, in milliseconds, in which Shazzam can launch packets.

- Type: integer
- Default value: 1

mid.shazzam.regulator.packets_per_interval

Sets the number of packets that Shazzam can launch in the time interval specified by the mid.shazzam.regulator.interval_ms property.

- Type: integer
- Default value: 1

mid.shazzam.threads

Specifies the number of concurrent threads that Shazzam uses. Setting this or the mid.shazzam.max_scanners_per_thread parameter to 0 disables Shazzam multi-thread optimization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: Integer
- Default value: 5

mid.shazzam.max_scanners_per_thread

Specifies the number of concurrent scanners processed by each Shazzam thread. Setting this or the mid.shazzam.threads parameter to 0 disables Shazzam optimization.

- Type: Integer
- Default value: 100

mid.sm.discolog.max_log_size

Limits the length of the log statements in the Horizontal Discovery Log. If the results are truncated, the **Command results** reports, "Result is larger than [value] characters and was truncated by the logger."

- Type: integer (characters)
- Default value: 1000

mid.sm.discolog.max_object_size

Limits the length of the object in the Horizontal Discovery Log. Objects in the log statement are truncated to the number of characters set by this property's value. This property only affects the object character size in the Horizontal Discovery Log. The following message appears if an object is limited by this property "The max object size reached the maximum limit of [value]. To adjust this use the mid property mid.sm.discolog.max_object_size."

- Type: integer (characters)
- Default value: 5000

mid.snmp.use_getbulk

Specifies whether to use GETBULK to receive a large amount of data in batches. This can be used to globally configure all MID servers.

- Type: true | false
- Default value: true

GETBULK can also be set at the probe level or for an individual MID Server. Settings are listed in the order of precedence:

- SNMP probe parameter
- MID Server configuration parameter
- MID Server properties

mid.ssh.algorithms.kex

Modifies the Key Exchange SSH algorithm priority list. The property accepts a comma separated lists with operators. The first name in the list is highest priority, last name in list is lowest priority. Adding a comma separated list without any operators replaces the default algorithm list. For more information, see MID Server SSH cryptographic algorithms.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: string
- Default value: ecdh-sha2-nistp256,ecdh-sha2-nistp384,ecdh-sha2-nistp521,diffie-hellman-group-exchange-sha256,diffie-hellman-group14-sha256,diffie-hellman-group16-sha512,diffie-hellman-group14-sha1,diffie-hellman-group1-sha1,diffie-hellman-group-exchange-sha1

mid.ssh.algorithms.host_key

Modifies the Host Key SSH algorithm priority list. The properties accept comma separated lists with operators. The first name in the list is highest priority, last name in list is lowest priority. Adding a comma separated list without any operators replaces the default algorithm list. For more information, see MID Server SSH cryptographic algorithms.

- Type: string
- Default value: ecdsa-sha2-nistp256,ecdsa-sha2-nistp384,ecdsa-sha2-nistp521,rsa-sha2-256,rsa-sha2-512,ssh-rsa,ssh-dss

mid.ssh.algorithms.cipher

Modifies the Cipher SSH algorithm priority list. The properties accept comma separated lists with operators. The first name in the list is highest priority, last name in list is lowest priority. Adding a comma separated list without any operators replaces the default algorithm list. For more information, see MID Server SSH cryptographic algorithms.

- Type: string
- Default value: aes128-ctr,aes192-ctr,aes256-ctr,3des-ctr,aes128-cbc,aes192-cbc,aes256-cbc,3des-cbc

mid.ssh.algorithms.mac

Modifies the MAC SSH algorithm priority list. The properties accept comma separated lists with operators. The first name in the list is highest priority, last name in list is lowest priority. Adding a comma separated list without any operators replaces the default algorithm list. For more information, see MID Server SSH cryptographic algorithms.

- Type: string
- Default value: hmac-sha2-256,hmac-sha1,hmac-sha2-512,hmac-sha1-96,mac-md5-96,hmac-md5

shazzam.chunk_size

Maximum number of IP addresses Shazzam can scan in parallel. This property primarily controls outbound port consumption.

- Type: integer
- Default value: 100

mid.use_net_tools

Enables or disables the use of net-tools commands during discovery of devices running on the Linux operating system. Starting from Quebec, ITOM Visibility supports the iproute2 commands for discovery. By default, ITOM Visibility and discovery patterns first use net-tools commands, and only then, as a fallback, may use iproute2 commands. If all Linux-based devices and applications in your IT network use iproute2 commands, disable net-tools commands to make the discovery process more efficient.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: true | false
- Default value: true

mid.servicewatch.use_full_linux_netstat_path

Controls if the *netstat* command is executed with its full installation path. This command lists open ports on Linux servers during the process detection phase of the top-down discovery.

- Type: true | false
- Default value: true

mid.servicewatch.num_paths_linux_netstat_to_check

Define the maximum number of installation paths to use during discovery of Linux servers. This property is relevant when you run the top-down discovery on Linux servers with several netstat installation paths, and the *mid.servicewatch.use_full_linux_netstat_path* property is set to true.

The top-down discovery attempts to execute the *netstat* command using each of these installation paths. The result of the first successful execution is used to determine the list of open ports.

- Type: true | integer
- Default value: 5

mid.servicewatch.use_full_linux_ss_path

Controls if the *ss* command is executed with its full installation path. This command lists open ports on Linux servers during the process detection phase of the top-down discovery.

- Type: true | false
- Default value: false

mid.servicewatch.num_paths_linux_ss_to_check

Define the maximum number of installation paths to use during discovery of Linux servers. This property is relevant when you run the top-down discovery on Linux servers with several ss installation paths, and the *mid.servicewatch.use_full_linux_netstat_path* property is set to true.

The top-down discovery attempts to execute the *ss* command using each of these installation paths. The result of the first successful execution is used to determine the list of open ports.

- Type: true | integer
- Default value: 5

Create a MID Server property

Use a MID Server property to control either the behavior of all MID Servers or a particular MID Server.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

You set MID Server properties to override MID Server parameters. Configure MID Server properties in the MID Server plugin. Do not configure MID Server properties in the **glide.properties** file that is located in the properties folder of the agent. The **glide.properties** file gets overwritten during the upgrade process.

Procedure

1. Navigate to **All** > **MID Server** > **Properties**.
2. Click **New**.
3. Fill in the fields, as appropriate (see table).

MID Server properties fields

Field	Description
Name	Enter the property name.
Value	You can enter the value you want the property to have. **Note:** If you are amending JDBC operations through the mid.property.jdbc_operations properties, you can enter verbs like BEGIN, END, IF, or common PL/SQL block statements. This will assist in being able to run CREATE or ALTER statements. You might have to restart the MID server before running some of the statements.
MID Server	Leave this field blank to set a MID Server property that affects all MID Servers. To set a MID Server property for a particular MID Server , select the MID Server.

4. After setting any MID Server properties, restart the MID Server to ensure the properties sync with the instance.

MID Server parameters

Parameters control the behavior of a particular MID Server and have lower precedence than MID Server properties.

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To add a parameter to a MID Server, see Add a MID Server parameter.

Important:
Changes to parameters only take effect when the MID Server is started (or restarted).

Note:
The value of any MID Server parameter in the config.xml file can be encrypted. See Encrypt or decrypt MID Server configuration file values for more information.

Required parameters

Note:
Using special characters in an XML configuration file requires you to encode them.

url

Specifies the URL to the associated instance. Normally the URL is similar to https://instance.service-now.com, where you replace instance with the instance name. If you host your own instance, use the URL set by your organization.

- Type: string
- Default value: none

mid_sys_id

Records the MID Server record's unique identifier. This parameter should be empty when you initially configure a MID Server. Do not change the value.

- Type: string
- Default value: automatically set (GUID)

name

Use this parameter to supply a name that is meaningful for you. If you do not supply this parameter, the MID Server uses the default value. A set of business rules synchronizes the name in the configuration file with the name in the MID Server record. The business rules ensure that changing the name in one location also changes the name in the other location.

- Type: string
- Default value: YOUR_MIDSERVER_NAME_GOES_HERE

mid.instance.username or glide.glidesoap.username

If the ServiceNow instance has authentication enabled, as it is by default, set this parameter to define the user name the MID Server should use to log in to the instance. This user should have the mid_server role on the ServiceNow instance in order to access necessary tables and fields. You can use this parameter to define user names with special characters.

- Type: string
- Default value: none

mid.instance.password or glide.glidesoap.password

If your ServiceNow instance has authentication enabled, as it is by default, set this parameter to define the password the MID Server should use to log in to the instance. You can use this parameter to define passwords with special characters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: string
- Default value: none

CIM parameters

mid.cim.batch.size

Specifies the maximum number of messages sent at once to a CIM server.

- Type: integer
- Default value: 1

mid.cim.request.interval

Specifies the number of milliseconds to wait between requests to the same Common Information Model Object Manager (CIMOM).

- Type: integer
- Default value: 0

mid.cim.host.connection.limit

Specifies the maximum number of simultaneous connections to each CIMOM. A value of zero disables simultaneous connections.

- Type: integer
- Default value: 0

Connection parameters

glide.mid.fast.responses

Instructs the MID Server to try sending messages to the instance as soon as they are ready. Normally the MID Servers end messages to the ServiceNow instance serially (that is, one message at a time). Since many probes can be run in parallel, there can be multiple messages transmitted simultaneously to the instance. Setting this parameter to **true** may decrease the time between a probe's completion and its response arriving at the instance. However, the multiple simultaneous messages consume resources, decreasing the overall instance responsiveness. If there are communications problems, this parameter's value can also cause a logjam on the MID Server, as threads normally used for running probes may become consumed for sending messages. Generally, leave this parameter out of your configuration. Setting it to **true** is meaningful only under very special circumstances.

- Type: true | false
- Default value: false

glide.mid.max.sender.queue.size

Places an upper limit on how large the queue is allowed to get. The MID Server starts deleting queued messages if this limit is exceeded. When the MID Server generates messages to the ServiceNow instance faster than it can send them, it queues them temporarily on the file system of the MID Server's host. This queue is normally quite small, and is completely emptied as soon as the MID Server processing slows for a short period. However, this queue can grow in size when there are communication problems between the MID Server and the instance, and especially if there is an integration running on the MID Server.

The parameter is of the form {number}{multiplier}, where {number} is any positive decimal number including non-integers, and the optional multiplier is any spelling

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

of bytes, kilobytes, megabytes, gigabytes, or terabytes (only the first character is tested, and the test is case-insensitive). The default multiplier is bytes. White space is liberally tolerated. The following strings all represent valid parameters: "1000000000", "0.5m", "5 GB", "7.67gigas", "145.69392 meg", and "1.1 terra".

- Type: string
- Default value: 0.5 GB

instance.date.format

Specifies the format the instance uses for dates and times. The primary impact of setting this parameter is to allow the MID Server to correctly refresh its start and stop times on the MID Server record in ServiceNow. The format of this date/time string is identical to that used by the Java SimpleDateFormat class.

- Type: string (Date format)
- Default value: yyyy-MM-dd HH:mm:ss

mid.disable_amb

Disables the Asynchronous Message Bus (AMB) notifications for new ECC queue output messages. For more information, see the Asynchronous Message Bus section in Asynchronous Message Bus. When AMB is enabled the MID Server uses a different default polling interval than when AMB is disabled. See the **mid.poll.time** parameter for more details. If you set a polling interval with the **mid.poll.time** parameter, the MID Server uses that value whether or not the AMB client is enabled.

- Type: true | false
- Default value: false

mid.https.truststore.password

Sets the trustStore password that is required for HTTPS connections with the Asynchronous Message Bus (AMB) Client.

- Type: string
- Default value: none

mid.https.truststore.path

Path to the trustStore to be used by the MID Server for TLS transactions (Asynchronous Message Bus (AMB) Client). Add this parameter only if you want to change the default path.

- Type: string
- Default: Path to the JRE trustStore bundled with the MID Server

mid.instance.skip_basic_auth

Allows the MID Server to connect to an instance using cookies instead of basic authentication credentials. When set to **true**, it uses cookies first. However, if the connection fails, the MID Server will try to connect again using basic authentication credentials.

- Type: true | false
- Default value: true

mid.jmx.enabled

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Enables a JMX server on the MID Server, which exposes some management information to JMX consoles. Implementing JMX requires additional configuration of the Java runtime environment. Setting this parameter to **true** is only recommended for those with detailed knowledge of the Java security architecture and a specific need for JMX.

- Type: true | false
- Default value: false

mid.poll.time

Sets the default MID Server polling interval (in seconds). The polling interval is the amount of time the MID Server waits before checking the ECC queue for work when the MID Server is not busy. For more information, see the Asynchronous Message Bus section in.

When **mid.disable.amb** is set to false (the default setting), see the Asynchronous Message Bus section in Asynchronous Message Bus for more information about how **mid.poll.time** is used.

When **mid.disable.amb** is set to true, polling occurs on a fixed **mid.poll.time** interval, but polling switches to using **mid.poll.time.standard** (5 seconds by default) when the MID Server is busy.

- Type: integer (seconds)
- Default value: 40 when **mid.disable.amb** is false, or 5 when **mid.disable.amb** is true.

mid.probe.wait.resources

Indicates whether probe execution is delayed until resources are available. Used to enable MID Server Resource Reservation.

Note:
Requires MID Server restart.

- Type: true | false
- Default value: true

mid.property.long_runner

Identifies the name of a script include that manages long running commands.

Note:
This property is applicable till the Rome version only. If your instance is of a later version, you must configure the system property, *`glide.eccprobe.longrunner.class`*.

- Type: string
- Default value: LongRunner

threads.interactive.max

Sets the maximum number of interactive worker threads that can run simultaneously in the interactive thread pool. See Set MID Server Thread Use.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: integer
- Default value: 10

threads.expedited.max

Sets the maximum number of expedited worker threads that can run simultaneously in the expedited thread pool. See Set MID Server Thread Use.

- Type: integer
- Default value: 20

threads.max

Sets the maximum number of standard worker threads that can run simultaneously in the standard thread pool. This parameter provides direct control over what CPU resources the MID Server consumes on the computer that hosts it. See Set MID Server Thread Use.

- Type: integer
- Default value: 25

> **Important:**
> You can set threads.max as high as 200, however, this setting may need to be changed depending on the OS. For example, Windows-based MID Servers running Discovery uses Powershell which is resource intensive. In this case, you may exhaust the CPU power of the host machine with just 50 threads count.

Credentials parameters

mid.aws.instance_profile_name

Name of the AWS IAM role configured on the EC2 instance. When configured, the MID Server uses the temporary credentials granted to this role by the AWS instance profile to Discover cloud resources.

- Type: string
- Default value: None (User must provide a non-blank value)

mid.credentials.provider

Specifies the Java class name of the credentials provider.

- Type: string
- Default value: com.service_now.mid.creds.standard.StandardCredentialsProvider

mid.secure_credentials.key_pairs.provider

Class that the MID Server uses to generate secure key pairs.

- Type: string
- Default value: com.service_now.mid.keypairs.provider.standard.StandardKeyPairsProvider

Debug parameters

debug.logging

[Deprecated] Specifies whether to enable logging of MID Server events and messages (both sent and received). Normally this parameter is only used by

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

developers, but it is occasionally useful when troubleshooting a problem. Be aware that setting this parameter to **true** causes intensive logging on the MID Server, potentially using considerable disk space.

- Type: true | false
- Default value: false

This parameter has been replaced by the *mid.log.level* parameter.

debug

[Deprecated] Specifies whether to enable debug logging on the MID Server. Normally this parameter is only used by developers, but it is occasionally useful when troubleshooting a problem. Be aware that setting this parameter to **true** causes intensive logging on the MID Server, potentially using considerable disk space.

- Type: true | false
- Default value: false

This parameter has been replaced by the *mid.log.level* parameter.

file.probe.template.debug

Specifies whether to debug file probe templates.

- Type: true | false
- Default: false

mid.cim.debug

Specifies whether to enable debug logging for CIM, WBEM, SLP, or SMI-S.

- Type: true | false
- Default value: false

mid.ssh.debug

Enables SSH debug information in the log file. The parameter usage depends on whether the ServiceNow SSH client is enabled.

When the ServiceNow SSH client is enabled, the parameter functions as follows:

- Type: string
- Default value: false

  The following string values are valid for the ServiceNow SSH client:

  - true: Enables SSH debug information in the log file.
  - false: Disables SSH debug information in the log file.
  - <IP Addresses>: Specify which IP ranges to enable SSH debug information in the log file. You can enter IP addresses in the following formats:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- An IP range defined by a slash and the number of bits in the subnetwork. For example, the string 10.10.10.0/24 scans 24 bits of IP addresses from 10.10.10.0 to 10.10.10.254.
- An IP range defined by a dash. For example, the string 10.10.11.0-10.10.11.165 scans the IP addresses from 10.10.11.0 to 10.10.11.165.
- A comma-separated list of specific IP addresses. For example the string 10.10.11.200,10.10.11.235 scans the IP addresses 10.10.11.200 and 10.10.11.235.

- deferred: Logs SSH debug information in memory unless an error or warning occurs. If an error or warning occurs, the platform publishes the debug information to the log file. This ensures that only the part of the log file pertaining to the error or warning is recorded. If no error or warning is detected, the platform deletes the unused log data from memory when the session closes. Each session stores up to 1000 log messages. If the session exceeds 1000 log messages, the deferred log discards the oldest log message to make room for the newest log message.

When the ServiceNow SSH client is disabled, the parameter enables or disables SSH debug information in the log file:

- Type: true | false
- Default value: false

Note:
The MID Server parameter **mid.ssh.debug** only affects SNCSSH and J2SSH. To enable Maverick client debug logging, set the MID Server configuration parameter **mid.log.level** to `debug, com.maverick=debug`.

mid.log.level

Specifies the logging level for the MID Server. Possible values are:

- debug
- info
- warn
- error

Note:
Values are case insensitive.

- Type: string
- Default value: info

mid.http.idle_connection_monitor.debug

Enables debug logging for the Idle Connection Monitor.

- Type: true | false
- Default value: false

DNS parameters

mid.dns_scan.regulator.interval_ms

Specifies the interval between DNS scans in milliseconds.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: integer
- Default value: 10

mid.dns_scan.regulator.packets_per_interval

Specifies the number of regulator packets per DNS scan.

- Type: integer
- Default value: 1

mid.dns_scan.default_name_servers

Specifies the host names or IP addresses of the default name servers.

- Type: string
- Default value: none

mid.dns_scan.default_name_servers

Specifies the host names or IP addresses of the default name servers.

- Type: string
- Default value: none

mid.dns_scan.additional_name_servers

Specifies the host names or IP addresses of any additional name servers.

- Type: string
- Default value: none

mid.dns_scan.load_balancing_enable

Specifies whether to enable load balancing of name servers.

- Type: true | false
- Default value: false

mid.probe.use_legacy_forward_dns

Enables the legacy DNSNameResolver probe and disables the default DNSNameResolver probe. See Probes used by Orchestration for more information.

- Type: true | false
- Default value: false

mid.probe.use_legacy_reverse_dns

Enables the legacy DNS probe and disables the default DNS probe. If you experience problems with the features of the default DNS probe, use this parameter to disable those features. The default DNS probe's features include being lightweight and faster due to executing in parallel, while the legacy probe is throttled by the MID Server because it executes in serial. The default probe utilizes DNS lookup by the MID Server host OS to make use of the OS maintained DNS cache, while the legacy probe does not. Consequently, after a DNS lookup by the default probe fails in Windows systems, the OS also tries looking up by NETBIOS name.

- Type: true | false
- Default value: false

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Event Management parameters

mid.probe.event.bulk_size

Specifies the maximum size of an event payload, in MB.

- Type: integer
- Default value: 120

mid.probe.event.wait_time

Waiting period on an empty queue for sending events.

- Type: integer
- Default value: 1000

mid.probe.event.send.enabled

Enables or disables the sending of events.

- Type: true | false
- Default value: true

mid.probe.event.queue.max_size

Specifies the maximum size permitted for the event queue before incoming events are rejected.

- Type: integer
- Default value: 100,000

mid.probe.event.max.retry_time

The maximum number of seconds MID retries sending events.

- Type: integer
- Default: 1800

mid.probe.event.queue.use_bulk

Specifies whether events are sent to the server singly or in bulk. If this parameter evaluates to **true** then events are sent to the server in bulk.

- Type: true | false
- Default value: true

mid.probe.event.suppress.whitespaces

Allows line breaks in description fields for multi-line events. Apply this parameter to each MID Server used with event connector instances. Choices are:

all

This setting removes all whitespaces.

leave_as_is

This setting keeps all whitespaces.

keep_newline

This setting keeps only new_line and removes all other whitespaces.

- Type: string
- Default: all

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

mid.em.metric.metric_to_ci_map_limit

Specifies the maximum number of active metrics allowed per CI map.

- Type: integer
- Default value: 200,000

mid.em.metric_binding_timeout_seconds

Specifies the number of seconds to wait before resending unhandled events

- Type: integer
- Default value: 300

mid.em.metric_binding_timeout_max_seconds

Specifies the maximum number of seconds to wait before resending unhandled events.

- Type: integer
- Default value: 10800

mid.em.metric_max_elapsed_time_before_refresh

Specifies the maximum number of seconds before the metric source type cache is refreshed in memory.

- Type: integer
- Default value: 60

mid.em.matric_max_sql_string_length_for_types

Specifies the maximum length of the string (composed of types) used for an SQL command

- Type: integer
- Default value: 30000

mid.em.statistics_report_perioon_sec

Specifies the period, in seconds, between statistics reports to the instance. Use **0** to disable reporting. This parameter requires a restart.

- Type: integer
- Default value: 60

mid.em.metric_connector_max_run_time_seconds

Specifies the maximum number of seconds to collect metrics in every cycle.

- Type: integer
- Default value: 300

mid.em.metric_connector_history_min

Specifies the number of minutes to go back in history to retrieve metrics.

- Type: integer
- Default value: 180

mid.em.metric_event_logging

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Specifies the level of metric and event logging. Choices are:

- none
- all
- events
- metrics
- metrics:<filter>
- events:<filter>

- Type: string
- Default value: none

mid.em.metric_connector_late_arrivals_delay

Specifies the number of seconds to delay when collecting metrics.

- Type: integer
- Default value: 30

FTP connection parameters

mid.ftp.max_pool_size

Specifies the maximum size of the FTP Connection Pool, in megabytes.

- Type: integer
- Default value: 25

mid.ftp.max_per_target

Specifies the maximum number of the FTP connections per target.

- Type: integer
- Default value: 5

mid.ftp.max_conn_idle_time

Specifies the maximum amount of time, in milliseconds, that an FTP connection can sit idle in the pool.

- Type: integer
- Default value: 300000

mid.filesystem.max.ls

Specifies the maximum number of files that can be returned in the filesystem list directory command.

- Type: integer
- Default value: 10000

Logging parameters

disable_monitors

Specifies whether to disable the MID Server from actively checking for monitors on the instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: true | false
- Default value: true

mid.show.queries

Instructs the MID Server whether to log details about every query it makes to the ServiceNow instance. Typically this parameter is only used by developers, but it is occasionally useful when troubleshooting a problem. Be aware that setting this parameter to **true** causes intensive logging on the MID Server, potentially using considerable disk space.

- Type: true | false
- Default value: false

disable.remote.logging

Prevents the MID Server from logging any information to the MID Server log on the instance. Relatively little information is logged on the instance in any case, but setting this parameter to **true** eliminates all logging to the instance.

- Type: true | false
- Default value: false

disable.status

Prevents the MID Server from sending a status report to the instance every 10 minutes.

- Type: true | false
- Default value: false

mid.file_cleaner.disabled

Files and empty folders within the following folders may be deleted by this MID File Cleaner. Files last accessed more than 30 days ago are deleted. It runs on start-up, and then every 24 hours after that. You can force the File Cleaner to run by restarting the MID Server service.

Folders/files cleaned:

- `\agent\import`
- `\agent\export`- Used by the Export Set feature.
- `\agent\work\monitors\ECCSender\output_error` - Used for ECC input payloads that cannot be inserted for any reason
- `\agent\work\monitors\ECCSender\output_oversize` - Used for saving copies of payloads that are not sent to the instance because they are larger than the limit set by **mid.eccq.max_payload_size**, which defaults to 20000000 bytes
- `\agent\logs`- Specifically JFR Dumps

- Type: true | false
- Default value: false

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

mTLS protocol parameters

Add these parameters to the `config.xml` file in the `/agent` directory, in the MID Server installation directory.

mid.httpclient.protocol.myprotocol.path

Specifies the path to the keystore. The path can be absolute or relative. In the parameter name, make sure you replace **myprotocol** with the name of your protocol.

Type: String.

mid.httpclient.protocol.myprotocol.port

Specifies the port number for the protocol. In the parameter name, make sure you replace **myprotocol** with the name of your protocol.

Type: String.

mid.httpclient.protocol.myprotocol.password

Specifies the mTLS credential password. In the parameter name, make sure you replace **myprotocol** with the name of your protocol. Add the encryption attribute *`secure="true"`* to encrypt the password using standard MID Server encryption.

Type: String.

Pattern parameters

mid.parsing.max_field_size

Sets the maximum character length of strings stored as temporary variables while patterns are run. Strings longer than this parameter's value are truncated to equal the value. Use the parameter to increase the limit when parsing longer strings.

> ⚠ **Warning:**
> Exceeding the max field size limits of the SQL database implementation cause errors.

- Type: integer
- Default value: 1024

mid.sa.discovery.pattern_string_attributes.deduplicate

Reduces memory consumption for pattern execution context attributes by eliminating duplicate strings.

- Type: true | false
- Default: true

Proxy server parameters

mid.instance.use_proxy or mid.proxy.use_proxy

If your MID Server must go through a web proxy to access the ServiceNow instance, set this parameter to **true** to instruct the MID Server to use the proxy. You must also set the proxy server's host and port, and perhaps the user name and password as well.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: true | false
- Default value: false

mid.proxy.host

If your MID Server must go through a web proxy to access the ServiceNow instance, set this parameter to define the proxy's host.

- Type: string
- Default value: none

mid.proxy.password

If your MID Server must go through a web proxy to access the ServiceNow instance, and your proxy requires a password, set this parameter to define that password.

- Type: string
- Default value: none

mid.proxy.port

If your MID Server must go through a web proxy to access the ServiceNow instance, set this parameter to define the proxy's port.

- Type: integer (0-65535)
- Default value: 80

mid.proxy.username

If the MID Server must go through a web proxy to access the ServiceNow instance, and the proxy requires a user name, set this parameter to define that user name.

- Type: string
- Default value: none

Request timeout override parameters

mid.sa.cloud.request_timeout

Sets the timeout in milliseconds for cloud requests. This parameter overrides the **glide.http.timeout** system property, which specifies the maximum number of milliseconds to wait before an outbound REST transaction times out.

- Type: integer
- Default value: 30000

mid.http_classy.request_timeout

Sets the timeout in milliseconds for HTTP classification requests with the HTTP - Classify probe. This parameter overrides the **glide.http.timeout** system property, which specifies the maximum number of milliseconds to wait before an outbound transaction times out.

- Type: integer
- Default value: 30000

Security parameters

mid.windows_host.file_permissions.allow_list

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sets an inclusion list for Windows file permissions enforcement to improve security. The parameter takes a string of comma separated group names, user names, and SIDs. Group and user names must follow SAM account naming requirements. Domain accounts can be specified by using the SID.

- Type: string (comma separated group and user names)
- Default value: None

mid.windows_host.file_permissions.enforce

Enables the MID Server to use Windows file permissions enforcement to improve security. Setting this parameter to **false** will prevent the MID Server from updating the file permissions inclusion list, but will not revert the file permissions.

- Type: true | false
- Default value: true

mid.httpclient.tls.verify_revoked_certificate.verify_issuer

Controls whether the issuer must be present during certificate revocation (OCSP) checks. By default, when certificate revocation checking is enabled, the issuer for each certificate must be present. If the parameter is set to **false**, the MID Server walks the returned certificate chain and checks each certificate for revocation; however, the request will not fail if a issuer is missing from the chain.

Note:

- This property affects only OCSP revocation checks. It does not affect TLS certificate chain validation.
- If *Certificate Chain Check* is enabled in MID Certificate Check Policies, a complete and valid certificate chain, from the returned certificates to those present in the local cacerts, is enforced regardless of the *mid.httpclient.tls.verify_revoked_certificate.verify_issuer* parameter setting.

- Type: boolean
- Default value: true

Shazzam parameters

mid.shazzam.regulator.interval_ms

Sets the interval, in milliseconds, in which Shazzam can launch packets. This parameter works with the *mid.shazzam.regulator.packets_per_interval* parameter to set the number of packets allowed in this interval. By default, Shazzam launches one packet each millisecond.

- Type: integer
- Default value: 1

mid.shazzam.regulator.packets_per_interval

Sets the number of packets that Shazzam can launch in the configured time interval. This parameter works with the *mid.shazzam.regulator.interval_ms* parameter, which sets that interval. By default, Shazzam launches one packet each millisecond.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: integer
- Default value: 1

mid.shazzam.chunk_size

Specifies the maximum number of IP addresses that Shazzam scans in parallel. This parameter primarily controls outbound port consumption.

- Type: integer
- Default value: 100

mid.shazzam.threads

Specifies the number of concurrent threads that Shazzam uses. Setting this or the mid.shazzam.max_scanners_per_thread parameter to 0 disables Shazzam multi-thread optimization.

- Type: integer
- Default value: 5

mid.shazzam.max_scanners_per_thread

Specifies the number of concurrent scanners processed by each Shazzam thread. Setting this or the mid.shazzam.threads parameter to 0 disables Shazzam multi-thread optimization.

- Type: integer
- Default value: 500

SNMP configuration parameters

mid.snmp.enable_auto_public

Specifies whether to use the SNMP public community string automatically if no other SNMP credentials were successful.

- Type: true | false
- Default value: true

mid.snmp.request.timeout

Specifies the timeout value for the first OID request, in milliseconds. For subsequent requests (for example, table OIDs), the *mid.snmp.session.timeout configuration* parameter (see below) takes effect.

Note:
You can override this parameter with the *timeout* SNMP probe parameter.

- Type: integer
- Default value: 1500

mid.snmp.session.timeout

Specifies the timeout value for subsequent OID request, in milliseconds. SNMP communication is stateless and does not have a session or connection in the normal sense. The system regards a positive response from the first OID request as a sign that it should expect prompt responses to subsequent requests. While the default is short, it may be useful to increase this parameter value to the same value as that used for *mid.snmp.request.timeout*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
You can override this parameter with the *establish_session_timeout* SNMP probe parameter.

- Type: integer
- Default value: 500

mid.snmp.use_getbulk

Specifies whether to use GETBULK to receive a large amount of data in batches. This can be used to configure an individual MID Server.

- Type: true | false
- Default value: True

GETBULK can also be set at the probe level or globally for all MID servers. Settings are listed in the order of precedence:

- SNMP probe parameter
- MID Server configuration parameter
- MID Server properties

mid.snmp.use_snmp4j

Use the Snmp4j library for SNMP communication. This is a strict requirement for SNMPv3. This parameter should only be set to **false** based on advice from Customer Service and Support.

- Type: true | false
- Default value: true

mid.snmp.use_snmp_v1_v2c

Attempt communication using the SNMPv1 and SNMPv2c protocol versions. It may require configuration of SNMP community credentials. This parameter is an alternative and **not a strict requirement for SNMPv3.**

- Type: true | false
- Default value: true

mid.snmp.use_snmp_v3

Attempt communication using the SNMPv3 protocol version. Requires configuration of SNMPv3 credentials.

- Type: true | false
- Default value: true

SSH Discovery parameters

By default, the MID Server is configured to search for SSH commands in the following paths and the logged-on user's default paths:

- /usr/sbin
- /usr/bin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- /bin
- /sbin

mid.connection_cache

Specifies whether to cache connections. Set to **false** to disable connection caching. This parameter applies to SSH connections only.

- Type: true | false
- Default value: true

mid.ssh.disable_history

Controls whether the shell session history is saved on the target host and if the `HISTFILE=/dev/null` command is executed. Set this property to **false** to retain history on the target host, ensuring the `HISTFILE=/dev/null` command is not sent to the target device.

- Type: true | false
- Default value: true

> **Important:**
> This parameter requires Yokohama 8 or later.

mid.ssh.set_path

Specifies whether to set the PATH environment variable for SSH commands.

- Type: true | false
- Default value: true

mid.ssh.local

Specifies whether to execute commands for the MID Server host machine (localhost) via SSH rather than from a console. This allows long-running commands to execute properly. This parameter applies to the legacy SSH client only.

- Type: true | false
- Default value: false

mid.ssh_connections_per_host

Controls the number of concurrent probes the MID Server can run against a given host. Lowering the number of concurrent connections can slow Discovery.

- Type: integer
- Default value:

  7 for the ServiceNow client

  3 for the legacy SSH client.

mid.ssh.sudo_preserve_environment

Specifies whether to use sudo to preserve the environment for SSH.

- Type: true | false
- Default value: false

mid.ssh.terminal.width

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Controls the maximum characters per line when handling sudo -l in the terminal. If the value is too low, the output can be broken into multiple lines and affect the parser. Set the value to a sufficient size to handle outputs as needed.

- Type: int
- Default value: 255

mid.ssh.path_override

Overrides the default paths set before executing a command. Enter one or more override paths delimited by a colon (:). The default path is /usr/sbin: /usr/bin: /bin: /sbin.

- Type: string (a colon-separated list of directories)
- Default value: None

The ServiceNow SSH client accepts the following prefixes in front of the path_overide value.

- *append*: Appends the override path to the end of the host's path. This is the default behavior.
- *replace*: Replaces the host path with the path_overide value.
- *prepend*: Appends the override path to the front of the host path.

mid.ssh.use_snc

Enables the ServiceNow SSH client (SNCSSH) on individual MID Servers. SNCSSH is a ServiceNow implementation of an SSH client and is active by default for all MID Servers on new instances, via a MID Server property. Enabling the ServiceNow SSH client disables the legacy J2SSH client.

Important:
Mixing SSH client types for MID Servers connected to the same instance is not a good practice.

- Type: true | false
- Default value: false

mid.ssh.max_retries

Specifies the maximum amount of times to retry an SSH operation after a time-out. The system sleeps two seconds between each connection attempt. By default, the MID Server retries once only. Set the parameter to *0* to disable retries.

- Type: integer
- Default value: 1

mid.ssh.alt_rm

Sets a different SSH remove file command.

- Type: string
- Default value: none

mid.ssh.initial_delay_ms

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Delays sending any SSH probe commands to a server after connecting to the target for the time specified, in milliseconds. This parameter applies to the legacy SSH client only.

- Type: integer (milliseconds)
- Default value: 0

mid.ssh.suppress_history

Suppresses the generation of the SSH history file. This parameter applies to the legacy SSH client only.

- Type: true | false
- Default value: false

mid.ssh.socket_timeout

Specifies the timeout value for the SSH socket to prevent issues created by a socket timeout. Some devices, such as systems with embedded controllers like UPSs and PDUs, that have SSH enabled require more time to respond to an authentication request. The default value of 2 minutes ensures such requests do not timeout prematurely.

- Type: integer (milliseconds)
- Default value: 120000 (2 minutes)

mid.ssh.channel_timeout

Specifies the amount of time that the MID Server waits for activity on the SSH socket before closing the connection. If there has been no activity on the SSH socket for the specified timeout value, the MID Server closes the connection. Some devices, such as systems with embedded controllers like UPSs and PDUs, that have SSH enabled may require more time to respond to an authentication request.

- Type: integer (milliseconds)
- Default value: 120000 (2 minutes)

mid.ssh.session_timeout

Specifies the amount of time that a cached session remains in memory after last use. Excessively small values tend to decrease performance. This parameter applies to the ServiceNow SSH client only.

- Type: integer (milliseconds)
- Default value: 300000 (5 minutes)

mid.ssh.command_timeout_ms

The timeout duration, in milliseconds, for the execution of an SSH command.

- Type: integer (milliseconds)
- Default value: 300000 (5 minutes)

mid.ssh.use_keyboard_interactive

Uses the keyboard interactive authentication mode in SSH daemons on which it is activated.

- Type: true | false
- Default value: false

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

> **Warning:**
> An issue exists in Mac OS X Sierra and later with the authentication order of the **password** and **keyboard-interactive**modes that can cause Discovery to fail. For details about this issue and the configuration required for proper SSH authentication, see KB0623600.

mid.ssh.dh_group_length_min

Specifies the minimum group length in bits used for generating a "shared secret" key in Diffie-Hillman key exchange. The larger the key the more secure the SSH connection is but at the cost of performance.

- Type: integer (bits)
- Default value: 1024

mid.ssh.dh_group_length_max

Specifies the maximum group length in bits used for generating a "shared secret" key in Diffie-Hillman key exchange. The larger the key the more secure the SSH connection is but at the cost of performance.

- Type: integer (bits)
- Default value: 8192

mid.ssh.shells_supported

Defines the bourne-compatible shells supported by the MID Server. This value is a comma-separated list of supported shells, such as **ksh**, **dsh**, **bash** and **sh**.

- Type: string
- Default value: ksh,bash,sh

mid.ssh.discard_lrc_error

Discard long running command error output, emulating legacy behavior.

- Type: string
- Default value: j2ssh - true, sncssh - false

mid.ssh.pool_thread_ratio

Ratio of the SSH session pool capacity to the configured MID Server thread number (threads.max), expressed as a percentage. The number of permitted pool capacity sessions is set in this parameter. Regardless of the value set in this parameter, the system never permits the pool capacity to fall below 25 sessions.

- Type: integer
- Default value: 150

mid.ssh.disable_privilege_check

This parameter has no effect if the target is using a privileged command other than sudo. For more information, see MID Server privileged commands.

The remainder of this section only applies to targets which run sudo. When this parameter is set to **true**, the MID Server assumes that the user configured in the credential has the privilege to run the given command using sudo. The MID Server assumes the target user can run any command string following sudo on the target. When this parameter is set to **false**, the MID Server runs "sudo -l" on the target to verify the command which follows sudo has permission to run on the target.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Regardless of this parameter's value, the MID Server always validates that sudo by itself can be run on the target.

Some releases do not show this parameter in the MID Configuration Parameters pull down list. In this case, you may optionally add this parameter in MID Properties.

- Type: true | false
- Default value: false

Upgrade parameters

mid.pinned.version

Name of the version to which this MID Server is pinned.

- Type: string
- Default value: MID buildstamp

> **Note:**
> To see the MID buildstamp for your instance, type **stats.do** in the navigation filter. An example of the buildstamp format is **london-06-27-2018__patch3-10-24-2018_11-11-2018_0542**.

mid.upgrade.use_proxy

If your MID Server must go through a web proxy to access the upgrade URL, set this parameter to **true** to instruct the MID Server to use the proxy. You must also set the proxy server's host and port. If the instance proxy user name and password are set, they are used for the upgrade proxy as well.

> **Note:**
> This parameter is not intended to control proxy details configured with **glide.mid.autoupgrade.proxy*** parameters.

- Type: true | false
- Default value: true

glide.mid.autoupgrade.proxy_host or glide.glidesoap.proxy_host

If your MID Server must go through a web proxy to access the upgrade URL, define the proxy's host here.

- Type: string (URL)
- Default value: none

glide.mid.autoupgrade.proxy_port or glide.glidesoap.proxy_port

If your MID Server must go through a web proxy to access the upgrade URL, define the proxy's port here.

- Type: integer (0-65535)
- Default value: 80

glide.mid.autoupgrade.proxy_user

If your MID Server must go through a web proxy to access the upgrade URL, define the proxy's user name here.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: string (URL)
- Default value: none

glide.mid.autoupgrade.proxy_password

If your MID Server must go through a web proxy to access the upgrade URL, define the proxy's password here.

- Type: string
- Default value: none

Windows Discovery parameters

mid.powershell_api.session_pool.max_size

Specifies the maximum number of sessions allowed in the session pool.

> **Note:**
> Setting or changing this parameter requires restarting the MID Server.

- Type: integer
- Default value: 25

mid.powershell_api.session_pool.target.max_size

Specifies the maximum number of sessions allowed in the pool per target host.

> **Note:**
> Setting or changing this parameter requires restarting the MID Server.

- Type: integer
- Default value: 2

mid.sa.prefer_powershell

Enables MID Server to use PowerShell Remoting.

- Type: true | false
- Default value: false

mid.powershell_api.winrm.use_ssl

Requires the use of SSL certificates for HTTPS connections using WinRM.

- Type: true | false
- Default value: false

mid.powershell_api.winrm.additional_pssesion_options

Controls advanced options for a PSSession. For more information about advanced PSSession options, see https://docs.microsoft.com/en-us/powershell/module/microsoft.powershell.core/new-pssessionoption?view=powershell-6.

mid.powershell_api.winrm.remote_https_port

Configures the port for connecting to Windows servers using PowerShell over HTTPS.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: integer
- Default value: 5986

mid.powershell_api.winrm.remote_port

Configures the port for connecting to Windows servers using PowerShell over HTTP.

- Type: integer
- Default value: 5985

mid.powershell_api.winrm.skip_ssl_cert_check

Skips the SSL certificate check when using WinRM for HTTPS connections.

- Type: true | false
- Default value: false

mid.powershell_api.winrm.skip_ssl_cert_check_options

Skips specific SSL certificate checks when using WinRM for HTTPS connections. Configure the MID Server to skip checks for certificates from a Certification Authority (CA), from the Common Name (CN) that identifies the host associated with the certificate, and for revoked certificates.

- Type: string
- Default value: -SkipCACheck -SkipCNCheck -SkipRevocationCheck

mid.powershell.use_credentials

Determines the credentials to use for Discovery with PowerShell. A setting of **true** directs the MID Server to run probes with the Windows credentials from the credentials table. To run probes with the credentials of the user for the MID Server service, set this parameter to **false**.

- Type: true | false
- Default value: true

mid.powershell.path

Enables an administrator to point to a specific PowerShell on a MID Server in cases where more than one PowerShell is installed. Supply the path to the folder containing the PowerShell executable, for example, `C:\mypowershell` or `C:\mypowershell\`. ServiceNow automatically appends the string powershell.exe to the path. Configure this parameter when both a 32-bit and 64-bit PowerShells are active on the same MID Server, and it becomes necessary to launch the correct PowerShell for the context. 64-bit Windows employs file system redirection and the MID Server runs as a 32-bit application. If trying to specify a path in %WinDir%\System32, Windows automatically redirects to %WinDir%\SysWOW64. To avoid redirection, specify the path as %WinDir%\Sysnative. For example, instead of C:\WINDOWS\system32\WindowsPowerShell\v1.0\, specify C:\WINDOWS\sysnative\WindowsPowerShell\v1.0\.

Note:
On a 64-bit version of Windows XP, a Microsoft hotfix may be required to enable this.

To discover applications running on a 64-bit Windows machine, the MID Server must be running on a 64-bit Windows host machine.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: string (path)
- Default value: none

mid.powershell.enforce_utf8

Enable this parameter to force commands on a target Windows system to return UTF-8 encoded output. Disabling it allows the target system to use its default encoding. This parameter is only valid when PowerShell is enabled.

Setting this value to **false** may result in incorrect values in the CMDB when non-ASCII characters are returned by a probe.

- Type: true | false
- Default value: true

mid.powershell.local_mid_service_credential_fallback

Enables automatically falling back to MID Server service credentials if all other credentials fail.

- Type: true | false
- Default value: true

mid.powershell_api.idle_session_timeout

Specifies the timeout value of idle PowerShell sessions in seconds.

Note:
Setting or changing this parameter requires restarting the MID Server.

- Type: integer
- Default value: 60

mid.powershell.command.parameter_passing

Enable this parameter to allow passing PowerShell parameters from the command line.

- Type: true | false
- Default value: false

mid.powershell.command.script.parameter_passing

Enable this parameter to allow passing PowerShell scripts from the command line.

- Type: true | false
- Default value: true

mid.windows.management_protocol

Enables administrators to select the Windows management protocol used for device and process classification. Options include: WMI and WinRM.

- Type: string
- Default value: WMI

mid.windows.probe_timeout

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sets the timeout interval for all Windows probes on a specific MID Server. This value is overridden by the values configured for individual probes with the wmi_timeout probe parameter.

- Type: integer
- Default value: 300

mid.powershell.jea.append_username

Specifies whether user name of the current user will be appended to the JEA endpoint.

- Type: true | false
- Default value: False

mid.powershell.jea.endpoint

JEA configuration name (endpoint) on remote servers that the MID Server will connect to. Set to JEA_DISCO_BASIC.

- Type: string
- Default value: ""

Add a MID Server parameter

Use a MID Server parameter to control the behavior of a particular MID Server.

Before you begin

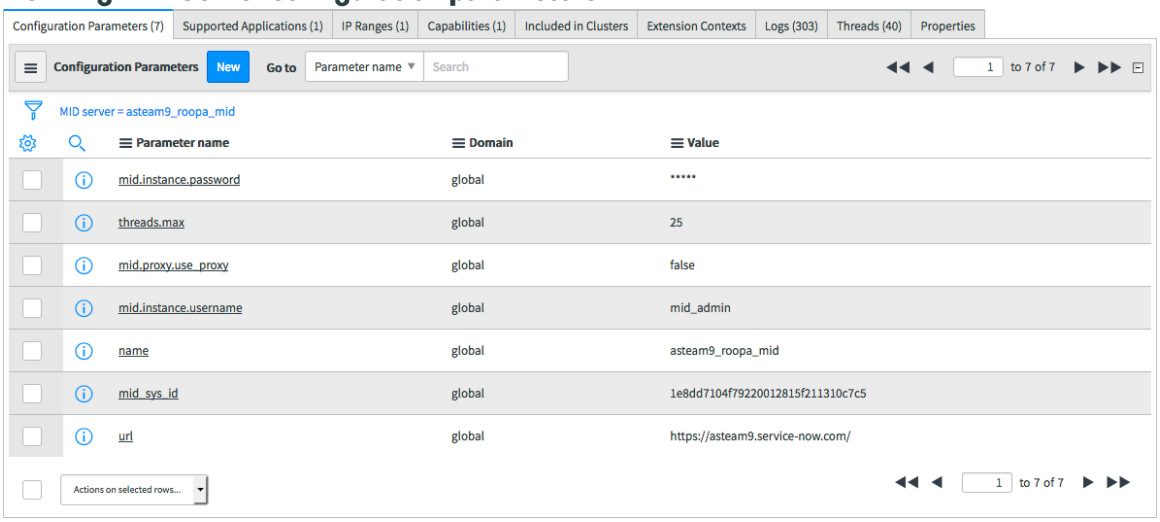
Role required: admin

Procedure

1. Navigate to **All** > **MID Server** > **Servers**.
2. From the list of MID Servers, select a MID Server to configure.
3. Select the **Configuration Parameters** related list.

   This shows all the parameters currently in the MID Server's configuration file. If there are any passwords, they are displayed in asterisks for security reasons. See MID Server parameters for a list of available parameters.

Defining MID Server configuration parameters



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. To add parameters, click **New**, and then complete the form.
   After the form is submitted, the configuration file for that MID Server is modified to include the new parameter. Changes to existing parameters are reflected in the MID Server configuration file as well. Changes made to the MID Server configuration file do not take place immediately, but rather the next time the MID Server is restarted. The MID Server form has a related link for restarting the MID Server.

   Note:
   ServiceNow prevents you from saving changes, such as modifying or deleting parameters, that would cause the MID Server to lose communications with the instance. For example, you cannot change the url parameter. Any changes to these protected parameters must be made directly in the `config.xml` file for that MID Server.

5. **Optional:** Set parameters in the `config.xml` file.
   MID Server configuration is controlled by an XML file called `config.xml`. This file is located in the `/agent` directory, in the MID Server isntallation directory. You can edit this file directly to make any configuration changes to protected parameters. Many configuration changes, such as those that do not disrupt communication between the MID Server and the ServiceNow instance, may also be made from the instance.

   The structure of the `config.xml` file is simply an outer parameters tag and a series of inner parameter tags. Each parameter tag has name and `value` attributes.

   - To change the value of a parameter, edit the value attribute.
   - To add a parameter, add another parameter tag with its name and value.
   - To delete a parameter, delete the entire parameter tag.

   The order of the parameters within the file is not important. Notice the green comment sections in the sample. Use these elements to add useful comments to the configuration file.

   Note:
   When configuring the MID Server for use with a proxy server, be sure to remove the comment tags around the proxy sections that you configure.

MID Server config.xml file

```
- <parameters>
    <!-- MID Server Configuration -->
    <parameter name="url" value="https://example.service-now.com"/>
    <parameter name="refresh_rate" value="65"/>
    <parameter name="name" value="Super Duper MID Server #1"/>
    <parameter name="mid_sys_id" value=""/>
    <!-- MID Server Threads -->
    <parameter name="threads.max" value="25"/>
    <!-- MID Server proxy configuration -->
    <parameter name="mid.proxy.host" value=""/>
    <parameter name="mid.proxy.port" value=""/>
    <parameter name="mid.proxy.username" value=""/>
    <parameter name="mid.proxy.password" value=""/>
  - <!--

            MID Server to instance configuration options

              mid.instance.use_proxy
                  - when talking to instance, should we use the proxy config?

              mid.instance.username
              mid.instance.password
                  - supply username and password if instance has basic authentication enabled

    -->
    <parameter name="mid.instance.use_proxy" value="true"/>
    <parameter name="mid.instance.username" value=""/>
    <parameter name="mid.instance.password" value=""/>
  - <!--

            MID Server upgrade options

              mid.upgrade.use_proxy
                 - when talking to upgrade server, should we use the proxy config?

              mid.upgrade.branch
                 - define a branch our MID Server is pinned to

    -->
    <parameter name="mid.upgrade.use_proxy" value="true"/>
    <parameter name="mid.upgrade.branch" value=""/>
</parameters>
```

Note:
The sample file here is from a Firefox browser. Conventional text editors, such as Notepad, WordPad, or TextEdit, do not display colors and variable fonts.

MID Server Configuration Parameter settings and priority

The MID Server's settings reside in multiple tables and the MID Server prioritizes them in a set order. MIDConfigParameter must be defined with the correct type-style builders.

MID Server settings priority

MID Server settings can reside in both the Configuration Parameter table and Properties tables. MID Servers prioritize the settings in the following order:

1. MID Configuration Parameter
2. MID Property (specific MID)
3. MID Property (global)

Invalid Record Prevention

Avoid creating duplicate records in the MID Property table because they can invalid records. Duplicate properties have the same name and are assigned to the same MID Server.

Similarly, avoid creating global configuration parameters because they are unsupported. Global configuration parameters are configuration parameters with no assigned MID Server. If a setting should be applied to all MID Servers, then use a global MID Property.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MID Server File Cleaner

A monitor thread runs in the MID Server to clean up old files, to keep the size and quantity of files within the install folder manageable, and to prevent performance issues with the MID Servers.

Files and empty folders within the following folders may be deleted by this MID File Cleaner. Files last accessed more than 30 days ago are deleted.

It runs on startup, and then every 24 hours after that. You can force the File Cleaner to run by restarting the MID Server service.

Folders/files cleaned:

- \agent\import
- \agent\export - Used by the Export Set feature.
- \agent\work\monitors\ECCSender\output_error - Used since San Diego for ECC input payloads that cannot be inserted for any reason (see PRB1521761/KB0995569).
- \agent\work\monitors\ECCSender\output_oversize - Used since Eureka/Fuji for saving copies of payloads that are not sent to the instance because they are larger than the limit set by mid.eccq.max_payload_size, which defaults to 20000000 bytes (see PRB598334)
- \agent\logs - Specifically JFR Dumps (Utah release)

Logging

The MID Server agent log shows this monitor starting and shutting down with the MID Server.

Disabling the MID File Cleaner

Export Sets write files to the MID Server agent\export folders. The idea is then that a custom implementation on the customer side takes those files and moves them elsewhere, so that these files only need to remain in the MID Server application's install directory for a short time.

The MID File Cleaner can be disabled completely for all folders, by adding the MID Server Configuration Parameter **mid.file_cleaner.disabled=true**. When the parameter is not present, which is the out-of-box state, it defaults to false, and the file cleaner runs.

On the MID Server form, click New on the "Configuration Parameters" related list, select mid.file_cleaner.disabled, and enter the value "true".

This can also be manually added to the config.xml file: `<parameter name="mid.file_cleaner.disabled" value="true"/>`. See MID Server parameters for more information.

MID Server protected records and reserved characters

Some MID Server records cannot be altered. Certain special characters are pre-defined in XML and cannot be used in passwords.

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

MID Server Records that cannot be altered

These records cannot be modified or deleted.

Table	Record

Table	Record
	• MIDServerCheck • MIDServerFileProvider

Using special characters in an XML file

The XML specification defines five predefined entities that represent special characters, and requires that all XML processors honor them. If these characters are used in a password, you will experience unexpected results.

The following characters represent the five pre-defined entities:

- "
- &
- '
- <
- >

If you use the pre-defined entity characters in an XML file, such as the MID Server configuration file, you need to encode them. To encode pre-defined entities into an XML document:

- replace **"** with **"**
- replace **&** with **&**
- replace **'** with **'**
- replace **<** with **<**
- replace **>** with **>**

For example, to specify the password as `test&` in the MID Server config.xml file:

```
<parameter encrypt="true" name="mid.instance.password"
 value="test&amp;"/>
```

MID Server privileged commands

To discover certain information on a host server, the MID Server must run SSH commands with higher privileges. The platform provides default privileged commands for the MID Server to use and the ability to add additional commands to the system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

An example of information that requires elevated privileges is information about storage disks on a host server, retrieved with the *fdisk -l* command. If your system cannot use sudo commands, you must configure the hosts in your network to use one of the other privileged commands. You can configure different privileged commands for different hosts. However, Discovery supports only one privileged command per host.

Important:
You can edit supported privileged commands, but do not delete them.

For a list of possible SSH commands requiring root privileges, see SSH credentials.

SSH privileged escalation command requirements

Command	Description
sudo	• Host must support the *sudo -S -p <password>* command and return the correct list of allowed SSH commands. • Credentials provided for Discovery must be able to run the command *sudo -S -p <password> <commands>*. • Discovery calls *sudo -l* to determine whether *sudo* is available on the host and which commands the current user can run with elevated privileges.
pbrun	• Host must support the *pbrun -v* command and return the correct version of PowerBroker. • Credentials provided for Discovery must be able to run *pbrun <commands>*. • Discovery does not support any other **pbrun -** options, such as a password prompt. • The instance must be able to reach the target host via SSH.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SSH privileged escalation command requirements (continued)

Command	Description
pfexec	• Host must support the *pfexec id -a* command and return the correct ID. • Credentials provided for Discovery must be able to run *pfexec <commands>*. • Discovery does not support any other **pfexec -** options, such as a password prompt.
dzdo	• Host must support the *command -v dzdo* command and return the path to dzdo in standard output. • Credentials provided for Discovery must be able to run dzdo <commands>. • Discovery does not support any other *dzdo* – options, but Discovery supports password authentication for dzdo.

Long-running commands with sudo

Configure J2SSH and ServiceNow SSH to prevent long running commands using sudo from failing when the MID Server disconnects.

ServiceNow SSH allows probes to run sudo against individual commands or an entire, long-running script. This is also supported for the *pbrun* and *pfexec* privileged commands.

Sudo for individual commands

You can run sudo against individual commands within a probe, but only if all the following sudoer configurations are performed on the target:

- The `!requiretty` option is required.
- Allow individual commands to be run by the user in the provided credential with NOPASSWD configured.
- The target specifies an individual sudo call in the command or referenced scripts. For example, set sudo as `"sudo fdisk -I"` or `"${sudo:fdisk -I}"` rather than `"must_sudo"` for the entire script.

Note:
Running sudo against individual commands with ServiceNow SSH produces detailed and useful entries in the sudo logs on the target computer.

Running sudo on an entire script

If any of the required sudoer configuration requirements for individual commands is not in place, Discovery applies sudo to the initial and complete probes, and does not execute sudo remotely inside the command. This condition can be forced by setting **must_sudo** on the probe and eliminating any sudo commands within the probe.

This approach prevents long running commands from failing when the probe disconnects, but cannot specify individual commands in the sudoers configuration.

Logging

The logs from ServiceNow SSH sudo activity run against an entire script show cryptic entries, such as `/tmp/.run.aef13123fe124123`, which prevent administrators from controlling permissible commands and knowing the exact command that was run. Sudo run against individual commands produces more detailed log entries, such as `/sbin/fdisk -l`.

Add a new privileged command for use by the MID Server

Add a new privileged command to the Privileged Command [privileged_command] table that is available to your MID Servers.

Before you begin
Role required: admin

About this task

Important:
Do not delete any of the supported commands.

Procedure

1. Navigate to **All** > **MID Server** > **Privileged Command** and click **New**.
2. Complete these fields:
   - **Command**: The name of the privileged command.
   - **Password Prompt**: The password prompt displayed to the user for this privileged command, or a regular expression that matches this password prompt. If this field is empty, no password is required for this privileged command, and no prompt is displayed. SUDO commands do not require a password prompt.
3. Click **Submit**.

Configure the MID Server to use specific privileged commands

You can configure the MID Server to use specific commands in a defined order.

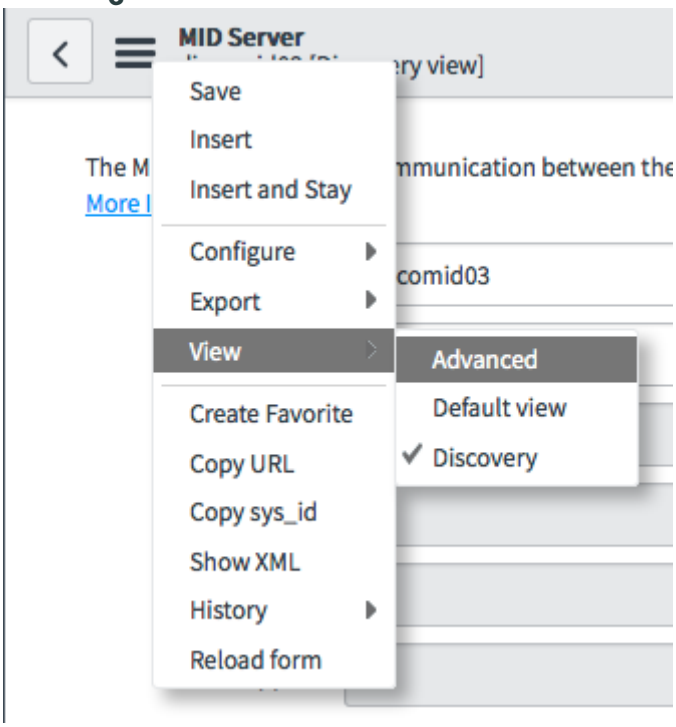
Before you begin
Role required: admin

Procedure

1. Navigate to the list of MID Servers using one of the following paths:
   - **MID Server** > **Servers**
   - **Discovery** > **MID Servers**
   - **Orchestration** > **MID Servers**
2. Select the MID Server you want to configure.
3. Click the menu icon in the header bar and select **View** > **Advanced** from the context menu.

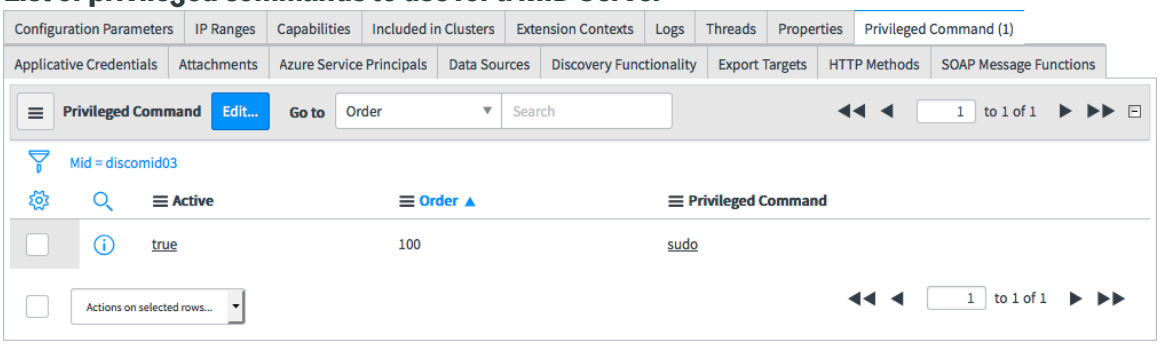
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Selecting the Advanced view



4. In the **Privileged Command** related list, click **Edit**.
5. Select the command you want this MID Server to use and click **Save**.
   The default order of privileged commands is 100, but you can change the order as necessary. The privileged command with the smallest order number is tried first.

List of privileged commands to use for a MID Server



Create a pbrun profile privileged command

You can create a special configuration for the *pbrun* privileged command that allows it to run as a profile.

Before you begin

Role required: discovery_admin, admin

About this task

Of all the privileged commands, only the *pbrun* command can be configured to run as a profile, and only one of these special *pbrun* configurations can function on a MID Server.

Important:
Edit the existing *pbrun* record for this purpose. The system ignores any additional commands you create for *pbrun*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **MID Server** > **Privileged Command**.
2. Select **pbrun** from the list.
3. In the Privileged Command record, edit the value in the **Command** field to use the format *pbrun -u <profile>*.
   For example, you can set *pbrun -u admin* as a command to run with an admin profile.
4. Click **Update**.

What to do next

Return to Configuring MID Servers.

MIDSystem methods

MIDSystem variables (referred to by the variable name ms.) provide a variety of methods to get information about the MID Server.

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

Method summary	Description
log(String message)	Logs the given message with a standard prefix to indicate that the message was generated by JavaScript.
getConfigParameter(String parameter name)	Returns the value of the named configuration parameter.
include(String script include)	Include the MID Server script include with the given name into the current context.
getName()	Returns the name of the MID Server.
getSysID()	Returns the sys_id of the MID Server.
toJavaScript(Object)	Converts the given Java object into the equivalent JavaScript object.

This example writes a message to the log:

```
ms.log('Attempting to log in with user: ' +
this.getParameter('user'));
```

Manually start, stop, and restart a MID Server

If you did not start the MID Server at the end of the installation procedure, you can manually start the MID Server.

Before you begin

Role required: MID Server Service account user or a Windows Admin account

This procedure is only for users who install the MID Server using the ZIP file. The Windows MID Server installer completes the installation automatically.

Procedure

1. Open the agent directory in the directory you created for the MID Server installation files. For example, the path might be C : `\ServiceNow\MID Server1\agent`.
2. Start the MID Server by executing the `start.bat` file.
3. To stop the MID Server, execute the `stop.bat` file.
4. To restart a stopped MID Server, either:
   - If the MID Server is stopped, execute the `start.bat` file.
   - If the MID Server is running, execute the `restart.bat` file.

MID Server heartbeat

The instance checks the MID Server for a response every 5 minutes, using a synthetic transaction monitoring system.

---

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

Checking for a heartbeat

ServiceNow instances send a synthetic transaction via the Heartbeat probe to every MID Server every 5 minutes. The Heartbeat probe functions exactly as a normal probe does and is sent by writing an output record to the ECC queue. A MID Server retrieves the record when it queries the ECC queue for work. The MID Server processes the probe just as it would any other probe and responds back to the instance. If the instance does not detect a response from a MID Server, the instance marks that MID Server as **Down**. If the MID Server responds, the instance considers the MID Server to be functioning and communicating properly with the instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Make sure that your MID Server can communicate on **port 443**. See Configure MID Server network connectivity and MID Server system requirements for more information.

System events

When a MID Server transitions from one state to another, one of these events is triggered:

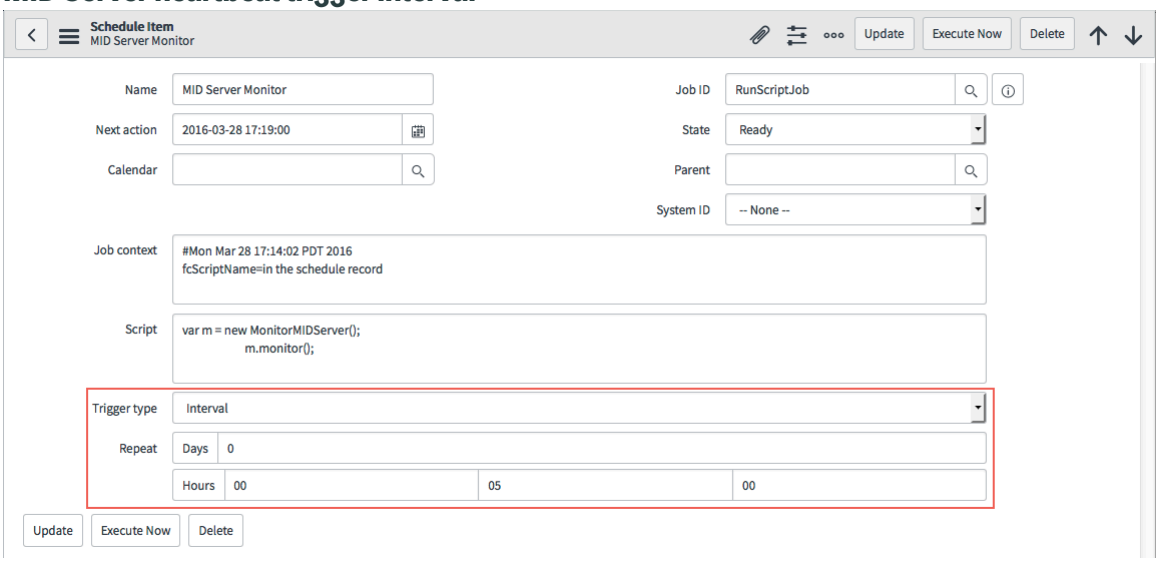
- *mid_server.up*: The MID Server goes from a status of **Down**, **Paused**, or **Upgrading** to a status of *Up*.
- *mid_server.down*: The MID Server goes from a status of *Up* to a status of *Down*.
- *mid_server.paused*: The MID Server is paused.
- *mid_server.upgrading*: The MID Server is being automatically upgraded because the instance is being upgraded.

You can use these events to send notifications or trigger actions that you specify in scripts.

Scheduled job

To change the trigger interval for the Heartbeat probe, navigate to **System Scheduler** > **Scheduled Jobs** > **Scheduled Jobs**. Open the **MID Server Monitor** record and edit the interval.

MID Server heartbeat trigger interval



Set the MID Server JVM memory size

The MID Server starts with a default JVM memory allocation, but you can modify this setting in the configuration file.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

About this task

In the base ServiceNow system, the MID Server JVM memory is set to 1024 MB, which is configured in the `\agent\conf\wrapper-override.conf` file in the MID Server installation directory. This setting might not be appropriate for the way your organization uses the MID Server. If you want the MID Server to work harder, allocate more resources to it. If the MID Server is located in a small branch office and runs in an environment where memory allocation is shared between a print server, mail server, or web proxy server, the allocation might have to be reduced.

Note:
For a complete list of minimum MID Server requirements, see MID Server system requirements.

Procedure

1. Open the `\ServiceNow\<MID Server name>\agent\conf\wrapper-override.conf` file in a text editor.
   For more information about this file, see Installing Multiple MID Servers on a Single System.
2. Locate the following lines in the file:

```
# OPTIONAL: Maximum Java Heap Size (in MB)
#wrapper.java.maxmemory=1024
```

3. Edit the memory allocation.
4. Remove the comment tag (#) from the memory allocation parameter, `#wrapper.java.maxmemory=1024`.
   The resulting code is as follows:

```
# OPTIONAL: Maximum Java Heap Size (in MB)
wrapper.java.maxmemory=1024
```

5. Save the file.
6. Restart the MID Server service.

Pause the MID Server

Pause the MID Server to temporarily prevent it from polling the ECC Queue for work or sending Discovery results back to the instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: agent_admin

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

About this task
You can only pause validated MID Servers. You might want to pause the MID Server when your network infrastructure is undergoing changes. This prevents applications like Discovery from throwing errors during a particular maintenance window.

A paused MID Server continues processing commands that it had already retrieved before it was paused. When you resume the MID Server, the MID Server starts retrieving new commands to process.

Note:
Discovery continues to assign jobs to MID Servers that are **Paused**. MID Servers that are **Down** are not assigned jobs.

Procedure
1. Open the MID Server record.
2. Select a running MID Server that has been validated.
3. On the MID Server form, select **Pause MID** under **Related Links**.
   The state of the MID Server changes to **Paused**.

A paused MID Server

Name	Version	Host name	Status	Validated
MidServer1	Version	MidServer1hostname.com	Paused	Yes

4. To resume MID Server processing, select **Resume MID** under **Related Links**.

MID Server pause

The MID server can be put into a **Paused** state to temporarily prevent it from polling the ECC Queue for work or sending Discovery results back to the instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Unlike stopping the MID Server from the Windows or Linux server command line on the MID Server machine, pausing the MID server is something that you can do from the instance. The MID Server pause feature is available starting with the Istanbul release.

Note:
You can only pause validated MID Servers.

You can still perform these actions when the MID Server is paused:

- Access the MID Server logs and delete log entries.
- View MID server statistics. While the MID Server is in the **Paused** state it stops generating statistics. But you can still view the statistics generated before you paused the MID Server.
- Retrieve the MID Server thread dump.
- Make and save configuration changes and property changes to the server. The changes take effect after the MID Server is resumed.
- Clear the ECC queue.

The MID server heartbeat continues to function while the MID Server is in the **Paused** state. If the MID Server is upgraded while it is in the **Paused** state, the MID Server state automatically changes to **Up** after successful upgrade. It does not return to the **Paused** state.

During MID Server selection, paused MID Servers can still be selected but are prioritized below MID Servers that are not paused.

Events that occur during MID Server pause

The **vCenter** and **SNMP** event collectors, continue to run and process events when you pause the MID Server. These events are not part of the normal synchronous communication that the MID Server has with the instance that you see in the ECC queue. Events are still relayed to the instance and can even trigger actions on records in the instance, such as a CI update. For example, if vCenter detects that a virtual machine goes down or is deleted, a vCenter event makes a change to the status of the corresponding CI record for that virtual machine.

To prevent these events from being processed, stop the extensions from running. For more information, see:

- Configure and run the vCenter event collector extension
- Configure the SNMP Trap Collector Extension

Remote tables

Connect the ServiceNow AI Platform to third-party sources, or to another instance, so that you can retrieve external data and optionally cache it in memory.

You can view external data in lists or forms and process it with standard Glide scripts. You can also group, sort, aggregate, and filter the data just like you would for standard internal tables. If editing is enabled for a remote table, you can insert, update, and delete data in the external source from the remote table on the instance.

Remote table components

Use the following components to build an external data framework:

Remote tables

You create remote tables to describe the schema for the data that you want to retrieve from an external source.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The table definition is in the ServiceNow AI Platform, but its rows, or external records, live in memory. You create a remote table the same way that you would create a standard internal table. You define columns and controls and designate application access for it just like you would do for an internal table. Unlike an internal table, a remote table doesn't get its records from the ServiceNow AI Platform database. It gets its records from running an associated query script against an external data source.

To learn more about creating remote tables, see Create a remote table.

Script definitions

You create and associate script definitions with a remote table. The external data that you retrieved using the query script can be cached in memory. You can also designate how this data is cached and how long the data is cached in memory. Every time that you refresh a list that contains the external data from a remote table, the associated query script runs again. For editable remote tables, you can create insert, update, and delete script definitions in addition to the query script definition.

To learn more about script definitions and how to associate them with a remote table, see Create script definitions for a remote table.

How remote tables work

By using a remote table, you can retrieve the data from external sources or from another instance with REST or SOAP services. The external data lives in memory in read-only mode, which makes the data temporary, or transient, within the ServiceNow AI Platform. You can then view and update the external data without importing or storing it.

You view the external data in lists or forms in the same way that you view internally stored data. You can manipulate this data by using standard Glide records, business rules, remote APIs, scripting, table reference fields, services, and development tools in the ServiceNow AI Platform. If editing is enabled for a remote table, you can insert, update, and delete data in the external source from the remote table on the instance.

Important:
If the data size that is retrieved from the external source is small, use the 1000 rows default limit in a remote table to minimize query times. If the retrieved data size is large and could be less performative, in the script definition, you can select the advanced **Enhanced Capacity** field to support a large number of rows.

External data life cycle within the ServiceNow AI Platform

The data that you retrieve from an external source has a finite duration, or life cycle, within the ServiceNow AI Platform.

- When you run a script that is associated with a remote table, the retrieved data lives in memory for as long as the list or form appears. After you close the list or form, that external data is purged from memory. The next time that you use or view the external data in this remote table, memory is repopulated from the external system.
- However, if you have defined caching parameters for the script, the external data remains cached in memory for the specified caching duration.

  For example, if you designate that the external data should be cached for 300 seconds, it remains cached in memory for 5 minutes. After that time expires, the cached data is purged from memory. The next time that you use or view the external data in this remote table, the cache is refreshed from the external system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Practical applications for remote tables

Set up and use remote tables in your enterprise when:

- You want to fetch external data for temporary use without storing it in the ServiceNow AI Platform. For example, you can create a remote table that fetches weather-related data that appears on a home page when a user logs in. You would then create an associated query script definition that retrieves this data from a third-party weather source that is based on the user's location.
- You want to retrieve customer details that are stored in an external Customer Relationship Management (CRM) application for viewing in Customer Service Management functions such as Agent Workspace.

  Note:
  To learn more about data retrieval for Customer Service Management, see Third-party data integration for CSM.

- You want to retrieve and view personnel data from Human Capital Management (HCM) applications such as Workday or SAP SuccessFactors for use in HR Service Delivery functions.

Post-filtering and sorting

When you run a remote table script, it applies post-filtering and sorting query conditions after it adds rows to a table. These applied conditions support any other required queries that the script doesn’t handle. When you apply post-filtering and sorting, the remote table queries work like standard internal table queries.

When you create remote table scripts, you generally handle the most frequent and expansive queries in the script. Post-filtering queries and sorting can take a long time and might adversely affect how your instance performs. Use a small data set instead so that it doesn't take much time to do post-filtering and sorting.

Based on your use cases, determine if you should try a narrower query in the external call or a more expansive query. Because the internal filtering and sorting can be expensive to run on large result sets, use a narrower query when the data doesn't require extra filtering. Use a more expansive query when a more general query would return a small result set and would require extra filtering and sorting.

Differences between remote tables and the Integration Hub

Choose whether to use a remote table or Integration Hub to process external data.

- When you want to cache external data temporarily, use remote tables.
- If you want more advanced importing and transformation options, including Workflow Studio, or if you want to develop custom integrations, use the Integration Hub.

Note:
If you create a remote table that uses the data from an external source that is outside of the ServiceNow AI Platform, you must have an Integration Hub subscription entitlement. To learn more about the Integration Hub, see Integration Hub.

Activate the remote tables plugin

If you have the admin role, you can activate the Remote Tables plugin (com.glide.script.vtable). This plugin includes demo data and activates related plugins if they aren’t already active.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

About this task
Remote Tables activates these related plugins if they are not already active.

Plugins for Remote Tables

Plugin	Description
Remote Tables [com.glide.script.vtable]	Supports remote tables and associated script definitions that can be used to retrieve and optionally cache data from external sources.
Transformation Service [com.glide.transform]	Supports use of Transform APIs that are associated with the remote tables.

Procedure
1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Create a remote table

Create a remote table using data retrieved from an external source.

Before you begin
Role required: delegated_developer or admin

About this task
When you designate a table as a remote table, keep the following points in mind:

- Before you create a remote table, you must have a good understanding of external data sources. For example, if you want to retrieve CRM data for use in Customer Service Management, you must understand how the data is structured in the external CRM source.
- A remote table needs an external primary key to relate its temporary data to the data that is stored in the external source. When you designate a table as remote, only a sys_id field is auto-

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

generated and appears in the Columns section, which it uses as its primary key for use in Glide records. All external table primary key values are converted to string values.

- Unlike standard internal tables, you can't extend a remote table from another table.

Procedure

1. Navigate to **System Definition** > **Remote Tables** > **Tables**.

   Tip:
   You can also create a remote table using the standard form for tables from **System Definition** > **Tables**.

2. Select **New**.
3. On the form, fill in the fields.

   Note:
   You create a remote table in the same manner as a normal table, but designate it as a remote table. The following controls differ in how they operate and what you enter into them when you create a remote table:

Control	Description
Name	Table name, which is automatically populated based on the table label and a prefix as follows: ○ For a remote table in a scoped application, the name is prefixed with a namespace identifier and the string `st_` to indicate that it's remote and part of an application. ○ For a remote table in the global application, the name is prefixed with the string `u_st_`. You can't modify the prefix; however, you can modify the rest of the table name. The name can contain only lowercase, alphanumeric ASCII characters and underscores (_).
Extends Table	Option that is not available if you select the **Remote Table** option to designate that this table is remote. It no longer appears because you can't extend remote tables from other tables.
Remote Table	Option to designate this table as a remote table. A remote table is a table to which you can associate a script definition for retrieval of data from an external data source. Unlike a standard internal table, the data doesn't come from records in the current instance. To learn more about remote tables, see Remote tables.

4. In the Columns section, use the **Table Columns** embedded list to add columns to the remote table like you do when you create columns for a standard internal table.
5. In the Controls section, define additional remote table options like you do when you define additional table options for a normal table.
6. In the Application Access section, define the scope protection for the remote table like you do when you define additional table options for a normal table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information, see Application access settings.

7. Select **Submit**.

Related topics

Create a table

Create script definitions for a remote table

Define scripts for a remote table to retrieve data from an external data source or edit data in the external source.

Before you begin

Role required: delegated_developer with Allow scripting permissions or admin

About this task

The ServiceNow AI Platform retrieves and caches the data for the remote table by running the query script against an external data source so you can view or modify it. You can also designate how this external data is cached and how long the data is cached in memory until the script must run again.

Procedure

1. Navigate to **All** > **System Definition** > **Remote Tables** > **Definition**.
2. Select **New**.
3. On the form, fill in the fields.

Control	Description
Name	Name of the script that you're creating to associate with the selected remote table.
Table	Name of the remote table that you want to associate the script that you're creating. ○ For a remote table in a scoped application, the name is prefixed with a namespace identifier and the string `st_` to indicate that it's remote and part of an application. ○ For a remote table in the global application, the name is prefixed with the string `u_st_`.
Application	Application that is associated with this remote table. If you're working on an application or are creating a remote table from an application record, the field defaults to that application. Otherwise, the field defaults to **Global**. Any records that are created from the table record, such as modules and security rules, are assigned to this application by default.
Active	Option for activating the script that you're associating with the remote table. You can have multiple inactive script definitions for a remote table, but can only have one active script definition. When you activate a script definition, you associate it with the remote table so that you can retrieve and cache the external data.
Advanced	Option to access advanced caching and editing settings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Control	Description
	Caching settings designate how the memory caching should operate in the ServiceNow AI Platform for this remote table. **Note:** Only advanced users should set caching parameters for a remote table.

4. **Optional:** If you selected the **Advanced** option, from the Advanced section, fill in the fields.

   Note:
   By default, the external data is cached in the memory by the user.

Field	Description
Cache TTL	Cache time to live, expressed in seconds, that external data is cached in memory for this remote table script definition. For example, enter 300 to cache the data in the memory for 5 minutes. The default value is 0, meaning data isn't cached and is retrieved every time. The maximum value is 60 minutes (3600 seconds).
Cache Isolation Level	Cache query results for each user or across all users. ○ Cache per user: The cached query results should be specific to the logged-in user. This is the default value. ○ System Shared Cache: The cached query results should be the same for all users.
Enhanced Capacity	Option to select the enhanced capacity to support more than 1000 rows in a remote table. **Note:** If the data size that is retrieved from the external source is small, use the 1000 rows default limit in a remote table to minimize query times. You can select the **Enhanced Capacity** field if the retrieved data size is large and can be less performative. This field isn't supported if **Editable** is selected.
Editable	Option to support editing the remote table and its external data source from the instance. Use the `v_record` API to customize script definitions for inserting, updating, and deleting data in the table.

5. Customize the following script definitions using the `v_table`, `v_query`, and `v_record` APIs.

   For more information about these APIs, see v_table – Scoped, Global, v_query – Scoped, Global, and v_record - Scoped, Global.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Script definition	Description

Query	The query script definition retrieves data from the external source to include in the remote table. From the Query section, customize the script using the `v_table` and `v_query` APIs.
	
	Every time a list that contains external data from a remote table is refreshed, the associated query scripts runs.
	
	`(function executeQuery(v_table, v_query) {`
	`// Parameters:`
	`// v_table - object to record response:`
	`// v_table.addRow({ ... }) - adds a row to the result set.`
	`// keys are the column names of the table definition.`
	`// sys_id must be non-empty and uniquely identify each row.`
	`// the above rule will be strictly enforced for editable tables, and generate warnings for read-only tables.`
	`// sys_id will be supplied to the Update, and Delete scripts to specify the row's identity.`
	
	`// v_query - the query definition:`
	`// v_query.getEncodedQuery() - encoded querystring`
	`// v_query.getCondition(field) - encoded querystring for the given field (includes field name, operator, and value)`
	`// v_query.getParameter(field) - parameter for the given field (only includes value for equality conditions)`
	`// v_query.isGet() - whether the query is a single get by sys_id`
	`// v_query.getSysId() - parameter for sys_id field`
	`// v_query.isTextSearch() - whether the query contains a text query parameter`
	`// v_query.getTextSearch() - text search query parameter (internal field name 123TEXTQUERY321)`
	`// v_query.getFirstRowWanted() - the first row to include, don't use with caching`
	`// v_query.getLastRowWanted() - the last row to include, don't use with caching`
	`// v_query.setLastErrorMessage(message) - the message is visible from GlideRecord.getLastErrorMessage()`
	
	`// Sample code:`
	`// try {`
	`// retrieve-rows-from-external-system; // if (there-was-an-error) {`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Script definition	Description

	`//  var message = ...;  // v_query.setLastErrorMessage(message);`
	`//  return;`
	`//  }`
	`//`
	`//  for (var row in rows) {`
	`//  v_table.addRow(row);`
	`//  }`
	`// } catch (ex) {`
	`//  var message = ex.getMessage();`
	`//  v_query.setLastErrorMessage(message);`
	`// }`
	
	`})(v_table, v_query);`

Insert	The insert script definition adds a record to the external source. This script definition is available only if you selected the advanced **Editable** option. From the Insert section, customize the script using the *v_record* API.
	
	Every time a record is added to a remote table, the associated insert scripts runs.
	
	`function executeInsert(v_record) {`
	`// Parameters:`
	`//  v_record is a map of field names and values containing the sys_id of the`
	`//  record and the fields that need to be inserted in the record on the`
	`//  remote system (source of data)`
	
	`//  v_record.<field_name>  - fields in the remote table GlideRecord`
	`//  v_record.setLastErrorMessage(message)  - signal an error`
	
	`// Sample code:`
	`// try {`
	`//  update-external-system;`
	`//  if (there-was-an-error) {`
	`//  var message = ...;`
	`//  v_record.setLastErrorMessage(message);`
	`//  }`
	`// } catch (ex) {`
	`//  var message = ex.getMessage();`
	`//  v_record.setLastErrorMessage(message);`
	`// }`
	`})(v_record);`

Update	The update script definition modifies a record in the external source. This script definition is available only if you selected the advanced **Editable** option. From the Update section, customize the script using the *v_record* API.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Script definition	Description

	Every time a record is updated in a remote table, the associated update scripts runs.
	
	Note:
	If multiple users update the same record at the same time, the value on the remote system is from the last update call executed.
	
	`(function executeUpdate(v_record, v_changed_fields) {`
	`// Parameters:`
	`// v_record - a map of field names and values containing the sys_id of the record`
	`// v_record.<field_name> - fields in the remote table GlideRecord`
	`// v_record.setLastErrorMessage(message) - signal an error`
	`// v_changed_fields - a map of field names and values containing the sys_id of the record`
	`// v_changed_fields.<field_name> - changed fields in the remote table GlideRecord`
	
	`// Sample code:`
	`// try {`
	`// update-external-system;`
	`// if (there-was-an-error) {`
	`// var message = ...;`
	`// v_record.setLastErrorMessage(message);`
	`// }`
	`// } catch (ex) {`
	`// var message = ex.getMessage();`
	`// v_record.setLastErrorMessage(message);`
	`// }`
	`})(v_record, v_changed_fields);`

Delete	The delete script definition removes a record from the external source. This script definition is available only if you selected the advanced **Editable** option. From the Delete section, customize the script using the *v_record* API.
	
	Every time a record is deleted from a remote table, the associated delete scripts runs.
	
	`(function executeDelete(v_record) {`
	`// Parameters:`
	`// v_record - a map of field names and values containing (among others) the`
	`// sys_id of the record that needs to be deleted on the remote system`
	`// v_record.<field_name> - fields in the remote table GlideRecord`
	`// v_record.setLastErrorMessage(message) - signal an error`

Script definition	Description

	// Sample code:
	// try {
	// update-external-system;
	// if (there-was-an-error) {
	// var message = ...;
	// v_record.setLastErrorMessage(message);
	// }
	// } catch (ex) {
	// var message = ex.getMessage();
	// v_record.setLastErrorMessage(message);
	// }
	})(v_record);

6. Select **Submit**.

Example 1: Retrieving all incident records from an external source

These are examples of script definitions you might create for retrieval and caching of data from sources external to your current instance. In this first example, we create a script to load all incident records from an external source.

For Remote Table API information, refer to:

- v_query – Scoped, Global
- v_record - Scoped, Global
- v_table – Scoped, Global

```
/**
 * Using `v_query`, add the rows to `v_table`
 */
(function executeQuery(v_table, v_query) {
 fetchAllIncidents(v_table, v_query);
 /**
 * fetch all incidents records from the remote instance
 */
 function fetchAllIncidents(v_table, v_query) {
   // Uses RestMessage with name 'Remote Instance Incidents' and function 'All Incidents'
   // Create a RestMessage first which calls an external REST service
   try {
     var restMessage = new sn_ws.RESTMessageV2('Remote Instance
Incidents', 'All Incidents');
     var response = restMessage.execute();
     var responseBody = response.getBody();

     // if REST call ends up in an error, set the last error message which shows up
     // at the bottom of the list view
     if (response.haveError()) {
       v_query.setLastErrorMessage(response.getErrorMessage());
       // can use gs.error() or gs.addErrorMessage() while debugging
       // gs.debug() messages visible in session debugger
       // gs.debug(response.getErrorMessage());
       return;
     }
   } catch (ex) {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    v_query.setLastErrorMessage(ex.message);
    // gs.debug(ex.message);
    return;
   }
   var transformerDefinition = getTransformerDefinition();
   var transformer = new
 sn_tfrm.Transformer(transformerDefinition, responseBody);
   // transformer parses the responseBody and extracts rows
   while (transformer.transform()) {
    // row is field-value map e.g. { active:"true", number: "INC0000001"}
    var row = transformer.getRow();
    // you may do any additional transformations to the row like GlideDuration, GlideDataTime
etc. For example,
    // row.duration = new GlideDuration(row.duration);
    // finally add the row to the remote table
    v_table.addRow(row);
   }
 }
 /**
 * returns a sn_tfrm.TransformerDefinition, which defines the mapping of the table fields and
elements in the response body
 */
 function getTransformerDefinition() {
   // create a rule list to map a field to its element path
   var ruleList = new sn_tfrm.TransformerRuleList()
    .fromJSON()  // the response body is a JSON
    // 'active' field maps to path '$.active'
    .addRule("active", "$.active")
    .addRule("caller_id", "$.caller_id.value")
    .addRule("number", "$.number")
    .addRule("short_description", "$.short_description")
    .addRule("sys_id", "$.sys_id")
    .addRule("updates", "$.sys_mod_count");
   var recordPath = "$.result";
   return new sn_tfrm.TransformerDefinition(ruleList, recordPath);
 }

})(v_table, v_query);
```

These code snippets are of note in this script:

```
function fetchAllIncidents(v_table, v_query) {
   // Uses RestMessage with name 'Remote Instance Incidents' and
 function 'All Incidents'
   // Create a RestMessage first which calls an external REST
 service
   try {
    var restMessage = new sn_ws.RESTMessageV2('Remote Instance
 Incidents', 'All Incidents');
    var response = restMessage.execute();
    var responseBody = response.getBody();

    // if REST call ends up in an error, set the last error
 message which shows up
    // at the bottom of the list view
    if (response.haveError()) {
     v_query.setLastErrorMessage(response.getErrorMessage());
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    // can use gs.error() or gs.addErrorMessage() while
debugging
    // gs.debug() messages visible in session debugger
    // gs.debug(response.getErrorMessage());
    return;
   }
  } catch (ex) {
   v_query.setLastErrorMessage(ex.message);
   // gs.debug(ex.message);
   return;
  }
```

You can create a RestMessage and directly use it in the script. In this example, it uses a RESTMessageV2 API with the name of `Remote Instance Incidents`, and the function `All Incidents`, which gets all incident data. Once a response is returned from the server, an error message appears if problems are encountered in the data retrieval.

Note:
To learn more about use of RESTMessageV2 and how to define a direct message, see RESTMessageV2 - Scoped, Global and Direct RESTMessageV2 example.

If no problems are encountered in the data retrieval, it gets the data body for the records.

```
  var transformerDefinition = getTransformerDefinition();
  var transformer = new
sn_tfrm.Transformer(transformerDefinition, responseBody);
  // transformer parses the responseBody and extracts rows
  while (transformer.transform()) {
   // row is field-value map e.g. { active:"true", number:
"INC0000001"}
   var row = transformer.getRow();
   // you may do any additional transformations to the row like
GlideDuration, GlideDataTime etc. For example,
   // row.duration = new GlideDuration(row.duration);
   // finally add the row to the remote table
   v_table.addRow(row);
```

It then uses the Transformer API to perform any required data transformations, extracts rows, and then adds a row for each record to the remote table.

```
/**
  * returns a sn_tfrm.TransformerDefinition, which defines the
 mapping of the table fields and elements in the response body
  */
 function getTransformerDefinition() {
  // create a rule list to map a field to its element path
  var ruleList = new sn_tfrm.TransformerRuleList()
   .fromJSON() // the response body is a JSON
   // 'active' field maps to path '$.active'
   .addRule("active", "$.active")
   .addRule("caller_id", "$.caller_id.value")
   .addRule("number", "$.number")
   .addRule("short_description", "$.short_description")
   .addRule("sys_id", "$.sys_id")
   .addRule("updates", "$.sys_mod_count");
  var recordPath = "$.result";
  return new sn_tfrm.TransformerDefinition(ruleList,
 recordPath);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 }

})(v_table, v_query);
```

`getTransformerDefinition` defines the schema of the record in the external API response body. It maps each of the fields in the table script to an element in the external record. Any external data elements outside of this mapping are not supported or retrieved.

Note:
You must map a sys_id in the transformer definition to an element in the external data. In this case, the sys_id is mapped to the external incident sys_id. The maximum length of the sys_id is 32 characters. You do this sys_id mapping so forms that use the external data can operate properly.

Example 2: Retrieving specific records from a third-party source

In this example, we create a script to retrieve specific types of incident records from a third-party source.

For Remote Table API information, refer to:

- v_query – Scoped, Global
- v_record - Scoped, Global
- v_table – Scoped, Global

```
/**
 * Using `v_query`, add the rows to `v_table`
 */
(function executeQuery(v_table, v_query) {
 if (v_query.isGet()) {
  bySysId(v_table, v_query, v_query.getSysId());
 }
 else if (v_query.getParameter("caller_id")) {
  byCallerId(v_table, v_query, v_query.getParameter("caller_id"));
 }
 else {
  fetchAllIncidents(v_table, v_query);
 }
 /**
 * fetch all incidents records from the remote instance
 */
 function fetchAllIncidents(v_table, v_query) {
  // Uses RestMessage with name 'Remote Instance Incidents' and function 'All Incidents'
  // Create a RestMessage first which calls an external REST service
  var restMessage = new sn_ws.RESTMessageV2('Remote Instance
Incidents', 'All Incidents');
  loadData(v_table, v_query, restMessage);
 }
 /**
```

```
 * fetches a specific record from the remote instance with Sys Id being `sys_id`
 */
 function bySysId(v_table, v_query, sys_id) {
   // Uses RestMessage with name 'Remote Instance Incidents' and function 'By SysId'
   var restMessage = new sn_ws.RESTMessageV2('Remote Instance
Incidents', 'By SysId');
   // sets variable 'sys_id'
   restMessage.setStringParameterNoEscape("sys_id", sys_id);
   loadData(v_table, v_query, restMessage);
 }
 /**
 * fetches records from the remote instance with Caller (caller_id) being `caller_id`
 */
 function byCallerId(v_table, v_query, caller_id) {
   var restMessage = new sn_ws.RESTMessageV2('Remote Instance
Incidents', 'By CallerId');
   restMessage.setStringParameterNoEscape("caller_id", caller_id);
   loadData(v_table, v_query, restMessage);
 }
 /**
 * Adds rows to `v_table` using `restMessage`
 */
 function loadData(v_table, v_query, restMessage) {
   try {
     var response = restMessage.execute();
     var responseBody = response.getBody();

     // if REST call ends up in an error, set the last error message which shows up
     // at the bottom of the list view
     if (response.haveError()) {
       v_query.setLastErrorMessage(response.getErrorMessage());
       // can use gs.error() or gs.addErrorMessage() while debugging
       // gs.debug() messages visible in session debugger
       // gs.debug(response.getErrorMessage());
       return;
     }
   } catch (ex) {
     v_query.setLastErrorMessage(ex.message);
     // gs.debug(ex.message);
     return;
   }
   var transformerDefinition = getTransformerDefinition();
   var transformer = new
 sn_tfrm.Transformer(transformerDefinition, responseBody);
   // transformer parses the responseBody and extracts rows
   while (transformer.transform()) {
     // row is field-value map e.g. { active:"true", number: "INC0000001"}
     var row = transformer.getRow();
     // you may do any additional transformations to the row like GlideDuration, GlideDataTime
etc. For example,
     // row.duration = new GlideDuration(row.duration);
     // finally add the row to the remote table
     v_table.addRow(row);
   }
 }
 /**
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 * returns a sn_tfrm.TransformerDefinition, which defines the mapping of the table fields and
elements in the response body
 */
 function getTransformerDefinition() {
  // create a rule list to map a field to its element path
  var ruleList = new sn_tfrm.TransformerRuleList()
    .fromJSON()  // the response body is a JSON
   // 'active' field maps to path '$.active'
    .addRule("active", "$.active")
    .addRule("caller_id", "$.caller_id.value")
    .addRule("number", "$.number")
    .addRule("short_description", "$.short_description")
    .addRule("sys_id", "$.sys_id")
    .addRule("updates", "$.sys_mod_count");
  var recordPath = "$.result";
  return new sn_tfrm.TransformerDefinition(ruleList, recordPath);
 }
})(v_table, v_query);
```

These code snippets are of note in this script:

```
function fetchAllIncidents(v_table, v_query) {
  // Uses RestMessage with name 'Remote Instance Incidents' and
 function 'All Incidents'
  // Create a RestMessage first which calls an external REST
 service
  var restMessage = new sn_ws.RESTMessageV2('Remote Instance
 Incidents', 'All Incidents');
  loadData(v_table, v_query, restMessage);
 }
```

You can create a RestMessage and directly use it in the script. In this example, it uses a RESTMessageV2 API with the name of `Remote Instance Incidents`, and the function `All Incidents`, which gets all incident data. Once a response is returned from the server, an error message appears if problems are encountered in the data retrieval.

```
 function bySysId(v_table, v_query, sys_id) {
  // Uses RestMessage with name 'Remote Instance Incidents' and
 function 'By SysId'
  var restMessage = new sn_ws.RESTMessageV2('Remote Instance
 Incidents', 'By SysId');
  // sets variable 'sys_id'
  restMessage.setStringParameterNoEscape("sys_id", sys_id);
  loadData(v_table, v_query, restMessage);
 }
```

When you query a specific record using `GlideRecord.get("<sys_id>")`, then `v_query.isGet()` is `true`. It fetches the specific record from the external service.

```
function byCallerId(v_table, v_query, caller_id) {
  var restMessage = new sn_ws.RESTMessageV2('Remote Instance
 Incidents', 'By CallerId');
  restMessage.setStringParameterNoEscape("caller_id",
 caller_id);
  loadData(v_table, v_query, restMessage);
 }
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can also handle any other specific query conditions in the script, such as using `caller_id` in the preceding code snippet. The remainder of this script operates in a manner similar to Example 1.

```
 function getTransformerDefinition() {
  // create a rule list to map a field to its element path
  var ruleList = new sn_tfrm.TransformerRuleList()
   .fromJSON() // the response body is a JSON
   // 'active' field maps to path '$.active'
   .addRule("active", "$.active")
   .addRule("caller_id", "$.caller_id.value")
   .addRule("number", "$.number")
   .addRule("short_description", "$.short_description")
   .addRule("sys_id", "$.sys_id")
   .addRule("updates", "$.sys_mod_count");
  var recordPath = "$.result";
  return new sn_tfrm.TransformerDefinition(ruleList,
 recordPath);
 }
})(v_table, v_query);
```

If no problems are encountered in the data retrieval, it gets the data body for the records. It then uses the Transformer API to perform any required data transformations, extracts rows, and then adds a row for each record to the remote table.

`getTransformerDefinition` defines the schema of the record in the external API response body. It maps each of the fields in the table script to an element in the external record. Any external data elements outside of this mapping are not available in the remote table.

Example 3: Insert a record in an external source

In this example, we create a script to insert an incident record into the external source.

For Remote Table API information, refer to:

- v_query – Scoped, Global
- v_record - Scoped, Global
- v_table – Scoped, Global

```
(function executeInsert(v_record) {
 var gr = new GlideRecord("incident");
 gr.setNewGuidValue(v_record.sys_id);

 delete v_record["sys_id"];
 gr.number = v_record.u_number;
 gr.short_description = v_record.u_short_description;
 if (!gr.insert()) {
  v_record.setLastErrorMessage("Error on insert: " +
 gr.getLastErrorMessage());
 }
})(v_record);
```

Example 4: Update a record in an external source

In this example, we create a script to update an incident record in the external source.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If multiple users update the same record at the same time, the value on the remote system is from the last update call executed.

For Remote Table API information, refer to:

- v_query – Scoped, Global
- v_record - Scoped, Global
- v_table – Scoped, Global

v_changed_fields is a map of changed field names and values.

```
(function executeUpdate(v_record, v_changed_fields) {

 var gr = new GlideRecord('incident');
 if (gr.get(v_changed_fields.sys_id)) {
  Object.keys(v_changed_fields).map(function(k) {
    switch (k){
    case "u_number" :
     gr.number = v_changed_fields.u_number;
     break;
    case "u_short_description" :
     gr.short_description =
 v_changed_fields.u_short_description;
     break;
   }
  });
 gr.update();
} else {
 v_record.setLastErrorMessage("Missing record to update, " +
 v_changed_fields.sys_id);
}

})(v_record, v_changed_fields);
```

Example 5: Delete a record in an external source

In this example, we create a script to delete an incident record from the external source.

For Remote Table API information, refer to:

- v_query – Scoped, Global
- v_record - Scoped, Global
- v_table – Scoped, Global

