Organization Extension (com.snc.organization_extension) plugin

Organization Extension (com.snc.organization_extension) plugin activates Goals, Business unit, Enterprise strategy, and Business unit strategy entities. It is available on zBoot to all customers with demo data.

Business Units, Goals, Enterprise Strategy, and Business Unit Strategy modules are available in the Organization application menu.

Business Applications and Business Capabilities modules are also available within the Organization application menu, however, their related tables are moved to Configuration Management (CMDB) (com.snc.cmdb) plugin, which is available on zBoot but without demo data.

Exploring Portfolio Planning

Prioritize, roadmap, and track the work planned for your products and portfolios using Portfolio Planning. Enhance management of your traditional project and product delivery approach.

Portfolio Planning overview

Portfolio Planning helps you plan work for your products and portfolios in the desired delivery perspective. Cascade the plans from the enterprise level down through portfolios and products or plan work to align with your business objectives.

With lens in Portfolio Planning, you can flexibly switch between planning perspectives and create personalized plans to achieve focused planning for your products and portfolios. From the work associated to these portfolio plans, prioritize and roadmap relevant work, thus aligning the right execution teams to the right strategy.

Learn about different features of Portfolio Planning in detail from the following sections.

Lenses in Portfolio Planning

Flexibly switch planning perspectives to prioritize, roadmap, and view the alignment of work using personalized portfolio plans. Improve enterprise planning by discovering planning insights that drive shared outcomes.

Lenses

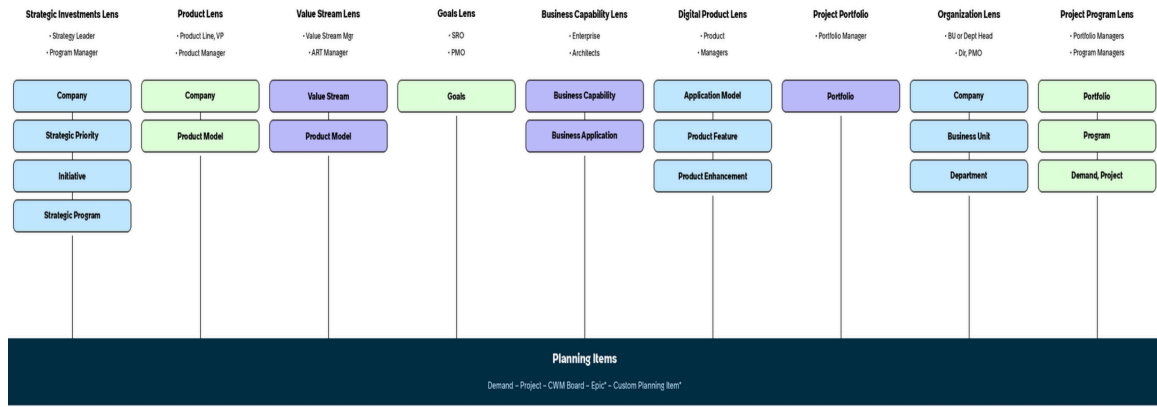

Lens in Portfolio Planning indicate a perspective by which you can prioritize and plan your work. Lens and its structure represent the way that different planning managers choose to prioritize, fund, and plan work. For example, depending on your role, you can plan work from the perspective of a delivery organization, strategic investment, product, and others.

Pre-defined lenses and their structure

Portfolio Planning provides two pre-defined lenses to get you started with building your portfolio plans - Organization and Project Portfolio.

Planning managers can use these lenses based on their role at the company. Each lens includes multiple levels, that the personas can plan at, and together these levels form the structure for that lens.

Structure of pre-defined lenses

Lens	Planning levels	Planning manager	Description
Organization	<ul style="list-style-type: none"> Company Business unit Department 	<ul style="list-style-type: none"> Department head Business unit head 	Visualize how work is aligned to company's objectives
Project Portfolio	Portfolio	<ul style="list-style-type: none"> Product manager Portfolio manager 	Visualize how work is aligned to portfolios across the company
Project Program	<ul style="list-style-type: none"> Portfolio Program 	<ul style="list-style-type: none"> Portfolio manager Program manager 	Plan, prioritize, and roadmap the work in your programs.

You can work with your administrator to modify the structure for these pre-defined lenses. For more information, see [Configuring lens in Portfolio Planning](#).

Start creating portfolio plans to improve the alignment of your work with the business strategy. See [Create a portfolio plan](#).

Portfolio plans in Portfolio Planning

Personalized portfolio plans help you align work with your company's objectives and roadmap the right work for the right time.

Portfolio plans overview

Portfolio plans are custom plans per planning manager that are built using a lens. A portfolio manager can use the Project Portfolio lens to plan in the perspective of portfolios, and a department head can use the Organization lens to plan in the perspective of a department.

As a planning manager, you can create multiple portfolio plans using different lenses. Visualize the plans and progress of work from different perspectives and share them with stakeholders.

Using portfolio plans, you can:

- Enable focused planning of work in the desired perspective (lens).
- Prioritize and roadmap the right work to ensure alignment with the company's objectives.
- Reduce the time spent on aligning execution teams to the right work.

High-level planning using portfolio plans

In Portfolio Planning, you can prioritize and roadmap programs (pm_program) for your organization by building high-level portfolio plans. High-level planning items usually span across multiple business units, departments, or portfolios of a company. These high-level planning items help you further breakdown a company's priorities and achieve specific milestones and outcomes.

Using the Hierarchy view, review the work pipeline and drill down to the low-level planning items that are associated with your programs.

For example, as an EPMO, you can view the epics associated with each program.

You can use Programs (pm_program) from the Project Program lens to create high-level portfolio plans. See [Create a high-level portfolio plan](#).

Here's a sample portfolio plan that shows a few programs of the company and the low-level work (projects and demands) that are aligned with

Number	Program Name	Planned start date	Planned end date	Percent complete	State
1	Customer Feedback	2022-10-11 07:00:00	2024-09-04 17:00:00	15.02%	Work in Progress
2	2024 Software Upgrades	2022-10-11 07:00:00	2026-06-15 21:09:48	0%	Work in Progress
3	Sales Dashboard 2024	2022-10-11 07:00:00	2026-06-15 21:09:51	0%	Work in Progress
4	Marketing Dashboard 2024	2022-10-11 07:00:00	2026-06-15 21:10:35	0%	Work in Progress
5	Finance Dashboard 2024	2022-10-11 07:00:00	2026-06-15 21:10:38	0%	Work in Progress

them.

Start creating portfolio plans to align work with your company's objectives. See [Managing portfolio plans in Portfolio Planning](#).

Work prioritization in Portfolio Planning

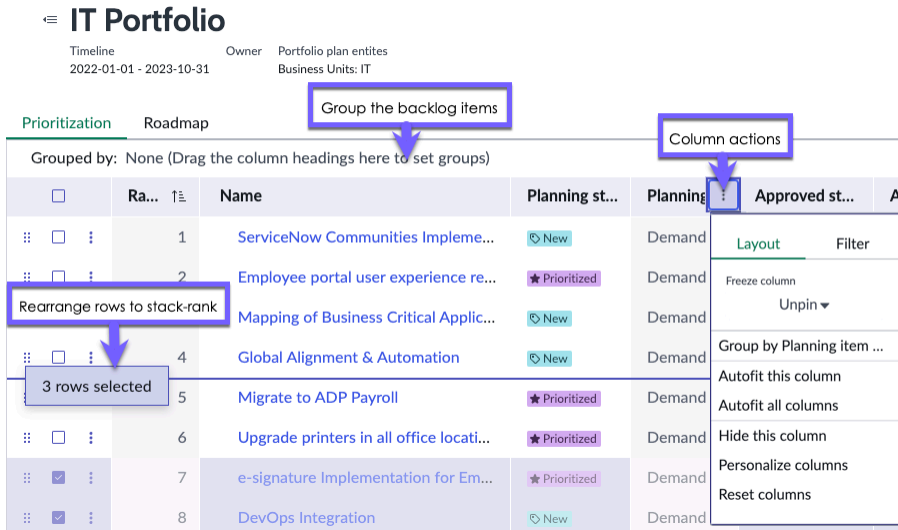

Prioritize work that is relevant for your portfolio using a centralized Workspace in Portfolio Planning. Review and determine the right work to invest in.

Before scheduling the roadmap for your portfolio plan, it's helpful to first know the existing and upcoming workload. Having all the work items listed at one place helps you understand the overall work pipeline. The consolidated view enables smoother backlog grooming so that you easily review and decide which items must be prioritized.

Using the Prioritization tab in the workspace, you can review all the new and existing work for your portfolio plan, representing its backlog. To help you review the workload efficiently, Prioritization provides information for each work item such as the associated goal, planned costs, and planned benefits. Using these data points, you can stack-rank the items and decide which items are to be prioritized over the others.

Prioritization tab

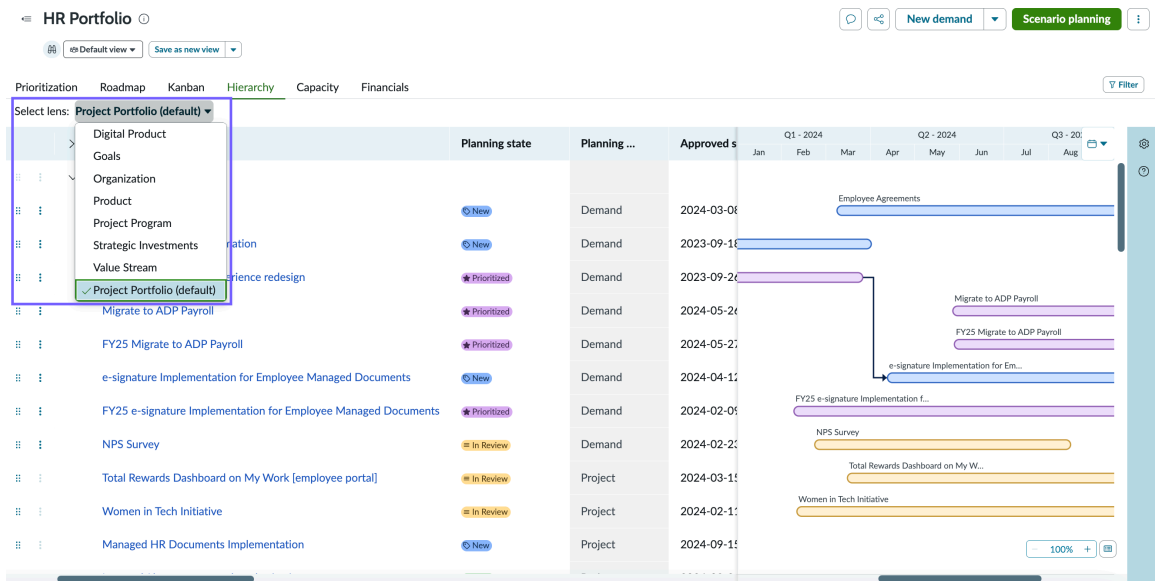

Planning items are listed in a grid format. You can stack-rank the items, group them by a desired attribute, and sort them based on their priority by using the drag functionality.

Alternatively, you can use the Hierarchy tab to review and manage your backlog.

Hierarchy tab

This tab displays how work in the current portfolio plan is aligned with respect to entities of other lenses. Using the lens switcher, you can change the perspective in which you view the alignment of the work. Using the timeline section of the view, prioritize work effectively by gaining visibility into the schedule and dependencies between the planning items.

For example, as a portfolio manager, you can view the projects and demands created for your portfolio all in one place, as your portfolio's backlog. If your portfolio must take up a new project, you can add it to this backlog directly. These items are marked as **New** for easy identification. If you are in discussion over certain items with your stakeholders, mark them as **In Review** until you decide on its priority. After you decide which items are ready to be worked on, mark them as **Prioritized** and they would be added to your portfolio roadmap. If you don't want to pursue a project or a demand, mark it **Cancelled**.

To get started with managing your work pipeline in Portfolio Planning, see [Prioritizing portfolio plan work in Portfolio Planning](#).

Roadmaps in Portfolio Planning

Effectively plan work for your company using visual roadmaps in Portfolio Planning Workspace.

As your organization grows and priorities change, it's important to have the flexibility of changing existing plans and making new plans with ease. Using roadmaps, you can create a layout of current and upcoming plans while aligning them with your business objectives. Share these visual plans with other stakeholders across the organization, drive meaningful conversations, and validate common understandings.

Each roadmap is a high-level block of work, prioritized by different planning personas such as enterprise project managers, portfolio managers, project managers, or others. Roadmaps also provide insights to the stakeholders while guiding the delivery teams during development.

The following are the types of roadmaps that you can work with:

- Portfolio plan roadmaps
- Free-form roadmaps

The features available in these roadmaps are:

- Hybrid roadmaps
- Roadmap-level milestones
- Planning item-level milestones
- Planning item dependencies
- Tracking mode

Note:

Roadmaps are available with Portfolio Planning by default. Roadmap Planning (sn_roadmap_plng) is no longer available to install as a separate application.

Portfolio plan roadmaps

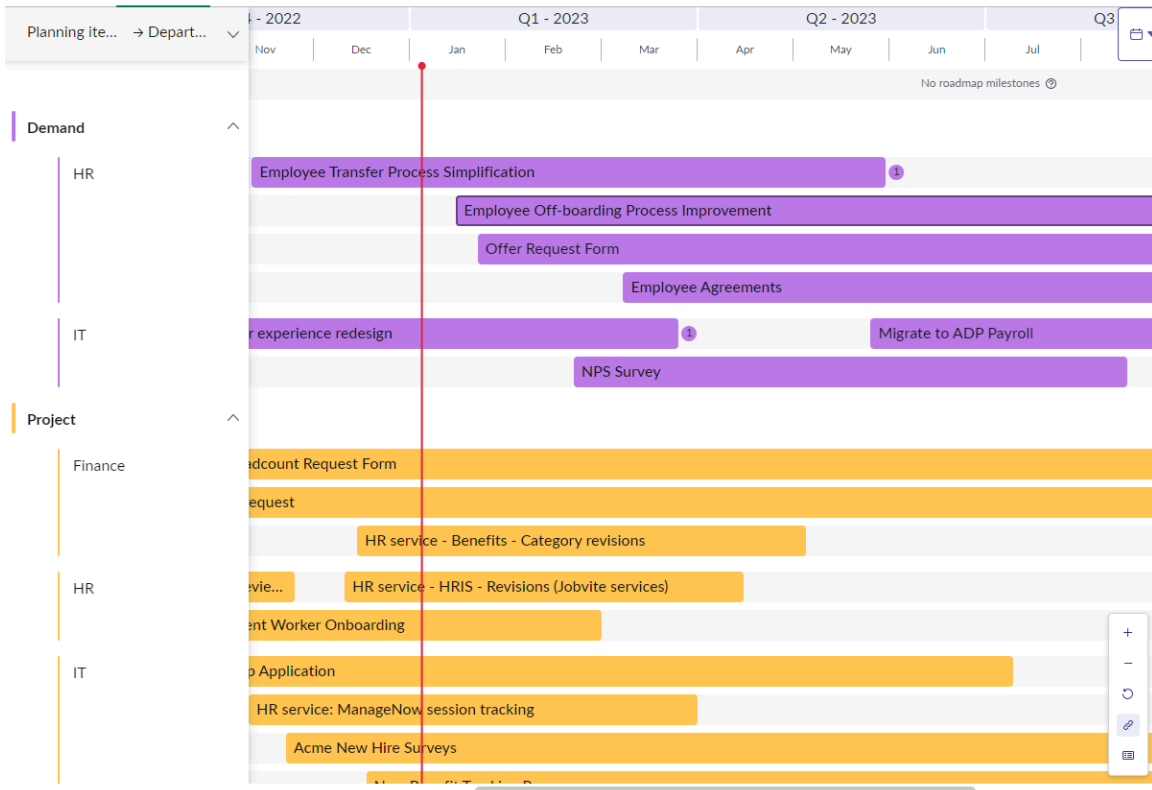

By creating a flexible portfolio plan using lenses, you can prioritize and roadmap work for your portfolio. Use these portfolio roadmaps to plan and track work in different perspectives of the organization separately, while connecting them to the high-level plans of the company.

[Create a portfolio plan](#) to get started.

HR Portfolio

Timeline 2022-06-01 - 2023-12-31 Owner Megan Burke (it portfolio manager) Portfolio plan entities Portfolios: HR

Prioritization Roadmap

Free-form roadmaps

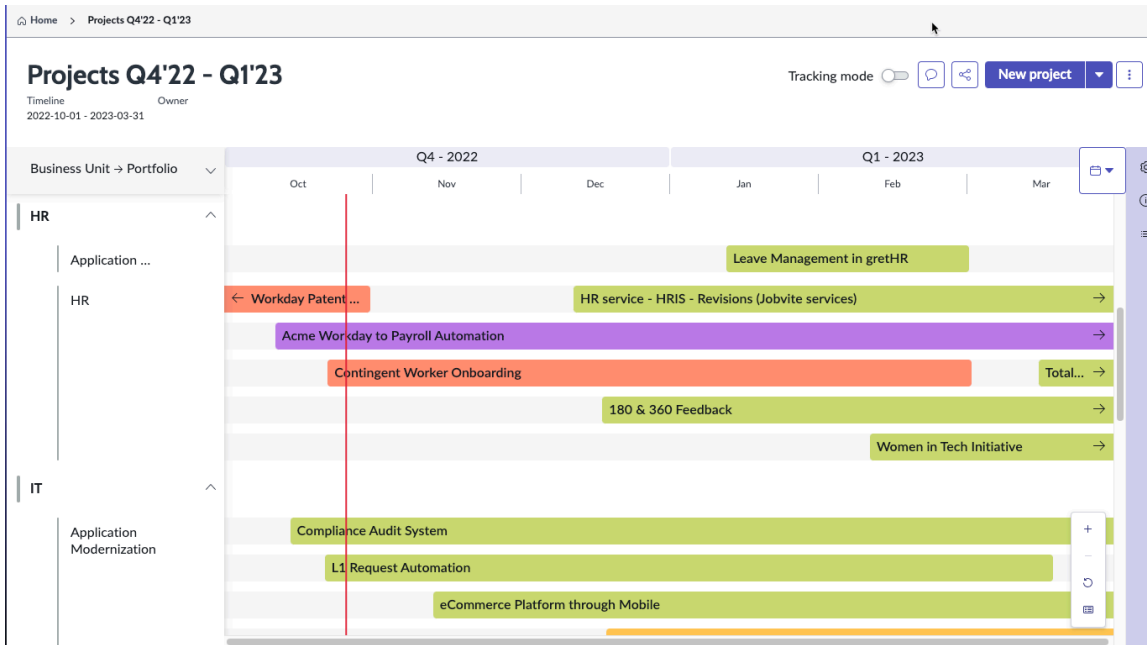

Free-form roadmaps provide you the flexibility of planning and tracking work from different units of your company, such as work across multiple portfolios.

Using a filter condition, you can define what kind of work items you want on your roadmap. If you want to have a roadmap dedicated to just the projects of your department, define a roadmap for projects to start tracking the progress of current projects and create plans for new ones. See [Create a free-form roadmap](#).

Free-form roadmaps provide you the flexibility of planning and tracking work from different units of your company, such as work across multiple portfolios.

Using a filter condition, you can define what kind of work items you want on your roadmap. If you want to have a roadmap dedicated to just the projects of your department, define a roadmap for projects to start tracking the progress of current projects and create plans for new ones.

See [Create a free-form roadmap](#).

Hybrid roadmaps

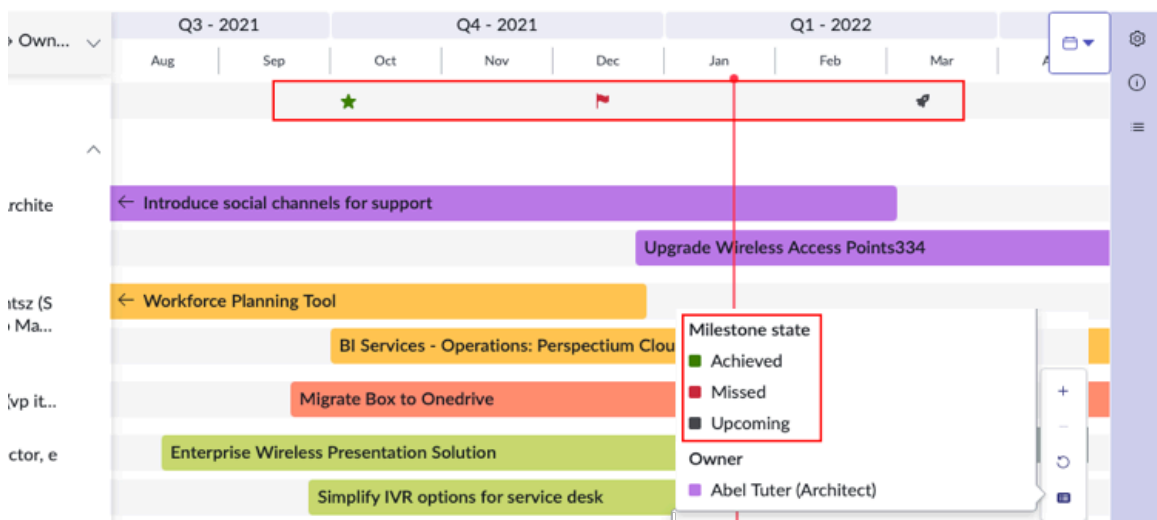

In Portfolio Planning, with both the portfolio roadmaps and free-form roadmaps, you can build hybrid roadmaps. For example, you can have a combination of projects and demands in a single view.

Milestones on the roadmap

You can create milestones for your roadmap, or for each planning item on the roadmap.

Roadmap-level or portfolio-level milestones

The milestones created at the roadmap level can help with tracking launch dates or key events during that roadmap's timeline. To learn how to create roadmap milestones, see [Add milestones for roadmap](#).

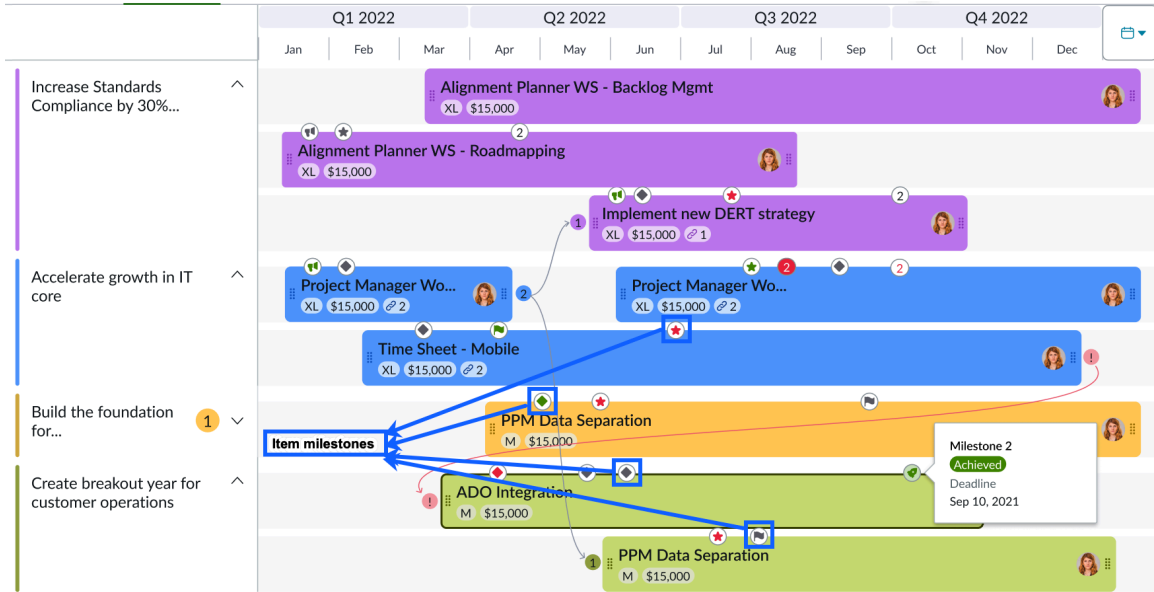

Planning item milestones

Using the milestones created at the item level, you can focus better on strategic outcomes. These milestones help with tracking deadlines or other important dates. You can access milestones on projects and demands.

You can create and update milestones for all types of planning items from the roadmap, but the project milestones are read-only. As any changes to project milestones may impact the associated project plans, it is recommended to create or update project milestones using Project Workspace in Project Portfolio Management (PPM).

To learn how to create item-level milestones on a roadmap, see [Add milestones for roadmap items](#).

Planning item dependencies

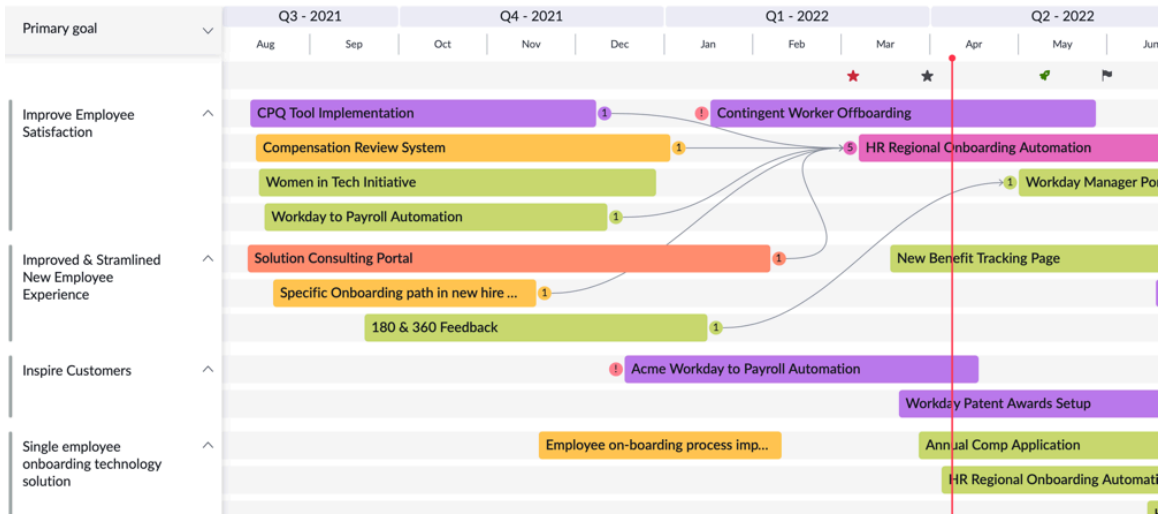

While planning, it is essential to know how your planning items are connected with each other. Unless you know the dependency for each item, you might miss prioritizing time-critical projects or demands. This lack of information may also put you at risk of not scheduling the right work for the right time period.

Dependencies on the roadmap help you visualize these relationships between the planning items, so that you can adjust their scheduling accordingly.

In Portfolio Planning, you can create simple or hybrid dependencies. For example, you can establish dependencies between two projects or between a project and an epic. Also, planning items can have dependency on items within the same portfolio plan or on items that aren't planned yet.

The dependency lines help you easily identify the items that may have to be prioritized together. Such easy identification of relationships between planning items provides better collaboration and facilitates enhanced decision making in the planning process.

To learn about creating and managing dependencies, see [Add dependencies for roadmap items](#).

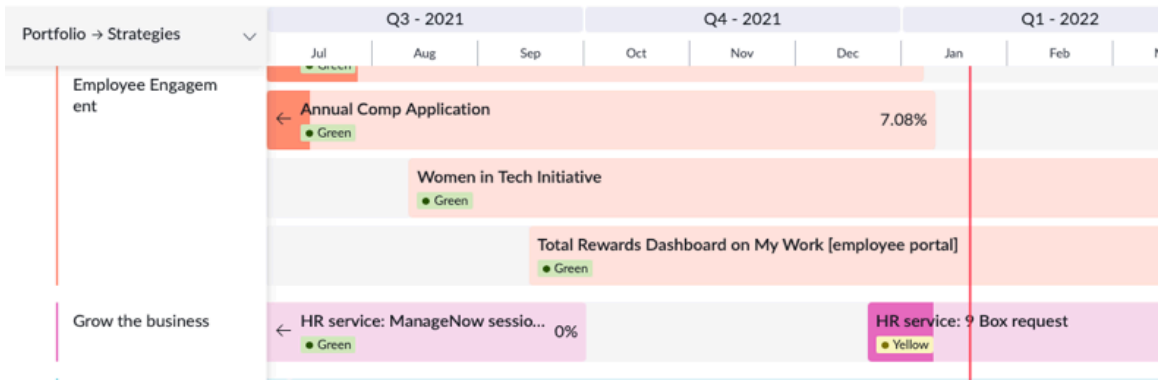

Tracking mode in roadmaps

Track status, progress, and metrics for each item on the roadmap. Using the status indicators and the percentage complete score on the planning item bars, make informed decisions ahead of time and easily communicate your work progress to the stakeholders.

See [Track the progress of roadmap items.](#)

Projects 2022

Scenario planning in Portfolio Planning

Create and evaluate strategic scenarios to explore different planning approaches. Approve the optimal scenario that aligns with the organizational goals and strategic priorities.

Scenario planning overview

Scenario planning in Portfolio Planning enables organizations to create, evaluate, and approve the best strategic scenario that aligns with their strategic goals and intended business outcomes. This process helps in visualizing different approaches, assessing their impacts, and making informed decisions before implementing the live plan. By utilizing scenario planning, organizations can anticipate potential challenges. Scenario planning overview

What is a scenario

A scenario in Portfolio Planning is a simulated version of a plan that enables you to explore a strategic approach without affecting the live plan. It provides a safe environment to prioritize items, adjust timelines, and evaluate the potential impacts of each approach.

As compared to a plan, a scenario additionally has the following:

Rank	Name	Planning state	Planning item type	Start date	End date	MoSCoW
1	Machine Learning Classification & Regression Infrastructure for BI	★ Prioritized	Demand	2023-03-15	2025-07-31

- **In Plan** toggle: The **In Plan** toggle enables you to prioritize or de-prioritize the planning items in the scenario you're creating. By default, when you create a scenario, the **In Plan** toggle is turned on for planning items that have all of the following field values:
 - Planning state as Prioritized or Done
 - Start and end dates within the portfolio plan dates.
- **Date** fields: The **Start date** and **End date** fields for the scenario are automatically populated based on either the planned or actual start and end dates of the planning items. You can update these dates during the scenario planning process. Once the scenario is approved, the updated dates are recorded as the approved dates for the planning items. If the updated dates fall outside the acceptable range, they're highlighted in yellow.

For more information on portfolio plans, see [Portfolio plans in Portfolio Planning](#).

By comparing scenarios side by side, you can assess the differences in goal alignment and trade-offs between each scenario. This comparative analysis helps identify the scenario that best meets strategic objectives. For more information on comparing the scenarios, see [Compare scenarios](#).

Scenario planning workflow in Portfolio Planning

Using the Scenario Planning feature in Portfolio Planning, you can perform the following activities:

- Create a scenario to explore different strategic approaches and business outcomes. For more information, see [Create a scenario](#).
- Adjust and compare multiple scenarios side by side to evaluate differences in goal alignment and trade-offs. For more information, see [Compare scenarios](#).
- Approve the best scenario that aligns with the organizational goals. For more information, see [Approve a scenario](#).
- Set a target portfolio budget for each of your planning cycle, which can be for fiscal period, quarter, yearly, or portfolio timeline.
- Evaluate the target vs proposed budget of In-plan items and review the monetary benefit from the prioritized items.

Scenario Planning workflow overview

The scenario planning workflow involves an execution owner and a portfolio owner. The following illustration illustrates how scenario plans are created based on the planned or actual dates of planning items and how the In-plan toggle is adjusted based on the states of these planning items.

User journey in Scenario planning

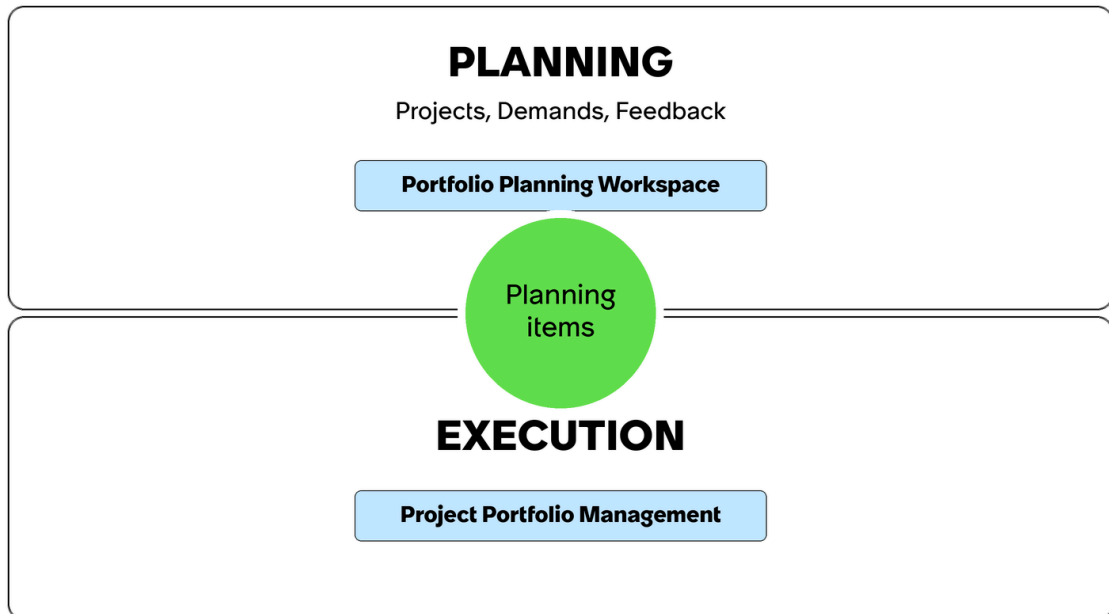

For more detailed guidance on using scenario planning to enhance your Portfolio Planning process, see [Optimizing planning with scenario planning in Portfolio Planning](#).

Portfolio Planning with Project Portfolio Management

Facilitate execution of the work planned in Portfolio Planning in ServiceNow Project Portfolio Management (PPM) application.

While planning personas like portfolio managers or product owners use Portfolio Planning to align their plans with the business objectives, execution teams can use PPM to deliver work on the planned projects and demands.

Portfolio Planning integration with ServiceNow® Project Portfolio Management

Key benefits of Portfolio Planning with PPM

- View available PPM planning items in Portfolio Planning.
- Import planning items from PPM to Portfolio Planning.

- Export planning items from Portfolio Planning to PPM.
- Synchronize updates for linked planning items of Portfolio Planning with PPM.
- Track the progress of the linked planning items in Portfolio Planning.

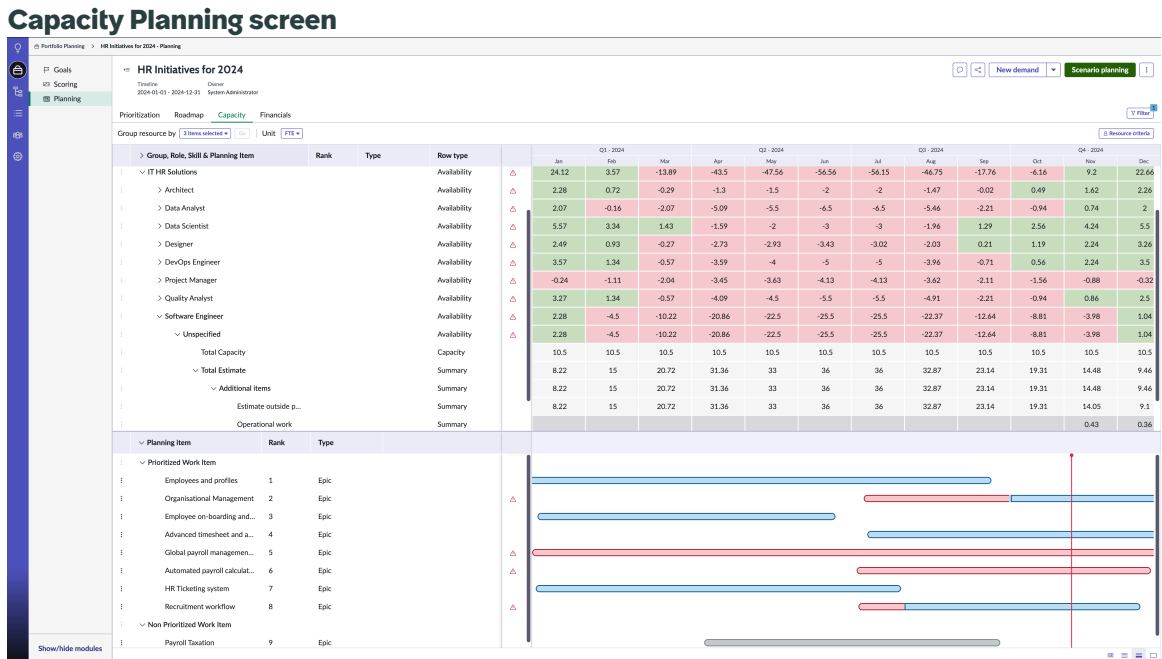

To get started on integrating Portfolio Planning with PPM, see [Configuring Portfolio Planning with PPM](#).

Capacity planning in Portfolio Planning

The Capacity Planning screen provides portfolio managers a comprehensive view of capacity, allocations, and utilization of resources.

Analyzing the Capacity Planning screen, you can easily:

- View resource capacity for prioritized items in your portfolio.
- Understand the resource capacity needs and estimates across your organization by using key attributes such as group, role, and skill.
- Effectively forecast the supply of resources and the demand of work in your portfolio.
- Understand and get an overview of the resource capacity allocations by using the color indicators.
- Plan for resources with specific skills or roles for future assignments.
- View the resource allocation health instantly with the new intuitive user interface that gives you a detailed breakdown of portfolio duration by month having over allocations.

- The top tray of the screen displays:
 - Resource capacity details depending on the defined resource criteria.
 - Allocation details for the time period.
 - Resources grouped by primary attributes.
- The bottom tray of the screen displays:

- Prioritized planning items.
- Interactive Gantt chart for the duration of planning items.
You can click a Gantt chart bar to see the capacity for that specific planning item only.
You can move the Gantt chart to adjust your resource capacity details accordingly.
- Toggle option (☰) to adjust your view of the Capacity Planning screen.

Using the Capacity Planning screen

Follow these steps to analyze and manage resource capacity for your portfolio:

1. Navigate to **Portfolio Planning > Portfolios** and open a portfolio.
2. Select the **Capacity** tab to open the Capacity Planning screen.
3. In the top tray, define your resource criteria by selecting primary attributes such as **Group**, **Role**, or **Skill** to filter the resource view.
4. Review the resource capacity bars to identify over-allocated or under-utilized resources across the time period.
5. In the bottom tray, review prioritized planning items and their Gantt chart bars. Select a Gantt bar to see capacity for that specific item.
6. Drag the Gantt bars of planning items to adjust planned dates based on available resource capacity.

Note:

Planning items with actual dates (indicated by the in-progress icon) cannot be adjusted.

7. Use the toggle option (☰) to adjust your capacity view between different display modes.

Financial planning for Projects and Demands

Plan, re-forecast, track the financials, and create baselines for projects and demands.

The financials view provides a streamlined perspective, showcasing the actual and planned expenses for the entire fiscal period. You can view the latest estimated cost of completion by displaying the Actual costs for the past fiscal periods, planned costs for the current and future fiscal periods, the totals for quarter, year, and total duration of work.

The interface gives you the ability to create cost plans, expense lines, and baselines. As a project manager or a financial user, you can:

- Enter high-level financial forecasts for planning items using the simple financials section in the Details tab.
- Work on high-level estimating for Planned opEx and Planned capEx.
- Create a detailed breakdown of the planned costs [using the financials tab](#).
- View the rollups of Planned costs, Actuals costs, and Planned benefits for all of your planning items in the Prioritization grid.
- [Add, edit, or delete cost plans](#) effortlessly from the Cost screen.
- Re-forecast your planned expenses using the in-line editing feature.
- View a streamlined perspective, showcasing your actual costs for the past and planned expenses for the future, for the entire time scope of the planning item.

- Get a better comprehensive solution by viewing the Forecast (previously EAC - Estimate at Completion), Remaining Estimates (previously ETC - Estimate to Completion), and Actuals of each cost plan for the total time scope and the yearly breakdowns.
- Re-forecast the planned cost for future fiscal periods by directly updating the quarterly and yearly totals using the in-line editing capability of the grid.
- **Generate labor costs** depending on the resource assignments for the entire scope of the planning item broken down by the financial attributes configured for your organization. For more information on the planning attributes for attribute-based mapping, see [Using the Planning attributes](#).
- **Add or edit expense lines** against the cost plans easily from the side panel with the associated cost plan details pre-populated.
- Record unplanned expenses using the New expense line side panel.
- Create and compare financial baseline to track the financials of your planning items.
- Compare the latest costs (actual expenses for past fiscal periods and planned costs for current and future fiscal periods) with the initial forecasted planned costs by creating financial baseline and using the compare baselines capability.
- Analyze the cause of variance in costs and when did this occur over time by capturing the financial baselines manually or automatically.

The screenshot displays the 'Automating IT operations for streamlined efficiency' financials screen. At the top, there are summary cards for Budget (\$0.00 K), Forecast (\$80.00 K), Budget vs. Forecast (\$-80.00 K), Planned Cost (\$510.00 K), Actuals (0.00 K), Planned Benefits (\$1.20 M), and Total Return (\$0.00 K). Below these is a table with columns for Name, Record Type, Cost type, Full scope, and fiscal years (FY25: M01, FY25: M02, FY25: M03). The table lists various items like 'Benefit (2)', 'Demo benefit Plan 2', 'OTHER CAPEX', and 'other opex'. A 'Record Type' column is highlighted with a blue box, and a note below it says 'Grouping of financial records indicating Cost plans or Benefit plans'. A 'Multicurrency selection' dropdown is also highlighted, showing 'USD (Functional)'.

You can view the following information on the financials screen.

- Time scope: duration of the planning item or a cost plan, whichever has a larger fiscal period range.
- Functional currency: currency defined and used to calculate the financials.
- Customizable widgets showing different financial information such as allocated budget, Forecast (previously EAC - Estimate at Completion), Variance (the difference between budget and Forecast), breakdown of planned costs, and actuals by cost type.

Note: Budget and Budget vs EAC Variance widgets are available for Demands and Projects only.

- Time scale: time period breakdowns to view the financials. Default value is set to Month/Period, depending on the fiscal calendar type.
- Display mode: list options to switch between different modes to get a focused view of financials.
- Generate labor costs: one-click solution to generate or refresh the planned labor costs for the planning item depending on resource assignments.

Note:

This option is enabled for the projects with resource assignments only.

- The pane gives you a tabulated view of the cost plan attributes displaying the Name, Cost type, Expense type, Stat fiscal period, End fiscal period, Total planned cost, Employee type, and Role. You can customize these fields. For more information, see [Customize the left pane view for financials](#).
- In the right pane, you can view the total Actuals, Forecast, and Remaining Estimates for the selected Time scope duration. Actual expenses against a cost plan for the past fiscal periods, Actuals, Forecast, and Remaining Estimates for the current fiscal year, and planned costs for the current and future fiscal periods.

Note:

The header rows of actuals and planned are color-coded differently to help you easily identify and differentiate between the expense types.

- New cost plan: opens a simplified side-panel to create a new cost plan for the entity.
- Personalize option to customize the columns in the left pane of the table.
- Export option to download Cost or Baselines comparison as Microsoft Excel or CSV file.

Dashboards in Portfolio Planning Workspace

As a product and portfolio manager, use dashboards in Portfolio Planning Workspace to monitor performance, track progress, and make informed decisions related to planning and execution. These dashboards leverage Platform Analytics to provide a trend of historical data and regular reports.

The Execution Dashboard is available in the Portfolio Planning Workspace:

You can use the default dashboard or create your own dashboards to monitor performance and take informed decisions.

Benefits of dashboards

- Create data visualizations and add them to the dashboards using the Platform Analytics experience.
- Monitor performance, track progress, and make informed decisions related to planning and execution.
- Duplicate existing dashboards and customize them as needed, without modifying the out-of-the-box dashboards.
- Use the out-of-the-box dashboards or configure your own dashboards as needed.
- Share dashboards with stakeholders to enable collaboration.

- View relevant data by applying filters directly within a dashboard.
- Any filters applied are saved as part of user personalization and are available the next time you log in.

For guidance on using and managing dashboards in the Portfolio Planning Workspace, see [Using dashboards in Portfolio Planning](#).

Better together with other ServiceNow® applications

Integration of Portfolio Planning with other ServiceNow® applications helps portfolio and product managers to optimize planning, collaboration, and release management for their products.

Portfolio Planning with Collaborative Work Management

With the integration of ServiceNow® Collaborative Work Management (CWM) with Portfolio Planning, you can plan and roadmap with Boards in a portfolio plan. By adding CWM Boards to a lens configuration, you can access them in the Prioritization and Roadmap pages of a portfolio plan as planning items.

The lenses supported to configure CMW Board as a planning item are Organization and Project Portfolio.

For more information on integration of CWM with Portfolio Planning, see [Connecting CWM with Strategic Planning or Portfolio Planning](#).

Configuring Portfolio Planning

Learn about the process required to set up Portfolio Planning to enable your product and portfolio managers start aligning their work business objectives.

Configuration workflow

Use the following steps as guidelines to set up Portfolio Planning. Some of these steps require the admin role and some require the sn_align_core.apw_admin role.

1. [Install Portfolio Planning](#).
2. Assign user roles.

See the Roles installed table in [Components installed with Portfolio Planning](#).

Note:

If you are upgrading from an older version to Portfolio Planning v6.1.1 or higher, a fix script is run to remove the milestone_editor role from the roadmap_editor role because the roadmap_editor role is no longer used. In this case, you may experience a longer time for the upgrade to complete if your ServiceNow instance has a large number of users with the roadmap_editor role. For more information, see [KB1443618](#).

3. Configure lenses to enable portfolio plans.

See [Configuring lens in Portfolio Planning](#).

4. Integrate ServiceNow® Portfolio Planning with Project Portfolio Management (PPM).

See [Portfolio Planning with Project Portfolio Management](#).

5. Configure Capacity Planning and generate resource capacity.

See [Capacity configuration in Portfolio Planning](#).

6. Enable financial planning for epics and customise the Financials screen view.

See [Configure financials for Portfolio Planning](#).

Guided Setup to configure Portfolio Planning

Guided Setup provides a sequence of tasks to help you with the required configuration on your ServiceNow instances. After installing Portfolio Planning, navigate to **All** > > **Portfolio Planning** > **Guided Setup**.

When you're configuring a task from the Guided Setup, you can launch the in-app help for additional guidance by clicking the Show Help icon ().

Install Portfolio Planning

You can install the Portfolio Planning application (sn_align_ws) if you have the admin role. The application includes demo data and installs related ServiceNow[®] Store applications and plugins if they are not already installed.

Before you begin

- Confirm that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see [Get entitlement for a ServiceNow product or application](#) .
- Review the Portfolio Planning application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Role required: admin

About this task

The following items are installed with Portfolio Planning:

- Roles
- Tables

For more information, see [Components installed with Portfolio Planning](#).

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Portfolio Planning application (sn_align_ws) using the filter criteria and search bar.

You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

In the list next to the **Install** button, the versions that are available to you are displayed.

3. Select a version from the list and select **Install**.

In the Review Installation Details dialog box, any dependencies installed with your application are listed.

4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.

5. Optional: If demo data is available and you want to install it, select the **Load demo data** check box.

Demo data comprises the sample records that describe application features for the common use cases. Load the demo data when you first install the application on a development or test instance.

6. Select Install.

Result

The following components are installed with installation of the Portfolio Planning application:

- Roles
- Tables

See [Components installed with Portfolio Planning](#) for more information.

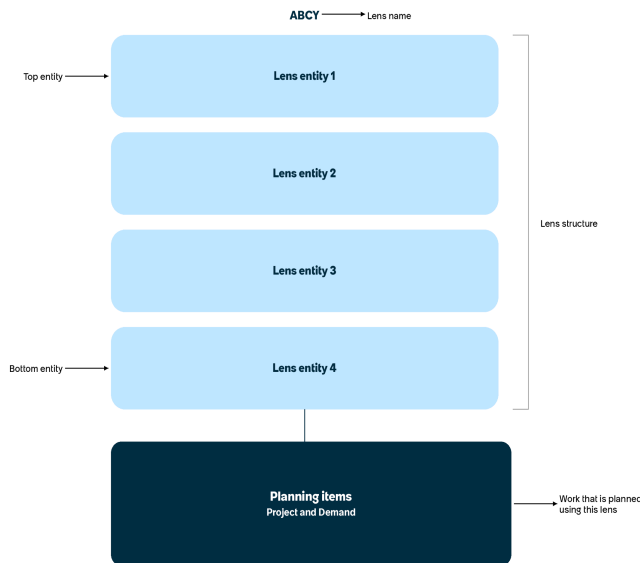

Configuring lens in Portfolio Planning

Learn about lens structure and pre-defined lenses in Portfolio Planning so that you can configure a lens that represents your company's planning process.

Lens structure

Each lens in Portfolio Planning consists of a structure that is made up of lens entities. These entities represent different levels of planning. Planning managers can build portfolio plans at one of these levels, and create plans for the type of work items that are associated to this lens.

Sample lens structure

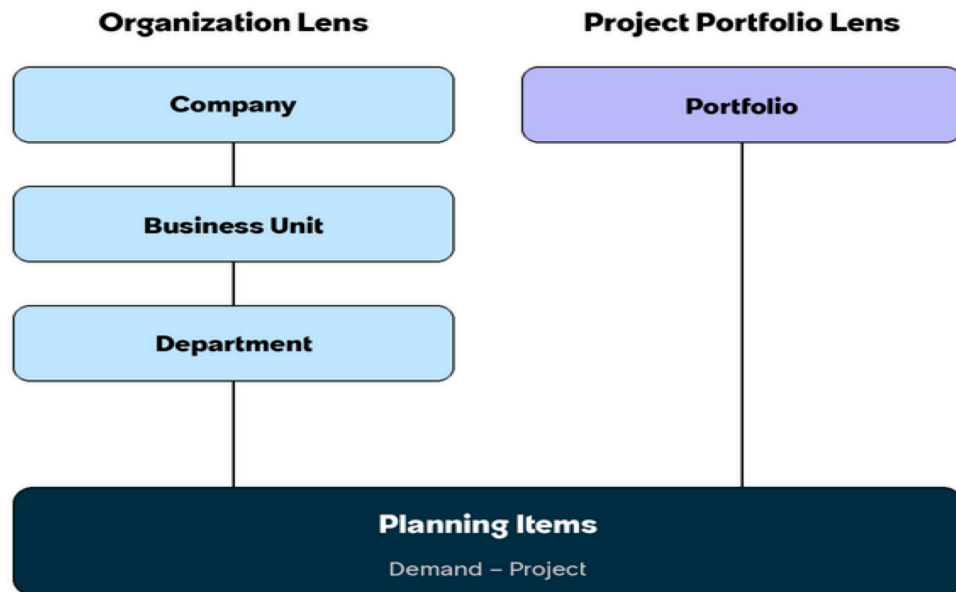

Pre-defined lenses in Portfolio Planning

Two pre-defined lenses, Organization and Project Portfolio are available.

For example, the Organization lens has Company, Business Unit, and Department as its entities. A department head can create a portfolio plan at the department level, and start to prioritize and roadmap the department's work. This work can be in the form of projects, demands, or any other custom type that is configured.

Lens structure of pre-defined lens

In the Portfolio Planning Workspace, planning managers can get started with creating portfolio plans with one of the pre-defined lenses.

Planning items for a lens

For every portfolio plan that is built using a lens, only those item types that are included with that lens are available for planning. For example, a lens XYZ has just demands added to it. Then, in any portfolio plan that is built using the XYZ lens, work can be planned in the form of demands only.

Configuring lens and lens structure

You can either use a pre-defined lens as it is or update its existing configuration.

- To use the lens as it is, complete your lens setup by configuring integration with a ServiceNow Project Portfolio Management.

See [Configuring Portfolio Planning with PPM](#).

- To update the lens configuration:
 - Change the planning items included within the lens. See [Lens Form](#).
 - Add more entities to the lens structure. See [Modify lens structure in Portfolio Planning](#).

Modify lens structure in Portfolio Planning

Add or modify entities for your lens structure so that your planning managers can start creating their portfolio plans in Portfolio Planning.

Before you begin

Ensure that your application scope is set to **Portfolio Planning Core**.

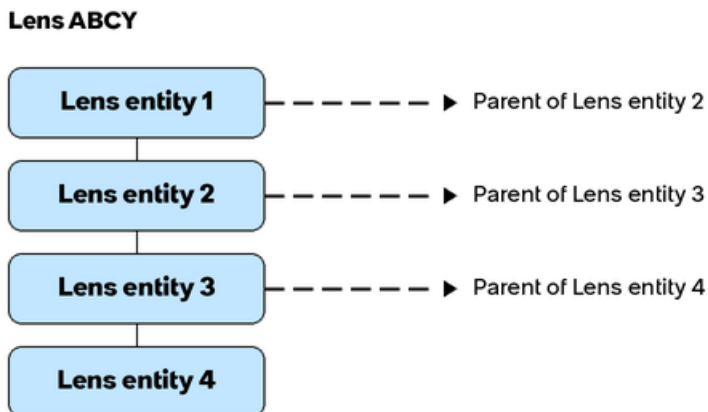

Role required: admin

About this task

For a lens, add entities to modify its existing structure. You can add up to six entities in a lens structure. For more information on lens and its structure, see [Configuring lens in Portfolio Planning](#).