```
(function executeDelete(v_record) {

     var gr = new GlideRecord('incident');
     if (gr.get(v_record.sys_id)) {
         gr.deleteRecord();
     } else {
         v_record.setLastErrorMessage("Record not found");
     }
 })(v_record);
```

Create a flow definition for a remote table

Build and create a flow for a remote table so that you can retrieve data from an external source with it.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Remote Tables** > **Definition**.
   A list of all remote tables definitions shows up.
2. Click **New** to create a new flow definition.
3. On the form, fill in the fields.

Control	Description
Name	Name of the script that you are creating to associate with the selected remote table.
Table	Name of the remote table that you want to associate the script that you are creating. ○ For a remote table in a scoped application, the name is prefixed with a namespace identifier and the string `st_` to indicate that it's remote and part of an application. ○ For a remote table in the global application, the name is prefixed with the string `u_st_`.
Flow	Option to build and define your own flow by leveraging the existing functions. Configure the mapping of the flow and tie it to thee required remote table. When the remote table is queried, the flow is triggered and the data is retrieved. See Defining the flow for more information. **Note:** The Script section doesn't show up when the **Flow** field has an entry.
Application	Application that is associated with this remote table. If you are working on an application or are creating a remote table from an application record, the field defaults to that application. Otherwise, the field defaults to **Global**. Any records that are created from the table record, such as modules and security rules, are assigned to this application by default.
Active	Option for activating the script that you are associating with the remote table. You can have multiple inactive script definitions for a remote table, but can only have one active script definition.
Advanced	Option to access the Caching section to designate how the memory caching should operate in the ServiceNow AI Platform for this remote table. **Note:** Only advanced users should set caching parameters for a remote table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the Caching section, designate how this data is cached and how long the data is cached in the memory of the ServiceNow AI Platform:

Field	Description
Cache TTL	Cache time to live, expressed in seconds, that external data is cached in memory for this remote table script definition. For example, enter 300 to cache the data in the memory for 5 minutes. The maximum value you can enter is 60 minutes (3600 seconds).
Enhanced Capacity	Option to select the enhanced capacity to support more than 1000 rows in a remote table. **Note:** If the data size that is retrieved from the external source is small, use the 1000 rows default limit in a remote table to minimize query times. You can select the **Enhanced Capacity** field if the retrieved data size is large and can be less performative.

Note:
By default, the external data is cached in the memory by user.

5. Click **Submit**.

Define a flow logic

Set the triggers and actions to define a remote table flow logic.

Before you begin
Role required: admin

Procedure

1. Select the **Flow** field on the flow definitions form.
   The Flow properties dialog box shows up.
2. Set the **Trigger** and link the required remote table.
   For the set trigger, the flow pills get created in the right nav.
3. Set the action items in the Create Remote Table Record section.

   a. Set the Action as Create Remote Table Record.

   b. Drag and drop the Query ID pill from the right nav.

   Note:
   The Query ID is the id of the query that triggered the execution of the flow. It is a mandatory step to pass the Query ID to the Create Remote Table Record action to associate the Trigger to the Action.

   c. Select **Done** to save the action.

4. **Optional:** Add conditions to the flow logic if you want to create a different flow path.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Fill up the Condition Label field.

b. Set the condition by dragging and dropping the Query Parameter pill from the right nav.

c. Select the add function icon next to the Query Parameter pill to add specifics.
The Search Transform Functions dialog box shows up.

d. Go to **Utilities** and select the next function depending on the Query Parameter type.
For example, if the condition is set to search for a name, you can go to **Utilities** > **Get Item from Name/Values**. Fill up the **Key** details and select **Apply**. The **Key** field needs to specify the parameter you are looking for.

> **Note:**
> Ensure that the **Key** is the same as the Column name and not the Label name.

5. **Optional:** Add a log to the flow logic.
   a. Select Log as the **Action** and select a **Level**.
   b. Set the Message field by dragging and dropping the Query Parameter pill from the right nav.
   c. Select **Done** to create logs for the set condition.

Debugging remote table script definitions

You can enable session debugging for remote table script definitions. To enable script definition logging in a session debug log, set the *glide.script.vtable.log.debug* property to **true**.

When you create remote table script definitions, you can use the `gs.debug()` command to add debug logs that are visible in the session debugger. The session debugger also contains debug logs with [RemoteTable] tags, each with the following information:

- Query definition
- Number of rows loaded in the remote table
- Number of aggregate rows `(if GlideAggregate)`

Prolonged use of the *glide.script.vtable.log.debug* property can affect performance, so it is best to set its value to **false** when you finish a debugging session.

> **Note:**
> If you are not on the application node that processed your remote table script, you may not see the resulting log statements. In this case, contact Technical Support.

Use the *v_query.setLastErrorMessage(message)* API to set the last error message that appears at the bottom of the list view. In script, you can retrieve this message using the *glideRecord.getLastErrorMessage()* API. To learn more about these APIs, see Text-To-Display.

Domain separation and remote tables

Domain separation is unsupported in remote tables. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: No support

- The domain field may exist on data tables but there is no business logic to manage the data.
- This level is not considered domain-separated.

For more information on support levels, see Application support for domain separation.

Overview

Domain separation provides complete data isolation for domain-specific users.

How domain separation works with remote tables

When you create standard internal tables, you can add a sys_domain field, which results in domain separation of the data that is stored in the table. This functionality is not supported when you natively create remote tables, which results in lack of domain separation for rows that are added to a remote table.

However, script definitions that you create and associate with a remote table can be domain (data) separated. When you create the script, you can include DomainSupport APIs that provide domain separation support. If the script definition is domain separated, only users that belong to the designated domain can view the data in the remote table.

Document Services

Take care of all your documentation through ServiceNow® Document Services. Get storage space and tracking for large amounts of documents with Document Management. Examine files up to 50 MB without downloading, by using Document Viewer. Access to electronic documents is easily controlled through Managed Documents, with adjustable user parameters. Integrate third-party providers for document handling, including Microsoft OneDrive, Microsoft Entra ID, and more.

Knowledge Management

Keep your users up to date with knowledge bases crafted to fit with your ServiceNow instance. The Knowledge Management plugin enables sharing of articles for task resolution, self-help, troubleshooting, and any other information pertinent to your enterprise. Create and maintain articles, control access for reading, contribution, and feedback, and delegate administrative roles as needed for multiple groups and separate workflows.

Response templates

Resolve cases or support issues faster and more efficiently with response templates, which are reusable snippets of text. Use response templates in Agent Chat sessions to provide quick and consistent messages to your users.

Document Services

Document Services provides a broad range of services related to document management, creation, maintenance, and conversion, and integrating with third parties such as Microsoft SharePoint.

Document Management

Manage large numbers of documents efficiently

Document Viewer

View documents directly in the ServiceNow AI Platform®

Managed Documents

Control documents within your instance

Benefit	Feature
Maintain versions of documents. Versions can be a file or a URL.	Document versions
Link a document record to other records, which can be any other table or record on the platform.	Document references
Link documents to other records on the platform.	Linking documents to a parent record
Create document lists and add multiple documents to a single list.	Document Management lists
Include documents in activity streams to include and track updates on attached documents to any record.	Document attachments in an activity stream
Send documents for review and approval before publishing.	Document approval and publish process
Digitally sign PDF documents by using your Personal Identity Verification (PIV) or Common Access Card (CAC) card.	Digital signature for PDF documents using CAC or PIV smart cards
Integrate Document Management with external cloud providers for editing, sharing and collaborating on documents.	Document Management integration with external content providers
Redact sensitive data from documents.	Redact sensitive data from documents

Document Management plugin

With the ServiceNow® Document Management plugin (**com.snc.platform_document_management**), you can create documents, manage large numbers of documents efficiently, and track each version. The plugin is independent, with no dependencies on existing plugins and has been built on the existing **sys_attachment** framework.

Overview

There are Document Management roles the system admin can assign to maintain the lifecycle of documents. The system admin installs the plugin and then assigns one or more of these roles to users.

The system admin installs the Document Management plugin (**com.snc.platform_document_management**).

The application contains four modules:

- Documents
- References
- Lists
- List Entries

Activate Document Management

Activate the Document Management plugin.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The following items are installed with Document Management:

- Roles
- Tables

For more information, seeComponents installed with Document Management.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Document Management plugin (com.snc.platform_document_management) using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Document security and access

Document access permissions for users and groups provide you with security for your documents.

Owner access to documents

By default, the document owner has all privileges to the document and can do the following:

- Update the document parameters
- Upload document versions
- Create document references
- Share a document with other users
- Delete a document

Note:

If the document owner changes, the new owner obtains all rights to the document and the previous owner loses access. If the previous owner wants to keep access to the document, the document should be shared instead of transferring owner access.

Document access settings

You can access documents through three different settings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Document access settings

Access	Description
By referenced records	When a document is referenced to a parent record, any user with access to the parent record has access to the document.
Admin access	All document users with admin access can access the document.
Shared permissions	Enables sharing a document with other users as Reader, Writer, or Owner at different permission levels such as: • User Permissions • Group Permissions • Role Permissions • User Criteria Permissions

Sharing permissions and roles

Users can give permissions to other users based on their own access to the document. The permission levels are:

- Owner
- Writer
- Reader

To share documents with other users and groups you must have write access to the document record and roles to share at different levels.

Sharing permissions and roles

Sharing permissions	User permissions required	Role required
User Permissions	All users even if they don't have a role assigned	No role required. All users can share documents with other user
Group Permissions	Writers and Owners can assign access based on their access permissions	dm_user_group_read
Role Permissions	Writers and Owners can assign access based on their access permissions	dm_user_role_read
User Criteria Permissions	Writers and Owners can assign access based on their access permissions	dm_user_criteria_read

Share documents with users

Assign Reader, Writer or Owner permissions to users to enable them to read, download, update, or delete documents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: none

About this task
User permission is assigned to all users, even if they don't have a role assigned.

Procedure
1. Navigate to **Documents** > **Documents**.
2. Open the document record.
3. Select the **Sharing Permissions** check box.
4. Select the **User Permissions** tab.
5. Select **New** and select the permission level from the drop-down list.
6. Select the record for the user you want to assign permission to.
7. Click **Submit**.

Share documents with groups

As a Writer or Owner, assign access to user groups based on your access permissions.

Before you begin
Role required: dm_user_group_read

Procedure
1. Navigate to **Documents** > **Documents**.
2. Open the document record.
3. Select the **Sharing Permissions** check box.
4. Select the **Group Permissions** tab.
5. Select **New** and select the permission level from the drop-down list.
6. Select the user group you want to assign permission to.
7. Click **Submit**.

Share documents with roles

As a Writer or Owner, assign access and permissions based on user roles.

Before you begin
Role required: dm_user_role_read

Procedure
1. Navigate to **Documents** > **Documents**.
2. Open the required document record.
3. Select the **Sharing Permissions** check box.
4. Select the **Role Permissions** tab.
5. Select **New** and select the permission level from the drop-down list.
6. Select the user role you want to assign permission to.
7. Click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Share documents with user criteria

As a Writer or Owner assign access to a document based on the user criteria permissions.

Before you begin

Role required: dm_user_criteria_read

Procedure

1. Navigate to **Documents** > **Documents**.
2. Open the document record.
3. Select the **Sharing Permissions** check box.
4. Select the **User Criteria Permissions** tab.
5. Select **New** and select the permission level from the drop-down list.
6. Select the user criteria you want to assign permission to.
7. Click **Submit**.

Using Document Management

Use Document Management to easily upload, retrive, share, publish, and delete documents.

Document repository

In the Document Management application, you can create, view, update, share documents in the document repository. When new documents are created, they’re placed into a record with metadata such as name, description, type, and so on. The record contains all the versions of the document so you can track and update the documents.

You can access the document by opening one of its versions. A document can contain numerous versions. The document record contains references to the documents and not contain actual document files.

When you want to add a document to a record, upload it as an attachment. Each time you update the document, you can create a new version. Alternatively, you can provide the link to a document in the URL field. You can include the review and approval workflow before publishing a document.

You can generate and share the document link with authorized users for collaboration or to include the link on any page. The default version of the shared document will have public access and can be accessed by anyone within or outside the organization.

Create a document record

Create document records and include default versions for the documents.

Before you begin

Role required: none

Procedure

1. Navigate to **All** > **Documents** > **Documents**.
2. Select **New**.
3. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

New document record fields

Field	Description
Name	Name of the document.
Owner	Name of the document owner.
Reviewers	Name of the reviewers if any.
Template	Option to determine whether the document is a template.
Department	Name of the department that created the document.
Type	The type of document based on the content: guideline, policy, procedure, or contract.
Classification	Classification of the document: public, restricted, or confidential.
Audience	Audience of the document, either internal or external. **Note:** The **Audience** field is hidden in the default view.
State	The state the document is in: Draft, Submit, Review, or Complete.
Description	A brief description about the document.
Default Version	The document version that is used for document download. By default, the latest version is the default version.

4. Select the access setting.
5. Select **Submit**.

Document versions

In the ServiceNow® Document Management application, documents display as versions in the record. You view these versions as a related list within the document record. A document can have many versions.

The term "document" refers to the container record that holds document information such as its name, description, type and other metadata. While the document record doesn't contain the actual document file, it does contain versions in the record, which you can open, update, and track.

Use the Attachment icon (📎) to add documents to a record.

Alternatively, you can provide the link to a document in the URL field. You then access the actual documents by selecting the versions in the related list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Document version review and approval

All approver and reviewer users have read access to the documents that they're approving.

A document can have a reviewer or multiple reviewers and no approvers and vice versa. Users with admin and platform_document_management_admin roles have the option to create approval and review rules.

Document owners have the option to:

- Initiate approval and review workflow for a document version.
- Publish the approved version.
- See the activity stream of the approval and review workflow.
- Track the document **Version State**.

For multiple document versions, the latest reviewed and approved version gets published and the previous versions are retired.

Create a document version

Create a document version for each document.

Before you begin

Role required: none

Procedure

1. Navigate to **All** > **Documents** > **Documents** and click the document record.
2. Scroll down to **Versions** tab.
3. Select **New**.
4. Select the file type you want to upload and add any information related to the file under **Notes**.
   - To upload a file, select **Attachment**, select the file icon, and select the file.
   - To link to a document, select **URL** and provide the link.
5. Select **Submit**.
6. To submit the version for review and approval, go back and select the version and select **Submit Version**.

Download a document

Download an attached document version based on the selected default version.

Before you begin

Role required: none

About this task

Note:
To download a document, the version file type must be an attachment and not a URL.

Procedure

1. Navigate to **All** > **Documents** > **Documents**.
2. Select the record.
3. Select the **Documents** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select the documents you want to download.
5. In the **Actions on selected rows** drop-down menu, select **Download Document**.

Share a document link

Create a shared link with public access to share and download a document for collaboration.

Before you begin
Role required: owner or writer

About this task
The **Share document** button is visible only when the document has a valid default version.

Procedure
1. Navigate to **All** > **Documents** > **Documents**.
2. Select the record that you want to share the document link for.
3. In the record, select **Share Document**.
4. For Link Validity, select **Permanent** to keep the link permanently, or select **Expire Link On**, and select the link expiry date.
5. Select the copy link icon ( ) to copy and share the document link to download the document.

> **Important:**
> The permalink generated can be accessed publicly irrespective of the document classification.

6. Select **Done**.

Modify a shared link access

Modify the document shared link access to make the link inactive or change the expiration date.

Before you begin
Ensure that the Permalinks table is added in the related list.

Role required: owner or writer

Procedure
1. Navigate to **All** > **Documents** > **Documents**.
2. Scroll down to the **Documents Permalinks** tab.
3. For the document:
   - To make the link inactive, in the Active column, select **false**.
   - To add or modify the expiry date, in the Expiration column, select the date.

> **Important:**
> The permalink generated can be accessed publicly irrespective of the document classification.

Delete a document link

Delete a shared link to remove existing user access to the document.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: owner or writer

Procedure

1. Navigate to **All** > **Documents** > **Documents**.
2. Select the record that you want to share the link for.
3. In the record, select **Share Document**.
4. Select the delete icon ( ) to delete the shared link.
5. In the dialog box, select **Delete** to confirm.

Delete documents

Delete documents in the document repository.

Before you begin
Role required: admin with admin access

or

Access permission: owner

or

User: owner

Procedure

1. Navigate to **All** > **Documents** > **Documents**.
2. Either delete a single document or multiple documents.
   - To delete a single document, open the document record and select **Delete**.
   - To delete multiple documents, select the document record entries, and from the Actions on selected rows drop-down menu, select **Delete**.

Document approval and publish process

A reviewer approves or rejects the document. A document can have multiple reviewers. During the approval process, the approver approves or rejects the document. A document goes through the approval process after the review process. A document is published after the review and approval process.

A document can have a reviewer or multiple reviewers and no approvers and vice versa. You must have the platform_document_management_admin or admin role to create approval and review rules.

Users who can create documents have the option to do the following:

- Add approvers and reviewers to a document.
- Initiate the approval and review workflow for a document version.
- Publish the approved version.
- See the activity stream of the approval and review workflow.

All approvers and reviewers have read access to the documents that they’re approving.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Document approval revision rule

The document approval and revision rule is created based on the conditions defined in the condition builder to determine which documents use the approval rule. After the approval rule is saved, reviewers and approvers are added if the conditions in the Condition field are met.

Note:
Document reviewer and approver directly added from the document record aren't added to the Document approval and revision rule.

Document review

If the reviewer rejects the document, the author and owner are notified and the review is canceled. The author, owner, and reviewer should discuss what changes must be made to the document. If the reviewer approves the document, the author and owner are notified that the review was successful, and the document can move to the approval stage. If multiple reviewers are assigned to a document, the first reviewer to act dictates what happens to the document. For example, there are two reviewers, A and B.

If reviewer A acts first and rejects the document, the review process stops and the revision state is set to Canceled. Reviewer B receives a notification email stating that the review was rejected and the status is changed to No Longer Required. If reviewer A acts first and approves the document, the review process stops and the document can move to the approval stage. Reviewer B's status is changed to No Longer Required.

Document approval

After the document has been reviewed, submit the document for approval. If the document doesn't have an approver, the approval process is omitted.

If the final approver approves the document, the author and the owner are notified. After the final approval is successful, the document stage changes to Ready for Publishing in the Document versions list.

If there are multiple approvers, the approval process works in sequence, and multiple approvers can be assigned to a single sequence. For example:

- Sequence 1: Approvers A and B
- Sequence 2: Approvers C and D
- Sequence 3: Approver E

The sequences take place in ascending chronological order, approvers A and B receive the approval request first (approvers C, D, and E aren't part of the process yet). Similar to the review process, the first approver to act within a sequence dictates what happens to the document. If approver A acts first and rejects the document, the approval process stops and the state is set to Canceled. Approver B's status is changed to No Longer Required. If approver A acts first and approves the document, the process stops and approver B's status is changed to No Longer Required. The document then moves to approval sequence 2. After at least one approver in each sequence approves the document, the author and the owner are notified that the document has been approved.

Publish a document

After a document has been created and edited, the revision can be submitted for draft review and final approval. After final approval, the document can be published.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If the approval and publishing process is repeated, the published revision is retired when the new revision is published. Any workflows running against previous revisions are canceled when the document is published.

Create a document approval revision rule

Create a document approval revision rule for the document review and approval process.

Before you begin

Role required: platform_document_management_admin or admin

Procedure

1. Navigate to **All** > **Documents** > **Approval and Revision Rules**.
2. On the form, fill in the fields.

Approval revision rule form

Field	Description
Name	A unique identifier for the approval rule.
Description	A short description of the approval rule.
Document Conditions	A condition builder that determines which documents use this approval rule.
Active	Activates the rule.

3. Select **Submit**.

Add a reviewer

Add a single or multiple reviewers to the document approval and review rule for document review.

Before you begin

Role required: platform_document_management_admin or admin

About this task

The procedure described in this task applies to newly created records. For existing records, go to the document record, select the additional actions icon (☰) and select **Refresh Approvers and Reviewers** to match the rules and add reviewers.

Note:
Document reviewers can be directly added through the document record but they aren't added to the Document approval and revision rule.

Procedure

1. Navigate to **All** > **Documents** > **Approval and Revision Rules**.
2. Go to the rule that you want to add a reviewer or approvers to.
3. Select the **Reviewers** tab.
4. Select **New**.
5. In the **Reviewer** field, enter the name of the reviewer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Select **Submit**.
7. Repeat steps 3–6 to add multiple reviewers.

Add an approver

Add a single or multiple approvers to the document approval and review rule for document approval.

Before you begin
Role required: platform_document_management_admin or admin

About this task
The procedure described in this task applies to newly created records. For existing records, go to the document record, select the additional actions icon (☰) and select **Refresh Approvers and Reviewers** to match the rules and add approvers.

> **Note:**
> The document reviewer and approver can be directly added through the document record but they aren't added to the Document approval and revision rule.

Procedure
1. Navigate to **All** > **Documents** > **Approval and Revision Rules**.
2. Go to the rule that you want to add a reviewer or approvers to.
3. Select the **Approvers** tab.
4. Select **New**.
5. In the **Approvers** field, enter the name of the reviewer.
6. In the **Sequence** field, enter the sequence for the approver.

> **Note:**
> The document is sent to approvers in ascending order based on the sequence number entered. If two approvers have the same sequence number, only one approver's approval is needed to move on to the next approver in the sequence or to publish the document if there’s no approver in the sequence.

7. Select **Submit**.
8. Repeat steps 3–7 to add multiple approvers.

Send a document version for review and approval

Send a document version for review and approval before publishing the document.

Before you begin
Role required: none

Procedure
1. Navigate to **All** > **Documents** > **Documents**.
2. Select the document record.
3. Select the version and select **Submit Version**.

Approve or reject a document version

Approve or reject a document version after the review process is complete.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: approver_user

Procedure

1. Navigate to **All** > **Self-Service** > **My Approvals**.
2. Select the requested document for approval.
3. Select **Approve** to approve the document version or select **Reject** to reject the document version.

Approve or reject a document version through email

Approve or reject a document version request directly from your email.

Before you begin
Role required: approver_user

Procedure

1. Open the approval request email.
2. Select **Click here to approve** to approve the document version or select **Click here to reject** to reject the document version.

Publish a document

Publish a document revision that has been approved.

Before you begin
Role required: none

About this task
After a document has been created and edited, a version can be submitted for draft review and final approval. After the final approval, the document can be published. The published version becomes the default version of the document.

Procedure

1. Navigate to **All** > **Documents** > **Documents**.
2. Select the document record.
3. Scroll down to the **Versions** tab.
4. Select the document version that has been approved.
5. Select **Publish Version**.

Digital signature for PDF documents using CAC or PIV smart cards

Use digital signatures to make the document signing experience seamless and to eliminate manual intervention by using your Personal Identity Verification (PIV) or Common Access Card (CAC) smart card.

CAC or PIV cards

The Common Access Card (CAC) and Personal Identification Verification (PIV) are smart cards used for general identification and authentication of user access. CAC and PIV hold a unique digital certificate and user information such as a photograph, personal identification number (PIN), and signature to identify each user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sign PDF documents

ServiceNow enables you to integrate with Adobe, as well as configure and use PIV or CAC smart cards as an authenticator for digital signing of PDF documents. This integration provides the flexibility to use PIV or CAC cards to safeguard critical and valuable assets.

The Adobe Acrobat Reader desktop application enables you to digitally sign a PDF with CAC or PIV smart cards.

Note:
You should do the following to digitally sign a PDF with CAC or PIV smart cards:

- Install Adobe Acrobat Reader on your desktop.
- Configure your Google Chrome or Mozilla Firefox browser to open downloaded PDFs in Adobe Acrobat Reader.

Document template for digital signature

Digital signing for documents is configured with a document template. You must define document templates and signing workflows for digital signature using smart cards to generate and send auto-filled documents to be signed by different participants.

To configure digital signing for CAC or PIV smart cards, the following must be done:

- Use Document Templates to create and upload a PDF document
- Set up certificates in the sys_ca_certificate table
- Set up a map certificate in the sys_user_certificate table
- Review the *com.snc.pdfsigning.validation.method* property
- Sign and review the PDF document

Install Document Template integration with digital signatures using a smart card

You can install the Document Template integration with Digital Signatures using Smart Cards application (com.sn.dt-digital-signature-smart-card-integration) if you have the admin role.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.

Role required: admin

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Document Template integration with Digital Signatures using Smart Cards application (com.sn.dt-digital-signature-smart-card-integration) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

   In the list next to the **Install** button, the versions that are available to you are displayed.
3. Select a version from the list and select **Install**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In the Review Installation Details dialog box, any dependencies installed with your application are listed.

4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. Select **Install**.

Set up a document template for signing documents using a CAC or PIV smart card

Set up a document template for PDF using a Common Access Card (CAC) or Personal Identification Verification (PIV) card. Set up certificates to automate and simplify the process of filling, reviewing, and signing a document online.

Before you begin

Adobe Acrobat Reader must be installed on your desktop.

The Document Templates application must be installed. For more information, see Configuring Document Templates.

Role required: sn_doc.admin, sn_doc.reader, or admin

Procedure

1. Create a document template.
   a. Configure a PDF document template.

      Note:
      The **Signing type** field should be **Digital Signature Smart Cards**.

   b. Map fields for the PDF document template

   c. Select **Edit Document Preview** to define the label and placement of the button to submit the signature.

   d. Create participants for the PDF document template.

   e. To map templates to participants, go to the **Template Mapping** tab, select the field name, and add the participant name, and to map fields, select the field from the **Mapping field** drop-down menu.

      Note:
      The text fields can have pre-filled values mapped, and the digital signature field types should be mapped to the participants.

   f. Select **Update**.

   g. Select **Publish**.

2. Set up Certificate-based authentication.
3. Configure your browser settings to automatically open the downloaded PDF documents in Adobe Acrobat Reader.

   For Google Chrome, see PDF download setting for Google Chrome.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For Mozilla Firefox and Apple Safari, see Configure browser to use the Adobe PDF plug-in to open online PDF files.

4. Configure Adobe Acrobat Reader to add your download location as your Privileged Location.
   a. In Adobe Acrobat Reader, go to **Preferences** > **Security (Enhanced)**.
   b. Select **Add Folder Path** and add your download location as your Privileged Location.
   c. Select **OK**.

What to do next

Sign document templates for PDF documents using CAC or PIV smart card

Property value for digital signature using CAC or PIV smart cards

Specify the method that will be used to identify and validate the user who has signed the PDF using the *com.snc.pdfsigning.validation.method* property.

The property value *com.snc.pdfsigning.validation.method* is used for identifying and validating the user who has signed the PDF. Identifying the user is necessary to validate whether the correct user has signed the PDF. The IT team of a customer can define the way to validate a PDF depending on their policies and issued certificates.

Property value and action

Value	Action
common_name	Uses the Common Name (CN) field in the Subject of the certificate to check if a certificate exists in the sys_user_certificate table that is associated with a user.
email	Uses the email IDs in the certificate to locate a user in ServiceNow with a matching email ID.
any (default value)	Utilizes both of the above validation methods to resolve a user.
ignore	No user validation is performed on the signing fields.

Sign document templates for PDF documents using CAC or PIV smart card

Use the PDF document template to initiate digital signing, review, and generate a filled PDF document using a Common Access Card (CAC) or Personal Identification Verification (PIV) card.

Before you begin

Adobe Acrobat Reader must be installed on your desktop.

A document template must be set up for signing documents. For more information, see Set up a document template for signing documents using a CAC or PIV smart card.

Role required: none

About this task

Procedure

1. Initiate the PDF document signing process with a custom implementation using script.
   For more information, see Using Document Templates: Custom use case.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
HR cases can skip this step as custom implementation using scripts is for cases related to non-HR applications.

2. Sign the PDF document in Service Portal.
   - To navigate through the Employee Center, navigate to **All** > **Self-Service** > **Employee Center**.
   - To navigate through My Document Tasks, navigate to**Self-Service** > **My Document Tasks**.
3. Select the document task that is assigned to you.
4. Review the PDF document and select **Sign Document** to sign the document or **Reject** to reject the document.
   The signed document opens as a PDF document in Adobe Acrobat Reader.
5. Go to the sign location to click and select the mapped certificate or Digital ID file.
6. Enter the password for the Digital ID file, select **Sign**, and save the signed copy.
7. In the PDF document, select send to send the signed PDF document.
   The signed document is uploaded to the document task for verification.
8. Go to the **My Document Tasks** and select the document, review and select **Validate Document** to validate the document or select **Reject** to reject the document.
   The signature is successfully captured and authenticated after document validation.

Review the digitally signed document

Review the digitally signed PDF document to either approve or reject it.

Before you begin

Role required: none

Procedure

1. Navigate to your Document Tasks through either the Employee Center or through My Document Tasks.
   - To navigate through the Employee Center, navigate to **All** > **Self-Service** > **Employee Center**.
   - To navigate through My Document Tasks, navigate to**Self-Service** > **My Document Tasks**.
2. Select the document template task assigned to you and review the document.
3. To approve or reject the document, do one of the following.
   - To approve the document, select **Approve**.
   - To reject the document, select **Reject** and provide a reason for the rejection.

Document references

References are used for linking a document record to other records, which can be any other table or record on the platform.

A reference is a link or mapping between a document and a target or a parent record.

You can add references directly and view all document references in other records across the platform by navigating to **Documents** > **References**.

You can create and link document references directly from references or from the document record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create document references from document record

Link the document record to other records in any other table or record.

Before you begin
Role required: none

Procedure

1. Navigate to **Documents** > **Documents**.
2. Select the document.
3. In the **Document References** tab, select **New**.
   In the dialog box, the **Document** field reflects the document you selected.
4. In the **Target Record** field, select the Lookup documents using list icon .
5. In the Select the document dialog box, for the **Table name** field, select the table for the record you want to link the document to.
6. In the **Document** field, select the Lookup using list icon ( ) and select the record to which you are linking the document.
7. Select **OK**.
8. Select **Submit**.

Create document reference from References

Link document references to any record directly from the References list. You can easily see all documents linked to tables and target records.

Before you begin
Role required: admin

About this task

Procedure

1. Navigate to **Documents** > **Documents** > **References**.
2. Select **New**.
3. Select the document.
4. In the **Target Record** field, select the Lookup documents using list icon .
5. In the Select the document dialog box, for the **Table name** field, select the table for the record you want to link the document to.
6. In the **Document** field, select the Lookup using list icon ( ) and select the record to which you are linking the document.
7. Select **OK**.
8. Select **Submit**.

Delete a document reference from document record

Remove and unlink a document reference from a document record.

Before you begin
Role required: admin with admin access

or

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Access permission: owner

or

User: owner

About this task

Note:
This action unlinks the document but does not delete the document.

Procedure

1. Navigate to **Documents** > **Documents**.
2. Select the document.
3. In the **Document References** tab, select the documents you want to unlink.
4. In the **Actions on selected rows** drop-down menu, select **Remove**.

Linking documents to a parent record

Documents can be linked to records referred to as "parent records." You can create a document version and reference it through a parent record. You can also view, edit, download, or delete document references in the parent record.

Note:

The terms "other record" and "parent record" are used interchangeably and refer to any records to which documents are linked.

You can use references to link a document record to any other table or record on the platform.

Enable viewing related documents in a parent record

Add the Documents related list to the record to be able to link and view documents related to the record.

Before you begin

Role required: admin

Procedure

1. Navigate to the record, (for example, Incident, Interaction, and so on).
2. Select the Additional Actions icon ( ) and select **Configure** > **Related Lists** .
3. Move **Documents** from the Available list to the Selected list.
4. Select **Save**.

Result

The Documents related list is added to the related lists available in the record.

Create a document record in a parent record

Add documents to a parent record so they are available for downloading, sharing, or viewing directly from the record.

Before you begin

Role required: none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the record (for example, Incident).
2. Select the **Documents** tab.
3. Select **New**.
4. On the form, fill in the fields.

New document record fields

Field	Description
Name	Name of the document.
Owner	Name of the document owner.
Reviewers	Name of the reviewers.
Template	Option to determine whether the document is a template.
Department	Name of the department.
Type	The type of document based on the content, for example, guideline, policy, procedure, or contract.
Classification	Classification of the document such as public, restricted, or confidential.
Audience	Audience of the document, either internal or external.
State	The state the document is in: Draft, Submit, Review, or Complete.
Description	A brief description about the document.
Default Version	The document version used for document download. By default, the latest version is the default version.

5. Select the access settings.
6. Click **Submit**.

Upload a document version in a parent record

Upload a document version for each document in the parent record.

Before you begin

Role required: none

Procedure

1. Navigate to the record (for example, Incident).
2. Select the **Documents** tab.
3. Right-click the document name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select **Upload Version**.
5. Select the file type you want to upload and add any information related to the file under **Notes**.
   - To upload a file, select **Attachment**, select the file icon, and select the file.
   - To link to a document, select **URL** and provide the link.
6. Select **OK**.

Related topics

Create a document version

Download a document from its parent record

Download documents related to a parent record directly from the record.

Before you begin
Role required: none

About this task

Note:
To download a document, the version file type must be an attachment and not a URL.

Procedure

1. Navigate to the required record (for example, Incident).
2. Select the **Documents** tab.
3. Select the documents you want to download.
4. In the **Actions on selected rows** drop-down menu, select **Download Document**.

Link existing documents to a parent record

Link documents that are in your repository to a parent record.

Before you begin
Role required: none

You must have sufficient permissions to access the document.

Procedure

1. Navigate to the required record (for example, Incident).
2. Select the **Documents** tab.
3. Select **Edit**.
4. Select the documents you want to link.
5. In the **Actions on selected rows** drop-down menu, select **Link Documents**.

Unlink documents from a parent record

Remove and unlink documents from a parent record when they are no longer relevant.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Note:
This action unlinks the document from the parent record but doesn't delete it from the repository.

Procedure

1. Navigate to the record (for example, Incident).
2. Select the **Documents** tab.
3. Select the documents you want to unlink.
4. In the **Actions on selected rows** drop-down menu, select **Remove**.

Delete a document from a parent record

Delete documents directly from a parent record.

Before you begin

Role required: admin with admin access

or

Access permission: owner

or

User: owner

Procedure

1. Navigate to the required record (for example, Incident).
2. Select the **Documents** tab.
3. Select and open the documents you want to delete.
4. Select **Delete**.

Document Management lists

Lists are a collection of template documents you can use to create documents that are linked to other target records. Only users with the admin role can access lists.

Document lists

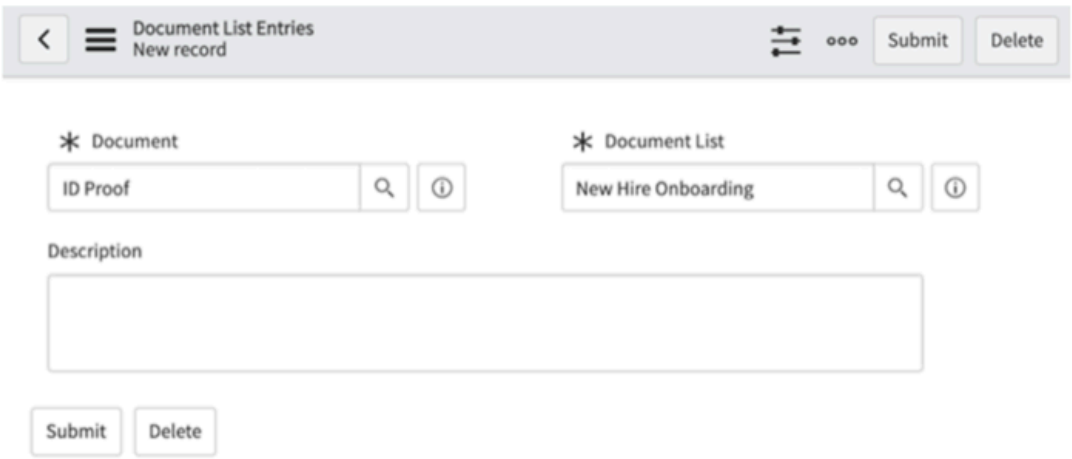
A user with the admin role can create document lists and add multiple documents to a single list. Only users with the admin role can access lists.

Example: New hire onboarding

During new hire onboarding, employees must upload multiple documents such as ID, training certificates, and so on. Your organization can create documents as templates and group them under a list. Then when you reference this list to a target record, all the template documents under the list are created and linked to the target record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Document List Entries

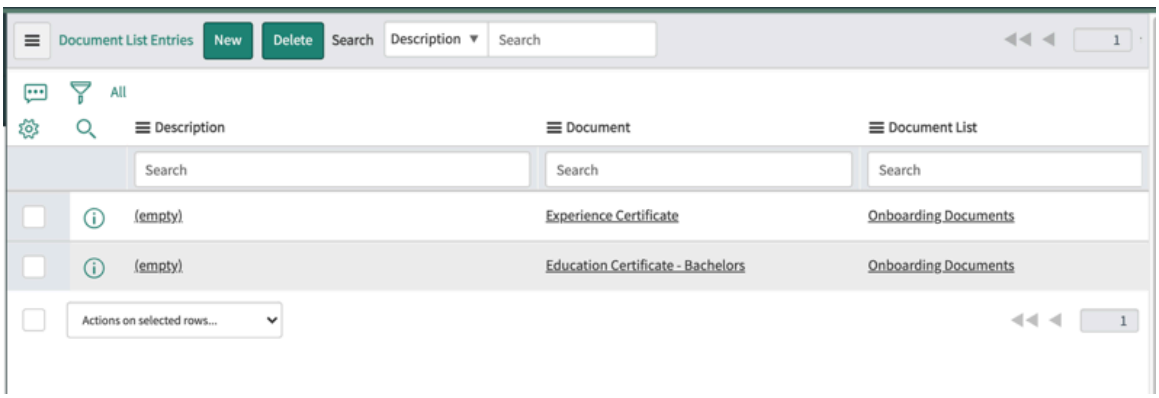


List entries

Lists entries are a mapping of a template document with a document list. Only template documents can be linked to a list, such as when documents have the **Template** option selected in the document record. The Document List Entries related list displays the list entries.

Note:
Users can link only documents that they have access to.

List entries



Related topics

Group document templates in a list for creating and linking documents to a target record

Add a document template to a document list

Group document templates in a list for creating and linking documents to a target record

Group document templates in a list to enable all the template documents in the list to automatically be created and linked to the target record when the list is referenced.

Before you begin

Role required: platform_document_management_admin

Procedure

1. Navigate to **Documents** > **Documents** > **Lists**.
2. Select **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Provide a name and description of the list.
4. Select **Submit**.

What to do next
Create a document template

Related topics
Add a document template to a document list

Add a document template to a document list

Add a template document to a document list that groups document templates for creating and linking to a parent record.

Before you begin
Role required: platform_document_management_admin

About this task
Note:
Only document templates can be linked to a list.

Procedure
1. Navigate to **Documents** > **Documents** > **List Entries**.
2. Select **New**.
3. On the form, fill in the fields.

List entry fields

Field	Description
Document	Name of the document template.
Document List	Name of the list.
Description	A brief description about the document list entry.

4. Click **Submit**.

Create documents using document lists for a target table record

You can create and reference documents on a target table record through the `DocumentListService` API.

Before you begin
See the DocumentListService API topic

Role required: admin

Note:
You cannot create documents through Document Lists with the user interface (UI). It must be done with APIs.

Document attachments in an activity stream

Include documents in activity streams to include and track updates on attached documents to any record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can include and track attached documents in activity stream journal fields like work notes or comments that display task records.

To add and attach documents to a record's activity stream, you would need to complete the following tasks:

- Enable Document actions in activity stream
- Enable Documents in the record
- Add documents to the record

Include document actions in an activity stream

Include document actions in an activity stream to view and track updates to attached documents in a record.

Before you begin
Role required: admin

About this task
To add and attach documents to a record's activity stream, you would need to complete the following tasks:

- Enable Document actions in activity stream
- Enable Documents in the record
- Add documents to the record

Procedure

1. Enter `sys_properties.list` in the navigation filter.
2. Select the **glide.documents.journal.enabled** property.
3. On the form, set the **Value** field to **true**.
4. Select **Update**.
5. Select the **glide.documents.attach.fields**.
6. On the form, in the **Value** field, add the field name that you want the record to reflect.
   For example, you would enter work_notes for the **Work notes** field.

   Use a comma to add multiple field names.

   Note:
   Document updates are pushed only if the field names exist.

7. Select **Update**.

Redact sensitive data from documents

Manually mask sensitive content or data from your PDF documents. Data redaction is available in configurable workspaces.

Data redaction

Only documents in the Published or Draft state are eligible for data redaction.

Sensitive data can be redacted by searching for a keyword or by selecting and drawing over any area in PDF that needs to be masked. The search and redact option is applicable only for text and not for images.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- Paragraphs or keywords split into multiple consecutive lines can't be redacted together while using the search and redact option for a keyword or phrase.
- In some instances search and redact might not hide special characters that are prefixed or suffixed with the text, such as "manual:" or ".PDF".
- In some cases during manual redaction, the text or redaction marks may overlap other sections of the PDF. This overlap can cause the original text to be removed and replaced with white space.
- Data redaction is not possible if the PDF includes non-parseable images, like those in JBIG2 format.

Redact data from documents

Redact sensitive data from PDF documents by either searching keywords or selecting text.

Before you begin

Documents related list should be configured for the workspace.

Role required: none

Procedure

1. From to the required record (for example, Incident).
2. Select the **Documents** tab.
3. Select the document and version.
4. Select and open the attached PDF document.
5. Select the redact icon to enable data redaction.
6. Enter a keyword under **Search a keyword to redact** and select the search icon .

   Note:

   Searching and redacting data manually is applicable only for text and not for text within images or any other line art.

   If the redaction is unsuccessful, then check if there's an issue with the PDF format, manually redact by highlighting the text.

7. To select and draw over an area to redact data, select **Draw and redact**.
8. To undo, select the undo .
9. Select **Apply redaction**.
10. Select **Save changes**.
11. To discard, select the close icon in the Redact document pane.

Document Management integration with external content providers

Integrate Document Management with external cloud providers for editing, sharing, and collaborating over documents for Core UI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integration with external cloud

Edit, share, and collaborate on documents in:

- Microsoft OneDrive
- Microsoft SharePoint
- Google Drive

Attach a document from an external provider

Attach documents from an external cloud like Microsoft OneDrive, Microsoft SharePoint, or Google Drive to Document Management.

Before you begin

Activate Multi Provider Document Services Framework

For Microsoft OneDrive:

- Setup Microsoft OneDrive for Document Services
- Register Microsoft OneDrive as an OAuth provider for Document Services

For Google Drive, Set up Document Services framework for Google Drive.

Configure permission for roles or groups by selecting the **mp_document_admin** from the document list.

Role required: mp_document_admin

Procedure

1. Navigate to **All** > **Documents** > **Documents**.
2. Select an existing record or create a document record.
3. Select the **Connect With External Provider** check box.
4. Select **Attach from Provider**.
5. Select the External Provider.
   - For Microsoft OneDrive, enter the Folder Path and the File Name.

     To get the Folder Path, go to the file in Microsoft OneDrive and check the folder path.
   - For Google Drive, enter the File Name and the File URL.

     To get the File Name, go to the file in Google Drive, right click and select **Share** > **Share** > **Copy link**.
6. **Optional:** If you only want to link the URL, select the **Link Only URL of the external file to the document** check box.
7. Select **Attach**.

   Note:
   Only the latest version from the provider is attached.

   A new version is created. Select the **Versions** tab to view the versions and the attached document.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Select the **External Provider Settings** tab to view the provider details and the external file URL.
9. Select **Open Cloud URL** at the top to open the document in the external cloud.

Upload to an external provider

Upload documents from Document Management to external cloud like Microsoft OneDrive, Microsoft SharePoint, or Google Drive.

Before you begin

Activate Multi Provider Document Services Framework

For Microsoft OneDrive:

- Setup Microsoft OneDrive for Document Services
- Register Microsoft OneDrive as an OAuth provider for Document Services

For Google Drive, Set up Document Services framework for Google Drive.

Configure permission for roles or groups by selecting the **mp_document_admin** from the document list.

Role required: mp_document_admin

Procedure

1. Navigate to **All** > **Documents** > **Documents**.
2. Select an existing record or create a document record.
3. For a newly created record, create a document version.
4. Select the **Connect With External Provider** check box.
5. Select **Upload to Provider**.
6. Select the external provider and enter the folder path.
7. Select **Upload**.

> **Note:**
> Only the latest version is uploaded.

8. Select the **External Provider Settings** tab to view the provider details and the external file URL.
9. Select **Open Cloud URL** at the top to open the document in the external cloud.

Sync versions

Sync document versions from an external provider to Document Management and vice versa.

Before you begin

Versions can be synced multiple times but a new version on Document Management can't be uploaded to an external provider.

Configure permission for roles or groups by selecting the **mp_document_admin** from the document list.

Role required: mp_document_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Documents** > **Documents**.
2. To sync the documents, select the **Versions** tab and select **Sync from Provider**.
3. Select **Sync now**.
   If the external cloud document has been updated, then a new version will be created under the **Versions** tab.
4. Select the **External Provider Settings** tab to view the provider details and the external file URL.
5. Select **Open Cloud URL** at the top to open the document in the external cloud.

References

The following sections describe the installed components and roles for Document Management, along with domain separation and supported browser information.

Components installed with Document Management

Several types of components are installed with activation of the Document Management plugin, including tables and user roles.

Demo data is available for this feature.

Roles installed

Role title [name]	Description	Contains roles
Admin	Provides Create, Read, Update, and Delete access to the document and its related tables. Admin users have access to List and List Entries modules.	platform_document_management_admin

Sharing permission roles

Role Name	Description
dm_sharing_levels_user	This role contains the following roles: • dm_user_role_read • dm_user_group_read • dm_user_criteria_read Provides the ability to share documents at all levels (group, role, and user criteria).
dm_user_role_read	Provides read access to the user role table and the ability to share documents based on user roles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sharing permission roles (continued)

Role Name	Description
dm_user_group_read	Provides read access to the User Group table and the ability to share documents based on user groups.
dm_user_criteria_read	Provides read access to the User Criteria table and the ability to share documents based on user criteria.

Tables installed

Table	Description
ds_document	Stores document records containing document metadata.
ds_document_version	Stores document versions containing the actual document file or URL to the file.
ds_document_references	Stores references between document records and other records. **Note:** The records can be from any other table and record on the platform Supports a many-to-many relationship between documents and target records.
ds_document_lists	Stores document lists, which are a collection of template documents used to create and link documents to other records.
ds_document_list_entry	Stores mappings between template documents and document lists.
ds_document_user_can_access_mtom	Stores permissions provided to users to access documents as a Reader, Writer, or Owner.
ds_document_ug_can_access_mtom	Stores permissions provided to user groups to access documents as a Reader, Writer, or Owner.
ds_document_ur_can_access_mtom	Stores permissions provided to user roles to access documents as a Reader, Writer, or Owner.
ds_document_uc_can_access_mtom	Stores permissions provided to user criteria to access documents as a Reader, Writer, or Owner.
ds_document_permalink	Stores the permalink and expiration date for the document.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The Documents [ds_document] and Versions [ds_document_version] tables can be extended.

Document Management roles

Document Management is installed with these roles.

To learn more about managing subscriptions, see Managing per-user subscriptions in Subscription Management and contact your account representative.

Administrator [platform_document_management_admin]

Provides Create, Read, Update, and Delete access to the document. Admin users have access to List and List Entries modules.

Contains Roles

List of roles contained within the role.

- dm_sharing_levels_user
- dm_user_role_read
- dm_user_group_read
- dm_user_criteria_read

Groups

List of groups this role is assigned to by default.

None.

Special considerations

Note:
Avoid granting an admin role when more specialized roles are available.

Domain separation and Document Management

Domain separation is supported for Document Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Standard

- Includes all aspects of **Basic** level support.
- Application properties are domain-aware as needed.
- Business logic: The service provider (SP) creates or modifies processes per customer. The use cases reflect proper use of the application by multiple SP customers in a single instance.
- The instance owner must configure the minimum viable product (MVP) business logic and data parameters per tenant as expected for the specific application.

Sample use case: An admin must be able to make comments required when a record closes for one tenant, but not for another.

For more information on support levels, see Application support for domain separation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Overview

Document Management provides an access level approach to controlling the document access and providing security to the users.

How domain separation works in Document Management

When domains are separated in Document Management, users can see and manage documents and give access privileges only in their own (tenant) domain.

A user in the parent domain has access to documents in the child domain.

When a user creates a document, document list or document entries, then their domain is the same as the user's domain.

When the owner of the document changes then the related versions, references, and permission record's domain is updated with the domain of the parent document.

Use cases

- **Documents**

  Documents can be edited or accessed only within their domain. Access to a document can become void if a user belongs to a different domain from the document's domain.

  - Users in the global domain can access documents in all domains when the read access is granted to the user.
  - Users in a non-global domain can access documents only in the same domain and global domain when document access is granted to the user.

- **Versions, References and Permissions table**
  - Users can access the versions, references, and, permissions table records only if they have access to the parent document.
  - If a user has access to the target record in the references table, access to the parent document is granted only if inherited access is enabled for the document and the user is in the same domain as the parent document.

- **List and List Entries**

  List and List Entries have domain pointing to the current user domain and can be accessed by the users with document admin rights.

Known issues

If a document contains references and if the owner of the document is changed and does not have access to the target record of one of the references, then the reference record might not be visible to the new owner.

For example, if the document owner, User A (Domain: D1) is changed to User B (Domain: D2) and User B does not have access to the target record of the reference table, User B might not be able to see the reference record.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Document Viewer

Document Viewer enables you to view documents directly in the ServiceNow AI Platform rather than having to download them.

Document Viewer supports viewing various file types in the platform including a UTF-8 character encoded PDF file. The maximum document file size is 50 MB. To use Document Viewer, enable it at instance level and for the tables for which you want to use it.

Note:
Document Viewer also supports FedRAMP instances.

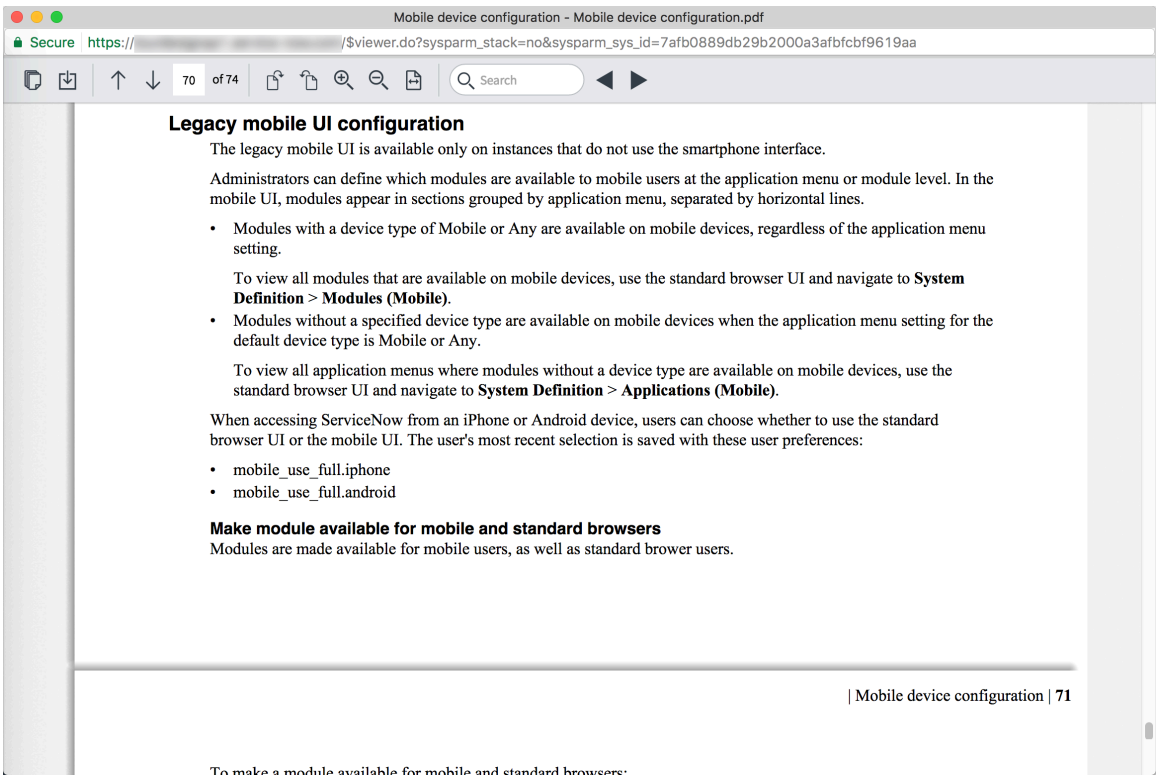
You can view the following file types:

- MS Word (.doc) and (.docx)
- MS PowerPoint (.ppt) and (pptx)
- MS Excel (.xls) and (.xlsx)
- PDF
- PNG
- JPEG

Note:
The rotate option doesn't work for images.

Other document types, for example, .zip or .exe files, are automatically downloaded without requiring Document Viewer. Document viewer converts word documents and spreadsheets to pdf first in order to view them. This might take some time to render the file the first time.

PDF view in Document Viewer



Note:

You can only download PDF attachments with in the document.

View attachments with Document Viewer

Enable Document Viewer

Enable Document Viewer

Enable Document Viewer to view documents directly rather than download them to view them in their native applications.

Before you begin

Role required: admin

About this task

Document Viewer is enabled by default. Activate it at the instance level and then enable it at the table level for the tables where you want to use it. Ensure that the system property **com.snc.documentviewer.enable_document_viewer** is set to true or create it if it does not already exist. To de-activate Document Viewer, create the system property **com.snc.documentviewer.enable_document_viewer** manually and set it to false.

Procedure

1. Activate Document Viewer at the instance level
   a. Navigate to **All** > **System Definition** > **All Available Applications** > **All**.
   b. Enter `ServiceNow Document Viewer` or `com.snc.documentviewer` in the Search field.
   c. Select **Install**.
2. Activate Document Viewer for the tables where you want to use it.
   a. Navigate to **System Definition** > **Dictionary**.
   b. Search for the table, open the record with the type field **Collection**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Enter `Use Document Viewer` in the **Attribute** field.

d. Enter `true` in the **Value** field.
Document Viewer is enabled at the table level. Repeat this procedure for each table for which you want to enable Document Viewer.

Disable Document Viewer

Document Viewer plugins

With Document Viewer, you can view documents directly in the ServiceNow Platform rather than having to download them. Two new plugins enhance the experience and provide more options for document viewing. You can collaborate with other people, copy, delete, restore, and view version history directly in a ServiceNow instance.

Overview

In previous ServiceNow releases, not all documents could be shared and used for team collaboration. With new plugins for the Platform Document Viewer, now you can:

- Collaborate (edit, share) with Microsoft OneDrive and copy documents to your ServiceNow instance.
- Upload a policy document authored in your ServiceNow instance as a Microsoft 365 document in Microsoft 365 SharePoint.
- Attach shared links to a record. Clicking the link opens the document in Microsoft 365 SharePoint.
  - The link can be shared with a co-worker, who can view and edit the document in real time.
  - The current version is also viewable in the ServiceNow instance.
- Use collaboration tools such as Microsoft 365 for review and co-authoring documents.

Plugins

To use this feature, install the following plugins:

- Microsoft OneDrive Spoke
- Microsoft OneDrive document service Spoke
- Microsoft Azure AD Spoke for Integration Hub
- Multi Provider Document Service Framework

See List of plugins (Rome) for a complete list of ServiceNow plugins.

After installation, you can use the base system subflows or customize them. Configure the subflows in the Document actions table. Once configured, they can be invoked as UI actions from List views or can be invoked through Script Include APIs.

Microsoft OneDrive integration plugin

Collaborate in Microsoft OneDrive and perform copy, delete, restore, and version actions on documents directly in a ServiceNow instance. This integration is bi-directional (performs in both directions): Changes are reflected in both Microsoft OneDrive and in the instance.

Microsoft Azure AD Spoke for IntegrationHub

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Microsoft Azure AD Spoke for Integration Hub provides actions that a Process Analyst can use when designing flows. The actions allow them to automate the management of users, security groups, and office groups. User management includes applying licenses that result in user provisioning into Office 365.

Multi Provider Document Service Framework plugin (glide plugin)

Plugin contains the data model needed to integrate with third-party document service providers.

Note:
To activate a plugin:

1. Navigate to **System Definition** > **Plugin**.
2. Enter the plugin name in the Search field.
3. Select **install**.

Document Viewer

Enable accessibility features for DOCX to PDF conversion

Enable the *com.snc.document.conversion.accessibility_enabled* system property to enable accessibility features for DOCX to PDF conversion. If the DOCX files have accessibility support, then accessibility support is retained in the Document Viewer while viewing the files.

Before you begin

Role required: admin

Procedure

1. In the navigation filter, enter `sys_properties.list`.
2. Open the *com.snc.document.conversion.accessibility_enabled* system property.
3. In the value field, update the value to `true`.
4. Select **Update**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

View attachments with Document Viewer

View documents within the platform using Document Viewer rather than having to download them to your own file system.

Before you begin

Make sure that Document Viewer is enabled for the table containing the record. For more information, see Enable Document Viewer.

Role required: none

About this task

Document Viewer supports inline viewing of certain document types within the platform.

Procedure

1. Navigate to a record (incident, form, list, and so on) with an attachment.
2. Click View next to the file attachment name.

   Document Viewer displays the document.

   If the document does not display, Document Viewer does not support inline viewing in your situation and a message instructs you to download the document. The possible reasons are:

   - The document uploaded is platform encrypted or edge encrypted.
   - The file size exceeds the maximum allowed value of 50 MB.
   - The document is password-protected but it is not a PDF file.

   Click **Download Document** to view the document in the relevant external application.

Related topics

Enable Document Viewer

Disable Document Viewer

Disable Document Viewer at the instance level to disable it or at table level to disable it for specific tables within the instance.

Before you begin

Ensure the Add a system property (com.snc.documentviewer.enable_document_viewer) exists in your instance.

Role required: admin

Procedure

Disable Document Viewer at the instance level or for specific tables.

Enable Document Viewer

PDF generation and accessibility

Export an individual record or list of records into a PDF format that supports accessibility. When this feature is enabled, accessibility tags will be available in the PDF tag tree to help users who rely on screen readers to navigate, understand, and interact with the generated PDF documents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
PDF generation with accessibility is unavailable for regulated markets and on-premise customers.

Accessible PDF

To enable accessibility for PDF generation, add the accessibility property *com.snc.pdf.generation.accessibility* and set the value to `true`. Only users with admin roles can set the property. For more information, see Add a system property

For PDF generation API, see PDFGenerationAPI - Scoped, Global

Export to PDF for list of records

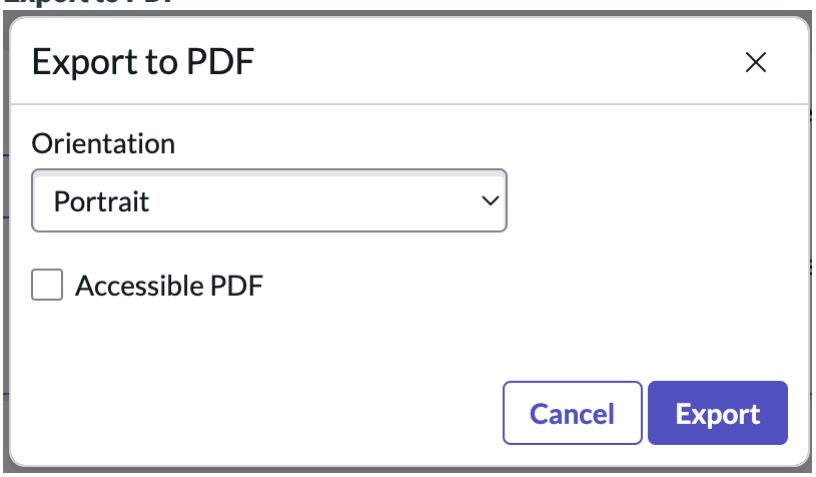
Export a list of records in a variety of formats. The **Export** option is available in the column heading context menu in List v2. In List v3, it's available in the list title menu.

PDF export orientation includes:

- Portrait
- Landscape
- Detailed Portrait (exports the list and the associated form for each record).
- Detailed Landscape (exports the list and the associated form for each record).

When the accessibility property is enabled, users will get a pop-up when they export to PDF where they can specify whether to create an accessible PDF or not.

Export to PDF



To enable accessibility, select the **Accessible PDF** check box.

Note:
Adding accessibility tags to a PDF increases the file size.

To export a PDF list, see Export data from a list.

Export to PDF for a single record

To export an individual record from a form, select and hold (or right-click) a form header bar and select the export type.

PDF export orientations include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Portrait
- Landscape

When the accessibility property is enabled, users will get a pop-up when they export to PDF where they can specify whether to create an accessible PDF or not.

To enable accessibility, select the **Accessible PDF** check box.

Note:
Adding accessibility tags to a PDF increases the file size.

To generate a single PDF record, see Export data from a record.

Managed Documents

Use the ServiceNow® Managed Documents application to control electronic documents within your instance.

After parameters have been set by the administrator and the Knowledge Document plugin installed, documents can move through the managed document cycle.

Important:
From Yokohama onwards, the workflows have been configured and standardized to follow the new workflow and design experience.

Existing customers can continue using deprecated OOB workflows, but ServiceNow recommends adopting the new OOB flows. Custom workflows will still be supported, while customized OOB workflows are deprecated, with a recommendation to switch to new flows. Customers can also create workflows, though ServiceNow advises using flows for new requirements.

Managed Document features

Managed Documents is a lightweight, ITIL-based solution for creating and managing electronic documents within your instance.

This application adds a layer of control around any document by providing workflow, storage, security, and categorization options. It can be used for a variety of internal documents, such as policies and procedures, compliance documentation, and knowledge articles. Because it is integrated within the instance, Managed Documents offers a seamless alternative to 3rd-party systems.

Features

Feature	Description
Check-in/Check-out	Track revisions, approval history, and automated notifications for approvers and reviewers. Useful for compliance and risk authors, policy and procedure writers, and contract administrators.
Categorization	Classify documents for organization and search.
Access control	Share documents with selected users.
Revision control	Track changes to documents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Features (continued)

Feature	Description
Digital signature for approval	Integration with the Approval with E-Signature plugin.
Workflow	Support consistent content review and approval.
Security	Use high security setting.

Managed Document concepts

The following concepts explain Managed Documents: Managed Document, Document Collection, Document Revisions, and Document Parameters.

Concepts

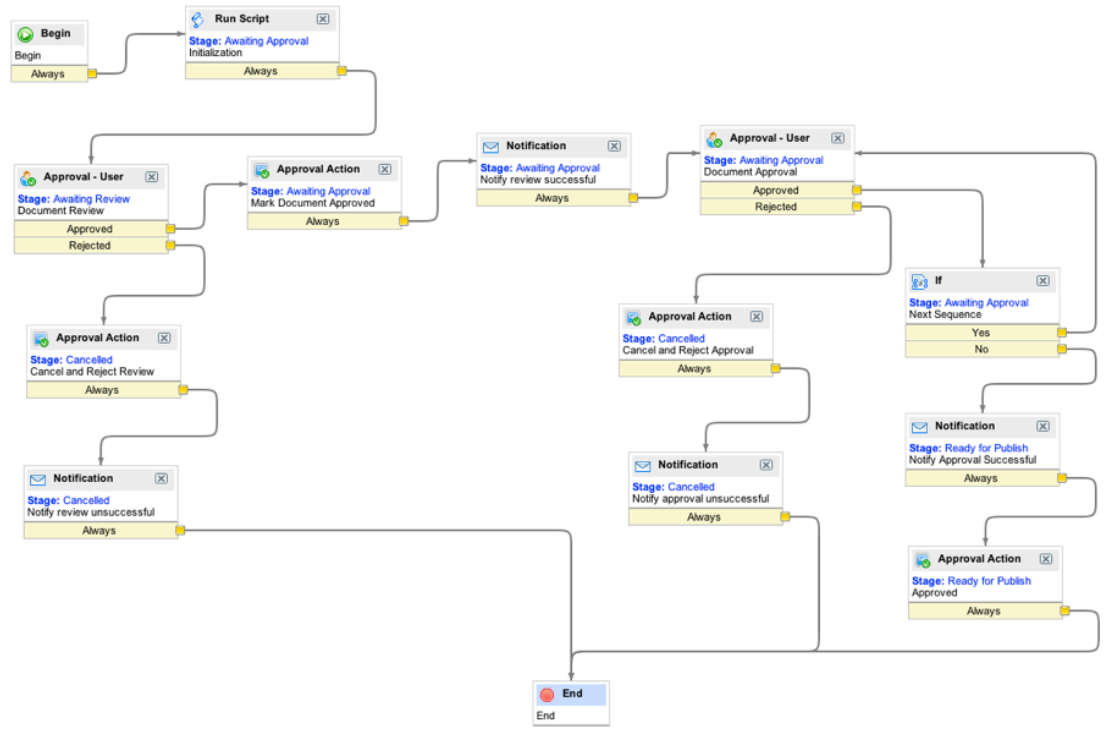
Concept	Description
Managed Document	The **Document [dms_document]** table contains the documents controlled through the managed documents process.
Document Collection	The **Document Collection [dms_collection]** table allows related documents to be grouped together.
Document Revisions	Because managed documents must have clear records of individual versions of a document, revisions (including the file) are attached to the primary document record through a related list. Document revisions are controlled to keep a standard naming scheme and consistent version numbers. Once a document revision is ready, it can be submitted for review.
Document Parameters	**Important:** Parameters do not control application or document security. Parameters only organize documents, they do not affect who can access documents. To grant access to the Managed Documents application, you can assign a role. To grant access to a specific document, set user and group permissions. Each document can be associated with predefined parameters. The parameters can help with grouping documents. • Type: Defines the type of document being controlled. Documents of the same type use the same controls. • Classification: Defines document restriction level, such as public, restricted, or confidential. • Audience: Defines the groups with access to the document, such as internal or external. • Name Formats: Defines the format of document names, ensuring that documents of the same type have the same name scheme assembled from name components. • Name Components: Defines the document values used in the name formats. • Approval Rules: Defines the approvals the document must have before it can be published.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Defining Document Workflow

In the base system, all managed documents use the **Managed Documents** workflow after the **Active** check box is selected.

Document workflow



The document parameters defined in the workflow are often used as conditions to trigger more specific workflows, such as type-specific workflows or classification-specific workflows. If different kinds of documents should follow different workflows, use the Graphical Workflow Editor to create new workflows.

Defining Document Parameters

Before using the Managed Documents application, the user with the `document_management_admin` role needs to set the parameters that define the kinds of documents to be managed through the application. Managed Documents provides both base and custom parameter options.

Defining Document Parameters

The following document parameters should be defined:

- **Type:** identifies the purpose of the document. The type also determines the default document format and name format.
- **Classification:** indicates the security level assigned to the document and determines who can view or edit the document.
- **Audience:** specifies the intended readers of the document.
- **Name format:** specifies the name format to use when a document revision is added.
- **Name components:** are individual identifiers used inside a name format. Name components define a reference path (often by dot-walking) that holds the value specific to the document.
- **Approval rules:** determine which approvers are added to documents (in addition to the **Reviewers** specified on the document record).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Defining Types

To define a new type, navigate to **Managed Documents** > **Administration** > **Type** and click **New**.

Field	Description
Name	A unique name for the type.
Code	A short code for the type. Referenced as a name component for the name format.
Label	A label to display in the **Type** choice list.
Name Format	The name format that documents of this type will use.
Order	A number indicating the type's sequence in the choice list.

The following types are available in the base system.

Name	Code	Label	Name format	Order
-- None --	null	-- None --	null	1
policy	POL	Policy	Default Policy	2
guideline	GUI	Guideline	Default	3
procedure	PROC	Procedure	Default	4
contract	CON	Contract	Default	5

Note:
For documents with a **Type** of **Contract**, a **Contracts** related list appears on the document record, listing any contracts the document is associated with.

Defining Approval Rules

To define a new approval rule, navigate to **Managed Documents** > **Administration** > **Approval Rules** and click **New**.

Field	Description
Name	A unique identifier for the approval rule.
Active	A check box indicating whether this approval rule is used.
Condition	A condition builder that determines which documents use this approval rule.
Description	A short description of the approval rule.

Once the approval rule is saved, the **Approvers** related list defines which approvers are added if the conditions in the **Condition** field are met.

The following approval rules are available in the base system.

Name	Condition
Internal policy	type=Policy ^ audience=Internal

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Condition
Development policy	type=Policy ^ department=Development

Related topics

Defining Document Parameters

Defining Audiences

To define a new audience, navigate to **Managed Documents** > **Administration** > **Audience** and click **New**.

Field	Description
Audience Name	A unique name for the audience.
Audience Code	A short code for the audience. Referenced as a name component for the name format.
Label	A label to display in the **Audience** choice list.
Order	A number indicating this audience's sequence in the choice list.

The following audiences are available in the base system.

Audience	Audience code	Label	Order
internal	INT	Internal	1
external	EXT	External	2

Related topics

Defining Document Parameters

Defining Classifications

Define a new classification on the Classification form.

Navigate to **Managed Documents** > **Administration** > **Classification** and click **New**.

Field	Description
Name	A unique name for the classification.
Code	A short code for the classification. Referenced as a name component for the name format.
Label	A label to display in the **Classification** choice list.
Order	A number indicating this classification's sequence in the choice list.

The following classifications are available in the base system.

Name	Code	Label	Order
public	P	Public	1
restricted	R	Restricted	2

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Code	Label	Order
confidential	C	Confidential	3

Defining Name Components

Name components define the document values used in the name format.

For example, the name component `document.audience.code` dot-walks from the document record to the audience **Code**.

To define a new name component, navigate to **Managed Documents** > **Administration** > **Components** and click **New**.

Field	Description
Name	A unique identifier for the name component.
Short Description	A short description of the name component value.
Value	The path to the field holding the value used for the name format. Defined relative to a current revision record. For example: • Enter `revision` to use the revision **Number** field on the revision record. • Enter `document.name` to use the **Name** field on the revision's referenced document. • Enter `document.audience.code` to use the **Code** field for the audience referenced by the document. This dot-walking approach makes it possible to get any value related to the revision into the name format.

Note:
The **revision** component is a special component replaced by the appropriate revision number (rather than querying a value related to the current record). The revision is either automatically incremented or uses the latest revision number, depending on the setting on the document form.

The following components are defined in the base system.

Name	Short description	Value
Audience code	Displays the code assigned to the document audience.	document.audience.code
Classification code	Displays the classification code.	document.classification.code
Document name	Displays the document name.	document.name
Revision	Displays the document revision.	revision
Type code	Displays the code assigned to the document type.	document.type.code

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Defining Name Formats

The name format automatically generates a name for a document revision by arranging name components in a standard code to match naming conventions.

For example, a name format with the name components **Type Code**, **Document Name**, and **Revision Number** and the separator **-**, would be formatted as:

`TYPECODE-Name-RevNumber.fileformat`

In this example, a policy (code POL) named `IT Off-Boarding Policy`, with revision number **1.0**, and uploaded as a **.docx** file would have the name:

`POL-IT Off-Boarding Policy-1.0.docx`

To define a new name format, navigate to **Managed Documents** > **Administration** > **Name Formats** and click **New**.

Field	Description
Name	A unique name for the name format.
Separator	A separator to put between each of the components. Hyphens (-) and underscores (_) are commonly used. Using alphanumeric characters can create a confusing name format.
Description	A description of the name format.

Use the related list to add name components. Use the **Order** field to set the sequence in which name components are used.

The following name formats are defined in the base system.

Name	Separator	Description
Default	_	The default format. Document name and revision separated by an underscore.
Default Policy	_	The format for the policy document type.
Development documentation	(no separator)	The format for the software documentation type.
Development Sources	(no separator)	The format for the development and code sources type.
Intranet Improvement	(no separator)	The format for documents that describe intranet use.

Domain separation and Managed Documents

Domain separation is unsupported in Managed Documents. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: No support

- The domain field may exist on data tables but there is no business logic to manage the data.
- This level is not considered domain-separated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information on support levels, see Application support for domain separation.

Domain separation for service providers

Managed Documents plugin

This page describes the applications and modules, database table structure, scripts, and roles.

Database table structure

The following tables are added:

Tables

Display Name (Table Name)	Description
Document [dms_document]	The document details.
Revision [dms_revision]	The document revisions.
Audience [dms_audience]	The intended document readers.
Classifications [classification]	The document restriction level, such as public or confidential. (Does not define access to the document. Document security is set in user and group permissions.)
Type [dms_type]	The document purpose.
Component [dms_component]	The components of name formats. The value field is a dot-walking expression that is evaluated. An exception is made for the revision because it does not exist when the revision name is generated.
Name format [dms_name_format]	The composition of components to generate revision names.
Approval sequence [approval_sequence]	The approval sequences that users must follow.
Approval Rule [dms_approval_rule]	The criteria that records of the dms_document table must match. Used to automatically add approvers to a document.
Collection [dms_collection]	The document groups created by the user.

Scripts

Business rules that are added to sys_script

Rule	Description
Update Document	Changes the state of a document depending on its revisions.
Add Approvers	Populates the list of approvers in the document.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Script includes that will be added to sys_script_include

Script include	Description
DocumentManagement	Contains the main logics for the Managed Documents plugin.
DocumentManagementDB	Contains methods to perform CRUD operations on the database.
DocumentManagementSecurity	Helps manage the security of the Managed Documents system.
DocumentManagementAjax	Updates the details of the temporary revision that is created when opening the upload/check in revision form.
DocumentAttachmentAjax	Renames an attachment file.
DocumentRevisionWorkflowHelper	Helps perform basic workflow operations on a revision.
DocumentManagementApprovalMatcher	Helps obtain the user and group approvers for a document that matches approval rules.
DocumentApproverHelper	Contains logics to handle document approvers.
DocumentManagementUtils	Useful methods.
DocumentReferenceQualifiers	Static methods that return reference qualifiers.

Client script that is added to sys_script_client

Rule	Description
Document type change	Updates the name format field in the revision settings section of the document. Each type has a default name format.

Roles

This plugin introduces two new roles:

Roles

Role	Description
document_management_user	This role enables a user to access the Managed Documents plugin, create documents, and search for documents. Document reviewers and approvers need the document_management_user role to access the Managed Document plugin. (Please note that reviewers and approvers can also access a document revision from an approval record.)
document_management_admin	This role enables a user to change administrative settings for the Managed Documents plugin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Each document has individual permissions, so even if a user is given the document_management_user role and has permissions to the application, the user can only view documents to which they have been given access.

Install the Managed Documents plugin

The Managed Documents plugin is available for activation by users with the admin role.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System Application** > **All Available Applications** > **All**.
2. Find the Managed documents (com.snc.document_management) plugin and select **Activate/ Upgrade**.

   If the plugin depends on other plugins, these plugins and their activation status are listed.
3. **Optional:** Select the **Load demo data** check box.

   (Optional) Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when first activating the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.
4. Select **Activate**.

Knowledge Document plugin

The Knowledge Document plugin extends the Managed Documents plugin by providing the functionality for managed documents to be published to the Knowledge Base.

Installed with Knowledge Document plugin

These elements are installed with the Knowledge Document plugin.

Dependencies

The Knowledge Document plugin depends on the Managed Documents plugin. Activating Knowledge Document activates Managed Documents.

Tables

Tables

Display Name [table_name]	Description
Knowledge Records [m2m_document_knowledge]	A many-to-many table storing the relationship between a document and a knowledge article.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

UI Actions

UI actions

UI action	Description
Link to Knowledge	Creates or updates a knowledge article related to the current document, depending on whether a knowledge article already exists.

Scripts

Script includes

Script include	Description
KnowledgeDocument	Holds the main logic for the Knowledge Document plugin.
KnowledgeDocumentDB	Class that gets, inserts, and updates data for the Knowledge Document plugin.

Link documents to Knowledge articles

Manage a document and access the latest version of the document from an article by linking the document to a Knowledge article.

Before you begin

Your administrator must have activated the following plugins:

- Knowledge Document plugin (com.snc.knowledge_document)
- Knowledge Management Advanced plugin (com.snc.knowledge_advanced)

The document is already uploaded and published. For more information, see Upload a document and Publish an approved revision.

You must have contribute access to the Knowledge Base within which the article linked to the document is stored.

If a Knowledge article is already linked to the document, you must have contribute access to the article.

Role required: document_management_user and knowledge

About this task

You can link the initial or revised version of a document to a Knowledge article. The document appears as an attachment to the linked article. Revising a document doesn't automatically update the document attached to the linked Knowledge article. Therefore, every time you revise a document, you must again link the revised document to the Knowledge article.

Note:

As the owner of a document or an administrator, you can link the document to a published article. If the article is checked out by another user, you can't link the document to the associated article, unless the article is published.

A managed document can only be linked to one article.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Managed Documents** > **Documents** > **All**.
2. Click the document.
3. In the Knowledge Settings related list, fill in the fields.

Knowledge settings

Field	Description
Behavior	Process performed when the **Link to Knowledge** related link is clicked. A behavior is one of the following types: ○ **Always create record**: A new Knowledge article is created and linked with the latest published revision of the document as an attachment. ○ **Update existing record**: The linked Knowledge article is updated with the latest published revision of the document as an attachment. If no Knowledge articles exist for the document, a new Knowledge article is created. **Note:** Once you select a behavior setting for a document, you can't modify it later when revising the document.
Knowledge Base	Knowledge Base in which the Knowledge article is stored. You can associate a Knowledge article with one Knowledge Base only. If you are using an article template, you can modify this value only if the template is available in the other Knowledge Base.
Type	Article template to create a Knowledge article using defined fields and values. **Note:** when a Knowledge article is created, the **Type** field becomes read-only.
Valid to	Date that the article expires. Adds valid to date information to the same field in the Knowledge article.
Short description	A few words or short phrase describing the Knowledge article. Adds the short description to the same field in the Knowledge article.

4. Click the **Link to Knowledge** related link.
5. **Optional:** In the information message that is displayed, click the message link to view the Knowledge article.

Result

The uploaded document is added as an attachment to a Knowledge article. Depending on the **Behavior** field value specified in the Knowledge settings related list, the Knowledge article is created or updated with the document.

Create a document

After Managed Documents parameters have been set by the administrator, documents can be created, requested, checked out, edited, checked in, copied, and, if necessary, rolled back to an earlier version.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Once documents have been added to the Managed Documents application, they can be grouped into document collections.

Document approval

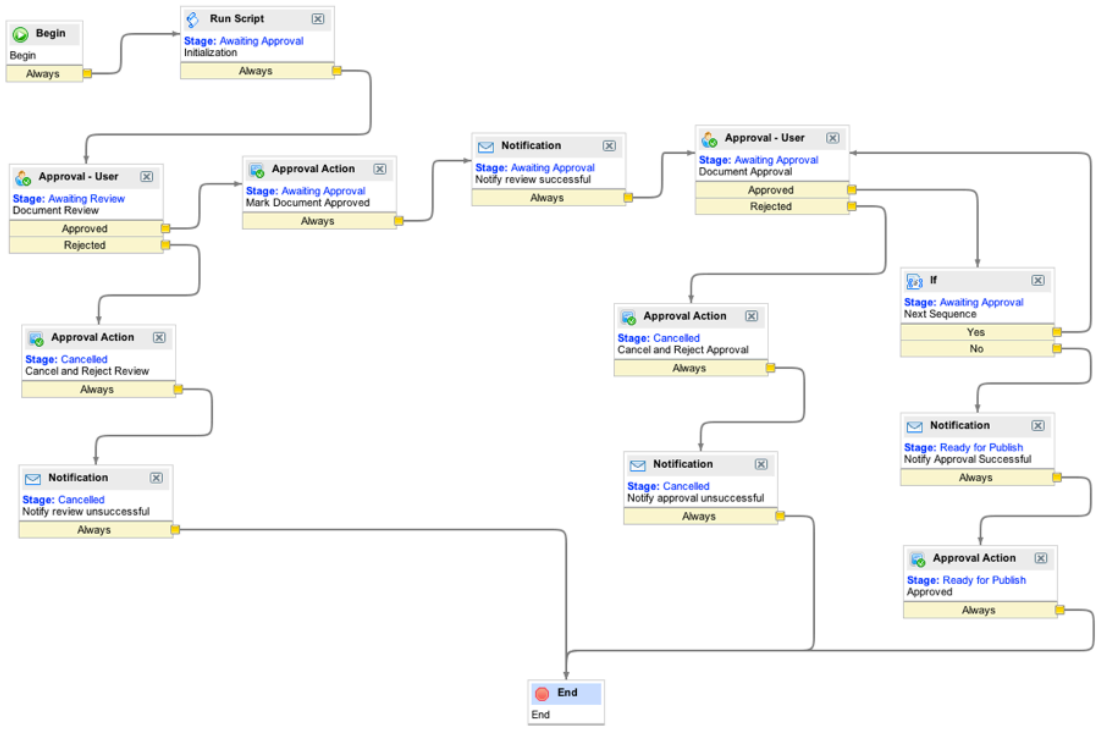
During the approval process, the approver approves or rejects the document. A document goes through the approval process after the review process.

Approval workflow

After the document has been reviewed, submit the document for approval. If the document does not have an approver, the approval process is omitted.

When the document is *Active*, the workflow *Document Management Default* is used to manage approvals:

Document Management Default workflow



If the approver rejects the document, the author and owner are notified and the document review is cancelled. The author, owner, and approver should discuss what changes need to be made to the document. When the document is ready, a new review can be initiated.

If the final approver approves the document, the author and the owner are notified. Once final approval is successful, the document stage changes to *Ready for Publishing* in the Document Revisions list:

Document Management Default workflow result

Process modification for multiple approvers

If there are multiple approvers, the approval process works in sequence and multiple approvers can be assigned to a single sequence. For example:

- Sequence 1: approvers A and B
- Sequence 2: approvers C and D
- Sequence 3: approver E

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Because the sequences take place in ascending chronological order, approvers A and B receive the approval request first (approvers C, D, and E are not part of the process yet). Similar to the review process, the first approver to act within a sequence dictates what happens to the document. If approver A acts first and rejects the document, the approval process stops and the state is set to Cancelled. Approver B's status is changed to No Longer Required. If approver A acts first and approves the document, the process stops and approver B's status is changed to No Longer Required. Then, the document moves to approval sequence 2. After at least one approver in each sequence approves the document, the author and the owner are notified that the document has been approved.

Review process

During the review process, the reviewer approves or rejects the document. Sometimes a document will have multiple reviewers.

If the reviewer rejects the document, the author and owner are notified and the review is cancelled. The author, owner, and reviewer should discuss what changes need to be made to the document. If the reviewer approves the document, the author and owner are notified that the review was successful and the document can move to the approval stage.

If multiple reviewers are assigned to a document, the first reviewer to act dictates what happens to the document. For example, there are two reviewers, A and B. If reviewer A acts first and rejects the document, the review process stops and the revision state is set to Cancelled. Reviewer B receives a notification email stating that the review was rejected and their status is changed to No Longer Required. If reviewer A acts first and approves the document, the review process stops and the document can move to the approval stage. Reviewer B's status is changed to No Longer Required.

Enable electronic signature for approval

Enabling electronic signatures for approval. Electronic signatures are helpful if you must obtain a digital signature for compliance or auditing purposes.

Before you begin

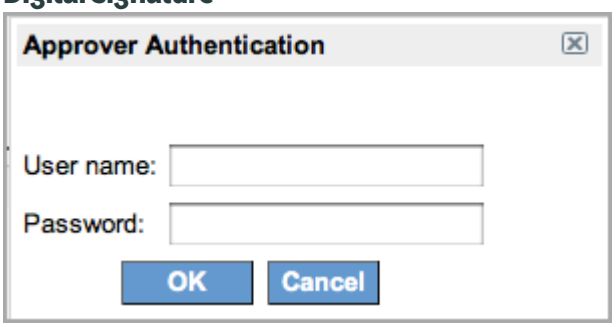
Role required: admin

About this task

You can activate the Approval with e-signature plugin to require that users type in a user name and password when reviewing and approving documents.

The digital signature is not tracked or stored in the document record. Users must simply type in a user name and password after clicking the **Approve** or **Reject** button.

Digital signature



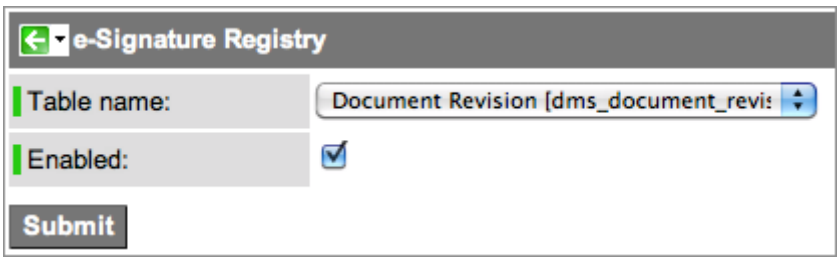
After activating the Approval with E-Signature plugin, ensure that a row in the e-signature registry table is created for the dms_document_revision table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Definition** > **e-Signature Registry**.
2. Check if *dms_document_revision* is already listed and **Enabled** is set to *true*.
3. If not listed, click **New**.
4. In **Table name**, select *Document Revision*.
5. Select *Enabled*.

Example



6. Click **Submit**.

Publish an approved revision

Publish a document revision that has been approved.

Before you begin

Role required: document_management_admin

or

Role required: document_management_user

About this task

Once a document has been created and edited, a specific revision can be submitted for draft review and final approval. After final approval, the document can be published.

Publish the approved revision from the Document Revisions list.

Note:
Publishing documents to the Knowledge Base requires the Knowledge Document Plugin.

Procedure

1. Navigate to the document record.
2. In the Document Revisions List, click the revision marked **Ready for Publishing**.
3. Click **Publish Revision** to display the **Publish** dialog box.

   The revision number matches the latest revision number. If your standard is to change the revision number when the document is published, such as incrementing the version number to 1.1 or 1.0.1, the change can be made on this dialog box manually.

4. Click **Publish**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The published revision is highlighted in green and the stage of previous revisions is automatically changed to *Retired*:

Note:
If the approval and publishing process is repeated, the published revision is retired when the new revision is published. Any workflows running against previous revisions are canceled when the document is published.

Submit a revision for draft review

Submit a document draft for review.

Before you begin
Role required: document_management_admin

or

Role required: document_management_user

About this task
Once a document has been created and edited, a specific revision can be submitted for draft review and final approval. After final approval, the document can be published.

When a draft of the document is ready, submit the draft for review. If the document does not have reviewers identified in the Reviewers field of the document record, the review process is omitted.

Procedure

1. Navigate to the document record.
2. Right-click the appropriate revision.
3. Select **Submit Revision**.

   The revision stage is set to *Awaiting Review*.

   The document name and parameters are changed to read-only. The document state is set to *Active*.

Create or request a new document

Once an administrator has set parameters for the Managed Documents application, you can create or request new documents.

Before you begin
Role required: document_management_admin

or

Role required: document_management_user

Procedure

1. Navigate to **All** > **Managed Documents** > **Create New**.
2. Complete the following fields:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

New document fields

Field	Input value
Number	An identifying number for the document. Automatically generated using number maintenance.
Name	A name for the document. Note that the name for the document is combined with other naming components (as defined by the name format) to create the names for each document revision.
Requested by	The person asking that the document be created or updated.
Owner	The approver of the document request. Also responsible for setting completion date with requesters and authors.
Reviewers	The user or users who review the document and provide feedback to owners and authors.
Department	The department responsible for the document.
Type	The document purpose. This is a choice list derived from the type parameters.
Classification	The document classification, based on security, audience, and confidentiality. This is a choice list derived from the classification parameters. **Note:** This does not drive any functionality.
Audience	The document readers, such as external or internal. This is a choice list derived from the audience parameters. **Note:** This does not drive any functionality.
State	The current status of the document in the editing and publication process.
Checked out by	The user who currently has the document checked out.
Description	A short description of the document.
Revision Settings	
Name format	The format for the name of each individual revision of the document. For more information, see name format.
Revision format	A choice between the two digit (0.x) or the three digit (0.0.x) revision format.
Auto increment revision	If selected, the revision number automatically increments each time the document is revised.

The *User Permissions* related list determines which users have rights to view and contribute to the document:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

User permissions

Field	Input value
User	A reference to a user who is entitled to read but not contribute to a document.
Type	A choice list describing how the user can interact with the document. Options are: ○ Reader - The user can read the document versions. ○ Editor - The user can upload new versions. ○ Owner - The user can edit the document.

The *Group Permissions* related list determines which groups have rights to view and contribute to the document:

Group permissions

Field	Input value
Group	A reference to a group of users who are entitled to read and contribute to the document.
Type	A choice list describing how group members can interact with the document. Options are: ○ Reader - Group members can read the document versions. ○ Editor - Group members can upload new versions. ○ Owner - Group members can edit the document.

Specify an approver

You can specify approvers for a document record after you save it.

Before you begin

Role required: document_management_admin

or

Role required: document_management_user

About this task

You can have one approver or multiple approvers. For example, set multiple approvers to have one person do a quality check of the document and a different individual to serve as a final approver. Approvers are assigned a number. The lowest number (usually number one) approver always goes first, then any other approvers in ascending chronological order. Multiple approvers can have the same sequence number. For example, two approvers can do a quality check and be assigned sequence number 1. Then, two individuals can be final approvers and be assigned sequence number 2.

Procedure

1. Navigate to the document record.
2. Select the additional actions icon and select **Add Approver**.
3. Add a user name.
4. Select a sequence number from the drop-down list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Lower numbers approve before higher numbers. For example, approver number one approves before number two.

5. Click **Add User**.
6. Repeat steps 2-5 to add more approvers.

Check in a document

Check in the document after you revise it so other users can check out the document.

Before you begin

Role required: document_management_admin

or

Role required: document_management_user

Procedure

1. Navigate to the document record.
2. Select the **Upload/Check In Revision** related link.
3. Click **Browse** and navigate to the revised file.
4. Click **Open**.
5. Check the Name and Revision Number.
6. Click **OK**.

Copy a document

A document can be duplicated at any time. This is useful if you have an existing document that you want to use as a base for a new document.

Before you begin

Role required: document_management_admin

or

Role required: document_management_user

Procedure

1. Navigate to the document record.
2. Right-click the header bar and select **Copy Document**.

   An information message with a link to the new document displays:

3. Click **OK**.

Result

The new document is renamed and includes the word "Copy".

Note:
Only the latest revision is copied.

Deactivate a document

To change the document state to *Inactive*, deactivate the document. This is useful when changes to a document have been put on hold. An inactive document can be reopened at any time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: document_management_admin

or

Role required: document_management_user

Procedure

1. Navigate to the document record.
2. Right-click the header bar and select **Deactivate Document**.

> **Note:**
> To activate a document, right-click on the header and click **Reopen Document**.

Reopen a deactivated document

A document that has been deactivated can be reopened.

Before you begin

Role required: document_management_admin

or

Role required: document_management_user

Procedure

1. Navigate to the document record.
2. Right-click the header bar and select **Reopen Document**.

Roll back a document

A document can be rolled back to an earlier revision at any time. Before rolling back to an earlier revision, ensure that the document is not checked out and that you have Editor or Owner permissions for the document.

Before you begin

Role required: document_management_admin

or

Role required: document_management_user

Procedure

1. Navigate to the document record.
2. In the Document Revisions list, click the revision that you want to roll back to.
3. Right-click the header bar and select **Rollback**.
   The Rollback to Revision dialog box displays. The name and revision number are new. The note specifies the revision to which you are rolling back.
4. Change any information on the Rollback to Revision dialog box as necessary.
5. Click **OK**.
   The latest revision is now the revision that you selected for rollback.

Cancel a document

Change the document state to *Cancelled* when no more changes will be made to the document.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: document_management_admin

or

Role required: document_management_user

About this task

When canceling a document, there is no confirmation message, so ensure that you want to cancel the document.

Procedure

1. Navigate to the document record.
2. Right-click the header bar and select **Cancel Document**.

   An info message confirms the cancellation:

   The **State** is set to **Cancelled**.

Check out a document

Documents in the Managed Documents application can only be revised by one user at a time. Check out the document to revise it.

Before you begin

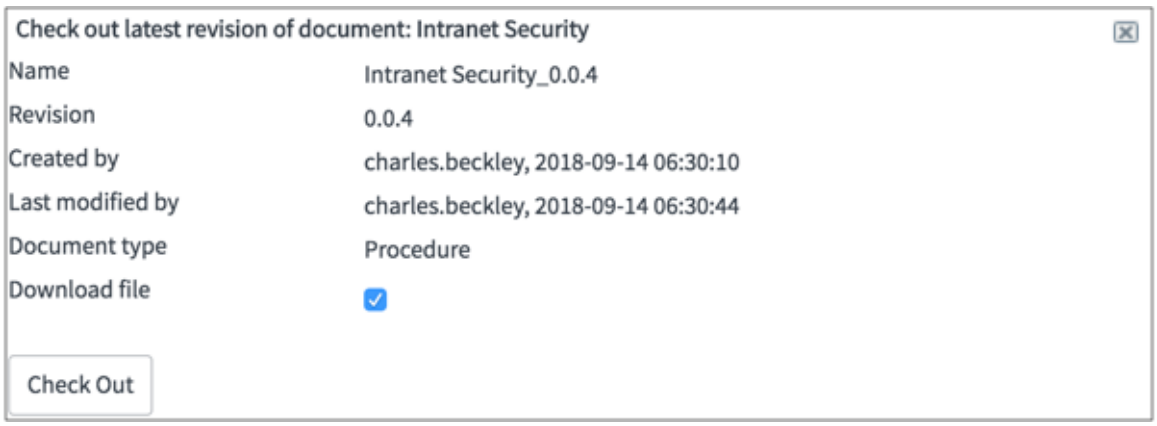
Role required: document_management_admin

or

Role required: document_management_user

Procedure

1. Navigate to the document record.
2. Select the **Check Out Document** related link.
3. Select **Download file** to download the current version of the document when it is checked out.



4. Click **Check Out**.

   After checking out a document, you can edit the document and make any necessary changes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a document collection

A document collection is a set of individual documents. After documents have been uploaded into Managed Documents, organize the documents by grouping them into collections.

Before you begin

Role required: document_management_admin

or

Role required: document_management_user

Procedure

1. Navigate to **All** > **Managed Documents** > **Document** > **My Collections**.
2. Select **New**.
3. Enter a *Name*.
4. **Optional:** Enter a *Description*.
5. Click **Submit**.
6. Click the name of the collection that you created.
7. Click **Edit**.
8. On the left, double-click an available document or select a document and click **Add**.
9. Click **Save**.
   The Document Collection page displays and the individual documents in the collection are listed.

Upload a document

Upload a document into a saved record. You can upload text files, spreadsheets, presentations, PDF files, and more.

Before you begin

Role required: document_management_admin

or

Role required: document_management_user

Procedure

1. Navigate to the document record.
2. Click the **Upload/Check In Revision** related link.
3. Click **Choose File** and navigate to the file.
4. Click **Open**.
5. Check the Name and Revision Number.
6. Click **OK**.

   After the initial document is uploaded, subsequent revisions can be created by checking out the document.

Create a new managed document record

Configure the properties and policies for a managed document.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: document_management_admin

or

Role required: document_management_user

Procedure

1. Navigate to **All** > **Managed Documents** > **Create New**.
2. In the **Name** field, type `Policy`.
3. In the **Requested by** field, add your name.
4. In the **Owner** field, add your name.
5. In the **Reviewer** field, add your name.
6. In the **Type** field, select **Policy**.
7. In the **Classification** field, select **Confidential**.
8. In the **Audience** field, select **Internal**.
9. Under **Revision Settings**, select the **Auto increment revision** option.

Example

10. Click **Submit**.

Check in a document after making changes

After making changes to a document, check the revised document into Managed Documents.

Before you begin

Role required: document_management_admin

or

Role required: document_management_user

Procedure

1. Open the document record.
2. Click the **Upload/Check in Revision** related link.
3. Click **Choose File**, select the revised file, and click **Open**.
4. Check that the **Name** and **Revision Number** contain the updated number.
5. Ensure that the **Check in** option is selected.
6. Click **OK**.
   The Document Revisions list updates to contain the most recent revision.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Check out a document to make changes

After a document is added to a managed document record, check the file out to make changes. Checking documents in and out keeps a record of document changes and ensures that only one person at a time is editing the document.

Before you begin

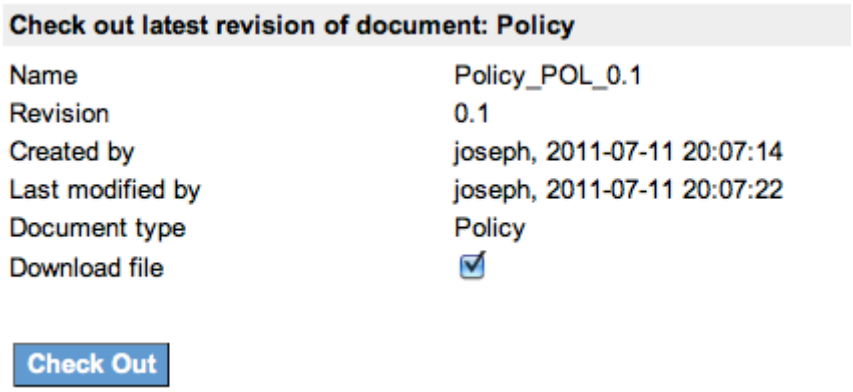
Role required: document_management_admin

or

Role required: document_management_user

Procedure

1. Open the document record.
2. Select the **Check Out Document** related link.



3. Select **Download file**.
4. Click **Check Out**.
5. Open the file and make a small change.
6. Save the document with the same name, but a new revision number.
   For example, `Policy_POL_02.txt`.

Publish a document in Managed Documents

After the document is reviewed and approved, publish the document within Managed Documents.

Before you begin

Role required: document_management_admin

or

Role required: document_management_user

Procedure

1. Open the document record.
2. In the Document Revisions list, click the name of the revision that was approved and is listed in the Ready for Publishing stage.
3. In the header bar, click **Publish Revision**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the Publish revision dialog box, check that the name and revision number are correct and click **Publish**.
   In the Document Revisions list, the revision you just published is now in the Published stage.

Send a document out for review and approval

When a document is ready, send it out for review and approval. If a reviewer or approver is not identified in the document record, the document is moved directly to the publishing stage.

Before you begin

Role required: document_management_admin

or

Role required: document_management_user

Procedure

1. In the Document Revisions list, right-click the revised document and select **Submit Revision**.
   Because you identified yourself as the reviewer, you receive an approve request email message.
2. In the email message, click the link next to **Click here to view Approval Request**.
3. **Optional:** View the document by clicking the attachment name under **Document Revision**.
4. Click **Approve**.
   The Approvals page displays and lists the document you just approved.
5. Open the document record.
6. In the Document Revisions list, the revision you approved is now in the Ready for Publishing stage.

Upload a document as an attachment

After creating a document record, add the document to the record as an attachment.

Before you begin

Role required: document_management_admin

or

Role required: document_management_user

Procedure

1. Open the document record.
2. Select the **Upload/Check in Revision** related link.
3. Click **Choose File**.
4. Select a simple document, such as a text file, and click **Open**.
5. Check that the name reads `Policy_POL_0.1`.
6. Click **OK**.

   The document is listed under Document Revisions.

Multi Provider Document Services Framework

Enable your team to collaborate in real time and add versions, store, copy, delete, restore, and upload documents by integrating document providers with your ServiceNow instance.

Create provider details for multi provider documents.	Provider details
Create document actions for multi provider documents.	Document actions
Add provider permissions for multi provider documents.	Provider permissions
Configure permission for roles and groups for multi provider documents.	Configure permissions

What to explore next

To learn more about configuring and using Multi Provider Document Services Framework, see:

- Activate Multi Provider Document Services Framework
- Integrate with Document Services
- Using Multi Provider Document Services Framework
- Reference Multi Provider Document Services framework

Activate Multi Provider Document Services Framework

You can activate the Multi Provider Document Services Framework plugin (com.snc.multiprovider_documents) for Document Services if you have the admin role.

Before you begin

Role required: admin

About this task

The following items are installed with the Multi Provider Document Services Framework:

- Plugin
- Roles
- Tables

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Multi Provider Document Services Framework plugin (com.snc.multiprovider_documents) using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Integrate with Document Services

Integrate Microsoft OneDrive, Microsoft SharePoint, and Google Drive with Document Services.

Integration overview

- Microsoft OneDrive integration with Document Services

1. Document Services Framework for Microsoft OneDrive
2. Setup Microsoft OneDrive for Document Services
3. Register Microsoft OneDrive as an OAuth provider for Document Services

- Google Drive integration with Document Services

1. Document Services Framework for Google Drive
2. Set up Document Services framework for Google Drive

Microsoft OneDrive integration with Document Services

Use Microsoft OneDrive to copy, delete, restore, and get version actions on documents directly in your ServiceNow instance.

Benefits of Microsoft OneDrive integration

Increase collaboration by integrating Microsoft OneDrive with your ServiceNow instance.

With Microsoft OneDrive integration you can do the following:

- Edit, share, and copy documents from Microsoft OneDrive to your ServiceNow instance.
- Edit, share, and copy documents from a ServiceNow instance to Microsoft OneDrive.
- Push a document authored in your ServiceNow instance to Microsoft SharePoint.
- Attach a shared link to a record.
- Share links to collaborate and edit documents in real time.
- Fetch the current version of the document.
- Collaborate with Microsoft 365 for reviewing, approving, or co-authoring documents.
- Migrate documents from Microsoft SharePoint to your ServiceNow instance.

Activation information

To integrate Microsoft OneDrive with Document Services, install the Multi Provider Document Services Framework plugin (com.snc.multiprovider_documents). For more information, see Activate Multi Provider Document Services Framework.

You also need to install the Document Services Framework for Microsoft OneDrive.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Document Services Framework for Microsoft OneDrive

Integrate the Document Services Framework with Microsoft OneDrive.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Microsoft OneDrive spoke for Document Services Framework spoke v 1.2.2 is the latest version.

Supported versions

This spoke was built for Microsoft OneDrive Spoke for Document Services Framework V1.1, but might be compatible with later versions.

Key features

Microsoft OneDrive Spoke for Document Services Framework enables a flow designer to do the following:

- Upload documents to Microsoft OneDrive
- Collaborate
- Manage versions
- Download documents

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- Complex Object (com.glide.cobject)
- IHUB Spoke Util Pack (com.snc.ihub_spoke_util_pack)
- Multi Provider Document Services Framework (com.snc.multiprovider_documents)
- Remote Directory Sync (com.snc.remote_directory_sync)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

Note:
Some of these plugins are licensable features and require appropriate licenses if used outside the spoke implementation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke subflows

The Microsoft OneDrive Spoke for Document Services Framework provides sample subflows to demonstrate the automation of Document Services tasks. To customize a sample subflow, copy it to a new application scope. The following tables list the available sample subflows for V1 and V2.

Note:
Only V2 subflows support the Microsoft SharePoint site.

V1 Subflows

Subflow	Description
Add Collaborator To Group	Adds the supplied CollaboratorID as the Member or Owner specified by Type.
Collaborate Document	Associates a document with a group or a user on Microsoft OneDrive.
Collaborate Document With Recipient Type	Associates a document with a specified Recipient Type
Connect Document From OneDrive Using Path	Connects the Microsoft OneDrive document.
Copy OneDrive Document Version	Copies the document with the specified version from Microsoft OneDrive to an attachment in the ServiceNow instance.
Create Document	Copies the document to Microsoft OneDrive, creates a record in the Multi Provider Document [mp_document] table, and adds a version in the Multi Provider Document Version [mp_document_version] table.
Create Group	Creates a group as specified in Microsoft OneDrive and updates the Multi Provider Permission Configuration [mp_permission_configuration] table.
Delete Document	Deletes the document in Microsoft OneDrive and removes its corresponding records in the Multi Provider Document Version [mp_document_version] tables.
Delete Document Version	Deletes the specified version of the document in Microsoft OneDrive and the ServiceNow instance and deletes a record in the Multi Provider Document Version [mp_document_version] table.
Get All Document Version	Retrieves all document versions from Microsoft OneDrive and creates and updates records in the Multi Provider Document Version [mp_document_version] table.
Get Document from OneDrive	Copies the document from Microsoft OneDrive to the specified document name. It also creates a record in the Multi Provider Document [mp_document] table and in all document versions in the Multi Provider Document Version [mp_document_version] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

V1 Subflows (continued)

Subflow	Description
Restore Document Version	Restore the document to the version in Microsoft OneDrive.
Sync Collaborators	Syncs all Microsoft Azure users into the Multi Provider Collaborators [mp_collaborators] table. If the user is deleted or updated, the user's record in the Multi Provider Collaborators [mp_collaborators] table is checked, if it's present then the record is deleted or updated. If the user is newly added, then it creates an entry in the Multi Provider Collaborators [mp_collaborators] table under Multi Provider Documents. **Note:** The scheduled job with the name **Sync Collaborators** triggers the subflow for Sync Collaborators. You can choose from the available run a script option. The default option is **On Demand**. The job is run based on the set schedule and collaborators are synchronized accordingly. For more information, see Automatically run a script of your choosing.
Delete Collaborator Record	Deletes the specified collaborator record from the Multi Provider Collaborators [mp_collaborators] table.
Update Document Content	Updates the specified document with the provided attachment in Microsoft OneDrive that corresponds to the document ID. The attachment name should match the name of the document in Microsoft OneDrive.
Upload Large File	Uploads an attachment to Microsoft OneDrive. The maximum size of the file can't exceed 60 MB.
Get Latest URL	Gets the latest URL to a document in the Microsoft OneDrive.
Reconnect Document from Microsoft OneDrive	Reconnects to a document in Microsoft OneDrive. **Note:** Before using the subflow, ensure that the corresponding Microsoft OneDrive connection and credential are created and the Microsoft OneDrive authorization token is available.

V2 Subflows

Subflow	Description
Get Document Latest URL V2	Gets the latest URL from Microsoft OneDrive for the referred document ID.
Update Document Content V2	Updates the specified document with the provided attachment content in Microsoft OneDrive corresponding to the document ID from table Multi Provider Document sys_id.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

V2 Subflows (continued)

Subflow	Description
	The attachment name should match with the name of the document in Microsoft OneDrive.
Collaborate Document V2	Associates a document with a specified recipient type.
Connect Document From OneDrive Using Path V2	Connects the Microsoft OneDrive document that can also be tracked under Multi Provider Documents.
Copy OneDrive Document Version V2	Copies the document with the specified version from Microsoft OneDrive to an attachment in the ServiceNow instance.
Create Document V2	Copies the document to Microsoft OneDrive and creates a record in the Multi Provider Document [mp_document] table and the Multi Provider Document Version [mp_document_version] table for Multi Provider Documents.
Delete Document V2	Deletes the document in Microsoft OneDrive and removes its corresponding records in the Multi Provider Document [mp_document] table and the Multi Provider Document Version [mp_document_version] tables.
Delete Document Version V2	Deletes the particular version of the document in bothMicrosoft OneDrive and deletes a record in the Multi Provider Document Version [mp_document_version] table under Multi Provider Documents.
Get All Document Versions V2	Retrieves all the document versions from Microsoft OneDrive and creates or updates records in the Multi Provider Document Version [mp_document_version] table under Multi Provider Documents. This subflow supports documents from different sources supported by Microsoft OneDrive.
Get Document from OneDrive V2	Copies the document from Microsoft OneDrive to the specified document name. It also creates a record in the Multi Provider Document [mp_document] table and all its versions in the Multi Provider Document Version [mp_document_version] table under Multi Provider Documents.
Reconnect Document from Microsoft OneDrive V2	Reconnects to a document in the Microsoft OneDrive.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

V2 Subflows (continued)

Subflow	Description
	Note: Before using the subflow, ensure that the corresponding Microsoft OneDrive connection and credential are created and the Microsoft OneDrive authorization token is available.
Restore Document Version V2	Restores the document to the version provided in the Microsoft OneDrive.
Sync Collaborators V2	Syncs all Microsoft Azure users into the Collaborators [mp_collaborators] table under Multi Provider Documents.
Upload Large File V2	Uploads an attachment to Microsoft OneDrive. The maximum size of the file can't exceed 60 MB.
Remove Document Collaboration	Removes collaboration on a Microsoft OneDrive document.
Update Document Collaboration	Updates collaboration on a Microsoft OneDrive document.

Note:
The V2 subflows work only for documents attached to the platform using the Create Document V2 or Connect Document V2 subflows.

.

Spoke Actions

The Microsoft OneDrive Spoke for Document Services Framework provides sample actions to automate Document Services tasks when events occur in ServiceNow. The following table lists the available sample actions.

Action	Description
Delete Collaborator Record	Deletes the specified collaborator record from the Multi Provider Collaborators [mp_collaborators] table.
Delete document	Deletes the document record from the Multi Provider Document [mp_document] table.
Delete document and versions	Deletes the specified document and all of its versions from the Multi Provider Document Version [mp_document_version] table.
Delete document version	Deletes specified versions of a document from the Multi Provider Document Version [mp_document_version] table.
Delete versions of document	Deletes all versions of a specified document.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action	Description
Look up Target Record Existence	Checks for the existence of a target record in the specified target table.
Look Up Files and Folders	Retrieves the list of files and folders under the given Folder ID for the selected Source and Source ID. If no source is selected, then it lists the contents of the root folder by default.
Look up Sites Based On Query String Stream	Lists all the sites satisfying the specified query string.
Update Delta Token	Updates the system property *deltaToken* with the specified delta token.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up Microsoft OneDrive spoke.

Setup Microsoft OneDrive for Document Services

Integrate the ServiceNow instance and Microsoft OneDrive for Document Services by creating a custom OAuth application in Document Services to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Set up and connect Microsoft Entra ID Spoke, see Set up Microsoft Entra ID spoke and Microsoft OneDrive Spoke.

Microsoft OneDrive requirements:

- Microsoft OneDrive account
- Microsoft Azure account
- Microsoft OneDrive tenant administrator credentials

Role required: admin

About this task

Complete these steps from your Azure Developer account. See the Azure product documentation for instructions on creating and configuring custom applications.

Procedure

1. Log in to the Microsoft Azure registration portal with your organization credentials. For more information, see the Microsoft documentation on the Microsoft Azure App registration portal.
2. Register a new custom application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Provide the application name and the supported account type.

b. Select **Register**.

c. Enter the redirect URL in the following format: `https://<instance>.service-now.com/oauth_redirect.do`.

An overview of the application's basic information is Displayed.

3. Copy the application ID to a text file.
   You will use this ID and the client secret generated in the next step to register the app as a third-party OAuth provider on your ServiceNow instance. The application ID is the client ID when you connect the application to your ServiceNow instance.
4. Add a client secret.

   a. In Microsoft Azure, navigate to **Manage** > **Certificates & secrets**.

   b. Provide a description and an expiration date.

   c. Select **Add**.
5. Enable the permissions you want the application to support.
   For more information, see the Microsoft Graph permissions reference documentation.

   a. In Microsoft Azure, navigate to **Manage** > **API permissions**.

   b. Click the Microsoft Graph tile.

   c. Select the delegated or application permissions that the application supports.

   Delegated permissions enable the application to access the API as a signed-in user.

   Application permissions enable the application to run as a background service or daemon without a signed-in user.

   You must mention these API permissions in the **OAuth Entity scopes** tab while configuring the application registry.

   d. Ensure that required API permissions are provided for your custom app.

Name	OAuth scope
Files.Read	Files.Read
Files.Read.All	Files.Read.All
offline_access	offline_access
Files.ReadWrite	Files.ReadWrite
Files.ReadWrite.All	Files.ReadWrite.All
AuditLog.Read.All	AuditLog.Read.All
Directory.AccessAsUser.All	Directory.AccessAsUser.All
Directory.Read.All	Directory.Read.All
User.Read	User.Read

   e. Select **Add permissions**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

Register Microsoft OneDrive as an OAuth provider for Document Services

Register Microsoft OneDrive as an OAuth provider for Document Services

Use the information generated during Microsoft OneDrive account configuration to register Microsoft OneDrive as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System OAuth** > **Application Registry**.
2. Select **New**.
3. On the screen titled **What kind of OAuth application**, select **Connect to a third-party OAuth Provider**.
4. On the form, fill in the fields.

Application Registries form

Field	Value required
Name	Name to uniquely identify the record.
Client ID	Application ID of the OneDrive application you created in Microsoft Azure.
Client Secret	The Client Secret you generated when you created the application in Microsoft Azure.
Default Grant type	This value should be **Authorization Code**.
Authorization URL	`https://login.microsoftonline.com/common/oauth2/v2.0/authorize` Note that you have to unlock this field and then lock it again.
Token URL	`https://login.microsoftonline.com/common/oauth2/v2.0/token` Note that you have to unlock this field and then lock it again.
Redirect URL	`https://<instance>.service-now.com/oauth_redirect.do` Note that you have to unlock this field and then lock it again.

5. Right-click in the form header and select **Save**.
   An OAuth Entity Profile record is created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. In the OAuth Entity Scopes related list, add scopes to match the permissions you defined when you configured the Microsoft OneDrive application.

   a. Select **Insert a new row**.

   b. Enter the name and the OAuth scope of the permission, which for these Document Services scopes are the same for both values.

      - Files.Read
      - Files.Read.All
      - offline_access
      - Files.ReadWrite
      - Files.ReadWrite.All

7. Right-click in the form header and select **Save**.
8. Select **Update**.

Result
The system validates the OAuth credentials.

Google Drive integration with Document Services

Use Google Drive to manage and sync your documents, and get version actions on documents directly in your ServiceNow instance. You can also collaborate on documents and manage attachments hosted within Google Drive.

Benefits of Google Drive integration

Increase collaboration by integrating Google Drive with your ServiceNow instance.

With the Google Drive integration, you can do the following:

- Edit, share, copy, and delete documents from Google Drive to your ServiceNow instance.
- Edit, share, copy, and delete documents from a ServiceNow instance to Google Drive.
- Fetch the current version of the document.
- Collaborate for reviewing, approving, or co-authoring documents.
- Integrate with Google Drive to create, update, and collaborate on documents within the platform

Activation information

To integrate Google Drive with Document Services, install the Multi Provider Document Services Framework plugin (com.snc.multiprovider_documents). For more information, see Activate Multi Provider Document Services Framework.

Document Services Framework for Google Drive

Integrate the Document Services with Google Drive.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Supported versions

This Spoke was built for Document Services Framework V1.0, but may be compatible with Utah and later versions.

Key features

Document Services Framework for Google Drive enables a flow designer to:

- Upload the document to Google Drive
- Collaborate
- Manage versions
- Download documents

Spoke requirements

- Google Drive Spoke
- Google Directory Spoke
- Google Docs Spoke

Spoke dependencies

If you're having trouble installing the app, verify that these dependent plugins are installed:

- IHUB Spoke Util Pack (com.snc.ihub_spoke_util_pack)
- Multi Provider Document Services Framework (com.snc.multiprovider_documents)
- Remote Directory Sync (com.snc.remote_directory_sync)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke subflows

The Document Services Framework for Google Drive provides sample subflows to demonstrate automating Google Drive tasks for My Drive and Shared drives. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Subflow	Description
Create Document	Copies the document to Google Drive and creates a record in the Documents table with the folder ID and created version in Version table under Multi Provider Documents.
Create Document V1	Copies the document to Google Drive and creates a record in the Documents table with shareable folder URL and created version in Version table under Multi Provider Document Services Framework Documents. **Note:** For shared drive copy the URL and the URL should be in the below the format and anything in between drive and folder needs to be removed while copying the URL. https://drive.google.com/drive/folders/<folder ID>
Create Group	Creates a group as specified in Google Drive and updates the Permission Configurations table under Multi Provider Documents.
Add Collaborator To Group	Given a Group ID from Google Drive, this subflow will add the given collaborator as specified by role.
Collaborate Document	Adds a permission to a given user, group or domain, or to anyone, for a file. This permission is based on a permission type and role and is how collaboration is configured in Google Drive. If **User** or **Group** is selected, the email address is required for those users and groups. If **Domain** is selected, the domain name to create permission for is required. If **Anyone** is selected, then anyone has permission to the file or folder.
Connect Document From Google Drive Using ID	Connects the Google Drive document using the ID and can be tracked under Multi Provider Document Services Framework documents
Connect Document From Google Drive V1	Connects the Google Drive document using the sharable URL for the document and can be tracked under Multi Provider Document Services Framework documents.
Copy Google Drive Document Version	Copies the document with the given version from Google Drive to an attachment in ServiceNow.
Delete Document	Deletes the document in Google Drive and remove its corresponding records in documents and versions tables.
Delete Document Version	Deletes the document in Google Drive and remove its corresponding records in documents and version tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Subflow	Description
Get All Document Versions	Gets all the document versions from Google Drive and creates or updates records in the Versions table under Multi Provider Documents.
Get Document From Google Drive	Copies the document from Google Drive to the Document Name referred by creating a record in the documents table and all its versions in the Versions table under Multi Provider Documents.
Get Document Latest URL	Constructs the web view URL and web edit URL for the file by verifying if the file actually exists in Google Drive. Consuming APIs are required to verify if the file is present or not.
Get Oldest Document Version	Returns the oldest version of the document.
Reconnect Document From Google Drive	Reconnects the Google Drive document that can be tracked under Multi Provider Documents.
Sync Collaborator	Syncs all Google Drive users in a domain with the Collaborators table under Multi Provider Documents.
Update Document Content	Updates the document with the attached content in Google Drive corresponding with the document ID from table Multi Provider Documents sys_id.

Spoke actions

The Document Services Framework for Google Drive provides actions to automate Document Services tasks when events occurs in your ServiceNow instance. Available actions include:

Action	Description
Delete document and versions	Deletes the specified document along with versions from Multi Provider document and versions table.
Look Up Incremental Files and Folders	Returns a list of Google Drive files and folders under the given folder ID.
Look Up Files and Folders Stream	Retrieves the list of files and folders under the given folder.
Copy File Revision as Attachment	Copies the given Revision ID for a File ID to any record in ServiceNow.
Delete document version	Deletes the specified versions of a document from Multi Provider document versions table.
Look Up Target Record Existence	Checks for the existence of the target record in the specified target table.
Copy Doc File to Attachment	Copies the Google doc file toServiceNow as an attachment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action	Description
Copy Doc Revision as Attachment	Copies the given revision ID for a Google document file ID to any record in ServiceNow.
Get File Type Info	Returns the file type and information for the input mime-type.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up Document Services framework for Google Drive.

Set up Document Services framework for Google Drive

Integrate a ServiceNow instance and Google Drive spoke for Google Drive by using Google Drive credentials to authenticate ServiceNow requests.

Before you begin

Request a Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Role required: admin

Procedure

1. Set up and connect Google Drive Spoke.
   For more information, see Set up Google Drive spoke.
2. Set up and connect Google Directory Spoke.
   For more information, see Google Directory Spoke.
3. Set up and connect Google Doc Spoke.
   For more information, see Google Docs Spoke.
4. Activate Document Services for Google Drive Spoke.
   For more information, see Document Services Framework for Google Drive.

Using Multi Provider Document Services Framework

Create provider details, document actions, provider permissions and configure permission.

Create provider details

Create provider details for multi provider documents.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Multi Provider Document** > **Admin** > **Permission Configurations**.
2. Select **New**.
3. In the Attributes field, enter Name and Value.
4. In the Provider details name field, enter the name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select the Provider Name from the drop-down.
6. Select **Submit**.

> **Note:**
> Once the provider details are created, it automatically creates the document actions and provider permissions.

Create document actions

Create document actions for multi provider documents.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Multi Provider Document** > **Admin** > **Document Actions**.
2. Select **New**.
3. Enter the Document Action Name.
4. Select Provider permission, Subflow, and Provider Details.
5. In the Description field, enter the description.
6. Select **Submit**.

Create provider permissions

Create provider permissions for multi provider documents.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Multi Provider Document** > **Admin** > **Permission Configurations**.
2. Select **New**.
3. On the form, fill in the fields.

New provider permissions fields

Field	Description
Permissions	Name of the document.
Description	A brief description about the provider permission.
Provider details	Select the provider details.
Attributes	Name and value of the attribute.

4. Select **Submit**.

Configure permissions

Configure permission for roles and groups for multi provider documents.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **Multi Provider Document** > **Admin** > **Permission Configurations**.
2. Select **New**.
3. Select the Entity Type.
4. Select the Entity id by selecting the search icon.
5. Go to the Documents field, select the role from the document list.
6. Select **OK**.
7. Enter Provider group attributes Name and Value.
8. In the Permissions field, select the permissions that you want to grant.
9. Select **Submit**.

Reference Multi Provider Document Services framework

Installed with Multi Provider Document Services Framework

Several types of components are installed with activation of the Multi Provider Document Services Framework plugin, including tables and user roles.

Roles installed

Roles installed with multi provider framework

Role	Description
Admin mp_document_admin	Configures multiple providers, remote document actions, and corresponding subflows.
Document User mp_document_user	Creates, updates, and deletes documents managed for providers

Tables installed

Tables installed with multi provider framework

Table	Description
Multi Provider Document mp_document	The documents connected with the third-party provider.
Multi Provider Document Version mp_document_version	The versions related to documents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables installed with multi provider framework (continued)

Table	Description
Multi Provider Document Activity mp_document_activity	Logs the activity for document and document versions table and can be used to troubleshoot the actions taken on documents and versions.
Multi Provider Collaborators mp_collaborators	Third-party users collaborating on the ServiceNow instance.
Multi Provider Detail mp_provider_detail	Details of the thirty-party providers that have been configured.
Multi Provider Document Action mp_document_action	The actions associated with each subflow.
Multi Provider Permission mp_provider_permission	Permissions allowed by the provider.
Multi Provider Permission Configuration mp_permission_configuration	Role/group mapping to permissions provided from the mp_permission table for each provider.

Multi Provider Document Services Framework Framework roles

Multi Provider Document Services Framework Framework is installed with these roles.

To learn more about managing subscriptions, see Managing per-user subscriptions in Subscription Management and contact your account representative.

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy, which may be updated by ServiceNow.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal.

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. In addition, this application will collect case information (for chat summarization, resolution notes generation, knowledge generation, call summarization), chat transcripts (for chat recommendation), and email information (for email response). Customers can opt out of future data collection at any time, as described in the Now Assist Opt-Out page.

For more information, see the Now Assist documentation.

Explore Now Assist in Document Management

Configure Now Assist in Document Management

If you have the admin role, you can configure Now Assist in Document Management in the application enabling the use of its generative AI skills within the application workspace.

Configuration overview

Configure how agents use generative AI capabilities to generate the document insights.

Configure the Smart Documents Skill for Now Assist in Document Management

Configure the Smart Documents Skill for Now Assist in Document Management

Configure the Smart Document skill to get document insights through seamless conversational interactions by using Now Assist in Document Management application.

Before you begin

Role required: sn_nowassist_admin.nsa_admin

Procedure

1. Navigate to **All** > **Now Assist Admin** > **Skills**.
2. In the workflow list, select **Platform**.
3. In the Now Assist skills for Platform, go to the Smart Documents skill and select **Activate skill**.
4. In the Define availability section, select the tables that you want to activate the smart documents for.
5. Select **Save and continue** to go to the next step in the guided setup.
   A guided setup leads you through the configuration of the general details, input, prompt, availability, display, review, and activation of the customized skill. If you complete the entire walk-through, the skill is activated.
6. In the Define access section, determine the roles that have access to this skill.
7. Select **Save and continue** to go to the next step in the guided setup.
8. In the select display section, choose where to display the smart documents.
9. Select **Save and continue**.
10. Review your selection and select **Activate**.
    The guided setup is complete and the skill is activated.

Exploring Knowledge Management

Learn more about Knowledge Management with a sample workflow and review the benefits it can provide for different users in your organization.

Knowledge Management overview

Knowledge Management supports processes for creating, categorizing, reviewing, and approving articles. Users can search and browse articles as well as provide feedback.

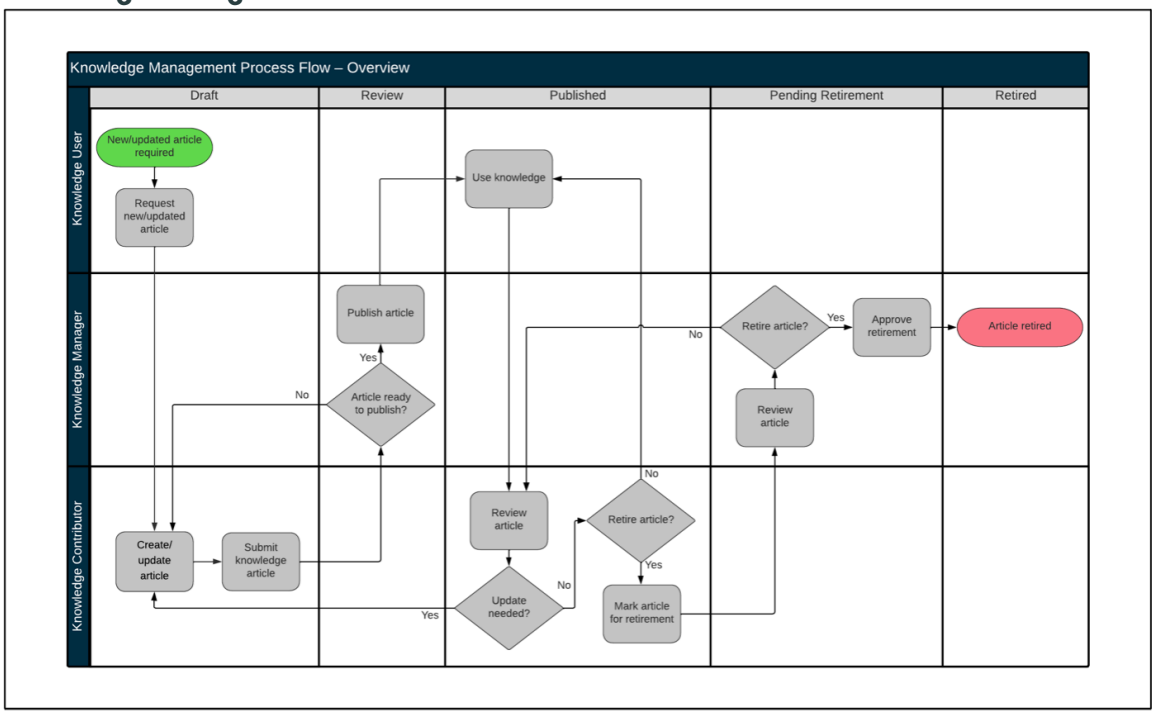
To support multiple groups, knowledge bases can be assigned to individual managers. Separate workflows can be used for publishing and retiring articles, and separate access controls can be used to control reading and contributing.

Knowledge Management workflow

This infographic shows a sample end-to-end workflow of how different users in an organization work together to create, share, use, and manage articles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Knowledge Management



In this workflow:

1. The knowledge user needs a new or updated knowledge article and requests it.
2. The knowledge contributor creates or updates an article and then submits it for review.
3. The knowledge manager reviews the article and either publishes it or sends it back to the knowledge contributor for revisions.
4. The knowledge user reads and shares the article. In parallel, a knowledge manager continuously reviews articles to determine their relevancy.
5. The knowledge manager marks articles that are no longer needed for retirement.
6. A knowledge manager reviews and approves or rejects the article retirement.

Knowledge Management benefits

Benefit	Feature	Users
Create a consistent structure for knowledge articles	Knowledge article templates	Knowledge manager

Sitemap Generator for the Knowledge Portal

The ServiceNow® Sitemap Generator application enables you to efficiently define and automatically generate XML sitemaps.

Sitemap Generator configuration requirements for the Knowledge Portal

The sitemap is generated from a script or static XML. Validating sitemaps isn't handled automatically, so verify when creating a sitemap that its contents meet the following requirements:

- Includes only the knowledge base configured for the Knowledge Portal
- Includes only Knowledge Portal pages with unauthenticated user access
- Excludes Knowledge Portal URLs that aren't publicly accessible
- Excludes pages that respond with a 301 redirect
- Excluded retired and expired knowledge base articles

For information about sitemap requirements for search engine optimization (SEO), see Build and submit a sitemap in the Google documentation.

I18N - Knowledge internationalization

The optional knowledge internationalization features enable knowledge users to view articles in multiple languages.

Beginning with the San Diego release, the I18N: Knowledge Management Internationalization v2 (com.glideapp.knowledge.i18n2) plugin is installed when any language pack is activated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In versions prior to San Diego, this plugin was installed along with the Internationalization (com.glide.i18n) plugin.

Knowledge internationalization enables the knowledge management team to create language-specific knowledge articles and keep translations of the same article related to each other so they are easy to manage. Users can view and search within their own language while still being able to view articles in other languages when necessary.

Set a custom language for the article

Beginning with the San Diego release, users with elevated privileges can add a custom language by adding language entries in the Choice [sys_choice] table to display the selected article in multiple languages. On the article page, the **Language** list shows all the languages for which the article language translation is available.

Set the search language for articles

You can set the default language for searching articles to a language different from the logged-in language by specifying the language as the value of the *glide.knowman.search.default_language* system property. For example, if French is the logged-in language and you want to set English as the default language for searched articles, specify English in the system property. You can also switch to French in the UI to see the French articles. If the system property is not set, the logged-in language of the user is set as the default article language. For more information, see Other knowledge properties.

To enable search for different languages simultaneously, navigate to **Knowledge Administration** > **Knowledge Search** > **Properties** > **Enable multi language search** and select the **Yes** check box. For information about performing a search on all available languages simultaneously, see Search using Knowledge Management v3.

Note:
If the *glide.knowman.search.default_language* system property is inactive, you can search one language at a time. If the property is enabled, you can search for multiple languages simultaneously.

Scoped knowledge bases

To protect knowledge bases containing sensitive articles, use a scoped knowledge base. Even system administrators and knowledge administrators can't administer scoped knowledge bases unless explicitly authorized through user criteria.

For example, say you have a knowledge article with sensitive payroll information that should be seen only by the Payroll department and not by a system administrator or knowledge administrator. You could create a knowledge article with the sensitive information in a scoped knowledge base within the Human Resources: Core application.

Only users with the admin role of an application and the knowledge_admin role can administer a scoped knowledge base. You control access to knowledge bases of an application with application administration enabled, such as HR, through the ACLs of the knowledge tables in the application instead of global ACLs. To define access to a scoped knowledge base, specify appropriate user criteria for users, including system administrators and knowledge administrators.

Note:
For Scope Master tables to derive scope and execute scoped ACLS, you must set the *glide.enforce_security_scope.<scope_name>* system property to true.

You can't modify the scope of existing knowledge bases. They remain in the global scope. However, you can create a scoped knowledge base to protect sensitive knowledge articles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To create a scoped knowledge base for an application, in addition to the knowledge_admin or admin role, you must have access to view and select that application in the application picker (see Application picker). For example, before you create a knowledge base in the Human Resources: Core application, you must select the Human Resources: Core application in the application picker, and then create the knowledge base. Then, when you create a knowledge base, on the Knowledge base form, the application scope of the knowledge base is set in the **Application** field.

Machine learning solutions for Knowledge Management

Machine learning in Knowledge Management helps improve knowledge governance and quality of your knowledge base.

Machine learning in Knowledge Management has the following benefits:

- Improves the quality of your knowledge base by avoiding duplicate articles and makes the knowledge base more Knowledge-Centred Service (KCS) compliant.
- Suggests related articles to help you solve an issue or resolve a question.
- Identifies knowledge gaps and improves content of your knowledge base using the Knowledge Demand Insights feature.

Predictive Intelligence for Knowledge Management

The Predictive Intelligence for Knowledge Management capability uses machine-learning algorithms to provide various Knowledge Management capabilities, such as similar articles and knowledge demand insights.

Solution definitions for Predictive Intelligence for Knowledge Management

The solution definitions for Predictive Intelligence for Knowledge Management capability are available in the Predictive Intelligence for Knowledge Management plugin (com.snc.knowledge_ml). For more information about the plugin, see Additional plugins for Knowledge Management.

Solution definition and solution type

Solution Definition	Solution Type	Description

Knowledge article templates

Article templates have pre-defined fields structured in a specific order. These templates help create a consistent structure for knowledge articles.

Using the Knowledge Article Templates feature, as a knowledge administrator (a user with knowledge_admin role), you can create article templates, add or customize fields in a template, and activate or deactivate a template.

As a security administrator (a user with security_admin role), you can configure field-level security in any template to make it visible to specific users.

As an author, you can create articles using pre-defined article templates or any newly created article templates.

Pre-defined knowledge article templates

Use either the standard template or one of the pre-defined How To, What Is, FAQ or KCS article templates.

Note:

When you upgrade Knowledge Management to Kingston or later releases, all the existing articles from the earlier version automatically use the standard template of the upgraded version. For example, if you upgrade Knowledge Management from Jakarta to Kingston, all existing articles use the standard template available in the Kingston version.

All pre-defined templates are inactive by default. If you do not activate a template, the articles automatically use the standard template. As a knowledge admin, you can activate a template by navigating to **Knowledge** > **Administration** > **Article Templates**. Then in the article template list, set the **Active** field to true for one or more templates you would like to activate.

Templates are associated with knowledge bases. Only templates which are active and associated with a knowledge base are shown.

The template structure is stored in kb_article_template while the fields for each template are stored in kb_article_template_definition. For creating and manipulating templates navigate to **Knowledge** > **Administration** > **Article Templates**.

The table below lists the fields available in each template and the name of the template table.

Pre-defined knowledge article templates

Template name	Template fields	Maps to table	SEO Description Tag
FAQ	• Question • Answer	FAQ [kb_template_faq]	Question

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Pre-defined knowledge article templates (continued)

Template name	Template fields	Maps to table	SEO Description Tag
How To	• Introduction • Instructions	How To [kb_template_how_to]	Introduction
What Is	• Introduction • Explanation	What Is [kb_template_what_is]	Introduction
KCS Article	• Issue • Environment • Cause • Resolution	KCS Article [kb_template_kcs_article]	Issue
Standard	Text	kb_knowledge	Text

Activating knowledge article templates

The Knowledge Article Templates feature is activated with the Knowledge Management Advanced (com.snc.knowledge_advanced) plugin. After the feature is activated, when creating an article, option to choose a template for the article appears. For details, see Activate the Knowledge Management Advanced plugin.

Deactivating knowledge article templates

You cannot delete an article template because article templates have an associated child table. Deleting a template would also require deleting the child table. Due to the limitations on dropping tables, article templates and template columns are explicitly made non-deletable. Instead, you can disable the Knowledge Article Templates feature by clearing the **Active** check box on the Article Template form.

Note:
The Standard template is available by default and can't be made inactive.

Related topics

Configure knowledge article templates

Knowledge blocks

Simplify knowledge authoring for writers and knowledge consumption for readers with knowledge blocks. Knowledge blocks are reusable pieces of content secured by user criteria that you can add to knowledge articles in a knowledge base. The user criteria controls which users can read or not read the block content in an article or search, enabling users to more easily view content that is relevant to them.

Knowledge blocks are available for use in ServiceNow AI Platform only.

How to use knowledge blocks

To use knowledge blocks, a knowledge administrator or manager must enable the knowledge blocks feature for each knowledge base in which the blocks will be used.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Enable knowledge blocks for each knowledge base

Knowledge contributors can create knowledge blocks and insert them into articles in a knowledge base:

Note:
Knowledge blocks are not supported in articles of type wiki. By default, knowledge block doesn't show files attached to it. However, you can see images and text are visible on KB's created from block files.

- Create a knowledge block
- Add knowledge blocks to a knowledge article
- Preview a knowledge article with knowledge blocks by user or date

Knowledge block content can be read or not read in an article or search based on user criteria set at the knowledge base and knowledge block level. See Select user criteria for a knowledge block for more information.

Example: Holiday calendar with location-specific knowledge block content

You are part of an enterprise HR organization that maintains a company knowledge base. You want to create a holiday calendar so that employees know which days of the year are company holidays. Since the company has multiple locations and holiday dates vary based on where the employee is located, there are several ways that you could create the knowledge article.

One way is that you could create a knowledge article for each location, with an article for Location A, Location B, and so on.

- Pros: simplified consumption. Employees have a single article to search for and read.
- Cons: more work for HR. HR has multiple articles to manage and update for each location where the company has employees.

Another way is that you could create a single knowledge article that includes sections for each location.

- Pros: simplified authoring. HR has a single article to manage and update.
- Cons: more work for employees. Employee must scroll through and disregard extraneous content to find the section in the article that pertains to them.

With knowledge blocks, you can create a single knowledge article with location-specific block content secured by user criteria. This approach helps to reduce the workload for both HR and employees. As an HR agent, you have a single article to manage and update. Employees have a single article to search for and read, with the user criteria ensuring that they only view content that is relevant to them.

If you are using a custom search or knowledge article viewer

If you are using a custom search or knowledge article viewer with your application, you should integrate it with the appropriate knowledge or knowledge blocks API. (Integration is only necessary if you are using a custom search or knowledge article viewer.)

Integrating a custom search or knowledge article viewer with knowledge blocks

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activation information

To use knowledge blocks in your application, you must activate knowledge blocks. For information on what components are installed with the feature, see Components installed with knowledge blocks.

Note:
Activating knowledge blocks automatically activates Knowledge Management Advanced, which enables advanced features such as article versioning. Knowledge blocks can be used with or without the article versioning feature. To disable the feature, see Disable the article versioning feature.

Knowledge subscriptions

Subscribe to knowledge bases and knowledge articles to receive email notifications about new articles and article revisions or comments.

- Subscribed to a knowledge base:
  - Knowledge base owners are auto-subscribed to all articles in the knowledge bases they own. They receive email notifications when new articles are created or revised (published) in the knowledge base.
  - Users who subscribe to a knowledge base receive email notifications when new articles are created in the knowledge base or if the existing articles are revised (published).
- Subscribed to a knowledge article:
  - Knowledge authors are auto-subscribed to the articles they create. They receive email notifications when the articles they created are checked out or revised (published) by other authors, and if the articles receive user comments.
  - Users who subscribe to an article receive email notifications when the article is revised (published).

Users can set their Knowledge notification preferences using **System Settings**. For more information, see Managing email notifications in Knowledge Management and Set knowledge notification preferences.

The knowledge subscription feature is available for both the Knowledge Management v3 user interface and the Knowledge Management Service Portal.

If the article versioning feature is enabled, the following notifications are also sent:

- An article is checked out
- An article is revised
- A new version of an article is published

Activation information

The knowledge subscriptions feature requires the Knowledge Management Advanced plugin (com.snc.knowledge_advanced). For more information, see Configure knowledge subscriptions.

Knowledge demand insights

Identify knowledge gaps and improve content of your knowledge base using the Knowledge Demand Insights feature.

The Knowledge Demand Insights feature automates the discovery of knowledge gaps in your knowledge bases. Knowledge gaps are topics on which knowledge bases are missing knowledge articles.

Addressing knowledge gaps has the following benefits:

- Improve effectiveness of self-service: Self-service users get more relevant information for research, troubleshooting, and how to queries.
- Increase case or incident resolutions: Having relevant information available helps you deflect future cases.
- Improved case resolution: Agents can find more relevant knowledge articles to solve cases, incidents, problems, and so on.

Activation information

The Knowledge Demand Insights feature requires the Predictive Intelligence for Knowledge Management plugin (com.snc.knowledge_ml). For more information, see Predictive Intelligence for Knowledge Management and Additional plugins for Knowledge Management.

Demand insights dashboards

You can use a demand insights dashboard for your tasks to analyze candidate knowledge gaps and create knowledge gap feedback tasks. By default, the Knowledge Demand Insights feature includes **Demand Insights for Incidents**, **Demand Insights for Cases**, and **Demand Insights: Similar HR Cases and Knowledge** dashboards for incidents, customer service cases, and HR cases, respectively. For other tasks, you can create a dashboard. To access a demand insights dashboard, you must have read access to the tasks and the sn_km_ml.knowledge_curation_user role. For more information, see Analyze knowledge gaps from a demand insights dashboard and create knowledge gap feedback tasks.

Self-Service Analytics

The Self-Service Analytics framework enables you to gather information about user activities and deflection outcomes related to those activities.

Display the effectiveness of self-service channels by using reports and dashboards based on the data generated by the Self-Service Analytics framework. This Self-Service Analytics data is used by the Self-Service Analytics dashboard for customer service. You can also use the Self-Service Analytics framework in dashboards of other applications that use the Subscriptions and Activity Feed Framework. For more information, see Self-Service Analytics dashboard for customer service.

Analyzing self-service deflection metrics has the following benefits:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Measure self-service effectiveness through self-service KPIs.
- Quantify successful self-service engagements to take corrective actions.
- Define custom self-service KPIs tailored to your organization.

Activation information

The Self-Service Analytics framework requires the Self-Service Analytics Core plugin (com.snc.self_service_analytics_core). For more information, see Activate Self-Service Analytics.

Note:
The data for the Communities and Virtual Agent channels are generated when the Communities plugin (com.sn_communities) and Glide Virtual Agent plugin (com.glide.cs.chatbot) are activated respectively.

Related topics

Configure Self-Service Analytics

Self-Service Analytics concepts

Platform Analytics Solutions for Self-Service Analytics for Customer Service

Self-Service Analytics concepts

You can quantify your self-service effectiveness by measuring case deflections.

The Self-Service Analytics framework enables you to measure case deflection by defining user activity patterns for a deflection outcome. A case deflection is when you are able to provide a resolution using one of the self-service channels, such as Knowledge, Communities, Catalog, and Virtual Agent, to a user who intended to create a case and as a result, no case is created.

By default, the Self-Service Analytics framework is used by the Self-Service Analytics dashboard for customer service. The framework can also be used in dashboards of other applications that use the Subscriptions and Activity Feed Framework.

The system includes predefined configurations for the Self-Service Analytics framework components associated with consumers and customer contacts. You can also configure these components for other user entities.

Self-service analytics components

Self-service analytics is based on the activity pattern associated with a deflection outcome. It consists of the following main components:

- Activity pattern (see Activity pattern components)
- Deflection outcome (see Deflection outcome components)

Activity pattern components

Activity pattern

A combination of pattern element, pattern element group, or both for a user entity such as consumers or customer contacts that is linked to an outcome. Each pattern element or pattern element group is implemented as regular expressions.

Example: The activity pattern Contacts: Case: Confirmed Deflection is a combination of pattern element groups Self-Service: Helpful and Self-service actions: Optionally Many.

Deflection outcome

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

An activity pattern can lead to a deflection outcome. See Deflection outcome components.

Primary activity

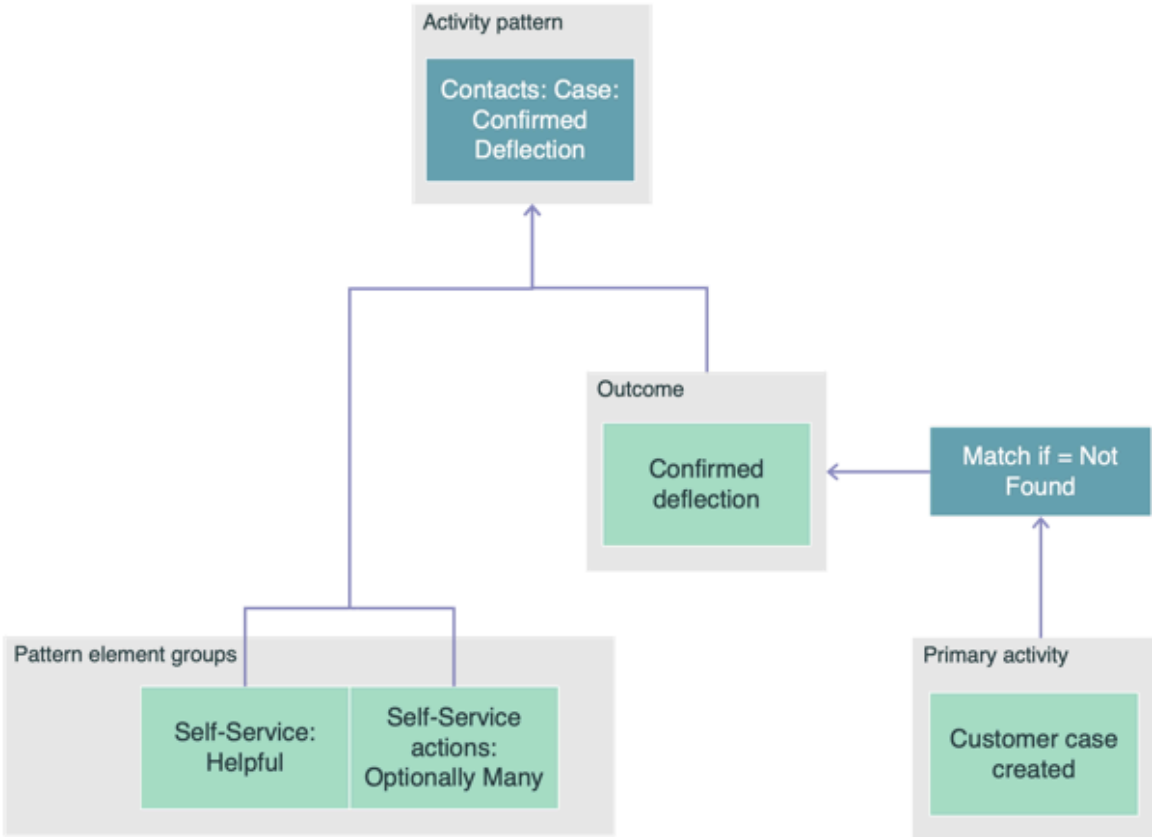
The final activity that determines the outcome associated with an activity pattern based on whether it happens or not.

Example: For the primary activity Customer created a case if the system does not find a match (that is a case was not created), the outcome Confirmed deflection is associated with the activity pattern Contacts: Case: Confirmed Deflection.

Pattern element group

A logical combination of two pattern elements, pattern element group, or both and how many times the combination occurs. For more information, see Pattern element group components.

The following figure illustrates the components of the activity pattern Contacts: Case: Confirmed Deflection.



Pattern element group components

Pattern element group

A logical combination of two pattern elements, pattern element group, or both and how many times the combination occurs. Each pattern element group is implemented as regular expressions.

The occurrence of the logical combination result is one of the following types:

- Once
- Optionally Once
- Optionally Many

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- At Least Once
- Range

Example 1: In the following table, the Knowledge engagements once pattern element group is true when it occurs only once and either Article viewed once is true or Article marked with positive feedback once is true.

Pattern element group example 1

Pattern element group	First Element	Second Element	Operator	Occurrence
Knowledge engagements once	Article viewed once	Article marked with positive feedback once	Or	Once

Example 2: In the following table, the Self-service engagements optionally many pattern group is true when engagements either have not occurred or have occurred multiple times and either the Knowledge or catalog engagements once is true or the Communities or virtual agent engagements once is true.

Pattern element group example 2

Pattern element group	First Element	Second Element	Operator	Occurrence
Knowledge or catalog engagements once	Knowledge engagements once	Catalog engagements once	Or	Once
Communities or virtual agent engagements once	Communities once	Virtual agent engagements once	Or	Once
Self-service engagements optionally many	Knowledge or catalog engagements once	Communities or virtual agent engagements once	Or	Optionally Many

Pattern element

Denotes a single activity type and how many times it occurs. Each pattern element is implemented as regular expressions.

Example: The pattern element Article viewed once denotes that the activity Viewed a knowledge article must occur once.

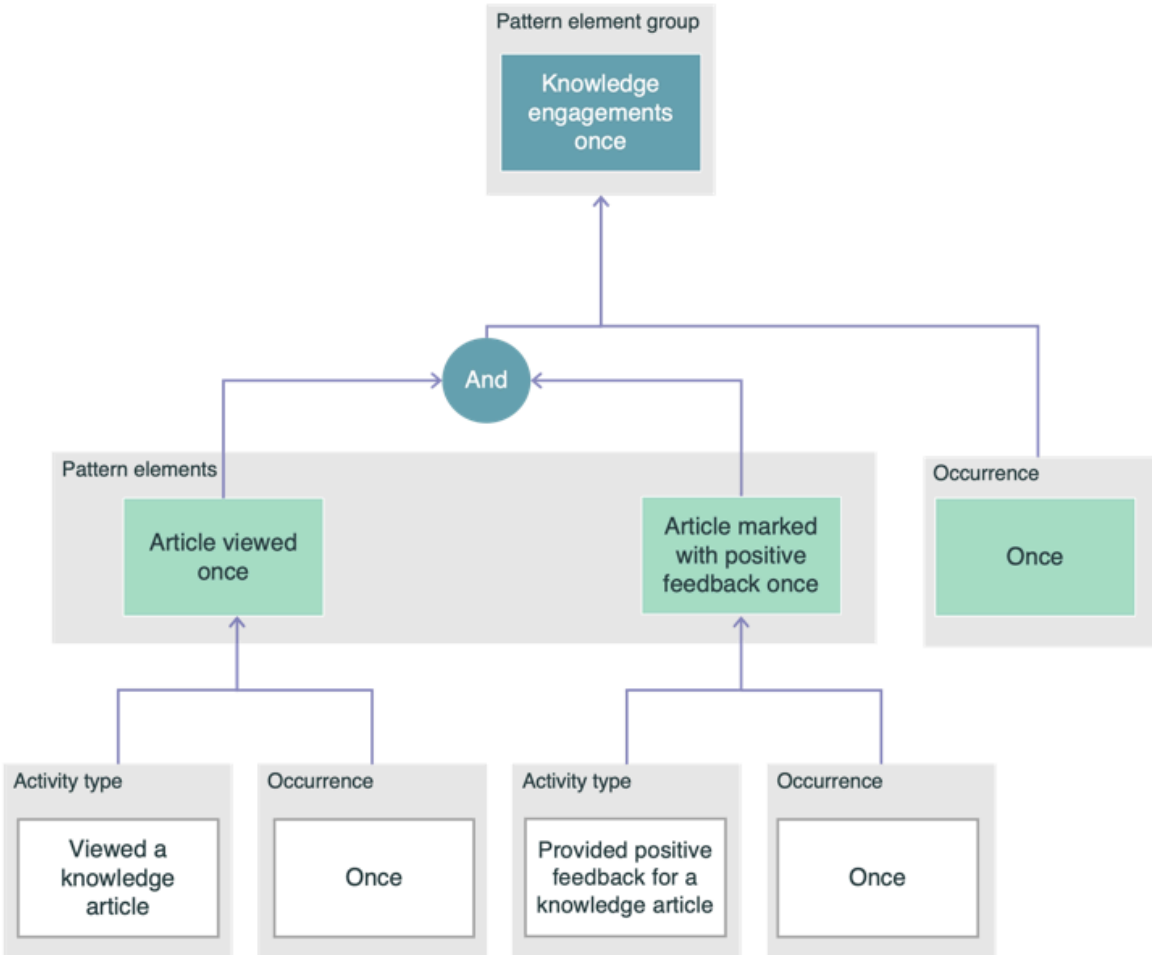
Activity type

An action that a user (consumer or customer contact) performs.

Example: The activity type Viewed knowledge article occurs when a user views a knowledge article.

The following figure illustrates the components of the pattern element group Knowledge engagements once.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Activity context components

Activity context

A collection of activity groups a user might perform such as Catalog, Knowledge, Case, Communities, and Virtual Agent.

Example: The activity context Contact is a collection of activity groups Catalog, Knowledge, Case, Communities, and Virtual Agent associated with the customer contact.

Activity group

A logical grouping of activity types performed on the same object type such as a knowledge article, community answer, or customer service case.

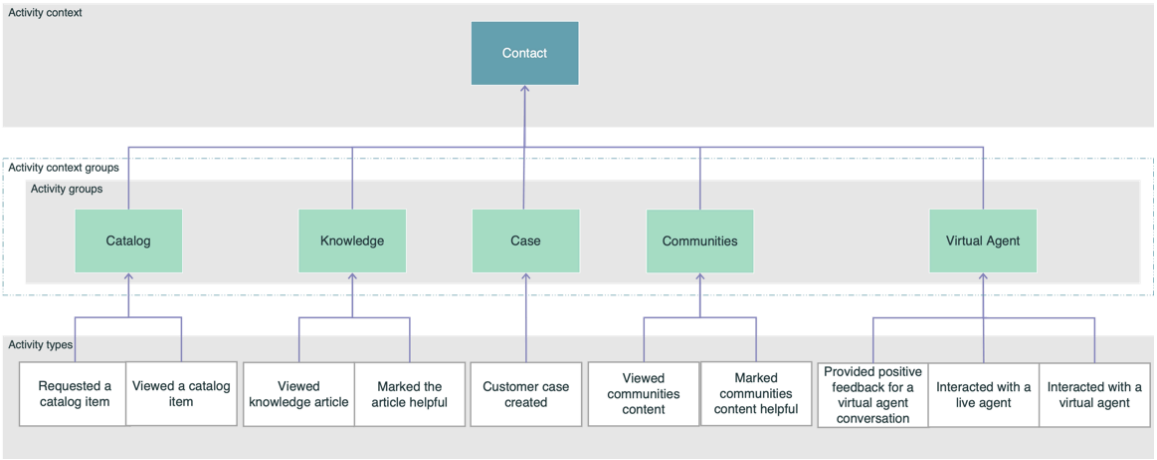
Example: The activity group Knowledge is a logical grouping of the activities Viewed knowledge article and Marked the article helpful performed on a knowledge article.

Activity context group

An activity group that has been added to a context.

The following figure illustrates the components of the activity context Contact.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Deflection outcome components

Deflection outcome

In the context of deflection, an activity pattern can lead to one of the following three outcomes:

Confirmed deflection

The self-service content definitely prevented a case from getting created.

Potential deflection

The self-service content was viewed and no case was created, but it's unclear whether the content is the factor that prevented the case from getting created.

No deflection

A case was created after the self-service content was viewed.

Deflection configuration

Associates a window (duration) with an activity context. The window defines how long a system will wait for a case to be created to match with a deflection pattern.

Example: To track the create case activity for a consumer within a day, set the window as 1 day.

- If the consumer created a case within that window, the deflection pattern matched is a No deflection.
- If the consumer did not create a case within that window, the deflection pattern matched is a Potential deflection.
- If the consumer did not create a case and the last activity is submitted positive feedback for any self-service channel content within that window, the deflection pattern matched is a Confirmed deflection.

Deflection metrics

A transactional table that stores the outcome of matched patterns. By default, the scheduled job for Self-Service Analytics captures data and stores the generated data in the Deflection Metric [ssa_deflection_metric] table.

Deflection pattern

Associates deflection configuration with an activity pattern. A deflection pattern is implemented as a table.

Configure Self-Service Analytics

Translation management

Knowledge articles are authored and published in many languages and translating these articles to languages other than the language they are authored in requires creating translation tasks. Translation management enables you to manage these translation tasks.

The translation management feature enables the following translation activities:

- Translate published knowledge articles that are missing translations manually or use the machine translation option to automatically translate them.
- Create translation tasks automatically for specified languages.
- Configure assignment rules and auto-assigned tasks for a language, knowledge base, or category to a translator or a group of translators.

For information about activating translation management, see Activate translation management.

Enabling the *glide.knowman.translation.enable_translation_task* property adds the following menu options to the Translation Management submenu under the Knowledge menu:

- **All Open Tasks**
- **My Assigned Tasks**
- **Translator Mapping**

You can choose a default language when you log in to an instance. The available languages are based on the internationalization language plugins you have installed.

Related topics

Translate a knowledge article from a translation task

I18N - Knowledge internationalization

Activate the knowledge management internationalization plugin

Knowledge-Centered Service configuration

Knowledge-Centered Service (KCS) is a method for the creation and continuous improvement of knowledge based on the experience of agents and the patterns observed by knowledge reuse.

ServiceNow Knowledge Management is a KCS (V6) verified product. As a KCS (V6) verified product, Knowledge Management provides features to improve knowledge, such as article quality reviews, in-context knowledge capture, and feedback management.

Visit the following page on the ServiceNow Community for information about getting started with Knowledge Management and KCS: Knowledge Management Getting Started .

Activation information

The Knowledge-Centered Service configuration is activated with the Knowledge Management KCS Capabilities plugin (com.snc.knowledge_kcs_capabilities). For more information, see Activate Knowledge Management KCS Capabilities.

Related topics

Managing KCS article states

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Article quality index for knowledge management

Assess the quality of knowledge articles with the article quality index (AQI). The AQI helps maintain consistent quality of knowledge articles attached to a knowledge base where articles are written by various authors.

Using AQI feature, a knowledge administrator (a user with knowledge_admin role) creates a checklist and adds a set of true or false questions to the checklist to assess the quality of knowledge articles. For each question, the knowledge_administrator assigns a weight based on its importance to the quality measurement and then attaches the checklist to a knowledge base.

A knowledge reviewer (a user with knowledge_coach and knowledge_domain_expert role) performs AQI review on knowledge articles attached to the knowledge base by answering the true or false questions in the checklist. The article quality is then scored based on the cumulative weight of all answers set to true in the checklist.

The average AQI scoring is displayed on the Content Quality tab of the Knowledge Management dashboard (see Knowledge Management dashboard).

Activating article quality index

The article quality index feature is activated with the Knowledge Management Advanced (com.snc.knowledge_advanced) plugin. For details see, Activate the Knowledge Management Advanced plugin.

Related topics

Use Article Quality Index

Article versioning

Use the Knowledge Management article versioning feature to create and maintain multiple versions of a knowledge article.

Knowledge contributors can create a new version of a knowledge article from an existing published version. This existing version can be either the latest published version or an older outdated version. All changes are stored in the new version of the article and the information in the existing article remains the same.

If you import published knowledge articles from a ServiceNow instance that does not support article versioning, you must run the *Initialize Versions on Articles* fix script to enable article checkout and editing.

With the article versioning feature, a knowledge user can:

- Check out a published article and create another version.

  Note:
  Only an author (who checks out an article for revision), knowledge base owner, and user with knowledge_admin role can edit an article in the draft state.

- Select a previously published (outdated) version of an article and make it current.
- Recall an article that is being reviewed or scheduled for publication.
- Retire the latest published version of an article.

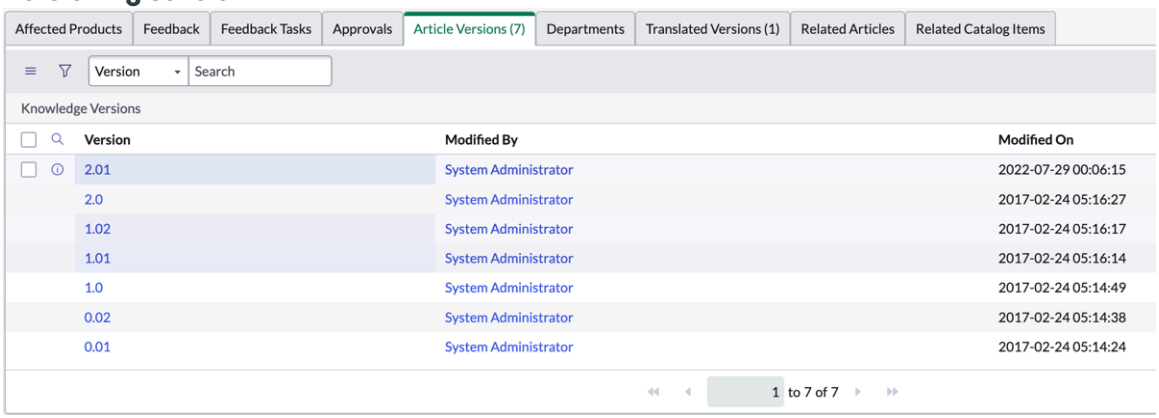
Note:
Only an author (who checks out an article for revision), knowledge base owner, and user with knowledge_admin role can edit an article in the draft state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

There are two types of article revisions: major and minor. Minor revisions include updates to an article that has not yet been published. Major revisions include updates to an article that has been published and is available to customers. To track the different revisions, the article versioning feature introduces version numbering. For more information, see Knowledge article version numbers

With the article versioning feature, the knowledge article number also includes the version number. All references to knowledge articles use this number format. For example, KB0010003 v2.0. To access all the versions of knowledge article, navigate to **All** > **Knowledge** > **Articles** > **All** and open article with multiple versions. In the Related list, you can access all the versions.

Versioning control



Activation information

The article versioning feature requires the Knowledge Management Advanced plugin (com.snc.knowledge_advanced) to be activated and the *glide.knowman.versioning.enabled* property to be set to true (default value). For more information, see Activate the Knowledge Management Advanced plugin and Article versioning properties.

Related topics

Use article versioning

Knowledge Management FAQ

Ownership groups

Configure ownership groups and associate them with knowledge articles to maintain article quality, manage approvals, and for timely resolution of feedback.

For the ease of maintenance of knowledge articles, you can assign an ownership group to a knowledge article and shift the ownership of an article from a single person to a group. An ownership group consists of a group of members and a manager who are responsible for knowledge articles. Responsibilities include: approving knowledge articles, performing AQI checks to ensuring article quality, and managing feedback tasks for knowledge articles.

When a knowledge article is assigned to an ownership group:

- Only ownership group members have contribute access to the article even if they don't have contribute access to the knowledge base of the article. They can edit, approve, publish, and retire the knowledge article with which they are associated.
- Users who aren't a member of the ownership group and not an author or editor can't contribute to the article even if they have **contribute** access to the knowledge base of the article.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When Create a knowledge article from an incident in ITSM Agent Workspace or editing a knowledge article, you may need to configure the Knowledge form to add the **Ownership Group** field.

Activation information

To enable the use of ownership groups, enable the *glide.knowman.ownership_group.enabled* property. This property is available when the Knowledge Management Advanced plugin (com.snc.knowledge_advanced) is activated. By default, the property is disabled.

Note:
If you use ownership groups, try not to disable the *glide.knowman.ownership_group.enabled* property later. If you must disable the property later, ensure that you manually reassign all knowledge articles associated with any ownership group, close all article approvals sent to ownership groups, and resolve all open feedback tasks assigned to ownership groups.

Contribute access to published articles

If an ownership group is associated with a knowledge article, the author or reviser of the article can't contribute to the article after the article is published. You can override this behavior by enabling the *glide.knowman.ownership_group.override* property. When the property is set to `true`, the authors or revisers of knowledge articles associated with ownership groups retain contribute access to their published articles. By default, the property is set to false.

Approval of self-authored articles for ownership group members

With an ownership group associated with a knowledge article, ownership group members can approve self-authored articles for publication. You can override this behavior by disabling the *glide.knowman.ownership_group.allow_self_approval* property. By default, the property is set to true. When the property is set to `false`, ownership group members can't approve self-authored knowledge articles.

Related topics

- Manage ownership groups
- Knowledge Management properties

Automating feedback management to improve content

Manage high volumes of article feedback by enabling task generation for negative feedback. When an article is rated poorly or marked as unhelpful, a feedback task is generated.

If an ownership group is assigned to the article, the feedback task is assigned to the manager of the ownership group. Ownership group managers can reassign tasks to another group member, or group members can assign a feedback task to themselves.

If no ownership group is assigned to the article, the feedback task is assigned to the author or reviser of the article.

The task assignee can update the article, create a new article, request additional feedback, or reassign the task and receives notification after the feedback is updated or resolved.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The actionable feedback feature is available in the Knowledge Management Service Portal and Agent Workspace. To use the actionable feedback feature in other service portals, you can activate the **Knowledge Article View** page route map.

Beginning with New York, the **Knowledge Article View** page route map is activated by default. Existing customers on release versions prior to New York can activate the **Knowledge Article View** page route map. For more information, see Activate the Knowledge Article View page on upgrade.

Related topics

- Enable actionable knowledge feedback

Migrate to Knowledge Management v3

When you migrate to Knowledge Management v3 from v2, you must migrate legacy knowledge content and any customizations you have made to the Knowledge Base applications.

The following video provides more information on how to migrate from Knowledge Management v2 to v3.

Migrating from Knowledge Management v2 to v3

Knowledge Management v3 migration process

When you upgrade from knowledge v2, consider a multi-step migration process. This process ensures you can access existing knowledge content and allows you to fully migrate at your own pace.

Review automatic changes before upgrading. These changes are applied immediately when upgrading and may impact existing functionality.

1. Migrate knowledge functionality to use your customized functionality with the Knowledge Management v3 enhancements.
2. Migrate knowledge content to use the Knowledge Management v3 enhancements with your existing knowledge articles.

Configuring Knowledge Management

Plan and configure your Knowledge Management implementation.

Configuration overview

Visit the following page on the ServiceNow Community for information on setting up Knowledge Management: Knowledge Management Getting Started.

You can also use Knowledge Management capabilities within a website built on Adobe Experience Manager (AEM). For more information, see Integration with Adobe Experience Manager.

Using guided setup to implement Knowledge Management

Guided setup provides a sequence of tasks that help you configure Knowledge Management on your instance. To open guided setup for Knowledge Management, navigate to **Knowledge** > **Administration** > **Guided Setup**. For more information, see Using guided setup.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activate the Knowledge Management Advanced plugin

Activate the Knowledge Management Advanced plugin (com.snc.knowledge_advanced) to enable advanced features for Knowledge Management.

Before you begin

Role required: admin

About this task

The Knowledge Management Advanced plugin includes feature code and demo data.

The Knowledge Management Advanced Installer plugin (com.snc.knowledge_advanced.installer) is used to activate the Knowledge Management Advanced plugin.

Starting with the Xanadu release, the Knowledge Management Advanced plugin is automatically activated for new customers.

Note:
The Knowledge Management Advanced plugin isn't automatically activated with the Knowledge Management v3 application.

The Knowledge Management Advanced Installer plugin performs two validation steps prior to activation.

- Determines whether there are any active Knowledge Management v2 knowledge bases.
- Determines whether there's a unique database index on the **Number** field. If a unique constraint has been added to the **Number** field, the plugin activation fails. Resolve this issue by following the instructions in the Installation of the Knowledge Management Advanced Plugin fails if unique index already exists in article number [KB0634959] article in the Now Support Knowledge Base.

Note:

Starting with the Washington DC release, the Knowledge Management v3 homepage (com.snc.knowledge3) is being prepared for deprecation in the future Y release. It is replaced by the Knowledge Management Service Portal (com.snc.knowledge_serviceportal), which is active by default for customers on Madrid and later releases. For more information about the new experience, see Knowledge Management Service Portal homepage features.

The Knowledge Management Advanced plugin activates the following features:

- Article versioning
- Article subscriptions
- Article quality index
- Article templates
- Ownership groups
- In context article creation
- Translation management

Demo data is included as part of the Knowledge Management Advanced plugin. If the validation step performed by the Knowledge Management Advanced Installer plugin completes successfully, the Knowledge Management Advanced plugin is activated automatically. However, the demo data isn't included in this activation. To load the demo data, go to the Knowledge Management Advanced plugin page, select the **Load Demo Data Only** related link, and then select **OK**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Knowledge Management setup guide for admins

Before users in your organization can start creating knowledge bases and knowledge articles, you must set up Knowledge Management. Work with stakeholders to define requirements for setting up Knowledge Management effectively to meet the needs of users.

Requirements

Role required: admin.

Before you begin

Meet with the stakeholders

Stakeholder	Responsibilities
Knowledge manager	Defines and oversees the knowledge management processes for day-to-day operations related to content publishing and usage.
Knowledge admin	Configures advanced settings for specific Knowledge Management features
Knowledge coach	Enables users to adhere to content standards.
Knowledge domain expert	Provides domain knowledge expertise.
Version author	Contributor to a particular version of an article.
Content creators and reviewers	Create, review, and update articles in the knowledge bases.
Community managers	Focus on the creation and curating of social content.
Line managers	Manage teams that create and use knowledge articles

With stakeholders, determine the following requirements

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Who are the consumers of the content in the knowledge bases?
- Who are the writers, editors, and managers for the knowledge base articles?
- What are the required workflows to publish and retire articles?
- What are the unique behaviors required for your knowledge management implementation? For example, should attachments appear in search results?
- Do you want to translate knowledge articles into other languages?

What to do

Assign knowledge roles to users and groups

Determine which Knowledge Management roles are appropriate for each user, and then assign those roles .

Create custom Knowledge workflows

If the default knowledge workflows for publishing and retiring knowledge articles are not appropriate for your knowledge bases, create custom workflows for those knowledge bases.

Configure Knowledge properties

If the default knowledge properties do not fulfill the requirements of users, reconfigure the properties as necessary.

Activate support for other languages besides English

If languages other than English must be supported, activate the Knowledge Management Internationalization plugins.

Coordinate with knowledge managers for knowledge base setup

Let knowledge managers and administrators know that they can start configuring their knowledge bases. For details, refer them to the Knowledge base setup guide for knowledge admins and managers.

Next steps

Depending on any other requirements for the knowledge bases, you may be asked to help with additional tasks, such as configuring knowledge landing pages.

Using guided setup to implement Knowledge Management

Knowledge Management guided setup provides a sequence of tasks that help you configure Knowledge Management on your instance. To open Knowledge Management guided setup, navigate to **Knowledge** > **Administration** > **Guided Setup**.

For more information about using the guided setup interface, see Using guided setup .

Knowledge base setup guide for knowledge admins and managers

After basic Knowledge Management setup is completed, you can set up a knowledge base for users to create and publish knowledge articles.

Create multiple knowledge bases for different groups within your organization to share information within and between those groups. Create scoped knowledge bases to enable only application administrators to administer the knowledge bases and restrict unauthorized access to application-specific data.

Administrators create knowledge bases, and assign them to individual managers responsible for controlling the behavior and organization scheme of each knowledge base.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Each knowledge base contains knowledge articles that provide information for users, such as policy, release notes, or instructions for a task. Each knowledge base can also use a separate workflow for publishing and retiring articles.

Requirements

Role required: knowledge_administrator, knowledge_manager, or admin.

Before you begin

Determine the following requirements for each knowledge base that you want to set up:

- Whether to create a scoped knowledge base? For more information, see Scoped knowledge bases.
- Who are the knowledge base managers that are responsible for approving articles?
- Who are the users and contributors for that knowledge base? Access for these users is defined through user criteria.
- What are the categories to be used to classify articles? Will users be able to create categories?
- Will users of the knowledge base be able to create new content?

What to do

Set up the knowledge base

1. Create the knowledge base.
2. Set up which users can read, create, or edit knowledge articles by selecting user criteria for the knowledge base.
3. Define the approval process for articles using workflows.
4. Define the knowledge categories that are needed for organizing articles in the knowledge base.
5. If you want a custom knowledge homepage, ask your ServiceNow administrator to create it.

Next steps

Let users in your organization know that they can start creating and searching articles in the knowledge base. For details, refer users to the Knowledge Management guide for users.

If you have the knowledge_manager role, there are many other tasks that you can perform to maintain the knowledge base. You can pin articles so they are featured prominently in the search results and on landing pages. You can also assign other users as managers of a knowledge base. For details, see Configuration tasks for knowledge managers.

Activate the sitemap configuration and definition records for the Knowledge Portal

Include knowledge articles in your sitemap by activating the sitemap configuration and definition records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Activate Sitemap Generator
- Verify that an unauthenticated user can access the knowledge base article by accessing it as a guest user.
- Verify that the Public option is selected on the Knowledge Article View form.

Role required: admin

About this task

Beginning with the Yokohama release, the Sitemap Generator configuration is available with the base system and is inactive by default.

Procedure

1. Navigate to **All** > **Sitemap Generator** > **Sitemap Configuration**.
2. In the UX Sitemap Configurations [sys_ux_seo_sitemap_config] table, select the sitemap_config_KB record.
3. Enable the generation of sitemaps.
   a. On the form, select the **Active** check box.
   b. In the Sitemap Config Definition related list, double-click the **Type** field and select the **true** option from the list.
   c. Select the Save icon ( ).
4. Select **Update**.

Result

All active sitemaps regenerate once in a day and include content from any of their active sitemap definitions.

Activate the knowledge management internationalization plugin

To enable translation of knowledge articles, you must activate multiple plugins.

- Knowledge Management Advanced (com.snc.knowledge_advanced) plugin. For more information, see Activate the Knowledge Management Advanced plugin
- I18N:Knowledge Management Internationalization Plugin v2 (com.glideapp.knowledge.i18n2) plugin. For more information, see Activate a plugin.
- Internationalization plugins for each appropriate language. For more information, see Activate a language.

Note:

- Activating internationalization plugins for the available languages automatically activates the I18N: Internationalization plugin (com.glide.i18n) that instead activates the I18N: Knowledge Management Internationalization Plugin v2 (com.glideapp.knowledge.i18n2) plugin.
- Beginning with the San Diego release, you can request ServiceNow personnel to customize your Languages [sys_language] table. You can create translations of knowledge articles into any combination of language and region configured in the table. These combinations must be in compliance with the Internet Engineering Task Force (IETF) BCP-47 standard. For more information, see The region subtag.

Installed components

The I18N:Knowledge Management Internationalization Plugin v2 (com.glideapp.knowledge.i18n2) plugin installs the following components:

- A relationship named *Translated Versions* that creates a related list on the Knowledge form showing other articles that have the same parent article.
- A business rule named *knowledge query* that automatically filters the knowledge portal and search results based on the user's selected language.
- A UI macro named *kb languages*.
- Two fields, named *Language* and *Parent*, in the Knowledge [kb_knowledge] table and the Knowledge form.

Knowledge form changes

The I18N:Knowledge Management Internationalization Plugin v2 (com.glideapp.knowledge.i18n2) plugin adds the following fields to the Knowledge form:

- **Language**: Language in which you are creating the knowledge article. The list is populated based on the languages enabled for the selected knowledge base.
- **Parent**: The article number that represents the base language article. This setting keeps translations of the same article related to each other. Consider choosing the same language consistently for the parent article.

> **Note:**
> The **Parent** field tracks translations of articles.

Additionally, the Translated Versions related list is automatically added to the Knowledge form after you save an article.

Activate knowledge blocks

You can activate knowledge blocks [com.snc.knowledge_blocks] if you have the admin role. This plugin includes demo data and activates related plugins if they are not already active.

Before you begin

Role required: admin

About this task

Knowledge blocks activates these related plugins if they are not already active.

Plugins for knowledge blocks

Plugin	Description
Knowledge Management Advanced [com.snc.knowledge_advanced]	Enables advanced features for Knowledge Management, such as article versioning. For a full list of features, see activate the Knowledge Management Advanced plugin. **Note:** Knowledge blocks can be used with or without the article versioning feature. To disable the feature, see Disable the article versioning feature.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Enable knowledge blocks for each knowledge base

Enable the knowledge blocks feature for each knowledge base where you plan to use the blocks. Once enabled, you can create knowledge blocks to add to knowledge articles within a knowledge base.

Before you begin

Make sure that the knowledge blocks [com.snc.knowledge_blocks] plugin is activated.

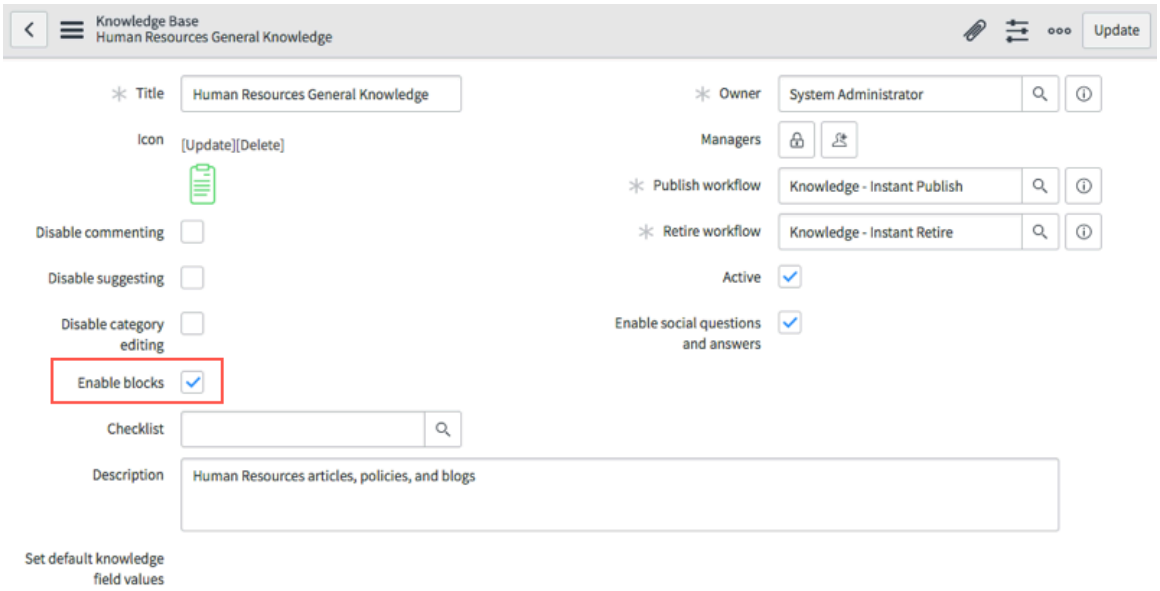
Role required: knowledge_admin or knowledge_manager

Procedure

1. Navigate to **All** > **Knowledge** > **Administration** > **Knowledge Bases**.
2. Open the knowledge base record.
3. In the Knowledge Base form, select the **Enable blocks** check box.

   Note:
   If the **Enable blocks** check box is not visible, you can add the field to the form by right-clicking the form header and navigating to **Configure** > **Form Layout**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Click **Update**.

> **Note:**
> If you decide to later disable the knowledge blocks feature, all knowledge blocks within the knowledge base must be deleted before you can clear the box.

What to do next

Create knowledge blocks to use within the enabled knowledge base.

Configure translation management

Configure translation management to create translation tasks.

Activate translation management

You can activate the Knowledge Management Advanced (com.snc.knowledge_advanced) and I18N:Knowledge Management Internationalization Plugin v2 (com.glideapp.knowledge.i18n2) plugins for translation management if you have the admin role.

Before you begin

Role required: admin

- Translation management requires the following plugins. Ensure that these plugins are activated before you install translation management.

  Required ServiceNow plugins

  Knowledge Management Advanced plugin [com.snc.knowledge_advanced]

  I18N:Knowledge Management Internationalization Plugin v2 [com.glideapp.knowledge.i18n2]

  The internationalization plugin for the languages you want to make available. The is automatically activated once any of the language plugins are activated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Translation management also requires enabling the *glide.knowman.translation.enable_translation_task* property to add translation task options to the Translation Management submenu under Knowledge menu.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Add a custom Localization Framework setting to enable bulk translations

Add a custom Localization Framework setting to translate multiple knowledge articles manually.

Before you begin

- Activate the Knowledge Management Advanced plugin.
- Activate Localization Framework.
- Activate a language.
- Bulk Translation is available with the base Yokohama release. If you are upgrading from a previous release, you must configure the following settings:
  - Enable the Localization Framework by setting the *glide.knowman.translation.enable_lf_article_translation* system property to true.
  - Set the *glide.knowman.translation.enable_translation_task* system property to false.
  - Set the *glide.knowman.translation.enable_localization_framework* system property to true.

Role required: admin

Procedure

1. Navigate to **All** > **Localization Framework** > **Settings**.
2. In the Setting list, select **New**.
3. Enter a name for the setting.
4. Select **Knowledge** from the **Artifact** list.
5. Select the languages into which you want the articles translated.
6. Select the **Workflow Preferences** tab.
7. Select **Translation -> Publish** from the **Workflow** list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Select the **Project Preferences** tab.
9. Enable the creation of bulk translation localization projects.
   - To enable manual creation, select **Enable projects**. For more information, see Create translation projects.
   - To enable the auto-creation of the localization projects, select **Enable projects** and **Enable auto creation**.

     If auto creation is enabled, selected localization requested items (LRITMs) are automatically bundled into a single localization project.
10. Select **Update**.

What to do next

Request bulk translations for multiple knowledge articles.

Add a custom Localization Framework setting to enable machine translation

Add a custom Localization Framework setting to enable machine translation for bulk translations of knowledge articles.

Before you begin

- Activate the Knowledge Management Advanced plugin.
- Activate Localization Framework.
- Activate a language.
- Bulk Translation is available with the base Yokohama release. If you are upgrading from a previous release, you must configure the following settings:
  - Enable the Localization Framework by setting the *glide.knowman.translation.enable_lf_article_translation* system property to true.
  - Set the *glide.knowman.translation.enable_translation_task* system property to false.
  - Set the *glide.knowman.translation.enable_localization_framework* system property to true.

Role required: admin

Procedure

1. Navigate to **All** > **Localization Framework** > **Settings**.
2. In the Setting list, select **New**.
3. Enter a name for the setting.
4. Select **Knowledge** from the **Artifact** list.
5. Select the languages into which you want the articles translated.
6. In the **Translation Preferences** tab, select the **Enable machine translate** check box to enable machine translation for knowledge articles.
7. Select the desired translator in the **Translator** field.
8. Select the **Workflow Preferences** tab.
9. Select **Auto Translation** > **Auto Publish** from the Workflow list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

10. Select the **Project Preferences** tab.
11. Enable the creation of bulk translation localization projects.
    - To enable manual creation, select **Enable projects**. For more information, see Create translation projects.
    - To enable the auto-creation of the localization projects, select **Enable projects** and **Enable auto creation**.

      If auto creation is enabled, selected localization requested items (LRITMs) are automatically bundled into a single localization project.
12. Select the group that includes the localization_manager role in the **Localization manager group** field.
    The **Localization manager group** field appears only when the **Enable projects** and the **Enable auto creation** options are selected.
13. Select **Update**.

What to do next

Translate knowledge articles using Dynamic Translation

Activate Knowledge Management KCS Capabilities

You can activate the Knowledge Management KCS Capabilities plugin (com.snc.knowledge_kcs_capabilities) to enable the use of certain KCS roles and KCS article states.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Enable languages for a knowledge base

Select the languages you want enabled at a knowledge base level. Users can then create articles only for selected languages.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

You must activate the Knowledge Management Advanced (com.snc.knowledge_advanced) plugin, and I18N: Knowledge Management Internationalization Plugin v2 (com.glideapp.knowledge.i18n2) plugin.

Role required: knowledge_admin or admin

Procedure

1. Navigate to **All** > **Knowledge** > **Administration** > **Knowledge Bases**.
2. Select an existing knowledge base.
3. Click the lock icon to unlock the **Languages** field in the Knowledge base form.

   Note:
   You may need to configure the knowledge base form to include the **Languages** field.

   Click the form context menu icon ( ) and navigate to **Configure** > **Form layout**. Use slushbucket to add the Languages field.

4. Click **Submit**.

Configure the Knowledge Management Service Portal

The Knowledge Management Service Portal enables users to perform the same operations that are available with the Knowledge Management V3 plugin. From the portal, users can view knowledge bases and articles, search for information, sort and filter search results, and provide feedback.

- For new customers on the Madrid and later releases, the Knowledge Management Service Portal plugin (com.snc.knowledge_serviceportal) is active by default.
- For existing customers on release versions prior to Madrid, activate the plugin, if required.
- Configure the Knowledge Management Service Portal properties, including the property that directs users to the Knowledge Management homepage in the Knowledge Management Service Portal.

- Navigate to **Service Portal** > **Portals** and click **Knowledge Portal** (Knowledge Management Service Portal is named as Knowledge Portal). See Service Portal for more information about creating a custom interface.
- System administrators can configure portal pages and configure widgets for searching, sorting, and filtering knowledge base information. To configure widget instance options and configure search, sort, and filter features, see Knowledge Management Service Portal widgets
- To add knowledge bases to the Knowledge Service Portal, complete the following steps.
  1. Navigate to **Service Portal** > **Portals**, and click **Service Portal**.
  2. Click the **Knowledge Bases** related list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Click **Edit** to map one or more knowledge bases to the portal.

Note:
If no knowledge bases are added, all knowledge bases are available in the portal.

If knowledge bases are mapped, only those knowledge bases are available in the portal. All search results and all widgets display results from the mapped knowledge bases only.

- **Note:**

  Starting with the Washington DC release, the Knowledge Management v3 homepage (com.snc.knowledge3) is being prepared for deprecation in the future Y release. It is replaced by the Knowledge Management Service Portal (com.snc.knowledge_serviceportal), which is active by default for customers on Madrid and later releases. For more information about the new experience, see Knowledge Management Service Portal homepage features.

Section 508 compliance features

Users can view and interact with the Knowledge Management article view page in the Knowledge Management Service Portal using Section 508 compliance features. See Enabling accessibility features for more information.

Enable external or public users to view knowledge articles from the Knowledge Management Service Portal

Enable knowledge articles on the Knowledge Management Service Portal to be visible to external or public users.

Before you begin

The Knowledge Management Service Portal plugin (com.snc.knowledge_serviceportal) must be enabled.
Role required: admin

About this task

If you are using Knowledge Management within the Customer Service Management (CSM) application, you can automatically make knowledge articles public by activating and running the *`Make KM Service Portal Pages Public`* fix script after you install the Customer Service Management plugin (com.sn_customerservice).

If you are using Knowledge Management as a standalone application, perform the steps in this procedure.

Procedure

1. Navigate to **All** > **Service Portal** > **Pages**.
2. In the Pages list, search for and select **kb_home**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If the application scope isn't set to Knowledge Management - Service Portal, you cannot edit the form and a warning message appears. To make the form editable, click the word **here** at the end of the message.

3. Enable public or external users to view knowledge articles from the Knowledge Management Service Portal.

Action	Description
Make knowledge service portal pages visible to public users	**a.** On the Page form, select the **Public** check box. **b.** Click **Update**.
Make knowledge service portal pages visible to external users	**a.** On the Page form, in the **Roles** field, click the edit user roles icon. **b.** On the Roles form, move **snc_external** from the available roles in the **Available** column to the **Selected** column. **c.** On the Roles form, click **Done**. **d.** On the Page form, click **Update**.

4. Repeat the steps 2 and 3 for **kb_article_view** and **kb_search** pages.
5. Manage access to the articles for the Knowledge Management Service Portal pages.

Action	Description
Enable access to the knowledge base for public.	After you set the page to public as described in step 3, ensure that the Cannot Read and Can Read user criteria are not set and the *glide.knowman.block_access_with_no_user_criteri* property is set to false for the knowledge bases you want to give access to public users.
Enable access to the knowledge base for external users.	After you add the snc_external role to the page as described in step 3, ensure that external users have read access to the knowledge bases for which you want to give access.

For more information about providing access to knowledge bases, see Managing access to knowledge bases and knowledge articles.

Knowledge Management Service Portal widgets

The Knowledge Management Service Portal uses a number of widgets to enable searches, display search results, and display articles, related articles, and related items.

In the Knowledge Management Service Portal, the Knowledge Management homepage, search results page, and article view page honor the Knowledge Management V3 system properties. If configured, widget instance options can override the system properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

Starting with the Washington DC release, the Knowledge Management v3 homepage (com.snc.knowledge3) is being prepared for deprecation in the future Y release. It is replaced by the Knowledge Management Service Portal (com.snc.knowledge_serviceportal), which is active by default for customers on Madrid and later releases. For more information about the new experience, see Knowledge Management Service Portal homepage features.

Users with the knowledge_admin or admin role can configure the widget instance options used on the Knowledge Management Service Portal pages. Use the control + right-click menu to access the widget instance options and configure a widget instance. For more information, see Configure widget instance options.

Note:
Before configuring widget instance options, switch to the Knowledge Management - Service Portal scope.

Homepage widgets:

- Knowledge Homepage Search

  Customize search features for the homepage.

- Knowledge Bases Browse

  Displays knowledge base tiles in the homepage.

- Knowledge Featured Articles

  Displays a list of featured articles in the homepage.

- Knowledge Most Useful Articles

  Displays a list of most useful articles in the homepage.

- Knowledge Most Viewed Articles

  Displays a list of most viewed articles in the homepage.

Search results page widgets:

- Knowledge Breadcrumbs

  Displays navigation path to the current page and a search box for users to search the knowledge base.

- Knowledge Search
- Knowledge Facet Header

  Displays the title for the filter facets.

- Knowledge Field Facet

  Display search results filtered by knowledge base, knowledge category, and author.

- Knowledge Tags Facet

  Display search results filtered by article tags.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Knowledge Resource Facet

  Display search results filtered by article resource.

- Knowledge Query Facet

  Display search results filtered by article rating, number of article views, and last modified.

- Knowledge Result Sort

  Displays search results filtered by sort options for returned results.

- Knowledge Selected Filter

  Displays the selected facet filters and allows you to clear the selections.

- Knowledge Result

  Displays search results filtered by returned results.

Article view page widgets:

- Knowledge Breadcrumbs

  Displays navigation path to the current page.

- Knowledge Article Content

  Customize what information users can view and what actions they can perform in the article view page.

- Knowledge Article Helpful

  Enables users to mark the article as helpful.

- Knowledge Article Comments

  Enables users to add comments for the article.

- Knowledge Attachments

  Displays article attachments if the **Display Attachment** field for the article is enabled.

  Note:
  You must add the Knowledge Attachments widget to any page in addition to Knowledge Article Content widget. After upgrade, if this widget does not get added automatically, you must add it manually.

- Related Catalog Item

  Displays a list of catalog items mapped to the article. The widget appears only when the related catalog items are available for the selected article.

- Knowledge Related Articles

  Displays a list of related articles with information similar to the selected article. The related articles are manually mapped, automatically predicted, or both. The manually mapped articles appear first in the widget. The widget appears only when the related articles are available for the selected article.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Affected Products

  Displays the products related to the knowledge articles available in the **Affected Products** related list for the article. The widget appears only when the affected products are available for the selected article.

- Most Recent Tasks

  Displays the tasks attached to the articles available in the **Attached Tasks** related list for that article. The widget appears only when the related tasks are available for the selected article.

- Most Useful

  Displays a list of knowledge articles that users found most useful.

Activate the Knowledge Management Service Portal plugin

The Knowledge Management - Service Portal plugin (com.snc.knowledge_serviceportal) is active by default for customers on Madrid and later releases. Existing customers on release versions prior to Madrid can activate the plugin, if required.

Before you begin
Role required: admin

About this task
This plugin requires the following plugins:

- Knowledge Management V3 (com.snc.knowledge3)
- Service Portal for Enterprise Service Management (com.glide.service-portal.esm)

Note:

Starting with the Washington DC release, the Knowledge Management v3 homepage (com.snc.knowledge3) is being prepared for deprecation in the future Y release. It is replaced by the Knowledge Management Service Portal (com.snc.knowledge_serviceportal), which is active by default for customers on Madrid and later releases. For more information about the new experience, see Knowledge Management Service Portal homepage features.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure search widget instance options

Configure widget instance options for the search widgets on the Knowledge Management Service Portal homepage and search results page.

Before you begin

Role required: sp_admin or admin

About this task

The homepage uses the Knowledge Homepage Search widget and the search results page uses the Knowledge Search widget. Use the widget instance options to customize the search feature for these pages.

Procedure

1. Navigate to the Knowledge Management Service Portal homepage or search results page.
2. Control + right-click the search bar.
3. Click **Instance Options**.
4. Configure the search widgets settings.

Instance option	Page(s)	Description
Title	Knowledge Management Service Portal homepage	The title of the search widget. The default for the homepage is Welcome to Knowledge.
Search Placeholder	Knowledge Management Service Portal homepage	Default text that appears in the search bar.
Bootstrap color	Search result page	The color of the search widget.
Bootstrap size	Search result page	The size of the search widget.
Allow Empty Search	Search result page	Allow empty knowledge base searches. The default for the homepage uses the system property. The default for the search results page is Yes.
Allow Instant Search On Keypress	Search result page	Enables instant search results as you type a search term. The default for the search results page uses the system property.
Wait time (ms) between searches, if instant search is enabled	Search result page	The time, in milliseconds, to wait between searches if the instant search feature is enabled. The default wait time is 500 ms.
Alternate URL Parameters for Search	Search result page	Alternate parameters that appear in the search results URL. By default these parameters include keyword and query.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Instance option	Page(s)	Description
Alternate URL Parameters for Language	Search result page	Alternate parameters that appear in the URL denoting the selected language.
Minimum Number of Characters for Search	Both	The minimum number of characters required to generate a search.
Glyph	Both	An icon that appears in the search bar.
CSS	Both	Custom configurations that determine the look and feel of the elements in the widget. For more information, see Service Portal SCSS Primer.

5. Click **Save**.

Configure knowledge base tile widget instance options

Configure widget instance options for the knowledge base tile widgets on the Knowledge Management Service Portal homepage.

Before you begin
Role required: sp_admin or admin

About this task
The homepage uses the Knowledge Bases Browse widget to display knowledge base tiles.

Procedure

1. Navigate to the Knowledge Management Service Portal homepage.
2. Control + right-click a knowledge base tile.
3. Click **Instance Options**.
4. Configure the desired settings for the knowledge base tile widgets.

Instance option	Description
Title	The title that appears above the knowledge base tiles. The default is **Explore our Knowledge Bases**.
Bootstrap color	The color of the widget.
CSS	Custom configurations that determine the look and feel of the elements in the widget. For more information, see Service Portal SCSS Primer.
Order By	The order in which the knowledge base tiles appear on the homepage. Use any field on the Knowledge table. If this field is empty, tiles are displayed in alphabetical order. Other available options include article_count.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Instance option	Description
Reverse Order	Enable this check box to display knowledge base tiles in the reverse order.
Post Question Label	The label on the button used to post a question. The default is **Ask a Question**.
Create Article Label	The label on the button used to create an article. The default is **Create Article**.
Post Question URL	The parameters that appear in the URL when posting a question.
Create Article URL	The parameters that appear in the URL when creating an article.

5. Click **Save**.

Configure the home page widget instance options

Configure widget instance options for the widgets used to display popular articles on the Knowledge Management Service Portal homepage.

Before you begin

Role required: sp_admin or admin

About this task

The homepage displays links to the featured, most viewed, and most useful articles using several widgets. The featured articles are displayed based on the keywords associated with the articles. For information on displaying articles in the Featured content section, see Pin a knowledge article. Most viewed and most useful articles are displayed based on the highest view and use count of the articles.

Procedure

1. Navigate to the Knowledge Management Service Portal homepage.
2. Control + right-click one of the widgets.
3. Click **Instance Options**.
4. Configure the desired settings for the widget.

Instance option	Description
Title	The title of the widget.
Bootstrap color	The color of the widget.
Glyph	An icon that appears in the widget.
CSS	Custom configurations that determine the look and feel of the elements in the widget. For more information, see Service Portal SCSS Primer.
Table	The table that contains the **Source Field** used to provide the featured, most viewed, and most useful articles widget options. The default table is Knowledge (kb_knowledge).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Instance option	Description
Display Field	The title displayed for each article in the list. By default, this is the article short description.
Secondary Fields	Additional information displayed for each article in the list below the title. By default, this information includes the author, view count, the date that the article was last modified, and the article rating.
Max number of records to show	The maximum number of articles to include in the list.
Show even when empty	Enable this check box to display the widget even if there are no articles in the list.
Show Secondary Fields Label	Enable this check box to display the field labels for the additional information displayed for each article.
Knowledge Base	To restrict the articles that appear in this list to a specific knowledge base, select the knowledge base from the knowledge base list.

5. Click **Save**.

Configure sort widget instance options

Configure widget instance options for the knowledge sort widget on the Knowledge Management Service Portal search results page.

Before you begin

Role required: sp_admin or admin

About this task

The search results page uses the Knowledge Result Sort widget to provide sort options for the returned list of results. Use the widget instance options to customize the sort options.

Procedure

1. Navigate to the Knowledge Management Service Portal search results page.
2. Control + right-click the sort options at the top of the results list.
3. Click **Instance Options**.
4. Configure the desired settings for the sort widget.

Instance option	Description
Bootstrap color	The color of the search widget.
CSS	Custom configurations that determine the look and feel of the elements in the widget. For more information, see Service Portal SCSS Primer.
Hide Relevancy	Removes the relevancy sort option.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Instance option	Description
Table	The table that contains the fields used to sort the list of knowledge items. The default table is **Knowledge**.
Sort Fields	The fields used for sorting the list of knowledge items.
Sort Field Labels	The labels for the fields that appear in the sort options. The default is **Views:desc,Newest:desc,Alphabetical**. The sort order for the sort field labels is ascending. To use a descending order, denote **:desc**.

5. Click **Save**.

Configure article list widget instance options

Configure widget instance options for the article lists on the Knowledge Management Service Portal homepage.

Before you begin
Role required: sp_admin or admin

About this task
The homepage uses the Article List widget to display different lists of articles, including Featured, Most Useful, and Most Viewed.

Procedure

1. Navigate to the Knowledge Management Service Portal homepage.
2. Control + right-click one of the article list headers.
3. Click **Instance Options**.
4. Configure the desired settings for the article list widget.

Instance option	Description
Title	The title of the article list.
Bootstrap color	The color of the widget.
Glyph	An icon that appears in the widget.
CSS	Custom configurations that determine the look and feel of the elements in the widget. For more information, see Service Portal SCSS Primer.
Table	The table that stores the list articles.
Display Field	The title displayed for each article in the list. By default, this is the article short description.
Secondary Fields	Additional information displayed for each article in the list below the title. By default, this information includes the author, view

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Instance option	Description
	count, the date that the article was last modified, and the article rating.
Max number of records to show	The maximum number of articles to include in the list.
Show even when empty	Enable this check box to display the article list even if it does not contain any articles.
Show Secondary Fields Label	Enable this check box to display the field labels for the additional information displayed for each article.
Knowledge Base	To restrict the articles that appear in this list to a specific knowledge base, select the knowledge base from the knowledge base list.

5. Click **Save**.

Configure search results list widget instance options

Configure widget instance options for the results list widget on the Knowledge Management Service Portal search results page.

Before you begin
Role required: sp_admin or admin

About this task
The search results page uses the Knowledge Result widget to provide display options for the returned list of results. Use the widget instance options to customize the display options.

Procedure
1. Navigate to the Knowledge Management Service Portal search results page.
2. Control + right-click the list of returned search results.
3. Click **Instance Options**.
4. Configure the desired settings for the results list widget.

Instance option	Description
Glyph	An icon that appears in the search bar.
CSS	Custom configurations that determine the look and feel of the elements in the widget. For more information, see Service Portal SCSS Primer.
Show Relevancy Score	Shows how relevant each search result is based on the search term. The default setting uses the system property.
Breadcrumb: Hide Categories	Hides the category in the breadcrumb that appears below the article short description in the results list. The default setting uses the system property.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Instance option	Description
Breadcrumb: Knowledge Base Separator	The character used as a separator between the knowledge base and the category in the breadcrumb.
Breadcrumb: Category Separator	The character used as a separator between categories in the breadcrumb.
Default Sort Order	The default sort order for the list of returned results. The default sort order is **sys_view_count:desc**, which sorts the results by the number of views in descending order.
How to Display Attachments in Knowledge Search Results	How attachments are shown in the list of returned results. The default uses the system property.
Label for Show Pinned Articles Link	The text used for the pinned articles link.
Table	The table that stores the information returned in the search results.
Knowledge Secondary Fields	Fields that display additional information for each article in the search results.
Show Secondary Fields Label	Enable this check box to display the field labels for the additional information displayed for each result.
Pagination Type	Controls how additional knowledge article search results are displayed. ○ **Standard Pagination:** displays the search results in multiple pages. ○ **Infinite Scroll:** displays the search results while scrolling. The default pagination type is set to **Infinite Scroll**.
Maximum no. of articles displayed per page with standard pagination	The maximum number of items included in a page when the search results list is displayed using standard pagination.
Maximum no. of articles displayed after first fetch during infinite scroll	The maximum number of items included when the search results list is first displayed using infinite scroll.
Maximum no. of articles displayed at subsequent fetches during infinite scroll	The maximum number of items included when the search results list updates as the user scrolls to the bottom.
No. of links in pagination bar	The number of links displayed in the pagination bar.

5. Click **Save**.

Configure filter facet widget instance options

Configure widget instance options for the filter facet widgets on the Knowledge Management Service Portal search results page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sp_admin or admin

About this task
The homepage uses several widgets to filter the items in the search results list. There are two types of facet widgets:

- Simple field facets based on the Knowledge table fields
- Advanced query facets based on custom queries of the Knowledge table

Use the widget instance options to customize these facet widgets:

- Knowledge Field Facet (for filtering by knowledge base, knowledge category, and author)
- Knowledge Tags Facet (for filtering by tag)
- Knowledge Resource Facet (for filtering by resource, such as articles)
- Knowledge Query Facet (for filtering by rating, last modified, and number of views)

> **Note:**
> Query facets are displayed when there's at least one knowledge field facet added to the page.

Use default Knowledge Language Widget to include language filters in the knowledge Search Result page. To add a custom language widget, you need to deactivate the Knowledge Language Widget on the Knowledge Search Result page.

Procedure
1. Navigate to the Knowledge Management Service Portal search results page.
2. Control + right-click a filter facet widget.
3. Click **Instance Options**.
4. Configure the desired settings for the selected type of facet widget.

Instance option	Description
Title	Title of the filter facet widget.
Glyph	Icon that appears to the left of the title.
Order	Order in which the filter facet widgets appear on the left side of the search results page. If empty, the filter facet widgets sort alphabetically.
Bootstrap color	Color of the filter facet widget header.
CSS	Custom configurations that determine the look and feel of the elements in the widget. For more information, see Service Portal SCSS Primer.
Source Table	Table that contains the **Source Field** used to provide the filter facet widget options. The default table is Knowledge (kb_knowledge).
Source Field	Field in the **Source Table** that provides the filter facet widget options. Field types that

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Instance option	Description
	can be used as a source field include string, glide list, integer, reference, and boolean.
Facet Identifier	Unique name for the custom query facet that can be used in script code.
Facet Template	Template that determines the type of facet interaction. Knowledge Field Facet widget templates: ○ **Single Select**: users can select only one filter from this widget. ○ **Multi Select**: users can select more than one filter from this widget. ○ **Dropdown Select**: users can select more than one filter from a drop-down menu. Knowledge Query Facet widget templates ○ **Simple Query**: shows a label for each facet value. ○ **Rating**: shows rating stars.
Custom Template	Custom template that determines facet interaction and value selection.
Facet Options	Custom query in JSON format for the label, ID, order, and query for each facet value. Includes the table, value (encoded query), and display value (encoded query).
Order by	Order of the filter options within the facet widget. The default order is **label**, which sorts the options in alphabetical order. For reference fields, you can also state an order from the reference field table.
Minimum results for showing filter search bar	Minimum number of results required to display a search bar at the top of the filter facet widget.
Minimum results for showing scroll bar	Minimum number of results required to display a scroll bar in the filter facet widget.
Maximum length for string field	Maximum field length. Only fields whose length is less than this value are allowed to be added as a filter facet.
Alternate URL Parameters	Names of the URL parameters used to initialize this filter facet, if used in the URL as a search parameter.
Fetch Maximum Values	Option to fetch filter values from all knowledge articles in the search results. Selecting the **Fetch Maximum Values** option might impact the load time for search results. If this option is disabled,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Instance option	Description
	the load time improves based on the *glide.knowman.search.facet_depth* property value. If the *glide.knowman.search.apply_acls* property is set to true, a filter value can appear in a filter facet even when there are no search results for that filter value. For example, a knowledge base without any articles might appear as a value in the knowledge base filter facet.
Show Empty Value	If enabled, shows an empty filter facet option that users can select to filter for articles that do not have this field set. For example, if an article does not have an assigned category, clicking the empty option lists all articles with no assigned category.
Show Only Facet Values Matching Results	Creates a dynamic filter facet widget that displays only those filter values that match the search results rather than showing all values. If you disable this instance option, the time needed to load the filter facet data is reduced.
Show category hierarchy (valid for kb_category only)	If enabled, shows categories with their hierarchy list up to the fourth-level. When you enable this option, you can select only one category at a time. Any articles that are included in the subcategories beyond the fourth-level also appear in the fourth-level of category. The search results filtered on a selected parent category include articles within that category and all the associated child categories.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Instance option	Description
	Note: ○ If the number of knowledge articles returned in search results is greater than the search facet depth, all categories are displayed in this facet. Therefore, some categories shown in this facet might not be associated with any knowledge articles in the search results. By default, the facet depth is set to 300 and configured by an administrator in the *glide.knowman.search.facet_depth* property. ○ To configure the knowledge Search Results page widgets by adding more filters. Specifically if filters on language need to be applied they should be using the OOB Knowledge Language Widget. The field facet widget can be configured using language field in instance options for similar behaviour but in that case OOB Knowledge Language Widget instance should be inactivated on the Knowledge Search Results page.

5. Click **Save**.

Configure a user action for the article view page

Configure a user action for the Knowledge Management article view page in the Knowledge Management Service Portal.

Before you begin

Role required: sp_admin or admin

About this task

The article view page uses the Knowledge Article Content widget to provide user actions. Use the widget instance options to customize these actions.

Ensure that the application scope on the ServiceNow AI Platform is set to Knowledge Management Service Portal.

User actions available for the article view page appear in a menu after clicking the overflow icon (⋯) in the article header. These actions enable users to flag an article, edit an article, or create an incident for an article.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the Knowledge Management Service Portal article view page.
2. Control + right-click the article header.
3. Click **Instance Options**.
4. Configure the desired settings for the Knowledge Article Content widget.

Instance option	Description
Bootstrap color	The color of the widget header.
CSS	Custom configurations that determine the look and feel of the elements in the widget. For more information, see Service Portal SCSS Primer.
Hide All Actions	Hides the user actions in the article header including the **Subscribe/Unsubscribe** button and the overflow icon.
Show Version Information	Displays version information for the selected article. Requires the Knowledge Management Advanced plugin (com.snc.knowledge_advanced).
Show Create Incident Action	Displays the **Create Incident** user action when a user clicks the overflow icon in the article header.
Create Incident Action Label	The label for the user action that appears in the overflow icon menu. The default is **Create Incident**.
Create Incident Action URL	The target URL for the **Create Incident** user action. If no URL is specified, the system uses the URL in the *glide.knowman.create_incident_link* system property.
Redirect to the latest article	Redirects the article view page to the latest accessible version of the article, if available. Disable the **Show Version Information** option to hide the version information on the article view page because any version link will redirect to the latest version only.

5. Click **Save**.

Configure article helpful widget instance options

Configure the Knowledge Article Helpful widget instance options for the Knowledge Management article view page in the Knowledge Management Service Portal.

Before you begin

Role required: sp_admin or admin

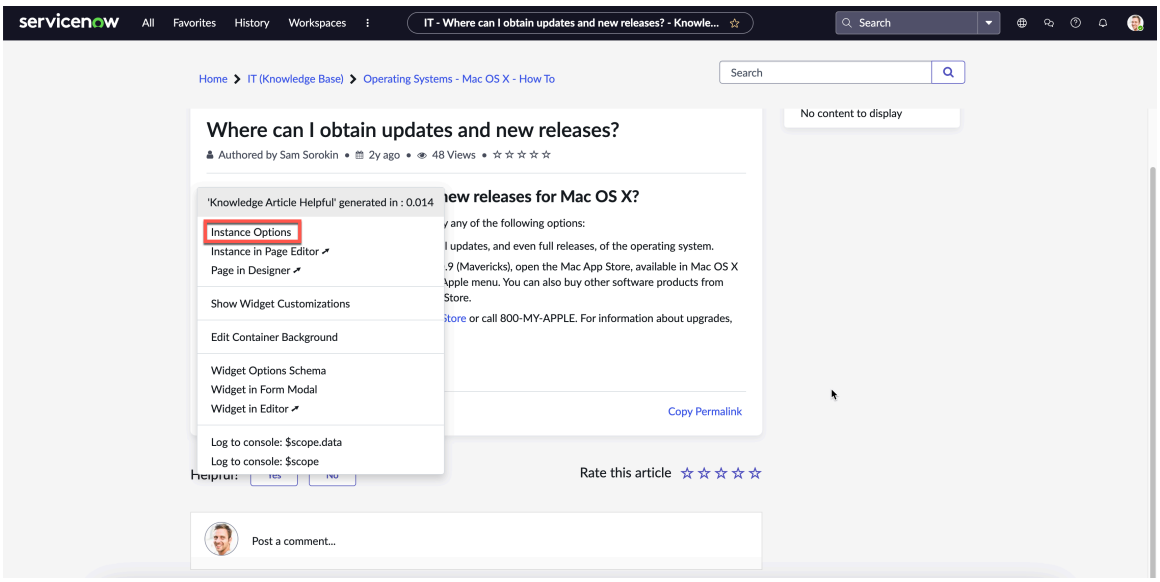
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The article view page uses the Knowledge Article Helpful widget to allow users to provide feedback on the helpfulness of the article, display a confirmation message after a feedback is provided, and display the percentage of users who found the article to be useful. Use the widget instance options to customize these actions.

Procedure

1. Navigate to the Knowledge Management article view page in the Knowledge Management Service Portal.
2. Control + right-click **Helpful?**
3. Click **Instance Options**.



4. Configure the desired settings for the Knowledge Article Helpful widget.

Instance option	Description
Bootstrap color	The color of the widget header.
CSS	Custom configurations that determine the look and feel of the elements in the widget. For more information, see Service Portal SCSS Primer.
Show helpful percentage information	Check box to enable the display of percentage of users who found this article to be helpful.
Helpful Action Label	Label for marking this article as helpful or not.
Feedback Message	Text that displays when the user marks the article as helpful or not.

5. Click **Save**.

Configure article comments instance options

Before you begin
Role required: sp_admin or admin

About this task
The article view page uses the Knowledge Article Comments widget to allow users to rate an article, add a comment, or view existing comments for the article. Use the widget instance options to customize these actions.

Procedure
1. Navigate to the Knowledge Management article view page in the Knowledge Management Service Portal.
2. Control + right-click the comments section.
3. Click **Instance Options**.
4. Configure the desired settings for the Knowledge Article Comments widget.

Instance option	Description
Bootstrap color	The color of the widget header.
CSS	Custom configurations that determine the look and feel of the elements in the widget. For more information, see Service Portal SCSS Primer.
Other Options	
Show User Comments	Displays the field for users to enter comments. Available options: ○ Yes - displays the field that enables users to enter comments for the article. ○ No - hides the field that enables users to enter comments for the article. ○ Use system property - display or hide the comments field using article view properties.
Add Comment Label	Label for the field to add comments.
Maximum number of attachments that can be attached to a comment	Maximum number of attachments that can be attached to a comment included for a knowledge article.
Maximum attachment file size in MB that can be attached to a comment	Maximum attachment file size in MB that can be attached to a comment included for a knowledge article.

Configure related catalog item widget instance options

Configure the Related Catalog Item widget instance options for the Knowledge Management article view page in the Knowledge Management Service Portal. These options relate to the list of catalog items mapped to an article.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sp_admin or admin

About this task
The knowledge article view page displays the Related Items section when an article has related catalog items. Use the widget instance options to customize the Related Items section on the article view page.

Procedure
1. Navigate to the Knowledge Management homepage in the Knowledge Management Service Portal by adding `/kb` to the end of your instance URL.

   Note:
   Your administrator might have changed this default navigation.

2. Search for and click the article for which you want to modify the instance options for the Related Catalog Item widget.
3. Press Control and right-click the Related Items section.
4. Click **Instance Options**.
5. Configure settings for the Related Catalog Item widget.

Instance option	Description
Source Table	Source table containing related catalog items. The source table specified in the base system is Related Catalog Items (kb_2_sc).
Source Column	Field in the source table referring to the source record. The source column specified in the base system is Knowledge article (kb_knowledge).
Title	Title that appears on the widget header. The default title is Related Items.
Max Number	Maximum number of catalog items to include in the Related Items section on the article view page. The maximum number specified in the base system is 5.
Use Full Width	Option for displaying the widget in a 12-column grid at 100% of the available width. If you clear the check box, the widget displays at 75% of the available width.
Target Column	Field in the source table referring to the target record. The target column specified in the base system is Catalog item (sc_cat_item).
Source Id	URL parameter containing the unique record identifier (sys_id) of the source record. For the article view page, the URL parameter containing the source ID is sys_kb_id.

6. Click **Save**.

Map catalog items related to an article

Configure knowledge related articles widget instance options

Configure the Knowledge Related Articles widget instance options for the Knowledge Management article view page in the Knowledge Management Service Portal. These options relate to the list of related articles mapped to an article.

Before you begin

Role required: sp_admin or admin

About this task

The knowledge article view page displays the Related Articles section when an article has related articles. Use the widget instance options to customize the Related Articles section on the article view page.

Procedure

1. Navigate to the Knowledge Management homepage in the Knowledge Management Service Portal by adding `/kb` to the end of the URL for your instance.

   Note:
   You can change the default navigation by configuring the property *`sn_km_portal.glide.knowman.serviceportal.portal_url`*.

2. Click to open the article for which you want to modify the instance options for the Knowledge Related Articles widget.
3. On the article page, press Control+right-click and select **Page in Designer**.
4. In the Service Portal Designer page, click the edit icon ( ) on **Knowledge Related Articles** widget to add the related articles.

   Note:
   You can also add **Knowledge Related Articles** widget using **Widgets** search field and drag-and-drop the widget to the blank field.

5. Configure settings for the Knowledge Related Articles widget.

Instance option	Description
Title	Title that appears on the widget header. The default title is Related Articles.
Bootstrap color	Color scheme of the widget header. Select a color for your widget from a list of common bootstrap colors.
Glyph	Icon that appears beside each list item displayed in the widget. To skip this field, select the empty glyph.
CSS	Custom configurations that determine the look and feel of the elements in the widget. For more information, see Service Portal SCSS Primer.

Map related articles

Knowledge Management Service Portal properties

Search using the Knowledge Management Service Portal

Enter one or more words in the search bar on the Knowledge Management Service Portal homepage to view all search results.

Search results include items in which the short description, content, or attached files include the search term. By default, knowledge search results include articles, pinned articles, and social Q&A.

You can also filter the search results.

Enable multi-language search

The multi-language search facet is available when more than one supported language is enabled. All available languages are displayed in the facet and you can select which languages you want your search results to appear in. Your selection is maintained per session, but not across logins.

1. To enable different languages, activate the I18N: Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2) or activate one of the internationalization plugins for the language you require.

   Note:
   Activating internationalization plugins for any of the available languages automatically activates the I18N: Knowledge Management Internationalization Plugin v2 plugin.

2. Navigate to **Knowledge** > **Administration** > **Knowledge Search Properties** > **Enable multi language search**.
3. Select the **Yes** check box to enable the feature.

   Note:
   If this property is not enabled, you can only search for one language at a time.

Search auto-correct feature

The Knowledge Management Service Portal homepage search tool also includes an auto-correct feature. When enabled, users can auto-correct a typing error in a search term by clicking one of the suggestions.

When a search term contains a misspelling, the search tool displays the search results page and includes one or more suggested terms at the top of the page under the heading **Did you mean**. Clicking one of these suggestions shows all the search results that match the selected term.

Users with the system administrator role can enable this feature.

1. Navigate to **System Properties** > **Text Search**.
2. Set the following properties to **true**:
   - Suggest alternate search spellings for knowledge or global search (glide.ts.dym.enable_spell_correct).
   - Suggest related searches for knowledge or global search (glide.ts.dym.enable_chain_suggest).
3. Click **Save**.

Integrating Knowledge Management features with the Service Portal

To create a consistent user experience for Knowledge Management, integrate Knowledge Management Service Portal in your end-user facing Service Portal.

The Knowledge Management Service Portal includes the following features:

- Multiple knowledge bases
- A Knowledge Management article view page with feedback options
- A Knowledge Management search results page with options to filter and sort search results
- A number of widgets to enable searches, display search results, display knowledge articles, and so on

By default, all knowledge articles in the Service Portal are redirected to the Knowledge Management article view page using the **Knowledge Article View** page route map. If upgrading from a previous release, a system administrator can activate the **Knowledge Article View** page route map to take advantage of the features of the Knowledge Management article view page. For more information, see Activate the Knowledge Article View page on upgrade.

Note:
The Knowledge Management Service Portal supports only Zing search and not AI search.

System administrators perform the following tasks to integrate the Knowledge Management Service Portal features with the Service Portal:

- Integrate the Knowledge Management homepage with the Service Portal homepage.
- Integrate the Knowledge Management search results page with the Service Portal search results page.
- Add the Knowledge Management Service Portal widgets to quickly access knowledge articles from the Service Portal homepage (Optional).

Note:
These configurations apply to the base system pages within the Service Portal only.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: admin

About this task

The Knowledge Management homepage displays knowledge articles organized by knowledge base and category, featured content, and popular articles. You use a page route map to access the Knowledge Management homepage from the Service Portal homepage.

Procedure

1. Navigate to **All** > **Service Portal** > **Page Route Maps**.
2. Click **New**.
3. On the Page Route Map form, fill in the fields.

Page Route Map form

Field	Value
Service Portal(s)	Service Portal
Route from	kb_view2
Route to	kb_home
Active	Selected

Note:
On the Page Route Map form, you can fill in the **Short Description** and **Order** fields as appropriate.

4. Click **Submit**.

Result

You can now open the Knowledge Management homepage from the Service Portal homepage by clicking the Knowledge link or Knowledge Base icon link.

Integrate the Knowledge Management search results page with the Service Portal search results page

Use a custom knowledge search widget to access the enhanced Knowledge Management search results page from the Service Portal search results page.

Before you begin

Role required: admin

About this task

The Knowledge Management search results page in the Knowledge Management Service Portal includes options to filter and sort search results and a number of widgets to enable searches, display search results, display articles, and so on. In this procedure, to access the Knowledge Management search results page from the Service Portal search results page, you create a custom knowledge search widget named Search Within and add it to the Service Portal search results page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Create a custom knowledge search widget named Search Within.

   a. Navigate to **Service Portal** > **Service Portal Configuration**.

   b. On the Service Portal page, click **Widget Editor**.

   c. Click **Create a new widget**.

   d. In the Add a Widget dialog box, in the **Widget Name** field, enter `Search Within`.
   The **Widget ID** field is automatically populated based on the widget name.

   e. Click **Submit**.

   The widget HTML template, client script, and server script display in the widget editor.

   f. In the widget editor, enter the following field values to replace any existing text.

   - In the **HTML Template** field, enter the following code to add a link to the Knowledge Management search results page in the Search Within widget from the Service Portal.

```
<div role="list" class="list-group">
  <span class="list-group-item active">${Search
 Within}</span>
  <a role="link" class="list-group-item"
 ng-href="{{data.url}}">${Knowledge}</a>
</div>
```

   - In the **Server Script** field, enter the following code to set the URL parameters for the Knowledge Management search results page:

```
(function(){
 var q = encodeURIComponent($sp.getParameter('q'));
 var kb = $sp.getValue('kb_knowledge_base') || "";
 data.url = '/sp?id=kb_search';
 if(q)
  data.url += "&keyword="+q;
 if(kb)
  data.url += "&kb_knowledge_base="+kb;
})();
```

   Note:
   For more information about these fields, see Widget developer guide.

   g. Click **Save**.

2. Add the custom knowledge search widget to the Service Portal search results page.

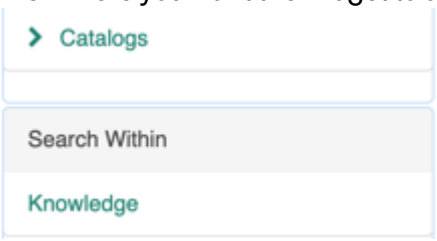
   a. Navigate to **Service Portal** > **Service Portal Configuration**.

   b. Click **Designer**.

   c. In the **Filter by title or Id** field, enter `sp_search`, the ID for the Service Portal search results page, and then select **Search**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. In the **Filter Widget** field, search for the Search Within widget and drag it onto the container where you want the widget to appear on the Service Portal search results page.



Tip:
To verify the location and appearance of the newly added Search Within widget on the Service Portal search results page, click the **Preview** tab.

The Search Within knowledge search widget is added to the Service Portal search results page. Clicking **Knowledge** in the widget and searching for a keyword will redirect you to the Knowledge Management search results page in the Knowledge Management Service Portal.

Add widgets to access knowledge articles from the Service Portal homepage

Add the Knowledge Management Service Portal widgets Featured Articles, Most Useful Articles, and Most Rated Articles to the Service Portal homepage to quickly access knowledge articles.

Before you begin
Role required: admin

About this task
For more information about Knowledge Management Service Portal widgets, see Knowledge Management Service Portal widgets.

Procedure

1. Navigate to **All** > **Service Portal** > **Service Portal Configuration**.
2. Click **Designer**.
3. Select the Service Portal homepage.
4. In the **Filter by title or Id** field, enter `index`, the ID for the Service Portal homepage, and then select **Service Portal**.
5. In the **Filter Widget** field, search for the following Knowledge Management Service Portal widgets, and then drag them onto the container where you want them to appear on the Service Portal homepage.

Tip:
To verify the location and appearance of the added widgets on the Service Portal, click the **Preview** tab.

Result
Clicking a knowledge article link from one of the added widgets on the Service Portal homepage opens the Knowledge Management article view page in the Knowledge Management Service Portal.

Configure custom SEO tags for canonical URLs and localized knowledge articles

Discover relevant knowledge articles through search engines by adding custom SEO tags for canonical URLs and *`hreflang`* tags to the knowledge article view page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

About this task
Update the *SPSEOHeaderTagsArticleView* script include to add canonical URLs and *hreflang* tags to the knowledge article view page. You can also add custom header tags to the knowledge article view page by implementing the *generateCustomTagsForSEO* function.

Note:
The metatags will be added to the Knowledge Article View [kb_article_view] only when viewed by the user agents mentioned in *glide.knowman.serviceportal.seo_user_agent* system property. For more information, see Create and edit a page using the Service Portal Designer.

For information about the default behavior of canonical URLs and *hreflang* tags for the knowledge article view page, see SEO for canonical URLs and localized versions of knowledge articles.

Procedure
1. Navigate to **All** > **System Definitions** > **Script Includes**.
2. Search for `SPSEOHeaderTagsArticleView`.
3. In the **Name** column, click the **SPSEOHeaderTagsArticleView** link.
4. On the Script Include form, modify the functions for knowledge articles.

Functionality	Implementation
Return a canonical URL for a knowledge article	Modify the *generateCanonicalURL* function to return the fully qualified canonical URL of a knowledge article as a string. For example, use the following URL format for a knowledge article in the customer service portal: `"https://<instance name>.servicenow-com/csp?id=kb_article_view&sysparm_article=<article number>"`
Return an *hreflang* tag for translated versions of a knowledge article	Modify the *generateHrefLangArray* function to return an *hreflang* array for the current language and the available translations for a knowledge article. For example, use the following format for a knowledge article translated in French in the customer service portal: `[{locale:'fr', href:'https://<instance name>.servicenow-com/csp?id=kb_article_view&sysparm_article=<article number>'}]`
Return a custom header for a knowledge article	Modify the *generateCustomTagsForSEO* function to return any custom header tags as an array of strings used for the knowledge article view page. For example, use the following format for a custom tag for a knowledge article: `['<meta custom-tag="" property="og:title" content="Service Portal">']`
Return a SEO optimized HTML	Modify the *generateSEOTags* function to return the SEO optimized HTML content in *items.customSEOHTML*.

For more information about configuring script includes, see Script includes.

5. Click **Update**.

Enable and configure AI Search for Knowledge Management Service Portal

Enable and define the AI Search experience in Knowledge Management Service Portal.

Before you begin

Role required: sp_admin or admin

About this task

All new and existing customers must manually enable AI Search in the Knowledge portal. If you leave AI Search inactive, the portal uses Zing search by default.

Procedure

1. Navigate to **Service Portal** > **Portals** and open the **Knowledge Portal** record.
2. On the form, select the **Enable AI Search** check box.
3. In the **Search Application** field, select the Knowledge Portal Search Configuration to use for the portal.
   A search application configuration defines search experience settings such as the search engine, search results limit, and suggestions limit.
4. In the **Search Results Configuration** field, determine how search results are displayed by selecting the Knowledge Portal Search.
5. Select **Update**.

Important:

- The **View count** and **Rating** facets that are available in Zing search aren't available for AI Search.
- If you select a Knowledge Base from the Knowledge Portal, you will be directed to the AI Search results page. Because you are not entering a search term, the placeholder "***" will be displayed instead of a search term. You can enter a search term on the search results page or select additional filters as needed to refine your results within the selected knowledge base.

Result

AI Search is enabled throughout the Knowledge portal. Customers can use AI Search from the search bar on the portal.

Create a knowledge base

Create a knowledge base to provide a self-service platform for users to store, share, and manage content. Configure knowledge bases into product or service categories and manage user access based on permissions. Customize workflows for publishing and retiring articles in the knowledge base.

Before you begin

Understand the requirements for setting up a knowledge base.

Role required: knowledge_admin or admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Knowledge** > **Administration** > **Knowledge bases**.
2. In the Knowledge Bases list, click **New**.
3. On the Knowledge base form, fill in the following fields as appropriate:

Knowledge base form

Field	Description
Title	Unique name for the knowledge base.
Article Validity	Number of default days articles will be valid for after their created date. **Note:** The **Article Validity** field is configured to set the **Valid to** date for an article. The **Valid to** date is the date this knowledge article expires. When you create an article within a knowledge base, the date value in the **Valid to** field of the article is calculated as follows: Created (sys_created_on) + Article Validity (in days). An article author or editor can select whether to keep or change the **Valid to** date (see Create a knowledge article). If the **Article Validity** field is blank, the date in the **Valid to** field date is set to January 1, 2100.
Icon	An image that provides a visual reference to describe the knowledge base. This image is displayed next to all articles from this knowledge base in the article search results page.
Disable commenting	Option to disable commenting. If selected, users cannot comment on articles in the knowledge base.
Disable suggesting	Option to disable edit suggestions. If selected, users cannot suggest edits to articles in the knowledge base.
Disable category editing	Option to disable editing of knowledge categories. If selected, only knowledge managers can add or edit knowledge categories for the knowledge base.
Disable rating	Option to disable the rating for knowledge articles. If selected, users cannot rate the article in the knowledge base.
Disable mark as helpful	Option to disable the mark as helpful. If selected, user cannot mark any article as helpful in the knowledge base.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Enable blocks	Option to enable the knowledge blocks feature. If selected, you can create knowledge blocks to add to knowledge articles within a knowledge base.
Checklist	Checklist to evaluate the quality of articles in the knowledge base.
Application	Application scope of the knowledge base. **Note:** This field is automatically set to the application selected in the application picker. For information about a scoped knowledge base, see Scoped knowledge bases.
Owner	The user responsible for the knowledge base. A knowledge base owner can assign other roles to the knowledge base.
Managers	Users who perform administrative functions on the knowledge base.
Publish workflow	The workflow for publishing the articles in the knowledge base. ○ **Knowledge - Instant Publish:** publishes articles in the knowledge base without requiring an approval. ○ **Knowledge - Approval Publish:** requests approval from the manager of the knowledge base before moving the articles to the published state.
Retire workflow	The workflow for retiring the articles in the knowledge base. ○ **Knowledge - Instant Retire:** retires articles in the knowledge base without requiring an approval. ○ **Knowledge - Approval Retire:** requests approval from the manager of the knowledge base before moving the articles to the retired state.
Active	Option to indicate that the knowledge base is active. If not selected, only users with the admin role or knowledge administrators can create, search for, or view its articles.
Description	A short description to describe the knowledge base.
Set default knowledge field values	Default configuration settings for the knowledge base.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Related products	List of products related to the knowledge base content.
Auto-create translation tasks	Option to enable creating translation tasks automatically after an article is published. If this option is selected, when a knowledge article is published in this knowledge base, translation tasks are automatically created for the configured languages. This field appears only when the translation management feature and *glide.knowman.translation.enable_translati* property are enabled. For more information, see Translation management and Knowledge Management properties.
Languages	Languages enabled for the knowledge articles in this knowledge base. If your system has more languages, use this option to select only those languages in which you want to translate knowledge articles in this knowledge base. You can add more languages later. However, you can remove languages only when no knowledge articles exist in that language. This field appears only when the translation management feature and *glide.knowman.translation.enable_translati* property are enabled. For more information, see Translation management and Knowledge Management properties.

4. Right-click the form header and click **Save**.
5. In the related list section, view or configure the following items related to the knowledge base:

Name	Description
Knowledge	List of knowledge articles stored in this knowledge base.
Can Read	List of user criteria that grants read access and enables user matching the criteria to read articles in a knowledge base. **Note:** It is recommended to assign appropriate user criteria to secure read access. See, Select user criteria for a knowledge base.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
Can Contribute	List of user criteria that grants contribute access and enables user matching the criteria to create and modify articles in a knowledge base. **Note:** It is recommended to assign appropriate user criteria to secure contribute access. See, Select user criteria for a knowledge base.
Article Templates	If you have activated the Knowledge Management Advanced (com.snc.knowledge_advanced) plugin, the **Article Templates** related list is displayed. If there are article templates in the related list, articles in that knowledge base can only be created using one of the article templates listed. If the **Article Templates** related list is empty, articles can be created using any article template. Click **Edit** to map article templates to the knowledge base. **Note:** Admins, knowledge admins, and knowledge managers can edit the article templates for the knowledge base.
Featured Content	List of knowledge articles that appear in the homepage **Featured Content** section based on the corresponding keyword search set for each article.
Knowledge Categories	List of knowledge categories associated with this knowledge base. **Note:** If the category is marked as inactive then you can't associate articles to the category. However, it does not have any effect on the existing articles of that category.

6. Click **Submit**.

Configure knowledge bases for a portal

Select which knowledge bases are displayed in a portal to view the associated knowledge articles. If no knowledge bases are configured, users can view articles from all knowledge bases in the portal.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Service Portal** > **Portals**.
2. Select the portal for which you want to enable search for the desired knowledge bases.
3. In the Knowledge Bases related list, click **Edit**.
4. On the Edit Members form, move the desired knowledge bases from the available items in the **Collection** column to the **Knowledge Bases List** column.
5. Click **Save**.

Related topics

- Create a knowledge base

Configure knowledge subscriptions

Configure knowledge subscriptions by activating the Knowledge Management Advanced plugin and setting the subscription properties.

Before you begin

Ensure that the Knowledge Management Advanced plugin (com.snc.knowledge_advanced) is activated.

Note:
The Knowledge Management Advanced plugin activates the Subscriptions and Activity Feed Framework plugin (com.snc.activity_subscriptions).

Role required: knowledge_admin or admin

Procedure

1. Navigate to **All** > **Knowledge** > **Administration** > **Properties**.
2. In the **KM Subscription Properties** section, configure the following properties.

Property	Description
Enable subscribe feature for KM [glide.knowman.enable_km_subscription]	Enables or disables the Knowledge Management knowledge subscriptions feature.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
List of roles (comma-separated) who can have subscription feature [glide.knowman.enable_km_subscription.roles]	A comma-separated list of the roles that can use the knowledge subscriptions feature and subscribe to knowledge bases and articles.
List of workflow states (comma-separated) that can have subscription feature [glide.knowman.enable_km_subscription.workflow_state]	A comma-separated list of the article states for which the knowledge subscription feature is available. The default states include **Draft**, **Review**, and **Published**.

3. Select **Save**.

Configuration tasks for knowledge managers

Having multiple knowledge bases allows an organization to spread management responsibilities across multiple users, known as knowledge managers.

As a knowledge manager, you can assign other managers, define category structures, configure which users can read and contribute articles, move and pin articles, and modify most fields on the Knowledge Base form. You can also approve the publishing or retiring of knowledge articles in those knowledge bases.

The primary manager of a knowledge base is the owner of that knowledge base. Each knowledge base must have one owner. There may be any number of additional managers for each knowledge base. The owner and all managers of a knowledge base automatically receive the knowledge_manager role. If the knowledge base is made inactive later, the knowledge_manager role is not automatically removed for these users.

Add a knowledge article to featured content

Add a knowledge article to appear in the Featured content section of the knowledge homepage and at the top of knowledge search results page.

Before you begin

Role required: knowledge_manager, knowledge_admin, or admin

About this task

Adding an article to featured content requires associating an article to specific keywords. You can search a keyword in the knowledge service portal or search results page to display articles in the Featured content section or at the top of the knowledge search results list.

Note:
The articles added to the Featured content section do not appear in the global search results and Virtual Agent conversations.

- To display articles in the Featured content section, add a default keyword in the **glide.knowman.default_keyword** property **Value** field and add the same keyword to all articles you want to display in that section.
- To display articles at the top of the knowledge search results list, add a list of keywords to each article you want to display at the top of the list (it is not applicable for AI search).

Procedure

1. Navigate to **All** > **Knowledge** > **Knowledge Bases**.
2. Select a knowledge base.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the Knowledge form, click the Featured content related list.
4. Select **New**.
5. On the Knowledge keyword form, in the Knowledge field, search for and select the article.
6. In the Keywords field, click the unlock keywords icon ( ).
7. Select the lookup icon ( ) to open the **Knowledge keywords** list.
8. Select the keyword to add for this article.

> **Note:**
> If you're creating a new keyword, it must be a single word and cannot contain spaces.

9. Select the unlock keywords icon ( ) to add the keywords to the article.
10. Select **Submit**.

Result
The featured content on the knowledge service portal displays the article.

Define a knowledge article category

Each knowledge base has a hierarchy of categories that organizes the articles.

Before you begin
Role required: knowledge_admin, knowledge_manager, **CanContribute** access to the knowledge base

About this task
Define a hierarchy for categories by creating parent-child relationships. Each hierarchy consists of a top-level category and a structure of subcategories, which are also named the child categories. The category hierarchy is saved in the **Full category** field in the Knowledge Category [kb_category] table.

You can create and edit categories separately for each knowledge base.

Procedure
1. Navigate to **All** > **Knowledge** > **Administration** > **Knowledge Bases**.
2. Select a knowledge base you manage.
3. Create a top-level category.
   a. In the Knowledge Categories related list, click **New**.
   b. On the Knowledge Category form, fill in the fields.

Knowledge Category form

Field	Description
Label	Label for the category. The label appears as the name of the category.
Value	Value for the category you use when referencing the category in scripts.
Parent ID	Top-level component associated with the category.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	This field is automatically set to the top-level component ID.
Active	Option to enable the category.

c. Click **Submit**.

4. **Optional:** Create a child category.
   a. Expand an existing category and click **New** within the expanded section.
   b. Fill in the Knowledge Category form.
   c. Click **Submit**.

What to do next
In addition to using categories defined by a knowledge manager, knowledge contributors can add and edit categories when editing an article.

Related topics
Select a knowledge article category

Assign a knowledge base manager

You can assign users as managers of a knowledge base.

Before you begin
Role required: knowledge_admin, or admin

Procedure
1. Navigate to **All** > **Knowledge** > **Knowledge Bases**.
2. Select a knowledge base you manage.
3. In the **Managers** field, click the unlock icon.
4. Add one or more users.
5. Click **Update**.
   After you save the knowledge base record, users selected as managers automatically receive the knowledge_manager role if they do not have it already.

What to do next
You can remove a knowledge base manager by removing that user from the **Managers** field. If the user is not a manager of any other knowledge base, the knowledge_manager role is removed from that user.

Configure Self-Service Analytics

Configure the Self-Service Analytics framework so you can use the generated metrics in a dashboard.

Before you begin
Role required: admin

About this task
Complete the following tasks to use the metrics generated by the Self-Service Analytics framework in a dashboard of an application:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Activate Self-Service Analytics.
2. Configure activity contexts for Self-Service Analytics.
3. Configure pattern elements for Self-Service Analytics.
4. Configure pattern element groups for Self-Service Analytics.
5. Configure activity patterns for Self-Service Analytics.
6. Set up the deflection configuration for Self-Service Analytics.
7. Configure scheduled jobs for Self-Service Analytics.

Related topics

Self-Service Analytics dashboard for customer service

Activate Self-Service Analytics

Activate the Self-Service Analytics Core plugin (com.snc.self_service_analytics_core) if you have the admin role. This plugin activates related plugins if they are not already active.

Before you begin

Role required: admin

About this task

The Self-Service Analytics Core plugin provides the Self-Service Analytics framework for configuring deflection contexts and activity patterns to collect the case reduction (deflection) metrics. The metrics are used in the Self-Service Analytics dashboard.

The Self-Service Analytics Core plugin activates these related plugins if they are not already active.

Plugins for Self-Service Analytics Core

Plugin	Description
Subscriptions and Activity Feed Framework [com.snc.activity_subscriptions]	Provides a generic set of artifacts to handle subscriptions for any defined subscribable object. Any entity can be defined as a subscribable object and a set of subscribers can subscribe to the objects. When a event occurs related to the subscribable object, activities can be tracked and subscribers can be notified.

Note:
The Self-Service Analytics Core plugin is also installed when you activate the Platform Analytics Solution for Self-Service Analytics for Customer Service. For more information, see Activate the Platform Analytics Solution for Self-Service Analytics for Customer Service.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select **Install** to start the installation process.

> **Note:**
> When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Configure activity contexts for Self-Service Analytics

Define the type of activities you want to collect as Self-Service Analytics data for a user entity such as consumers and customer contacts.

Before you begin

Role required: sn_ssa_core.self_service_manager

About this task

The activity types you add to an activity context are already predefined for use in applications that use the Subscriptions and Activity Feed Framework. This framework is available when you install the Subscriptions and Activity Feed Framework plugin (com.snc.activity_subscriptions). The plugin is activated when you activate the Self-Service Analytics Core plugin (com.snc.self_service_analytics_core).

Procedure

1. Navigate to **All** > **Self-Service Analytics** > **Configuration** > **Activity Context**.
2. In the Activity Contexts list, search for and select the activity context for your user entity.
   - For consumers, select **Consumer**.
   - For customer contacts, select **Contact**.
   - For user entities other than consumers and customer contacts, click **New** to create another activity context.

> **Note:**
> To get the activity contexts Consumer and Contact by default, you must install Self-Service Analytics for Customer Service (com.snc.pa.self_service_analytics_csm) plugin.

3. On the Activity Context form, verify the default field values for consumers and customer contacts, or fill in the values for a custom configuration.

Activity Context form

Field	Description
Name	Unique name for your activity context.
Context Table	Table that includes the user entity whose actions need to be tracked and displayed on the Self-Service Analytics dashboard. For example, if you want to track all actions for a customer contact, select the Contact [customer_contact] table. Similarly, if you want to track all actions for a consumer, select the Consumer [csm_consumer] table.
Module	Module associated with the application that stores the activities data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Application	Scope of the application. This field is automatically set based on the application scope selected in the application picker.
Domain	Domain in which the activities records exist.

4. If you are creating a new activity context, click **Submit** and then select the newly created activity context link from the Activity Contexts list.
5. In the Activity Context Groups related list, map an activity context with activity groups.
   - For consumers and customer contacts, verify the default field values for an existing configuration.
   - For user entities other than consumers and customer contacts, click **New** to create another activity group or map with an existing activity group.

   For a new activity group mapping, on the Activity Group form, fill in the fields and click **Submit**. In the Activity Context Groups related list, you then have to select the newly created activity group and add available activity types to the activity group.

Activity Group form

Field	Description
Activity Context	Activity context associated with the activity group.
Activity Group	Option to search for and select an activity group.
Application	Defines the scope of the application. This field is automatically populated based on the application scope.
Domain	Domain in which the activities records exist.

6. In the Activity Context Types related list, map an activity context with an activity type.
   - For consumers and customer contacts, verify the default field values for an existing configuration.
   - For user entities other than consumers and customer contacts, click **New** to create another mapping or use an existing configuration.

   For a new activity type mapping, on the Activity Source Context Mapping form, fill in the fields and click **Submit**.

Activity Source Context Mapping form

Field	Description
Activity Context	Activity context associated with the activity source.
Context Table	Table that includes the user entity whose actions need to be tracked and displayed on the Self-Service Analytics dashboard. This field is auto-populated based on the selected activity context.
Activity Type	Activity type you want to associate with the activity context.
Source Table	Table from which the data for the activity context is populated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Filter Criteria	Filter conditions applied on the source table.
Advanced Mapping	Option to enable advanced mapping of activity source and activity context. You enter a script in the **Advanced Mapping Script** field.
Advanced Mapping Script	Script to use if the source and context mapping is not sufficient. This field appears only when the **Advanced Mapping** option is selected.
Module	Module associated with the application that stores the activities data.
Application	Scope of the application that contains the user entity. This field is automatically set based on the application scope selected in the application picker.
Domain	Domain in which the activities records exist.
Fetch from Activities	Option to enable a business rule defined for an activity type.

7. On the Activity Context form, click **Update**.

What to do next
Configure pattern elements for Self-Service Analytics.

Configure pattern elements for Self-Service Analytics

Configure a pattern element to specify a single activity type and how many times it occurs. Each pattern element is implemented as regular expressions.

Before you begin
Configure activity contexts for Self-Service Analytics.

Role required: sn_ssa_core.self_service_manager

About this task
By default, the system includes pattern elements for analyzing activity patterns within Knowledge, Catalog, Communities, or Virtual Agent self-service channels. These pattern elements are available with the Self-Service Analytics for Customer Service plugin [com.snc.pa.self_service_analytics_csm].

Procedure
1. Navigate to **All** > **Self-Service Analytics** > **Configuration** > **Pattern Element**.
2. In the Pattern Elements list, modify an existing pattern element or click **New** to create another pattern element.
3. On the Pattern Element form, fill in the fields.

Pattern Element form

Field	Description
Name	Name to identify the pattern element.
Activity Type	Activity type you want to associate with the pattern element.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Application	Scope of the application that contains the user entity. This field is automatically set based on the application scope selected in the application picker.
Occurrence	Frequency with which an activity should occur. An activity occurrence is one of the following types: ○ **Once**: An activity must have occurred only once. For example, an article was marked with positive feedback only once. ○ **Optionally Once**: An activity might not have occurred, but if it has, then it has occurred only once. For example, either no catalog request was created or only one was created. ○ **Optionally Many**: An activity might not have occurred but if it has, then it has occurred multiple times. For example, either no catalog request has been created or multiple requests have been created. ○ **At Least Once**: An activity has occurred at least once. For example, a community blog was viewed one or more times. ○ **Range**: An activity has occurred as many times as is specified in a range. You specify a range using the **Minimum** and **Maximum** fields. For example, if you specify a range of 2 to 4 Virtual Agent interactions, only 2, 3, or 4 interactions can have occurred.
Minimum	Minimum occurrence of an activity. This field appears only when **Range** is selected from the Occurrence list.
Maximum	Maximum occurrence of an activity. This field appears only when **Range** is selected from the Occurrence list.

4. Submit or update the pattern element.
   - Click **Submit** if you created a new pattern element.
   - Click **Update** if you modified an existing pattern element.

What to do next
Configure pattern element groups for Self-Service Analytics.

Configure pattern element groups for Self-Service Analytics

Define a logical combination of two pattern elements, pattern element group, or both and how many times the combination occurs. Each pattern element group is implemented as regular expressions.

Before you begin
Configure pattern elements for Self-Service Analytics.

Role required: sn_ssa_core.self_service_manager

About this task
By default, the system includes pattern element groups for analyzing activity patterns within the Knowledge, Catalog, Communities, and Virtual Agent self-service channels. These pattern elements are available with the Self-Service Analytics for Customer Service plugin [com.snc.pa.self_service_analytics_csm].

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Self-Service Analytics** > **Configuration** > **Pattern Element Group**.
2. Either configure an existing group or create a new group.
   - Select an existing group in the Pattern Element Groups list.
   - Create a new group by clicking **New**.
3. On the Pattern Element Group form, fill in the fields.

Pattern Element Group form

Field	Description
Name	Name to identify the pattern element group.
First Element	Conditional regular expression consisting of a pattern element or pattern element group.
Second Element	Another conditional regular expression consisting of a pattern element or pattern element group.
Application	Scope of the application that contains the user entity. This field is automatically set based on the application scope selected in the application picker.
Operator	Logical operator that returns the result of the combination of the first and second elements. Valid values are: ○ **And**: Both the first and second elements are true. ○ **Or**: Either the first or second element is true.
Occurrence	Frequency with which a pattern element or pattern element group must occur. An occurrence is one of the following types: ○ **Once**: Must have occurred only once. ○ **Optionally Once**: Might not have occurred but if it has, then it has occurred only once. ○ **Optionally Many**: Might not have occurred but if it has, then it has occurred multiple times. ○ **At Least Once**: Has occurred at least once. ○ **Range**: Has occurred within a range. You specify a range using the **Minimum** and **Maximum** fields.
Minimum	Minimum occurrence of the result of the logical combination of the first and second elements. This field appears only when Occurrence is set to **Range**.
Maximum	Maximum occurrence of the result of the logical combination of the first and second elements. This field appears only when Occurrence is set to **Range**.

4. Save the pattern element group settings.
   - Save a new pattern element group by clicking **Submit**.
   - Save the changes to an existing pattern element group by clicking **Update**.

What to do next

Configure activity patterns for Self-Service Analytics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure activity patterns for Self-Service Analytics

Configure an activity pattern to combine the pattern element, pattern element group, or both for a user entity and link them to an outcome.

Before you begin

Configure pattern element groups for Self-Service Analytics.

Role required: sn_ssa_core.self_service_manager

About this task

By default, the system includes activity patterns for the activities Consumer created a case and Customer created a case. These pattern elements are available with the Self-Service Analytics for Customer Service plugin [com.snc.pa.self_service_analytics_csm].

Procedure

1. Navigate to **All** > **Self-Service Analytics** > **Configuration** > **Activity Pattern**.
2. Either configure an existing activity pattern for your user entity or create a new one.
   - Select an existing activity pattern in the Activity Patterns list.
   - Create a new activity pattern by clicking **New**.
3. On the Activity Pattern form, verify the default field values for an existing activity pattern or fill in the values for a custom configuration.

Activity Pattern form

Field	Description
Name	Name to identify the activity pattern.
Description	Summary of the activity pattern.
Primary Activity	Activity to be tracked in the activity sequence after a pattern matches with an outcome using the pattern recognition. An activity sequence is a stream of activities a user performs.
Outcome	Result of an activity pattern.
Application	Scope of the application that contains the user entity. This field is automatically set based on the application scope selected in the application picker.
Match If	Pattern recognition using the Match If function to associate the pattern with an outcome. For example, you can indicate that if the activity Consumer created a case is not found, you want to match it with the Confirmed Deflection outcome.
Domain	Domain in which the activities records exist.

4. Click **Submit** and then select the newly created activity pattern link from the Activity Patterns list.
5. In the Elements related list, select elements to map with the primary activity and use the **Order** column to decide the order of each element mapping.
   - To use an existing element, select an element, modify the fields and click **Update**.
   - To create another pattern element or pattern element group, click **New** and select the type of element, fill in the fields on the form, and then click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

An element can be a pattern element or pattern element group. For more information, see Configure pattern elements for Self-Service Analytics and Configure pattern element groups for Self-Service Analytics.

In the **Order** column, the following conditions apply:

- If there is only one matching table map, the system uses that map.
- If there are multiple matching table maps with the same order, the system uses the map with the older created date.
- If there are multiple matching table maps with different orders, the system uses the map with the highest order.

6. On the Activity Pattern form, click **Update**.

What to do next

Set up the deflection configuration for Self-Service Analytics.

Set up the deflection configuration for Self-Service Analytics

Associate a period of time with an activity context that defines how long a system will wait for a case to be created to match a deflection pattern.

Before you begin

Configure activity patterns for Self-Service Analytics.

Role required: sn_ssa_core.self_service_manager

Procedure

1. Navigate to **All** > **Self-Service Analytics** > **Configuration** > **Deflection Configuration**.
2. In the Deflection Configurations list, search for and select the deflection configuration for your activity context.
   - For customer contacts, select **Contact Case Deflection Configuration**.
   - For consumers, select **Consumer Case Deflection Configuration**.
   - For user entities other than consumers and customer contacts, click **New** to create another deflection configuration or modify an existing configuration.
3. On the Deflection Configuration form, verify the default field values for an existing configuration or fill in the values for a custom configuration.

Deflection Configuration form

Field	Description
Name	Name for your deflection configuration.
Activity Context	Type of activities for which you want to collect data. For more information, see Configure activity contexts for Self-Service Analytics.
Description	Summary of the configuration.
Application	Scope of the application that contains the user entity. This field is automatically set based on the application scope selected in the application picker.
Window	Activity context window (duration) for tracking activities that match a deflection pattern. Example: To track the create case activity for a consumer within a day, set the window as 1 day.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ If the consumer created a case within that window, the deflection pattern matched is not a deflection. ○ If the consumer did not create a case within that window, the deflection pattern matched is a potential deflection. ○ If the consumer did not create a case and the last activity is submitted positive feedback for any self-service channel content within that window, the deflection pattern matched is a confirmed deflection.

4. In the Deflection Patterns related list, add or modify existing deflection patterns to associate them with the deflection configuration or add a new pattern.
   This related list appears only if a deflection configuration exists.
5. In the Deflection Metrics related list, add or modify an existing deflection metric table that stores the deflection data for an activity pattern associated with a deflection type.
   This related list appears only if a deflection configuration exists. Alternatively, you can also configure a deflection metric table by navigating to **Self-Service Analytics** > **Deflection Metric**.
6. On the Deflection Configuration form, click **Update**.

What to do next
Configure scheduled jobs for Self-Service Analytics.

Configure scheduled jobs for Self-Service Analytics

Schedule when to run the deflection configuration to generate the activities that match an activity pattern within an activity window.

Before you begin
Set up the deflection configuration for Self-Service Analytics.

Role required: admin

About this task
You configure the duration of processing the deflection configuration for a user entity. This configuration is optional for consumers and customer contacts. The scheduled job captures data for Self-Service Analytics and stores the generated data in the Deflection Metric [ssa_deflection_metric] table.

Procedure
1. Navigate to **All** > **System Definition** > **Scheduled Jobs**.
2. Configure the scheduled script processed for a user entity in a scheduled job.
   - For consumers, select **Deflection Analytics for Consumers**.
   - For customer contacts, select **Deflection Analytics for Contacts**.
   - For user entities other than consumers and customer contacts, click **New** and select **Automatically run a script of your choosing** to create another scheduled job or modify an existing schedule job.
3. On the Scheduled Script Execution form, verify the default field values for consumers and customer contacts or fill in the values for a custom configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scheduled Script Execution form

Field	Description
Name	Name to identify the scheduled script execution.
Active	Option to activate the script at the scheduled date and time. By default the job is inactive.
Run	Type of schedule to execute the script on. Choices are: ○ Daily ○ Weekly ○ Monthly ○ Periodically ○ Once
Day	○ If you select **Weekly** as the **Run** value, the day of the week. ○ If you select **Monthly** as the **Run** value, the day of the month.
Repeat Interval	If you select **Periodically** as the **Run** value, the duration between each script execution. **Note:** This setting does not account for Daylight Savings Time changes. For example, if you select a period of one day, this adds 24 hours to the starting time of the job. If the start time was configured during a period with Daylight Savings Time, the job executes with a one hour offset on days when that time zone is not in Daylight Savings Time.
Time	If you select **Daily**, **Weekly**, or **Monthly** as the **Run** value, the time of day, based on a 24-hour clock.
Starting	Date and time of the first scheduled script execution.
Application	Application that contains the script.
Conditional	Option to run a scheduled job if certain conditions are met in the associated script.
Condition	Conditional script that determines whether a scheduled job must run. The last expression of the script should evaluate to a Boolean (true or false) value. This field appears only when the **Condition** check box is selected.
Run this script	Script to run at the scheduled date and time. For a new scheduled script, copy the script from the existing script (Deflection Analytics for Consumers or Deflection Analytics for Contacts) and modify the `deflectionAnalyticsService.captureDeflectionAnalytics('sys_ID')` field value to include the sys_id of your deflection configuration record. For information about identifying the sys_id, see The unique record identifier (sys_id).

4. Click **Update** for consumers and customer contacts or **Submit** to save a custom configuration.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Managing access to knowledge bases and knowledge articles

Determine whether certain users or categories of users can access knowledge bases and knowledge articles by controlling contribute and read access.

As a knowledge administrator, manager of a knowledge base, or owner of a knowledge base, you can assign user criteria to control contribute and read access at the knowledge base level, where:

- Read access determines the ability to view knowledge articles in a knowledge base.
- Contribute access determines the ability to create, modify, and retire knowledge articles in a knowledge base.

As a knowledge administrator, manager of a knowledge base, or owner of a knowledge base, you can assign user criteria, or roles, or both, to control read access at the knowledge article level.

Try to use only user criteria, which were introduced in Knowledge Management v3, to control access to knowledge articles. Roles were used for this purpose in Knowledge Management v2. If no user criteria is selected for a knowledge base, all users can read and all users with roles can contribute to that knowledge base.

Note:
By default, when contribute access isn't provided for a knowledge base, a user must meet both roles and user criteria conditions for read access. However, you can override roles set for a knowledge article and provide access through user criteria only by setting the *`glide.knowman.search.apply_role_based_security`* system property to `false`. Because this property isn't available by default, you must add it. For more information, see Add a system property.

User criteria for knowledge access

As a knowledge administrator, manager of a knowledge base, or owner of a knowledge base, you control access to knowledge bases or knowledge articles for a user through user criteria, which are described in the following table.

User criteria definitions

User criteria	Result
Cannot Contribute	Cannot contribute (that is can't create, modify, or retire) knowledge articles within a knowledge base. The Cannot Contribute user criteria is available only for knowledge bases.
Can Contribute	Can contribute (that is can view, create, modify, or retire) knowledge articles within a knowledge base. The Can Contribute user criteria is available only for knowledge bases.
Cannot Read	At the knowledge base level, cannot view knowledge articles within a knowledge base. At the knowledge article level, cannot view a knowledge article.
Can Read	At the knowledge base level, can view knowledge articles within a knowledge base. At the knowledge article level, can view a knowledge article.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The access to knowledge base and its articles are defined based on the user criteria status for a user as described in the following table.

Combining knowledge base and knowledge article user criteria

Status	Access
The user matches both Can Contribute and Cannot Contribute at the knowledge base level	The user is denied contribute access to the knowledge base and its articles.
The user matches both Can Read and Cannot Read at the knowledge base level	The user is denied read access to the knowledge base and its articles.
The user matches Can Read at the knowledge base level and Cannot Read at the knowledge article level	The user is denied read access to the knowledge article.
The user matches Cannot Read and Can Read at the knowledge article level	The user is denied read access to the knowledge article.

Users with special knowledge privileges

Users with special knowledge privileges aren't evaluated based on user criteria and have knowledge bases and knowledge articles access as described in the following table.

Access of users with special privileges to knowledge bases and knowledge articles

User	Access
Knowledge administrator	• Contribute to and read all knowledge bases and their articles. • Modify the definition of all knowledge bases and assign user criteria to them. **Note:** This access doesn't apply to scoped knowledge bases. For more information, see Scoped knowledge bases.
Owner of a knowledge base	• Contribute to and read that knowledge base. • Modify the definition of that knowledge base and assign user criteria to it.
Manager of a knowledge base	• Contribute to and read that knowledge base. • Modify the definition of that knowledge base and assign user criteria to it. **Note:** If the article versioning feature is enabled, the manager of a knowledge base can't modify knowledge articles of other authors that are in the **Draft** state. For more information, see Article versioning.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Access of users with special privileges to knowledge bases and knowledge articles (continued)

User	Access
Members of an ownership group associated with a knowledge article	Read, modify, approve, and retire that knowledge article (see Ownership groups).

Explicit roles and user criteria

Explicit roles (snc_external and snc_internal) are added to your instance when your administrator installs a plugin, such as the Customer Service plugin (com.sn_customerservice), that also activates the Explicit Roles plugin (com.glide.explicit_roles). If you create a knowledge base with the Explicit Roles plugin (com.glide.explicit_roles) activated, the application automatically adds the following predefined user criteria at the knowledge base level:

- **Users with 'snc_internal' role** – Added to the Can Read user criteria enabling only users with the snc_internal role have read access to the knowledge base.
- **Users with snc_internal' and another role** – Added to the Can Contribute user criteria enabling only users with the snc_internal role and at least one additional role have contribute access to the knowledge base.

When you upgrade to product versions (from Rome onwards) that offer the Explicit Roles plugin (com.glide.explicit_roles), the predefined user criteria **Users with 'snc_internal' role** and **Users with 'snc_internal' and another role** aren't automatically added to any existing knowledge bases created prior to the activation of the Explicit Roles plugin. To add these predefined user criteria to an existing knowledge base, run the *Fix unsecured knowledge bases* fix script. For more information about explicit roles and fix scripts, see Explicit Roles and Fix scripts.

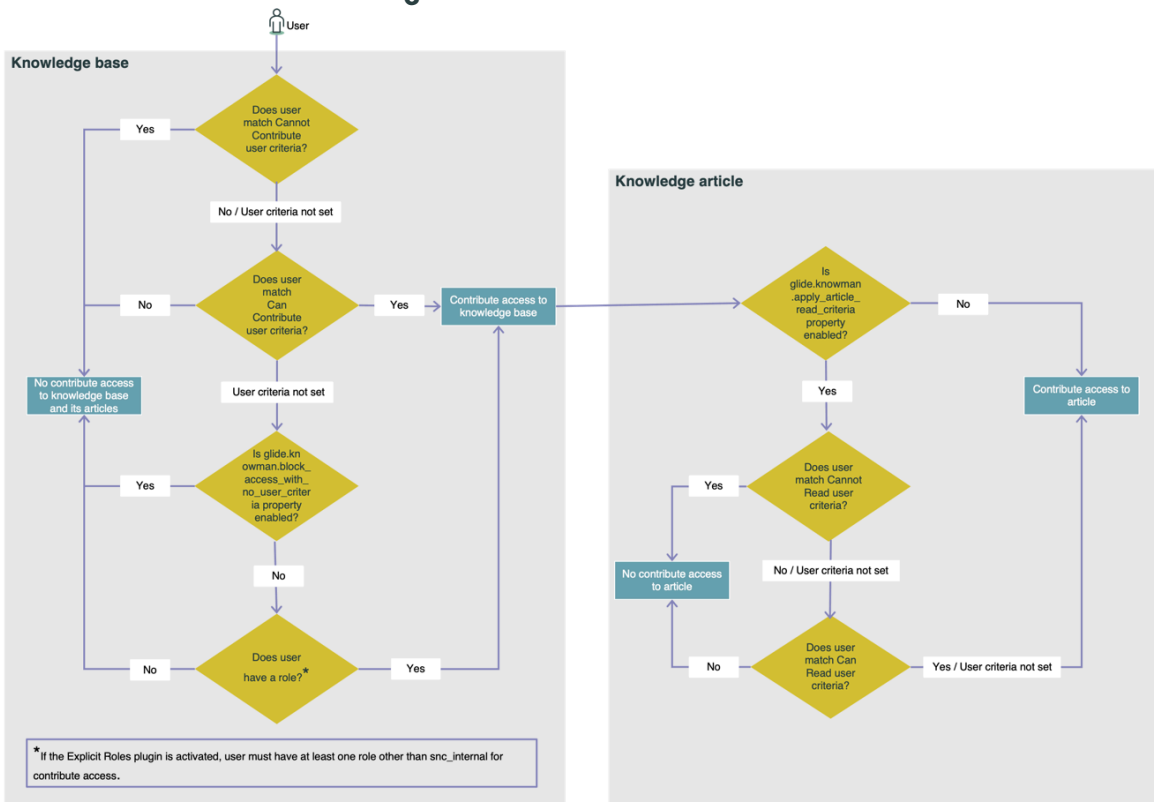
Determining contribute access to a knowledge base and its articles using user criteria

The flowchart in this section illustrates the user criteria checks that determine contribute access at the knowledge base and article levels.

Note:
In order for an unauthenticated user to view knowledge articles within the knowledge base, ensure that the audience for the Knowledge Management Service Portal pages is set to public; that is, the page can be accessed without the need for authentication. For more information, see Create and edit a page using the Service Portal Designer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Contribute access to a knowledge base and its article flowchart



When either Cannot Contribute isn't set or a user doesn't match Cannot Contribute and additionally Can Contribute is not set, the *glide.knowman.block_access_with_no_user_criteria* property value is further evaluated to determine contribute access, as explained in the following table.

Contribute access to a knowledge base when user criteria for a knowledge base aren't set

Property value	Result
true	No user has contribute access to the knowledge base except users with special knowledge privileges.
false	All users, including unauthenticated users, with at least one role can contribute to the knowledge base. If the Explicit Roles plugin (com.glide.explicit_roles) is activated, users who have at least one role other than snc_internal can contribute to the knowledge base. To check knowledge bases accessible to unauthenticated users, use the User Criteria Diagnostics feature. For more information, see Configure access to knowledge bases for unauthenticated users.

When a user has contribute access to a knowledge base, the *glide.knowman.apply_article_read_criteria* property is evaluated to determine contribute access to an article in the knowledge base, as explained in the following table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

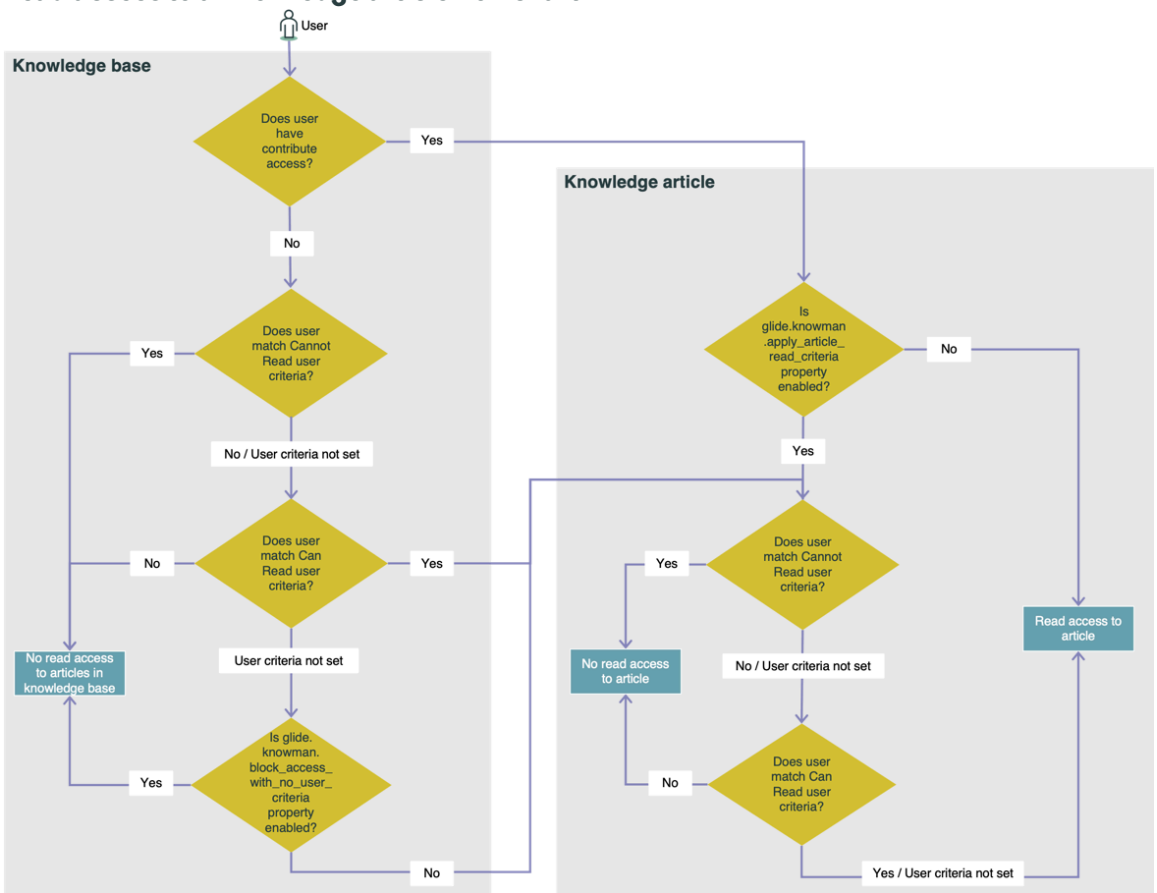
Contribute access to an article when a user has contribute access to a knowledge base

Property value	Result
true	Article-level read access overrides the default contribute permission granted by contribute access at the knowledge base level.
false	Contribute access at the knowledge base level takes precedence over article-level user criteria and the user has contribute access to every article in the knowledge base.

Determining read access to articles in a knowledge base using user criteria

The following flowchart illustrates the user criteria checks that determine read access to a knowledge article.

Read access to a knowledge article flowchart



When either Cannot Read isn't set or a user doesn't match Cannot Read and additionally Can Read is not set, the *glide.knowman.block_access_with_no_user_criteria* property value is further evaluated to determine read access, as explained in the following table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Read access when user criteria for a knowledge base aren't set

Property value	Result
true	No user has read access except users with special knowledge privileges and users who have contribute access to the knowledge base.
false	All users, including unauthenticated users, have read access to the knowledge base and the article-level user criteria are further evaluated. To check knowledge bases accessible to unauthenticated users, use the User Criteria Diagnostics feature. For more information, see Configure access to knowledge bases for unauthenticated users.

When a user has contribute access to a knowledge base, the *glide.knowman.apply_article_read_criteria* property is evaluated to determine read access to an article in the knowledge base, as explained in the following table.

Read access to an article when a user has contribute access to a knowledge base

Property value	Result
true	Article-level read access overrides the default read permission granted by contribute access at the knowledge base level.
false	Contribute access at the knowledge base level takes precedence over article-level user criteria and the user has read access to every article in the knowledge base.

Important:
After you add user criteria, you can use the user criteria diagnostics feature to verify the access that users have to a knowledge base or a knowledge article. For more information, see User criteria diagnostics for Knowledge Management.

- Configuration tasks for knowledge managers
- Knowledge Management FAQ
- Create user criteria for controlling access to knowledge bases and articles

Create user criteria for controlling access to knowledge bases and articles

Control access to knowledge bases and articles by creating user criteria.

Before you begin

Role required: user_criteria_admin

Note:
To create a user criteria record from the Knowledge module, you must have the user_criteria_admin role in addition to the knowledge role. For more information about access, see Managing access to knowledge bases and knowledge articles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Knowledge** > **Administration** > **User Criteria**.
2. Click **New**.
3. On the User Criteria form, fill in the fields.

User Criteria form

Field	Description
Name	Unique name of the user criteria.
Users	Users that must match the user criteria.
Groups	Groups that must match the user criteria.
Roles	Roles to match the user criteria. **Note:** ○ Because the evaluation of a role is cached in the session, any change in the role requires you to log in again. ○ User criteria are not applicable for elevated privilege roles.
Advanced	Option to display or hide the advanced option that includes the **Script** field on the User Criteria form.
Script	Script to define any additional user criteria that returns true or false. This field is available when the **Advanced** option is selected on the User Criteria form. **Note:** ○ A script is evaluated in the scope that the user criteria are created in. ○ The evaluation of a script is cached in the session, so any change in the evaluation requires you to log in again. If a scripted user criterion is defined for a knowledge base, user access to knowledge bases is evaluated once per session. If the script results in changes after a session cache is built, the result takes effect in the next session. ○ Don't use `gs.getUser()` or other session APIs because they cause conflicts when used in diagnostic tools. Use the predefined `user_id` variable available in the script to get the user ID of the user being used to evaluate the script. ○ Scripts are evaluated dynamically. Therefore, including scripts in a user criteria can impact performance.
Active	Option to activate or deactivate the user criteria.
Companies	Companies that the user record must match.
Locations	Locations that the user record must match.
Departments	Departments that the user record must match.
Match All	Option to determine whether all elements from each populated user criteria field must match. If selected, only users who match all user criteria are given access. If cleared, the user must meet one or more of the set user criteria to be given access.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	By default, this check box is cleared so that any condition met provides a match. For example, consider a user criteria record for the following: ○ Locations A or B ○ Company C or D With **Match All** selected, only users that meet all of these conditions are matched. For example, a user with a location A and a company C. If **Match All** isn't selected, users meeting any of these conditions are matched. For example, a user with a location B. **Note:** If you select **Match All**, ensure that you don't create contradictory conditions that can never be met. For example, if all users in location A work for company G, the conditions in this example can never be met.

4. Click **Submit**.

Related topics

Control access at the knowledge base level through user criteria

Control access at the knowledge article level through user criteria

Control access at the knowledge base level through user criteria

You specify user criteria for a knowledge base to control which users are granted access to read and contribute knowledge articles to that knowledge base.

Before you begin

Role required: knowledge_manager, knowledge_admin, or admin

Note:
To administer a scoped knowledge base, you must have the application-specific admin role in addition to the knowledge_admin or admin role. For more information, see Scoped knowledge bases.

About this task

You can assign user criteria to control read or contribute access. For example, you could enable all users in your Support department to have contribute access to a knowledge base by creating a user criteria record with the required department set to Support, and then including the user criteria record in the Can Contribute user criteria. For more information, see Managing access to knowledge bases and knowledge articles. Try to use only user criteria, which were introduced in Knowledge Management v3, to control access to knowledge bases. Roles were used for this purpose in Knowledge Management v2.

Note:

Starting with the Washington DC release, the Knowledge Management v3 homepage (com.snc.knowledge3) is being prepared for deprecation in the future Y release. It is replaced by the Knowledge Management Service Portal (com.snc.knowledge_serviceportal), which is active by default for customers on Madrid and later releases. For more information about the new experience, see Knowledge Management Service Portal homepage features.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Knowledge** > **Administration** > **Knowledge Bases**.
2. Click the link to knowledge base you manage.
3. Add user criteria to the knowledge base.

   a. Depending on the user criteria you want to set, select one or more of the relevant related lists.

Related list	Description
Can Read	Users can read knowledge articles in the knowledge base.
Cannot Read	Users can't read knowledge articles in the knowledge base.
Can Contribute	Users can create, modify, and retire knowledge articles in a knowledge base. Contribute access to a knowledge base also provides read access to all articles in the knowledge base.
Cannot Contribute	Users can't create, modify, retire, or read knowledge articles in the knowledge base.

   Note:
   If the related lists aren't visible, configure the Knowledge form to display them. For more information, see Add a related list to a form.

   b. In the selected related list, add the required user criteria.

   - As a user with the admin role, to add a new user criteria record, click **New**, specify the required fields, and then click **Submit**.
   - As a user with the knowledge_manager, knowledge_admin, or admin role, to add an existing user criteria record, click **Edit**, move the required user criteria from the **Collection** column to the **Knowledge** column, and then click **Save**.

4. On the Knowledge Base form, click **Update**.

What to do next

After you add user criteria, you can use the user criteria diagnostics feature to verify the access that users have to a knowledge base or a knowledge article. For more information, see User criteria diagnostics for Knowledge Management.

Important:
After making user criteria additions or changes, you may need to log out and log back in to clear the prior configuration.

Control access at the knowledge article level through user criteria

You specify user criteria for a knowledge article to control which users are granted read access to the knowledge article.

Before you begin

Role required: knowledge_manager, knowledge_admin

Note:
You may need to configure the form to add **Can Read** and **Cannot Read** fields.

About this task

Try to use only user criteria, which were introduced in Knowledge Management v3, to control access to knowledge articles. Roles were used for this purpose in Knowledge Management v2. For more information, see Managing access to knowledge bases and knowledge articles.

Note:

Starting with the Washington DC release, the Knowledge Management v3 homepage (com.snc.knowledge3) is being prepared for deprecation in the future Y release. It is replaced by the Knowledge Management Service Portal (com.snc.knowledge_serviceportal), which is active by default for customers on Madrid and later releases. For more information about the new experience, see Knowledge Management Service Portal homepage features.

As a knowledge base owner or a manager if the *glide.knowman.apply_article_read_criteria* property is enabled and you don't satisfy the article level user criteria, then the article will not be visible in portal search. To be able to view the article in the portal search, you must configure article level user criteria accordingly.

If you are a part of the ownership group associated with the article then you can see the article in portal search, irrespective of the article level user criteria.

Procedure

1. Open a knowledge article.

   Note:
   You can update only the latest version of the knowledge article.

2. Assign access based on user criteria.

   Note:
   If the **Can Read** and **Cannot Read** fields aren't visible, configure the Knowledge form to display them. For more information, see Configuring the form layout.

3. On the Knowledge form, click **Update**, and then click **Publish** to apply the changes.

What to do next

After you add user criteria, you can use the user criteria diagnostics feature to verify the access users have to a knowledge base or a knowledge article. For more information, see User criteria diagnostics for Knowledge Management.

Important:
After making user criteria additions or changes, you may need to log out and log back in to clear the prior configuration.

Configure Knowledge Management - Add-in for Microsoft Word

Configure the Knowledge Management - Add-in for Microsoft Word to author and access knowledge articles in Microsoft Word.

Before you begin

Complete the following tasks to use the Knowledge Management - Add-in for Microsoft Word.

Procedure

1. Activate Knowledge Management - Add-in for Microsoft Word.
2. Deploy Knowledge Management - Add-in for Microsoft Word.
3. Configure the security for Knowledge Management add-in for Microsoft Word.
4. **Optional:** Enable downloading of the source Microsoft Word document for a knowledge article.

Related topics

- Authoring a knowledge article in Microsoft Word

Activate Knowledge Management - Add-in for Microsoft Word

Activate the Knowledge Management - Add-in for Microsoft Word plugin (com.snc.knowledge.ms_word) if you have the admin role. This plugin activates related plugins if they are not already installed.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Deploy Knowledge Management - Add-in for Microsoft Word

Deploy the Knowledge Management - Add-in for Microsoft Word for authoring knowledge articles from within the Microsoft Word.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

In addition to having one of the following roles on the ServiceNow instance, you must be an Office365 administrator to deploy the Knowledge Management - Add-in for Microsoft Word.

Role required: admin, sn_outlook_addin.outlook_addin_setup

Procedure

1. Navigate to **All** > **ServiceNow Add-Ins for Office** > **Office Add-In-Manifests**.
2. In the Add-In Name column, click **Knowledge Management**.
3. Click **Download Manifest** to download the add-in manifest file to your desktop.

> **Note:**
> For releases prior to the Paris Patch 3 release, the downloaded manifest reports validation errors in Office 365. For more information about resolving such errors, see the Enabling Knowledge MS-Word add-in fails validation [KB0858357] article in the HI knowledge base.

4. Deploy the Knowledge Management- Add-in for Microsoft Word.
   For more information, see Deploy add-ins in the admin center.

Import a Word document to a knowledge base

Import a Word document to a knowledge base using Knowledge Management v3

Configure the security for Knowledge Management add-in for Microsoft Word

Use the *sn_km_word.glide.knowman.word.xframe* property to specify all the parent domains in the Microsoft Word Online application in which Knowledge Management - Add-in for Microsoft Word is embedded.

Before you begin

Ensure that you have activated the Knowledge Management - Add-in for Microsoft Word plugin and the application scope is set to Knowledge Management - Add-in for Microsoft Word.
Role required: admin

About this task

The domains you specify for the Microsoft Word application in the *sn_km_word.glide.knowman.word.xframe* property are used for setting the x-frame-options and content-security-policy headers. These settings securely display the Knowledge Management add-in for Microsoft Word in the online version of Microsoft Word documents.

> **Note:**
> If you don't set the *sn_km_word.glide.knowman.word.xframe* correctly, the Knowledge Management - Add-in for Microsoft Word fails to load in the Word document. For more information about resolving such errors, see the Knowledge Word Office Manifest fails validation [KB0860916] article in the HI knowledge base.

Procedure

1. In the navigation filter, enter `sys_properties.list`.
2. Search for the *sn_km_word.glide.knowman.word.xframe* property.
3. In the **Value** field, enter a domain.
   For multiple entries, separate the domains with commas.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, to enter the Microsoft SharePoint and Microsoft OneDrive domains: `https://sitename.sharepoint.com,https://sitename-my.sharepoint.com,https://word-edit.officeapps.live.com`

4. Click **Update**.

Enable downloading of the source Microsoft Word document for a knowledge article

Set the *sn_km_word.glide.knowman.enable_document_download* property to enable users to download the source Microsoft Word document of a knowledge article from the knowledge article view page in a portal or workspace.

Before you begin
Role required: admin

About this task
When a knowledge article is created using Microsoft Word, users accessing the knowledge article view page in a portal or workspace can download the source Microsoft Word document when the *sn_km_word.glide.knowman.enable_document_download* property is set to true.

Note:
After you enable the *sn_km_word.glide.knowman.enable_document_download* property, the Microsoft Word source document of a knowledge article also might appear in search results as an attachment to the article. Therefore, enabling this property might affect the search relevancy of a knowledge article.

Procedure
1. In the navigation filter, enter `sys_properties.list`.
2. Search for the *sn_km_word.glide.knowman.enable_document_download* property.
3. In the **Value** field, enter `true`.
4. Click **Update**.

User criteria diagnostics for Knowledge Management

Manage user access to a knowledge base or an article using user criteria diagnostics. Understand what access users have to a knowledge base or an article and determine which user criteria define those permissions.

User access to a knowledge base or an article can be restricted based on:

- Domain separation
- Access control list (ACL) rules
- Knowledge workflows
- User criteria set for a knowledge base or an article

This feature considers domain separation and user criteria to determine the user access to knowledge bases and articles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activation information

The user criteria diagnostics feature is activated with the Knowledge Management v3 plugin (com.snc.knowledge3). For more information, see Activate a plugin.

Note:

Starting with the Washington DC release, the Knowledge Management v3 homepage (com.snc.knowledge3) is being prepared for deprecation in the future Y release. It is replaced by the Knowledge Management Service Portal (com.snc.knowledge_serviceportal), which is active by default for customers on Madrid and later releases. For more information about the new experience, see Knowledge Management Service Portal homepage features.

Diagnose user access to a knowledge base

Identify which users have access to a knowledge base and what enables that access.

Before you begin

Role required: knowledge_manager, knowledge_admin, or admin

Procedure

1. Access the **User Criteria Diagnostics** landing page using one of these options:

To access	Navigate to
Using the application navigator	**Knowledge** > **Administration** > **User Criteria Diagnostics**
From a knowledge base	**a.** **Knowledge** > **Administration** > **Knowledge Bases**. **b.** Select the knowledge base to diagnose user access. **c.** In the **Related Links** section, click **Run User Criteria Diagnostics**. The **User Criteria Diagnostics** landing page appears with the **Select knowledge base** field pre-populated.

2. To diagnose user access:

   a. In the **Select user** field, select a user.

   b. From the **Select record type** choice list, select **Knowledge base**.

   c. In the **Select knowledge base** field, select a knowledge base.
   Every time you select a different user, record type, or knowledge base, the page refreshes and displays data for the selected user.

   d. Click **Diagnose**.
   The page displays these details:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

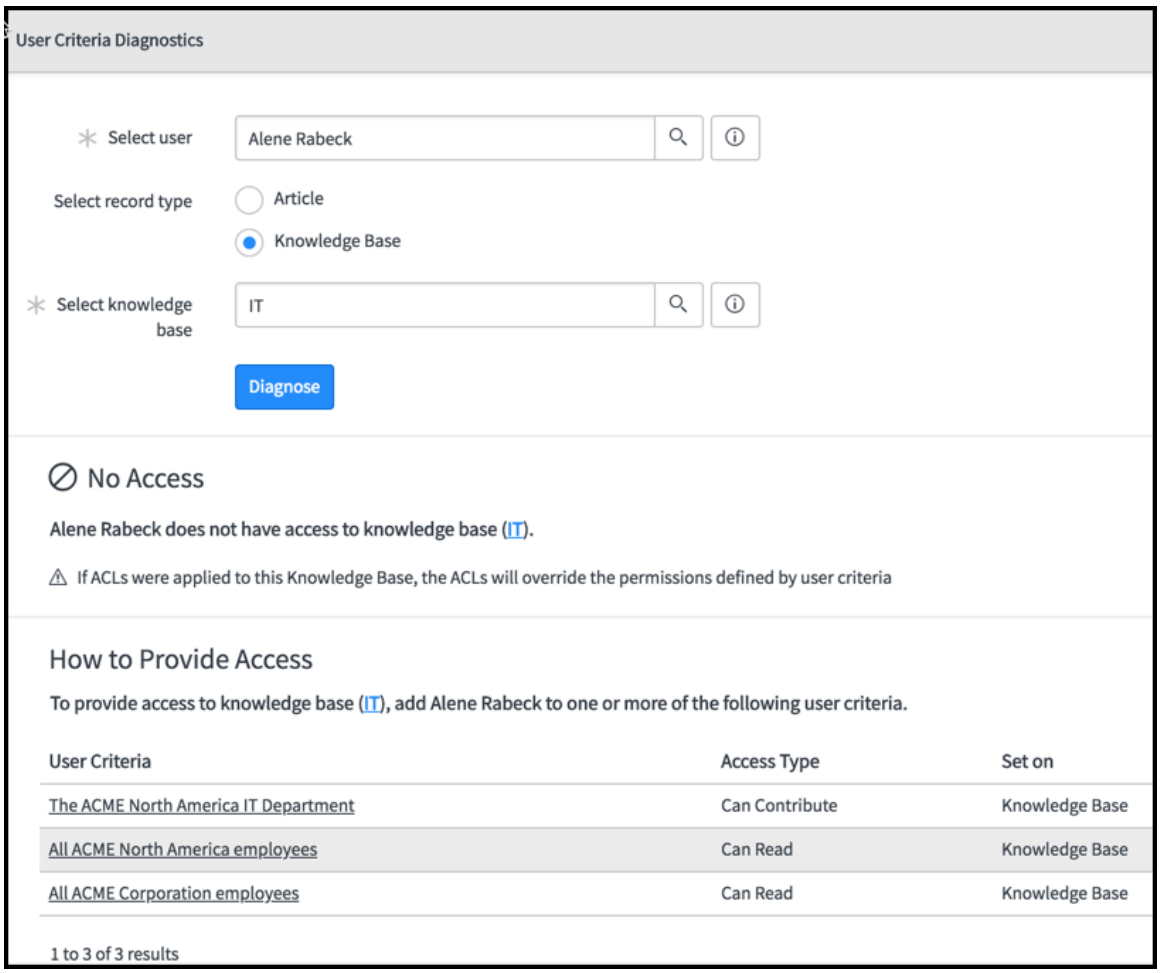
- Whether the user has access to the knowledge base based on their domain. Only system administrators can view domain information and change the domain to give access to a user.
- Which user criteria provides read or read and contribute access for this user to the knowledge base and what type of user criteria definition enables this access.
- Whether a role that the user has (knowledge_manager, knowledge_admin, or owner of the knowledge base) enables this access.
- For a user with no access to this knowledge base, which user criteria may be modified to grant the access.

Example:
The following image shows an example of a diagnosis where the user Alene Reback does not have access to the IT knowledge base.

Alena can get access to the knowledge base if:

- Alena is added to one of the existing user criteria defined in the knowledge base.
- Alena is added to a new user criteria that is defined and added to the knowledge base.

Click the IT knowledge base link and provide the access by adding Alena to a user criteria for this knowledge base.



Diagnose user access to an article

Identify which users have access to an article and what enables that access.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: knowledge_manager, knowledge_admin, or admin

Procedure

1. Access the **User Criteria Diagnostics** landing page using one of these options:

To access	Navigate to
Using the application navigator	**Knowledge** > **Administration** > **User Criteria Diagnostics**.
From an article	**a.** **Knowledge** > **Administration** > **Knowledge Bases**. **b.** Select the knowledge base that has the article to diagnose for user access. **c.** In the **Knowledge** related list, select the article. **d.** In the **Related Links** section, click **Run User Criteria Diagnostics**. The **User Criteria Diagnostics** landing page appears with the **Select article** field pre-populated.

2. To diagnose user access:

   a. In the **Select user** field, select a user.

   b. From the **Select record type** choice list, select **Article**.

   c. In the **Select article** field, select an article.
   Every time you select a different user, record type, or knowledge base, the page refreshes and displays data for the selected user.

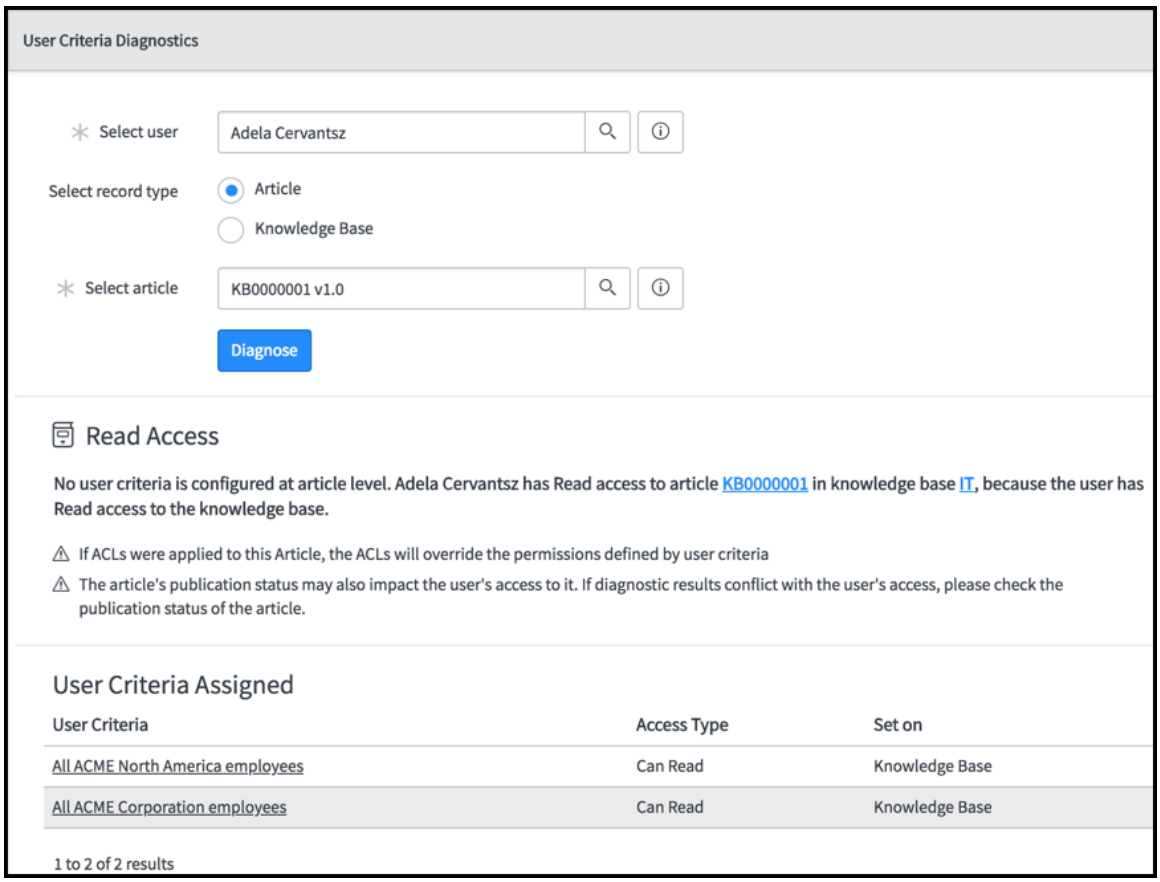
   d. Click **Diagnose**.
   The page displays these details:

   - Whether or not the user has access to the knowledge article based on their domain. Only system administrators can view domain information and change the domain to give access to a user.
   - Which user criteria provides read or read and contribute access for this user to the article and what type of user criteria definition enables this access.
   - Whether a role of the user has (knowledge_manager, knowledge_admin, or owner of the knowledge base) enables this access.
   - For a user with no access to this article, which user criteria may be modified to grant the access.

   Note:
   Members of an ownership group are automatically given **Can Contribute** access to knowledge articles that their ownership group is associated with.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example:
The following image shows an example of a diagnosis where the user Adela Cervantsz has read access to the KB article, KB0000001 v5.0, in the IT knowledge base because Adela belongs to one of the **Can Read** user criteria defined in the knowledge base.



Configure access to knowledge bases for unauthenticated users

Identify knowledge bases accessible to unauthenticated users based on the user criteria and the system property settings.

Before you begin

You must activate the Knowledge Management v3 plugin (com.snc.knowledge3).

Role required: knowledge_manager, knowledge_admin, or admin

Note:

Starting with the Washington DC release, the Knowledge Management v3 homepage (com.snc.knowledge3) is being prepared for deprecation in the future Y release. It is replaced by the Knowledge Management Service Portal (com.snc.knowledge_serviceportal), which is active by default for customers on Madrid and later releases. For more information about the new experience, see Knowledge Management Service Portal homepage features.

Procedure

1. Navigate to **All** > **Knowledge** > **Administration** > **User Criteria Diagnostics**.
2. Click the **View knowledge bases accessible to unauthenticated users** related link.
3. Review knowledge bases accessible to unauthenticated users.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. **Optional:** Restrict unauthenticated users to access a knowledge base by selecting the knowledge base and configuring its access settings.
   - Use user criteria to determine access to the knowledge base for unauthenticated users.

     (Optional) For more information, see Managing access to knowledge bases and knowledge articles.

   - If no user criteria is specified for the knowledge base, as an administrator, you can set the value of the *glide.knowman.block_access_with_no_user_criteria* system property to **true**.

     For more information, see Knowledge Management properties.

Collect knowledge usage metrics

Capture metrics such as article views, page views, and portal searches to track aggregated knowledge usage by users.

Before you begin

Set the duration over which the metrics are aggregated through the *glide.knowman.usage_metrics_duration* property. For more information, see Other knowledge properties. By default, the property value is set to 60 minutes.

You must activate the Knowledge Management v3 plugin (com.snc.knowledge3).

Role required: admin

About this task

Monitor the knowledge usage metrics to improve the overall effectiveness of the knowledge usage across the portals.

Procedure

1. Navigate to **All** > **System Definition** > **Scheduled Jobs**.
2. Search and open the **Knowledge Usage Metrics** scheduled job.
3. In the **Knowledge Usage Metrics** form, select the **Active** check box to activate the scheduled job.
   The scheduled job is inactive by default.
4. In the **Run** field, select **Periodically** as the frequency of the scheduled job.
   See the Scheduled jobs topic for other frequency options.
5. In the **Repeat Interval** field, enter the repeated time interval at which the scheduled job should run.
   By default, the duration is set to 60 minutes.
6. Click **Update**.

What to do next

Modify the data retention policy for knowledge usage metrics to remove unwanted and older data from the knowledge usage metrics [kb_usage_metrics] table.

Modify the data retention policy for knowledge usage metrics

Remove unwanted and older data from the knowledge usage metrics [kb_usage_metrics] table through the data retention policy.

Before you begin

Role required: maint and admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
Activating the data retention policy for the kb_usage_metrics table deletes records that you no longer need.

Procedure
1. Navigate to **All** > **System Maintenance** > **Table Cleanup**.
2. In the **Tablename** column, search for `kb_usage_metrics` and click the **kb_usage_metrics** link.
3. On the Auto Flush form, activate the kb_usage_metrics table cleanup job by selecting the **Active** check box.
4. **Optional:** Adjust the duration the system waits before deleting the records by modifying the value in the **Age in seconds** field.
   By default, the **Age in seconds** field value is set to 2,592,000 seconds (equivalent to 30 days).
   For more information, see Autoflush form.
5. Click **Update**.

Configure knowledge article templates

Configure knowledge article templates to customize and display content as per your requirements.

Create an article template and use it to create a knowledge article

Create new article templates in addition to the pre-defined templates. Add new fields based on how you want to customize and display your content.

Before you begin
You must activate following plugins:

- Knowledge Management Advanced (com.snc.knowledge_advanced)
- Knowledge Management Advanced Installer (com.snc.knowledge_advanced.installer)

Role required: admin, knowledge_admin or admin, personalize_form

About this task
For each new article template, a child table of the Knowledge [kb_knowledge] table is created. When you add a new field to the template, a new column is added to that table created for the template.

Procedure
1. Navigate to **All** > **Knowledge** > **Administration** > **Article Templates**, and click **New**.
2. On the Article Template form, fill in fields.

Article Template form

Field	Description
Name	Name for the article template. The name can contain only lowercase, alphanumeric ASCII characters and underscores (_).
Description	Description for the article template.

Note:
The **Active** check box is selected by default making the template available for use.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Right-click the form header and click **Save**.
4. In the Article Templates Field related list, add fields to the template.
   a. Click **New**.
   b. On the Article Template Field form, fill in the fields.

Article Template Field form

Name	Description
Field Name	Title to display on the template form.
Field Type	Available field types: ▪ HTML ▪ String ▪ Integer ▪ Date ▪ Date and time
Order	Position of the field in the article page view and the article edit view.
Article Template	(Read-only) Name of the article template associated with this field.
Template Table	(Read-only) Name of the table for this template.
Template Field	(Read-only) Name of the template column associated with this field.
Mandatory	Option to make this field as mandatory. When selected, this field is required to be filled.
Expand/Collapse	Defines whether the template field displays as collapsed or expanded by default.
Active	Option to display the field on the template.
Heading style	CSS formats applied to the template header. For example, to display the background of the template header in red, with a 24-px font size, Arial font family, and white text color, enter the following code: `background-color:red; font-size:24px; font-family:Arial; color:white;`
Field style	CSS formats applied to the template fields. Any CSS format applied at the field level is automatically applied to the header if not already specified in the **Heading style** field. For example, to display the 300px page width, 25px solid green border, 25px padding, and 25px page margin, enter the following code: `width:300px;`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	`border:25px solid green; padding:25px; margin:25px;`
Preview text	Preview text displayed on the article template selector. Empty value will display random text.

c. Click **Submit**.

The field is added to the template.

5. **Optional:** In the **SEO Description Tag** field, search for and add article template field name. The content in this field is used as meta description tags to search for articles created using this article template.
6. Configure the Knowledge form to display the fields that you added to the template.
   a. Navigate to **Knowledge** > **Articles** > **Create New**.
   b. Select a knowledge base, and then the newly added article template.
   c. Right-click the header and select **Configure** > **Form Layout**.
   d. Select and move the fields you added to the article template from the **Available** column to the **Selected** column.
   e. Click the up or down icon to arrange the fields in the order in which you want them to appear in the Knowledge form.
   f. Click **Save**.

Note:
Authors who started a session before a template was created or activated will see the newly added template upon their next login.

What to do next

If you want to search for duplicate articles when creating an article from a new template, you must configure the article template table for contextual search. On the Table Configuration form, the **Search context** field must be set to **Knowledge ML Search**. For more information, see Configure table for a contextual search.

Configure the preview text setting for a standard article template

Configure the preview text setting to customize the default preview text for a standard article template.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Script Includes**.
2. On the Script Includes page, in the **Name** field, enter `ArticleTemplateUtilSNC`.
3. Open the ArticleTemplateUtilSNC record.
4. On the ArticleTemplateUtilSNC page, copy the following code from the **Script** field.

```
setPreviewTextForStandardArticle: function(){
            return null;
    },
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. On the Script Includes page, in the **Name** field, enter `ArticleTemplateUtil`.
6. Open the ArticleTemplateUtil record.
7. On the ArticleTemplateUtil page, modify the code in the **Script** field by pasting the copied code as shown.

```
var ArticleTemplateUtil = Class.create();
                ArticleTemplateUtil.prototype =
 Object.extendsObject(ArticleTemplateUtilSNC,{
                type: 'ArticleTemplateUtil',
     setPreviewTextForStandardArticle: function(){
                        return null;
                },
                });
```

8. In the **Script** field, remove `null` and enter a preview text.
9. Select **Update**.

Result
The modified preview text displayed on the standard article template selector.

Example:
The following code is modified to show custom preview text. You can also include HTML tags to modify the appearance of preview text.

```
var ArticleTemplateUtil = Class.create();
                ArticleTemplateUtil.prototype =
 Object.extendsObject(ArticleTemplateUtilSNC,{
                type: 'ArticleTemplateUtil',
     setPreviewTextForStandardArticle: function(){
                        return 'Demo for standard article';
                },
                });
```

Restrict access to fields in an article template

Use encryption modules to set field-level security in article templates and display the fields based on role permissions.

Before you begin
Role required: security_admin

Note:
Use Knowledge blocks to restrict the content within the same field. For more information, see Knowledge blocks.

Procedure
1. Create an encryption module for the article template field to be encrypted.
   See Create a cryptographic module for details.
2. Associate the article template field with the encryption module.
   See Encrypting fields and attachments for details.

   a. Navigate to **System Security** > **Field Encryption** > **Encryption Field Configurations** and click **New**.

   b. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Encrypted Field Configuration form

Field	Description
Table	Table associated with the article template fields. For example, for the How to article template fields, select **How To [kb_template_how_to]**.
Column	Article template field to be encrypted. Only String, Date, Date/Time, and URL fields are supported. ▪ **String and URL fields**: You can add a new encryption configuration to either a parent table or a child table. ▪ **Date and Date/Time fields**: You can create encrypted field configurations to encrypt existing Date and Date/Time fields. You can add a new encryption configuration to a parent table only. You cannot add a new encryption configuration to a child table. **Note:** Depending on the number of records affected by the Date and Date/Time fields you are encrypting, it may take up to a few minutes to create the encryption configuration. Make sure that you create the encryption configuration for Date and Date/Time fields when transaction volume on the instance is low.
Encryption module	Encryption module you created for the article template field.
Method	▪ **Single Encryption Module**: Enables data to be encrypted with a single encryption module only. The field is encrypted with the encryption module defined in the **Encryption module** field. Users that do not have the encryption module cannot view or update field values. ▪ **Multiple Encryption Module**: Enables data to be encrypted with more than one encryption module. The field is encrypted by the encryption context of the first user to enter data. If the user has multiple encryption modules, the context defined in the encryption module selector is used. Because the encryption module is set on a per record basis, fields in a list can have different encryption modules. However, within a single record, the field can be encrypted by only one module. **Note:** Mass encryption is not available when using the **Multiple Encryption module** method. After a configuration is created using the single encryption module method, you can update the record to use multiple encryption modules. However, you cannot change a field using multiple encryption modules to use a single encryption module.

c. Click **Submit**.

3. Define role permissions for the encrypted field.

a. Navigate to **User Administration** > **Roles**.

b. In the **Name** column, click the link to the role you want to allow to view this field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. In the **Encrypted context** field, search for and select the name of the encryption context for the article template field to apply for the selected role.

Note:
You may need to configure the Role form to add the **Encrypted context** field.

d. Click **Update**.

Result
Depending on their role permissions defined for the encrypted field, users can view the field on the article template.

Field Encryption

Generate SEO information for articles using article templates

Improve the searchability of knowledge articles by using the content in an article template field to generate SEO tags for articles created using that template. Search Engine Optimization (SEO) optimise searches in public search engine.

Before you begin
Role required: knowledge_admin or admin

About this task

Note:
If you are using the **Standard** article template, the content of the Text field is used to generate the tags.

You can define the number of characters to be used as tags in the *glide.knowman.seo.pages.meta_description.length* system property.

Procedure

1. Navigate to **All** > **Knowledge** > **Administration** > **Article Templates**.
2. Select an article template.
3. In the **SEO Description Tag** field, search and select an article template field.
   The content in this field is used as meta description tags to search for articles created using this article template.
4. Click **Update**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
You can change which article template field is used for generating SEO. Changes are applied only to knowledge articles created or updated after the change was made. To apply the update to all existing published articles created using this template, run the *Populate Meta Description on KB Articles* fix script.

Article template page

Integration with external knowledge sources

Use the external content integration feature to integrate content from various external sources and enable unified knowledge search results.

Users store and manage knowledge using various external sources and search each source separately for relevant results. External content integration enables acquiring and searching all WebDAV-compliant source content from a single location. This provides users with a seamless search experience across multiple knowledge sources and drives more usage to the platform.

Using this feature, knowledge administrators can define the external content to be imported into a knowledge base and periodically run a job to import the content. Knowledge users have a seamless user experience searching for relevant content across multiple knowledge sources.

Activate the External Content Integration plugin

The External Content Integration feature is activated with the Knowledge Management - External Content Integration plugin (com.snc.knowledge.external_integration).

Before you begin
Role required: admin
The Knowledge Management - External Content Integration plugin is not active by default.

The following plugins are automatically activated when the Knowledge Management - External Content Integration plugin is activated:

- Centralized Connection and Credentials plugin (com.snc.core.automation.connection_credential)
- Knowledge Management V3 plugin (com.snc.knowledge3)
- Knowledge Management Advanced Installer plugin (com.snc.knowledge_advanced.installer)

The **Knowledge** > **Administration** module displays the **External Knowledge Sources** and **External Knowledge Jobs** sub-modules when the Knowledge Management - External Content Integration plugin is activated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

Starting with the Washington DC release, the Knowledge Management v3 homepage (com.snc.knowledge3) is being prepared for deprecation in the future Y release. It is replaced by the Knowledge Management Service Portal (com.snc.knowledge_serviceportal), which is active by default for customers on Madrid and later releases. For more information about the new experience, see Knowledge Management Service Portal homepage features.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Define an external knowledge source

Before you import content, create and configure the connection between the a Web Distributed Authoring and Versioning (WebDAV) - compliant external knowledge source and the ServiceNow knowledge base into which you want to import content. Define import parameters for the external knowledge source.

Before you begin

Define Basic authentication credentials and Getting started with connections to the external source.

Caution:
This feature expects that the external source endpoint is a publicly accessible endpoint. Mid-server configuration is not supported.

Role required: admin

About this task

Only basic authentication is supported for the external content integration feature.

Procedure

1. Define the connection from the external source and the target knowledge base.

   a. Navigate to **Knowledge** > **Administration** > **External Knowledge Sources**.

   b. Click **New**.

   c. Fill in the following fields:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Instruction
Name	Enter unique name for the external source.
Target Knowledge Base	Select the knowledge base in which you want to create articles for the external content.
Connection Alias	Select the connection alias to connect to the external source.

d. Right-click the form header and click **Save**.

2. Set import parameters for the external content.

a. In the **Parameter** related list, click **New**.

b. In the **Name** field, select the name of the parameter from the drop-down list.

c. In the **Value** field, enter the desired value for the parameter.
The table below lists the parameters and the corresponding values that can be set for the external source.

Parameter Name	Instructions
Maximum size limit (in MB) for this source	Set maximum allowed content size for this source. Once this limit is reached, no further content is processed. Default value is 400 MB.
Maximum size limit (in KB) per file/content in this source	Set maximum allowed size limit for each file from this external source. If a file exceeds this limit, that file is not processed. Default value is 4000 KB.
Open search results in the original source system	Set value to **true** to open search results in the external source system. Set value to **false** to open search results in the target knowledge base. Default value is set to **false**.
Include folders with names that match these regex patterns	Enter a comma-separated list of regular expressions for folder names that need to be included from this external source.
Exclude folders with names that match these regex patterns	Enter a comma-separated list of regular expressions for folder names that need to be excluded from this external source.
Create articles when file names match these regex patterns	Enter a comma-separated list of regular expressions for file names that need to be included to create articles.
Do not create articles when file names match these regex patterns	Enter a comma-separated list of regular expressions for file names that need to be excluded to create articles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter Name	Instructions
Maximum retry limit	Maximum number of retries to send request to the external source.

d. Click **Submit**.

Import content from an external knowledge source

Run an import job manually or set up a schedule to process the integrated external content.

Before you begin

Role required: admin or knowledge_admin

About this task

Each external source is associated with two handlers: the **Acquire handler** and the **Process handler**, for running the import job. The acquire handler uses a WebDAV client to acquire external content to create articles. You can customize the process handler to assign categories to articles or populate additional metadata for the knowledge articles.

Procedure

1. Navigate to **All** > **Knowledge** > **Administration** > **External Knowledge Sources**.
2. Select the external knowledge source from which you would like to import content.
3. In the **Handler**tab, set a schedule to run the acquire and process handlers.
4. In the Related Links section, click **Run Scheduled Job**.
5. To view all jobs scheduled to run to import content for the external source, click the **Jobs**. You can open the most recent job to monitor the status.

Result

For each file in the external content source, a blank knowledge article is created and the external file is added as an attachment to the article. The short description of the article is derived from the file name of the external content source.

Note:
If the externally imported content is infected, a notification about each infected file is sent to the users with the knowledge_admin role and Knowledge Base owners. The notified users can then take required actions on the infected files.

Open knowledge search results in source system

While search results are aggregated within your instance, your users can also utilize features available in the source system (being able to edit in Microsoft SharePoint, for example). To open knowledge search results in a host system, configure the URL to the external source system to open articles from search results directly in the source system.

Before you begin

Make sure the **Open search results in the original source system** import parameter for the external knowledge source is set to **true**.

You can follow this procedure when you have a file as a knowledge article in Microsoft SharePoint, for example.

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Definition** > **Script Includes**.
2. Open *KBWebDAVContentHandler*.
3. In the **Script** window, override the function *getFileURL* using script shown below.
   The *getFileURL* function is shown below.

```
//fileObj.getName() - Returns name of the file
     //fileObj.getPath() - Returns path to the file from root
folder
     //fileObj.getAbsolutePath() - Returns Absolute WebDAV URL
of the file
     //fileObj.getCreationDate() - Returns creation date of
the file as GlideDateTime object
     //fileObj.getModifiedDate() - Returns last modified date
of the file as GlideDateTime object
     //fileObj.getContentType() - Returns content type of the
file as GlideDateTime object
     //fileObj.getSize() - Returns size of the file
```

```
getFileURL: function(fileObj) {
     //write your logic here
},
```

4. Click **Update**.

Sample configuration for integrating external knowledge content

You can integrate content from multiple external sources so your users can acquire and search knowledge from a single location. Use this sample configuration to create a connection to your external account, configure external knowledge sources, and import content to enable search results for unified content.

Requirements for integrating external content

Make sure the Knowledge Management -- External Content Integration plugin (com.snc.knowledge.external_integration) is enabled and your external source is WebDAV-compliant.

Integrate external knowledge sources into the Knowledge Management application

Create authentication credentials and a connection alias to connect your external knowledge source to the ServiceNow Knowledge Management application. Define import parameters for your external source to import integrated content.

Before you begin

Role required: admin

Procedure

1. Enable basic authentication on your external account.

   Note:
   Your external account password is not affected when you enable basic authentication.

2. Create the connection to your external account using the basic authentication credentials.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **Connections and Credentials** > **Credentials**.

b. Click **New**.

c. Click **Basic Auth Credentials**.
Fill in the following fields:

Field	Description
Name	Name for the credential. For example, `Demo_Auth`.
User name	The external account user name created for basic authentication.
Password	The external account password for the user name.

d. Click **Submit**.

3. Create an HTTP connection to your external account.

a. Navigate to **Connections & Credentials** > **Connection & Credential Aliases**.

b. Select **New**.

c. In the **Name** field, enter the name of the connection alias.

Example
For example, `Demo_Account`.

d. Right-click the form header and click **Save**.

e. In the **Connections** related list, click **New**.
Fill in the following fields:

Field	Description
Name	Name for the HTTP connection. For example, `Demo_Connection`.
Credential	Credential created to connect to the external account. For example, `Demo_Auth`.
Connection URL	WebDAV URL to your external account. This is the WebDAV end point of your external account. **Note:** You can also import contents from a specific folder by appending the folder path to the URL. For example, https://<web link to your extermal_account>/KnowledgeIT.

f. Click **Submit**.

4. Configure the external knowledge source for importing content.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **Knowledge** > **Administration** > **External Knowledge Sources**.

b. Click **New** and fill in the following fields:

Field	Description
Name	Unique name for the external source. For example, `Demo_knowledge`.
Target Knowledge Base	Knowledge base in which you want to create articles for the external content. For example, `IT`.
Connection Alias	Connection alias to connect to the external source. For example, `Demo_Account`.

c. Right-click the form header and select **Save**.

d. In the Parameter related list, click **New**.

e. On the Parameter form, select the name of the import parameter that you want to configure for your external source and then set the value for the parameter.
The table below lists the parameters and the corresponding values that can be set for the external source.

Parameter name	Value
Maximum size limit (in MB) for this source	Maximum allowable content size to import from your external source. For example, `250 MB`.
Maximum size limit (in KB) per file/content in this source	Maximum allowable size for each article, including attachments, that you can import from this external source. For example, `2000 KB`.
Open search results in the original source system	Opens search results in the external source system if this value is set to **true**.
Include folders with names that match these regex patterns	Comma-separated list of regular expressions for folder names to include from this external source. For example, to include all folders names that start with the letters a and b, enter `a.*,b.*`.
Exclude folders with names that match these regex patterns	Comma-separated list of regular expressions for folder names to exclude from this external source. For example, to exclude all folders names that start with the letters a and b, enter `a.*,b.*`.
Create articles when file names match these regex patterns	Comma-separated list of regular expressions for file names that to include when creating articles. For example, to include all file names have `.docx` and `.pdf` extensions, enter `.*\.docx,.*\.pdf`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter name	Value
Do not create articles when file names match these regex patterns	Comma-separated list of regular expressions for file names to exclude when creating articles. For example, to exclude file names have `.docx` and `.pdf`extensions, enter `.*\.docx,.*\.pdf`.
Maximum retry limit	Maximum limit for the number of times a connection request can be sent to the external source. For example, 5.

What to do next

Import content from an external knowledge source.

Open knowledge search results in source system

Knowledge Management Service portal search results page

Duplicate knowledge article numbers

Importing knowledge articles into an instance can create articles with duplicate numbers.

The Knowledge **Number** field is auto-generated and is incremented every time you create a new article in an instance. The initial value for the **Number** field is 10,000. To customize this number:

1. Navigate to **System Definition** > **Number Maintenance**.
2. In the **Table** column, search for and select **Knowledge**.
3. Under **Related Links** select **Number Counter**, then update the Number field.
4. Select**Update**.

Importing knowledge articles from another instance or as part of the demo data for another application may introduce an article with a number that is already in use. Because the Knowledge **Number** field is not uniquely indexed, the import completes without error.

With duplicate knowledge article numbers present, links to article view pages that use the knowledge number can behave inconsistently. For example, if there are two articles with the same Knowledge number KB0000033, the following link may open either of these two articles randomly: *kb_view.do?sysparm_article=KB0000033*. This can happen in Knowledge search results where clicking on a result opens a different article instead of the article displayed in the search results.

Avoiding duplicate Knowledge article numbers

To avoid inserting Knowledge articles with duplicate numbers into a production environment:

- Do not import demo data articles in production environment.
- Verify the numbers of the articles to be inserted to make sure they are not already in use.
- Create a before insert business rule on the Knowledge table (kb_knowledge) to ensure the new number is not already in use.

You can also update the initial value for the Knowledge **Number** field so that newly created articles do not conflict with existing articles.

1. Navigate to **System Definition** > **Number Maintenance**.
2. In the **Table** column, search for and select **Knowledge**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the Controls related list, in the **Number** field, update the count to a number greater than the largest value already in the system.
4. Click **Update**.

Create a custom knowledge homepage

As a system administrator, you can create a module allowing users to open a knowledge homepage for a specific knowledge base or category.

Before you begin

Role required: admin

About this task

Note:
This topic creates a legacy v3 knowledge homepage. You can create a portal homepage and configure it to get a new look and feel. For information, see Configure the Knowledge Management Service Portal.

Procedure

1. In the application navigator, point to the application name and click the edit application icon ( ).
2. In the **Modules** related list click **New**.
3. Enter a **Title** for the module.
4. In the **Link type** field, select **URL (from Arguments)**.
5. In the **Arguments** field, append one or more of the following values to `$knowledge.do#/search?`.

Option	Description
sysparm_kb=<knowledge base sys_id>	Enter the sys_id of a knowledge base to show knowledge articles from that knowledge base by default. If the specified knowledge base does not ex ist, the default knowledge homepage appears when accessing the custom homepage mod ule.
sysparm_category=<knowledge category sys_id>	Enter the sys_id of a knowledge category to show knowledge articles from that category by default. If the specified category does not exist, the default category for the selected knowledge base appears when accessing the custom homepage module.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	Note: The category passed in this parame ter must belong to the knowledge base passed in the *sysparm_kb* parameter.
sysparm_order=<view_count, last_modi fied, or relevancy>	Enter the default sort order for articles to ap pear in.

Configuring Knowledge Management

I18N - Knowledge internationalization

View knowledge logs

Knowledge logs display information about which users have viewed knowledge articles, what they looked for, and where.

Before you begin
Role required: knowledge_admin, knowledge_manager

About this task
Knowledge logs capture information from all the available sources where users can access knowledge articles, such as Customer Service Portal, Knowledge Management Service Portal, Now Mobile, Agent Workspace, and Knowledge Management v3.

Note:

Starting with the Washington DC release, the Knowledge Management v3 homepage (com.snc.knowledge3) is being prepared for deprecation in the future Y release. It is replaced by the Knowledge Management Service Portal (com.snc.knowledge_serviceportal), which is active by default for customers on Madrid and later releases. For more information about the new experience, see Knowledge Management Service Portal homepage features.

Procedure

1. Navigate to **All** > **Knowledge** > **Administration** > **Search Log** or **View Log**.
2. View the Search or View logs.

Knowledge logs

Log	Description
Search Log	View records of the search source, search terms, the highest click rank, and the number of search results of knowledge searches from all the available sources where users can access knowledge articles. The Search log displays data from the Knowledge Searches [ts_query_kb] table. For more information about the search source, see View the source of a knowledge article search.
View Log	View records showing who has viewed which knowledge articles, who has attached a knowledge article to a task and when, and identify final search terms when the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Log	Description
	type-ahead search suggestions feature is enabled. The View log displays data from the Knowledge Use [kb_use] table. **Note:** ○ An administrator can activate the kb_use table cleanup job to delete any older records from the Knowledge Use [kb_use] table and improve the table performance. For more information, see Modify the data retention policy for View logs. ○ The View log record doesn't display information for a knowledge article accessed and viewed from the global search results.

Search Log fields and description

The knowledge search log stores the history of all knowledge searches performed by the users.

The Search log stores information from all the available sources where users can access knowledge articles. It displays data from the Knowledge Searches [ts_query_kb] table.

Note:
The Knowledge Search log captures data only from Zing searches. It does not work with AI searches.

As an administrator and knowledge manager, you can access the search log by navigating to **All** > **Knowledge** > **Administration** > **Search Log**.

The following table describes some of the fields in the Search log.

Search log field	Description
Search term	Search term used to perform the search.
Results	Number of matching knowledge articles returned by the search.
User	User ID of the user who performed the search.
Sort Order	Sort order (relevance, views, newest, or alphabetical) while performing the search.
Final Search Term	When this value is *true*, the value in **Search term** is the final successful search term used in the search session.
Highest Click Rank	The rank of the first search result the user clicked on to get the relevant search results. A lower search count indicates that the search operation is efficient.
Session Id	Unique identifier for the user session.

For information about finding the source used for searching a knowledge article, see View the source of a knowledge article search.

View Log fields and description

The knowledge View log stores the history of knowledge articles views and their usage.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The View log shows who has viewed which knowledge articles and who has attached a knowledge article to a task and when. It identifies final search terms when the type-ahead search suggestions feature is enabled. The View log displays data from the Knowledge Use [kb_use] table.

As an administrator and knowledge manager, you can access the view log by navigating to **All** > **Knowledge** > **Administration** > **View Log**.

The following table describes some of the fields in the View log.

View log field	Description
Created	Date and time when the article was viewed or used by the user.
Article	Article that was viewed or used by the user.
User	User who viewed or used the article
Used	If set to true, the article was attached to a task (case, incident, and the like).
Viewed	If set to true, indicates that the article was viewed.
Search Id	Reference ID of the Search log (ts_query_kb). This links the search performed by a user to the article viewed from the search results.
Session Id	Unique identifier for user session.
Times Viewed	How many times the article was viewed.

View the source of a knowledge article search

Analyze knowledge searches by finding the source used for searching a knowledge article.

Before you begin

Role required: knowledge_admin, knowledge_manager

Procedure

1. Navigate to **All** > **Knowledge** > **Administration** > **Search Log**.
2. View the following data for a search record in the corresponding column of the Search log.

Search source details

Column	Search record data
Source Doc	Source record in the source table. For example, Problem: *problem_number*, Case: *case_number*, Incident: *incident_number*, Service Portal: *Customer Support*
Source Table	Label and name of the source table. For example, Knowledge [kb_knowledge], Service Portal [sp_portal], Case [sn_customerservice_case], Incident [incident], Problem [problem], KCS Article [kb_template_kcs_article]
Source Type	Application where the knowledge article search was performed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Search record data
	The **Source Type** column is set to one of the following values: ○ **Portal**: Service Portal application ○ **Classic**: ServiceNow AI Platform application ○ **Workspace**: Agent assist in Workspace ○ **Knowledge Classic**: Knowledge Management v3 or v2 ○ **Other**: Unidentifiable source
Source URL	URL of the searched text query.

Related topics

View knowledge logs

Modify the data retention policy for View logs

Remove unwanted and older data from the Knowledge Use [kb_use] table through the data retention policy.

Before you begin

Role required: admin

About this task

The View log displays data from the Knowledge Use [kb_use] table. By default, all the records in the Knowledge Use [kb_use] table are retained. Activating the data retention policy for the kb_use table deletes records that you no longer need. The deleted data is not visible on the reports used in dashboards such as Self-Service Analytics for customer service and Knowledge Management dashboards.

Procedure

1. Navigate to **All** > **Instance Scan** > **Table Cleanup**.
2. In the **Tablename** column, search for `kb_use` and click the **kb_use** link.
3. On the Auto Flush form, activate the kb_user table cleanup job by selecting the **Active** check box.
4. **Optional:** Adjust the amount of time the system waits before deleting the records by modifying the value in the **Age in seconds** field.
   By default, the **Age in seconds** field value is set to 31,536,000 seconds (equivalent to 365 days). For more information, see Autoflush form .