Procedure

1. Navigate to **All > Portfolio Planning > Lenses**.
2. From the Lenses list, select a lens for which you want to update the lens structure.
3. Add an entity to the lens structure.
 - a. From the Lens structure related list, select **New**.
 - b. On the form, fill in the fields.
For field information, see [Lens structure form](#).
 - c. Select **Submit**.
4. Repeat step 3 to complete adding all your lens entities.
 - Add the entities in a top-down manner:
Add the top-level entity first, followed by the second-level entity, followed by the third, and so on.
 - Ensure that every entity, except the top-level, has a parent entity reference.
For example, the second-level entity must refer to the top-level entity as its parent.

What to do next

1. Verify that the Planning item table [sn_align_core_planning_item] has a field that references the bottom entity of this lens.
2. Ensure that the following form views for all the planning item types that are associated in your lens contains a field for the bottom entity of your lens structure.

- APW Preview
- APW New
- APW Default

3. Update the roadmap configuration for the tables of all planning item types that you associate with this lens:

Add the bottom entity of this lens structure and its parent to **Group by fields** and **Color by fields**. These fields are used as the default group by and color by settings for the portfolio roadmap. See [Customize the planning item display preferences for Prioritization and Roadmap in Portfolio Planning Workspace](#).

4. Validate your lens configuration and activate it. See [Activate a lens in Portfolio Planning](#).

Activate a lens in Portfolio Planning

Validate your lens configuration and activate it so that your planning managers can start creating portfolio plans using this lens.

Before you begin

Role required: admin

About this task

If you've changed the structure of an existing lens, validate its configuration and set its state to Active.

Planning managers can create portfolio plans using only lenses that are active. For a lens to be available in the workspace for a planning manager, its configuration must be valid and must be in the Active state.

Procedure

1. Navigate to **All > Portfolio Planning > Lenses**.
2. From the Lenses list, select a lens.
3. On the lens form, click the **Validate Lens** related link.
 - If the lens configuration is valid, a success message prompts you that you can now activate it.
 - If the lens configuration isn't valid, use the error messages to understand the issues and fix the configuration.

Try validating the lens using the related link again.

4. Select the **Active** field and save the form.

Related topics

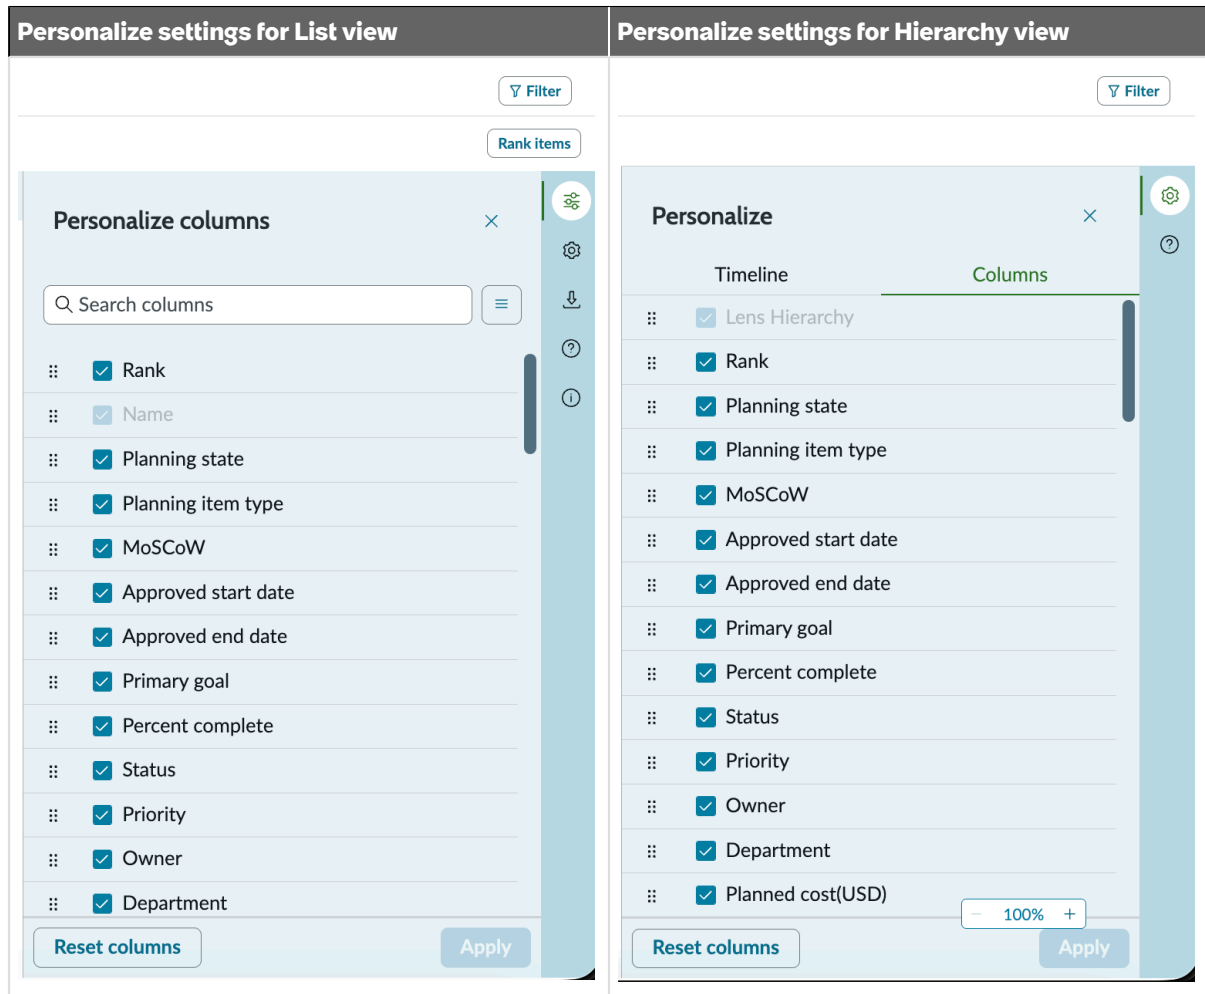

[Modify lens structure in Portfolio Planning](#)

Configuring additional columns for Prioritization page in Portfolio Planning

Configure what columns must be displayed on the Prioritization page of portfolio plans so that your planning managers can select the appropriate data points they need.

Portfolio managers or product owners can show or hide the data for their planning items by using the Personalize side panel in the Prioritization page of their workspace. By default, this side panel of Prioritization and Hierarchy tabs provide all the default fields available for that planning

item. If your planning managers want to see additional columns, for example, there could be a requirement of information from a dot-walked field. In such cases or to remove any existing choices, you can configure them using the admin role.

Add extra columns as choices to this side panel or remove any of the default column choices by updating the list layout configuration for the planning item types associated to the portfolio plan.

- If the portfolio plan has multiple item types associated to it, update the view configuration of the Planning Item [sn_align_core_planning_item] table.
- If the portfolio plan has a single item type associated to it, update the view configuration of the relevant table.

From the form view of the identified table, change the view to **APW Prioritization**, and update the list layout. For the detailed procedure of updating the layout configuration for a list, see [Configure the list layout](#).

Note:

List v3 is no longer available for new deployments. If you are already using list v3, you may continue to do so, but in this case some of the functionalities might not be available.

Configuring Prioritization and Roadmap settings in Portfolio Planning

Configure the way data is shown on the Prioritization and Roadmap pages of the workspace so that your planning managers view the information that is relevant for them.

Customizing highlighted fields on prioritization tab of Portfolio Planning workspace

Customize the fields to be highlighted on the Prioritization tab of a portfolio plan according to your planning manager's needs.

By default, the Prioritization and Hierarchy tabs of a portfolio plan highlight the **Planning state** and **Status** fields of a planning item with colors. Based on your planning manager's requirements, you can configure fields that are of Choice type, such as Owner or Priority to also be the highlighted columns on the page. This customization requires:

- Modifying the Prioritization view Script Includes (APWBacklogConfigImpl for List view and APWGanttConfigImpl for Hierarchy view).
- Configuring a new record for the required field in the sys_highlighted_value table.

Modify Script Includes for Prioritization page in Portfolio Planning

Modify the Script Includes for List and Hierarchy views of the Prioritization page to change the columns to be highlighted in these views in the workspace.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Definition > Script Includes**.
2. From the list, select one of the following:
 - For List view, select APWBacklogConfigImpl
 - For Hierarchy view, select APWGanttConfigImpl
3. Update the column name in the **Script** field of the Script Include.

In the *getColumnsForHighlightedValues* function, update the return value to the desired column.

For example, if you want to highlight the Priority column, update the return value to ("planning_state", "state", "priority").

4. Select **Update**.

What to do next

[Create new highlighted values for Prioritization columns in Portfolio Planning](#)

Create new highlighted values for Prioritization columns in Portfolio Planning

Customize the fields to be highlighted on the Prioritization page of a portfolio plan according to your planning manager's needs.

Before you begin

[Modify Script Includes for Prioritization page in Portfolio Planning](#).

Role required: admin

Procedure

1. Navigate to **Workspace Experience > Administration > Highlighted Values**.
2. Select **New**.
3. On the form, fill in the fields.
For field information, see [Highlighted Value form](#).

4. Save the form.
5. In the Highlighted Value Conditions related list, create records to configure the color, order, and icon for each of the field values that you want to be highlighted in the workspace.
 - a. Select **New**
 - b. On the form, fill in the fields.
For field, information, see [Highlighted Value Condition form](#).
 - c. Select **Submit**.
6. Repeat step 5 to complete this configuration for all the field values.
For example, if you are configuring for status column, you must create three records in the Highlighted Value Conditions related list for each of the choices Red, Green, and Yellow.
7. Select **Update**.

Modify Script Includes for milestone icons in Portfolio Planning Workspace

Modify the Script Includes for milestone icons of the roadmap and portfolio plan to customize the icons to be shown in the Roadmap tab in the workspace.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Definition > Script Includes**.
2. From the list, select RoadmapMilestoneAPIImpl.
3. Update the milestone icon type in the **Script** field of the Script Include.
In the *getMilestoneMetadata* method, update the return value to the required icon.

For example, if you want to display the Circle exclamation icon (ⓘ) for key event milestone, update the return value to 'circle-exclamation-outline' for the key_event milestone.

The default icons are as follows:

- key_event: 'flag-fill'
- launch_date: 'rocketship-fill'
- important_date: 'calendar-clock-fill'
- key_milestone: 'diamond-fill'
- deadline: 'star-fill'

```

168 getMilestoneMetadata: function() {
169
170     return {
171         type: {
172             key_event: {
173                 icon: 'flag-fill'
174             },
175             launch_date: {
176                 icon: 'rocketship-fill'
177             },
178             important_date: {
179                 icon: 'calendar-clock-fill'
180             },
181             key_milestone: {
182                 icon: 'diamond-fill'
183             },
184             deadline: {
185                 icon: 'star-fill'
186             }
187         }
188     };
189 },
190 type: 'RoadmapMilestoneAPIImpl'
191 };

```

4. Select **Update**.

Configure additional source tables for free-form roadmap in Portfolio Planning

Add new tables to roadmap preferences and configure their details so that these tables can be used as source tables while creating a free-form roadmap in Portfolio Planning.

Before you begin

[Install Portfolio Planning](#).

Role required: sn_align_core.apw_admin

Procedure

1. Navigate to **All > Portfolio Planning > Portfolio Plan Configuration**.
2. Select **New**.
3. On the form, fill in the fields.
For field information, see [Portfolio plan configuration form](#).
4. Select **Submit**.

Customize the planning item display preferences for Prioritization and Roadmap in Portfolio Planning Workspace

Update source table configurations so that you can customize the roadmap view in Portfolio Planning according to your business priorities.

Before you begin

[Install Portfolio Planning](#).

Role required: sn_roadmap_plng.roadmap_admin or sn_align_core.apw_admin

About this task

For the source tables that you use to create your portfolio plans or free-form roadmaps, modify the configuration. You can update the fields to group and color the items on the roadmap, the metrics to be displayed for each item, and others.

Procedure

1. Navigate to **All > Portfolio Planning > Portfolio Plan Configuration**.
2. Open a table for which you want to edit the configuration.
3. Edit the required fields.
For field information, see [Portfolio plan configuration form](#).
4. Select **Update**.

Update the display limit of items for Prioritization and Roadmap in Portfolio Planning

Create a system property to update the display limit of the items shown in Prioritization page, Roadmap page, and the item milestones on the roadmap view in Portfolio Planning.

Before you begin

Ensure the application scope in your instance is set to Global.

Role required: admin

About this task

The default display limit for Prioritization and Roadmap pages are:

- Planning items shown in the Prioritization tab = 250
- Roadmap items shown in the Roadmap tab = 250
- Item-level milestones in the Roadmap tab = 100
- Items shown in the Kanban tab = 250

If the total number exceeds these default limits, the additional number of planning items, milestone indicators, and vertical lanes are not visible in the workspace. To overwrite this default setting, create a system property and set its value to a desired limit of display.

Important:

If the value of a system property exceeds its default value, the UI performance can degrade.

Procedure

1. Navigate to **All > System Properties > All Properties**.
A list of all the properties in the System Properties [sys_properties] table appears.
2. Click **New**.
3. On the form, fill in the fields.
For information on the other form fields, see the field description table in [Add a system property](#).
4. Select **Submit**.

Hierarchy view configuration in Portfolio Planning

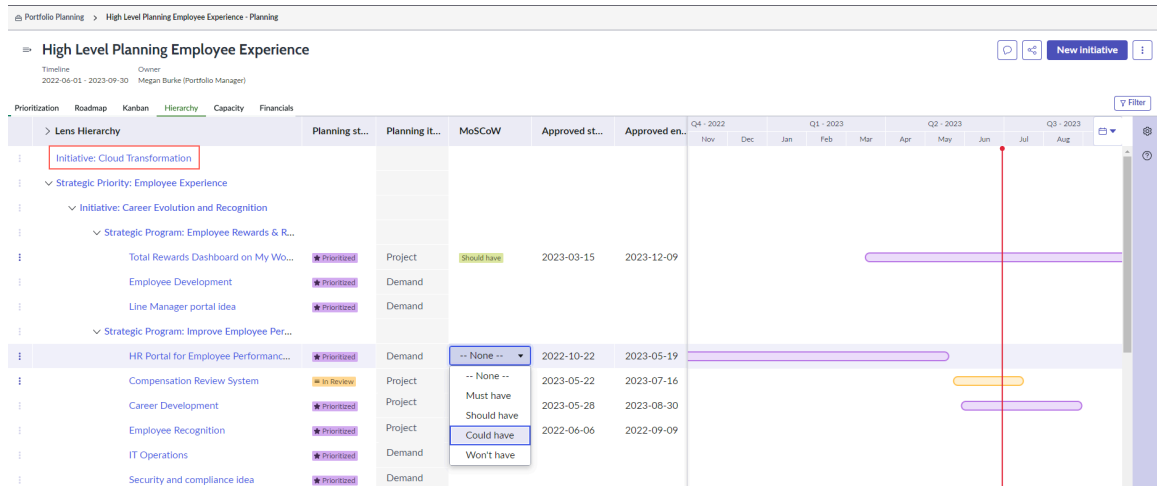

Show or hide parent records of planning items shown in the Hierarchy view for high-level and regular portfolio plans by configuring system properties.

Display empty parent entities in the Hierarchy tab

In the Hierarchy tab, the parent records are displayed only if they have any associated planning items.

For example, a portfolio plan built from the Organization lens (Company > Business Unit > Department) is used to manage and track plans for Demands and Projects. So, when you switch to the Hierarchy tab, only those departments that have at least one Demand or Project associated with it are shown in the view.

If you want to see other departments that are included in this portfolio plan but have no planning items associated to them, work with your administrator to create the system property `sn_align_ws.gantt_hide_empty_entities` and set it to **false**.

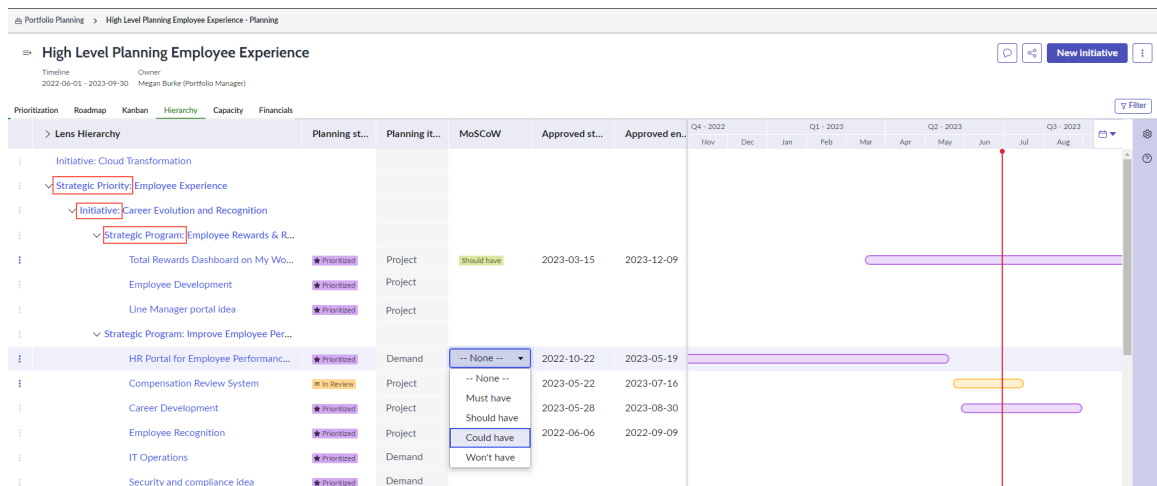

Display complete hierarchy for high-level portfolio plans

For high-level portfolio plans, the Hierarchy tab by default shows only the hierarchy up to the parent level.

For example, a portfolio plan built from the Strategic Investment lens (Company > Strategic priority > Initiative > Strategic program) is used to manage and track plans for strategic programs. So, when you switch to the Hierarchy tab, only Strategic Priority > Initiative levels are shown by default.

If you want to see the whole hierarchy of Strategic priority > Initiative > Strategic program > planning items, work with your administrator to create the system property **true**.

Configuring roadmap in Portfolio Planning

Create custom themes to configure roadmap bar colors, ensuring they align with your organization’s standards.

Use the following steps as guidelines for configuring custom themes for your roadmap bar colors:

1. Create a custom theme for roadmap bar colors. For details, see [Create a custom theme for roadmap](#).
2. Publish your custom theme so that you can apply it to your roadmap. For details, see [Publish a custom roadmap theme](#).
3. Apply a custom theme for your roadmap. For details, see [Apply a custom theme to roadmap](#).
4. Verify that the custom theme is applied for your roadmap.

Create a custom theme for roadmap

Customize roadmap bar colors to align with your organization’s branding guidelines and maintain visual consistency.

Before you begin

Role required: admin

About this task

The roadmap applies the colors defined in the UI theme’s **Alert** and **Grouped** options.

Procedure

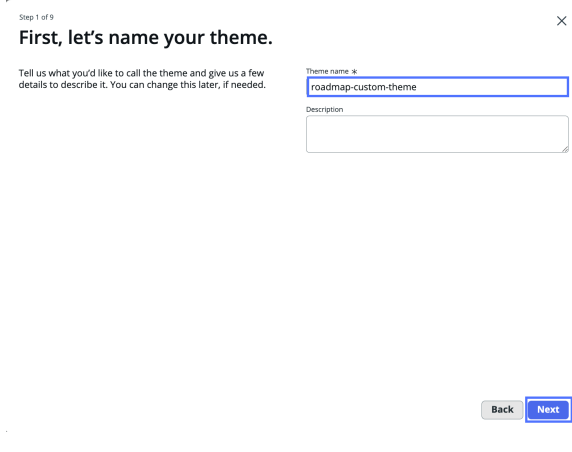

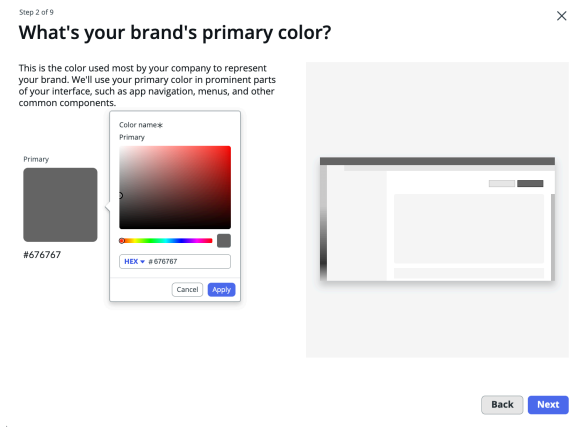

1. Navigate to **All > Now Experience Framework > Theme Management > Theme Builder**.
2. From the Theme Builder Home page or Editor page, select **Create a theme**.
The theme creation wizard opens.
3. On the Before we get started window, select **Continue**.

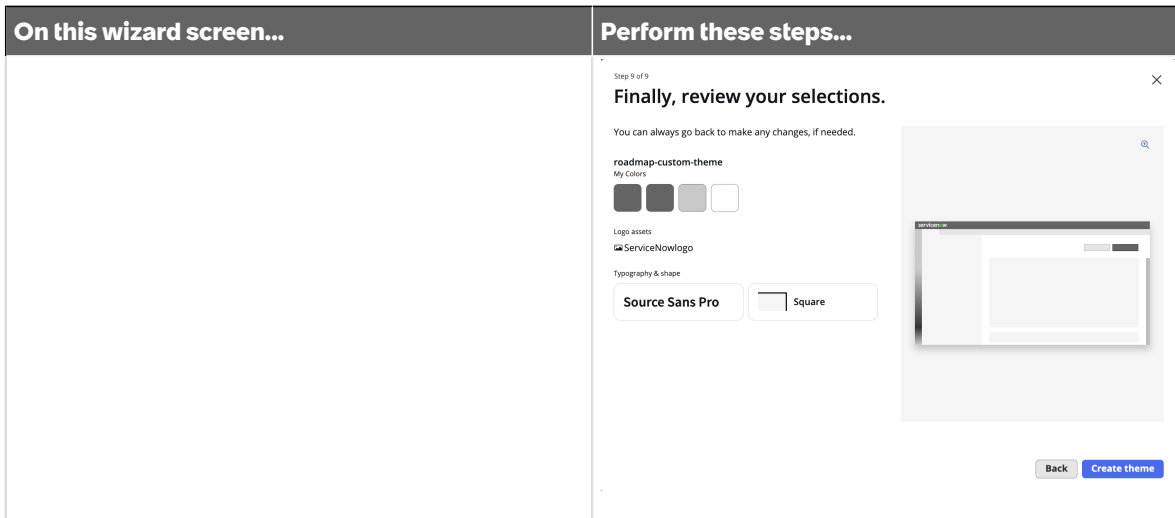

Complete the following steps for each screen in the wizard.

Note:

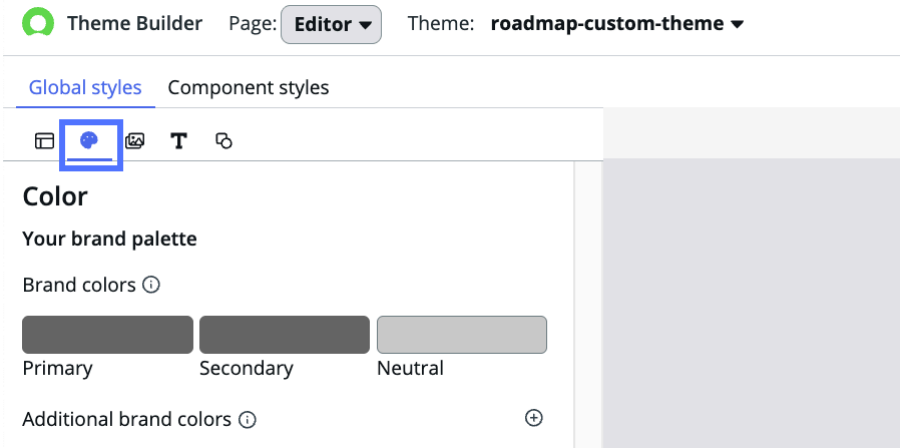

- Only the step 1 (Naming your theme) is required to create a theme.
- Configuring items in steps 2–8 (such as primary, secondary, and neutral colors, company logo, additional colors, fonts, and corner shapes) doesn’t affect roadmap bar colors.

On this wizard screen...	Perform these steps...
Step 1 of 9 First, let’s name your theme	<ol style="list-style-type: none"> a. Enter a name for your theme in the Theme name field. b. (Optional) Enter a brief description for your theme in the Description field. c. Select Next to continue.

On this wizard screen...	Perform these steps...
	
<p>Step 2–8 of 9</p> <ul style="list-style-type: none"> ○ Step 2: What's your brand's primary color ○ Step 3: Do you want to add a secondary color ○ Step 4: Now, choose a neutral brand color ○ Step 5: Do you want to add any additional colors ○ Step 6: Next, let's add your company logo ○ Step 7: Which font would you like to use ○ Step 8: Almost done. Choose the corner shape you prefer. 	<p>a. (Optional) Choose the primary color, secondary color, neutral color, add any extra colors, company logo, font style, user interface corner shapes for your organization on the respective screens.</p> <p>b. Select Next to continue until you reach step 9.</p> 
<p>Finally, review your selections.</p>	<p>a. Review all configured items (colors, logo, font, and shape).</p> <p>b. Select Create theme to finalize.</p>

4. On the Theme Builder page under **Global styles**, select Color icon (🎨) to configure colors for your roadmap bars.

5. Under UI colors, in the **Show** option, select **All colors**

Theme Builder Page: **Editor** Theme: **roadmap-custom-theme** ▾

What to do next

Publish your custom theme so that you can apply it to your roadmap. For details, see [Publish a custom roadmap theme](#).

Publish a custom roadmap theme

Publish a custom roadmap theme so that you can apply it to your roadmap.

Before you begin

You have created a custom theme to apply to the roadmap.

Role required: admin

Procedure

1. Navigate to **All > Now Experience Framework > Theme Management > Theme Builder**.
2. On the Theme Builder page, select **Manager** from the **Page** drop-down.
3. In the Unpublished section, find your theme in the list, select the More actions icon (), and then select **Publish**.

4. On the Publish the theme window, select **Publish**.

Manage your themes

Choose the theme you want to publish or select a theme to view and edit its details.

Published

Unpublished

Result

Your custom theme is now published.

What to do next

Apply your custom theme to update the colors displayed in the roadmap. For details, see [Apply a custom theme to roadmap](#).

Apply a custom theme to roadmap

Apply your custom theme to ensure roadmap bar colors align with your organization’s style.

Before you begin

- You have created and published a custom theme to apply to the roadmap.
- Ensure the application scope in your instance is set to **Portfolio Planning**.

Role required: admin

About this task

To update the color theme for your roadmap bars, you must copy the sys_id of your custom theme, and then create a system property and set its value to the copied sys_id.

The colors configured in the custom theme will be applied to the roadmap bars. However, these colors won’t affect the colors of roadmap milestones or planning item milestones.

Procedure

1. Copy the sys_id of the custom theme.
 - a. Navigate to **Now Experience Framework > Theme Management > Themes**.
 - b. Search for the custom theme that you want to apply to the roadmap.
 - c. Right-click the name of your custom theme and select **Copy sys_id**.
The sys_id of your custom theme is copied.
2. Create a system property and enter the copied sys_id in the form.
 - a. Navigate to **All > System properties > All properties**.
 - b. Select **New**.
 - c. On the form, fill in the fields.

System Property

Field	Description
Name	Name of the system property. Enter the name as <code>sn_align_ws.spw_custom_theme</code>
Application	Application scope for the system property. Ensure the scope is set to Portfolio Planning .
Type	System property type. Set the type to string .
Value	Sys_id of the custom theme you created for roadmap bar colors.

Field	Description
	Enter the copied sys_id.

d. Select Submit.

The system property is created and updated to include the custom theme information.

Result

The roadmap bars now display the colors configured in the custom theme.

Customizing Lists in Portfolio Planning Workspace

You can add custom tables to the Lists menu in Portfolio Planning Workspace and manage access to the newly created categories and lists.

Perform the following tasks to customize Lists and manage access to the newly created categories and lists in the Lists page of Portfolio Planning Workspace:

- Add the **New** button to the APW List Menu Configuration page. For more information, see [Enable adding custom tables to the Lists menu](#).
- Add custom tables to the Lists menu. For more information, see [Customize Lists in Portfolio Planning Workspace](#).
- Manage who can view the newly created categories and lists in the Lists page. For more information, see [Define audience for new lists in Portfolio Planning](#).

Enable adding custom tables to the Lists menu

Add the **New** action button to the APW List Menu Configuration page, so that you can add custom tables to the Lists menu in Portfolio Planning Workspace.

Before you begin

Role required: admin

Procedure

1. Navigate to **Workspace Experience > Actions & Components > List Actions**.
2. From the Action Assignments page, select **New** to create the action button.
3. On the form, fill in the fields.
For a description of the field values, see [Action Assignment form](#).
4. Select **Submit**.

Result

The **New** action button is added to the APW List Menu Configuration page.

What to do next

[Customize Lists in Portfolio Planning Workspace](#).

Customize Lists in Portfolio Planning Workspace

Add custom tables to the Lists menu in Portfolio Planning Workspace.

Before you begin

Role required: admin

- Ensure that your application scope is set to **Portfolio Planning**.
- [Enable adding custom tables to the Lists menu](#).

About this task

Lists menu in the Workspace homepage helps planning managers quickly find a record that they need. By default, this view shows the list of entities of all the planning items and lens available for this ServiceNow instance. If your planning managers need more categories or lists, you can add them.

For more information of configuring lists in a workspace, see [Lists](#) .

Procedure

1. Navigate to **sys_ux_list_menu_config.list**.
2. From the UX List Menu Configurations list, select **APW List Menu Configuration**.
3. Select a new category or a new list.

Tip:

Create a category first and then create a list.

4. On the form, fill in the fields.
 - [UX List Category form](#).
 - [UX List form](#).
5. Select **Submit**.
Repeat this procedure until you've created all the custom categories and lists.

Define audience for new lists in Portfolio Planning

Manage who can view the newly created categories and lists in the Lists page of Portfolio Planning Workspace.

Before you begin

[Customize Lists in Portfolio Planning Workspace](#).

Role required: admin

Procedure

1. Navigate to **sys_ux_applicability_m2m_list.list**.
2. Select **New**.
3. On the form, fill in the fields.
For field information, see [List Applicability form](#).
4. Select **Submit**.

Configure scenario planning in Portfolio Planning

Configure scenario planning in strategic planning to create and compare multiple scenarios.

1. Enable or disable scenario planning.

For more information, see [Enable or disable scenario planning in Portfolio Planning](#).

2. Manage financial widgets in compare scenarios page.

For more information on how to add and manage widgets to the comparison view, see [Configure financial widgets in compare scenario.](#)

Enable or disable scenario planning in Portfolio Planning

Enable or disable scenario planning in Portfolio Planning.

Before you begin

Role required: sn_align_core.apw_admin

About this task

Scenario planning is enabled by default. Use the following steps to disable or enable scenario planning, as required.

Procedure

1. Navigate to **All > System properties > All properties.**
2. Search for the property

sn_align_ws.is_scenario_planning_disabled.

3. Verify the value of the property.

- To enable scenario planning, verify that the property is set to **False.**
- To disable scenario planning, verify that the property is set to **True.**

What to do next

[Create a scenario](#)

Configure financial widgets in compare scenario

Add or manage existing widgets to view financial insights while comparing scenarios. Define your own attribute from the cost types to view it's details in the Compare scenario page.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > Project Administration > Widgets.**
2. In the Widgets list, filter the Short description with **Compare scenario** to view the existing list.

By default, there are five financial widgets enabled to compare the financial performance of scenarios.

Name	Active	Aggregate type	Short description
Total Benefit from In-Plan items	true	Count	Compare Scenario - totalBenefitWidget
Capex Budget	true	Count	Compare scenario - budget vs target (Ca...
Opex Budget	true	Count	Compare scenario - budget vs target (Opex)
Total Simulated Budget	true	Count	Compare scenario - budget vs target (To...
Primary Goal	true	Count	Compare scenario - budget distribution b...

3. Edit an existing widget or create a widget to use it in scenario planning.

4. Select **Submit**.

Portfolio Planning diagnostics

Run diagnostic scans to identify and fix errors in the configuration and other common settings for Portfolio Planning before your planning managers prioritize and roadmap their projects and demands.

Portfolio Planning diagnostic scans help you find discrepancies by validating the configuration for the following:

- Lens and lens structure
- Form views, list views, related list views, and workspace view rules for planning items
- Global ranking for planning items
- Portfolio plans

The following are the default diagnostic scans available for Portfolio Planning.

Portfolio Planning diagnostics

Name of the scan	Description
Identify planning items without a global rank	Identifies the number of planning items on the Prioritization List page, for which the global rank is not populated. If this scan fails, the result shows the planning items that do not have a global rank. Click Run Fix Script to populate a global rank to items for which this field is empty.
Validate List views for planning items	Verifies that all the planning items that can be added to portfolio plans have the APW Prioritization and APW Default List views. If this scan fails, the result displays the List views that are missing for certain planning item tables.

Name of the scan	Description
	<p>To learn how to fix these, see Create list views for new planning item tables in Strategic Planning.</p>
<p>Validate Form section views for planning items</p>	<p>Verifies that all the planning items that can be added to portfolio plans have the APW Prioritization, APW Default, and APW New form views.</p> <p>If this scan fails, the result displays the Form section views that are missing for certain planning item tables.</p> <p>To learn how to fix these, see Create form views for new planning item tables in Strategic Planning.</p>
<p>Validate Related list views for planning items</p>	<p>Verifies that all the planning items that are allowed on portfolio plans have the APW Default Related list view.</p> <p>If this scan fails, the result displays the Related list views that are missing for certain planning item tables.</p> <p>To learn how to fix these, see Create related list views for new planning item types in Strategic Planning.</p>
<p>Validate Workspace view rule for Default view of planning items</p>	<p>Verifies that all the planning items that are allowed on portfolio plans have the Default view's workspace view rule.</p> <p>If this scan fails, the result displays the Default view rule is missing for certain planning item tables.</p> <p>To learn how to fix these, see Create workspace view rules for new planning item forms in Strategic Planning.</p>
<p>Validate Workspace view rule for APW Default view of planning items</p>	<p>Verifies that all the planning items that are allowed on portfolio plans have the APW Default view's workspace view rule.</p> <p>If this scan fails, the result displays the APW Default view rule is missing for certain planning item tables.</p> <p>To learn how to fix these, see Create workspace view rules for new planning item forms in Strategic Planning.</p>

Name of the scan	Description
Validate invalid fields in the Portfolio Plan configuration	<p>Finds any invalid fields in the portfolio plan configuration records for all existing portfolio plans.</p> <p>If this scan fails, click Run Fix Script to remove the identified invalid fields.</p>
Validate Portfolio Plan Configuration for all the portfolio plans	Verifies if each existing portfolio plan created in your instance has a valid portfolio plan configuration.

Capacity configuration in Portfolio Planning

Generate employee profiles for resources and map them with primary attributes to start capacity planning.

- Enable the planning attributes for capacity to map resources to a unique attribute. For more information, see [Enable planning attributes for capacity in Portfolio Planning](#).
- Create resource assignments and generate employee profiles. For more information, see [Generate employee profiles for resources to work with capacity planning](#).
- Map resources to a unique group, role, and skill to generate employee profiles. For more information, see [Map primary attributes to resources](#).

Enable planning attributes for capacity in Portfolio Planning

Enable the planning attributes Group, Skill, and Role so that your planning managers can view the resource capacity details.

Before you begin

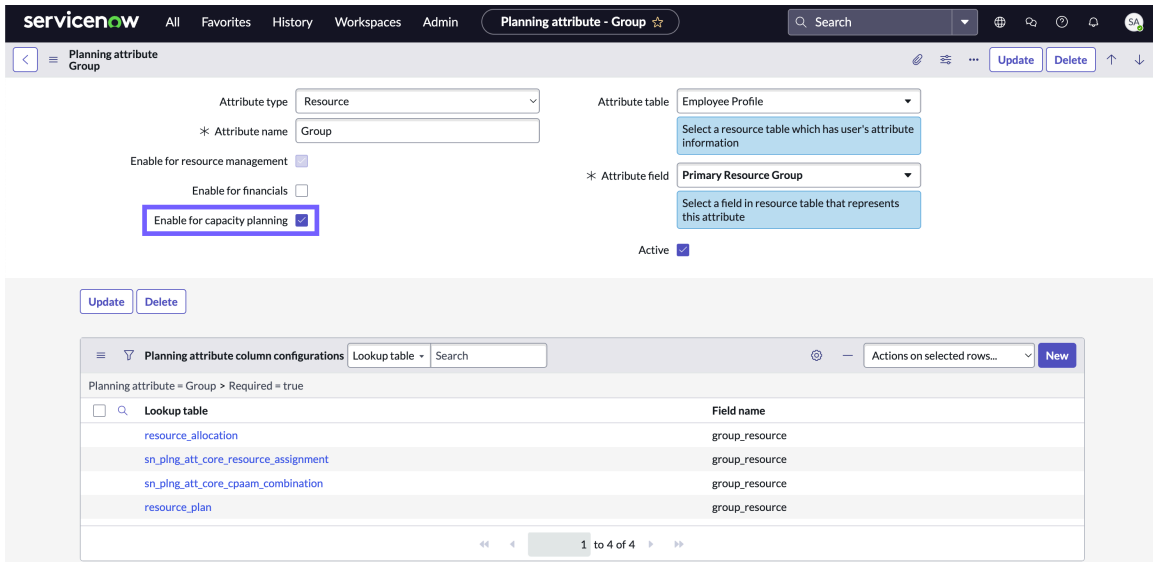

Role required: admin

- Note:** This activation is a one-time task to enable planning attributes to plan and work on resource capacity.

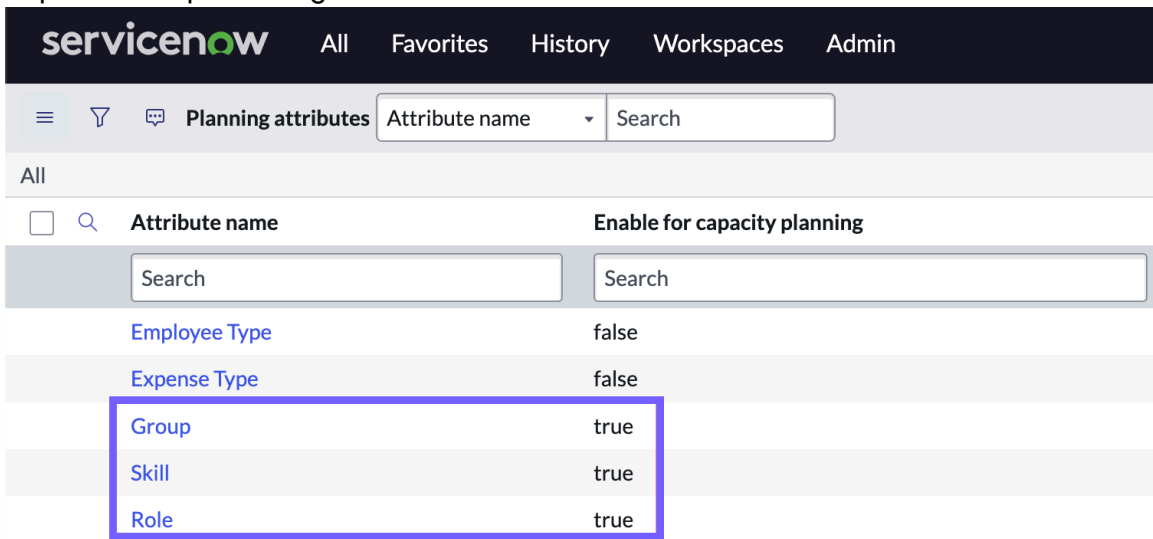

Procedure

1. Navigate to **All > Portfolio Planning > Planning Attributes**.
2. Filter the Attribute name to locate and open the **Group** attribute.
3. Select the **Enable for capacity planning** option.
4. Select **Update**.

- Note:** If an attribute is enabled for capacity planning, it is enabled for resource management by default.

5. Repeat the steps 2 through 4 for the **Skill** and **Role** attributes.

You can create custom attributes and map them to resources. For more information, see [Create or edit planning attributes](#).

6. Set the value of the Enable for capacity planning column for Group, Role, and Skill field to **true**.

What to do next

1. Configure attribute values: Navigate to **All > Strategic Planning > Planning Attributes** to view and manage attribute values. You can add, edit, or import attribute entries for Group, Skill, and Role.
2. Map attributes to resources: Assign the enabled planning attributes to your resources so they appear in capacity views. For custom attributes, see [Create or edit planning attributes](#).
3. Start capacity planning: Navigate to the Capacity tab in your *Strategic Planning Workspace* to view resource capacity based on the enabled attributes.

Generate employee profiles for resources to work with capacity planning

Generate employee profiles for the resources to map against primary attributes.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > Employee Profile > Employee Definition**.
2. Filter the name to locate and open the sys_user table.
3. In the Employee Definition page, select **User** from the Table list.
4. Use the condition builder to filter the required resources and then select the update count icon .
5. Select **Generate Employee Profiles** ().
6. In the Generate Employee Profiles window, select **Proceed**.

Result

Employee profiles for the selected resources are generated.

What to do next

Populate a primary group, primary role, and primary skill for the resources with employee profiles. For more information, see [Map primary attributes to resources](#).

Map primary attributes to resources

Locate and map the primary group, primary role, and primary skill for the resources associated with existing employee profile tables.

Before you begin

[Generate employee profiles for resources to work with Capacity](#).

Role required: admin

Procedure

1. Navigate to **All > Employee Profile > Employee Profiles**.
2. Filter the User column to locate and open the resources with employee profiles.
3. Select the **Populate primary resource attributes** related link to auto-populate the attributes.
 - If an employee is assigned to a single group, role, and skill, the primary attributes are populated.
 - If an employee is assigned to multiple groups, skills, or roles, select the **Primary Resource Group, Primary Resource Role, and Primary Resource Skill**, using the lookup icon.
4. Select **Update**.

Activate a scheduled job to automatically generate resource capacity

Activate the scheduled job to auto-generate the resource capacity at required cadence.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Definition > Scheduled Jobs**.
2. Filter the name field to locate and open **Generate Resource Capacity**.
3. Select **Active** option to activate the schedule job.

4. Edit the fields on the Scheduled Script Execution form to customize the job and meet your requirements.
For more information about the field description and scripts, see [Automatically run a script of your choosing](#).
5. Select **Execute Now** to execute the scheduled job or select **Update** to save your changes.

Configure financials for Portfolio Planning

Configure the ServiceNow Internal integrations to view the financials for planning items in Portfolio Planning.

Before you begin

Role required: admin

Procedure

1. Configure the attributes to generate labor costs in financials based on the resource assignments on the work items.
For more information, see [Using the Planning attributes](#) and [Create or edit planning attributes](#).
2. Generate default mapping configurations to create table maps.
For more information, see [Generate default mapping configurations](#).
3. Create new widgets to view the rolled up financial data at planning item level.
For more information, see [Configure a widget and associate it with project](#).
4. **Optional:** Customize the left pane in the financials screen to match the requirements of your organization.
For more information, see [Customize the left pane view for financials](#).
5. Enable budgeting option to allocate and manage budget of your planning items.
For more information, see [Enable financial budget allocation for planning items in Portfolio Planning](#).
6. Configure the budget attribute to expense type or cost type to manage the budget of your planning items.
For more information, see [Configure budget attribute at instance-level to allocate budget](#).
7. **Optional:** Customize the Create cost plan form fields to match the requirements of your organization.
For more information, see [Customise cost plan form](#).
8. Customize the default expense types to manage cost plans for your planning items.
For more information, see [Change the default expense type in Portfolio Planning](#).
9. Define a custom prefix for your baseline name.
For more information, see [Create a custom prefix for baseline](#).
10. Activate and define a scheduled job to migrate budget for your planning items.
For more information, see [Activate a scheduled job to migrate budget of your planning items](#).
11. Activate and define scheduled job to automatically create financial baselines for your planning items at a defined cadence.
For more information, see [Activate a scheduled job to create financial baselines for your projects and demands](#).
12. Activate and define a scheduled job to generate labor costs for your projects and demands based on the attribute-based resource assignments.
For more information, see [Activate a scheduled job to generate labor costs for your projects and demands](#).

Customize the left pane view for financials

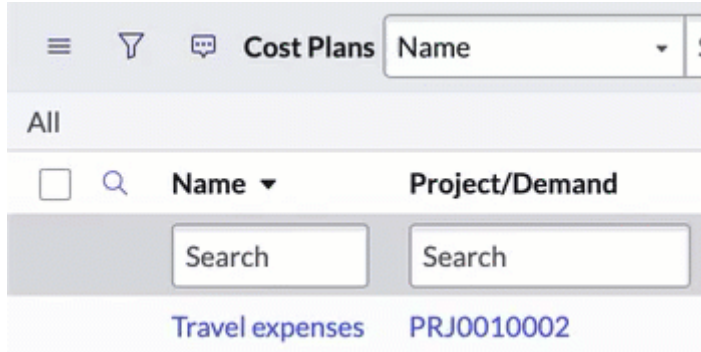

Customize the left pane for financials to view custom field information.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Definition > Tables**.
2. Filter the Label field to locate and open the **Cost Plan** table.
3. Select the **Show List** related link.
4. Select the financials view by navigating to **List controls > View > Financials View**.

The selected view (Financials View) is displayed on the header.

5. Select the header options to configure list layout.

Cost Plans View: Financials View		Name	Search
All			
<input type="checkbox"/>	<input type="text"/>	Name	Cost type
		Travel costs	Other Opex
		Travel costs	Other Opex
		Support vendors	External labor Opex
		Servicenow Subscription	Software Capex
		Servicenow Subscription	Software Capex
		SAP Subscription	Software Opex
		Resource_Internal_DEV_Opex	Labor Opex
		QE team	Labor Opex
		Oracle SDK	Software Capex
<input type="checkbox"/>	<input type="text"/>	Office supplies	Other Capex
		Office supplies	Other Capex
		Monitor Rentals	Hardware Capex

6. Add or remove the fields in the Selected column to customize the left pane view in financials view.
7. Select **Save**.

Result

Cost plans table with customized fields for Financials View is displayed.

Enable monetary benefit plans for planning items

Enable the benefit plans property to create and manage benefit plans for planning items.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Properties > Properties**.
2. Filter the Name column to locate and open **sn_invst_pln.enable_benefit_plan_in_new_financials** property.
3. Enter **true** in the Value field.
4. Select the **Update** button.

Add monetary and non-monetary benefit plans related lists

Add the monetary benefit plans and non-monetary benefit plans related lists for your planning item.

Before you begin

- This is a one time activity to enable and view the monetary benefit plans and non-monetary benefit plans related list for all the planning items.
- Role required: admin

Procedure

1. Navigate to **All > System Definition > Tables**.
2. Filter the Label field to locate a planning item type.
3. Select the **Show List** related link.
4. Open a record from the list of Features or Capabilities.
5. Change the scope of the application if you do not see the editable form of the record page.
6. Change the record page view to **EAP Default**.
To change the view, select **Additional actions** menu (), select **View**, and select the **EAP Default** view.

7. Select **Additional actions** menu (☰), select **Configure**, and select the **Related Lists** option.

8. Select **Monetary Benefit Plans** and **Non-monetary Benefit Plans** from the Available list and add them to Selected list.

9. Select **Save**.

10. Select **Update** on the planning item record page.

What to do next

Create and manage monetary and non-monetary benefits plans for your planning items.

- [Create monetary benefit plans for your planning items in Portfolio Planning](#)
- [Manage non-monetary benefit plans for your planning items in Portfolio Planning](#)

Enable financial budget allocation for planning items in Portfolio Planning

Enable allocation property after migrating to Next Experience to work on budget allocation for your planning items using Portfolio Planning.

Before you begin

- For new customers accessing financials in Next Experience, this property is enabled by default.
- Role required: admin

Procedure

1. Navigate to **All > System Properties > Properties**.
2. Filter the Name column to locate and open **sn_invst_pln.enable_budget_allocation_v2** property.
3. Update the Value field to **True** and select **Update**.

What to do next

Configure budget attributes to work on managing budget of your planning items. For more information, see [Configure budget attribute at instance-level to allocate budget](#).

Configure budget attribute at instance-level to allocate budget

Configure the budget attribute by expense type or cost type as an instance-level to work on budget allocations for your planning items using Portfolio Planning.

Before you begin

- Enable the budget allocation property to work on budgeting for planning items. For more information, see [Enable financial budget allocation for planning items in Portfolio Planning](#).
- Role required: admin

**Important:**

Existing customers cannot change the budget attribute to `cost_type`.

Procedure

1. Navigate to **All > System Properties > Properties**.
2. Filter the Name column to locate and open **sn_invst_pln.budget_allocation_attribute** property.
3. Update the Value field to one of the following.
 - **cost_type** - view financials by cost types such as Hardware Opex, External labor Capex, Software Capex, Software Opex, and so on.
 - **expense_type** - view financials by expense types such as Capex and Opex.
4. Select **Update**.

Customise cost plan form

Manage the fields required on the new cost plan form as per your organization needs.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Definition > Tables**.
2. Filter the Label field to locate and open the **Cost Plan** table.
3. Select the **Design Form** related link.
4. On the header row, select **Cost Plan [cost_plan]** from the table list and **Financials View** from the view list.
5. On the form, you can:
 - Drag and drop the required fields from the Fields column.
 - Remove the existing fields using the Remove field icon.
6. Select **Save**.

Change the default expense type in Portfolio Planning

Configure the default expense type to create or edit cost plans for your planning items.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Properties > All properties**.
2. Filter the name to locate and open the **sn_plng_att_core.default.expense_type** table.
3. Change the Value field to the required expense type and select **Save**.
Opex is the default value.

Create custom labor costs and map them to sys_id

Create and map custom labor costs to sys_id to generate labor costs based on the relevant expenses.

Before you begin

Role required: admin

Procedure

1. Create custom labor costs.
 - a. Navigate to **All > System Definition > Tables**.
 - b. Filter the Label field to locate the open **Cost Type Definition**.
 - c. From the Related Links, select **Show List**.

List of OOB labor costs is displayed.

- d. Select **New**.
- e. On the Cost Type Definition form, fill the fields.
 - **Name** - enter the name of the labor cost plan.

Tip:

Adding the cost type, either capex or opex, as a suffix to the name helps you to easily identify while creating cost plans.

- **Expense type** - select Capex or Opex from the list to define expense.

For example, you can create Software Capex labor cost to capture software purchasing expenses. Hardware Opex labor cost to capture your hardware purchasing expenses.

- f. Click **Submit**.

The new cost plan is displayed on the list.

- g. Right-click on the cost plan row and select **Copy sys_id**.

2. Map the custom labor costs with sys_id.
 - a. Navigate to **All > System Properties > All properties**.
 - b. Filter the name field to locate and open the **sn_plng_att_core.labor_costtype_sysid_mapping** property.
 - c. In the Value field, enter the labor cost type name and its sys_id in the same format as the OOB labor costs mapping format.
 - d. Select **Update**.

Activate a scheduled job to migrate budget of your planning items

Activate the **Migrate budget for active demands and projects** scheduled job to migrate budget of active planning items from Classic UI to Next Experience.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Definition > Scheduled Jobs**.
2. Filter the name field to locate and open **Migrate budget for active demands and projects**.
3. Edit the fields on the Scheduled Script Execution form to customize the job and meet your requirements.
For more information about the field description and scripts, see [Automatically run a script of your choosing](#) .
4. Select **Execute Now** to execute the scheduled job or select **Update** to save your changes.

Activate a scheduled job to create financial baselines for your projects and demands

Define a scheduled job to automatically create financial baselines for your planning items at a required cadence.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Definition > Scheduled Jobs**.
2. Filter the name field to locate and open **Create Financial Baseline For active Demands and Projects**.
3. Select **Active** option to activate and schedule the job.
4. Edit the fields on the Scheduled Script Execution form to customize the job and meet your requirements.
For more information about the field description and scripts, see [Automatically run a script of your choosing](#) .
5. Select **Execute Now** to execute the scheduled job or select **Update** to save your changes.

Activate a scheduled job to generate labor costs for your projects and demands

Activate a scheduler job to automatically create labor costs for attribute-based resource assignments.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Definition > Scheduled Jobs**.
2. Filter the name field to locate the *Generate Labor Costs* scheduled job and open it.
3. Select **Active** and on the Scheduled Script Execution form, fill the fields.
For a description of the field names, see [Scheduled Script Execution form to generate labor costs for projects and demands](#).
4. Select **Update** to save your changes or **Execute Now** to run the scheduled job.

Configure portfolio financials in Portfolio Planning

Configuration details for properties and scheduled jobs to view and manage portfolio financials in Portfolio Planning

Before you begin

Role required: admin

Procedure

1. Enable integration for an internal planning item type.
For more information, see [Enable integration for internal planning item](#).
2. Activate the investment entities for Demands and Projects.
For more information, see [Activate investment entities for planning items](#).
3. Enable the roll up system property to true to view financials.
For more information, see [Activate rollup property for projects to view portfolio financials](#).
4. Activate the data generation scheduled job to view portfolio financials.
For more information, see [Activate a scheduled job to generate data to view portfolio financials](#).

Enable integration for internal planning item

Enable the integration for an internal planning item type to view portfolio financials.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Definition > Tables**.
2. Filter the name field to locate and open the **Table Map** [sn_align_cm_n_int_table_map] table.
3. Select the **Show List** Related Link.
4. Set the Active field to **true** for dm_n_demand and pm_project.