   If the *glide.knowman.view_age.days* property, which sets the number of days used when summing article views, is active, the **Age in seconds** field value must be larger than that property's value. For more information, see Knowledge Management properties

   .
5. Click **Update**.

Use extension points for Knowledge Management

Use UI extension points to add knowledge article headers and footers to knowledge articles and to customize the email template for notifications when a knowledge article is commented on. Use scripted extension points to customize the feedback object used in the email template for notifications when a knowledge article is commented on.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

The Knowledge Management Advanced plugin (com.snc.knowledge_advanced) must be activated to view the KMFeedbackNotification UI extension point and the KMFeedbackObject scripted extension point. These notifications are part of the Subscriptions feature, which is activated with this plugin.

Starting with the Washington DC release, the Knowledge Management v3 homepage (com.snc.knowledge3) is being prepared for deprecation in the future Y release. It is replaced by the Knowledge Management Service Portal (com.snc.knowledge_serviceportal), which is active by default for customers on Madrid and later releases. For more information about the new experience, see Knowledge Management Service Portal homepage features.

Role required: admin

About this task

Using extension points makes it easier to integrate customizations without actually altering the base code. You can extend standard base functionality using customized scripts.

To use UI extension points in Knowledge Management, create an implementation and change the data as required. You can create multiple implementations per extension point, but for these scenarios, the use is limited to one implementation only. Example code is provided in the extension point, which can be edited, as required.

An implementation is delivered in the base system for scripted extension points. You can change the data and add additional fields, as required.

Procedure

1. To use UI extension points to customize headers and footers in knowledge articles, and the email notification that is sent when a knowledge article is commented on:

   a. Navigate to **System Extension Points** > **UI Extension Points**.

   b. Click the UI extension point you want to use.

   Note:

   - Use the KMArticleViewFooter and KMArticleViewHeader UI extension points to add knowledge article headers and footers to the knowledge article view pages (kb_view.do) in Knowledge Management v3.
   - Use the KMFeedbackNotification UI extension point to customize the email template for notifications when a knowledge article is commented on.

   c. Click **Create Implementation**.

   d. Change the data as required.

   e. Click **Update**.

2. To use scripted extension points to update the feedback object used in the email template for notifications when a knowledge article is commented on:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **System Extension Points** > **Scripted Extension Points**.

Note:
Use the KMFeedbackObject scripted extension point to customize the feedback object used in the email template for notifications when a knowledge article is commented on.

b. In the **API Name** column, click *global.KMFeedbackObject*.

c. In the **Implementations** related list, click the *KMFeedbackObjectBaseImpl* class.

d. Change the data and add additional fields, as required.

e. Click **Update**.

Train the similarity solution for Knowledge Management to find related articles

Train the Knowledge Similar Articles solution definition included within the Predictive Intelligence for Knowledge Management capability to find related knowledge articles when creating or viewing a knowledge article.

Before you begin

Ensure that the Predictive Intelligence for Contextual Search plugin (com.snc.contextual_search_ml) and Predictive Intelligence for Knowledge Management plugin (com.snc.knowledge_ml) are activated.
Role required: admin

Note:
This solution is only applicable to OOB (Out of Box) similarity solution and not to knowledge articles that are created manually.

Procedure

1. Navigate to **All** > **Predictive Intelligence** > **Similarity** > **Solution Definitions**.
2. In the Similarity Definitions list, search for and select the Knowledge Similar Articles solution definition (ml_sn_global_knowledge_similar_articles).
3. On the Similarity Definition form, verify the default field values for knowledge articles.

   For more information about the Similarity Definition form fields, see Create and train a similarity solution.

   Note:
   If the application scope isn't set to Knowledge Management - Machine Learning, you cannot edit the form and a warning message appears. To make the form editable, click the word **here** at the end of the message.

4. Click **Update & Retrain**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Open the Similarity Definition form for the Knowledge Similar Articles solution definition (ml_sn_global_knowledge_similar_articles).
6. In the ML Solutions related list, view the training solution progress in the **Progress** column. When **Progress** is 100%, in the ML Solutions related list, you can include more useful related articles by reviewing the similarity examples based on the similarity score and updating the similarity score threshold value.
7. **Optional:** Update the similarity score threshold.

   a. In the **Active** column, click the link for the solution.

   b. Review the similarity examples by clicking the **Similarity Examples** related link on the ML Solution form.
   For more information, see Review solution similarity examples.

   c. In the Solution Statistics related list on the ML Solution form, enter the required value in the **Similarity Score Threshold** field, right-click the ML Solution form, and then click **Save**.
   For more information, see Update your similarity score threshold.

Result

When the solution is complete, the related knowledge articles appear in the Knowledge results section on the Knowledge form in the ServiceNow AI Platform, in the Related Articles section on the knowledge article view page in the Knowledge Management Service Portal, and in Agent assist when the **Similar Articles (ML)** option is selected.

- Using Now Mobile for Knowledge Management

Enable actionable knowledge feedback

The actionable knowledge feedback feature is available when the Knowledge Management Service Portal (com.snc.knowledge_serviceportal) plugin is activated and the actionable knowledge feedback properties are enabled.

Before you begin

Role required: admin

About this task

The actionable feedback feature is available in the Knowledge Management Service Portal and Agent Workspace. To use the actionable feedback feature in other service portals, you can activate the Knowledge Article View page route map. For new customers, the Knowledge Article View page route map is activated by default.

Note:
The actionable knowledge feedback is not supported in Knowledge Management v3.

A feedback task is created for an article when the article is flagged. For generating feedback tasks when an article is marked as not helpful or rated below a set value, you must set the following associated properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
When you select **No** on the article form, an actionable feedback pop-up window appears. On the Actionable feedback form, choose one of the reasons to provide feedback. If you choose **Other** as a reason consider providing feedback details.

Procedure

1. Navigate to **All** > **Knowledge** > **Administration** > **Properties**.
2. In the **Actionable Feedback Properties** section, configure the following properties:

Property	Setting
Create actionable feedback task when an article is flagged	By default, the property is set to **Yes** and feedback tasks are created when the article is flagged.
Create actionable feedback task when an article is marked as not helpful	Select **Yes**.
Create actionable feedback task when an article is rated at or lower than this value. 0 or no value indicates that actionable feedback tasks are not enabled for Rating type feedback	Enter a value from 1 to 5 to specify the rating threshold for generating a feedback task. For example, if you set this value to 3, a feedback task is generated when a user selects three or less stars to rate an article. **Note:** If you enter '0', a negative article feedback does not generate a feedback task.
Create actionable feedback task only when feedback details are provided for the negative feedback	Select the check box to enable actionable feedback task generation for the negative feedback. Set this value to "True", to activate this feature.

3. Click **Save**.

Create field mapping from an HR case to a knowledge article

Copy information from an HR case into a knowledge article by creating custom mapping between the HR case table and the KCS article table.

Before you begin

Role required: admin

- Ensure that the Knowledge Advanced plugin (com.snc.knowledge_advanced) is active.
- Ensure that the Developer Application is set to **Human Resources: Core**.
- Ensure that the KCS Article template is active.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Navigate to **Knowledge** > **Administration** > **Article Templates**.
2. Set the **Active** field to **true** for the KCS Article template.

Procedure

1. In the filter navigator, type `csm_table_map.list`.
2. Click **New**.
3. In the **Mapping Name** field, enter `HR Case KCS Article`.
4. In the **Source Table** field, enter `HR Case`.
5. In the **Target Table** field, enter `KCS Article`.
6. Right-click the form header and **Save**.
7. In the **Basic Field Mapping** related list, click **New**.
8. Create mappings for the following fields.

Source Field	Target Field
Sys ID	Source Task
Short description	Short description
Close notes	Resolution
Description	Cause

Note:
You can create field mappings for more fields, as required.

- In the **Source** field, select the field in the source HR Case table that contains the information to be copied to the field in the article template target table.
- In the **Target** field, select the field in the article template target table to which you need information copied to from the field in the source Incident table.

9. To customize when and how the **Knowledge** check box is displayed, click the **Condition** tab.
10. To map fields using advanced scripts, select the **Advanced Field Mapping** check box.
11. On the **Advanced field Mapping** tab, paste in the following code.

```
(function (source) {
   // Get the first comments from HR case and use it as Issue
 description for article
   target.short_description=source.short_description+"";
   target.kb_resolution=source.close_notes+"";
   target.kb_cause=source.description+"";
  var notes = source.comments.getJournalEntry(-1);
  var entries = notes.split("\n\n");
  var comment = "";
  if(entries[entries.length-2]){
      comment = entries[entries.length-2];
      var part = comment.toString().indexOf(")");
      if(part != -1){
comment =
 comment.toString().substring(part+2).replaceAll("\r\n","<br/>
");
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  }
  }if(comment)
      target.kb_issue = comment;

   //Only if selected article type is active
   var tem =  new GlideRecord("kb_article_template");
   tem.addQuery("child_table","kb_template_kcs_article");
   tem.addActiveQuery();
   tem.query();
   if(!tem.hasNext())
       return false;

   //Do not allow to create the knowledge again
   var now_GR = new GlideRecord("kb_knowledge");
   gr.addQuery("source",source.sys_id);
   gr.query();
   if(gr.next())
       return false;

   return true;
})(source);
```

The first comment on an HR case is mapped to the **Issue Description** field in the knowledge article.

Note:
If the same source or target field is configured in both the basic and advanced field mappings, the advanced field mapping overrides the basic field mapping.

If the fields configured in the basic and advanced field mapping are different, the field configurations in the advanced field mapping are appended to the field configurations in the basic field mapping.

Add a property to enable creating knowledge articles from HR cases

Add a property, which is required to allow users to create a knowledge article from an HR case.

Before you begin

Role required: admin
Ensure that the Developer Application is set to **Human Resources: Core**.

Procedure

1. In the Filter navigator, enter `sys_properties.list`.
2. Click **New**.
3. Fill in the following fields.

System Property form

Field	Description
Name	enable_kcs_hr
Description	Enable Knowledge Centered Services (KCS) for HR Service Delivery.
Type	true|false

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Value	true

4. Click **Submit**.

Result
The property is added and you can now create knowledge articles from an HR case.

Create a UI action to enable creating knowledge articles from HR cases

Create a UI action to add the Knowledge check box to the HR case form.

Before you begin
Role required: admin
Ensure that the Developer Application is set to **Human Resources: Core**.

Procedure
1. Navigate to **All** > **System UI** > **UI Actions**.
2. Click **New**.
3. Fill in the following fields.

UI Action form

Field	Description
Name	Create Knowledge
Table	HR Case
Action name	create_knowledge

4. Select the **Client** check box.
5. Select the **List v3 Compatible** check box.
6. Select the **Form button** check box.
7. In the **Onclick** field, enter `createKnowledgeClient()`.
8. In the **Condition** field, enter `gs.getProperty("sn_hr_core.enable_kcs_hr") == 'true' && new global.CSMTableMapUtil (current).findMapByName("sn_hr_core.hr_case_kcs_article") && new global.KBKnowledge().canCreate()`.
9. In the **Script** field, enter the following code.

```
function createKnowledgeClient() {
    if (g_form.modified) {
        alert(new GwtMessage().getMessage('You have unsaved
 changes. Please save them to continue.'));
    }else{
        //Call the UI Action again but skip the 'onclick'
 function
        gsftSubmit(null, g_form.getFormElement(),
 'create_knowledge');
//MUST call the 'Action name' set in this UI Action
    }
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
//Code that runs without 'onclick'
//Ensure call to server-side function with no browser errors
if (typeof window == 'undefined')
    CreateKnowledgeServer();

    function CreateKnowledgeServer(){
    current.update();

    var map = new global.CSMTableMapUtil (current);
    map.findMapByName("sn_hr_core.hr_case_kcs_article");
    var targetURL = map.getTargetURL();
    var referenceLink =
"&sysparm_collection=sn_hr_core_case&sysparm_collectionID="+cur
rent.sys_id+"&sysparm_collection_key=task&sysparm_link_collecti
on=m2m_kb_task&sysparm_collection_related_field=kb_knowledge&sy
sparm_referring_url=sn_hr_core_case.do%3fsys_id%3d"+current.sys
_id;
    if(targetURL)
        action.setRedirectURL(targetURL[0]+referenceLink);
}
```

10. Click **Submit**.

Enable creating an article from a customer service case

You can enable authors to reuse information in a case by copying case details into an article template. Use the pre-defined customer service source case table to article template target table configuration or create custom configurations between the two tables to copy information from a case to an article.

Before you begin

- The Knowledge Management Advanced plugin must be active.
- The Properties installed with Customer Service Management must be enabled
- The pre-defined KCS article template or a newly created article template must be active.

  Note:
  You can do one of the following to create an article from a case:

  - Use the pre-defined **Case KCS Article** mapping as is or modify the field mappings between the case source table and article template target table.
  - Create a new article template target table and map it to the case source table and customize the field mappings between them. For information on creating article templates, refer to Create an article template.
- Knowledge users use the **Create Knowledge** button in a case form to create an article from a case and must have "can contribute" permission for at least one active knowledge base to create an article from a case. For information on user permissions, see Knowledge Management roles.

Role required: sn_customerservice.customer_admin or admin

About this task

The pre-defined **Case KCS Article** mapping is stored in the CSM Table Map [csm_table_map] table. This configuration has the sn_customerservice_case source case table configured to the kb_template_kcs_article target article template table with the four field mappings pre-configured

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

between the tables. You can customize the existing field mappings or map additional fields between the tables.

Procedure

1. In the application filter navigator, type `csm_table_map.list`.
2. Click **Case KCS Article**.
3. From the **Target Table** list, use the pre-defined KCS article template table or select the newly created article template table.
4. Map each customer service case field that must be used to create knowledge articles.

   a. In the **Basic Field Mapping** related list, click **New**.
   To map fields, fill in the following fields:

   Customer service case table to article template target table field mapping

Field	Instructions
Source Field	Select the field in the source case table that contains the information to be copied to the field in the article template target table.
Target Field	Select the field in the article template target table to which you need information copied to from the field in the source case table.

   b. Click **Submit**.

   c. To map fields using advanced scripts, select the **Advanced Field Mapping** check box and then map the fields between the source and the target table using advanced scripts in the **Advanced Field Mapping** tab.

   Note:

   If the same source or target field is configured in both the basic and advanced field mappings, the advanced field mapping overrides the basic field mapping.

   If the fields configured in the basic and advanced field mapping are different, the field configurations in the advanced field mapping are appended to the field configurations in the basic field mapping.

   d. To customize when and how the **Create Knowledge** button is displayed, use the condition builder in the **Condition** tab or select **Use Advanced Condition** check box and configure using advanced scripts.

   Note:
   If you change the target table in the **Case KCS Article** mapping, also update the scripts with the configuration changes for display of this button.

5. Click **Update**.

Configuration tasks for knowledge demand insights

Review the following configurations tasks for knowledge demand insights.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure Knowledge Demand Insights

Configure the Knowledge Demand Insights feature to identify which topics are missing knowledge articles and creating actionable knowledge gaps for missing topics.

Before you begin

Activate the Predictive Intelligence for Knowledge Management plugin (com.snc.knowledge_ml). For more information, see Predictive Intelligence for Knowledge Management and Additional plugins for Knowledge Management.

About this task

To configure the Knowledge Demand Insights feature, use the Knowledge Management guided setup. The guided setup takes you through the entire setup and configuration process.

This task provides general steps to configure the Knowledge Demand Insights feature. For more information about the feature, see Knowledge demand insights.

Procedure

1. Configure similarity and clustering solution definitions to enable comparing knowledge bases with a task type.
2. Configure the combination of the task table and similarity and clustering solution definitions that are processed in a scheduled job for a task type.
3. Configure scheduled jobs for each task.
4. Configure assignment rules to automatically assign feedback tasks of type Knowledge gap.

> **Note:**
> If no assignment rules are configured, a knowledge admin or knowledge manager can later use the Feedback Management feature in the Knowledge module to manually assign a feedback task.

Related topics

Analyze knowledge gaps from a demand insights dashboard and create knowledge gap feedback tasks

Configure solution definitions to find gaps in a knowledge base

The Knowledge Demand Insights feature finds knowledge gaps by comparing knowledge bases with existing tasks. To enable comparing knowledge bases with a task type, you must first configure similarity and clustering solution definitions.

Before you begin

This task describes the process for configuring a solution definition.
Instead of doing the configuration through this procedure, consider using a guided setup. Navigate to **Knowledge** > **Administration** > **Guided Setup**, click **Get Started**, and then scroll to the Knowledge Demand Insights section.

Role required: admin

About this task

Configure one similarity type and one clustering type solution definitions for each task type: incidents, customer service cases, or other tasks. A similarity solution definition collects and compares your existing records to new similar records. A clustering solution definition groups similar records into clusters so you can address them collectively or identify patterns.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Knowledge Demand Insights** > **Solution Definitions**.
2. In the Solution Definitions (ML view) list, search for and select the similarity solution definition for the task type.
   - For customer service cases, select **Demand Insights: Similar Cases and Knowledge (ml_sn_global_similar_cases_and_kbs)**.
   - For incidents, select **Demand Insights: Similar Incidents and Knowledge (ml_sn_global_similar_incidents_and_kbs)**.
   - For HR cases, select **Demand Insights: Similar HR Cases and Knowledge (ml_x_sn_hr_core_global_demand_insights_similar_hr_cases_and_knowledge)**.
   - For tasks other than customer service cases, incidents, and HR cases, click **New** to create another similarity solution definition.
3. On the Similarity Definition form, verify the default field values for customer service cases or incidents, or fill in the values for a custom configuration.

Note:
If the application scope isn't set to Knowledge Management - Machine Learning, you cannot edit the form and a warning message appears. To make the form editable, click the word **here** at the end of the message.

Similarity Definition form

Field	Description
Label	Unique name for your similarity solution.
Word Corpus	Defines which knowledge articles and tasks are selected for knowledge gap analysis. If you don't have a relevant word corpus, follow the steps in Create a word corpus.
Table	Table that contains the knowledge article records. Set the value to Knowledge [kb_knowledge] unless you use a different table for storing knowledge articles. After you assign a table value, the number of records that match the filter conditions is displayed as a link.
Fields	Fields from the Knowledge table selected for knowledge gap analysis.
Filter	Filter conditions applied on the Knowledge table to filter knowledge article records for knowledge gap analysis.
Test Table	Table that contains the task records that you want to compare with knowledge article records.
Test Fields	Fields from the task table selected for knowledge gap analysis.
Processing Language	Dominant language of the dataset you're training on the solution definition. By default, English processing is applied to all datasets. For example, if you select Italian, the system processes the data in both English and Italian.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: The term processing indicates some of the language-specific steps used as part of training a solution. These steps might include tokenizing words, removing stop words, and stemming.
Stopwords	Common terms in the processing language that are excluded from the search, for example, prepositions. When you select your processing language, the system automatically adds a Stopwords list that uses the same language. For example, if your processing language is Italian, the **Default Italian Stopwords** list appears. The **Default English Stopwords** list also appears in your selection as well.
Training Frequency	Frequency with which the model for similarity solution definition must be retrained.
Update Frequency	Frequency with which to include new records in the model for the similarity solution definition.

4. Submit and train the solution definition.
   - For a new solution definition record, click **Submit & Train**.
   - For an existing solution definition record, click **Update & Retrain**.
5. **Optional:** Include more useful related articles by reviewing the similarity examples based on the similarity score and updating the similarity score threshold value.
   For more information, see Review solution similarity examples and Update your similarity score threshold.
6. In the Solution Definitions (ML view) list, search for and select the clustering solution definition for the task type.
   - For customer service cases, select **Demand Insights: Case Clusters Need Knowledge (ml_sn_global_cases_need_knowledge_cluster)**.
   - For incidents, select **Demand Insights: Incident Clusters Need Knowledge (ml_sn_global_incidents_need_knowledge_cluster)**.
   - For HR cases, select **Demand Insights: HR case clusters need knowledge (ml_x_sn_hr_core_global_demand_insights_hr_case_clusters_need_knowledge)**.
   - For tasks other than customer service cases and incidents, click **New** to create another clustering solution definition.
7. On the Clustering Definition form, verify the default field values for customer service cases or incidents, or fill in the values for a custom configuration.

   Note:
   If the application scope isn't set to Knowledge Management - Machine Learning, you cannot edit the form and a warning message appears. To make the form editable, click the word **here** at the end of the message.

Clustering Definition form

Field	Description
Label	Unique name for your clustering solution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Word Corpus	Which tasks are selected for collections.
Table	Table that contains the filtered tasks that require knowledge articles. Set the value to Task knowledge coverage [kb_task_knowledge_coverage] unless you use a different table for storing filtered tasks. After you assign a table value, the number of records that match the filter conditions is displayed as a link.
Fields	Fields from the Task knowledge coverage table selected for knowledge gap analysis.
Filter	Filter conditions applied on the Task knowledge coverage table to filter knowledge article records for knowledge gap analysis.
Processing Language	Dominant language of the dataset you're training on the solution definition. By default, English processing is applied to all datasets. For example, if you select Italian, the system processes the data in both English and Italian. **Note:** The term processing indicates some of the language-specific steps used as part of training a solution. These steps might include tokenizing words, removing stop words, and stemming.
Stopwords	Common terms in the processing language that are excluded from the search, for example, prepositions. When you select your processing language, the system automatically adds a Stopwords list that uses the same language. For example, if your processing language is Italian, the **Default Italian Stopwords** list appears. The **Default English Stopwords** list also appears in your selection as well.
Update Frequency	Frequency with which to include new and updated records in the model for the clustering solution definition.
Training Frequency	Frequency with which the model for clustering solution definition must be retrained.

8. Submit and train the solution definition.
   - For a new solution definition record, click **Submit & Train**.
   - For an existing solution definition record, click **Update & Retrain**.

What to do next

Complete the KB curation configuration form to define the scheduled jobs for demand insights. For more information, see Configure the mapping of solution definitions with task tables.

Configure the mapping of solution definitions with task tables

Configure the combination of the task table and similarity and clustering solution definitions that are processed in a scheduled job for a task type. You can create another demand insights configuration or modify an existing configuration to define a scheduled job for demand insights.

Before you begin

This task describes the process for configuring a scheduled job.
Instead of doing the configuration through this procedure, consider using a guided setup. Navigate to **Knowledge** > **Administration** > **Guided Setup**, click **Get Started**, and then scroll to the Knowledge Demand Insights section.

Ensure that you have configured a similarity type and clustering type solution definitions for a task type. For more information, see Configure solution definitions to find gaps in a knowledge base.

Role required: admin

About this task

A scheduled job for each task type runs business rules and then executes the similarity and clustering solution definitions. In the Demand Insights Configuration module, you configure the combination of the task table and similarity and clustering solution definitions that are processed in a scheduled job for a task type. This configuration is optional for customer service cases and incidents.

Note:
For task types other than customer service cases and incidents, a user with the admin role must also perform the following tasks:

- Assign the sn_km_ml.knowledge_curation_user role and the appropriate roles for the task type to the users performing the knowledge gap analysis. To assign roles, perform the Assign knowledge curator roles guided setup task, which are available in the Knowledge Demand Insights section of the Knowledge Management guided setup.
- Create a demand insights dashboard for the task type. To create a dashboard, see Create or configure a responsive dashboard.

Procedure

1. Navigate to **All** > **Knowledge Demand Insights** > **Demand Insights Configuration**.
2. Configure the combination of the task table and similarity and clustering solution definitions that are processed in a scheduled job.
   - For customer service cases, select **sn_customerservice_case**.
   - For incidents, select **incident**.
   - For HR cases, select **sn_hr_core_case**.
   - For tasks other than customer service cases, incidents, and HR cases, click **New** to create another combination.
3. On the KB curation configuration form, verify the default field values for customer service cases or incidents or fill in the values for a custom configuration.

KB curation configuration form

Field	Description
Curation table	Name of the table you want the data to pull information from. For example, for customer service cases, select Case [sn_customerservice_case] and for incidents select Incident [incident].

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Fields	Fields in the curation table that include the ID of knowledge articles, for example, the knowledge article ID KB07276660 in the field resolution notes,
Query condition	Conditions for filtering the number of tasks from the curation table. You can create conditions using the condition builder (see Condition builder).
Similarity solution definition	Similarity solution definition for your task type. For example, for customer service cases, select **Demand Insights: Similar Cases and Knowledge**.
Clustering solution definition	Clustering solution definition for your task type. For example, for customer service cases, select **Demand Insights: Case Clusters Need Knowledge**.

4. Click **Update** for incidents or customer service cases or **Submit** to save a custom configuration.

What to do next

Set the frequency of the scheduled job for your task. For more information, see Set the frequency of knowledge gap analysis.

Related topics

Configure solution definitions to find gaps in a knowledge base

Set the frequency of knowledge gap analysis

Set the frequency of the scheduled job for your task to automatically run knowledge gap analysis.

Before you begin

This task describes the process for setting the frequency of knowledge gap analysis. Instead of doing the configuration through this procedure, consider using a guided setup. Navigate to **Knowledge** > **Administration** > **Guided Setup**, click **Get Started**, and then scroll to the Knowledge Demand Insights section.

Role required: admin

Procedure

1. Navigate to **All** > **Knowledge Demand Insights** > **Scheduled Jobs**.
2. In the Scheduled Jobs list, select the scheduled job for your tasks in the **Name** column.
   - For customer service cases, select **[Knowledge Curation]: Generate Case Clusters**.
   - For incidents, select **[Knowledge Curation]: Generate Incident Clusters**.
   - For HR cases, select **[Knowledge Curation]: Generate HR Case Clusters**.
   - For tasks other than customer service cases, incidents, and HR cases, create another scheduled job. For more information, see Create a scheduled job .
3. On the Scheduled Script Execution form, either accept the default value of running the analysis once a quarter (every 90 days) or change the frequency.

> **Note:**
> For best performance results, try not to perform knowledge gap analysis more frequently than once a month.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Click **Update**.

> **Note:**
> If the application scope is not set to Knowledge Management - Machine Learning, a warning message appears and the **Update** button is not available. Click the word **here** at the end of the message to change the scope and click **Update**.

5. **Optional:** To run the job immediately, click **Execute Now**.

Result
The knowledge gap analysis is repeatedly run at the duration as configured in the scheduled job.

What to do next
Create assignment rules to assign knowledge gap feedback tasks. For more information, see Assign knowledge gap feedback tasks to content authors.

Related topics
Analyze knowledge gaps from a demand insights dashboard and create knowledge gap feedback tasks

Assign knowledge gap feedback tasks to content authors

Create assignment rules to assign knowledge gap feedback tasks to authors or groups of content creators.

Before you begin
Role required: admin or assignment_rule_admin

About this task
Knowledge gap feedback tasks created through the Knowledge Demand Insights feature create feedback tasks of type **Knowledge gap**.

Procedure
1. Navigate to **All** > **Knowledge Demand Insights** > **Knowledge Gap Assignment**.
2. In the Assignment Rules list, click **New**.
3. On the Assignment rule form, fill in the fields.

Assignment rule form

Field	Description
Name	Descriptive name for the assignment rule.
Active	Option to activate the assignment rule. Only active assignment rules take effect.
Applies to tab	
Table	Table to store the feedback tasks on knowledge articles. This field is automatically set to **Knowledge Feedback Task [kb_feedback_task]**.
Conditions	Conditions for assigning feedback tasks of the Knowledge gap type. This field is automatically set to **[Feedback Task Type] [is] [Knowledge gap]**. You can add more conditions as appropriate.
Assign to tab	
User	User assigned the feedback task type of knowledge gap.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Group	Ownership group assigned the feedback task type of knowledge gap.
Script tab	
Script	Script you can use to specify more complex conditions for assignment rules using dynamic variables and loops.

4. Click **Submit**.

Related topics

Create an assignment rule

Analyze knowledge gaps from a demand insights dashboard and create knowledge gap feedback tasks

Analyze knowledge gaps from a demand insights dashboard and create knowledge gap feedback tasks

Use the demand insights dashboard for your tasks to analyze candidate knowledge gaps and create knowledge gap feedback tasks.

Before you begin

You must have read access to the tasks that you want to analyze and the sn_km_ml.knowledge_curation_user role.

About this task

A demand insights dashboard displays tasks as topics for which your knowledge bases do not have adequate knowledge coverage. You can create and assign knowledge gap feedback tasks for a topic so your knowledge bases can better be used to solve and deflect any issues described in a task. Tasks represent customer service cases, incidents, problems, and so on.

Procedure

1. Navigate to **Knowledge Demand Insights** and select the demand insights dashboard for your tasks, or navigate to **All** > **Self-Service** > **Dashboards**.
   - For customer service cases, select **Demand Insights for Cases**.
   - For incidents, select **Demand Insights for Incidents**.
   - For HR cases, select **Demand Insights for HR cases**.

   Note:
   For tasks other than customer service cases, incidents, and HR cases, you can create another dashboard or update an existing dashboard. For more information, see Create and use dashboards.

2. To view similar tasks grouped together, click a bar in the Pareto chart.
   Each bar represents a collection of similar tasks grouped together because they are likely to be on the same topic. The bars covering the largest number of tasks start from the left in a descending order. The blue line indicates how many bars you must analyze to cover 80% of all tasks that don't have good knowledge coverage. For more information, see Pareto chart for Knowledge Demand Insights.
3. **Optional:** To generate a representative sample to see a smaller list, in the Knowledge Curation Tasks list, click **Generate Representative Sample**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If the Knowledge Curation Tasks list is large, you can generate a representative sample subset of a Knowledge Curation Tasks list. This smaller list aims to accurately reflect the characteristics of the tasks included in the main list.

4. Analyze the sample to create a knowledge gap feedback task or ignore the tasks within a collection.

Result

If tasks within a collection are reported as knowledge gaps, a common feedback task for all the selected tasks is created and appears in the Knowledge Management application. You can use the assignment rules to assign a feedback task to an ownership group or author. In the Knowledge Curation Tasks list, the **Is knowledge gap created** column value for the selected tasks is set to **true**.

If you select an ignored collection from the demand insights dashboard, you can no longer report tasks within the collection as knowledge gaps.

Using Knowledge Management

Use Knowledge Management to search and find information on self-help, troubleshooting, and task resolution in knowledge bases.

Knowledge Management guide for users

After knowledge bases are set up, you can start searching and creating articles.

Requirements

Role required: All users can read knowledge articles. Users with the knowledge or any other fulfiller role, such as sn_customerservice_agent, can create and edit knowledge articles in a knowledge base, unless the knowledge manager has restricted access to the knowledge base or knowledge articles.

If you need these permissions, contact the knowledge manager or knowledge administrator for the knowledge base.

What to do

Create knowledge articles

If you have the required permissions for a knowledge base, you can create articles for it. You can Create a knowledge article from an incident in Service Operations Workspace or by importing Word documents.

You can also create knowledge articles from incidents and problems.

Search for knowledge articles

From the Knowledge homepage, you can select a knowledge base to search for articles and answers. You can view only the knowledge bases to which you have access.

Access to knowledge using your mobile device is supported.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Next steps

After articles are created, you can perform the following tasks to make sure that articles are organized in the right knowledge bases and retired when appropriate. If existing knowledge bases do not fit your needs, you can request a new knowledge base.

- Move a knowledge article
- Retire a knowledge article
- Request a knowledge base

Knowledge Management Service Portal homepage features

The Knowledge Management Service Portal homepage displays knowledge articles organized by knowledge base and category, as well as featured content and popular articles. Learn how to navigate the homepage to search for and find useful and relevant information quickly.

To use the Knowledge Management Service Portal, the Knowledge Management — Service Portal plugin (com.snc.knowledge_serviceportal) must be activated.

Note:
It's active by default for customers on the Madrid and later releases.
Existing or upgrade customers must activate the plugin and enable the *glide.knowman.serviceportal.enable_redirect* property.

To see the Knowledge Management Service Portal homepage, add `/kb` to the end of the URL for your instance. You can change the default navigation by configuring the system property *sn_km_portal.glide.knowman.serviceportal.portal_url*.

Your organization can customize the homepage, so it may look different to the following image. You must be logged in to view the knowledge homepage.

Knowledge Management Service Portal homepage features

UI component	Description
Knowledge profile menu	Click your profile photo to either view your knowledge profile or logout.
Search	Enter a search term to search knowledge bases.
Counters	Displays the number of available knowledge bases and the total number of knowledge articles.
Ask a question	This action is available to logged-in users with the knowledge role. Click **Ask a Question**, which opens a question page. Fill in the **Question** and **Question details** fields, and click **Post question** to post the question.
Overflow icon (···)	Click the Overflow icon and select **Create Article** to create a knowledge article.
Browse knowledge bases	Click a knowledge base to view knowledge articles and questions stored in it. View counters of how many articles and questions are stored in the knowledge base. Click **Show All** to view up to eight available knowledge bases.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Knowledge Management Service Portal homepage features (continued)

UI component	Description
Subscribe	Click **Subscribe** to subscribe to that knowledge base. Unsubscribe by clicking **Unsubscribe**.
Featured	Lists any knowledge articles that were pinned. For more information, see Add a knowledge article to featured content.
Most Useful	Lists the top five articles that were marked as helpful.
Most Viewed	Lists the top five articles with the most views.

Note:
The Knowledge Management Service Portal homepage is mobile responsive.

Using search in Knowledge Management Service Portal

View a list of search results as well as options for sorting and filtering the items in the list. You can also use knowledge search in other Service Portals.

Note:
When you perform a new search, the filters you selected earlier on the Knowledge Management search results page are not saved. You must reselect the filters that you want to apply for every search.

Knowledge Management Service Portal search results page

UI component	Description
Search bar	Use the search bar at the top of the page to search for additional information.
Sort	Sort the items in a knowledge base or search results list using the Sort by options at the top of the list. • Views: sorts by number of article views. • Newest: sorts by the date created or updated. • Alphabetical: sorts alphabetically by the article Short description field. • Relevancy: sorts by relevance to the search term. The header displays the number of search results, which updates as the user selects and de-selects filters. When you navigate away from the search results page and then return, your last sort selection is retained.
Search results list	View knowledge articles and pinned articles. Knowledge article search results include articles in which the short description, text content, or attached file content includes the search term. View the knowledge article short description, the knowledge base in which the article is stored, author name, number of views, and rating information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Knowledge Management Service Portal search results page (continued)

UI component	Description
Language filter facet widget	Language: lists the languages that have been activated. Select one or more languages to display search results in. Your selection is maintained across logins. If multi-language search is enabled, you can search for multiple languages simultaneously.
Knowledge base filter facet widget	Knowledge Base: lists the available knowledge bases
Category filter facet widget	Category: lists the available knowledge categories. **Note:** Shows a hierarchy of categories if the administrator configured the Show category hierarchy (valid for kb_category only) instance option for the facet widget.
Other filter facet widgets	Use filter facets to refine your search results. The selections you make filter the items displayed in the search results list. The search results list updates to display only those items that match your selections. Deleting a selection from the filter facet or breadcrumb reverses the filtering in the list. Clear selected filter options by: • Deleting a single option from the search results list header. • Clicking Clear all in the search results list header. • Clicking Clear in the filter facet widget header. • Author: lists the names of the authors for the knowledge articles included in the search results list • Tags: lists the available knowledge tags • Resource: lists the types of items available, such as knowledge articles • Rating: lists article ratings from 0-5 stars (clicking a rating displays articles that have the selected rating and higher) • Last Modified: lists selections based on the timing of knowledge item modifications such as Past Month or Past Week • View Count: lists the knowledge item view counts such as More Than 50 or Less Than 10. Set the number of days to consider when calculating view count using the *glide.knowman.view_age.days* property. For more information on this property, see Knowledge portal properties.
View additional search results	Depending on the system setup, view additional search results using one of these options: • Standard Pagination: displays the search results in multiple pages. • Infinite Scroll: displays the search results while scrolling.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If a custom widget on the knowledge search results page uses the *KnowledgeSearchService* angular service, you must add the *sn.knowledgeApplication* dependency to enable the functionality of the custom widget.

1. Navigate to **Service Portal** > **Dependencies**.
2. In the **Name** field, search for the *sn.knowledgeApplication* dependency.
3. If a message appears, click **here** to edit.

   You have to be in the **Knowledge Management - Service Portal** application to edit.
4. Click **Update**.

The search functionality in Knowledge Management Service Portal pages uses the **Knowledge Base Search** search context to fetch results. As an administrator, you must not update the definition of this search context because it may impact the search behavior. For more information about contextual search, see Contextual search concepts.

Knowledge Management Service Portal article view page features

The knowledge article view page in Knowledge Management Service Portal displays the knowledge article details, including the article number, short description, and article content. You can also give feedback or comment on an article.

Knowledge article view page in Knowledge Management Service Portal

UI component	Description
Breadcrumb	View which knowledge base the knowledge article is in.
Header	View the knowledge article number.
Subscribed	Click **Subscribe** to subscribe to the knowledge article. Unsubscribe by clicking **Unsubscribe**.
Actions ···	Edit the knowledge article or flag an article that contains incorrect or inappropriate content. To edit the article, you must have contribute access to the knowledge article. **Note:** The flagged comment appears in the comment section without reloading the page. If the article was created using Microsoft Word, download the article as a Microsoft Word document to your computer by clicking **Download as Word**. This option appears only when the article was originally created using Microsoft Word and the system administrator has enabled the *sn_km_word.glide.knowman.enable_document_download* property.
Article title	View the short description of the article as the title of the article.
Language list	Select a language for the selected article. This field appears if the translations of the knowledge article in other languages are available.
Knowledge article content	View the text and images of the knowledge article.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Knowledge article view page in Knowledge Management Service Portal (continued)

UI component	Description
	View who authored the article and when as well as the number of views (including multiple views from the same user) the article has.
Copy Permalink	Click **Copy Permalink** to copy the URL of the latest article version to the clipboard. **Note:** The version of the article that loads for the user using the permalink depends on their level of access to the article. Users with view access will see the most recent published version. Users with contribute access will see the most recent version of the article, even if it is a draft.
Helpful?	Provide feedback on an article by marking it as helpful or not. View a percentage value of how many other users found the article helpful.
Rate this article	Rate a knowledge article.
Click here to comment to this article	Add a comment to an article
Attachments	View a list of article attachments if the **Display Attachment** field for the article is enabled.
Related Items	View a list of catalog items mapped to the article. The section appears only when the related catalog items are available for the selected article.
Related Articles	View a list of related articles with information similar to the selected article. The related articles are manually mapped, automatically predicted, or both. The manually mapped articles appear first in the section. The section appears only when the related articles are available for the selected article.
Affected Products	View a list of which products were affected.
Most Recent tasks	View a list of tasks, such as incidents, cases, problems, and so on, recently associated with the article.
Most Useful	View a list of knowledge articles that users found most useful.
Search bar	Use the search bar to start a new search. The search is executed in the current portal where you are viewing the article.

Note:

- If enabled, users can subscribe to articles, view article versions, and create feedback for articles that are rated as not helpful.
- The dynamic titles don't apply to the knowledge article view page in the Knowledge Management Service Portal.

Knowledge article URL parameters

You can add parameters to an article URL to view the latest version and an existing translation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Knowledge article URL structure

The knowledge article URL appears in the following structures:

- Accessed from **Service Portal**: `https://<instance-name>.service-now.com/kb?id=kb_article_view&sysparm_article=<article number>&sysparm_language=<language code>`

  For example, the URL `https://yourbusiness.service-now.com/kb?id=kb_article_view&sysparm_article=KB0010053&sysparm_language=EN` returns the article with the most recent version in the selected language, if the translation for the selected language exists.

  Note:
  If you open an article with sysparm_article and sys_kb_id parameters that belong to different articles, the article loads based on a sysparm_article.

- Accessed from **Knowledge Base View (kb_view) UI page**: `kb_view.do?sysparm_article=<article number>&sysparm_language=<language code>'`

  For example, the URL `https://yourbusiness.service-now.com/kb_view.do?sysparm_article=KB0010044&sysparm_language=en`returns the article with the most recent version in the selected language, if the translation for the selected language exists.

Note:
The listed parameters can include the sys_id in the url parameter.

Parameters

The following parameters are available for knowledge article URLs.

Parameter	Possible values
sysparm_article	Returns the most recent article version. For example, `https://yourbusiness.service-now.com/kb?id=kb_article_view&sysparm_article=KB001005`
sysparm_language	Returns the most recent article version in the input language if a translation exists. For example, `https://yourbusiness.service-now.com/kb?id=kb_article_view&sys_id=3b07857187032100d`

Managing email notifications in Knowledge Management

Reminders enable relevant users to review knowledge articles and complete tasks associated with them.

By default, the Knowledge Management application includes the following types of email notifications:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Email notifications for knowledge article feedback tasks.
- Email notifications for knowledge subscriptions.
- Email notifications for knowledge article approval publishing workflow.
- Email notifications for translation tasks.
- Email notifications for expiring knowledge articles.
- Email notifications for article quality index (AQI) reviews.

You can decide if you must receive any knowledge notifications by setting notification preferences. For more information, see Set knowledge notification preferences.

Email notifications for knowledge article feedback tasks

The email notifications for knowledge article feedback tasks are available when your administrator activates the Knowledge Management Core plugin (com.glideapp.knowledge).

The following table describes the recipient list of notifications for knowledge article feedback tasks and the associated conditions when a notification is sent.

Recipient list of the email notification for knowledge article feedback tasks

Notification	Condition	Recipients
KM Feedback Task: Commented	A comment was added to a user feedback task.	User who was assigned the feedback task
KM Feedback Task: Created	A user feedback task was created.	User who was assigned the feedback task
KM Feedback Task: Info from Submitter	More information was requested from the submitter of a user feedback task.	User who submitted the feedback task
KM Feedback Task: Reassigned	A user feedback task was reassigned.	User who was reassigned the feedback task
KM Feedback Task: Resolution Accepted	A resolution described in a user feedback task was accepted.	User who was assigned the feedback task
KM Feedback Task: Resolution Rejected	A resolution described in a user feedback task was rejected.	User who was assigned the feedback task
KM Feedback Task: Resolved	A user feedback task was set as resolved.	User who submitted the feedback task

Email notifications for knowledge subscriptions

The email notifications for knowledge subscriptions are available when your administrator activates the Knowledge Management Core plugin (com.glideapp.knowledge). For notifications associated with ownership groups, your administrator must also activate the Knowledge Management Advanced plugin (com.snc.knowledge_advanced).

The following table describes the recipient list of notifications for knowledge subscriptions and the associated conditions when a notification is sent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Recipient list of the email notification for knowledge subscriptions

Notification	Condition	Recipients
KM Subscription Group: Article checkout	A subscribed knowledge article was checked out	• Author (if no Ownership group is associated with the article) • Ownership group manager and members (if an Ownership group is associated with the article) • Revisers **Note:** The user who checked out the article does not receive the notification.
KM Subscription Group: Article commented	A comment was added to a subscribed knowledge article	• Author (if no Ownership group is associated with the article) • Ownership group manager and members (if an Ownership group is associated with the article) • Revisers
KM Subscription: Article published	A knowledge article was created in a subscribed knowledge base	• knowledge base owner • Knowledge base subscribers
KM Subscription: Article revised	A subscribed knowledge article was edited	• Knowledge base owner • Knowledge article subscribers • Author • Revisers
KM Subscription: Article revised in subscribed KB	A knowledge article in a subscribed knowledge base was edited.	• Knowledge base owner • Knowledge article subscribers • Author • Revisers • Knowledge base subscriber

Note:
An email notification is sent to a reviser of a knowledge article when the article versioning feature is enabled.

Email notifications for knowledge article approval publishing workflow

The email notifications for knowledge article approval publishing workflow are available when your administrator activates the Knowledge Management Core plugin (com.glideapp.knowledge).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following table describes the recipient list of notifications for the knowledge article approval publishing workflow and the associated conditions when a notification is sent.

Recipient list of the email notification for the knowledge article approval publishing workflow

Notification	Condition	Recipients
KM: Approve article for publishing	A knowledge article was approved for publishing with the ownership group feature disabled.	Knowledge base owner and managers
	A knowledge article was approved for publishing with the ownership group feature enabled.	Ownership group manager and members
	Note: In Out-of-Box (OOB) configurations, the approval is sent only to the author.	
KM: Article approved for publish	A knowledge article was approved for publication.	User (author or reviser) who submitted the article for approval
KM: Article rejected for publish	A knowledge article was rejected for publication.	User (author or reviser) who submitted the article for approval

Note:
An email notification is sent to a reviser of a knowledge article when the article versioning feature is enabled.

Email notifications for translation tasks

The email notifications for translation tasks are available when your administrator activates the Knowledge Management Advanced plugin (com.snc.knowledge_advanced) and I18N: Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2). The 18N: Internationalization plugin (com.glide.i18n) activates the I18N: Knowledge Management Internationalization Plugin v2 plugin.

The following table describes the recipient list of notifications for translation tasks on knowledge articles and the associated conditions when a notification is sent.

Recipient list of the email notification for translation tasks

Notification	Condition	Recipients
KM Translation Task: Assigned to me	A translation task was assigned.	User who was assigned the translation task

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Recipient list of the email notification for translation tasks (continued)

Notification	Condition	Recipients
KM Translation Task: Closed	A translation task was closed after the translated version of the knowledge article was published.	• User who was assigned the translation task • User who submitted the translation task

Email notifications for expiring knowledge articles

The email notifications for expiring knowledge articles are available when your administrator activates the Knowledge Management Core plugin (com.glideapp.knowledge) and sets the value of the *glide.knowman.enable_article_expiry_notification* property to `true`. By default, the property value is set to false.

Knowledge articles have an expiration date set using the **Valid to** field when creating the article. Articles do not appear in search results after the Valid to date.

On the first day of each month, the application sends an email notification to a list of authorized recipients to remind them about articles that are scheduled to expire in the next month. The user can then determine whether to extend the **Valid to** date to continue providing access to the article.

Note:
To extend the **Valid to** date of a knowledge article, see Edit a knowledge article

The content of the email notification is determined by the number of articles expiring in the coming month.

- Up to 10 – The email notification includes a list of article links displayed in a tabular format and arranged in ascending order by their Valid to date. Clicking a link opens the article in ServiceNow AI Platform.
- More than 10 – The email notification includes a **View the list of expiring articles** link, which when accessed opens a list in ServiceNow AI Platform of all articles expiring in the next month.

The following table describes the recipient list of notifications for expiring knowledge articles and the associated conditions when a notification is sent.

Recipient list of the email notification for expiring knowledge articles

Notification	Condition	Recipients
KM: Article Expiry Warning	An article is scheduled to expire in the next month with the ownership group feature disabled.	• Author • Knowledge base owner and managers • Reviser for the updated and checked-out versions

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Recipient list of the email notification for expiring knowledge articles (continued)

Notification	Condition	Recipients
	An article is scheduled to expire in the next month with the ownership group feature enabled.	• Author • Knowledge base owner and managers • Reviser for the updated and checked-out versions • Ownership group manager and members

Note:
An email notification is sent to a reviser of a knowledge article when the article versioning feature is enabled.

Email notifications for article quality index (AQI) reviews

The email notifications for an article quality index review on knowledge articles are available when your administrator activates the Knowledge Management Advanced plugin (com.snc.knowledge_advanced).

The following table describes the recipient list of notifications for an AQI review on knowledge articles and the associated conditions when a notification is sent.

Recipient list of the email notification for AQI reviews

Notification	Condition	Recipients
KM: AQI on Article	An AQI was performed and submitted on a knowledge article with the ownership group feature disabled.	User (author or reviser) who last updated the article
KM: AQI on Ownership Group Article	An AQI was performed and submitted on a knowledge article with the ownership group feature enabled.	• User (author or reviser) who last updated the article • Ownership group

Note:
An email notification is sent to a reviser of a knowledge article when the article versioning feature is enabled.

Set knowledge notification preferences

Set notification preferences for knowledge bases and knowledge articles.

Before you begin

Role required: knowledge

About this task

Users can set notification preferences from the Knowledge menu or from the Knowledge Management Service Portal.

Procedure

1. Navigate to the Notification Settings page.
2. Click the Notification Preferences tab.
3. Click **Knowledge Base** and enable or disable the knowledge base notification options.
4. Click **Knowledge Articles** and enable or disable the knowledge article notification options.

Using the homepage of Knowledge Management v3

The Knowledge Management v3 homepage displays knowledge articles organized by knowledge base and category, as well as featured content and popular articles.

To view the default knowledge homepage, navigate to **Self-Service** > **Knowledge**.

Note:

- The knowledge homepage is not compatible with Internet Explorer 9 or earlier. Using one of these browsers will cause you to be redirected to the legacy knowledge portal.
- The Knowledge v3 home page is not customizable. Use the Knowledge Management Service Portal for an easily configurable user experience.
- Starting with the Washington DC release, the Knowledge Management v3 homepage (com.snc.knowledge3) is being prepared for deprecation in the future Y release. It is replaced by the Knowledge Management Service Portal (com.snc.knowledge_serviceportal), which is active by default for customers on Madrid and later releases. For more information about the new experience, see Knowledge Management Service Portal homepage features.

If you access knowledge from a service management application, the knowledge homepage for the associate application opens.

Only published and not yet expired knowledge articles (that is the valid do date not yet reached) appear on the homepage.

From the homepage, you can import a Word document to a knowledge base by clicking **Import Articles**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
From Madrid, you can import a word document from the Import Articles module available in the Application Navigator. This feature is active by default for customers on Madrid and later releases. Existing customers on release versions prior to Madrid use the Word import functionality on the Knowledge V3 homepage. Upgrade customers use the Word import functionality on the Knowledge V3 homepage by default. If required, add the Import Articles module to the Application Navigator. If you add the module, the **Import Articles** button does not appear on the Knowledge v3 homepage.

You can also create a new article using the **Create An Article** button.

- Import a Word document
- Create a knowledge article from an incident in Service Operations Workspace

Note:
You must have contribute access to at least one active knowledge base, otherwise these buttons do not appear. See Configuration tasks for knowledge managers.

You can select a knowledge base to browse articles within that knowledge base. You can view only knowledge bases you can access.

Articles are organized by category or by tag. Categories are listed alphabetically. You can sort content by most recent update or by number of views.

You can comment on an article. There is no HTML formatting available for comments on the Knowledge V3 homepage.

Existing customers on release versions prior to New York can view knowledge article feedback comments in the following ways.

- On the Knowledge v3 homepage.
- If the Knowledge Management — Service Portal plugin (com.snc.knowledge_serviceportal) is installed, on the Knowledge Service Portal.
- If the Use Live Feed for knowledge feedback property is active, in the Live Feed.

For new customers on New York and later releases, comments can only be viewed in the Knowledge Service Portal.

An administrator can configure the knowledge homepage to display the number of articles within each category. This count includes articles from subcategories. To display the article count, set the *glide.knowman.show_number_on_categories* property to `true`.

Related topics

Define a knowledge article category

Import a Word document to a knowledge base using Knowledge Management v3

Import a Word document to a knowledge base

Search using Knowledge Management v3

Search for knowledge articles from the knowledge homepage using the search bar on the Knowledge Management v3 homepage.

Search results include only articles and questions you are authorized to read. The search results count do not take into consideration any security rules set for the articles. The number of articles you can access may be lower than the count displayed in the search results page. Documents that are attached to articles are also listed in the search results.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- To change how the attachments are displayed in the search results, set the **How to display attachments in Knowledge Search Results** *glide.knowman.search.attachment* property. Attachments can be displayed with a text snippet, link only, or not at all.

  Warning:
  Attachments set to display with a text snippet may cause slowness.

- To use wildcards in your search, navigate to **Contextual Search** > **Search Contexts** > **Knowledge Base Search** and select **Enable wildcard searches**.

Sort knowledge content by relevancy, most recent update, or number of views.

Filter results using the check boxes that appear. Filtering options appear depending on the search text. Knowledge homepage; browsing and searching for articles; viewing articles, providing feedback; posting questions; importing/creating articles

Filtering options

Field	Description
Knowledge Bases	Select a knowledge base to search. You can select only knowledge bases you can access. If you do not select a specific knowledge base, search results include articles and questions from all knowledge bases that you can access. You can also select a knowledge base from the choice list in the search bar. For pinned articles, only those in the selected knowledge base in the corresponding language appear.
Categories	Select one or more knowledge categories. Categories are listed alphabetically.
Authors	Select one or more authors.
Language	The multi-language search feature is available when more than one supported language is enabled. **1.** To enable multi-languages, activate the I18N: Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2) or activate one of the internationalization plugins for the language you require. **Note:** Activating internationalization plugins for any of the available languages automatically activates the I18N: Knowledge Management Internationalization Plugin v2 plugin. **2.** To display search results in all available languages simultaneously, enable the *glide.knowman.enable_multi_language_search* property.

Field	Description
	a. Navigate to **Knowledge** > **Administration** > **Properties** > **Knowledge Search Properties** > **Enable multi language search** and select the **Yes** check box. **b.** Enter `sys_properties.list` in the filter navigator, search for the property to configure, and in the **Value** field, enter `true`. **Note:** By default, the *`glide.knowman.enable_multi_language_search`* property is not enabled. Search results are displayed based on the language you select in the language filter on the Search page.

Note:

Starting with the Washington DC release, the Knowledge Management v3 homepage (com.snc.knowledge3) is being prepared for deprecation in the future Y release. It is replaced by the Knowledge Management Service Portal (com.snc.knowledge_serviceportal), which is active by default for customers on Madrid and later releases. For more information about the new experience, see Knowledge Management Service Portal homepage features.

Knowledge Management properties

Import a Word document to a knowledge base using Knowledge Management v3

Import a Microsoft Word document using Knowledge Management v3 homepage to create a knowledge article.

Before you begin

You must have contribute access for at least one active knowledge base.

Note:

Starting with the Washington DC release, the Knowledge Management v3 homepage (com.snc.knowledge3) is being prepared for deprecation in the future Y release. It is replaced by the Knowledge Management Service Portal (com.snc.knowledge_serviceportal), which is active by default for customers on Madrid and later releases. For more information about the new experience, see Knowledge Management Service Portal homepage features.

The **Import Articles** button does not appear in the following conditions:

- The Import Articles module is available in the application navigator.

  Note:
  Beginning with Madrid, the Import a Word document feature is enabled by default and the Import Articles module is displayed in the application navigator. The Import a Word document feature isn't enabled automatically for the existing customers who can continue using the **Import Articles** option on the Knowledge Management v3 page. For more information, see Import a Word document to a knowledge base.

- You cannot contribute to any knowledge base.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
An administrator can control the visibility of the **Import Articles** button by setting the other knowledge property **Hide the 'Import' functionality (button and drag-n-drop) for all users** (*glide.knowman.import.hide_import_functionality*) to true.

Role required: None

About this task

You can import Microsoft Word documents in the .doc and .docx file formats.

Note:
The file extension must be lowercase.

When you import a document, text content from the document is used to create the knowledge article. The articles support all editing functions supported by the TinyMCE editor. All HTML supported by TinyMCE such as tables, lists, and links, as well as styling such as bold and italics, are preserved. Images from the document are added as attachments to the knowledge article and embedded in the article body.

Note:

You can import multiple files at a time. Closing the browser or navigating away cancels any in-progress uploads but does not delete articles created from completed imports.

You cannot import documents to knowledge from mobile devices.

The following styles and elements are preserved when importing a .doc or .docx file into a knowledge base. Styles and elements not included in this list may not be preserved when importing a document.

- Titles
- Headings

  Note:
  Only default heading settings are supported. For any headings and subheadings with numbers, the numbers are not imported.

- Images

  Note:
  Images may not be aligned exactly as in the Word document you import.

- Links

  Note:
  Links are preserved for documents with .docx format only.

- Bold text
- Italic text
- Underlined text
- Ordered and unordered lists

  Note:
  After import, the bullets in an unordered list are replaced with dots.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Tables

> **Note:**
> Only default heading settings are supported. Custom heading styles are imported using the default settings for those styles. Table styling and borders are not supported.

Procedure

1. Navigate to **All** > **Self-Service** > **Knowledge**.
2. Select one or more document files and drag onto the knowledge homepage.
3. Select the **Knowledge base** to add the new article to.
   You can select only knowledge bases you can contribute to.
4. **Optional:** Select a **Category** from within that knowledge base.

   > **Note:**
   > Use the category picker to add a category. The picker does not differentiate between the different category levels. You can select a category or sub category and add it to the **Category** field.

5. **Optional:** Select the **Publish** check box to start the publishing workflow for each imported article immediately after the import finishes.
   This check box applies only when importing to v3 knowledge bases and only if the **Show publish checkbox on the knowledge import pop-up** property is set to **Yes** on the Knowledge Management properties form. You cannot automatically publish articles imported to v2 knowledge bases.

   Knowledge v2 articles go into **Draft** state. Knowledge v3 articles go into **Review** or **Published** state, depending on the workflow attached to the knowledge base (Approval Publish or Instant Publish).

6. Select **Import**.

   A new article is created in the selected knowledge base and category using the content from the uploaded document. If you uploaded multiple documents, one article is created for each. If you use knowledge internationalization, the language of the new article is set to the currently selected system language.

   After the upload completes, a popup window appears displaying the number and short description of the newly-created articles. Click an article to view the full record.

   If any errors occur during the upload, a popup window appears to display the error.

Request a knowledge base

If existing knowledge bases do not fit your needs, you can request a new knowledge base through the service catalog. If the request is approved, you are added as the owner of the new knowledge base.

Before you begin

Role required: none

About this task

If no knowledge base exists that fit your needs, all users can request a new knowledge base.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Self-Service** > **Service Catalog**.
2. Select **Can We Help You?**.
3. Select the **Request Knowledge Base** catalog item.
4. Enter the reason you want the knowledge base, and a name for the knowledge base.
5. Click **Submit**.

What to do next

You are notified when the request is approved or rejected. If the request is approved, you are added as the owner of the new knowledge base. You can then assign managers and manage articles in the new knowledge base.

Knowledge bases created through this request process are inactive by default, so you must activate the knowledge base to make it available for users.

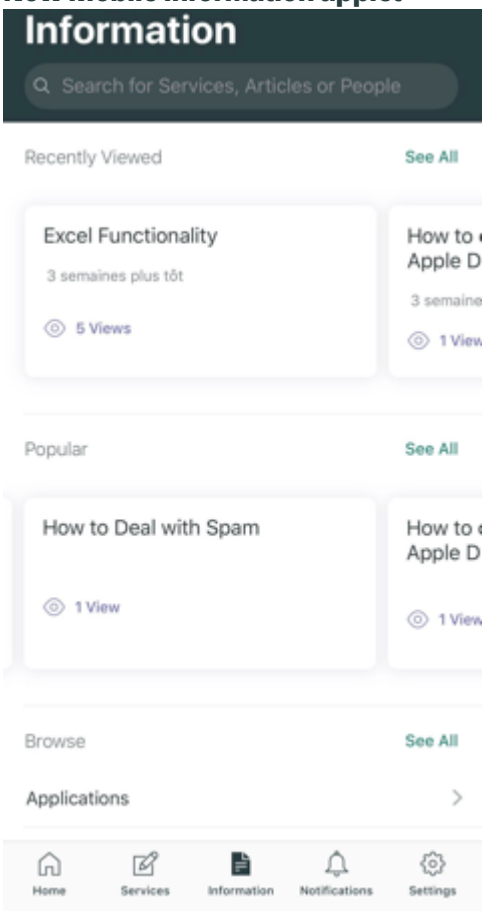
Using Now Mobile for Knowledge Management

Access knowledge articles from anywhere using the Information applet on the Now Mobile app. You can view recently viewed and most popular articles, search for articles, browse articles by category, and provide feedback for articles.

To access articles from the Information applet on the Now Mobile app, you must first download the ServiceNow mobile application on an iOS platform from the Apple App Store or on an Android platform from the Google Play Store.

Now Mobile Information applet



Make sure your administrator has activated the Now Mobile app. For more information, see Now Mobile app.

After you access an article, you can view the author, published date, number of views, and the overall rating details of the article. In addition, you can respond to and evaluate articles and view related items, related articles, and attachments.

Using Now Mobile app, even external users can access and provide feedback to the knowledge articles. For more information about external user functionalities and capabilities, see Mobile external users.

Activation information

The Information applet is available on the Now Mobile app. The ServiceNow Mobile Request - Knowledge Management Screens and Applet Launcher plugin (com.glideapp.knowledge.mobile_requestor) activates the Information applet. The Information applet is activated by default for both new and upgrade customers.

View the most popular or recently viewed articles in the Now Mobile Information applet

The Information applet on the Now Mobile app enables you to access knowledge articles from a mobile device.

Before you begin

You can specify user criteria for an article to control which users can read the article. If no user criteria is defined for an article, all users can read the article.

Procedure

1. Access your instance using the mobile application.
2. On the Now Mobile app, tap **Information**.
3. Access your recently viewed or the most popular knowledge articles

Information applet article views

Section	Description
Recently Viewed	Up to five of the articles you viewed within the last 30 days.
Popular	Up to five of the most popular knowledge articles. The Now Mobile app homepage includes a similar section that displays up to three of the most popular articles.

Note:
Tap **See All** to view the complete list of articles within the selected section.

Related topics

Manage ownership groups

Create ownership groups and associate them to knowledge articles. Knowledge group managers or knowledge administrators can edit ownership groups.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

The Knowledge Management Advanced plugin (com.snc.knowledge_advanced) must be activated.

Role required: Users with the knowledge_domain_expert or knowledge_admin roles can create ownership groups.

Users with the knowledge_group_manager or knowledge_admin roles can edit ownership groups.

About this task

Create an ownership group by adding members and a manager. Knowledge administrators approve ownership groups.
When knowledge articles are created, ownership groups can be associated to them. Ownership groups manage article approvals and feedback and can edit and retire knowledge articles that they are associated with.

Knowledge group managers can edit ownership groups managed by them by adding or removing members without the need for approval. They cannot change the manager assigned in their groups. Only knowledge administrators can reassign managers.

Procedure

1. Navigate to **All** > **Knowledge** > **Ownership Groups** > **Manage Group**.
2. To create an ownership group, from the Request Type list, select **Create Ownership Group**.

   Note:
   To edit an existing ownership group, from the Request Type list, select **Edit Ownership Group**.

3. Fill in the fields on the form.

Manage Knowledge Ownership Group form

Field	Description
Name	Name of the ownership group.
Group email	An email address for the ownership group. Emails are sent to group members in these cases. ○ Activity on articles they are associated with, for example, comments. ○ Article quality checks (AQI) performed on articles they are associated with. If no group email is defined, emails are sent to individual group member emails.
Description	Description that defines the ownership group.
Manager	Manager for the ownership group.
Group members	Members of the ownership group.

4. Click **Order Now**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The ownership group is sent to the knowledge administrator for approval. Once approved, the ownership group is ready to use and associate to a knowledge article.

Note:
You can also create an ownership group from an existing group.

a. Navigate to **System Security** > **Users and Groups** > **Groups**.

b. Click a group.

c. In the **Type** field, enter `Knowledge`.

Note:
If the **Type** field does not appear on the form, configure the form layout to add it.

d. In the **Manager** field, enter a manager and add the role knowledge_group_manager.

e. In the Roles related list, click **Edit** and add the role knowledge_group_member to the group.

Use article versioning

Use article versioning to create and maintain multiple versions of a knowledge article.

Manually update customized files

If you have customized any of the files that are updated as part of the Knowledge Management Advanced Installer plugin, these files are skipped during plugin activation and must be updated manually.

Manually update your customization to include the article versioning-related changes.

- Add the **Version** field to the Knowledge form layout and the Knowledge list view, if it is not already present.
- Add the **outdated** choice to the **Workflow** choice list field on the Knowledge form, if it is not already present. Keep the value as **outdated** because of dependencies that article versioning functionalities have on this choice.
- Update the **Knowledge** > **My Flagged** and **Self-Service** > **My Knowledge Articles** modules to include the following condition in the **Filter** field, if these modules do not already reflect this change: **Revised by is (dynamic) me**.

If you have customized any of the Knowledge Management Overview dashboard reports, these files are also skipped during plugin activation and must be updated manually.

Check out a published article and create a new version

Create a new version of a knowledge article by checking out the latest published version.

Before you begin

Roles required: knowledge owner, knowledge manager, or knowledge administrator

About this task

You cannot check out a published article unless there is already a checked out version. If a version has been checked out, the **Checkout** button does not appear on the Knowledge form header and you cannot edit the knowledge article. To make changes, you must first publish the knowledge article.

When you check out an article, the default value of **Valid to** field of the article is derived from the **Article Validity** field configured for the knowledge base (see Create a knowledge base). If the **Article Validity** field is blank, the date in the **Valid to** field date is set to January 1, 2100. An article author or editor can select whether to keep or change the default **Valid to** date.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When you check out an article, attachments from the article's base version are copied into the new article version and relative paths to these attachments are also updated.

Note:
For article versions that were created in the previous releases, the relative paths to the attachments may not be updated. To update them, activate and run the *Fix attachment links on article versions* fix script.

Procedure

1. Navigate to **All** > **Knowledge** > **Articles** > **Published**.
2. Select the desired article from the list.
3. Click **Checkout** in the Knowledge form header.
   The system creates a new version of the knowledge article and displays a message to the user. The article number for the new version remains the same, the version number is increased by 0.01, and the state changes to **Draft**.
4. Make your changes and click **Publish**.
   The new version of the article is added to the Knowledge list and to the **Article Versions** related list on the Knowledge form.

Revert an outdated article to the current state

Use an outdated version of an article to create a new version.

Before you begin
Roles required: knowledge base owner, knowledge_manager, knowledge_admin

About this task
This action is available for earlier published version that have a state of **Outdated** and only when there is no checked out version. If a version has been checked out, the **Make this current** button does not appear on the Knowledge form header.

Procedure

1. Navigate to **Knowledge** > **Articles** > **All**.
2. Open an article in the **Outdated** state.
3. Click **Make this current** in the Knowledge form header.
   The system displays the Knowledge form. The version number increments to the latest version number plus 0.01 and the state changes to **Draft**. For example, if the latest published version of an article is 3.0 and you select the outdated 1.0 version to become the current version, the version number increments to 3.01.

View all versions of an article

View a list of all available versions for a selected knowledge article and then view the selected version in a new tab.

About this task
The list of all available versions for a selected knowledge article is displayed in the **Article Versions** related list on the Knowledge form. Users with read access can see major versions. Users with contribute access can see major and minor versions.

Procedure

1. Navigate to **Knowledge** > **Articles** > **All**.
2. Open the desired article.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Click the **Article Versions** tab to display the related list.
4. Click **Version** to display the desired article version in a new tab.
5. If desired, click the **View Version** related link to see the article view page.

Compare two versions of an article

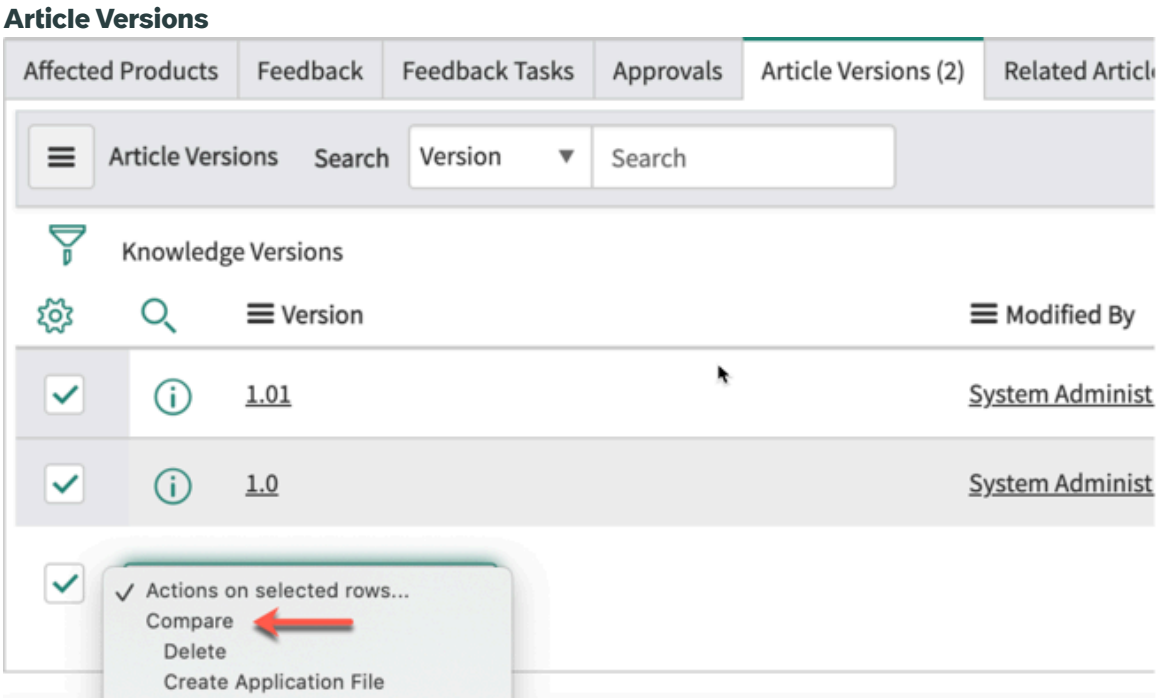
Select and compare two versions of a knowledge article.

Before you begin
Role required: knowledge_manager, knowledge_admin

Note:
For better comparison experience of the knowledge article versions, see Compare knowledge article versions in Agent Workspace.

Procedure

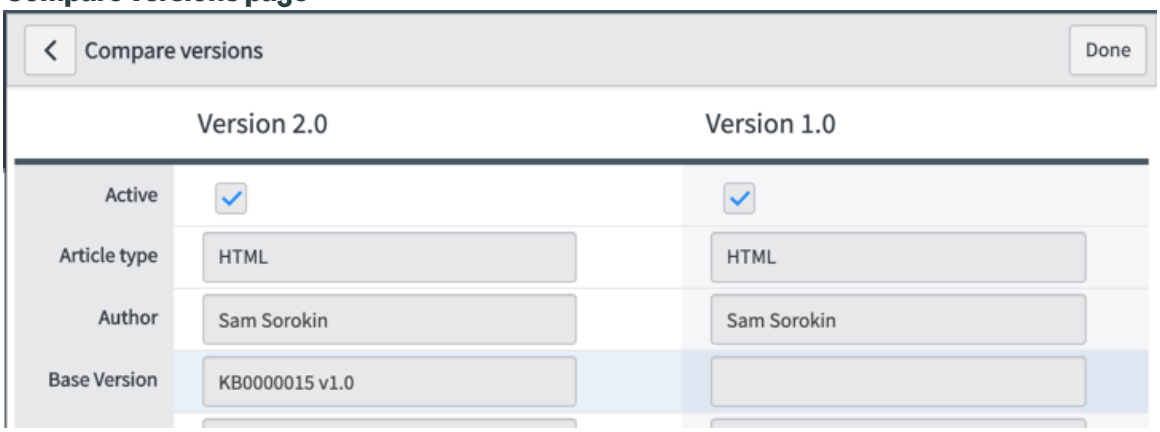
1. Navigate to a **Knowledge** > **Articles** > **All**.
2. Click a knowledge article with multiple versions.
3. In the Article Versions related list, select the check boxes for the two versions of the article to compare.



4. In the Actions on selected rows list, select **Compare** from the list.
The Compare versions page opens and lists the fields (including Article body) for the selected article versions in a side-by-side format. Differences between the two article versions are highlighted.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Compare versions page



5. Click **Done** to return to the Knowledge form.

Retire a versioned article

You can retire the latest published version of a knowledge article. Retiring a knowledge article doesn't create a version. It simply marks the article as **Retired**.

Before you begin

Role required: knowledge administrator, knowledge manager, and latest publisher of the versioned knowledge article (not available for kcs_candidate or kcs_contributor)

About this task

You can only retire an article, which has no checked out version. If a version has been checked out, the **Retire** button doesn't appear on the Knowledge form header.

Note:
For the Knowledge - Approval Retire workflow, this happens only when the retire request is approved.

You can still access outdated articles that have been attached to incidents by navigating to the article view page with the sys_id of the article. Outdated articles include a message that an updated article is available.

If versioning is disabled, only the latest version of the article is shown in search results and list views.

Retired knowledge articles can't be searched by external users or customers. To reuse a retired article, create an article with the same content, which is published once approved.

Beginning with the Utah release, you can give a replacement article while retiring a knowledge article. When the retired article is accessed, you will automatically be redirected to the replacement article with a display message `The article KBxxx is retired and has been replaced with the knowledge article KBxxx`. If no replacement article is available, the page displays the message `Knowledge record not found`.

- Article with replacement returns a 301 code.
- Article without any replacement returns a 404 code.
- By default, the *`glide.knowman.enable_article_replacement_on_retire`* system property is set to true to give a replacement article for a retired article. The setup to redirect an article to a replacement article is set by default.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Knowledge** > **Articles** > **Published**.
2. Select an article.
3. Click **Retire** in the Knowledge form header.
   The system returns to the Knowledge list. The state of the article changes to **Pending retirement** and the state of previously published versions change to **Outdated**.

> **Note:**
> You can't check out or edit a retired article.

Result
The selected article is retired and can be accessed from **Knowledge** > **Articles** > **Retired**

Disable the article versioning feature

Users with the system administrator role can disable the article versioning feature by setting a property.

Before you begin
Role required: admin

About this task
The **Enable article versioning feature**(glide.knowman.versioning.enabled) property controls the article versioning feature. Setting this property to **false** disables the article versioning feature. Once disabled:

- The **Version** field is removed from the Knowledge form. The **Version** column remains on the Knowledge list and can be removed manually.
- The **Article Versions** related list is removed from the Knowledge form.
- The **Recall**, **Checkout**, and **Make this current** buttons are removed from the Knowledge form.
- Outdated articles are removed from Knowledge list views.
- The version history does not appear on the article view page.

Articles continue to be versioned in the background. Minor versions are incremented until an article is published and then the version number is increased to the next major version.

Users can still access outdated articles that have been attached to incidents. Outdated articles include a message that an updated article is available.

Procedure

1. Navigate to **All** > **Knowledge** > **Administration** > **Properties**.
2. Locate the **Enable article versioning feature** property in the Article Versioning Properties section.
3. Click the check box to disable the property.
4. Click **Save**.

Using knowledge blocks

Use knowledge blocks to simplify knowledge authoring for writers and knowledge consumption for readers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a knowledge block

Create or modify a knowledge block to define a reusable piece of content that can be inserted into knowledge articles in a knowledge base. The knowledge block is secured by user criteria, which controls what users, groups, roles, companies, locations, or departments can read or not read the content in an article or search, enabling users to more easily view content that is relevant to them.

Before you begin

Activate knowledge blocks

Role required: user must have contributor access to the knowledge base.

Procedure

1. Navigate to **All** > **Knowledge** > **Knowledge Blocks** > **Create New**.
2. Click **New** or open a record.
3. Fill in the fields on the form.

Knowledge Block form

Field	Description
Number	This field is automatically set to a knowledge block number.
Knowledge base	Name of the knowledge base. The knowledge blocks feature must be enabled for each knowledge base that you plan to create blocks. See Enable knowledge blocks for each knowledge base.
Category	Name of the knowledge category or subcategory.
Ownership Group	Ownership group for the knowledge block. This field appears when the ownership groups feature is enabled. Knowledge blocks can be used with or without the ownership groups feature. To learn more about ownership groups, including how to enable the feature, see Ownership groups.
Can read	User criteria to apply for read access at the knowledge block level. User criteria set at the knowledge base and knowledge block level controls which users can read or not read block content within an article. To learn more about selecting user criteria for a knowledge block, see Select user criteria for a knowledge block.
Cannot read	User criteria to apply for cannot read access at the knowledge block level. User criteria set at the knowledge base and knowledge block level controls which users can read or not read block content within an article. To learn more about selecting user criteria for a knowledge block, see Select user criteria for a knowledge block.
Valid to	Date that the knowledge block expires. After the valid to date:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Knowledge article viewer will no longer display expired knowledge block content in the associated knowledge article. ○ Search will no longer return knowledge articles if the keywords are contained in the expired blocks.
Short Description	Description of the knowledge block.
Text	Text of the knowledge block.
Version	This field is automatically set to a version number when the article versioning feature is enabled. Knowledge blocks can be used with or without the article versioning feature. To learn more about article versioning, including how to disable the feature, see Article versioning.
Article type	This field is automatically set to HTML. **Note:** Knowledge blocks are only supported with HTML knowledge articles.
Workflow	This field is automatically set to the publication state of the block, such as Draft, Published, or Retired.
Source task	Not applicable.

4. Click **Save** or **Update** to create or update the block.
5. Click **Publish** to publish the block.

Note:
Any additional steps required to publish the knowledge block, such as approvals, depend on the publishing workflow for the knowledge base. See Knowledge workflows for more information.

What to do next
After the knowledge block is published, you can add the block to an article within the knowledge base.

Select user criteria for a knowledge block

Control which users can read or not read knowledge block content within an article in a knowledge base by setting user criteria at the knowledge base and knowledge block level. As a knowledge contributor, you can apply user criteria at the knowledge block level.

Before you begin
Activate knowledge blocks

Role required: knowledge_admin or admin

Procedure
1. Navigate to **Knowledge** > **Knowledge Blocks** > **All**.
2. Open a knowledge block.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

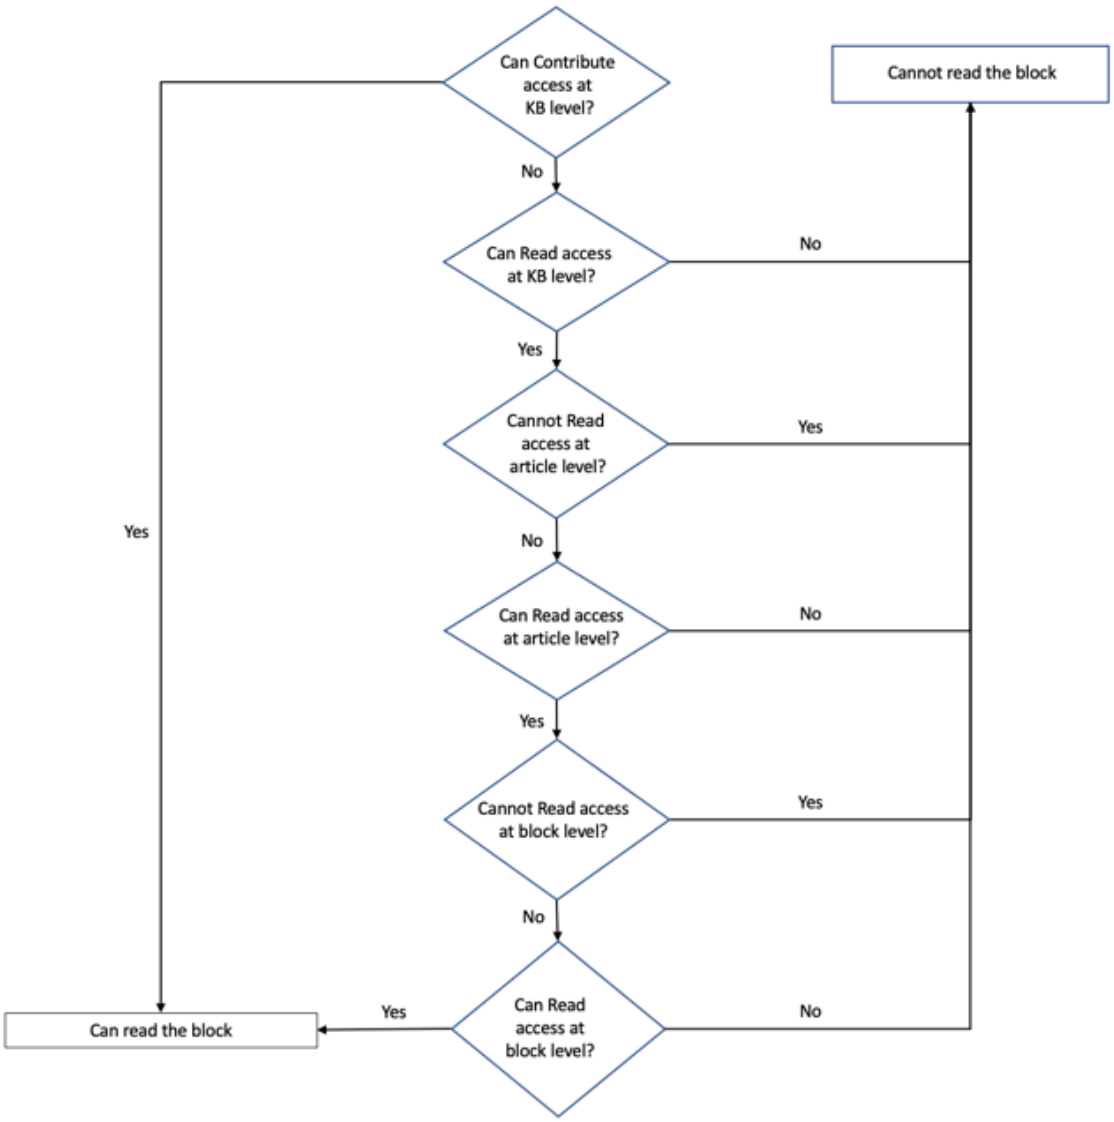
3. Apply the desired user criteria for the **Can Read** and **Cannot Read** fields.

Name	Description
Can Read	User criteria to apply for read access at the knowledge block level.
Cannot Read	User criteria to apply for cannot read access at the knowledge block level.

Note:

- You can use existing or create new user criteria records. To create a new record, see Create a user criteria record in Knowledge Management.
- If a user meets any **Can Contribute** criteria at the knowledge base level, they can read all knowledge block content, regardless of the **Can read** and **Cannot read** criteria set at the knowledge block level.
- If a user meets any **Cannot read** criteria at the knowledge block level, they cannot read the block content, regardless of the **Can read** criteria set at the knowledge block level.
- If a user has access to knowledge article and doesn't have access to one or more blocks within article then user can still read the content but without specify block content.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Right-click the form header and click **Save**.

What to do next

- To finish and publish the block, see Create a knowledge block.
- To add the block to an article, as well as preview the article by impersonating different users, see Add knowledge blocks to a knowledge article.

Retire a knowledge block

You can retire a published knowledge block so that it's no longer available for users to view or search.

Before you begin

Role required: user must have contributor access to the knowledge base.

Procedure

1. Navigate to **All** > **Knowledge** > **Knowledge Blocks** > **Published**.
2. Open the applicable record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select **Retire** to retire the knowledge block.

Note:

- Starting from the Yokohama release, you can retire the knowledge block attached to an article by setting the (*glide.knowman.allow_retire_block*) system property to true.
- Any additional steps required to retire the knowledge block, such as approvals, depend on the workflow for the knowledge base. See Knowledge workflows for more information.
- A knowledge block can only be deleted if it's not being used in any knowledge article, including any retired article or previous version of an article.

Result
The retired knowledge block is no longer visible in the article.

Add knowledge blocks to a knowledge article

You can insert one or more knowledge blocks into a knowledge article within a knowledge base. Each knowledge block is secured by user criteria, which controls who can read or not read the content in an article.

Before you begin
Activate the Knowledge Management Advanced plugin

Role required: user must have contributor access to the knowledge base.

Procedure

1. Navigate to **All** > **Self-Service** > **My Knowledge Articles**.
2. Click **New** or open a record.
   On clicking **New**, you are provided options to select an article template. The article templates appear when you activate them in the **Knowledge** > **Article templates**.
3. Select an article template.

Note:
You can add or remove knowledge blocks in more than one HTML field of any article template including custom templates.

4. Fill in the fields on the form, as appropriate.
   For more details on creating a knowledge article, see Create a knowledge article from an incident in ITSM Agent Workspace.

Note:
Knowledge blocks are only supported with HTML knowledge articles. Make sure that the **Article type** field is set to **HTML**.

5. In the article body, click where a block needs to be inserted and then click **Add Blocks**.

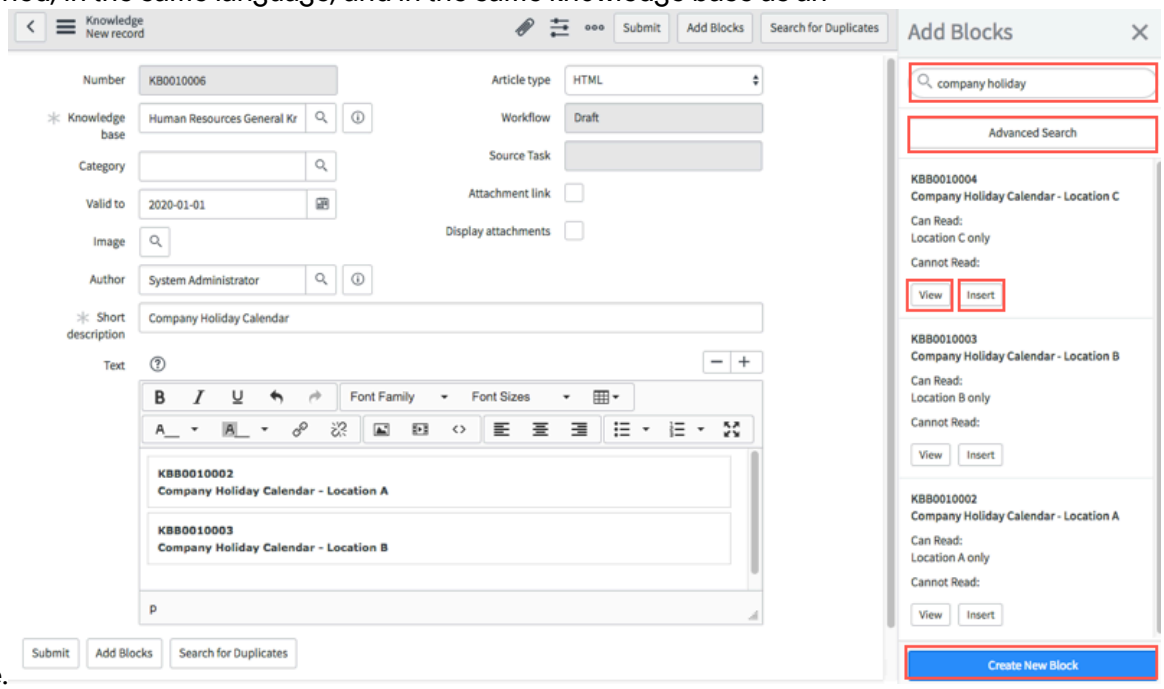
   If the **Add Blocks** button is not visible, make sure that the knowledge blocks feature is enabled for the knowledge base that the article is in. See Enable knowledge blocks for each knowledge base for more information.

Note:
Blocks can be added to only the text field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In the **Add Blocks** side panel, you can search for, do an advanced search, view, and insert knowledge blocks into the article. To use condition builder with advanced search, see Condition builder. You can also create blocks directly from the side panel.

- You can configure the number of search results displayed in the **Add Blocks** side panel using the *glide.knowman.add_blocks.search_results* property. By default, the minimum number of search results displayed is 6 and the maximum number of search results displayed is 25. See Knowledge properties for more information.
- If there are knowledge blocks you cannot find, make sure that the blocks are published, in the same language, and in the same knowledge base as an article.

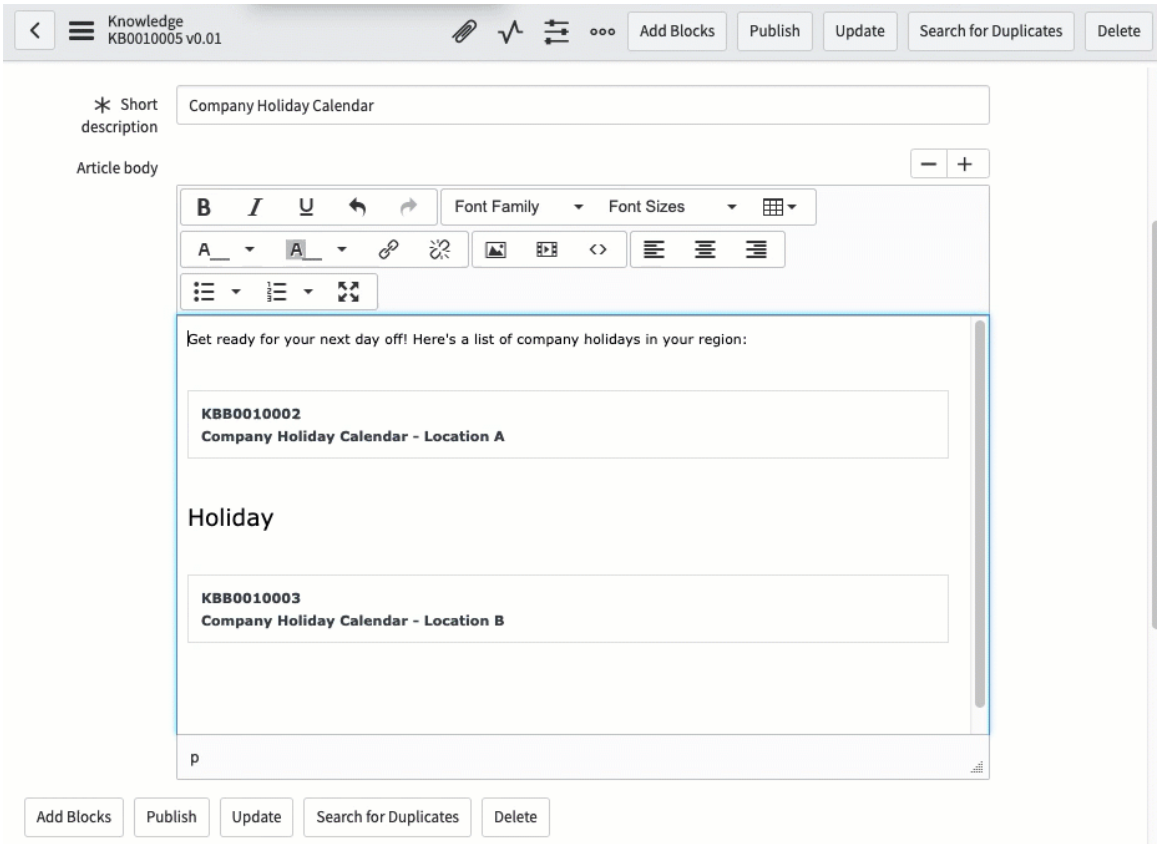


6. **Optional:** Rearrange knowledge block in the article body.

Example

(Optional) The following GIF shows an example of a user moving a knowledge block within an article using a keyboard.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



7. Click **Save** or **Update** to create or update the article.

> **Note:**
> You can preview the article with the blocks by user or, if published, date. See Preview a knowledge article with knowledge blocks for more information.

8. Click **Publish** to publish the article.

> **Note:**
> Any additional steps required to publish the knowledge article, such as approvals, depend on the publishing workflow for the knowledge base. See Knowledge workflows for more information.

Preview a knowledge article with knowledge blocks

Preview a knowledge article with knowledge blocks by user or, if published, by date. For an unpublished article, you can preview the article by user by impersonating different users to see how the article displays or hides block content (based on the user criteria set at the knowledge base and knowledge block level). For published articles, you can preview the article by both user and date to see how the article appears in past versions for different users.

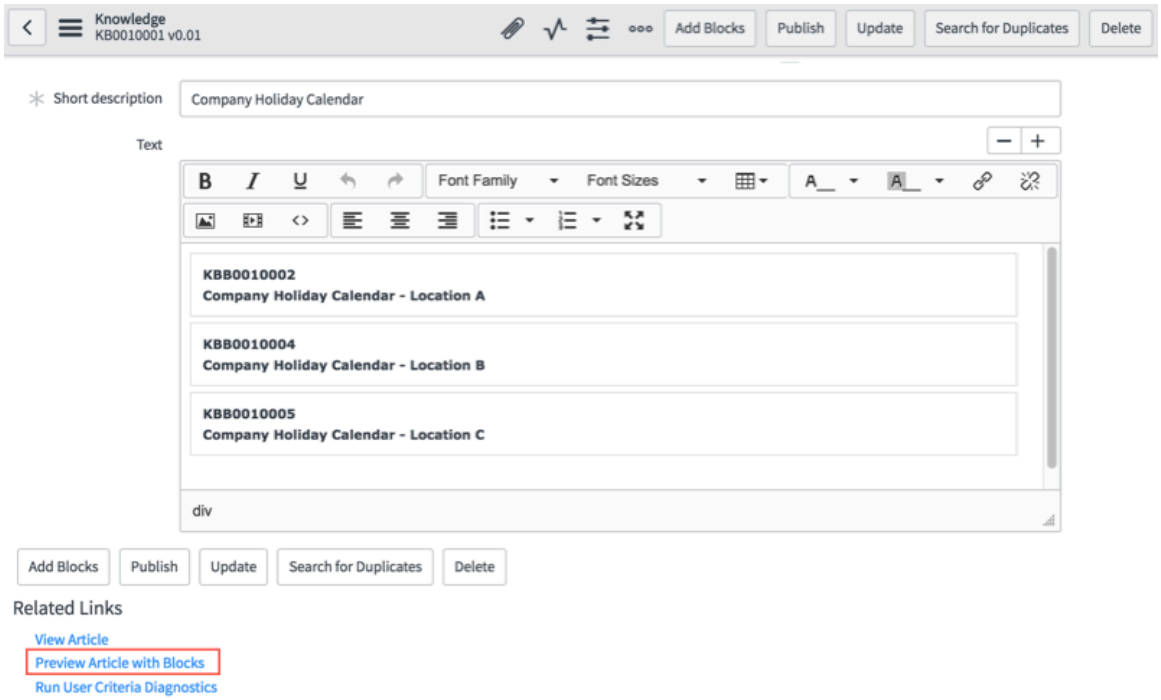
Before you begin

Role required: user must have contributor access to the knowledge base.

Procedure

1. Navigate to **All** > **Knowledge** > **Articles**, and open one of the modules, such as **Unpublished** or **Published**.
2. Open the knowledge article with knowledge blocks.
3. In the **Related Links** section, click **Preview Article with Blocks**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Preview the article as one of the following.

Knowledge blocks authoring in Agent Workspace

Reuse content by creating, editing, and publishing knowledge blocks in Agent Workspace.

You can perform the following knowledge blocks-related tasks in Agent Workspace:

- Create a knowledge block for a knowledge base.
- Manage all unpublished and published knowledge blocks authored by you.
- Add knowledge blocks to a knowledge article.

  When adding a knowledge block to a knowledge article, you can also add knowledge blocks to any fields associated with an article template if used for an article.

- Retire a knowledge block not used in any knowledge articles.

View a knowledge block in Agent Workspace

View a knowledge block in Agent Workspace, including the block number, short description, and block content.

Before you begin

You must have read access to the knowledge base that stores the knowledge block you want to view.
Role required: agent_workspace_user and knowledge

Procedure

1. Navigate to **All** > **Agent Workspace** > **Agent Workspace Home**.
2. View knowledge blocks authored by you or by other people.
   - View all blocks by navigating to **Lists** > **Knowledge Blocks** > **All**.
   - View blocks authored by you by navigating to either **Lists** > **Knowledge Blocks** > **Published** or **Lists** > **Knowledge Blocks** > **Unpublished**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Click the link to the knowledge block that you want to view.
4. **Optional:** View another version of the knowledge block by selecting the version in the Version list.

> **Note:**
> The Version list appears only when the article versioning feature is enabled. For more information, see Article versioning.

Result

The selected version of the knowledge block opens within Agent Workspace. Any earlier version of the knowledge block is indicated as outdated. When viewing an earlier version, click the version number of the knowledge block to view a list of all versions.

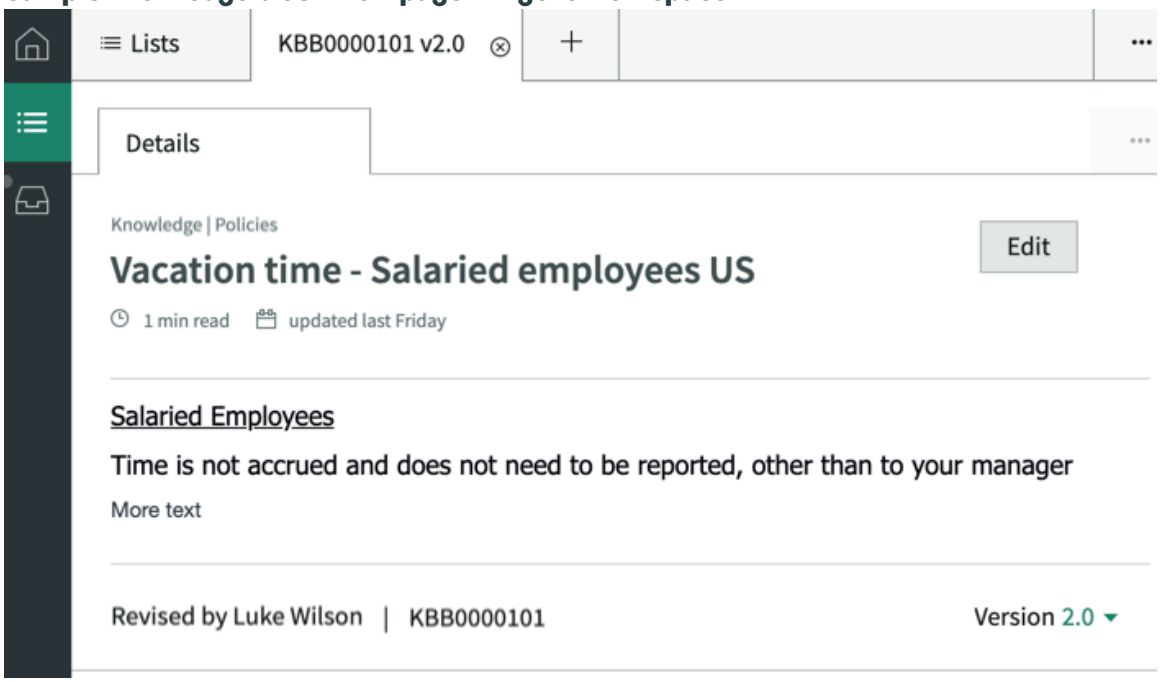
Knowledge block details displayed in Agent Workspace

View the details of a knowledge block in Agent Workspace.

The knowledge block view page in Agent Workspace provides several details about a displayed block.

Sample knowledge block view page in Agent Workspace



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Article information displayed on the knowledge block view page in Agent Workspace

Details	Description
Knowledge base	Knowledge base that stores the knowledge article and the article category. In the figure, Knowledge is the knowledge base and Policies is the knowledge block category.
Read time	Average time to read the knowledge block, which can help you decide whether you have time to read the block. The read time is calculated based on an average reading speed of 200 words per minute. For blocks in languages such as Chinese, Japanese, and Korean, the read time is calculated based on an average speed of 500 characters per minute. If images are present in an article, the read time is calculated using the following rules: • For the first image add 12 seconds, for the second image add 11 seconds, and so on. • If there are more than 10 images, after the tenth image add 3 seconds for each image.
Last updated time	Last time the knowledge block was updated in number of days for the current week, number of weeks, or number of years.
Knowledge block content	Text and images in the knowledge block.
Authored by	Author of the knowledge block. This field appears only in the first version of a knowledge block.
Revised by	User who revised the knowledge block. This field appears if a knowledge block was later edited.
Knowledge block number	Unique number automatically assigned to the knowledge block. In the figure, KBB0000101 is the block number.
Version	Selected version of the knowledge block. This field appears when the article versioning feature is enabled. In the figure, 2.0 is the selected version of the knowledge block.

Create a knowledge block in Agent Workspace

Create a knowledge block for a knowledge base in Agent Workspace to reuse a piece of content in knowledge articles in that knowledge base.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Enable the knowledge blocks feature for the knowledge base where you plan to create blocks. For more information, see Enable knowledge blocks for each knowledge base.
- You must have contribute access to the knowledge base within which you want to create the knowledge block.

Role required: agent_workspace_user and knowledge

About this task

You can also create blocks when accessing an article panel. For more information, see Add a knowledge block to a knowledge article in Agent Workspace.

Procedure

1. Navigate to **All** > **Agent Workspace** > **Agent Workspace Home**.
2. **Optional:** Check whether a knowledge block on this subject is already available.
   a. Navigate to **Lists** > **Knowledge Blocks** > **All**.
   b. Set a filter to search for possible matching knowledge blocks.
      - Click a column header. Based on the data type included in the column, in the Filter section, select the filter options or enter the filter conditions you want to apply. For example, for the Workflow column, you can select the following states:
        - Draft
        - Review
        - Scheduled for publish
        - Published
        - Pending retirement
        - Retired
        - Outdated
      - Click the show filter panel icon ( ), and click **Advanced view**. In the Advanced view dialog box, specify conditions in the **All of these conditions must be met** field and click **Update**.
3. Click **New** in a Knowledge Blocks list.
4. On the Knowledge Block form, fill in the fields.

Field	Description
Number	Unique number for identifying the knowledge block. This field is automatically populated.
Knowledge base	Name of the knowledge base to which you are adding the knowledge block.
Category	Name of the knowledge category or subcategory associated with the knowledge base.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Ownership Group	Ownership group for the knowledge block. This field appears when the ownership groups feature is enabled (see Ownership groups). **Note:** Knowledge blocks can be used without the ownership groups feature.
Can Read	User criteria to apply for read access at the knowledge block level. **Note:** User criteria set at the knowledge base and knowledge block level control which users can read block content within an article. (For more information, see Select user criteria for a knowledge block.)
Cannot Read	User criteria to apply for cannot read access at the knowledge block level. **Note:** User criteria set at the knowledge base and knowledge block level controls which users can read block content within an article. (For more information, see Select user criteria for a knowledge block.)
Valid to	Date that the knowledge block expires. Once the valid to date has passed: ○ The Knowledge article view page no longer displays expired knowledge block content in the associated knowledge article. ○ Knowledge article searches no longer return knowledge articles if the keywords are contained only in the expired blocks.
Short description	Description of the knowledge block.
Article body	Content of the knowledge block.
Version	Version number of the knowledge block. This field is automatically set to a version number when the article versioning feature is enabled. **Note:** Knowledge blocks can be used without the article versioning feature. To learn more about article versioning, including how to disable the feature, see Article versioning.
Article type	Markup language used for formatting the block. This field is automatically set to HTML because

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: knowledge blocks are supported only with HTML knowledge articles.
Workflow	Publication state of the block. This field is automatically set to the publication state of the block, such as Draft, Published, or Retired.

Note: You can ignore the **Source Task** field, which is not used.

5. Click **Save**.
   The knowledge block is saved and appears in the Unpublished list of Knowledge Blocks in Agent Workspace and additional functionality becomes available on the form.
6. **Optional:** Publish the block by clicking **Publish**.

   (Optional) A knowledge block is published depending on the workflow setting of its knowledge base.

   - **Knowledge - Instant Publish**: The knowledge block is immediately published.
   - **Knowledge - Approval Publish**: The knowledge block is published on approval completion.

   When published, your knowledge block appears in the Published and All lists under Knowledge Blocks in Agent Workspace. If the article versioning feature is enabled, the version number of the knowledge block is incremented.

Related topics

Edit a knowledge block in Agent Workspace

Edit a knowledge block in Agent Workspace

Edit knowledge blocks within a knowledge base in Agent Workspace to update the reused content across articles within the knowledge base.

Before you begin

You must have contribute access to the knowledge base that stores the knowledge block you want to edit. By default, the knowledge block doesn't show attached files and it only shows as a link.
Role required: agent_workspace_user and knowledge

Procedure

1. Navigate to **All** > **Agent Workspace** > **Agent Workspace Home**.
2. Go to **Lists** > **Knowledge Blocks** > **All**.
3. Click a knowledge block link.
4. Modify the fields on the Knowledge Block form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- For an unpublished knowledge block, the Knowledge Block form opens when you select the article.
- For a published knowledge block, click **Edit** to access the Knowledge Block form.

> **Note:**
> If the article versioning feature is enabled, you can edit only the latest version of a knowledge block. Click **Checkout** after you click **Edit**.

5. Click **Save**.
   The knowledge block is saved and appears in the Unpublished list under Knowledge Blocks. If the article versioning feature is enabled, the version of the knowledge block is incremented by 0.01.
6. **Optional:** Publish the knowledge block by clicking **Publish**.
   The knowledge block is published depending on the workflow setting of its knowledge base.
   - **Knowledge - Instant Publish**: The knowledge block is immediately published.
   - **Knowledge - Approval Publish**: The knowledge block is published on approval completion.

   When published, your knowledge block appears in the Published and All lists under Knowledge Blocks in Agent Workspace. If the article versioning feature is enabled, the version number of the knowledge block is updated to the next whole number (for example, from 2.02 to 3.0).

Publish a knowledge block in Agent Workspace

Publish a knowledge block to make it available to add to knowledge articles.

Before you begin

You must have contribute access to the knowledge base that stores the knowledge block you want to publish.
Role required: agent_workspace_user and knowledge

Procedure

1. Navigate to **All** > **Agent Workspace** > **Agent Workspace Home**.
2. Go to **Lists** > **Knowledge Blocks** > **Unpublished**.
3. Click a knowledge block link.
4. On the Knowledge Block form, click **Publish**.

Result

A knowledge block is published depending on the workflow setting of its knowledge base.

- **Knowledge - Instant Publish**: The knowledge block is immediately published.
- **Knowledge - Approval Publish**: The knowledge block is published on approval completion.

When published, your knowledge block appears in the Published and All lists under Knowledge Blocks in Agent Workspace. If the article versioning feature is enabled, the version of the block is incremented.

View a knowledge block in Agent Workspace

Approve a knowledge block in Agent Workspace

Approve a knowledge block that is awaiting your review in Agent Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: agent_workspace_user and knowledge

Procedure
1. Navigate to **All** > **Agent Workspace** > **Agent Workspace Home**.
2. Go to **Lists** > **Knowledge Blocks** > **Unpublished**.
3. Click a knowledge block link that is in the **Review** workflow state.
4. Click **Edit**.
5. In the Approvals related list, in the **State** column, click **Requested**.
   The Approval form opens in another tab within Agent Workspace.
6. From the State list, select **Approved**.
7. Click **Save**.

Result
The approved knowledge block is published immediately. If the article versioning feature is enabled, the version number of the knowledge block increments to the next whole number (for example, from 2.02 to 3.0). On the Knowledge Block form, the workflow state changes to **Published**. The new published version of the knowledge block is added to the Block Versions related list on the Knowledge Block form. The version is also available in the All list under Knowledge Blocks in Agent Workspace, go to **Knowledge Blocks** > **All**.

Add a knowledge block to a knowledge article in Agent Workspace

Add a knowledge block to a knowledge article in Agent Workspace.

Before you begin
- Both the knowledge article and the knowledge block must be in the same knowledge base.
- You must have contribute access to the knowledge base.
- Ensure that the knowledge blocks feature is enabled for the knowledge base that the article is in. For more information, see Enable knowledge blocks for each knowledge base.

Role required: agent_workspace_user and knowledge

Procedure
1. Navigate to **All** > **Agent Workspace** > **Agent Workspace Home**.
2. Go to **Lists** > **Knowledge Articles** > **All**.
3. Click an existing article link.
   For more information, see Edit a knowledge article in Agent Workspace.

   Note:
   - Knowledge blocks are supported only with HTML knowledge articles. Make sure that the **Article type** field is set to **HTML**.
   - If a knowledge article uses an article template, you can add knowledge blocks to any fields associated with the article template.

4. In the contextual side panel, click the add blocks icon ().
5. Search for the article to which you want to add the knowledge block.
   To use condition builder with advanced search, see Condition builder .
6. Click **Insert** to add the knowledge block to the article.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If there are no knowledge blocks, click **Create New Block** and follow the procedure to create another block. For more information, see Create a knowledge block in Agent Workspace.

7. Click **Update** to save your changes.

Note:
You can preview the article with the blocks. For more information, see Preview a knowledge article with knowledge blocks in Agent Workspace.

8. Click **Publish** to publish the article.

The knowledge article is published depending on the workflow setting of its knowledge base. For more information, see Publish a knowledge article in Agent Workspace.

Preview a knowledge article with knowledge blocks in Agent Workspace

Preview a knowledge article with knowledge blocks in Agent Workspace.

Before you begin

You must have contribute access to the knowledge base that stores the knowledge article.
Role required: agent_workspace_user and knowledge

Procedure

1. Navigate to **All** > **Agent Workspace** > **Agent Workspace Home**.
2. Go to **Lists** > **Knowledge Articles** > **All**.
3. Select the article in which you want to preview a knowledge block and click **Edit**.
4. Click **Preview with Blocks**.
   The article edit page refreshes to show options for previewing a knowledge block.
5. **Optional:** Click **Show Blocks** to highlight the knowledge blocks added to the article.
6. Click **OK**.

Retire a knowledge block in Agent Workspace

Retire a published knowledge block if you no longer want it to be available for users to view or search.

Before you begin

You must have contribute access to the knowledge base that stores the knowledge block you want to retire.
Role required: agent_workspace_user and knowledge

About this task

You can retire knowledge blocks only if they are not used in any knowledge articles.

Procedure

1. Navigate to **All** > **Agent Workspace** > **Agent Workspace Home**.
2. Go to **Lists** > **Knowledge Articles** > **Published**.
3. Select the knowledge block you want to retire.
4. Click **Edit**.
5. Click **Retire**.

Result

The knowledge block is retired depending on the workflow setting of its knowledge base.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Knowledge - Instant Retire**: The knowledge block is immediately retired.
- **Knowledge - Approval Retire**: The knowledge block is retired on approval completion.

When retired, your knowledge block no longer appears in the Published list under Knowledge Blocks in Agent Workspace.

Integrating a custom search or knowledge article viewer with knowledge blocks

If you are using a custom search or knowledge article viewer with your application, you can integrate that custom search or viewer with the appropriate knowledge or knowledge blocks API.

Note:
Integration is only necessary if you are using a custom search or knowledge article viewer.

KBPortalServiceImpl - Global

The `KBPortalServiceImpl` API is included with Knowledge Management V3 [com.snc.knowledge3] as a script include. It provides methods to use with knowledge, such as integration with a custom search.

KBPortalServiceImpl - KBPortalServiceImpl()

Instantiates a KBPortalServiceImpl object in a global application.

Parameters

Name	Type	Description
None		

KBPortalServiceImpl - getResultData(Object request)

Returns search results based on keywords from the knowledge article and from relevant knowledge block content that the user has access to read.

If you have activated the knowledge blocks feature and are using a custom search for knowledge with your application, your search may not return relevant articles when keywords are contained in the blocks. To return search results based on keywords from the article and from relevant block content that the user has access to read, you must call the `getResultData()` method inside your custom search.

Parameters

Name	Type	Description
request	Object	JSON object to refine the search.

Returns

Type	Description
Object	Array of search results in JSON format based on keywords from the knowledge article and from relevant knowledge block content that the user has access to read.

Example: Integrating a custom search with knowledge blocks

```
function doKeywordSearch(queryText, count, queryLocation) {
  var results = [];
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 // To set up the request.
 var request = {
   keyword: queryText,
   language: "",

   // To pass data to filter on different metadata.
   variables: {
     kb_knowledge_base: ['Knowledge'],
     kb_category: '',
     author: ['']
   },

   // Provide the following.
   context: gs.getProperty('glide.knowman.sp.search_context',
'Knowledge Search'),
   resource: 'Knowledge',
   order: "relevancy,true",

   // Provide the pagination variables.
   start: queryLocation,
   end: queryLocation+count,

   attachment: false,

   // Provide any additional metadata you want to include in
your results.
   knowledge_fields: [
     "number",
     "sys_id",
     "published"
   ]
 };

 // To execute the search.
 var response = new KBPortalServiceImpl();
 response.getResultData(request);

 // To send the search results back to the UI or to store
results in your object.
 for (var i = 0; i < response.results.length; i++) {
   result = response.results[i];
   var article = {};
   article.sys_id = result.meta.sys_id.display_value;
   article.number = result.meta.number.display_value;
   article.short_description = article.short_description;
   article.title = result.title;
   article.published = result.meta.published.display_value;
   article.publishedUTC = result.meta.published.display_value;
   article.text = article.text;
   article.score = result.meta.score;
   article.label = article.short_description;
   article.shortDescription = article.short_description;
   results.push(article);
 }
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  return results;
}
```

KBBlock - Global

The `KBBlock` API is included with knowledge blocks [com.snc.knowledge_blocks] as a script include. It provides methods to use with the knowledge blocks feature, such as integration with a custom knowledge article viewer.

KBBlock - KBBlock()

Instantiates a KBBlock object in a global application.

Parameters

Name	Type	Description
None		

KBBlock - getArticleContent(GlideRecord knowledgeRecord)

Gets knowledge articles with relevant knowledge block content that a user has access to read.

If you have activated the knowledge blocks feature and are using a custom knowledge article viewer with your application, your viewer may not display articles that expand the relevant block content. To expand block content that a user has access to read, you must call the `getArticleContent()` method inside your custom viewer.

Parameters

Name	Type	Description
knowledgeRecord	GlideRecord	GlideRecord of the knowledge article to display.

Returns

Type	Description
String	Knowledge article with relevant knowledge block content that a user has access to read.

Example: Integrating a custom knowledge article viewer with knowledge blocks

```
// This function returns the article text with expanded block
 content.
function getArticleText(kbSysId) {
  var knowledgeRecord = new GlideRecord('kb_knowledge');
  var kbText='';
  if(knowledgeRecord.get(kbSysId)) {
    if(new
 GlidePluginManager().isActive('com.snc.knowledge_blocks')) {
      kbText = new KBBlock();
      kbText.getArticleContent(knowledgeRecord);
    }
    else
      kbText = knowledgeRecord.getValue('text');
    }
  return kbText;
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
}

// This is an example of how to call the function defined above.
var kbText = getArticleText('01a1ca5b6710130038876c3b5685efd3');
```

Use knowledge subscriptions

Use knowledge subscriptions to receive email notifications about new articles and article revisions or comments.

Subscribe to a knowledge base

Subscribe to a knowledge base and receive notifications when articles are added to that knowledge base.

Before you begin

You must activate the Knowledge Management Advanced (com.snc.knowledge_advanced) plugin. For more information, see Configure knowledge subscriptions.

Role required: knowledge

About this task

Users can subscribe to a knowledge base from either the Knowledge Management v3 user interface or the Knowledge Management Service Portal.

Note:

Starting with the Washington DC release, the Knowledge Management v3 homepage (com.snc.knowledge3) is being prepared for deprecation in the future Y release. It is replaced by the Knowledge Management Service Portal (com.snc.knowledge_serviceportal), which is active by default for customers on Madrid and later releases. For more information about the new experience, see Knowledge Management Service Portal homepage features.

Procedure

1. Navigate to **All** > **Knowledge** > **Homepage**.
2. Click the **Subscribe** link on the knowledge base tile.
   The link changes to **Subscribed** and includes a check mark.

Result

Receive notifications when articles are added to the subscribed knowledge base.

Unsubscribe from a knowledge base

Unsubscribe from a knowledge base.

Before you begin

Role required: knowledge

About this task

Users can unsubscribe from a knowledge base from either the Knowledge Management v3 user interface or the Knowledge Management Service Portal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If you subscribe to an article and then subscribe to the knowledge base, unsubscribing from the knowledge base also unsubscribes you from the article.

Starting with the Washington DC release, the Knowledge Management v3 homepage (com.snc.knowledge3) is being prepared for deprecation in the future Y release. It is replaced by the Knowledge Management Service Portal (com.snc.knowledge_serviceportal), which is active by default for customers on Madrid and later releases. For more information about the new experience, see Knowledge Management Service Portal homepage features.

Procedure

1. Navigate to **All** > **Knowledge** > **Homepage**.
2. Point to and click the **Subscribed** link on the knowledge base tile, which toggles to **Unsubscribe**.
   After unsubscribing you from the knowledge base, the link toggles to **Subscribe**.

Subscribe to a knowledge article

Subscribe to a knowledge article within a knowledge base to receive email notifications about new articles and article revisions or comments.

Before you begin
Role required: Check with your admin

About this task
Users can subscribe to a knowledge article from either the Knowledge Management V3 user interface or the Knowledge Management Service Portal.

Note:

- Users who are already subscribed to a knowledge base are also subscribed to the articles within that knowledge base.
- To subscribe to articles from the base service portal (`https://<instance name>/sp?`), you must navigate to the Knowledge Management Service Portal pages (for example, `https://<instance name>/sp?id=kb_home`) from the base service portal.
- To manage the knowledge subscription for knowledge base and knowledge article, see Manage knowledge subscriptions.
- Starting with the Washington DC release, the Knowledge Management v3 homepage (com.snc.knowledge3) is being prepared for deprecation in the future Y release. It is replaced by the Knowledge Management Service Portal (com.snc.knowledge_serviceportal), which is active by default for customers on Madrid and later releases. For more information about the new experience, see Knowledge Management Service Portal homepage features.

Procedure

1. Navigate to **All** > **Knowledge** > **Homepage**.
2. Click **Subscribe** at the top of the knowledge article.
   The system shows an information message about the article subscription and the button toggles to **Subscribed**. If the email notification contains an article link, the link points to the Knowledge Management Service Portal. The email notification for a subscribed article includes the knowledge article ID, short description, and link to the article.

© 2026 ServiceNow, Inc. All rights reserved.

Unsubscribe from a knowledge article

Unsubscribe from a knowledge article.

Before you begin
Role required: knowledge

About this task
Users can unsubscribe from a knowledge article from either the Knowledge Management v3 user interface or the Knowledge Management Service Portal.

Note:
If you are subscribed to a knowledge base and you unsubscribe from an article in that knowledge base, you must also unsubscribe from the parent knowledge base.

Starting with the Washington DC release, the Knowledge Management v3 homepage (com.snc.knowledge3) is being prepared for deprecation in the future Y release. It is replaced by the Knowledge Management Service Portal (com.snc.knowledge_serviceportal), which is active by default for customers on Madrid and later releases. For more information about the new experience, see Knowledge Management Service Portal homepage features.

Procedure
1. Navigate to **All** > **Knowledge** > **Homepage**.
2. Point to and click **Subscribed**, which toggles to **Unsubscribe**.
   If you are subscribed to the knowledge article, this action results in an information message that the article subscription has been removed. If you are also subscribed to the parent knowledge base, proceed to the next step.
3. If you are subscribed to the parent knowledge base, click **Yes** on the Unsubscribe pop-up window.
   This action results in an information message that the knowledge base subscription has been removed.

Manage knowledge subscriptions

Manage knowledge base and knowledge article subscriptions from the Notification Settings page.

Before you begin
Role required: knowledge

About this task
Users can manage knowledge subscriptions from the Knowledge application or from the Knowledge Management Service Portal.

Procedure
1. Navigate to the Notification Settings page.
2. Click the Subscriptions tab.
3. Click **Knowledge Base** or **Knowledge Articles** to see a list of current subscriptions.
4. To unsubscribe from a knowledge base or knowledge article, click **Subscribed**.
   The link toggles to **Unsubscribed**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use translation management

Use translation management to create and manage translation tasks.

Create translation assignments for knowledge articles

Assign knowledge articles to language experts to ensure accurate translations. Identify the language experts and create assignment rules so that translation tasks are automatically assigned to language experts and groups.

Before you begin

Role required: knowledge_admin or admin

About this task

Translation tasks are automatically assigned once the assignment rules are created. Assignment rules are applied only if a task is not already assigned to another user or group.

Procedure

1. Navigate to **All** > **Knowledge** > **Translation Management** > **Translator Mapping**.
2. Click **New** to create a new assignment rule.
3. Enter a name for the assignment rule in the **Name** field.
4. In the **Applies To** tab, choose the task type you want to assign by setting a condition.
   a. Select the **Knowledge Translation Task [kb_translation_task]** table from the **Table** drop-down list.
   b. Set a condition for assigning tasks in the **Conditions** field.
   For example, to assign tasks for translation into English, you would set the condition to**[Translated language][is][English].**
5. In the **Assign To** tab, select the user or group you want to assign the task to.
6. **Optional:** Click the **Script** tab to enter a script to further customize the assignment rule.
7. Click **Submit**.

Result

An email notification is sent to the user or group that has been assigned the task with a link to the translation task and source article.

Auto-create translation tasks

Auto-create translation tasks in specified languages to avoid having to manually create translation tasks after an article is published. The available languages are determined by the language plugins that have been installed on your instance.

Before you begin

Role required: knowledge_admin or admin

Procedure

1. Navigate to **All** > **Knowledge** > **Administration** > **Knowledge Bases**.
2. Select an existing knowledge base.
3. Display the languages you have installed by clicking the lock icon to unlock the **Languages** field.
4. Select the languages for which you want to create tasks from the drop-down list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select **Auto-create translation tasks**.
6. Click **Submit**.

What to do next

Open a knowledge article and access the Knowledge Translation Tasks related list to view the associated translation tasks.

Bulk Translation for knowledge articles

Perform bulk translations of knowledge articles in multiple languages using the Localization Framework application.

The Bulk Translations feature extends the localization service in Knowledge Management to support customers across geographies by localizing knowledge articles in the language they speak. You can select multiple knowledge articles and translate them into different languages by using the ServiceNow® Localization Framework application. Once the translation process is complete, you can access the translated article from the Knowledge [kb_knowledge] table. You can request translations for up to 200 articles at a time.

Translation workflow

You can define a workflow to determine the actions required to complete a translation. For information, see Workflows in the Localization Framework .

Preferences configuration

Through preferences, define the translations, workflow, and project preferences to request translation for activated languages. For more information, see Configure the Localization Framework preferences .

Artifact configuration

The Knowledge artifact is included in the Artifact Configurations [sn_lf_config] table and is active by default. For more information, see Localization Framework support for Knowledge Base .

Translation validations

Translation validation enables you to review and manage the translation request before submitting knowledge articles for translation. The validations to be executed are:

- The requested language is allowed in the knowledge base.
- Blocks used in the article have translations present in the target language.
- Source articles are not in the retired or outdated state.
- The article's source language is different from the requested language.
- The source article shouldn’t be a translated article.
- The total number of selected articles is less than 200.

Use Bulk Translation for manual translation

Translate knowledge articles into different languages through bulk translations.

Bulk Translation uses the ServiceNow® Localization Framework application, which enhances the translation process of knowledge artifacts through configurable workflows. You can select multiple knowledge articles and the preferred language into which you want to localize your content.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request bulk translations for multiple knowledge articles

Request translations for multiple knowledge articles through Bulk Translations to localize them into one or more languages.

Before you begin

Add a custom Localization Framework setting to enable bulk translations.

Role required: Localization requester to request translations

Procedure

1. Navigate to **All** > **Knowledge** > **Articles**.
2. Select the articles you want to translate.
3. Select **Request Translations**.

   Note:
   . Check the validation list to ensure that all articles to be translated have been validated. For more information, see Bulk Translation for knowledge articles.

4. In the **Request Translations** dialog box, select the languages into which you want to translate the articles.
5. Select **Submit**.

Result

Localization tasks are created for the selected items in all the selected languages. A success message with a link to the list of requested items is displayed. Select the link to see the list of requested items.

Translate multiple knowledge articles into different languages

Translate multiple knowledge articles to localize your content into different locales.

Before you begin

- Add a custom Localization Framework setting to enable bulk translations.
- Request bulk translations for multiple knowledge articles.

Role required: Localization fulfiller to fulfill translation request

Procedure

1. Navigate to **All** > **Knowledge** > **Knowledge Translations** > **My translation request**.
2. On the Localization Request Items page, select the gear icon ( ) to add the **Localization task** to your task list.
3. Open any localization task.
4. On the Localization Task page, select **Translate** in the form header.
   A two-column comparison UI page displays a **Source Language** column on the left and **Target Language** column on the right. You can set the display as follows:
   - Select **Expand all** to expand all the groups on the comparison UI.
   - Select **Collapse all** to collapse all the groups on the comparison UI.
   - Select **Show groups with missing translations** to see only the groups that have missing translations when the content is translated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. In the comparison UI page, copy the content from **Source Language** column and paste it in **Target Language** column.
6. Repeat the copy and paste process for each listed article.
7. Select **Publish Translation**.
8. In the **Publish Translations** dialog box, select **Publish Translations**.

Result
The selected articles are translated into the selected languages and marked as version 0.01. The articles can be accessed from the Knowledge [kb_knowledge] table.

Use Bulk Translation for Dynamic Translation

Translate knowledge articles into different languages using machine translations.

Dynamic Translation for Bulk Translation translates knowledge articles content in real-time and offers a seamless localization experience to your customer. With the help of language translator, dynamic translation automatically detects the language of the user-entered texts and displays translated text in the comparison UI page.

Translate knowledge articles using Dynamic Translation

Use machine translation to automatically translate knowledge articles into different languages.

Before you begin
Add a custom Localization Framework setting to enable machine translation.

Role required: Localization requester to request translations

About this task
Dynamic Translation uses the ServiceNow® Localization Framework to translate knowledge articles into different locales without any manual intervention.

Procedure
1. Navigate to **All** > **Knowledge** > **Articles**.
2. Select the articles you want translated.
3. Select **Request Translations**.

> **Note:**
> .Check the validation list to ensure that all articles to be translated have been validated. For more information, see Bulk Translation for knowledge articles.

4. In the **Request Translations** dialog box, select the languages into which you want the articles translated.
5. Select **Submit**.
   Dynamic Translation automatically initiates a translation process and creates a translated article.

Result
The selected articles are translated in selected languages and marked as version 0.01. The article can be accessed from the Knowledge [kb_knowledge] table.

Translate a knowledge article from a translation task

Start translating articles once they are published and assigned to you for translation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Activate the Dynamic Translation plugin (com.glide.dynamic_translation).
- Enable the *glide.knowman.translation.enable_translation_task* property. For more information, see Translation management.

Role required: admin, knowledge_admin, or knowledge

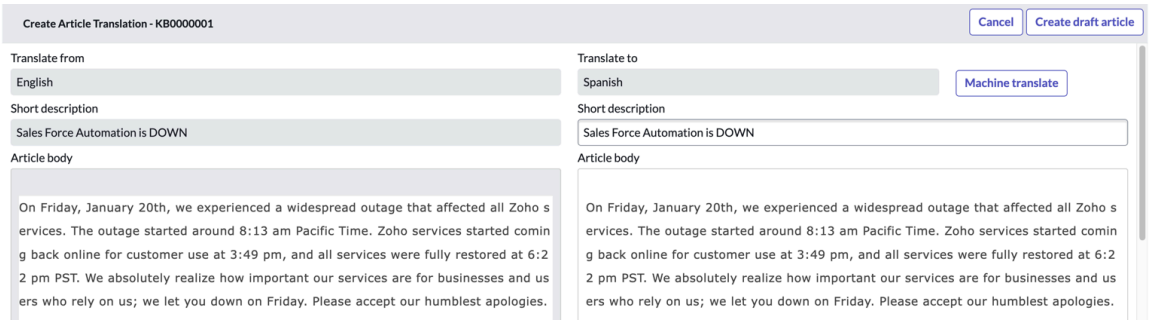
About this task

Note:
This procedure has been superseded by the Localization Framework. For more information see Localization Framework support for Knowledge Base. This information is provided for legacy context.

For information about how administrators configure the translation API, see DynamicTranslation API.

Procedure

1. Navigate to **All** > **Knowledge** > **Translation Management** > **My Assigned Tasks**.
2. In the Knowledge Translation Tasks page, select one of the listed translation tasks assigned to you.
3. Select **Translate**.
   The **Translate from** and **Translate to** panes are side-by-side for easy comparison, as shown in the following figure.



4. Select **Machine translate** to automatically translate to the targeted languages.
5. Select **Create draft article** to create a draft version of the translated article.
   If a translated article is already present for that language, a new draft version overwrites the existing translated content.
6. Select **Publish**.

Note:
By default, the translated version is always created as v1.0 so that the parent version remain same for all the translated versions. For more information, see Translated KB articles always show Parent version 1.0 regardless of version used for translation.

Result

The newly created draft is listed in the **Translated Versions** tab.

Translate knowledge blocks within an article

If a selected article indicates that a knowledge block is missing a translation, you must translate the knowledge block before you can translate the article.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: translator

Procedure

1. Navigate to **All** > **Knowledge** > **Translation Management** > **My Assigned Tasks**.
2. In the Knowledge Translation Task page, select a translation task and click **Translate**.
   A message stating that the knowledge article contains one or more knowledge blocks that have missing translations is displayed.
3. Click on the link in the message to view the list of blocks that require translation.
4. Click the block that requires translation and click **Translate**.
   The newly translated blocks appears in the **Translated Block Versions** related list.

Related topics

Add knowledge blocks to a knowledge article

Request missing translations for available languages

Manually create translation tasks if an article does not have translation tasks created for all the languages you have configured.

Before you begin

- Role required: none
- Verify that the *glide.knowman.translation.enable_translation_task* property is set to true.

Procedure

1. Navigate to **All** > **Knowledge** > **Articles** > **Published**.
2. Select an article from the list of published articles.
3. Click the **Request translations** related link.
4. Select the languages from the list that are unselected, which indicates they do not have associated translation tasks.
5. Click **Submit**.

Result
The translation tasks for the languages are created and listed in the Knowledge Translation Tasks tab.

Work on a feedback task

You can change the state of a task and resolve or reassign tasks generated by article feedback.

Before you begin
Role required: knowledge

About this task

- If no ownership group is assigned to the article, the feedback task is available to you as the author or reviser of the article.
- If an ownership group is assigned to the article, a feedback task is assigned to you as an ownership group manager. As a manager, you can reassign the task to another group member. All group members see the feedback task in **All Open Tasks**. As a group member, you can reassign the task to yourself to appear in **My Assigned Tasks**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Knowledge** > **Feedback Management** > **My Assigned Tasks**.
2. Select a feedback task.
3. Review the feedback given by the submitter.
   When a feedback task is generated, the information in the article feedback form is copied to the feedback task form as follows:

Feedback task form field	Information from article feedback form
Reason	The selected reason for the feedback.
Description **Note:** If feedback is negative and the **Details** field is left blank, this field indicates whether the article was not helpful or rated poorly.	Text in the **Details** field.

4. Work on the feedback task.

Track the progress on a feedback task

Monitor open and closed feedback tasks and track the duration of time a feedback task remains in each state.

Before you begin

Role required: Owner of the knowledge base, knowledge_manager, knowledge_admin, or admin

Procedure

1. Navigate to the open or closed tasks you want to track.
2. In the **Knowledge Feedback Task Metrics** related list section, select a feedback task metric to view the start and end time and the duration of the feedback task.

Note:

- If you are a knowledge administrator, you can view the feedback tasks and task metrics of articles in the knowledge bases. If you are a knowledge owner or knowledge manager, you can view feedback tasks and task metrics of all articles in the knowledge bases you own or manage.
- You may need to configure the form to add **Knowledge Feedback Task Metrics** in the related list section. For more information, see Add a related list to a form.
- The feedback task state is unaffected by changes in the article state. Therefore, when the article is retired, the feedback owner or group assigned to the feedback task has to close or resolve the feedback task.

Use Article Quality Index

Use article quality index (AQI) to assess the quality of knowledge articles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create an AQI checklist

Create a checklist of questions that reviewers can use to evaluate the quality of knowledge articles.

Before you begin

Role required: knowledge_admin or admin

Procedure

1. Navigate to **All** > **Knowledge** > **Article Quality Index** > **AQI checklists**, and click **New**.
2. Fill in the following fields:

Field	Description
Checklist	Name for the checklist.
Description	Description for the checklist.

3. Right-click the form header and click **Save**.
4. In the **Checklist Questions** related list, add questions to the checklist.
   Add questions and adjust the weight of the questions until the combined weight of all questions is equal to 100. The weight defines the score that is added to the total AQI review score of the article when the answer for that question is set to **true**. The maximum score that can be applied to an article in an AQI review is 100.

   Note:
   The default AQI pass score is 70. You can change the pass score in the Article Quality Index properties.

   To add a question:

   a. Click **New**.

   b. Fill in the following fields:

Checklist Question form

Field	Description
Question	Text for the question to evaluate articles.
Description	Short description for the question.
Order	Value for the display order of questions in the checklist. The lower the value in the **Order** field, the higher the question displays in the checklist.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: Before you assign a value for the display order, think about how many questions you would create for the checklist. For example, if you have five questions in a checklist, you can assign the value in increments of 20. This ensures that you have enough values to assign if you add questions to the checklist later.
Weight	A value for the question to score the article quality. This value is added to the AQI score when the answer for the question is set to **true**. **Note:** ▪ The combined weight of all questions cannot exceed 100. ▪ The sum of weights of all questions in a checklist must be equal to 100 to be assigned to a knowledge base.

c. Click **Submit**.

5. After you finish adding questions to the checklist, click **Update** on the AQI Checklist form.

What to do next
After you create a checklist, assign it to a knowledge base.

Assign an AQI checklist to a knowledge base

Before a knowledge reviewer can start performing the AQI review, you must assign an AQI checklist to a knowledge base.

Before you begin
You can only assign a checklist to a knowledge base when the weight of all questions in the checklist is equal to 100. Each knowledge base can have one assigned checklist. However, a checklist can be assigned to more than one knowledge base.
Role required: knowledge_admin or admin

About this task

Procedure
1. Navigate to **All** > **Knowledge** > **Administration** > **Knowledge Bases**.
2. Click a knowledge base to which you want to assign a checklist.
3. On the Knowledge Base form, click the search icon in the **Checklist** field and select the AQI checklist to apply.
4. Click **Update**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next
After you assign an AQI checklist to a knowledge base, you can start performing AQI reviews.

Remove an AQI checklist from a knowledge base

Before you can edit a checklist that is assigned to a knowledge base, you must remove it from the knowledge base.

Before you begin
A checklist with pending AQI reviews cannot be removed from the knowledge base until all AQI reviews associated with the checklist are complete.
Role required: knowledge_admin or admin

Procedure

1. Navigate to **All** > **Knowledge** > **Administration** > **Knowledge Bases**.
2. Click a knowledge base from which you want to remove a checklist.
3. On the Knowledge Base form, delete the name of the AQI checklist from the **Checklist** field.
4. Click **Update**.

Delete questions from an AQI checklist

Deleting a question in a checklist deletes the text in the question of previously performed AQI reviews that use the checklist. Deleting an AQI question from a checklist will not affect the score of the previously performed AQI reviews. However, the text of the question will not be displayed in the checklist.

Before you begin
You can delete questions from a checklist if the following conditions are met:

- The checklist is not attached to a knowledge base. For more information, see Remove an AQI checklist from a knowledge base.
- There are no AQI reviews using the checklist in progress.

Role required: admin

Procedure

1. Navigate to **All** > **Knowledge** > **Article Quality Index** > **AQI checklists**.
2. Click the AQI checklist from which you want to delete one or more questions.
3. In the Checklist Questions related list, select the check box next to the questions that you want to delete.
4. From the **Actions on Selected Rows** choice list, select **Delete**.
5. In the Confirmation window, click **Delete**.

Perform the Article Quality Index review

Perform the Article Quality Index (AQI) review to evaluate the quality of the article.

Before you begin
The knowledge base must have an assigned AQI checklist.
Role required: knowledge_domain_expert, knowledge_coach, knowledge_admin, or admin

About this task
Configure the *glide.knowman.aqi.article_workflow_states* property to set the article workflow states where you could perform AQI reviews. You can perform several AQI

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

reviews for an article. If you perform several AQI reviews for the same version of the article, the latest AQI score appears in the **Latest AQI** field in the article.

Procedure

1. Navigate to **All** > **Knowledge** > **Articles** and click **Published**.
2. Click an article link.

   Note:
   To read the article and perform the AQI review simultaneously, open the article in two separate tabs or window in your browser. You can then read the article from one tab or window and perform the AQI from another tab or window.

3. Perform the AQI review.

4. In the **Article Checklist Answers** related list, read the questions and evaluate which ones are true.

   Double-click the **Answer** cell for each question that is true, select **true**, and select the green check mark.

   Note:
   The associated **Weighted Score** is applied to the AQI score when the answer is set to **true.**

   Note:
   - If you perform several AQI reviews for the same version, the latest AQI score appears in the **Latest AQI** field in the article.
   - If you're using Knowledge Management within the Customer Service Management application, you can automatically make knowledge public by running the *`Make KM Service Portal Pages Public`* fix script after you install the Customer Service Management plugin (com.sn_customerservice).

   Standard Pagination - Displays the search results in multiple pages.

   Infinite Scroll - Displays the search results while scrolling.

5. Perform one of the following actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

To view all the AQI reviews you completed, navigate to **Knowledge** > **My Completed AQI Checklists**.

View all pending and completed AQI reviews

View checklists of all users to monitor the pending and completed reviews.

Before you begin

Role required: knowledge_admin or admin

Procedure

1. Navigate to **All** > **Knowledge** > **Article Quality Index**
2. Do one of the following:
   - To view all completed AQI checklists, select **All Completed AQI Checklists**.
   - To view all pending AQI checklists, select **All Pending AQI Checklists** .

Delete AQI reviews

Delete an AQI review that was created by mistake or is no longer required.

Before you begin

Roles required:

- To delete an AQI in a submitted state: admin or knowledge admin
- To delete an AQI not in a submitted state: knowledge admin or the reviewer who initiated the AQI

Procedure

1. Navigate to **All** > **Knowledge** > **Articles** > **My Pending AQI Checklists**.
2. Select all checklist reviews you would like to delete.
3. Click **Delete**.

Managing KCS article states

Manage the readiness of KCS articles and comply with regulated information using KCS article states.

For information about the KCS article states, see KCS v6 Practices Guide .

For information about all the KCS roles, see Knowledge Management roles.

Activation information

Activate the Knowledge Management KCS Capabilities plugin (com.snc.knowledge_kcs_capabilities) to enable the use of KCS roles (kcs_contributor, kcs_publisher, and kcs_candidate) and metadata fields for the KCS article state (governance and confidence). For more information, see Activate Knowledge Management KCS Capabilities.

Note:
If you are not an admin and has either kcs_contributor or kcs_candidate roles, you cannot retire an article.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Article confidence

The confidence state of an article indicates where the article is in its life cycle. Only users with the knowledge_coach, knowledge_admin, kcs_contributor or kcs_publisher role can modify the value of the **Confidence** field.

For articles existing before the Knowledge Management KCS Capabilities plugin (com.snc.knowledge_kcs_capabilities) was activated, the **Confidence** field is automatically set to **None**.

If an article is created after the Knowledge Management KCS Capabilities plugin (com.snc.knowledge_kcs_capabilities) is activated, the **Confidence** field is automatically set based on the workflow state of the article.

Article workflow states and confidence values

Workflow state	Confidence field value
Draft, Review, or Scheduled for publish	Work in Progress
Published	• Validated: For articles published by users with the knowledge_coach, kcs_contributor, or kcs_publisher role. • Not Validated: For articles published by users with a role other than knowledge_coach, kcs_contributor, or kcs_publisher.
Pending retirement or Outdated	Same as in the Published workflow state.
Retired	Archived

Article governance

The governance state of an article indicates which users can manage articles specific to a regulatory requirement, either experience based or compliance based. Users with contribute access to a knowledge article can modify the value of the **Governance** field.