Execution table	Alignment table	Active
dm_n_demand	Demand [sn_align_core_demand]	true
pm_project	Project [sn_align_core_project]	true
im_idea_core	Feedback [sn_align_core_feedback]	true
pm_project_task	Milestone [sn_milestones_milestone]	true
rm_epic	Epic [sn_align_core_scrum_epic]	true

Activate investment entities for planning items

Activate the investment entitied for Demands, Projects, and Epics to view portfolio financials.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Definition > Tables**.
2. Filter the name field to locate and open the **Investment Entity** [sn_invst_pIn_invst_funding_entity] table.

3. Select the **Show List** Related Link.

4. Set the Active field to **true** for Demand and Project fields.

Name	Table	Owner field	Owner filter	Active	Fundable entities
Demand	Demand [dmn_demand]	demand_manager	Active = true	true	
Epic	Epic [sn_align_core_scrum_epic]	owner	Active = true	false	
Generic Bucket			Active = true	true	
Portfolio	Portfolio [pm_portfolio]	portfolio_manager	Active = true	false	
Program	Program [pm_program]	program_manager	Active = true	false	
Project	Project [pm_project]	project_manager	Active = true	true	
Project Task	Project Task [pm_project_task]	assigned_to	Active = true	true	

Activate rollup property for projects to view portfolio financials

Activate project cost rollup property to view the rolled up costs of top projects in portfolio financials.

About this task

Financial fields such as planned costs, forecasts, actual costs are rolled up from sub-projects to top projects upon setting this property to true.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Properties > All Properties**.
2. Filter the name field and select the **com.snc.project.rollup.cost** property.
3. Enter **true** in the Value field and select **Update**.

Activate a scheduled job to generate data to view portfolio financials

Activate and define **Data generation for financials in SPW/PPW** scheduled job to migrate budget from old data model to new data model and view portfolio financials.

About this task

It is a one-time activity to define and run this scheduled job to view portfolio financials.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Definition > Scheduled Jobs**.
2. Filter the name field to locate and open **Data generation for financials in SPW/PPW**.
3. Select Active option to activate and schedule the job.
4. Edit the fields on the Scheduled Script Execution form to customize the job and meet your requirements.

For more information about the field description and scripts, see [Automatically run a script of your choosing](#) .

5. Select **Execute Now** to execute the scheduled job.

Result

All the required mappings to view the portfolio financials for Epics, Demands, and Projects are mapped.

To validate if the data generation job is successful, navigate to **All > System Definition > Tables** and check the mappings for **Investment** record in the **Project** [sn_align_core_project] table.

Configuring Portfolio Planning with PPM

Understand the process required to set up Portfolio Planning to work with ServiceNow® Project Portfolio Management.

Configuration workflow

Use the following steps as guidelines for your Portfolio Planning with Project Portfolio Management (PPM) setup process. Some of these steps require the admin role (sn_align_core.apw_admin) and some require the user role (sn_align_core.apw_user).

1. [Create an alignment integration.](#)
2. [Generate default mapping configurations.](#)
3. [Create custom mapping configurations.](#)

Guided Setup

After installing Portfolio Planning, you can use the guided setup to help you with the required configuration. To open the guided setup, navigate to **Portfolio Planning > Guided Setup**.

Create an alignment integration

Internal alignment integration synchronizes internal processes and data to support Strategic Portfolio Management, confirming that planning and execution are aligned with business objectives through real-time bi-directional synchronization with applications such as Project Portfolio Management, Agile Development 2.0, and Scaled Agile Framework (SAFe).

About this task

After you have Portfolio Planning installed, the **ServiceNow Internal** Alignment integration is created by default. In case the alignment integration isn't available, you can create your alignment integration type.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > Portfolio Planning > Integrations**.
2. Verify if the **ServiceNow Internal** alignment integration exists.
3. If not, click **New** to create an alignment integration.
4. In the **Name** field, enter a name for the alignment integration (For example, **ServiceNow Internal**).

Alternatively, you can also click **Create ServiceNow Internal Integration** from the related links to create an internal alignment integration.

5. Click **Submit**.

Generate default mapping configurations

Generate default mapping configurations to create table maps for Project Portfolio Management (PPM).

Before you begin

Role required: sn_align_core_apw.admin

Procedure

1. Navigate to **All > Portfolio Planning > Integrations**.
2. Click **ServiceNow Internal** to view the alignment integrations for the internal applications.
3. Click **Generate Default Mapping Configurations** to create the table maps for projects and demands.

Note:

Mapping configurations consist of table, field, and choice maps.

Create custom mapping configurations

Create mapping configurations for planning items that are not created by default such as features, stories, etc.

As an admin, you can choose to create table maps, field maps, and choice maps for the planning items that are not created by default. For more information, see:

1. [Create a table map](#).
2. [Create a field map](#).
3. [Create a choice map](#).

Create a table map

Create a table map to define the mapping between tables in Portfolio Planning with the tables in Project Portfolio Management (PPM).

Before you begin

Role required: sn_align_core.apw_admin

Procedure

1. Navigate to **All > Portfolio Planning > Integrations**.
2. Select **ServiceNow Internal**.
3. Create a new table map by selecting **New** in the **Table maps** tab.
4. In the [Table map form](#), fill in the fields.
5. Select **Submit**.

Result

A new table map is created with your alignment and execution table configurations.

Note:

To create or update a table map for a planning item type other than demand or project, the SPM Pro license is required. Contact your administrator for more details.

What to do next

Create a business rule to support export of this new table map configuration to PPM. For more information, see [Create a business rule to apply a custom table map configuration](#).

Create a business rule to apply a custom table map configuration

Create a business rule to enable import for your new custom table map configuration from and Project Portfolio Management (PPM) application.

Before you begin

Role required: sn_align_core_apw.admin

About this task

After you create a custom table map in Portfolio Planning integrations, create a business rule similar to 'Sync Data from Execution to Alignment' business rule in the rm_epic or dmn_demand tables.

Note:

Ensure that the business rule is created in the execution application, PPM.

Procedure

1. Navigate to **All > System Definition > Business Rules**.
2. From the list of available business rules, locate and open the Sync Data from Execution to Alignment rule.
3. From the context menu () , perform an Insert and Stay operation on this business rule. If you have not enabled the **Insert and Stay** action in your ServiceNow instance, see [Allow insert options on records](#) .
4. On the business rule form, edit the following fields.

Business rule form

Field	Description
Name	Unique name for the business rule. For example, if your new table map is to map demands, name this rule as Sync Demands with Portfolio Planning.
Table	Select the table for which you've created the custom map. For example, Feature [sn_safe_feature].

5. Click **Update**.

Create a field map

Map the fields for each table map from Portfolio Planning to Project Portfolio Management and vice-versa.

Before you begin

Ensure that you have created a table map for an alignment integration record. For more information, see [Create a table map](#).

Note:

If the execution field type is 'Reference' and the alignment field type is 'String', then the sync will not work.

Role required: sn_align_core.apw_admin

Procedure

1. Navigate to **All > Portfolio Planning > Integrations**.
2. Select **ServiceNow Internal**.
3. In the **Table Maps** related list, select the table map for which you want to create a field map.
4. Create a new field map by selecting **New** in the Field Maps tab.
5. In the [Field map form](#), fill in the fields.
6. Click **Submit**.

Create a choice map

Map the choice list for each field map for fields with a list of values from Portfolio Planning to Project Portfolio Management and vice-versa.

Before you begin

Ensure that you have created a field map and it contains choice fields with a list of values. For more information, see [Create a field map](#).

Role required: sn_align_core.apw_admin

Procedure

1. Navigate to **All > Portfolio Planning > Integrations**.
2. Select **ServiceNow Internal**.
3. In the **Table Maps** related list, select the table map which has the fields for which you want to create a choice map.
4. In the **Field Maps** related list, select a relevant field map for which you want to create a choice map.
5. Create a new choice map by selecting **New** in the Choice Maps tab.
6. In the [Choice map form](#), fill in the fields.
7. Click **Submit**.

Configure bulk import

This system property enables you to update the bulk import functionality in Portfolio Planning with PPM.

Before you begin

Role required: sn_align_core.apw_admin

Procedure

1. Enter `sys_properties.list` in the navigation filter.
2. Search for `com.sn_align_cmn_int.bulk_import`.
3. Set the property value to either of the following options.

Managing portfolio plans in Portfolio Planning

Create personalized portfolio plans in Portfolio Planning Workspace and enable focused planning of work in the desired perspective (lens) to align with business objectives.

The following sections guide you on creating, updating, sharing, and collaborating with portfolio plans in Portfolio Planning Workspace.

For details on how to use roadmaps for your portfolio plans, see [Planning roadmaps in Portfolio Planning](#).

Create a high-level portfolio plan

Build a portfolio plan for high-level items (programs) in the Portfolio Planning Workspace so that you can prioritize, roadmap, and manage work aligned to these programs.

Before you begin

Role required: sn_align_core.apw_user or business_stakeholder

About this task

You can create high-level planning only for Program (pm_program) planning items and is supported by the Project Program lens.

In this task, select the Project Program lens, add conditions to filter the planning item data that you need, and enter additional details to build a portfolio plan.

Procedure

1. Navigate to **Workspaces > Portfolio Planning Workspace > Portfolio Planning**.
2. From the Portfolio Plans page, select **New**.
If there are no existing portfolio plans, select **Create your first portfolio plan**.
3. Select **Project Program** lens for your high-level planning.
The Create portfolio plan wizard is shown.
4. For the lens, select **Programs** as work items for planning.
 - a. For the lens, select work that you want to plan.

For example, you want to manage work for programs in your company. Select Programs as your high-level planning item. This enables you to plan for programs and review the work aligned to these programs.

What are you planning in Project Program?

Your lens structure: **Portfolio** → **Program** → **Work items**

Select the item you want to see on your planning board. You can only choose one type.

- Program
- Demand, Project

b. Add conditions to further filter the data of your planning items.

For example, you are responsible for the programs of the Customer Support department. You can set a condition to filter programs of only the Customer Support department from the Program table.

You can also add multiple conditions to help you set a complex filter and add the right kind of data to your portfolio plan.

c. Fill in the details of the portfolio plan.

Provide the information of the portfolio plan's name, owner, start and end dates, and description.

Use the **Previous** and **Next** buttons to navigate between the steps.

5. Select **Create**.

Result

The portfolio plan is created and the page is refreshed to show the Planning page. You can view the list of all portfolio plans that you own or shared with you from the Home page.

What to do next

Analyze the backlog and prioritize work for your portfolio plan. See [Prioritizing portfolio plan work in Portfolio Planning](#).

Create a portfolio plan

Use lens and build a personalized portfolio plan in Portfolio Planning Workspace so that you can start to prioritize and align work in the planning perspective of your choice.

Before you begin

Role required: sn_align_core.apw_user or business_stakeholder

Procedure

1. Navigate to **Workspaces > Portfolio Planning Workspace > Portfolio Planning**.
2. Select **New**.
If there are no portfolio plans existing, select **Create your first portfolio plan**. The Create Portfolio plan wizard is shown.
3. Make your selections by using the Create Portfolio plan wizard.

a. Select a lens.

b. For the selected lens, choose the entity type and the desired entities of that type.

The entity type represents the perspective that you plan your work in. For example, if you've chosen the Organization lens, you can select Business Unit as your entity type, and then select the required business units, to plan work from their perspective.

Add filters

Select the relevant planning item types.

Demand

Project

Apply filters to narrow the results for all selected planning item types.

Created ▼ at or after ▼ This year ▼ or and ×

+ New condition set

You can also add multiple conditions to help you set a complex filter and add the right kind of data to your portfolio plan.

c. Select the type of planning items that you want to include in your portfolio plan.

You can further filter the planning item data with additional conditions.

d. Fill in the details of the portfolio plan.

Provide the information of the portfolio plan's name, start and end dates, and description.

You can use the **Previous** and **Next** buttons to navigate between the steps.

4. Select **Create**.

Result

The portfolio plan is created and the page is refreshed to show the Planning page for this new portfolio plan. You can view the list of all portfolio plans that you own or shared with you from the Home page.

Planning items that meet the following criteria appear in the portfolio plan:

- Planning items that belong to one of the entity types selected in Step 3(b)
- Planning items that match the planning item types selected in Step 3(c)
- Planning items with an approved start date or an end date that falls within the portfolio plan timeline
- Planning items that don't have both Approved start and Approved end dates

Note:

If any demands were converted into projects in Project Portfolio Management, only the resulting project planning items (converted from demands) appear in the portfolio plan.

What to do next

- Analyze the backlog and prioritize work for your portfolio plan. See [Prioritizing portfolio plan work in Portfolio Planning](#).
- Roadmap the prioritized work to visualize and track progress of your plans. See [Planning roadmaps in Portfolio Planning](#).
- [Modify a portfolio plan](#).
- Show or hide features for your portfolio plan according to your requirement while sharing a portfolio plan with your stakeholders. See, [Show or hide the features for a portfolio plan](#).
- [Share a portfolio plan with stakeholders](#).

Duplicate a portfolio plan

Create a portfolio plan with the data of an existing portfolio plan. If the portfolio plan you want to create is similar to an existing portfolio plan, duplicating the existing portfolio plan saves your time. You can also copy portfolio plans that were shared with you either with view or edit access.

Before you begin

Role required: sn_align_core.apw_user or business_stakeholder

About this task

The **Duplicate portfolio plan** option copies the selected portfolio plan with its all data (Prioritization and Roadmap) into the portfolio plan. It also preserves all dependencies and relationships among the copied items and their child items.

Procedure

1. Navigate to **Workspaces > Portfolio Planning Workspace > Portfolio Planning**.
2. From the list of portfolio plans, select one.
3. From the portfolio plan header, select the More actions icon () and then select **Duplicate portfolio plan**.
4. On the Duplicate portfolio plan window, fill the details.
 - a. Enter a name for the portfolio plan in the **Portfolio plan name** field.
By default, the name is *ABC (Copy)* where ABC is the name of the portfolio plan you copied from.
 - b. **Optional:** Select **Share with same users and groups** option to grant access to the users of the portfolio plan you copied from.

The action grants the same read and edit access as is the users had for the portfolio plan you copied from.

c. Select **Confirm.**

Result

The new portfolio plan is created and a link is generated on the screen to access the new portfolio plan.

What to do next

- Analyze the backlog and prioritize work for your portfolio plan. See [Prioritizing portfolio plan work in Portfolio Planning](#).
- Roadmap the prioritized work to visualize and track progress of your plans. See [Planning roadmaps in Portfolio Planning](#).
- [Modify a portfolio plan](#).
- Show or hide features for your portfolio plan according to your requirement while sharing a portfolio plan with your stakeholders. See, [Show or hide the features for a portfolio plan](#).
- [Share a portfolio plan with stakeholders](#).

Modify a portfolio plan

Update the details of a portfolio plan in Portfolio Planning Workspace or delete it, to reflect the changes in your planning priorities.

Before you begin

[Create a portfolio plan](#).

Role required: sn_align_core.apw_user or business_stakeholder

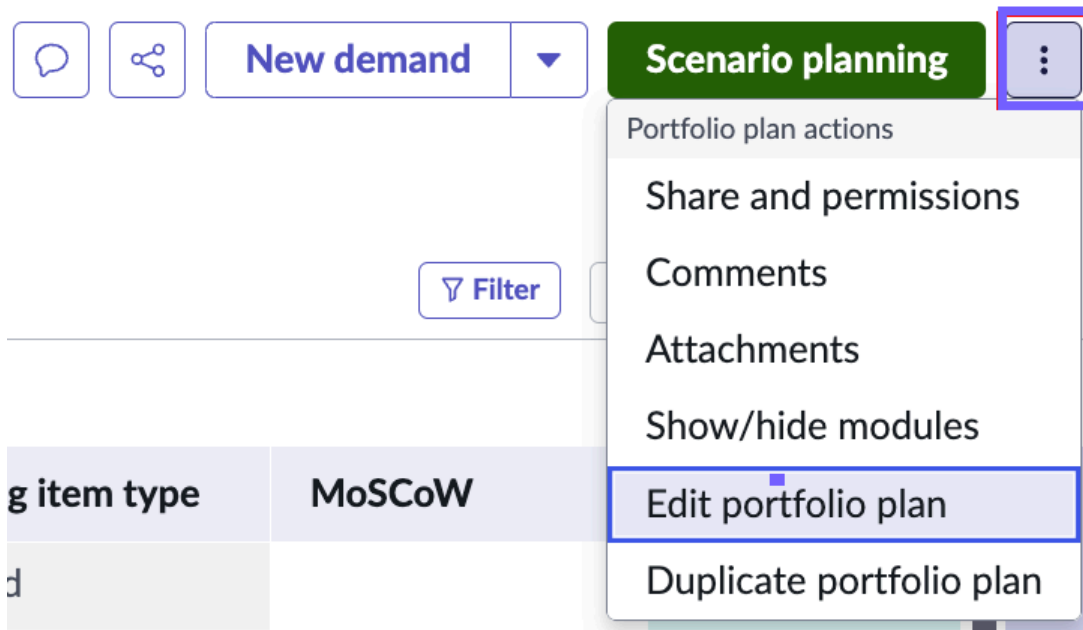

About this task

Note:

Only the owner or editors of a portfolio plan can modify it.

Procedure

1. Navigate to **Workspaces > Portfolio Planning Workspace > Portfolio Planning**.
2. From the list of portfolio plans, select one.
3. From the portfolio plan header, select the More actions icon ().

4. Update the details of the portfolio plan or delete it using the Portfolio plan actions menu.

What to do next

Share your updated portfolio plan or collaborate with other stakeholders.

- Show or hide features for your portfolio plan according to your requirement while sharing a portfolio plan with your stakeholders. See, [Show or hide the features for a portfolio plan](#).
- [Share a portfolio plan with stakeholders](#).
- [Collaborate on portfolio plans](#).

Show or hide the features for a portfolio plan

As a portfolio manager, show or hide the features (for example, Prioritization, Roadmap, and so on) for your portfolio plan as needed so that you can share only the required data with your stakeholders.

About this task

Hiding features for your portfolio plan helps you share only the data that matters to your stakeholders and restrict access to the other data in your portfolio plan.

i Note:

When you [share a portfolio plan with your stake holder](#) providing view access and hiding a feature (for example, Capacity Planning), the viewer can only view the enabled features and can't see the hidden feature (Capacity Planning) in the shared portfolio plan. However, when you share a portfolio plan providing edit access, the editor can enable or hide the features as required and can view and edit any data in the shared portfolio plan.

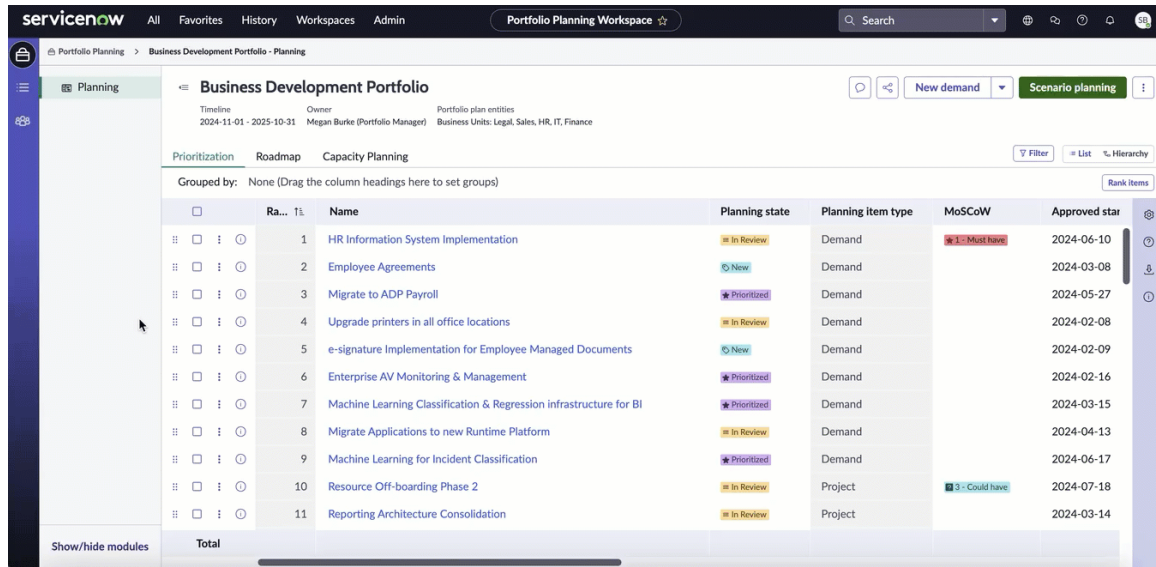

Before you begin

[Create a portfolio plan](#).

Role required: sn_align_core.apw_user or business_stakeholder

Procedure

1. Navigate to **Workspaces > Portfolio Planning Workspace > Portfolio Planning**.
2. From the list of portfolio plans, select the portfolio plan for which you want to show or hide the features.
3. From the left pane of the portfolio plan, select **Show/hide modules**.
4. On the Show/hide modules window, select the features that you want to show and deselect the features that you want to hide.

5. Select **Apply changes**.

Related topics

[Share a portfolio plan with stakeholders](#)

Share a portfolio plan with stakeholders

Share your portfolio plan with stakeholders and other planning managers so that they have visibility into the plan's progress and start collaborating.

Before you begin

- [Create a portfolio plan](#).
- Users or groups that you want to share the portfolio plan with must have the `sn_align_core.ap_read_only` or `sn_align_core.apw_user` role to get the read or edit access to the portfolio plan respectively.

Role required: `sn_align_core.apw_user` or `business_stakeholder`

About this task

Select individual users or groups to share the portfolio with.

When you share a portfolio plan with an individual user or a group, they can access the entire portfolio plan, which includes Prioritization and Roadmap. Also, they can access the Capacity tab in the Planning page if the user has the `sn_align_ws.spw_capacity_user` or `sn_align_ws.spw_capacity_read` role.

Procedure

1. Navigate to **Workspaces > Portfolio Planning Workspace > Portfolio Planning**.
 2. From the list of portfolio plans, select one.
 3. From the portfolio plan header in the Planning page, select the **Share portfolio plan** icon (.
 4. On the Share portfolio plan form, select users to share the portfolio plan with and set their access appropriately.
 - a. In the **Members or Groups** field, enter the names of individual users or groups.
 - b. From the **Access** field, select the access level as **Viewer** or **Editor** for the selected names.
 - An editor can view and change the portfolio plan's settings and data.
 - A viewer can comment and add attachments to the portfolio plan, but cannot modify the portfolio plan's settings or data.
- Note:** Even if a user has the `sn_align_core.apw_user` role, they cannot edit planning item data from the portfolio plan grid view when granted view-only access. However, users with the `sn_align_core.apw_user` role can edit planning items and related tables from the record page.
5. Select **Send invite**.

Result

The selected individual and group users are notified of the portfolio plan sharing through an email.

What to do next

[Collaborate on portfolio plans.](#)

You can change the access level or remove access for a user or a group.

1. On the Share portfolio plan form, select **Manage access**.
2. From the user or group card, select the Action Menu icon (.
3. Select the right access level or select **Remove**.

Related topics

[Modify a portfolio plan](#)

Collaborate on portfolio plans

Add comments and attachments to your portfolio plan so that users can review and share their feedback. Collaborate with stakeholders and drive shared outcomes.

Before you begin

[Create a portfolio plan.](#)

Role required: `sn_align_core.apw_user` or `business_stakeholder`

About this task

Comment on plans and data points, share attachments, and provide feedback from a single place in the workspace to ensure all the stakeholders are in alignment with the business priorities.

The attachments and comments that you add from the portfolio plan's header, they apply to the entire portfolio plan, which includes Prioritization and Roadmap.

Procedure

1. Navigate to **Workspaces > Portfolio Planning Workspace > Portfolio Planning**.
2. From the list of portfolio plans, select one and then select **Planning**.
3. From the portfolio plan header in the Planning page, select the **Comments** icon ()
4. Add comments or attachments to the portfolio plan.

Related topics

[Show or hide the features for a portfolio plan](#)

Prioritizing portfolio plan work in Portfolio Planning

Use the Prioritization feature of the Portfolio Planning Workspace to add, update, and rank planning items so that you can prioritize the right work for the right time.

Views for prioritizing planning items

Prioritization tab in Portfolio Planning represents your backlog, displaying the items of your work pipeline. The Hierarchy tab also represents your backlog, each providing a different view of the same items. For an overview of these views, see [Work prioritization in Portfolio Planning](#) for an overview of these views.

Note:

The Prioritization feature is available only for portfolio plans.

Prioritization features

In each of these views on the Prioritization page, you can perform the following actions:

Add new planning items

Add new items to your backlog directly from the Prioritization page. The type of planning items that you can create here depends on your portfolio plan configuration. See [Add planning items to Prioritization](#).

Update planning item details

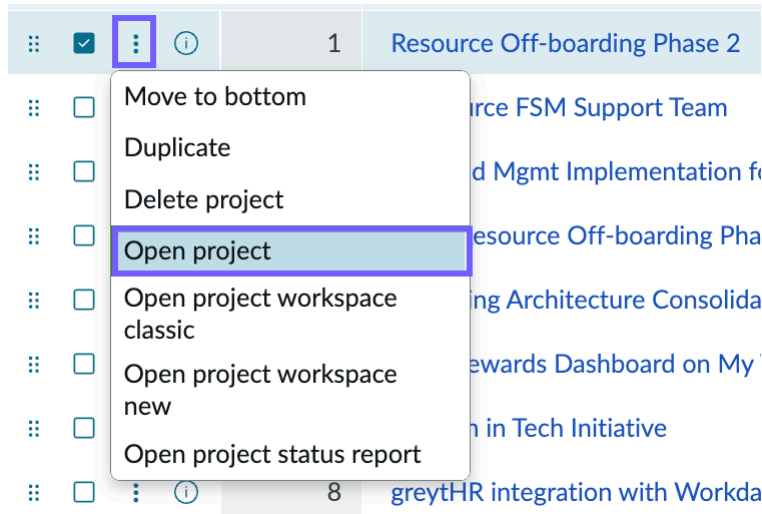

You can edit details of the planning items, add attachments, and collaborate on them with the stakeholders directly from the Prioritization page views to enable smoother real-time backlog grooming.

See [Update planning item details from Prioritization view](#).

Open the planning item in the Execution app

If you're using ServiceNow PPM, Agile Development 2.0, or SAFe applications to execute the planned work, you can open the planning items in their own application. For example, if your planning item is a project, you can navigate to the

project form, project planning console, or project status report directly from the Prioritization page.

Personalize the Prioritization tab view

Change the way that the Prioritization tab is displayed so that you can view the information in the format that you need. See [Personalizing views for prioritization](#).

All settings, such as row and column personalization, grouping, and sorting, are saved as the portfolio plan preferences. So, these settings are applied to all the users or user groups that the portfolio plan is shared with.

Add planning items to Prioritization

Add new planning items to your portfolio plan's work backlog in Portfolio Planning Workspace and ensure that the work pipeline is current.

Before you begin

[Create a portfolio plan](#).

Role required: sn_align_core.apw_user

About this task

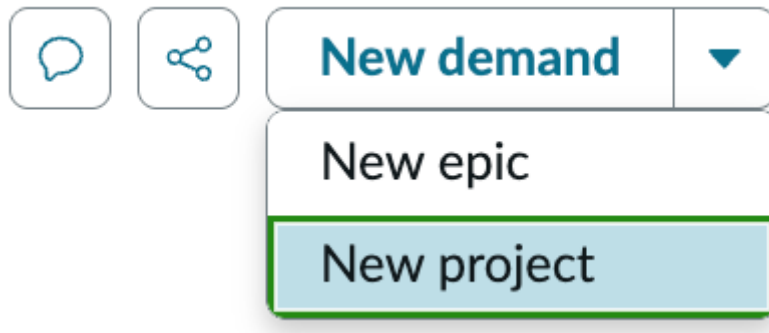

Use the Prioritization tab of your portfolio plan to add new planning items or import them from other ServiceNow execution system such as Project Portfolio Management (PPM).

You can use the List or Hierarchy views while you perform this task.

Procedure

1. Navigate to **Workspaces > Portfolio Planning Workspace > Portfolio Planning**.
2. From the list of portfolio plans, select one and then select **Planning**.
3. From the Prioritization tab, add a new planning item for your portfolio plan.

Use the More options drop-down to select the planning item that you want to create.

4. On the form, fill in the short description and approved dates.
For full field information, see [Demand planning item form](#) or [Project planning item form](#).
5. Select **Submit**.
6. **Optional:** If you're using PPM to execute the planned work, you can also import your work items from the application.
For more information, see [Executing Portfolio Planning work in PPM](#).

Result

The new item is created with its **Planning state** field is set to **New** and the position of the item is based on the view that you are in.

- Prioritization tab: Added to the bottom of the list.
- Hierarchy tab: Added to the appropriate grouping. For example, your selected lens is Organization. Then, the new item is added to the grouping of its department.

What to do next

- [Rank planning items](#).
- [Update planning item details from Prioritization view](#).

Duplicate a planning item

Create a copy of an existing planning item to add it to your portfolio plan's work backlog in Portfolio Planning Workspace and ensure that the work pipeline is current. If the planning item you want to create is similar to an existing planning item, duplicating the existing planning item saves your time.

Before you begin

[Create a portfolio plan](#).

Role required: sn_align_core.apw_user

About this task

Use the Prioritization page of your portfolio plan to add new planning items or import them from other ServiceNow execution system such as Project Portfolio Management (PPM).

Procedure

1. Navigate to **Workspaces > Portfolio Planning Workspace > Portfolio Planning**.
2. From the list of portfolio plans, select one and then select **Planning**.
3. From the Planning page, select **Prioritization** tab.

4. Select the More actions icon () of the planning item that you want to copy and then select **Duplicate**.

The new planning item is created and the item appears right below the planning item you copied from. Also, the rank is updated for the new planning item automatically based on the rank of the planning item you copied from.

By default, the name is *Copy of ABC* where ABC is the name of the planning item you copied from.

5. **Optional:** If you're using PPM to execute the planned work, you can also import your work items from the application.

For more information, see [Executing Portfolio Planning work in PPM](#).

What to do next

- [Rank planning items](#).
- [Update planning item details from Prioritization view](#).
- [Personalizing views for prioritization](#).

Update planning item details from Prioritization view

Update the details of your planning items or delete them so that the Prioritization page in Portfolio Planning Workspace reflects the latest work pipeline.

Before you begin

Role required: sn_align_core.apw_user

About this task

Update the details of a planning item using the Prioritization and Hierarchy tabs in the portfolio planning page. Edit the details inline from the grid view to facilitate smoother real-time backlog grooming. Use the full details page of the planning item to add attachments and collaborate on them with the stakeholders.

Procedure

1. Navigate to **Workspaces > Portfolio Planning Workspace > Portfolio Planning**.
2. From the list of portfolio plans, select one and then select **Planning**.
3. Update item details, attach files to the item, or delete the item.

Information of certain columns that aren't editable in the full details page, can't be edited inline too. For example, planned cost and planned benefit. These cells are visually differentiated using grey color as their background.

If you group the Prioritization items list by any attribute, you can't edit the short description of the items directly from the grid view.

Rank planning items

Rank the planning items that are added to the pipeline of your portfolio plan and decide on their priority so that you can start planning your portfolio roadmap.

Before you begin

- [Create a portfolio plan.](#)
- Ensure that the planning items in the Prioritization tab are sorted by the Rank column in ascending order.

Role required: sn_align_core.apw_user

About this task

Use the Prioritization tab to stack-rank the planning items of your portfolio plan.

Within the ServiceNow system, all the planning items are assigned a global rank. Reorder the items in the Prioritization tab to change their rank and update their planning state. If you decide to include a planning item into your roadmap schedule, mark its Planning State as **Prioritized** to add it to the roadmap directly from the Prioritization tab.

The Rank column helps you quickly identify the rank of an item relative to the other items in the backlog. This information is useful to determine the top-ranked items from a long list of planning items. When there's no custom grouping or sorting, the planning items are sorted by their rank, and you can reorder the rows.

Note:

Reordering of rows is not allowed if the planning items are already grouped or sorted by any other attribute. Remove the grouping or sorting to reorder rows.

Procedure

1. Navigate to **Workspaces > Portfolio Planning Workspace > Portfolio Planning.**
2. From the list of portfolio plans, select one and then select **Planning.**
3. From the Prioritization tab, rank the planning items according to your priority by rearranging their order.

Repeat this step until the ranking of the planning items align with your business priorities. To get better visibility of data that you need:

- Sort or group the list by the required columns. See [Personalize Prioritization view.](#)
- Filter the planning items. See [Apply quick filters for Prioritization and Roadmap data in Portfolio Planning.](#)

Tip:

Using the Row context menu (), you can also assign the highest and lowest ranks to the planning items using the **Move to top** and **Move to bottom** options respectively.

Result

The rank of the item is automatically updated and can be seen from the Rank column. The Rank column is read-only.

Prioritize work

Review and prioritize the items of your portfolio plan pipeline to add them to the plan's roadmap so that your teams can start working on them.

Before you begin

- [Create a portfolio plan.](#)
- Ensure that the planning items in the Prioritization page are sorted by the Rank column in ascending order.

Role required: sn_align_core.apw_user

About this task

Review and prioritize the items in the Prioritization or Hierarchy tab views during your grooming sessions. You can use the MoSCoW values assigned to an item to help you decide the priority of work.

Procedure

1. Navigate to **Workspaces > Portfolio Planning Workspace > Portfolio Planning.**
2. From the list of portfolio plans, select one and then select **Planning.**
3. From the Prioritization or Hierarchy tab, mark a planning item as In Review or Prioritized.

Once you mark a planning item as **Prioritized**, it is automatically added to your portfolio roadmap, based on the values in the **Approved start date** and **Approved end date** fields.

- If the dates fall within the portfolio planning period, then the item is displayed on the roadmap.
- If either of the date fields is empty, then the item is added to the **Unscheduled items** list of the roadmap.

Note:

Your roadmap shows only those items that have Planning state set to **Prioritized**.

If you've marked an item as **Done** or **Cancelled**, that item is not displayed on the Prioritization page by default. You can update the filter on the Planning state column to show the items that are completed or cancelled.

4. **Optional:** From the Prioritization tab, you can update the planning state of multiple items at once.

- a. Select the **Planning state** cell of one of the rows that you want to update.
- b. Press and hold the **Ctrl** key (for Windows OS) or **command** key (for Mac OS), and select the **Planning state** cells of the other rows that you want to update.
- c. Double-click one of the selected cells and choose a state.

Short description	Planning state
New Benefit Tracking Page	★ Prioritized
HR service - Benefits - Category re	★ Prioritized
Employee on-boarding process imp	New
Contingent Worker Onboarding	New
Workday Patent Awards Setup	New
Integrate HR Portal with Training A	New
Employee Off-boarding Process Irr	New
New Hire Surveys	New
HR service: ManageNow Implemer	New

(Optional)

Categorize planning items using tags

Categorize your planning items based on your requirement by adding tags.

Before you begin

[Create a portfolio plan.](#)

Role required: sn_align_core.apw_user

About this task

Tags enable you to categorize planning items. You create the tag name, which should name the reason for the tag. You can make the tags visible to everyone, some people, or just yourself. The visibility setting specifies who can use the tags to search for planning items.

Any tagging additions or removals made to a planning item are automatically synced across all views in the Planning page and in the Scoring page. After tagging planning items, you can use the tags to search for planning items using the **Filter** option () in the List view of Prioritization and in the Scoring page.

Procedure

1. Navigate to **Workspaces > Portfolio Planning Workspace > Portfolio Planning**.
2. From the list of portfolio plans, select one and then select **Planning**.
3. From the List view of Prioritization, add a tag for a planning item using one of the following options.

Note:

The tag visibility setting defaults to private, which means the tag is only visible to the user who created the tag. So, only the user who created the tag can use the tag to search for planning items labeled with that tag.

- To change the visibility setting of the tag, on the Details page of the planning item, select the tag and change the **Viewable by** setting.

Edit Tag
×

Tag name

Viewable by

Me ▾

Save

Option	Description
Me	Tag is visible only to the person who created the tag. Only the user who created the tag can use the tag to search for planning items labeled with that tag. This setting is the default.
Groups and Users	Tag is visible to specific groups or users. You can specify the groups and users who can view this tag.
Everyone	<p>Tag is visible to everyone.</p> <p>Note: This visibility setting is only available to an admin or tags_admin role.</p>

A planning item can have multiple tags and each can have a different visibility setting.

- To remove a tag from a planning item, double-click the cell in the Tag column on the List view or select the filled tag icon () on the Details page of the planning item to open the list of tags, then select the **X** next to the tag you want to remove.

Personalizing views for prioritization

Personalize how the Prioritization and Hierarchy tabs on the Planning page are displayed in Portfolio Planning Workspace so that you can view the information that is most relevant to you and your stakeholders.

Personalize Prioritization view

Group and sort the planning items by the attributes of your choice, and customize the displayed columns to facilitate effective grooming.

Personalize Hierarchy view

Modify the views based on the lens to learn how work in the current portfolio plan relates to other lenses and gain better visibility into roll-ups of finances and schedules.

Personalize Prioritization view

Personalize the Prioritization tab view in the Planning page in the workspace so that you can view the information that is most relevant to you and your stakeholders.

Before you begin

Create a portfolio plan

Role required: sn_align_core.apw_user

About this task

This task provides guidance on different options to personalize the Prioritization view of the Planning page.

Personalization preferences are saved as the portfolio plan's settings in Portfolio Planning. So, these settings are applied to all the users or user groups that the portfolio plan is shared with.

Procedure

1. Navigate to **Workspaces > Portfolio Planning Workspace > Portfolio Planning**.
2. From the list of portfolio plans, select one and then select **Planning**.
3. Use the Personalize side panel to update the display of rows and columns on the page.

a. Select the Personalize icon ()

b. From the Columns section, select the columns that you want to see or hide the data of.

You can reorder the columns here to change their display order on the backlog.

If you want additional columns to be available in this page, your admin can configure them. See [Configuring additional columns for Prioritization page in Portfolio Planning](#).

c. From the Rows section, choose how the rows are displayed, using the **Shade alternate rows** toggle.

4. Group your items by one or multiple columns that are on display in the Prioritization page.

You can group the planning items by an attribute of the type choice or reference. Some examples to group by are Planning state, Planning item type, Owner, and Primary goal.

Use one of the following ways to group the planning items. Repeat the action to group the list by multiple attributes.

5. Sort the planning items by any column, by clicking the column name.

For example, you can sort the items by **Approved start date**.

6. Filter the planning items by an attribute.

a. For the column that you want to filter, select the Column actions icon ()

b. Select **Filter**.

c. Select or type the filter that you want to apply.

For example, you can have the list to show only **New** items, by filtering the **Planning state** column. Other examples to filter by are the item's planning state, primary goal, or priority.

Note:

You can filter only on those attributes that are of the type choice, string, or reference.

7. Pin columns to the left or right of the list.

a. For the column that you want to pin, select the Column actions icon ()

b. From the Pin column section, select **Pin to left** or **Pin to right**.

The default selection is **Unpin**.

8. Adjust the width of the columns as per choice or set the width to autofit. Hold and drag the column border to adjust its width. You can set the column width to autofit using the **Autofit this column** or **Autofit all columns** options from the Column actions ().
9. Reset columns to default settings by selecting **Reset columns** from the Personalize menu ().

Selecting this option reverts the column personalization, grouping, and sorting to default settings.

Personalization settings that you've made so far on the Prioritization page would be cleared. Any personalization that you make after this point is set as the new preference for the portfolio.

10. Apply quick filters for Prioritization and Roadmap data in Portfolio Planning

Personalize Hierarchy view

Personalize the Hierarchy view in the Planning page of Portfolio Planning Workspace so that you can view the information that is most relevant to you and your stakeholders.

Before you begin

[Create a portfolio plan.](#)

Role required: sn_align_core.apw_user

About this task

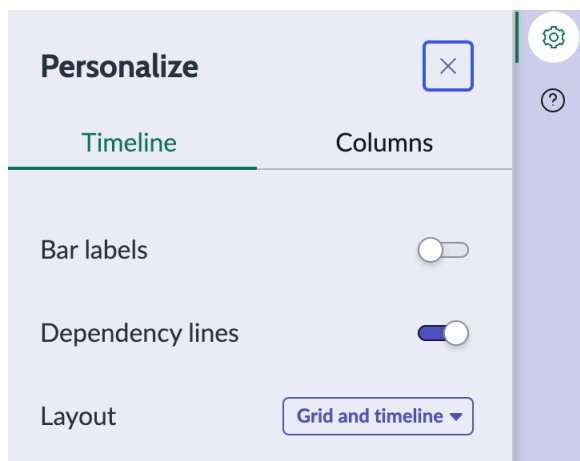

Sort the planning items by an attribute of your choice and use the Personalize side panel to customize the display of the columns.

Personalization preferences are saved as the portfolio plan's settings in Portfolio Planning. So, these settings are applied to all the users or user groups that the portfolio plan is shared with.

Procedure

1. Navigate to **Workspaces > Portfolio Planning Workspace > Portfolio Planning.**
2. From the list of portfolio plans, select one and then select **Planning.**
3. Personalize the timeline view and the columns on the grid view using the Personalize side panel.
 - a. Select the Personalize icon ().

The personalize side panel opens.

- b. From the Timeline section, toggle the display of item names and dependency lines.
You can also choose to update the layout. Select Grid and timeline view, Grid view, or just the Timeline view.
 - c. From the Columns section, update the planning item fields that are displayed in the grid view.
Select the necessary columns and click **Apply**.
4. Sort the planning items by any column, by clicking the column name.
For example, you can sort the items by **Approved start date**.
 5. [Apply quick filters for Prioritization and Roadmap data in Portfolio Planning](#)

Export data of portfolio plan items from Prioritization to Excel or CSV

Export the data of portfolio plan items from your portfolio plan into a Microsoft Excel or CSV file. You can share this data and collaborate with your business stakeholders.

Before you begin

Role required: sn_align_core.apw_user

Procedure

1. Navigate to **All > Strategic Planning > Strategic Planning Workspace > Portfolio Planning**.
2. From the list of portfolio plans, select one and then select **Planning**.
3. In the Prioritization tab, select **List** view.
4. Verify that the columns you want to export are personalized.

Note:

If the filters are applied on the view, the filtered data is exported.

5. Use the personalized side panel to export the data of your portfolio plan items.

a. Select Export icon ()

b. From the **File type** drop-down on the Export window, select **Excel** or **CSV** to export the data to a Microsoft Excel or CSV file respectively.

A file with the selected format is exported. By default, the name of the file is

ABC_Prioritization_List where ABC is the name of the portfolio plan you exported the data from.

Planning roadmaps in Portfolio Planning

Create a layout of the plans for upcoming projects or initiatives while aligning them with your business objectives using roadmaps in a centralized workspace. Facilitate collaboration among stakeholders and adjust plans on the go.

Roadmaps in Portfolio Planning Workspace are of two types: Portfolio plan roadmaps and free-form roadmaps.

For portfolio plans, only those planning items that are prioritized from the Prioritization page are shown on the roadmap. See [Prioritize work](#).

Use the information in the following sections to start using roadmap capabilities for your business plans.

Related topics

[Roadmaps in Portfolio Planning](#)

Create a free-form roadmap

Create a standalone visual roadmap to start high-level planning of work from different units of the company.

Before you begin

Role required: sn_align_core.apw_user

About this task

Create a standalone roadmap to plan work across multiple units of your organization, such as projects of all departments. To learn more about free-form roadmaps, see [Roadmaps in Portfolio Planning](#).

Select a source table as a starting point to base your roadmap on. Select one of project or demand for a simple roadmap or Planning Item table for a hybrid roadmap.

Procedure

1. Navigate to **Workspaces > Portfolio Planning Workspace > Portfolio Planning > Free-form Roadmaps**
2. Select **New**.
If this is the first free-form roadmap in your ServiceNow® instance, select **Create your first free-form roadmap**.
3. Use the Create free-form roadmap wizard to fill out the details of your roadmap.

- a. Select a source table to base your roadmap on.
- b. Add conditions to filter the data from the source table.

For example, if your source table is **Project**, the related filter condition can be **Business Unit is Finance AND Active is true**.

- c. Enter details of the name and planned dates for the roadmap.

Note:

The start and end dates for your roadmap act as a date range filter for all the items displayed in the roadmap.

4. Select **Create**.

Result

- A new roadmap is created and displayed.
- This roadmap is listed in the **Free-form roadmaps** tab of the home page of Portfolio Planning Workspace.

What to do next

- Update, personalize, and collaborate with your roadmap.
- Add milestones or create dependencies for the items planned on your roadmap.

Update details of free-form roadmap

Update the details of a free-form roadmap to reflect the changes in priorities or the timeline of the roadmap.

Before you begin

[Create a free-form roadmap.](#)

Role required: sn_align_core.apw_user

Procedure

1. Navigate to **Workspaces > Portfolio Planning Workspace > Portfolio Planning > Free-form Roadmaps**
2. Select a roadmap to open it.
3. From the roadmap header, select the More actions icon ().
4. Use the Update free-form roadmap wizard to edit out the details of your roadmap.
5. Select **Update**.

Result

The roadmap is updated and the roadmap items are displayed according to the latest changes.

Share a free-form roadmap with stakeholders

Add people from your organization who are the stakeholders for the work involved in your roadmap plan so that they have visibility into the roadmap's progress.

Before you begin

- [Create a free-form roadmap.](#)
- Ensure that the users that you add as stakeholders have the appropriate role to access the roadmap. For more details on user roles, see [Components installed with Portfolio Planning](#).

Role required: sn_align_core.apw_user

About this task

Grant access for the free-form roadmap to other users and stakeholders in your organization.

Procedure

1. Navigate to **Workspaces > Portfolio Planning Workspace > Portfolio Planning > Free-form Roadmaps**
2. Select a roadmap to open it.
3. From the roadmap header, select the **Share roadmap** icon ().
4. On the Share roadmap form, select users to share the roadmap with and set their access appropriately.
 - a. In the **Members or Groups** field, enter the names of individual users or groups.
 - b. From the **Access** field, select the access level as **Viewer** or **Editor** for the users selected.

- An editor can view and change the roadmap's settings and data.
- A viewer can only comment or add attachments. They can't change any settings or data.

5. Select **Send invite**.

What to do next

Change the access level or remove access for a user or a group.

1. On the Share roadmap form, select **Manage access**.
2. From the user or group card, select the action menu icon (⋮).
3. Select the right access level or select **Remove**.

Collaborate on a free-form roadmap with stakeholders

Add comments and attachments to a free-form roadmap for other users of your organization can review and share their feedback. Collaborate and ensure that your roadmap aligns with your company's priorities.

Before you begin

Role required: sn_align_core.apw_user or sn_roadmap_plng.roadmap_editor

About this task

Using the Comments side panel, add attachments or notes at the roadmap-level or the planning item-level.

Procedure

1. Navigate to **Workspaces > Portfolio Planning Workspace > Portfolio Planning > Free-form Roadmaps**
2. Select a roadmap to collaborate on.
3. Select the appropriate tab at the roadmap-level or planning item-level.
4. Add attachments or worknotes.

Managing free-form roadmap views

Portfolio managers can create customized views for their free-form roadmap by applying personalization settings such as grouping, milestones selection, dependencies selection, and tracking mode. Portfolio owners or editors can share these personalized views with stakeholders to enable easier collaboration on the free-form roadmaps.

Benefits of free-form roadmap views

Portfolio managers can create personalized views as needed by applying settings such as grouping, milestones selection, dependencies selection, and tracking mode.

- Views can be created as private or public.
- Can create up to three private views and up to 10 shared (public) views.
- Free-form roadmap views can be shared with stakeholders to enable collaboration on the free-form roadmap.
- Switch between shared and private views as needed.

Create a free-form roadmap view

Create a customized free-form roadmap view based on your requirements, so you can access it when you log in again and share it with stakeholders for collaboration.

Before you begin

Role required: sn_align_core.ap_read_only

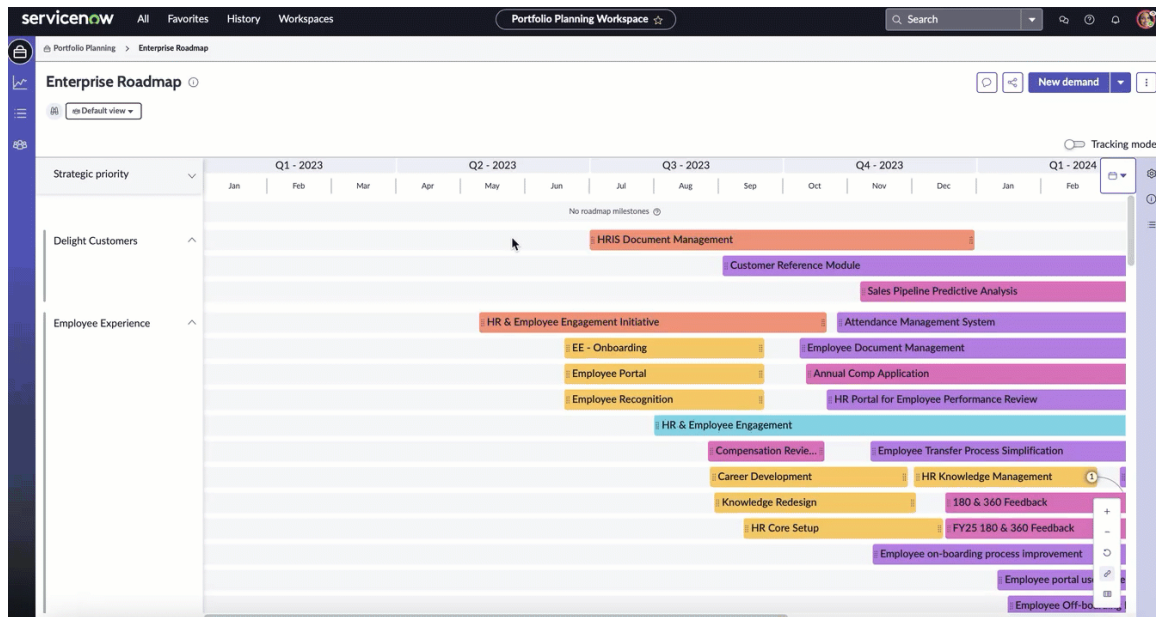

About this task

You can create up to three private views and up to 10 shared (public) views per free-form roadmap.

Procedure

1. Navigate to **Workspaces > Portfolio Planning Workspace > Portfolio Planning > Free-form Roadmaps**
2. Select a free-form roadmap to open it.
3. Change the view as needed.
For example, you can enable the **Tracking mode** toggle.

The **Save as new view** option appears on the free-form roadmap header.

4. From the free-form roadmap header, select **Save as new view**.
5. On the Save as new view window, fill the details.
 - a. Enter a name for the view in the **View name** field.
 - b. **Optional:** Select the **Shared view** toggle to make this view public.
Selecting the **Shared view** toggle makes the view visible to all stakeholders with whom this free-form roadmap is shared.
 - c. Select **Save**.

Result

The shared view for the free-form roadmap is created and is visible to all stakeholders with whom this free-form roadmap is shared.

What to do next

- Share the free-form roadmap with your stakeholders to start collaborating on the free-form roadmap. See [Share a free-form roadmap with stakeholders](#).
- Edit a free-form roadmap view to change the existing view. See [Edit a free-form roadmap view](#).

Edit a free-form roadmap view

Edit a customized free-form roadmap view based on your requirements, so you can access it when you log in again and share it with stakeholders for collaboration.

Before you begin

Role required: sn_align_core.ap_read_only

About this task

- Only the owner of a free-form roadmap view can edit a shared (public) view.
- You can have up to three private views and up to ten shared (public) views per free-form roadmap.

Procedure

1. Navigate to **Workspaces > Portfolio Planning Workspace > Portfolio Planning > Free-form Roadmaps**

2. Select a free-form roadmap to open it.

3. From the free-form roadmap header, select the view you want to edit or override with your personalization settings from the list of available free-form roadmap views. The selected view appears.

4. Make changes to the view as needed.
For example, enable **Tracking mode** toggle.

After you make any change to the view, the Save view option appears in the free-form roadmap header.

5. Select **Save view**.
The view is updated to reflect the changes made.

6. **Optional:** To edit the name of the view, select the Free-form roadmap drop-down from the free-form roadmap header and then select the Edit view icon () next to the view you want to edit the name for.
On the Edit view window, fill the details.

a. Update the name for the view in the **View name** field as required.

Note:

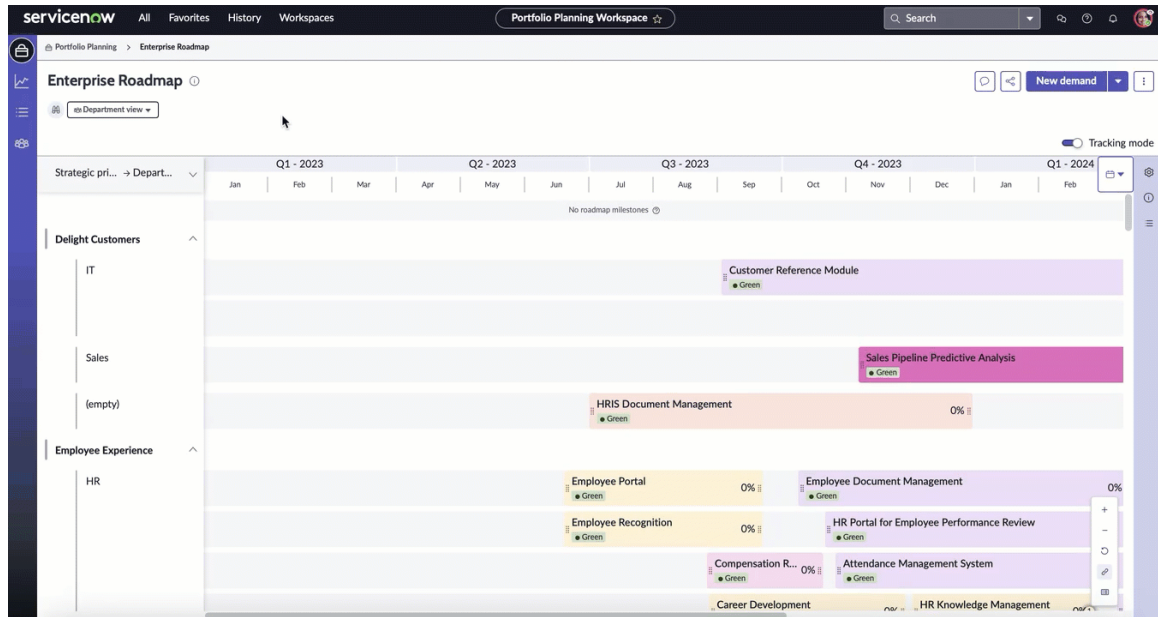

Only the owner of the free-form roadmap view can rename the view.

b. **Optional:** Select the **Shared view** toggle to make this view public or disable the **Shared view** toggle to make the view private.

Important:

Changing a shared view to a private view removes access for existing stakeholders.

c. Select Save.

What to do next

Share the free-form roadmap with your stakeholders to start collaborating on the free-form roadmap. For more information, see [Share a free-form roadmap with stakeholders](#).

Related topics

[Create a free-form roadmap view](#)

[Delete a free-form roadmap view](#)

Delete a free-form roadmap view

Delete a customized free-form roadmap view if it is no longer needed or if the maximum limit of ten shared or three private views has been reached.

Before you begin

Role required: sn_align_core.ap_read_only

About this task

- Only the owner of the free-form roadmap view or an editor of the free-form roadmap can delete the view.
- Deleting a free-form roadmap deletes the view, including any changes made to the view. However, this action keeps the items (projects, demands, epics) intact in the free-form roadmap.
- You can have up to three private views and up to ten shared (public) views per free-form roadmap.

Procedure

1. Navigate to **Workspaces > Portfolio Planning Workspace > Portfolio Planning > Free-form Roadmaps**
2. Select a free-form roadmap to open it.
3. Select the Free-form roadmap view drop-down from the free-form roadmap header and then select the Delete view icon (🗑️) next to the view you want to delete.

The Delete this view window appears.

4. On the Delete this view window, select **Delete.**

Related topics

[Create a free-form roadmap view](#)

[Edit a free-form roadmap view](#)

Duplicate a free-form roadmap

Create a roadmap with the data of an existing roadmap. If the roadmap you want to create is similar to an existing roadmap, duplicating the existing roadmap saves your time.

Before you begin

Role required: sn_align_core.apw_user

About this task

Create a standalone roadmap to plan work across multiple units of your organization, such as projects of all departments. To learn more about free-form roadmaps, see [Roadmaps in Portfolio Planning](#).

Procedure

1. Navigate to **Workspaces > Portfolio Planning Workspace > Portfolio Planning > Free-form Roadmaps**
2. Select a roadmap that you want to create a copy from.
3. From the roadmap header, select the More actions icon () and then select **Duplicate roadmap**.
4. On the Duplicate roadmap window, fill the details.
 - a. Enter a name for the roadmap in the **Roadmap name** field.
By default, the name is *ABC (Copy)* where ABC is the name of the roadmap you copied from.
 - b. **Optional:** Select **Share with same users and groups** option to grant access to the users of the roadmap you copied from.

The action grants same read and edit access as is the users had for the roadmap you copied from.

c. Select **Confirm**.

Result

- A new roadmap is created and a link is generated on the screen to access the new roadmap.
- This roadmap is listed in the **Free-form roadmaps** tab of the Home page of Portfolio Planning Workspace.

What to do next

- Update, personalize, and collaborate with your roadmap.
- Add milestones or create dependencies for the items planned on your roadmap.

Create planning items from roadmap view

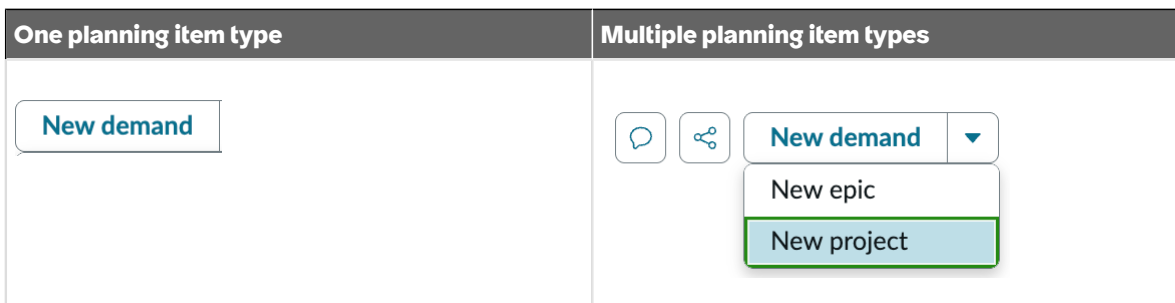

Create and add new planning items to your portfolio roadmap or free-form roadmap directly from the roadmap view.

Before you begin

Role required: sn_align_core.apw_user

Procedure

1. Navigate to **Workspaces > Portfolio Planning Workspace > Portfolio Planning** and open your roadmap.
2. From the roadmap view, select the **New <item type>** option.
 - For a free-form roadmap, the option depends on the roadmap's source table.
 - For a portfolio plan roadmap, the option depends on the portfolio plan settings.

3. On the form, fill in the required field information.
For full field information, see [Demand planning item form](#) or [Project planning item form](#).
4. Select **Submit**.

Result

The new item appears on the roadmap, at a place based on its approved start and end dates.

If you don't fill both the approved start and end date fields, the item that you created would be moved to the list of unscheduled items. You can add them to your roadmap plan later. For more information, see [Plan unscheduled items into roadmap](#).

Modify planning items from roadmap

Update the details of planning items or delete them from a portfolio plan or free-form roadmap so that your roadmap reflects the latest plans.

Before you begin

Role required: sn_align_core.apw_user

About this task

Edit the details of planning items from a side panel view, or the full details view in the roadmap.

Procedure

1. Navigate to **Workspaces > Portfolio Planning Workspace > Portfolio Planning** and open your roadmap.

2. From the roadmap view, select a planning item that you want to update or delete.

The side panel opens with the Details tab.

Further, you can select **Full details** and open the item's record page. On the full details page, you can also view related lists such as Milestones, Dependencies, and others. For field information, see [Demand planning item form](#) or [Project planning item form](#).

i Note:

If your free-form roadmap was built on one of the PPM tables, such as project [pm_project] or demand [dmn_demand], you can only make updates from the full details page.

3. Update the details or delete the item.

- To update, edit the field details and select **Update**.

If you're on the full details page, select **Save**.

- To delete, do the following:

a. On the full details page, select the More Actions icon () and select **Delete**.

b. Select **OK** to confirm.

Plan unscheduled items into roadmap

Add items without start or end dates yet to your portfolio plan or free-form roadmap.

Before you begin

Role required: sn_align_core.apw_user

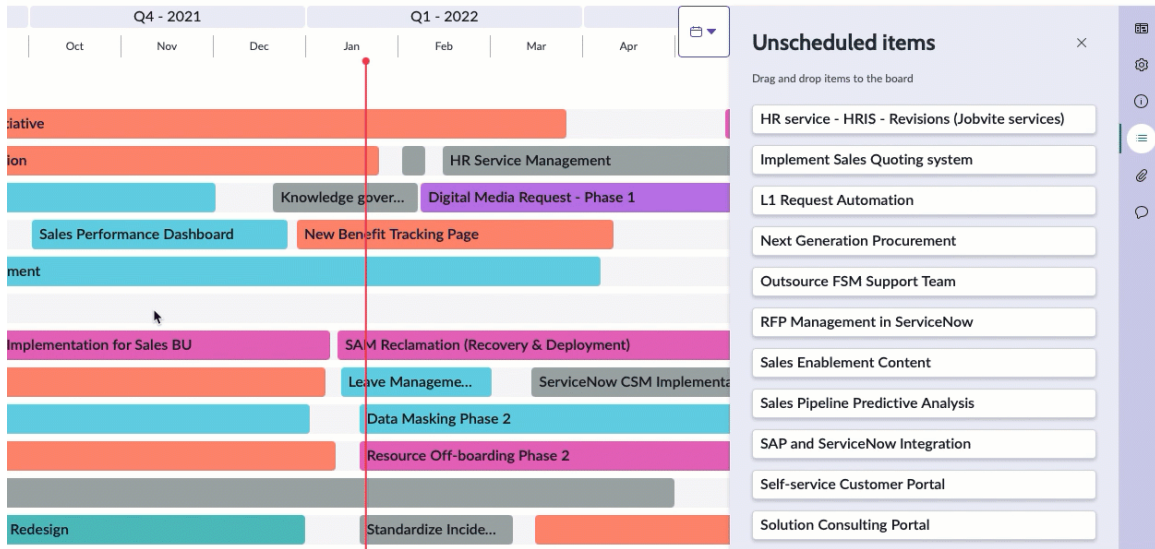

About this task

Planning items that meet the criteria of your portfolio plan or free-form roadmap, but don't have either the start or end dates are categorized as unscheduled items. As you progress in your planning, use the unscheduled items list to schedule these items into your roadmap timeline.

Procedure

1. Navigate to **Workspaces > Portfolio Planning Workspace > Portfolio Planning** and open your roadmap.

- From the sidebar, select **Unscheduled items** (☰).
- From the list of unscheduled items in the side panel, drag and drop a planning item at a place of your choice on the roadmap.

Reschedule roadmap items

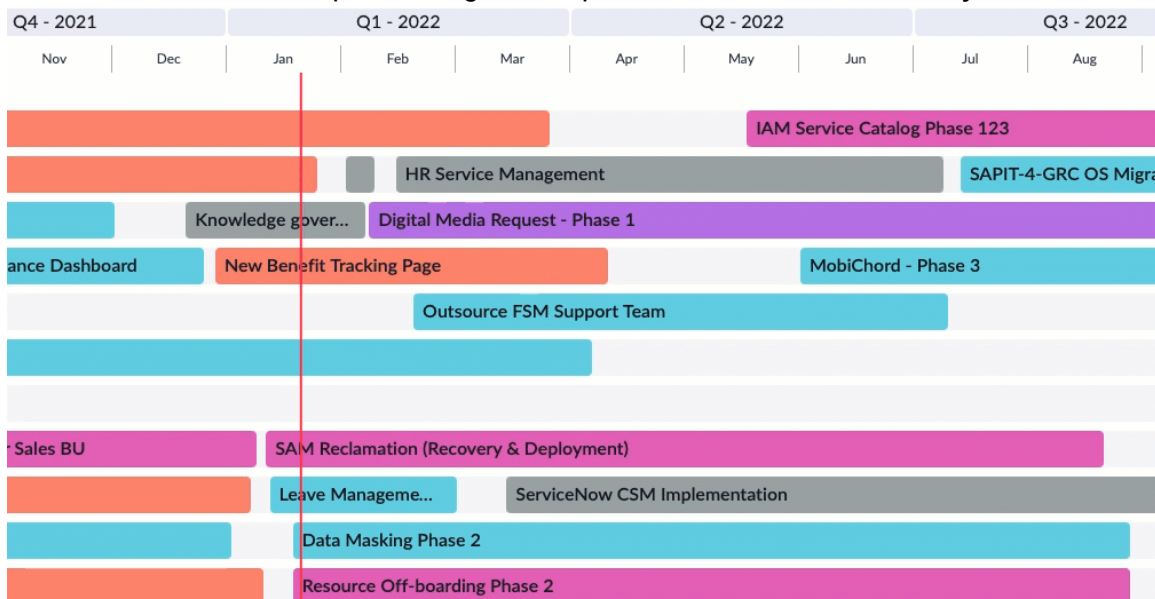

Update the planned dates of your roadmap items to account for any changes in your scheduling priorities.

Before you begin

Role required: sn_align_core.apw_user

Procedure

- Navigate to **Workspaces > Portfolio Planning Workspace > Portfolio Planning** and open your roadmap.
- To change the dates planned for a roadmap item, resize the roadmap item bar.
- To reschedule the roadmap item, drag and drop the item to a timeline area of your choice.

Add milestones for roadmap

Track key dates of your plan's timeline by creating milestones and displaying them on the roadmap.

Before you begin

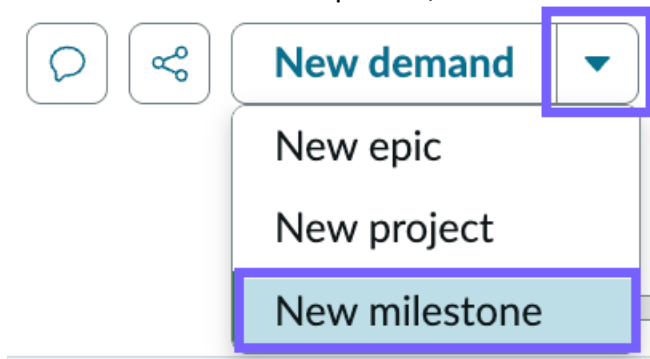

Role required: sn_align_core.apw_user

About this task

For the timeline of your portfolio plan or free-form roadmap, create milestones such as launch dates, deadlines, or other key events directly from the roadmap view.

Procedure

1. Navigate to **Workspaces > Portfolio Planning Workspace > Portfolio Planning** and open your roadmap.
2. From the More actions drop-down, select **New milestone**.

3. On the form, fill in the fields.

For field information, see [Roadmap milestone form](#).

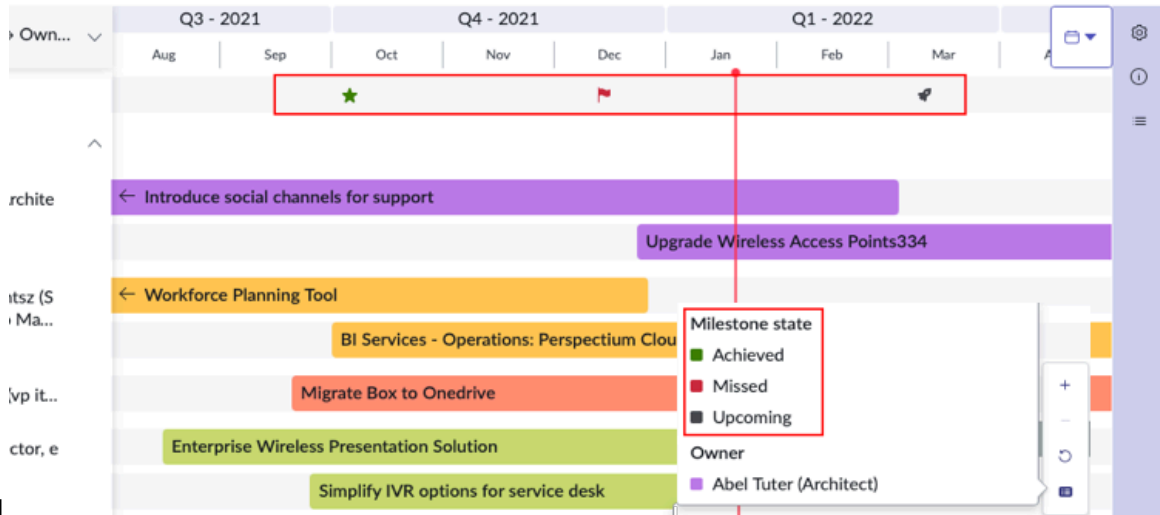

4. Select **Submit**.

5. **Optional:** Repeat steps 2 through 4 to add more milestones to your roadmap.

Result

Milestones that you created are visible on the roadmap.

Here is an image of a sample roadmap with the milestone bar showing different milestones for the planning

period.

The color of the milestone, shown on the legend, indicates the status of the milestone.

- Red: Missed milestone.
- Green: Achieved milestone.
- Grey: Upcoming milestone.

If multiple milestones are scheduled close to each other, they might appear grouped in the milestone bar. In this case, you can expand and collapse the milestone bar to view all the milestones of that period.

Update a roadmap milestone

Update or delete the milestones that you added to your portfolio plan or free-form roadmap so that they reflect any change of plans.

Before you begin

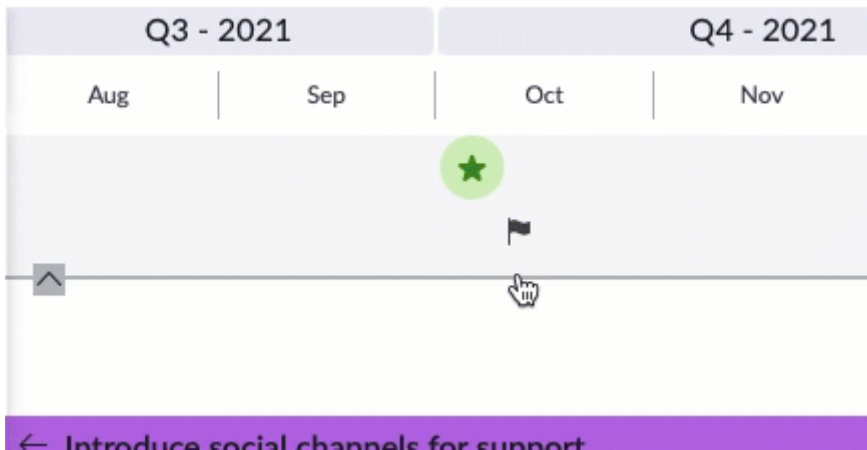

[Add milestones for roadmap.](#)

Role required: sn_align_core.apw_user

Procedure

1. Navigate to **Workspaces > Portfolio Planning Workspace > Portfolio Planning** and open your roadmap.

2. To reschedule a milestone, you can drag and drop it at a timeline area of your choice.

If you want to update other details or delete the milestone, proceed with the following steps.

3. From the roadmap view, click the milestone that you want to update. The side panel opens showing the milestone details.

4. Update or delete the milestone.

- To update, edit the field details and click **Save**.

For information on the form fields, see [Roadmap configuration form](#).

- To delete the milestone, click **Delete**.

Select **OK** to confirm.

Add milestones for roadmap items

Track key outcomes of your planning items (such as demands and projects) by creating milestones for them, directly from the roadmap view.

Before you begin

Role required: sn_align_core.apw_user

About this task

Select a roadmap item and create a milestone for it. Use the roadmap side panel to fill in the details and submit.

For free-form roadmaps, milestones are supported only if the source table is Planning Item [sn_align_core_planning_item] or one of its extensions.

i Important:

You can't add a project milestone from the roadmap view. Creating or updating project milestones may impact the associated project plans. So, it's recommended to create or update project milestones using Project Workspace in Project Portfolio Management (PPM).

However, any existing milestones of the project are visible on the roadmap if you've integrated [Portfolio Planning with Project Portfolio Management](#).

Procedure

1. Navigate to **Workspaces > Portfolio Planning Workspace > Portfolio Planning** and open your roadmap.

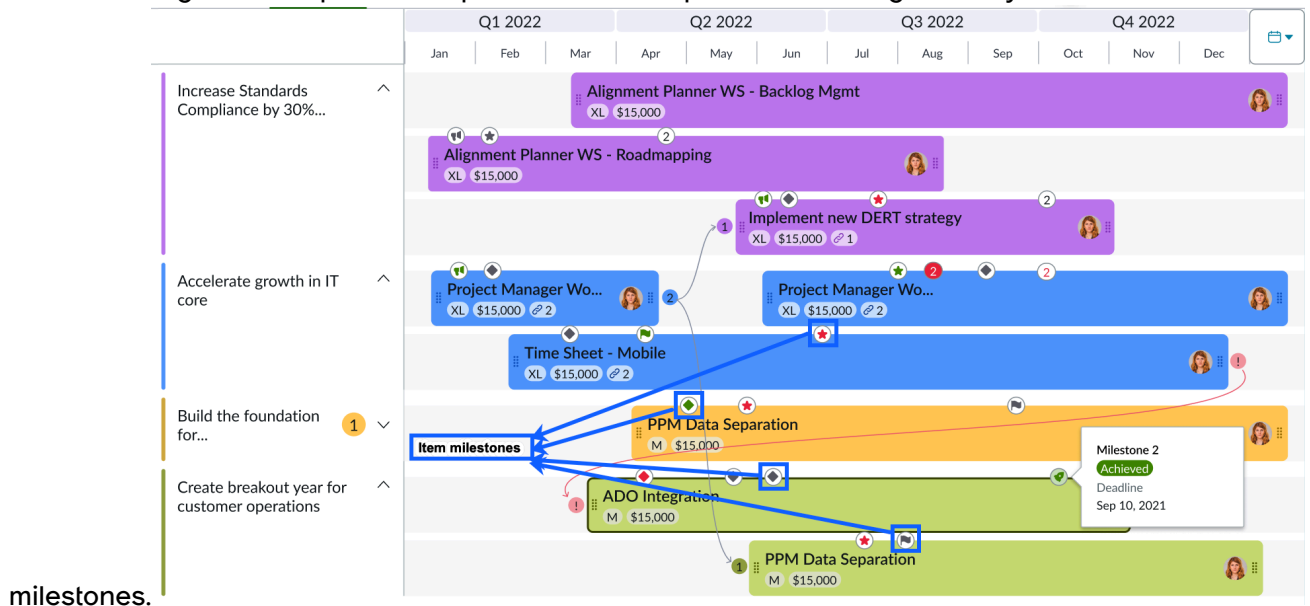

2. From the roadmap view, click a planning item to which you want to add the milestone.
The side panel opens showing the item details.
3. Select the Milestones tab.
Alternatively, you can click **Full details** and select the Milestones tab from the full details page.
4. Select the Add milestone icon (+).
If the item doesn't have any milestones, select **New milestone**.
5. On the form, fill in the fields.

For field information, see [Planning item milestone form](#).
6. Select **Save**.
When you go back to the Milestones tab, you can see the milestone listed there.
7. **Optional:** Repeat steps 2 through 6 to add more milestones to your items.

Result

- Milestones that you created are indicated on the roadmap item bars.

Here's an image of a sample roadmap with the roadmap items indicating that they have

- Pointing your cursor over these milestone indicators shows the details such as the milestone name, type, and due date.
- Clicking one of these indicators opens the Milestones tab of the Item details side panel. Here, you can see a list of all the milestones for this planning item.

What to do next

Learn more about managing milestones:

- [Customizing milestone display on roadmap](#)
- [Item milestone errors in Portfolio Planning Workspace](#)
- [Update roadmap item milestones](#)

Update roadmap item milestones

Update or delete the milestones that you added to your planning items (such as demands, scrum epics, or programs) so that they reflect any change of plans.

Before you begin

Add milestones for roadmap items.

Role required: sn_align_core.apw_user

About this task

From the portfolio roadmap or free-form roadmap, select a planning milestone to update its details. Use the roadmap side panel to edit the details and submit.

For free-form roadmaps, milestones are supported only if the source table is Planning Item [sn_align_core_planning_item] or one of its extensions.

i Important:

You can't add a project milestone from the roadmap view. Creating or updating project milestones may impact the associated project plans. So, it's recommended to create or update project milestones using Project Workspace in Project Portfolio Management (PPM).

However, any existing milestones of the project are visible on the roadmap if you've integrated [Portfolio Planning with Project Portfolio Management](#).

Procedure

1. Navigate to **Workspaces > Portfolio Planning Workspace > Portfolio Planning** and open your roadmap.

2. From the roadmap view, click a planning item and select the Milestones tab.

The side panel shows the list of all the milestones associated with this planning item.

Alternatively, you can click **Full details** and open the item's record page and then select the Milestones tab.

3. Click the milestone that you want to update.

4. From the milestone form, update the details or delete the milestone.

- To update, edit the field details and click **Save**.

For information on the form fields, see [Planning item milestone form](#).

- To delete the milestone, click **Delete**.

Select **OK** to confirm.

Add dependencies for roadmap items

Create dependencies and visualize relationships between planning items of your portfolio or free-form roadmap, so that you can adjust their scheduling.

Before you begin

Role required: sn_align_core.apw_user

About this task

From the portfolio roadmap or the free-form roadmap, use the item details side panel to create dependencies between two planning items. Dependencies are supported for projects, epics, demands, initiatives, programs, or any custom planning item types that you may have created.

The dependency for a planning item on your roadmap can be on an item from the same roadmap, a different roadmap, or the item might not be planned yet. [Learn more about dependencies in the roadmap.](#)

Note:

Dependencies for free-form roadmaps are available only if the roadmap's source table is Planning Item [sn_align_core_planning_item] or one of its extensions.

Procedure

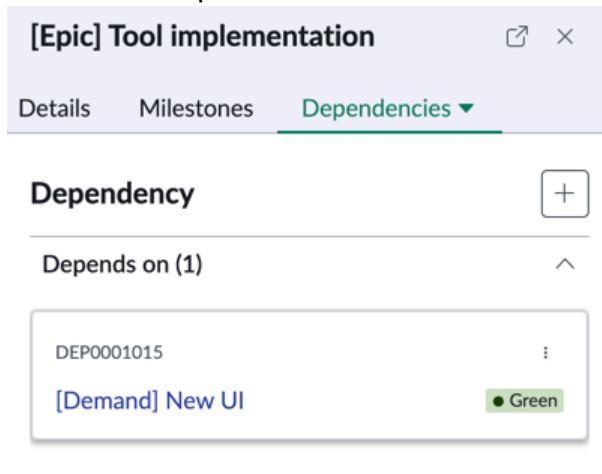

1. Navigate to **Workspaces > Portfolio Planning Workspace > Portfolio Planning** and open your roadmap.
2. From the roadmap view, click a planning item for which you want to add the dependency. The side panel opens showing the item details.
3. Select **More > Dependencies**.
4. From the Dependencies tab, select the Add dependency icon (+).
5. On the form, fill in the fields.

For form field information, see [Dependency form](#).

6. Select **Save**.

Result

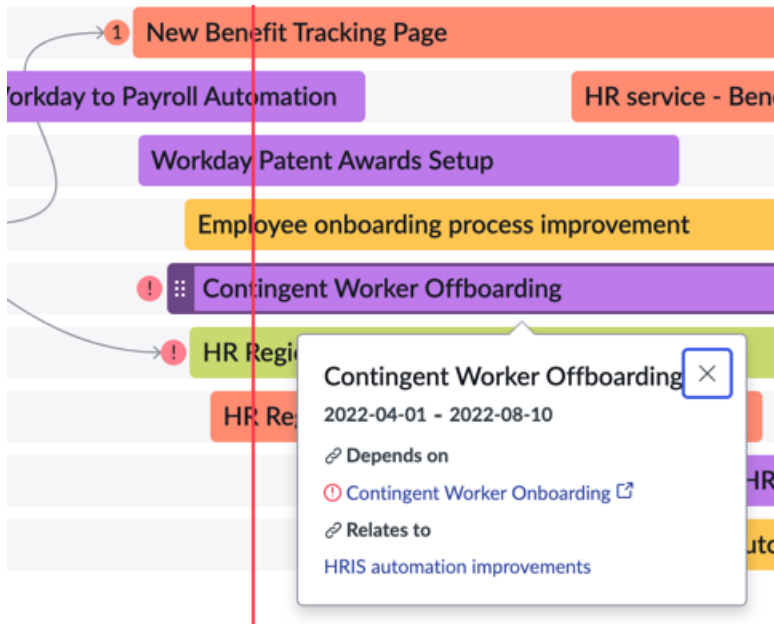

The dependency is created between the selected planning items and is listed in the Dependencies tab of the Item details side

panel.

On the roadmap, you can see the dependency details from the roadmap item card or the dependency lines. [Learn about display settings available for dependencies on the roadmap.](#)

If one of the dependency items is not on the roadmap, then the dependency details are shown on the roadmap item card, with a redirect link to the external planning item. In this case, the items could belong to the same roadmap or not.

What to do next

- [Learn how to resolve a roadmap item dependency error.](#)
- Update the dependency details or delete it. See [Update roadmap item dependencies.](#)

Update roadmap item dependencies

Update or delete the dependencies for the planning items on your roadmap so that they reflect any change of plans.

Before you begin

Role required: sn_align_core.apw_user

About this task

Use the roadmap side panel to change the details of a dependency or delete it.

Dependencies for free-form roadmaps are available only if the roadmap's source table is Planning Item [sn_align_core_planning_item] or one of its extensions.

Procedure

1. Navigate to **Workspaces > Portfolio Planning Workspace > Portfolio Planning** and open your roadmap.
2. From the roadmap view, click a planning item whose dependencies you want to update or delete.

The side panel opens showing the item details.
3. Select **More > Dependencies**.
Dependencies for this planning item are listed in the form of cards.
4. From the side panel, locate your dependency and use the More actions icon () to edit or delete.

Personalize roadmap view

Customize the way that your roadmap is displayed. Group the roadmap items, color them by a category, add numerical data points, and display milestones and dependencies to analyze your roadmap efficiently and take informed decisions.

Before you begin

Role required: sn_align_core.apw_user

About this task

This task provides guidance on different options to personalize your roadmap view. Choose the options that you want to apply.

Any settings that you apply here are saved as preferences per roadmap. All users who can access the roadmap would see the same settings.

Procedure

1. Navigate to **Workspaces > Portfolio Planning Workspace > Portfolio Planning** and open your roadmap.

2. Modify the scale of the timeline of your roadmap.
Select the time scale icon (📅) and choose **Month**, **Quarter**, or **Year**.

Note:

The timescale view that you choose is saved in the roadmap preferences.

3. Use the side panel to personalize how your roadmap looks like.

a. From the side bar, select the Personalize icon (⚙️).

b. Group and color your roadmap items by the available attributes.

You can group the roadmap items by up to two attributes and color-code them by one attribute.

You can work with your admin to add other attributes for the Group by, Color by, and Metrics fields. See [Customize the planning item display preferences for Prioritization and Roadmap in Portfolio Planning Workspace](#).

c. Enable visibility of owners of the roadmap items by using the **Owner** toggle.

d. Display data points such as planned cost on the roadmap item bars by adding fields in the **Metrics** section.

You can add up to three metrics.

- e. If your roadmap items (such as projects, epics, or demands) have milestones, adjust how they're displayed using the toggles in the Milestones section.
For more information, see [Customizing milestone display on roadmap](#).
- f. If your roadmap items have dependencies, adjust how they're displayed using the toggles in the Dependencies section.
For more information, see [Customizing roadmap item dependency display](#).
- g. Identify the current date on your timeline using the current date indicator.
Enable the **Current date line** toggle from the Other settings section.

4. Filter the data shown on the roadmap by applying conditions to the planning items.

- a. From the sidebar, select the Filter roadmap items icon ().
The side panel opens to show the currently applied filters in the Filter overview.
- b. Select **Update filter** to add or update the conditions.
Use the **AND** and **OR** operators to build your conditions.
- c. Select **Apply**.

5. Quickly enable or disable the display of dependency lines between the roadmap items using the Display dependency lines icon ().

6. Zoom in, zoom out, and reset the zoom of your roadmap view by using the zoom options.

Note:

The zoom level that you choose isn't saved as the roadmap preferences.

7. [Apply quick filters for Prioritization and Roadmap data in Portfolio Planning](#)

Customizing milestone display on roadmap

Easily track the milestones of your roadmap timeline or its planning items by choosing how the milestones are displayed on the roadmap view.

The Personalize () side panel on the roadmap provides different toggles to personalize the display of milestones on your roadmap.

- For portfolio plan roadmaps, these toggles are always available.
- For free-form roadmaps, these toggles are available only if the roadmap's source table is the Planning Item table [sn_align_core_planning_item] or one of its extensions.

Customizing roadmap item dependency display

Improve the efficiency of identifying the relationships between your planning items by choosing how the dependencies are displayed on the roadmap view.

The Personalize (⚙️) side panel on the roadmap provides different toggles to personalize the display of dependencies on your roadmap.

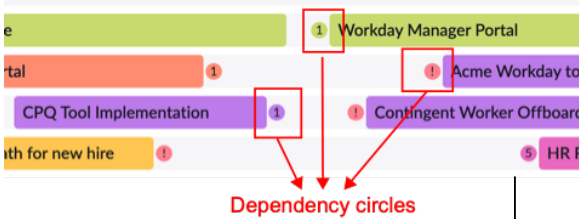

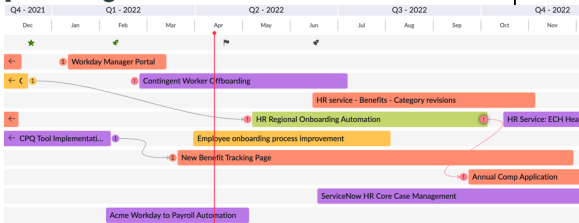

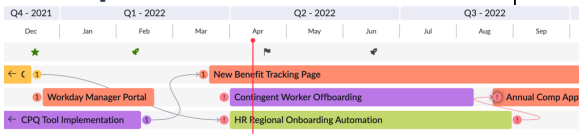

- For portfolio plan roadmaps, these toggles are always available.
- For free-form roadmaps, these toggles are available only if the roadmap's source table is the Planning Item table [sn_align_core_planning_item] or one of its extensions.

Track the progress of roadmap items

Visually track the completion of a work item on your portfolio plan roadmap or free-form roadmap using the tracking mode.

Before you begin

Role required: sn_align_core.apw_user

About this task

Use a toggle to switch your roadmap view from planning mode to tracking mode. The roadmap item cards turn into progress bars to indicate the status and progress.

Note:

While in Tracking mode, you cannot create, update, or reschedule roadmap items and milestones. This view is a read-only mode.

Procedure

1. Navigate to **Workspaces > Portfolio Planning Workspace > Portfolio Planning** and open your roadmap.

2. Use the Tracking mode toggle to turn on the tracking view of the roadmap.

3. **Optional:** Personalize the roadmap view in tracking mode.

Note:

The group by and color by personalization that you've done in the planning mode of your roadmap gets carried over to the tracking mode but the metrics are not carried over.

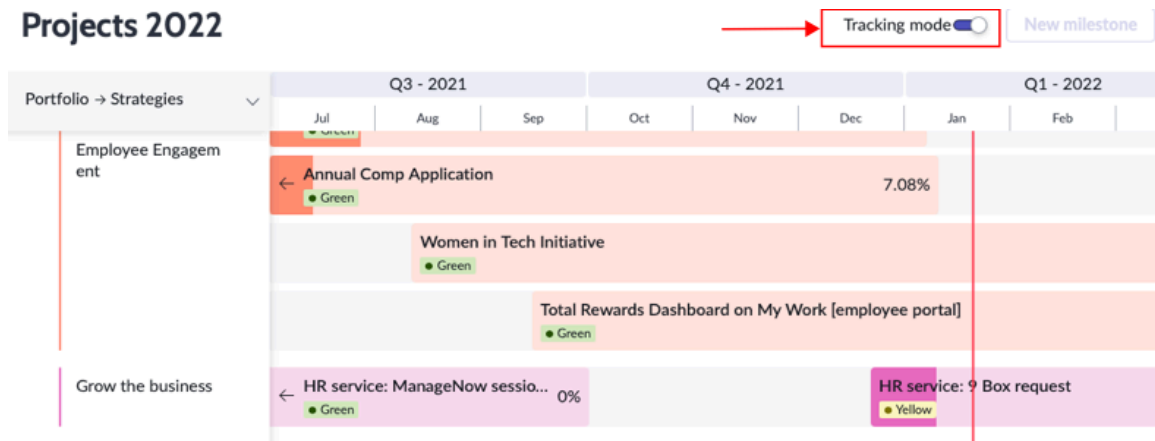

- a. Enable or disable the visibility of the roadmap item status and percentage complete using the **Status** and **% Complete** toggles respectively.
- b. Display data points such as planned cost on the roadmap item bars by adding fields in the **Metrics** section.
You can add up to two metrics in tracking mode.
- c. Personalize the display of milestones.
You can choose to display the milestone with just its icon or along with its label.

Apply quick filters for Prioritization and Roadmap data in Portfolio Planning

Quickly apply filters for data in the Prioritization or Roadmap tabs to help you seamlessly plan using a consistent data set across all views of the tab.

Before you begin

Role required: sn_align_core.apw_user

About this task

Quick filters help you filter the data shown in the List and Hierarchy views of Prioritization and Roadmap. These filters are saved as your preferences. This way, you can view the same data across all views for a tab, even when you log back in later, helping you seamlessly plan, prioritize and roadmap work.

Procedure

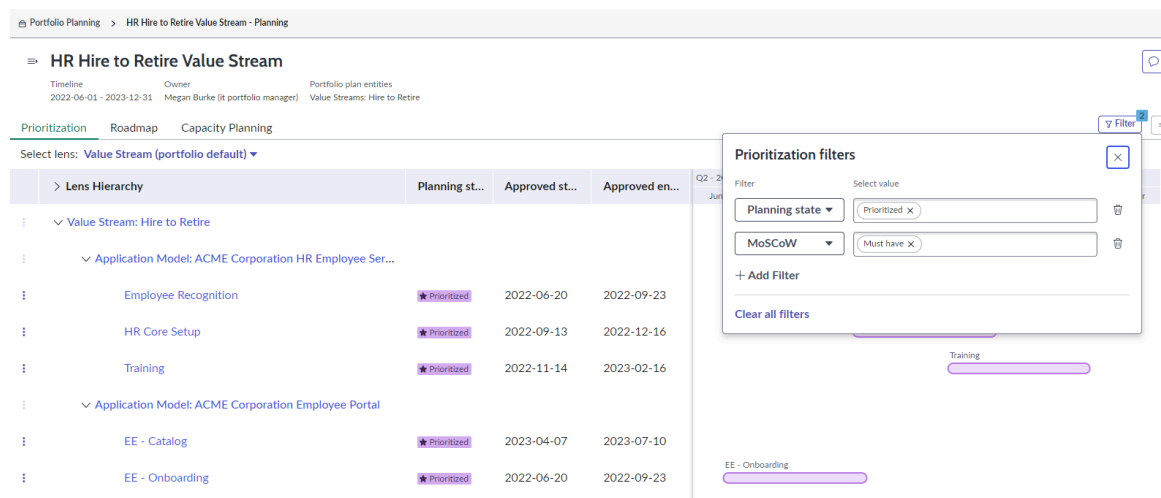

1. Navigate to **Workspaces > Portfolio Planning Workspace > Portfolio Planning**.
2. From the list of portfolio plans, select one and then select **Planning**.
3. Based on the tab you want to work in, select **Prioritization, Roadmap, or Capacity Planning**.

By default, the data in the Roadmap tab is filtered with the Planning state of **Prioritized** and you see only prioritized items.

4. From the portfolio plan header, select **Filter** and add conditions.

You can add filters for only those fields that are of the choice or reference type, within the tab.

- You can apply filters on only those fields that are available in those views.
- The filters are automatically applied and the data shown in the tabs is automatically refreshed.
- The filters set in the Prioritization tab are not applied to the Roadmap tab and vice-versa.
- The filters set in to one view are also applied to the other views, within the same tab.

Optimizing planning with scenario planning in Portfolio Planning

As a portfolio manager, optimize your portfolio planning by comparing potential outcomes, assessing their alignment with strategic goals, and approving the best scenario as your live plan.

Scenario planning items in the Prioritization tab

The **Prioritization** tab of the Scenario page enables you to add and remove planning items to/from a scenario and adjust their dates.

Scenario planning items in the Roadmap tab

The **Roadmap** tab displays a Gantt chart-like view of the planning items in the scenario, showing their planned start and end dates across the portfolio plan timeline. Using the Roadmap tab, you can drag the bars representing planning items across the timeline to adjust their dates.

Scenario planning items in Financials tab

The **Financials** tab of the Scenario page enables you to set custom targets, budget, and compare the allocated budget against target using the outcomes panel.

Portfolio Manager can simulate multiple scenarios with different budget combinations and compare their outcomes to arrive at an informed decision to balance the resources and strategic objectives. Using the financials view in Scenario planning, you can get a simulation mode for the financial information. Using this view, the strategic planning users such as Portfolio managers, Program managers, or Portfolio user working on the portfolios, can set a portfolio budget target for a particular planning cycle, which could be a monthly, quarterly, yearly, or beyond a year up to 5 years. Using this defined budget, portfolio users can prioritize the planning items within the portfolio to analyze if the prioritized items can be executed within their portfolio budget, while reviewing the monetary benefit from the prioritized items.

i Important: Enable the budget allocation property to allocate budget to your planning items at portfolio-level and configure the budget attributes to allocate budget by expense type or cost type.

Create multiple scenarios to compare them, and work with your stakeholders to approve an ideal plan with better monetary benefit returns. Once approved, the approved Scenario will become your new portfolio plan for the defined planning cycle. For more information to know about the changes happening in a portfolio after scenario approval, see [Approve a scenario](#).

You can perform financial scenario planning throughout your planning or execution cycle depending on your organization needs such as at your regular planning cycles, quarterly reviews, or financial review cycles. Financials in scenario planning helps you to arrive at an informed decision and customize the portfolio planning to match with your organization needs.

- i Note:**
- Financials in scenario planning is supported only for Epics, Projects, and Demands type of planning items.
 - Customers using the Legacy Investment Funding should migrate to new experience to work on the financial scenario planning.

Personalize your scenario planning financials view using the Time scale and Range filters. Manage the budget of your planning items by monthly, quarterly, or yearly cadence depending on the planning cycle of your organization.

Outcomes panel in Scenario planning

The outcomes panel in the simulation indicates the financial information of the portfolio such as target and budget amounts for Capex and Opex, set budget target for this simulation, utilized and remaining budget from the target, benefit from the In-plan items, and the actual costs accounting from the out of plan items. The aggregated data is fetched based on the portfolio timeline range including the target and budget data.

Representations in outcomes panel for the identification.

Outcomes panel representation

Indication	Definition
Red text for amount without progress bar indication for Total Simulated Budget	No defined or set target amount for this scenario.
Red text for amount and red progress bar for Total Simulated Budget	Total allocated budget for planning items exceeds the scenario's set target amount.
Red text amount for Capex Budget	Capex Budget allocations exceed the scenario's Capex target.
Red text amount for Opex Budget	Opex Budget allocations exceed the scenario's Opex target.
Green text for budget amounts and green progress bar	Budget allocation for each expense types and total budget is within the scenario's set target.

Scenario planning features

In scenario planning, you can perform the following actions:

Feature	Description
Create a scenario	Create a scenario from the current plan, or another scenario, in a simulated environment to compare the scenario with the live plan and other scenarios.
Compare scenarios	Compare scenarios and the live plan side by side to review tradeoffs and items added or removed from the plans.
Approve a scenario	Approve the best scenario.
Manage scenarios	View list of scenarios, rename scenarios, and delete scenarios.

Scenario planning use cases

The following are high-level use cases for scenario planning.

- **Fiscal year planning:** Megan Burke, Portfolio Manager at ACME Inc, is planning for the next fiscal year and is required to prioritize planning items and align them with the organizational strategic goals. Megan creates a scenario for the portfolio plan and then uses the Prioritization tab to align items with goals. Megan holds discussions with program managers and with the financial team, creates multiple scenarios, and compares them. Megan approves the optimal scenario as a well-aligned strategic portfolio plan for the next fiscal year.
- **Mid-cycle reprioritization;** Changed priorities emerging mid-year require adjustments to the current portfolio plan. John Doe, the product manager at ACME Inc, creates a scenario and incorporates the changed priorities. John adjusts the plan based on the program manager's and financial team's feedback and finalizes the plan.

Create a scenario

Create a scenario from a live plan or another scenario in a simulated environment to compare the scenario with the live plan and other scenarios.

Before you begin

Role required:

- sn_align_core.apw_user
- sn_align_ws.spw_financial_user - to view and edit financial details.

About this task

Creating a scenario enables you to visualize and anticipate potential outcomes. You can create a scenario based on the live plan or on another existing scenario. Once you have created one or more scenarios, you can compare them side by side with the live plan and approve the most desirable scenario. The scenario you approve becomes the live plan.

Procedure

1. Navigate to **Workspaces > Portfolio Planning**.
2. From the list of portfolio plans, select one and then select **Planning**.
3. Select **Create scenario**.

Note:

Before you have created your first scenario, you see the **Scenario planning** button on the Scenario page. In such a case, select **Scenario planning** and then you see the **Create scenario** button.

- a. Enter a name for your scenario in the **Scenario name** field.
- b. **Optional:** Enter the details of your scenario in the **Description** field.
- c. In the **Copy From** field, select the *Current Plan* or the name of an existing scenario based on which you want to create the scenario.

d. Select **Create**.

The Scenario planning- [Scenario Name] page appears with the Prioritization tab open. The Prioritization tab lists all the planning items that you have in the live plan, or in the existing scenario that you copied the scenario from. The planning item start and end dates are determined based on the dates specified in the live plan or the actual execution dates.

- **In Plan** toggle: By default, the **In Plan** toggle is switched on for planning items that have the planning state as Prioritized or Done and have their start dates within the portfolio plan timeline. The **In Plan** toggle is turned off for items that have the status New, In Review, or Canceled.
- Yellow highlights for out of range dates: The planning item dates that are out of range of the portfolio plan timeline are highlighted with a yellow background. For such items, the **In Plan** toggle is turned off.

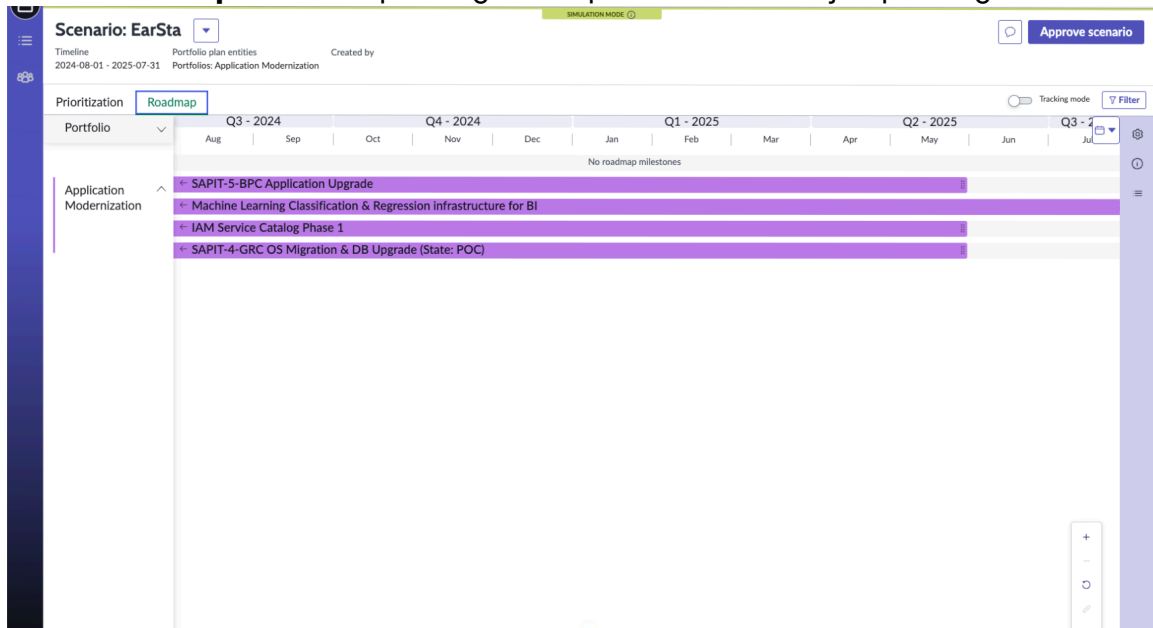

4. Use the Prioritization tab to include or exclude additional planning items in the scenario.

Rank	Name	Planning state	Planning item type	Start date	End date	MoSCoW
1	Machine Learning Classification & Regression Infrastructure for BI	★ Prioritized	Demand	2023-03-15	2025-07-31

12	SAM Reclamation (Recovery & Deployment)	■ In Review	Project	2023-01-11	2023-08-20	
13	GRC Process Improvement	★ Prioritized	Demand	2022-09-18	2025-01-31	
14	SAP CRM Cloud Migration	■ In Review	Demand	2022-12-12	2025-07-23	
15	Field Services Upgrade	★ Prioritized	Demand	2023-01-16	2025-05-31	
16	ML Similarity Framework	★ Prioritized	Demand	2022-09-11	2025-05-01	
17	Replace Tableau with Performance Analytics	★ Prioritized	Demand	2022-09-03	2023-10-04	
18	Discovery Implementation	★ Prioritized	Demand	2022-10-16	2023-02-28	
19	Migrate Internal Build instances to AWS	★ Prioritized	Demand	2022-10-04	2025-03-31	
20	Artificial Intelligence in Operations	★ Prioritized	Demand	2022-11-14	2025-01-31	
21	Unification of Mobile Apps	★ Prioritized	Demand	2023-01-09	2025-07-31	
22	Replace SVN with Github	★ Prioritized	Demand	2023-01-17	2025-06-30	

- a. **Optional:** To exclude a planning item from the scenario, turn off the **In Plan** toggle.
- b. **Optional:** To include a planning item in the scenario, edit the start and end dates of the item to fall within the portfolio plan timeline, and then turn on the **In Plan** toggle.

If you include out-of-timeline items in a scenario, these items remain in the scenario during the planning and prioritization process. When the scenario is approved, the dates of these items are updated to align with the scenario dates. However, because these updated dates fall outside the original portfolio plan timeline, the items are moved out of the live portfolio plan.

5. Use the **Roadmap** tab to view planning item dependencies and adjust planning item dates:

- a. Drag the start or end of the planning item bars to change their start or end dates.
 - b. Drag the planning item bars to shift them in the plan timeline.
 - c. View the dependencies and milestones of the various planning items.
6. Use the **Financials** tab view the prioritize, invest, and execute the right items to provide best returns on investments for your organization.

a. Set target for your portfolio budget.

i. Select the **Set Targets () button.**

ii. In the Set Targets window, set budget for an expense type or a cost type using the inline edit feature.

Tip:

You can change the **Time scale** and **Range** to set targets for each fiscal period at monthly, quarterly, or yearly cadence to meet your organization's planning cycle. The target set for a higher timescale, it is equally split it between the fiscal periods.

Once the target is set for a scenario, the **Target** row displays the defined target amount by fiscal period and budget allocation choices.

b. Include or exclude planning items in scenario using the **In-plan toggle.**

c. Add or reduce budget for individual planning items using the inline editing feature.

Changes made to the budget using while creating a scenario are marked with  icon.

What to do next

- Create more scenarios, if necessary.
- **Compare scenarios.** You can directly compare scenarios from simulation mode by selecting **Compare scenarios** from the Scenario actions list.
- **Approve a scenario.**

Compare scenarios

Compare scenarios side by side to evaluate comprehensive planning, optimize resource usage, confirm feasibility, and financial information.

Before you begin

Verify that you have created one or more planning scenarios and selected planning items for execution. For more information, see [Create a scenario](#).

Role required:

- sn_align_core.apw_user
- sn_align_ws.spw_financial_user - to view the financial widgets.

Procedure

1. Navigate to **Workspaces > Portfolio Planning**.
2. From the list of portfolio plans, select one and then select **Planning**.
3. From the Create scenario menu, select **Compare scenarios**.
The Compare scenarios page appears.
4. Select **Add Scenario To Compare** and select or deselect scenarios to be included in the comparison.
You can add up to five scenarios to the comparison.
5. Select **Compare**.
You can also view the Compare Scenario page by selecting **Compare Scenarios** from the Scenario Actions menu in the Scenario page. The Compare Scenario page appears with the scenario open in the Scenario page included in the comparison with the current plan.
The selected scenarios appear side by side on the Compare Scenario page.
6. Compare different aspects of the scenarios such as Budget vs Target, Benefit, Budget distribution, trade offs.

Portfolio Planning > Portfolio FY25 > Scenario Planning - Benefits optimization > Compare scenarios

Compare scenarios + Add scenario to compare

	Current plan Default <small>Current execution plan</small>	Benefits optimization	Prioritization by rank

		Approve scenario	Approve scenario

Note:

Cost and benefit widgets in compare scenarios page reads the live data of **In-Plan** items for which the budget isn't manually changed while scenario planning.

Visual cues in scenario comparison

Criteria	Description
Removed from this plan	Items that are removed from the plan when the scenario is approved, are marked with a red X.
Added to this plan	Items that are added to the plan, when the scenario is approved, are marked with a green checkmark.

The following are some indications of the suitability of a scenario for approval:

- All planning items providing a focused strategy that supports the organization's objectives effectively.
- The trade-off section includes relevant items, demonstrating comprehensive and inclusive planning that addresses various aspects of the project or initiative.
- The scenario is realistic and achievable, considering current constraints and capabilities, confirming that planned actions can be executed within the given timeframe and budget.
- Better benefit from financial planning using the widgets, Budget vs Target to validate the allocated budget against the set targets, Benefit to identify scenario with better monetary benefit, and Budget Distribution.

7. Optional: Select the **Approve Scenario** button relevant to a scenario to approve it. For more information about approving existing scenarios in the Portfolio Planning Workspace, see [Approve a scenario](#).

What to do next

[Approve a scenario](#)

Approve a scenario

Approve a scenario that aligns with your organizational goals and offers the best business outcomes to make the scenario your current plan.

Before you begin

Ensure that you have compared the scenarios and selected the one you want to approve. For more information, see [Compare scenarios](#).

Role required:

- sn_align_ws.scenario_approver
- sn_align_ws.spw_funding_user - to view and approve the financial changes.

About this task

When you approve a scenario:

- Planning items with the In Plan state are updated to the Prioritized state.
- Planning items that you moved out of the plan are changed to the In Review state.
- The approved dates are revised accordingly.
- Changes made to the budget of a planning item is will be approved as the budget.