Create a knowledge article from an incident in ITSM Agent Workspace

Create a knowledge article in Agent Workspace

Knowledge article creation from an incident

Enable users to quickly and easily reuse information from an incident in a knowledge article.

Perform the following steps to enable creating a knowledge article from an incident. You can create a knowledge article from an incident using Incident KCS Article template. For more information, see Create a knowledge article from an incident using an article template.

Create field mapping from an incident to a knowledge article

Copy information from an incident into a knowledge article by creating custom mapping between the Incident table and the KCS article table.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- You must activate the Knowledge Advanced plugin (com.snc.knowledge_advanced).
- You must activate the KCS Article template.
  1. Navigate to **Knowledge** > **Administration** > **Article Templates**.
  2. Set the **Active** field to **true** for the KCS Article template.

Procedure

1. In the filter navigator, type `csm_table_map.list`.
2. Click **New**.
3. In the **Mapping Name** field, enter `Incident KCS Article`.
4. In the **Source Table** field, enter `Incident`.
5. In the **Target Table** field, enter `KCS Article`.
6. Right-click the form header and **Save**.
7. In the **Basic Field Mapping** related list, click **New**.
8. Create mappings for the following fields.

Source Field	Target Field
Sys ID	Source Task
Short description	Short description
Resolution notes	Resolution

Note:
You can create field mappings for more fields, as required.

- In the **Source** field, select the field in the source Incident table that contains the information to be copied to the field in the article template target table.
- In the **Target** field, select the field in the article template target table to which you need information copied to from the field in the source Incident table.

9. To customize when and how the **Knowledge** check box is displayed, click the **Condition** tab.
10. To map fields using advanced scripts, select the **Advanced Field Mapping** check box.
11. On the **Advanced field Mapping** tab, paste in the following code.

```
(function (source,target) {
    // Get the first comments from incident and use it as Issue
 description for article
    var notes = source.comments.getJournalEntry(-1);
    var entries = notes.split("\n\n");
    var comment = "";
    if(entries[entries.length-2]){
        comment = entries[entries.length-2];
        var part = comment.toString().indexOf(")");
        if(part != -1){
comment =
 comment.toString().substring(part+2).replaceAll("\r\n","<br/>
");
    }
    }if(comment)
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        target.kb_issue = comment;
})(source,target);
```

The first comment on an incident is mapped to the **Issue Description** field in the knowledge article.

Note:
If the same source or target field is configured in both the basic and advanced field mappings, the advanced field mapping overrides the basic field mapping.

If the fields configured in the basic and advanced field mapping are different, the field configurations in the advanced field mapping are appended to the field configurations in the basic field mapping.

Add a property to enable creating knowledge article from incidents

Add a property, which is required to allow users to create a knowledge article from an incident.

Before you begin
Role required: admin

Procedure

1. In the Filter navigator, enter `sys_properties.list`.
2. Click **New**.
3. Fill in the following fields.

System Property form

Field	Description
Name	enable_kcs_incident
Description	Enable Knowledge Centered Services (KCS) for Incident Management.
Type	true|false
Value	true

4. Click **Submit**.

Create a UI action to enable creating knowledge articles from incidents

Create a UI action to add the Knowledge check box to the Incident form.

Before you begin
Role required: admin

Procedure

1. Navigate to **System UI** > **UI Actions**.
2. Click **New**.
3. Fill in the following fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

UI Action form

Field	Description
Name	Create Knowledge
Table	Incident
Action name	create_knowledge

4. Select the **Client** check box.
5. Select the **List v3 Compatible** check box.
6. Select the **Form button** check box.
7. In the **Onclick** field, enter `createKnowledgeClient()`.
8. In the **Condition** field, enter `gs.getProperty("enable_kcs_incident") == 'true' && new global.CSMTableMapUtil (current).findMapByName("incident_kcs_article") && new global.KBKnowledge().canCreate()`.
9. In the **Script** field, enter the following code.

```
function createKnowledgeClient() {
    if (g_form.modified) {
        alert(new GwtMessage().getMessage('You have unsaved
 changes. Please save them to continue.'));
    }else{
        //Call the UI Action again but skip the 'onclick'
 function
        gsftSubmit(null, g_form.getFormElement(),
 'create_knowledge');
//MUST call the 'Action name' set in this UI Action
    }
}

//Code that runs without 'onclick'
//Ensure call to server-side function with no browser errors
if (typeof window == 'undefined')
    CreateKnowledgeServer();

function CreateKnowledgeServer(){
    current.update();

    var map = new global.CSMTableMapUtil (current);
    map.findMapByName("incident_kcs_article");
    var targetURL = map.getTargetURL();
        if(targetURL)
        action.setRedirectURL(targetURL[0]);
}
```

Knowledge content migration from v2 to v3

To use the new functionality available in knowledge v3 with legacy articles, you must migrate these articles out of the default knowledge base.

To migrate knowledge content, move articles out of the default knowledge base by changing the **Knowledge Base** value for each article. The state of the article remains unchanged when

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

moving articles. After selecting a new knowledge base, assign a category to each article using the category structure defined in the new knowledge base.

After you migrate a knowledge article, the legacy feedback functionality is automatically replaced with the new knowledge feedback mechanisms. Legacy feedback is copied to the Live Feed Message [live_message] table to ensure previously submitted feedback is available for knowledge v3 articles.

Creating and maintaining articles

Share your ideas and experience by creating a knowledge article. Review and provide feedback on knowledge articles, and resolve issues yourselves rather than contacting customer service or an internal helpdesk.

Create a knowledge article

Knowledge contributors can create and edit knowledge articles within a knowledge base to share information across your organization.

Before you begin

To view an article template, you must activate the article templates feature and enable the desired templates.

Role required: knowledge, knowledge_manager, knowledge_admin, knowledge_coach, knowledge_domain_expert, knowledge_group_member, admin. You must have contribute access to at least one active knowledge base.

About this task

Users with at least one role can create and edit knowledge articles. These users are known as knowledge contributors. Users without any role can read articles and submit feedback, but can't create or edit articles.
Some knowledge bases may allow only certain users to contribute. For example, a member of the IT department can create knowledge articles in the IT knowledge base, such as desktop support information or articles describing company IT processes.

Procedure

1. There are three ways of creating knowledge articles.
   - Navigate to **Self-Service** > **Knowledge** and select the Create an Article icon.
   - Navigate to **Knowledge** > **Articles** > **Create New**.
   - From the Knowledge Management homepage, select the more icon ( ) and then select **Create Article**.
2. On the Create new article page, select a knowledge base.
   The list of article templates to select in the next step is filtered according to the article templates available for the selected knowledge base.

   Note:

   On the Create new article page, you can select to **Switch to older version of this page** or **Switch to updated version of this page (recommended)**.

3. Select an article template.
4. Select **Next**.
   The Knowledge form is displayed based on the article template selected.
5. On the Knowledge form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Knowledge form

Field	Description
Number	Number of the article. This field is automatically set to a number. For more information, see Duplicate knowledge article numbers.
Knowledge Base	The knowledge base selected for this article. **Note:** An article can only be associated with one knowledge base. You can change the knowledge base, but only if the selected article template is available in the knowledge base.
Category	The category for this article. Select a **Knowledge Base** before you can select a category. Articles without a category appear on the knowledge homepage in the (empty) category.
Ownership Group	The ownership group for this knowledge article. An ownership group is a group of members and a manager who are responsible for approvals, ensuring article quality, and feedback tasks. Ownership groups can publish, edit, and retire knowledge articles that they're associated with. **Note:** If no ownership group is assigned, the article automatically goes to the knowledge administrator and knowledge manager for approval.
Language	Language in which you're creating the article. The list is populated based on the languages enabled for the selected knowledge base.
Schedule publish date	Date in future when the article is published automatically. If approvals are enabled, the approval process must be completed before this date.
Valid to	The date this knowledge article expires. Articles don't appear in search results after the **Valid to** date or if the **Valid to** date is empty. The default value of the **Valid to** field is derived from the **Article Validity** field configured for the knowledge base (see Create a knowledge base). The **Valid to** date starts from the date that the article was created until the number of days specified in the **Article Validity** field. If the **Article Validity** field is empty, the default date in the **Valid to** field for the knowledge article is set to January 1, 2100. An article author or editor can select whether to keep or change the default **Valid to** date. For more information, see Validity of a knowledge article. On the first day of each month, the application sends an email notification to a list of authorized recipients to remind them about articles that are expire in the next month. The recipient can then extend the **Valid to** date to continue using the article. For more information, see Managing email notifications in Knowledge Management.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: If the system date format or user preferences is set to use `yy` year format, you might face issues when the **Valid to** date is set to the default date. Contact your administrator or modify the user preferences to use a date format with the `yyyy` year format. For more information, see Global date and time field format and Personalize the system date format topics.
Confidence	Maturity of an article based on its completeness and reusability.
Version	Version of the article. This field appears only when the article versioning feature is enabled. For more information, see Article versioning.
Parent	Number of the article that represents the base language article. This setting keeps translations of the same article related to each other. Consider choosing the same language consistently for the parent article. This field appears only when the I18N:Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2) is activated. For more information, see I18N - Knowledge internationalization. **Note:** The **Parent** field contains the first version of the parent article only. This field is used by the translation management feature to maintain the relationship between the source article and its translations.
Article type	The type of article, either HTML or wiki. **Note:** This field is only visible in the standard template.
Workflow	[Read-Only] The publication state of the article, such as **Draft**, **In Review**, or **Published**. When inserting a new article from an existing article, the state of the new article is reset to **Draft**.
Source	The task this knowledge article was created in response to, if any. This field is set automatically when you create the knowledge article from a task record.
Attachment link	Option for downloading an attached file automatically when a user accesses the article, instead of opening the article view. Add one or more attachments to the article to use this option. **Note:** You may attach multiple files, but most web browsers permit users to download only the first one. To ensure download of all the files, bundle them into an archive, such as with WinZip, and attach the archive. The Attachment link option applies to articles accessed from search links only. Articles accessed as links within other knowledge articles won't replicate this behavior.
Display attachments	Option for displaying attachments to users viewing this knowledge article. Attachments appear below the article text. Add one or more attachments to the article to use this option.
Governance	An attribute of an article that enables you to control sensitive, critical, or regulated information. Not all articles have the same requirement for compliance reviews. Some articles are based on the collective experience of

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	the people who use the articles (experience-based). Other articles have policy or legal information that require tight control (compliance-based).
Short description	The title of the article. This title appears when browsing and searching for a knowledge article, and at the top of the article. You can enter up to 100 characters in this field. **Note:** If contextual search is enabled, the knowledge articles similar to the entered short description text appear in the Knowledge results section.
Article body	Content for the article. A preview of the content appears when browsing and searching for a knowledge article. Use the editing functions in the HTML editor to create content. For more information, see Editing functions for knowledge articles in the HTML editor.
Meta	Tags for optimizing search from external search engines. Separate multiple entries by commas. You may need to configure the form to add this field. For more information, see Configuring the form layout. **Note:** If AI Search is enabled for the Knowledge Management Service Portal, the tags you add to the **Meta** field aren't indexed. To fine-tune AI Search results, your administrator can configure result improvement rules. For more information, see AI Search in Service Portal.

Note:
The **Confidence** and **Governance** fields appear when the Knowledge Management KCS Capabilities plugin (com.snc.knowledge_kcs_capabilities) is activated. For more information, see Managing KCS article states.

6. To preview the article select the **View Article** link in the Related Links section located below the form.

Note:

Viewing the article through this link is only to facilitate a preview of the edited article and, does not add to the actual view count of the article on the document site.

7. **Optional:** To search for similar articles, enter the text in the **Related Search** field or continue with the default text in the Knowledge results section.
If the Knowledge results section isn't displayed on the Knowledge form, an administrator can configure the form layout to add the **Contextual Search Results** field to the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To find knowledge articles that have high text similarity with the entered search text, choose **Similar Articles (ML)**.

  Note:
  This option is available only when the Predictive Intelligence feature is enabled and your administrator has trained the similarity solution for Knowledge Management to find related articles. For more information, see Train the similarity solution for Knowledge Management to find related articles.

- To find knowledge articles that match the entered search text, choose **Search Articles**.

8. **Optional:** To view the entire article in a pop-up window, select the link to the article title.
9. Select **Submit** to create the article.
10. **Optional:** Select **Search for Duplicates** for any redundant content in existing articles.
11. **Optional:** Select the link in the **For SEO suggestions on this article, click here** message, if available, to review suggestions for improving your article.
    Suggestions are provided to help you improve the search engine optimization and accessibility of your article, such as removing multiple **Heading 1** or `<H1>` tags. Suggestions are provided for the heading 1 `<h1>`, anchor `<a>`, and image `<img>` tags.
12. **Optional:** Either add to or modify the article details or publish the article.
    - Add to or modify the article details.

      (Optional) For more information, see Edit a knowledge article.

    - Publish the article by selecting **Publish**.

      A knowledge article is published depending on the workflow setting of its knowledge base:

      - **Knowledge - Instant Publish**: The knowledge article is immediately published unless it's scheduled to be published at a later date.
      - **Knowledge - Approval Publish**: The knowledge article is published on approval completion unless it's scheduled to be published at a later date.

        Note:
        With an ownership group associated with a knowledge article, ownership group members can approve self-authored articles for publication. An administrator can override this behavior by disabling the *`glide.knowman.ownership_group.enable_self_approval`* property. For more information, see Ownership groups.

      For more information, see Schedule a knowledge article for publishing.

      If an article is visible to a guest user, a message appears that reads `This article may be visible to unauthenticated users after it is published. Do you still want to proceed?`

      When published, the knowledge article appears in the Published and All lists. To view the Published list, navigate to **Knowledge** > **Articles** > **Published**. To view the All list, navigate to **Knowledge** > **Articles** > **All**.

      If the article versioning feature is enabled, the version number of the knowledge article increments to the next whole number (for example, from 2.02 to 3.0). For more information, see Knowledge article version numbers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

After saving the article record, you can add tags to organize the article.
After you create and publish a knowledge article, you can perform the following actions related to the article:

- Request translations for the knowledge article. For more information, see Request missing translations for available languages.
- Retire the knowledge article. Select **Retire** to enable the retirement workflow. For more information, see Retire a knowledge article.
- Translate the knowledge article directly from the knowledge article. For more information, see Translate a knowledge article from a translation task.
- Delete the published knowledge article. Select **Delete**. If the **Delete** button isn't displayed, select the more actions icon ( ), and then select **Delete**.

> **Note:**
> Only users with the admin role can delete a published knowledge article.

Predictive Intelligence for Knowledge Management

Edit a knowledge article

Edit knowledge articles within a knowledge base to update information shared across your organization.

Before you begin

Role required: knowledge

About this task

Users with at least one role can edit knowledge. These users are known as knowledge contributors. Users without any role can read articles and submit feedback, but cannot edit articles.

However, knowledge managers can configure User Criteria to restrict access to certain knowledge bases. For example, only members of the IT department can create or edit knowledge articles in the IT knowledge base, such as desktop support information or articles describing company IT processes.

> **Note:**
>
> - If the article versioning feature is enabled, the author cannot edit the article if it is already checked out by the contributor. If the feature is disabled, any users with contribute access to an article can edit the draft version of the article. An administrator can disable the article versioning feature by setting the *glide.knowman.versioning.enabled* property (from the **System Property** [sys_properties] table) to **false**.
> - If an ownership group is associated with a knowledge article, the author or reviser of the article can't contribute to the article after the article is published. An administrator can override this behavior by enabling the *glide.knowman.ownership_group.override* property. For more information, see Ownership groups.
> - If the *glide.knowman.translation.enable_translation_task* property is enabled, you can't modify the knowledge base of existing articles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Knowledge** > **Articles**.
2. Select an article from the **Published** or **Unpublished** category.
3. On the Knowledge form, click **Edit**.

   Note:
   If the knowledge article was created using Microsoft Word, you can edit the article only in Microsoft Word. In this case, select **Open in Word** to open the article in Word Online. For more information, see Edit a knowledge article in Microsoft Word.

   If you want to edit the article using the HTML editor, you can unlink the article from Word. For more information, see Unlink knowledge articles from linked Microsoft Word documents.

4. If the article versioning feature is enabled, click **Checkout** for a published knowledge article. You can only edit the latest version of a knowledge article.
5. Click **Update**.
   When you edit a knowledge article, a default value appears in the **Valid to** field. You can select whether to keep or change the default **Valid to** date.

   Note:
   If the article versioning feature is enabled, the default value of the **Valid to** date in the updated article version is automatically set based on the following criteria:

   - If the **Article Validity** field in the knowledge base associated with the article is blank, the **Valid to** date value from the earlier version of the article is retained.
   - If the **Article Validity** field in the knowledge base associated with the article is not blank, the **Valid to** date is automatically updated to start from the date the article was updated until the number of days specified in the **Article Validity** field (Article updated date + article validity).

   If you move a knowledge article to another knowledge base, the default value of the **Valid to** date in the updated article is automatically set based on the following criteria:

   - If the **Article Validity** field in the selected knowledge base is blank, the earlier **Valid to** date value is retained for the knowledge article.
   - If the **Article Validity** field in the selected knowledge base isn't blank, the **Valid to** date is automatically updated to start from the date the article was updated until the number of days specified in the **Article Validity** field (Article updated date + article validity).

   If the dictionary value of the **Valid to** field is modified, this dictionary value overrides the default value of the **Valid to** field calculated according to the **Article Validity** field. For more information, see Validity of a knowledge article.

   The article is saved. If the article versioning feature is enabled, the version of the knowledge article is incremented by 0.01. For more information, see Knowledge article version numbers
6. **Optional:** Select the link in the **For SEO suggestions on this article, click here** message, if available, to review suggestions for improving your article.
   Suggestions are provided to help you improve the search engine optimization and accessibility of your article, such as removing multiple **Heading 1** or `<H1>` tags. Suggestions are provided for the heading 1 `<h1>`, anchor `<a>`, and image `<img>` tags.
7. **Optional:** Publish the article by clicking **Publish**.
   The knowledge article is published depending on the workflow setting of its knowledge base:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Knowledge - Instant Publish**: The knowledge article is immediately published unless it is scheduled to be published at a later date.
- **Knowledge - Approval Publish**: The knowledge article is published on approval completion unless it is scheduled to be published at a later date.

Note:

- With an ownership group associated with a knowledge article, ownership group members can approve self-authored articles for publication. An administrator can override this behavior by disabling the *glide.knowman.ownership_group.enable_self_approval* property. For more information, see Ownership groups
- If an article is visible to a guest user, a message appears that reads `This article may be visible to unauthenticated users after it is published. Do you still want to proceed?`

For more information, see Schedule a knowledge article for publishing.

When published, the knowledge article appears in the Published and All lists. To view the Published list, navigate to **Knowledge** > **Articles** > **Published**. To view the All list, navigate to **Knowledge** > **Articles** > **All**.

If the article versioning feature is enabled, the version number of the knowledge article increments to the next whole number (for example, from 2.02 to 3.0). For more information, see Knowledge article version numbers.

Editing functions for knowledge articles in the HTML editor

Improve the readability and usefulness of knowledge articles by formatting the article text using the HTML editor.

The HTML editor available in knowledge articles uses the built-in TinyMCE editor. The text formatting is preserved when the content is displayed on a portal.

The HTML toolbar within the HTML editor contains an array of icons that enable you to edit and format the body text of your knowledge article. You can also use the HTML Editor to add images, links, audio, and video to the knowledge article.

Note:
Your administrator can configure the HTML toolbar within the HTML editor. For more information, see Customize TinyMCE attributes.

You can perform the following functions using the HTML editor:

- Spell check as you type in the Article body section of a knowledge article.

  The HTML editor automatically checks spelling as you type and underlines spelling and grammar mistakes in red.

- View the style applied to the selected text and the word count from the bottom pane of the HTML editor.
- Apply formatting.
- Paste without formatting.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Insert tables and modify cells, rows and columns of a table.
- Include HTML content.
- Insert or edit a code snippet.
- Insert a basic table of contents at the cursor's current position.
- Find and replace text.
- Identify and resolve accessibility related issues in a knowledge article using the Accessibility checker in the toolbar.
- Revert changes that you have made during the current session of content editing.

Managing HTML content in knowledge articles

You can manage HTML content in knowledge articles by using the HTML editor.

You can perform the following functions for HTML content in knowledge articles:

- Insert a hyperlink by using the insert/edit link icon ( ) available on the HTML toolbar. For more information, see Link to a website in HTML fields.
- Insert an image by using the insert/edit image icon ( ) available on the HTML toolbar. For more information, see Embed images in HTML fields.
- Embed a video from the video library, an attachment, or URL by using the insert/edit video icon ( ) available on the HTML toolbar. You can also add videos to the video library. For more information, see Embed videos in HTML fields.
- Copy content from external sources and paste them as simple text into the editor. For more information, see Paste content into the HTML editor.
- View and edit the HTML source code by using the source code icon ( ) available on the HTML toolbar. For more information, see Extended functions.

  Note:
  To insert or edit a code snippet, see Format a code snippet automatically in knowledge articles.

- Expand the HTML field to use the full form view for easier editing by using the fullscreen icon ( ). For more information, see Extended functions.

Formatting options for knowledge articles

You can apply formatting to a knowledge article using the HTML editor.

You can use the options on the HTML toolbar to apply the following formatting in knowledge article text:

- Change the font or font size of knowledge articles.
- Format text as bold, italicized, underlined, or strikethrough.
- Change the text color and text background color.
- Create bulleted and numbered lists.
- Change paragraph indentation.
- Apply styles to text.
- Auto-format content copied from Microsoft Word to match the format of the article.
- Create collapsible sections in an article to show or hide the content.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Insert bookmarks to the article content that can link to specific parts of the text with an ID.
- Identify and resolve accessibility related issues in a knowledge article using the Accessibility checker in the toolbar.

For more information, see Formatting icons for HTML fields.

Paste content without formatting into the knowledge article

Paste content into the body of a knowledge article without copying the content formatting.

Before you begin

Open the knowledge article in which you want to use the HTML editor.

About this task

You can also use the HTML editor when creating or editing a knowledge article using the Knowledge Management application in the ServiceNow AI Platform interface or in Agent Workspace. To create or edit a knowledge article in the ServiceNow AI Platform interface, see Create a knowledge article or Edit a knowledge article. To create or edit a knowledge article in Agent Workspace, see Create a knowledge article in Agent Workspace or Edit a knowledge article in Agent Workspace.

Procedure

1. Copy your text from a content source.
2. Click the paste as text icon ( ) on the HTML toolbar.
3. In the Article body section, place your cursor at the point where you want to paste the content, right-click, and select **Paste** from the context menu.

Adding tables to knowledge articles

You can insert tables and modify the cells, rows, and columns of a table in a knowledge article.

You can add tables to your knowledge articles by clicking the table icon ( ) on the HTML toolbar and selecting your desired table options. For example, you can adjust the height and width of rows and column, the spacing between cell text and cell borders, and change the colors of cells.

For more information, see Add a table to the HTML field.

Insert an image in a knowledge article

Insert an image in a knowledge article using the HTML editor.

Before you begin

Role required: user with contribute access

Procedure

1. Navigate to **All** > **Knowledge** > **Articles** > **All**.
2. Select a knowledge article.
3. On the knowledge article form, in the **Article body** field, place the cursor where you want to insert an image.
4. On the HTML editor toolbar, select the Insert/edit image icon ( ).
5. On the Insert/Edit Image dialog box, select the Upload icon ( ).
6. Select an image.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Select **Open**.
8. Select **Save**.

Result
The image is included in the knowledge article.

Format a code snippet automatically in knowledge articles

Add syntax highlighting to a code snippet in knowledge articles using the HTML editor.

Before you begin
Open the knowledge article in which you want to use the HTML editor.

Role required: knowledge

About this task
You can also use the HTML editor when creating or editing a knowledge article using the Knowledge Management application in the ServiceNow AI Platform interface or in Agent Workspace. To create or edit a knowledge article in the ServiceNow AI Platform interface, see Create a knowledge article or Edit a knowledge article. To create or edit a knowledge article in Agent Workspace, see Create a knowledge article in Agent Workspace or Edit a knowledge article in Agent Workspace.

Procedure
1. In the Article body section, place the cursor where you want to insert the code snippet.
2. Click the insert/edit code sample icon ({;}) on the HTML toolbar.
3. In the Insert/Edit code sample dialog box, select a markup or programming language from the Language list.
4. In the text box after the Language list, enter your code.
   Alternatively, you can copy the code from an external source and paste it.
5. Click **Ok**.
6. **Optional:** Edit the code by clicking the code snippet, and then clicking the insert/edit code sample icon ({;}).

Insert a table of contents in knowledge articles

Insert a hierarchical table of contents (toc) based on the headings in your knowledge article.

Before you begin
Open the knowledge article in which you want to use the HTML editor.

Role required: none

About this task
You can also use the HTML editor when creating or editing a knowledge article using the Knowledge Management application in the ServiceNow AI Platform interface or in Agent Workspace. To create or edit a knowledge article in the ServiceNow AI Platform interface, see Create a knowledge article or Edit a knowledge article. To create or edit a knowledge article in Agent Workspace, see Create a knowledge article in Agent Workspace or Edit a knowledge article in Agent Workspace.

You can generate a table of contents only if your article uses heading levels from Heading 1 to Heading 3 and is a standard article.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Use Format select to set heading levels in the article. You can also configure the HTML toolbar using TinyMCE attributes.
For more information, see Customize TinyMCE attributes.

Procedure

1. In the Article body section, place the cursor where you want to insert the table of contents.
2. Click the table of contents icon ( ) on the HTML toolbar.
   If you do not see the table of contents icon on the toolbar, add it using steps available in Customize TinyMCE attributes.
3. **Optional:** Update an existing table of contents by selecting it and then clicking the update icon ( ) on the HTML toolbar.

Result
The HTML editor searches for the headings in your content including their levels (such as Heading 2 or Heading 3). It then automatically generates a table of contents that contains links to the heading levels from Heading 1 to Heading 3 only. The links to heading levels are indented to show the heading hierarchy.

Find and replace text in knowledge articles

Make global changes to the content of a knowledge article by finding and replacing specific text using the HTML editor.

Before you begin
Open the knowledge article in which you want to use the HTML editor.

About this task
You can also use the HTML editor when creating or editing a knowledge article using the Knowledge Management application in the ServiceNow AI Platform interface or in Agent Workspace. To create or edit a knowledge article in the ServiceNow AI Platform interface, see Create a knowledge article or Edit a knowledge article. To create or edit a knowledge article in Agent Workspace, see Create a knowledge article in Agent Workspace or Edit a knowledge article in Agent Workspace.

Procedure

1. In the Article body section, place the cursor anywhere.
2. Click the find and replace icon ( ) on the HTML toolbar.
3. In the Find and Replace dialog box, in the **Find** field, enter the search term you want to find.
4. Enter replacement text for the search term in the **Replace with** field.
   If you want to delete repeated occurrences of the search text, leave the **Replace with** field blank.
5. **Optional:** Refine the scope of the search.
   - To limit the search to text that exactly matches the case of the search term, select the **Match case** check box.
   - To limit the search to text that matches one or more complete words only, select the **Whole words** check box.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Find or replace the search term.

Result
When no more occurrences of the term can be found or if the search term is not found at all in the content, a message appears indicating that the specified string wasn't found.

Accessibility checker in the toolbar

Accessibility checker in the toolbar enables you to identify and resolve accessibility related issues in a Knowledge article.

Before you begin
Open the Knowledge article in which you want to use the Accessibility checker.

Role required: user with contribute access

Procedure
1. Navigate to **All** > **Knowledge** > **Articles** > **All**.
2. Select a Knowledge article.
3. Select the **Accessibility checker** icon in the toolbar of the article body.
4. View accessibility-related issues in the **Accessibility Checker** window along with suggestions for resolution of each issue.
5. Select **Repair** to implement the suggestion, or **Ignore**.
   If there are no accessibility issues in the article, then the **Accessibility Checker** window displays a success message:

```
No accessibility issues detected
```

Undo or redo typing actions or formatting while authoring knowledge articles

Quickly revert typing actions or formatting that you made during the current session of editing a knowledge article using the HTML editor.

Before you begin
Open the knowledge article in which you want to use the HTML editor.

About this task
You can also use the HTML editor when creating or editing a knowledge article using the Knowledge Management application in the ServiceNow AI Platform interface or in Agent Workspace. To create or edit a knowledge article in the ServiceNow AI Platform interface, see Create a knowledge article or Edit a knowledge article. To create or edit a knowledge article in Agent Workspace, see Create a knowledge article in Agent Workspace or Edit a knowledge article in Agent Workspace.

Procedure
1. Place the cursor in the Article body section.
2. Undo or redo a typing action or format change.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To undo the previous change, click the undo icon ( ).
- To redo a change that has been undone, click the redo icon ( ).

Note:

The undo ( ) and redo ( ) icons are available based on the number of actions that are saved to be undone or certain actions that can't be undone.

Map related articles

Discover similar information across articles on a topic while viewing an article. You can manually map related articles or have the application automatically present related articles using machine learning (ML) algorithms.

Before you begin

Role required: knowledge
To edit the article, you must have knowledge contributor access for the associated Knowledge Base.

About this task

If you have manually mapped related articles when editing an article, those articles are listed in the Related Articles section on the knowledge article view page before the related articles that are predicted thorough the Knowledge Management similarity solution.

Note:
An administrator can train the solution definition for Knowledge Management within the Predictive Intelligence feature to find related articles. For more information, see Train the similarity solution for Knowledge Management to find related articles.

This task provides steps to manually map related articles when editing an article.

Procedure

1. On the ServiceNow AI Platform, open the knowledge article for which you want to map related articles.
2. On the Knowledge form, click the Related Articles related list.
3. Click **Edit**.
4. On the Edit Members form, move the desired articles from the available articles in the **Collection** column to the **Related Articles List** column.
5. Click the up or down icon to arrange the articles in the order in which you want them to appear in the Related Articles section on the article view page, and then click **Save**.

Note:
Knowledge administrators can configure the number of articles shown in the Related Articles section using the instance options.

Related topics

Map catalog items related to an article

Manually map catalog items related to a knowledge article to enable employees to request the related product or service.

Before you begin

Role required: knowledge
To edit the article, you must have knowledge contributor access for the associated Knowledge Base.

Procedure

1. Navigate to **All** > **Knowledge** > **Articles** > **All**.
2. Open the knowledge article for which you want to map related catalog items.
3. On the Knowledge form, click the Related Catalog Items related list.
4. Click **Edit**.
5. On the Edit Members form, move the desired catalog items from the available catalog items in the **Collection** column to the **Related Catalog Items List** column.
6. Click the up or down icon to arrange the articles in the order in which you want them to appear in the Related Items section on the article view page, and then click **Save**.

Note:
Knowledge administrators can configure the number of catalog items shown in the Related Items section using the instance options.

Schedule a knowledge article for publishing

Set a specific time and day for a knowledge article to be published automatically.

Before you begin

You must have contribute access to the knowledge base that stores the knowledge article you want to schedule for publishing.
Ensure that the system administrator verifies the following settings:

- Knowledge Management Advanced plugin (com.snc.knowledge_advanced) is activated. For more information, see Activate the Knowledge Management Advanced plugin.
- The article versioning feature is enabled. For more information, see Article versioning.

Role required: knowledge

Procedure

1. Navigate to **All** > **Knowledge** > **Articles** and click **Unpublished**.
2. Select an article link.
3. In the **Scheduled publish date** field, click the select date and time icon.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You may need to configure the knowledge block form to include the **Scheduled publish date** field. Click the form context menu icon ( ) and navigate to **Configure** > **Form Layout**. Use slushbucket to add the Scheduled publish date field.

> **Important:**
> You must set the **Scheduled publish date** at least 24 hours from the current date. To publish the article earlier than 24 hours, click **Publish article** available in the form.

4. Select any future date from the calendar.
5. In the **Time** field, enter a time in the format hh:mm:ss.
6. Select the save (enter) icon .
7. Select **Publish** to enable the publishing workflow.
   The article is available in the All list. Go to **Knowledge** > **Articles** > **All**.

> **Tip:**
> If you want to cancel an article's scheduled publication and move the article back to the Draft state, click **Recall**.

Result

The knowledge article is published on the scheduled publish date depending on the following workflow settings of its knowledge base:

- If the knowledge base workflow is set to **Knowledge - Instant Publish**, the knowledge article is automatically published on the scheduled publish date. The **Workflow** field on the Knowledge form of the article is updated to **Scheduled for publish**.
- If the knowledge base workflow is set to **Knowledge - Approval Publish**, the knowledge article is published on approval completion. The **Workflow** field on the Knowledge form of the article is updated to **Review**.

  The approval completion affects the scheduled publishing as follows:

  - If the approvals are completed before the scheduled publish date, the **Workflow** field on the Knowledge form of the article is updated to **Scheduled for publish** and the article is published on the scheduled publish date.
  - If the approvals are completed after the scheduled publish date, the article is published immediately on the approval completion.

Related topics

Edit a knowledge article

Recall an article that is being reviewed

Recall an article that is being reviewed to make additional changes.

About this task

If ownership groups is not enabled, only the author of the article, knowledge administrators, or system administrators can recall the article.

If ownership groups is enabled, the author of the article, the ownership group manager, ownership group members, knowledge administrators, or system administrators can recall an article.

Recalling an article in the **Review** state results in a minor version increment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When a revised article is in **Review** state, only the corresponding versions reviser can recall the article to make additional changes.

Procedure

1. Navigate to **Knowledge** > **Articles** > **All**.
2. Open an article in the **Review** state.
3. Click **Recall** in the Knowledge form header.
   The system returns the state of the article to **Draft**, increments the version number by 0.01, and displays a message to the user.

Approve an article that is being reviewed

Approve an article that is being reviewed and create a new published version.

Before you begin
Role required: Owner and knowledge manager

About this task
When an article is in the **Review** state, only those users who are included in the **Approvals** related list can modify the article.

Procedure

1. Navigate to **All** > **Knowledge** > **Articles** > **Unpublished**.
2. Open an article in the **Review** state and review the text.
3. In the **Approvals** related list, click **Requested** in the **State** column to display the Approval form for the article.
4. Click **Approve**.

Result
The system displays the Knowledge form. The version number of the article increments to the next whole number (for example, from 2.02 to 3.0) and the state changes to **Published**. The new published version of the article is added to the Knowledge list and to the **Article Versions** related list on the Knowledge form.

Retire a knowledge article

Initiate the retirement workflow to retire a knowledge article. Knowledge base owners and managers can view articles after they are retired but cannot search for retired articles on the Knowledge homepage and portal.

A knowledge article has an associated retirement workflow, similar to the publishing workflow. This allows administrators to configure these workflows, defining an approval and review process for retiring knowledge if appropriate.

When editing an article, click **Retire** to launch the retirement workflow associated with that article. Only knowledge administrator, knowledge manager, and the latest publisher of the versioned knowledge article (not available for kcs_candidate or kcs_contributor) can retire a knowledge article. For more information, see Retire a versioned article. If the article requires approval prior to retirement, the article goes to a pending approval state, and the workflow either finishes upon approval or cancels if rejected by a required approver. The article number associated with the retired article is not available for reuse. For information on the status of a knowledge article see Knowledge article states.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- Only administrators and knowledge administrators can view the retired knowledge articles. To reuse a retired article, administrators and knowledge administrators can republish the article. For more information, see Republish a retired article.
- An article and its translations have a parent-child relationship. Retiring a parent article does not automatically retire all its translated child articles.

Beginning with the San Diego release, you can provide a replacement article while retiring a knowledge article. When the retired article is accessed, the user will automatically be redirected to the replacement article with a display message `The article KBxxx is retired and has been replaced with the knowledge article KBxxx`. If no replacement article is available, the page displays the message `Knowledge record not found`. The retire with replacement feature is not supported on classic workspace. By default, the *`glide.knowman.enable_article_replacement_on_retire`* system property is set to `true` for new users, to provide a replacement article for a retired article. Existing and upgraded users must enable this property (set it to true manually), to able to view and use the feature.

Note:

- Article with replacement returns a 301 code.
- Article without any replacement returns a 404 code.
- The retire action on classic workspace will just retire the article and not provide a replacement irrespective of the setting of *`glide.knowman.enable_article_replacement_on_retire`*.

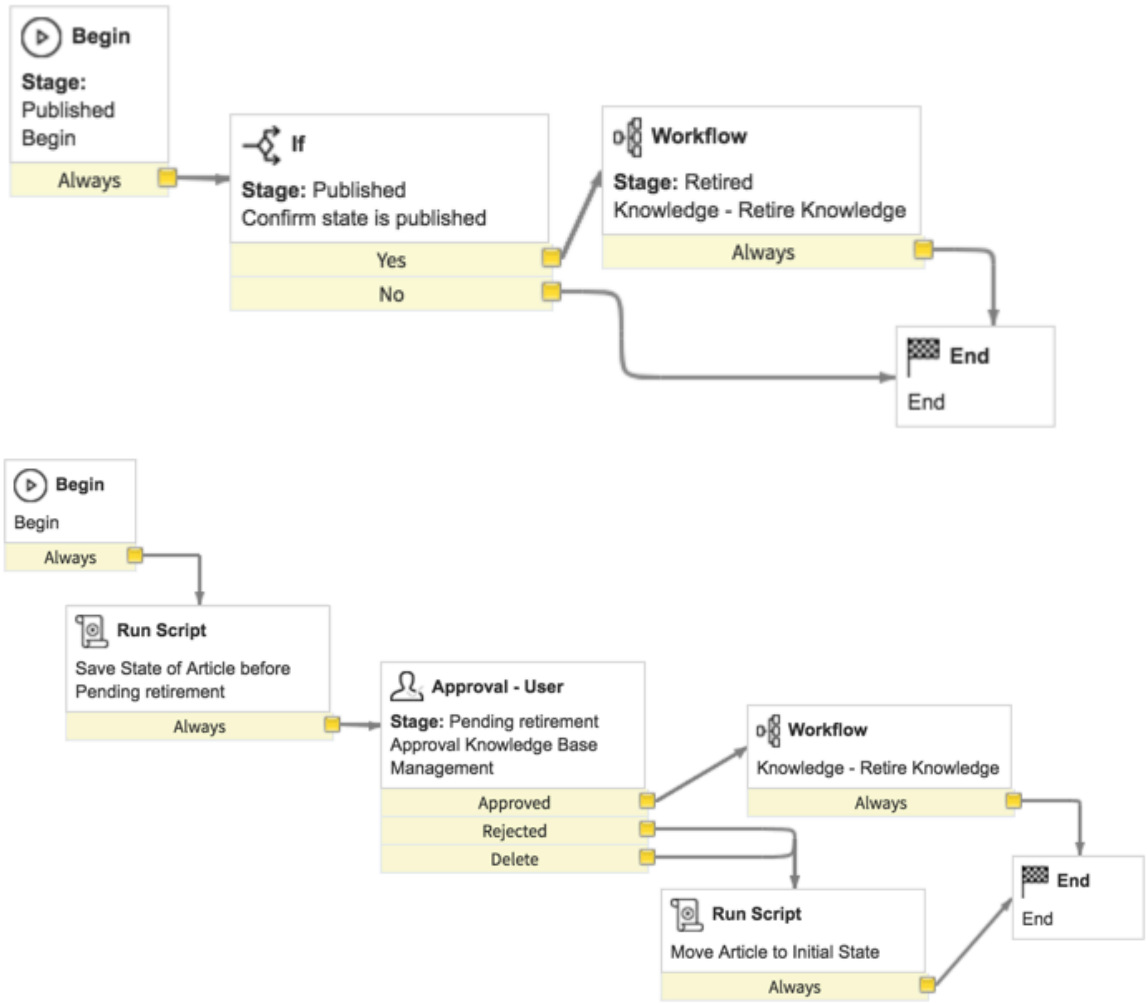
Instant retire and Approval retire workflows



Republish a retired article

Instantly republish a retired article.

Before you begin

You must activate the Knowledge Management Advanced (com.snc.knowledge_advanced) plugin.

Role required: admin or knowledge admin

Note:
You need a scoped admin role to republish a retired article in the Scoped knowledge bases.

About this task

There may be cases where you will need to republish a retired article. For example, an admin may want to temporarily retire an article when its information doesn't currently apply, but will at a later date. An administrator or knowledge administrator who can view retired articles can instantly republish these without having to go through an approval workflow.

Procedure

1. Navigate to **All** > **Knowledge** > **Articles** > **Retired**.
2. Select a retired article and click **Republish**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The article is instantly published as the previous last published version.

Move a knowledge article

You can move articles between knowledge bases.

Before you begin
Role required: User must have contributor access to the knowledge base.

Note:

- When versioning is enabled, and you move an article from one knowledge base to another, the latest version of an article is moved to the new knowledge base. However, the previous versions of the article remain in the old knowledge base. It is recommended to retire the article from the old knowledge base. For more information, see Retire a knowledge article.
- Although you can move an article from one knowledge base to another consider creating an article in new knowledge base.

Procedure

1. Edit a knowledge article.
2. Change the **Knowledge Base** field value.
   After moving an article, the Apply Default Values dialog box prompts you to populate certain fields in the article with default values from the new knowledge base. If the new knowledge base has no default values, the dialog box does not appear.
3. Click **OK** to overwrite fields with the default values, or **Cancel** to leave all fields unchanged.

   A knowledge manager can define default values for articles in knowledge bases you manage using the **Set default knowledge field values** field on the Knowledge Base form.
4. Click **Update**.

Comment on a knowledge article

Comment on a knowledge article or reply to a comment.

Before you begin
You must activate the Knowledge Management V3 plugin (com.snc.knowledge3).

Role required: User with Can Read access. Unauthenticated users and users with only the snc_external role can't add or view attachments for comments.

Note:

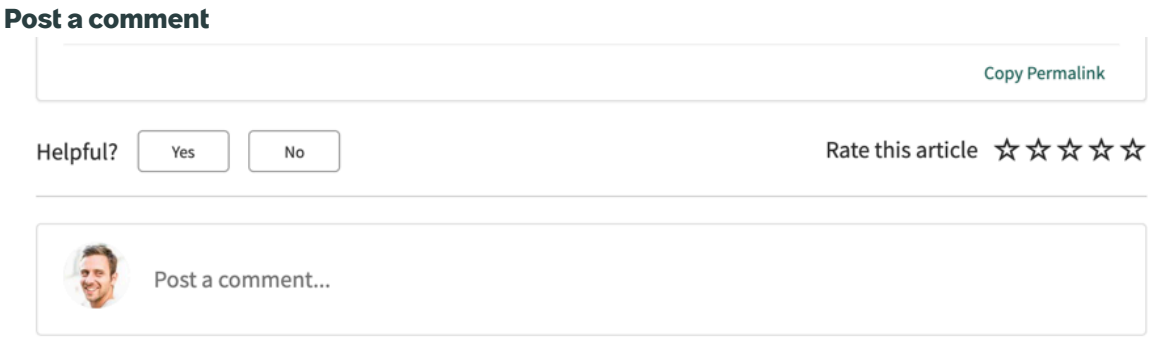
Starting with the Washington DC release, the Knowledge Management v3 homepage (com.snc.knowledge3) is being prepared for deprecation in the future Y release. It is replaced by the Knowledge Management Service Portal (com.snc.knowledge_serviceportal), which is active by default for customers on Madrid and later releases. For more information about the new experience, see Knowledge Management Service Portal homepage features.

Procedure

1. Navigate to the Knowledge Management Service Portal.
2. Click the article you want to comment or reply to a comment on.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select **Post a comment**.
   If you want to reply to an existing comment, select **Reply**



4. Enter your comment or reply and add links, images, and attachments as required.

> **Note:**
> Attachments to comments posted in the Knowledge Management Service Portal are not displayed in the Live Feed. If attachments to comments are posted in Live Feed, they are displayed in the Knowledge Management Service Portal.
>
> If antivirus protection is enabled, all attachments are automatically scanned for viruses once the comment is posted. Attachments are only displayed once the scan is finished and successful.
>
> If you are the author of the comment, you can delete it. All comments and replies underneath are automatically deleted.

5. Click **Submit**.

> **Note:**
> When the Use Live Feed for Knowledge Feedback property is enabled, you can only view comments in the Live Feed. By default, it is set to inactive.
>
> Comments posted in Live Feed before upgrading to release version New York are not shown hierarchically in the Knowledge Management Service Portal. Comments posted in Live Feed after upgrading to release version New York are shown hierarchically in the Knowledge Service Portal.

The following table illustrates how comments and replies to comments are displayed depending on where you are viewing them.

Display of comments and replies to comments

Viewing from	HTML formatting	Hierarchy	Attachments
Knowledge Management Service Portal	Yes	Yes	Yes
Live Feed	No	Yes	Yes
Knowledge Management v3	No	No	No

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create knowledge from incident or problem

Create a knowledge article, so the next time the issue comes up the resolution is easy to find.

Before you begin

Role required: knowledge

About this task

To create a knowledge article from an incident, see Create a knowledge article from an incident.

To create a knowledge article from problem, see Create a known error article.

Depending on the value of the *glide.knowman.submission.workflow* property, knowledge created from an incident or problem may require additional approval. When this property is true, a submission record is created instead of a knowledge article. A user with the knowledge role must approve the submission to create a knowledge article.

Procedure

1. Open a resolved incident or problem.
2. Select the **Knowledge** check box on the form.
   You may need to configure the form to include the **Languages** field. Click the form context menu icon ( ) and navigate to **Configure** > **Form layout**. Use slushbucket to add the Languages field.
3. Close the incident or problem.
   A new draft knowledge article is created.
4. If additional approval is required, navigate to **Knowledge** > **Articles** > **Open Submissions**.
5. Select a submission record.
6. Review the submission to ensure the content and settings are correct.
7. Click **Create Article**.
   A new draft knowledge article is created. Articles created this way are added to the knowledge base specified in the property *glide.knowman.task_kb*.

Create an article version by importing a Word document

Import a Word document to a knowledge article to create a new version.

Before you begin

- Ensure that the Knowledge Management Advanced plugin (com.snc.knowledge_advanced) is installed.
- You can only upload new versions to articles that are in **Draft** or **Published** state.
- You cannot upload new versions to articles that are created using an article template or if the article type is **Wiki**.

Role required: admin

Procedure

1. Navigate to **All** > **Knowledge** > **Articles**.
2. Click an article.
3. Click the **Upload New Version** related link.

Note:
Any text written in TinyMCE is overwritten once the file is imported.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Add the file you want to import.
5. **Optional:** Select the **Copy Attachments** check box to copy all attachments to the knowledge article.

   Note:
   If the article is published, the attachments are added to a new article version. If the article is in draft, the attachments are added to the existing knowledge article. The draft article does not appear in the knowledge base (KB) for users until it is reviewed and published.

6. Click **Import**.
   A draft version is created and sent to approvers to approve or reject. Once the article is approved, it is displayed in the **Article Versions** related list.

Using human readable URLs for the Knowledge article page

Human readable URLs include more readable keywords to the URL structure.

Human readable URLs are short and simple web addresses that use relevant keywords from the knowledge article page that are easier to understand. Users have a better idea of what they will find when they access the link.

The benefits of using human readable URLs rather than technical URLs include:

- Improves the readability of the URL to make it easier for a human to understand
- Improves search engine optimization (SEO) rankings and the click-through rate

Enable Human Readable URLs for the Knowledge Article View page

Update a human readable URL structure in the Knowledge Article View page to improve search ranking and click-through rates.

Before you begin
Role required: admin, sp_admin

About this task
If you are upgrading from a release earlier than the Yokohama release, you must enable the Human Readable URLs feature for the Knowledge Article View page. Beginning with the Yokohama release, this feature is enabled by default.

Note:
To disable the Human Readable URLs feature, change the *glide.service_portal.enable_human_readable_urls* system property value to false.

Procedure

1. Navigate to **All** > **Service Portal** > **Pages**.
2. On the Pages form, search for the ID `kb_article_view` and select it.
3. In the information message on the Page form indicating that you have to change the current application to edit the record, select the word **here**.
4. On the Knowledge Article View form, in the **Human readable url structure** field enter the `%short_descr` variable.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
You can also create a variable to add information from various data sources. For more information, see Add human readable keywords to page URLs.

5. Select **Update**.

Result
The *%short_descr* variable is added to the URL structure and will enable simpler, non-technical words in the URL.

Example: Knowledge Article View page with human readable keywords in the URL

The following sample URL shows the keywords from the Knowledge article KB0000007. The URL considers *en* as the preferred language and displays the Knowledge article content in the English language.

```
https://<instance>.com/kb/en/faq/what-is-a-cookie?id=kb_article_
view&sysparm_article=KB0000007
```

This article URL contains the field variables, and keywords in the following table.

Field variables in the URL structure

Field	Variable	Keywords
Category	%category	`faq`
Short description	%short_descr	`What is a cookie?`

Select a knowledge article category

Knowledge articles within a knowledge base are grouped by category. These groups can help you define the knowledge base taxonomy, and can help users find articles within that knowledge base.

Before you begin
Role required:

About this task
As a knowledge contributor, when editing a knowledge article you can select categories using the Category picker, and add or edit categories if enabled for the knowledge base.

Procedure

1. Click the reference lookup icon beside the **Category** field.
2. Select an existing category, or click the add category icon (+) to add a new category.
   After you select a category, you can click the pen icon to rename that category. Press the enter key or click outside the selected category to save the change.

   Note:
   Clicking **Cancel** while selecting a category cancels selecting a new category, but does not revert any changes you make to the categories such as renaming or adding new categories.

3. Fill in the fields on the form, as appropriate.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. **Optional:** Select or add a subcategory.
5. Click **OK**.

Associate a knowledge article with a taxonomy category

Associate a knowledge article with a taxonomy topics to create a uniform classification structure across different kinds of content.

Before you begin

You must have contribute access to the knowledge base that contains the knowledge article.

Role required: knowledge

About this task

The taxonomy feature enables you to link an article to one or more topics from multiple taxonomies. It helps you maintain a unified content categorization across content types such as catalog items, knowledge articles, and community posts. For more information, see Unified taxonomy for Employee Center

Note:
You can associate only articles in the Draft, Review, or Published state.

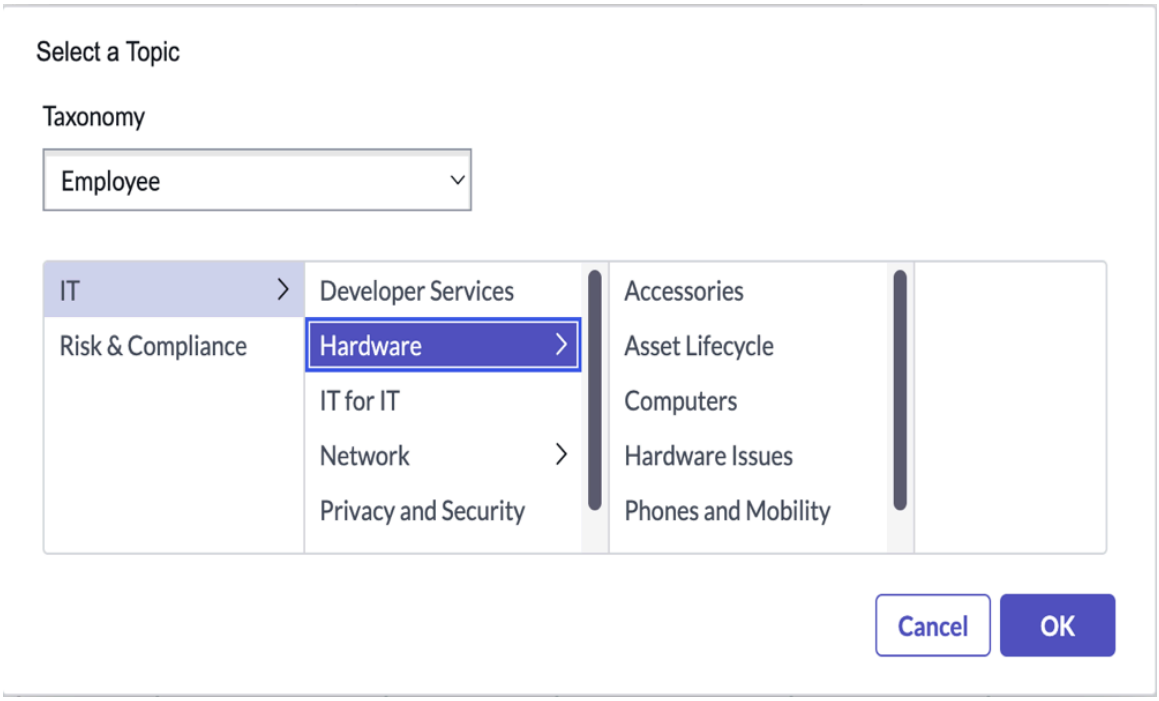
Procedure

1. Navigate to **All** > **Knowledge** > **Articles**.
2. On the article page, click the article you want to associate to a taxonomy topic.
3. In the Assigned Topics related list, click **Add**.

   Note:
   As an admin, you may need to configure the form to include the Connected Content → Knowledge in the related list. Click the form context menu icon and navigate to **Configure** > **Related Lists**. Using slushbucket, add the Connected Content → Knowledge.

4. Select a Taxonomy category from the list in the topic picker dialog box.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Select a topic from a topic picker list and click **OK**.

Result
The selected article is associated with a taxonomy category for better content browsing.

Authoring a knowledge article in Agent Workspace

Complete your job efficiently by creating, editing, and publishing knowledge articles in Agent Workspace.

Knowledge Management features specific to agents and authors are available in Workspace. Perform any knowledge administration-related tasks such as creating a knowledge base, managing access to knowledge articles, enabling an article template, and so on using the ServiceNow AI Platform interface.

You can perform the following Knowledge-related tasks in Workspace:

- Create a knowledge article using a default or custom article template.
- Manage all unpublished and published knowledge articles authored by you.
- Address feedback tasks assigned to you.
- Compare two knowledge article versions.
- Request translations for published untranslated knowledge articles.
- Complete translation tasks assigned to you.
- Map related articles and related catalog items to a knowledge article.
- Add affected products to a knowledge article.
- Use Agent assist to avoid creating knowledge articles with duplicate content.

The authoring experience for knowledge articles in Workspace is similar to the one in ServiceNow AI Platform with the following exceptions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Knowledge blocks can't be created or associated with knowledge articles. However, you can view articles containing knowledge blocks.
- Knowledge articles of type Wiki aren't supported.
- Knowledge article categories can't be created.

Activation Information

The Knowledge list in Workspace is available with the activation of the Agent Workspace plugin (com.glide.core-ui-components). When you install and activate the Agent Workspace plugin, the sn-component-workspace-knowledge plugin for using Knowledge Management in Workspace is also installed and activated.

View a knowledge article in Agent Workspace

View a knowledge article in Agent Workspace, including the article number, short description, and article content.

Before you begin
You must have read access to the knowledge article.
Role required: agent_workspace_user

Procedure

1. Navigate to **All** > **Agent Workspace** > **Agent Workspace Home**.
2. View knowledge articles authored by you or by other people.
   - View all articles by navigating to **Lists** > **Knowledge** > **All Articles**.
   - View articles authored by you by navigating to either **Lists** > **Knowledge** > **My Articles - Published** or **Lists** > **Knowledge** > **My Articles - Unpublished**.
3. Click the link to the knowledge article that you want to view.
4. **Optional:** View the knowledge article in another language by selecting a language in the Language list.

   Note:
   The Language list is populated based on the available translated versions of the article.

5. **Optional:** Copy the link to the knowledge article to your clipboard by clicking the more actions icon (···) and then clicking **Copy link**.
6. **Optional:** Download the article as a Microsoft Word document to your computer by selecting the more actions icon (···) and then selecting **Download as Word**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
This option appears only when the article was originally created using Microsoft Word and the administrator has enabled the *sn_km_word.glide.knowman.enable_document_download* property.

7. **Optional:** View another version of the knowledge article by selecting the version of the knowledge article in the Version list.

Note:
The Version list appears only when the article versioning feature is enabled.

Result

The selected version of the article opens in a knowledge article view page displayed in another tab within Agent Workspace. The tab name includes the knowledge article number and its version number.

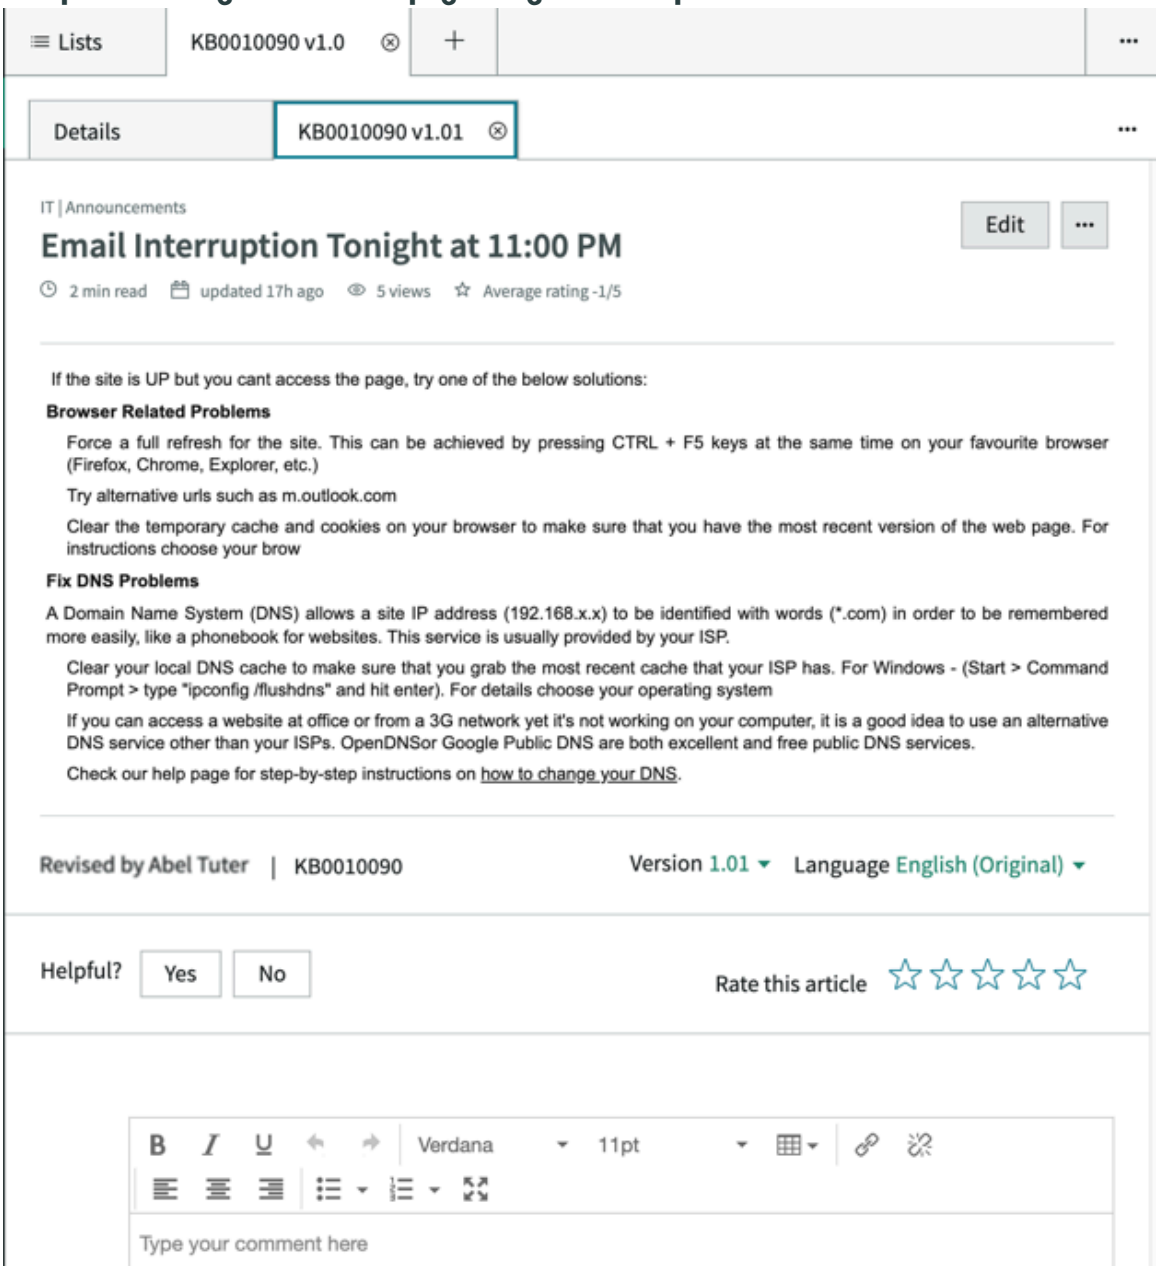
Viewing knowledge article details in Agent Workspace

View the details of a knowledge article in Agent Workspace.

The knowledge article view page in Agent Workspace provides several details about a displayed article.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample knowledge article view page in Agent Workspace



Article information displayed on the knowledge article view page in Agent Workspace

Details	Description
Knowledge base	Knowledge base that stores the knowledge article and the article category. In the figure, IT is the knowledge base and Announcements is the knowledge article category.
Read time	Average time to read the knowledge article, which can help you can decide whether you have time to read the article. The read time is calculated based on an average reading speed of 200 words per minute. For articles in languages such as Chinese, Japanese, and Korean, the read time is calculated based on an average speed of 500 characters per minute. If images are present in an article, the read time is calculated using the following rules:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Article information displayed on the knowledge article view page in Agent Workspace (continued)

Details	Description
	• For the first image add 12 seconds, for the second image add 11 seconds, and so on. • If there are more than 10 images, after the tenth image add 3 seconds for each image.
Last updated time	Last time the knowledge article was updated in number of days for the current week, number of weeks, or number of years.
Number of views	Number of times the knowledge article was viewed in the past number of days set by your system administrator in the *glide.knowman.view_age.days* property. For more information on this property, see Knowledge portal properties.
Average rating	Result of the weighted average rating of the knowledge article based on numeric 1 through 5 ratings. The average rating is carried on the next version of the article.
Knowledge article content	Text and images of the knowledge article.
Authored by	Author of the knowledge article. This field appears only in the first version of a knowledge article.
Revised by	User who revised the article. This field appears if a knowledge article was later edited.
Article number	Unique number automatically assigned to the knowledge article. In the figure, KB0010090 is the article number.
Version	Selected version of the knowledge article. This field appears when the article versioning feature is enabled. In the figure, 1.01 is the selected version of the article.
Language	Language of the selected article. This field appears if the translations of the knowledge article in other languages are available.
Attachments	List of article attachments. This field appears if the knowledge administrator has enabled it to be displayed on the knowledge article view page.

Create a knowledge article in Agent Workspace

Create a knowledge article in Agent Workspace to share information across your organization.

Before you begin

You must have contribute access to the knowledge base within which you want to create the knowledge article.
Role required: agent_workspace_user

About this task

You can also create a knowledge article when adding a knowledge block. For more information, see Add a knowledge block to a knowledge article in Agent Workspace.

Procedure

1. Navigate to **All** > **Agent Workspace** > **Agent Workspace Home**.
2. **Optional:** Check whether a knowledge article on this subject is already available by going to **Lists** > **Knowledge** > **All Articles** and setting a filter to search for possible matching articles.
3. Click **New**.
4. Create the knowledge article by either selecting an article template or using the default template.

Option	Description
Selected article template	Select an article template to create a knowl edge article using defined fields and values. In the Create Article dialog box: **a.** From the Knowledge Base list, select a knowledge base. **b.** From the Article Template list, select the de sired article template. **Note:** The Article Template list is populated based on the article templates config ured for the selected knowledge base. **c.** Select **Create Article**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	The Create Article dialog box is available if the article versioning and the Knowledge Article Templates features are enabled. For more information, see Article versioning and Knowledge article templates.
Default Standard template	Create a knowledge article using the default Standard template.

5. On the form, fill in the fields.

Note:
If you're using an article template, the available fields will vary.

Knowledge form

Field	Description
Knowledge base	Knowledge base in which the knowledge article is stored. You can associate a knowledge article with one knowledge base only. If you're using an article template, you can modify this value only if the template is available in the other knowledge base.
Category	Category for the knowledge article. This value helps users find the article within a selected category. You can select only categories available within the selected knowledge base. Articles without a category appear in the (empty) category.
Ownership Group	Ownership group for the knowledge article. An ownership group consists of a group of members and a manager who are responsible for approvals and feedback tasks. Ownership groups can publish, edit, and retire knowledge articles that they're associated with. **Note:** This field is available only if the *glide.knowman.ownership_group.enabled* property is enabled. If no ownership group is assigned and approvals are required to publish a knowledge article, it's automatically submitted for approval to the knowledge administrator and knowledge manager. For more information, see Ownership groups.
Version	Automatically generated article version number. This number is incremented when changes are made to a published article. **Note:** This field is available if the article versioning feature has been enabled.
Workflow	Publishing workflow state of the knowledge article, such as **Draft**, **In Review**, or **Published**. For a new article, the workflow state is set to **Draft**.
Language	The language in which you're creating the knowledge article. The list is populated based on the languages enabled for the selected knowledge base. This field appears only when the I18N:Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2) is activated. For more information, see I18N - Knowledge internationalization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Short description	Title of the knowledge article. This title appears when browsing and searching for knowledge article, and at the top of the article. You can enter up to 100 characters in this field. **Note:** Knowledge articles similar to the short description text will appear in Agent assist.
Article body	Content for the knowledge article. Use the editing functions in the HTML editor to create content. For more information, see Editing functions for knowledge articles in the HTML editor.
Source Task	Task this knowledge article was created from. This field is set automatically when you create the knowledge article from a task, such as an incident or a customer service case, or from a submission record.
Scheduled publish date	Future date when the knowledge article will be published automatically. For more information, see Schedule a knowledge article for publishing in Agent Workspace.
Valid to	The date this knowledge article expires. Articles don't appear in search results after the **Valid to** date or if the **Valid to** date is empty. The default value of the **Valid to** field is derived from the **Article Validity** field configured for the knowledge base (see Create a knowledge base). The **Valid to** date starts from the date that the article was created until the number of days specified in the **Article Validity** field. If the **Article Validity** field is empty, the default date in the **Valid to** field for the knowledge article is set to January 1, 2100. An article author or editor can select whether to keep or change the default **Valid to** date. For more information, see Validity of a knowledge article. On the first day of each month, the application sends an email notification to a list of authorized recipients to remind them about articles that are expire in the next month. The recipient can then extend the **Valid to** date to continue using the article. For more information, see Managing email notifications in Knowledge Management. **Note:** If the system date format or user preferences is set to use `yy` year format, you might face issues when the **Valid to** date is set to the default date. Contact your administrator or modify the user preferences to use a date format with the `yyyy` year format. For more information, see Global date and time field format and Personalize the system date format topics.
Confidence	Maturity of an article based on its completeness and reusability.
Article type	Type of the article, which is automatically set to HTML. This field is available in the Standard template only. **Note:** The Wiki article type isn't supported in Agent Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Display attachments	Option to display attachments in the knowledge article. If the article has attachments, they're listed below the text of a knowledge article on the knowledge article view page.
Attachment link	Option to automatically download an attached article when a user accesses it instead of opening the article. The Attachment link option applies to articles accessed from search links only. **Note:** Although you may attach multiple files, most web browsers permit users to download only the first attachment. To ensure download of all the files, bundle them into an archive and attach the archive. Articles accessed as links within other knowledge articles will not replicate this behavior.
Governance	An attribute of an article that enables you to control sensitive, critical, or regulated information. Not all articles have the same requirement for compliance reviews. Some articles are based on the collective experience of the people who use the articles (experience-based). Other articles have policy or legal information that require tight control (compliance-based).
Issue	Brief description about an issue. **Note:** This field is available in the KCS Article template only.
Environment	Details of the environment in place when the issue occurred. **Note:** This field is available in the KCS Article template only.
Cause	The cause of the issue. **Note:** This field is available in the KCS Article template only.
Resolution	Method used to resolve the issue. **Note:** This field is available in the KCS Article template only.
Question	Text to display as a question. **Note:** This field is available in the FAQ template only.
Answer	Text to display as an answer to an included question. **Note:** This field is available in the FAQ template only.
Introduction	Introduction to the topic.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: This field is available in the How To and What Is templates only.
Instructions	Instructions for a how-to topic. **Note:** This field is available in the How To template only.
Explanation	Explanation of a what-is topic. **Note:** This field is available in the What Is template only.

Note:
The **Confidence** and **Governance** fields appear when the Knowledge Management KCS Capabilities plugin (com.snc.knowledge_kcs_capabilities) is activated. For more information, see Managing the KCS article state.

6. **Optional:** Research for content related to knowledge article you're authoring using Agent assist.

   a. In the contextual side panel, select the agent assist icon ( ).
   The search results in Agent assist display default content based on the text-based search.

   b. Click the select a search resource icon ( ), and then select a search resource.
   For example, to view knowledge articles, select **Knowledge Articles**.

   c. **Optional:** In the search results, you can click a resource item, such as a knowledge article, to view its content in Agent assist.

   Tip:
   For better readability, you can resize the contextual side panel for Agent assist. For a full view of the selected resource item content, select **Full View**. The resource item content opens in another tab within the Agent Workspace.

7. **Optional:** Check whether your content matches the content in an existing article.

   a. Enter your search text in the text box available in Agent assist or retain the default text, which is the short description of the knowledge article.

   b. Select the lookup icon ( ).

   c. Select a search resource by clicking the Select a search resource icon ( ).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To find knowledge articles that have high text similarity with the entered search text, choose **Similar Articles (ML)**.

  Note:
  This option is available only when the Predictive Intelligence feature is enabled and your administrator has trained the similarity solution for Knowledge Management to find related articles. For more information, see Train the similarity solution for Knowledge Management to find related articles.

- To find knowledge articles that match the entered search text, choose **Knowledge Articles**.

8. **Optional:** Attach a file with supporting information by clicking the attachments icon ( ) in the contextual side panel and selecting the file.
9. **Optional:** Add a knowledge block.
   For more information, see Add a knowledge block to a knowledge article in Agent Workspace.
10. Click **Save**.
    The article is saved and appears in the My Articles - Unpublished list and additional functionality becomes available on the form.
11. **Optional:** Either add to or modify the article details or publish the article.
    - Add to or modify the article details.

      (Optional) For more information, see Edit a knowledge article in Agent Workspace.

    - Publish the article by clicking **Publish**.

      A knowledge article is published depending on the workflow setting of its knowledge base:

      - **Knowledge - Instant Publish**: The knowledge article is immediately published unless it is scheduled to be published at a later date.
      - **Knowledge - Approval Publish**: The knowledge article is published on approval completion unless it is scheduled to be published at a later date.

        Note:
        With an ownership group associated with a knowledge article, ownership group members can approve self-authored articles for publication. An administrator can override this behavior by disabling the `glide.knowman.ownership_group.enable_self_approval` property. For more information, see Ownership groups.

      For more information, see Schedule a knowledge article for publishing in Agent Workspace.

      When published, your knowledge article appears in the My Articles - Published and All Articles lists. If the article versioning feature is enabled, the version number of the knowledge article is updated. For more information, see Knowledge article version numbers.

What to do next

After you create and publish a knowledge article, you can perform the following actions related to the article:

- Request translations for the knowledge article. For more information, see Request translations for missing languages in Agent Workspace.
- Retire the knowledge article. Click **Retire** to enable the retirement workflow. For more information, see Retire a knowledge article.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Translate the knowledge article directly from the knowledge article. For more information, see Translate a knowledge article in Agent Workspace.
- Delete the published knowledge article. Click **Delete**. If the **Delete** button isn't displayed, click the more actions icon ( ), and then click **Delete**.

> **Note:**
> Only users with the admin role can delete a published knowledge article.

Using Agent Assist in Agent Workspace

Create knowledge from incident or problem

Publish a knowledge article in Agent Workspace

Publish a knowledge article to make it available to users.

Before you begin

You must have contribute access to the knowledge base that stores the knowledge article you want to publish.
Role required: agent_workspace_user

Procedure

1. Navigate to **All** > **Agent Workspace** > **Agent Workspace Home**.
2. Go to **Lists** > **Knowledge** > **My Articles - Unpublished**.
3. Click a knowledge article link.
4. On the Knowledge form, click **Publish**.

Result

A knowledge article is published depending on the workflow setting of its knowledge base:

- **Knowledge - Instant Publish**: The knowledge article is immediately published unless it is scheduled to be published at a later date.
- **Knowledge - Approval Publish**: The knowledge article is published on approval completion unless it is scheduled to be published at a later date.

> **Note:**
> With an ownership group associated with a knowledge article, ownership group members can approve self-authored articles for publication. An administrator can override this behavior by disabling the *glide.knowman.ownership_group.enable_self_approval* property. For more information, see Ownership groups.

Knowledge workflows

Edit a knowledge article in Agent Workspace

Edit knowledge articles within a knowledge base in Agent Workspace to update information shared across your organization.

Before you begin

You must have contribute access to the knowledge base that stores the knowledge article you want to edit.

Note:

- If the article versioning feature is enabled, only the knowledge administrator, knowledge managers, and author can edit the checked-out version of an article. If the feature is disabled, any users with contribute access to an article can edit the draft version of the article. An administrator can disable the article versioning feature by setting the *glide.knowman.versioning.enabled* property (from the **System Property** [sys_properties] table) to **false**.
- If an ownership group is associated with a knowledge article, the author or reviser of the article can't contribute to the article after the article is published. An administrator can override this behavior by enabling the *glide.knowman.ownership_group.override* property. For more information, see Ownership groups.
- If the *glide.knowman.translation.enable_translation_task* property is enabled, you can't modify the knowledge base of existing articles.

Role required: agent_workspace_user

Procedure

1. Navigate to **All** > **Agent Workspace** > **Agent Workspace Home**.
2. Go to **Lists** > **Knowledge** > **All Articles**.
3. Click a knowledge article link.
4. On the Knowledge form, click **Edit**.

   Note:
   If the knowledge article was created using Microsoft Word, you can edit the article only in Microsoft Word. In this case, select **Open in Word** to open the article in Word Online. For more information, see Edit a knowledge article in Microsoft Word.

   If you want to edit the article using the HTML editor, you can unlink the article from Word. For more information, see Unlink knowledge articles from linked Microsoft Word documents.

5. If the article versioning feature is enabled, click **Checkout** for a published knowledge article. You can only edit the latest version of a knowledge article.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Access the relevant related lists to modify the information.

Knowledge form related lists

Related list	Description
Details	Knowledge article content and its metadata. **Note:** If the article versioning feature is enabled, the default value of the **Valid to** date in the updated article version is automatically set based on the following criteria: ○ If the **Article Validity** field in the knowledge base associated with the article is empty, the **Valid to** date value from the earlier version of the article is retained. ○ If the **Article Validity** field in the knowledge base associated with the article isn't empty, the **Valid to** date is automatically updated to start from the date the article was updated until the number of days specified in the **Article Validity** field (Article updated date + article validity). If you move a knowledge article to another knowledge base, the default value of the **Valid to** date in the updated article is automatically set based on the following criteria: ○ If the **Article Validity** field in the selected knowledge base is empty, the earlier **Valid to** date value is retained for the knowledge article. ○ If the **Article Validity** field in the selected knowledge base isn't empty, the **Valid to** date is automatically updated to start from the date the article was updated until the number of days specified in the **Article Validity** field (Article updated date + article validity). If the dictionary value of the **Valid to** field is modified, this dictionary value overrides the default value of the **Valid to** field calculated according to the **Article Validity** field. For more information, see Validity of a knowledge article.
Feedback	Feedback received on the published versions of the article. To view more details about the feedback, in the **Comments** column, select a link for the desired version of an article.
Feedback Tasks	Details about the feedback task created for a knowledge article version.
Approvals	Approval history of the knowledge article.
Article Versions	Version history of the knowledge article.
Translated Versions	Translated versions of the knowledge article. This related list appears only when the translation management feature is enabled. To translate a knowledge article, select **New**. The **New** button on this related list appears when the *glide.knowman.translation.enable_translation_task* property is inactive.
Translation Tasks	Tasks submitted for translating the article.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related list	Description
	This related list appears when the Translation Management feature and the *glide.knowman.translation.enable_translation_task* property to enable creation of translation tasks are enabled. For more information, see Knowledge Management properties.
Related Articles	Related articles mapped to the knowledge article. For more information, see Map a related article in Agent Workspace.
Related Catalog Items	Related catalog items mapped to the knowledge article. For more information, see Map a related item in Agent Workspace.
Affected Products	Products mapped to the knowledge article. For more information, see Add an affected product to a knowledge article in Agent Workspace.

7. **Optional:** Research for content related to knowledge article you're authoring using Agent assist.

   a. In the contextual side panel, select the agent assist icon ( ).
   The search results in Agent assist display default content based on the text-based search.

   b. Click the select a search resource icon ( ), and then select a search resource.
   For example, to view knowledge articles, select **Knowledge Articles**.

   c. **Optional:** In the search results, you can click a resource item, such as a knowledge article, to view its content in Agent assist.

   Tip:
   For better readability, you can resize the contextual side panel for Agent assist. For a full view of the selected resource item content, select **Full View**. The resource item content opens in another tab within the Agent Workspace.

8. **Optional:** Check whether your content matches the content in an existing article.

   a. Enter your search text in the text box available in Agent assist or retain the default text, which is the short description of the knowledge article.

   b. Select the lookup icon ( ).

   c. Select a search resource by clicking the Select a search resource icon ( ).

   - To find knowledge articles that have high text similarity with the entered search text, choose **Similar Articles (ML)**.

     Note:
     This option is available only when the Predictive Intelligence feature is enabled and your administrator has trained the similarity solution for Knowledge Management. For more information, see Train the similarity solution for Knowledge Management to find related articles.

   - To find knowledge articles that match the entered search text, choose **Knowledge Articles**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. **Optional:** Work with attachments.
   - Attach a file with supporting information by clicking the attachments icon ( ) in the contextual side panel and selecting the file.
   - Download, remove, or rename an existing attachment by clicking the menu icon ( ) displayed for the attachment.
10. Click **Save**.
    The article is saved and appears in the My Articles - Unpublished list. If the article versioning feature is enabled, the version of the knowledge article is incremented by 0.01. For more information, see Knowledge article version numbers.
11. **Optional:** Publish the article by clicking **Publish**.
    The knowledge article is published depending on the workflow setting of its knowledge base:
    - **Knowledge - Instant Publish**: The knowledge article is immediately published unless it is scheduled to be published at a later date.
    - **Knowledge - Approval Publish**: The knowledge article is published on approval completion unless it is scheduled to be published at a later date.

      Note:
      With an ownership group associated with a knowledge article, ownership group members can approve self-authored articles for publication. An administrator can override this behavior by disabling the `glide.knowman.ownership_group.enable_self_approval` property. For more information, see Ownership groups.

    For more information, see Schedule a knowledge article for publishing in Agent Workspace.

    When published, the knowledge article appears in the My Articles - Published and All Articles lists. If the article versioning feature is enabled, the version number of the knowledge article increments to the next whole number (for example, from 2.02 to 3.0). For more information, see Knowledge article version numbers.

Using Agent Assist in Agent Workspace

Create knowledge from incident or problem

Map a related article in Agent Workspace

Discover similar information across articles on a topic while viewing a knowledge article. You can manually map related articles or have the application automatically present related articles using machine learning (ML) algorithms.

Before you begin

You must have contribute access to the knowledge base that stores the knowledge article for which you want to add related articles.
Role required: agent_workspace_user

About this task

If you have manually mapped related articles when editing an article in Agent Workspace, those articles are listed in the Related Articles section on the knowledge article view page in the Knowledge Management Service Portal before the related articles that are predicted thorough the Knowledge Management similarity solution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
An administrator can train the solution definition for Knowledge Management within the Predictive Intelligence feature to find related articles. For more information, see Train the similarity solution for Knowledge Management to find related articles.

This task provides steps to manually map related articles when editing an article in Agent Workspace. You can also manually map related articles when editing an article from the Knowledge Management application in the ServiceNow AI Platform interface. For more information, see Map related articles.

Procedure

1. Navigate to **All** > **Agent Workspace** > **Agent Workspace Home**.
2. Go to **Lists** > **Knowledge** > **All Articles**.
3. Click the link to the knowledge article for which you want to map related articles.
4. In the Related Articles related list, click **New**.
5. On the Related Articles form, fill in the fields.

Related Articles form

Field	Description
Active	Option to enable the mapping to the related knowledge article.
Related knowledge article	Knowledge article that contains related information. You can click the search for record icon (), to access the list of available knowledge articles.
Knowledge article	Number of the knowledge article for which you are adding the related knowledge article.
Order	Order in which you want the article to appear in the Related Articles section on the Knowledge Management article view page. A lower value means that a knowledge article has the greater priority to appear in the Related Articles section. The default value is 100.

6. Click **Save**.

Result

The mapped articles are available in the Related Articles section on the Knowledge Management article view page in the Knowledge Management Service Portal. See Knowledge Management Service Portal article view page features.

Note:
Because system administrators can configure the number of knowledge articles shown in the Related Articles section, not all mapped related articles might appear in the Related Articles section. For more information, see Configure knowledge related articles widget instance options.

Map a related item in Agent Workspace

Manually map catalog items related to a knowledge article in Agent Workspace to enable employees to request the related catalog item.

Before you begin

You must have contribute access to the knowledge base that stores the knowledge article for which you want to add related articles.
Role required: agent_workspace_user

About this task

This task provides steps to map related catalog items when editing an article in Agent Workspace. You can also map related catalog items when editing an article from the Knowledge Management application in the ServiceNow AI Platform interface. For more information, see Map catalog items related to an article.

Procedure

1. Navigate to **All** > **Agent Workspace** > **Agent Workspace Home**.
2. Go to **Lists** > **Knowledge** > **Published** for a published article or **Lists** > **Knowledge** > **Unpublished** for an unpublished article.
3. Click the link to the knowledge article for which you want to map a related item.
4. On the Knowledge form, click the Related Catalog Items related list.
5. Click **New**.
6. On the Related Catalog Items form, fill in the fields.

Related Items form

Field	Description
Active	Option to enable the mapping to the related catalog item.
Catalog item	Catalog item related to the knowledge article. You can click the search for record icon (🔍) to access a list of available catalog items.
Knowledge article	Number of the knowledge article for which you are adding the related catalog item.
Order	Order in which you want the catalog item to appear in the Related Items section on the Knowledge Management article view page. A lower value means that a catalog item has the greater priority to appear in the Related Items section. The default value is 100.

7. Click **Save**.

Result

The mapped catalog items are listed in the Related Items section on the Knowledge Management article view page in Knowledge Management Service Portal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Because system administrators can configure the number of catalog items shown in the Related Items section, not all mapped related catalog items might appear in the Related Items section. For more information, see Configure related catalog item widget instance options.

Add an affected product to a knowledge article in Agent Workspace

Add affected products to a knowledge article to view the products associated with the knowledge article

Before you begin

The Knowledge Product Entitlements plugin (com.snc.kb_product_entitlements) must be activated to use the Knowledge Product Entitlements application. Installing this plugin adds the Affected Products related list to the Knowledge form. For more information, see Knowledge product entitlements.

You must have contribute access to the knowledge base that stores the knowledge article for which you want to add affected products.

Role required: agent_workspace_user

About this task

This task provides steps to add affected products to a knowledge article in Agent Workspace. You can also add affected products to a knowledge article using the Knowledge Management application in the ServiceNow AI Platform interface. For more information, see Add a related product to a knowledge base or knowledge article.

Procedure

1. Navigate to **All** > **Agent Workspace** > **Agent Workspace Home**.
2. Go to **Lists** > **Knowledge** > **All Articles**.
3. Click the link to the knowledge article for which you want to add a related product.
4. On the Knowledge form, in the Affected Products related list, click **New**.
5. On the Knowledge Related to Products form, in the **Configuration item** field, click the search for record icon ( ).
6. In the Configuration item dialog box, click the related product.
7. Click **Save**.

Edit a knowledge article in Agent Workspace

Schedule a knowledge article for publishing in Agent Workspace

Set a specific time and day for a knowledge article to be published in Agent Workspace automatically.

Before you begin

You must have contribute access to the knowledge base that stores the knowledge article you want to schedule for publishing.
Ensure that the system administrator verifies the following settings:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Knowledge Management Advanced plugin (com.snc.knowledge_advanced) is activated. For more information, see Activate the Knowledge Management Advanced plugin.
- The article versioning feature is enabled. For more information, see Article versioning.

Note:
You can also schedule a knowledge article for publishing from the Knowledge Management application in the ServiceNow AI Platform interface. For more information, see Schedule a knowledge article for publishing.

Role required: agent_workspace_user

Procedure

1. Navigate to **All** > **Agent Workspace** > **Agent Workspace Home**.
2. Go to **Lists** > **Knowledge** > **My Articles - Unpublished Articles**.
3. Click an article link.
4. In the **Scheduled publish date** field, click the show calendar icon ().
5. Select any future date in the calendar.
6. In the **Select Time** field, enter a time in the format hh:mm:ss.
7. Click **OK**.
8. Click **Publish** to enable the publishing workflow.

Tip:
If you want to cancel an article's scheduled publication and move the article back to the Draft state, click **Recall**.

Result

The knowledge article is published on the scheduled publish date depending on the following workflow settings of its knowledge base:

- If the knowledge base workflow is set to **Knowledge - Instant Publish**, the knowledge article is automatically published on the scheduled publish date. The **Workflow** field on the Knowledge form of the article is updated to **Scheduled for publish**.
- If the knowledge base workflow is set to **Knowledge - Approval Publish**, the knowledge article is published on approval completion. The **Workflow** field on the Knowledge form of the article is updated to **Review**.

  The approval completion affects the scheduled publishing as follows:

  - If the approvals are completed before the scheduled publish date, the **Workflow** field on the Knowledge form of the article is updated to **Scheduled for publish** and the article is published on the scheduled publish date.
  - If the approvals are completed after the scheduled publish date, the article is published immediately on the approval completion.

Work on a feedback task in Agent Workspace

Start working on a feedback task, request clarifications, and resolve or close the feedback task in Agent Workspace. You can view all feedback tasks assigned to you or your ownership group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
You must have contribute access to the knowledge base that stores the knowledge article you want to work on.
Role required: agent_workspace_user

About this task
A feedback task is created based on the following types of feedback sources.

Source	Description
User feedback	Knowledge article was marked as not helpful or given low ratings.
Internal feedback	Knowledge article was flagged.
Knowledge gap	Knowledge gap feedback task was created for one or more tasks using the Knowledge Demand Insights feature.
Knowledge gap - manual	Knowledge gap feedback task was created manually from a task, such as a customer service case or an incident.
Unsuccessful search	Knowledge gap feedback task was created from the Unsuccessful Searches report in the Self-Service Analytics for Customer Service dashboard.
Other	Feedback for a knowledge article from other sources. **Note:** When you upgrade your instance, for any existing records that don't have any feedback task type set or don't match with supported types, the feedback task type is automatically set to **Other**.

Procedure
1. Navigate to **All** > **Agent Workspace** > **Agent Workspace Home**.
2. Click **Lists** > **Knowledge** > **My Tasks - Feedback**.
3. Click the link to a feedback task number.
4. On the Knowledge Feedback Task form, review the feedback given by the submitter.
5. Work on the feedback task.
6. **Optional:** In the Compose section, enter comments, which all viewers can see, or work notes, which only internal users can see.
7. **Optional:** Track the time spent on each state for a feedback task by clicking the **Knowledge Feedback Task Metrics** tab and then clicking a link to the state in the **Value** column.
8. Click **Save**.

Result
The feedback task is updated.

Create a knowledge article from a feedback task in Agent Workspace

When working on a knowledge article feedback task, if the current knowledge article doesn't address the issue, you can create another knowledge article from within the task. A feedback task is created for a knowledge article when the article is flagged, marked as not helpful, or rated low, or a knowledge gap feedback task is created on a topic.

Before you begin

You must have contribute access to the knowledge base that stores the knowledge article.
Role required: agent_workspace_user

About this task

A feedback task is created in the following ways:

- When a user provides a feedback for the knowledge article. For more information, see Provide feedback for a knowledge article in Agent Workspace.
- When knowledge gap feedback tasks are created on a topic from a demand insights dashboard. For more information, see Analyze knowledge gaps from a demand insights dashboard and create knowledge gap feedback tasks.

Procedure

1. Navigate to **All** > **Agent Workspace** > **Agent Workspace Home**.
2. Go to your tasks list.
   - For feedback tasks created through knowledge gaps or if a knowledge article was marked as not helpful or rated low, go to **Knowledge** > **My Tasks - Feedback**.
   - For tasks created when an article was flagged, go to **Knowledge** > **My Tasks - Flagged**.
3. In the **Number** column, click the link to a feedback task assigned to you or your ownership group.
4. Click **Create Article**.
5. Create the knowledge article by either selecting an article template or using the default template.

Option	Description
Selected article template	Select an article template to create a knowl edge article using defined fields and values. In the Create Article dialog box: **a.** From the Knowledge Base list, select a knowledge base. **b.** From the Article Template list, select the de sired article template. **Note:** The Article Template list is populated based on the article templates config ured for the selected knowledge base. **c.** Select **Create Article**. The Create Article dialog box is available if the article versioning and the Knowledge Arti cle Templates features are enabled. For more

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	information, see Article versioning and Knowledge article templates.
Default Standard template	Create a knowledge article using the default Standard template.

6. On the form, fill in the fields.

Note:
If you're using an article template, the available fields will vary.

Knowledge form

Field	Description
Knowledge base	Knowledge base in which the knowledge article is stored. You can associate a knowledge article with one knowledge base only. If you're using an article template, you can modify this value only if the template is available in the other knowledge base.
Category	Category for the knowledge article. This value helps users find the article within a selected category. You can select only categories available within the selected knowledge base. Articles without a category appear in the (empty) category.
Ownership Group	Ownership group for the knowledge article. An ownership group consists of a group of members and a manager who are responsible for approvals and feedback tasks. Ownership groups can publish, edit, and retire knowledge articles that they're associated with. **Note:** This field is available only if the *glide.knowman.ownership_group.enabled* property is enabled. If no ownership group is assigned and approvals are required to publish a knowledge article, it's automatically submitted for approval to the knowledge administrator and knowledge manager. For more information, see Ownership groups.
Version	Automatically generated article version number. This number is incremented when changes are made to a published article. **Note:** This field is available if the article versioning feature has been enabled.
Workflow	Publishing workflow state of the knowledge article, such as **Draft**, **In Review**, or **Published**. For a new article, the workflow state is set to **Draft**.
Language	The language in which you're creating the knowledge article. The list is populated based on the languages enabled for the selected knowledge base. This field appears only when the I18N:Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2) is activated. For more information, see I18N - Knowledge internationalization.
Short description	Title of the knowledge article. This title appears when browsing and searching for knowledge article, and at the top of the article.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	You can enter up to 100 characters in this field. **Note:** Knowledge articles similar to the short description text will appear in Agent assist.
Article body	Content for the knowledge article. Use the editing functions in the HTML editor to create content. For more information, see Editing functions for knowledge articles in the HTML editor.
Source Task	Task this knowledge article was created from. This field is set automatically when you create the knowledge article from a task, such as an incident or a customer service case, or from a submission record.
Scheduled publish date	Future date when the knowledge article will be published automatically. For more information, see Schedule a knowledge article for publishing in Agent Workspace.
Valid to	The date this knowledge article expires. Articles don't appear in search results after the **Valid to** date or if the **Valid to** date is empty. The default value of the **Valid to** field is derived from the **Article Validity** field configured for the knowledge base (see Create a knowledge base). The **Valid to** date starts from the date that the article was created until the number of days specified in the **Article Validity** field. If the **Article Validity** field is empty, the default date in the **Valid to** field for the knowledge article is set to January 1, 2100. An article author or editor can select whether to keep or change the default **Valid to** date. For more information, see Validity of a knowledge article. On the first day of each month, the application sends an email notification to a list of authorized recipients to remind them about articles that are expire in the next month. The recipient can then extend the **Valid to** date to continue using the article. For more information, see Managing email notifications in Knowledge Management. **Note:** If the system date format or user preferences is set to use `yy` year format, you might face issues when the **Valid to** date is set to the default date. Contact your administrator or modify the user preferences to use a date format with the `yyyy` year format. For more information, see Global date and time field format and Personalize the system date format topics.
Confidence	Maturity of an article based on its completeness and reusability.
Article type	Type of the article, which is automatically set to HTML. This field is available in the Standard template only. **Note:** The Wiki article type isn't supported in Agent Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Display attachments	Option to display attachments in the knowledge article. If the article has attachments, they're listed below the text of a knowledge article on the knowledge article view page.
Attachment link	Option to automatically download an attached article when a user accesses it instead of opening the article. The Attachment link option applies to articles accessed from search links only. **Note:** Although you may attach multiple files, most web browsers permit users to download only the first attachment. To ensure download of all the files, bundle them into an archive and attach the archive. Articles accessed as links within other knowledge articles will not replicate this behavior.
Governance	An attribute of an article that enables you to control sensitive, critical, or regulated information. Not all articles have the same requirement for compliance reviews. Some articles are based on the collective experience of the people who use the articles (experience-based). Other articles have policy or legal information that require tight control (compliance-based).
Issue	Brief description about an issue. **Note:** This field is available in the KCS Article template only.
Environment	Details of the environment in place when the issue occurred. **Note:** This field is available in the KCS Article template only.
Cause	The cause of the issue. **Note:** This field is available in the KCS Article template only.
Resolution	Method used to resolve the issue. **Note:** This field is available in the KCS Article template only.
Question	Text to display as a question. **Note:** This field is available in the FAQ template only.
Answer	Text to display as an answer to an included question. **Note:** This field is available in the FAQ template only.
Introduction	Introduction to the topic.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: This field is available in the How To and What Is templates only.
Instructions	Instructions for a how-to topic. **Note:** This field is available in the How To template only.
Explanation	Explanation of a what-is topic. **Note:** This field is available in the What Is template only.

Note:
The **Confidence** and **Governance** fields appear when the Knowledge Management KCS Capabilities plugin (com.snc.knowledge_kcs_capabilities) is activated. For more information, see Managing the KCS article state.

7. **Optional:** Research for content related to knowledge article you're authoring using Agent assist.

   a. In the contextual side panel, select the agent assist icon ( ).
   The search results in Agent assist display default content based on the text-based search.

   b. Click the select a search resource icon ( ), and then select a search resource.
   For example, to view knowledge articles, select **Knowledge Articles**.

   c. **Optional:** In the search results, you can click a resource item, such as a knowledge article, to view its content in Agent assist.

   Tip:
   For better readability, you can resize the contextual side panel for Agent assist. For a full view of the selected resource item content, select **Full View**. The resource item content opens in another tab within the Agent Workspace.

8. **Optional:** Check whether your content matches the content in an existing article.

   a. Enter your search text in the text box available in Agent assist or retain the default text, which is the short description of the knowledge article.

   b. Select the lookup icon ( ).

   c. Select a search resource by clicking the Select a search resource icon ( ).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To find knowledge articles that have high text similarity with the entered search text, choose **Similar Articles (ML)**.

  Note:
  This option is available only when the Predictive Intelligence feature is enabled and your administrator has trained the similarity solution for Knowledge Management to find related articles. For more information, see Train the similarity solution for Knowledge Management to find related articles.

- To find knowledge articles that match the entered search text, choose **Knowledge Articles**.

9. Click **Save**.
   The article is saved and appears in the My Articles - Unpublished list and additional functionality becomes available on the form.
10. **Optional:** Either add to or modify the article details or publish the article.
    - Add to or modify the article details.

      (Optional) For more information, see Edit a knowledge article in Agent Workspace.

    - Publish the article by clicking **Publish**.

      A knowledge article is published depending on the workflow setting of its knowledge base:

      - **Knowledge - Instant Publish**: The knowledge article is immediately published unless it is scheduled to be published at a later date.
      - **Knowledge - Approval Publish**: The knowledge article is published on approval completion unless it is scheduled to be published at a later date.

        Note:
        With an ownership group associated with a knowledge article, ownership group members can approve self-authored articles for publication. An administrator can override this behavior by disabling the `glide.knowman.ownership_group.enable_self_approval` property. For more information, see Ownership groups.

      For more information, see Schedule a knowledge article for publishing in Agent Workspace.

      When published, your knowledge article appears in the My Articles - Published and All Articles lists. If the article versioning feature is enabled, the version number of the knowledge article is updated. For more information, see Knowledge article version numbers.

What to do next

After you create and publish a knowledge article, you can perform the following actions related to the article:

- Request translations for the knowledge article. For more information, see Request translations for missing languages in Agent Workspace.
- Retire the knowledge article. Click **Retire** to enable the retirement workflow. For more information, see Retire a knowledge article.
- Translate the knowledge article directly from the knowledge article. For more information, see Translate a knowledge article in Agent Workspace.

Edit a knowledge article from a feedback task in Agent Workspace

When working on a knowledge article task, you can edit the knowledge article from within the task. A feedback task is created for a knowledge article when the article is flagged, marked as not helpful, or rated low, or a knowledge gap feedback task is created on a topic.

Before you begin

Role required: You must have contribute access to the knowledge base that stores the knowledge article.

> **Note:**
> If the article versioning feature is enabled, only the knowledge administrator, knowledge managers, and author can edit the checked-out version of an article. If the feature is disabled, any users with contribute access to an article can edit the draft version of the article. An administrator can disable the article versioning feature by setting the *glide.knowman.versioning.enabled* property (from the **System Property** [sys_properties] table) to **false**.

Role required: agent_workspace_user

Procedure

1. Navigate to **All** > **Agent Workspace** > **Agent Workspace Home**.
2. Go to your tasks list.
   - For feedback tasks created through knowledge gaps or if a knowledge article was marked as not helpful or rated low, go to **Knowledge** > **My Tasks - Feedback**.
   - For tasks created when an article was flagged, go to **Knowledge** > **My Tasks - Flagged**.
3. In the **Number** column, click the link to a feedback task assigned to you or your ownership group.
4. Click **Edit Article**.
5. If the article versioning feature is enabled, click **Checkout** for a published knowledge article. You can only edit the latest version of a knowledge article.
6. Access the relevant related lists to modify the information.

Knowledge form related lists

Related list	Description
Details	Knowledge article content and its metadata.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related list	Description
	Note: If the article versioning feature is enabled, the default value of the **Valid to** date in the updated article version is automatically set based on the following criteria: ○ If the **Article Validity** field in the knowledge base associated with the article is empty, the **Valid to** date value from the earlier version of the article is retained. ○ If the **Article Validity** field in the knowledge base associated with the article isn't empty, the **Valid to** date is automatically updated to start from the date the article was updated until the number of days specified in the **Article Validity** field (Article updated date + article validity). If you move a knowledge article to another knowledge base, the default value of the **Valid to** date in the updated article is automatically set based on the following criteria: ○ If the **Article Validity** field in the selected knowledge base is empty, the earlier **Valid to** date value is retained for the knowledge article. ○ If the **Article Validity** field in the selected knowledge base isn't empty, the **Valid to** date is automatically updated to start from the date the article was updated until the number of days specified in the **Article Validity** field (Article updated date + article validity). If the dictionary value of the **Valid to** field is modified, this dictionary value overrides the default value of the **Valid to** field calculated according to the **Article Validity** field. For more information, see Validity of a knowledge article.
Feedback	Feedback received on the published versions of the article. To view more details about the feedback, in the **Comments** column, select a link for the desired version of an article.
Feedback Tasks	Details about the feedback task created for a knowledge article version.
Approvals	Approval history of the knowledge article.
Article Versions	Version history of the knowledge article.
Translated Versions	Translated versions of the knowledge article. This related list appears only when the translation management feature is enabled. To translate a knowledge article, select **New**. The **New** button on this related list appears when the *glide.knowman.translation.enable_translation_task* property is inactive.
Translation Tasks	Tasks submitted for translating the article. This related list appears when the Translation Management feature and the *glide.knowman.translation.enable_translation_task* property to enable creation of translation tasks are enabled. For more information, see Knowledge Management properties.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related list	Description
Related Articles	Related articles mapped to the knowledge article. For more information, see Map a related article in Agent Workspace.
Related Catalog Items	Related catalog items mapped to the knowledge article. For more information, see Map a related item in Agent Workspace.
Affected Products	Products mapped to the knowledge article. For more information, see Add an affected product to a knowledge article in Agent Workspace.

7. **Optional:** Research for content related to knowledge article you're authoring using Agent assist.

   a. In the contextual side panel, select the agent assist icon ( ).
   The search results in Agent assist display default content based on the text-based search.

   b. Click the select a search resource icon ( ), and then select a search resource.
   For example, to view knowledge articles, select **Knowledge Articles**.

   c. **Optional:** In the search results, you can click a resource item, such as a knowledge article, to view its content in Agent assist.

   Tip:
   For better readability, you can resize the contextual side panel for Agent assist. For a full view of the selected resource item content, select **Full View**. The resource item content opens in another tab within the Agent Workspace.

8. **Optional:** Check whether your content matches the content in an existing article.

   a. Enter your search text in the text box available in Agent assist or retain the default text, which is the short description of the knowledge article.

   b. Select the lookup icon ( ).

   c. Select a search resource by clicking the Select a search resource icon ( ).

   - To find knowledge articles that have high text similarity with the entered search text, choose **Similar Articles (ML)**.

     Note:
     This option is available only when the Predictive Intelligence feature is enabled and your administrator has trained the similarity solution for Knowledge Management. For more information, see Train the similarity solution for Knowledge Management to find related articles.

   - To find knowledge articles that match the entered search text, choose **Knowledge Articles**.

9. Click **Save**.
   The article is saved and appears in the My Articles - Unpublished list. If the article versioning feature is enabled, the version of the knowledge article is incremented by 0.01. For more information, see Knowledge article version numbers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

10. **Optional:** Publish the article by clicking **Publish**.
    The knowledge article is published depending on the workflow setting of its knowledge base:
    - **Knowledge - Instant Publish**: The knowledge article is immediately published unless it is scheduled to be published at a later date.
    - **Knowledge - Approval Publish**: The knowledge article is published on approval completion unless it is scheduled to be published at a later date.

    Note:
    With an ownership group associated with a knowledge article, ownership group members can approve self-authored articles for publication. An administrator can override this behavior by disabling the *glide.knowman.ownership_group.enable_self_approval* property. For more information, see Ownership groups.

    For more information, see Schedule a knowledge article for publishing in Agent Workspace.

    When published, the knowledge article appears in the My Articles - Published and All Articles lists. If the article versioning feature is enabled, the version number of the knowledge article increments to the next whole number (for example, from 2.02 to 3.0). For more information, see Knowledge article version numbers.

Compare knowledge article versions in Agent Workspace

Select and compare two versions of a knowledge article in Agent Workspace to view the differences between them.

Before you begin

You must have contribute access to the knowledge base that stores the knowledge article.
Role required: agent_workspace_user

Note:
For comparison of the knowledge article versions in the Next Experience UI, see Compare two versions of an article.

Procedure

1. Navigate to **All** > **Agent Workspace** > **Agent Workspace Home**.
2. Click **Lists** > **Knowledge** > **All Articles**.
3. Click the link to a knowledge article for which you want to compare two versions.
4. Click **Edit** to open the Knowledge article form.
5. In the Article Versions related list, select the two versions of the article to compare.
6. Click **Compare**.

Article versioning

Recall an article that is being reviewed in Agent Workspace

Recall an article that is being reviewed to stop the approval process.

Before you begin

You must have contribute access to the knowledge base that stores the knowledge article you want to recall.
Ensure that the article versioning feature is enabled. For more information, see Article versioning.

Role required: agent_workspace_user

About this task

The author of a knowledge article, knowledge administrators, and system administrators can recall the article. If an ownership group is assigned to a knowledge article, the ownership group manager and ownership group members can also recall the knowledge article.

If a version of a knowledge article is in the **Review** workflow state, you can recall only the corresponding version to make additional changes. Recalling the article results in a minor version increment.

Procedure

1. Navigate to **All** > **Agent Workspace** > **Agent Workspace Home**.
2. Go to **Lists** > **Knowledge** > **All Articles**.
3. Click the link to the article in **Review** workflow state that you want to recall.
4. On the Knowledge form, click **Recall**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The article opens in edit mode and the workflow state of the article is changed to **Draft**. The version number of the article increments by 0.01.

Knowledge workflows

Approve a knowledge article in Agent Workspace

Approve a knowledge article that is awaiting your review in Agent Workspace.

Before you begin
Role required: agent_workspace_user

About this task
If the article versioning feature is enabled, only users who are assigned as approvers can modify a knowledge article that is in the **Review** state. If you are not an approver but need to modify the article, consider recalling the article. For more information, see Recall an article that is being reviewed in Agent Workspace.

Procedure

1. Navigate to **All** > **Agent Workspace** > **Agent Workspace Home**.
2. Go to **Lists** > **Knowledge** > **My Articles - Unpublished**.
3. Click an article link in **Review** workflow state.
4. Click **Edit**.
5. In the Approvals related list, in the **State** column, click **Requested**.
   The Approval form opens in another tab within Agent Workspace.
6. From the State list, select **Approved**.
7. Click **Save**.
   The approved knowledge article is published immediately or on the scheduled publish date, if the article is scheduled for publishing. If the article versioning feature is enabled, the version number of the knowledge article increments to the next whole number (for example, from 2.02 to 3.0). On the Knowledge form of the article, the workflow state changes to **Published**. The new published version of the article is added to the Article Versions related list on the Knowledge form. The version is also available in the All Articles list in Agent Workspace, go to **Knowledge** > **All Articles**.

Request translations for missing languages in Agent Workspace

Request to translate a published knowledge article in available languages by creating a translation task in Agent Workspace.

Before you begin
You must have contribute access to the knowledge base that stores the knowledge article. Ensure that the system administrator verifies the following settings:

- Knowledge Management Advanced plugin (com.snc.knowledge_advanced) is activated.
- I18N: Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2) is activated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The 18N: Internationalization plugin (com.glide.i18n) activates the I18N: Knowledge Management Internationalization Plugin v2 plugin.

- The *glide.knowman.translation.enable_translation_task* property is set to `true` in the ServiceNow AI Platform interface. For more information, see Knowledge Management properties.

Role required: agent_workspace_user

Procedure

1. Navigate to **All** > **Agent Workspace** > **Agent Workspace Home**.
2. Click **Lists** > **Knowledge** > **All Articles**.
3. Click the link to a knowledge article for which you want to create a translation task.
4. On the Knowledge form, click **Edit**.
5. Click **Request translations**.
6. In the Request translation dialog box, select one or more available languages in the Select languages list.
   If a language appears grayed out, a translation is already in progress or has been completed for that language. Some languages might not be available if the system administrator has configured only specific languages for the knowledge base in which the article is contained.
7. Click **Submit**.

Result
The translation task is created for the article in the selected languages and assigned to a group or user based on assignment rules, if configured.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The *glide.knowman.translation.enable_translation_task* property is set to `true` in the ServiceNow AI Platform interface. For more information, see Knowledge Management properties.

  Note:
  When the *glide.knowman.translation.enable_translation_task* property is set to `false`, translate the knowledge article by clicking **New** in the Translated version related list of a Knowledge form. The Knowledge form that is displayed to translate the article is based on the article template of the source knowledge article. You can enter your translation content in the Knowledge form. For more information about the Knowledge form, see Create a knowledge article in Agent Workspace.

Role required: agent_workspace_user

About this task

If you have contribute access to a knowledge article, you can translate a knowledge article directly from the knowledge form.
If your system administrator has configured languages for the knowledge base, you can translate into those languages only. For more information, see Create a knowledge base.

Note:
The translation management feature isn't available for knowledge blocks in Agent Workspace.

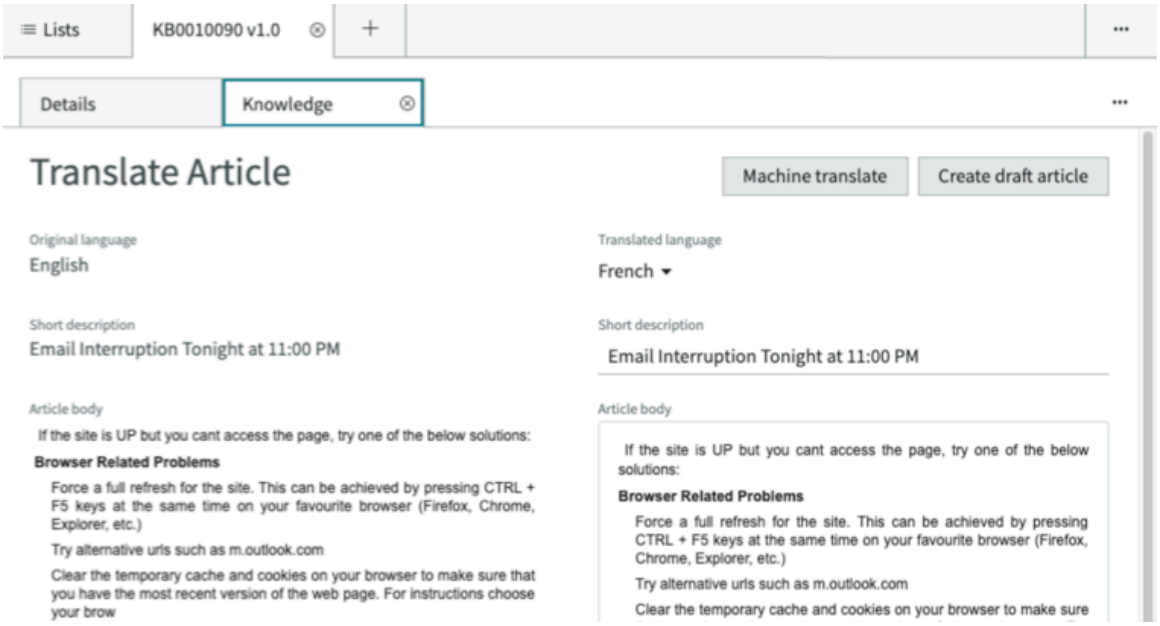
Procedure

1. Navigate to **All** > **Agent Workspace** > **Agent Workspace Home**.
2. Click **Lists** > **Knowledge** > **All Articles**.
3. In the **Number** column, click the link to a knowledge article that you want to translate.
4. Click **Edit**.
5. Click **Translate**.

   Note:
   The **Translate** button is not available if the *glide.knowman.translation.enable_translation_task* property is disabled, translations of the knowledge article are available in all available languages, or a translation task has already been created for all the available languages.

   The Original language and Translated language sections appear side by side for easy viewing, as shown in the following figure. The text in the Translated language section still appears in the original language content.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Provide the translation in the Translated language section.
   - If dynamic translation is enabled, click **Machine translate** to automatically replace the draft content in the Translated language section with machine-translated content in the targeted language.

     Note:
     A default translator configuration should be available. For configuring the translation API, see Dynamic translation.

     When you click **Machine translate**, any draft content in the Translated language section is automatically replaced with the machine-translated content.

   - If dynamic translation is not available, replace the draft content in the Translated language section with your translated text.
7. Click **Create draft article** to create a draft version of the translated article.
8. Click **Publish**.

Result

When the translated version of the knowledge article is published, a new knowledge number is assigned to the translated version. The translated version is available in the All Articles list in Agent Workspace. Also, the Translated Versions related list on the Knowledge form of the original and translated knowledge article is updated with all the translated versions.

Translation management

Authoring a knowledge article in Microsoft Word

Author and access knowledge articles in Microsoft Word by deploying the Knowledge Management - Add-in for Microsoft Word.

User with contribute access to a knowledge base can open, create, edit, publish, and search for knowledge articles from within the Knowledge Management pane in Microsoft Word. A user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

with read access to a knowledge base can view the article in Microsoft Word. The Knowledge Management - Add-in for Microsoft Word is available in the online version of Microsoft Word only.

The Knowledge Management - Add-in for Microsoft Word works with applications that are integrated with the online version of Microsoft Word such as Microsoft SharePoint and Microsoft OneDrive.

Consider the following points when using the Knowledge Management - Add-in for Microsoft Word to maintain knowledge articles:

- The URL is automatically generated for Word documents created in Microsoft SharePoint and Microsoft OneDrive with business accounts only.

  For other applications, account types and custom SharePoint URLs, you must manually enter the URL in the **Document URL** field on the Knowledge form in Microsoft Word. For more information, see Create a knowledge article in Microsoft Word.

- The conversion time of a knowledge article from a Microsoft Word document depends on the document size.
- Headers and footers corresponding to pages in the Microsoft Word document appear as is in the knowledge article. You can remove headers and footers in the Microsoft word document before creating or updating the knowledge article.

Note:
As an admin, you must create a Restricted Caller Access Privileges record for the Microsoft Word add-in to publish a knowledge article content in scoped knowledge bases. For more information, see Restricted caller access privilege settings.

Activation information

Activate the Knowledge Management - Add-in for Microsoft Word plugin (com.snc.knowledge.ms_word) to access knowledge articles from within the Microsoft Word online application. For more information, see Activate Knowledge Management - Add-in for Microsoft Word.

Configure Knowledge Management - Add-in for Microsoft Word

Log in to your ServiceNow instance for authoring knowledge articles in Microsoft Word

Author and collaborate on knowledge articles in Microsoft Word by logging in to your ServiceNow instance from the Word Online application.

Before you begin

You must have contribute access to the knowledge base within which you want to create the knowledge article.
The system administrator and Office 365 administrator have configured the Knowledge Management - Add-in for Microsoft Word. (For more information, see Configure Knowledge Management - Add-in for Microsoft Word.)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

You need to authenticate with your ServiceNow instance credentials for accessing and creating knowledge articles using Microsoft Word. You might also need to re-authenticate if your session has expired.

Procedure

1. Sign in to your Office 365 account.
2. From the Microsoft 365 app launcher, select the icon to launch the Microsoft Word app. For more information, see Use the Office 365 app launcher.
3. In the New section, click **New blank document**, or open any existing Microsoft Word document.
4. On the Home tab, click the Knowledge icon ( ).
5. In the Knowledge Management pane of the Word document, click **Log in to ServiceNow**. The ServiceNow login page opens in a separate tab of your browser.
6. On the ServiceNow login page, enter your ServiceNow credentials.

Result

After successful authentication, the ServiceNow instance browser tab closes and you are redirected to the Microsoft Word browser tab. On the Microsoft Word document, the Knowledge Management pane displays the welcome screen.

View a knowledge article in Microsoft Word

View a knowledge article in Microsoft Word, including the article number, short description, and article content.

Before you begin

- Ensure that the administrator has configured the Knowledge Management - Add-in for Microsoft Word. (For more information, see Configure Knowledge Management - Add-in for Microsoft Word.)
- You must have logged in to your ServiceNow instance from the Word Online application. For more information, see Log in to your ServiceNow instance for authoring knowledge articles in Microsoft Word.
- You must have read access to the knowledge article.
- You must have signed in to your Office 365 account.

Procedure

1. From the Microsoft 365 app launcher, select the icon to launch the Microsoft Word app. For more information, see Use the Office 365 app launcher.
2. In the New section, click **New blank document**, or open any existing Microsoft Word document.
3. On the Home tab of the Word document, click the Knowledge icon ( ).
4. Access the article in the Knowledge Management pane of the Word document.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- In the Knowledge Management pane, in the **Search** box, enter the knowledge article number or description.
- In the Knowledge Management pane, click a knowledge base to view a list of knowledge articles within the knowledge base. All knowledge bases and associated knowledge articles for which you have contribute or read access appear in the Knowledge Management pane

5. In the Knowledge Management pane, click the link to the knowledge article that you want to view.

Tip:
To go back to the previous view in the Knowledge Management pane, click the left caret icon ( ). To go back to the landing screen, click the home icon ( ).

Result
If a knowledge article was created from the Knowledge Management application in the ServiceNow AI Platform interface, the article content appears in the Document pane and the article details appear in the Knowledge Management pane of the Microsoft Word document.

If a knowledge article was created using another Word document, the document opens in a new browser tab with the content in the Document pane and the article details in the Knowledge Management pane of that document.

Note:
If the article uses a template, the article opens in the ServiceNow AI Platform interface in a new browser tab. You can't edit articles with templates in Microsoft Word.

The following article details appear in the Knowledge Management pane.

Knowledge form

Field	Description
Number	Automatically generated knowledge article number.
Knowledge base	Knowledge base in which the knowledge article is stored. You can associate a knowledge article with one knowledge base only.
Category	Category for the knowledge article. This value helps users find the article within a selected category. You can select only categories available within the selected knowledge base. Articles without a category appear in the (empty) category.
Ownership Group	Ownership group for the knowledge article. An ownership group consists of a group of members and a manager who are responsible for approvals and feedback tasks. Ownership groups can publish, edit, and retire knowledge articles that they are associated with. **Note:** This field is available only if the *glide.knowman.ownership_group.enabled* property is enabled. If no ownership group is assigned and approvals are required to publish a knowledge article, it is automatically submitted for approval to the knowledge administrator and knowledge manager. For more information, see Ownership groups.
Workflow	Publishing workflow state of the knowledge article, such as **Draft**, **In Review**, or **Published**. For a new article, the workflow state is set to **Draft**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Knowledge form (continued)

Field	Description
Short description	Title of the knowledge article. This title appears when browsing and searching for knowledge article, and at the top of the article. You can enter up to 100 characters in this field.
Document URL	URL of the article for accessing the online version in Microsoft Word. The URL is automatically generated for Word documents created in Microsoft SharePoint and Microsoft OneDrive with business accounts only. For other applications and account types, you must manually enter the URL in the **Document URL** field. **Note:** Avoid copy-pasting the browser URL, because it might not always work. Depending on the collaboration tool for your Word document use the URL generated specifically for sharing with other users. When manually entering the URL: • For Microsoft SharePoint, use the URL generated by the Word Online application for specific users you want to have access to the document. • For Box, use the Box Shared Link. For more information, see Creating Shared Links.
Version	Automatically generated article version number. This number is incremented when changes are made to a published article. **Note:** This field is available if the article versioning feature has been enabled.
Valid to	The date this knowledge article expires. Articles do not appear in search results after the **Valid to** date or if the **Valid to** date is blank. The default value of the **Valid to** field is derived from the **Article Validity** field configured for the knowledge base (see Create a knowledge base). The **Valid to** date starts from the date the article was created until the number of days specified in the **Article Validity** field. If the **Article Validity** field is blank, the default date in the **Valid to** field for the knowledge article is set to January 1, 2100. An article author or editor can select whether to keep or change the default **Valid to** date. On the first day of each month, the application sends an email notification to a list of authorized recipients to remind them about articles that are about to expire in the next month. The recipient can then extend the **Valid to** date to continue using the article. For more information, see Managing email notifications in Knowledge Management.

Knowledge form (continued)

Field	Description
	Note: If the system date format or user preferences are set to use the `yy` year format, you might face issues when the **Valid to** date is set to the default date. Contact your system administrator or modify the user preferences to use a date format with the `yyyy` year format. For more information, see Global date and time field format and Personalize the system date format topics.
Scheduled publish date	Future date when the knowledge article will be published automatically. For more information, see Schedule a knowledge article for publishing in Microsoft Word.

Related topics

Create a knowledge article in Microsoft Word

Edit a knowledge article in Microsoft Word

Create a knowledge article in Microsoft Word

Create a knowledge article in Microsoft Word to author and collaborate on content using Word.

Before you begin

- Ensure that the administrator has configured the Knowledge Management - Add-in for Microsoft Word. (For more information, see Configure Knowledge Management - Add-in for Microsoft Word.)
- You must have logged in to your ServiceNow instance from the Word Online application. For more information, see Log in to your ServiceNow instance for authoring knowledge articles in Microsoft Word.
- You must have contribute access to the knowledge base within which you want to create the knowledge article.
- You must have signed in to your Office 365 account.

Procedure

1. From the Microsoft 365 app launcher, select the icon to launch the Microsoft Word app from your Office 365 account and open a Word document.
   For more information, see Use the Office 365 app launcher.
2. In the New section, click **New blank document**, or open any existing Microsoft Word document.
3. On the Home tab of the Word document, click the Knowledge icon ( ).
4. In the Knowledge Management pane of the Word document, click **Create Article**.
5. On the Knowledge form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Knowledge form

Field	Description
Number	Automatically generated knowledge article number.
Knowledge base	Knowledge base in which the knowledge article is stored. You can associate a knowledge article with one knowledge base only.
Category	Category for the knowledge article. This value helps users find the article within a selected category. You can select only categories available within the selected knowledge base. Articles without a category appear in the (empty) category.
Ownership Group	Ownership group for the knowledge article. An ownership group consists of a group of members and a manager who are responsible for approvals and feedback tasks. Ownership groups can publish, edit, and retire knowledge articles that they are associated with. **Note:** This field is available only if the *glide.knowman.ownership_group.enabled* property is enabled. If no ownership group is assigned and approvals are required to publish a knowledge article, it is automatically submitted for approval to the knowledge administrator and knowledge manager. For more information, see Ownership groups.
Workflow	Publishing workflow state of the knowledge article, such as **Draft**, **In Review**, or **Published**. For a new article, the workflow state is set to **Draft**.
Short description	Title of the knowledge article. This title appears when browsing and searching for knowledge article, and at the top of the article. You can enter up to 100 characters in this field.
Document URL	URL of the article for accessing the online version in Microsoft Word. The URL is automatically generated for Word documents created in Microsoft SharePoint and Microsoft OneDrive with business accounts only. For other applications and account types, you must manually enter the URL in the **Document URL** field. **Note:** Avoid copy-pasting the browser URL, because it might not always work. Depending on the collaboration tool for your Word document use the URL generated specifically for sharing with other users. When manually entering the URL: ○ For Microsoft SharePoint, use the URL generated by the Word Online application for specific users you want to have access to the document. ○ For Box, use the Box Shared Link. For more information, see Creating Shared Links.
Version	Automatically generated article version number. This number is incremented when changes are made to a published article.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: This field is available if the article versioning feature has been enabled.
Valid to	The date this knowledge article expires. Articles do not appear in search results after the **Valid to** date or if the **Valid to** date is blank. The default value of the **Valid to** field is derived from the **Article Validity** field configured for the knowledge base (see Create a knowledge base). The **Valid to** date starts from the date the article was created until the number of days specified in the **Article Validity** field. If the **Article Validity** field is blank, the default date in the **Valid to** field for the knowledge article is set to January 1, 2100. An article author or editor can select whether to keep or change the default **Valid to** date. On the first day of each month, the application sends an email notification to a list of authorized recipients to remind them about articles that are about to expire in the next month. The recipient can then extend the **Valid to** date to continue using the article. For more information, see Managing email notifications in Knowledge Management. **Note:** If the system date format or user preferences are set to use the `yy` year format, you might face issues when the **Valid to** date is set to the default date. Contact your system administrator or modify the user preferences to use a date format with the `yyyy` year format. For more information, see Global date and time field format and Personalize the system date format topics.
Scheduled publish date	Future date when the knowledge article will be published automatically. For more information, see Schedule a knowledge article for publishing in Microsoft Word.

6. In the Document pane of the Word document, enter the article content.
7. In the Knowledge Management pane of the Word document, click **Submit**.
8. **Optional:** Publish the article by clicking **Publish**.

   (Optional) A knowledge article is published depending on the workflow setting of its knowledge base:

   - **Knowledge - Instant Publish**: The knowledge article is immediately published unless it is scheduled to be published at a later date.
   - **Knowledge - Approval Publish**: The knowledge article is published on approval completion unless it is scheduled to be published at a later date.

   For more information, see Schedule a knowledge article for publishing in Microsoft Word.

   If the article versioning feature is enabled, the version number of the knowledge article is updated. For more information, see Knowledge article version numbers.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

You can share the document URL so that users can co-author the document. For more information, see Document collaboration and co-authoring.

Edit a knowledge article in Microsoft Word

Use Microsoft Word to edit a knowledge article originally created in Microsoft Word.

Before you begin

- Ensure that the administrator has configured the Knowledge Management - Add-in for Microsoft Word. (For more information, see Configure Knowledge Management - Add-in for Microsoft Word.)
- You must have logged in to your ServiceNow instance from the Word Online application. For more information, see Log in to your ServiceNow instance for authoring knowledge articles in Microsoft Word.
- You must have contribute access to the knowledge article.
- You must have signed in to your Office 365 account.

About this task

Note:
You can't edit a knowledge article that uses an article template in Word.

Procedure

1. From the Microsoft 365 app launcher, select the icon to launch the Microsoft Word app. For more information, see Use the Office 365 app launcher.
2. In the New section, click **New blank document**, or open any existing Microsoft Word document.
3. On the Home tab of the Word document, click the Knowledge icon ( ).
4. Access the article in the Knowledge Management pane of the Word document.
   - In the Knowledge Management pane, in the **Search** box, enter the knowledge article number or description.
   - In the Knowledge Management pane, click a knowledge base to view a list of knowledge articles within the knowledge base. All knowledge bases and associated knowledge articles for which you have contribute or read access appear in the Knowledge Management pane. However, you can edit knowledge articles for which you have contribute access.
5. In the Knowledge Management pane, click the link to the knowledge article that you want to edit.
6. If the Document pane of the Word document contains any content, retain or replace the content.
   - To overwrite the existing content in the Word document with content from the article you selected, click **Replace**.
   - To keep the existing content in the Word document, click **Retain**.

   Note:
   When you save the article, the Word document content will replace the article content.

7. If the article versioning feature is enabled, click **Checkout** for a published knowledge article. You can edit only the latest version of a knowledge article.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Edit the content of the article in Microsoft Word.
   - Edit the article content online using Microsoft Word in your browser.
   - Edit the article content using the Word Desktop app on your computer. In this case, after you complete editing the desktop version of the article content, you must return to the online version in your browser to save the article content in your ServiceNow instance.

   Tip:
   If multiple people with contribute access to the knowledge article need to co-author the same document, you can share the document URL. For more information, see Document collaboration and co-authoring.

9. In the Knowledge Management pane, click **Save**.
10. **Optional:** Publish the article by clicking **Publish** in the Knowledge Management pane.
    The knowledge article is published depending on the workflow setting of its knowledge base.
    - **Knowledge - Instant Publish**: The knowledge article is immediately published unless it is scheduled to be published at a later date.
    - **Knowledge - Approval Publish**: The knowledge article is published on approval completion unless it is scheduled to be published at a later date.

    For more information, see Schedule a knowledge article for publishing in Microsoft Word.

    If the article versioning feature is enabled, the version number of the knowledge article increments to the next whole number (for example, from 2.02 to 3.0). For more information, see Knowledge article version numbers.

Unlink knowledge articles from linked Microsoft Word documents

Unlink a knowledge article from a linked Microsoft Word document to edit the article directly from the Knowledge form in the ServiceNow AI Platform.

Before you begin
Ensure that the article was created using the Knowledge Management - Add-in for Microsoft Word.
Role required: admin

About this task
If a knowledge article is created using the Knowledge Management - Add-in for Microsoft Word, you can edit the article using only the linked Word document in the Word Online application. However, if you delete or move the linked Word document, the URL to the Word document and article is broken. Therefore, you will no longer be able to edit the article using the linked Word document. To continue editing such articles:

- Manually enter the new document URL for the Word document in the **Document URL** field on the Knowledge form in Microsoft Word. For more information about the field, see Create a knowledge article in Microsoft Word.
- Unlink the article from its linked Word document by following the steps in this procedure.

Procedure

1. Navigate to **All** > **Knowledge** > **Articles**.
2. Select an article from the **Published** or **Unpublished** category.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the Knowledge form, click the **Unlink from Word** related link.

> **Important:**
>
> When you unlink an article from Microsoft Word, it may affect the HTML formatting in the editor. This formatting change can impact how knowledge articles appear and function during editing and display.

Publish a knowledge article in Microsoft Word

Use the Word Online application to publish a knowledge article originally created in Microsoft Word to make it available to users.

Before you begin

- Ensure that the administrator has configured the Knowledge Management - Add-in for Microsoft Word. (For more information, see Configure Knowledge Management - Add-in for Microsoft Word.)
- You must have logged in to your ServiceNow instance from the Word Online application. For more information, see Log in to your ServiceNow instance for authoring knowledge articles in Microsoft Word.
- You must have contribute access to the knowledge base within which you want to publish the knowledge article.
- You must have signed in to your Office 365 account.

Procedure

1. From the Microsoft 365 app launcher, select the icon to launch the Microsoft Word app. For more information, see Use the Office 365 app launcher.
2. In the New section, click **New blank document**, or open any existing Microsoft Word document.
3. On the Home tab of the Word document, click the Knowledge icon ( ).
4. Access the article in the Knowledge Management pane of the Word document.
   - In the Knowledge Management pane, in the **Search** box, enter the knowledge article number or description.
   - In the Knowledge Management pane, click the knowledge base to view a list of knowledge articles within the knowledge base.
5. In the Knowledge Management pane, click the link to the knowledge article that you want to publish.
6. On the Knowledge form, click **Publish**.

Result

A knowledge article is published depending on the workflow setting of its knowledge base:

- **Knowledge - Instant Publish**: The knowledge article is immediately published unless it is scheduled to be published at a later date.
- **Knowledge - Approval Publish**: The knowledge article is published on approval completion unless it is scheduled to be published at a later date.

For more information, see Schedule a knowledge article for publishing in Microsoft Word.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If the article versioning feature is enabled, the version of the article is incremented based on the version number pattern.

Schedule a knowledge article for publishing in Microsoft Word

Set a specific time and day for the draft version of a knowledge article created in Microsoft Word to be published automatically.

Before you begin

- You must have contribute access to the knowledge base that stores the knowledge article you want to schedule for publishing.
- You must have logged in to your ServiceNow instance from the Word Online application. For more information, see Log in to your ServiceNow instance for authoring knowledge articles in Microsoft Word.
- You must have signed in to your Office 365 account.

Ensure that the system administrator verifies the following settings:

- Knowledge Management Advanced plugin (com.snc.knowledge_advanced) is activated. For more information, see Activate the Knowledge Management Advanced plugin.
- The article versioning feature is enabled. For more information, see Article versioning.
- The Knowledge Management - Add-in for Microsoft Word is enabled. (For more information, see Configure Knowledge Management - Add-in for Microsoft Word.)

Procedure

1. From the Microsoft 365 app launcher, select the icon to launch the Microsoft Word app. For more information, see Use the Office 365 app launcher.
2. In the New section, click **New blank document**, or open any existing Microsoft Word document.
3. On the Home tab of the Word document, click the Knowledge icon ( ).
4. In the Knowledge Management pane of the Word document, in the **Search** box, enter the knowledge article short description.
5. Click the link to the knowledge article in the Draft state that you want to schedule for publishing.

   Note:
   The knowledge article must have been originally created using Microsoft Word.

6. In the **Scheduled publish date** field, click the show calendar icon .
7. Select any future date from the calendar.
8. In the **Select Time** field, enter a time in the format hh:mm:ss.
9. Click **OK**.
10. Click **Publish** to enable the publishing workflow.

    Tip:
    If you want to cancel an article's scheduled publication and move the article back to the Draft state, click **Recall**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result

If approvals are disabled, the state of the knowledge article is changed to **Scheduled for Publish** and the article is automatically published on the scheduled publish date.

If approvals are enabled, the state of the knowledge article is changed to Review. If the article is approved, the state of the article is changed to Scheduled for Publish. If the article was approved after the scheduled publish date, the article is published immediately.

The version number of the knowledge article increments based on the publishing workflow. For more information, see Knowledge article version numbers.

Related topics

Knowledge workflows

Approve an article that is being reviewed

Recall an article that is being reviewed in Microsoft Word

Recall a knowledge article that is being reviewed and created using Microsoft Word to stop the approval process.

Before you begin

- You must have contribute access to the knowledge base that stores the knowledge article you want to recall.
- You must have logged in to your ServiceNow instance from the Word Online application. For more information, see Log in to your ServiceNow instance for authoring knowledge articles in Microsoft Word.
- You must have signed in to your Office 365 account.

Ensure that the system administrator verifies the following settings:

- Knowledge Management Advanced plugin (com.snc.knowledge_advanced) is activated. For more information, see Activate the Knowledge Management Advanced plugin.
- The article versioning feature is enabled. For more information, see Article versioning.
- The Knowledge Management - Add-in for Microsoft Word is enabled. (For more information, see Configure Knowledge Management - Add-in for Microsoft Word.)

About this task

The author of a knowledge article, knowledge administrators, and system administrators can recall an article. If an ownership group is assigned to a knowledge article, the ownership group manager and ownership group members can also recall the knowledge article.
If a version of a knowledge article is in the Review state, you can recall only the corresponding version to make additional changes. Recalling the article results in a minor version increment.

Procedure

1. From the Microsoft 365 app launcher, select the icon to launch the Microsoft Word app. For more information, see Use the Office 365 app launcher.
2. In the New section, click **New blank document**, or open any existing Microsoft Word document.
3. On the Home tab of the Word document, click the Knowledge icon ( ).
4. In the Knowledge Management pane of the Word document, in the **Search** box, enter the knowledge article title or description.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Click the link to the article in Review state that you want to recall.
6. On the Knowledge form, click **Recall**.

Result

The article opens in edit mode and the state of the article is changed to Draft. The version number of the article increments by 0.01.

Create a knowledge article from a customer service case

Reuse information from a customer service case by creating knowledge articles from cases.

Before you begin

Your administrator must enable creation of articles from customer service cases.

Role required: sn_customerservice_agent or knowledge

Procedure

1. Navigate to **Customer Service** > **Cases** > **All**.
2. Select a case from which you want to create a knowledge article.
3. Click **Create Knowledge**.
   The relevant fields are automatically copied from the case to the record that opens.
4. In the **Knowledge base** field, enter the name of the knowledge base in which you want this article to display.
5. Click **Submit**.

Provide feedback on knowledge articles

You can view and contribute to feedback on knowledge articles.

Feedback options

You can submit feedback for knowledge articles in these ways:

- Flag an article as incorrect or inappropriate.
- Provide a rating value for the article.
- Mark an article as helpful or not helpful.
- View comments, add a new comment, or reply to existing comments.

Users can view comments directly on the article. Knowledge managers can view the other types of feedback by navigating to **Knowledge** > **Feedback**.

Note:
To know more about Knowledge article view properties and rating options that appear with articles, see Knowledge article view properties.

Administrators and knowledge managers can disable some feedback options using fields on the Knowledge Base form. Administrators can configure feedback options using properties.

Flagging articles

You can flag an article for incorrect or inappropriate content. Click **Flag Article** in the article header to open a new window, allowing you to enter suggested changes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Flagged comments do not appear on the Article View page. Users with the admin, knowledge_admin, and knowledge_manager roles can access flagged articles by navigating to **All** > **Knowledge** > **Articles** > **All Flagged**. Users with the knowledge role can access their flagged articles by navigating to **All** > **Knowledge** > **Feedback Management** > **My Flagged**.
- If disabled, the author of the article and users with the admin, knowledge_admin, and knowledge_manager roles can see all flagged comments. Other users can see only their own flagged comments.

Note:

- You cannot disable flagging for an article until you have disabled the flagging for all feedback comments for that article.
- If Disable Suggesting is checked at the Knowledge Base level, the **Flag Article** button does not appear for any knowledge article

Flagged comments are stored in the Knowledge Feedback (kb_feedback) table but not the Live Feed Messages (live_message) table.

Rating articles

The five stars below the article title allow you to indicate the article's effectiveness on a scale of 1 to 5.

Note:
If the **Disable rating** is checked at the Knowledge Base level, the Rating Article button does not appear for any knowledge article.

Marking articles

The question Helpful? at the bottom of the article allows you to indicate the usefulness of the article with a simple **Yes** or **No** answer. The **Yes** and **No** options are always available on the knowledge article view page even when you had selected an option earlier.

Note:
If the **Disable Mark as helpful** is checked at the Knowledge Base level, the Marking Article button does not appear for any knowledge article.

Comments

Knowledge comments at the bottom of the article use Live Feed to enable a conversation around a knowledge article. For example, you can post replies to comments, add attachments, or Like comments. The *glide.knowman.use_live_feed* property controls the display of knowledge article comments. If enabled, the system uses Live Feed to manage and display feedback on knowledge articles.

Note:
Unauthenticated users and users with only the snc_external role can't add or view attachments for comments.

Knowledge Management reference

Reference topics provide additional information that you can use to configure and administer Knowledge Management.

Domain separation and Knowledge Management

Domain separation is supported in Knowledge Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Standard

- Includes all aspects of **Basic** level support.
- Application properties are domain-aware as needed.
- Business logic: The service provider (SP) creates or modifies processes per customer. The use cases reflect proper use of the application by multiple SP customers in a single instance.
- The instance owner must configure the minimum viable product (MVP) business logic and data parameters per tenant as expected for the specific application.

Sample use case: An admin must be able to make comments required when a record closes for one tenant, but not for another.

For more information on support levels, see Application support for domain separation.

Overview

Domain separation works differently at different access levels of an application. In Knowledge Management, data, requester, and fulfiller access to knowledge bases are domain separated.

How domain separation works in Knowledge Management

In Knowledge Management, the following rules apply:

Data: At the data level of domain separation, data visibility is separated from one domain to another. Knowledge bases, user criteria, articles, categories, article feedback, article versions, article templates, and external sources are domain separated in the base system.

Note:
The data in one domain cannot be seen in any other domain. For example, if you create a Knowledge Management article in a domain A using an article template which is not in domain A, the article will not be visible in domain A. Similarly, if you create a Knowledge Management article in the global domain using a template that is not in global, the article might not be visible in all the domains.

Requester: Requester activities are supported within tenant domains. Users can search; view; comment; and rate articles of their domain, any child domain, and global domains, if feedback is enabled and the knowledge base settings grant them read access to articles.

- Users in the global domain can access articles in all the domains if read access is granted at knowledge base and/or article level.
- Users in the parent domain can access articles in that domain, global, and all its child domains if read access is granted at knowledge base and/or article level.
- Users in the child domain can access articles in that domain and the global domain if read access is granted at knowledge base and/or article level.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fulfiller: The application can be used by the Fulfiller within the tenant domains as a tenant domain-owned application. Users are allowed to author articles in knowledge bases of their domain, any child domain, and the global domain if the knowledge base has user criteria set up to grant contribute access.

- Articles are automatically saved to the user's current domain when the article is created.
- If the `glide.knowman.allow_edit_global_articles` system property is enabled, users from a domain other than the global domain can check out and edit global articles. Otherwise, system administrators and users from a domain other than the global domain cannot check out global articles and are shown a warning message to that effect. Depending on their access, users can change their domain to the global domain to check out and edit the global articles.
- Domains of versioned articles will be maintained as per the latest article version's domain. This includes updating the domain for kb_version, kb_knowledge, kb_feedback, and sys_attachment tables.
- If domains contain another domain: If Domain A contains Domain B, users with access to Domain A can author articles in Domain B by toggling the domain scope. To learn more about toggling domain scope, see Visibility domains and Contains domains.

See Managing access to knowledge bases and knowledge articles to learn how to control contribute and read access to knowledge bases and knowledge articles.

Use cases

This image demonstrates a basic domain hierarchy that is available in the base system.