Procedure

1. Navigate to **Workspaces > Portfolio Planning**.
2. From the list of portfolio plans, select one and then select **Planning**.
3. From the Create scenario menu, select **Compare scenarios**.

The **Approve scenario** button is also available on the Scenario page. As soon as you have created a scenario, you can directly approve a scenario without comparing it with the other scenarios.

4. Select the **Approve scenario** button relevant to the scenario that you want to approve.

While approving a scenario, you can:

- Convert the prioritized demands to projects to automatically build a portfolio plan by selecting the **Convert In-plan Demands to Projects** toggle.
- Delete the remaining scenarios by selecting the **Delete other scenarios** toggle.
- Enter a reason for approving the scenario in the Notes field.

5. Select **Approve**.

Manage scenarios

Use the Manage scenarios option to view a list of all scenarios, rename scenarios, or delete scenarios.

Before you begin

Role required:sn_align_core.apw_user

Procedure

1. Navigate to **Workspaces > Portfolio Planning**.
2. From the list of portfolio plans, select one and then select **Planning**.
3. Navigate to **Create Scenario > Manage Scenarios**.

You can also select **Manage Scenarios** in the Recent Scenarios menu in the Scenario page.

The Manage scenarios dialog appears with the list of scenarios relevant to the current plan.

4. Do any of the following actions.

Using capacity planning in Portfolio Planning

Assess the resource capacity and review existing allocations, which help you to make informed decisions while working on assigning resources.

Use the [manage resource capacity](#) screen to generate resource capacity details.

Use the [Capacity Planning screen](#) to view detailed information about the resource capacity mapping to a portfolio.

Manage resource capacity

Manage resource capacity screen

The screenshot displays the 'Manage resource capacity' screen. On the left, there are filters for 'Start Month' (Jan 2023) and 'End Month' (Dec 2024). Below these are fields for 'Group' (Employee Management) and 'Role' (Project Manager). A 'View capacity' button is visible. The main area shows a table with columns for months from Jan 2023 to Apr 2024. The table contains three rows of data representing different roles and their capacity over time.

Group	Role	Skill	Jan 2023	Feb 2023	Mar 2023	Apr 2023	May 2023	Jun 2023	Jul 2023	Aug 2023	Sep 2023	Oct 2023	Nov 2023	Dec 2023	Jan 2024	Feb 2024	Mar 2024	Apr 2024
Employee Managem...	Project Manager		1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Employee Managem...	Quality Analyst		1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Employee Managem...	Software Engineer		3	3	3	3	3	3	3	3	3	3	3	3	3	3	3	3

Using Manage resource capacity, select a time frame and primary attributes to view number of available resources. Generated resource capacity details are saved. You can regenerate capacity to view latest changes in the resource availability.

Resource capacity screen helps you to view the following data.

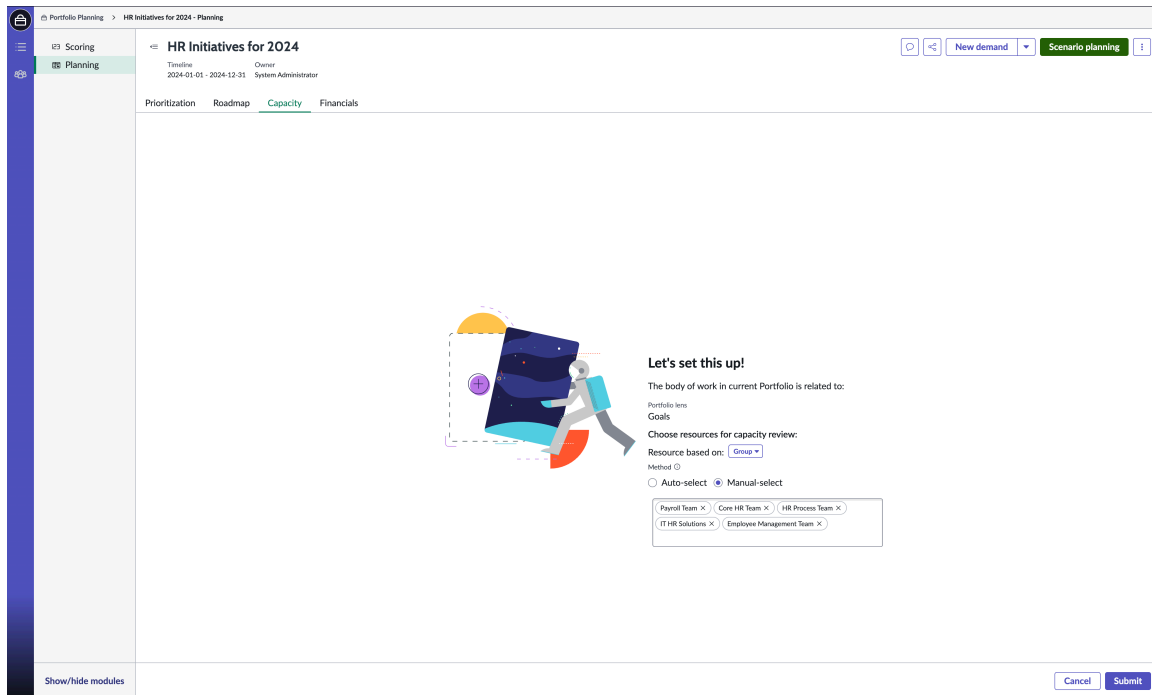

- Resource availability for generated capacity.
- Total number of available resources in a monthly breakdown view.
- Latest date of generating the capacity details.
- Option to regenerate and fetch the latest capacity details from the employee profile mappings.

On the Manage resource capacity screen, you can:

- Filter resources with specific capacity attributes for a required date range to view the number of available resources.
- Regenerate capacity details to view the latest details from the resource employee profile mapping.

Select resource criteria

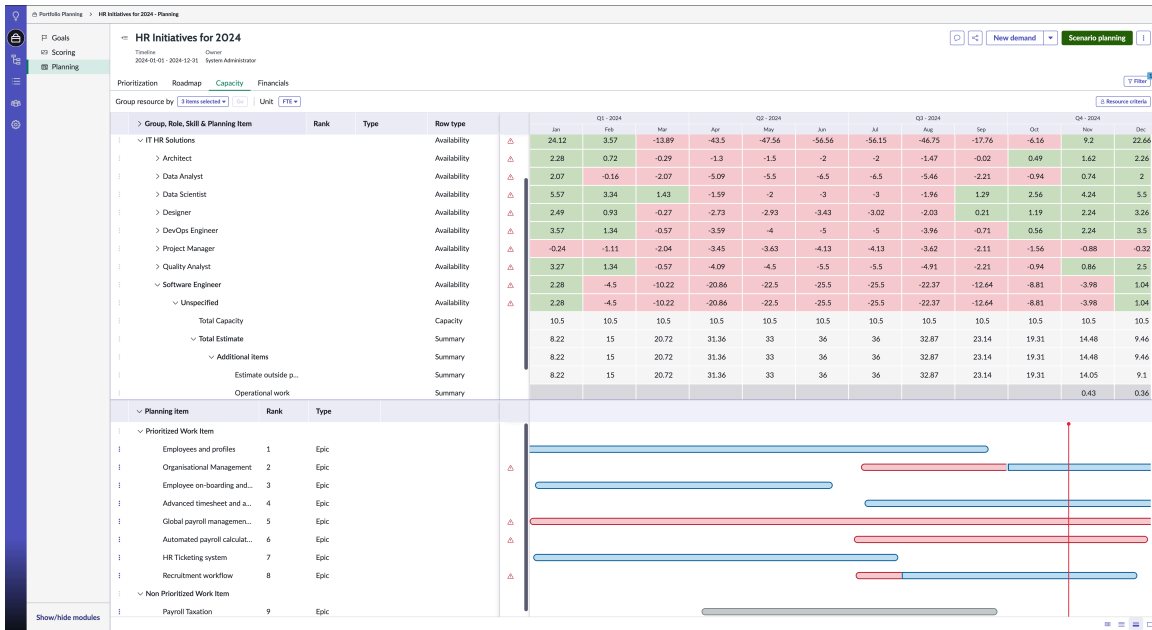

- Select a primary attribute to automatically view the available groups, roles, or skills from the resource assignments of the prioritized planning items.
- Switch between **Auto-select** and **Manual-select** option to view the allocated resource efforts for all planning items or to view a custom data, respectively.
- Define resource criteria to view the available groups, roles, or skills from the resource assignments of the prioritized planning items.

Capacity Planning

Capacity Planning screen displays the resource efforts from the prioritized planning items.

- Comprehensive overview of resource capacity and allocations.
- Current resource capacity allocation.
- Interactive Gantt chart to view prioritized planning items in the bottom tray to analyze and plan work.

Understanding the Capacity Planning screen.

Capacity Planning legend

Color	Description
Yellow (Gantt bar)	Planning item with no resource assignments.
Blue (Gantt bar)	Resource estimates for Planning items are within the resource capacity.
Red (Cells and Gantt bar)	Overallocation in resource estimates.
Green (Cells)	Resource estimates within the resource capacity.

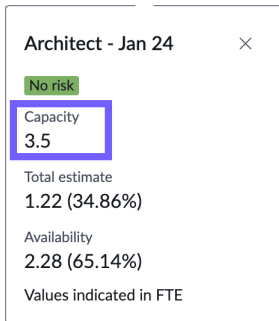

Using Capacity Planning, you can:

- View the capacity allocations of prioritized planning items for your current portfolio and better forecast your future resource requirements.
- Use the filter option (Filter) to view planning items by their type, state, priority or any by any required attributes to create capacity plans.

Note:

Default filter is set to display prioritized planning items only.

- View the updated resource capacity based on the assigned operational resource assignments.
- View the total resource capacity in the heatmap view.

- View total resource capacity and total estimates.
- View the efforts for operational work and efforts for estimates outside of portfolio in the **Additional items** list.
- Redefine the workforce criteria by selecting **Resource criteria** (—)

Example: Calculation of Operational Resource Assignment in Capacity Planning

As a Resource Manager, you can [create operation resource assignments](#) or [migrate existing operational resource plans](#) of your employees to handle the required meetings, trainings, time off and so on to meet your work requirements.

Consider a group with capacity of 2 FTE and resource manager creates a Group type operation resource assignment for 10% of the capacity for training. This operational assignment can be viewed in the **Operational work** line item in the top-tray of the Capacity Planning screen. The value of the **Operational work** line item will be 0.2, which is 10% of total capacity of the group.

When a resource manager creates a Group type operation resource assignment for time off, this doesn't update the **Operational work** line item but reduces the total available capacity.

Consider the same group for which resource manager creates an operation resource assignment for 25% of the capacity for time off, for a quarter from April to June. The total available capacity of the group for the quarter April to June will be 1.5 FTE, which is 75% of the total capacity after reducing the 25% time off.

0.5 FTE, which is 25% of total capacity of the group will be reduced.

Note:

The **Operational work** line item is highlighted in gray color.

Group, Role, Skill & Planning Item	Rank	Type	Row type	Q1-2024			Q2-2024			Q3-2024			Q4-2024		
				Jun	Jul	Aug	Jun	Jul	Aug	Jun	Jul	Aug	Jun	Jul	Aug

Generate resource capacity

Generate and view the total capacity of the resources with primary attributes. Capacity details helps Portfolio Managers to plan and manage planning items depending on the resource availability.

Before you begin

1. Enable planning attributes for capacity planning. For more information, see [Enable planning attributes for capacity in Portfolio Planning](#).
2. Generate employee profiles for resources. For more information, see [Generate employee profiles for resources to work with capacity planning](#).

Role required: sn_align_ws.spw_capacity_user

Procedure

1. Navigate to **Workspaces > Portfolio Planning Workspace**.
2. Select the **Manage resource capacity** option (🔧).

Note:

If planning attributes aren't enabled for capacity planning, you see an empty state screen with an option to configure. Contact your admin to enable planning attributes for capacity planning. For more information, see [enable planning attributes for capacity planning](#).

3. Use one the following options to view and regenerate the capacity details.

What to do next

Use [Capacity Planning](#) to view the resource capacity, resource-to-work mapping and re-prioritize resource allocations to effectively execute your prioritized planning items.

Use Capacity Planning in Portfolio Planning

View and analyze the resource capacity for your portfolio to plan and re-forecast the resource assignments.

Before you begin

Generate resource capacity using [Generate resource capacity](#).

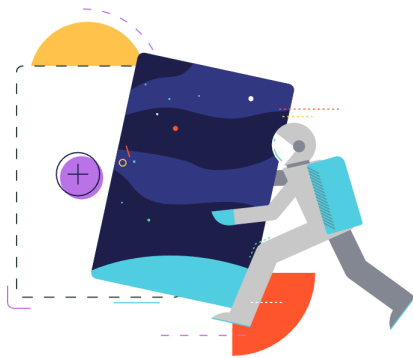

Role required: sn_align_ws.spw_capacity_user

Procedure

1. Navigate to **Workspaces** > *Portfolio Planning Workspace*.
2. Select a plan from Portfolio Plans.
3. Select **Planning** > **Capacity Planning**.
4. Define a resource criteria by selecting a primary attribute from the list.
If you select Group, all the available groups from the resource assignments of the prioritized planning items are automatically displayed in the Auto-select option. You can add or remove the suggestions to view the resource capacity using the Manual-select option.

Tip:

You can always redefine and change the resource criteria to view custom results using the **Resource criteria** (—) button.

Let's set this up!

The body of work in current Portfolio is related to:

Portfolio lens
Goals

Choose resources for capacity review:

Resource based on: Group ▾

Method 

Auto-select Manual-select

Payroll Team ×
Core HR Team ×
HR Process Team ×

IT HR Solutions ×
Employee Management Team ×

5. Select Submit.

Result

The Capacity Planning screen for resource capacity allocation for the selected workforce criteria is displayed. Based on the workforce criteria selection, the resource capacity is nested by Group, Skill, and Role.

Managing financials for planning items in Portfolio Planning

Manage budget, cost plans as forecasts, actual expenses as expense lines, generate labor costs, create financial baselines, and view, analyze, and compare the financial performance of your planning items at required cadence in Portfolio Planning Workspace.

The comprehensive financials view helps you to understand planned and actual costs, Forecast (previously EAC - Estimate At Completion), Remaining Estimates (previously ETC - Estimate To Completion), Actual (previously Actuals to date), and so on, for the selected item. You can manage cost plans and associate the expense lines and process them to reflect the actuals for a planning item.

Export the financials data from Costs and benefits or Baseline comparison view as Microsoft Excel or a CSV file and share it with your stakeholders to review the financial performance of your planning items and portfolio.

Cost view

Forecast your planned costs, create, and manage cost plans and expense lines to track the financial performance of your planning items, review the latest costs and actuals.

The screenshot displays the 'Automating IT operations for streamlined efficiency' project page in ServiceNow. At the top, there are navigation tabs for 'Details', 'Docs', 'Resource assignments', 'Financials', 'Goal/Target Relationships', 'Milestones', 'Product idea', 'Feedback', 'Depends on', 'Dependent items', 'Related items', 'Monetary Benefit Plans (2)', 'Non-monetary Benefit Plans', and 'Record History'. A 'Currency' dropdown menu is set to 'USD (Functional)', with an annotation 'Multicurrency selection' pointing to it. Below this, several summary cards show budget and forecast values for different categories like Capex and Opex. The main table shows financial records grouped by 'Record Type' (Benefit or Cost) and 'Cost type' (Other Capex or Other Opex). The table columns include 'Name', 'Record Type', 'Cost type', 'Full scope', and fiscal years (FY25: M01, M02, M03) with 'Planned' and 'Actuals' sub-columns. A 'Returns' row is at the bottom. An annotation 'Grouping of financial records indicating Cost plans or Benefit plans' points to the 'Record Type' column.

In the Cost screen, you can:

- As a Project Manager, you have the enhanced visibility and ability to manage the financial data across multiple project levels. Cost view of financials shows cost plans and expense lines from sub-projects, allowing you to track the finances.
- The parent project widgets display the consolidated values of forecasted costs and expenses.
- Identify and manage costs using the **Project/Demand** column for any sub-project or demand directly from Cost view of the parent planning item.
- Reforecast all the cost plan values for future fiscal periods by double-clicking to edit the value in the least time scale view, either by month or by period.
- Manage cost plans for your planning items. For more information, see [Add, edit, or delete cost plans](#).
- Add or edit expense lines for your planning items to record any planned or unplanned expenses. For more information, see [Add or edit expense lines](#).
- Generate labor costs for the fiscal period. For more information, see [Generate labor costs](#).
- Create and compare baselines to capture the financial snapshot of your planning items. For more information, see [Create and compare financial baselines for demands and projects](#).
- [Configure widgets](#) to get a high-level overview of the financial data for your planning item.
- All financial details from sub-projects will be aggregated and displayed in the parent project's cost plans and widgets.

Tip:

Cost view gives you enhanced user experience to customize the left pane columns by using the personalize icon () and by saving user preferences to retain the customizations made to hide, view, or adjust columns, time scope viewing, and so on.

Multicurrency

The multicurrency feature enables you to manage the financials of your planning items in two different currencies, Functional currency and Investment currency. Functional currency

is typically defined by the admin based as the primary currency that is used for planning, budgeting, and tracking the financials of your planning items.

Financial users can now perform the following financial activities in Investment currency.

- Ability to select the Investment currency.
- Track the planned and actual expenses.
- Allocate and manage the budget.
- View simple financials data.

i Important:

New customers should install the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin to enable multicurrency feature and [Activate scheduled job to populate to multicurrency fields.](#)

Using this feature, you can work on financial reporting at a global level and see the real-time currency conversions of your financial records.

Organizations operation at a global or multinational level, the work is planned and financed at one location and executed at a different location. Each might use a different currency from what was used in the planning phase, multicurrency makes it easy to manage and track your planning items using any currency.

You can monitor and track the financials in one currency, and capture the costs in a different currency.

Using multicurrency, you can see all the costs in the currency you choose for the planning item, instead of restricting to use Functional currency defined in your locale. For more information on how to choose investment currency of your planning items, see [Configure multicurrency for planning items.](#)

Financial records and widgets will display the costs based on the currency selection.

i Note:

Once a cost plan, benefit plan or expense line or an investment budget gets created, you won't be able to change investment currency. You can change the investment currency as long as there are no financial records captured against the planning item.

Display modes

On the financials page for a planning item in Portfolio Planning Workspace, you have Display Mode drop-down switch between different modes to view different formats of financial information of your planning items. These views provide the relevant and focused information which helps project managers and funding users to work on the financial planning.

- Forecast
- Budget vs forecast
- Planned vs actual
- Planned

Users with financial funding role [sn_align_ws.spw.funding_user] will see the Budget allocation option instead of the Budget vs forecast.

Display modes value

Mode	Value
Forecast	<p>View Actuals, Remaining estimates, and Forecast for the entire scope of the planning items.</p> <p>Use the time scale to view the actuals for the past fiscal periods and planned costs for the current and future fiscal periods.</p>
Budget vs forecast	<p>View the Budget, Actuals, and Variance for the fiscal periods and Forecast values for the entire scope of the planning items.</p> <p>Using this mode, you can:</p> <ul style="list-style-type: none"> • Compare the latest forecasts with the approved budget at different time scales. • View the budget vs actual for past fiscal periods and budget vs planned for current and future fiscal periods at fiscal period level.
Budget allocation (funding role)	<p>View the Budget, Actuals, and Variance for the fiscal periods and Forecast values for the entire scope of the planning items.</p> <p>Using this mode, funding users can:</p> <ul style="list-style-type: none"> • View the latest forecast and enter the budget that can they be approved to the work item. • Analyze the variance for the past fiscal periods and work on budget allocation for future fiscal periods. • Compare latest forecast with approved budget and revise the budget, if necessary.
Planned vs actual	<p>Compare the planned costs with actual expense for the past and current fiscal periods, and view planned costs for the future fiscal periods.</p>
Planned	<p>View only planned costs for the full range and manage the planned costs using the inline editing feature.</p>

Note:

- If you don't see the Budget allocation or Budget vs forecast display options, [enable the budget allocation property](#) and [configure the budget attribute](#) at instance level.
- To work on budget allocation using the Next Experience, [Activate a scheduled job to migrate budget of your planning items](#).

The last selected view is saved as user preferences.

Default display mode and access level for financial users

User role	Default mode	Role-level access
sn_align_ws.spw_funding_user	Budget Allocation	Allocate and approve budget, manage cost plans and expenses lines.
sn_align_ws.spw_financial_user	Forecast	Manage cost plans and expense lines.
business_stakeholder	Forecast	View financial data.

Baseline view

Create a financial to capture a snapshot of the financial changes for your planning items. You can create on-demand baselines manually or automatically at a required cadence using a scheduler job. For more information, see [Create a baseline](#)

Note:

Baselines created on the parent project include cost plans and expense lines from all of the child projects to calculate and give you a better breakdown of the financial performance of the projects and sub-projects.

[Compare baselines](#) to compare the difference in costs between latest status against a baseline or between any two baselines.

Note:

Each baseline is tagged with a number based on the order that they're created. The Current Financials baseline captures the financials details in real-time and is always represented with a flag icon ().

Financial baselines now capture the investment currency for customers using multicurrency.

A planning item baseline includes the following financial metrics in investment currency.

- Investment currency
- Total planned cost
- Planned benefit
- Planned return
- Budget cost

At the investment baseline level, a corresponding investment baseline is automatically created. This baseline captures:

- Planned cost
- Actual cost
- Planned benefit
- Actual benefit
- Total budget
- Capex, Opex, and breakdown of these fields, and so on

All values are populated along with their respective investment currency.

Cost plan baselines now store actual cost values in investment currency, along with the investment currency field. Benefit plan baselines capture benefit values in the investment currency, along with the associated currency. At the breakdown level (for example, fiscal period or monthly breakdowns), actual cost and actual benefit values are populated in investment currency where actuals exist.

Note:

Comparison of financial baselines using multicurrency is not yet supported.

You can view the planning item and investment baseline using the list view.

Access the `pm_project_baseline` list to view project baselines, and `sn_invst_pln_invst_investment_baseline` to view the investment baselines.

The baselines comparison view helps you to understand the variances between the two baselines.

Name	Cost type	Full scope - EAC			FY23: M04			FY23: M05		
		EAC	EAC	Variance	Actuals	Actuals	Variance	Actuals	Actuals	Variance
Software costs	Software Capex	30,000	30,500	(500)	2,500	2,500	0	2,500	2,500	0
Labor costs	Labor Capex	96,000	99,200	(3,200)	8,000	8,000	0	8,000	8,000	0
Product Documen...	Other Opex	17,000	20,000	(3,000)	7,000	7,000	0	0	0	0
Travel costs	Other Opex	6,000	7,000	(1,000)	500	500	0	500	500	0
Hardware costs	Hardware Capex	64,500	64,500	0	5,500	5,500	0	5,500	5,500	0
Professional services	Other Opex	71,500	71,500	0	8,000	8,000	0	4,000	4,000	0
Total		285,000	292,700	-7,700	31,500	31,500	0	20,500	20,500	0

Use the widgets when you compare baselines to view:

- Two dedicated widgets for each baseline displaying the EAC.
- The third widget displays the total variance between the EAC values of the selected baselines.
- The fourth widget displays the top three variances contributing to the overall variance by cost type.

The widgets and the header rows are color-coded to help you identify the selected baselines.

Tip:

Switch between different baselines from the comparison view by selecting the name of a baseline from one of the widgets.

When you compare baselines, you get the list of cost plans with their associated costs types, EAC at full scope, and a breakdown view of actual expenses and planned costs.

By default, the time scale of the breakdown view is set to Month.

- Use the **Time scale** option to view the comparison breakdown view at monthly, quarter, and yearly levels.
- Select **Time scope** to filter fiscal periods, data in the widgets, and the comparison table.

The widgets and the header rows are color-coded to help you identify the selected baselines.

Tip:

Select the name of a baseline from the first or second widget to compare different baselines.

Let's take an example of the comparison view of two baselines: 2023-10-01, Baseline A, and Current Financials, Baseline B.

Example: How actuals, planned, and EAC are compared between two baselines captured at different timestamps

For a selected baseline, based on the creation date, the table shows Actuals values for the past fiscal periods from the created date and Planned values for the current and future fiscal periods.

Consider a planning item scoped from July 2023 to June 2024. Baseline A is created on 2023-10-01. If you compare the Current Financials baseline in December 2023 to the baseline captured in October 2023:

1. The baseline comparison view show Actuals vs Actuals columns from July 2023 to September 2023.

Name	Cost type	FY23: M07			FY23: M08			FY23: M09		
		Actuals	Actuals	Variance	Actuals	Actuals	Variance	Actuals	Actuals	Variance
Professional services	External labor Capex	3,500	3,500	0	3,500	3,500	0	4,700	4,700	0
Travel costs	Other Opex	800	800	0	450	450	0	0	6,000	(6,000)
Labor costs	Labor Capex	9,800	9,800	0	9,800	9,800	0	9,800	9,800	0
Software costs	Software Capex	0	0	0	3,000	3,000	0	3,000	3,000	0
Hardware costs	Hardware Capex	4,000	4,000	0	4,000	4,000	0	4,000	4,000	0
other costs	Other Capex									
Server costs	Hardware Capex									
Total		18,100	18,100	0	20,750	20,750	0	21,500	27,500	-6,000

2. Planned vs Actuals for October 2023 and November 2023.

Name	Cost type	FY23: M10			FY23: M11		
		Planned	Actuals	Variance	Planned	Actuals	Variance
Professional servi...	External labor Capex	3,000	3,000	0	3,000	4,000	(1,000)
Travel costs	Other Opex	450	500	(50)	450	600	(150)
Labor costs	Labor Capex	9,800	9,800	0	9,800	9,800	0
Software costs	Software Capex	3,000	3,500	(500)	3,000	3,000	0
Hardware costs	Hardware Capex	4,000	4,000	0	4,000	4,000	0
other costs	Other Capex		0	0		0	0
Server costs	Hardware Capex					1,200	(1,200)
Total		20,250	20,800	-550	20,250	22,600	-2,350

3. Planned vs Planned from December 2023 to June 2024.

Name	Cost type	FY23: M12			FY24: M01			FY24: M02			FY24: M03		
		Planned	Planned	Variance	Planned	Planned	Variance	Planned	Planned	Variance	Planned	Planned	Variance
Professional servi...	External labor Capex	3,000	3,000	0	3,000	3,000	0	3,000	3,000	0	3,000	3,000	0
Travel costs	Other Opex	450	450	0	450	450	0	450	450	0	450	450	0
Labor costs	Labor Capex	9,800	9,800	0	9,800	9,800	0	9,800	9,800	0	9,800	9,800	0
Software costs	Software Capex	3,000	3,000	0	3,000	4,000	(1,000)	3,000	4,000	(1,000)	3,000	4,000	(1,000)
Hardware costs	Hardware Capex	4,000	4,000	0	4,000	5,000	(1,000)	4,000	5,000	(1,000)	4,000	5,000	(1,000)
other costs	Other Capex	1,000	(1,000)										
Server costs	Hardware Capex	1,000	(1,000)										
Total		20,250	22,250	-2,000	20,250	22,250	-2,000	20,250	22,250	-2,000	20,250	22,250	-2,000

Note:

The columns are defined to calculate EAC, which is the sum of Actual costs until the last fiscal period and Planned costs from current to future fiscal periods.

Budget allocation

Portfolio managers can manage and approve the budget for planning items. The approved budget helps project managers to plan and meet the expenses to execute work.

Plan and approve the budget for a shorter planning cycle at monthly, quarterly, or yearly level using the lean budgeting and funding feasibility. Lean budgeting helps Portfolio managers to track the value in return for the approved budget and to better plan the budget for future fiscal periods.

Note:

If the budget is allocated monthly, the total budget is rolled up to quarterly and yearly level. Similarly, if the budget is allocated at a quarterly or yearly level, the equal breakdown happens until monthly level.

For more information on how to allocate, approve, and handle budget for planning items, see, [Manage budget of your planning items in Strategic Planning](#).

Tip:

In the budget allocation view, Portfolio managers review the EAC to understand the financial projections made by Project managers and use the **Copy cost as budget** option to allocate the entire planned cost as budget.

Choose the cost type as the attribute to allocate and approve the budget for individual cost types such as labor, non-labor.

Project managers can view the approved budget at the required time scale using the Budget vs forecast option from the display modes. As the work progresses and the actuals are captured, you can compare the budget and actual costs using the Budget vs forecast mode and reforecast the planned costs where the actuals are exceeding the budget using the inline edit feature at the required time scale.

Product managers can compare the latest cost with the approved budget by Capex or Opex, cost types, and for the required time scale at monthly, quarterly, or yearly level. The comparison view provides insights to Product managers to locate any variance at expense type or cost type, and at which fiscal period. Product manager can leverage this information to request for additional budget from the Portfolio manager.

You can migrate the budget of existing active projects and demands items from the Classic UI to Next Experience. Financials in the Next Experience has new budget data model that facilitates to store the budget at a detailed level by monthly breakdowns and cost types. You can migrate the budget for active projects and demands individually or by bulk using the scheduled job.

- Migrate budget of active projects from Classic UI to Next Experience. For more information, see [Migrate budget of active projects to Next Experience](#).
- Migrate budget of active demands from Classic UI to Next Experience. For more information, see [Migrate budget of active demands to Next Experience](#).

Note:

The migrated budget is captured in the `sn_invst_pln_invst_budget` table to enable the lean budgeting for required time scope.

Budget distribution logic

The budget allocation approach introduces data-aware budget distribution, prioritizing actuals for completed periods and planned costs for future periods. The system uses different distribution strategies depending on whether actuals or Estimate at Completion (EAC) values are available, and whether the fiscal period falls in the past, present, or future.

Budget allocation logic is divided into three focus areas: past fiscal periods, current fiscal periods, and future fiscal periods.

1. Past fiscal periods that have already ended.

- If actuals exist, the budget is distributed proportionally to actual spending. If the total budget amount equals the total actuals, the distribution exactly matches the actual values.
- If there are no actuals, the budget is distributed evenly across the past fiscal periods.

2. The current fiscal year is like a mid-year scenario where both past and future fiscal periods are available.

- For past or completed fiscal periods, the system distributes the budget proportionally matching the actual expenses. If there are no actual expenses, budget is allocated as zero (0).
- If planned costs exists for the current and future fiscal periods the remaining budget is distributed proportionally based on the planned costs.
- If planned costs doesn't exists for the current and future fiscal periods, budget is distributed evenly across the fiscal periods.

3. Future fiscal periods

- If planned costs exists, the remaining budget is distributed proportionally based on planned costs.
- If planned costs doesn't exists, the remaining budget is distributed evenly across the remaining fiscal periods.

Budget distribution based on financial records

Fiscal periods	Available financial data	Distribution method
Past fiscal	Actual expenses	Proportional to actuals
Past fiscal	No financial records	No budget allocation
Current year – past fiscals	Actual expenses	Allocate budget proportionate to actual values
Current year – remaining months	Planned costs exists	Allocate budget proportionate to planned costs
Current year – remaining months	No planned costs	Even distribution
Future fiscal periods	Planned costs exists	Allocate budget proportionate to planned costs
Future fiscal periods	No financial records	Even distribution

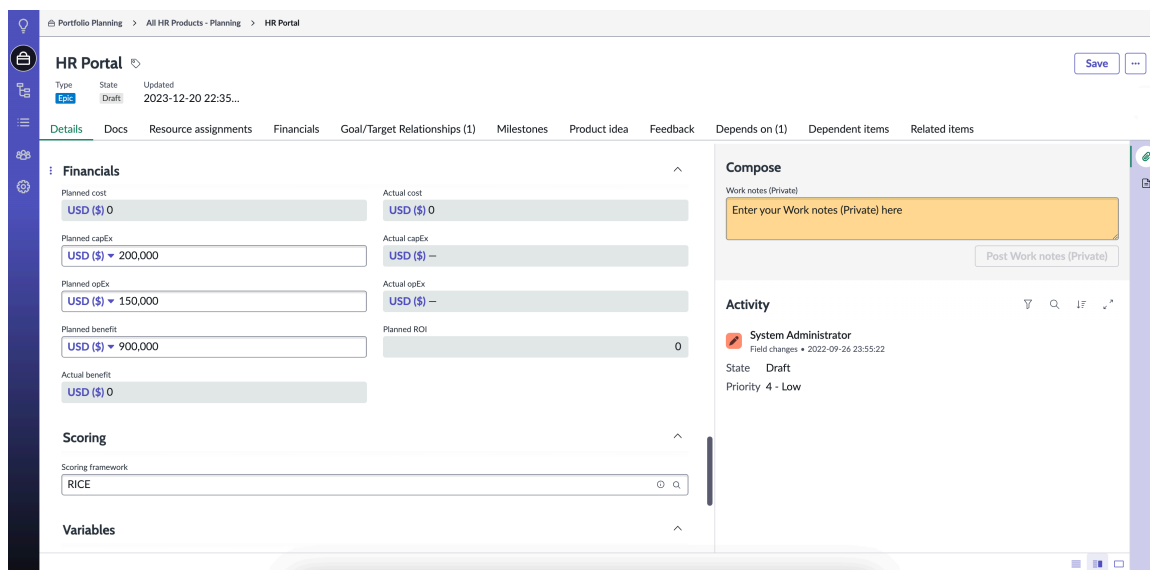

Benefit plans

Monetary benefit plans capture potential benefits accrued while executing a planning item. Non-monetary benefit plans capture the potential non-financial benefits accrued while executing a planning item. You can create and manage [monetary benefit plans](#) and [non-monetary benefit plans](#) to capture the potential benefits of your planning items.

Instead of switching to and fro from the financials record page to benefit plan tabs, you now have a seamless experience to manage all the cost plans and benefit plans from the Cost and benefits view and can leverage the new financials experience with the side panel and grids for quick forecasting and tracking of monetary benefit plans.

Simple financials

Simple financials gives you the ability to enter the preliminary high-level planned capex, opex, benefit, and so on from the Details page without capturing the costs plans from the Cost view. You can update the simple financials values as required until you have the planned and actual costs captured.

Using the baseline feature, you can capture these simple financial values in a baseline and compare them against any existing baseline. You can:

- Reforecast simple financials and compare the by selecting the Current Financials from the list of baselines.
- Capture the planned and actual expenses as the project progresses and compare any financial baseline with a simple financials baseline to track the financial performance of the planning item.

Configure multicurrency for planning items

Select investment currency as an additional currency, which can be different from your functional currency, to manage financial records of your planning items.

Before you begin

- [Enable monetary benefit plans for planning items](#)
- Role required: admin

Procedure

1. Navigate to **Workspaces > Portfolio Planning** and select portfolio plan.
2. Select a planning item from the Planning module.
3. Select the **Financials** tab.

In the **Currency** field, the current system currency is displayed. For example, if your Functional currency is in USD, the field is displayed as **USD (Functional)**.

4. Select **Confirm** to save the investment currency selection.

Add, edit, or delete cost plans

Create a cost plan for a required duration to track your planned and actual expenses. Edit cost plans to adjust your planned expenses and delete any de-scoped forecasts.

Before you begin

Role required: sn_align_ws.spw_financial_user

Procedure

1. Navigate to **Workspaces** > *Portfolio Planning Workspace* and open a planning item.
2. Select the **Financials** tab.

Tip:

Create a [financial baseline](#) immediately after capturing the initial planned costs to have a snapshot of your planned costs. Use this baseline to compare it against the baselines from later dates, as the work progresses, to identify the variance between initial planned costs and actual expenses.

This helps you to plan for the future expenses and re-forecast the planned costs.

Manage budget of your planning items in Portfolio Planning

Allocate, manage, and approve budget for your planning items. Lean budgeting enables you to allocate budget for short planning cycles for different fiscal periods such as monthly, quarterly, or yearly breakdown level rather than allocating the budget to the complete duration of the planning item.

Before you begin

- As an Admin, enable the property to work on budgeting. For more information, see [Enable financial budget allocation for planning items in Portfolio Planning](#).
- As an Admin, configure the attribute to allocate and approve budget by cost type or expense type. For more information, see [Configure budget attribute at instance-level to allocate budget](#).
- Role required: it_portfolio_manager

Procedure

1. Navigate to **Workspaces** > *Portfolio Planning Workspace* and open a planning item.
2. Select the **Financials** tab.
3. Enable the **Budget allocation** toggle ().
4. You can manage the budget by one of the following ways for the selected time scale at monthly, quarterly, or yearly level.
 - Double-click each cell in the Budget column to manually enter the value.
 - Select **Copy cost as budget** from the Budget column options to copy the EAC as budget. You can always reforecast the budget for each cost type using the in-grid editing feature even if the EAC is copied as budget.

Note:

Unapproved budget values are indicated with  icon.

5. Select **Approve budget ().**

Approve budget confirmation window is displayed. The **Create a financial baseline for this budget approval** option is enabled by default which captures the latest budget and financial estimates.

Tip:

The financial baseline created while approving the budget can be compared with the future baselines once the actual expenses are captured to track financial performance.

6. On the confirmation window, select **Approve (.****Result**

Budget widget is updated to reflect the latest approved budget. Project Manager can view the approved budget and compare it with the planned costs using the **budget vs cost** view by cost type.

Add or edit expense lines

Create or edit expense lines to capture the actuals costs. You can associate the expense lines with a cost plan or create standalone expense lines to record unplanned expenses.

Before you begin

Role required: sn_align_ws.spw_financial_user

About this task

An expense line is part of the project cost plans that can be associated with a specific source. You can create multiple expense lines for a cost plan. Only the expense lines that are in the processed state are considered for roll ups on the work item.

For unplanned expense lines which are not associated to any cost plan, system automatically creates a cost plan or associates to an existing system generated cost plan of the same expense type.

Procedure

1. Navigate to **Workspaces** > *Portfolio Planning Workspace* and open a planning item.
2. Select the **Financials** tab.
3. Add an expense line using one of the following options.
4. On the Create expense line form, fill the fields.
For a description of the field names, see [Create expense line form](#).
5. Select **Save**.

Generate labor costs

Generate labor costs in the Financials view for attribute-based resource assignments based on the financial attributes configured in the planning attributes page.

Before you begin

When the distribution of effort for a resource assignment is adjusted without changing the total planned effort, the system automatically recalculates and generates labor costs to align with the updated effort distribution. For example, consider a resource assignment of 100 hours distributed as 60 hours in January and 40 hours in February; now if you swap the efforts to make 40 hours in January and 60 hours in February. Now the system automatically adjusts the labor costs so that January reflects the cost of 40 hours and February reflects the cost of 60 hours, ensuring that costs accurately correspond to the revised effort distribution.

Role required: sn_align_ws.spw_financial_user

Procedure

1. Navigate to **Workspaces** > *Portfolio Planning Workspace* and select a planning item.
2. Select the **Financials** tab.
3. Select **Generate labor costs** ().
4. Select **Generate** on the Generate labor costs confirmation window.

Note:

Alternatively, you can [activate a scheduled job](#) to automatically create baselines at the required cadence.

Create and compare financial baselines for demands and projects

Create and compare financial baselines to get a snapshot of the project expenses and compare the planned costs against the actual expenses.

Before you begin

Role required: sn_align_ws.spw_financial_user

Procedure

1. Navigate to **Workspaces** > *Portfolio Planning Workspace* and select a planning item.
2. Select **Financials** from the left menu.
3. Create or compare baselines.

Tip:

You can migrate existing financials baselines of your projects or demands from Classic UI to Financials in Next Experience.

For more information on how to migrate financial baselines of demands, see [Migrate financial baselines of demands to Next Experience](#).

For more information on how to migrate financial baselines of projects, see [Migrate financial baselines of projects to Next Experience](#).

Create monetary benefit plans for your planning items in Portfolio Planning

Create and manage monetary benefit plans to capture the potential benefits while executing your planning items.

Before you begin

- [Enable monetary benefit plans for planning items](#)
- [Add monetary and non-monetary benefit plans related lists](#)
- Role required: sn_align_ws.spw_financial_user

Procedure

1. Navigate to **Workspaces** > *Portfolio Planning Workspace* and select a planning item.
2. From the list of portfolio plans, select a portfolio plan.
3. From the Prioritization or Roadmap tab, select the planning item to create a monetary benefit plan.
The full details page of the planning item is displayed.
4. Create a monetary benefit plan using one of the following options.
5. On the Benefit Plan form, fill the fields.
For a description of the field names, see [Benefit Plan form](#)
6. Select **Save**.

Result

The newly created monetary benefit plan appears in the financials record page and in the monetary benefit plans related list.

What to do next

- [Edit monetary benefit plan.](#)
- [Capture actual monetary benefits.](#)

Edit monetary benefit plan

Edit a planned monetary benefit plan to revise the benefits, dates, offset, and so on, to maintain the updated financial records as your work progresses.

Before you begin

- [Create monetary benefit plans for your planning items in Portfolio Planning](#)
- Role required: sn_align_ws.spw_financial_user

Procedure

1. Navigate to **Workspaces** > *Portfolio Planning Workspace* and select portfolio plan.
2. From the Prioritization or Roadmap tab, select the planning item for which you want to edit a monetary benefit plan.
The full details page of the planning item is displayed.
3. Update a monetary benefit plan using one of the following options.

Capture actual monetary benefits

Capture the actual benefit from the planned benefits to measure revenue and calculate the profits.

Before you begin

- [Create monetary benefit plans for your planning items in Portfolio Planning](#)
- Role required: sn_align_ws.spw_financial_user

Procedure

1. Navigate to **Workspaces** > *Portfolio Planning Workspace* and select portfolio plan.
2. From the list of portfolio plans, select a portfolio plan.
3. From the Prioritization or Roadmap tab, select the planning item for which you want to capture actual monetary benefits.
The full details page of the planning item is displayed.
4. Capture actual monetary benefits using one of the following options.
5. **Optional:** You can change the previously captured planned benefit from the **Entered benefit** field.
6. Enter the actuals benefits resulted from the work execution in the **Actual benefit** field and select **Save**.

Manage non-monetary benefit plans for your planning items in Portfolio Planning

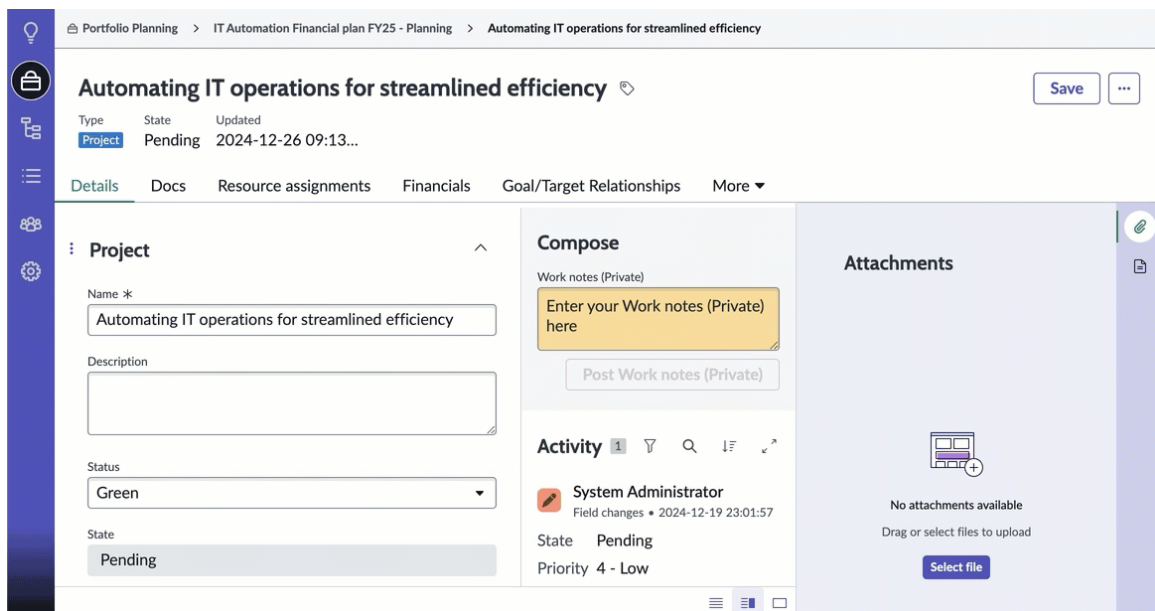

Create and manage monetary benefit plans to capture the potential benefits while executing your planning items.

Before you begin

Role required: sn_align_ws.spw_financial_user

Procedure

1. Navigate to **Workspaces** > *Strategic Planning Workspace* and select portfolio plan.
2. Select a planning item from the Planning module.
3. Select the **Non-monetary Benefit Plans** related list.

4. On the Benefit Plan form, fill the fields.
For a description of the field names, see [Non-monetary benefit plans form](#).
5. Select **Save**.

Export financials as Excel or CSV file

Export the costs or baseline comparison data of your planning items to easily share them with your stakeholders.

Before you begin

Role required: sn_align_ws.spw_financial_user

Procedure

1. Navigate to **Workspaces** > *Portfolio Planning Workspace* and select a planning item.
2. Select the **Financials** tab.
3. Select the Export option ().
4. In the Export side panel, select **Excel** or **CSV** from the File type list and select the **Export** button (.

The financials data is download as an Excel or CSV file with name_fin_mmddyy naming convention. The breakdown of the naming convention:

- a. name - fetches the first 10 characters from the name of the planning item.
 - b. fin - denotes that the file has financial data.
 - c. mmddyy - system date format when you're exporting this data.
- For example, if you're downloading financials data for a planning item named Documentation on January 26, 2024, then the file name reads documentat_fin_012624.

Note:

You can export financials data from Cost view and Baselines comparison view.

Managing portfolio financials in Portfolio Planning

View the financial breakdown of estimates, approved costs, benefits, and actuals and so on for portfolio financials.

As a portfolio user, you can view the rolled up financial values of top-level demands and projects.

You can view the costs by expense type or cost type. Using the Financials view at portfolio level, you can view different financial fields such as Budget (approved budget for planning items), Forecast, Variance (difference between the approved budget and latest forecast), Actuals, and the Remaining Estimates for Capex, Opex, Total, and Benefits for each planning item. This information can be used to track the financials status of the planning items and take an informed decision on which planning items to consider while working on the next planning cycle and track the to avoid overspending.

Using the portfolio financials, portfolio managers can:

- Track the financial performance and status of planning items.
- Arrive at an informed decision by analyzing the estimated cost and benefits of a planning item while planning and prioritizing for the next Portfolio cycle.

- View the financials based on the expense type or cost type depending on the [budget attribute configuration](#).
- Avoid overspending on planning items by comparing the approved budget with the latest forecast and actuals.

i Important: New and existing customers need to configure the portfolio financials to view the financials of your planning items at portfolio level. For more information, see [Configure portfolio financials in Portfolio Planning](#).

The portfolio financials view supports Demands and Projects with Fiscal Calendar type configuration only.

Note:

Group header row displays the rolled up values for Budget, Forecast, Variance, Actuals, and Remaining estimate of all the planning items in the group.

The default view of portfolio financials is set to display the planning items grouped by their budget approval status. Budget approved grouping lists the planning items which have the budget allocated and approved. Approval pending grouping lists the planning items which do not have any budget or if the requested budget is not approved.

Note:

Portfolio financials view is not yet compatible with Investment Funding. This view may not show the right budget values allocated to planning items from Investment Funding application. This will be add as a future enhancement.

In the left-grid, planning item details such as name, rank, planning state, planning item type, approved start date, total planned cost, total actual costs, total planned benefits and ROI for the full planning item duration.

In the right-grid, financial attributes of the planning items such as, Budget, Forecast, Variance, Actuals, and Remaining Estimates for Capex, Opex, Total, and Benefits portfolio for the portfolio timeline or breakdowns by year, quarter, month, or period.

Tip:

You can select the name of a planning item from the left-grid to directly access the financials record page of that planning item.

You can export the portfolio financials details to Excel or CSV using the **Export** option ().

Customize your financials view

Customize the portfolio financials to view and access the required parameters helping you in better planning your portfolio and planning items.

- You can get a more detailed and granular view of the financials at monthly, quarterly, and yearly view by defining Timescale and Range. Use time scale to select a fiscal period and filter the range within the time scale to view the financials for any specific months, quarters, or years.

Time scale & range ✕

Select time scale & range to personalize your financials view.

Time scale

Fiscal Month
 Fiscal Quarter
 Fiscal Year
 Plan Timeline

Range start Range end

ⓘ Select up to 5 years.

Time scale and range parameters

Time scale	Description and range
Fiscal Month	Portfolio financials view by monthly breakdown. You can select up to 12 months.
Fiscal Quarter	Portfolio financials view by quarterly breakdown. You can select up to 4 quarters.
Fiscal Year	Portfolio financials view by yearly breakdown. You can select up to 5 years period.
Plan Timeline	Portfolio financial breakdown for the entire portfolio timeline.

- Personalize grouping and columns in the grids.

Configure the columns and groupings in the right-grid using Personalize option () to build a custom view.

For example, if you want to compare budget and actuals breakdowns, select only these two options and apply your preferences. You can also customize the left-grid by selecting the required columns from the **Left Grid** list from the personalize settings.

- Group the planning items.

By default, the financials view is grouped by the Budget status column. You can remove Budget status grouping from the Grouped by row and drag-drop the required header to change this view.

Docs for planning items in Portfolio Planning

Store and manage all kinds of documentation for planning items from a centralized location of Portfolio Planning Workspace.

Docs overview

Product and portfolio managers can store information for planning items using the Docs feature.

- Each planning item can have a separate doc page to capture the information related to it.

For example, for an Epic planning item, you create a doc page for high level business objectives or technical product requirements.

- Each planning item can have multiple doc pages associated to it to help you effectively organize key artifacts.
- Predefined templates such as Project Brief, Product Requirements, Brainstorming Ideas, and Meeting notes are available. Create doc pages for your planning items using one of these templates or start with a blank page.

Features of Docs

The following are the key features of Docs:

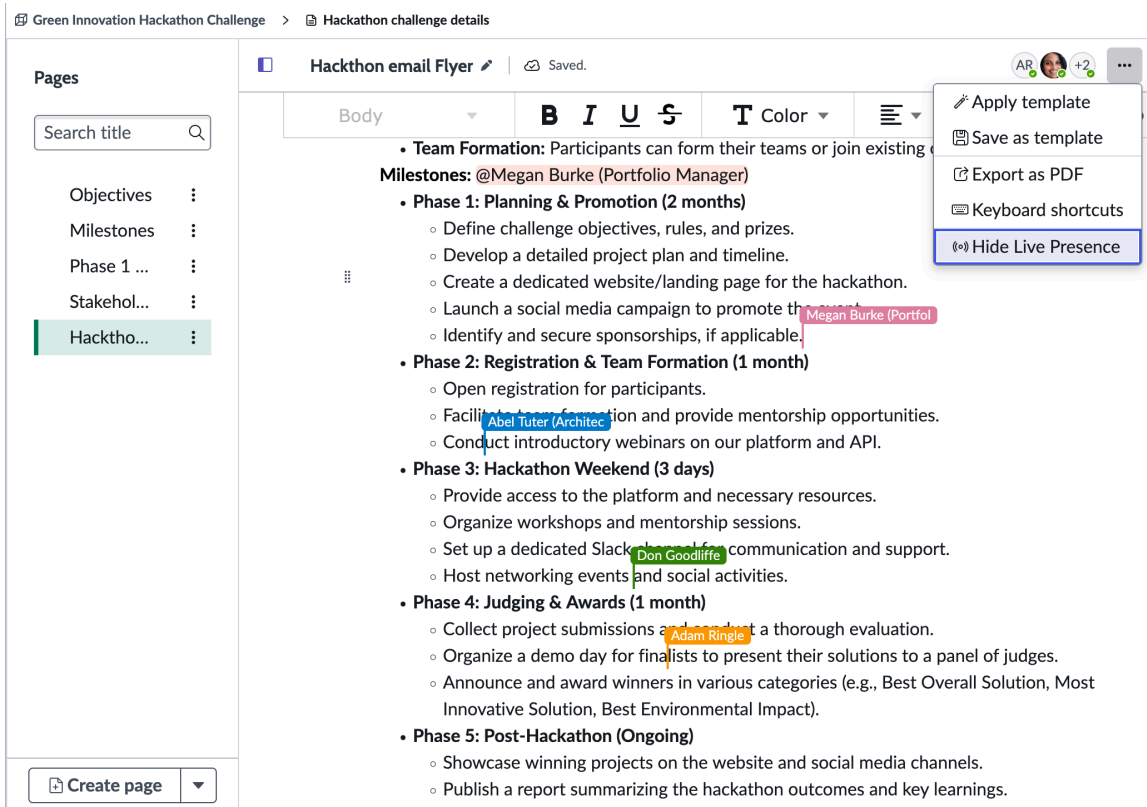

- Auto-save content.
- See who is viewing or working on a doc page using the feature of live user presence.
- Create documents using pre-defined templates.
- Use rich text paragraph formatting, which includes headings, lists, alignment, and others.
- Move text blocks to change their placement using block-level editing.
- Tag team members inline or insert tables using the `/` command.
- Add reference to other ServiceNow AI Platform tables to connect work across teams.
- Insert images by uploading files or using web URLs.

Note:

The experience of inserting Google Images links might not work.

Real-time collaboration within planning item Docs

With the feature of real-time collaboration, edit a doc page concurrently with multiple other editors. Colored cursors denote the current location of each editor on the page. You can choose to show or hide these live presence indicators based on your preference while working on or reviewing the content of the page.

Note:

Huge number of users editing the same block of content simultaneously might result in issues with application performance.

Dynamic data linking in Docs

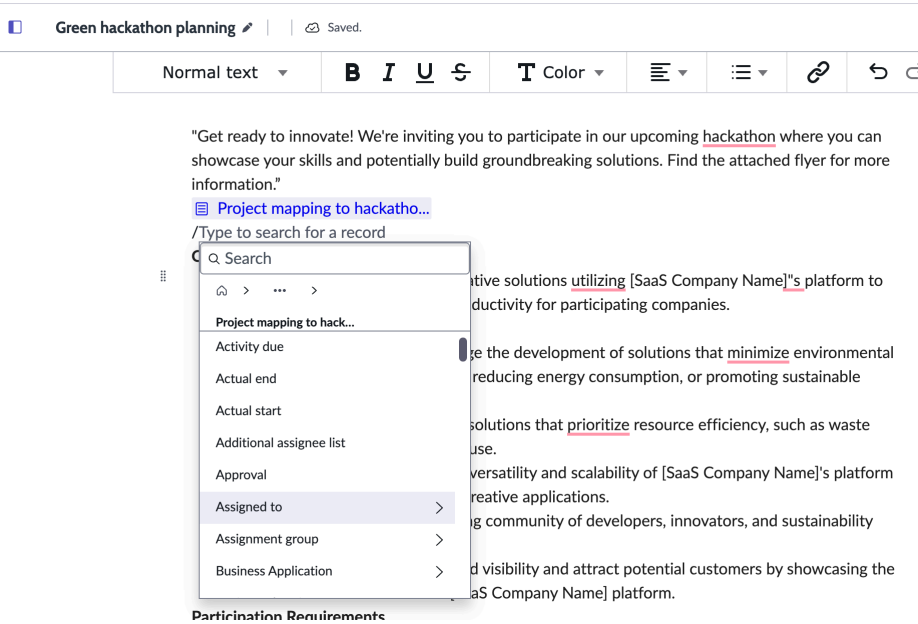

Keep record information in your documentation always current and reduce manual effort with the Dynamic data linking feature in Docs. You can now reference any ServiceNow application record and Docs will automatically reflect the latest updates from those records.

For example, if you add a reference to a Project record, the reference shows the latest field information of the project in Docs without requiring manual edits. Selecting the project reference opens up the project form so that you can view the full details of the project and make any necessary changes.

A hover popover displays the details of the mentioned record, providing quick access to additional information without leaving the current context.

Dynamic linking also enables adding references to a particular field of a record, such as Assigned to of a Project record.

You can add references from any ServiceNow table you have access to, with no setup or configuration needed.

This feature reduces the need to switch between multiple ServiceNow applications within your instance and helps maintain a single, reliable source of truth for collaborative work, making it easier for teams to stay aligned and informed.

Create and manage pages and subpages for planning items

Flexibly organize information for your planning items by creating, duplicating, and deleting pages and subpages in Strategic Planning.

Before you begin

Role required: sn_align_core.apw_user

Procedure

1. Navigate to **Workspaces > Portfolio Planning Workspace > Portfolio Planning**.
2. From the list of portfolio plans, select a portfolio plan.
3. From the Prioritization or Roadmap page, select a planning item that you would like to create a doc page for.
If you have selected a planning item from the Roadmap page, select **Full details** from the **Details** tab of the item's side panel.
4. From the planning item's record page, select **Docs**.
5. To create a page, you can create a blank page or start with a predefined template.
 - For a blank page, select **Create page**.
 - To create from templates:
 - a. Select **Create Page from template**.

- b. Select a template from the Template Center and select **Create page**.

The new page is created and added to your Doc with the name **Untitled**, which you can rename.

6. To create a subpage, select the **Page Actions** menu () and select **Create subpage**.

7. To delete a page or a subpage, select the **Page Actions** menu () and select **Delete**.

Managing portfolio plan views in Portfolio Planning

Portfolio managers can create customized views for their portfolio plans by applying personalization settings such as column selection, grouping, and filtering. Portfolio owners or editors can share these personalized views with stakeholders to enable easier collaboration on the portfolio plans.

Benefits of portfolio plan views

Portfolio managers can create personalized views as needed by applying settings such as column selection, grouping, and filtering.

- Views can be created as private or public.
- Can create up to three private views and up to 10 shared (public) views.
- Portfolio plan views can be shared with stakeholders to enable collaboration on the portfolio plan.
- Switch between shared and private views as needed.
- Each view saves your display preferences across the Prioritization, Roadmap, Capacity, and Financials tabs.

Create a portfolio plan view

Create a customized portfolio plan view based on your requirements, so you can access it when you log in again and share it with stakeholders for collaboration.

Before you begin

Role required: sn_align_core.ap_read_only

About this task

You can create up to three private views and up to 10 shared (public) views per portfolio plan.

Procedure

1. Navigate to **Workspaces > Portfolio Planning Workspace > Portfolio Planning**.
2. From the list of portfolio plans, select one.
3. Make any changes to the view as needed.
For example, apply filter with the **Department** attribute and the value as **Finance**.

The **Save as new view** option appears on the portfolio plan header.

	Ra...	1:	Name	Planning state	Planning item type	MoSCoW	Approve
	1		Contract Migration Playbook & Program	Prioritized	Demand	1 - Must have	2023-11
	2		Seal Contracts Search and Analytics	In Review	Demand	2 - Should have	2024-02
	3		FY25 Seal Contracts Search and Analytics	Prioritized	Demand	2 - Should have	2024-02
	4		Replace Legacy CS with ServiceNow	Prioritized	Demand	2 - Should have	2024-02
	5		FY25 Replace Legacy CS with ServiceNow	Prioritized	Demand	2 - Should have	2024-02
	6		Develop Workday SN Integration	New	Demand	1 - Must have	2023-11
	7		Attendance Management System	Prioritized	Demand	1 - Must have	2023-10
	8		Workday Time Tracking for Employees with Temporary Work Schedules	New	Demand	2 - Should have	2023-11
	9		Sourcing Request Portal	New	Demand	2 - Should have	2023-10
	10		Offer Request Form	Prioritized	Demand	3 - Could have	2024-01
	11		FY25 Offer Request Form	Done	Demand	3 - Could have	2024-01
Total							

4. From the portfolio plan header, select **Save as new view**.

5. On the Save as new view window, fill the details.

a. Enter a name for the view in the **View name** field.

b. **Optional:** Select the **Shared view** toggle to make this view public.

Selecting the **Shared view** toggle makes the view visible to all stakeholders with whom this portfolio plan is shared.

c. Select **Save**.

Result

The shared view for the portfolio plan is created and will be visible to all stakeholders with whom this portfolio plan is shared.

What to do next

- Share the portfolio plan with your stakeholders to start collaborating on the portfolio plan. See [Share a portfolio plan with stakeholders](#).
- Edit a portfolio plan view to make any changes to the existing view. See [Edit a portfolio plan view](#).

Edit a portfolio plan view

Edit a customized portfolio plan view based on your requirements, so you can access it when you log in again and share it with stakeholders for collaboration.

Before you begin

Role required: sn_align_core.ap_read_only

About this task

- Only the owner of a portfolio plan view can edit a shared (public) view.
- You can have up to three private views and up to ten shared (public) views per portfolio plan.

Procedure

1. Navigate to **Workspaces > Portfolio Planning Workspace > Portfolio Planning**.
2. From the list of portfolio plans, select one.
3. From the portfolio plan header, select the view you want to edit or override with your personalization settings from the list of available portfolio plan views. The selected view appears.
4. Make changes to the view as needed. For example, apply filter with the **Department** attribute and the value as **Finance**.

After you make any change to the view, the Save view option appears in the portfolio plan header.

5. Select **Save view**. The view is updated to reflect the changes made.
6. **Optional:** To edit name of the view, select the Portfolio plan view drop-down from the portfolio plan header and then select Edit view icon (🔗) next to the view you want to edit the name for. On the Edit view window, fill the details.

- a. Update the name for the view in the **View name** field as required.

Note:

Only the owner of the portfolio plan view can rename the view.

- b. **Optional:** Select the **Shared view** toggle to make this view public or disable the **Shared view** toggle to make the view private.

Important:

Changing a shared view to a private view removes access for existing stakeholders.

- c. Select **Save**.

(Optional) The name of the view is updated.

What to do next

Share the portfolio plan with your stakeholders to start collaborating on the portfolio plan. See [Share a portfolio plan with stakeholders](#).

Related topics

- [Create a portfolio plan view](#)
- [Delete a portfolio plan view](#)

Delete a portfolio plan view

Delete a customized portfolio plan view if it is no longer needed or if the maximum limit of ten shared or three private views has been reached.

Before you begin

Role required: sn_align_core.ap_read_only

About this task

- Only the owner of the portfolio plan view or an editor of the portfolio plan can delete the view.
- Deleting a portfolio plan deletes the view, including any changes made to the view. However, this action keeps the items (projects, demands, epics) intact in the portfolio plan.
- You can have up to three private views and up to ten shared (public) views per portfolio plan.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Portfolio Planning**.
2. From the list of portfolio plans, select one.
3. Select the Portfolio plan view drop-down from the portfolio plan header and then select Delete view icon (🗑️) next to the view you want to delete. The Delete this view window appears.
4. On the Delete this view window, select **Delete**.

The screenshot shows the 'ACME Corporation' workspace with a 'department level vi...' dropdown menu. Below the menu are tabs for 'Prioritization', 'Roadmap', 'Capacity', and 'Financials'. A 'Grouped by: None (Drag the column headings here to set groups)' label is present above a table of projects.

Using dashboards in Portfolio Planning

Using the Platform Analytics dashboards in Portfolio Planning Workspace, you can monitor performance, track progress, and make informed decisions related to planning and execution.

Roles required for managing dashboards

Required roles to access out-of-the-box dashboards

Access level	Required roles
Read, duplicate, or share the Execution Dashboard	sn_align_core.ap_read_only Note: To view data in financial-related and capacity-planning-related widgets, users must have the appropriate roles.
Edit the Execution Dashboard	admin

Required roles to create or edit dashboards (excluding out-of-the-box dashboards)

Access level	Required roles
Create dashboards	sn_align_core.apw_user
Edit dashboards	sn_align_core.apw_user Note: You can edit dashboards that you own or those you've been granted permission to edit.

Note:

You can create widgets in dashboards by configuring any available data source table in the ServiceNow AI Platform. However, you must have read access to the source tables to view key data, metrics, or visualizations.

For example, if you create a widget in a dashboard configuring the Cost Plan Breakdown table to display budget data, the budget summary is visible on the dashboard only if you have read access to the Cost Plan Breakdown table. Similarly, when you share this dashboard with a stakeholder, the stakeholder must also have read access to the Cost Plan Breakdown table to view the budget summary.

For more information on the required roles to manage Platform Analytics dashboards, see [Platform Analytics dashboard roles](#).

Execution Dashboard in Portfolio Planning Workspace

The Execution Dashboard helps portfolio and product managers gain real-time visibility into delivery progress across work items, enabling portfolio leads to detect delays, course-correct early, and keep the strategy on track.

The Execution Dashboard provides various analytics across different tabs, including Overview, Financial, Milestones & Dependency, Capacity, RIDAC, Data Quality, and Geo.

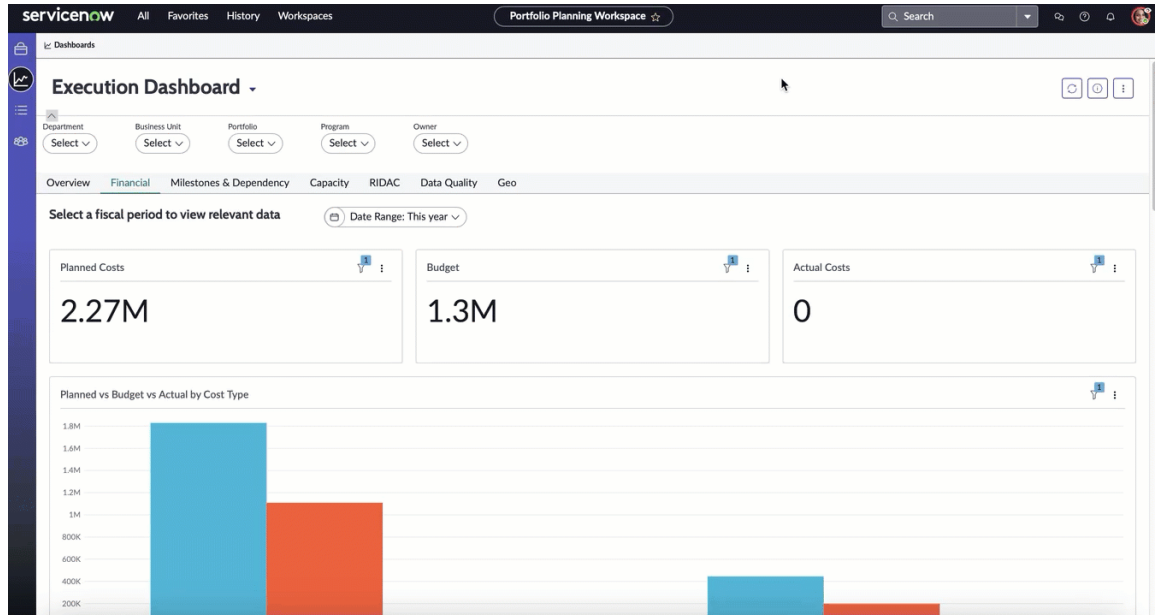

Overview tab in the Execution Dashboard

Widget/Visualization	Description
Delayed Planning Items	Planning items that were prioritized but haven't started yet (no recorded actual start date), despite having an approved start date in the past.
Overdue Items	Prioritized planning items that remain incomplete (no recorded actual end date), despite having an approved end date in the past.
Dependencies whose provider planning item is in Red status	Dependencies that have a provider planning item in red status, affecting all dependent planning items.
Planning Items	
New and In-Review Items	Visualization of new and in-review planning items grouped by Priority. You can also group the items using other available options.
Prioritized Items	Visualization of prioritized planning items grouped by Status. You can also group the items using other available options.
Completed Items	Visualization of planning items whose state is Done. You can also group the items using other available options.
Execution Items	
Projects	Visualization of projects count grouped by State. You can also group the items using other available options.

Widget/Visualization	Description
Demands	Visualization of demands count grouped by State. You can also group the items using other available options.

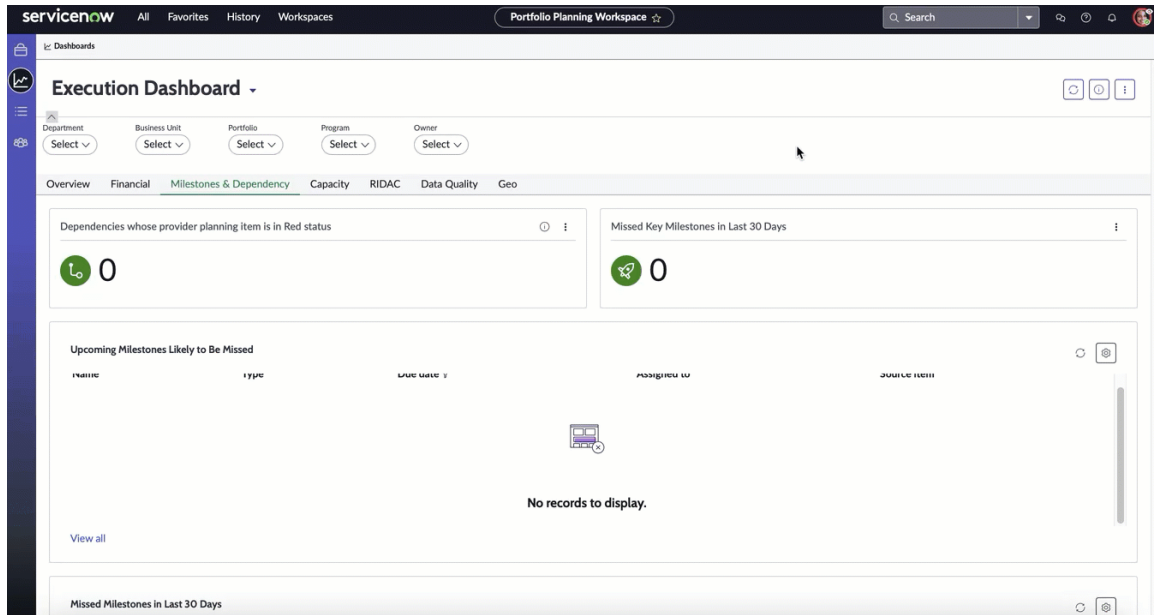

Financial tab in the Execution Dashboard

Widget/Visualization	Description
Select a fiscal period to view relevant data	Option to select date range as This year or Last year to filter and display the data accordingly. Clearing the date range displays the data considering from the start date of the portfolio plan.
Planned Costs	Estimated cost for executing the plan.
Budget	Estimated budget for executing the plan.
Actual Costs	Actual cost incurred during plan execution.
Planned vs Budget vs Actual by Cost Type	Visualization of Planned vs Budget vs Actuals by Cost Type.
Planned vs Budget vs Actual	Visualization of cost by Planned vs Budget vs Actual.
Budget by Investment Type	Visualization of budget by Investment type.
Benefits	
Planned Monetary Benefits	Monetary benefits that have been planned.
Actual Monetary Benefits.	Monetary benefits that have been achieved.
Pending Monetary Benefits.	Monetary benefits that are in pending state.
Benefits by Category	Benefits by category such as Revenue, Cost savings, and Customer satisfaction score.

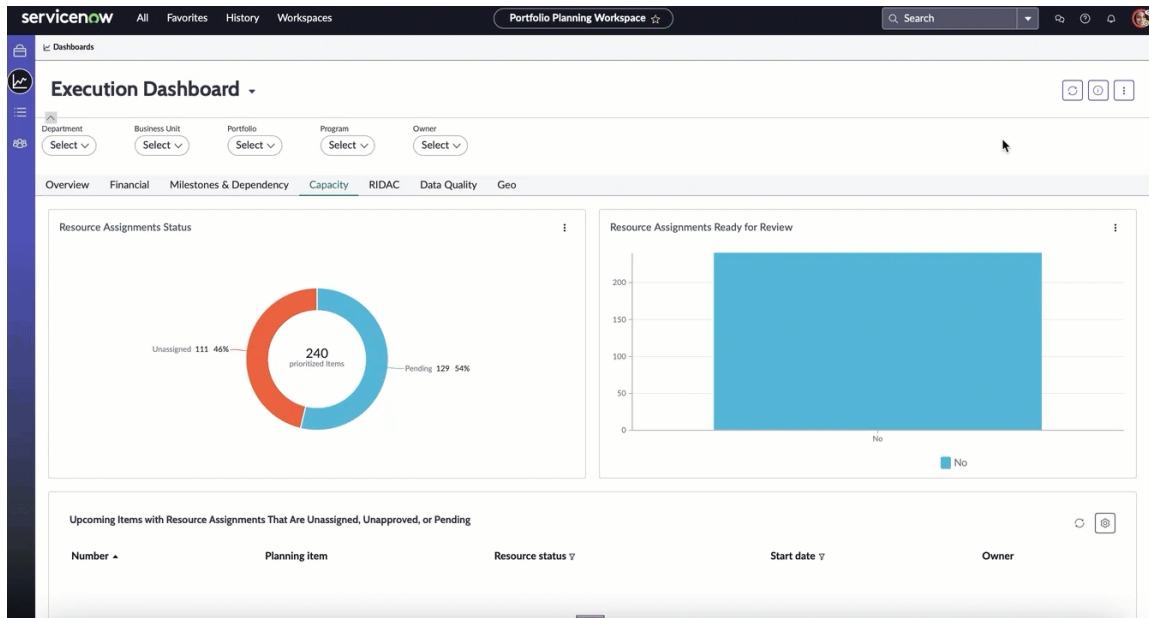

Widget/Visualization	Description
Monetary Benefits	Visualization of monetary benefits with respect to planned and actual benefits.

Milestones & Dependency tab in the Execution Dashboard

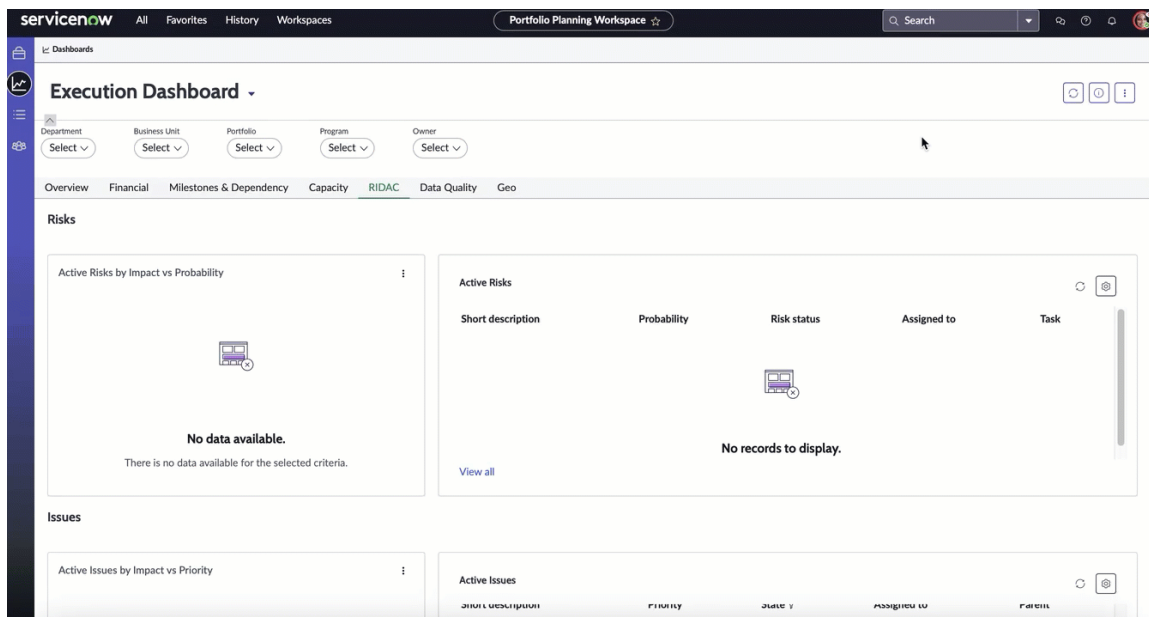

Widget/Visualization	Description
Dependencies whose provider planning item is in Red status	Count of dependencies that have a provider planning item in red status, affecting all dependent planning items.
Missed Key Milestones in Last 30 Days	Count of planning items whose key milestones were missed within the last 30 days.
Upcoming Milestones Likely to Be Missed	List of planning items whose key milestones about to be missed soon with details including Name, Type, Due date, Assigned to, Source item.
Missed Milestones in Last 30 Days	List of planning items whose key milestones were missed within the last 30 days with details including details, Name, Type, Due date, Assigned to, and Source item.
Achieved Milestones in Last 30 Days	List of planning items whose key milestones were achieved within the last 30 days with details including details, Name, Type, Due date, Assigned to, and Source item.
Milestones Analyzer	Visualization of key milestones grouped by state and stacked by Type. You can also group and stack the items using other available options.

Capacity tab in the Execution Dashboard

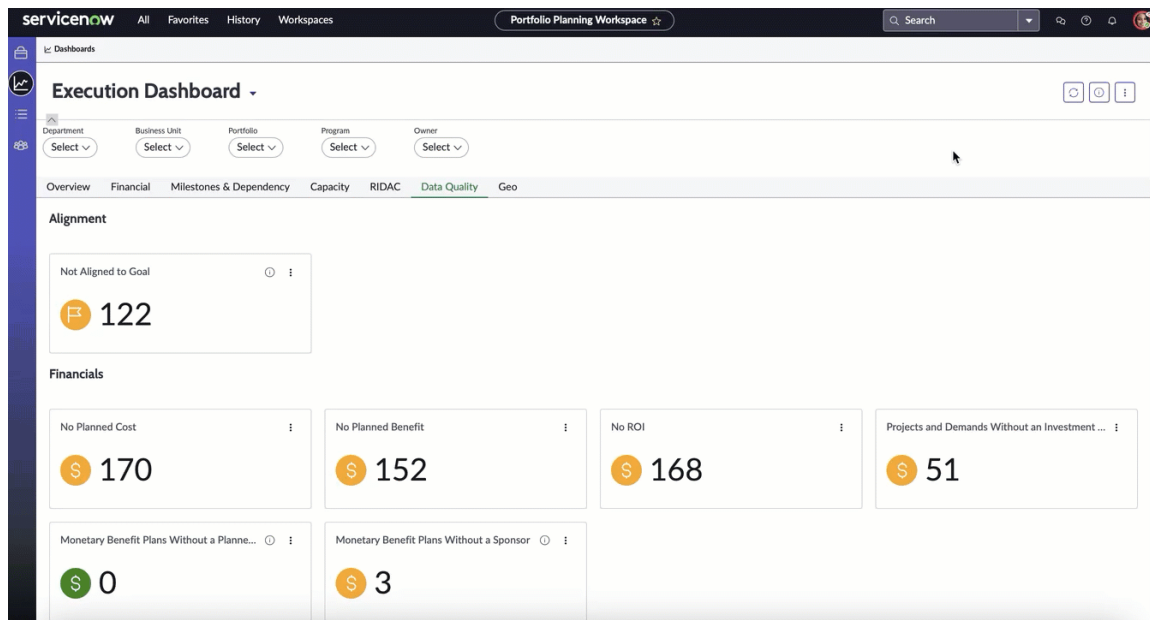

Widget/Visualization	Description
Resource Assignments Status	Visualization of resource assignments status.
Resource Assignments Ready for Review	Visualization of resource assignments count that is ready for review.
Upcoming Items with Resource Assignments That Are Unassigned, Unapproved, or Pending	List of upcoming planning items whose resource assignments status is Unassigned, Unapproved, or Pending.
Resource Assignments by Group, Role & Skill	Visualization of resource assignments count by their group, role, and skill.

RIDAC tab in the Execution Dashboard

Data Quality tab in the Execution Dashboard

Widget/Visualization	Description
Alignment	
Not Aligned to Goal	Count of work items that aren't associated with any goal.
Financials	
No Planned Cost	Count of work items for which cost estimation is done yet for execution.
No Planned Benefit	Count of work items for which benefit estimation is done yet.
No ROI	Count of work items for which ROI isn't estimated yet.
Projects and Demands Without an Investment Type	Count of projects and demands for which Investment type isn't defined yet.
Monetary Benefit Plans Without a Planned Benefit	Count of monetary benefit plans for which benefit isn't defined yet.
Monetary Benefit Plans Without a Sponsor	Count of monetary benefit plans for which a sponsor hasn't been assigned yet.
Planning Items with Other Attributes	
No Resource Assignments	Count of planning items without resource assignments.
Unscheduled Items	Count of planning items not scheduled yet.
No Portfolio	Count of planning items with no portfolio defined.
No Program	Count of planning items with no program defined.

Widget/Visualization	Description
No Department	Count of planning items with no department populated.
No Business Unit	Count of planning items with no business unit populated.
No Owner	Count of planning items with no owner assigned.

Geo tab in the Execution Dashboard

Widget/Visualization	Description
Planned cost by location	Estimated cost by location for executing the plan.

View a dashboard in Portfolio Planning Workspace

View key data and metrics on a dashboard to monitor performance, track progress, and make informed decisions related to planning and execution.

Before you begin

Role required: sn_align_core.ap_read_only

About this task

Dashboards consolidate data from multiple sources into a single, easily digestible format. Each widget within a dashboard displays key data and metrics and may include visualizations.

Procedure

1. Navigate to **Workspaces > Portfolio Planning Workspace > Dashboards**.
By default, the Execution Dashboard appears on the Dashboards page.
2. **Optional:** From the Change dashboard drop-down, select the dashboard you want to view.
The selected dashboard appears on the Dashboards page.
3. **Optional:** Select a required tab that you want to view the key data and metrics for.
Each widget within a dashboard displays key data and metrics and may include visualizations.
4. **Optional:** Select a widget to see more details of the data in list view.
If you have edit access, you can update the details of an individual record directly from the list view when necessary.

Related topics

Create a dashboard

In the Platform Analytics experience, you can create shareable dashboards with data visualizations, filters, and other elements. You can use the available elements in the inline editor to create different types of widgets as needed.

Before you begin

Role required: sn_align_core.apw_user

About this task

Dashboards consolidate data from multiple sources into a single, easily digestible format. Each widget within a dashboard displays key data and metrics and may include visualizations.

Procedure

1. Navigate to **Workspaces > Portfolio Planning Workspace > Dashboards**.
By default, the Execution Dashboard appears on the Dashboards page.
2. From the dashboard header, select the More actions icon () and then select **Create new**.
3. On the New dashboard window, fill the details.
 - a. Enter a name for the dashboard in the **Name** field.
 - b. **Optional:** Enter a brief description for the dashboard in the **Description** field.
 - c. Select **Create new dashboard**.

What to do next

Edit a dashboard as needed by adding sections, filters, images, lists, process mining maps, and rich text. For more information, see [Edit a dashboard](#).

Edit a dashboard

Customize or edit a dashboard as needed by adding sections, filters, images, lists, process mining maps, and rich text. If the dashboard has been shared, any changes you make are applied globally.

Before you begin

Role required: sn_align_core.apw_user

About this task

Note:

- You can edit dashboards that you own or those you’ve been granted permission to edit.
- Only an administrator can edit the out-of-the-box dashboard that is Execution Dashboard. However, you can [duplicate an out-of-the-box dashboard](#) and customize it as needed.

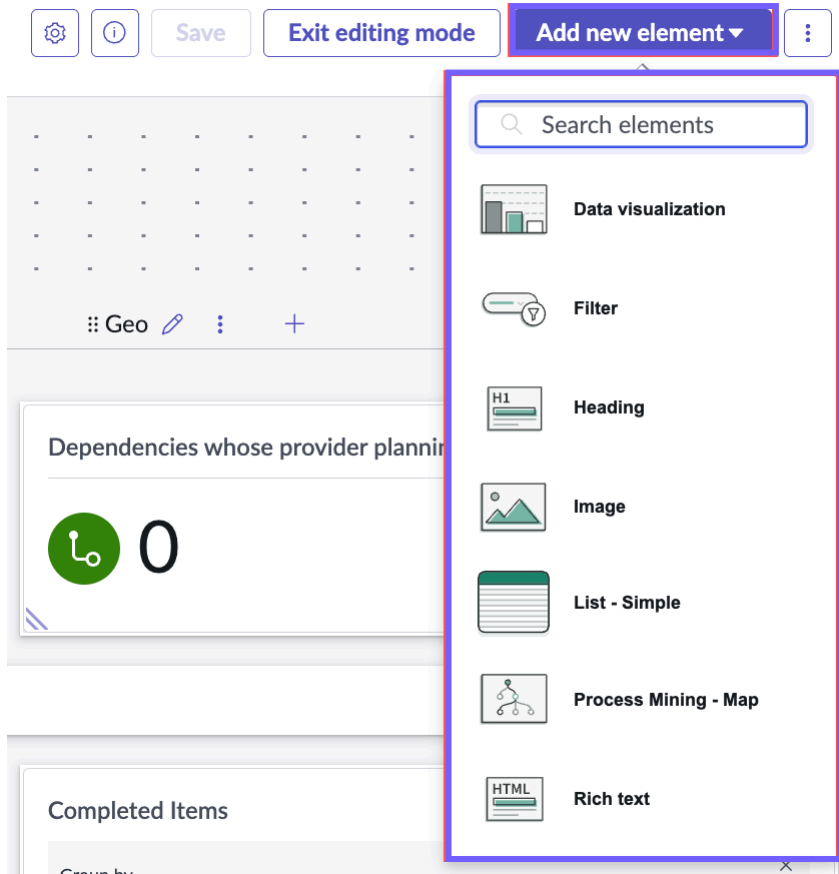

You can use the following elements to create or edit your dashboard.

Dashboard elements in Strategic Planning

Element	Description
Data visualization	Enables you to present a visual representation of current instance data or temporary data that you’ve imported. Data visualizations include visualizations that you create in the dashboard

Dashboard elements in Strategic Planning (continued)

Element	Description
	designer and data visualizations from the library.
Filter	Enables you to filter the visualizations on a dashboard based on specified criteria. You can put filters either on the individual tabs or above the tabs so that the filter applies to elements every tab. Filters include both data filters and domain filters. You can create filters in the dashboard designer or select them from the library.
Heading	Provides a place for text at the top of a dashboard or section of a dashboard. Formatting for headings is limited to six heading levels.
Image	Holds static or animated images on the dashboard.
List - Simple	Shows table data that you can customize for the dashboard audience.
Process Mining - Map	Maps the different states that are part of your process and the transitions between those states. See which states the objects of the process are in and the speed with which they change state. Requires an existing Process Mining project.
Rich text	Holds text that you can format either as text or as html, including font selection, text size, highlighting, and hyperlinks. To edit HTML markup, open the HTML editor from the Configuration panel and select the Code tags < > icon.

Procedure

1. Navigate to **Workspaces > Portfolio Planning Workspace > Dashboards**.
By default, the Execution Dashboard appears on the Dashboards page.
2. From the Change dashboard drop-down, select the dashboard you want to edit.
The selected dashboard appears.
3. From the dashboard header, select **Edit**.
4. Drag to move the widget or resize it as required.
5. From the dashboard header, select **Save**.
6. From the dashboard header, select **Exit editing mode**.

Result

The dashboard is updated with the latest changes.

What to do next

- Add more elements and customize your dashboard as required.
- For detailed instructions on editing a dashboard using the Platform Analytics experience in Portfolio Planning, see [Edit Platform Analytics dashboards](#).

[Share a dashboard](#)

[Add a Platform Analytics dashboard](#)

Duplicate a dashboard

If the dashboard you want to create is similar to an existing one, duplicating the existing dashboard saves your time. After duplicating the dashboard, you can customize the tabs and widgets as required.

Before you begin

- Users or groups that you want to share the dashboard with must have the `sn_align_core.ap_read_only` or `sn_align_core.apw_user` role to get the read or edit access to the portfolio plan respectively.
- When you duplicate a dashboard, you copy all settings and details of the original. Content that exists locally on the original dashboard is duplicated onto the new dashboard. If the original dashboard contains references to content in a library, such as a shared visualization, the references are duplicated. The role requirements for editing an element in a library apply to the latter.

Role required: `sn_align_core.ap_read_only`

Procedure

1. Navigate to **Workspaces > Portfolio Planning Workspace > Dashboards**.
By default, the Execution Dashboard appears on the Dashboards page.
2. From the Change dashboard drop-down, select the dashboard that you want to duplicate.
3. From the dashboard header, select the More actions icon () and then select **Duplicate**.
4. On the Duplicating dashboard window, fill the details.
 - a. Enter a name for the portfolio plan in the **New name** field.
By default, the name is *ABC (Copy)* where ABC is the name of the dashboard you duplicated from.
 - b. **Optional:** Enter a brief description of the goal in the **Description** field.
 - c. Select **Duplicate**.

Duplicating the dashboard can be time-consuming. Select **Continue in background** to keep using the application in the meantime.

Result

The dashboard is copied with the new name. The appearance of the dashboard is identical to the original.

What to do next

Edit a dashboard as needed by adding sections, filters, images, lists, process mining maps, and rich text. For more information, see [Edit a dashboard](#).

[Share a dashboard](#)

[Add a Platform Analytics dashboard](#)

Share a dashboard

Share a dashboard with stakeholders, planning managers, portfolio managers, or product managers to provide visibility into work progress and foster collaboration. You can grant either view-only rights or both view and edit rights to a shared dashboard.

Before you begin

Role required: sn_align_core.ap_read_only

About this task

Users or groups you want to share the dashboard with must have the appropriate roles assigned to access shared dashboards:

Procedure

1. Navigate to **Workspaces > Portfolio Planning Workspace > Dashboards.**

By default, the Execution Dashboard appears on the Dashboards page.

2. From the Change dashboard drop-down, select the dashboard you want to share.

The selected dashboard appears.

3. From the dashboard header, select the More actions icon () and then select **Share.**

4. On the Share Dashboard window, fill the details.

a. Enter a user name or group name in the **Grant access to** field to provide access to individual users or user groups, respectively.

You can also select a role to grant dashboard access to all users assigned to that role.

b. Optional: Select **Allow recipients to add, edit, or delete sharing permissions associated with this dashboard** to enable users to grant access to new users and modify or remove existing permissions.

c. Select **Add as viewer** or **Add as editor** as required.

 Note:

You can select **Add as editor** only if you have the sn_align_core.apw_user role assigned to you.

The selected users, groups, and roles appear under **Manage Access.**

You can also manage to share permissions by selecting a user, group, or role and enabling the **Can share** option.

d. Select Confirm.

Result

The roles, groups, and users you have shared the dashboard with appears again when you reopen the dialog, along with the rights you have given them.

What to do next

You can change the rights of whom you have shared the dashboard with in the Share Dashboard dialog, under the Can view/Can share list for each user, group, or role.

Add a Platform Analytics dashboard

If you have existing dashboards created using Platform Analytics, you can add them to the Portfolio Planning Workspace to access them directly from a single location.

Before you begin

Role required: sn_align_core.apw_user

About this task

You can add any Platform Analytics dashboard to the Portfolio Planning Workspace.

Procedure

1. Navigate to **All > Platform Analytics > Analytics Center**.
The Dashboards section appears on the page.
2. From the **Bookmarked** or **Certified** tabs, select a bookmarked or certified dashboard .
If the dashboard that you want to add isn't bookmarked or certified, select **View all** from the Dashboards section, and then select the dashboard from the Dashboards page.
3. From the dashboard header, select **Edit**.
4. From the dashboard header, select the View dashboard details icon ().
 - a. In the Details side panel, fill in the **Dashboard visibility** field with Portfolio Planning Workspace.
5. From the dashboard header, select **Save**.
6. From the dashboard header, select **Exit editing mode**.

Result

The dashboard appears on the Portfolio Planning Workspace.

Export the portfolio plan status or roadmap to Microsoft PowerPoint

Export the status of work items, roadmap, and key metrics of your portfolio plan and free-form roadmap into a Microsoft PowerPoint file so that you can keep your business stakeholders updated on the progress. Save time by avoiding copying data into reports and drive shared outcomes by enabling collaboration even with stakeholders who cannot access your ServiceNow instance.

Before you begin

[Install Export to PowerPoint for Strategic Portfolio Management.](#)

 Important:

Export to PowerPoint is currently unavailable for customers in the FedRAMP, NSC DOD IL5, or Australia IRAP-Protected data centers, self-hosted customers, or in other restricted environments. Please check for availability updates in future releases.

Role required: admin

About this task

The following two PowerPoint templates are provided by default to generate a status report for your portfolio plan:

- Portfolio plan status: Contains individual detailed slides for the top five items prioritized by rank.
- Roadmap Template - default: Contains slides for Roadmap for this portfolio. You can export roadmap data for a maximum period of a year at a time.

You can customize the type of the data to be shown in the generated report by updating a predefined template or by creating your own branded template. See [Create a Microsoft PowerPoint template](#).

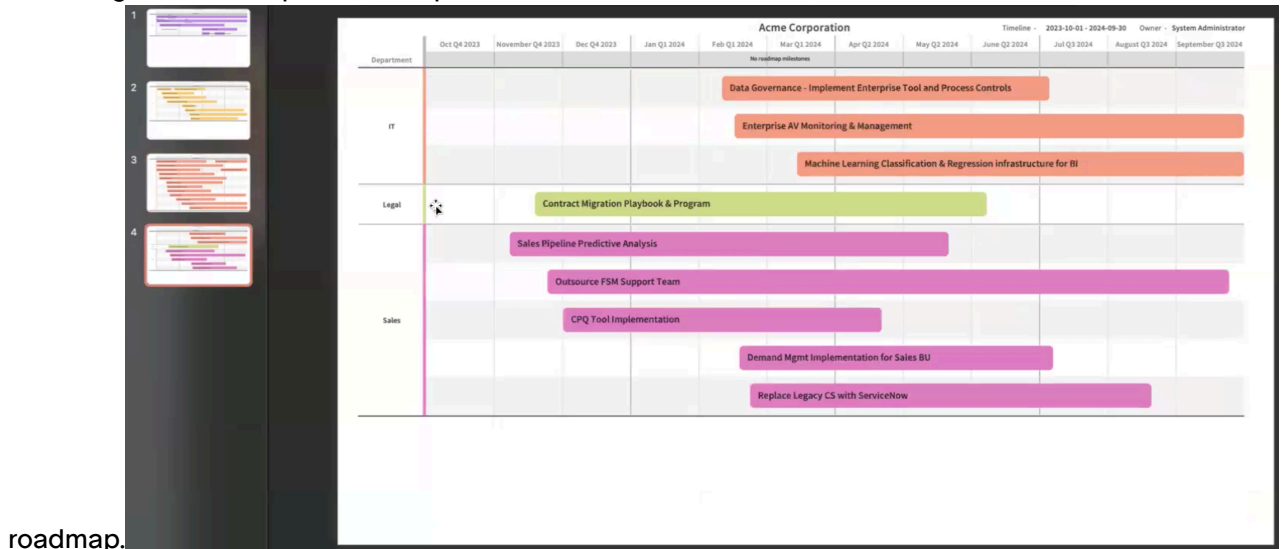

Procedure

1. Navigate to **Workspaces > Portfolio Planning Workspace > Portfolio Planning**.
2. Export the status of goals, work items, roadmap, and key metrics of your portfolio plan and free-form roadmap into a Microsoft PowerPoint file.

Result

A PowerPoint file is generated with the relevant data.

This image is an example for an exported

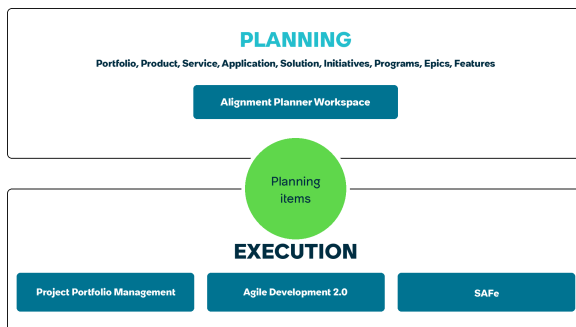

roadmap.

Executing Portfolio Planning work in PPM

Facilitate execution of the work planned in Portfolio Planning in ServiceNow Project Portfolio Management application.

Import, export, and manage your planning items between Portfolio Planning and PPM.

Integrating Portfolio Planning and PPM

Key benefits of Portfolio Planning with PPM

- View available PPM planning items in Portfolio Planning.
- Import planning items from PPM to Portfolio Planning.
- Export planning items from Portfolio Planning to PPM.
- Synchronize updates for linked planning items of Portfolio Planning with PPM.
- Track the progress of the linked planning items in Portfolio Planning.

To get started on integrating Portfolio Planning with PPM, see [Configuring Portfolio Planning with PPM](#).

Frequently asked questions about execution integration

Can I use PPM Standard for project execution without Agile 2.0 or SAFe?

Yes. If your teams follow waterfall or traditional Project Management methodology, use PPM Standard (Project Portfolio Management) as your execution system. Planning items created in Portfolio Planning can be exported to PPM as projects. Changes in PPM (project status, costs, resources) sync back to Portfolio Planning automatically.

Use case: Infrastructure team plans in Portfolio Planning, executes data-center migration project in PPM Standard with Gantt charts, task dependencies, and resource management.

When do I use PPM for execution?

Base your decision on team methodology and org scale: PPM Standard: For waterfall projects, traditional PM teams, infrastructure work, conformance-driven initiatives.

Should I install PPM Standard to use Portfolio Planning?

No. Install PPM Standard if your teams actually uses it. Portfolio Planning works standalone for planning and prioritization. Add the PPM plug-in when teams are ready to execute work in this system.

What data syncs between Portfolio Planning and PPM?

Bi-directional sync includes:

- From Portfolio Planning → execution: Planning item name, description, owner, goals, budget, priority, timeline.
- From execution → Portfolio Planning: Status, progress %, actual costs, resource assignments, risks/issues.
- Real-time updates: Changes in either system appear in both within seconds.

Common execution scenarios

Scenario: PPM only organization (waterfall projects)

1. Portfolio managers create planning items in Portfolio Planning.
2. After prioritization, export planning items to PPM Standard as projects.
3. Project managers build WBS, create tasks, assign resources, manage timeline in PPM.
4. Portfolio Planning shows project status, costs, risks automatically

Troubleshoot execution integration

- Issue: Planning item not appearing in PPM
 - Verify the execution system plugin is installed and activated.
 - Check that planning item state is Prioritized (items in the Backlog state don't export).
 - Confirm user has required role in execution system (project_manager, scrum_admin, safe_admin).
- Issue: Changes in PPM not syncing back to Portfolio Planning
 - Verify bi-directional sync is enabled in integration configuration.
 - Check that the planning item and PPM project/epic are properly linked (primary planning item field is populated).
 - Review transformation maps for any table, field, or choice mapping issues.

Import records to Portfolio Planning Workspace

Import records from Project Portfolio Management, after the relevant table maps, fields maps, and choice maps are configured.

Before you begin

Role required: sn_align_core.apw_admin

Procedure

1. Navigate to **All > Portfolio Planning > Integrations**.
2. Select **ServiceNow Internal** Alignment Integration record.
3. Click **Import**.
4. On the Create Import Request form, fill in the date range for importing the records.

Create Import Request

×
Create Import Request

Select the From and To dates below and click OK to import the records from respective Execution tables to Alignment tables.

* From Date

* To Date

5. Select **OK**.

i Note:

Records that have been created within the specified dates will be imported.

View error logs

View error logs to understand the cause of any issues that might have occurred during the integration process.

Before you begin

Role required: sn_align_core.apw_admin

Procedure

1. Navigate to **All > Portfolio Planning > Integrations**.
2. To view the error logs, select the **Integrations Errors** tab.

Portfolio Planning reference

Reference information to provide additional details about Portfolio Planning such as user roles, tables, and domain separation information.

Components installed with Portfolio Planning

Several types of components are installed with activation of the Portfolio Planning application, including tables and user roles.

Roles installed

Role title [name]	Description	Contains roles
Portfolio Planning admin [sn_align_core.apw_admin]	Can access all the modules in the Portfolio Planning application	<ul style="list-style-type: none"> • it_portfolio_manager • sn_align_core.apw_user • view_changer
Portfolio Planning user [sn_align_core.apw_user]	<p>Can create, update, and delete portfolio plans, free-form roadmaps, and planning items.</p> <p>This role can be given to users such as portfolio or product managers, business unit leads, and other planning personas.</p>	<ul style="list-style-type: none"> • sn_align_cmn_int.user • sn_milestones.milestone_editor
sn_align_core.ap_read_only	<ul style="list-style-type: none"> • Can view portfolio plans and free-form roadmaps that are shared with them. • Can add notes, comments, or attachments to portfolio plans and roadmaps that are shared with them. 	sn_milestones.milestone_viewer

Role title [name]	Description	Contains roles
	<ul style="list-style-type: none"> • Can create, edit, and delete portfolio plan views and free-form roadmap views. <p>Note: Only the owner can edit or delete a portfolio plan view or a free-form roadmap view.</p>	
Milestones editor [sn_milestones.milestone_editor]	Can create, update, and delete milestones on the roadmap.	sn_milestones.milestone_viewer
Milestones viewer [sn_milestones.milestone_viewer]	Can view milestones on the roadmap.	None
Business stakeholder [business_stakeholder]	<ul style="list-style-type: none"> • Can create and update portfolio plans and free-form roadmaps. • Can add notes, comments, or attachments to portfolio plans and roadmaps that are shared with them. • Can personalize the roadmaps. • Can view generated resource capacity for planning items in the Capacity Planning screen. • Can view goals and related records using the platform view. <p>Note: Users with this role do not have access to create or edit any roadmap items.</p>	<ul style="list-style-type: none"> • sn_align_core.ap_read_only • sn_align_ws.spw_capacity_read • sn_gf.goal_user_read

Scenario Planning roles

Role title [name]	Description	Contains roles
sn_align_ws.scenario_approver	Can approve the scenarios for the portfolio.	sn_align_core.apw_user

Portfolio Planning with PPM roles

Role title [name]	Description	Contains roles
Portfolio Planning integrations user [sn_align_cmn_int.user]	Imports, exports, and manages planning items between Portfolio Planning and PPM.	connection_admin

Capacity roles

Role title [name]	Description	Contains role
sn_align_ws.spw_capacity_user	Can generate resource capacity details.	sn_align_ws.spw_capacity_read
sn_align_ws.spw_capacity_read	Can view resource capacity details.	None

Financial planning roles

Role title [name]	Description	Contains roles
sn_align_ws.spw_financial_user	Create cost plans and expense lines for planning items.	None

Tables installed

Table	Description
Alignment Integration [sn_align_cmn_int_integrations_setup]	Stores data of integration information for your ServiceNow instance
Choice Map sn_align_cmn_int_choice_map	Stores choice map relationships between fields of planning items of Portfolio Planning and PPM
Demand [sn_align_core_demand]	Stores records created with Demand planning item type.
Dependency	Stores data of dependencies between roadmap items.

Table	Description
[sn_align_core_dependency]	
Field Map [sn_align_cmn_int_field_map]	Stores field map relationships between planning items of Portfolio Planning and PPM
Import Request [sn_align_cmn_int_import_request]	Stores imports requests from Portfolio Planning to PPM
Instance Mapping [sn_align_cmn_int_instance_mapping]	Stores mapping information between instances
Integration Error [sn_align_cmn_int_integration_error]	Stores errors for integration between Portfolio Planning and PPM
Integration Mapping [sn_align_cmn_int_integration_mapping]	Stores Integration mappings between Portfolio Planning and PPM
Lens [sn_align_core_lens]	Stores data of the lens configuration.
Lens structure [sn_align_core_lens_structure]	Stores data of lens entities and the relationship between them for different lenses.
Planning Item [sn_align_core_planning_item]	Stores the data of all planning item types.
Portfolio plan [sn_align_ws_portfolio_plan]	Stores data of portfolio plans.
Project [sn_align_core_project]	Stores records created with Project planning item type.
Roadmap configuration [sn_align_ws_roadmap_configuration]	Stores the configuration data for tables that are used to create portfolio roadmaps and free-form roadmaps.
Table Map	Stores table mapping relationships between planning items in Portfolio Planning and PPM

Table	Description
sn_align_cmn_int_table_map	

System properties installed

Portfolio Planning with PPM system properties

Name	Description
com.sn_align_cmn_int.bulk_import	<ul style="list-style-type: none"> • Type: Choice list • Default value: INSERT • Other possible values: <ul style="list-style-type: none"> ○ INSERT ○ <Value 2 names> • Location: System Property [sys_properties] table • Learn more: Configure bulk import

Domain separation and Portfolio Planning

Domain separation is supported for Portfolio Planning. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see [Application support for domain separation](#) .

Overview of domain separation in Portfolio Planning

You can create lens, portfolio plans, planning items, and roadmaps in different domains.

How domain separation works in Portfolio Planning

After you enable domain separation on your ServiceNow instance, the data of Portfolio Planning is automatically domain separated. So, the data of lens, portfolio plans, planning items, and roadmap configuration for different domains is visible to only those users who have access to these domains.

Domain separated tables in Portfolio Planning

All the tables installed with Portfolio Planning support domain separation. For a complete list of tables, see [Components installed with Portfolio Planning](#).

Planning item reorder errors in Portfolio Planning

Review the scenarios when the reordering of items can fail in the List view of Prioritization in Portfolio Planning Workspace.

To update the rank of the planning items in the work pipeline of your portfolio plan, you can reorder the items from the List view of the Prioritization page. While doing so, the reorder can fail due to an error in the ranking configuration. Following are the scenarios where reordering of planning items can fail:

Scenario 1: Global ranking plugin is not active

Check if the Global Ranking Application plugin (com.snc.sdlc.ranking) is active in your ServiceNow instance. If not, contact your admin to activate it.

Scenario 2: Planning item doesn't have a rank configuration

Check if all the planning items that you are reordering have a rank configuration. If not, contact your admin to update rank configuration for these planning item types.

Scenario 3: Target row doesn't have a global rank

Check if the planning item before or after your target position to reorder has a global rank. If not, contact your system admin to generate a global rank for them.

[Rank planning items](#)

Item milestone errors in Portfolio Planning Workspace

Learn about the scenarios when the planning item milestones on the portfolio plan roadmap or free-form roadmap can be in an error state in the Portfolio Planning Workspace.

An item milestone can fall out of the approved start or end dates of the item when you reschedule the existing planning item.

When you reschedule a planning item on the roadmap, the due dates of its milestones don't change. So, if the due date of a milestone is falls outside the item's date range, the indicator for that out-of-range milestone is hidden and moved to an

error state. Indicators for milestones that are still within the item's date range are

visible.

The milestones that are out of sync with the item's schedule can be viewed from the Milestones tab on the side panel. From the side panel, you can edit and adjust the due date of the milestone to reflect the change of plans. See [Update roadmap item](#)

milestones.

Note:

You can't update a project milestone from the roadmap view. Updating project milestones may impact the associated cost and resource plans of the project. So, it's recommended to update project milestones using Project Workspace in Project Portfolio Management (PPM).

Item dependency errors in Portfolio Planning Workspace

Learn about the scenarios when the planning item dependencies on the portfolio plan roadmap or free-form roadmap in Portfolio Planning Workspace can be in an error state.

A dependency between two planning items can be in an error state when a scheduling conflict exists between the items. In a linear (Depends on) dependency, the items are scheduled in a way that starting the work on one item requires completing the work on another item.

Note:

Error states are displayed for only if the planning items have a **Depends on** type of relationship.

In the sample roadmap shown here, starting work on **Employee onboarding process improvement** is dependent on the completion of **Specific onboarding path for new hire**. This relation is considered a linear dependency. Here, **Employee onboarding process improvement** is scheduled to start before the end date of **Specific onboarding path for new hire**. This conflict is indicated on the roadmap with an error icon (❗), and is also mentioned in the Dependencies tab of the Item details side panel.