User domain	Knowledge base domain	Contribute user criteria domain	Article domain	Result
	MSP domain (TOP/MSP)	MSP domain (TOP/MSP)	MSP domain (TOP/MSP)	
Child domain (TOP/ACME)	Global	Global	Global	Can author, update, view, comment, rate articles.
	Parent domain (TOP)	Parent domain (TOP)	Parent domain (TOP)	
	Child domain (TOP/ACME	Child domain (TOP/ACME	Child domain (TOP/ACME	
	MSP domain (TOP/MSP)	MSP domain (TOP/MSP)	MSP domain (TOP/MSP)	

Known Issues

- The following AQI tables are not domain separated:
  - AQI Checklist [kb_quality_checklist]
  - Checklist Question [kb_checklist_question]
  - Article Checklist Answer [kb_article_checklist_answer]

  Note:
  The Article Checklist Answer table does not contain the Order field. The application shows the list in a random order.

- Comment provided by a user on an article is stored in article's domain instead of user domain.

Domain separation for service providers

Additional plugins for Knowledge Management

After Knowledge Management is activated, you can activate additional plugins that provide access to various additional Knowledge Management features.

You must have the admin role to activate these additional plugins. For details, see Activate a plugin.

Note:

Starting with the Washington DC release, the Knowledge Management v3 homepage (com.snc.knowledge3) is being prepared for deprecation in the future Y release. It is replaced by the Knowledge Management Service Portal (com.snc.knowledge_serviceportal), which is active by default for customers on Madrid and later releases. For more information about the new experience, see Knowledge Management Service Portal homepage features.

Plugin	Description
Knowledge Management Core (com.glideapp.knowledge)	Installs the core Knowledge Management items used to allow other Knowledge-related plugins to work, such as Knowledge V3, Knowledge Advanced, and Knowledge Service Portal. This plugin is activated by default.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Plugin	Description
Knowledge Management Advanced Installer (com.snc.knowledge_advanced.installer)	Installs the Knowledge Management Advanced plugin. Activating/upgrading to this plugin validates the knowledge articles and knowledge bases to make sure that the Knowledge Advanced plugin can be successfully installed. If validation fails, check the Plugin Activation logs and follow instructions given to fix any errors. Once you fix all the issues, re-run this plugin.
Knowledge Management Advanced (com.snc.knowledge_advanced)	Adds advanced features to Knowledge Management such as version control and subscriptions. This plugin requires that all knowledge bases are version Knowledge V3. Use the Knowledge Management Advanced Installer plugin to activate this plugin.
Predictive Intelligence for Knowledge Management (com.snc.knowledge_ml)	Provides various Knowledge Management capabilities driven by machine-learning solutions. For example, capabilities such as similar articles and knowledge demand insights. Activation of this plugin on production instances may require a separate license. Contact ServiceNow for details. **Note:** When you install and activate the Predictive Intelligence for Knowledge Management plugin (com.snc.knowledge_ml), the Predictive Intelligence for Contextual Search plugin (com.snc.contextual_search_ml) is also activated.
Performance Analytics - Content Pack - Knowledge Management (com.snc.pa.knowledge_v2)	Enables the Performance Analytics content pack for the Analytics and Reporting Knowledge Management Solution. Activation of this plugin on production instances might require a separate Performance Analytics license. Contact ServiceNow for details.
Knowledge Management V3 (com.snc.knowledge3)	Enables support for Knowledge Management V3. Activate this plugin when you upgrade from Eureka or earlier versions.
I18N: Knowledge Management Internationalization Plugin v2 (com.glideapp.knowledge.i18n2)	Helps create and maintain translations of an article in various languages in a way that is easy to manage translations while authoring as well as viewing articles. Activating internationalization plugins for any of the available languages automatically activates this plugin.
Knowledge Document (com.snc.knowledge_document)	Adds knowledge-based functionalities to the Managed Documents plugin. You can create a knowledge article from a document or update a knowledge document to a newer revision.
Knowledge Management - External Content Integration (com.snc.knowledge.external_integrations)	Adds external content search capabilities to the Knowledge Management application. Once configured, this feature creates a copy of the external content on ServiceNow as knowledge articles, and then indexes the articles through Zing Search. You must have appropriate reuse and copy privileges before you configure an external source to be searchable using this feature.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Plugin	Description
Knowledge Management Wiki Support (com.glideapp.knowledge2.wiki)	Enables support to save Knowledge articles in wiki type field instead of html type field.
Knowledge Management KCS Capabilities (com.snc.knowledge_kcs_capabilities)	Enables the use of KCS roles (kcs_contributor, kcs_publisher, and kcs_candidate) and use the metadata fields for the KCS article state (governance and confidence).
Knowledge Management - Add-in for Microsoft Word (com.snc.knowledge.ms_word)	Enables authoring content in Microsoft Word and publishing it as a knowledge article using a Word add-in.
Knowledge Blocks (com.snc.knowledge_blocks)	Enables you to create re-usable content blocks that can be included in existing knowledge articles. This feature is capable to display only pieces of an article to specific users.
Knowledge Overview (com.sn_knowledge_overview)	Enables you to generate reports to provide an overview of knowledge base and article data.

Components installed with Knowledge Management Core

Several types of components are installed with activation of the Knowledge Management Core plugin (com.glideapp.knowledge) including user roles and tables.

Note:
The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Demo data is available.

Roles installed

Role	Description	Contains roles
Knowledge [knowledge]	Users with the knowledge role can contribute to the default knowledge base and access the Knowledge application menu. The knowledge role is a fulfiller role and not a requester role.	None.
Knowledge administrator [knowledge_admin]	Knowledge administrator can create new knowledge bases and manage all knowledge bases.	Knowledge administrator contains the knowledge role.
Knowledge manager [knowledge_manager]	Knowledge managers perform administrative functions for knowledge bases they manage such as defining categories, pinning important articles, and approving changes to articles. Users selected as managers of a knowledge base receive this role automatically.	Knowledge manager contains the knowledge administrator role.

Tables installed

Table	Description
CSM Table Map [csm_table_map]	Stores information about the mapping source and target table. For example, while creating a knowledge article from a customer service case, the source table would be customer service case [sn_customerservice_case] and the target table would be Knowledge [kb_knowledge].
CSM Field Map [csm_field_map]	Stores information about the fields that are mapped from the source table to the target table in a given table map (CSM Table Map). For example, when creating a knowledge article from a customer service case [sn_customerservice_case], the source field value would be case.short description and the target field value would be knowledge.short description.
Related Articles [kb_2_kb]	Stores information about related knowledge articles.
Related Catalog Items [kb_2_sc]	Stores information about related catalog items.
Knowledge Category [kb_category]	Stores the category of a knowledge article.
Knowledge Feedback Task [kb_feedback_task]	Stores information about the feedback task on a knowledge article.
Knowledge Feedback [kb_feedback]	Stores information about flagged comments on a knowledge article.
Knowledge Keyword [kb_keyword]	Stores information about keywords associated with the featured knowledge articles on the homepage of the Knowledge Management Service Portal.
Knowledge Base [kb_knowledge_base]	Stores information about knowledge bases that store knowledge articles.
Knowledge keyword [kb_knowledge_keyword]	Stores information related to mapping between knowledge articles and keywords.
Knowledge [kb_knowledge]	Stores knowledge articles organized by knowledge base and category, as well as featured content and popular articles.
Who Can Contribute To Knowledge Base [kb_uc_can_contribute_mtom]	Stores information about who can read and write to a knowledge base.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
Who Can Read Knowledge Base [kb_uc_can_read_mtom]	Stores information about who can read a knowledge base.
Who Cannot Contribute To Knowledge Base [kb_uc_cannot_contribute_mtom]	Stores information about who cannot read and write to a knowledge base.
Who Cannot Read Knowledge Base [kb_uc_cannot_read_mtom]	Stores information about who cannot read a knowledge base.
Knowledge Use [kb_use]	Stores information about the number of times articles are viewed and the number of times knowledge articles are used in an incident, problem, or case.
Knowledge Related to Products [m2m_kb_ci]	Stores information about the products related to knowledge articles.
Knowledge Comment Likes [m2m_kb_feedback_likes]	Stores information about users who like a comment in knowledge feedback.
Knowledge Applied to Tasks [m2m_kb_task]	Stores information about articles attached to tasks (incident, case, or problem).

Components installed with knowledge blocks

Several types of components are installed with activation of the knowledge blocks plugin, including tables.

Note:
The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Demo data is available for this feature.

Tables installed

Table	Description
Knowledge Block [kb_knowledge_block]	Knowledge blocks table. **Note:** This table extends the Knowledge [kb_knowledge] table.
KB Knowledge to Block [m2m_kb_knowledge_to_block]	KB knowledge to block table.
KB Knowledge to Block History	KB knowledge to block history table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
[m2m_kb_to_block_history]	

For further information on table administration and how to manage data, see Table administration.

Knowledge Management roles

Certain roles are required to use Knowledge Management functionality.

Note:
The user criteria determine the access to knowledge articles. For more information, see Managing access to knowledge bases and knowledge articles.

The kcs_candidate, kcs_contributor, and kcs_publisher roles also include the knowledge role. For more information about these KCS-related roles, see KCS v6 Practices Guide.

Knowledge [knowledge]

Users with the knowledge role can contribute to the default knowledge base and access the Knowledge application menu. The knowledge role is a fulfiller role and not a requester role. Requesters can view, comment, and give feedback to the knowledge articles. However, a requester cannot create or edit articles.

Properties for Actionable Knowledge Feedback (continued)

Property	Description
	• Location: **Knowledge** > **Administration** > **Properties**
Create actionable feedback task only when feedback details are provided for the negative feedback (*glide.knowman.feedback.enable_explicit_feedback*)	Select the check box to enable actionable feedback task generation for the negative feedback. • Type: true|false • Default value: false • Location: **Knowledge** > **Administration** > **Properties** **Note:** Set the property to **True** to deactivate feedback task generation if: • The feedback dialog box is close or cancel • Other option is chosen and no reason provided

Group ownership properties

The knowledge administrator can set group ownership properties that enable the use of ownership groups for knowledge articles and decide who can edit and approve a published knowledge article.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
Enable ownership group for Knowledge articles (*glide.knowman.ownership_group.enabled*)	Select the check box to enable associating ownership groups with knowledge articles. **Note:** Once you have set this property to **true**, try not to change it to **false**. Before setting this property back to **false**, manually reassign all knowledge articles associated with any ownership group, close all article approvals sent to ownership groups, and resolve all open feedback tasks assigned to ownership groups. • Type: true | false • Default value: false • Location: **Knowledge** > **Administration** > **Properties**
Retain contribute access for author or reviser of knowledge article linked to ownership group (*glide.knowman.ownership_group.override*)	Select the check box to enable the author and reviser of a knowledge article to retain contribute access to the article even when an ownership group is associated with the article.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	• Type: true | false • Default value: false • Location: **Knowledge** > **Administration** > **Properties**
Allow approval of self-authored article as ownership group member (*glide.knowman.ownership_group.allow_self_approval*)	Select the check box to allow ownership group members to approve self-authored articles for publication. • Type: true | false • Default value: true • Location: **Knowledge** > **Administration** > **Properties**

Quick start tests for Knowledge Management

Validate that Knowledge Management still works after you make any configuration change, such as apply an upgrade or develop an application. Copy and customize these quick start tests to pass when using your instance-specific data.

Knowledge Management quick start tests require activating the Knowledge Management Core plugin (com.glideapp.knowledge), the Knowledge Management Advanced Installer plugin (com.snc.knowledge_advanced.installer), the Knowledge Blocks plugin (com.snc.knowledge_blocks), and the Customer Service Management Demo Data plugin (com.snc.customerservice.demo).

Understanding access to the Knowledge knowledge base

User criteria are available to manage access to the Knowledge knowledge base.

The Knowledge knowledge base is provided as a demo example in the Knowledge Management application. Starting from the Paris release, user criteria were added to the Knowledge knowledge base to enable you to control access for guest (unauthenticated) users:

- Any User user criteria in Can Read, which enables any user to read articles in the Knowledge knowledge base.
- Guest User in Cannot Read, which prevents guest or unauthenticated users from reading articles in the Knowledge knowledge base.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If you are on a release version prior to the Paris release, see Configure access to knowledge bases for unauthenticated users for information about managing access without any user criteria.

Although you can continue to use the Knowledge knowledge base consider creating your own knowledge base to store, share, and manage content. You can configure access to your knowledge bases through user criteria. For more information, see Create a knowledge base.

Knowledge workflows

The publishing and retirement processes for a knowledge article are controlled by workflows defined for the knowledge base that the article belongs to.

You can assign different workflows to each Knowledge Base .

You can use one of the default workflows, or create your own workflows to define custom publishing and retirement processes for different types of knowledge.

For the workflows that require approval, you can configure which users can approve or reject by editing the *`getApprovers()`* function in the *`KBWorkflow`* script include.

Default knowledge workflows

Workflow	Description
Knowledge - Approval Publish	Requests approval from a manager of the knowledge base. Articles in approval are In Review state before moving to Published state once approved or to Scheduled for publish if set to publish later. If the manager rejects the request, the workflow is canceled and the article remains in Draft state. If ownership groups is enabled, email notifications with a link to the article are sent to the ownership group members for approval. If ownership groups is not enabled, email notifications with a link to the article are sent to knowledge base managers for approval. A notification is also sent to authors or revisers of articles to inform them that their article has been approved or rejected. To turn on approval email notifications, set the *`glide.knowman.enable_approval_notification`* property to `true`. **Note:** Only the active user receives the notifications.
Knowledge - Approval Retire	Requests approval from a manager of the knowledge base before moving the article to the retired state. The workflow is canceled and the article remains in the published state if any manager rejects the request.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Default knowledge workflows (continued)

Workflow	Description
	If ownership groups is enabled, email notifications with a link to the article are sent to the ownership group members for approval. If ownership groups is not enabled, email notifications with a link to the article are sent to knowledge base managers for approval.
Knowledge - Instant Publish	Immediately publishes a draft article without requiring an approval, or publishes on the scheduled publish date if set to publish later.
Knowledge - Instant Retire	Immediately retires a published article without requiring an approval.
Knowledge - Publish Knowledge	A subflow that moves the knowledge article to the published state. You can use this subflow when defining your own workflow.
Knowledge - Retire Knowledge	A subflow that moves the knowledge article to the retired state. You can use this subflow when defining your own workflow.

Note:

- Only administrators and knowledge administrators can view the retired knowledge articles. To reuse a retired article, administrators and knowledge administrators can republish the article. For more information, see Republish a retired article.
- An article and its translations have a parent-child relationship. Retiring a parent article does not automatically retire all its translated child articles.

Email notifications for approval workflows

You can send email notifications for approval workflows.

- Notify approvers about knowledge articles submitted for their approvals.
- Notify authors about the approval status of their knowledge articles.

To send email notifications for approval workflows, enable the **Send notification to approvers and authors in article approval workflow** property (*glide.knowman.enable_approval_notification*). Beginning with New York, the property is enabled by default. Existing customers on release versions prior to New York can enable this property to send email notifications. Disable any custom notifications for article approvals before enabling this property. If the *glide.knowman.enable_approval_notification* property is not available, an administrator can create the property and set its value to `true`. For more information, see Knowledge Management properties.

Knowledge Management Service Portal properties

Knowledge Management Service Portal properties determine how information is displayed on the Knowledge portal. You must have the admin role to set configuration properties.

The following system properties are set to direct users to the Knowledge Management Service Portal homepage, and to specify the URL suffix for the homepage.

Property	Description
sn_km_portal.glide.knowman.serviceportal.enable_redirect	Directs users to the desired Knowledge homepage. • Type: true|false • Default value: false Set to **true** to redirect users navigating to v2 or v3 pages to the Knowledge Management Service Portal homepage. **Note:** This property is not honored for the following use cases: • Contextual search in the Incident form • Connect • Global search
sn_km_portal.glide.knowman.serviceportal.portal_url	The URL suffix for the Knowledge Management Service Portal. The default is **kb**.

The Knowledge Management Service Portal supports the Knowledge Management V3 properties. Configuring widget instance options on the portal pages can override these properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

Starting with the Washington DC release, the Knowledge Management v3 homepage (com.snc.knowledge3) is being prepared for deprecation in the future Y release. It is replaced by the Knowledge Management Service Portal (com.snc.knowledge_serviceportal), which is active by default for customers on Madrid and later releases. For more information about the new experience, see Knowledge Management Service Portal homepage features.

SEO for canonical URLs and localized versions of knowledge articles

Improve the searchability of knowledge articles by adding tags for canonical URLs and *hreflang* tags for translated knowledge articles.

You can add the default tags for canonical URLs and *hreflang* tags by selecting the **Use SEO script** check box on the Knowledge Article View [kb_article_view] page record. For more information, see Enable SEO for canonical URLs and localized versions of a portal page.

When the **Use SEO script** option is selected:

- The canonical URLs for a knowledge article are added to the knowledge article view page.

  Example canonical URL: `https://<instance name>.servicenow-com/csp?id=kb_article_view&sysparm_article=<article number>`

- The *hreflang* tags for the translated versions of a knowledge article are added to the knowledge article view page.

  Example URL with an *hreflang* tag: `<link rel="alternate" href="https://<instance name>.servicenow-com/csp/fr?`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
id=kb_article_view&sysparm_article=<article number>"
hreflang="fr"/>
```

Note:
A self-referencing *hreflang* URL is also added for the language of current knowledge article.

For example, an English knowledge article is viewed by visiting a URL with the following format:

```
https://<instance name>.servicenow-com/csp/?
id=kb_article_view&sys_kb_id=<sys_id>
```

In addition to the *hreflang* tags added for translations, the English language self-referencing *hreflang* tag is added:

```
<link rel="alternate" href="https://
<instance name>.servicenow-com/csp/?
id=kb_article_view&sys_kb_id=<sys_id>" hreflang="en"/>
```

Script includes for canonical URLs and hreflang tags

By default, the knowledge article view page uses the *SPSEOHeaderTagsArticleViewSNC* script include to add the SEO tags for canonical URLs and *hreflang* tags.

The following table describes the script includes for adding canonical URLs and *hreflang* tags to Service Portal pages, including the knowledge article view page.

Script includes for canonical URLs and hreflang tags

Script include	Description
SPSEOHeaderTagsSNC	Includes the default implementation for the canonical URLs and *hreflang* tags for Service Portal pages. This script include is read-only. For more information, see Enable SEO for canonical URLs and localized versions of a portal page.
SPSEOHeaderTags	Facilitates overriding the default implementation in the *SPSEOHeaderTagsSNC* script include for Service Portal pages. The *SPSEOHeaderTags* script include extends the #*SPSEOHeaderTagsSNC* script include.
#SPSEOHeaderTagsArticleViewSNC	Overrides the *generateHrefLangArray* and *generateCanonicalURL* functions for the knowledge article view page configured in the *SPSEOHeaderTags* script include. The *SPSEOHeaderTagsArticleViewSNC* script include is read-only and extends the #*SPSEOHeaderTags* script include.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Script includes for canonical URLs and hreflang tags (continued)

Script include	Description
SPSEOHeaderTagsArticleView	Facilitates overriding the default implementation in the *SPSEOHeaderTagsArticleViewSNC* script include for the knowledge article view page. The *SPSEOHeaderTagsArticleView* extends the *SPSEOHeaderTagsArticleViewSNC* script include.

As an administrator, you can add canonical URLs, *hreflang* tags, and any custom headers for knowledge articles by updating the *SPSEOHeaderTagsArticleView* script include. For more information, see Configure custom SEO tags for canonical URLs and localized knowledge articles.

Article versioning changes

Article versioning introduces new actions that allow knowledge users to create and revise versions of existing articles. It also introduces new fields and related lists to the Knowledge form, new columns to the Knowledge list, and updates to Knowledge dashboard reports.

New user actions

As part of creating article versions, users can:

- Check out a published article and create another version by clicking **Checkout** on the Knowledge form.

  Note:
  Only the author, knowledge base owner, and users with the knowledge_admin role can edit an article in the Draft state.

- Recall an article that is being reviewed or scheduled for publish by clicking **Recall** on the Knowledge form.
- Select a previously published article in the Outdated state and make it the current published version by clicking **Make this current**in the Knowledge form header.

Note:
To edit a published article without having to create a new version, make sure the *glide.knowman.versioning.enable_minor_edits* property is enabled.

Changes to the Knowledge list

The article versioning feature adds the following to the Knowledge list:

- The **Version** column displays the article version number. The Knowledge list displays multiple versions of an article.
- The **Workflow** column includes the new **Outdated** state.

Changes to the Knowledge form

The article versioning feature adds the following to the Knowledge form:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The **Version** field displays the article version number.
- The **Display number** field displays a combination of the article number and the version number. For example, KB0010004 v1.02. All references to a knowledge article use this display number.
- The **Base Version** field displays the knowledge article number and version on which the current article is based.
- The **Revised By** field displays the name of the user who checked out a published article and created a new version.
- The **Article Versions** related list displays a list of all versions for an article. From this list,you can:
  - Click the **Version** to view a specific version of an article.
  - Click the **View Article** related link to see the article page view.

Note:
If necessary, configure the form to display the fields and the related list.

Changes to Knowledge modules

The article versioning feature introduces the following Knowledge module changes:

- **My Knowledge Articles**
  - For a knowledge user, this module includes records for the articles authored by the user as well as records for each article revised by the user.
  - For a knowledge reviser, this module includes records for the articles published by the user as well as records for each article revised by the user.
- **My Flagged**
  - For a knowledge user, this module includes records for each revision made to articles authored by the user.
  - For a knowledge reviser, this module includes records for each article revised by the user.

Note:
Users that have customized these modules do not see these changes.

Changes to Knowledge Management dashboard reports

The Knowledge Management Overview dashboard reports have been updated to include article versioning-related changes when the Knowledge Management Advanced plugin is activated.

- Articles Flagged in the Last 30 Days
- Articles Marked Not Useful in the Last 30 Days
- Articles Used per Month
- Knowledge use
- Knowledge view
- Knowledge updated in past 30 days
- Knowledge flagged in past 30 days
- Knowledge by Workflow state
- Knowledge created by Author
- Knowledge created in past 30 days

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- New Knowledge Articles Created in the Last 30 Days
- Knowledge Ratings for past 30 days

Versioning information available in the Knowledge Management Service Portal

Knowledge search results show the article number and the version number for each article.

Note:

To display the article version number next to the article number in the search results, enable the *glide.knowman.search.show_article_number* property in the Knowledge Search Properties section of the Knowledge Management Properties page.

If you are accessing an article from the base system or knowledge service portals using the URL to a KB article, you must also include the article version number in the URL. For example, to access the KB0000005 knowledge article, instead of using the `https://<instance name>/sp?id=kb_article&sys_id=KB0000005` as the URL, you must use `https://<instance name>/sp?id=kb_article&sys_id=KB0000005%20V1.0` to view the article.

The article view page shows a version history section for articles that have been updated. This section includes the version numbers, date updated, and the name of the author or reviser.

- Click **Latest version** or the version number and current state to expand the version history section.
- Click the version number to open that particular version of the article.
- When viewing an outdated article, a message informs the user that a newer updated version is available. The message includes a link to the latest version.

Feedback on article versions

With the article versioning feature, users can view and contribute to feedback on the current versions of knowledge articles.

For more information about feedback options, see Knowledge feedback.

Feedback option	How this option works with article versioning
Rating an article	The average rating for an article is carried over to the checked out version. The average rating calculation updates and displays on the current version of the article.
Marking an article as helpful	The helpfulness percentage of a previous version of an article is also considered for a new version when displayed in the helpfulness column on the homepage.
Comments	The Comments section at the bottom of an article displays comments from previous versions unless Live Feed is enabled. Live Feed only shows comments for the current version.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Feedback option	How this option works with article versioning
Flagging an article	Checking out an article or setting a previous version to the current version resets the flagged value to false.
View count	The view count is carried over to the checked out article. Any view of a version of an article increments the view count of all the subsequent published versions. Views to a newer version of an article do not affect the view count of previous versions. When a draft article is published, the total view count shows sum of previous published article view count and its own standalone view count.
Use count	The use count is carried over to the checked out article. Any use of a version of an article increments the use count of all subsequent versions. Any use of a newer version of an article does not affect the use count of previous versions.

Knowledge article version numbers

Knowledge article version numbers follow a specific pattern. Increments to the version number depend on the revision type.

Article version numbers follow this pattern: <major release number.minor release number>.

The type of revision being made to an article determines the increment. A minor revision increments the version number by 0.01. A major revision, such as publishing an article, increments the version to the next whole number, for example, from version 2.02 to 3.0.

The following example illustrates the life cycle of a versioned article and the changes to the version number.

User action	Article state	Version number
Knowledge author creates a new article	Draft	0.01
Knowledge author makes a change and updates the article.	Draft	0.01
Knowledge author submits the article for review.	Review	0.02
Knowledge author recalls the article to make another change.	Draft	0.03
Knowledge article submits the article for review	Review	0.04
Approver rejects the article and requests a change.	Draft	0.05

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

User action	Article state	Version number
Knowledge author makes the change and submits the article for review.	Review	0.06
Approver approves the article	Scheduled for publish	0.07
Article is published	Published	1.0
Knowledge author checks out the published article.	Draft	1.01
Knowledge author submits the article for review.	Review	1.02
Approver approves the article	Scheduled for publish	1.03
Article is published When the version 2.0 article is published, the state of the version 1.0 article changes to **Outdated**.	Published	2.0

Any change to the state of an article results in a version increment, except to and from the **Pending retirement**, **Retired**, and **Outdated** states.

Note:
To know more about minor version edits, see Article versioning changes.

Knowledge article version information

Users can view version information for a knowledge article from the Knowledge view page.

The knowledge article number and the version number appear at the top of the article, just below the title. Clicking the version number expands the version history section, which includes a list of the available article versions. User roles determine what is included in this list:

- Users with read access to a knowledge base can see the latest published version and previous major versions.
- Users with read and contribute access to a knowledge base can see the latest published version, previous major versions, and any draft or review versions.

You can view any of the previous versions of an article by clicking the version number in the list. When you view a previous version, a message at the top of the article indicates that an updated version is available.

At the bottom of a knowledge article, you can see additional information about an article, including the name of the author or revisor and the date that the article was last modified.

Validity of a knowledge article

Knowledge article validity is the date a knowledge article expires. Articles do not appear in search results after the **Valid to** date or if the **Valid to** date is blank.

Decide when to expire a knowledge article by using the **Valid to** field in the Knowledge form. The Knowledge form is available when creating or editing a knowledge article.

When you create or edit a knowledge article, a default value appears in the **Valid to** field. As an article author or editor, you can select whether to keep or change the default **Valid to** date.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If the system date format or user preferences is set to use `yy` year format, you might face issues when the **Valid to** date is set to the default date. Contact your system administrator or modify the user preferences to use a date format with the `yyyy` year format. For more information, see Global date and time field format and Personalize the system date format topics.

Default article validity when creating a knowledge article

The default value of the **Valid to** field is derived from the **Article Validity** field configured for the knowledge base (see Create a knowledge base). The **Valid to** date starts from the date the article was created until the number of days specified in the **Article Validity** field. If the **Article Validity** field is blank, the default date in the **Valid to** field for the knowledge article is set to January 1, 2100.

Default article validity when editing a knowledge article

If the article versioning feature is enabled, the default value of the **Valid to** date in the updated article version is automatically set as described in the following table.

Valid to date in the updated article version

Article Validity value in the associated knowledge base	Valid to default value	Notes
Blank	Earlier version **Valid to** date value	If the **Article Validity** field in the knowledge base associated with the article is blank, the **Valid to** date value from the earlier version of the article is retained.
Is not blank	Article updated date + article validity	If the **Article Validity** field in the knowledge base associated with the article is not blank, the **Valid to** date is automatically updated to start from the date the article was updated until the number of days specified in the **Article Validity** field.

If you move a knowledge article to another knowledge base, the default value of the **Valid to** date in the updated article is automatically set as described in the following table.

Valid to date when moving a knowledge article to another knowledge base

Article Validity value in the updated knowledge base	Valid to default value	Notes
Blank	Earlier **Valid to** date value	If the **Article Validity** field in the selected knowledge base is blank, the earlier **Valid to** date value is retained for the knowledge article.
Is not blank	Article updated	If the **Article Validity** field in the selected knowledge base isn't blank, the **Valid to** date is automatically updated to start from the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Valid to date when moving a knowledge article to another knowledge base (continued)

Article Validity value in the updated knowledge base	Valid to default value	Notes
	date + article validity	date the article was updated until the number of days specified in the **Article Validity** field.

Note:
If the dictionary value of the **Valid to** field is modified, this dictionary value overrides the default value of the **Valid to** field calculated according to the **Article Validity** field.

Email notifications for expiring knowledge articles

On the first day of each month, the application sends an email notification to a list of authorized recipients to remind them about articles that are about to expire in the next month. The recipient can then extend the **Valid to** date to continue using the article. For more information, see Managing email notifications in Knowledge Management.

Knowledge article states

Knowledge article versions can be in one of several states as it progresses through the creation cycle.

Note:
You need to activate the Knowledge Management Advanced plugin (com.snc.knowledge_advanced) and set the *glide.knowman.versioning.enabled* system property to `true`. For more information, Activate the Knowledge Management Advanced plugin and Article versioning properties.

State	Description
Draft	The article is in the process of being created. **Note:** A versioned knowledge article in the **Draft** state can be modified only by the author or reviser with the contribute access to the knowledge base, owner of a knowledge base, users with the admin and knowledge_admin role, and ownership group members, if ownership group is added to the article.
Review	The draft version of the article is sent to reviewers to approve or reject.
Scheduled for publish	The draft version of a knowledge article is scheduled for publishing on a future date.
Published	The article is approved and published. When the state of an article changes to **Published**,

Knowledge access controls

Knowledge subscription email notification templates

The knowledge subscription feature uses email notification templates to send subscription notifications to knowledge users.

Email template	Subscription type
KM Subscription: Article published	Knowledge base
KM Subscription: Article revised in KB	Knowledge base
KM Subscription: Article checked out	Knowledge article
KM Subscription: Article revised	Knowledge article
KM Subscription: Article commented	Knowledge article

Users with the admin or knowledge_admin role can customize these email notification templates. To locate the template, navigate to **System Notifications** > **Email** > **Notifications**. For more information about customizing a template, see Create an email notification.

Subscription notifications include a link at the bottom of the email to the user's Notification Preferences page.

Analytics and Reporting Solutions for Knowledge Management

The following topics provide information on Platform Analytics Solutions and Demand Insights dashboards for Knowledge Management.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Knowledge Management Platform Analytics Solutions

Platform Analytics Solutions contain preconfigured dashboards. These dashboards contain actionable data visualizations that help you improve your business processes and practices.

Platform Analytics Solutions

Platform Analytics data visualizations use Performance Analytics indicator data to show you data over time, helping you analyze your business processes and identify areas of improvement. With Platform Analytics Solutions, you can get value from Performance Analytics for your application with minimal setup. You can always create your own objects as well.

To enable the solution for Knowledge Management, an admin can navigate to **Performance Analytics** > **Guided Setup**. Click **Get Started** then scroll to the section for Knowledge Management. The guided setup takes you through the entire setup and configuration process.

Note:
You must Activate the Knowledge Management Advanced plugin.

Domain separation and 'Run As' user

In some solutions, System Administrator is the **Run As** user for data collection jobs in the Platform Analytics Solutions. In other solutions, the **Run As** user for data collection jobs is left blank. Verify that the **Run As** user exists on the instance, and that this user has the appropriate level of access. An inappropriate **Run As** user can cause errors or limit the data that is collected. This setting only has an effect if domain separation is enabled.

New and deprecated versions of this solution

In London , this Solution was replaced with a new version, `com.snc.pa.knowledge_v2`. If you activated an earlier version of the Solution and then upgraded your instance, you still have and can still use the earlier Solution. You can also activate the newer version without losing data from existing indicators and breakdowns. If you activate the newer version, run a historical data collection job to populate any new indicators and breakdowns.

Add Self-Service Analytics to Knowledge Management dashboards

If you have Self-Service Analytics activated on an instance, you can add Self-Service analytics widgets to your Performance Analytics dashboards or a Service Portal. To obtain a ready-made set of indicators and breakdowns, activate the Self-Service Analytics PA (*`com.snc.pa.self_service_analytics`*) plugin. Find the Self-Service indicators through the Performance Analytics Admin Console, then create widgets and add them to your dashboard or portal. Also activate the [SSA] Self-Service Analytics data collection job.

End users and roles

End user and goal	Required role	Benefits
Knowledge Manager: must identify areas of concern and direct resources optimally.	knowledge_manager	Can review the velocity of content publication and see what content customers are searching for, to direct the efforts of content owners more efficiently.
Knowledge Administrator: needs clear visibility into the usage and quality of knowledge content.	knowledge_admin	Can plan and direct content creation.
Content creator: must see the usage of content they own and areas for improvement	pa_viewer	Can see what content in their subject area that customers are looking for.

CSM Knowledge Management dashboard indicators

The CSM Knowledge Management dashboard provides three views, into content usage, content governance, and content quality.

The Knowledge Management dashboard presents the following key performance indicators:

% of Knowledge Articles Published

A daily calculation using the formula `[[Number of knowledge articles published]] / [[Number of knowledge articles active]]`

Monthly Average Article Rating

A monthly calculation of the sum of all article ratings for the month divided by the number of knowledge articles rated for the month.

Average select Rank

A monthly calculation using the formula `[[Sum of knowledge search ranks]] / Number of knowledge searches with rank]]`

Select Through Rate

A monthly calculation using the formula `Number of knowledge searches with rank]] / [[Number of knowledge searches]]`

Average Time to Publish

The average time to publish is recalculated daily, as a number of days. The goal of the indicator is for scores to minimize.

Number of Active Users Who Performed Searches- Monthly

The number of authenticated users who performed at least one search of the knowledge base in the preceding month. The goal is for the number to maximize.

Number of Active Users Who Viewed Articles- Monthly

The number of authenticated users who viewed at least one knowledge article in the preceding month. The goal is for the number to maximize.

Number of Knowledge Searches with Rank- Monthly

The number of knowledge searches in a month where the Highest select Rank has a value higher than zero. The goal is for the number to maximize.

Number of Knowledge Searches- Monthly

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The number of knowledge searches in a month. The goal is for the number to maximize.

Number of Knowledge Articles Rated- Monthly

The number of knowledge feedback records created in a month, excluding records where the Rating field is empty. The goal is for the number to maximize.

Number of Knowledge Articles Published

A daily count of the total number of knowledge articles that have entered the Published state. The goal is for the number to maximize.

Number of Knowledge Articles Active

A daily count of the number of active knowledge articles with up-to-date workflows. The goal is for the number to maximize.

Sum of Knowledge Article Rating- Monthly

The monthly sum of all knowledge article ratings. This indicator is used only to calculate the average monthly article rating.

Sum of Knowledge Search Ranks- Monthly

The sum of feedback rankings of knowledge searches made in a month, excluding empty Highest select Rank values. The goal is for the number to maximize.

Average select Rank for Unauthenticated Users

A monthly calculation of the average select rank for the unauthenticated user activity. The score is calculated according to the formula `[[Sum of Knowledge Search Ranks by Unauthenticated Users- Monthly]]/[[Number of Knowledge Searches by Unauthenticated user with Rank- Monthly]]`. A lower value is better.

Select Through Rate for Unauthenticated Users

A monthly calculation of the percentage of select through rate for the unauthenticated user activity. The score is calculated according to the formula `[[Number of Knowledge Searches by Unauthenticated user with Rank- Monthly]]/[[Number of Knowledge Searches by Unauthenticated user- Monthly]] * 100`. A higher value is better.

Number of Knowledge Searches by Unauthenticated Users- Monthly

A monthly count of the knowledge searches by unauthenticated users.

Number of Article Views by Unauthenticated Users- Monthly

A monthly count of the knowledge articles viewed by unauthenticated users.

Sum of Knowledge Search Ranks by Unauthenticated Users- Monthly

A monthly sum of the knowledge search ranks for the unauthenticated user activity.

Number of Knowledge Searches with Rank for Unauthenticated Users- Monthly

A monthly count of the knowledge searches with select rank for the unauthenticated user activity.

Breakdowns

The following breakdowns apply to the indicators on the dashboard:

- Time to Publish Groups
- Knowledge Base
- Knowledge Category

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data visualizations

The dashboards include the following visualizations:

Title	Type	Description
Articles with Inactive Authors	Column	Active = true and Author.Active = False
Invalid Articles	Column	Active = true and Workflow is one of Draft, Review, Published, or Pending Retirement and Valid to is before today and latest = true
Articles Created Over 1 Year	Column	Active = true and Created = before 1 year ago
Articles not Published	Column	Active = true and Workflow is Draft or Review

Knowledge Management Overview dashboard

The Knowledge Management Overview dashboard provides an overview of various usage metrics associated with knowledge articles. You can view and track knowledge usage and views and direct the efforts of content owners more efficiently.

Note:

If you're upgrading from a previous release, you must activate the Knowledge Overview (com.sn_knowledge_overview) plugin to enable the Knowledge Management Overview dashboard. You must also update the navigation path. For more information, see Update the navigation path for the Knowledge Management Overview dashboard.

Enable the responsive dashboard to optimize analytics by setting the *glide.cms.enable.responsive_grid_layout* system property to true.

To access the Knowledge Management Overview dashboard, navigate to **All** > **Self-Service** > **Dashboards**. Search for the Knowledge Management Overview dashboard. The dashboard by default opens with the **Article Lifecycle** tab displayed.

Title	Type	Description
Monthly knowledge usage by author	Trend ( )	Shows the count of articles used as attachments trended by month with respect to the author.
Monthly knowledge views by author	Trend ( )	Shows the count of viewed articles trended by month per author.
Articles created by author	Trend ( )	Shows articles created according to knowledge author trended by month.

Update the navigation path for the Knowledge Management Overview dashboard

Update the navigation path to access the Knowledge Management Overview dashboard.

Before you begin

- Activate the knowledge overview (com.sn_knowledge_overview) plugin.
- If you are upgrading from a previous release, you must update the knowledge overview entry in the Modules (sys_app_module) table.

Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Modules**.
2. On the Modules page, in the **Title** field, enter `overview`.
3. In the **Application menu** field, enter `knowledge`.
4. Open the **Overview** module.
5. In the Module Overview page, click **Link Type**.
6. In the **Link type** field, select **URL (from Arguments)** from the list.
7. In the **Arguments** field, enter `now/platform-analytics-workspace/dashboards/params/edit/false/sys-id/5d5e18458731fd51a2522b5a4309cacc`.
8. Select **Update**.

Result

The navigation path for the Knowledge Management dashboard is updated to **All** > **Knowledge** > **Administration** > **Overview**.

Pareto chart for Knowledge Demand Insights

The Pareto chart for Knowledge Demand Insights enables you to visualize candidate knowledge gaps and prioritize the order in which knowledge gaps should be resolved.

The following information is available in the Pareto chart for Knowledge Demand Insights:

- The left Y axis is the count of tasks with no or insufficient knowledge coverage.
- The right Y axis is the cumulative percentage of the total number of tasks evaluated.
- Each bar represents a collections of similar tasks that don't have good knowledge coverage. The bars are arranged in a descending order such that the collection with most number of tasks appears in the left. This order enables you to resolve the largest collection first. When you point to a bar, you view the number of tasks included within the bar and the cumulative percentage.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The line graph shows the cumulative percentage of tasks that are included in each collection.
- The blue line indicates the 80% of total number of tasks that have no or insufficient knowledge coverage. The intersection of the blue line and the line graph indicates the minimum number of collections that need to be resolved so that 80% of tasks can be covered.

Example: Pareto chart for demand insights

The following figure displays a Pareto chart for identifying candidate knowledge gaps for incidents.

Exploring Knowledge Center

Exploring Knowledge Center

The Knowledge Center Knowledge Center helps in the effective management of knowledge articles by using an intuitive interface. Beyond traditional knowledge bases, the Knowledge Center provides actionable insights and identifies gaps so that your content stays relevant and accurate.

Benefits

- Knowledge Center Article editor provides a range of formatting tools to help you edit and format the content of knowledge articles, including text, images, and media.
- Insights Dashboard- Track top actions, duplicates, and optimization opportunities.
- Gap Analysis- Identify missing topics and improve coverage.
- Article optimization- Generate and edit articles with Now Assist. Turn a text prompt into an article, helping you overcome writer's block and speed up the article writing process.

Why use Knowledge Center

- Monitor the performance of your knowledge ecosystem.
- Enhance article quality through AI-driven recommendations.
- Close gaps and keep your content aligned with audience needs.

Knowledge Center Home Page

Knowledge Center is a plugin within Knowledge Management that helps in the effective management of knowledge articles by using an intuitive interface.

UI features

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Following are the features supported by the Knowledge Center plugin. Some features are only accessible if you have the appropriate role access and meet the necessary criteria to view them.

UI Features and capabilities

Section	Features	Conditions
Search	Find knowledge material by title or text in the body. It lets you quickly access the relevant information, reducing time spent searching.	When the AI Search feature is active, searches are performed using AI. If it's not enabled, contextual search is used instead.
Insights	Discover areas of improvement in the knowledge base through potential knowledge gaps, potential duplicates, and article optimization. It helps you improve the content quality and helps for a complete, accurate knowledge base.	This feature works only if the Now Assist Skills are enabled for your role.
Requires Attention	The Requires Attention section helps you manage and update critical articles and tasks, ensuring content accuracy and timeliness. It includes features like My Approvals, My Feedback Task, and My Article Checklist, and highlights flagged articles and those expiring soon assigned to the logged in user.	User can access features assigned to their role.
Quick View	Navigate quickly to knowledge bases and filter articles by most viewed, most useful, or featured. It speeds up access to popular and high-value content.	User can access features assigned to their role.
Knowledge Features	The Knowledge features section provides a guide to workflows and supporting processes for knowledge management. It helps you understand and maintain a robust knowledge ecosystem.	User can access features assigned to their role.
Actions	The Actions panel provides options to create articles, blocks, or manage groups, helping you organize knowledge and maintain group ownership effectively.	Now Assist feature should be enabled for your role. You can use Now Assist for creating or updating articles. For more information, see
Configurations	The Configurations section provides references to tools and settings that support knowledge management and system optimization. Use these options to configure assistance, manage properties, and improve article quality.	User can access features assigned to their role.
Knowledge Resources	The Knowledge Resources section offers links to learning materials and community platforms. Use these resources to build your skills, connect with peers, and find product documentation.	User can access features assigned to their role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Knowledge Center article editor

The Knowledge Center article editor has editing tools that help in formatting knowledge article content such as text, images, and media.

The toolbar within the article editor contains an array of icons that enable you to edit and format the text content of your knowledge article. You can also use the editor to add images, links, audio, and video to the knowledge article.

You can perform the following functions using the article editor:

- Review and edit knowledge article record metadata such as short description (title), knowledge base, and valid to date.
- Preview the article layout on different screen views such as desktop, mobile, and tablets.
- Toggle component outlines, undo, or redo changes and clear the content.
- Drag blocks of columns, text, images, and video into the editing area and format them using settings.
- Use inline text formatting tools such as bold, alignment, font, color, headings, links, and lists to enhance content presentation.
- Use Now Assist for AI-powered content creation and editing, including open prompt commands for text manipulation.
- Use article templates for layout/sections and form templates for default content.

Knowledge Center Article Optimization

Article Optimization is an automated system designed to improve the quality and health of knowledge articles, providing actionable feedback to authors and managers.

The Article Optimization tool scans your knowledge articles and provides instant, actionable feedback. This feature enables you to quickly address issues, resulting in high-quality content that is more accessible and easily discoverable. By streamlining improvements, the tool helps verify that your articles meet accessibility and searchability standards, saving time and enhancing the user experience.

Note:
Your administrator or manager can configure the Article Optimization features to enable and customize a range of operations. For more information, see Configuring custom script based Article Optimization scans.

The Article Optimization tool performs the following operations:

- Scheduled jobs run various scans on articles, such as checking for proper heading tags, missing image alt attributes (for accessibility), and title relevance (for search engine optimization).
- Findings from these scans are presented as cards in the user interface, offering suggestions like adding alt text or updating titles.
- Both script-based and AI-powered scans are supported. AI scans come with suggestions for improvement.
- Authors can fix, ignore, or review findings directly from the UI. Some fixes (changing heading tags, and so on) can be batch-applied.
- Managers can see aggregated findings on the home page (for example, number of flagged articles, types of issues, and so on), while authors can see findings at the individual article level.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Potential knowledge gaps

Potential knowledge gaps represent areas where you frequently encounter issues but lack supporting articles. Managing these gaps promotes better coverage and improved user experience.

The Knowledge Center identifies gaps based on case or incident trends and their reporting patterns. These gaps highlight missing or insufficient knowledge articles that need attention.

Note:
The Knowledge Gap also known as Potential gaps feature is supported currently in CSM and ITSM products.

Types of views

- All Knowledge Gaps: Displays a complete list of gaps across the organization.
- Top five Gap Views: Shows information of the top five gaps from the incident and cases.

Benefits

Addressing gaps helps reduce repeated incidents, improves self-service, and promotes a comprehensive knowledge base.

Available knowledge actions

- **Unmark as gap**: Remove invalid gaps discovered and remove the issues and all its tasks from the list.
- **Mark as resolved**: Close gaps after creating or updating articles.
- **Report a gap**: Create feedback task for the articles where you believe that a gap exists. Once the article is created, the gap can't be reported again.
- **Create an article**: Draft new content to address the gap.

Related topics

Configure Now Assist Skills for potential gaps

Configuring Knowledge Center

For using the Knowledge Center, the admin must enable system properties and configure the features that enable agents to use its generative AI skills within their application workspace.

The first step in configuring the Knowledge Center involves enabling the following system properties:

- `sn_km_center.glide.knowman.ece.enable`
- `sn_km_center.glide.knowman.enable`
- `sn_km_center.glide.knowman.redirect.enable`

For more information, see Enable system properties for Knowledge Center

Configure how agents use Knowledge Center to generate, edit, and optimize knowledge articles. Refer the following :

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Configuring custom script based Article Optimization scans
- Activate Article Optimization skill
- Configuring Article Optimization skill and prompts

Enable system properties for Knowledge Center

To use the Knowledge Center plugin, you must enable the system properties before you configure the space.

Before you begin

The default system properties settings for Knowledge Center:

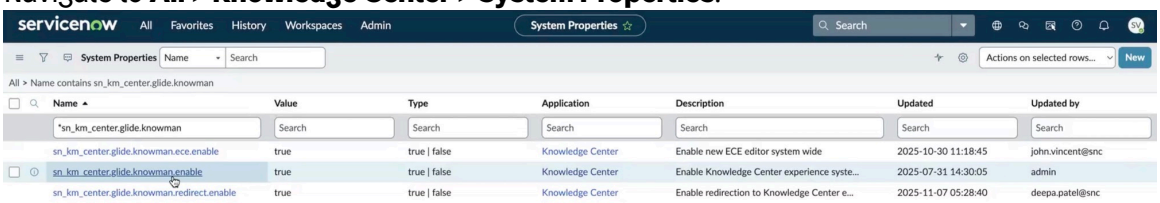
- **For new users:** All the properties are enabled (set to **true**) by default, encouraging immediate use of the new system.
- **For existing users:** All the properties are disabled (set to **false**) by default to avoid disrupting current workflows or customizations. Existing users must manually enable the properties to access KC and its features.

Supporting releases: Knowledge Center and its features are available to the users in Yokohama Patch 11 (YP11) and Zurich Patch (ZP4) releases.

Role required: admin

Procedure

1. Navigate to **All** > **Knowledge Center** > **System Properties**.



2. Enable the following system properties by setting the parameter to **true**.

Configuring Article Optimization jobs

Article Optimization jobs are used to define a schedule to run scans along with their conditional settings, if any. Each job will have one or more scans associated with it.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Knowledge** > **Knowledge Center** > **Lists** > **Article Optimization** > **Jobs**.
2. Select **New**.
   a. If you want to clone and modify an existing job, go to the *sysauto_kb_assist_job* table.
   b. Open a record and select **Insert and stay** to copy the scan.
   c. **Rename** the copied scan.
3. Fill out the record form as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Set the **Query table** field to **Knowledge** (or another table used to store knowledge articles).

b. Define the filter criteria for the job in the **Query conditions** field.

4. Define the schedule of the job in the **Run** field and refine it using the **Time Zone** and the **Time** fields (to stagger job run times and avoid performance issues).
5. **Save** the record.
6. Add or delete scans on the job from the **Related Article Assist Scans** related list.

Result
The article optimization job is configured.

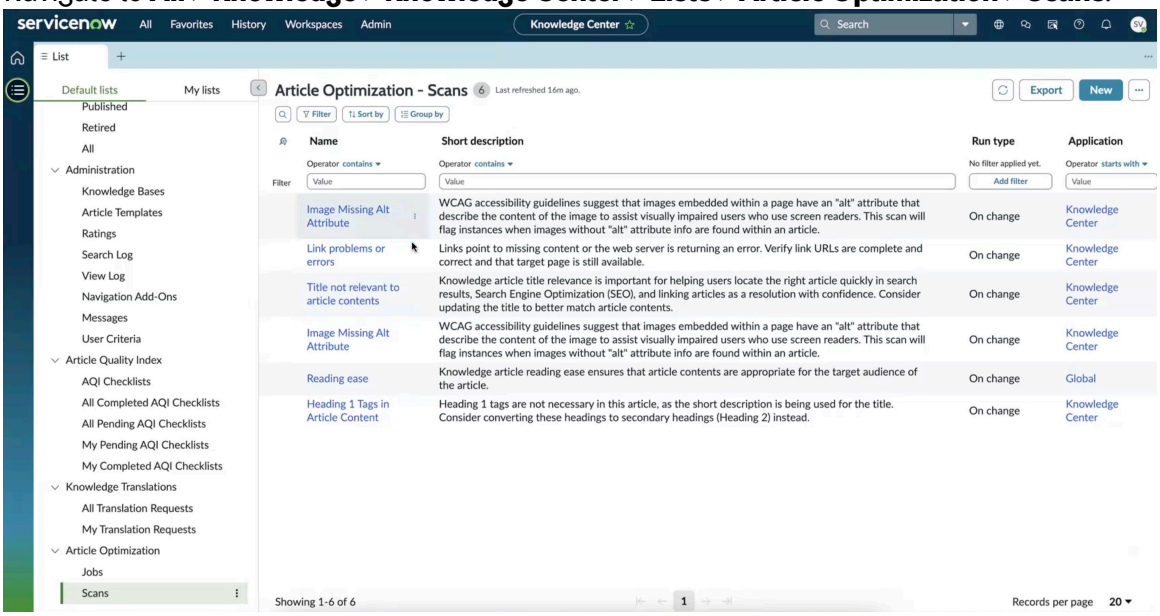
Configuring custom script based Article Optimization scans

The Out-of-Box (OOB) Knowledge Center settings provide default configurations for article optimization scans. However, users can configure new scans for article optimization.

Before you begin
Role required: admin

About this task
Configure Article Optimization scans for articles in the Knowledge Center. Two types of Article Optimization scans are available in the Knowledge Center. One is a script-based scan and the other is a AI-based scan. If you are subscribed to Now Assist, you can configure both the scan types. If you are not subscribed to Now Assist, you can configure only the script-based scans, and Article Optimization runs only the script-based scans.

Procedure
1. Navigate to **All** > **Knowledge** > **Knowledge Center** > **Lists** > **Article Optimization** > **Scans**.



2. Select **New**.

a. If you want to clone and modify an existing scan, go to the *kb_assist_scan_definition* table.

b. Open a record and select **Insert and stay** to copy the scan.

c. **Rename** the copied scan.

3. Fill out the record form as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Set the **Run type** field to:

- **On change:** If you want the scan to run each time an article is saved.

  Note:
  the scan must still be associated with a job in order to run but the job schedule will not control when this scan runs.

- **Always:**If you want the scan to run based on the schedule set up in the associated job.

b. Set the **Execution type** to **Script Based**.

4. Type the script code in the **Script** field.

   Note:
   Using a copy of an existing scan can come in handy as this specific format has to be used for processing the results.

5. **Save** the record.

Result
The Article Optimization scan is custom configured.

What to do next
To run the scan, you must add the configured scan to a job. For more information see, Configuring Article Optimization jobs

Using Knowledge Center

Learn how to manage and enhance your knowledge base using the powerful tools and workflows available in Knowledge Center.

Using Knowledge Center goes beyond viewing dashboards as it involves tasks that keep your knowledge ecosystem accurate, complete, and user-friendly. This section explains how you interact with the system to maintain content health and an effective technical support system.

Key Tasks

- **Resolve Issues:** Address knowledge gaps and duplicates highlighted in Insights.
- **Optimize Articles:** Edit, retire, or delete outdated content to maintain relevance.
- **Create New Content:** Draft articles for missing topics identified through gap analysis.
- **Respond to Feedback:** Review user feedback and implement improvements.

UI feature and uses

Following is the list of features and how they can be useful to you.

Search

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Find knowledge material by title or text. Search is equipped with the Now Assist feature, providing more guided and relevant results.

Note:
When the AI Search feature is active, searches are performed using AI. If it's not enabled, contextual search is used instead.

Insights

Discover areas of improvement in the knowledge base through Potential gaps, Potential duplicates, and Article optimization.

- Article optimization

Note:
This feature works only if the Now Assist Skill is enabled for your role. See Configure skills with custom prompts for knowledge article templates.

Requires Attention

This feature highlights items that need immediate review or action to maintain content accuracy and compliance. Following are the filters of this feature:

- **Articles Expiring in 90 Days:** Review and update articles scheduled to expire soon to promote relevance and accuracy.
- **My Flagged Items:** Address flagged content for corrections or improvements.
- **My Feedback Tasks:** Resolve feedback requests promptly to maintain content quality.

Quick View

Quickly navigate to knowledge bases and view articles filtered by criteria such as most viewed, most useful, and featured.

Knowledge Features

The Knowledge features section offers a comprehensive guide to various knowledge management workflows and supporting processes. It enables you to explore features that help maintain a robust and efficient knowledge base.

Actions

The Actions Panel helps you organize knowledge effectively by creating articles, adding reusable content blocks, and managing ownership groups.

- **Create an Article**: Use a template to share detailed information and troubleshooting steps.
- **Add Knowledge Blocks**: Knowledge blocks are reusable pieces of content secured by user criteria. Add them to knowledge articles to maintain consistency and reduce duplication.
- **Manage Groups**: Control ownership by editing existing groups or creating one so that the group users have access and responsibility.

For more information, see the following links:

Related topics

Generate a Knowledge article from the Now Assist panel

Search knowledge article

Use the search function to find articles you want to work on and then filter and sort your results as needed.

Before you begin

Role required: admin

About this task

Searching for knowledge articles is essential because users often struggle to find accurate information quickly. Without a reliable search, they waste time and risk using outdated content. A strong search experience helps in faster resolution and improves productivity.

Note:
When AI Search feature is active, search uses AI for results. If not enabled then contextual search is used.

Procedure

1. Navigate to **All** > **Knowledge** > **Knowledge center**.
   You can also access Knowledge Center through **Workspaces** > **Knowledge center**
2. In the **Search** bar, enter the name of the topic you want to find articles about.
3. You can see the detailed results by selecting **View all Knowledge**.
   The detailed results are displayed in a card format.
4. You can also see the detailed results in the list view by selecting **Go to list view**

Result

The detailed results are displayed in a list format.

Check Knowledge Center insights

Learn how to access detailed views for gaps, duplicates, or article optimization from the Insights section in the Knowledge Center.

Before you begin

Role required: admin

About this task

Knowledge Center Insights provide visibility into the health of your knowledge base. Without actionable insights, teams may overlook issues that impact content quality. Insights highlight optimization needs, duplicates, and gaps, enabling informed decisions and proactive maintenance.

The Insights section provides quick links to key actions such as managing gaps, duplicates, and article optimization. Selecting these links takes you to the respective detailed view for further actions.

Procedure

1. Navigate to **All** > **Knowledge** > **Knowledge center**.
   You can also access Knowledge center through **Workspaces** > **Knowledge center**
2. In the **Insights** section, under **Top knowledge actions** select the action item you want to manage:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Select **Article Optimization** to open the optimization window to edit, view, retire, or delete articles.
- Select **Incident Gap** to open the knowledge gaps window to review or resolve gaps.
- Select **Duplicates** to open the duplicate articles window to manage duplicate content.

> **Note:**
> The number of items displayed under Knowledge Actions depends on the categories that you have access to. If you have access to all three categories (Duplicates, Gaps, and Article Optimization), six actions appear, with two actions from each category. When access is limited to any two categories, six actions are still shown, but three actions come from each category. If you have access to only one category, all six actions are displayed from that single category. This approach helps in consistency in the total number of actions while adapting to your permissions.

3. Select the item to navigate to its detailed view.

Result
You're redirected to the relevant detailed view for managing the selected case.

Role required: admin.

Suggested reading: Configure Now Assist Skills for potential gaps

About this task
Potential gaps also known as Knowledge gaps represent missing documentation for recurring issues. If it's unresolved, these gaps lead to repeated incidents and higher support costs. Addressing gaps promotes comprehensive coverage, reduces ticket volume, and enhances self-service adoption.

> **Note:**
> Currently, the Potential Gap feature is supported only in CSM and ITSM products.

Procedure

1. Navigate to **All** > **Knowledge** > **Knowledge center**.
   You can also access Knowledge center through **Workspaces** > **Knowledge center**
2. In the **Insights** section, under **Potential gaps**, select **View more** to view the gaps list.
3. Select a view:
   - **View all gaps** Review the full list of gaps.
   - **View top gaps** Review only the highest-priority gap groups.
4. Select the gaps that you want to manage and choose one of the following actions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Select **Unmark as gap** to clear related incidents or cases tasks when the article meets completeness criteria.
- Select **Mark as Resolved** to close the incident or cases after creating or updating an article.
- Select **Create an Article** to draft a knowledge article to address the gap.
- Select **Report Knowledge Gap** to create a feedback task for incidents or cases.

> **Note:**
> When you report a gap, a feedback task is created for the article, and consequently, you can't create that article again.

5. Confirm your action if prompted.

Result
The selected gap is updated or resolved, improving knowledge coverage and reducing repeated incidents.

Potential knowledge gaps

Identify and resolve duplicate articles

Learn how to find and manage duplicate knowledge articles in the Knowledge Center.

Before you begin
Role required: admin

About this task
Duplicate articles can confuse readers and reduce search accuracy. Use this task to identify duplicates and take corrective actions to maintain content quality.

> **Note:**
> The **Potential Duplicate** card on the dashboard displays a trend analysis of the number of duplicate topics for the current year. The card will not display detailed information if the scheduled job runs are fewer than four.

Procedure

1. Navigate to **All** > **Knowledge** > **Knowledge center**.
   You can also access Knowledge center through **Workspaces** > **Knowledge center**
2. In the **Insights** section, under **Potential Duplicates**, select **View all** to view the duplicate articles list.
3. Select the duplicate articles that you want to unmark as duplicate.
4. Select **Unmark as Duplicate** to remove the duplicate tag if the article is valid.
5. Confirm your action if prompted.

Result
The duplicate articles are resolved, improving content accuracy and reducing redundancy.

Address items that requires attention

Learn how to review and manage items that need your attention, such as expiring articles, flagged content, and feedback tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
The **Requires Attention** section helps you quickly identify and act on items that need review. This section includes articles nearing expiration, flagged content, and feedback tasks assigned to you.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **Knowledge** > **Requires Attention**.
2. Review the sections under **Requires Attention**, and select the feature that suits your interest from the following list:
   - Select **My Approvals** to view articles that are assigned to you for your approval.
   - Select **My Pending Group Requests** to view if a request is opened by a logged-in user is not completed or closed.
   - Select **My Feedback Tasks** to view feedback tasks assigned to you.
   - Select **My Article Checklist** to view the article checklist. Here the logged-in user should be a reviewer, and state shouldn't be already submitted.
   - Select **My Flagged** to view the articles that you flagged for review.
   - Select **Articles expiring in 90 days** to view the articles that are assigned to the logged-in user that expire soon.
   - Select **My Translation Requests** to view that any translation requests assigned to the logged-in user and are open
3. Select **View all** to see the complete list of items.
4. Open an item link, like from the list of **My Feedback Tasks**, to view details and select desired action on the items.

Result
You can track and resolve to pending tasks efficiently from the **Requires Attention** section.

Generate and edit articles using the article editor

The Knowledge Center (KC) Article Editor delivers an intuitive experience for creating and managing content. Featuring blocks, responsive previews, and AI-powered assistance, it simplifies article design while verifying accessibility and search engine optimization compliance. Backward compatibility with existing templates guarantees a smooth transition for authors and administrators.

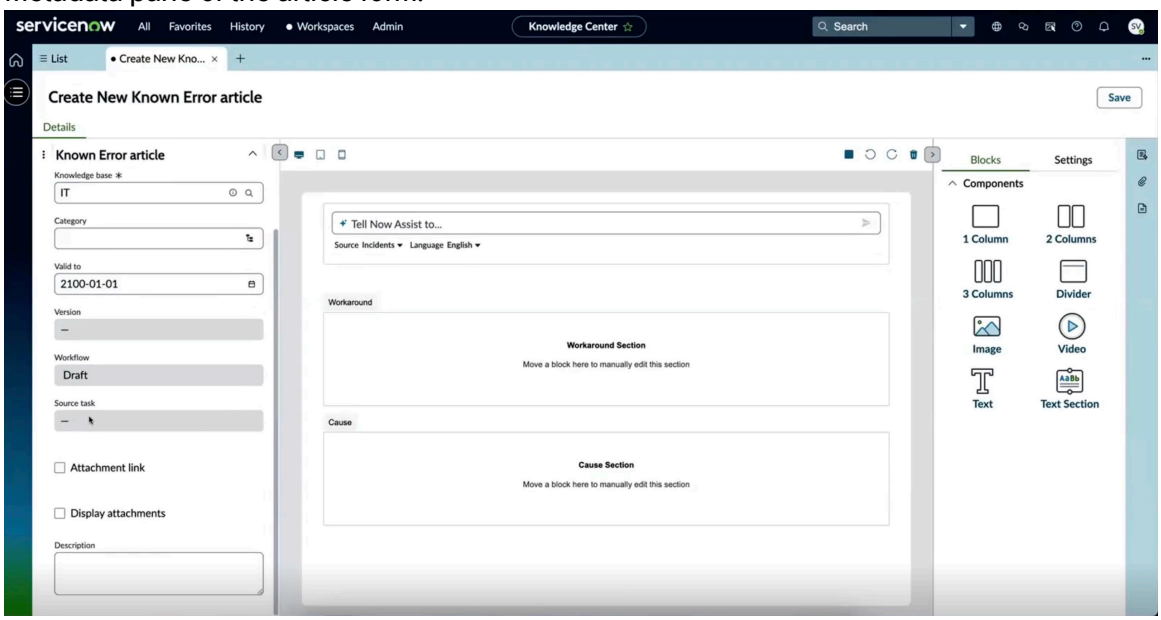
Before you begin
Role required: agent

About this task
Generate and edit knowledge articles in the Knowledge Center from a task using AI-powered editing blocks and formatting tools. The article editor supports all existing article templates, including custom templates, with no migration needed. You can create an article or edit an existing one.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

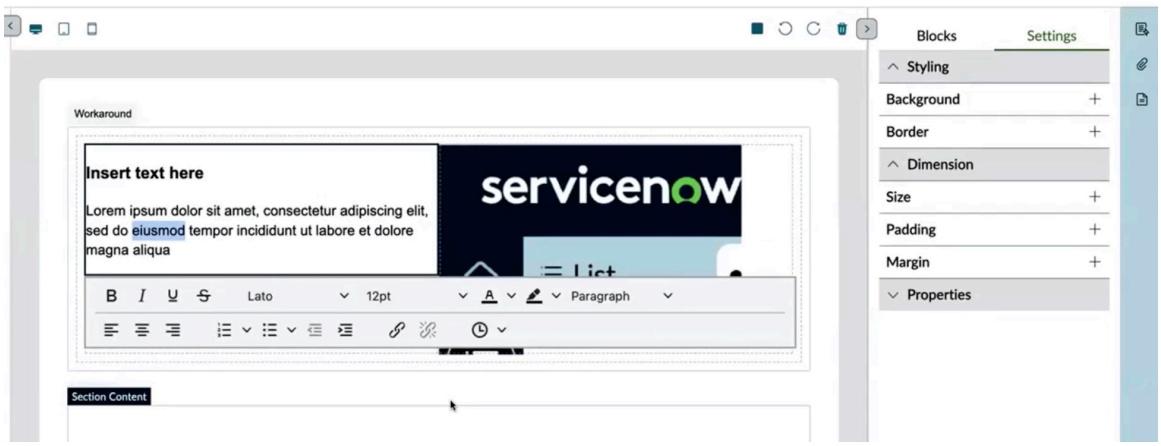
1. Navigate to **All** > **Knowledge** > **Knowledge Center** > **Lists**.
2. Select the type of article from the **List** menu (Unpublished, Published, Retired, and so on).
3. Select **New** to create an article.
4. Select the knowledge base and the article template in the **Create new article** window.
5. Preview the article template and select **Next**.
6. Start by entering the **Knowledge base**, **Short description** (title), and other details in the metadata pane of the article form.



7. As you create the article in the main article editor space, drag **Components**, such as columns and text section, into the article area from the **Blocks** pane.

> **Note:**
> Collapse and expand the article area using the arrows for better visibility.

8. Use the block-level controls in the toolbar to preview articles for aspect ratios, toggle component outlines, delete, redo, or undo blocks.
9. Edit blocks using the block **Settings** to fine-tune margins and alignment.
10. Select and format inline text such as headings, lists, fonts, and hyperlinks, with the floating formatting toolbar.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

11. Upload images and resize, rotate, or flip using the image-editing tools.
12. Use the Now Assist article assistant to modify content with open prompt commands for summarizing, expanding and, formatting paragraphs.
13. Select **Save** to save the draft of the article.

View article optimization analysis

Learn how to navigate to Article optimization in Knowledge Center.

Before you begin
Role required: admin

About this task
Article optimization safeguards content relevance and accuracy. Outdated or poorly structured articles compromise usability and can result in operational errors. Regular optimization maintains quality standards, supports compliance, and strengthens the accuracy of the knowledge base.

Procedure

1. Navigate to **All** > **Knowledge** > **Knowledge center**.
   You can also access Knowledge center through **Workspace** > **Knowledge center**.
2. In the **Insights** section, under **Article optimization**, select **View top issues**.
   In the new tab, you see a list of all flagged articles with their detected issues.
3. Select the knowledge article that you want to view.
4. In the **Article Optimization** pane, you can review the detected issues by using following actions:
   - Select **Ignore** to ignore this suggestion.
   - Select **Review** to review the article and update it.
5. Select **Checkout**, to create another version of this article.
6. After you create an article, you can **Save** and **Publish** the article.
   You can ignore suggestions, apply recommended updates, or create an article. Save and publish the article so that it meets quality and optimization standards.

Result
The selected gap is updated or resolved, improving knowledge coverage.

Review and optimize articles using Article Optimization

The Knowledge Center Article Optimization feature provides automated, actionable feedback to improve content quality, accessibility, and search engine optimization, with configurable scans to identify and fix issues.

Before you begin
Role required: agent

About this task
Review and optimize knowledge articles in the Knowledge Center (KC) by running quality scans of all the articles. Default settings come with default scan configurations, but you can also customize scan jobs. For more on creating an Article Optimization job, see Configuring Article Optimization jobs.

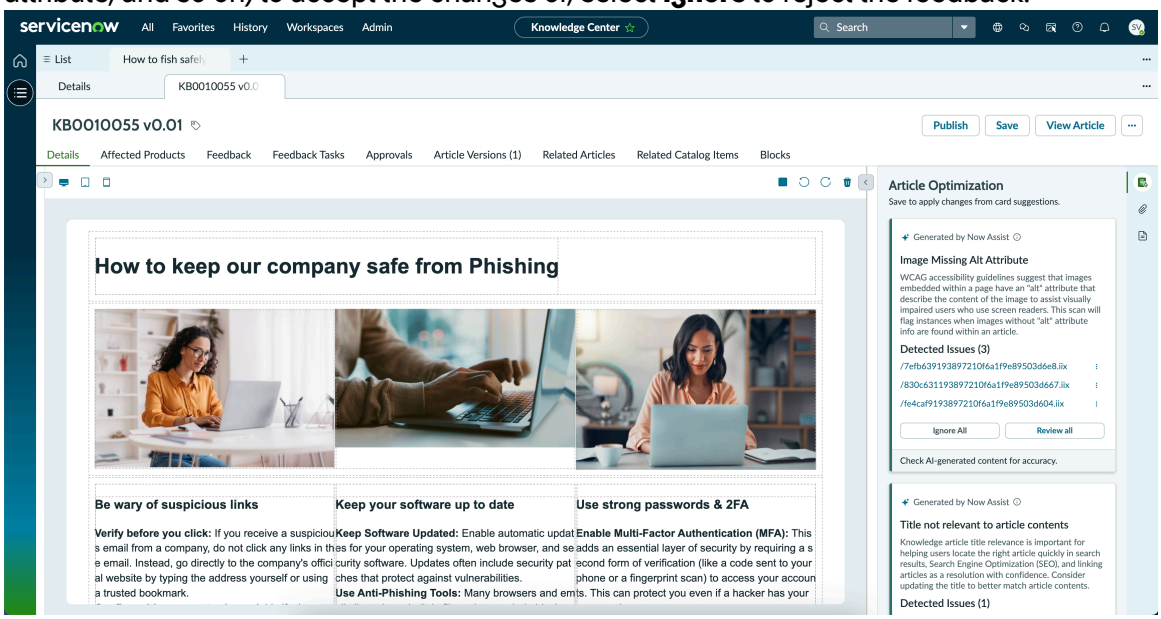
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Knowledge** > **Knowledge Center** > **Lists**.
2. Select the type of article from the **List** menu (Unpublished, Published, Retired, and so on).
3. Select an existing article from the article list.
4. Select **Edit** to open the article in the **Article Editor** window.
5. Select the **Article Optimization** icon to view the list of issues identified in the article, along with the suggestions to fix them.

> **Important:**
> Two types of article optimization scans are available. One is a script-based scan and the other is a Now Assist based scan. If you're subscribed to Now Assist, article optimization feature runs both the scans. If you aren't subscribed to Now Assist, then article optimization runs only the script-based scan.

6. Review each of the feedback cards and select the suggested action (such as Review, Add alt attribute, and so on) to accept the changes or, select **Ignore** to reject the feedback.



7. Select **Save** to save the changes made to the article.

> **Note:**
> - Selecting suggested action opens the description for the issue. Only Now Assist subscribers can see these suggestions.
> - Select **Update** to implement the solution in the relevant section. If you aren't subscribed to Now Assist, you can manually rectify the identified issue and **Update** the card.

Now Assist in Knowledge Management

Use ServiceNow Now Assist in Knowledge Management to generate a new knowledge article for a case or incident via the Now Assist panel, classic environment, or the respective configurable workspace. Agents can use these articles to propose quicker resolutions to customers.

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy , which may be updated by ServiceNow.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal .

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. Customers can opt out of future data collection at any time, as described in the Now Assist Opt-Out page .

Exploring Now Assist in Knowledge Management

Use the Now Assist in Knowledge Management application to help agents generate a new knowledge article for a case or incident via the Now Assist panel, classic environment, and configurable workspace.

https://player.vimeo.com/video/1009282001?h=fc84a7cd87&badge=0&autopause=0&player_id=0&app_id=58479

The video above shows how an agent can generate a knowledge article with Now Assist from similar incidents in IT Service Management.

Now Assist in Knowledge Management Overview

Once activated and configured, Now Assist in Knowledge Management makes the following generative AI capabilities available to an agent:

- Agents can generate articles from the Now Assist panel.
- Agents can generate articles from their respective configurable workspace.
- Agents can also edit and publish articles in the knowledge base.

Now Assist in Knowledge Management Skills

The Now Assist in Knowledge Management application includes KB generation skills that enable agents to generate knowledge articles when working on a case or incident. Agents can document the resolutions employing various generative AI features enabled within Knowledge Management and relay them to customers, providing quick resolutions to their queries and issues.

Now Assist panel

Agents can use the Now Assist panel available in their workspace. This conversational interface enables agents to generate a new knowledge article related to a case or incident. For more information about the Now Assist panel, see Now Assist panel.

Now Assist multi-language support

Agents and authors can use Now Assist multi-language support to generate articles in from incidents, cases and other task types that are documented in languages other than English by using a language selector. For more information see Generate a Knowledge article using multi-language support.

Now Assist context menu

Agents and authors can use Now Assist context menu, a content recommendation skill, to elaborate or shorten content within a Knowledge article. For more information see Edit an article using the Now Assist context menu.

Now Assist identify and review duplicate articles

Knowledge managers and admins can review duplicate Knowledge articles using the Now Assist identify and review duplicate articles feature. For more information see Identify and review duplicate Knowledge articles.

Configuring Now Assist in Knowledge Management

If you have the admin role, you can configure the Now Assist in the Knowledge Management application, enabling agents to use its generative AI skills within their application workspace and the classic environment.

Configuration overview

Configure how agents use generative AI capabilities to generate new knowledge articles. Third-party AI model providers are available for Now Assist skills and AI agents.

Configuring the KB generation skill

Configure the KB generation skill that agents can use to draft a knowledge article with Now Assist.

Before you begin

Before configuring the KB generation skill, the following applications and their respective plugins must be installed.

- The latest Now Assist in Knowledge Management and Knowledge Capabilities in UI Builder store apps must be installed prior to the following configuration steps.
- For ServiceNow Store installation steps, see Install a ServiceNow Store application.

> **Note:**
> You can access knowledge articles created with TinyMCE by enabling KB generation skill, see Configuring the KB generation skill. To use articles created with custom instructions, please activate the knowledge content recommendation skill, see Edit an article using the Now Assist context menu.

Role required: admin

Procedure

1. Navigate to **All** > **Now Assist Admin** > **Now Assist Skills**.
2. Select the application that you want to configure the KB generation skills for.
3. Select the Knowledge feature from the features drop-down.
4. Select **Activate skill** on the feature card.
5. Review the values in the Choose input window, then select **Save and Continue**.
   Review the read-only fields for more information.
   - **Input Table**: The record type used for KB generation. For example, the value is **case** for Now Assist for CSM.
   - **Input Fields**: The fields from which information is gathered to draft the Knowledge article. Based on the Input Table, the Input Fields can be configured. Together, they serve as an input to Now LLM Service from the case or incident where the article is created.
   - **Default Knowledge Base for Now Assist panel**: The Knowledge Base in which the Now Assist panel generates the article.

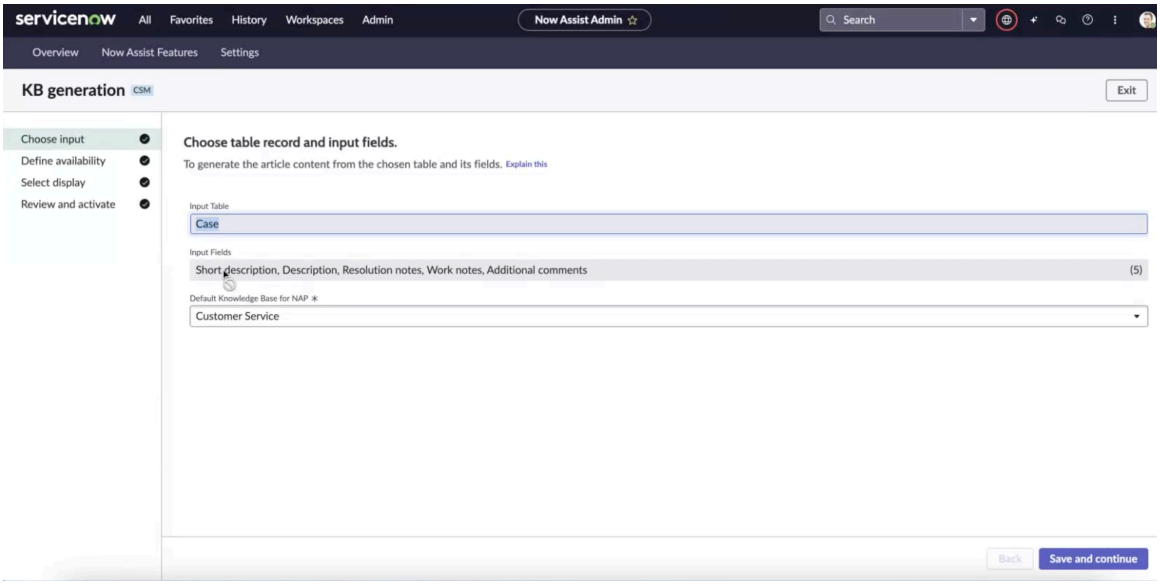
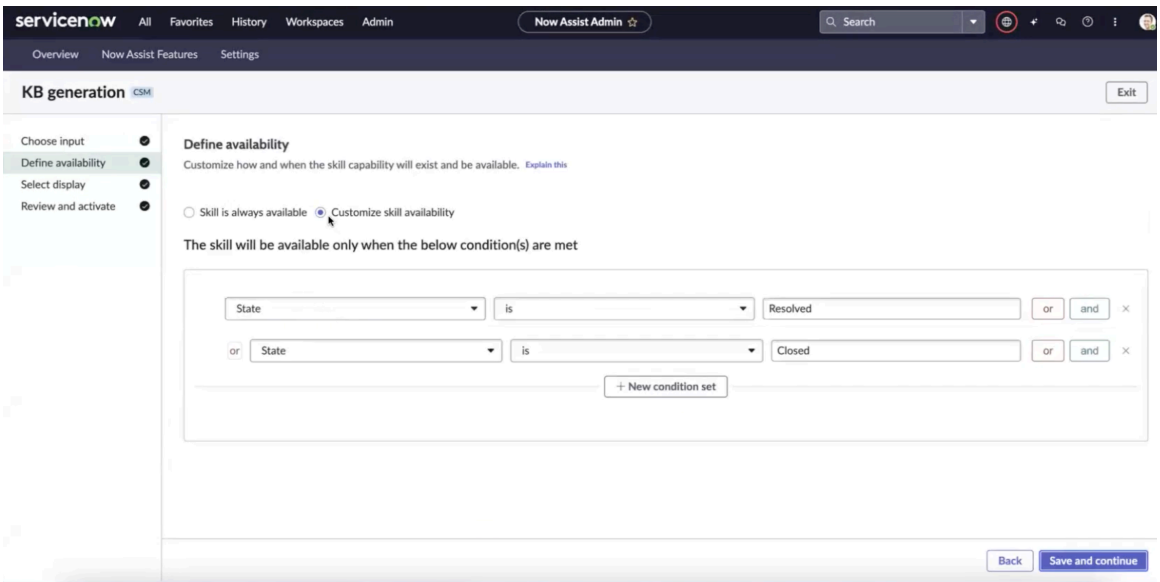
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Configure whether the KB generation skill should always be available or available based on a set of conditions.



7. Select where you want to display the KB generation skill. You can select In-product, Now Assist panel, or both.
   - **In-product**: When selected, Now Assist skills are displayed on forms and workspaces. Select the arrow next to the toggle switch to define the roles that can use this skill in-product.
   - **Now Assist panel**: When selected, Now Assist skills are available in the Now Assist panel. Select the arrow next to the toggle switch to define roles that can use this skill in the Now Assist panel.

Configure skill for Now Assist context menu

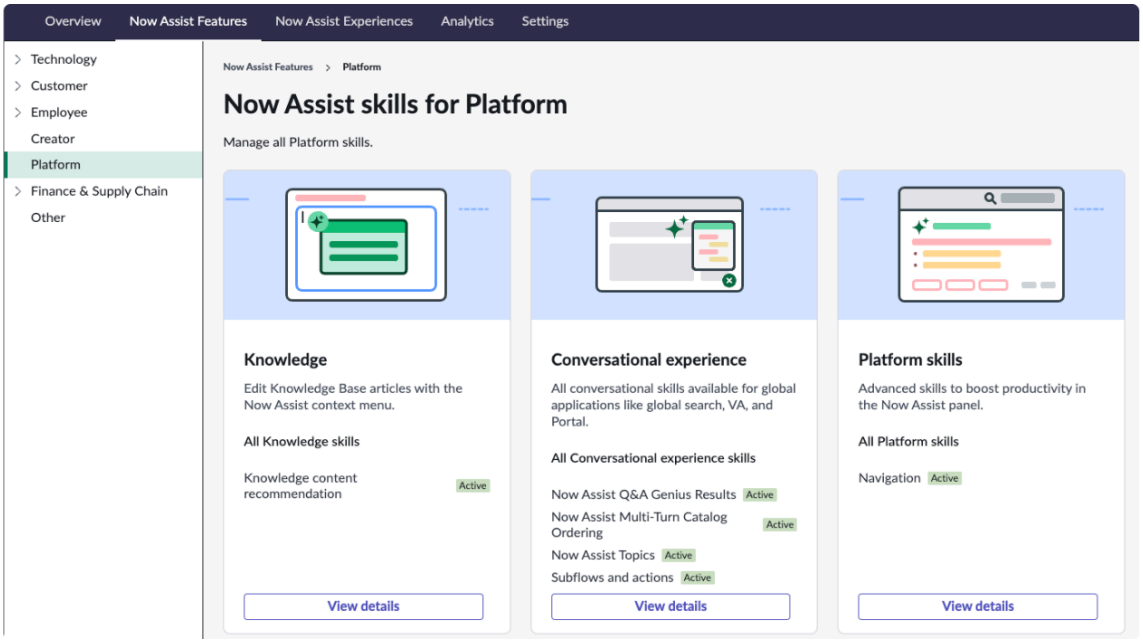
Configure the knowledge content recommendation skill so that the agents can use the Now Assist context menu to expand or shorten a knowledge article in TinyMCE. With the new content editor available in the Knowledge Center, agents can create and edit knowledge articles using custom instructions.

Before you begin
Role required: admin

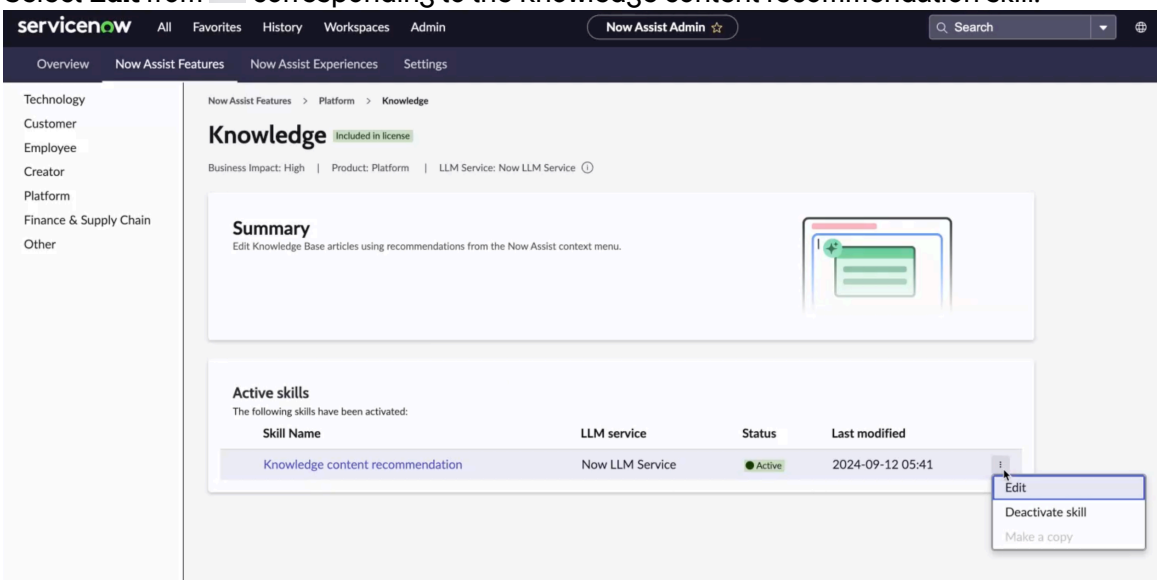
Procedure

1. Navigate to **All** > **Now Assist Admin** > **Now Assist Features** > **Platform**.
2. Select **View details** on the Knowledge feature card and navigate to Active skills.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

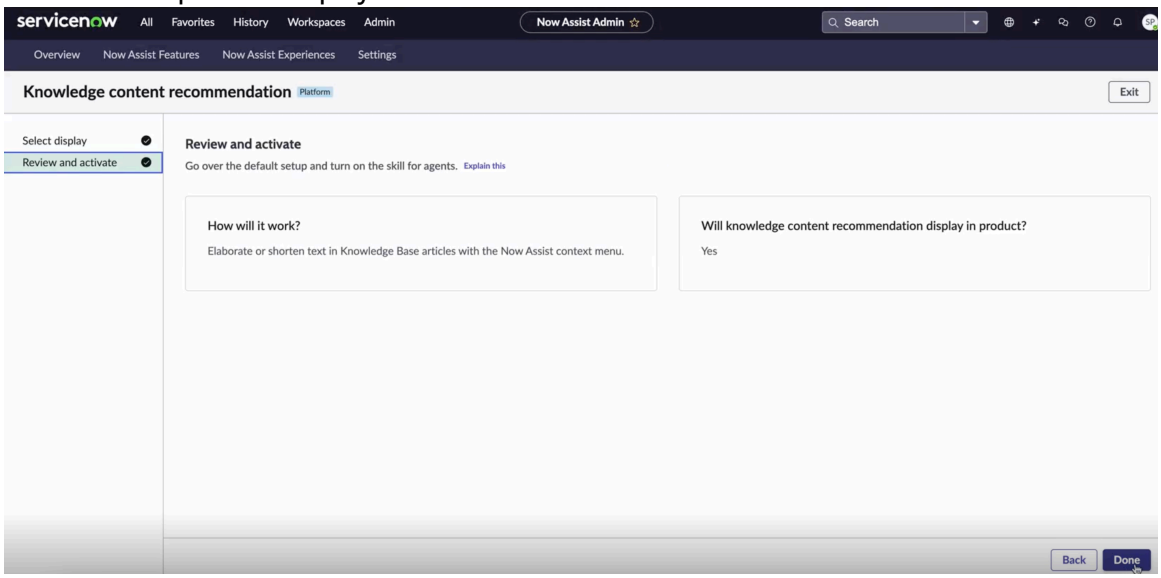


3. Select **Edit** from ⋮ corresponding to the Knowledge content recommendation skill.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Enable the In-product display and select **Done** to activate the skill.



Related topics

Edit an article using the Now Assist context menu

Generate and edit articles using Now Assist in the Knowledge Center article editor

Configure and activate the Now Assist Identify duplicate articles skill

Configure the Knowledge content management skill to enable admins and managers to activate the Now Assist Identify duplicate articles skill.

Before you begin

Role required: knowledge_admin and knowledge_manager

Now Assist Identify duplicate articles skill supports third-party AI model providers. For configuring these settings, see Edit model providers. In the Edit model provider settings, select **Knowledge duplicate topic** as the skill.

About this task

This skill enables admins and managers to identify and review duplicate content.

Procedure

1. Navigate to **All** > **Admin Center** > **Now Assist Admin** > **Now Assist Skills** > **Platform**.
2. In the Now Assist Skills for Platform list view, scroll down to the Identify duplicate articles skill.
3. Navigate to the skill configuration page by selecting **Activate**.
4. In the Choose input section, select **Switch scope** and specify the following fields.

Field	Description
Table name	The table on which the skill is configured. This is a read-only field with a default value.
Fields	Specify the fields which will be used to identify duplicate articles. To run this job on OOB templates, select**Configure custom template**. After configuration, this becomes a read-only field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Filter	Build a filter by adding knowledge related conditions such as Article ID, Base version and, Knowledge base.
Duplicates generation frequency	Set the frequency at which the job for identifying the duplicate articles is run. **Note:** ○ The skill must be reset every time the frequency is set. ○ When you select the **Run once** option and activate the skill, the application runs the job immediately after its activation. Selecting any other option, runs the job soon after its activation and, as per the selected frequency in the subsequent runs.
Configure custom template	Use the template to specify all the fields that will be used in the identify duplicate articles job. Fields specified in this template will be used to configure the job runs.

5. Select **Save and continue**.
6. Review your inputs in the Review and activate section and select **Done**.

Result
The Now Assist Identify duplicate articles skill is configured.

Configure skills with custom prompts for knowledge article templates

Now Assist in Knowledge Management has extended the out-of-box (OOB) KB generation skill to create custom prompts for OOB and custom knowledge article templates.

Before you begin
In the form configuration of the article record, admin must check for the availability of **Knowledge Gen AI Message** and **Knowledge Now Assist Modal**. If they aren't present, admin must add them from the **Available** to the **Selected** list.

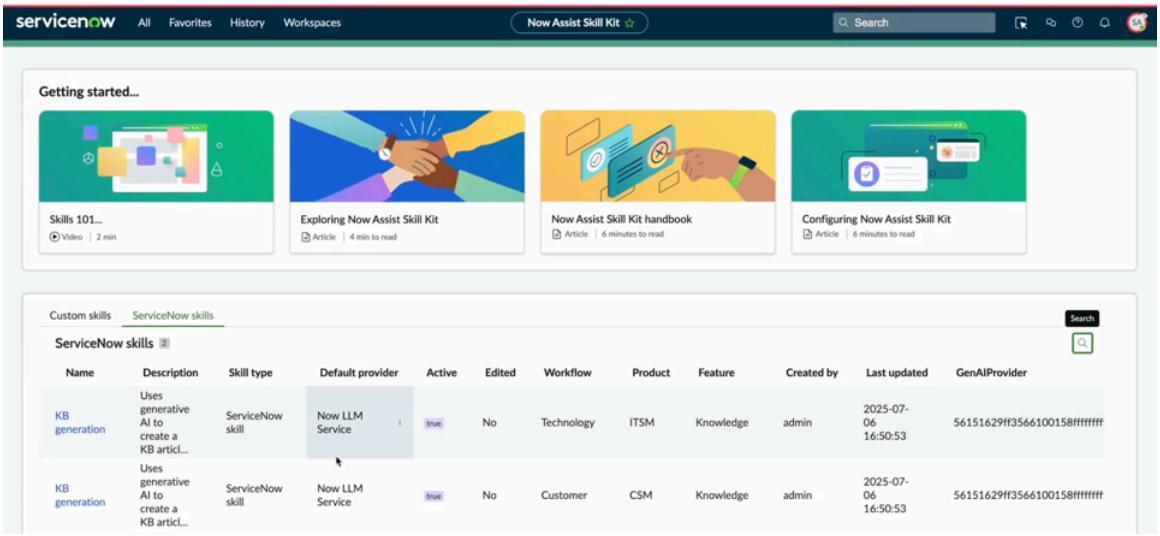
Role required: sn_skill_builder.admin, sn_nowassist_admin.nsa_admin

About this task
To create custom prompts for OOB and custom knowledge article templates, clone the existing KB generation skill, from the Now Assist skill Kit (NASK). For more information, see Now Assist Skill Kit Configuration of the skill happens in three steps:

- Clone the OOB KB generation skill
- Prompt configuration
- Activate the skill

Procedure
1. Navigate to **All** > **Now Assist Skill Kit** > **Home**.
2. In the **ServiceNow skills** tab, search for KB generation skill.

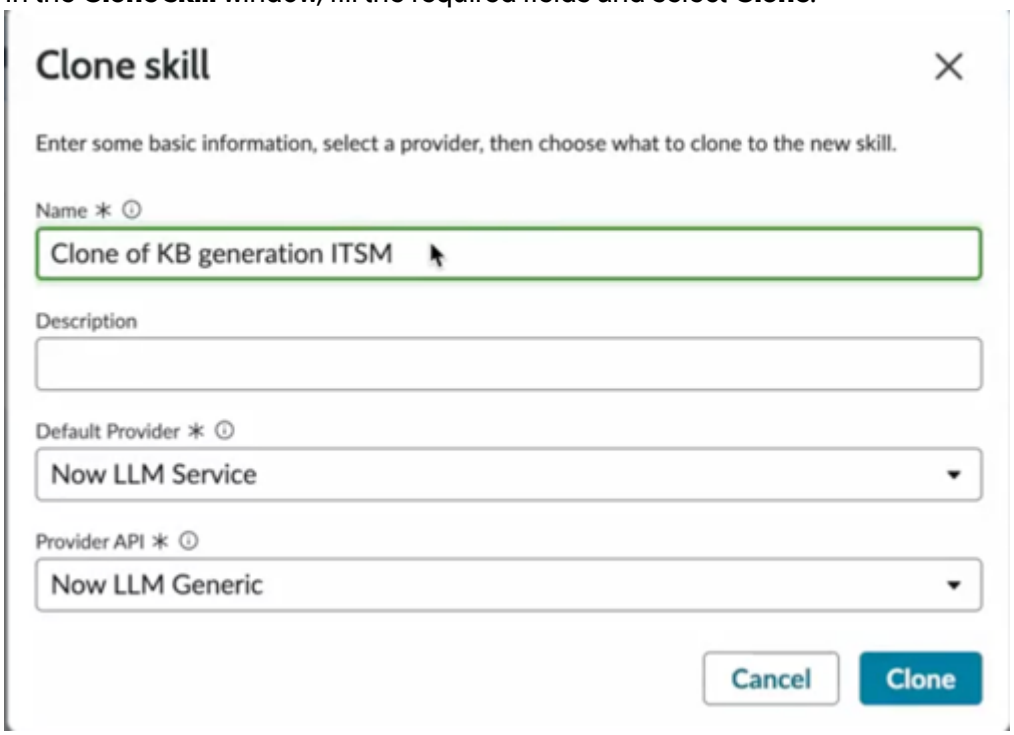
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Open the KB generation skill associated with the workflow (ITSM, CSM, and so on) that you want to configure.
4. Select **Clone** to create a clone of the OOB skill.

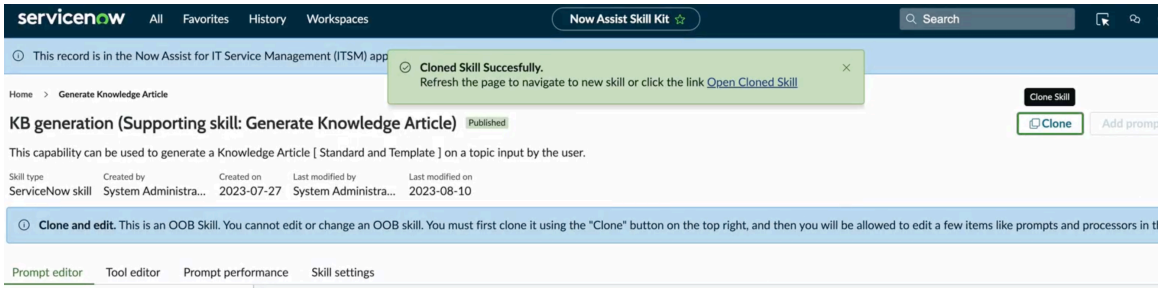
> **Important:**
> Prompts can be configured only in the cloned skill and not the OOB skill.

5. In the **Clone skill** window, fill the required fields and select **Clone**.

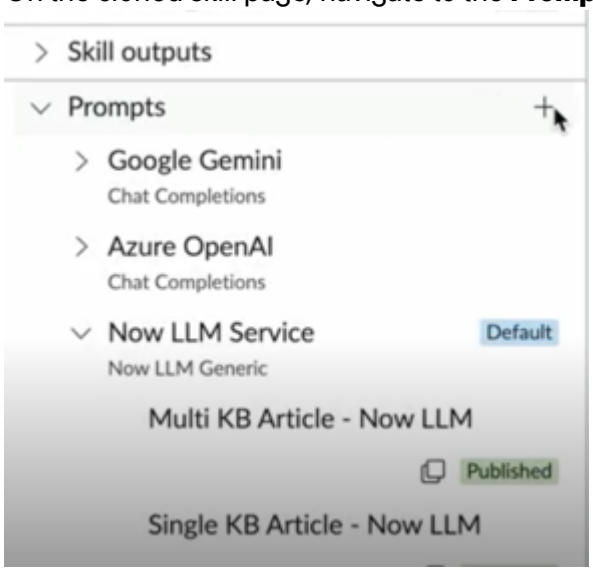


6. On the success message window, select **Open Cloned Skill**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



7. On the cloned skill page, navigate to the **Prompts** menu and select the **Add** icon.



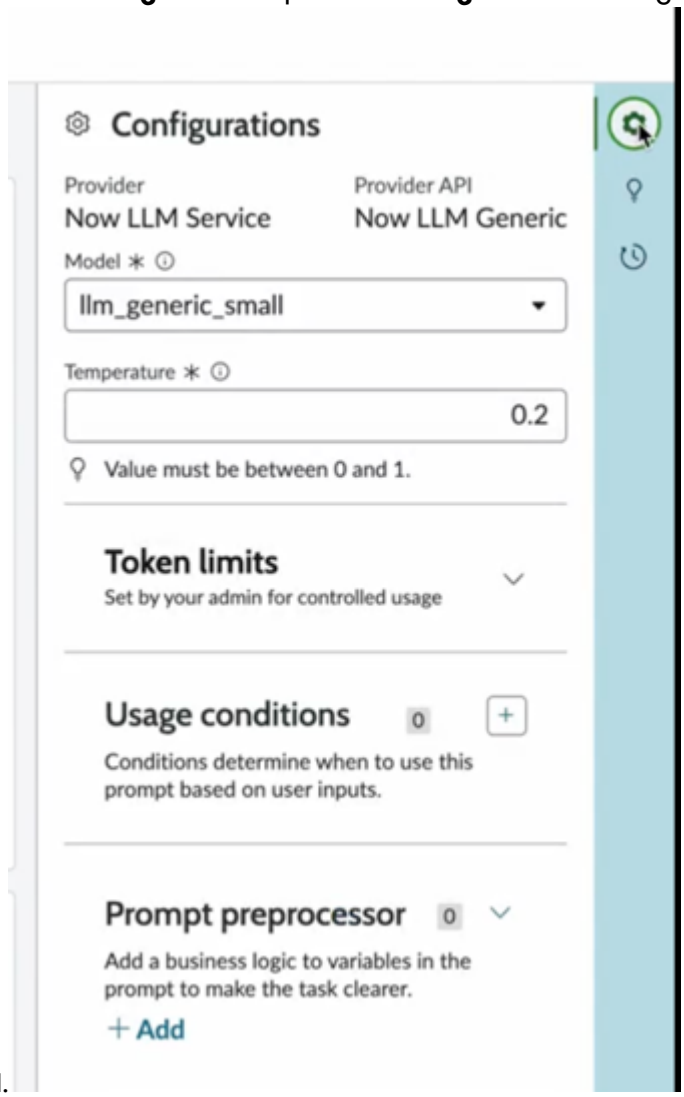
8. In the **Add prompt** table, fill the required fields as follows and select **Add**.

Field name	Description
Prompt name	Enter a name to define your prompt
Provider	Select the third-party AI provider that you want to use
Provider API	Select the API details of the third-party AI provider

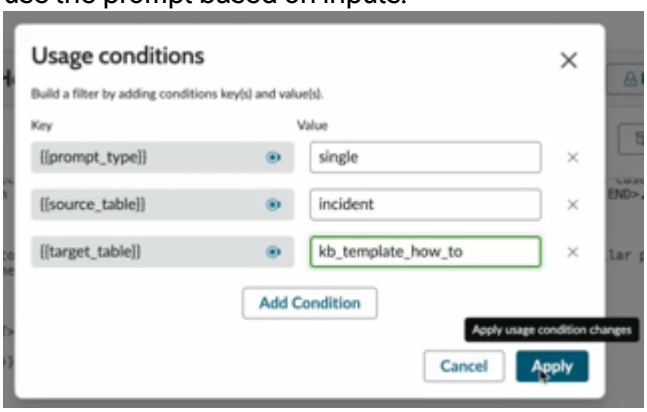
9. To develop a prompt, see Guidelines for creating prompts.
10. Save the prompt.
11. Evaluate the prompt.
    For more, see Evaluate a prompt

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

12. Select the **Settings** icon to open the **Configurations** settings panel.



13. Scroll down to **Usage conditions** and select the **Add** icon to define the conditions on when to use the prompt based on inputs.



14. Fill in the **Key** and **Value** fields to build filters in the **Usage conditions** modal and select **Apply**.

Key	Value
`prompt_type`	Type single or multi
`source_table`	Incident or case

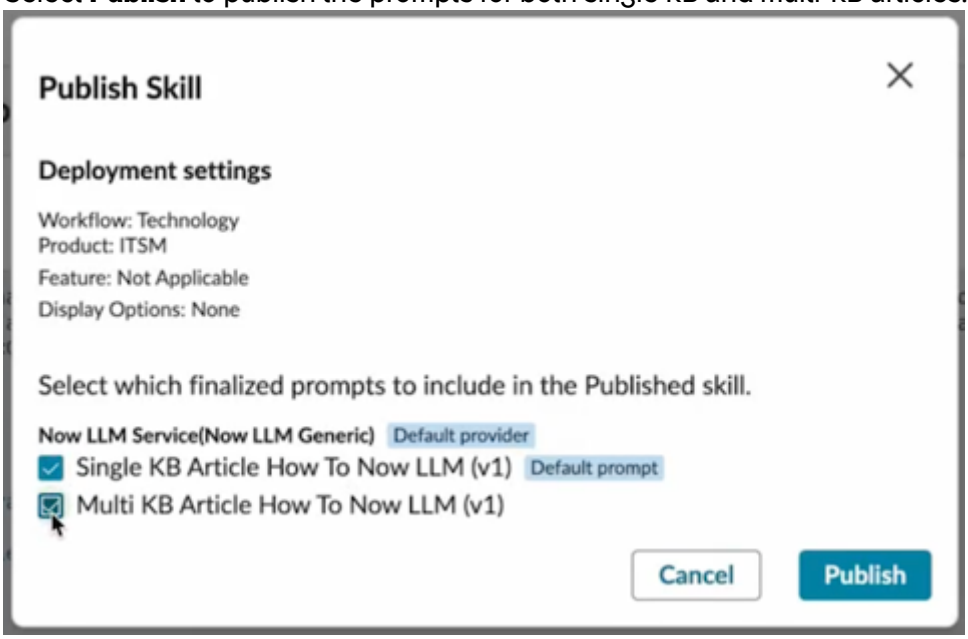
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Key	Value
`target_table`	Type name of the template table

15. Select **Finalize prompt**.
    Finalize the prompt after checking the JSON output map with the prompts provided.
16. Repeat the steps 8 to 15 to create prompts for MultiKB articles.

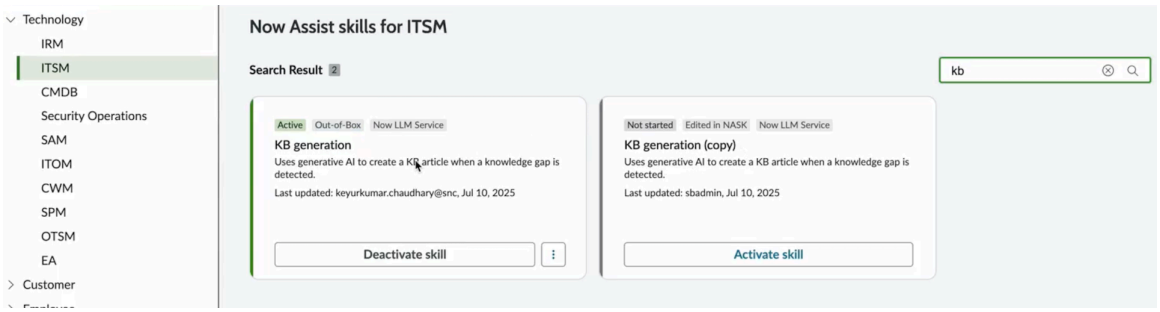
> **Note:**
>
> Finalize the prompts for both single KB and multi KB articles and only then publish the skill.

17. Select **Publish** to publish the prompts for both single KB and multi-KB articles.



The skill is published and available in the **Now Assist Admin** page for the selected workflow. However, the skill must be activated to be available for use during article generation from Now Assist.

18. To activate the skill, navigate to **Now Assist Admin** and select **Link to NAA** in the **Skill published** window.
19. Select **Activate skill** to activate the cloned skill.



The KB generation skill for Now Assist is activated and ready to use the custom templates as defined by the prompt.

Guidelines for creating prompts

The guidelines help to write prompts for Out-of-Box (OOB) and custom knowledge article templates. Follow these instructions to create ideal prompts that optimize the use of AI models for generating knowledge articles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create prompts for a how-to article template for a case

An ideal prompt maps to the following three fields in the template form:

- Introduction: Includes the problem statement of the case along with the severity level.
- Instruction: Includes the resolution steps for the issue described in the incident.
- Short description: Includes the title of the issue described in the incident

Mapping between sections and template fields

Section	Template field
Problem	Introduction
Severity	Introduction
Instructions	Steps to resolve
Title	Short description

Structure of the prompt

Use the following prompt draft structure to create a prompt:

- Initial header instructions (the purpose of the prompt)
- Input source data
- Guidelines for generating the article
- Output structure along with mapping details, according to your requirements

> **Important:**
> When mapping, it's important that the mapping key matches with the article template's field key. The value must contain the sections that you intend to add.

Sample prompt for generating a single KB how-to template article

```
As a professional customer support agent, your goal is to create
 a clear and comprehensive article based on a customer's case
 with only the following sections:
Problem, Severity, Steps to resolve and Title.
Follow the structure below to ensure the article is easy for
 other customers to read and solve the problem independently.

Customer Case Input:
<CUSTOMER CASE START>
{{short_description}}
{{description}}
{{activities}}
{{close_notes}}
<CUSTOMER CASE END>

Guidelines for Article Generation:
Do not use actual people's names, emails, phone numbers, or
 machine names from the case in the article.
Do not use your outside knowledge to write the article. Kindly
 use content from the case only.
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
In providing the content for each of the sections, if you are
 not confident, then return N/A for the specific section.
```

Content Guidelines for Each Section:

Problem:

```
Describe the issue comprehensively, in sentence format and
 include:
Observations of visible indications of the issue.
Relevant error messages or log details directly related to
 understanding the issue.
Steps to reproduce the problem with each step being a numbered
 list describing only a single action.
Add a new line character at the end of each step to display
 individual steps in separate lines in the final output.
```

Severity:

```
Calculate the severity of the problem after reading description
 from the case details and determine how critical it is to the
 users.
```

Steps to Resolve:

```
List each step required to resolve the issue, and ensure that
 each step is written in sentence format.
Attempted troubleshooting steps are included.
Steps should be in a numbered list with each step describing a
 single action.
Add a new line character at the end of each step to display
 individual steps in separate lines in the final output.
Derive information from comments, work notes, or resolution
 notes of the case, after verifying all relevant steps.
If no resolution is provided in the case, enter "N/A".
```

Title:

```
Provide a concise and formal title that accurately describes
 the issue. Derive the title from the short description of the
 incident
Use this structure to create a helpful and user-friendly article
 for other customers facing similar problems while adhering to
 the guidelines provided.
```

Output Format:

```
Before completing, verify that each list item is in a new line,
 in all cases of a numbered list. *Always generate a valid JSON
 object.
Generate a JSON response in the following format:
{
"kb_introduction": {
  "Problem": "string",
  "Severity": "string
},
"kb_instructions": {
  "Steps To Resolve": "string"
},
“short_description”: {
  “Title”: “string”
}
}
```

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample prompt for generating a multi-KB how-to template article

```
Act like a professional customer service agent and understand
 the content of the child articles provided below.
These child articles are used by customers to resolve issues
 encountered for different problems.
Each child article starts with <CHILD_ARTICLE_START> and ends
 with <CHILD_ARTICLE_END>.

CHILD ARTICLES:

{{intermediateKBGenerator.output}}
{{intermediate_article_1}}

Your job then is to combine these child articles and write one
 parent article that captures all the important information
 present in the child articles.
The parent article should show other customers how to resolve
 the problems on their own. Only use information present in the
 child articles.

The parent article must contain the following sections in the
 same order:
Problem:
Summarize problems from all child articles
Severity:
determine severity from all child articles
Steps to Resolve:
It should contain the detailed list of steps that customers can
 take to resolve the problem on their own. It should include all
 the steps and their details from the Steps to Resolve section
 of the child articles. Make sure to include all the relevant
 notes, code, scripts, references, additional information, URLs
 and any other entities that are needed for resolving the issue.
 For each separate problem, provide a title of the problem in
 a new line but do not include any generic words like "Issue",
 "Problem" or "Steps to Resolve" and do not add markdown format
 while generating the title for steps to resolve section and
 then the list of steps to resolve that problem. Make each step
 a numbered list item (starting with 1., 2., etc.). Then add a
 new line character at the end of each list item and 2 new line
 characters at the end of the last list item of each problem
 such that they appear in a new line in the final output with
 proper titles. Make sure to use full sentences for each step.
Title:
It should only contain a short description of the problem in
 formal language and only be a few words. It should be generic
 enough to capture the topics of the issues present in all the
 child articles.
For each section, if you are not absolutely sure, generate "Not
 enough information available for this section.".

Do not underline the section headers and titles.
Do not apply bold styling to section headers and titles.
Do not add special characters "*", "-" or "#" to the section
 headers and titles.
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
Generate a JSON response in the following format:
{
"kb_introduction": {
  "Problem": "string",
  "Severity": "string
},
"kb_instructions": {
  "Steps To Resolve": "string"
},
“short_description”: {
  “Title”: “string”
}
}
```

Configure custom AI-based Article Optimization scans

The Out-of-Box (OOB) Knowledge Center settings provide default configurations for article optimization scans. However, you can customize scans for article optimization.

Before you begin

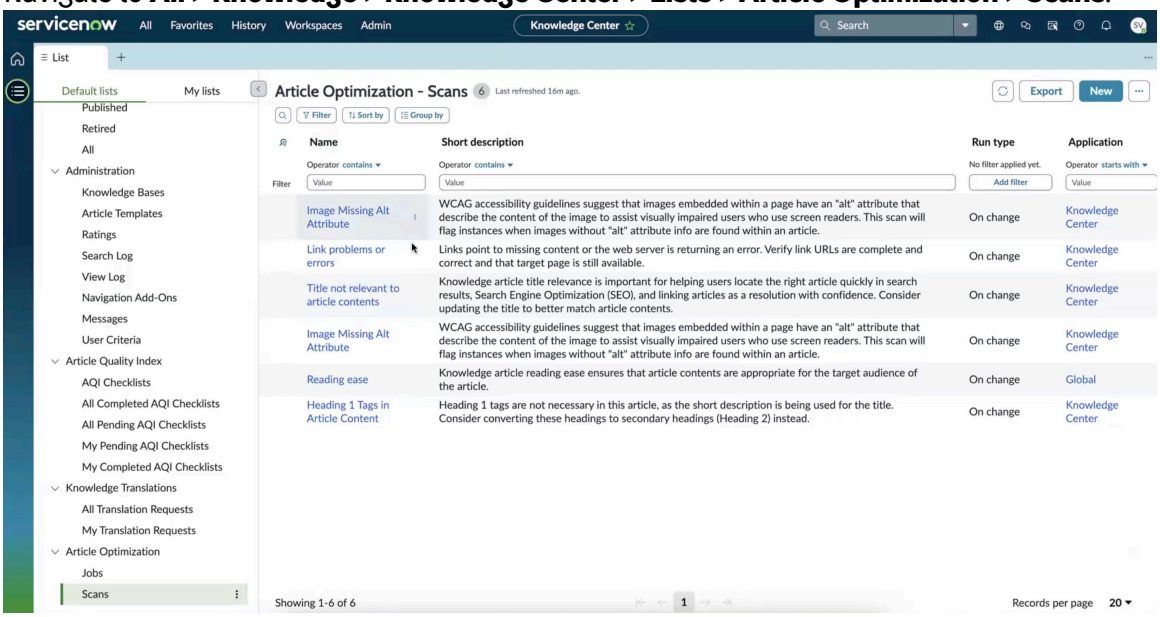
Role required: admin

About this task

Configure Article Optimization scans for articles in the Knowledge Center. Two types of Article Optimization scans are available in the Knowledge Center. One is a script-based scan and the other is a AI-based scan. If you are subscribed to Now Assist, you can configure and run both the scan types. If you are not subscribed to Now Assist, you can configure only the script-based scans, and Article Optimization runs only the script-based scans.

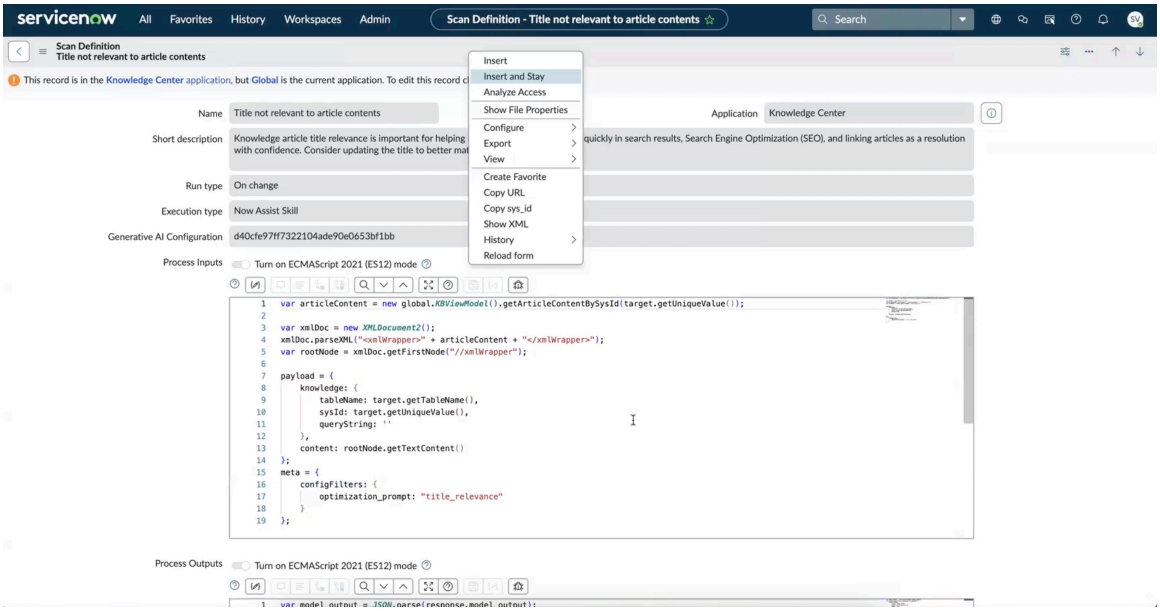
Procedure

1. Navigate to **All** > **Knowledge** > **Knowledge Center** > **Lists** > **Article Optimization** > **Scans**.



2. Select **New**.
   a. If you want to clone and modify an existing scan, go to the *kb_assist_scan_definition* table.
   b. Open a record and select **Insert and stay** to copy the scan.
   c. **Rename** the copied scan.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Fill out the record form as follows:

a. Set the **Run type** field to:

- **On change:** If you want the scan to run each time an article is saved.

  Note:
  the scan must still be associated with a job in order to run but the job schedule will not control when this scan runs.

- **Always:**If you want the scan to run based on the schedule set up in the associated job.

b. Set the **Execution type** to **Now Assist skill**.

c. Select the **Look-up** icon and open the **List filter**.

d. Set the condition to **Name** and enter part of your prompt name.

e. Select **Run** to view filtered results.

Note:
The list can show multiple results if the same prompt name is used in multiple skills or if there are multiple versions of a prompt due to modifications. In this case, select one of the prompts and use **Preview** to make sure that it's the prompt you want to select (the **Active** flag is a good indicator).

4. Add scripts to the **Process Inputs** and **Process Outputs** fields.

Note:

- Using a copy of an existing scan can come in handy as this specific format has to be used for sending data to the Now LLM Service and processing the results.
- The last part of the **Process Outputs** script is used to define the finding record and what appears on the **Article Optimization** cards in the editor UI.

5. Save the record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The Article Optimization scan is custom configured.

What to do next
To run the scan, you must add the configured scan to a job. For more information see, Configuring Article Optimization jobs.

- Activate Article Optimization skill

Configuring Article Optimization skill and prompts

Create custom prompts for the default Article Optimization (AO) skill in the Knowledge Center application and prompts using standalone custom skills.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **Now Assist Skill Kit** > **Home**.
2. Select **Create Skill** and complete the configuration form.
3. Select **Next**.
   a. Set **Role restriction** field to **Nobody**.
   b. Select **Choose from library** to import an existing prompt for reference, otherwise, select**Write from scratch**.

      Note:
      Using existing custom skills to modify prompts may result in unreliable article optimization scans. The easier option is to choose an existing prompt, then clone and modify to suit your specifications.

   c. Enter at least one value in the **Skill input** field.

      Note:
      The default value for **Datatype** is **Record** and that of **Table** is **Knowledge (kb_knowledge)**.
4. Select **Go to summary** and then **Finish**.
5. Modify the existing prompt or select the **Plus** icon at the top of the prompt list to create a new prompt from scratch.
6. Navigate to the **Deployment settings** page for the skill.
7. Select **Publish** after ensuring that all the prompts and skill settings meet your specifications.
8. Navigate to the **sys_generative_ai_config** table and filter your prompt(s).
   a. Add the location where the skill should be located on the **Now Assist Admin** page (AO is located under **Platform Knowledge**.
   b. Enter the **Feature name**, which should be the name of this skill.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. Open the record(s), scroll down to the **Generative AI Prompt Configs** related list and select **New**.
10. Add the following filter properties:
    - Name: **optimization_prompt**
    - Value: prompt name from the **Output format** section of prompt.

Result
Article optimization skill is now configured.

What to do next
After successfully configuring the skill, proceed to activate the article optimization skill. For more information, see Activate Article Optimization skill.

Configure custom AI-based Article Optimization scans

Activate Article Optimization skill

Activate the Knowledge Center Article Optimization skill to enable use of article optimization features for generating knowledge articles in the Knowledge Center.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **Now Assist Admin** > **Now Assist Skills**.
2. Select the list view and locate your new skill in the location specified during the setup (Platform > Knowledge > Skill Name).
3. Select **Activate Skill** on the skill card.

Result
The Article Optimization skill is activated.

Configure Now Assist Skills for potential gaps

The Potential Gaps also known as the knowledge gaps feature identifies missing knowledge articles. This functionality is available only when the Knowledge Gaps skill is activated in Now Assist Admin. Configuring this skill is necessary when working with gaps.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **Now Assist Admin** > **Now Assist Skills** > **Platform** > **Knowledge**.
2. From the set of knowledge gap skills, you can **enable** or **disable** the following skills:
    - You can activate or deactivate the **Knowledge gaps identification (ITSM)** skill.
    - You can activate or deactivate the **Knowledge gaps identification (CSM)** skill.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Verify that the skills display an **Active** or **Deactivated** status according to your selection.

Once the skills are activated, you can view the gap recommendations on the Knowledge Center home page.

Manage potential knowledge gaps

Enable multilingual service in Now Assist

Enable multilingual service in Now Assist Admin for Knowledge Management to support different languages in various third-party AI model providers. Select the languages that you want enabled for each of the AI model providers and enable native and dynamic translation support.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Now Assist Admin** > **Settings** > **Multilingual service**.
2. In **Native Translation**, select the toggle button to enable Now Assist to respond in user preferred languages using the AI model provider's built-in multilingual capabilities.
3. In **Dynamic Translation**, select the toggle button to get additional support for languages that aren't supported by the AI model providers.
4. Select **Edit** to manage addition or removal of a language support for an AI model provider.

Result
Multilingual service is enabled for Now Assist in Knowledge Management.

Using Now Assist in Knowledge Management

Now Assist in Knowledge Management enhances the agent experience by using artificial intelligence (AI) to generate a new knowledge article based on the resolution provided to a case or an incident.

Generating knowledge articles

You can generate knowledge articles in Now Assist for Customer Service Management (CSM), Now Assist for IT Service Management (ITSM), Now Assist for HR Service Delivery (HRSD), and Now Assist for Field Service Management (FSM). For more information, review the following.

- Generate a knowledge article from the CSM Configurable Workspace and classic environment with Now Assist.
- Generate a knowledge article from the Service Operations Workspace for ITSM and classic environment by using Now Assist.
- Generate a knowledge article from HR Agent Workspace with Now Assist.
- Generate a knowledge article from the CSM/FSM Configurable Workspace and classic environment with Now Assist
- To generate knowledge articles based on cases or incidents from the Now Assist panel, see Generate a Knowledge article from the Now Assist panel.
- Generate a Knowledge article from the classic environment with Now Assist.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Generate a Knowledge article from the Now Assist panel

Generate a new knowledge article for a case or an incident from the Now Assist panel.

Before you begin

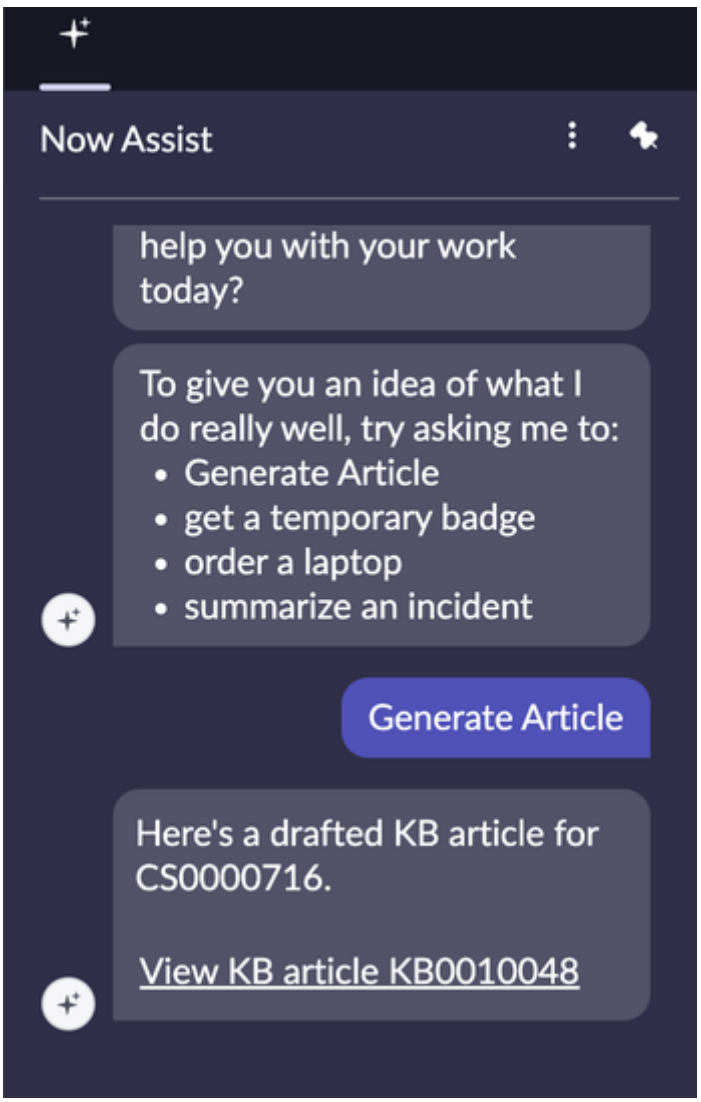
For Now Assist for HR Service Delivery (HRSD), Knowledge articles are only supported on the HR case record (sn_hr_core_case), not on the record from extended tables.

Role required: agent

Procedure

1. Open a case or an incident that is assigned to you.
2. Open the Now Assist panel by selecting the Now Assist icon ( ).
3. In the Now Assist panel, select or enter **Generate Article**.

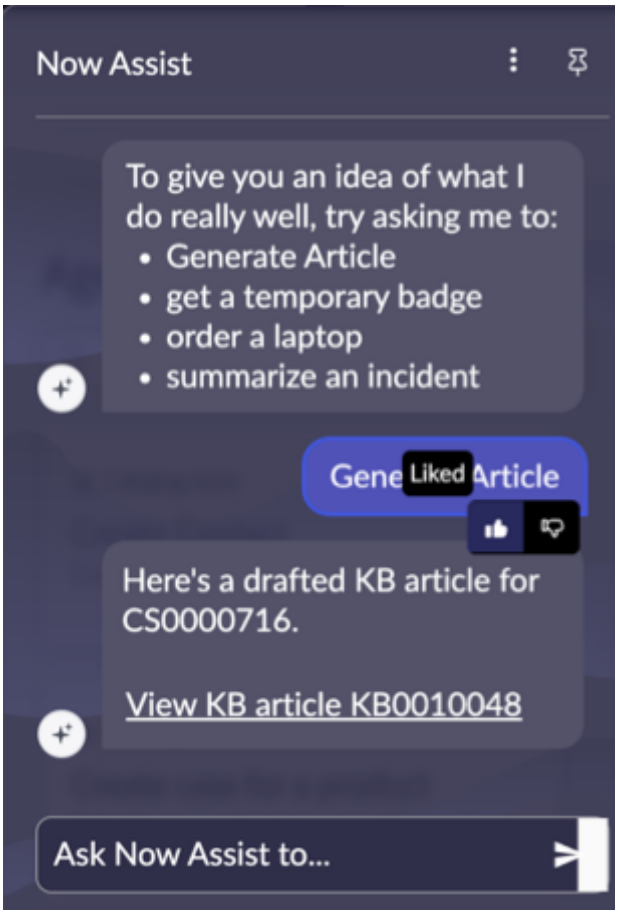
   Now Assist generates a Knowledge (KB) article.



4. View the draft article by selecting the **View KB article** link in the chat window.
   The article appears in a new tab, with a unique ID number for the article.
5. Review the article and edit it if necessary.
6. View, edit, and publish the article by using the respective buttons on the screen.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. **Optional:** Provide feedback on whether the article is helpful or not by selecting the liked icon (👍) or the not liked icon (👎).



Generate a Knowledge article from the classic environment with Now Assist

As an author or an agent, generate new Knowledge articles using Now Assist on tasks within the classic environment.

Before you begin

Only standard and KCS templates are available when generating Knowledge articles from the classic environment using Now Assist. For details on how to enable these settings in individual workspaces, refer to the respective knowledge article generation topics.

To see the Now Assist experience on the Create Article page, the following Knowledge generation criteria should be configured:

- Confirm that the KB generation skills are installed.
- In Now Assist Admin confirm with your admin that the following criteria are in place:
  - The table record and input fields must be specified.
  - The conditions for skill availability must be specified from the list of attributes.
  - The display of the KB generation feature In-product or Now Assist panel must be specified.

Role required: author or agent

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

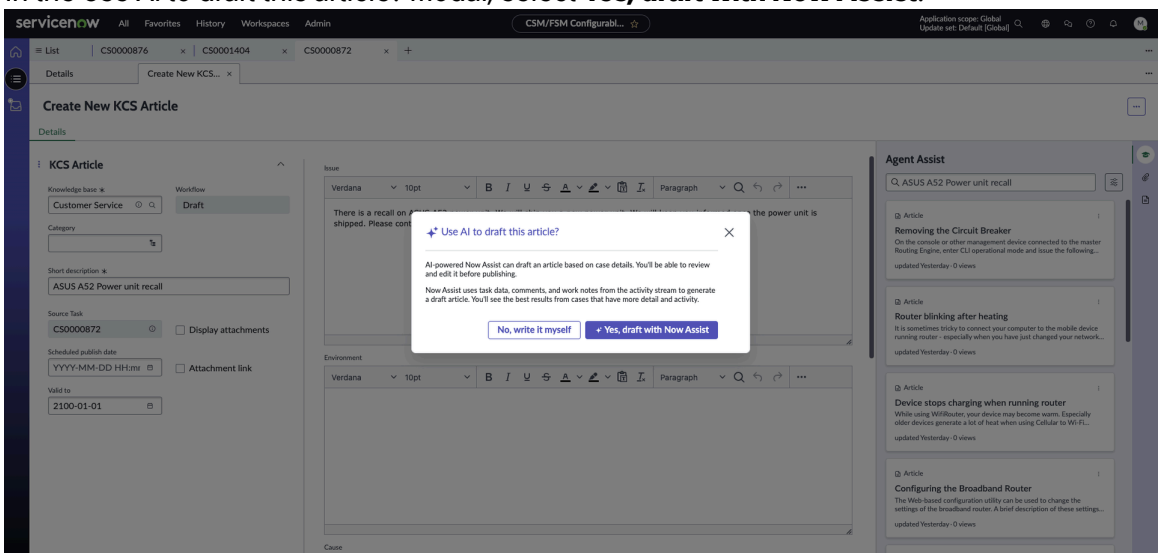
Generate article in classic environment for agents

Procedure

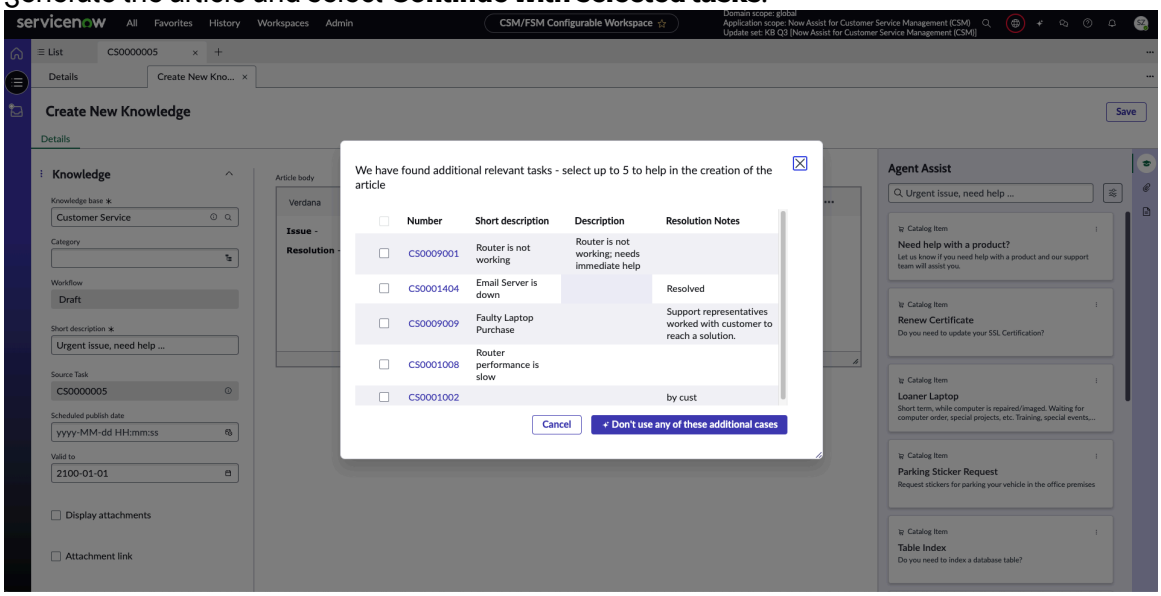
1. Open a task that is assigned to you.
2. Generate an article by using the UI actions that appear in the record.

> **Note:**
> Based on the template selection made by your administrator while configuring Knowledge Management system properties, you can apply either the KCS or standard template to the article.

3. In the Use AI to draft this article? modal, select **Yes, draft with Now Assist**.



4. Select up to five additional relevant cases in the new modal, powered by generative AI, to generate the article and select **Continue with selected tasks**.



The article appears in a new tab with a unique ID number for the article.

Generate article in classic environment for authors

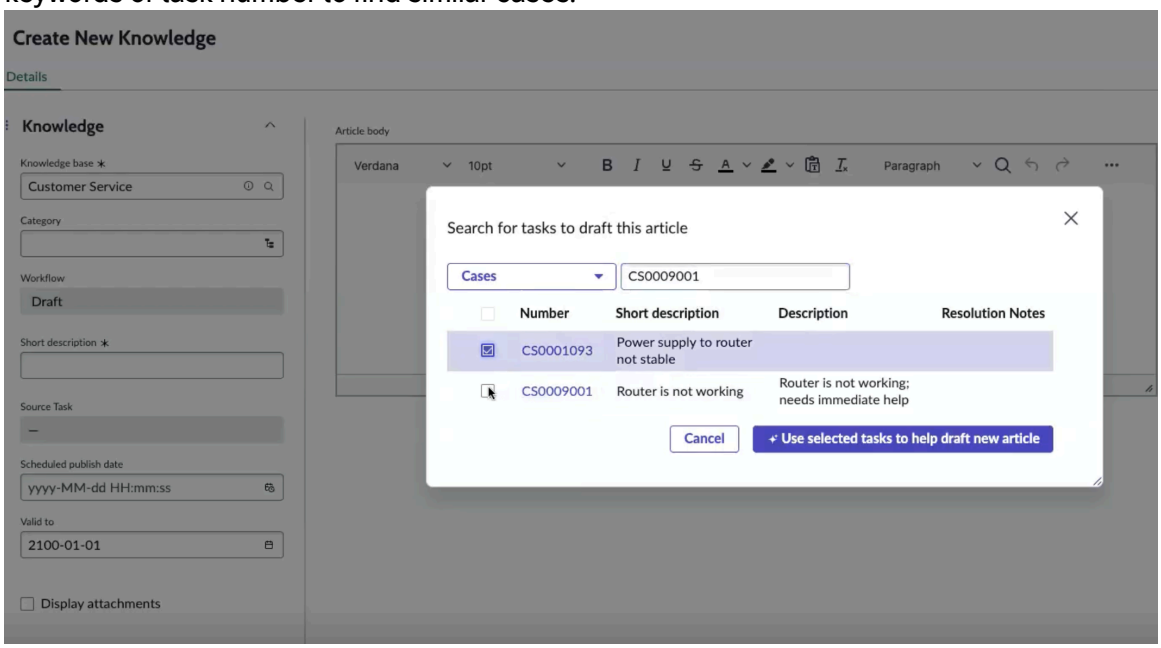
As an author, generate new Knowledge articles using Now Assist on tasks within the classic environment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: author

Procedure

1. For the author experience in a classic environment, navigate to **Lists** > **Knowledge** > **All articles** and select **New**.
2. In the Create article modal, select a Knowledge Base and an article template and select **Create Article**.
3. In the Use AI to draft this article modal, select **Yes, draft with Now Assist**.
4. In the Search for tasks to draft this article modal, select the up to five task types and enter the keywords or task number to find similar cases.



5. Select **Use selected tasks to help draft new article** to generate the article.
   The completed article is displayed in the chosen template, along with the success message: `This article was drafted by Now Assist. Be sure to review it for accuracy before saving.`

Note:

- If no similar tasks exist, this modal won't appear, and the article is created. The generated article, based on the chosen relevant records, is linked to both the parent task and all the relevant cases selected.
- You can modify the draft before saving it. The article appears in a new tab with a unique ID number for the Knowledge article and is attached to the parent record.
- After reviewing the Now Assist generated article, when you select **Save** or **Publish**, the Now Assist success message disappears indicating that it's no longer a Now LLM Service- generated article.
- If Now LLM Service fails to generate a result, an error message appears.
- When creating an article using Now Assist, once the process is triggered, it can't be stopped. Now Assist continues to generate the article even if you close the modal.

6. Review the Now Assist generated article and select **Save** or **Publish**.
   The Now Assist success message disappears indicating that it's no longer a Now LLM Service-generated article.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Generate a Knowledge article using multi-language support

Now Assist in Knowledge Management provides multi-language support for Knowledge article generation. Generate knowledge articles in multiple languages with the Now Assist multi-language support for Knowledge Management. As an agent, you can generate articles from incidents, cases and other task types that are documented in languages other than English by using a language selector configured by the admin.

Before you begin

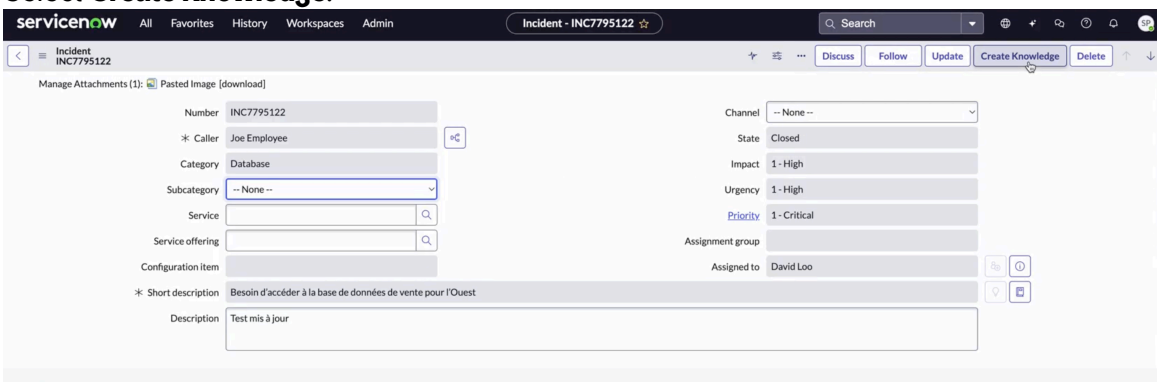
Languages available in the language selector are determined by:

- The language package installed for the Knowledge Base
- The language preference selected by the admin in the knowledge settings

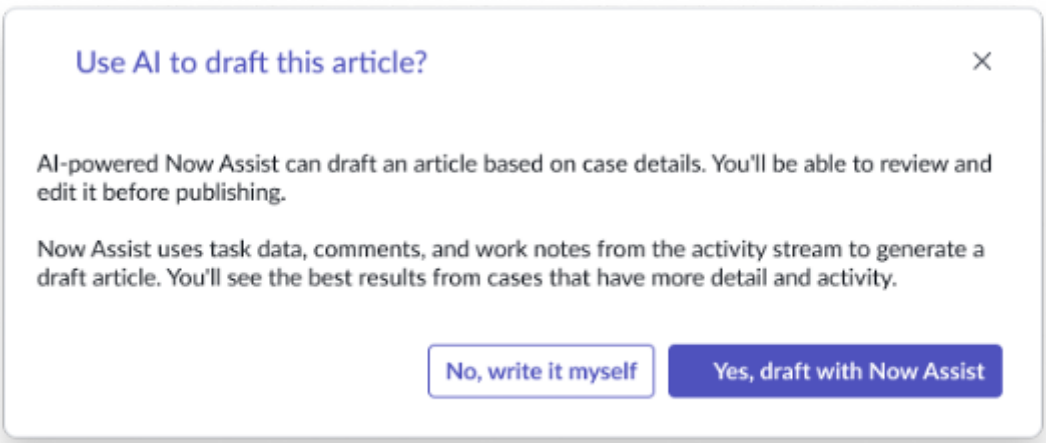
Role required: author or agent

Procedure

1. Navigate to **All** > **Knowledge** > **Articles** > **All**
2. Open a case or an incident assigned to you that is documented in a language other than English.
3. Select **Create Knowledge**.

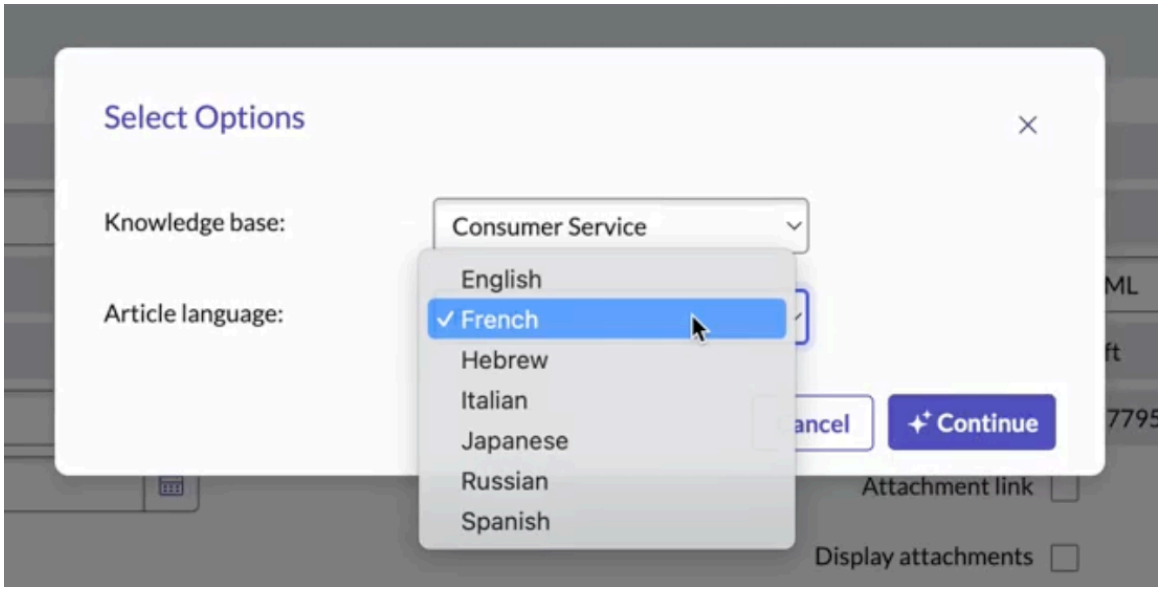


4. In the Use AI to draft this article? modal, select **Yes, draft with Now Assist**.

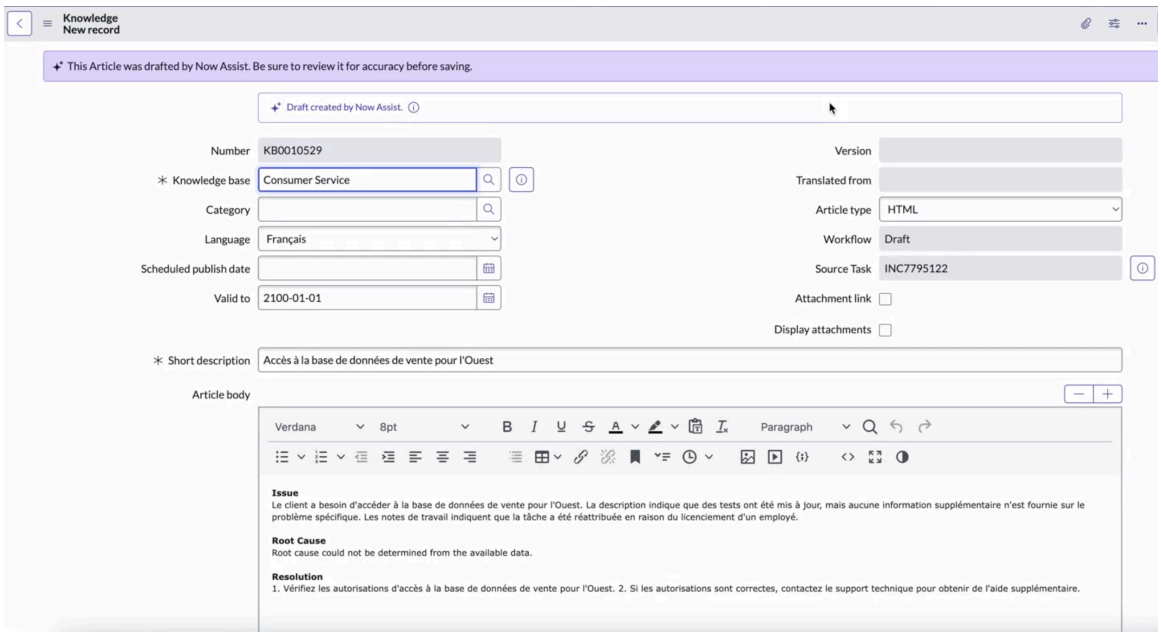


5. In the Select Options modal select the **Knowledge base** in which you would like to publish the article and the **Article language** to be used to generate the article.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Select **Continue**.



Now Assist generates the Knowledge article in the language selected.

Edit an article using the Now Assist context menu

Elaborate or shorten content within a Knowledge article using the Now Assist context menu feature that enables agents to leverage the generative AI capabilities of Now Assist in Knowledge Management.

Before you begin

The Now Assist Knowledge content recommendation skill required to enable the context menu feature is activated by the admin. To configure the skill see Configure skill for Now Assist context menu. The elaborate and shorten function of the context menu feature is available for all article templates.

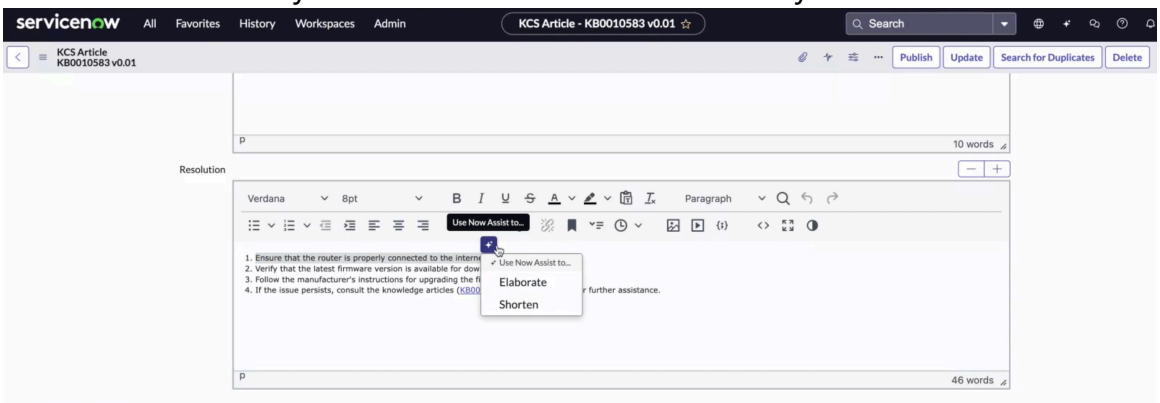
Starting this release, Now Assist context menu can be configured to use a third-party AI model provider to elaborate or shorten content within a Knowledge article. To configure the skill, see .

Role required: author or agent

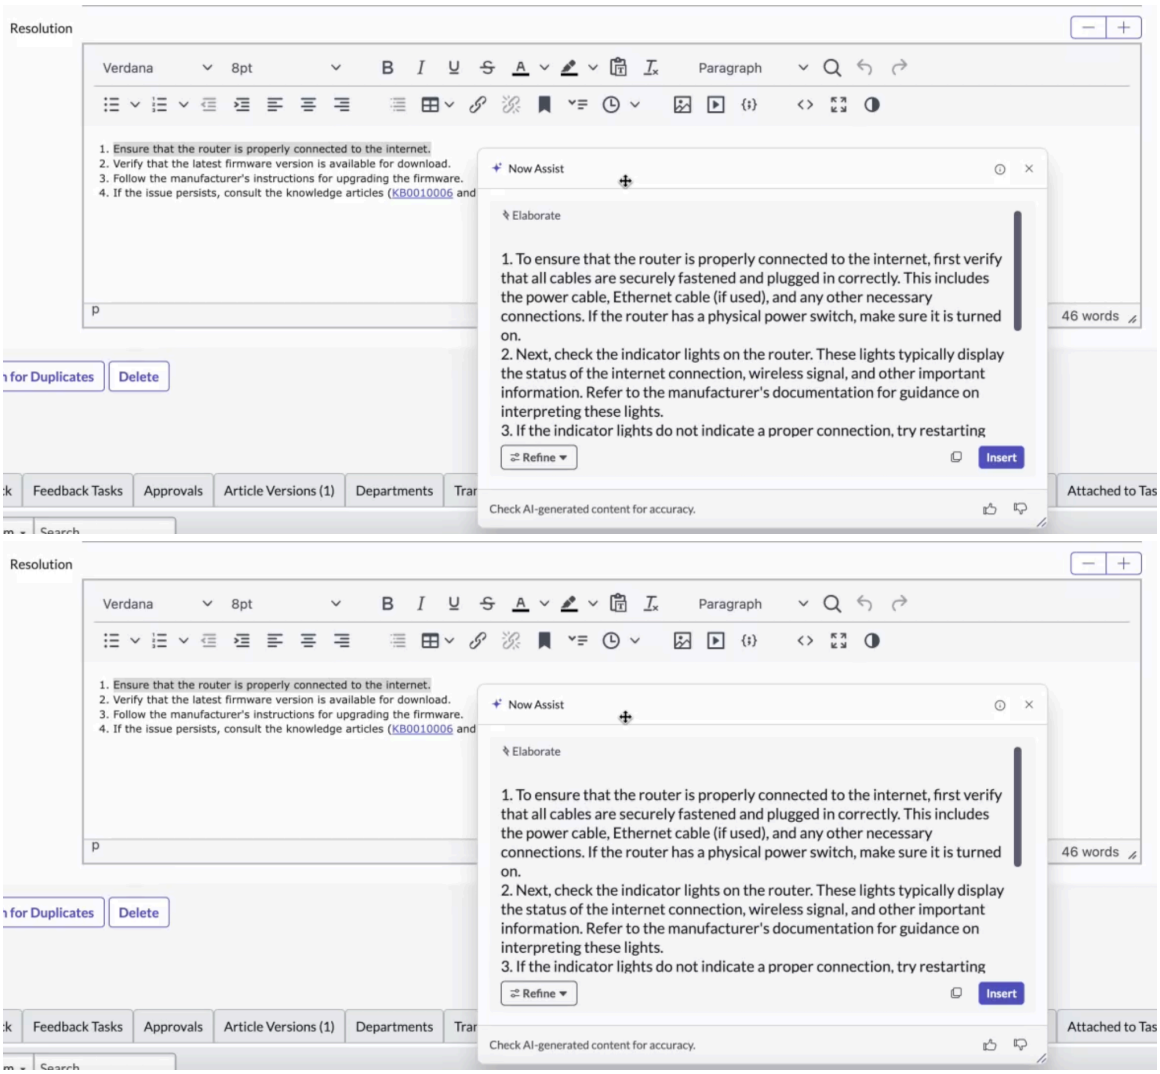
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Open a Knowledge article or create a new one.
2. Select the content that you want to elaborate or shorten from any of the fields in the form.



3. Select the Now Assist icon and select either **Elaborate** or **Shorten** from the context menu.



4. Select **Insert** to add the Now Assist generated content to the article.

Supported tags

The Now Assist Knowledge content recommendation skill currently supports only a limited set of HTML tags and styles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The HTML tags supported and not supported by Now Assist Knowledge content recommendation are listed in the following tables. Using the content recommendation skill on text containing unsupported tags triggers an error message and requires the author to manually update the text.

Supported HTML tags

Tags	Description
p	Paragraph
br	Line breaks
ol, li, ul	Ordered and unordered list
h1, h2, h3, h4, h5, h6	Headers (H1 to H6)
strong, em, s	Bold
a	Anchor (link to URL)

Unsupported HTML tags

Tags	Description
img, video, audio, picture, source, iframe, embed, object	Media tags
table, details, summary, knowledge blocks	Other tags

Note:

- Unsupported HTML tags in the selected content trigger the following error message:

```
Unsupported content such as a table, knowledge block, or
 media file is included in your selection. Reselect and
 try again.
```

- Styles such as bold, italics, tables, and links may not be retained and may result in unpredictable results.

Generate and edit articles using Now Assist in the Knowledge Center article editor

This task explains how to create and improve a knowledge article with the Knowledge center article editor.

Before you begin

Role required: admin

Suggested reading: Edit an article using the Now Assist context menu.

Procedure

1. Navigate to **All** > **Knowledge** > **Knowledge Center**.
   You can also access Knowledge Center through **Workspace** > **Knowledge Center**.
2. In the **Knowledge Actions**, select **Create an article**.
3. Select the desired knowledge base.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Choose either the desired template and select **Next** to open the Knowledge center article editor.
5. Enter the instructions for generating content, such as `Generate an article for password reset`.
   Review the generated article. You can edit the content, check grammar, and make the article easy to read. You can also select **Regenerate** to create an article based on your prompt.

   Using the Knowledge Center Article Editor helps you quickly produce high-quality, accurate, and lucid knowledge articles, saving time and improving support for your organization.

> **Note:**
> The instruction block's content should not include any of the following tags: `img`, `video`, `audio`, `canvas`, `svg`, `iframe`, `script`, `input`, and `button`. Additionally, some elements, when selected on their own, can prevent the Now Assist icon from appearing.

Identify and review duplicate Knowledge articles

Review duplicate Knowledge articles using the Now Assist Identify and review duplicate articles feature.

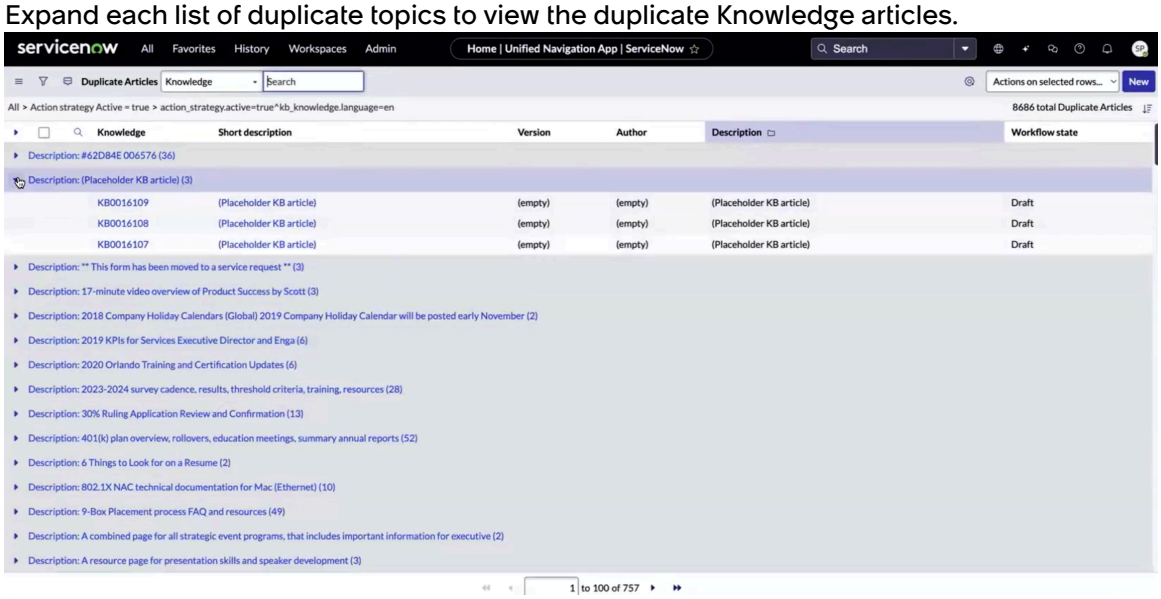
Before you begin

Role required: knowledge_admin and knowledge_manager

The Now Assist Knowledge skill required to enable the identify duplicate articles feature is activated by the admin. To configure the skill, see Configure and activate the Now Assist Identify duplicate articles skill.

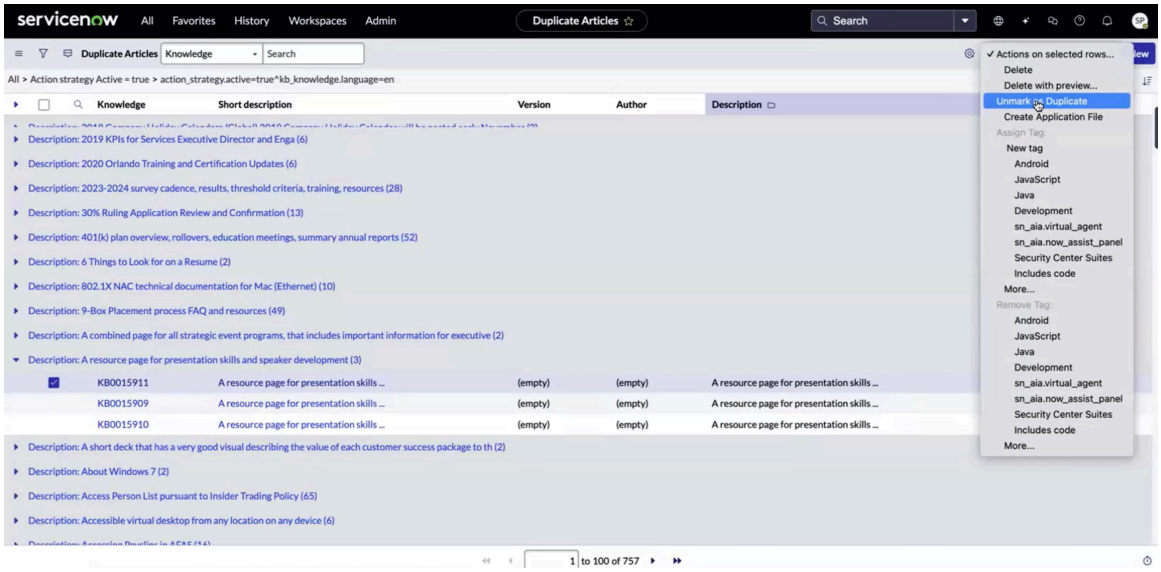
Procedure

1. Navigate to **All** > **Knowledge** > **Articles** > **Duplicate Articles**.
2. Expand each list of duplicate topics to view the duplicate Knowledge articles.



3. Review the article categories and select the duplicate articles listed under it.
4. From the **Actions on selected rows** menu select the **Unmark as Duplicate** action to be applied on the selected articles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Important:

Articles unmarked as duplicates may reappear in the list during the next schedule of the job run due to regrouping of records. Grouping of records happens during every job run. Records created after a job run are considered for the next schedule.

This feature can be applied to new articles, published articles, new drafts or articles that are in review.

This feature may not work as expected for non-English articles.

Response templates

Resolve cases or support issues faster and more efficiently with response templates. Response templates (formerly known as templated snippets) are reusable messages that can be copied to case or task forms to provide quick and consistent messages to users, or to display standard chat response messages to requesters in Agent Chat.

Note:
Response templates are available only for existing records.

Assign response template roles

The following roles are installed when you activate the response templates plugin.

Response template role	Description
Response template administrator [sn_templated_snip.template_snippet_admin]	Grants access to scoped administration of the response templates feature.
Response template writer [sn_templated_snip.template_snippet_writer]	Grants access to create, read, update, and delete (CRUD) response template content.
Response template reader [sn_templated_snip.template_snippet_reader]	Grants access to read response template content.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response template role	Description
System Administrator [admin]	Response template administrator [sn_templated_snip.template_snippet_admin] **Note:** Admin inherits this role by default. When the Templated Responses [com.sn_templated_snip] plugin is activated without activating related HR applications, you can still use response templates. • Admin can reassign this role to other users. • Admin can also remove the Contained Role [sys_user_role_contains] table so Admin users do not inherit this role by default. Or: 1. Enter **sys_store_app_list.do** in the Filter navigator search bar of an instance, or **https://YOUR_INSTANCE/sys_store_app_list.do** from a web browser. 2. Search for and select **Templated Snippets**. 3. Scroll down to **Related Links**. 4. Click **Remove from the role contained by admin**.

Before you begin using response templates, you must assign these roles to the appropriate roles, groups, or users in your application.

- To assign a role to another role, see Add a role to an existing role.
- To assign a role to a group, see Assign a role to a group.
- To assign a role to a user, see Assign a role to a user.

For example,

- In the HR Service Delivery application, users with the HR administrator role are assigned the response template administrator role, users with the HR manager role are assigned the response template writer role, and users with the HR case writer role are assigned the response template reader role.
- In the Customer Service Management application, users with the customer service manager role (sn_customerservice_manager) inherit the response template writer role. Users with the customer service agent role (sn_customerservice_agent) inherit the response template reader role and can access response templates assigned to all groups to which they belong.

How to use response templates

Users with the response template writer [sn_templated_snip.template_snippet_writer] role can create response templates. Each template is associated with a table that is an extension of

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

the Task [task] or Interaction [interaction] table. Response templates include a short name for specifying a shortcut that can be used to identify the message. For chat response templates used in Agent Workspace, agents use the slash command with a short name to present the standard message during a chat. You can also configure the template to

- Include variables pulled from a table
- Specify a condition builder to specify the conditions that must be met for the template to be available for use, such as for a specific HR service

For more information, see Create or modify a response template.

Users with the response template reader [sn_templated_snip.template_snippet_reader] role can then copy response template content and use it in their responses to users when working on case or task forms that meet the specified conditions. For example, a response template for payroll discrepancy cases enables HR agents to use a standardized message when responding to that case type. See Copy a response template to an HR case for an HR-specific example.

Example: Response template to escalate payroll discrepancy cases

You are part of an enterprise HR organization using the HR Service Delivery application. You want your HR agents to respond to and, when necessary, escalate payroll discrepancy cases quickly and consistently. Create a response template so that HR agents have a reusable message to use when responding to employees about that case type.

One of your HR managers with the response template writer role is responsible for creating the template to escalate payroll discrepancy cases. The template is associated with the HR Payroll Case [sn_hr_core_case_payroll] table, and a condition filters on cases that match the appropriate HR service called Payroll Discrepancy. In the template body, the response text appears with variables, such as the subject person name in the salutation.

HR case writers with the response template reader role can copy the response template content and use it in their responses to employees when working on cases. Response templates provide a faster and efficient way to resolve cases.

Activation information

To use response templates in your application, you must activate response templates. For information on what components are installed with the feature, see Components installed with response templates.

Activate response templates

You can activate response templates (formerly known as templated snippets) [com.sn_templated_snip] if you have the admin role. This plugin includes demo data and activates related plugins if they are not already active.

Before you begin

Role required: admin

Note:
If you are using Agent Chat, the Agent Chat (com.glide.interaction.awa) plugin automatically activates response templates.

About this task

Response templates activate these related plugins if they are not already active.

© 2026 ServiceNow, Inc. All rights reserved.

Plugins for response templates

Plugin	Description
Scoped Application Restricted Caller Access [com.glide.scope.access.restricted_caller]	Allows scoped applications to restrict access to public tables and script includes.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Related topics

List of plugins (Madrid)

Components installed with response templates

Several types of components are installed with activation of the Templated Responses (com.sn_templated_snip) plugin, including tables and user roles.

Note:
The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Demo data is available for this feature.

Roles installed

By default, the following HR roles contain the following response template roles.

Note:
The Templated Responses [com.sn_templated_snip] plugin activates the sn_templated_snip.min_admin_count system property [sys_properties.list]. This property prevents you from deleting your only Response Template admin user by requiring a minimum number (default is two) of active users with this role.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles installed with response templates

Role title [name]	Description	Contains roles
Response templates administrator [sn_templated_snip.template_snippet_admin]	Grants access to scoped administration of the response templates feature.	sn_templated_snip.template_snippet_writer
Response templates writer [sn_templated_snip.template_snippet_writer]	Grants access to create, read, update, and delete (CRUD) response template content.	sn_templated_snip.template_snippet_reader
Response templates reader [sn_templated_snip.template_snippet_reader]	Grants access to read response template content.	None

You can assign these roles to the appropriate roles, groups, or users in your application.

- To assign a role to another role, see Add a role to an existing role.
- To assign a role to a group, see Assign a role to a group.
- To assign a role to a user, see Assign a role to a user.

For further information on user administration and how to manage users, see User administration.

Tables installed

Tables installed with response templates

Table	Description
Response Template [sn_templated_snip_note_template]	Stores response template information. Response templates are reusable messages that can be copied to case or task forms. Response templates provide quick and consistent messages to users, or display standard chat response messages to requesters in Agent Chat.
M2M Response Template to Channel [m2m_response_template_to_channel]	Maps channels to response templates.
Response Template Channel	Stores information about response template channels.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Tables installed with response templates (continued)

Table	Description
[sn_templated_snip_channel]	
Note Template for Table [sn_m2m_note_template_for_table]	Maps notes to response templates.

For further information on table administration and how to manage data, see Table administration.

Create or modify a response template

Create or modify a response template (formerly known as a templated snippet) to define a reusable message that can be copied to case or task forms or used in Agent Chat sessions to provide quick and consistent messages to users.

Before you begin

Role required: sn_templated_snip.template_snippet_writer

About this task

Each response template is associated with a table that is an extension of the Task [task] table or, if using Agent Workspace, the Interaction [interaction] table. The template can be configured to include variables pulled from that table. You can also use a condition builder to specify the conditions that a case must meet for the template to be available for use, such as for a specific HR service or for chat. For chat response templates, you specify a short name (shortcut) that is used with the slash command as a quick way to present the response message to a user.

Procedure

1. Navigate to **All** > **System Definition** > **Response template configuration**.
2. Select **New** to create a response template.
   Or, select an existing response template to modify from the list.
3. Fill in the fields on the form.

Response template form

Field	Description
Name	Name of the response template.
Short Name	Short description that identifies the response template when using chat in Agent Workspace. Use the short name with a quick command (/) to show the text from the template body of the response template while in chat. This feature provides a fast and consistent way to populate text while in chat. For example, the short name `gm` identifies the chat response template for a Good Morning greeting. Enter **/gm** in a chat window to show the text from this response template.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Table	Name of the table that the response template is associated with. If you are creating a response template for Agent Workspace chat, the associated table is the Interaction [interaction] table. For other response templates, the table must be an extension of the Task [task] table. **Note:** Creating custom COE tables do not allow you to add the Copy to Clipboard UI action. Users can still use the copy and paste function.
Condition	Conditions that determine when the response template is available for use. When defining conditions like case sensitivity or null values, see API GlideFilter - Scoped, Global. **Note:** The conditions available depend on the table you select. For chat response templates, specify the condition: **[Type] [is] [Chat]**
Application	The application that created the response template.
Group visibility	Indicates what groups have access to the response template. Adding groups filters who can view the response template. **Note:** Leaving this field empty makes the response template available to all groups.
Language	Language in which you want the response template to be translated. **Note:** Translation feature is available only when the required language plugins are installed on the instance.
Template body	Text of the response template providing instructions to the agent on how to respond to a specific case or task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	You can reference field values by selecting variables from the variables list based on the table you select. You can manually enter custom variable references: ○ Current user: `${current_user}` ○ Current date: `${Date}` Or, place your mouse where you want the custom variable reference to appear and select the **Insert Current User** or **Insert Current Date** buttons. **Note:** Response templates do not support rich text.
Select variables	Variables you can add to the template body. For example, if you choose the HR Case (sn_hr_core_case) table, you can select the Subject person variable to appear in the Template body and it will replace the variable with the actual name of the subject person when the response template is used. **Note:** The variables available depend on the table you select.

Example

The following GIF shows an example of an HR manager in the HR Service Delivery application creating a response template to escalate payroll discrepancy cases. The template is associated with the HR Payroll Case [sn_hr_core_case_payroll] table, and a condition is set to filter on cases that match the Payroll Discrepancy HR service. The template text is pasted into the body, and then a variable for the subject person is added to the salutation.

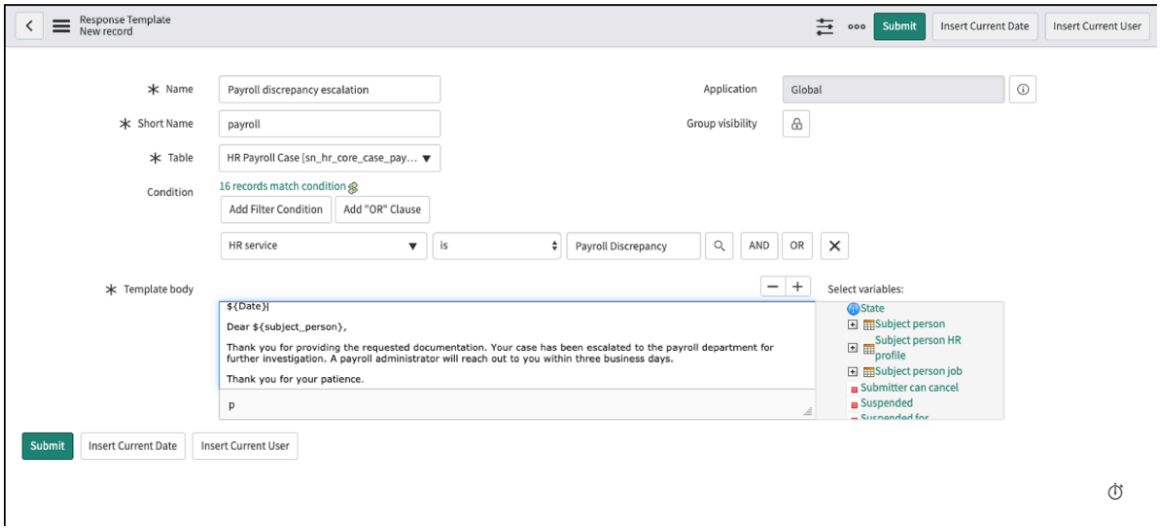
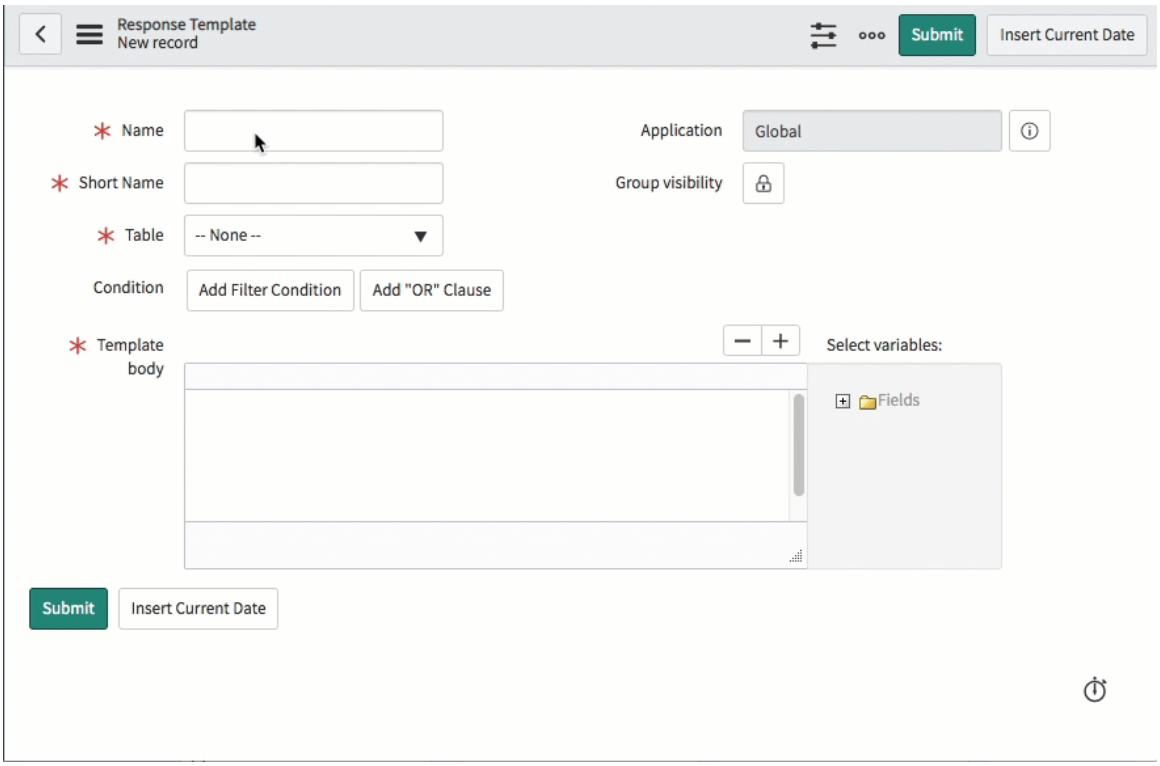
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.





4. Click **Submit** or **Update**.
   Channels limit the response template to only the channels you add. If you leave this blank, the response template is available to no channels. This feature allows you to have different messages for chats, emails, or form. For more information, see Create a response template channel.
   The Channels related list appears.

What to do next

You can copy response template content to any field on a form that meets the specified conditions.

The following GIF shows an example of an HR case writer in the HR Service Delivery application opening a payroll discrepancy case and copying a payroll discrepancy escalation template to the comments field in the HR case form for the employee to read.

Service catalog requests

This page contains links to content on service catalog requests.

Add new request items

Use ServiceNow's web-based interface to add new items to a request.

Before you begin

Roles required: Only an administrator or a user with the catalog_admin role can add a new item to a submitted request.

About this task

Modifying a request does not resubmit it to the approval process.

Procedure

1. Navigate to **All** > **Service Catalog** > **Open Records** > **Requests** and open an existing request.
2. Click **Add New Item**.

   Note:
   The Add New Item button appears only if the current **Request state** is **Pending Approval**. After the request is approved, this button is no longer available and you will not be able to add new items.

3. In the dialog box that appears, choose an item and a quantity to add.
4. Click **OK**.

Amazon EC2 instance request from the Service Catalog

Users can request the provisioning and deletion of virtual computers (Linux or Windows) in the Amazon EC2 virtual computing environment through the ServiceNow Service Catalog.

The Amazon EC2 offering requires the purchase and activation of ServiceNow Orchestration Automaton.

Note:
This feature has been deprecated and is no longer supported or available for new activation. For details, see the Deprecation Process [KB0867184] article in the Now Support knowledge base.

Request an instance

Request the provisioning of a new Amazon EC2 instance through the service catalog.

Before you begin

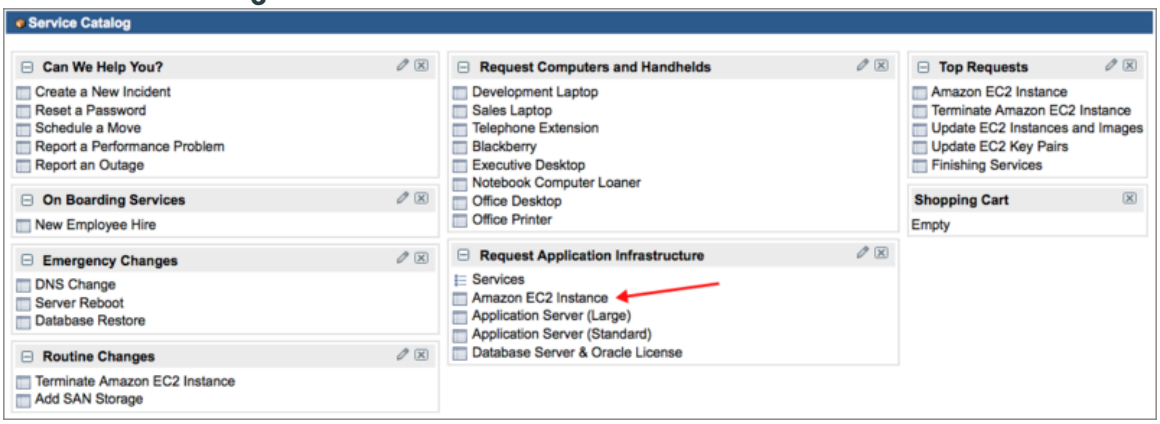
Role required: admin

Procedure

1. Navigate to **All** > **Self-Service** > **Service Catalog**.
2. Select **Amazon EC2 Instance** from the **Request Application Infrastructure** category.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

EC2 Service Catalog 2

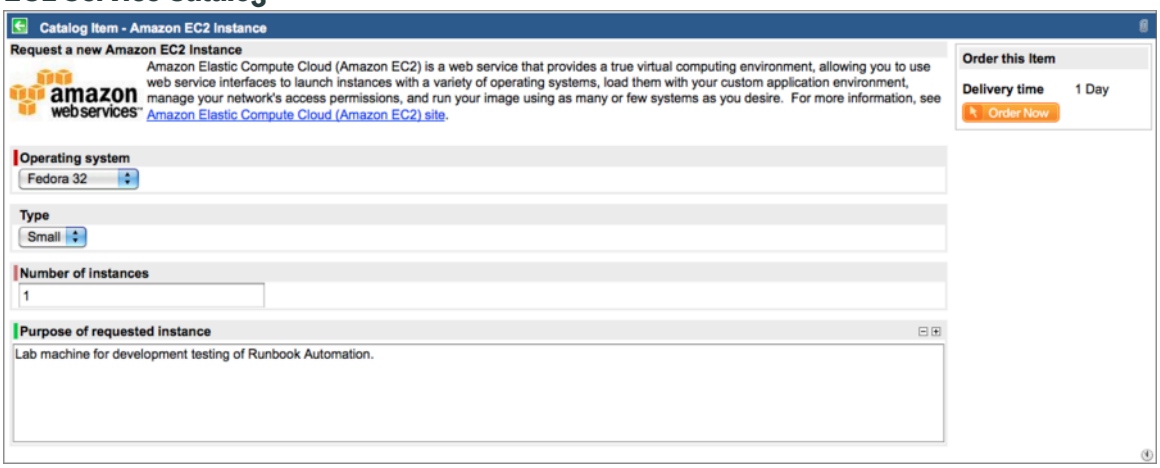


3. Select the operating system, the type of instance (Large or Small), and the number of instances requested.

   See the specifications for Large and Small instances in Amazon EC2 Instance Types.

4. Type a reason for the request.

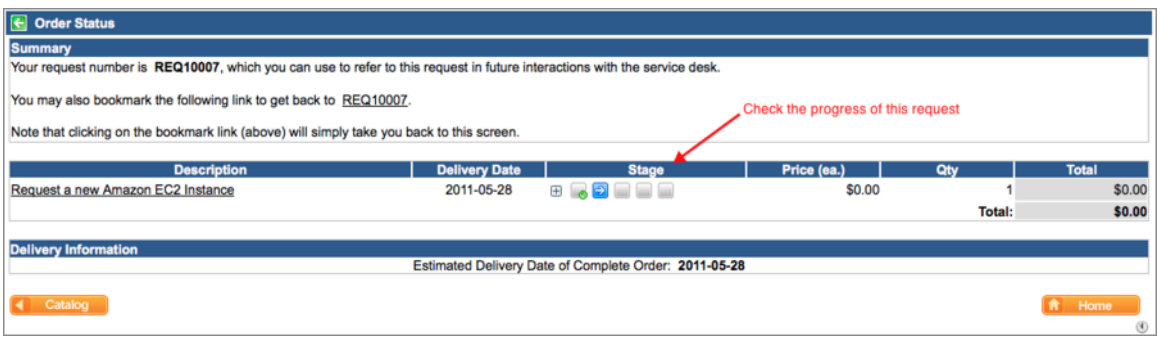
EC2 Service Catalog



5. Click **Order Now** to order the instance.

   The Order Status form appears, summarizing the request. A status bar tracks the progress of the approval and provisioning of the EC2 instance.

EC2 Order Status



Upon successful creation of the instance, you receive an email containing the instance ID, IP address, and the public DNS for the instances created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Terminate an instance

Shut down an Amazon EC2 instance through the service catalog.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Service Catalog** > **Routine Changes** > **Terminate Amazon EC2 Instance**.

   A list appears displaying the instances that are assigned to you.

2. Select an instance from the list and click **Order**.

   This list does not support multi-line selection, and there is no **undo** feature.

Check-out redirect property

A property called One-step checkout redirect (*glide.vm.checkout_redirect*) controls the view presented to virtual machine requesters in the service catalog.

By default, this property is set to **false**, which redirects the view to the Order Status form when the requester clicks **Order Now**. When this property is set to **true**, ServiceNow redirects the requester to their My Virtual Assets portal. This property is located in **Cloud Management** > **Administration** > **Properties**.

Delete request items

Use ServiceNow's web-based interface to delete items from a request.

Before you begin
Role required: admin

About this task
All users can delete items from their own requests any time prior to delivery. Modifying a request does not resubmit it to the approval process.

Procedure

1. Navigate to **All** > **Service Catalog** > **Open Records** > **Requests** and open an existing request.
2. In the **Requested Items** related list, select the check box beside the item to delete.
3. In the **Actions** choice list, select *Delete*.

   ServiceNow recalculates the price and delivery date for the order.

Place a request

Use ServiceNow's web-based interface for ordering predefined goods and services.

Before you begin
Role required: admin

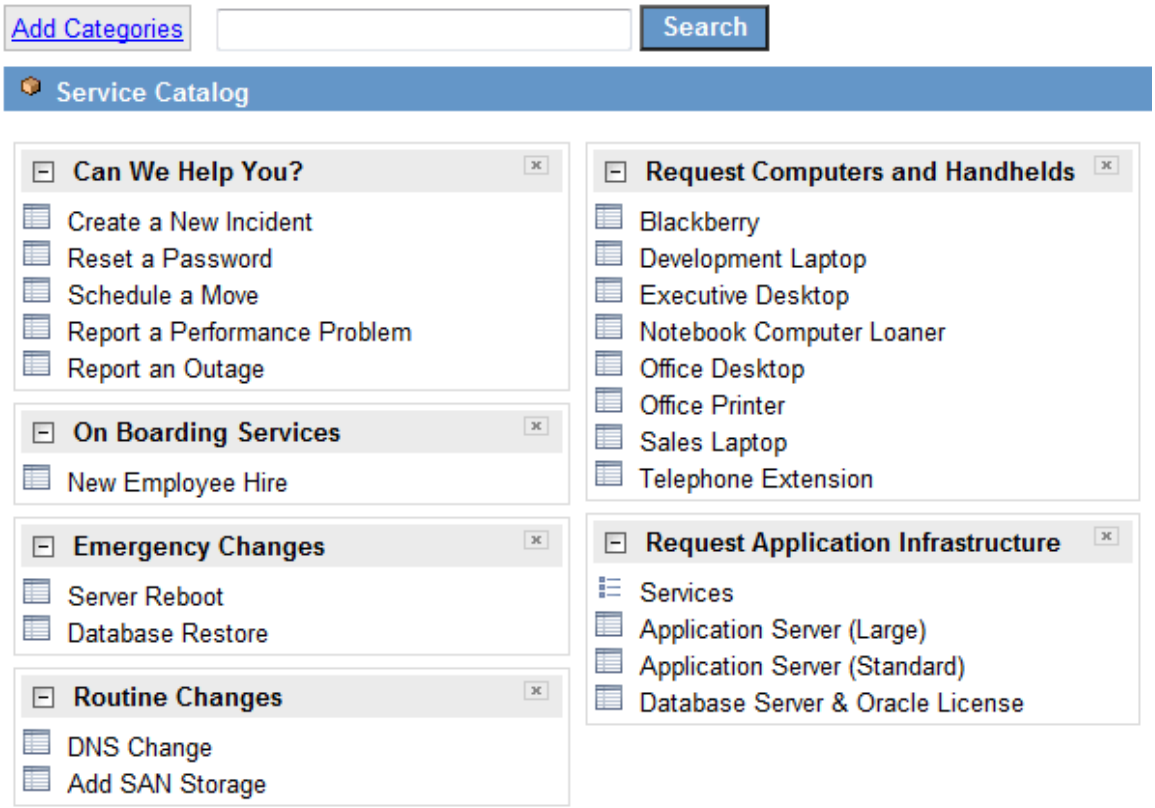
Procedure

1. Navigate to **All** > **Self-Service** > **Service Catalog**.

   The default catalog view organizes items in categories and subcategories.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Default catalog view

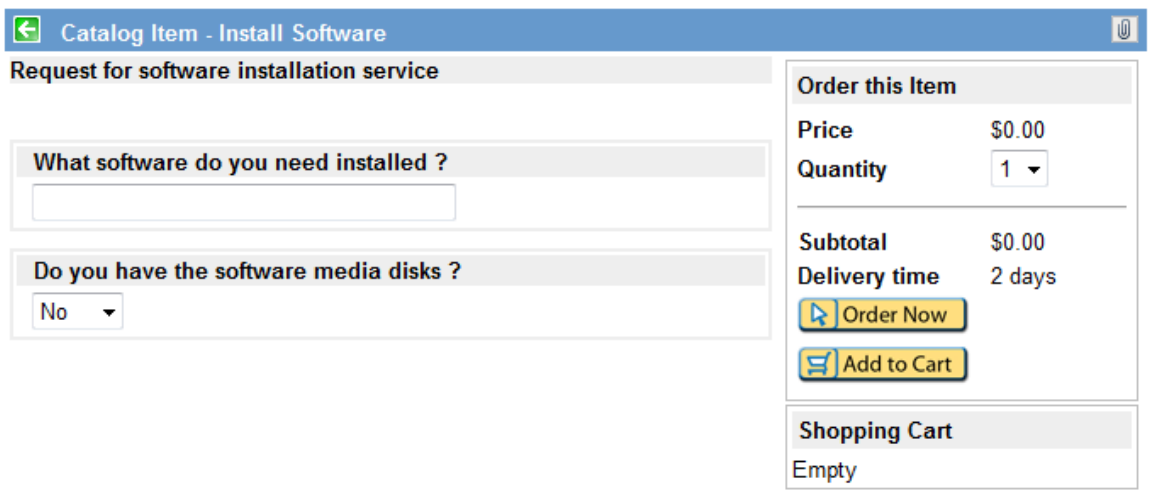


2. Select an item to order.

> **Note:**
> Some items are order guides, which combine related items for easier ordering. For example, an order guide called New Employee Hire presents a list of items that new employees typically receive (desk, phone, computer, email account). After you select the items you want to order, the order guide requests the information required and shows a separate time to delivery for each item ordered.

The order screen requests any additional information that's needed, such as the requester's name or location and the date the item is needed. It also displays the item's delivery time after approval.

Delivery time



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Enter complete and accurate information to expedite your order.
4. Order any other items required.
5. Click **Order Now** when the order is complete.

   ServiceNow displays a confirmation screen for your order:

   You can view the order's progress in the **Stage** column.

   Note:
   It may be useful to note the order number for future reference.

   ServiceNow automatically notifies the approvers if approval is required and creates work orders to fulfill the order according to your organization's process. For example, if you order a new notebook computer, the purchasing group might receive a work order to order the computer, and the desktop services group might receive a work order to configure the new computer and deliver it to your office after it arrives.

Create incidents and change requests from a requested item

You can quickly open an incident or a change request from a requested item. It also maintains a relationship between the requested item, and its associated incidents or change requests.

Before you begin

The administrator must enable the **Create Change** and **Create Incident** UI actions for the Requested Item [sc_req_item] table. The administrator must set the **Active** field to `true` when editing these UI actions .

Role required: itil

Procedure

1. Navigate to **All** > **Self-Service** > **Requested Items**.
2. Open a requested item.
3. Click the Additional actions menu icon and select **Create Change** or **Create Incident**

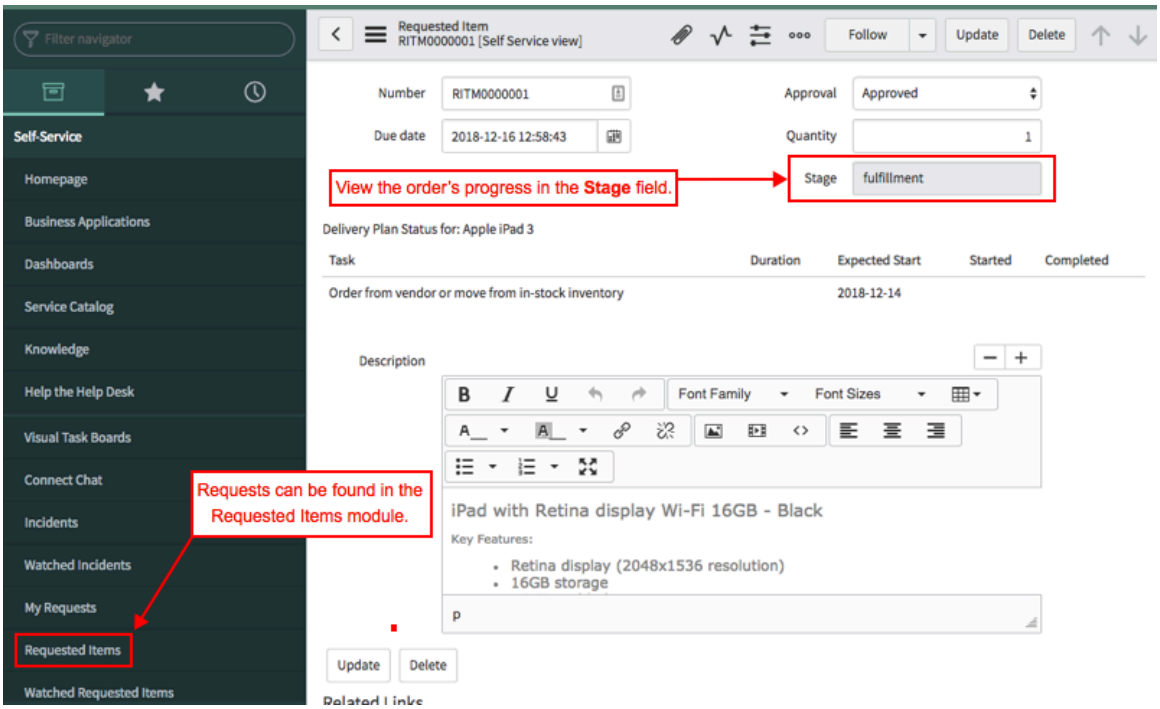
View request status

View the status of a request to see its progress, and determine when it may be fulfilled.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Self-Service** > **Requested Items**.
2. Click your order number to view details.
3. View the order's progress in the **Stage** field.



4. Check the **Backordered** field, and if the item is backordered, review comments for information about its return to stock.

Service Delegation

Service delegation is the ability to designate other users to view and interact with approvals sent or tasks assigned to you, and to receive copies of all email notifications sent to you.

Note:
Users to whom you delegate responsibility see all pending tasks and approvals regardless of the delegation period.

Note:
Delegation does not cascade. When a user acts as a delegate for another user, the delegate cannot in turn delegate to a third party. The original delegate is the only user who receives assignments and notifications. Delegation does not grant the delegate access to tasks where the caller or requester is the user for whom the delegate was created.

Add the Delegates related list to a user profile

To delegate approvals and tasks to another user, configure your user profile form to display the Delegates related list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: personalize_list or admin

Procedure

1. Navigate to **All** > **Self-Service** > **My Profile**.
2. On the form context menu, navigate to **Configure** > **Related Lists**, and then add the **Delegate->User** related list.

Result
The Delegates related list displays at the bottom of the user profile form.

Delegate approvals and tasks to another user

If you're out of the office, you can delegate responsibilities to another active user for a period of time.

Before you begin
Role required: none

Procedure

1. Navigate to **All** > **Self Service** > **My Profile**.
2. In the **Delegates** related list, click **New**.

   If the Delegates related list is not visible, do one of the following:

   - Select a different view, such as the ITIL or Default view, by selecting the **Additional actions menu** > **View** > **(name of view)**.

   - Configure the form to add the Delegates related list. For more information, see Configuring the form layout.
3. Select an active user as your Delegate.
4. Select date values from the **Starts** and **Ends** fields to set the period of time during which a delegate can work on your behalf.
5. Specify the responsibilities the delegate will assume by selecting the following check boxes. You can delegate:
   - **Approvals**: The delegate can approve items on your behalf.
   - **Assignments**: The delegate can view and work on tasks assigned to you.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **All notifications**: The delegate receives a copy of email notifications sent to you, except those marked as Meeting Invitation.

  Note:

  - If the **Approvals** check box is selected but **All notifications** is not, the delegate does not receive approvals.
  - If your delegate gets email notifications, they will be the same email notifications sent to you. The delegate may be confused to see "Incident assigned to you" emails, so make sure they know they are a delegate.

- **Meeting invitations**: The delegate receives a copy of email notifications sent of the type Meeting Invitation.

Service Administration

Give tailored support to your business infrastructure with Service Administration.

Service Administration applications

Assessments and Surveys Assessments and Surveys application helps you create, send, and collect responses for surveys. It also helps you evaluate, score, and rank records from any table in the system.	Classic approvals Classic approvals are a legacy process to require authorization on tasks before the work is done.
State Flows State flows enable an administrator to customize transitions from one state to another and configure the system to perform work during transitions to specific states.	Geolocation The geolocation feature uses Google Maps to track users, plan efficient routes between locations, and assist in finding accurate travel times for applications that require this information, such as Work Management.

Exploring Assessments and Surveys

The Assessments and Surveys application helps you create, send, and collect responses for surveys. The application also helps you evaluate, score, and rank records from any table in the system. Create questionnaires that you can assign to one or more users to assess their knowledge of any subject.

Create basic surveys to obtain collective data for analysis

You can create, send, and collect responses for basic surveys. If installed, you can also use a survey widget to set up a survey on Service Portal.

Evaluate, rank, and score the data to provide summarized results using Assessments

You can assess projects that executives want to evaluate for effective management, or rate and compare a vendor's goods and services. Use assessments to send custom questionnaires to selected users or write scripts that query the database directly.

Use quizzes to test user knowledge

The quiz functionality is built on the assessment engine and provides many of the same features as assessments and surveys.

Surveys

Two versions of the application are supported, Surveys, which is the latest version, and Legacy Surveys. Survey improves the user interface and extends the capabilities of the Legacy Surveys application.

Surveys | Getting started

Configuring surveys

There are many options for advanced configuration in Surveys:

- Create a survey, add questions, and choose recipients, all in one interface.
- Create conditional questions, which appear only when users answer other questions a certain way.
- Restrict a survey so only specific survey users can take it, and send invitations to those users simultaneously. Alternatively, make the survey a public survey so that any user can take the survey, even anonymous users (users who have not logged in to the ServiceNow system).

  Tip:
  The assessment_take2 UI page should be public for public surveys. If that page is not public, anonymous users do not have access to the page and public surveys do not work.

- Set a schedule to automatically assign a survey to users and to limit how often the same user can take a survey.
- Customize the look and feel of survey questionnaires.
- Save anonymous survey responses.
- Convert survey responses to numerical scores and view them on scorecards.
- Deactivate a survey for maintenance or to retire it without deleting it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Because surveys use the same tables and other back-end components as assessments, you may see assessment elements such as table and field names in certain places throughout the survey feature.

Legacy Surveys

Survey administrators can continue to use legacy survey functionality and data, however, it is recommended that you migrate legacy surveys to the Surveys application. Concurrent use of both survey applications can cause confusion and redundancy.

Survey wizards are not impacted and cannot be migrated.

Note:
The Legacy Surveys application is not described in the documentation that you are viewing. It is documented on the ServiceNow wiki.

Version comparison

Capability	Surveys	Legacy Surveys
Surveys in Service Portal.	✔	
Save new survey responses each time a user takes the same survey.	✔	
Create question templates to reuse sets of answer options.	✔	
Categorize survey questions and report on category results.	✔	
Deactivate a survey without deleting it.	✔

Using surveys

Survey administrators—users with the survey_admin role—create and maintain surveys and configure how they are distributed and published. Surveys on Service Portal are also supported.

Survey questionnaires

All surveys that are assigned to you appear in your personal assessment and survey queue.

No special role is required to complete a survey but you must be logged in and the survey must be assigned to you. When you submit a survey, the system stores your responses.

Survey notification

If the system is configured to send email, it sends you a notification when a survey is assigned to you. The message contains a link to the survey and instructions for viewing the assessment and survey queue.

Take a survey

Take an assigned survey that appears in your assessment and survey queue.

Before you begin

Role required: none

About this task

Each assessment or survey appears as a clickable card in the queue, which can be launched by clicking the card. The card includes helpful information, including the survey name, state, and due date. You must answer every required question, indicated by a red asterisk, before you can submit the survey. If you start to take a survey but can't complete it, save your responses and return to it later. When you've answered all the questions and you're happy with the responses, submit the survey.

Note:
If you've signed in as a user who doesn't have access to the trigger record, and you access a survey using the URI parameters, the associated record number isn't displayed. You can still take the survey.

Procedure

1. Navigate to **All** > **Self-Service** > **My Assessments & Surveys**.
   Users with the assessment_admin role, including survey administrators, can display other users' assessments and surveys in addition to their own. Use the **Show all** and **Show assigned to me** related links at the bottom of the queue to show and hide assessments and surveys. Click a card assigned to another user to open the associated metric type or survey definition.
2. Click the survey card to open the questionnaire.
   If there is more than one survey category, click the collapse icon ( ) or expand icon ( ) to hide or show the questions in the category.
3. Answer each question to the best of your ability.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you're unsure of how to respond to a question or if a question doesn't apply to a particular record, select **Not Applicable**, if available.

4. Complete one of the following steps.

Option	Description
Save your responses without submitting them	Click **Save**. You can close the questionnaire and access it later from your queue. **Note:** The system doesn't save the survey when there are invalid responses, such as a letter in a date field. You must enter valid responses or remove invalid responses before you can save the survey.
Submit the survey after answering all questions	Click **Submit**. You can't return to the questionnaire after submitting. **Note:** If there's an unanswered required question or an invalid response, an error message appears and the problematic questions are temporarily highlighted.

Survey responses and results

There is a metric result record for each user response to each question on every survey instance. Survey results for each question and category are calculated automatically based on the metric result records.

If you use survey result calculations for results and scorecards, ensure that the positive indicator field for the question is set appropriately, based on the answer options. To have any results, a category must contain scored questions.

Survey responses

Survey responses are stored in the Metric Result [asmt_metric_result] table and display the recipients' answers to each question in a category. To view general results, navigate to **Survey > Survey Responses**. To view results for a particular criterion, use a filter on the Metric Result [asmt_metric_result] table. For example, to view results based on the assignment group, apply a filter condition for assignment group.

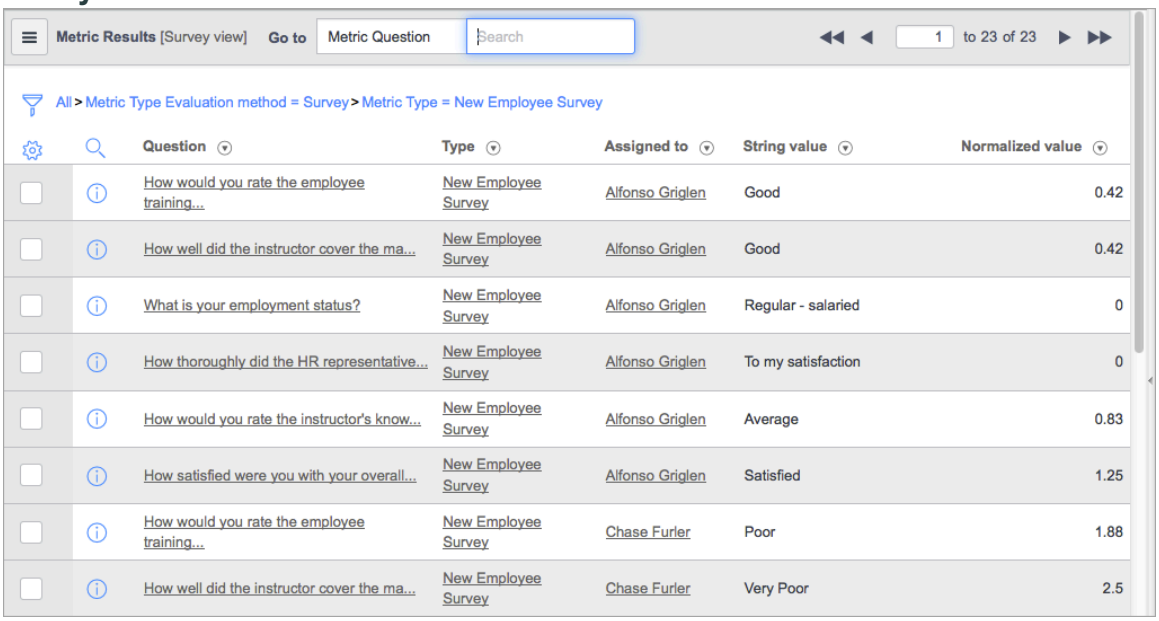
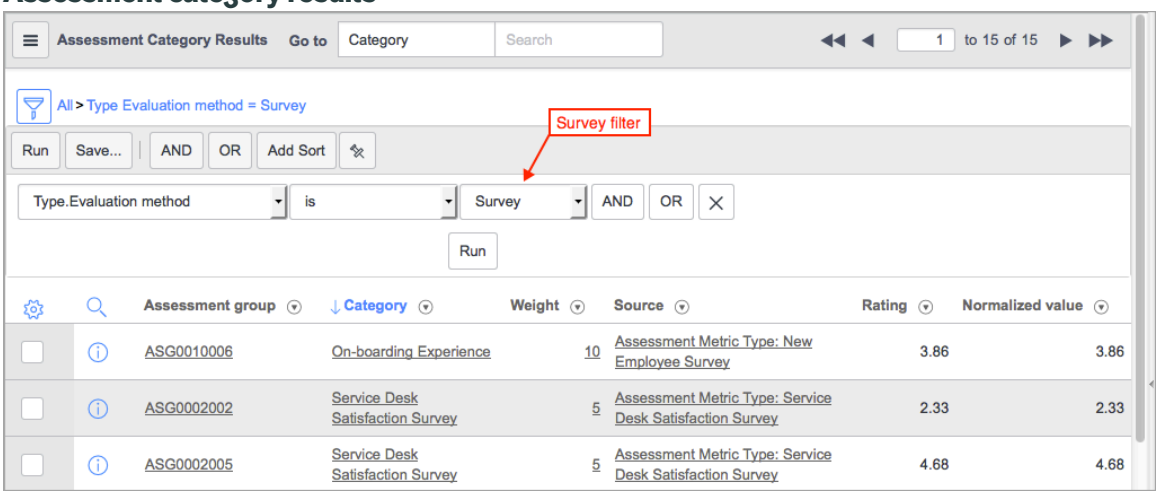
Survey metric results



Category results

Category results are stored in the Assessment Category Result [asmt_category_result] table and display the overall ratings for each category based on the weighted value for each scored question. To view these results, navigate to **Assessments** > **Results** > **Category results** and filter the results using the **[Type.Evaluation method] [is] [Survey]** condition.

Assessment category results



Survey scorecards

A scorecard provides a visual breakdown of survey responses, based on the way questions were answered, by category. To access a scorecard, see View a survey scorecard.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

View results for all surveys

You can view the survey responses that are stored on the Metric Result [asmt_metric_result] table.

Before you begin

Role required: survey_admin or survey_reader

Procedure

1. Navigate to **All** > **Survey** > **Survey Responses**.
   Do not confuse this module with **Survey** > **Legacy Surveys** > **Survey Responses**, which displays legacy survey responses.

   The **Type** column displays the survey definition each response is associated with.
2. Select a response to view its details.

View the results for a survey

You can view the responses for one survey definition. Survey results are stored on the Metric Result [asmt_metric_result] table.

Before you begin

Role required: survey_admin or survey_reader

Procedure

1. Navigate to **All** > **Survey** > **View Surveys**.
2. Open a survey definition.
3. Under **Related Links**, select **View Responses** to view information regarding each user's response.
   The results are grouped by metric, which is what questions are called in assessments.
4. Under **Related Links**, select **View Scorecard** review the compiled data of all responses represented in pie charts.
   For detailed information, see View a survey scorecard.
5. Open a metric result to view more detail.
   The metric result contains the user's response and calculated values of interest to advanced survey administrators. Because the Metric Result table is also used by the assessment feature, many field names aren't clear in the context of surveys.

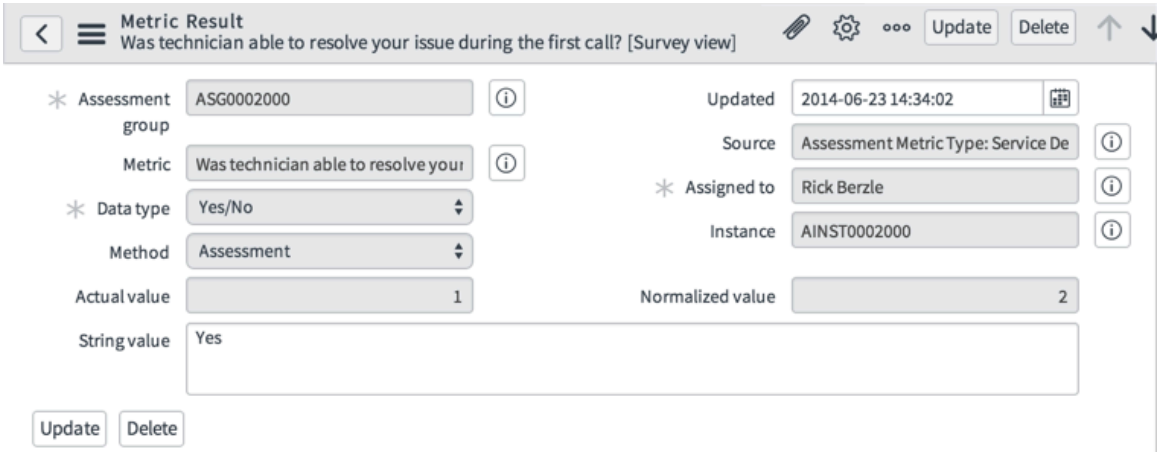
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example



For a description of the field values, see Metric Result form.

View a survey scorecard

A survey scorecard provides a visual breakdown of survey responses by category, based on the way questions were answered.

Before you begin

Role required: survey_admin or survey_reader

About this task

A scorecard displays charts for survey results, in which category and question responses are analyzed and current ratings are compared with previous ratings. Users can examine ratings over time, compare question ratings, or compare the ratings of all categories. All ratings are averages for the time range selected. The system dynamically updates a scorecard each time you view it, so the ratings reflect recently completed surveys.

Procedure

1. Navigate to **All** > **Survey** > **View Surveys**.
2. Open a survey definition.
3. Select the **View Scorecard** related link.

Note:
The **View Scorecard** related link is available only if there are survey results to report.

The interactive scorecard displays the following filters:

- Question Results: Displays the result of all questions or an individual question.
- Category Results: Displays the results of all questions associated with an individual category or all categories.
- Average Ratings: Displays the result of weighted average rating for each survey question in an individual category or all categories.
- History: Displays the result of all questions in comparison with their history (by calendar year or quarters).
- Sentiment Analysis Results: Displays the results of sentiment analysis for the survey.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Survey scorecard category results

The Category Results view is a stacked bar chart showing survey results for all questions in an individual category or all categories by respondent count.

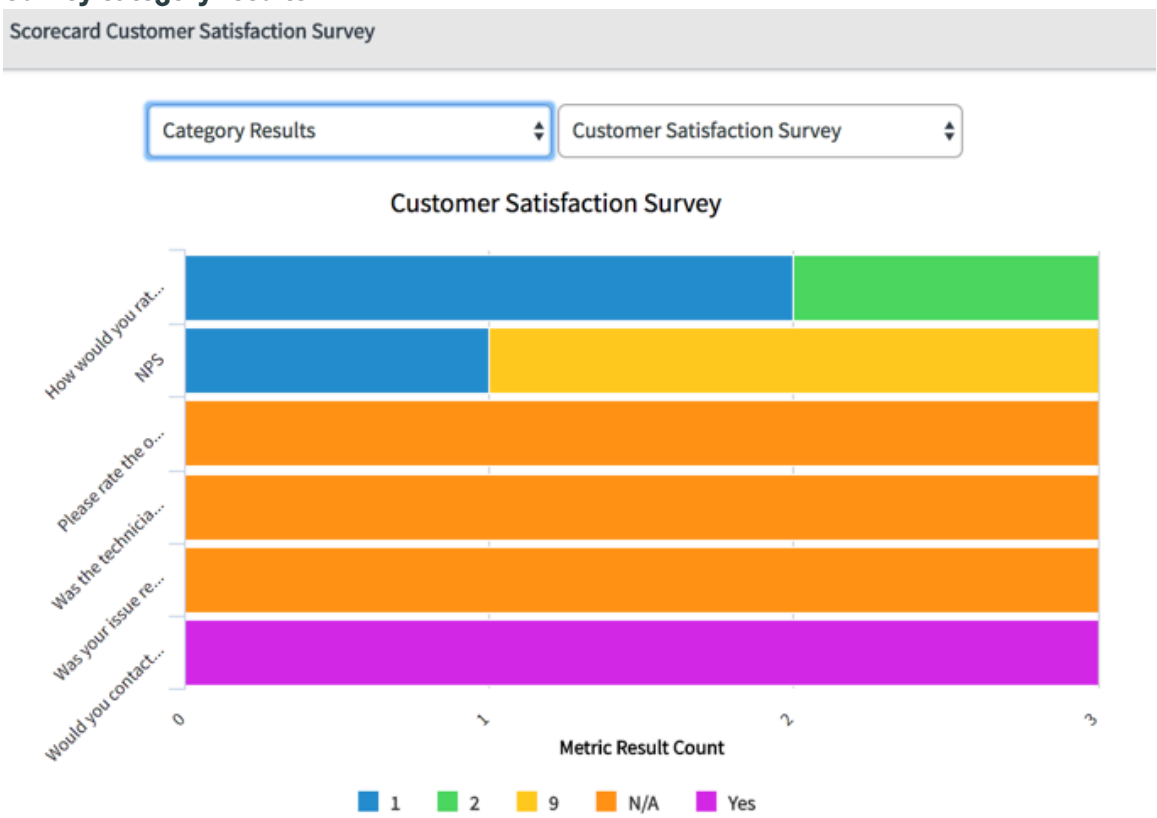
Select a category from the list to display the questions from that category in the chart.

This view displays responses that use the following data types:

- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No
- Multiple selection
- Image Scale
- Numeric Scale

Note:
The **Checkbox** and **Yes/No** data types are combined into the **Boolean** data type in the Survey Designer

Survey category results



To view details about a specific response, point to the colored bar to display the response, the number of responses, and the percentage it represents of all the responses to that question.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Survey scorecard category results detail

Survey scorecard question results

The Question Results filter displays the result of all questions or an individual question using charts or lists. For the String, Attachment, Date, Date/time, Reference, and Ranking data types, the results are displayed in the list view. The results of all other data types are displayed in the pie chart view.

Pie chart

The pie chart shows question results for all data types other than those that are displayed in the list view. See Survey question data types.

- Checkbox.
- Boolean.
- Choice.
- Likert Scale.
- Number.
- Percentage.
- Yes/No.
- Image Scale.
- Multiple Selection.
- Template. The question result shows the aggregated net promoter score (NPS) with promoters, detractors, and passives.

Net promoter score categories

Question score	NPS category
9 or 10	Promoter
7 or 8	Passive or Neutral
0 to 6	Detractor

The result is calculated as:

- %Promoters = Number of promoters / Sample size
- %Detractors = Number of detractors / Sample size
- %Passives = Number of passives / Sample size
- NPS = %Promoters - %Detractors

Note:
The **Checkbox** and **Yes/No** data types are combined into the **Boolean** data type in the survey designer.

When a user submits a survey, three records (one for each Timeframe) will be created/ updated- **Year**, **Quarter**, and **Monthly** in the **asmt_nps_result** table. For example, if a user submits

© 2026 ServiceNow, Inc. All rights reserved.

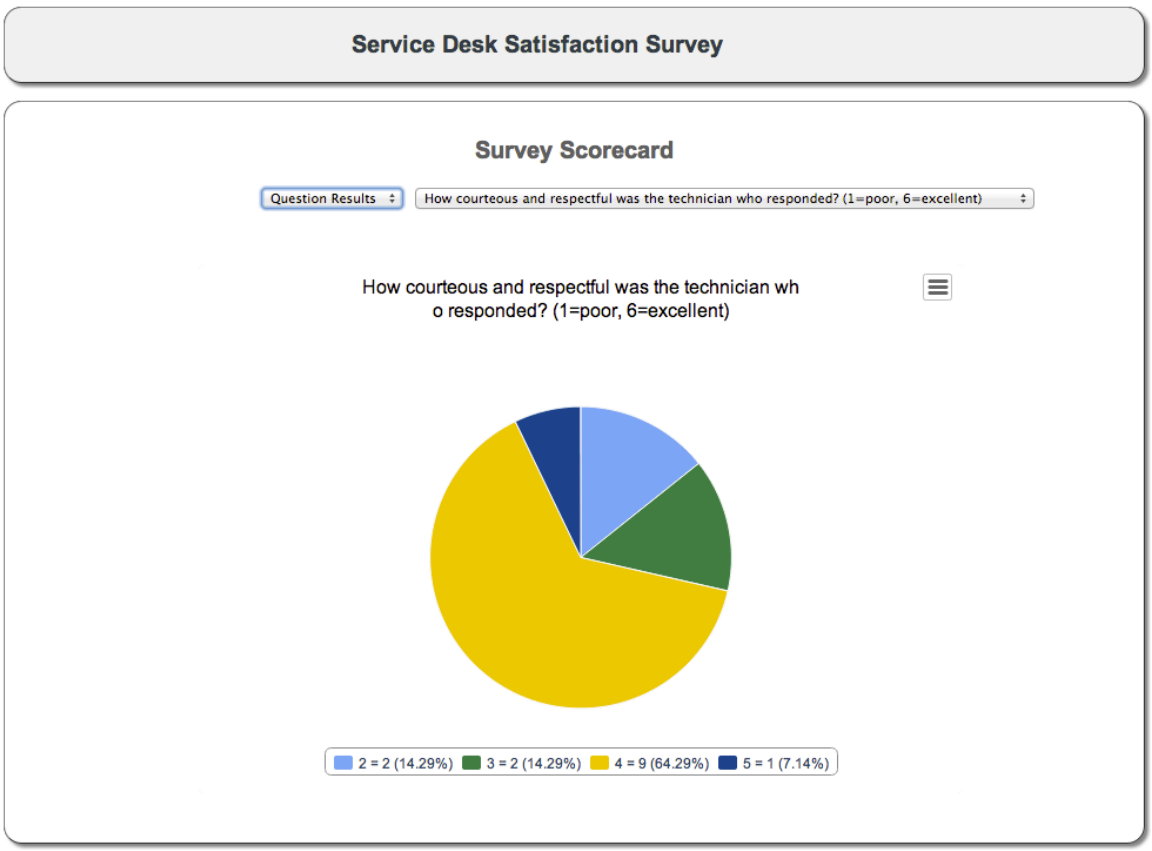
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a survey on November month of 2023, which falls under Quarter 3. Then three records are generated for the dates.

- Year: 2023-01-01
- Quarter: 2023-10-01
- Monthly: 2023-11-01

Now if a second user submits in December month of 2023, which falls under same Quarter 3, as above scenario. Then only a single record is created for Monthly Time frame.

Survey scorecard question results - pie chart



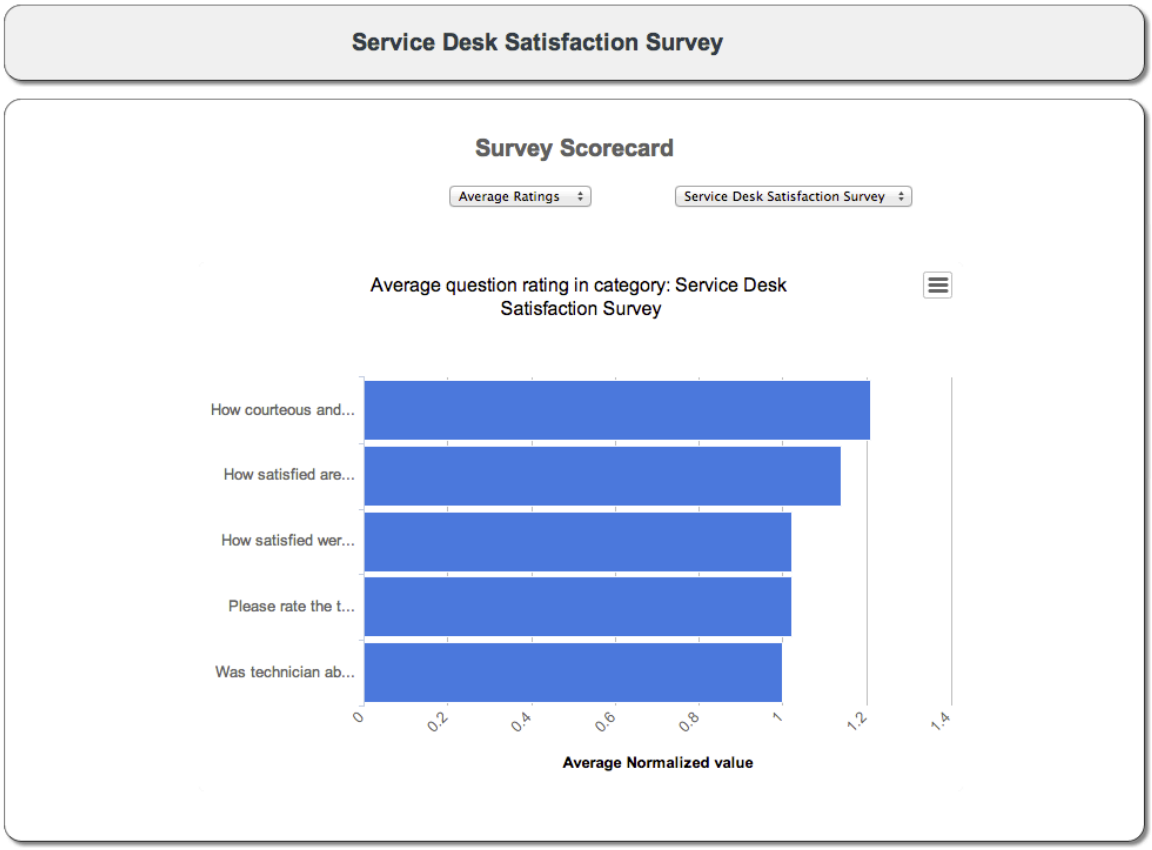
Survey scorecard average ratings

The Average Ratings view displays the weighted average rating for each survey question in an individual category or all categories.

Use this view to learn how individual questions affect the overall rating for the category. Select a survey category from the choice list to display the chart for that category.

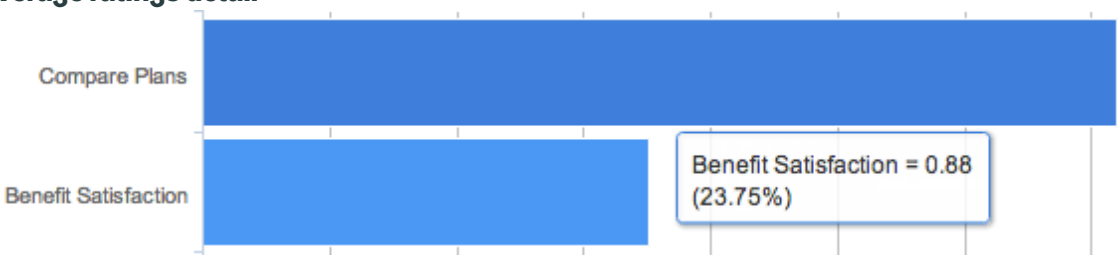
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Survey scorecard average ratings



To view the effect of each question's ratings on the entire category's ratings, point to the colored bar. The pop-up box shows the percentage of the total ratings represented by each individual question's weighted average.

Average ratings detail



Survey scorecard history

The History view compares the current ratings for the categories and their questions with ratings from the previous three years or four quarters.

Ratings that have declined are highlighted in red and display negative numbers. Ratings that have improved are highlighted in green with positive numbers. Arrow icons beside the values in the **Diff** column indicate the trend of the current survey against the previous survey.

Point to a category to display a line chart that shows the rating trend for that category. Click a category to view the Survey Category form containing the survey questions.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

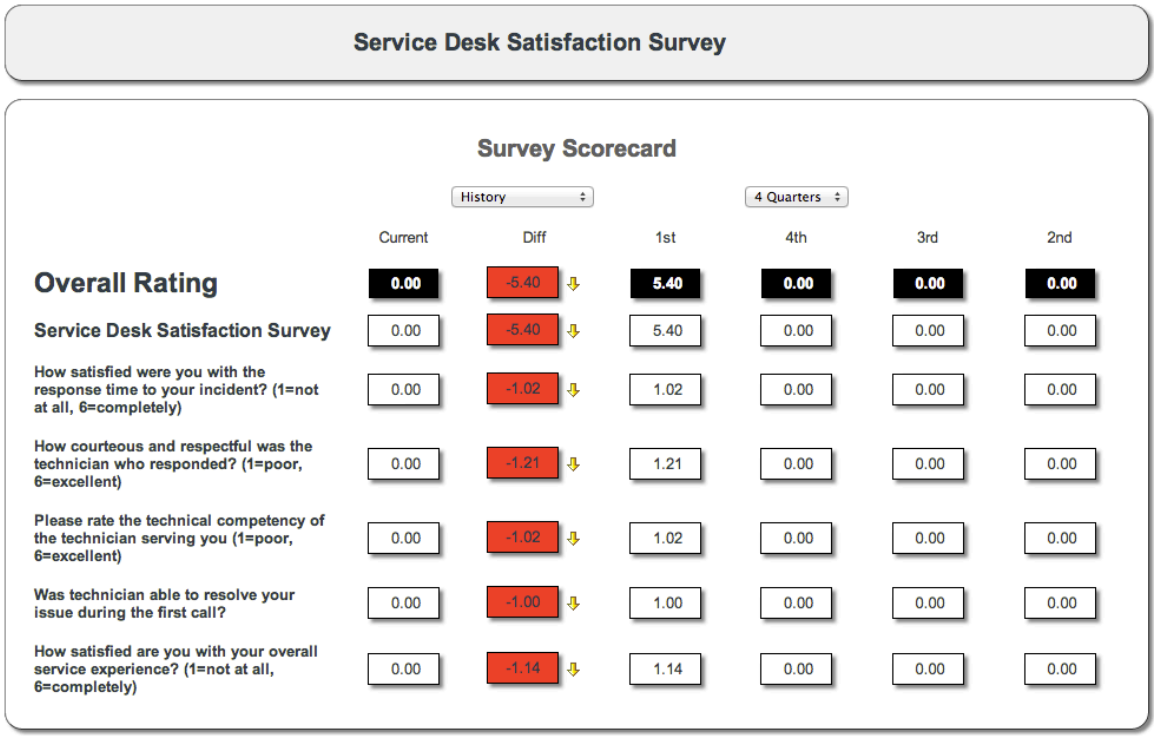
count backward, by quarter from the current quarter. For example, if the current quarter is the **3rd** quarter of 2015, then the previous quarters appear as **2nd** [2015], **1st** [2015], **4th** [2014], and **3rd** [2014]. All four of the previous quarters appear, whether or not there was any data for those quarters.

Survey scorecard history - 4 quarters



Export a survey scorecard as an image

You can export a scorecard as an image to use in presentations or other documents.

Before you begin

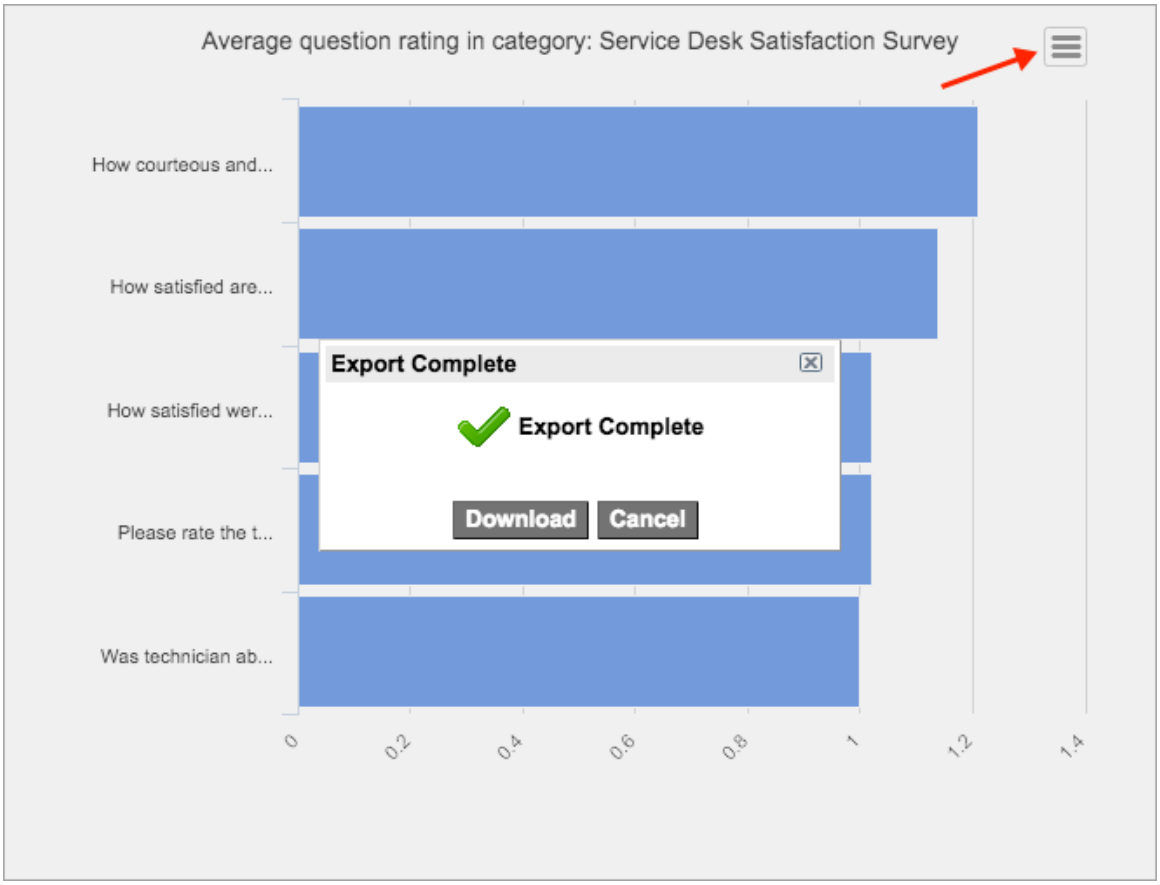
Role required: admin or survey_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Click the menu icon ( ) and select **Save as PNG** or **Save as JPEG** and wait for the export to complete.

   Example



2. Click **Download** and save the scorecard image to a storage location.

Export a quiz scorecard as an image

You can export scorecards as images.

Before you begin

Role required: assessment_admin or admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Click the menu icon and select **Save as PNG** or **Save as JPEG** as the download format.
2. When the export is complete, select **Download** to save the scorecard image to a storage location.

Request translations for surveys

Request translations for surveys to localize them into one or more languages. Localization requested items that are created for the selected surveys in all the selected languages.

Before you begin

Role required: localization_requestor

Procedure

1. Navigate to **All** > **Survey** > **View Surveys**.
2. Select one or more surveys that you want to translate.
3. From the **Actions on selected rows** list, select **Request Translations**.
4. In the **Request Translations** dialog box, select the languages.
5. Click **Submit**.

   Localization requested items are created for the selected surveys in all the selected languages. A success message with a link to the list of requested surveys is displayed. You can click the link to see the list.

Edit translations for surveys

Edit the translations for surveys, and after you make the changes, you can publish the translation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

You must install the Localization Framework Installer plugin (com.glide.localization_framework.installer) before you begin to edit the translations for a survey. To know more, see Localization Framework.

Role required: localization_editor

Procedure

1. Navigate to **All** > **Survey** > **View Surveys**.
2. Open a survey for which you want to edit translations.
3. Click **Edit Translations**.

   You can do the following actions while editing translations:

   - Edit translations manually.
   - Use machine translation (if you have configured in Localization Framework settings) to translate the fields, which are not translated. For more information about machine translation, see Create a translator configuration.
   - Export files for translation. To export files, click **Export Source File**, choose the file type, and then click **Export File**.
   - Import translated files to update the translations. To import files, from the **Export Source File** list, select **Import Translated File**.
4. After your changes are completed, click **Publish Translations**.

   After survey translations are published, they are made available to any user who takes a survey.

Survey responses in a database view

You can view survey responses in a database view for reporting purposes. For each survey instance, you can view the instance as a single row and the answers to each survey question (metric) in the corresponding columns. Analyze the responses easily and, if you want, export the survey responses.

You can create a database view on the Survey Definition form. After the database view is created, you can either export the survey response using the standard capabilities of the ServiceNow® platform or choose to create a report of the survey responses using the Reporting module.

Use the **View Responses in Rows** related link on the Survey Definition form to view each survey instance response in a separate row and each survey question as the name of the corresponding column. The answer to the question is displayed in that column. To export the survey response in a tabular form, in the context menu, click **Export**.

The first three columns of the form show the number of the survey instance (instance ID), who the survey is assigned to, and the task. A maximum of five active metrics are displayed in the view by default. The Survey Definition form doesn't show the **View Responses in Rows** related link when the following conditions occur.

- There are more than five active metrics.
- There are no responses to the survey instance.
- There are more than 100 K responses for that particular survey. To view this database view of the survey responses, the number of responses must be less than or equal to 100 K. But, the database view is still accessible for more than 100 K responses when it's already open in a new tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The database view can show the start date, due date, expiry date, and completed date, but this information is not available by default. If the survey instance is triggered, then the trigger record is displayed in the Task column. The total number of survey responses isn't displayed in the database view. For the ranking and multiple-choice metrics, based on user survey responses, multiple records are displayed instead of one record per survey instance.

Note:
Any change or update to survey configuration or metadata (For example, addition or deletion of a new metric or category) might affect the database view. In such cases, an event (survey.results_view.updated) is generated so that users can take necessary actions to synchronize the data.

Survey administration

Survey administrators—users with the survey_admin role—create and maintain surveys and configure how they are distributed and published. Surveys on Service Portal are also supported.

Survey administration includes the following procedures.

- Create, customize, and publish surveys.
- Write and maintain survey questions.
- Define trigger conditions for when surveys are sent to users, such as when an incident closes.
- Maintain surveys and survey questions as the organization's needs change.

To set up surveys in Service Portal, you must first install Service Portal and then Create and edit a page using the Service Portal Designer on the page. The base system includes the Survey widget.

View survey reports

Use the Survey Overview dashboard to view various survey reports, such as Surveys by Metric Type and State.

Before you begin

Note:
The **Survey Overview dashboard** is deprecated. It is no longer deployed, enhanced, or supported. For details, see the Deprecation Process [KB0867184] article in the Now Support knowledge base.

Role required: survey_admin, survey_reader, or admin

About this task

The dashboard displays your survey reports arranged in widgets. You can add new widgets to the dashboard.

Procedure

1. Navigate to **All** > **Survey** > **Overview**.
2. Click the elements within the reports to view more information.

   For more information about working with dashboards, see Dashboards.

Survey designer

Users with the survey_admin role can use the survey designer. The survey designer lets you create survey categories and questions, configure the details, and publish the survey to specific users or groups.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can assign a survey to individual users or groups who receive all the questions from all the categories. You can also customize each question and make it dependent on the response to another question. The following describes the procedures you follow to create and publish a survey.

- Create survey categories.
- Create questions within each category.
- Configure survey details, such as introductory and closing remarks and time limit.
- Select recipients for the survey.
- Publish the survey to the selected users or groups.

Note:
The survey designer replaces the survey creator in the Legacy Surveys application. If you are using Internet Explorer version 8 or earlier, the system redirects you to the survey creator.

Publish a survey in the Survey Designer

Survey designer elements

The survey designer is accessible from **Survey** > **Survey Designer**.

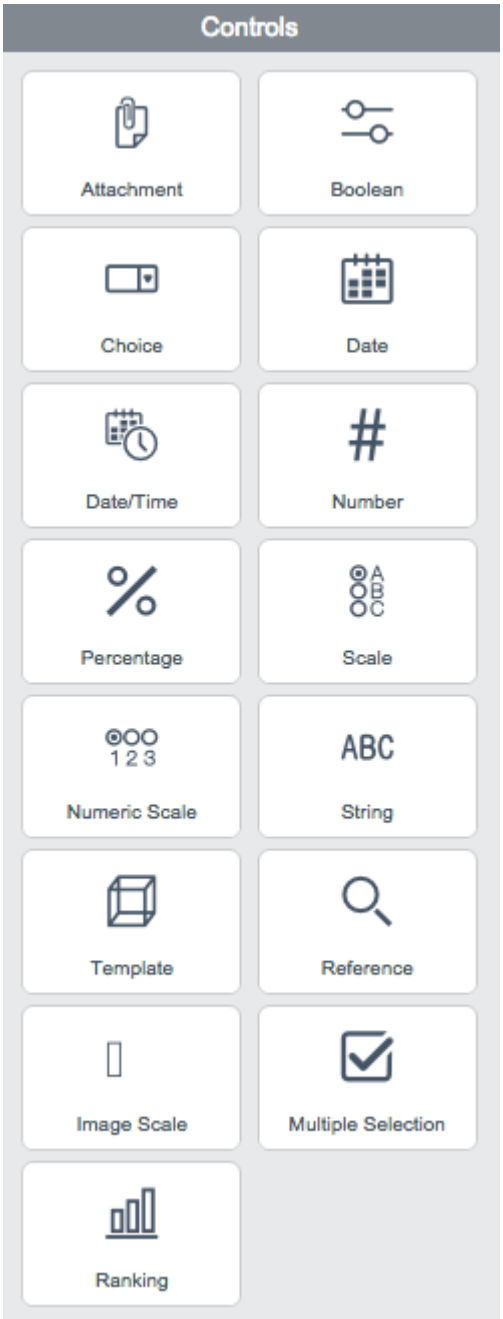
The survey designer contains the **Controls** tab, the **Questions** tab, the **Categories** tab,a header bar, and the design canvas.

Controls tab

To create a question, drag the appropriate data type control from the **Controls** palette and drop it onto the designer canvas.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Controls



The assessment engine provides a built-in result calculation feature that converts responses to scored question data types to a score from 0 through 10.

Question data types

Data type	Scored	Description
Attachment	No	Question with a Manage Attachments icon that allows users to attach one or more files.
Boolean	Yes	Question with a check box or *Yes* and *No* choices for user responses.
Choice	Yes	List of predefined options. For more information, see the definition of the **Choices** field in Create a question in the survey designer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Question data types (continued)

Data type	Scored	Description
		Note: The Choice values can only be numeric, string values will not be saved.
Date	No	Date field.
Date/Time	No	Date and time field.
Number	No	Number field with predefined minimum and maximum values. The default is 1-10.
Percentage	No	Percentage field with a prescribed range.
Scale	Yes	Predefined Likert scale. Answer options appear as radio buttons.
Numeric Scale	Yes	Selectable number scale. The default is 1-5. Answer options appear as radio buttons.
String	No	Single or multi-line text field.
Template	Yes	Choice list of templates that provide a predefined scale of options. For details, see Quiz scorecards.
Reference	No	Choice list of fields from a specified reference table. This data type does not support reference qualifiers. For example, a user could select a user name if you specify sys_user as the reference table.
Image Scale	Yes	Question with a choice of images that can be selected. A template can be used to apply the same images to multiple questions.
Multiple Selection	Yes	Question with multiple check boxes that can be selected.
Ranking		Question with an order number to be selected for each option. One order number cannot be selected twice. This question can be mandatory and it can also be dependent on a parent question, but not vice versa.

Questions tab

This tab displays all metrics added to the question bank for surveys. Use the **Filter** field to search for questions. Each metric is displayed with its name and type.

Categories tab

This tab displays all metric categories added to the question bank for surveys. All metrics in the question bank are group under the corresponding metric category. Use the **Filter** field to search for categories or questions.

© 2026 ServiceNow, Inc. All rights reserved.

Header bar

The tabs on the header bar display views and a menu of functions. Click a tab to change the view on the canvas:

- **Design**: Add and configure the properties of categories and questions. This is the default view.
- **Configuration**: Create introductions and end notes for surveys and select a signature.
- **Availability**: Select the recipients for each category in the survey.

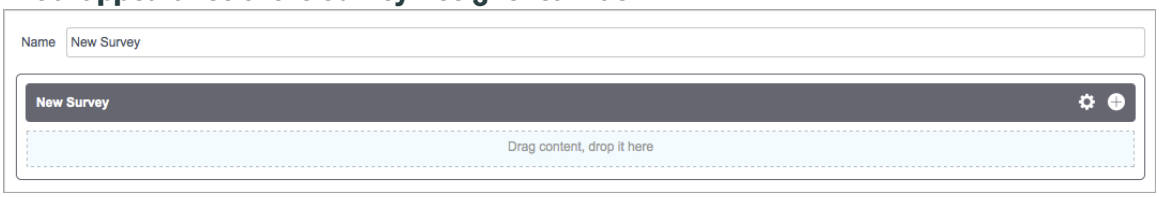
Point to the menu icon ( ) to select an option. The list of options depends on the currently open survey.

- **Save**: Save the current survey without changing its state.
- **Preview**: Display a preview of the survey as it appears to recipients.
- **Publish**: Distribute the survey to the selected recipients.
- **Save and Publish**: Save the survey to the **Draft** state and distribute the survey in one step.
- **New Survey**: Open a fresh canvas for a new survey.
- **Load Survey**: View the list of existing surveys.
- **Copy Survey**: Copy the current survey.

Design canvas

New surveys open in the canvas of the **Design** view. The survey **Name** field appears above first category in the canvas. A blank question field appears in the category container.

Initial appearance of the Survey Designer canvas



Configure a survey in the survey designer

Configuration settings apply to the entire survey.

Before you begin

Role required: survey_creator, survey_admin, or admin

Procedure

1. Navigate to **All** > **Survey** > **View Surveys**.
2. Open a survey definition in Survey Designer.
3. Select the **Configuration** tab.
4. On the Survey Designer Configuration form, fill in the fields.
   For a description of the field values, see Survey Designer Configuration form.
5. Select the **Availability** tab and complete the form.

Survey categories

Survey categories provide a way to group questions of a similar theme for a given survey.

There must be at least one survey category per survey definition and every survey question must be associated with a category. When you create a survey, the system generates one category, which all the questions belong to.

For simple surveys, one category is usually enough. Consider creating additional categories if you want to accomplish any of the following tasks.

- Separate groups of questions into collapsible sections by category on the survey questionnaire.
- Report on category scores, which are calculated based on responses for all questions within each category.

Create a category in the survey designer

A category represents a theme for evaluating a specific element of the survey topic and contains questions pertaining to that theme.

Before you begin

Role required: admin or survey_admin

About this task

When you create a survey, the system creates a default category, using the name of the survey. You can use this category, modify it, and create additional categories as needed. To have any results, a category must contain scored questions.

Procedure

1. Navigate to **All** > **Survey** > **Survey Designer**.
2. Enter the name of the survey in the **Name** field.
   The system uses this name as the name of the survey and of the first category.
3. To configure the category, click the gear icon in its title bar and complete the following steps in the Properties dialog box.
   a. Enter a new name and a description for the category.
   b. Enter text in the **Details** field that introduces or explains the category to recipients.
   c. Click the **X** icon to close the Properties dialog box and save your settings.
4. To add a new category, click the **+** icon in the title bar of an existing category.
   The new category appears below the category that you selected to create it. You can click the **X** icon in a category header to delete a category that you added in error.

Create a survey category in a survey

You can modify an existing survey to add one or more survey categories.

Before you begin

Role required: admin or survey_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
Only one category is required for each survey, but you can add additional categories as needed.

Procedure
1. Navigate to **All** > **Survey** > **View Surveys**.
2. Open a survey definition.
3. In the **Metric Categories** related list, open a category or click **New**.
   Each survey category is stored as a record on the Metric Category [asmt_metric_category] table with a modified view for survey use.
4. Enter the survey category name and description.
   The category name appears on questionnaires when either of the following is true.
   - There is more than one category for the survey.
   - There is only one category and its name is different from the survey definition name. If you create a survey using the survey creator, the category name is the same as the survey definition name.
5. Right-click the form header and click **Save**.
   The **Assessment Metrics** and **Users** related lists appear.
6. Click **Update**.

Create a question in the survey designer

You can create multiple questions for each category in the survey designer, but each question can only be associated with one category.

Before you begin
Role required: admin or survey_admin

About this task
The data type that you select for each question determines how it can be answered by survey recipients.

Procedure
1. In the Design view, drag a data type icon from the Controls palette and drop it into a category container.
2. To configure the question, click the gear icon in its title bar.
   The Properties dialog box opens.
3. On the Properties form, fill in the fields.
   For a description of the field values, see Properties form.
4. To create any special conditions that must be met before the question appears on the survey, click the Dependency tab.
   The question must have a data type of **Boolean**, **Choice**, **Scale**, or **Template**.

   For example, the question, “How many states have you visited in India”, is a dependent question for the current question “Have you visited any other state in India?”. The dependent question appears exactly below the current question only if your answer satisfies the condition in the current question. If not, the dependent question does not appear anywhere in the survey.

5. Select a question in the **Displayed when** field.
   The system selects the appropriate operator and displays the possible answers for the selected question.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Select the answer that satisfies the condition.
   You can select more than one answer. Selected answers are indicated by a check mark.

   The system prevents recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A.
7. Click the **X** icon to close the question properties dialog box and save your settings.
8. To add a question with the same data type as an existing question in the category, click the **+** icon in the title bar of the existing question.
9. Drag and drop questions to change their order within a category or move them between categories.
10. To delete a question, click the **X** icon in its title bar.

Survey question template

Create a survey designer template question

Survey question data types

You must choose a data type for each survey question. The data type determines the format of the question and the kind of data that is collected on survey questionnaires.

The following data types are available for surveys:

Attachment data type

On questionnaires, users can attach one or more files to a question.

Users click the Manage Attachments icon and select one or more files in the Attachments pop-up window to attach to the question. From this window, users can:

- View a list of the attached files.
- View an attached file in a separate window.
- Rename an attached file.
- Add or delete files

Once a survey has been submitted, attachments cannot be updated or deleted.

Any type of file supported by the platform can be attached to a question. One or more files can be attached a question while taking a survey or completing an assessment.

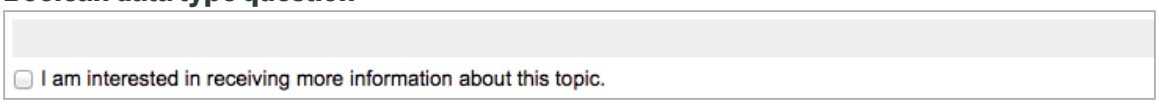
The assessment administrator can see the attachments associated with an individual question as well as those associated with the survey.

See Administering attachments for more information.

Boolean data type

On questionnaires, users select a check box beside a statement or leave it cleared.

Boolean data type question



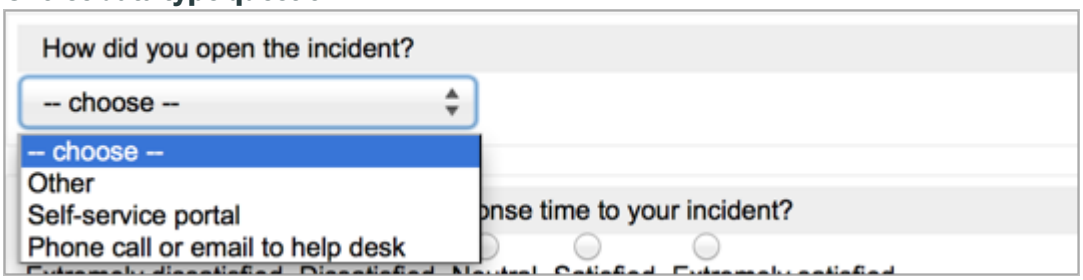
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you select **Boolean**, you must fill in the **Scale definition** field. Select **High** if it is best when users select the check box.

Choice data type

On questionnaires, users select a value from a list of choices.

Choice data type question



If you select **Choice**, you must fill in the **Scale definition** field and create answer options. Select **High** for the scale definition if the answer option with the largest metric definition **Value** is best.

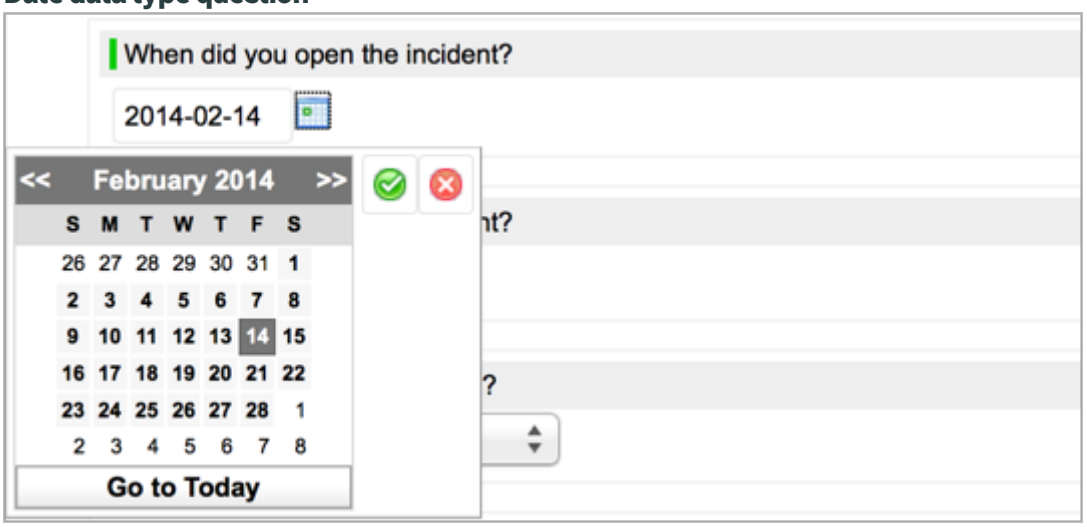
> **Note:**
> The system sets the **Min** and **Max** fields automatically based on the **Value** settings for the associated metric definitions.

Date and Date/Time data types

The **Date** and **Date/Time** data types are similar.

- **Date:** On questionnaires, users select a date.

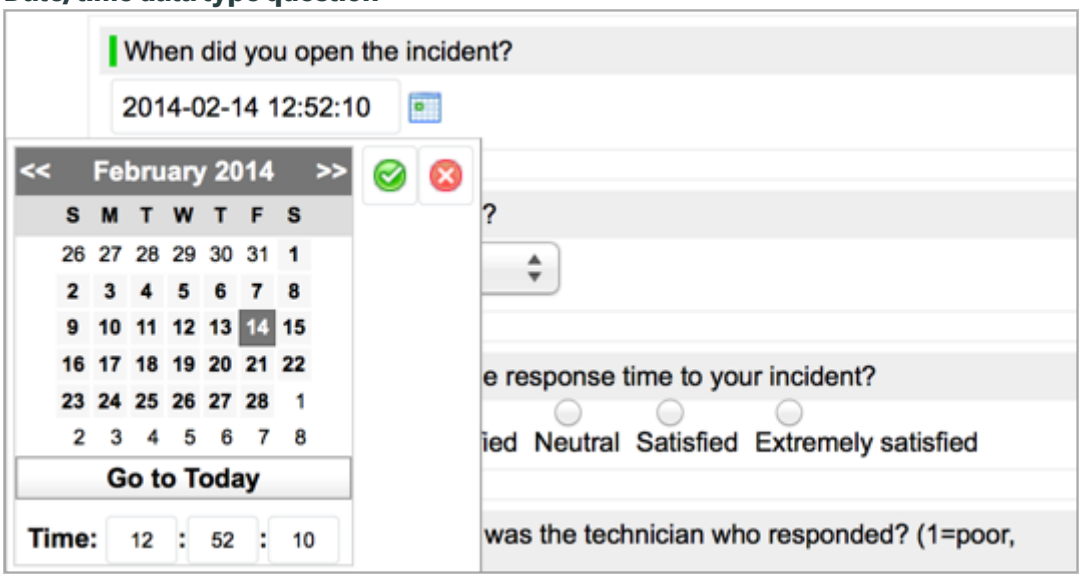
Date data type question



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Date/Time:** On questionnaires, users select a date and time.

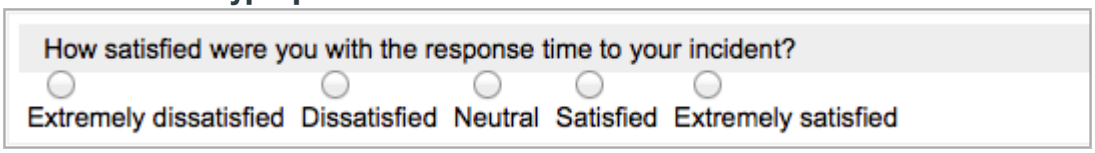
Date/time data type question



Likert Scale data type

On questionnaires, users select a multiple choice value from a custom Likert scale. Each answer option is represented by a radio button on the scale. A Likert scale question that evaluates an application's ease of use might have the answer options **Easy**, **Average**, and **Difficult**.

Likert scale data type question



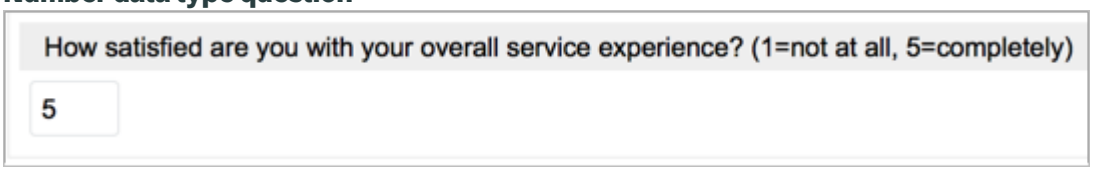
If you select **Likert Scale**, you must fill in the **Scale definition** field and create answer options. Select **High** for the scale definition if the answer option with the largest metric definition **Value** is best.

Note:
The system sets the **Min** and **Max** fields automatically based on the **Value** settings for the associated metric definitions.

Number data type

On questionnaires, users enter a number.

Number data type question



If you select **Number**, you must fill in these additional fields:

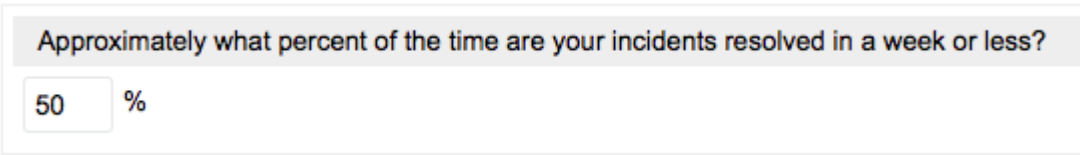
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Scale definition**: Select **High** if a larger number is better, such as for a question that measures the number of sales made in a quarter.
- **Min** and **Max**: Enter the smallest and largest numbers users can enter. State the range of acceptable answers in the question text.

Percentage data type

On questionnaires, users enter a number.

Percentage data type question



If you select **Percentage**, you must fill in these additional fields:

- **Scale definition**: Select **High** if a larger percentage is better, such as for a question that measures the percentage of work an agent has completed.
- **Min** and **Max:** Enter the smallest and largest numbers users can enter. Generally **0** and **100** are appropriate minimum and maximum values. If you choose values other than **0** and **100**, it is usually best to state the range of acceptable answers in the question text.

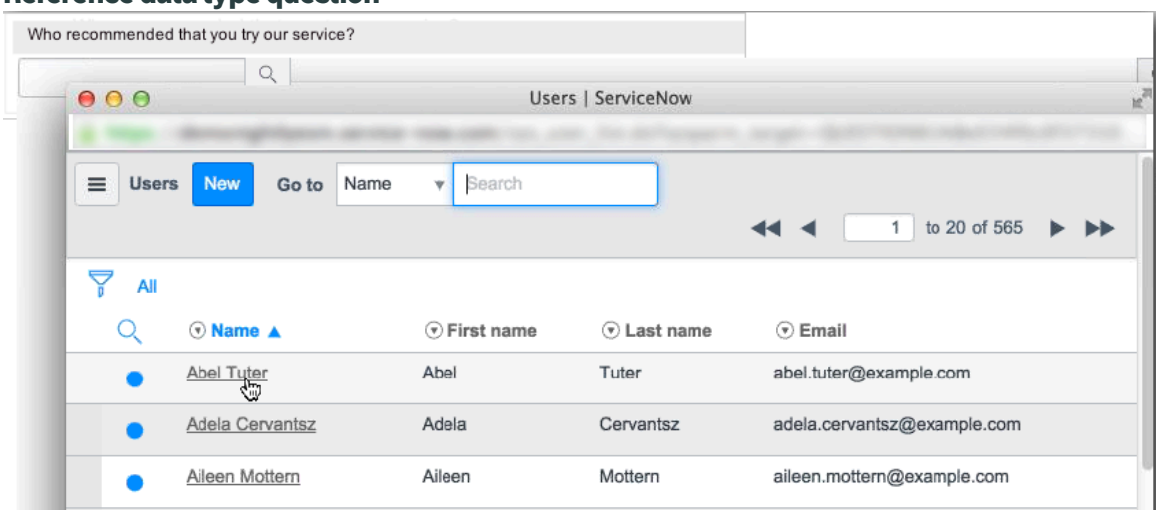
Reference data type

On questionnaires, users select a value from a list that is generated from a specified reference table. The response field supports auto-completion.

Note:
Reference qualifiers are not supported.

For example, a user could select a user name in response to a question if you specify User [sys_user] as the reference table.

Reference data type question



String data type

On questionnaires, users enter text. When you select **String**, the **String option** field appears. Select one of the following options to determine how the string field appears on questionnaires:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Single line**

- **Single line wide**

- **Multiline**

Template data type

On questionnaires, users select a value from a predefined series of answer options. To use this data type, a question template must be defined.

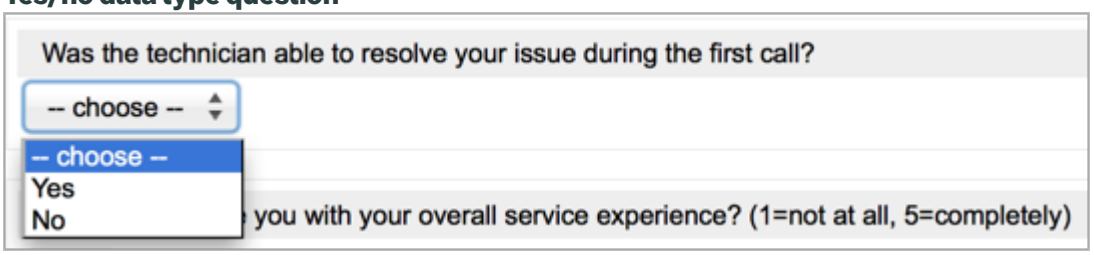
If you select **Template**, you must fill in these additional fields:

- **Template**: Select a template.
- **Scale definition**: Select **High** if the answer option with the largest template definition **Value** is best.

Yes/No data type

On questionnaires, users select **Yes** or **No** from a list.

Yes/no data type question



If you select **Yes/No**, you must fill in the **Scale definition** field. Select **High** if **Yes** is the best answer.

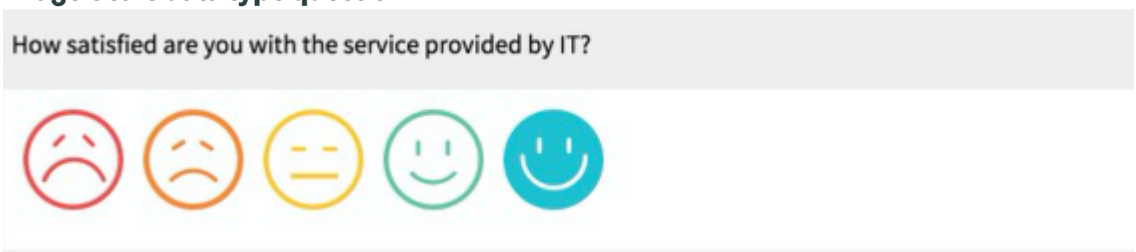
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Image Scale data type

On questionnaires, users select an image from a predefined set of images as their response. Image scale questions can also be used in a template for better performance with surveys that have the same type of answer options.

Five emojis, similar to the Likert scale (very dissatisfied to very satisfied) are provided. However, you can upload additional images in JPG, PNG, or GIF format. Two images can be uploaded, one for selected case and another for unselected case. For example, the selected image can be , and the unselected image can be . Larger size images are reduced to 64 x 64 pixels.

Image Scale data type question



The result behavior depends on the presence of uploaded images. If no selected image is uploaded, then the question shows up blank.

Selected image	Unselected image	Result
Yes	Yes	Unselected image loads. Clicking the image changes it to the selected image.
Yes	No	Selected image loads with 50% opacity. Clicking the image changes the opacity to 100%.
No	Yes	A blank placeholder box is displayed.
No	No	A blank placeholder box is displayed.

Note:

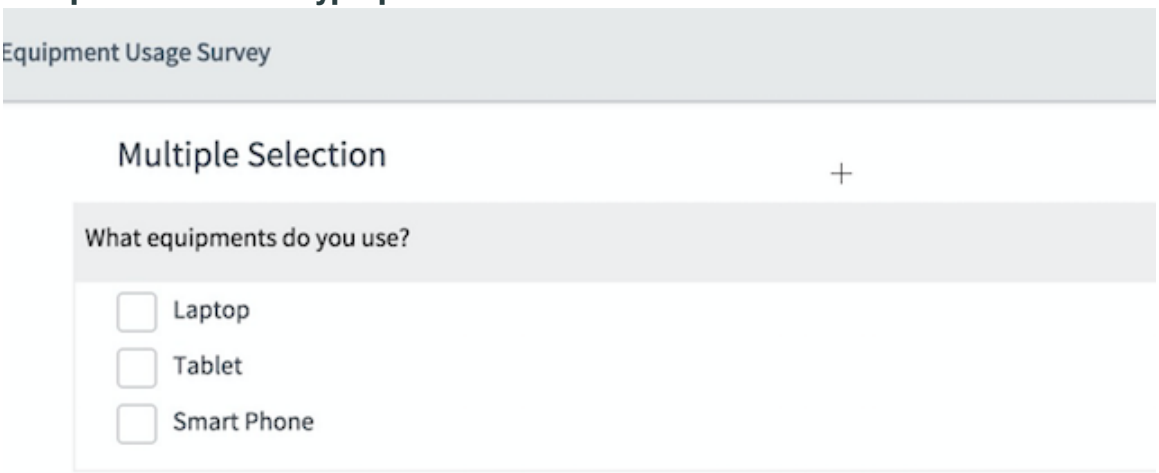
- N/A option is not supported for image scale type question.
- For an image scale type question, an empty string is saved as an answer for a hidden and dependent question of an unselected image.

Multiple selection data type

On questionnaires, users can select multiple check boxes indicating all answers that apply. For instance, a user can be instructed to "Select all that apply" in a multiple selection question.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Multiple Selection data type question



Ranking data type

On questionnaires, users can select a different order number for each option to rank them. Drag-and-drop functionality is also supported, which allows a user to either fill in the number, or simply drag an option.

Setting the order of the options

One order number cannot be selected twice. This question can be mandatory and it can also be dependent on a parent question, but not vice versa.

Create custom metric type

Create your own custom metric type if you don't find the metric type that you want in Survey Designer while designing surveys.

Before you begin

Role required: survey_admin, survey_creator, or admin

About this task

You can use the Custom Metric Type module for surveys to create the custom metric type. If you set the custom metric type using the Now Mobile app, ensure that the widgets support the current theme of Mobile Employee Service Portal.

Procedure

1. Navigate to **All** > **Survey** > **Administration** > **Custom Metric Type**.
2. On the Custom Metrics page, click **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the Custom Metric form, fill in the fields.
   For a description of the field values, see Custom Metric form.
4. Select **Submit**.

Note:

- Updating or deleting existing values in the **Macro**, **Widget**, and **Result type** fields might cause inconsistent effects.
- The custom metric type that you created doesn't appear for the public surveys. To make it visible for the public surveys, open the Service Portal configuration and configure your survey widget to make it public. For more information about configuring widget security, see Configure widget security.
- If the custom metric type is inactive or deleted, the question is not rendered on the survey form.
- If the value in the **Macro** or **Widget** field is updated, the updated value is used to render a survey form even if an instance was created before updating the values for macros or widgets.

Edit a survey in the survey designer

You can modify surveys using the survey designer.

Before you begin

Role required: admin or survey_admin

About this task

You can edit a survey even after it has been distributed, with the following results.

- Added questions are available only on surveys that are distributed after this change.
- Changes to existing questions are immediately available to users before the survey is submitted or during the retake period. This includes changes to the answers, such as additional choices or changes to the data type.
- Deleted questions are also deleted from the distributed surveys in user queues.

Note:
You can only edit a survey that has the same application scope as that of your current session.

Procedure

1. Navigate to **All** > **Survey** > **Survey Designer**.
2. Point to the menu icon in the survey header bar, and select **Load Survey**.
3. Select a survey from the list and modify it as needed.
4. Point to the menu icon in the survey header bar, and select **Save** or **Save and Publish**.
   When you publish the edited survey, the system generates survey instances for any associated survey users.

Configure category weights for a survey

You can assign a weight to each category in a survey. The system calculates results from the weight that you configure.

Before you begin

Configure the Survey Category form to display the **Weight** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: admin or survey_admin

About this task

Weights are set to a value of **10** by default but can be changed.

Procedure

1. Navigate to **All** > **Survey** > **View Surveys** and select a survey from the list.
2. In the Survey Definition form, select a category from the **Metric Categories** related list.
3. Edit the default weight value.
4. Click **Update**.

View a survey instance

A survey instance represents one questionnaire assigned to one user. You view an instance to verify that survey instances were created, to check the state of a survey instance, or to reassign a survey instance.

Before you begin

Role required: admin or survey_admin

Procedure

1. Navigate to **All** > **Survey** > **Survey Instances**.

   The following sub-modules are available based on the state of the instances:

   - **Ready to take**: Displays survey instances that are ready to be taken by the user. By default, these instances are sorted in ascending order by the **Number** field.
   - **In progress**: Displays survey instances that are in progress. By default, these instances are sorted in ascending order by the **Number** field.
   - **Completed**: Displays survey instances that are complete. By default, these instances are sorted in descending order by the **Taken on** field.
   - **Cancelled**: Displays survey instances that are cancelled. By default, these instances are sorted in ascending order by the **Number** field.
   - **All**: Displays survey instances in all states. By default, these instances are sorted in ascending order by the **Number** field.

2. Open a survey instance from the required sub-module.

   By default, you can view the following fields in the Survey Instance form for all sub-modules other than **Completed**.

   - **Number**
   - **Metric type**
   - **Due date**
   - **State**
   - **Assigned to**
   - **Domain**
   - **Expiration date**
   - **View User's Response**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Retry Sentiment Analysis**
- **Assessment Instance Questions**

Note:

- When you open an instance in the **Completed** sub-module, you are redirected to the User's Response page.
- Each survey instance is stored as a record on the Assessment Instance [asmt_assessment_instance] table with a modified view for survey use.

Related topics

Schedule periods

Event scheduling

Survey users and groups

Survey users and survey user groups help survey administrators control who can take a survey.

Survey administrators can restrict a survey so that only specified users can access it unless a survey administrator manually assigns the survey to a different user. Survey user groups provide a way to quickly designate multiple survey users.

Administering survey users

The list of survey users for a survey is visible on the Survey Definition and Survey Category forms. You can add or remove users from the list of survey users at any point. Note that designating a survey user does not automatically generate a survey instance for that user unless both of the following conditions are true:

- The survey definition **Schedule** period is set to **Daily**, **Weekly**, **Monthly**, or **Yearly**. In this case the system assigns a new survey instance to each survey user at the beginning of each schedule period.
- The user has no instances of the survey that are incomplete or that have not yet reached their expiration date.

You can designate survey users from the Survey Designer, the Survey Definition form, or the Survey Category form.

Note:
If there are trigger conditions for a survey, do not create survey users. Instead, use the Trigger Conditions form to assign users.

Create a survey user group

Survey user groups are groups that have the **Type** field set to survey and display only the information most relevant to surveys. You can assign survey groups or any user group to surveys.

Before you begin
Role required: admin or user_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Though it is possible to designate members of any group as survey users, one reason to create a survey group is to view it conveniently in the survey **User Groups** module.

By default, the Survey Creators user group is available. When you add a user to this group, the user will be assigned the survey_creator role to create surveys, quizzes, or assessments and view only those surveys, quizzes, or assignments created by the user.

Procedure

1. Navigate to **All** > **Survey** > **Administration** > **User Groups**.
2. Click **New**.
3. Complete the Group form.
4. Right-click the form header and click **Save**.
   The **Group Members** and **Groups** related lists appear.
5. To add group members, complete the following steps.
   a. In the **Group Members** related list, click **Edit**.
   b. Select users from the list on the left and add them to the **Group Members List** on the right.
   c. Click **Save**.

Related topics

Create a group

Select recipients for a survey in the Survey Designer

You can assign survey users while designing or modifying the survey.

Before you begin

Role required: admin or survey_admin

Procedure

1. In the Survey Designer, click the **Availability** tab.
2. Under **Accessible by:**, select the **Specific users** option, then select users.
3. If desired, select the **Survey groups only** check box, then select survey user groups or other groups.
4. Click **Save**.

Designate a survey user

You can designate one survey user at a time from the Survey Definition form.

Before you begin

Role required: admin or survey_admin

Procedure

1. Navigate to **All** > **Survey** > **View Surveys**.
2. Open a survey definition.
   There must be at least one category.
3. In the **Survey Users** related list, click **New**.
4. Select a **User**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Click **Submit**.
   The Survey Definition form reopens.
6. **Optional:** To remove survey users, in the **Survey Users** related list, select the check box beside the user, and then select **Delete** from the action list below the list.

Designate or remove multiple survey users at one time

Use the Survey Category form to designate or remove multiple survey users at a time.

Before you begin
Role required: admin or survey_admin

Procedure

1. Open a survey definition.
2. In the **Metric Categories** related list, open a category.
   You can choose any category. The system applies survey user changes to all the survey's categories automatically.
3. In the **Users** related list, click **Edit**.
4. Use the slushbucket to add or remove survey users.
5. Click **Save** to return to the survey category.
   The changes are also reflected in the **Survey Users** related list on the survey definition.

Allow recipients to retake a survey

You can configure a survey to allow recipients to resubmit their answers as many times as they like, up to the survey's due date.

Before you begin
Configure the Survey Definition form to display the **Allow retake** field. For more information, see

Configure the form .

Role required: admin or survey_admin

About this task
Results are not calculated for the survey until the configured duration has elapsed. The card in the user's queue remains visible until the due date of the survey, and a button is displayed to allow retakes.

Procedure

1. Navigate to **All** > **Surveys** > **View Surveys**.
2. Select a survey from the list.
3. Select the **Allow retake** check box.
4. Click **Update**.

Copy a survey

Create a copy of a survey with at least one category to reduce the effort of creating another survey with similar data.

Before you begin
Role required: survey_admin or admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
All associated questions (type), configurations, categories, metrics, domain separation rules, and role-based categories are copied. Assigned users, category users, instances, and trigger conditions are not copied.

Procedure
1. Navigate to **All** > **Survey** > **View Surveys**.
2. Open a survey definition.
3. Perform any of the following steps.

Publish a survey

You must publish a survey to enable people to receive and complete survey instances.

Before you begin
Role required: admin or survey_admin

About this task
The **State** field on the Survey Definition form indicates whether the survey is in the **Draft** or **Published** state.

> **Note:**
> You cannot return a survey to the **Draft** state after it has been published. You do have the option to deactivate a survey by clearing the **Active** check box.

Procedure
1. Navigate to **Survey View Surveys** and select a survey to publish.
2. Click **Publish**.
   When you publish a survey, the system generates survey instances for any associated survey users. You can assign the survey to other users manually.

Publish a survey in the Survey Designer

You must save changes to a survey before you can publish it to the specified recipients or groups.

Before you begin
Role required: admin or survey_admin

Procedure
1. In the Survey Designer, point to the menu and select **Load Survey**.
2. Select a survey to publish.
3. To preview the survey as a user, point to the menu icon and click **Preview**.
4. When you are satisfied with the survey, click either **Save and Publish** or **Publish** to distribute it.
   When you publish a survey, the system sends email notifications to the recipients and to their managers. The system displays a link to the survey on a card in each recipient's My Assessments & Surveys portal.

Customize the appearance of a survey

As an assessment and survey administrator, set properties to customize the color of various elements on the questionnaires.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: survey_admin or admin

About this task
For color properties, enter either an HTML color name or hexadecimal (hex) value. For hex values, the # character is required. Values aren't case-sensitive.

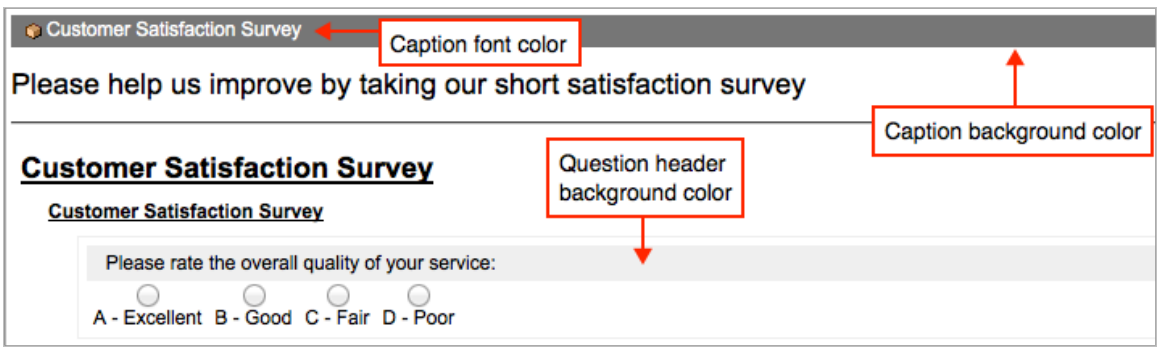
For example, if all the following formats are valid: `LightGray`, `lightgray`, and `#D3D3D3`, a preview of the color appears next to the field.

The customizations that you make apply to all assessments and surveys.

Procedure
1. Navigate to either of the following modules.
   - **Assessments** > **Admin** > **Assessment Properties**
   - **Survey** > **Administration** > **Properties**

   For a description of the properties, see .
2. On the Properties page, edit the properties as needed.
   Refer to the following screenshot to see which parts of the assessment questionnaires are controlled by the properties.

   Note:
   You can customize the **Caption font color**, **Caption background color**, and **Question header background color** only if Next Experience is turned off.



3. Click **Save**.
   Clear the browser's cache to see updates.

Survey definitions
A survey definition is the root record upon which a survey is built.

The survey designer generates a survey definition automatically when you save or publish the survey. Survey administrators may want to modify the survey definition to configure additional options for the survey, or to publish the survey when it is ready for distribution.

Survey administrators and survey readers can also send survey invitations directly to users from the survey definition.

Related topics
Send survey invitations to users

Modify a survey definition
You can configure additional options for a survey definition.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin, survey_creator, or survey_admin

Procedure

1. Navigate to **All** > **Survey** > **View Surveys**.
   Each survey definition is stored as a record on the Assessment Metric Type `[asmt_metric_type]` table with a modified view for survey use.
2. Open a survey definition.
   The **Response Trend** chart with the weekly trend of the survey instance count, and the **Survey Summary** chart with the overall summary response based on instance states are displayed.
3. Modify the fields on the Survey Definition form.

Note:
You can only edit a survey that has the same application scope as that of your current session.

Survey Definition form

Field	Description
Name	Name of the survey which appears on the questionnaire.
Description	Helpful information about the survey.
Active	Check box to activate the survey definition. When the **Active** check box is cleared, new survey instances cannot be generated and users cannot complete existing survey instances. Use the **Active** check box to deactivate or activate a published survey.
Owners	Owners of the survey. You can add a user with the survey_creator, survey_admin, or assessment_admin role.
Anonymize responses	Check box to ensure that all responses for this survey are stored without the submitting user names. When a user submits a survey, the system clears the **Assigned to** field for the associated survey instance. Also, survey responses for anonymous surveys do not contain **Assigned to** values. **Note:** The **Assigned to** field is cleared. However, each response record includes the **Created By** and **Updated By** fields that are accessible to users with the survey_admin role.
State	Status of the survey: **Draft** or **Published**.
Allow retake	Check box that allows users to modify their answers to a completed survey. Users can resubmit a survey as many times as they want until the due date. After that date, the system removes the survey from the user's My Assessments & Surveys page.
Scheduled job	Scheduled job that the system creates for this survey definition when the schedule period is a repeating interval. The system sets the scheduled job to run according to the selected schedule period. ○ If you change the schedule period and save the survey definition, the system deletes the old scheduled job. ○ If you selected a recurring schedule period, a new scheduled job is created. For example, if you change the schedule period from **Daily** to **Weekly** and save the record:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ The system deletes the daily scheduled job. ○ Creates a weekly one set to run a week from the current date. This field is visible to administrators only if the schedule period is **Daily**, **Weekly**, **Monthly**, or **Yearly**.
Assessment duration	The length of time to complete assigned survey instances, starting from the time the survey instance is generated. The assessment duration sets the Due date for each survey instance. The default duration is 14 days. Configure the form to view this field.
Send notifications	Sends notifications to the assigned users when the survey is published if there is an active notifications setup. Configure the form to see the field.
Other Options	
Sample Metric	A metric of the current survey that you can include as an image in the email or invitation sent to a survey user. When the survey user clicks the image in the email or while previewing the HTML body, the entire survey is available to be taken. **Note:** You cannot edit or delete a metric that is selected in this field.
Signature	Acknowledgement by a survey recipient of requirements, admonitions, or policies related to the survey. The signature may require the recipient to select a check box or to type in a full signature to verify having read these assertions. You can display assertions without requiring a signature. Select an existing signature from the list or click **New** to create a new one. The signature form contains these fields: ○ **Name**: Descriptive name for this signature. ○ **Signature type**: Type of signature required. The selections are **Check box**, **Full name**, or **Assertion only**. If **Assertion only** is selected, no signature is required to submit the survey. ○ **Assertion**: Text you want to display to recipients. By default, a property called **Require authentication for user signature** (*com.snc.assessment.signature_authentication*) requires users to authenticate when providing a full name signature.
Schedule period	Option that determines how often a user can take the same survey and whether the system generates survey instances on a schedule. **Note:** If you use a trigger condition for a survey, ensure the schedule period is set to **No Limit**. Trigger conditions use a different method to regulate how often users can receive survey instances.
Do not show survey introduction notes	Check box to skip the introduction notes when a survey is launched. This functionality is applicable in both the ServiceNow AI Platform and Service Portal product versions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Pagination setting for Service Portal view	The setting on which the pagination is based for desktop or tablet view in Service Portal. ○ Category: default ○ Question: 1 question per page (automatic for mobile) ○ None: no pagination **Note:** This field is displayed only when Service Portal is installed.
One Click Survey	Enables a One Click survey in Service Portal. **Note:** This option can be selected if the **Pagination setting for Service Portal view** is set to None.
Source Table	Table whose field is used as a dynamic value for a question in a triggered survey. **Note:** When you select a source table, ensure that its relevant field is selected as **Source Field** value of a metric.
Chat Survey	Option to validate if survey questions are supported in a chat survey. Enables conversational questionnaires (pre-chat and post-chat surveys) in the chat client. Also enables you to map chat context variables to survey questions. For information on a chat survey in ITSM Virtual Agent, see Surveys in ITSM Virtual Agent. **Note:** This field is available only when the Glide Conversation Server plugin (com.glide.cs) is activated.
Outlook Actionable Message	Includes an embedded survey in the survey email notification. After you select this check box and save the survey, a validation is run to ensure all survey questions are supported. **Note:** This field is available only when the Outlook Actionable Messages(sn_ms_oam) plugin is installed.
Allow Sentiment Analysis	Enables sentiment analysis for this survey.
Introduction & End Notes	
Introduction	Introductory content to display on survey questionnaires. Consider adding a company logo, a welcome message, background information about the survey, or instructions.
End note	End note that appears when someone submits a survey questionnaire. Consider adding a thank you message, follow-up instructions, or other applicable information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Related Links	
Enable Public Access Remove Public Access	Link that enables/disables the survey as a public survey. No login is required to take a public survey (including a survey with a trigger condition) and users or non-users can respond anonymously. For completed public surveys, the **Assigned to** field value is Guest. **Note:** You can use the **View Survey URL** related link to share the URL with users.
View Responses	Link that opens the list of responses for this survey. This related link is available only if there are results for the survey.
View Scorecard	Link that opens the scorecard for this survey. This related link is available only if there are results for the survey.
View Survey URL	Link that opens a dialog box that displays a URL for this survey. The URL is useful for sharing a public survey. This related link is available only if the **Active** check box is selected. The URL does not work until the survey definition is published.
Show Benchmarks	Opens the Benchmarks Dashboard that provides visibility into your key performance indicators (KPIs) and trends. **Note:** ○ This related link is available only for survey_admin, assessment_admin and survey_reader with bm_viewer role. ○ You must opt in to Benchmarks to view the dashboard. See Enable Benchmarks ○ This is applicable only for a published survey.
Create Improvement Initiative	Opens the Improvement Initiative window to create an improvement initiative record that helps in improving the performance of the survey. **Note:** ○ This related link is available only for the survey_admin and assessment_admin role. A survey_reader can only view the created improvement initiative records. ○ You should activate the Continual Improvement Management plugin (com.sn_cim).
Retry Sentiment Analysis	Checks all survey instances of this survey that do not have sentiment analysis data and sends them for analysis.
Related Lists	
Trigger Condition	Displays all the trigger conditions associated with the survey.
Survey Responses	Displays all the responses associated with the survey.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Metric Categories	All survey categories for this survey.
Survey Users	All survey users who are authorized to take this survey. If no users are listed, any user can take this survey.
Assessment Instances	All survey instances for this survey. Configure the form to add this related list to see it. **Note:** If you add a related list to the form, use list control to omit the **New** button. The system generates survey instances to produce functional surveys.
Improvement Initiatives	Displays improvement initiatives associated with the survey. **Note:** This related list is available only when there is at least one improvement initiative record.
Survey Recipients Lists	Recipients lists that are added to the survey.

4. Save the record.

Publish a survey

Event scheduling

Schedule periods

The available schedule periods are **Only Once**, **No Limit**, **Daily**, **Weekly**, **Monthly**, and **Yearly**.

The default schedule period is **No Limit**. When you set the schedule period to anything except **Only Once** or **No Limit**, the system creates a corresponding scheduled job. The scheduled job performs the following actions.

- Ensures that a user can take one survey instance of the same survey per schedule period.
- Generates a new survey instance for each survey user at the beginning of the new schedule period, as long as the survey user does not have an incomplete instance of that survey. A survey instance is incomplete if the state is not **Complete**.

For example, if you set the schedule period to **Monthly** and someone attempts to send survey invitations twice in the same day, the system generates survey instances for the survey users the first time only. At the beginning of the next schedule period, the system generates another survey instance for each survey user who completed the previous one.

Schedule periods are enforced by the **Expiration date** field on the survey instance. As long as the survey instance expiration date has not passed, the assigned user cannot receive a new survey instance. When the system generates a survey instance and the schedule period is anything except **No Limit**, the **Expiration date** field is automatically set to the appropriate date.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, if the schedule period is **Weekly**, the expiration date is a week after the survey instance is generated.

If you change the schedule period, the scheduled job updates automatically to the correct schedule. However, users who have survey instances for the survey cannot receive new survey instances until their existing survey instances expire, regardless of the new schedule period.

Consider the following example: Sal Pindell receives a survey instance when the schedule period is **Weekly**. The next day, a survey administrator changes the schedule period to **No Limit**. Sal cannot receive another survey instance until one of the following actions occurs.

- Seven days pass from the time Sal's survey instance was generated.
- A survey administrator deletes Sal's survey instance.

After one of these actions occurs, Sal can receive a new survey instance anytime, as long as he has no incomplete instances of the survey.

Note:
If you use a trigger condition for a survey, ensure the schedule period is set to **No Limit**. Trigger conditions use a different method to regulate how often users can receive survey instances.

Create a survey designer template question

You can create a question that uses choice lists from a template.

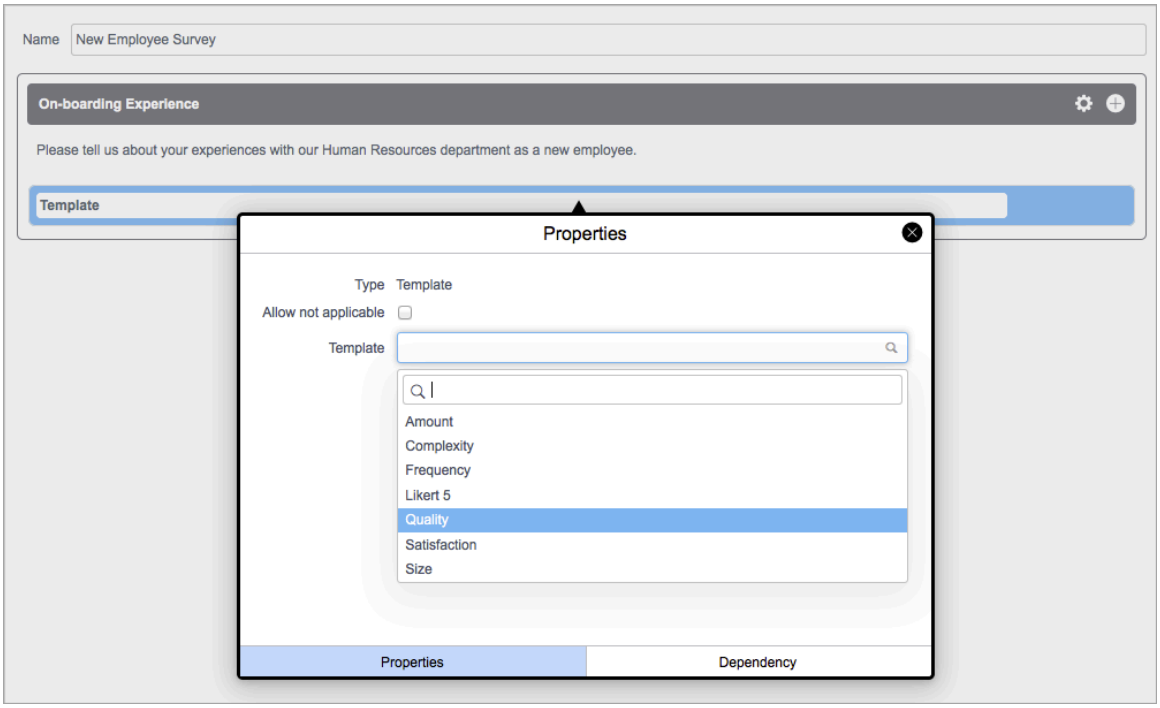
Before you begin
Role required: admin or survey_admin

About this task
For more information about the template, see Survey question template.

Procedure

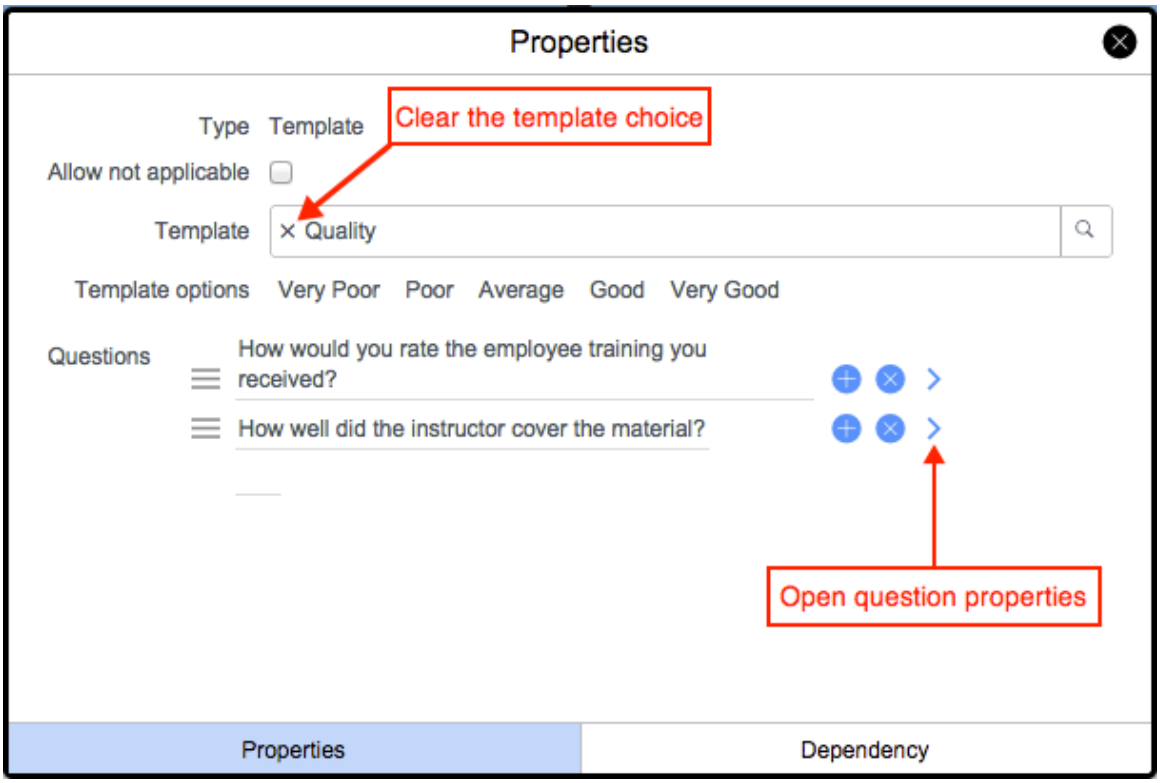
1. Navigate to **All** > **Survey** > **Survey Designer** and load a survey or create a new survey.
2. Drag the **Template** data type icon into a category container.
3. Click the gear icon in the question title bar to open the template properties dialog box.
4. Select a predefined scale from the list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



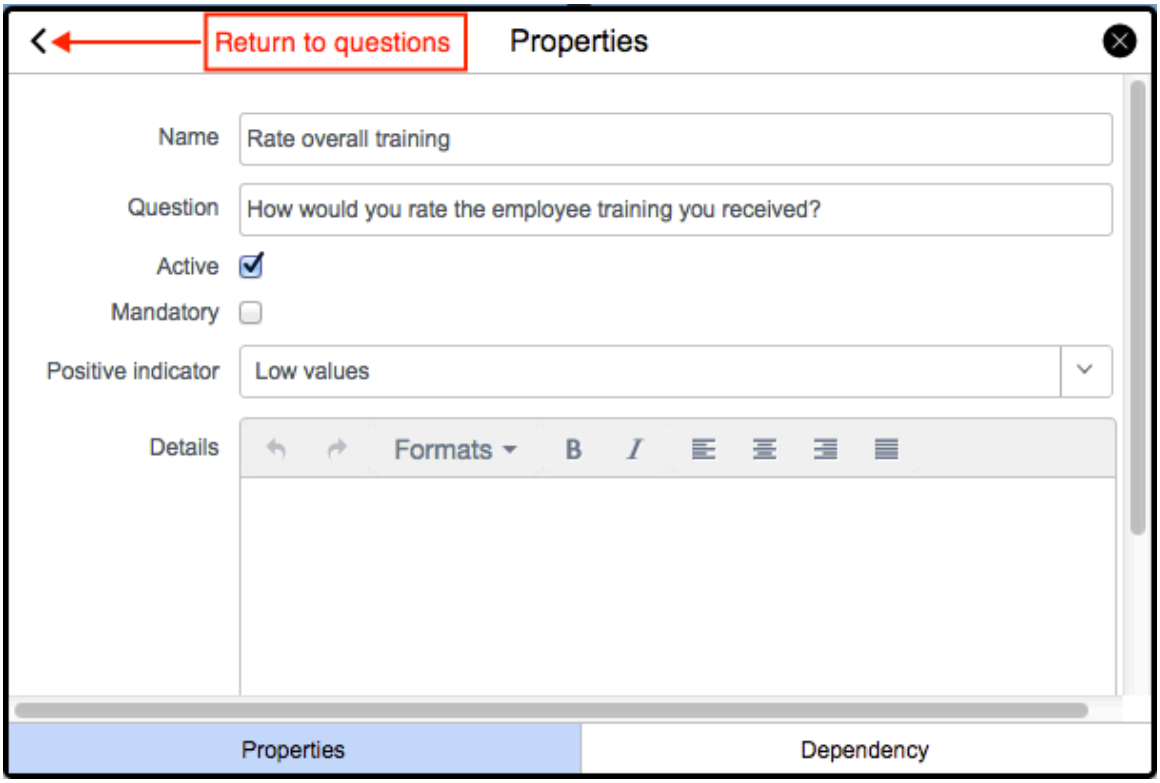
Question entry fields appear for that template.

5. Enter one or more questions that are appropriate for the template.



6. Click the arrow to the right of a question to configure its properties.
   You must provide a name for each question.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



7. Click the back arrow to return to the template properties dialog box.
8. Configure the properties for the remaining questions.
9. Click the **X** icon to close the template properties dialog box and save your settings.

Survey questions

Survey questions appear on survey questionnaires for the associated survey definition.

The survey creator generates questions and answer options automatically. However, it provides only the basic configuration options for questions, such as the question text and the data type. You may want to create additional questions or set advanced configuration options for the questions, including making a question appear conditionally or making a question mandatory. You can also use question templates to define reusable sets of answer options.

Survey questions are available from **Survey** > **Questions**. The list displays information about each question, including the associated survey definition listed in the **Type** column, and the data type. Survey administrators can modify these questions.

Create or modify survey questions

You can create and administer survey questions.

Before you begin

Role required: admin or survey_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Changes to a survey, such as the addition of questions or the modification of question templates, do not apply immediately to the existing survey instances. However, the changes apply immediately to any new survey instances that are created after the changes are saved.

Procedure

1. Navigate to **All** > **Survey** > **View Surveys**.
2. Open a survey definition.
3. In the **Metric Categories** related list, open a category.
4. In the **Assessment Metrics** related list, open an existing question or click **New**.
   Each survey question is stored as a record on the Assessment Metric [asmt_metric] table with a modified view for survey use.
5. On the Survey Question form, fill in the fields.
   The fields that appear depend on the selected **Data type**.

   For a description of the field values, see Survey Question form.
6. Save the record.

Note:

- Be sure to create answer options if you select the **Choice** or **Likert Scale** data type.
- You cannot delete a survey question (metric) with user responses. To delete a survey question with user responses, you should delete the responses, and then delete the survey question.

Survey trigger conditions

Survey question data types

You must choose a data type for each survey question. The data type determines the format of the question and the kind of data that is collected on survey questionnaires.

The following data types are available for surveys:

Attachment data type

On questionnaires, users can attach one or more files to a question.

Users click the Manage Attachments icon and select one or more files in the Attachments pop-up window to attach to the question. From this window, users can:

- View a list of the attached files.
- View an attached file in a separate window.
- Rename an attached file.
- Add or delete files

Once a survey has been submitted, attachments cannot be updated or deleted.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Any type of file supported by the platform can be attached to a question. One or more files can be attached a question while taking a survey or completing an assessment.

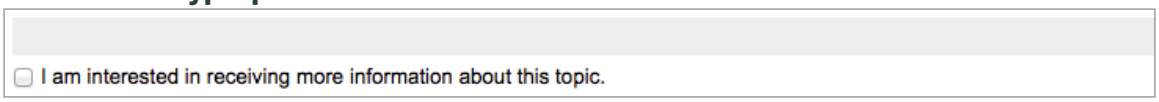
The assessment administrator can see the attachments associated with an individual question as well as those associated with the survey.

See Administering attachments for more information.

Boolean data type

On questionnaires, users select a check box beside a statement or leave it cleared.

Boolean data type question

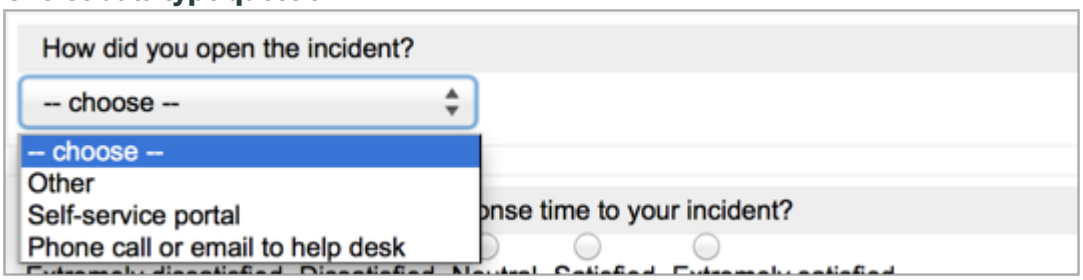


If you select **Boolean**, you must fill in the **Scale definition** field. Select **High** if it is best when users select the check box.

Choice data type

On questionnaires, users select a value from a list of choices.

Choice data type question



If you select **Choice**, you must fill in the **Scale definition** field and create answer options. Select **High** for the scale definition if the answer option with the largest metric definition **Value** is best.

Note:
The system sets the **Min** and **Max** fields automatically based on the **Value** settings for the associated metric definitions.

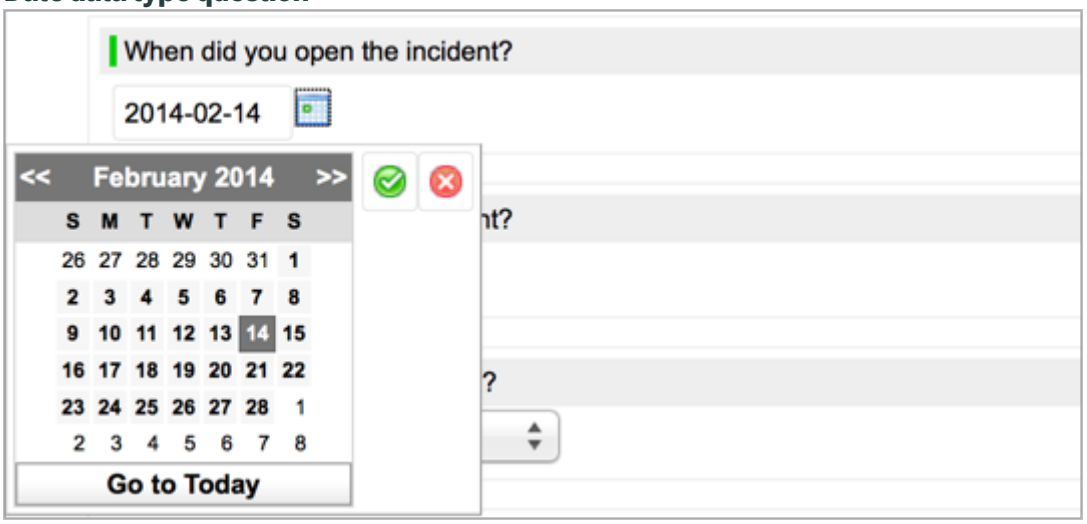
Date and Date/Time data types

The **Date** and **Date/Time** data types are similar.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

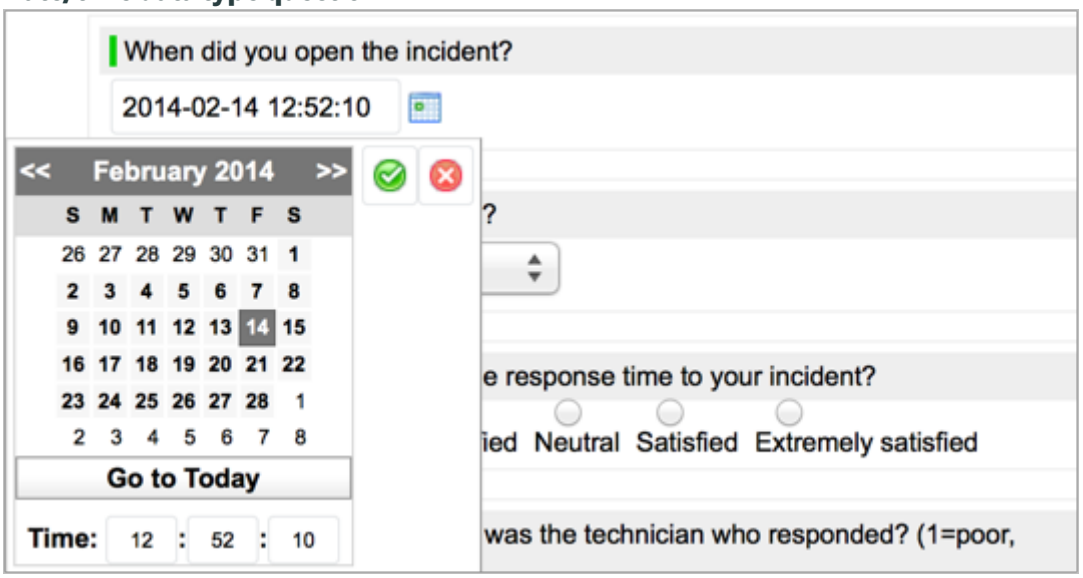
- **Date:** On questionnaires, users select a date.

Date data type question



- **Date/Time:** On questionnaires, users select a date and time.

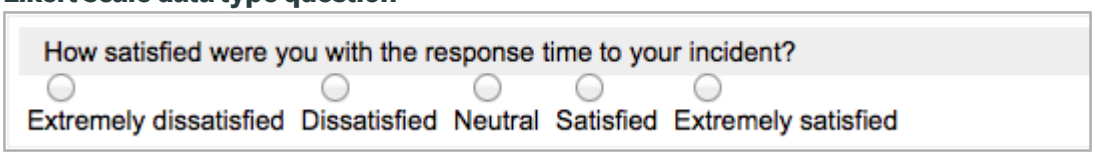
Date/time data type question



Likert Scale data type

On questionnaires, users select a multiple choice value from a custom Likert scale. Each answer option is represented by a radio button on the scale. A Likert scale question that evaluates an application's ease of use might have the answer options **Easy**, **Average**, and **Difficult**.

Likert scale data type question



If you select **Likert Scale**, you must fill in the **Scale definition** field and create answer options. Select **High** for the scale definition if the answer option with the largest metric definition **Value** is best.

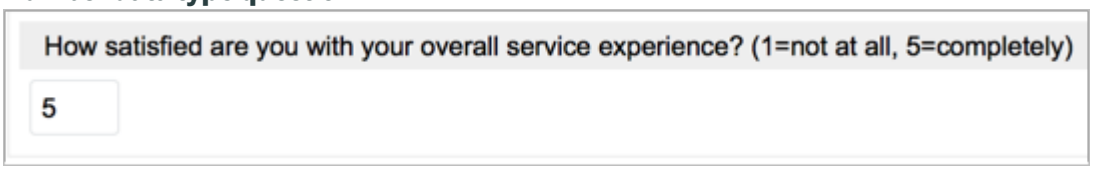
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The system sets the **Min** and **Max** fields automatically based on the **Value** settings for the associated metric definitions.

Number data type

On questionnaires, users enter a number.

Number data type question



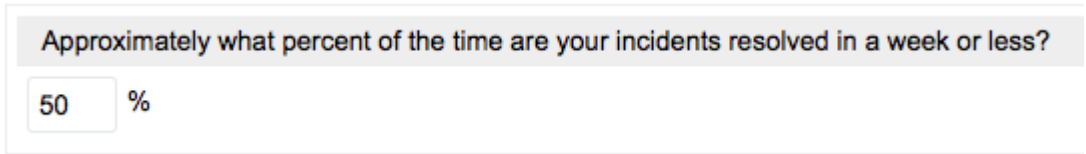
If you select **Number**, you must fill in these additional fields:

- **Scale definition**: Select **High** if a larger number is better, such as for a question that measures the number of sales made in a quarter.
- **Min** and **Max**: Enter the smallest and largest numbers users can enter. State the range of acceptable answers in the question text.

Percentage data type

On questionnaires, users enter a number.

Percentage data type question



If you select **Percentage**, you must fill in these additional fields:

- **Scale definition**: Select **High** if a larger percentage is better, such as for a question that measures the percentage of work an agent has completed.
- **Min** and **Max:** Enter the smallest and largest numbers users can enter. Generally **0** and **100** are appropriate minimum and maximum values. If you choose values other than **0** and **100**, it is usually best to state the range of acceptable answers in the question text.

Reference data type

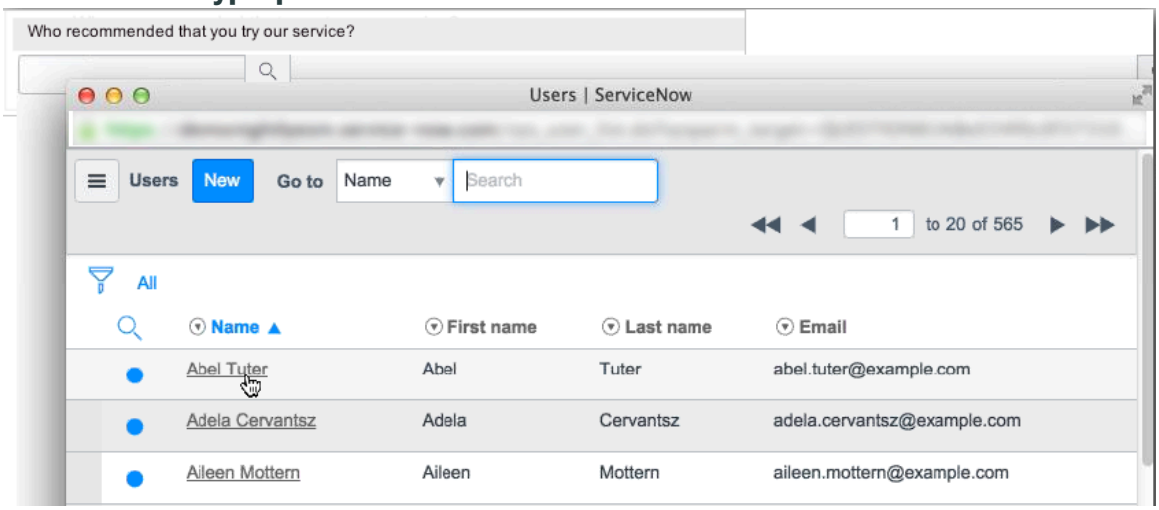
On questionnaires, users select a value from a list that is generated from a specified reference table. The response field supports auto-completion.

Note:
Reference qualifiers are not supported.

For example, a user could select a user name in response to a question if you specify User [sys_user] as the reference table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Reference data type question



String data type

On questionnaires, users enter text. When you select **String**, the **String option** field appears. Select one of the following options to determine how the string field appears on questionnaires:

- **Single line**

- **Single line wide**

- **Multiline**

Template data type

On questionnaires, users select a value from a predefined series of answer options. To use this data type, a question template must be defined.

If you select **Template**, you must fill in these additional fields:

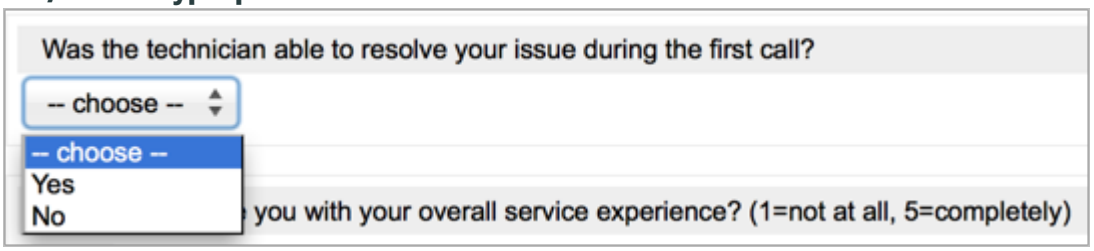
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Template**: Select a template.
- **Scale definition**: Select **High** if the answer option with the largest template definition **Value** is best.

Yes/No data type

On questionnaires, users select **Yes** or **No** from a list.

Yes/no data type question



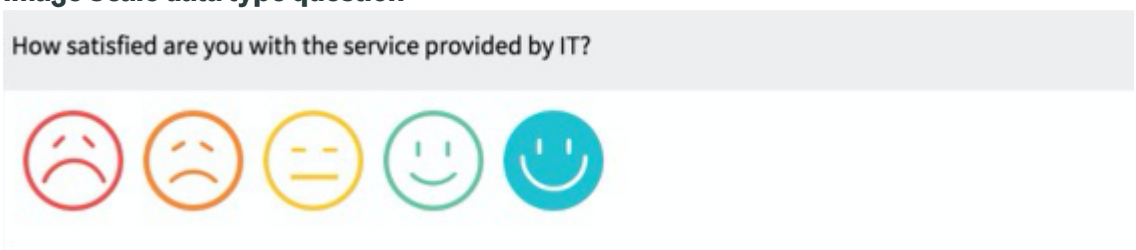
If you select **Yes/No**, you must fill in the **Scale definition** field. Select **High** if **Yes** is the best answer.

Image Scale data type

On questionnaires, users select an image from a predefined set of images as their response. Image scale questions can also be used in a template for better performance with surveys that have the same type of answer options.

Five emojis, similar to the Likert scale (very dissatisfied to very satisfied) are provided. However, you can upload additional images in JPG, PNG, or GIF format. Two images can be uploaded, one for selected case and another for unselected case. For example, the selected image can be , and the unselected image can be . Larger size images are reduced to 64 x 64 pixels.

Image Scale data type question



The result behavior depends on the presence of uploaded images. If no selected image is uploaded, then the question shows up blank.

Selected image	Unselected image	Result
Yes	Yes	Unselected image loads. Clicking the image changes it to the selected image.
Yes	No	Selected image loads with 50% opacity. Clicking the image changes the opacity to 100%.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Selected image	Unselected image	Result
No	Yes	A blank placeholder box is displayed.
No	No	A blank placeholder box is displayed.

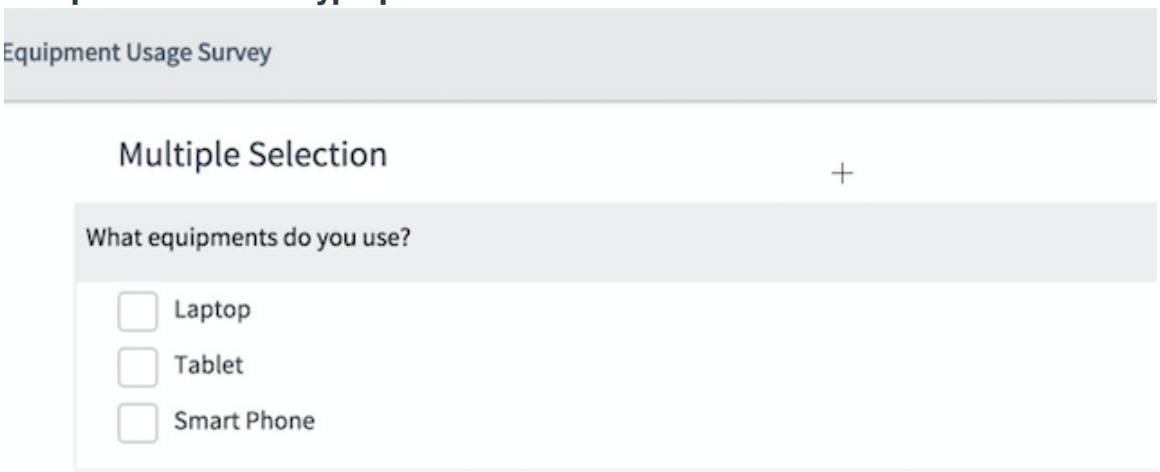
Note:

- N/A option is not supported for image scale type question.
- For an image scale type question, an empty string is saved as an answer for a hidden and dependent question of an unselected image.

Multiple selection data type

On questionnaires, users can select multiple check boxes indicating all answers that apply. For instance, a user can be instructed to "Select all that apply" in a multiple selection question.

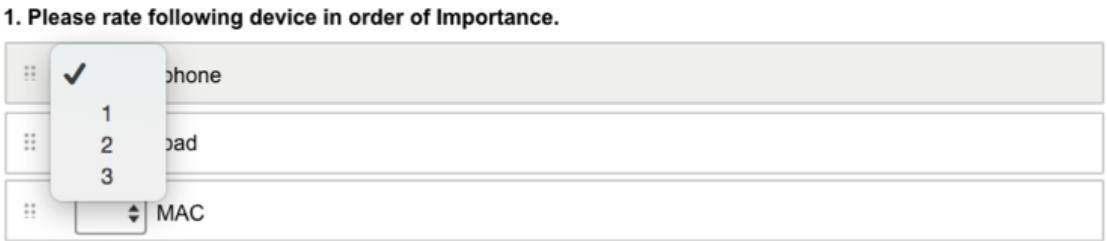
Multiple Selection data type question



Ranking data type

On questionnaires, users can select a different order number for each option to rank them. Drag-and-drop functionality is also supported, which allows a user to either fill in the number, or simply drag an option.

Setting the order of the options



One order number cannot be selected twice. This question can be mandatory and it can also be dependent on a parent question, but not vice versa.

Survey question template

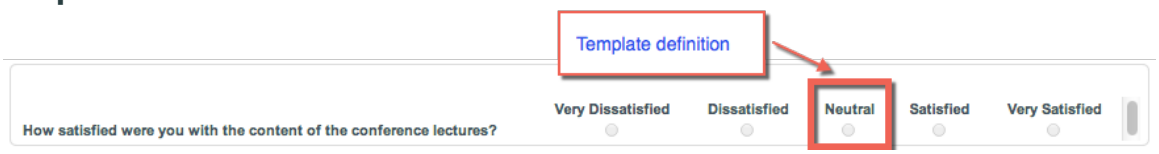
Question templates define reusable sets of answer options for survey questions.

Question templates define reusable rating scales for answering questions, where each answer option on the scale is a template definition. For example, the template named **Satisfaction** represents a satisfaction scale and contains the following template definitions: **Very Satisfied**, **Satisfied**, **Neutral**, **Dissatisfied**, and **Very Dissatisfied**.

Template definition



Templates are available for survey questions that have **Data type** set to **Template**. The following question templates are available in the base system. You can create or update a template as described in Create a survey question template.

Default question templates

Name	Template definitions
Amount	None, Few or little, Average amount, Many, Quite a lot
Complexity	Very Complex, Complex, Moderate, Simple, Very Simple
Frequency	Never, Seldom, Sometimes, Most of the time, All of the time
Likert 5	Strongly Disagree, Disagree, Neutral, Agree, Strongly Agree
Quality	Very Poor, Poor, Average, Good, Very Good
Satisfaction	Very Dissatisfied, Dissatisfied, Neutral, Satisfied, Very Satisfied
Size	Very Small, Small, Average, Large, Very Large

Create a survey question template

You can create and administer question templates.

Before you begin

Role required: admin or survey_admin

About this task

Changes to a survey, such as the modification of question templates, apply to existing survey instances immediately. Templates that you create are available for use with both surveys and assessments.

Procedure

1. Navigate to **All** > **Survey** > **Templates**.
   Each template is stored as a record on the Assessment Metric Template [asmt_template] table.
2. Click **New**.
3. Enter a **Name**.
4. Right-click the form header and click **Save**.
5. In the **Assessment Template Definitions** related list, click **New**.
   Create a template definition for each answer option you want to appear on a question.
6. Complete the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Display	Enter the text to appear as the answer option.
Value	Enter a numeric value, greater than or equal to zero, to which the answer option equates. Values are used in results calculations. When you view questions that use templates, answer options appear in order from smallest to largest **Value**. Each template definition for a given template must have a unique **Value**.

7. Click **Update**.

Update min and max values to match templates

If you use survey result calculation data, ensure that the **Min** and **Max** values for a question that uses a template are equal to the smallest and largest template definition **Value**.

Before you begin
Role required: admin or survey_admin

About this task
When you create a question of the **Template** data type, the system sets the **Min** and **Max** fields based on the template definition values. The fields for existing questions are not updated if you add a new template definition to a template or if you update the **Value** of an existing template. If the new **Value** is less than the minimum value or greater than the maximum value of any questions that use the template, update the questions accordingly.

Procedure
1. Navigate to **All** > **Survey** > **Questions**.
2. Configure the list to show the **Min** and **Max** columns.
3. Add the following list filter condition: **[Template] [is] [<select the template you updated>]**.
4. Ensure the **Min** and **Max** values match the smallest and largest template definition **Value** for the selected template.
   If the values do not match, edit the **Min** and **Max** values directly from the list.

> **Note:**
> When the data type is **Template**, a UI policy prevents the editing of **Min** and **Max** from the form.

Add a metric category and metric in the question bank for surveys

Reuse the question categories (metric categories) and questions (metrics) added in the question bank for surveys. You can add metric categories or metrics from the question bank to a survey, or from the survey to a question bank.

Before you begin
Role required: admin or survey_admin
Activate the Survey Question Bank Sample Data plugin (com.snc.question_bank_data) to access the demo data for the question bank.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Survey** > **Question Bank**.
2. Click **New**.
3. On the Metric Category form, fill in the fields.

Metric Category fields

Field	Description
Name	Name of the metric category.
Description	Description of the metric category.
Total metrics	Total number of metrics in the metric category. This number is automatically updated when you add or delete metrics from the category.

4. Right-click on the title bar and click **Save**.
5. In the Assessment Metrics related list, click **New**.
6. In the Survey Question form, fill the fields. For information on these fields, see Create or modify survey questions.
7. Click **Submit**.

Configure metric categories or metrics for a survey using the question bank

Reuse question categories (metric categories) and questions (metrics) from the **Question Bank** module while creating or updating a survey.

Before you begin

Role required: admin or survey_admin
Activate the Survey Question Bank Sample Data plugin (com.snc.question_bank_data) to access the demo data for the question bank.

Procedure

1. Navigate to **All** > **Survey** > **View Surveys**.
2. Open a survey definition.
3. **Optional:** To add metric categories to a survey from the question bank in Platform, perform the following steps.

   a. In the Metric Categories related list, click **New Category from Bank**.
   The New Category from Bank dialog box is displayed with a list of all metric categories added in the question bank.

   b. Select the required categories and click **Add Selected**.
   A copy of the metric category and the corresponding metric definitions is created in the Metric Categories related list.

4. **Optional:** To add metrics to a survey from the question bank in Platform, perform the following steps.

   a. In the Metric Categories related list, open a metric category definition.

   b. In the Assessment Metrics related list, click **New Metric from Bank**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The New Metric from Bank dialog box is displayed with a list of questions available in the question bank.

c. Select the required metrics and click **Add Selected**.
A copy of the metric and the corresponding metric definitions is created in the Assessment Metrics related list of the category.

5. **Optional:** To add a metric category to the question bank from a survey in Platform, perform the following steps.

   a. In the Metric Categories related list, open a metric category definition.

   b. Click **Add to question Bank**.
   A copy of the category is created along with its metrics and metric definitions in the question bank.

6. **Optional:** To add a metric to the question bank from a survey in Platform, perform the following steps.

   a. In the Metric Categories related list, open a metric category definition.

   b. In the Assessment Metrics related list, open the required metric definition.

   c. Click **Add to Question Bank**.
   The Add to Question Bank dialog box is displayed.

   d. In the **Choose a question bank to add this question/metric** field, select a metric category that you want to add this metric to, and click **OK**.
   A copy of the metric and the corresponding metric definitions is created for the selected category in the question bank.

7. **Optional:** To add a metric category or metric to a survey from the question bank in Survey designer, perform the following steps.

   a. Open the survey in Survey Designer.

   b. **Optional:** To add a metric category from the question bank, from the **Categories** tab in the left panel, drag the required category banner and drop in the **Design** tab.

   c. **Optional:** To add a metric from the question bank, drag and drop the required metric from the **Questions** tab or the **Categories** tab.

   Note:

   - When you drag and drop a metric category, all dependencies within the category are also added to the survey.
   - From the **Categories** tab, you can drag and drop an individual metric within a metric category.
   - When you drag and drop a parent metric, all dependent questions are also added to the metric category.
   - When you drag and drop a child metric, only the child question is added to the metric category.

© 2026 ServiceNow, Inc. All rights reserved.

Create or modify answer options

You must create answer options, called metric definitions, for survey questions that have **Data type** set to **Choice** or **Likert Scale**.

Before you begin

Role required: admin or survey_admin

About this task

Changes to a survey, such as the addition or modification of answer options, apply to existing survey instances immediately.

Procedure

1. Navigate to **All** > **Survey** > **Questions**.
2. Open a choice or Likert scale survey question.
3. In the **Assessment Metric Definitions** related list, open a metric definition or click **New**. Each answer option is stored as a record on the Assessment Metric Definition [asmt_metric_definition] table.
4. Complete the Assessment Metric Definition form.

Assessment Metric Definition fields

Field	Description
Display	Text to appear as the answer option.
Value	Numeric value, greater than or equal to zero, to which the answer option equates. Values determine the order in which answer options appear. See the example below. Values are also used to calculate survey results. Each metric definition for a given question must have a different **Value**.

5. Click **Submit**.

Example:

On survey questionnaires, the answer options for a question appear in order from smallest to largest **Value**. For example, consider the survey question **How do you feel?** with the answer options **Good**, **Neutral**, and **Bad**. The following table shows the answer option order based on the **Value**.

Answer option order based on value

Answer option	Value	Order
Good	1	First
Neutral	3	Second
Bad	5	Third

If you use survey result calculations, ensure the question **Scale definition** is set appropriately based on the answer options. In the previous example, if you want the answer option **Good** to earn the highest score, the scale definition should be **Low** because **Good** has the smallest value.

Change the order of survey questions

You can easily reorder survey questions at the category level or the question level.

Before you begin

Role required: admin or survey_admin

About this task

You can change the order in which the questions in one category appear relative to those in other categories for the same survey definition. If you add a new question manually after you create other questions, you may want to change the order of questions.

When you create questions using the survey creator, the system sets the **Order** field for the first question to **101**, the second to **102**, and so on. After you create a new question outside of the survey creator, the **Order** is set to **100** by default, which means it appears before all questions generated by the survey creator.

Procedure

1. Navigate to **All** > **Survey** > **View Surveys** and open the appropriate survey definition.
2. In the **Metric Categories** related list, edit the values in the **Order** column.
3. To change the order of questions within a category, complete the following steps.
   a. Open the **Assessment Metrics** related list.
   b. Edit the values in the **Order** column.
4. Click **Update**.

Survey trigger conditions

Trigger conditions specify when to send a particular survey and the persons to send it to.

Survey administrators can use trigger conditions to configure the system to generate a survey instance each time a specified action occurs on a specified table, for example, when an incident or change request closes. The system sends the survey to users that are related to the triggering record, for example, incident callers or change request assignees. You can choose to send a survey every time the condition is met, or you can set a probability for the system to send a survey at random when the condition is met.

Trigger conditions are ideal for sending transactional surveys. Transactional surveys generally measure satisfaction with a recent experience, such as closing an incident or purchasing an item.

Note:
Trigger conditions are comparable to survey conditions in legacy surveys. If you migrate a legacy survey that has survey conditions, ensure that the survey conditions are deactivated before you recreate them as trigger conditions.

Configure a trigger condition for a survey

Configure trigger conditions to specify when to send a particular survey and the persons to send it to.

Before you begin

Role required: admin or survey_admin or survey_creator

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Survey** > **Administration** > **Trigger Conditions**.
2. Click **New**.

> **Note:**
> Do not specify particular users for a triggered survey because only the specified users are allowed to take the survey.

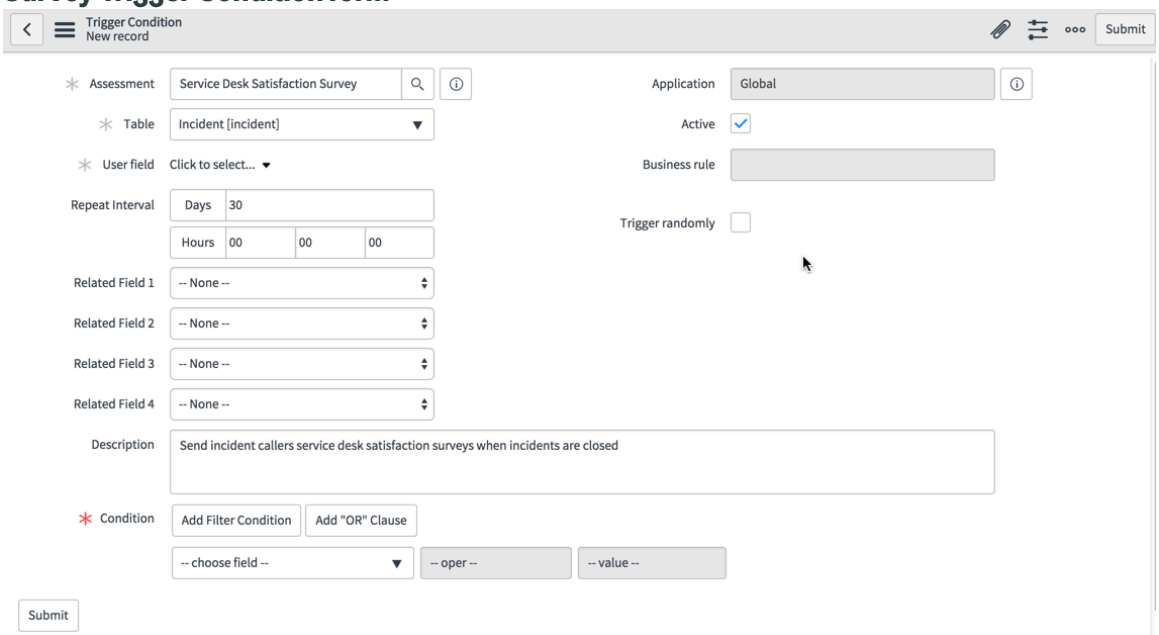
3. On the Trigger Condition form, fill in the fields.

   For a description of the field values, see Trigger Condition form for surveys.

   You can also create a trigger condition directly from the survey creator. If you select **Certain users can take this survey, based on conditions** in the Survey User Access section, the Trigger Condition form opens automatically when you click **Save as Draft** or **Publish**.

Example:

Survey Trigger Condition form



Related topics

Schedule periods

Trigger condition example

You can send out auto-triggered surveys when an incident is closed or resolved.

A trigger condition is configured as follows:

- **Assessment**: Service Desk Satisfaction Survey
- **Table**: Incident [incident]
- **User field**: Caller
- **Repeat interval**: 30 days
- **Active**: true
- **Trigger randomly**: false

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Related Field 1**: Assigned to
- **Related Field 2**: Problem
- **Condition**: [State] [is] [Closed] [or] [State] [is] [Resolved]

C is the caller on incident INC00004305 that is assigned to B, a service desk technician. B creates PRB010101 based on C's complaint and closes the incident. The system creates a survey instance assigned to C so C can rate satisfaction with the incident experience.

Because two related fields were selected as part of the trigger condition, the survey instance stores the following information from the incident:

- User (Related Field 1): **Boris Catino**
- Problem (Related Field 2): **PRB010101**
- Task (automatically created): **INC00004305**

Because the task field is automatically populated, UI-based filtering by dot-walking on incidents (or any task-based table) is supported when creating a report on survey results. For example, you can query all survey instances related to incidents assigned to a group (survey reports on all incidents assigned to `networking` group, for instance).

Even though the trigger condition is set to be triggered each time that the conditions are met, the **Repeat interval** setting ensures that C does not receive another survey for another of its incidents closes within 30 days of the first incident.

Survey report example based on task field

One of the most common use cases for Surveys is to send out an auto-triggered survey when an incident, request, or task is closed. Once you get the survey results back, you can filter the results by users and groups related to the ticket, such as Assignment Group, or Assignee.

Filtering the survey results provides more detail on how people and teams are performing based on ticket data. Since this information is automatically captured, you can dot-walk while filtering the data (instead of utilizing a related field on the Survey trigger condition form, as previously required).

Using the Task as a filter for survey results

Number ▼	Metric type	Due date	State	Assigned to	Trigger table	Trigger ID	Task
AINST0010011	Customer Satisfaction Survey	2016-09-20	Ready to take	System Administrator	Incident [incident]	Incident: INC0010008	INC0010008

To create a report on incident-triggered survey responses by Assignment group, set up the report on the Task Assessment Details by navigating to **Reports View/Run** and clicking **Create a report**.

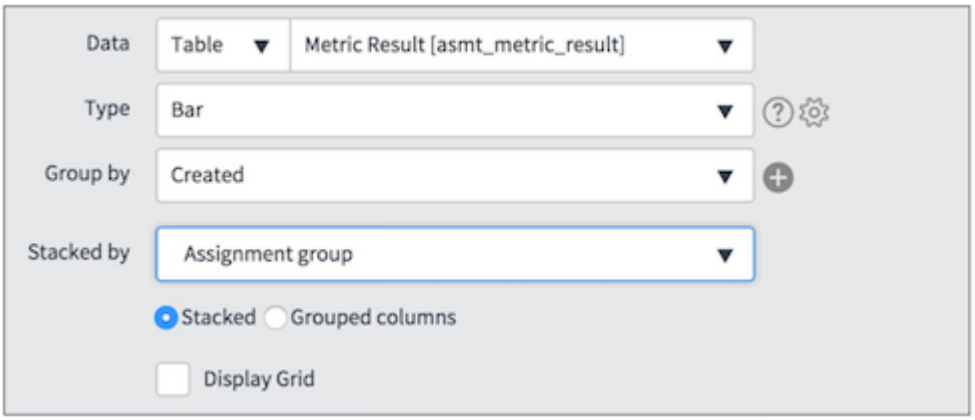
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Defining a report on survey responses that are triggered by an incident



Survey distribution

There are several ways for survey administrators to distribute surveys to users.

Surveys are distributed using any of the following methods.

- Send survey invitations to users.
- Share a survey URL that opens the survey directly.
- Create a module that opens a survey.

Email notifications for surveys

When an administrator creates a survey and assigns it to a user, an email notification is sent to the user. Selecting the survey link in the email notification redirects the user to the survey page, where the user can take the survey. This type of survey is called a non-triggered survey.

Triggered surveys are sent when a defined trigger condition is met. When the condition fires, an event is created and placed in the event queue. This event automatically invokes the base system **Survey Invitation** notification, which sends an email to the assigned user. You don't need to create event, as the survey invitation notification is preconfigured for this purpose.

To configure the teams that must receive the notification, or modify the notification content, navigate to **All** > **System Notification** > **Email** > **Notifications** and open the **Survey Invitation** notification. For more information, see .

Note:
You can include an embedded survey in the survey email notification by using the **Outlook Actionable Message** check box. After you select this check box and save the survey, a validation is run to verify that all survey questions are supported. This field is available only when the Outlook Actionable Messages (sn_ms_oam) plugin is installed. For more information, see Outlook Actionable Messages.

Base system Survey Invitation notification

ServiceNow includes a pre-configured **Survey Invitation** notification for surveys. When a survey is assigned to a user and a non-triggered or triggered condition fires, this notification sends an email to the designated user. You don't need to create event or notification.

Send survey invitations to users

You can send survey invitations using the **Assign Survey** or **Send Invitations** buttons on the Survey Definition form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin or survey_admin

About this task
Use the **Send Invitations** button to immediately assign survey instances to each survey user that is listed in the survey definition. Use the **Assign Survey** button to assign a survey instance to any one user at a time.

Each of the buttons generates survey instances assigned to the appropriate users. In addition, if the instance is configured to send email, the system generates survey notifications. For either button to be available, the survey definition must meet all of the following conditions.

- **Active** check box is selected.
- **State** is **Published**.
- Survey is associated with at least one question.

Note:
You (or a trigger) can send more than one instance of a survey to a user at any time.

Procedure
1. Navigate to **All** > **Survey** > **View Surveys**.
2. Select an active, published survey.
3. Complete one of the following actions.

Option	Description
Assign a survey to users listed in the Survey Users related list	Click **Send invitations**.
Assign a survey to any user	Click **Assign Survey** and select one or more users, and then click **OK**.

The system creates a survey instance assigned to the user or users, assuming the user is eligible to receive a new survey instance. When you use the **Assign Survey** button, the selected user is not saved as a survey user.

Define a recipients list for surveys

Use a recipients list to define targeted set of users for whom the survey invite can be sent. You can use a recipients list for multiple surveys.

Before you begin
Role required: admin or survey_admin or survey_creator

Procedure
1. Navigate to **All** > **Survey** > **Administration** > **Recipients Lists**.
2. Click **New**.
3. On the Recipients List form, fill in the fields:
   For a description of the field values, see Recipients List form.
4. Click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For recipients lists created by the file upload, clicking **Submit** validates the records in the Excel file. Following validation, the system displays a pop-up window with the upload results, including valid and invalid user records.

5. **Optional:** To get the updated user list, navigate to the recipient list and click **Refresh Recipient List**.

Add a recipients list to a survey

Send the survey invites to targeted sets of users by adding a recipients list to a survey.

Before you begin

Role required: admin or survey_admin
Recipients lists should be pre-defined in the Recipients Lists submodule. For more information on defining recipients lists, see Define a recipients list for surveys.

Procedure

1. Navigate to **All** > **Survey** > **View Surveys**.
2. Open a survey definition.
3. Perform any of the following steps.

4. To send survey invites to all survey users and recipients lists, click **Send Invitations**.

Note:

- The **Send Invitations** UI action is available when there is at least one recipients list or survey user for the survey.
- If a user is available in the **Survey Users** related list and multiple recipients lists, the survey invite is sent only once to the user.

Embed a survey within the Outlook email client

Embed an interactive survey in the email notification sent to a user. The user can answer the survey questions and submit the survey from the email client instead of opening the survey in a new browser tab.

Before you begin

Role required: admin or survey_admin
The Outlook Actionable Messages plugin (sn_ms_oam) should be activated.

Note:

- The Outlook Actionable Messages (OAM) feature is not supported in all Microsoft mail products and versions. To verify whether your version of Outlook supports OAM, refer to the Microsoft website.
- Actionable messages are supported only for emails sent from the @service-now.com email address. If you are sending an email from a customized email address, you should register as a new service in the Microsoft website setting the scope as **Organization**. Specify the provider ID value in the *sn_ms_oam.outlookactionable.originator* property.
- Actionable messages are based on the Sender Policy Framework (SPF)/DomainKeys Identified Mail (DKIM) validation for the email sender verification. If an email recipient receives email via an external provider, emails may not be rendered as adaptive cards.
- You cannot customize the default actionable message templates.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Notification** > **Email** > **Notifications**.
2. For the **Survey Invitation** notification, in the **What it will contain** tab, add the following script in the **Message** field in addition to the existing information.

   ```
   ${mail_script:include_survey_actionable}
   ```

   This script includes the Outlook actionable message in the email notification sent to the user.
3. Navigate to **Survey** > **View Surveys**, and open a survey.
4. To send an email notification to the survey user, select the **Send notifications** check box.
5. Select the **Outlook Actionable Message** check box and save the survey.

   Note:
   - The Image Scale type question is supported only if there is a single question in the survey.
   - Template type question with image option is supported only if there is a single question in the survey.
   - Date/Time type question is supported in web client of Outlook and not in desktop client as Microsoft doesn't support Date/Time for Outlook desktop client.
   - Two duplicate choice display values should not be used as the internal value may not be submitted incorrectly.
   - The answer for String type question can be validated based on the option selected in the Field Validation field. For example, if you select the option as email address, then the answer entered can only be in the email-id format. Answers in any other format will not be accepted.
   - The version of Microsoft Outlook does not support the following question types to create an embedded survey:
     - Attachment
     - Reference
     - Ranking
   - Dependent questions are not supported.
   - Signature is not supported.
   - Mandatory questions are supported.

   In both the Platform UI and Survey Designer, a validation is run to ensure all survey questions are supported.
6. Click **Assign Survey** and assign the survey to a user.
   An email notification with the embedded survey is sent to the user. The user can take the survey and submit it from the email client instead of opening the survey in a new browser tab.

Enable localization for a survey

Enable a survey user to take a survey in multiple languages.

Before you begin

Role required: admin or survey_admin
The plugin for the language that you want the survey to be available in should be installed.

Note:
Localization is applicable only for public surveys.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Survey** > **Administration** > **Properties**.
2. Enable the **Enable/Disable whether to show language picker when a public survey is taken** (*show_lang_picker_for_publicsurveys*) property.
3. In the System Settings window, from the **Language** list, select the language that you want the survey to be available in.

   Note:
   The **Language** list is available only when a language plugin is installed.

4. Navigate to **Survey** > **View Surveys** and open a public survey.
5. Enter the translated text for the survey title, questions, and answers.
6. Save and publish the survey.

   Note:
   The localization is also applicable in Service Portal if the **Assessment Properties** **Allow survey link from email to open in service portal view (applies only for surveys)** (*sn_portal_surveys.sp_survey.email_redirection*) property is enabled.

   - The survey is available for survey users in the translated language.
   - Users can change the language of the survey using the language picker.

Survey URLs

You can distribute a survey by giving survey users a survey URL.

Survey administrators can obtain one of the following types of URLs.

- A general URL for a survey, which users can open to take the survey questionnaire. The following process occurs.
  - When someone opens the URL, the system ensures that the person is logged in. It then searches for an instance of the associated survey that is assigned to the logged-in user.
  - If a survey instance is found, the appropriate action occurs based on the **State** of the survey instance (see table). If there are multiple active survey instances (**Ready to take** or **In progress**), the instance with the earliest due date opens.
  - If no survey instance is found, the system creates a new instance for the survey, assigns it to the user, and opens the survey questionnaire.
- A URL for a specific survey instance, which the assigned user can open to take the survey questionnaire. The following process occurs.
  - When someone opens the URL, the system ensures the person is logged in as the user the survey instance is assigned to. Only the assigned user can access the survey questionnaire.
  - The appropriate action occurs, depending on the **State** of the survey instance (see table).

Survey states

Survey instance state	Action upon opening URL
Ready to take: User has not saved any responses.	The survey questionnaire appears for the user to begin. The user can save or submit responses.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Survey states (continued)

Survey instance state	Action upon opening URL
In progress: User has saved at least one response.	The survey questionnaire appears for the user to continue. Any previously saved responses are displayed. The user can save or submit responses.
Complete: User has submitted all required responses.	If the schedule period is **No Limit** or if the period restriction has expired, the survey questionnaire for a new survey instance appears for the user to begin. If the schedule period restricts the number of times a user can take the same survey, and the period restriction has not expired since the user last completed survey, an error message appears.

If someone opens a URL for an unpublished or deactivated survey, an error message appears.

Obtain and distribute a general survey URL

You can distribute a general survey URL to allow any eligible user to open a survey questionnaire.

Before you begin

Role required: admin or survey_admin

About this task

The general URL is available on the Survey Definition form and on the survey creator. You can also email the URL for a public survey that is published.

Procedure

1. Navigate to **All** > **Survey** > **View Surveys**.
2. Open a survey definition from the Assessment Metric Types list.
3. To view or copy the URL, click the **View Survey URL** related link.
   This related link is visible only if the survey definition is **Active**.
4. To distribute the URL to users, paste the copied URL as desired, or click the **Email** button to send via email.
   The **Email** button is visible only for a public survey that is published.

What to do next

When a survey user clicks the general survey URL, the system creates a survey instance for the survey user as long as the user does not have an instance in the **Ready to take** state. The system is configured by default to send an email notification when a survey instance is generated.

As a result, the survey user receives a second notification in addition to the notification that you sent with the general survey URL. This may confuse the survey user. To avoid this issue, you can deactivate auto-notification.

Deactivate auto-notification for surveys

Deactivate an auto-notification to avoid a problem that causes a second system-generated email notification being sent to a user.

Before you begin

Role required: admin or survey_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Procedure

1. Navigate to **All** > **System Notification** > **Email** > **Notifications**.
2. Open the **Survey Invitation** notification.
3. Configure the form to add the **Send to event creator** option to the Who will receive section.
   The **Send to event creator** option is selected by default.
4. Clear the **Send to event creator** check box.

Obtain a survey instance URL

You can distribute a survey instance URL to allow the assigned user to open a survey questionnaire.

Before you begin
Role required: admin or survey_admin

About this task
The survey instance URL is available on the survey instance record.

Procedure

1. Navigate to **All** > **Survey** > **Survey Instances**.
2. Open the instance for the survey.
3. To view or copy the URL, click **View Instance URL** related link.
   The related link is available only when the survey instance **State** is **Ready to take** or **In progress** and the associated survey definition is **Active**.
4. In the dialog box, select and copy the URL then click **OK** or **Cancel**.
5. Distribute the URL to the assigned user.

Test a survey URL

When there are survey users associated with a survey, the survey is restricted so only those users can use the survey URL. You can test the survey URL to ensure it is restricted.

Before you begin
Role required: admin or survey_admin

Procedure

1. Navigate to **All** > **Survey** > **View Surveys** and open a survey for which you are not a survey user.
2. Under **Related Links**, click **View Survey URL**.
3. Copy the URL and click **OK** or **Cancel**.
4. Navigate to the URL.
   You see a message that you are not authorized to take the survey.

Create a survey module

You can create a module that opens a survey.

Before you begin
Role required: admin or survey_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

When a user clicks a survey module, the system performs one of the following actions, depending on the configuration options for the survey and other factors.

- Creates a new survey instance
- Opens an existing survey instance
- Displays an error message.

Procedure

1. Perform the appropriate action for your version of the UI:
   - **Core UI**: Point to the application menu that contains the module to which you want to add the survey module and click the edit application (pencil) icon.
   - **UI15**: Right-click the application menu you want to add the module to and select **Edit Application Menu**
2. In the **Modules** related list, click **New**.
3. Complete the following fields.
   - **Link type**: Assessment

     Do not select **Survey**, which is used for legacy surveys only.
   - **Assessment**: Select the survey you want the module to open.
4. Complete and save the form.

Sharing surveys

You can export a survey and then import it to a different ServiceNow instance.

> **Note:**
> Update sets are available in the Helsinki release and should be used to move data from one instance to another. For information about update sets, see System update sets.

The system exports a single XML file that contains a survey definition [asmt_metric_type] and the associated records, including the following.

- Assessment Metric Template [asmt_template]
- Assessment Template Definition [asmt_template_definition]
- Metric definitions [asmt_metric_definition] (survey question answer options)
- Scheduled Jobs associated with the Survey [sys_trigger]
- Survey categories [asmt_metric_category]
- Survey questions [asmt_metric]
- Survey users [asmt_m2m_category_user]
- Trigger Condition [asmt_condition]

Export a survey

You can export a survey and then import it to another instance.

Before you begin

Role required: admin, survey_reader, or survey_admin
For information about update sets, see System update sets.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Survey** > **View Surveys**.
2. Right-click the name of a record to show the context menu.
3. Select **Export Assessment**.
4. If applicable, follow the prompt in your browser to save the XML file.

Import a survey

You can import a survey that has been exported as an XML file. The exported XML file does not contain result data.

Before you begin
Role required: admin or survey_admin

Note:
Update sets are available in the Helsinki release and should be used to move data from one instance to another. For information about update sets, see System update sets.

About this task

Procedure

1. Verify that the target instance has assessments enabled.
2. Follow the steps in Import data from XML to import the assessment.

Use update sets for surveys and assessments

Use an update set to capture changes to surveys and assessments.

Before you begin
Role required: admin or survey_admin

Procedure

Create an update set and use it to make changes on a development instance.

Note:
For more information, see System update sets.

When developing surveys and assessments, use an update set to capture the changes and move them from a development instance to a production instance. Once an update set is created and marked current, all of the updates to the following tables are recorded in the update set.

The following tables are now update set enabled and also extend the application file:

- Assessment Metric Templates [asmt_template]
- Assessment metric type [asmt_metric_type]
- Assessment Template Definitions [asmt_template_definition]
- Assessment Metric Definitions [asmt_metric_definition]: survey question answer options
- Schedule [sys_trigger]: scheduled jobs associated with the survey
- Assessment Metric Categories [asmt_metric_category]: survey categories
- Assessment Metrics [asmt_metric]: survey questions

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Assessment Category Users [asmt_m2m_category_user]: survey users
- Trigger Conditions [asmt_condition]

Configure a survey in the Connect chat support

Enable a user to take a survey after chatting with a support agent.

Before you begin

Role required: admin or survey_admin

Note:
The Connect Support plugin (com.glide.connect.support) should be activated.

Procedure

1. Navigate to **All** > **Connect Support** > **Support Administration** > **Chat Survey**.
2. Click **New**.
3. In the Chat Survey form, fill the fields.

Chat Survey form fields

Field	Description
Survey	Survey whose instance should be available in Connect Support.
Type	Type of chat where the survey is available. Connect: Survey is available in Connect Support.
Chat queue	Chat queue where the survey is available.
Active	Specifies if the chat survey configuration is active.
Description	Description of the chat survey configuration.

4. Click **Submit**.
   When a support agent of the assignment group associated with the chat queue ends a chat with a user, the survey instance is available in the chat window for the users.

Note:
The survey URL displayed after a connect chat is not a clickable link in the Virtual Agent chat widget. Copy and paste the URL to access the survey.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **System Application** > **All Available Applications** > **All**.
2. In the search field, enter `Outlook Actionable messages`.
   You can search for the application by its name or ID. If you cannot find an application, you may have to request it from ServiceNow store. Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.
3. Click **Install**.

Customize fields for the approval message

Customize the body message for a request, change, and request item approval sent in Microsoft Outlook.

Customize fields in the approval message for request

Customize the body message for a request and request item sent in Microsoft Outlook.

Before you begin
Role required: oam_admin

Procedure

1. Navigate to **All** > **Actionable Messages** > **OAM Definition**.
2. Choose one of the following:

OAM definition

Option	Action
Request	Click **OAM Request Approval**
Request Item	Click **OAM RITM Approval**

3. In the OAM Container section, customize the following fields as required:
   a. **Title**: Title of the Outlook approval notification.
   b. **Requester info**: User who created the request.
   c. **Request Details**: This field can be customized. You can also add additional fields as per the requirement.
4. Click **Update**.

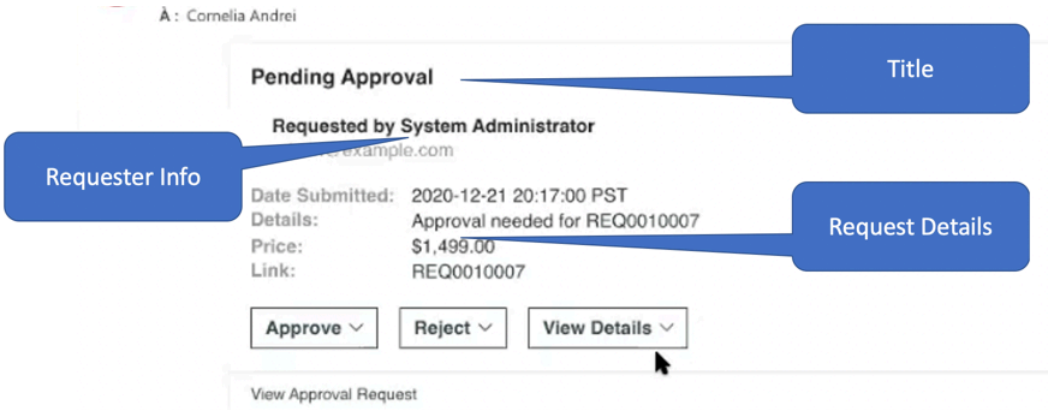
The approval message is displayed in Microsoft Outlook as shown below. Click **View Details** button to view the request in ServiceNow instance.



Customize fields in the approval message for change request

Customize the body message for a change request approval sent in Microsoft Outlook.

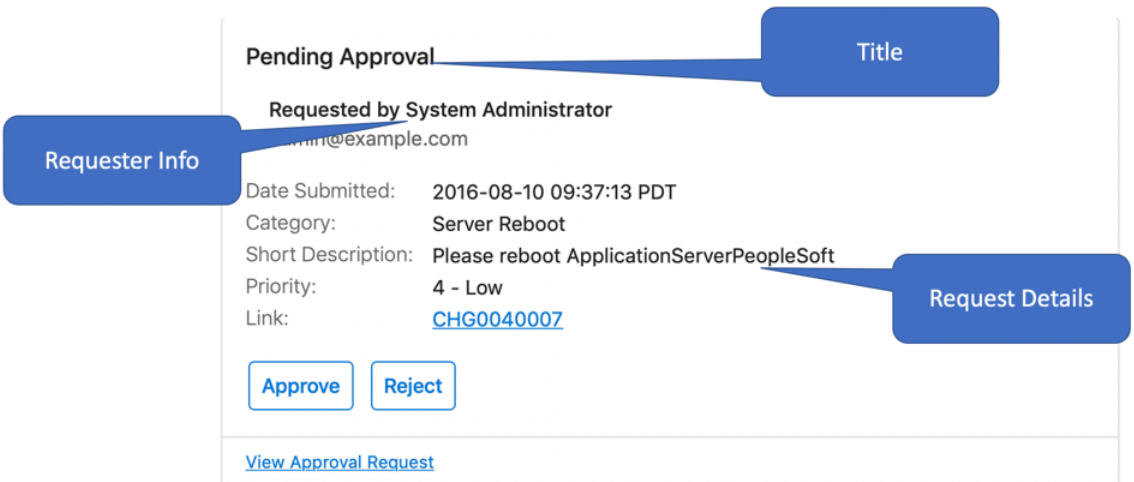
Before you begin

Role required: oam_admin

Procedure

1. Navigate to **All** > **Actionable Messages** > **OAM Definition**.
2. Click **OAM Change Approval**.
3. In the OAM Container section, customize the following fields as required:
   a. **Title**: Title of the Outlook approval notification.
   b. **Requester info**: User who created the request.
   c. **Request Details**: This field can be customized. You can also add additional fields as per the requirement.
4. Click **Update**.

The approval message is displayed in Microsoft Outlook as shown below. Click **View Approval Request** to view the request in ServiceNow instance.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Enable Advanced view for Outlook Actionable Message definition

Enable the advanced view to customize the actionable message as per the requirement for Microsoft Outlook.

Before you begin

Role required: oam_admin

Procedure

1. Navigate to **All** > **Actionable Messages** > **OAM Definition**.
2. Choose one of the following:

OAM definition

Option	Action
Request	Click **OAM Request Approval**
Request Item	Click **OAM RITM Approval**
Change	Click **OAM Change Approval**

3. Click **Advanced OAM** under **Related Links**.
4. In the OAM Definition form, perform the following actions:
   a. Modify the script as required.
   b. Click **Update**.

Sentiment analysis for surveys

You can use sentiment analysis to determine whether user responses for a survey are considered positive, negative, or neutral.

Activate the Sentiment Analysis (com.snc.sentiment_analysis) plugin.

For a survey, you can select questions that should be used for analysis. The survey responses of these questions are sent to the thirdparty platforms for analysis through the specified connector configurations.

Note:
You can only use string type questions for sentiment analysis.

The sentiment analysis results are displayed under **Survey** > **Question Sentiment Results**. The sentiment label is based on the normalized score:

Sentiment label

Normalized score	Sentiment label
-1 to 0	Negative
0	Neutral
0 to 1	Positive

Configure a sentiment connector

Specify the service URL and other configuration information for third party APIs that are used for sentiment analysis.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

Procedure
1. Change the scope of the current session to **Sentiment Analysis**.
2. Navigate to **Sentiment Analysis** > **Sentiment Connector Configurations**.
3. Add or edit the connector configuration for a third party vendor such as Google, IBMWatson, and MSAzure.

Note:
By default, placeholders are available for configuring connectors for Google, IBMWatson, and MSAzure.

Sentiment connector fields

Field	Description
Name	Name of the sentiment analysis connector configuration.
Active	Check box to activate the connector configuration.
Credential Alias	Credential alias associated with the connector configuration. It has a reference to the system level table (sys_alias_list).
Default	Check box to make this as the default connector configuration.
Description	Description of the connector configuration.
Script	Script to call the Sentiment Analysis API and the normalize the values.

4. Configure the connector credentials
   a. Open the record referred in the **Credential Alias** field.
   b. Under the **Connections** tab, select the connection.
   c. In the **Connection URL** field, enter the value.
   d. Open the record referred in the **Credentials** field.
   e. Enter the credential information.

   Note:
   - You should obtain the connection credentials from the respective third-party vendors.
   - If the credential is an API key, specify its value. If the credential is basic authentication, that is, user name and password, specify the corresponding information.

   f. Select the **Active** check box and click **Update**.
5. Select the **Active** check box for the connector configuration and click **Update**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sentiment analysis property

You can use the sentiment analysis property to customize the **Sentiment Analysis** module.

Sentiment analysis property

Name	Description
Response time for the outbound call of Sentiment Analysis API (*sn_nlp_sentiment.glide.sentiment.transaction.timeout*)	Maximum time (milliseconds) expected for executing the outbound call for Sentiment Analysis API before it's timeout.

Related topics

Sentiment analysis for surveys

Sentiment analysis results

The sentiment analysis results view contains a bar chart that displays the percentage of positive, negative, and neutral results, along with the instance count for each category.

Color indicators

Following are the color indicators in the bar chart:

- Green: Positive
- Red: Negative
- Blue: Neutral

Surveys in Service Portal and the Now Mobile app

If you've installed Service Portal, you can use the My Assessments and Surveys widget in Service Portal. Users can view surveys in Service Portal. Service Portal also supports surveys for users on mobile devices that have the Now Mobile app installed. The My Assessments and Surveys widget is available by default on the Service Portal home page.

Surveys in Service Portal

To create an intuitive interface for your users, you can set up surveys in Service Portal . Activate Service Portal to view the My Assessments and Surveys widget, which appears on the Service Portal home page.

To learn more about activating Service Portal, see Activate Service Portal.

To learn more about configuring a widget, see configure widget instances .

To configure a survey widget on a Service Portal page, press the CTRL key, right-click the widget heading, and select **Instance Options**.

© 2026 ServiceNow, Inc. All rights reserved.

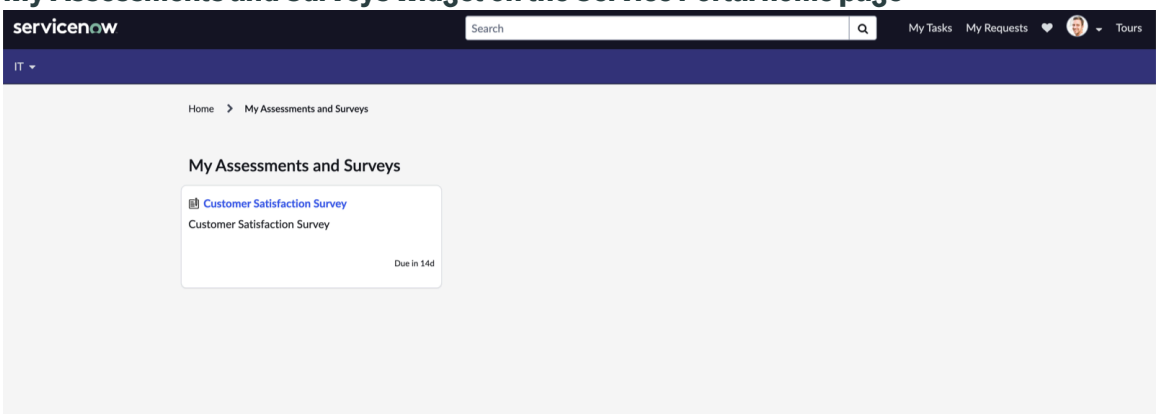
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Instance options (properties) for the survey widget on Service Portal

Property	Description
Max records	Maximum number of surveys to list in the widget on the Service Portal home page. Click the **View all** link to view all surveys. Default: **5**
Title of the widget	Text that appears in the title bar of the surveys widget. Default: **My Assessments and Surveys**

My Assessments and Surveys widget on the Service Portal home page



Surveys in the Now Mobile app

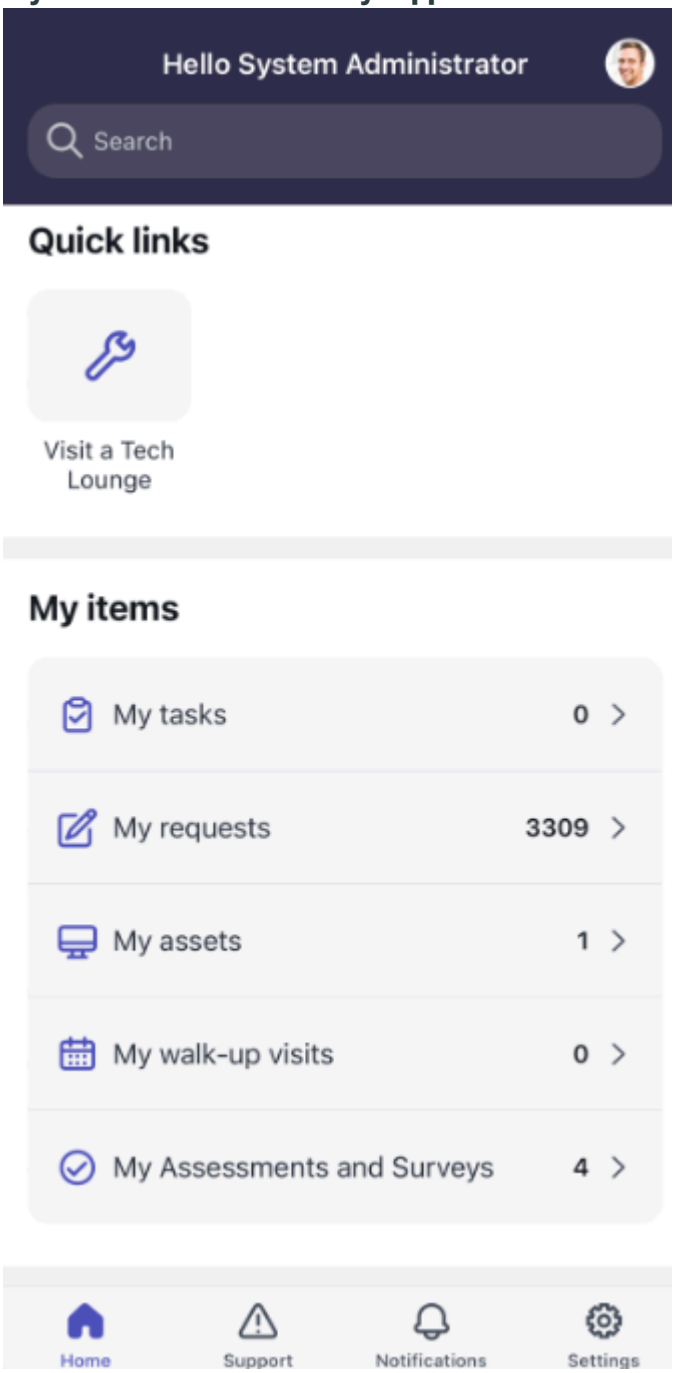
Users can view and take the surveys on mobile devices using the My Assessments and Surveys applet launcher that is available by default in the Now Mobile app.

When you assign a survey to a user an email notification about taking the survey is sent to the user. If users have installed the Now Mobile app, a mobile push notification is also sent on mobile devices. Tapping the notification opens an introduction page for a survey in the Mobile Employee Service Portal in the Now Mobile app. The page shows a **Get started** link. The introduction page and the **Get started** link are available only if the related settings are enabled. Users can tap the link to view and take the survey. You can activate push notifications by setting the *glide.sg.universal_links.enabled* system property to **true**.

Note:
A push notification doesn't apply for a triggered survey. For a triggered survey, an event is inserted in the event queue. The event can be configured to determine whether to send a notification or not.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

My Assessments and Surveys applet on a mobile device



Note:
In the Yokohama version, you now see the assessments and surveys assigned in the card view instead of the item view. If you customize the styles of the legacy card item views in older versions of Assessments and Surveys, the card continues to appear in the item view even after you upgrade to Yokohama. You can view the new card view in Yokohama only if no customizations were made to the legacy cards.

When users open a survey either in Service Portal or the Now Mobile app, the surveys provide the following features:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- A survey page shows breadcrumb navigation on the Service Portal. Users can click the links in the breadcrumb to navigate to previous pages or a home page. For example, clicking the **My Surveys** link in the breadcrumb navigates users to a page, which shows a list of all the surveys.
- When the survey is in progress, the progress bar, which is available on each page of the survey, shows the progress in percentage. The percentage of completion is based on the pages on the survey. For example, suppose that there are three pages of a survey. The third page shows 66% completion of the survey. But giving a response to one of the questions on the third page opens a new question on a separate page, which is the fourth page. The fourth page shows the progress of the survey as 75% completed, which affects the overall progress and page indicators. Users can see the pagination (total number of pages) for the entire survey as well as the current page that the users are on. To hide or show this progress bar, you can use the *sn_portal_surveys.sp_survey.show_progress_bar* property.
- Each user response is saved automatically when users move to the next page in the survey. If users don't answer the required survey questions before clicking **Next**, the page shows an error message at the top for all required and unanswered questions. This error message helps users find the exact location of the unanswered and required question. Any question that is not required and is not responded to before clicking **Next** is considered answered. The question is counted as completed.
- When the details of a survey question contain more than four or five lines of text, the text after these lines disappears. In such cases, users can see the complete details by clicking the **Show more** link. Users can go back to the default behavior by clicking the **Show less** link.
- For a question that has the answer options of **Yes**, **No**, and **Not Applicable**, the **Not Applicable** option appears last in the list of options. The **Not Applicable** option can be configured while creating a question.
- When the survey users leave the survey without submitting it, they can start the survey later from the same page where they left off in the previous session.

Note:
For mobile users, the pagination is always by question for surveys. For more information about pagination settings, see Configure a survey in the survey designer.

One Click survey

A One Click survey has no introduction page in Service Portal. This survey doesn't have the **Submit** and **Cancel** buttons in the desktop and iPad view.

Note:

- The One Click Survey is not supported in the mobile device view.
- The **One Click Survey** field should be selected in the survey definition.
- When the public access is enabled for a One Click survey, a user can submit the survey without having to log in.
- When the public access is enabled for a survey, you can't configure a signature or an attachment for the survey.
- For a published public survey, the Signature field is hidden and you can't add an attachment.

A kiosk survey is a One Click survey with only one question of any of the following types:

- Image Scale
- Choice

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Likert Scale
- Numeric Scale
- Yes/No

When users click the answer for the kiosk survey question in Service Portal, the survey is submitted, and the end note is displayed on the same page that contains the survey questions. The kiosk survey becomes read-only after it's clicked.

Note:

- A kiosk survey doesn't have any **Submit** or **Cancel** buttons.
- A kiosk survey can't have a signature, dependent questions, or additional information.
- A kiosk survey doesn't display introduction notes.

URI parameters for One Click survey

Pass these URI parameters through the *createAssessment()* API to store their values in the asmt_assessment_instance table for both platform view and Service Portal view.

URI parameters

Parameter	Description
sysparm_refresh_interval	Refresh the time, in seconds, after the survey submission to create another instance. For example, sysparm_refresh_interval=5.
sysparm_trigger_table	Location that is stored as the **Trigger Table** field in the asmt_assessment_instance table. For example, sysparm_trigger_table=incident.
sysparm_trigger_id	Location sys_id that is stored as the **Trigger ID** field in the asmt_assessment_instance table. For example, sysparm_trigger_id=1c741bd70b2322007518478d83673af3.
sysparm_kiosk	When set to **true**, both the sysparm_trigger_table and sysparm_trigger_id parameters should be specified. This parameter is required for kiosk requests. For example, sysparm_kiosk=true.

Surveys in ITSM Virtual Agent

You can use surveys in ITSM Virtual Agent to collect survey responses from users through conversational questionnaires (pre-chat and post-chat surveys) in the chat client.

A chat survey is available in ITSM Virtual Agent through the Provide Virtual Agent Feedback topic. The logic that renders the survey dynamically is called from the re-usable Survey topic block. It is common to use the Provide Virtual Agent Feedback topic as the survey setup topic in the general

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

definitions of ITSM Virtual Agent, so that users automatically receive a survey at the end of their conversations. For information about the Survey topic block, see ITSM Virtual Agent.

When you select the **Chat Survey** check box for a survey, the following conditions are validated for surveys on ITSM Virtual Agent.

- Survey should contain only one metric category.
- Survey can contain only these metric types.
  - Attachment
  - Boolean
  - Check box
  - Choice
  - Date
  - Date/Time
  - Image scale
  - Number
  - Numeric scale
  - Percentage
  - Scale
  - String

For information on configuring a survey, see Modify a survey definition and Configure a survey in the survey designer.

The following capabilities are supported for the survey:

- Dependent survey fields
- Introduction and end notes

Association between a survey and Virtual Agent chat

After a survey is submitted in a Virtual Agent conversation, a survey instance is created. This instance displays the following information:

- Trigger ID, which is the sys_id of the associated interaction ID created in the Virtual Agent chat
- Trigger table, which is the interaction table

Legacy survey migration

Users with the survey_admin role can migrate legacy survey data to create copies of legacy surveys and their related records in assessment tables. The Survey Management application, which is built on the assessment engine, is available as an alternative to legacy surveys.

The following legacy survey components are migrated:

- Survey masters
- Supported survey questions and question choices

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Survey instances
- Survey responses

Legacy survey conditions are not migrated and must be recreated as trigger conditions.

Note:

- The **Legacy Surveys** and **Legacy Administration** modules are available on instances upgraded from a previous release but not available for new instances. Customers using legacy survey or survey wizard should plan to migrate to the Survey Management application to create modern and high quality surveys for their users.
- The following legacy survey plugins are inactive by default, and are available upon request:
  - Best Practice - Task Survey Management (ID: com.snc.bestpractice.task_survey)
  - Survey Management (ID: com.glideapp.survey)
  - Assessment Components (ID: com.snc.assessment)
  - Survey Wizard (ID: com.glideapp.survey_wizard)
- Survey wizards cannot be migrated.

Migrate a legacy survey

Migrate a legacy survey and its related records to take advantage of a more powerful feature set.

Before you begin

Role required: admin or survey_admin

About this task

To avoid timing out for very large surveys, you can disable the transaction quota. See Transaction quotas.

Procedure

1. Navigate to **All** > **Survey** > **Legacy Surveys** > **Masters**.

   The list of legacy survey masters appears. By default, the list shows only survey masters that have not been migrated. To show all survey masters, remove the **Assessment is empty** breadcrumb.

2. Open a survey and click the **Migrate to New Survey Management** related link or **Migrate to New Survey Management** in the title bar.
   A dialog box describes what happens when you migrate the survey. Note that certain types of survey questions cannot be migrated.
3. Click **OK**.

   The system generates records on assessment tables based on the survey master, eligible questions and choices, results, and other related survey components. The original survey components are unaffected.

   System messages may appear at the top of the Survey form to notify you of questions that could not be migrated and to advise you to review migrated **Multiple Choice** questions.

4. **Optional:** Click the reference icon beside the **Assessment** field to view the new survey definition.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. **Optional:** Remove survey users from the assessment survey if you want all users to be able to take it.
   When you migrate a survey, any users who have taken it are automatically associated with the assessment survey and become survey users. When there are survey users associated with an assessment survey, only those users can take it.
6. Deactivate any survey conditions associated with the survey by completing the following steps.
   a. Navigate to **Survey** > **Legacy Administration** > **Survey Conditions**.
   b. In the **Active** column, ensure the value is false for any survey conditions that reference the migrated survey.
7. Navigate to **Survey** > **Administration** > **Trigger Conditions** to create new trigger conditions for the migrated survey.

Result

The **Migrate to Assessment** related link on the legacy survey record becomes unavailable after the migration. However, if you delete the record referenced in the **Assessment** field, the related link reappears and you can migrate the legacy survey again.

Survey question migration

Before you migrate a legacy survey, understand that some legacy survey questions cannot be migrated due to incompatible question types.

Legacy survey questions are migrated from the Survey Question [survey_question_new] table to the Assessment Metric [asmt_metric] table. In legacy surveys, the **Type** field on the Survey Question table determines how the question renders on the survey questionnaire. In assessment surveys, the **Data type** field on the Assessment Metric table serves a similar purpose. Certain legacy survey types are not supported in assessment surveys.

The following table shows the conversion path for each legacy survey question type to an assessment data type, if there is one.

Survey question migration

Legacy survey type	Assessment data type
Break	Not available
CheckBox	Checkbox
Date	Date
Date/Time	Date/Time
HTML	Not available
Label	Not available
List Collector	Not available
Lookup Multiple Choice	Not available
Lookup Select Box	Not available
Macro	Not available
Macro with Label	Not available
Multi Line Text	String (**String** option set to **Multiline**)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Survey question migration (continued)

Legacy survey type	Assessment data type
Multiple Choice	Likert Scale
Numeric Scale	Number
Reference	Not available
Select Box	Choice
Single Line Text	String (**String** option set to **Single line**)
UI Page	Not available
Wide Single Line Text	String (**String** option set to **Single line wide**)
Yes / No	Yes/No

Migrated components

When you migrate a survey, the system maps records from survey tables to assessment tables.

To create a functional survey on the assessment framework, the system converts survey records to the most logical equivalent assessment survey records. This may mean multiple assessment survey records represent one legacy survey record.

Migrated components

Survey component	Assessment survey components
Survey master [survey_master]	• Survey definition [asmt_metric_type] • Assessable record [asmt_assessable_record], for system use only • Survey category [asmt_metric_category]
Survey question [survey_question_new]	Survey question [asmt_metric]
Question choice [question_choice]	Assessment metric definition [asmt_metric_definition]
Survey instance [survey_instance]	• Assessment group [asmt_assessment], for system use only • Survey instance [asmt_assessment_instance]
Survey response [survey_response]	• Survey instance question [asmt_assessment_instance_question] • Survey response [asmt_metric_result] • Category result [asmt_category_result], for system use only

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Migrated question review

To maintain accurate result calculations, you may need to make minor adjustments to some of the migrated survey records to ensure results are calculated correctly.

Note:
The assessment engine provides a built-in result calculation feature that converts each survey response to a score between 0 and 10. The configuration required to maintain accurate result calculations is advanced and is not recommended for basic survey implementations. If you do not plan to use result calculation data, ignore the information in this section.

For each legacy question migrated, the system creates a survey question record on the Assessment Metric [asmt_metric] table. For legacy questions of the **Multiple Choice** and **Select Box** types, the system also creates a metric definition record, on the Assessment Metric Definition [asmt_metric_definition] table, for each legacy question choice.

Comparable metric definitions and survey question choices

Survey question choice field	Related metric definition field
Text	Display
Value (can be any string value)	Value (must be a numerical value)
Order	Value (metric definition with smallest **Value** is first)

When the system migrates legacy survey question choices, it uses the legacy **Order** to set each metric definition **Value**. For the legacy question choice with the smallest **Order**, the corresponding metric definition **Value** is set to **1**. For the legacy question choice with the next smallest **Order**, the metric definition **Value** is **2**, and so on.

The **Scale definition** field on the migrated Survey Question form determines whether smaller or bigger metric definition values equate to a good score in survey result calculations. By default, the scale definition is set to **High**, meaning bigger values are good. When you migrate a legacy survey, check that the default scale definition makes sense for each question.

For example, the following tables depict a sample migrated question and the metric definitions automatically created for it. Recall that the system uses the order of the legacy survey question choices to set the metric definition value. **Excellent** has the lowest **Order** value, so when the system creates a metric definition for this question choice, the **Value** is set to **1**. In this case the default scale definition value, **High**, does not make sense, as the system will calculate the worst scores for responses of **Excellent**.

Legacy question: Please rate the overall quality of your service

Question choice text	Question choice vlue	Question choice order
Excellent	A	100
Good	B	200
Fair	C	300
Poor	D	400

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Migrated question: Please rate the overall quality of your service

Metric definition display	Metric definition value
Excellent	1
Good	2
Fair	3
Poor	4

If there are no **Order** values for the legacy survey question choices, the system sets each corresponding metric definition **Value** based on the alphanumeric order of the legacy **Text** value.

Migrated question: Please rate the overall quality of your service

Metric definition display	Metric definition value
Excellent	1
Good	2
Fair	3
Poor	4

You may also need to change the **Scale definition** setting for other migrated questions. For details, see the scale definition recommendations for each survey question data type.

Surveys reference

Reference topics provide additional information about the forms, fields, and properties you use while working with surveys.

Survey roles

The Survey application uses the following roles.

To learn more about managing subscriptions, see Managing per-user subscriptions in Subscription Management and contact your account representative.

No role is required to take assigned survey questionnaires.

Survey administrator [survey_admin]

Create and administer surveys. Survey administrators know what types of surveys are necessary, when to send a survey, and to whom. Survey administrators can use all modules in the Survey application menu.

Key survey terms

These survey terms are used throughout the documentation to describe survey management functions and capabilities.

Key survey terms

Term	Description
Survey definition	Root record on which a survey is built. A survey definition contains information such as the survey name, state, and distribution schedule. Each survey definition has its own categories and questions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Key survey terms (continued)

Term	Description
	Survey definitions are comparable to legacy survey masters.
Public survey	Any user can take a public survey, even users who have not logged in to the ServiceNow system. For a completed survey, the **Assigned to** field value is Guest.
Survey category	Represents a theme for survey questions. Categories contain one or more questions. The system creates one category per survey by default. Additional categories are optional.
Survey question	A question that appears on a survey questionnaire for the associated survey definition. Survey questions are comparable to legacy survey questions.
Survey user	User who is authorized to receive invitations for a restricted survey.
Survey instance	Represents one survey questionnaire assigned to one user. Survey instances are comparable to legacy survey instances.
Trigger condition	Defines a rule that enables the system to send a survey when an action occurs on a table, such as when an incident closes. Trigger conditions are comparable to legacy survey conditions.
Scorecard	Visual representation of survey responses. Scorecards display a variety of data summaries for one survey definition.

Survey Overview dashboard

The Survey Overview dashboard displays various survey reports, such as Surveys by Metric Type and State.

Note:
The **Survey Overview dashboard** is deprecated. It is no longer deployed, enhanced, or supported. For details, see the Deprecation Process [KB0867184] article in the Now Support knowledge base.

Survey Overview dashboard reports

Report	Table
Assignment Group Customer Satisfaction 90 Day Average	Metric Results [asmt_metric_result]

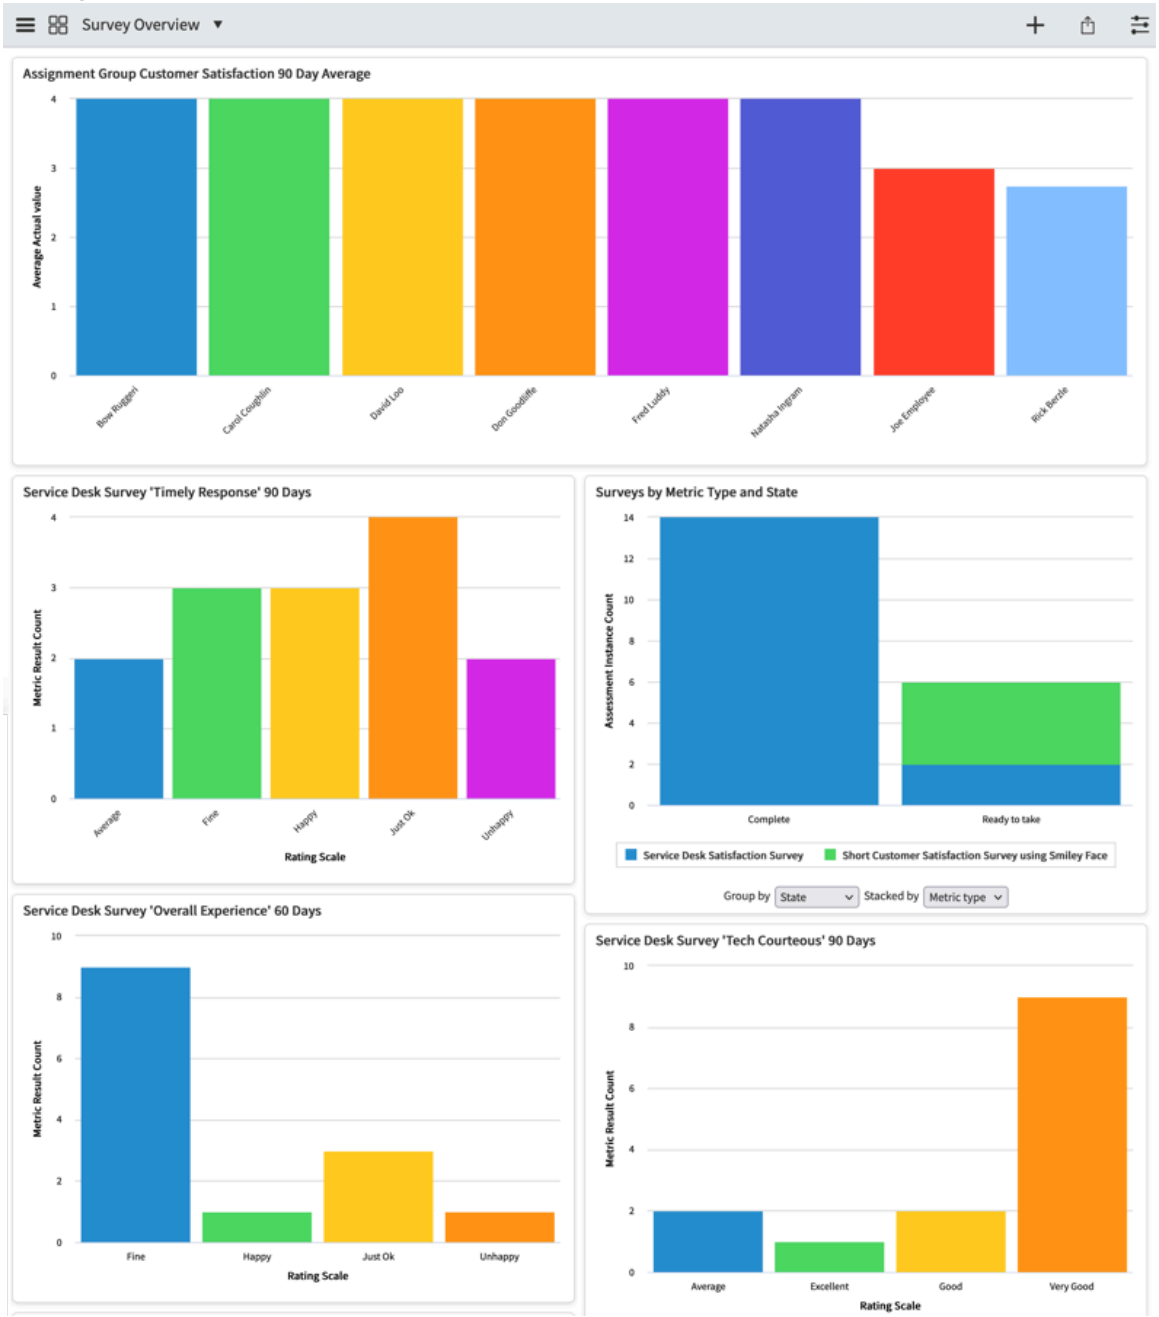
Survey report



Metric Result form

Description of the field values for the Metric Result form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metric Result form

Field	Description
Assessment group	Assessment group to which the metric result belongs. An assessment group is a container for survey instances and results generated in a single occurrence. The system generates an assessment group every time at least one survey instance is created. If multiple survey instances are created at once, such as when a survey administrator sends invitations to a list of survey users, they are all stored in the same assessment group.
Metric	Question that the user answered.
Data type	Data type of the question the user answered.
Method	Assessment method. Always **Assessment** for surveys.
Updated	Date and time the metric result was last updated.
Source	Survey definition from which the associated survey instance was generated.
Assigned to	User who completed the survey questionnaire.
Instance	Survey instance completed by the **Assigned to** user.
Actual value	Value obtained from the user response to the question. The actual value is determined by the question data type: • **Checkbox:** The actual value is *0* if the check box is cleared and *1* if it is selected. • **Choice** or **Likert Scale:** The actual value is equal to the **Value** of the metric definition associated with the chosen answer option. • **Date**, **Date/Time**, or **String:** The actual value is *-1* to indicate that these data types do not contribute to category result calculations. • **Template:** The actual value is equal to the **Value** of the template definition associated with the chosen answer option. • **Yes/No:** The actual value is *0* if the response is **No** and *1* if it is **Yes**.
Normalized value	Adjusted value that accounts for the **Scale definition** setting, minimum and maximum values, and other factors. The equation that generates the value and an example calculation appear in Normalized value for an assessment.
String value	Value that displays the response as it appears on a questionnaire. In some cases this is the same as the **Actual value**, such as when the question data type is **Percentage**. The string value is N/A for unanswered questions of certain data types.

Normalized value for an assessment

The normalized value is calculated based on a linear equation and the scale definition of the metric. This value can be used for risk assessment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Normalized value for any metric

The normalized value is directly proportional to the scale definition of the metric. If the scale definition is low, that is, the lower scale values are better, then `Normalized value = 1.0 – Normalized value`.

For the reporting purpose, use the Metric Result [asmt_metric_result] table.