To resolve such errors, review the scope of the planning items and update the start or end dates to adjust their scheduling accordingly.

Managing Portfolio Planning with PPM

Ensure that Portfolio Planning is integrated properly with Project Portfolio Management (PPM) following these guidelines.

- Do not change the filter condition of a table map after the records are interfaced. The already interfaced records might not match with the new filter condition and any change in the filter condition can result in data inconsistency. If you need to change the filter condition, ensure that the relevant attributes on the interfaced records are updated manually to avoid data inconsistency issues.
- Whenever a table map is created, ensure that the relevant field maps and choice maps are also configured.
- When an import job for a table map is running (processing), do not modify the table map or its field maps.
- Using the **Converted to** field on the planning item form, you can identify the original record from which it was converted.
- Ensure that the **Lookup field** and **Lookup column** values are added whenever the execution and alignment tables are referencing two different tables, while creating a field map for field type of reference or glide list.
- If there is a data synchronization failure, check if:
 - The **Integration error logs** related list within that Alignment integration record.
 - The **Alignment table filter** (for import) and **Execution table filter** (for export) conditions are met.
 - The **Active** flag in both the alignment integration and the table map is checked.
 - The appropriate fields and choices are configured for each table map.

- If you want to view the **Execution URL** field, configure the planning item record to view it.
- If the Execution URL field in your synced planning item(s) is blank, navigate to **Portfolio Planning > Integrations** and click **Fix execution URL(s) for planning items**. This action creates and updates the execution URL field.
- A **Primary goal** field is introduced to the projects, demands, and epics table maps to support the integration of the **Goal** field between alignment and execution tables.
- When you are trying to import or export a project, ensure that the demands (that are a part of that project) are synced.
- You can create a table map for any execution table. If a table map is not created from one of the delivered tables (dmn_demand, pm_project) or does not extend from them, you are required to create a business rule to support the interfacing of the table map records. For more information on creating a business rule, see [Create a business rule to apply a custom table map configuration](#).

Form field information for Portfolio Planning

Field information for forms used in the Portfolio Planning application.

Action Assignment form

Learn about the fields of the Action Assignment form. Use this form to add the **New** action button to the APW List Menu Configuration page.

Goal form

Field	Description
Action Label	Name of the action label. Enter New.
Action name	Name of the action. Enter <code>create - new - ux f</code> .
Implemented as	Implementation for the action. Select UXF Client Action .
Table	Name of the table the action is created for. Select sys_ux_list_menu_config .
Specify client Action	Client action. Look up and select Create New Record .
View	View of the form on which the action button is displayed.

Choice map form

Understand the fields of the choice map form. This form is used to create choice maps.

Choice map form

Field	Description
Execution table column	Field column of the selected execution table that needs to be mapped. The value in this field is automatically added based on the selection made in the field map configuration.
Execution choice	Select the choice field value of the selected execution table column field.
Alignment table column	Field column of the selected alignment table that needs to be mapped. The value in this

Choice map form (continued)

Field	Description
	field is automatically added based on the selection made in the field map configuration.
Alignment choice	Select the choice field value of the selected alignment table column field.

Create cost plan form

Use this form to create cost plans for your planning items.

Create cost plan form

Field	Description
Name	Name of the cost plan.
Entered currency	Currency to capture the unit cost value.
Unit cost	Planned cost for the cost plan.
Quantity	Quantity of cost plans.
Total planned cost	Total planned costs value of the cost plan.
Start fiscal period	Starting month in a fiscal period for the cost plan.
End fiscal period	Ending month in a fiscal period for the cost plan.
Cost distribution	Allocate planned cost by fiscal period or duration. Select a value from the list. <ul style="list-style-type: none"> • Split equally across fiscal periods - Distributes the cost equally among all the fiscal periods across the duration. • Recurring per fiscal period - Recurs the cost for each fiscal period across the duration.
Cost type	Cost type of the cost plan. Select a cost type form the list. <p>i Note: Based on the selected cost type, the Role and Product model fields appear.</p>
Employee type	Read-only field. <ul style="list-style-type: none"> • External if Cost type is External labor Capex or External labor Opex. • Internal if Cost type is Labor Capex or Labor Opex.
Role	Name of the role to expense the cost plan.

Create cost plan form (continued)

Field	Description
Product model	<p>Available if the Cost type is Software, Hardware, or Other Capex or Opex.</p> <p>Select a model from the list to expense the cost plan.</p> <p>Model name of a hardware expenditure to expense the cost plan.</p>

Create expense line form

Use this form to create expense lines for your actual expense.

Create expense line form

Field	Description
Number	Auto-generated number for the expense line.
Amount	Expense incurred.
Short description	<p>Short description of the expense.</p> <p>Mention unique and specific details to identify the expense line.</p>
Date	Date of the expense.
Process date	Processed date of the expense.
Cost plan	Associated cost plan name for recording the expense line.
Cost type	<p>Cost type of the expense.</p> <p>by default, the cost type of the cost plan is selected.</p>
State	<p>State of the expense line.</p> <p>Only processed expense lines are considered for an investment entity.</p>
Expense type	<p>Defines the expense type, internal or external.</p> <p>By default, the expense type is considered from the Cost type field entry.</p>
Rate card	Name of the rate card.
Summary type	Business purpose of the expense line.

Dependency form

Learn about the fields of the dependency form. Use this form to add and establish dependencies between planning items on the roadmap in Portfolio Planning .

Dependency form

Field	Description
Planning item	<p>Planning item that you selected from the roadmap, to create the dependency. Consider this as the successor item.</p> <p>This field is automatically filled based on your selection.</p>
Relationship type	<p>Choose one of the following:</p> <ul style="list-style-type: none"> • Depends on: Starting the work on one item depends on finishing the work of the other item. This dependency is considered a linear relationship. • Relates to: Work of the two items is related to each other but doesn't have a strict dependency on each other's completion. This dependency is considered a non-linear relationship.
Planning item	Planning item that is required. Consider this as the predecessor item.
Number	System-generated unique identification number for the dependency.

Field map form

Understand the fields of the field map form. This form is used to create mappings for a corresponding table map.

Field map form

Field	Description
Execution table	Table in Agile Development 2.0, SAFe, or PPM that needs to be mapped with a table in Strategic Planning. The value in this field is automatically added based on the selection made in the table map configuration.
Execution table column	Field column of the selected execution table that needs to be mapped.
Alignment table	Table in Strategic Planning that needs to be mapped with a table in Agile Development 2.0, SAFe, or PPM. The value in this field is automatically added based on the selection made in the table map configuration.
Alignment table column	Field column of the selected alignment table that needs to be mapped.

Field map form (continued)

Field	Description
Flow type	<p>Specifies whether the mapping is done from alignment to execution, execution to alignment, or both.</p> <p>Here, alignment implies Strategic Planning, and execution implies PPM, Agile Development 2.0, and SAFe applications.</p>

Demand planning item form

Learn about the fields of the demand form. Use this form to create or edit the details of a planning item of the type Demand in Portfolio Planning.

These fields are displayed on the full details page of the planning item.

Demand planning item form

Field	Description
Name	Brief description of the planning item.
Description	<p>Detailed information of the planning item.</p> <p>You can refine demand description using the Write planning item skill, if the Now Assist for SPM application is installed.</p>
State	Current working state of the planning item.
Owner	User assigned to this planning item.
Planning state	State of the planning item in the Strategic Planning Backlog.
Category	Category of this planning item. Choose from Strategic or Operational .
Execution URL	Link to the demand's execution record in Next Experience for Demand Management.
MoSCoW	<p>Priority of this planning item based on its importance. The available options are:</p> <ul style="list-style-type: none"> • 1 - Must have • 2 - Should have • 3 - Could have • 4 - Won't have
Portfolio	Portfolio that this planning item is associated to.
Program	Program that this planning item is associated to.

Demand planning item form (continued)

Field	Description
Product	Product that this planning item is associated to.
Strategic program	Strategic program that this planning item is associated to.
Primary goal	Goal that is associated with this planning item as the primary goal.
Product enhancement	Product enhancement that this planning item is associated to.
Primary target	Target that is associated with this planning item as the primary target.
Work notes	Notes to capture the updates and discussions on the planning item as the work progresses.
Strategic priority	Strategic priority that this planning item is associated to.

Dates section of the Demand planning item form

Field	Description
Approved start date	Approved start date for this planning item.
Approved end date	Approved end date for this planning item.
Planned start date	Date on which the work for this planning item is planned to start. This value is copied from the Approved start date field.
Planned end date	Date on which the work for this planning item is planned to be complete. This value is copied from the Approved end date field.

Details section of the Demand planning item form

In this section, capture additional details for this planning item such as Investment type, Execution type, impacted business application, and more.

Field	Description
Investment class	Choose from Run and Change
Investment type	Type of investment this planning item comes under. For example, if completing work on this item improves the user experience for your product, select End User Experience .
Priority	Priority of this planning item.
Business application	Business application that this planning item is related to.

Details section of the Demand planning item form

In this section, capture additional details for this planning item such as Investment type, Execution type, impacted business application, and more.

(continued)

Field	Description
Other impacted business applications	Business applications that this planning item has an impact on.
Business capabilities	Business capabilities of this planning item.

Business case section of the Demand planning item form

In this section, capture business details for this planning item such as risks, scope, blockers for this planning item.

Field	Description
Business case	Business case to invest in this planning item.
Risk of performing	Risks to the business if work on this planning item is completed.
Risk of not performing	Risks to the business if work on this planning item isn't completed.
Enablers	Enablers for this demand.
Barriers	Blockers, if any, for this planning item.
In scope	Defined criteria for this planning item.
Out of scope	Clearly defined criteria that is not necessary for this planning item.
Assumptions	Assumptions, if any, to work on this planning item.

Financials section of the Demand planning item form

In this section, capture financial details for this planning item such as cost, CapEx, OpEx, benefit, ROI, and other estimates.

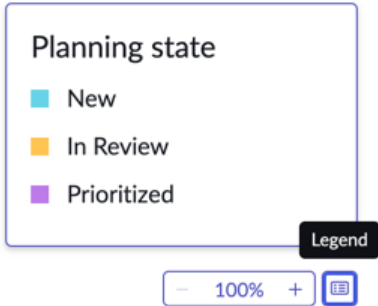

Field	Description
Planned cost	Planned cost to take up this planning item.
Planned capEx	Planned capital expenditure for this planning item.
Planned opEx	Planned operational expenditure for this planning item.
Planned ROI	Planned return of investment for this planning item.
Financial return	Financial return on this planning item.
Planned benefit	Planned benefit from this planning item.

Assessment data section of the Demand planning item form

Field	Description
Impact	Impact that this planning item has on the business.
Risk	Numerical value for the risk associated with this planning item.
Value	Numerical value for the value obtained with this planning item.
Score	Score of the planning item.

Highlighted Value Condition form

Learn about the fields of the Highlighted Value Conditions form. Use this form to configure the display of highlighted fields in Portfolio Planning workspace.

Field	Description
Condition	Condition for the field value. For example, Status is Green.
Color	Color for the field value that meets the condition specified.
Application	Scope of your ServiceNow instance. By default, this field is set to Portfolio Planning .
Order	Order in which this color appears on the legend in the Hierarchy view of the Prioritization page. For example, for the Planning Status column, the value New is given the order 1. 
Hide Label	Option to hide the label for the highlighted value condition. When selected, the Label field is not available.
Label	Name of the label displayed for the highlighted value condition. This field is not available when Hide Label is selected.
Show Icon	Option to show icon beside the field value.

Field	Description
Icon	Icon that is displayed beside the field value. This field is shown only if the Show Icon field is selected.
Variant	Option to define color variant. The available options are primary , secondary , and tertiary .
Value Override	Custom display text that replaces the actual field value in the view. When specified, the override text appears instead of the stored value.

Highlighted Value form

Learn about the fields of the Highlighted Value form. Use this form to customize the fields to be highlighted on the Prioritization page of a portfolio plan in Portfolio Planning workspace.

Field	Description
Table	Table which contains the highlighted columns. Enter sn_align_core_planning_item .
Application	Scope of your ServiceNow instance. By default, this field is set to Portfolio Planning .
Field	Column of the table that is highlighted in the workspace.

Lens Form

Learn about the fields of the Lens form. Use this form to create a lens in Portfolio Planning.

Lens form

Field	Description
Name	Name of the lens.
Active	Indicates if the lens is active.
Description	Brief description of the lens. You can indicate the business purpose of this lens and the planning managers that would use this lens.
Planning items	Type of work that can be planned using this lens. Move the desired planning item types from the Available list to the Selected list.

Lens structure form

Learn about the fields of the Lens structure form. Use this form to define a structure for your lens in the Portfolio Planning application.

Lens structure form

Field	Description
Entity	<p>Source table for your lens entity.</p> <p>An entity represents a planning level in the perspective of your lens.</p> <p>Select the entity that is relevant for your planning persona from the perspective of this lens. For example, Department, Product Model, or Business Objective.</p>
Entity filter	<p>Conditions to filter data from your entity source.</p> <p>The filtered data is shown on the workspace for your planning persona to select and plan for.</p>
Top entity	<p>Indicates if this entity is the top-level entity of your lens structure.</p>
Parent entity	<p>Entity that is one level above this entity in your current lens structure.</p> <p>This field is available only if the Top entity field isn't selected.</p>
Reference to parent entity	<p>Column in the current entity table that references the parent entity table.</p> <p>For example:</p> <ul style="list-style-type: none"> Entity is Strategic Program [sn_align_core_program] Parent entity is Department [cmn_department] <p>Then the field of the Strategic Program [sn_align_core_program] table that references the Department [cmn_department] table would be Department.</p> <p>This field is available only if the Top entity field isn't selected.</p>

List Applicability form

Learn the field information for the List Applicability form. Use this information to define audience for the newly created lists for Portfolio Planning workspace.

Field	Description
List	Name of the list that you want to define audience for.
Application	This field is set to Portfolio Planning by default.
Applicability	Audience for this list. Set this field to Alignment Workspace Home Audience .
Active	Option to enable this applicability to the list.

Planning item milestone form

Learn about the fields of the planning item milestone form. Use this form to create milestones for the planning items in your roadmap in Portfolio Planning.

Field	Description
Name	Preferred name for your milestone.
Type	Milestone type. Select one from the following: <ul style="list-style-type: none"> • Deadline • Key Milestone • Key Event • Launch Date • Important Date
Due date	The date of the milestone.
State	Status of the milestone. Select one from the following: <ul style="list-style-type: none"> • Upcoming • Missed • Achieved
Assigned to	User who is assigned to the milestone.
Description	Brief description about the milestone.

Project planning item form

Learn about the fields of the project form. Use this form to create or edit the details of a planning item of the type Project in Portfolio Planning.

These fields are displayed on the full details page of the planning item.

Project planning item form

Field	Description
Name	Brief description of the planning item.
Description	Detailed information of the planning item. You can refine project description using the Write planning item skill, if the Now Assist for SPM application is installed.
Status	Status of the planning item.
Owner	User assigned to this planning item.
State	Current working state of the planning item.
Percent complete	Percentage of work completed for this planning item.
Planning state	State of the planning item in the Strategic Planning or Portfolio Planning Backlog.
Execution URL	Link to the project's execution record in the Project Workspace.
MoSCoW	Priority of this planning item based on its importance. The available options are: <ul style="list-style-type: none"> • 1 - Must have • 2 - Should have • 3 - Could have • 4 - Won't have
Portfolio	Portfolio that this planning item is associated to.
Program	Program that this planning item is associated to.
Product	Product that this planning item is associated to.
Strategic program	Strategic program that this planning item is associated to.
Product enhancement	Product enhancement that this planning item is associated to.
Primary goal	Goal that is associated with this planning item as the primary goal.
Primary target	Target that is associated with this planning item as the primary target.
Work notes	Notes to capture the updates and discussions on the planning item as the work progresses.
Strategic priority	Strategic priority that this planning item is related to.

Dates section of the Project planning item form

Field	Description
Planned start date	Date on which the work for this planning item is planned to start. This value is copied from the Approved start date field.
Planned end date	Date on which the work for this planning item is planned to be complete. This value is copied from the Approved end date field.
Approved start date	Approved start date for this planning item.
Approved end date	Approved end date for this planning item.
Actual start date	Actual date on which the work for this planning item has started.
Actual end date	Actual date on which the work for this planning item is complete.

Details section of the Project planning item form

In this section, capture additional details for this planning item such as Investment type, Phase of the planning item, Execution type, affected business application, and more.

Field	Description
Investment class	Type of investment class that this planning item comes under. Choose from Run and Change
Investment type	Type of investment that this planning item comes under. For example, if completing work on this item improves the user experience for your product, select End User Experience .
Demand	Demand that this planning item is associated with.
Execution type	Execution methodology for this planning item. Select from Waterfall , Agile , or Hybrid . This field is available only if the planning item is of the type Project.
Priority	Priority of this planning item.
Phase	Phase of this planning item. This field is available only if the planning item is of the type Project.
Business application	Business application that this planning item is related to.
Other impacted business applications	Business applications that this planning item has an impact on.

Details section of the Project planning item form

In this section, capture additional details for this planning item such as Investment type, Phase of the planning item, Execution type, affected business application, and more.

Field	Description
Business capabilities	Business capabilities of this planning item.

Business case section of the Project planning item form

In this section, capture business details for this planning item such as risks, scope, and blockers for this planning item.

Field	Description
Business case	Business case to invest in this planning item.
Risk of performing	Risks to the business if work on this planning item is completed.
Risk of not performing	Risks to the business if work on this planning item isn't completed.
Enablers	Enablers for this project.
Barriers	Blockers, if any, for this planning item.
In scope	Defined criteria for this planning item.
Out of scope	Clearly defined criteria that is not necessary for this planning item.
Assumptions	Assumptions, if any, to work on this planning item.

Financials section of the Project planning item form

In this section, capture financial details for this planning item such as cost, CapEx, OpEx, benefit, ROI, and other estimates.

Field	Description
Planned cost	Planned cost to take up this planning item.
Planned capEx	Planned capital expenditure for this planning item.
Planned opEx	Planned operational expenditure for this planning item.
Planned benefit	Planned benefit from this planning item.
Actual benefit	Actual benefit achieved from this planning item,
Estimate to completion	Estimated cost to complete work on this planning item.
Actual cost	Actual cost on this planning item.

Financials section of the Project planning item form

In this section, capture financial details for this planning item such as cost, CapEx, OpEx, benefit, ROI, and other estimates.

(continued)

Field	Description
Actual capEx	Actual value of capital expenditure for this planning item.
Actual opEx	Actual value of operational expenditure for this planning item.
Planned ROI	Planned return of investment for this planning item.
Planned return	Financial return on this planning item.
Estimate at completion	Estimated cost at the time that work on this planning item is completed.

Score section of the Project planning item form

In this section, capture scoring details for this planning item such as score, value score, risk score, and size score.

Field	Description
Score	
Value score	Score for the value obtained with this planning item.
Risk score	Score for the risk associated with this planning item.
Size score	Score for the job required to complete the task.

Roadmap configuration form

Learn about the fields of the roadmap configuration form. Use this form to add new tables to roadmap preferences and configure their details in Portfolio Planning.

Roadmap configuration form

Field	Description
Source table	Table that is used to build your roadmap.
Start date field	Field that is used for the start date of the roadmap item. For example, Planned start date .
End date field	Field that is used for the end date of the roadmap item.

Roadmap configuration form (continued)

Field	Description
	For example, Planned end date .
Item name field	Field that is used for the name of the roadmap item. For example, Short description .
Item owner field	Field that is used for the owner of the roadmap item. For example, Assigned to .
Status	Field that is used for the status of the roadmap item.
Percent Complete	Field that is used to track the completion of the roadmap item. This field value is used to visualize the progress of the roadmap item in the tracking mode.
Group by fields	List of fields with which the roadmap items can be categorized into groups. For example, the State attribute can be used to categorize the items into groups of states such as Draft, Ready, Work in progress, and others.
Color by fields	List of fields with which the roadmap items can be categorized by color. For example, the Planning item type attribute can be used to assign a unique color to each group of items belonging to a specific type.
Metric fields	List of fields used as the metrics for the roadmap items. For example, Planned benefit or Actual cost . These values are displayed when you point the mouse cursor on the roadmap item.

Table map form

Understand the fields of the table map form. This form is used to create a new custom table map for any record to integrate with Agile Development 2.0, SAFe, and PPM.

table map form

Field	Description
Alignment Integration	Specifies the Alignment integration type. The value is ServiceNow Internal by default.
Execution table	Table in Agile Development 2.0, SAFe, or PPM that needs to be mapped with a table in Strategic Planning. For example, Defect [rm_defect].
Alignment table	Table in Strategic Planning that needs to be mapped with a table in Agile Development 2.0, SAFe, or PPM. For example, Milestone [sn_milestones_milestone].
Milestone table map	This field is relevant only for Project [pm_project] table map. It is a reference to the new Milestone table map (sn_milestones_milestone) for integrating project milestones from Project Portfolio Management workspace to Strategic Planning. For all the other table maps, the milestone table map field is not available.
Execution table filter	Filter condition to retrieve the relevant records from PPM, Agile Development 2.0, or SAFe. For example, Portfolio is HR or Active is True.
Alignment table filter	Filter condition to retrieve the relevant records from Strategic Planning.
Active flag	Ensures that the table map sync is active. This field is checked by default.
Sync attachments	Ensures that the attachments are synced between the applications. This field is checked by default.

Roadmap milestone form

Learn about the fields of the roadmap milestone form. Use this form to create a milestone for the timeline of your roadmap in Portfolio Planning.

Field	Description
Name	Preferred name for your milestone.
Type	Milestone type. Select from one of the following: <ul style="list-style-type: none"> • Key Event • Launch Date • Important Date • Deadline • Key Milestone

Field	Description
Due date	The date of the milestone.
Assigned to	User who is assigned to the milestone.

Scheduled Script Execution form to generate labor costs for projects and demands

Use the Scheduled Script Execution form to enable Generate Labor Costs scheduler job for projects and demands.

Schedule Item form

Field	Description
Name	Name that identifies this scheduled job.
Active	Option that indicates that scheduled job is active and should be executed at the specified date and time.
Run	<p>Time interval to use for running the scheduled job:</p> <ul style="list-style-type: none"> • Daily: Runs daily, at a designated time. • Weekly: Runs on a weekly basis, at a designated time and day of the week. • Monthly: Runs on a monthly basis, at a designated time and day of the month. • Periodically: Runs on a designated repeating interval. • Once: Runs for a single occurrence only. • On Demand: Runs immediately on demand. • Business Calendar: Entry Start: Runs on the starting entry dates for the business calendar that you select in the Business Calendar field. A scheduled job runs for the starting date of each of the business entries that you defined for the business calendar. <p>For example, if the business calendar represents a fiscal year, and the starting date of each entry is a fiscal month, the scheduled job runs on the first day of each month.</p> <ul style="list-style-type: none"> • Business Calendar: Entry End: Runs for the ending date for the business calendar that you select in the Business Calendar field. This selection runs in the same manner as Business Calendar: Entry Start, but for the end dates of the associated business calendar entries. <p>Note: When you select Business Calendar: Entry Start or Business Calendar: Entry End, you can apply an offset factor to schedule the job to run before or after the time span of the selected business calendar. To learn more, see the Offset type and Offset fields.</p> <p>To learn more about creating and using business calendars and defining business calendar entries, see Creating business calendars and Define business calendar entries.</p>
Time zone	Time zone to use with the Time field entry when you specify the time at which the scheduled job should run. Select a time zone entry:

Schedule Item form (continued)

Field	Description
	<ul style="list-style-type: none"> • -None-: Use the default time zone for the logged-in user who is creating the scheduled job. For example, the scheduled job runs at 04:45 p.m. US/Pacific time if it is the user's assigned time zone, and you enter 16 : 45 into the Time field. • Use System Time Zone: Use the default system time zone that is specified for the instance in which it runs. For example, the scheduled job runs at 10:15 p.m. London time if Europe/London is the default system time zone for the instance, and you enter 22 : 15 in the Time field. • Actual time zone. For example, the scheduled job runs at 1:30 p.m. in the US Eastern time zone if you select US/Eastern, and enter 13 : 30 in the Time field.
Day	<p>Day on which the scheduled job should run.</p> <ul style="list-style-type: none"> • If Run is set to Weekly, select the day of the week. For example, select Wednesday. • If Run is set to Monthly, select the day of the month. For example, select 25 for the 25th day of the month. <p>This field appears only if you select Monthly or Weekly in the Run field.</p>
Repeat Interval	<p>Duration of the repeat interval for each scheduled job execution. Enter the duration in the number of days, hours, or minutes. For example:</p> <ul style="list-style-type: none"> • To run the scheduled job every four days, enter 04 in the Days field. • To run it every 26 hours, enter 26 in the Hours field. • If it should repeat at an interval of 13:30:25, enter 13 in the Hours field, and then enter 30 and 25 in the two unlabeled fields after it. <p>These fields appear only if you select Periodically in the Run field.</p> <p>Note: This setting does not account for Daylight Saving Time changes. For example, if you select a period of one day, the calculation adds 24 hours to the starting time of the job. If the start time is in a Daylight Saving Time (DST) period, the job runs with a one-hour offset when that time zone is not in DST.</p>
Business Calendar	<p>Business calendar entry that you are using to determine the business calendar start or end date for the scheduled job. This field appears only if you select Business Entry: Start Date or Business Entry: End Date in the Time field.</p>
Offset Type	<p>Type of time offset, if any, to apply to the business calendar that you selected for scheduling this job:</p>

Schedule Item form (continued)

Field	Description
	<ul style="list-style-type: none"> • Past: Apply an offset factor to schedule the job to run before the start of the time span of the selected business calendar. • Future: Apply an offset factor to schedule the job to run after the end of the time span of the selected business calendar. • --None--: Do not apply a time offset when scheduling this job. <p>Adding an offset factor enables you to schedule the job to run before, or after, the formal time span that is defined in the business calendar for the following use cases:</p> <ul style="list-style-type: none"> • Schedule a job at a certain time, outside of the time span for the selected business calendar. • Arrange multiple jobs to run in sequence, around the time span of the selected business calendar. <p>The Offset type and Offset fields appear only if you select Business Calendar: Entry Start or Business Calendar: Entry End in the Run field.</p>
Offset	<p>Amount of time offset, expressed in days, hours, minutes, and seconds, to apply to the business calendar that you selected for scheduling this job. For example, if you want to schedule the job to start three days, 14 hours, 10 minutes, and 45 seconds before the business calendar start date, do the following actions:</p> <ul style="list-style-type: none"> • Select Past in the Offset type field. • Enter 3 in the Days field. • Enter 14, 10, and 45 in the Hours field. <p>The Offset Days and Hours fields appear only if you select Business Calendar: Entry Start or Business Calendar: Entry End in the Run field, and Past or Future in the Offset type field.</p>
Time	<p>Time of day at which the scheduled job should run, expressed in hours, minutes, and seconds on a 24-hour clock. The selection that you make in the Time zone field determines the time zone for this entry.</p> <p>i Note: Time values are always saved in the ServiceNow AI Platform® in UTC time and then translated into the proper time. This translation depends on the selected Time zone and the entry in the Time field.</p> <p>This field appears only if you select Daily, Weekly, or Monthly in the Run field.</p>
Starting	<p>Date and time of the first scheduled job generation. Select the calendar date and time. This field appears only if you select Periodically in the Run field.</p>
Priority	<p>Numerical priority for the scheduled job:</p>

Schedule Item form (continued)

Field	Description
	<ul style="list-style-type: none"> • Set essential jobs to a priority value below 100. • Set nonessential jobs to a priority above 100. • If 70 percent or more of all scheduled jobs are Overdue, any jobs that are marked with a value above 100 do not run.
Run as	Name of the user who is creating and running the scheduled job. To assign the scheduled job to the system instead of the person creating the scheduled job, create a system or dummy user and add it to this field.
Conditional	Option for enabling the running of the scheduled job if certain conditions are met in the associated script.
Condition	Conditional script that determines if a scheduled job should run. The last expression of the script should evaluate to a Boolean (true/false) value. This text box appears only if you select Use conditions .
Starting	Date and time of the first scheduled job generation. Select the calendar date and time. This field appears only if you select Periodically in the Run field.

UX List Category form

Learn about the fields of the UX List Category form. Use this form to create additional categories for lists in the Lists menu of Portfolio Planning workspaces.

Field	Description
Title	Display name of the category in the workspace.
Application	Application scope. Ensure that this is set to Portfolio Planning .
Order	Order in which this category is displayed in the workspace.
Active	Option to enable the display of this category in the workspace.
Description	Brief description of the category.
Configuration	Configuration that the category is referencing. By default, this field is set to APW List Menu Configuration .

Next Experience for Demand Management in Portfolio Planning

Create, evaluate, and prioritize demands throughout the demand life-cycle using Next Experience for Demand Management.

Next Experience for Demand Management gives organizations and teams a structured way to capture, assess, and prioritize different types of work before committing to execution. Using Next Experience for Demand Management, demand managers can review incoming requests, assess business cases and capacity, estimate costs, evaluate risks, and decide which demands are worth moving forward. Playbooks allow teams to define different governance processes as well.

Next Experience for Demand Management comes with the Playbook, Details, and Docs pages and is available for users with the Strategic Portfolio Management (SPM) Standard license.

Key benefits of Next Experience for Demand Management:

- Consistent demand intake and evaluation process - Next Experience for Demand Management enables a structured workflow where each demand progresses through defined evaluation stages such as intake, capacity and assessment, financial assessment, and approval.
- Centralized visibility into demand information - Next Experience for Demand Management provides a single interface to view all demands and their associated details such as business cases, capacity, and financials. This feature eliminates the need to cross-reference multiple forms, modules, or applications to compile a complete picture of a demand.
- Playbook-guided demand life-cycle - Playbooks define the sequence of stages and activities that a demand must go through such as creation, planning, assessment, and approval. Each stage contains a set of prescribed activities that must be completed before the demand transitions to the next stages. Using playbooks, you can define your own processes according to your requirements.
- Consolidated data for demand prioritization - Next Experience for Demand Management provides demand details, capacity and risk assessment outputs, financial summaries, and progress indicators in a unified view. This feature helps demand managers to compare, rank, and prioritize demands based on any defined criteria of an organization.
- AI system integration through playbook activities - The AI playbook enables the association of AI systems to a demand through a playbook activity. This feature enables demand managers to associate a demand with an AI system from directly within the demand workflow.

Exploring Next Experience for Demand Management

Next Experience for Demand Management helps you to create, evaluate, and prioritize demands, throughout the demand life-cycle.

Next Experience for Demand Management overview

Next Experience for Demand Management is a centralized workspace experience that streamlines how organizations capture, evaluate, and progress demands through their life-cycle. It brings together all demand-related activities, such as intake, qualification, and task management, into a single interface. By consolidating access to demands, tasks, resources, financials, and supporting records, the workspace experience eliminates the need to navigate across multiple modules.

Number	Name	State	Demand manager	Score	Start date	Due date	Primary goal	Portfolio	Business Unit	Department

Next Experience for Demand Management gives product owners, portfolio managers, and demand managers a comprehensive overview of all active and incoming demands. It enhances planning accuracy by providing structured ways to define demand scope, assess capacity, estimate effort, and evaluate financial and strategic impact. With guided governance through Playbooks, the Next Experience for Demand Management helps teams prioritize work effectively, improve decision-making, and ensure consistent progression of demands from intake to completion.

Next Experience for Demand Management benefits

Benefit	Feature
Capture a new business need and kick off structured governance from intake.	Create a demand and start the intake flow. For more information, see Create a demand .
Use advanced filtering options to find specific demands based on criteria such as status, start and end dates, and project type.	Filter and sort demands. For more information, see Demands list view .

Next Experience for Demand Management benefits (continued)

Benefit	Feature
Define different governance processes for demands.	Use playbooks (default and custom) for demand governance processes with low code/no code changes. For more information, see Use Playbooks .
Add and manage work needed to progress a demand to approval or delivery readiness.	Create and manage demand tasks (including time card submission). For more information, see Create and manage demand tasks .
Collaborate on specifications, notes, and decisions within the demand record.	Use Docs to co-author content directly from the demand. For more information, see Docs for demands in Next Experience for Demand Management .
Track risks, issues, and decisions to maintain traceability and control.	Add or associate RIDAC records with the demand. For more information, see Add and manage RIDAC records .
Plan and control financials associated with a demand.	Create cost plans, generate labor costs, and manage expense lines. For more information, see Managing financials for demands .
Create financial baselines to track variance over time.	Create demand baselines to track the demand finances. For more information, see Create financial baselines .
Quantify expected value for business cases.	Create and manage monetary and non-monetary benefit plans for your demand and associate them to each other. For more information, see Create and manage benefit plans .
Align work capacity with demand scope and timelines.	Create and manage capacity for a demand. For more information, see Create and manage resource assignments .
Progress qualified demands into downstream delivery entities.	Create entities from a demand such as projects, enhancements, and changes. For more information, see Create an entity from a demand .
Link AI systems to a demand directly from Next Experience for Demand Management.	Associate AI systems with your demand as and when necessary. For more information, see Create AI systems .

Demand workflow

The demand workflow defines the life-cycle of a request, from initial intake through assessment and approval to downstream execution. This structured approach ensures that each request is evaluated consistently, aligned with business objectives, and supported by the right processes before any resources are committed.

Workflow overview

The end-to-end life-cycle for managing demands is described in the following table. This workflow confirms that the demands are progressively refined, validated, and aligned with business and strategic objectives.

Note:

The demand workflow overview table describes the traditional demand management process. You can customize the states and activities according to the requirements of your organization by defining your custom playbook.

Demand workflow overview

Task	Description	Demand states involved	Roles involved
Create a demand	<p>Demands enter the system via Service Catalog, Idea Portal, or directly by demand managers:</p> <ul style="list-style-type: none"> • Business users can submit an idea via the Service Catalog or Idea Portal. These ideas are evaluated by demand managers and promoted to a demand, if necessary. • Business users can bypass the ideation process and submit a demand directly from the Service Catalog. • Demand managers or demand users can directly submit demands from Next Experience for Demand Management. 	Draft	Business user, demand manager, demand user
Complete demand details	<p>The demand manager or demand user reviews and adds the required details. Demand managers can create and assign demand tasks to gather more information, if necessary.</p> <p>The demand is moved from the draft to the submitted state once the basic demand details are added.</p>	Draft → Submitted	Demand manager, demand user
Refine and finalize demand	<p>The demand manager completes all required information (size, impact, business case, timeline, resources, costs/benefits, stakeholder registry, strategy alignment). They can assign tasks or request SME (subject matter expert) support, whenever required.</p>	Submitted	Demand manager
Move demand to screening	<p>The demand manager moves the demand to screening.</p> <p>The assessments are sent to the stakeholders to score</p>	Submitted → Screening	Demand manager

Demand workflow overview (continued)

Task	Description	Demand states involved	Roles involved
	the demand once it is in the screening state.		
Complete assessments	Stakeholders complete and submit assessments for scoring.	Screening	Stakeholder
Move demand to qualified	<p>The demand moves to the qualified state once the required assessments are submitted.</p> <ul style="list-style-type: none"> • Next Experience for Demand Management updates the state automatically. • Demand manager manually sets the demand to qualified while it is in screening. For example, when assessments are delayed or not required. 	Screening → Qualified	Demand manager, Next Experience for Demand Management
Review demand	Stakeholders review the demand for approval or deferral.	Qualified	Stakeholder
Approve/Defer a demand	The demand manager sets demand as approved (moves forward for execution) or deferred (moves to Deferred state).	Qualified → Approved/Deferred	Demand manager. demand approver
Convert demand to strategic/operational entity	<p>Once the Demand is approved, the demand manager creates the selected entity such as project, enhancement, or Enterprise Agile Planning (EAP) entities.</p> <p>The created entity is based on the values in the Category and Type fields of the Demand record.</p> <p>Depending on the type of record created, the demand data is migrated to the created entity.</p>	Approved	Demand manager
Complete demands	Based on the selection in the Close Demand field, a demand is completed automatically when converted entity is completed, or manually by the demand manager at any state.	Approved → Completed	Demand manager, Next Experience for Demand Management

Playbooks in Next Experience for Demand Management

Playbooks in Next Experience for Demand Management provide a guided, structured approach to managing a demand from initiation to completion. Playbooks focus specifically on helping

demand teams follow the standard demand life-cycle, confirming every demand progresses consistently and no critical steps are missed. You can define your playbooks according to your requirements.

Purpose of Playbooks in Demand Management

Playbooks provide a structured way to manage work by guiding teams through predefined steps. It shows what to do, when to do it, and where to find the tools or information required to complete each task. You can apply a playbook to processes such as managing a demand, resolving an issue, launching a product, onboarding new employees, or define key steps of a process. For more information on playbooks and how to create them, see [Workflow studio playbooks](#).

In Next Experience for Demand Management, playbooks help demand managers and reviewers:

- Understand exactly which activities must be completed at each demand stage.
- Track required inputs, approvals, and validations for demand progression.
- Confirm that demand evaluation, prioritization, and planning follow the organization's standard governance.
- Provide built-in process guidance within the demand record, reducing the need to rely on informal or undocumented knowledge.
- Maintain process consistency across all demands, regardless of the requester or manager.
- Enable you to define multiple standardized governance processes across the organization.

How Playbooks work for demands

When a playbook is applied to a demand:

- Demand life-cycle stages such as ideation, assessment, prioritization, and planning are outlined.
- Each stage contains activities and tasks tailored to demand requirements, such as defining scope, estimating effort, documenting benefits, or securing stakeholder approval.
- Playbooks guide demand managers through dependencies before the demand can move forward.
- Demand records automatically capture progress and trigger actions such as assessments and approvals as the tasks are completed.

For example, a demand about a Customer Self-Service Portal enhancement uses a playbook to guide its progress as follows:

- The ideation stage prompts the demand manager to capture objectives and benefits.
- The assessment stage guides effort, cost, and risk evaluation.
- Prioritization helps validate scoring and funding.
- Planning finalizes the scope and links the demand to a potential work entity.

As each stage is completed, the playbook ensures that the demand follows the standard life-cycle without missing any required steps.

Playbook benefits

Playbooks add value to demand management by:

- Standardizing demand intake: Ensuring required information is captured early.
- Providing step-by-step instructions: Useful for new demand managers or occasional users.

- Supporting governance: Ensuring stage gating for evaluation and approval.
- Improving visibility: Showing exactly where a demand sits in the life-cycle and what is blocking its progress.
- Integrating workflows: Using Flow Designer to set up different business logic for each playbook flow.

Types of Playbooks

- Demand default playbook - The default demand playbook is a stage-gate playbook. In a stage-gate playbook, the stages and tasks must be completed in a linear order. Each stage must be finished before moving to the next one. The stages are visible only when all activities in the previous stage are completed or skipped. After completing a stage, demand managers can still return to previous stages if needed.
- AI playbook - The AI playbook is available for a demand when the AI Control Tower plugin is installed and the investment type of the demand is set to artificial intelligence. This playbook has an additional AI checkpoint stage where you can associate new or existing AI systems to your demand.

Note:

- You can use the demand default playbook and customize it according to your organization's requirements. For more information about the stages and activities of this playbook, see [Demand default playbook stages and activities](#).
- You can also create a demand playbook according to your requirements. For more information, see [Create and configure playbooks](#) .

Configuring Next Experience for Demand Management

Configure your Next Experience for Demand Management to assess and promote demands to projects, enhancements, changes, defects, or Enterprise Agile Planning (EAP) entities.

Next Experience for Demand Management planning

Use the following table to identify what you must define before setting up the Next Experience for Demand Management.

Item name	Description
Roles	Define who can access and work in the Next Experience for Demand Management. Includes identifying workspace administrators, demand managers, approvers, and reviewers who participate in the demand process.
Stakeholders	Identify individuals or groups who review or need visibility into demand items. Stakeholders provide domain insight during

Next Experience for Demand Management planning

Use the following table to identify what you must define before setting up the Next Experience for Demand Management.

(continued)

Item name	Description
	evaluation. For more information, see Populate the stakeholder registry for demands .
Information model	Specify the fields and attributes required to capture demand data. Includes form layouts, required fields, and custom data elements.
Evaluation criteria	Define the metrics used to assess and compare demand items. Common criteria include business value, complexity, cost estimates, and alignment to strategy. For more information, see View an assessment metric category .
Resource considerations	Determine what resource-related information must be associated with demand items, such as estimated effort or team availability.
Workflow expectations	Describes the life-cycle stages for a demand item, from creation to review, approval, or conversion through Playbooks.
Playbooks	Define or verify that the demand playbooks are in accordance with the processes of your organization. For more information, see Create and customize playbooks .
Dependencies with other applications	Identify related workspaces or applications are required with Next Experience for Demand Management, such as Project Workspace or Resource Management Workspace. Ensures consistent data across applications.

Populate the stakeholder registry for demands

Add users to the stakeholder registry so that Next Experience for Demand Management can automatically populate the stakeholder list when demand users create a demand.

Before you begin

Role required: pps_admin

Procedure

1. Access the Stakeholder Register record form in one of the following ways.
 - Navigate to **All > Project Administration > Settings > Stakeholders**.
 - Navigate to a demand playbook or the **Stakeholders** tab in **Details** page, and select **New**. For more information, see [Access demands](#).
2. On the Stakeholder Register record form, fill in the fields. For a description of the field values, see [Stakeholder register form](#).

3. Select **Submit**.

Note:

When adding a user to the stakeholder registry, the combination of the user and the assigned portfolio must be unique. However, there can be multiple records for the same user but with different portfolios.

Configure a custom risk rank and risk value

Configure custom risk ranks and value scores to rate the impact and probability factors for a risk.

Before you begin

Role required: pps_admin

About this task

Use the Risk Value Lookup module to set up the risk rank and risk value for a specific combination of risk impact and probability. The system uses these values to determine the degree of risk (Absolute, High, Medium, and Low) based on the impact and probability factors of a risk.

The value in the **Probability** field is multiplied by the value of the **Impact** field to generate the values for the **Risk rank** and corresponding **Risk value** in the Create New Risk form.

By default, you can use the following impact, value, and probability scores for a risk to create a risk rank and risk value score:

- Absolute
- Low
- Medium or Moderate
- High

For example, a risk might have high probability and medium impact but you might want to consider it as an overall low risk for the demand. In that case, you would configure the Risk Value Matcher form with the following values:

- Impact = 2 Medium
- Risk Rank Color = Green
- Probability = High
- Probability Number = 1
- Risk Value = 3 Low

In this case, the calculated risk rank and value are as follows:

- Calculated risk rank = 2
- Calculated risk value = 2

The following image illustrates a Risk

The image shows a form with the following fields and values:

- Number: RSK0001002
- Probability: Low
- Impact: 3 - Low
- Risk rank: 9 (highlighted in green)
- Risk value: 3 - Low (highlighted in grey)

form.

Procedure

1. Navigate to **All > Project Administration > Settings > Risk Value Lookup**.
2. Select **New**.
3. On the risk value lookup form, fill in the fields.
For a description of the field names, see [Risk value lookup form](#).
4. Select **Submit**.

View an assessment metric category

View assessment metric categories that are used with assessment metric types and assessment metrics.

Before you begin

Role required: pps_admin

About this task

Demands come with an assessment metric type named **Demand**, five default assessment metric categories, and assessment metrics.

Procedure

1. Navigate to **All > Project Administration > Settings > Assessments Metric Categories**.
2. Open an assessment metric category to review it.
The following default assessment metric categories are available with demands.

Demand assessment metric categories

Assessment metric category	Data source	Description
Size	T-Shirt size field on the demand form.	Assesses demand size relative to the size of other demands.
Strategic Alignment	View an assessment category result field in the assessment category result for the Strategic Alignment metric category. For more information, see View an assessment category result	Assesses how closely the demand aligns with strategic goals of the organization compared to other demands.
Risk	Rating field in the assessment category result for the Risk metric category.	Assesses demand risks compared to other demands.

Assessment metric category	Data source	Description
ROI	Impact and Financial return fields on the Demand form.	Assesses demand return on investment compared to other demands.
Cost	Labor costs , Capital expense , and Operating expense fields on the Demand form.	Assesses demand cost compared to other demands.

Multicurrency in Next Experience for Demand Management

Manage and track demand financials in your corporate currency, regional currency, or project currency using the multicurrency feature.

Overview of multicurrency

In global organizations, demands are often managed at one location and executed at another. Each location might use different currencies for budget spending, making it difficult to monitor and track financials.

The multicurrency feature in Next Experience for Demand Management lets you manage and track demands from any geographic location in any currency. You can monitor demand financials in one currency while spending the budget in a different currency, such as your functional currency or regional currency. You can also manage your demands in one currency and specify a different currency for managing your future projects.

Activation information

To enable multicurrency features in Next Experience for Demand Management, activate the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin. This activation:

- Enables the demand currency view in demand, cost plan, and benefit plan forms.
- Enables you to manage simple demand financials, cost plans, benefit plans, and budgets in the demand currency
- Automatically activates the PPM Standard (com.snc.financial_planning_pmo) plugin, giving you the option to switch between the default view and demand currency view

Currency preferences

After activating the plugin, specify your currency preference for managing demand financials. You can select your functional currency, a regional currency, or a local currency. For more information, see [Select demand currency preference](#).

Demand currency view

The Demand Currency view displays multicurrency fields in addition to the standard demand form fields. Enable this view from the form context menu.

You can designate a currency other than the functional currency as the processing demand currency. The **Demand currency** field appears on the Financials section of the Demand form, where you can select any active currency from the Currencies [fx_currency] table.

Note:

The Demand currency field becomes read only once you create a cost plan, cost plan breakdown, benefit plan, or benefit plan breakdown for the demand.

Multicurrency in demand tasks

Track expenses for demand tasks in demand currency. When a time card for a demand task is submitted and processed, the actual cost is calculated based on the rate model, default labor rate, or system property rate. View this actual cost in the Demand Task form in the **Demand currency** and **Actual cost in demand currency** fields.

Multicurrency in demand baselines

Compare financial baselines to track demand performance over time. Baseline comparison helps you identify and review financial changes made to the demand at various life-cycle stages. With the multicurrency feature, you can view financial information in demand currency when comparing baselines. You can also configure the baseline view to add fields and view details in demand currency. For more information, see [Create financial baselines](#).

Select demand currency preference

Set your currency preference for managing and tracking demand financials from the functional currency, regional currency, or local currency.

Before you begin

Activate the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin.

Role required: admin

Procedure

1. Navigate to **All > Project Administration > Settings > Preferences-Project**.
2. Select a currency option from the Demand currency setup list.
3. Select **Save**.

What to do next

Enable the multicurrency view in the demand form and other demand-related forms. For more information, see [Enable demand currency view](#).

Enable demand currency view

Switch to the demand currency view to track the planned costs of a demand in the selected currency.

Before you begin

Activate the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin.

Role required: admin or it_demand_manager

About this task

To manage demands in a currency different from the functional currency, demand currency fields are added to the demand tables such as dmn_demand and dmn_demand_task.

Tables with demand currency fields

Table	Description
Demand [dmn_demand]	Demands can be tracked in a different currency. When you create a demand, select another currency by navigating to the

Tables with demand currency fields (continued)

Table	Description
	Financials tab and selecting a currency in the Demand Currency field.
Demand Task [dmn_demand_task]	Demand tasks delegate cost, effort, risk, and benefit assessment activities.
Cost Plans [cost_plan]	Cost plans capture the costs of demands.
Cost Plan Breakdown [cost_plan_breakdown]	Cost plan breakdowns specify the estimated cost and actual cost at a granular level for a fiscal period.
Benefit Plan [benefit_plan]	When you open the demand form in Demand Currency view, fields related to the demand currency appear in the Benefit Plans related list by default.
Benefit Plan Breakdowns [benefit_plan_breakdown]	Benefit plans capture the potential benefits accrued when the demand is executed.
Expense Line [fm_expense_line]	Expense lines are part of demand cost plans and store costs associated with a specific resource.
Project Funding [project_funding]	Stores the demand target and budget expense values for both capital and operating expenses for a single fiscal period.

Procedure

1. Navigate to the form in which you want to enable the demand currency view.
2. Right-click the form header or select the additional actions icon to open the context menu.
3. Select **View**.
4. Select **Demand Currency** from the list.

What to do next

Review the form fields exclusive to the **Demand Currency** view. All other form tabs and fields remain the same in both default view and demand currency view. Continue entering values as you would in the default view. For more information, see [Multicurrency fields in demand-related forms](#).

Quick start tests for multicurrency in Next Experience for Demand Management

Validate that multicurrency in Next Experience for Demand Management works correctly after making configuration changes such as applying an upgrade or developing an application. Copy and customize these quick start tests to pass when using your instance-specific data.

⚠ Danger:

By default, the system property that is used to run automated tests is disabled to prevent you from accidentally running these tests on a production system. To avoid data corruption or an outage, run tests only on development, test, and other non-production instances. See [Enable or disable executing Automated Test Framework tests](#).

Activate the PPM Standard Multicurrency – ATF Tests plugin (com.snc.ppm_multicurrency.atf) to use demand currency quick start tests.

Demand currency test suites tests

Test	Description
Verify cost in demand currency on cost plan	Validates the calculation of cost plan breakdown with budget reference rate and verifies the roll up to cost plan in demand currency.
Verify benefit in demand currency on benefit plan	Validates the calculation of benefit plan breakdown with budget reference rate and verifies the roll up to benefit plan in demand currency.

Upgrade existing demands

Execute scheduled jobs to upgrade your existing active and inactive demands after activating the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin.

Before you begin

Activate the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin.

Role required: admin

About this task

Run these scheduled jobs on demand to upgrade your existing active and inactive demands in demand currency only when necessary.

Note:

The jobs can impact performance depending on the number of demands and cost plans. Run the jobs only when necessary.

Procedure

1. Navigate to **All > System Definition > Scheduled Jobs**.
2. Execute the appropriate scheduled job for your demands.

Create and customize playbooks

Configure playbooks to customize demand workflows or create playbooks for your organization.

Before you begin

Role required: admin

About this task

Next Experience for Demand Management includes two predefined playbooks available in Workflow Studio:

- Demand default
- AI playbook

Note:

The AI playbook is available only when the AI Control Tower plugin is installed and the investment type of the demand is set to artificial intelligence.

These playbooks are ready to use without any additional configuration. Configure playbooks only when you must customize an existing playbook or create one for your organization's specific demand workflows.

In Next Experience for Demand Management, playbooks are triggered by record creation. A playbook is associated with demand records, and the Playbook page appears in the L-2 (level 2) menu when a demand meets the trigger condition.

For more information on how to create or customize playbooks, see [Configuring playbooks](#) .

Procedure

1. Navigate to **Workflow Studio > Playbooks**.
2. To customize an existing playbook or create one, create and configure the playbook according to your requirement.
 - To activate a predefined playbook, select the required playbook and define an appropriate trigger condition. For more information, see [Activate playbooks](#)  and [Triggers](#) .
 - To create a playbook, select **New**. For more information, see [Create and configure playbooks](#) .
 - Multiple playbooks can be enabled at a time. Define trigger conditions so that each demand maps to only one playbook type. For more information, see [Create and configure playbooks](#) .

Create a demand

Create demands to capture your strategic and operational requirements and centralize information for stakeholder assessment and prioritization.

Before you begin

Role required: `it_demand_manager`, `it_demand_user`

Procedure

1. Navigate to **Workspaces > Portfolio Planning Workspace > Demands >**

Demand

Name *

Planned start date

Planned end date

Cancel

Create

New.

2. On the Demand form, fill in the fields.

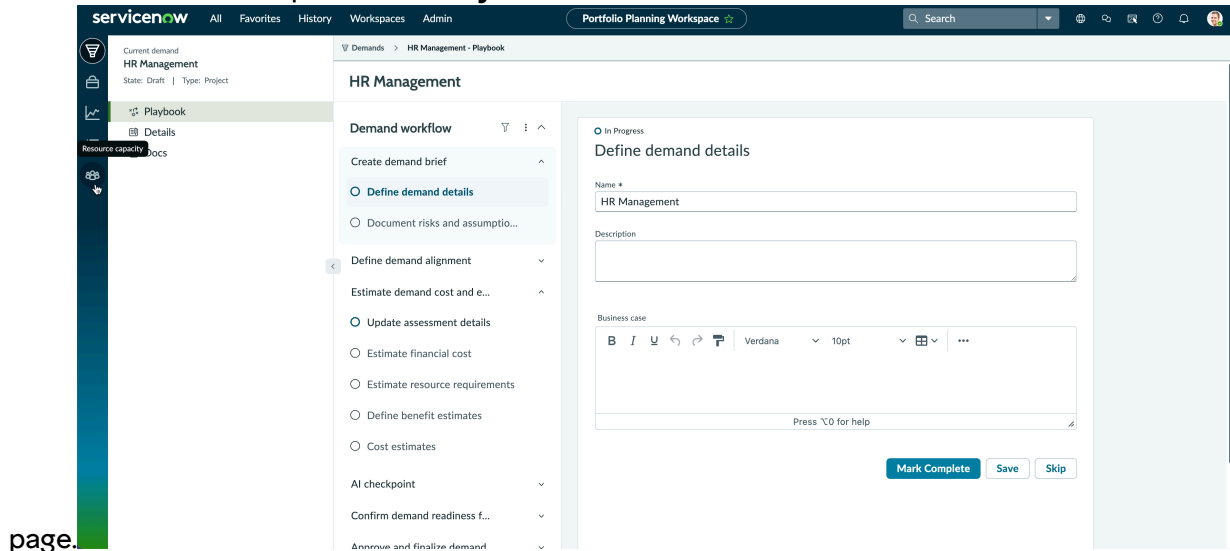

Demand form

Field	Description
Name	Name of the demand.
Start date	<p>The preliminary or estimated date when the work is initially planned to begin. This date helps outline the intended timing for early demand planning and prioritization. You can set this date during initial demand creation or anytime in the planning phase when a rough idea forms. This date can be updated until the demand is officially approved.</p> <p>For example, you're planning for a database upgrade to start on 2025-11-01.</p> <p>This date is changed to Planned start date when the demand is converted to a project.</p>

Field	Description
	<p>Note: When you change the planned start date of a demand or project, the associated cost plans and resource assignments also change. The Change Resource Plan and Cost Plan Start Date with Demand or Project Start Date Change property controls the behavior for a demand date change. This property isn't enabled by default. For more information, see Properties installed with Project Management.</p>
Due date	<p>The preliminary or estimated date when the planned work is expected to be completed. This date provides an expected completion window for planning and stakeholder communication. You can set this date anytime in the planning phase when a rough idea forms and can be updated until the demand is officially approved.</p> <p>For example, you're planning to complete the database upgrade by 2025-12-31.</p> <p>Note: This date is changed to Planned end date when the demand is converted to a project.</p>

3. Select Create.

The created demand opens in the **Playbook**

page.