```
Normalized value = (Input Value - Min value defined in metric) / (Max value defined in metric - Min value defined in metric) * (current metric weight * bias / (sum of all metric weight in the metric category)) * scale_factor
```

Bias is the ratio of total metric weight in the category and the sum of valid metric weight in the metric category. While calculating bias, the scripted metrics are excluded.

Note:

- If a metric is skipped when taking the assessment, its weight is excluded when calculating `sum of valid metric weight in the metric category`.
- The following metric types are excluded in the normalized value calculation:
  - String
  - Date
  - Date/Time
  - Reference
  - Attachment
  - Ranking

For example, consider the following scenario.

Calculate the normalized value for the **Please rate the competency of the technician** metric.

Values of the metric

Input value	3
Minimum value	1
Maximum value	6
Current metric weight	10
Number of metrics in the metric category	6 • 4 of type=number • 1 of type=yes/no • 1 of type=string (invalid data type; value cannot be calculated)
Valid metric weight of each response	10
Scale factor	10

```
Normalized value = (3 - 1) / (6 - 1) * (10 / (10 + 10 + 10 + 10 + 10)) * 10 = 0.8
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Normalized value for a multiple selection metric

The normalized value for a multiple selection metric is calculated by using the weight of the metric and the score for each choice of the metric.

In a multiple selection metric, for each choice that should be used for the normalization calculation, define the normalization input value.

```
Normalized value = (Score of all choices) * (current metric weight / (sum of valid metric weight in the metric category)) * scale_factor
```

Here, score of all choices of the metric is the sum of individual scores of each choice.

- `Score of each choice in a multiple selection metric= Normalization input of the choice / max value of the metric`
- `max value of the metric = Sum of the normalization input for all choices of the metric`
- `min value of the metric is always 0`

For example, consider the following scenario.

Calculate the normalized value for the multiple selection metric, **Please rate the competency of the technician**, with three choices, A, B, and C.

Values of the metric

Choice A	Normalization input is 1
Choice B	Normalization input is 1
Choice C	Normalization input is 2
Minimum value	0
Maximum value	4
Current metric weight	10
Number of metrics in the metric category	5
Valid metric weight of each metric	10
Scale factor	10

If Choice A and B are selected, `Normalized value = ((1 / 4) + (1 / 4)) * (10 / (10 + 10 + 10 + 10 + 10)) * 10 = 1`

Weighted value for a risk assessment

For a risk assessment, the weighted value from metric results table is calculated as following.

```
weighted_value = metric.weight * result.actual_value
```

Domain separation and Surveys

Domain separation is supported in Surveys. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

Overview

As a survey creator, survey_admin can create surveys in the assigned domain. A Global domain survey_admin can create or edit survey in any domain.

As a survey taker, a user can access the survey record and take the survey based on the domain of the survey record and user. Global domain users can take a survey in any domain.

How domain separation works in Surveys

There are several main areas to consider in how domain separation works in Surveys.

Surveys in domain-separated instances

The following domains are available by default after activating the Domain Support-Domain Extensions Installer [com.glide.domain.msp_extensions.installer] plugin. Only ServiceNow employees can activate this plugin.

- Global
- Acme
- Cisco

Access to surveys in domain-separated instances

Based on the domain of the survey record and users, users can access the survey record and take the survey.

Global domain users can access survey records in any domain. Users in any other domain can access records in their domain and Global domain. For example, users in the Acme domain can access records in the Acme domain and the Global domain.

Global domain users can take a survey in any domain. Users in any other domain can take surveys in their domain as well as the Global domain. For example, users in Acme domain can take surveys in the Acme domain and the Global domain.

Location of the survey record	**Users who can access and take the survey**		
N/A	Global	Acme	Cisco
Global	Yes	Yes	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Acme	Yes	Yes	No
Cisco	Yes	No	Yes

Any domain user can assign a survey in that domain to the same domain user or a Global domain user. For example, an Acme domain user can assign a survey to a Global domain user or an Acme domain user. Users from other domains are not visible to the Acme domain user.

Although the Global domain user can view a survey from other domains, this user cannot assign the survey of one domain to a user from a different domain. For example, a Global domain user can assign a survey from the Acme domain to another Global domain user or an Acme domain user, but not to a Cisco domain user.

Note:
When a task is closed in a child domain and the assigned survey is either in the child domain or the global domain, the user from the child domain can then take the survey.

Trigger conditions in domain-separated instances

A Global domain user can create a triggered condition for a survey from any domain. The Global domain user can create an incident and trigger the survey by selecting a user from the other domain in the **User field** under **Caller**. However, the Global user cannot assign the survey to the user of different domain.

A user can assign a trigger condition to a survey if the user belongs to the Global domain or the Survey domain.

If there is no domain path for a trigger condition, users from any domain can view the trigger condition. For example, in the `asmt_condition` table that has no column for the domain path, users from the Acme domain can view the trigger condition created by the Cisco domain users.

Domain separation for service providers

Survey Designer Configuration form

Description of the field values for the Survey Designer Configuration form.

Configuration tab fields

Field	Description
Active	Select the check box to enable the distribution of this survey to recipients.
Survey Owners	Owners of the survey. You can add a user with the survey_creator, survey_admin, or assessment_admin role.
Anonymize responses	Select the check box to collect survey responses anonymously. Recipients are not listed with survey results. When a user submits a survey, the system clears the **Assigned to** field for the associated survey instance. Also, survey responses for anonymous surveys do not contain Assigned to values. **Note:** The **Assigned to** field is cleared. However, each response record includes the **Created By** and **Updated By** fields that are accessible to users with the survey_admin role.
Description	Description of this configuration or the survey to which it is attached.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuration tab fields (continued)

Field	Description
Do not show survey introduction notes	Check box to skip the introduction notes when a survey is launched. This functionality is applicable in both the ServiceNow AI Platform and Service Portal product versions.
Introduction	Introductory content to display on surveys. You can add a welcome message or background information about the survey.
Signature	Acknowledgement by a survey recipient of requirements, admonitions, or expectations related to a survey.
Return URL	Destination address of a web page that is presented to users after they submit a completed survey. When a return URL is configured, the **End note** content does not appear.
End note	Content that is displayed to recipients after they submit a completed survey. You can add a thank you message, follow-up instructions, or other applicable information. End notes are not displayed if a **Return URL** is specified.
Public Survey	Enables public access to the survey. No login is required to take a public survey and users or non-users can respond anonymously. For completed public surveys, the **Assigned to** field value is Guest. **Note:** This check box is available only after you save the survey.
Survey Publish URL	Specifies a URL of the survey that can be shared with users. **Note:** This field is available only after you publish the survey.
Pagination setting for Service Portal view	Specify how the user will see pages on the desktop or tablet view in Service Portal. • **Category**: Display each category on a separate page. • **Question**: Display each question on a separate page. This happens for mobile regardless of this setting. • **None**: All items on a single page—no pagination Default: **Category** **Note:** This field appears only when Service Portal is installed.
Chat Survey	Option to validate if survey questions are supported in a chat survey. Enables conversational questionnaires (pre-chat and post-chat surveys) in the chat client. Also enables you to map chat context variables to survey questions. For information on a chat survey in ITSM Virtual Agent, see Surveys in ITSM Virtual Agent

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuration tab fields (continued)

Field	Description
	Note: This field is available only when the Glide Conversation Server plugin (com.glide.cs) is activated.
One Click Survey	Enables a One Click survey in Service Portal. **Note:** This option can be selected if the **Pagination setting for Service Portal view** is set to `None`.
Source Table	Table whose field is used as a dynamic value for a question in a triggered survey. **Note:** When you select a source table, ensure that its relevant field is selected as **Source Field** value of a metric.
Allow Sentiment Analysis	Enables sentiment analysis for this survey.
Duration	Amount of time that recipients are given to complete this survey, starting from the time that the survey is generated. The default duration is 14 days.
Outlook Actionable Message	Includes an embedded survey in the survey email notification. After you select this check box and save the survey, a validation is run to ensure all survey questions are supported. **Note:** This field is available only when the Outlook Actionable Messages(sn_ms_oam) plugin is installed.

Availability tab fields

Accessible by	Defines who can access the survey. Possible values are • Anyone: Accessible by anyone with the survey link. • Specific users: Accessible by specified users.
Survey groups only	If selected, a survey is available for survey groups only. **Note:** This field is displayed only if the **Accessible by** is `Specific users`.
Add group users	Group users for whom the survey is available.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Availability tab fields (continued)

	Note: This field is displayed only if the **Accessible by** is `Specific users`.
Add users	Users for whom the survey is available. **Note:** This field is displayed only if the **Accessible by** is `Specific users`.
Add recipients lists	Recipients lists for whom the survey is available. **Note:** This field is displayed only if the **Accessible by** is `Specific users`.

Properties form

Description of the field values for the Properties form of survey designer.

Question property fields

Field	Description
Name	Concise name of the question. The system uses this value to identify the question in Assessment Metric lists and in scorecard charts.
Question	Text to display as the question on surveys. Enter a clear, straightforward question that is easy to understand.
Type	Data type selected for this question. See the table in Controls for the available data types.
Active	Check box that determines whether this question is available on a survey. A question does not appear on surveys that are generated after the question becomes inactive.
Mandatory	Check box to require users to answer the question. Mandatory questions are denoted by a red field status indicator and must be answered before the survey can be submitted. This field is available when the question does not have a dependency and the question type is not **Boolean** with a check box option.
Allow Additional Information	If selected, the **Additional Information Label** field is enabled. The **Additional Information Label** field value is displayed as a field on the survey response page to provide additional information for a question. **Note:** This is not applicable for the String and Template data types.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Question property fields (continued)

Field	Description
Boolean option	Whether a check box or a **Yes/No** list appears as the option for a Boolean question.
String option	Setting for the appearance of a string field in a question. This field is available when the question type is **String**. The string options include the following. • **Single line**: Single-line text field 40 characters in length that allows strings of any length. • **String line wide**: Full page width text field that allows a single-line entry of any length. • **Multiline**: Full page width multiline text field that allows word wrap and returns
Min	Lowest positive whole number that users can enter or select to answer the question. This field is available when the question type is **Number**, **Percentage**, or **Numeric Scale**.
Max	Highest positive whole number that users can enter or select to answer the question. This field is available when the question type is **Number**, **Percentage**, or **Numeric Scale**.
Allow not applicable	Check box for including **Not Applicable** as an option for this question. Users can select **Not Applicable** if they do not have sufficient information to respond to a question. User responses of **Not Applicable** are excluded from results calculations. This field is available when the question does not have a dependency and the question type is not **Boolean** with a check box option.
Randomize answers	Check box for displaying answer options in a random order. Answer preference is sometimes influenced by the order in which options appear, which can result in biased results. Randomizing options can help prevent this bias. **Note:** Randomizing options for certain questions may make those questions confusing for users. In general, only randomize options that do not follow a logical order.
Positive indicator	Setting that determines whether smaller or larger numerical values equate to a good score in result calculations. Select **Low values** if smaller numerical values are better, such as for a question that measures the number of incidents for a vendor. Select **High values** if larger numerical values are better, such as for a question that measures user satisfaction on a scale of one to five.
Source Field	Source table field that appears as a dynamic value for the question in a triggered survey. When this field value is selected, a *`${param}`* placeholder is added at the end of the question label. **Note:** You can move this placeholder anywhere in the question label. When a user takes the survey, the question with dynamic value is included in the survey instance and *`${param}`* placeholder is replaced with the source field value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Question property fields (continued)

Field	Description
	If the record table specified in the trigger condition does not match the source table specified for the survey, or if the system fails to get the dynamic value from the source record, the *${param}* placeholder is not replaced by any value and is displayed as is in the question. For example, if the survey is triggered from a **PRB** record and the survey question is configured with a dynamic value from **Incident**, the *${param}* placeholder in the survey question label is not replaced by any dynamic value and is displayed as is. When survey questions are translated to other languages by a survey admin, the *${param}* placeholder should not be translated.
Allow Sentiment Analysis	Includes this question for the sentiment analysis of a survey. **Note:** This field is available only for String type questions.
Details	Information about the question that is displayed on the survey. Include details that help users understand how to answer the question.
Choices	Options for a question with a data type of **Choice** or **Scale**. The system automatically adds text and values that you can edit for each option. You must have at least two options, and each option must have a unique value. Click the **+** icon to add an option, or click the **X** icon to delete an option. By default, the system arranges options in the order established by their values. To change the order, drag and drop the options. **Note:** Value numbers also contribute to the calculations of survey response scores, which can be used by advanced survey administrators. 
Custom Metric form

Description of the field values for the Custom Metric form.

Custom Metric form

Field	Description
Name	Name of your custom metric type. The name appears on the Custom Metrics page.
Application	Name of the application that you are creating the custom metric type for.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Custom Metric form (continued)

Field	Description
Icon	An icon for the custom metric type. The custom metric type appears as the selected icon in Survey Designer.
Active	Option to enable or disable the custom metric type. If selected, the Survey Designer shows the custom metric type.
Macro	A macro that is used to render the custom metric type. **Note:** • If the **Macro** field is empty, the question is not rendered on the platform form. • The macro record that you select must contain an input element with the following attributes. This input element holds the value for the metric. ◦ `datatype="custom"` ◦ `name= "${jvar_question_name}"` • Value parameters can be accessed in a macro using the *`${jvar_value_params}`* object.
Widget	The widget is used to render the custom metric. **Note:** • If the **Widget** field is empty, the question is not rendered on the portal form. • The widget record that you select must contain an input element with the following attributes. This input element holds the value for the metric. ◦ `ng-model="page.fieldValue"` ◦ `ng-model-options="{getterSetter: true}"` • The client script must have *`$scope`* as one of the parameters in the function definition. The value parameters can be accessed using the *`$scope.page.field.value_params`* object.
Result type	Result type for the custom metric type. If a value is changed, the new results are stored as per the new value and the previous results remain unchanged. If a value is changed from string to number, the reports might not show the charts properly. If a value is changed from number to string, the scorecard is shown in a list view.
Value parameters	Value pairs that are passed to the custom metric type renderers. For example, in star ratings, you can pass a value as 5 for 5 stars or 10 for 10 stars.

Survey Instance form

Description of the field values for the on the Survey Instance form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Survey Instance form

Field	Description
Number	Automatically generated record number.
Metric type	Survey definition this survey instance was created from. Survey definitions are stored on the Assessment Instance table, and the field label on that table is **Metric type**.
Due date	Date by which the survey instance should be completed. The system populates the due date based on the **Assessment duration** of the associated survey definition, which is set to 14 days by default. The survey due date is not enforced in the base system. If you want to enforce the due date, consider using a workflow or other mechanism to send survey recipients reminders when a survey is overdue. **Note:** By default, the system runs the *Cancel Expired Assessments* script every 30 days to cancel expired survey, assessment, and quiz instances that are in the Work in progress or Ready to take states.
State	State of the survey instance.
Assigned to	User this survey instance is assigned to. This field becomes read-only when the state is In progress, Complete, or Canceled.
Domain	Domain associated with the instance.
Expiration date	Date on which the assigned user can receive a new instance of the same survey definition. The system automatically populates the expiration date based on the **Schedule period** of the associated survey definition.
Related Link	
View User's Response	Shows a read-only version of the survey responses completed by the user.
Retry Sentiment Analysis	Sends the survey instances for sentiment analysis. **Note:** This link is available only if any sentiment analysis result is not available for this instance under **Survey** > **Question Sentiment Results**
Related List	
Assessment Instance Questions	All instance question records, which store user response values for each question on the survey questionnaire. The following columns are relevant to surveys: • **Category**: Displays the survey categories the questions belong to. • **Metric**: Displays the survey questions.

Related topics

View a survey instance

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Survey Question form

Description of the field values for the Survey Question form.

Survey Question form

Field	Description
Name	Name of the question. When you create a survey, the question name is the same as the text in the **Question** field.
Question	Text to use for the question, which appears on survey questionnaires.
Data type	Data type of the question. The fields for the response depend on the data type. **Note:** If another question depends on this question, you cannot change the data type.
Template	Question template to use for the answer options. This field is visible and required only if the data type is **Template**. **Note:** If another question depends on this question, you cannot change the template.
Scale definition	Setting that determines whether smaller or larger numerical values equate to a good score in result calculations. Select **Low** if smaller numerical values are better, such as for a question that measures the number of incidents for a vendor. Select **High** if larger numerical values are better, such as for a question that measures user satisfaction on a scale of one to five. This field is visible and required only when certain data types are selected.
Randomize answers	Check box that determines whether to present the answer options for this question in a random order each time a user opens the survey. Answer preference is sometimes influenced by the order in which answer options appear, which can result in biased results. Randomize answer options to help prevent this bias. This field is visible only if the data type is **Choice** or **Likert Scale**. **Note:** Randomizing answer options may make a question confusing. In general, only randomize answer options that do not follow a logical order.
Mandatory	Check box that makes the question mandatory (selected) or optional (cleared) on survey questionnaires. Users cannot submit questionnaires until they provide valid responses to all mandatory questions, which are denoted by a red field status indicator. This field is visible only when the **Depends on** field is empty and the data type is not **Checkbox**. Questions that depend on other questions and check box questions cannot be mandatory.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Survey Question form (continued)

Field	Description
Allow not applicable	Check box that determines whether to include a **Not Applicable** answer option for this question on survey questionnaires. User responses of **Not Applicable** are excluded from results calculations. This field is visible only if the data type is **Choice**, **Likert Scale**, **Template**, or **Yes/No**.
Allow Additional Information	If selected, the **Additional Information Label** field is enabled. The **Additional Information Label** field value is displayed as a field on the survey response page to provide additional information for a question. **Note:** • This is only available on the Service Portal and is not supported on the Platform or Mobile views. • This is not applicable for the String and Template data types.
Depends on	Setting used to make this a conditional question, meaning that it only appears when users answer another question a certain way. To make a question depend on another question, select an existing question from the list, which displays **Checkbox**, **Choice**, **Template**, and **Yes/No** questions of the same category as this question. Then, use the **Displayed when** field to set the conditions that cause this question to appear on surveys. The system prevents the creation of recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A.
Displayed when	Answer options for the selected **Depends on** question which, when chosen on surveys, display this question. This field is visible and required only when the **Depends on** field is set.
Min	Smallest numerical value to be used as an answer option for this question. This field is visible and required only if the data type is **Choice**, **Likert Scale**, **Number**, or **Percentage**.
Max	Largest numerical value to be used as an answer option for this question. This field is visible and required only if the data type is **Choice**, **Likert Scale**, **Number**, or **Percentage**.
String option	Selection that determines what kind of response text box appears for this question on survey questionnaires. This field is visible and required only if the data type is **String**.
Source Field	Source table field that appears as a dynamic value for the question in a triggered survey. When this field value is selected, a *${param}* placeholder is added at the end of the question label. **Note:** You can move this placeholder anywhere in the question label. When a user takes the survey, the question with dynamic value is included in the survey instance and *${param}* placeholder is replaced with the source field value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Survey Question form (continued)

Field	Description
	If the record table specified in the trigger condition does not match the source table specified for the survey, or if the system fails to get the dynamic value from the source record, the *${param}* placeholder is not replaced by any value and is displayed as is in the question. For example, if the survey is triggered from a **PRB** record and the survey question is configured with a dynamic value from **Incident**, the *${param}* placeholder in the survey question label is not replaced by any dynamic value and is displayed as is. When survey questions are translated to other languages by a survey admin, the *${param}* placeholder should not be translated.
Allow Sentiment Analysis	Includes this question for the sentiment analysis of a survey. **Note:** This field is available only for String type questions.
Condition	Condition to filter the reference records from the table specified in the **Reference** field. **Note:** This field appears only for the Reference metric type.
Field validation	Validate the value entered for a String type metric of a survey. Possible validations are: • Email • IP Address(IPV4,IPV6) • Phone Number (E.164) • URL **Note:** This field appears only for the String metric type.
Related Lists	
Assessment Metric Definitions	Answer options for this question. This related list is available only if the **Data type** is **Choice** or **Likert Scale**.

Trigger Condition form for surveys

Description of the field values for the Trigger Condition form for surveys.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Trigger Condition form

Field	Description
Assessment	Survey to send.
Table	Table to run the trigger condition on. You can select only tables in the current application scope. For example, to send a survey whenever an incident closes, select the Incident [incident] table.
User field	Field that stores the users you want to send the survey. You can select any field, on the selected table or on a referenced table, that references the User [sys_user] table. Use the tree picker to select a field. **Note:** To avoid requiring users to log in to take a survey with a trigger condition, set the survey to **Public**.
Repeat interval	Minimum period that must pass before the trigger condition can resend the survey to the same user. For example, assume the repeat interval is set to 30 days. Even if the same user qualifies for multiple surveys from this trigger condition, the system can send only one survey every 30 days. **Note:** • Ensure that the Schedule period of the selected survey definition is set to **No Limit**. If the schedule period is set to a different value, it prevents the trigger condition from sending surveys as expected. • Trigger condition creates a survey instance irrespective of the repeat interval if the survey is set as anonymous.
Application	[Admin only] Application is set to Core.
Active	Check box that determines whether this trigger condition is active (selected).
Business rule	[Admin only] Business rule the system creates to monitor the selected table. When the condition is met, the business rule sends the survey to the correct user. No configuration is necessary for this business rule.
Trigger randomly	Check box that determines whether to send the survey to the appropriate user every time the condition is met (cleared) or only a percentage of the time (selected).
Probability (%)	Approximate probability that the survey is sent each time the condition is met. For example, if the probability is set to 50, the system sends the survey approximately 50% of the time the conditions are met. There are no repeat interval restrictions is assumed. This field is visible and required only when *Trigger randomly* is selected.
Related Field 1- 4	Field that contains a value you want to store for reporting purposes. You can pick any reference field on the selected table. When the trigger condition generates a survey instance, the system stores the value from the triggering record. Specify up to four fields. For example, select the Incident table, **Assigned to** and **Problem** as related fields. The system stores the assigned user and problem associated with the incident as Related record 1 and Related record 2 in the survey instance record. To view the fields, configure the form for any survey instance.

Trigger Condition form (continued)

Field	Description
	Note: You cannot use a related field for the ticket number because you cannot select the Number column. You can, however, use the trigger_id column of the table.
Description	Summary information to identify the trigger condition. **Note:** For a triggered record, the table title is used for the survey description.
Condition	Condition builder that defines the criteria that must be true to send the survey. For example, to send a survey whenever an incident closes, create the condition **[State] [is] [Closed]**. **Note:** • When defining conditions like case sensitivity or null values, see API GlideFilter - Scoped, Global. • Survey triggers will not function as expected when you use dot-walk conditions in the **Condition** field.

Recipients List form

Description of the field values for the Recipients List form.

Recipients List form

Field	Description
Name	Name of the recipients list.
Type	Type of users to include in the list. Possible values are: • Contacts • Internal Users The selection of each type changes the dynamic conditions. For example, if you select **Internal Users**, the **Table** field displays the value as **User [sys_user]**.
State	State of the recipients list. • **New**: List has not yet been generated. • **In Progress**: List is currently being generated. (You can see this state only when generating a very large list of recipients.) • **Complete**: List is generated.
Setup	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Recipients List form (continued)

Field	Description
Method	Method used to generate the recipients list. Possible values are: • `Upload File`: Upload an Excel file with the recipients list using the specified template. • `Dynamic Condition`: Run a script or condition builder to create the recipients list. **Note:** When the **Method** is `Dynamic Condition`, you can either use a script or a condition builder to create the recipients list.
Choose File	Allows you to download an Excel template, and then upload the Excel file with user information using the specified template. **Note:** • This field is available only if the **Method** is `Upload File`. • The templates vary based on the entity selected in the **Type** field. For accounts, the template includes columns for sys_id and account number values. For contacts, consumers, and internal users, the template includes columns for sys_id and email values.
Show Script	If selected, displays the script to create the recipients list. **Note:** This field is available only if the **Method** is `Dynamic Condition`.
Script	Script to create the recipients list. **Note:** This field is available only if the **Method** is `Dynamic Condition` and the **Show Script** check box is selected.
Table	Table that stores the user information. The table is selected based on the **Type** field. **Note:** This field is available only if the **Method** is `Dynamic Condition`.
User Field	Table field that refers to users. **Note:** This field is available only if the **Method** is `Dynamic Condition`.
Conditions	Condition builder to create the recipients list based on the specified table and user field. A condition is made up of a selected field, an operator, and a value. Add conditions using the AND and OR buttons. Delete conditions by clicking the Delete button to the right of a condition.

Assessments

Use assessments to evaluate, score, and rank records from any table in the system.

You can assess projects that executives want to evaluate for effective management, or rate and compare a vendor's goods and services. Use assessments to send custom questionnaires to selected users or write scripts that query the database directly. You can then compare assessment results for the records using unique graphical views designed to highlight key performance information. Share an assessment between ServiceNow instances by using update sets, which is the recommended way to move assessment data from one instance to another.

The Assessments plugin is enabled by default.

You can only edit an assessment that has the same application scope as that of your current session.

The difference between assessments, surveys, and quizzes, and when to use each; also provides a quick look at the three stages in the survey process: designing, sharing, and evaluating.

Using assessments

Before you create assessments, assign the assessment_admin role to the appropriate users in your organization and determine your objectives for the assessment.

Assessment administrator tasks

Before you create assessments, assign the assessment_admin role to the appropriate users in your organization and determine your objectives for the assessment.

Decide which sets of records in the system to assess, which themes you are interested in, and which traits to measure. Consider your organization's options for obtaining the data to compare. If you intend to use assessment questionnaires, consider which people can answer the questions.

Assessment terminology

Assessment admins use several terms when working with assessments.

Term	Description
Metric type	A metric type defines a set of records to evaluate, such as vendors, projects, or employees.
Assessable record	An assessable record links a record to evaluate, such as the company record for Amazon or the user record for a sales representative, to a metric type, such as

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Term	Description
	vendors or employees. You define sets of assessable records when you create metric types.
Metric category	A metric category represents a theme for evaluating assessable records. Categories contain one or more individual metrics, which define specific traits or values that comprise the theme. Examples of categories include overall vendor performance or quality of delivery services. You can also set filter conditions that control which assessable records to evaluate for the metrics in a category.
Metric	A metric is a trait or value used to evaluate assessable records. A metric can measure subjective values in an assessment questionnaire, or gather objective values in a database query run by a script. Examples of metrics include perceived courtesy of sales representatives or number of incidents per vendor.
Category user	A category user is a person who knows about a specific category. One person can be a category user for multiple categories. Examples of category users include a vendor manager who oversees all purchasing operations or a supervisor of a sales team.
Stakeholder	A stakeholder is a category user who knows about a specific assessable record. Examples of stakeholders include a vendor manager who coordinates purchases from Amazon or a supervisor of a sales team who manages a specific employee.
Assessment instance	An assessment instance represents one assessment questionnaire assigned to one user. The system generates a new assessment instance for each assigned user when: • The assessment generation scheduled job runs. • An assessment administrator creates an on-demand assessment.
Scorecard	A scorecard provides a visual illustration of an assessable record's performance, based on assessment results. Use scorecards to view a variety of data summaries for one assessable record and to compare the ratings with other assessable records.
Decision matrix	A decision matrix is a graph with two axes that plots the assessment results for multiple assessable records. Use decision matrixes to determine the relative standing of assessable records in selected categories.
Bubble chart	A bubble chart is a graph with three axes that plots the assessment results for multiple assessable records. Use bubble charts to determine the relative standing of assessable records in selected categories, with an emphasis on one category.

Assessment roles

The Assessments application requires certain roles to perform assessment tasks. No role is required to take assessment questionnaires that are assigned to you.

Role Title	Role Name	Description
Assessment administrator	assessment_admin	Assessment administrators set up assessments. They know which records to evaluate, the criteria on which to evaluate the records, and who to assign assessments to.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role Title	Role Name	Description
		Note: By default, users with the assessment_admin role have limited system rights and might not have access to all source records to assess. When planning assessments, grant additional roles to assessment administrators as needed. For example, to create and manage vendor assessments, the assessment administrator must also have the vendor_manager role, which grants access to the Company table and other relevant tables.
ITIL user	Base system roles	ITIL users perform basic technician operations in the system. In the Assessments application, they have read access to the Assessable Record table.
Administrator	Base system roles	Administrators have access to all aspects of the assessment process. Only administrators can set up assessment schedules.

Assessment methods

The available methods are **Assessment**, for non-scripted metrics, and **Script**, for scripted metrics. Each method serves a different function and can be used with certain data types.

Use the **Method** field to specify how to use the metric.

Assessment method

Metrics with the Method set to Assessment are called non-scripted metrics. Use each non-scripted metric to define a question for assessment questionnaires. Non-scripted metrics are useful if you want to obtain subjective data like personal opinions.

You can use the Assessment method with these *Data type* values:

- Attachment
- Checkbox
- Choice
- Date
- Date/Time
- Likert Scale
- Number
- Percentage
- String
- Template
- Yes/No

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Script method

Metrics with the Method set to Script are called scripted metrics. Use each scripted metric to define a custom script for database queries. Scripted metrics are useful if your system contains reliable data for the traits you want to evaluate.

You can use the Script method with these *Data type* values:

- Duration
- Number
- Percentage

Use the Script field to write JavaScript code. By default, the field contains information about available variables and an example, which you can use as the basis of your script or replace entirely.

You must use the following variables in your script:

- *primary*: Input variable used to access the sys_id of the record being assessed.
- *string_result*: Output variable that contains the display string value for this metric
- *actual_result*: Output variable that contains the actual value for this metric. The system uses this variable to populate the Actual value field on the Metric Result form. For each *actual_result,* you must specify a corresponding **scaled_result** value.
- *scaled_result*: Output variable that contains a numerical scaled value to represent an actual value. The system uses this variable to populate the **Scaled value** field on the **Metric Result** form. Ensure the scaled values you specify are between or equal to the **Min** and **Max** values for the metric. The **Scale definition** field determines how the system uses the scaled value. A scale definition of **Low** means smaller numbers are better, such as for a metric that measures the number of incidents for a vendor. **High** means larger numbers are better, such as for a metric that measures user satisfaction on a scale of one to five.

Script example

The metric Number of active devices uses the script pictured below. The *primary* variable is used to find CIs that are associated to the vendor record being assessed. The script retrieves the actual_result, the number of CIs associated to the vendor, then calculates the correct scaled_result. The script uses a series of scaled values, from the **Min** to the **Max** value, to represent actual values. Because the **Scale definition** is set to **High**, the greatest scaled values are best, meaning a vendor associated to the most CIs scores highest. The system stores the actual and scaled values in a metric result record for the vendor.

Configure an assessment

You can create a new assessment on a selected assessable records to evaluate, score, and rank records from any table in the system. Then create a metric category and assessment metrics for the assessment, publish the assessment, and assign it to the selected users.

Before you begin

Role required: admin, survey_creator, or assessment_admin

Procedure

1. Navigate to **All** > **Assessments** > **Metric Definition** > **Types**.
2. Click **New**.
3. On the Assessment Metric form, fill in the fields.
   For a description of the field values, see Assessment Metric form.
4. Create a new assessment and assign it to the assessors.
   Do the following in the Assessment Metric form.
   a. Add a condition: In the **Condition** tab, add a condition to define the assessable records on which the assessment is created.
   b. Add decision matrix fields: In the **Decision Matrix** tab, add the required filter field to identify filter menu choices on decision matrices and scorecard averages for this type. For more information, see Decision matrixes .
   c. Select the Assessors: In the **Assessors** tab, select the users to whom the assessment will be assigned.
   d. Generate Assessable records: When you save the assessment and click **Generate Assessable Records**, an assessable record is created for each unique user of the user field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- You must generate the assessable records, each time you update the condition.
- You can generate the assessable records only after updating the condition.

A new assessment is created. You must now create metric category and add assessment metrics to each metric category. Then publish the assessment and assign the assessment to the selected users.

e. Create a metric category: To create a metric category, do the following:

i. Open the assessment you just created and click **New** in the **Metric Categories** tab. Fill the form.

For more information about form fields, see Metric Category formform.

Tip:
To know how to create metric category alternatively, see Create a category for assessable records.

ii. Open a metric category, add a condition, and click **Assessable records** tab. The assessable records appear based on the selection made in the metric category form.

iii. Open a metric category, click **Assessment Metric** tab to add the questions. Click **New**.

For more information about form fields, see Assessment Metric form for a category.

Tip:
To know how to create assessment metric category alternatively, see Create an assessment metric for a category.

f. Click **Publish**, to publish the assessment. For more information, see Publish a metric type.

g. Assign the Assessment to the required users. Do the following:

i. For an on-demand Assessments, click either the **Assign Assessment** or **Assign to Assessors** link to assign the assessment. For more information, see Generate an on-demand assessment for multiple assessable records.

ii. For a scheduled Assessment, click the **Generate Assessments** link to trigger the scheduled job immediately. For more information, see Generate a scheduled assessment manually.

Assessment generation

In the Assessments application, administrators or assessment administrators can trigger the system to generate scheduled assessments or on-demand assessments when all the prerequisite steps are completed.

An assessment administrator must publish the metric type to enable assessment generation.

The system performs these tasks when it generates assessments:

- Creates assessment questionnaires from non-scripted metrics and assigns the questionnaires to users. When users complete their assigned questionnaires, the system uses their responses to calculate assessment results.
- Runs scripted metrics from each category to query the database and calculate assessment results.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Each time the system generates assessments, it creates some or all of the following components. Consider having an administrator set a schedule for recurring data cleanup, as the system can potentially generate a considerable amount of assessment data.

- Assessment group
- Assessment instances
- Assessment results

Assessment groups

An assessment group is a container for assessment instances and assessment results generated in a single occurrence.

The system generates an assessment group every time the scheduled job runs or the API is called, when there is at least one assessable record associated to a category in the type. You can find assessment group records in **Assessments** > **Assessment Groups**.

The Assessment Group form displays the group **Number**, the associated **Metric type**, and these related lists:

- **Assessment Instances**: Lists all assessment instances within this group. There may be no records in this related list. The system does not generate assessment instances if there are only scripted metrics for the type.
- **Metric Results**: Lists all metric results for this group. There may be no records in this related list initially. The system generates metric results immediately for scripted metrics, but not for non-scripted metrics, which appear as questions on assessments and require user response. The system dynamically updates the records in this list as users complete assessment questionnaires.
- **Assessment Category Results**: Lists all category results for this group. There may be no records in this related list initially. The system generates category results immediately if there are only scripted metrics in a category. Otherwise, the system does not calculate category results until a user completes an assessment questionnaire that contains questions from the category.

Note:
To prevent the loss of important assessment data, you cannot delete an assessment group if it contains any assessment instances, metric results, or category results.

View an assessment metric category

View assessment metric categories that are used with assessment metric types and assessment metrics in generating the bubble charts on the Demand Workbench. The bubble charts help the demand managers to visually assess the demands.

Before you begin
Role required: it_pps_admin

About this task
The Demand Management application comes with an assessment metric type named **Demand**, five default assessment metric categories, and assessment metrics.

Procedure

1. Navigate to **All** > **Project Administration** > **Settings** > **Assessments Metric Categories**.
2. Open an assessment metric category to review it.
   The following default assessment metric categories are available with the Demand Management.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Demand assessment metric categories

Assessment metric category	Data source	Description
Size	**T-Shirt size** field on the Demand form.	Assesses demand size relative to the size of other demands.
Strategic Alignment	View an assessment category result field in the assessment category result for the Strategic Alignment metric category.	Assesses how closely the demand aligns with strategic goals of the organization compared to other demands.
Risk	**Rating** field in the assessment category result for the Risk metric category.	Assesses demand risks compared to other demands.
ROI	**Impact** and **Financial return** fields on the Demand form.	Assesses demand return on investment compared to other demands.
Cost	**Labor costs**, **Capital expense**, and **Operating expense** fields on the Demand form.	Assesses demand cost compared to other demands.

Assessment metric categories

In the Assessments application, a metric category represents a theme for evaluating assessable records in a given metric type.

Each category has a numeric weight value to indicate its importance relative to other categories. Within a category, records called metrics are the traits or values used to evaluate assessable records. For example, there are many categories within the **Vendor** metric type, including Support Rating, which contains metrics that measure the quality of vendors' customer support services. Assessable records must be associated to categories to be eligible for evaluation. Assessment administrators create categories and manage which assessable records each category is associated to.

Weight categories and metrics

When you create a metric category or metric, you must specify a weight, a numeric value that indicates the importance of the category or metric relative to other categories and metrics.

The greater the weight value, the more important the item is. The system uses weight values in assessment result calculations. Consider these recommendations when choosing weight values.

- Determine a weighting scale and use it consistently. In general, use a scale with a small numeric range. A standard 1-10 scale is usually appropriate, where 1 is least and 10 most important. Understand that increasing the maximum value of a weighting scale impacts all related result calculations.
- Use the same weighting scale for metric categories and metrics. Though there is no limitation, consider using the same or very similar weighting scales for both categories and metrics to make it easier to remember which values to use. A scale of 1-10 is an effective and simple weighting system, but may not be suitable for all organizations.

Note:
If you do not want to use weighting, set the same weight value for all categories and metrics. The default weight value is 10.

Create a category for assessable records

After you create a metric type and generate assessable records, create categories for the themes you are interested in using to evaluate the assessable records.

Before you begin
Role required: none

Procedure

1. Navigate to **All** > **Assessments** > **Metric Definition** > **Categories**.
2. Click **New** to create a new metric category.
3. On the Metric Category form, fill in the fields.
   For a description of the field values, see Metric Category form.

Related topics

- Assessment metrics
- Assessment metric categories
- Assessable record associations

Assessable record associations

Only the assessable records associated to a category can be evaluated using metrics in that category. Manage which assessable records you evaluate for each category by creating and removing the associations.

Only the assessable records associated to a category can be evaluated using metrics in that category. Manage which assessable records you evaluate for each category by creating and removing the associations.

Note:
You can also manage which categories an assessable record is associated to using the Assessable Record form.

Related topics

- Assessment metrics
- Create a category for assessable records

Manage an assessable record automatically

Define at least one filter condition in the Metric Category form to automatically associate assessable records with the category.

Before you begin
Role required: assessment_admin or admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Assessments** > **Metric Definition** > **Categories**.
2. Open a category.
3. In the **Filter** field, create a condition statement that defines the records you want to associate to this category.

   The available fields are from the table defined for the metric type. For example, for a category in the **Vendor** type, you might create the condition **[Country] [is] [Germany]**. Metrics in the category will be used only to evaluate vendors that are located in Germany.
4. Save the record.

   The system associates this category to all assessable records that match the filter condition. As the system generates new assessable records that match the condition, it associates them to this category. If you change the filter condition, the system removes and creates assessable record associations, as appropriate.

   Note the following:

   - The system does not remove assessable record associations created manually, even if the assessable records do not match the filter conditions.
   - The system deletes any related stakeholders, if applicable, when it disassociates assessable records from a category.
   - The system does not create or remove assessable record associations if the related source records change. For example, consider the previous example in which all assessable records for vendors based in Germany were associated to a particular category. Assume that a user changes the **Country** of one of the vendor records from **Germany** to **Canada**. The system does not disassociate the related assessable record from the category, even though it no longer matches the filter condition.

   Note:
   To configure the system to automatically associate all assessable records from a metric type to a category, use the same category condition as the metric type condition. For example, if the **Vendor** metric type has the condition **[Vendor] [is] [true]**, create the same condition for the category. If the metric type does not have a condition specified, you can use the category condition **[Sys ID] [is not empty]**, which includes all records from any table.

Related topics

Assessment metrics

Create a category for assessable records

Manage an assessable record manually

You can manually create and remove assessable record associations for a category using a related list on the Metric Category form.

Before you begin
Role required: assessment_admin or admin

About this task
Keep in mind that when you disassociate an assessable record from a category, the system deletes any related stakeholders, if applicable, and you can no longer evaluate the assessable record using metrics in that category.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Assessments** > **Metric Definition** > **Categories**.
2. Open a category.
3. In the **Assessable records** related list, click **Edit** and use the slushbucket to add or remove one or more assessable records.

   Only assessable records associated to this category's metric type are available for selection.

Related topics

Assessment metrics

Create a category for assessable records

Delete a category

When you delete a category, the system also deletes the associated category users and stakeholders.

Before you begin

Role required: assessment_admin or admin

Procedure

1. Navigate to **All** > **Assessments** > **Metric Definition** > **Categories**.

   Alternatively, navigate to a record that contains a related list for categories.
2. Open a record from the list.
3. On the Metric Category form, click **Delete**.
4. Click **OK** when asked to confirm the action.

   The system displays messages at the top of the form describing the actions taken.

Related topics

Assessment metrics

Create a category for assessable records

Assessment metrics

In the Assessments application, a metric is a trait or value used to evaluate assessable records.

Depending on the metric method, a metric can be used as either of the following:

- A question on assessment questionnaires, to obtain a subjective value such as how much people enjoy using each cell phone offered in the service catalog.
- A script that queries the database, to obtain an objective value such as the number of incidents related to each cell phone.

Each metric is associated to one metric category and can be used to evaluate assessable records for that category only. For example, the Support Rating category contains metrics that measure the quality of vendors' customer support services. One metric addresses the quality of product documentation. Others address the strength of the user community, self-service options, online training, and other support services. Each metric has a numeric weight value to indicate its importance relative to other metrics in the same category.