What to do next

- Review and refine the demand details and progress the demand using the playbook stages. For more information, see [Use Playbooks](#).
- Review and refine the demand details using the forms and tabs in the **Details** page. For more details, see [Update the demand details](#).

Customize the demand new record form

You can customize the fields displayed on the demand new record form in Next Experience for Demand Management by modifying the APW New view.

Before you begin

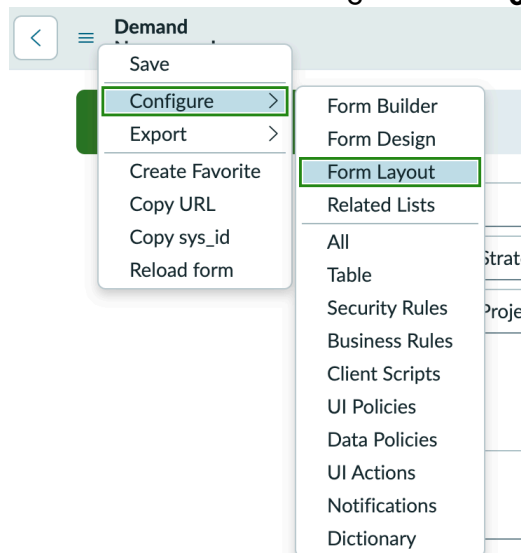

Role required: admin

About this task

By default, the demand new record form in Next Experience for Demand Management displays a predefined set of fields. Modifying the APW New view allows you to add, remove, or reorder fields to meet your organization's requirements.

Procedure

1. Navigate to **All > Demands > Demand > All > New**.
2. Select **Additional actions** and navigate to **Configure > Form**

Layout.

3. In the **View name** field, select **APW New**.
4. Add, remove, or reorder fields as needed.
5. Select **Save**.

Result

The updated field layout is applied to the demand new record form for all users.

Use Playbooks

Use a playbook to guide a demand through each stage of its life-cycle, from creating the initial brief to final approval and completion. Playbooks provide step-by-step activities within each stage, ensuring that all required information is captured and governance processes are followed.

Before you begin

- Role required: it_demand_user, it_demand_manager
- As an administrator, ensure that either the default or custom playbooks are activated.

About this task

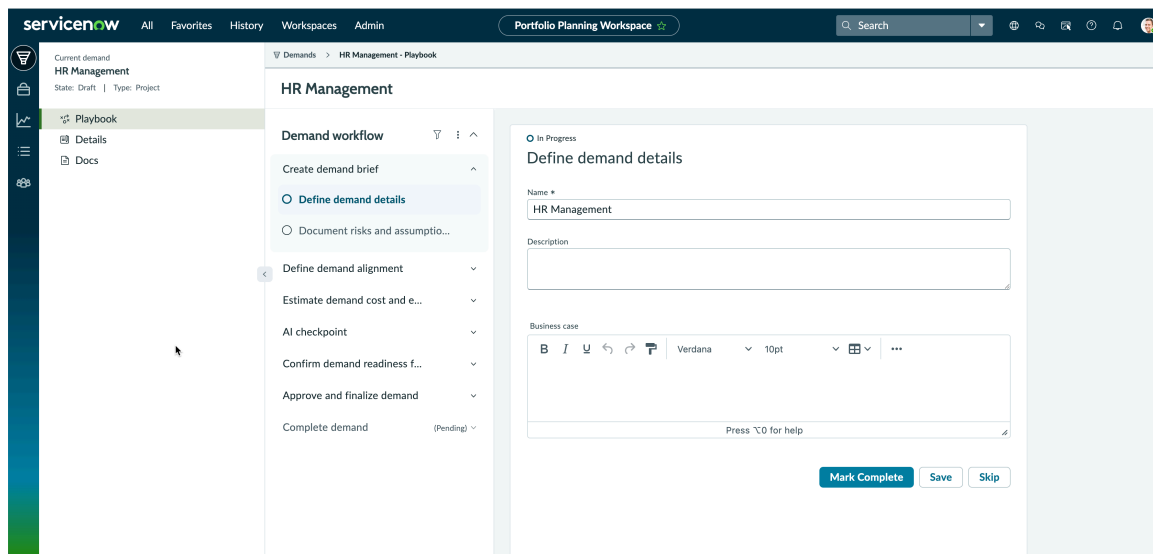

A playbook defines the standard stages of a demand (for example, Initiation, Planning, Execution, Monitoring, and Closure) and includes activities or action items to complete at each stage.

i Note:

The playbook presents demand information in a guided, stage-based workflow. The same fields and lists are also available in the **Details** page of the demand record. You can update demand information from either location, and changes made in one are reflected in the other.

This task topic follows the demand AI playbook. It's a standard playbook comprising the following seven stages:

- Create demand brief
- Define demand alignment
- Estimate demand cost and effort
- AI checkpoint
- Confirm demand readiness for review
- Approve and finalize demand
- Complete demand

i Note:

The AI checkpoint stage is available if the AI Control Tower plugin is installed and the investment type of the demand is set to artificial intelligence.

Each stage consists of activities, action items, or steps that guide the demand manager in successfully completing the demand. You can view the **Playbook** menu only if the demand matches the trigger condition defined for that playbook.

Note:

A demand created in Next Experience for Demand Management opens in the playbook page.

Procedure

1. Navigate to **Workspaces > Portfolio Planning Workspace > Demands**.

2. Open an existing demand or create a demand.

For more information on creating demands, refer to [Create a demand](#).

3. Use the default playbook or create or customize one.

○ To use the default playbook:

a. Select **Playbooks** from the L-2 (level 2) navigation menu.

b. Select a stage to view its activities. Each activity displays its status (In Progress, Pending, or Complete) and the fields or lists to update.

Note:

The default playbook is a stage-gate playbook, that is, a stage is unlocked only when its prior stages are marked as completed or skipped.

c. Complete the activities within each stage. For more information, see [Demand default playbook stages and activities](#).

d. For each activity, perform one of the following actions:

- Select **Mark Complete** to mark the activity as done and move to the next activity.
- Select **Save** to save your progress without completing the activity.
- Select **Skip** to bypass the activity and move to the next one.

Note:

- An activity becomes read-only when you select **Mark Complete** or **Skip**.
- A stage is marked as completed once all activities within it are either completed or skipped.
- Use the **Restart** option (available at both the activity and stage levels) to revisit or edit completed or skipped activities.
- Some stages include an automated task that advances the demand state when all activities in the stage are completed. These automated tasks don't require manual action.

○ To create a playbook, define the trigger condition in Workflow Studio. For more information, see [Triggers](#).

For more information on how to create and use playbooks, see [Building playbooks](#) and [Designing playbooks](#).

Update the demand details

Update the details of a demand record in Next Experience for Demand Management to reflect any changes in scope, priority, or capacity.

Before you begin

Role required: it_demand_user, it_demand_manager

Procedure

1. Navigate to **Workspaces > Portfolio Planning Workspace > Demands**.
2. Update the demand record details in any of the following ways.
For a description of the field values, see [Demand form](#).

Related topics

[Use Playbooks](#)

Create and manage demand tasks

Create tasks for a demand to delegate cost, effort, risk, and benefit assessment activities. Assign a resource or group to the demand task to track the actual time and effort spent on performing the specified activities.

Before you begin

Role required: it_demand_manager

About this task

You create demand tasks to plan the work for demands rather than for the target work entity such as a project, change, defect, or enhancement. The resources assigned to a demand task can submit the time spent on it using a time card.

Note:

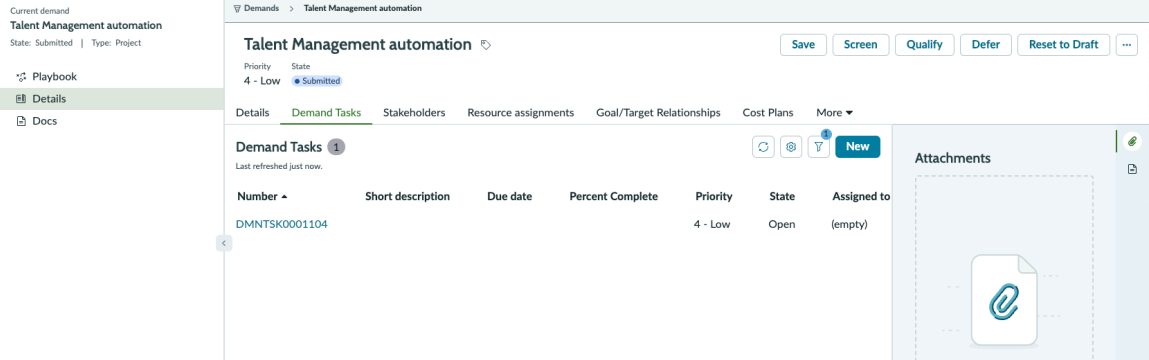

If you're creating a demand task with the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin activated and Demand Currency view enabled, additional fields are available. For more information about the fields that are available only in the Demand Currency view, see [Multicurrency in Next Experience for Demand Management reference](#).

For more information about demand tasks, see [Demand tasks](#).

Procedure

1. Open a demand from the home page of Next Experience for Demand Management.
For more information, see [Access demands](#).
2. Select **Details** from the L-2 (level 2) navigation menu.

3. Select Demand

Tasks.

Note: If the **Demand Tasks** tab isn't visible, select **More** and then select **Demand Tasks**.

4. Add or edit a demand task from the **Demand Tasks** tab:

- To add a demand task, select **New**.
- To update the details of an existing demand task, select the record.

5. On the Create New Demand Task form, fill in the fields.

For a description of the field names, see [Create demand task form](#).

6. Select **Save**.

- Note:**
- To delete a demand task, select the record and select **Delete** from the More Actions option.
 - Alternatively, you can create, edit, or delete demand tasks using the **Add demand tasks** playbook activity. For more information, see [Use Playbooks](#).

After completing your work on the demand task, use the breadcrumb navigation to return to the **Demand Tasks** tab.

Note: Team members can access demand tasks assigned to them from Collaborative Work Management. For more information, see [Managing SPM work in Collaborative Work Management](#).

Related topics

Submit a time card for a demand task

The resources assigned to a demand task create and submit a time card or time sheet to record the time spent on a demand task. The reported hours are used to calculate the actual cost and effort for a demand task.

Before you begin

Role required: timecard_user

About this task

The resource submits the time card or time sheet to record and track the work performed on a demand task. An appropriate approver then has to approve the submitted time card or time sheet.

Procedure

1. Navigate to **All > Time Sheets > Time Sheet Portal**.
2. Create a time card.
3. Fill in the hours for each day spent working on the demand task.
4. Select **Submit**.

Add and manage stakeholders

Add and manage stakeholders for a demand to delegate assignments and progress the demand in its life cycle.

Before you begin

Role required: it_demand_manager

About this task

When a demand is submitted, the demand stakeholder list is populated automatically from the associated portfolio. You can also add stakeholders.

A demand can have multiple stakeholders and a stakeholder can be associated with multiple demands.

Procedure

1. Open a demand from the home page of Next Experience for Demand Management.
For more information, see [Access demands](#).
2. Select **Details** from the L-2 (level 2) navigation menu.
3. Select **Stakeholders**.

Note:

If the **Stakeholders** tab isn't visible, select **More** and then select **Stakeholders**.

4. Add or edit a stakeholder record:
 - To add a stakeholder, select **New**.
 - To update the details of an existing stakeholder, select the record.
5. On the Create New Demand Stakeholder form, fill in the fields.
For a description of the field names, see [Create stakeholder form](#).
6. Select **Save**.

Note:

- To delete a stakeholder record, select the record and select **Delete** from the More Actions option.
- Alternatively, you can create, edit, or delete stakeholder records using the **Add stakeholders** playbook activity. For more information, see [Use Playbooks](#).

After completing your work on the stakeholder record, use the breadcrumb navigation to return to the **Stakeholders** tab.

Related topics

- [Use Playbooks](#)

Add and manage goal/target relationships

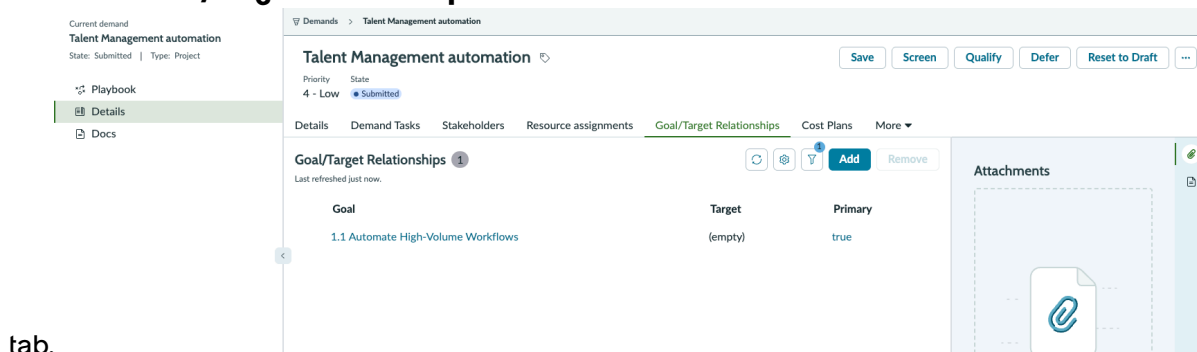

Track and manage the relationship between demands and organizational goals or targets directly from the Next Experience for Demand Management. Linking demands to goals or targets helps ensure alignment with strategic priorities and provides visibility into how each demand contributes to broader organizational objectives.

Before you begin

Role required: it_demand_manager

Procedure

1. Open a demand from the home page of Next Experience for Demand Management. For more information, see [Access demands](#).
2. Select **Details** from the L-2 (level 2) navigation menu.
3. Select the **Goal/Target Relationships**

tab.

Note:

If the required **Goal/Target Relationships** tab isn't visible, select **More** and then select the required **Goal/Target Relationships** tab.

4. Add or edit a goal/target relationship record:
 - To add a goal/target relationship record, select **New**.
 - To update the details of an existing goal/target relationship record, select the record.
5. On the form, fill in the fields. For field information, see [Create goal/target relationship form](#).
6. Select **Save**.

Note:

- To remove a goal/target relationship record:
 - Select a record from the **Goal/Target Relationships** tab and select **Remove**.
 - Select **Remove** from the More Actions option in the goal/target relationship form.
- Alternatively, you can add, edit, or remove goal/target relationship records using the **Add secondary goals** playbook activity. For more information, see [Use Playbooks](#).

After completing your work on the goal/target relationship record, use the breadcrumb navigation to return to the **Goal/Target Relationships** tab.

Related topics

- [Use Playbooks](#)
- [Demand default playbook stages and activities](#)

Add and manage requirements

Define and manage requirements for a demand to capture the functional and technical specifications needed for its fulfillment. Keeping requirements up to date within the demand record ensures clarity for stakeholders and reduces ambiguity during the demand evaluation and approval process.

Before you begin

Role required: it_demand_user, it_demand_manager

About this task

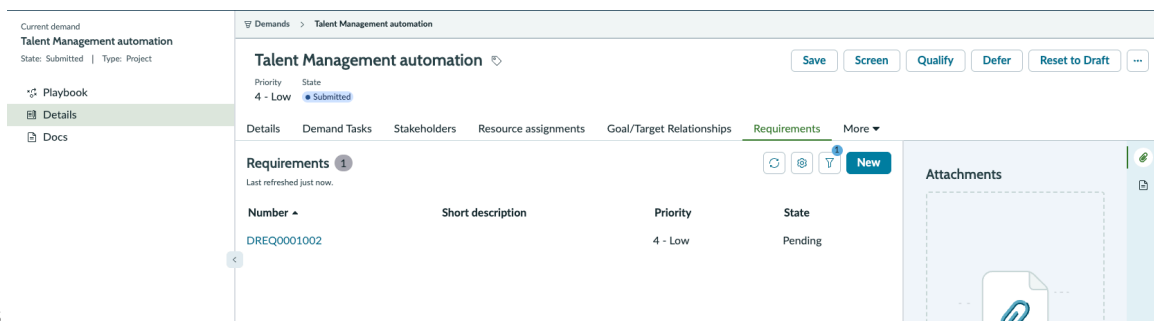

Typically, the stakeholders associated with a demand request have insights into what the requirements are for a demand request to be completed. The demand manager can create requirements from their inputs.

Demand managers use the Requirement form to describe the requirement and assign an owner who is responsible for making sure that the requirement is met. When a requirement is complex, demand managers can associate planned tasks, such as project tasks, with the requirement. The demand manager assigns and tracks the tasks until they're complete.

Procedure

1. Open a demand from the home page of Next Experience for Demand Management. For more information, see [Access demands](#).
2. Select **Details** from the L-2 (level 2) navigation menu.
3. Select

Requirements.

Note:

If the **Requirements** tab isn't visible, select **More** and then select **Requirements**.

4. Add or edit a requirement record from the **Requirements** tab:

- To add a requirement, select **New**.
- To update the details of an existing requirement record, select the record.

5. On the Create New Requirement form, fill in the fields.

For a description of the field names, see [Create requirement form](#).

6. Select **Save**.**Note:**

To delete a requirement record, select the record and select **Delete** from the More Actions option.

After completing your work on the requirement record, use the breadcrumb navigation to return to the **Requirements** tab.

Add and manage RIDAC records

Add a Risk, Issue, Decision, Action, or Request Change (RIDAC) record to your demand in the Next Experience for Demand Management. Adding RIDAC records enables you to keep a track of risks or issues during the demand life cycle and help in analyzing the outcome of a demand.

Before you begin

Role required: it_demand_user, it_demand_manager

About this task

You can select the type of record you want to create, fill in the required details, and associate it to your demand. You can use the RIDAC page in Next Experience for Demand Management to view, add, manage, and evaluate all the RIDAC records.

For information about RIDAC records for demand management, see [RIDAC \(Risk, Issue, Decision, Action, and Request Changes\) records for a demand](#).

Procedure**1.** Open a demand from the home page of Next Experience for Demand Management.

For more information, see [Access demands](#).

2. Select **Details** from the L-2 (level 2) navigation menu.**3.** Select the required RIDAC tab.**Note:**

If the required RIDAC tab isn't visible, select **More** and then select the required RIDAC tab.

4. Add or edit a RIDAC record from the required RIDAC tab:

- To add a RIDAC record, select **New**.
- To update the details of an existing RIDAC record, select the record.

5. On the form, fill in the fields.

For field information, see:

- Create risk form
- Create issue form
- Create action form
- Create decision form
- Create request change form

6. Select Save.

Note:

To delete a RIDAC record, select **Delete** from the More Actions option in the RIDAC record form.

After completing your work on the RIDAC record, use the breadcrumb navigation to return to the required RIDAC tab.

Submit a demand

Submit the demand record once the necessary details are provided for a demand.

Before you begin

Role required: it_demand_manager, it_demand_user

Procedure

1. Open a demand from the home page of Next Experience for Demand Management. For more information, see [Access demands](#).
2. Select **Details** from the L-2 (level 2) navigation menu.
3. Select **Submit**

demand.

Note:

The submit option is available only when the demand is in the Draft state.

The demand moves to the Submitted state.

Manage assessment instances and questions

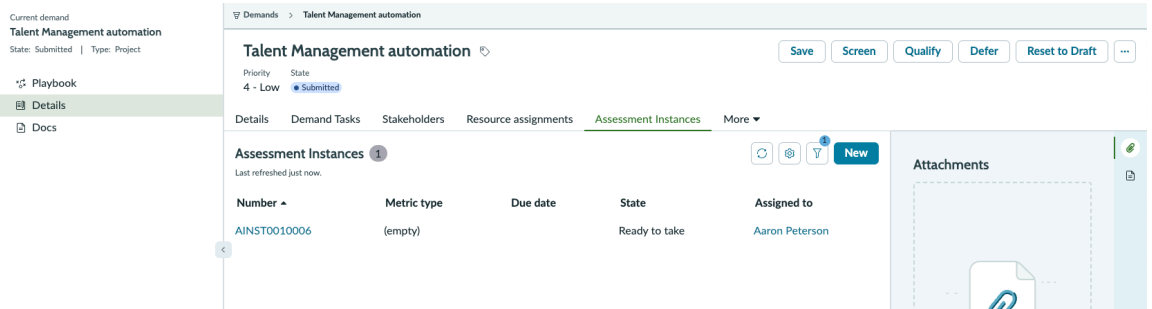

Add and manage assessment instances and questions for a demand to evaluate its feasibility and gather structured feedback from relevant stakeholders.

Before you begin

Role required: admin

Procedure

1. Open a demand from the home page of Next Experience for Demand Management.
For more information, see [Access demands](#).
2. Select **Details** from the L-2 (level 2) navigation menu.
3. Select **Assessment**

Instances.

Note:

If the **Assessment Instances** tab isn't visible, select **More** and then select **Assessment Instances**.

4. Add or edit an assessment instance record:
 - To add an assessment instance record, select **New**.
 - To update the details of an assessment instance record, select the record.
5. On the assessment instance form, fill in the fields.
For a description of the field names, see [Assessment instance form](#) form.
6. Select **Save**.
7. Select **Assessment Instance Questions**.
8. To add a question, select **New**.
9. On the Create New Assessment Instance Question form, fill in the fields.
For a description of the field names, see [Create assessment instance question form](#).
10. Select **Save**.

Note:

To delete an assessment instance record, select the record and select **Delete** from the More Actions option.

After completing your work on the assessment instance question and record, use the breadcrumb navigation to return to the **Assessment Instances** tab.

Create and manage resource assignments

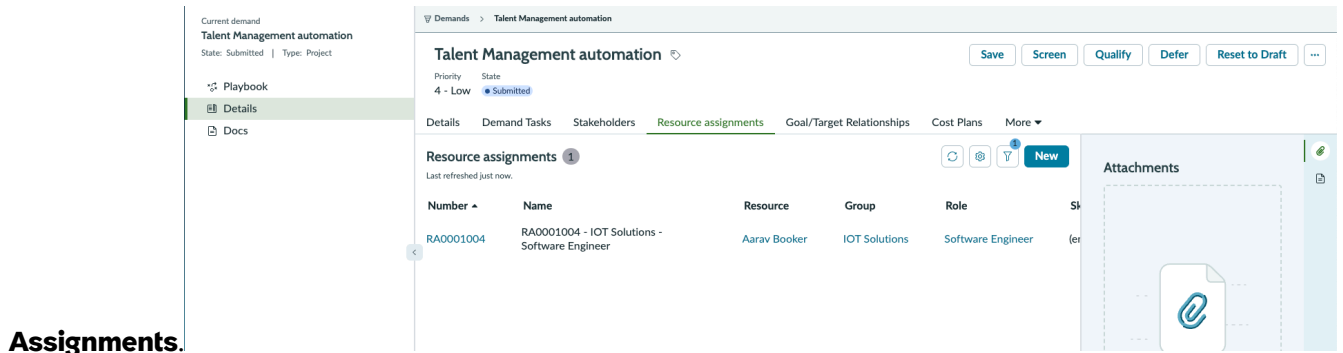

Create and manage resource assignments for a demand to find the availability of the resources and allocate them to the demand tasks. Effective resource assignment ensures that demands are adequately staffed and helps demand managers track resource availability and utilization.

Before you begin

Role required: it_demand_manager

Procedure

1. Open a demand from the home page of Next Experience for Demand Management.
For more information, see [Access demands](#).
2. Select **Details** from the L-2 (level 2) navigation menu.
3. Select **Resource**

Assignments.

- Note:**
If the **Resource Assignments** tab isn't visible, select **More** and then select **Resource Assignments**.

4. Add or edit a resource assignment record:
 - To add a resource assignment record, select **New**.
 - To update the details of an existing resource assignment record, select the record.
5. On the Create New Resource assignment form, fill in the fields.
For a description of the field names, see [Create resource assignment form](#).
6. Select **Save**.

- Note:**
 - To delete a resource assignment record, select the record and select **Delete** from the More Actions option.
 - Alternatively, you can create, edit, or delete resource assignment records using the **Estimate resource requirements** playbook activity. For more information, see [Use Playbooks](#).

After completing your work on the resource assignment record, use the breadcrumb navigation to return to the **Resource Assignments** tab.

Related topics

Recalculate costs of resource assignments of a demand

Recalculate the costs of all active resource assignments of a demand whenever the hourly rates change in the associated rate model. This feature helps keep the plan costs are up to date.

Before you begin

- The demand must be active.
- The demand must have an active rate model assigned.

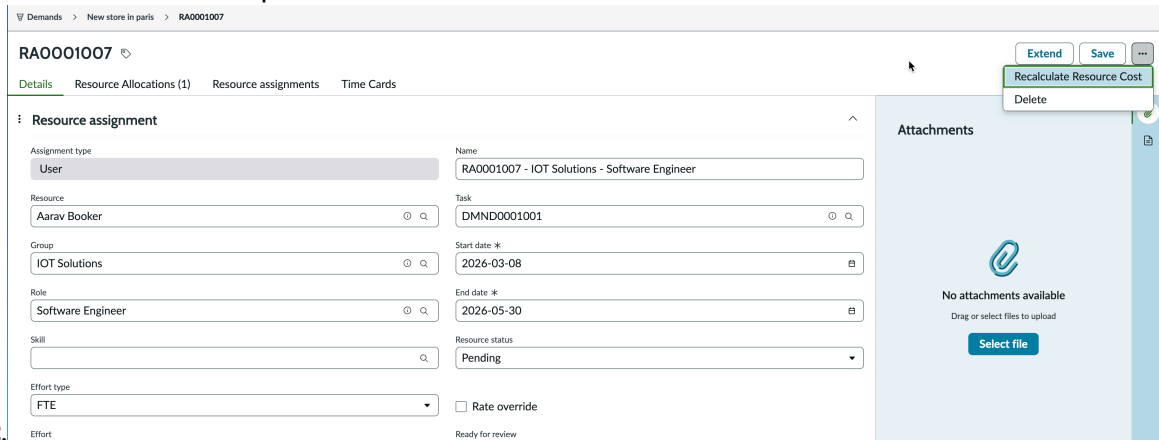

Role required: it_demand_manager

Procedure

1. Open a demand from the home page of Next Experience for Demand Management.
For more information, see [Access demands](#).
2. Select **Details** from the L-2 (level 2) navigation menu.
3. Select the **Resource assignments** tab.

Note: If the required **Resource assignments** tab isn't visible, select **More** and then select the required **Resource assignments** tab.

4. Select the resource assignment record that you want to recalculate the costs for.
5. Select the More Actions option and select **Recalculate Resource**

Cost.

6. On the Recalculate Resource Cost form, fill in the fields.

Field	Description
Start date	Start date of the time period for which the costs are recalculated. By default, the field shows the current date.
End date	End date of the time period for which the costs are recalculated. By default, the field shows the due date of the demand. If the due date isn't specified for the demand, the field is empty.

7. Select **OK**.

Note: Alternatively, you can recalculate the resource costs using the **Estimate resource requirements** playbook activity. For more information, see [Use Playbooks](#).

Result

- Recalculates the selected resource costs of all the applicable resource assignments in the demand based on the latest hourly rates. The hourly rates are derived from the rate model associated with the demand.
- Updates the recalculated resource costs on the respective cost fields on the resource assignment form and the **Resource assignments** tab.
- Reflects the revised values in the respective cost fields of the demand.

Realign resource assignments for demands

Planning and execution of your roadmap involves change in priority or timelines of your work. In such cases, you can adjust the resource assignment dates to match with the latest dates of your demands.

Before you begin

[Migrate resource plans to resource assignments](#)

Role required: it_demand_manager

Procedure

1. Open a demand from the home page of Next Experience for Demand Management.
For more information, see [Access demands](#).
2. Select **Details** from the L-2 (level 2) navigation menu.
3. Change the **Approved start date** and **Planned start date** to meet your organizational priorities.
4. Select **Save**.
5. Select the More Actions option and select **Realign assignments to demand**.

Result

In the Resource assignments tab, you can see the Start date of the resource assignments aligned with the demand start dates.

View assessment results

View assessment results for a demand to evaluate its feasibility, priority, and alignment with organizational objectives. Assessment results provide demand managers with the insights needed to make informed decisions on whether to approve, defer, or reject a demand.

Before you begin

Role required: it_demand_manager

Procedure

1. Open a demand from the home page of Next Experience for Demand Management.
For more information, see [Access demands](#).
2. Select **Details** from the L-2 (level 2) navigation menu.
3. Select **Assessment Results**.

Note:

If the **Assessment Results** tab isn't visible, select **More** and then select **Assessment Results**.

4. Select an assessment result record to view the details.

Approve demands

Review and approve demands in Next Experience for Demand Management to move them forward in the demand life cycle.

Before you begin

Role required: demand_approver, it_demand_manager

Procedure

1. Open a demand from the home page of Next Experience for Demand Management.

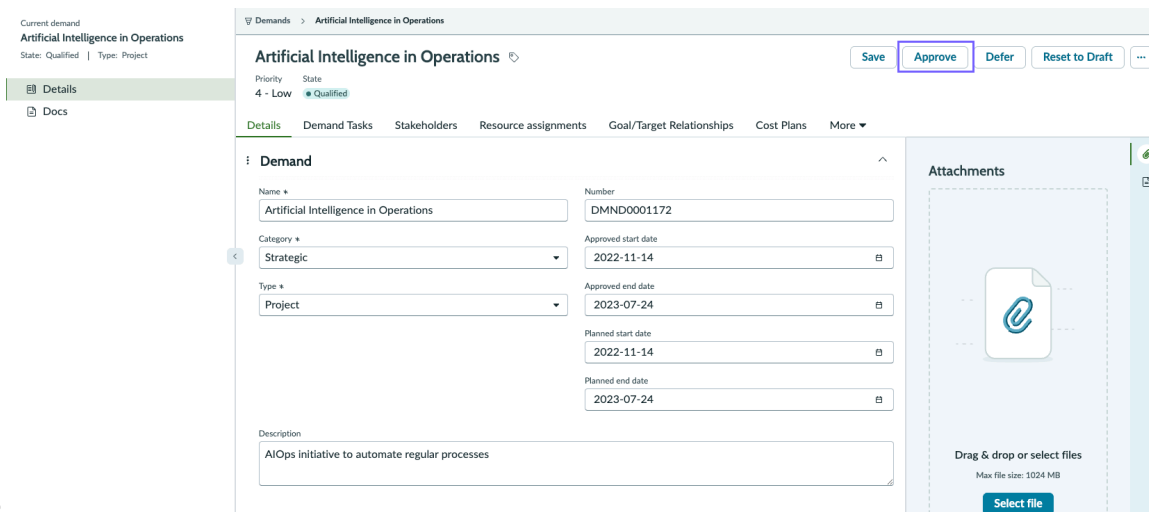

Note:

Users with the demand_approver role only see demands that are in the Qualified state.

For more information, see [Access demands](#).

2. Select **Details** from the L-2 (level 2) navigation menu.

3. Select

Approve.

Note:

The **Approve** option is available only when a demand is in the Qualified state.

Create an entity from a demand

Create an entity, such as a work item, from a demand so that you can track work on the demand.

Before you begin

A demand must have been created. For more information, see [Create a demand](#).

The category and type of a demand and the applications you have installed determine the entity you can create from it. The available entity types and the applications you must have installed to be able to create them are listed in the following table.

Entity	Required application
Enhancement, change, or defect	Project Portfolio Suite
Agile Development entities (story or epic)	Agile Development 2.0
Enterprise Agile Planning (EAP) entities (epic, feature, or capability)	Strategic Planning

Role required: it_demand_manager

Note:

The sn_apw_advanced.eap_user role is required to convert a demand to EAP entities.

Procedure

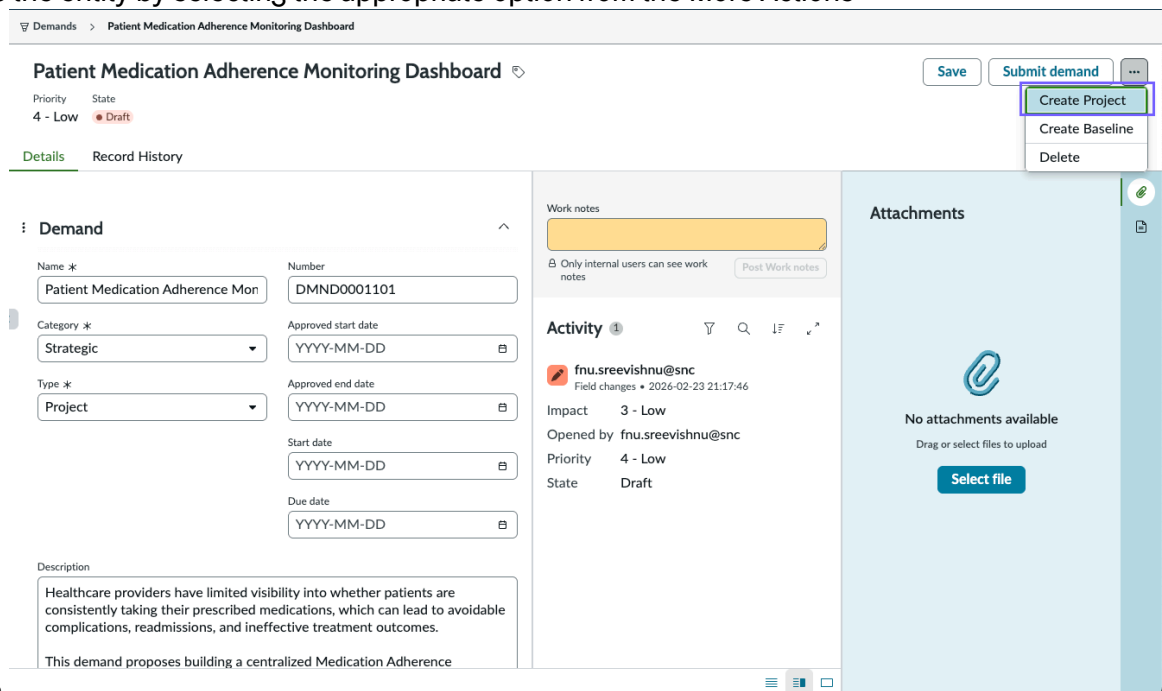

1. Open a demand from the home page of Next Experience for Demand Management.
For more information, see [Access demands](#).
2. Verify that the values in the **Category** and **Type** fields are appropriate for the entity you want to create.
The options in the Type list change according to the category that you select. For more information, see [Demand form](#).

Note:

The **Category** and **Type** fields are set to read only when an entity is created from a demand. If you delete the created entity, these fields become editable again.

3. Select **Save**.

4. Create the entity by selecting the appropriate option from the More Actions

option.

Depending on the category and type of the demand, options related to the entity you can create become available.

[Demand default playbook stages and activities](#)

Reset a demand to draft state

Move a demand back to the Draft state, if necessary.

Before you begin

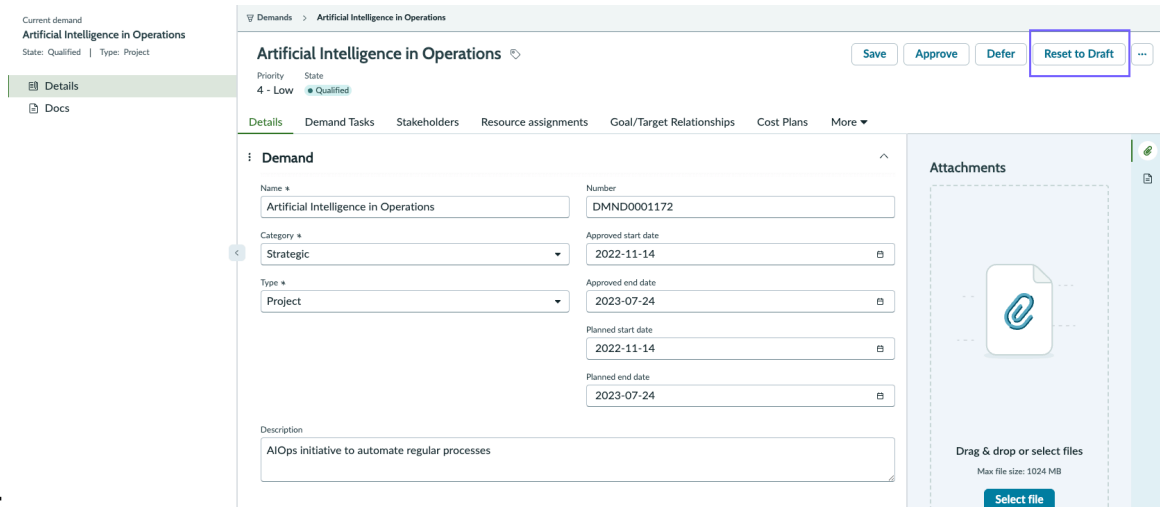

Role required: it_demand_manager

About this task

A demand can be reset to Draft from the Completed, Approved, Screening, or Submitted states, or until an entity such as a project is created from it. The **Reset to Draft** option is unavailable if the demand is in the Qualified state.

Procedure

1. Open a demand from the home page of Next Experience for Demand Management.
For more information, see [Access demands](#).
2. Select **Details** from the L-2 (level 2) navigation menu.
3. Select **Reset to**

Draft.

A confirmation message appears, if there are:

- Active assessments pending with stakeholders, or
- Resource assignments are created for the demand

4. Select the check box to replan the allocated resource plans that have no actual hours reported.
5. Select **OK**.

Result

- The demand is moved to the Draft state.
- All the score values in **Assessment Data** tab are reset to default.
- All active assessments for the demand are canceled. New assessments are triggered when the demand moves to the Screening state and if the **Assessment Required** field on the demand form is set to true.

Defer demands

Defer demands in Next Experience for Demand Management to move them to the backlog. You can review them and move them back to any other demand state.

Before you begin

Role required: it_demand_manager

Procedure

1. Open a demand from the home page of Next Experience for Demand Management. For more information, see [Access demands](#).
2. Select **Details** from the L-2 (level 2) navigation menu.
3. Select

Defer.

Note:

You can defer the demands that are not in the Draft or Completed states.

Delete demands

Delete demands to remove them from Next Experience for Demand Management. Demands can be deleted only while in the Pending state.

Before you begin

Role required: it_demand_manager, it_demand_user

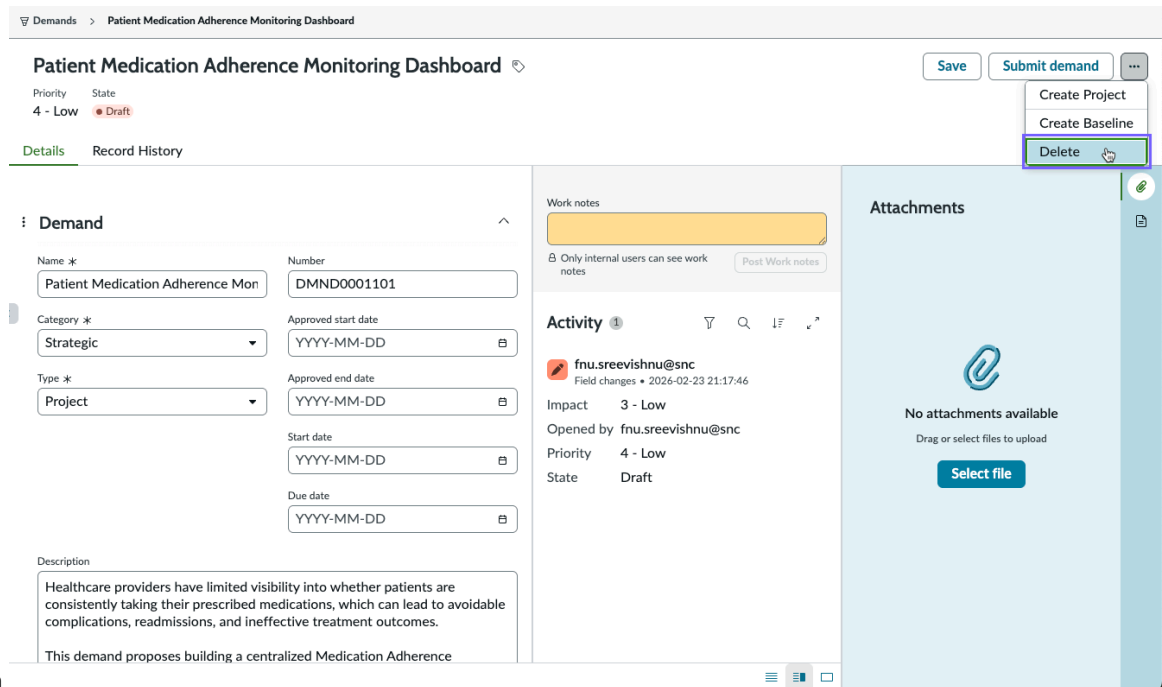

About this task

When you delete a demand, all data related to the demand, such as risks, demand tasks, requirements, and decisions are deleted. However, the stakeholders aren't deleted from the Stakeholder Register [dmn_stakeholders_register] table.

If a project is already created from a demand, its reference is removed from the project along with the data related to the demand. However, the project isn't deleted from the database.

Procedure

1. Open a demand from the home page of Next Experience for Demand Management.
For more information, see [Access demands](#).
2. Select **Details** from the L-2 (level 2) navigation menu.
3. Select **Delete** from the More Actions

4. Select **OK** to delete the demand.

Export demands

Export demand records from the Next Experience for Demand Management to share data with stakeholders or perform further analysis outside the platform.

Before you begin

Role required: it_demand_manager

Procedure

1. Navigate to **Workspaces > Portfolio Planning Workspace > Demands**.
2. Select the demands that you want to export.
You can export all demands on the record page by selecting the check box in the column header.
3. Select **Export**.
4. Select the **File Type** as Excel, CSV, JSON, or PDF.
The export file is created in the selected format.

5. Select the **Delivery Type** as Download or

Export ✕

File Type

Excel ▾

Delivery Type

Download

Email

Email *

abel.tutor@example.com|

Cancel
Export

Email.

6. Provide your preferred email address if you selected Email as the delivery type.

7. Select **Export**.

The export file is downloaded on your system or mailed to your provided email address.

Create AI systems

Create AI systems from directly within the demand workflow and associate them with your demands.

Before you begin

- The AI Control Tower plugin must be installed. For more information, see [Activation and installation of AI Control Tower](#).
- The investment type of the demand is set to artificial intelligence.
- Role required: sn_ai_steward

Procedure

1. Open a demand from the home page of Next Experience for Demand Management.
For more information, see [Access demands](#).
2. Select a demand record from the **All Demands** list.
3. Select **Details** from the L-2 (level 2) navigation menu.
4. Select the **Create AI System** button to create an AI system in the AI Control Tower workspace.
For more information on creating AI systems, see [Create AI system assets](#).

What to do next

Associate your demands with the created AI systems:

- Using the AI checkpoint stage in your demand AI playbook. For more information, see [Use Playbooks](#).
- Using the **AI Associations** section in the **Details** tab.

Managing financials for demands

Manage budget, cost plans as forecasts, actual expenses as expense lines, generate labor costs, and create financial baselines at a required cadence in Next Experience for Demand Management.

The following features help you to manage your financials.

- Manage cost plans for your demands. For more information, see [Add, edit, or delete demand cost plans](#).
- Add or edit expense lines for your demands to record any planned or unplanned expenses. For more information, see [Add or edit expense lines](#).
- Generate labor costs for the fiscal period. For more information, see [Generate labor costs](#).
- Create baselines to capture the financial snapshot of your demands. For more information, see [Create financial baselines](#).

Multicurrency

The multicurrency feature enables you to manage the financials of your demands in two different currencies, Functional currency and Demand currency. Functional currency is typically defined by the admin based as the primary currency, which is used for planning, budgeting, and tracking the financials of your planning items.

You can perform the following financial activities in Demand currency.

- Select the Demand currency.
- Track the planned and actual expenses.
- Allocate and manage the budget.
- View simple financials data.

Using this feature, you can work on financial reporting at a global level and see the real-time currency conversions of your financial records.

Organizations operate at a global or multinational level, the work is planned and financed at one location and executed at a different location. Each might use a different currency from what was used in the planning phase. Multicurrency makes it easy to manage and track your planning items using any currency.

You can monitor and track the financials in one currency, and capture the costs in a different currency. For more information, see [Multicurrency in Next Experience for Demand Management](#).

Note:

Once a cost plan, benefit plan or expense line or an investment budget gets created, you can't change the Demand currency. You can change the Demand currency as long as there are no financial records captured against the demand.

Baselines

Create a baseline to capture a snapshot of the financial changes for your demands. You can create on-demand baselines or at a cadence using a scheduler job. For more information, see [Create financial baselines](#).

Budget allocation

Portfolio managers can manage and approve the budget for demands. The approved budget helps demand managers to plan and meet the expenses to execute work. For more information, see [Allocate budget to a demand](#).

Benefit plans

Monetary benefit plans capture potential benefits accrued while executing a demand. Non-monetary benefit plans capture the potential non-financial benefits accrued while executing a demand. You can create and manage monetary and non-monetary benefit plans and to capture the potential benefits of your planning items. For more information, see [Create and manage benefit plans](#).

Add, edit, or delete demand cost plans

Create a cost plan for a required duration to track your planned and actual expenses. Edit cost plans to adjust your planned expenses and delete any descope forecasts.

Before you begin

Role required: it_demand_manager

About this task

The application automatically creates cost plan breakdown records when you save the cost plan. The cost plan breakdowns are records that specify the estimated and actual costs and the budget at a granular level for specific fiscal periods, such as FY16: M04 and FY16: M05. The demand cost plans are added to the parent program and portfolio.

If you want to use multiple currencies, create a cost plan for another currency.

If you're creating a cost plan for a demand with the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin activated and Demand Currency view enabled, the fields in the **Financials** section differ from the Default view. For more information about the fields that are available only in the Demand Currency view, see [Multicurrency in Next Experience for Demand Management reference](#).

Note:

For projects, the cost plan breakdowns specify the estimated cost and actual cost at a granular level for a fiscal period of the demand cost plan. These breakdowns are recalculated in the project currency. Similarly, the estimated breakdown amounts of the planned benefit and actual benefit of the demand benefit plans are recalculated in the project currency. The project currency amounts are then rolled up to the cost plan, benefit plan, and the project records.

Procedure

1. Open a demand from the home page of Next Experience for Demand Management.
For more information, see [Access demands](#).
2. Select **Details** from the L-2 (level 2) navigation menu.
3. Select **Cost Plans**.

Note:

If the **Cost Plans** tab isn't visible, select **More** and then select **Cost Plans**.

 **Tip:**

Create [financial baselines](#) immediately after capturing the initial planned costs to have a snapshot of your planned costs. Use this baseline to compare it against the baselines from later dates, as the work progresses, to identify the variance between initial planned costs and actual expenses.

This step helps you to plan for the future expenses and reforecast the planned costs.

Alternatively, you can create, edit, or delete cost plans and cost plan breakdowns using the **Estimate financial cost** playbook activity. For more information, see [Use Playbooks](#).

Create and manage benefit plans

Create a monetary or non-monetary benefit plan to specify the estimated monetary or non-monetary benefit in a category for a fiscal period. Demand benefit plans capture the potential benefits accrued by the demand when the demand is executed.

Before you begin

Role required: it_demand_manager

About this task

The monetary benefit plan breakdown records are automatically created when you save the benefit plan. The monetary benefit plan breakdown records specify the estimated and actual benefits at a granular level for specific fiscal periods, such as FY16: M04 and FY16: M05. The **Monetary Benefit Plan Breakdowns** tab shows the aggregated benefits for estimated and actual benefits for each fiscal period for the demand.

The non-monetary benefit plan breakdown records are automatically created when you save the benefit plan by selecting **Automatic** or **Manual** in the **Breakdown Type** field. The non-monetary benefit plan breakdown records specify the estimated and actual non-financial benefits at a granular level for specific fiscal periods, such as FY16: M04 and FY16: M05. The **Non-monetary Benefit Plan Breakdowns** tab shows the aggregated benefits for estimated and actual non-financial benefits for each fiscal period of the demand.

 **Note:**

Converting a demand to a project or EAP entity transfers the benefit plan from the demand to the target project or EAP entity.

Procedure

1. Open a demand from the home page of Next Experience for Demand Management.
For more information, see [Access demands](#).
2. Add, edit, or delete a benefit plan.

Related topics

- [Use Playbooks](#)

Associate monetary and non-monetary benefit plans

Associate monetary and non-monetary benefit plans, so that you can capture the potential benefits (financial and non-financial) accrued by the demand.

Before you begin

Role required: `it_demand_manager`

About this task

You can associate a monetary benefit plan with a non-monetary benefit plan and vice versa.

Note:

When you delete a benefit plan, its relationship with the associated benefit plan (if any) is also removed.

Procedure

1. Open a demand from the home page of Next Experience for Demand Management.
For more information, see [Access demands](#).
2. Select **Details** from the L-2 (level 2) navigation menu.
3. Select the **Monetary Benefit Plans** or **Non-monetary Benefit Plans** tab.

Note:

If the **Monetary Benefit Plans** or **Non-monetary Benefit Plans** tabs aren't visible, select **More** and then select the **Monetary Benefit Plans** or **Non-monetary Benefit Plans** tab.

4. Select the benefit plan that you want to associate.
5. On the Benefit Plan form, fill in the **Associated benefit** field with the benefit plan that you want to associate.
6. Select **Save**.
The selected benefit plan is associated with this benefit plan.

Note:

Alternatively, you can associate benefit plans with each other from the **Benefit estimate** playbook activity. For more information, see [Use Playbooks](#).

Related topics

- [Use Playbooks](#)

Create financial baselines

Create a financial baseline of a demand, which captures benefit and financial metric information (snapshot of cost plan, benefit plan, and demand-level financial metrics) at a particular moment in time.

Before you begin

Role required: it_demand_manager

About this task

You can create as many financial baselines as necessary and review the financials changes that have been made to the demand since the previous baseline. Any financial baseline doesn't capture the actual cost component of the demand.

Procedure

1. Open a demand from the home page of Next Experience for Demand Management.
For more information, see [Access demands](#).
2. Select **Details** from the L-2 (level 2) navigation menu.
3. To create a financial baseline of a demand, use either of the options.
4. On the Create New Demand Baseline form, fill in the fields.

Demand form

Field	Description
Name	Name of the demand baseline.
Demand	Demand to which the baseline belongs.
Description	Description of the demand baseline.

5. Select **Save**.

Note:

To delete a demand baseline, select the record and select **Delete** from the More Actions option.

After completing your work on the demand baseline, use the breadcrumb navigation to return to the **Demand Baselines** tab.

Allocate budget to a demand

Set the capital expense (Capex) and operating expense (Opex) budgets in demand or functional currency according to the fiscal years. The sum of the Capex and Opex budgets is calculated as the total budget in demand currency.

Before you begin

Role required: portfolio_manager

Procedure

1. Open a demand from the home page of Next Experience for Demand Management.
For more information, see [Access demands](#).
2. Select **Details** from the L-2 (level 2) navigation menu.
3. Select **Demand Budget**.

Note:

If the **Demand Budget** tab isn't visible, select **More** and then select **Demand Budget**.

4. Add or edit a demand budget record:
 - To add a demand budget record, select **New**.
 - To update the details of a demand budget record, select the record.
5. On the Create New Project Funding form, fill in the fields.

Tip:

You can work on allocating lean budgets at the fiscal period level using the Investment Budget. For more information, see [Enable lean budgeting for demands](#).

For a description of the field names, see [Create project funding form](#).

6. Select **Save**.

Note:

- To delete a demand budget record:
 - Select a demand budget record from the **Demand Budget** tab and select **Delete**.
 - Select **Delete** from the More Actions option in the project funding record form.
- If the demand doesn't have a cost plan, start date, and due date, then demand budget is distributed from the current month until the end of the demand budget fiscal year.
- If the demand doesn't have a cost plan, start date, and due date, then demand budget is distributed from the current month until the end of the demand budget fiscal year.
- If the demand doesn't have a cost plan and a due date but has a start date, then the demand budget is distributed from either:
 - Start date (if the start date falls in the given budget fiscal year) until the end of the demand budget fiscal year.
 - Start of the demand budget fiscal year until the end of the demand budget fiscal year.
- If the demand doesn't have a cost plan and a start date but has a due date, then the demand budget is distributed from either:
 - Current month until due date (if the due date falls in the given budget fiscal year).
 - Current month until the end of demand budget fiscal year.
- If the demand has a cost plan associated, then demand budget is distributed by honoring the cost plan fiscal periods.

After completing your work on the demand budget record, use the breadcrumb navigation to return to the **Demand Budget** tab.

Result

The demand budget for the selected year appears in the **Demand Budget** tab. You can select the amounts in the list to revise them.

Enable lean budgeting for demands

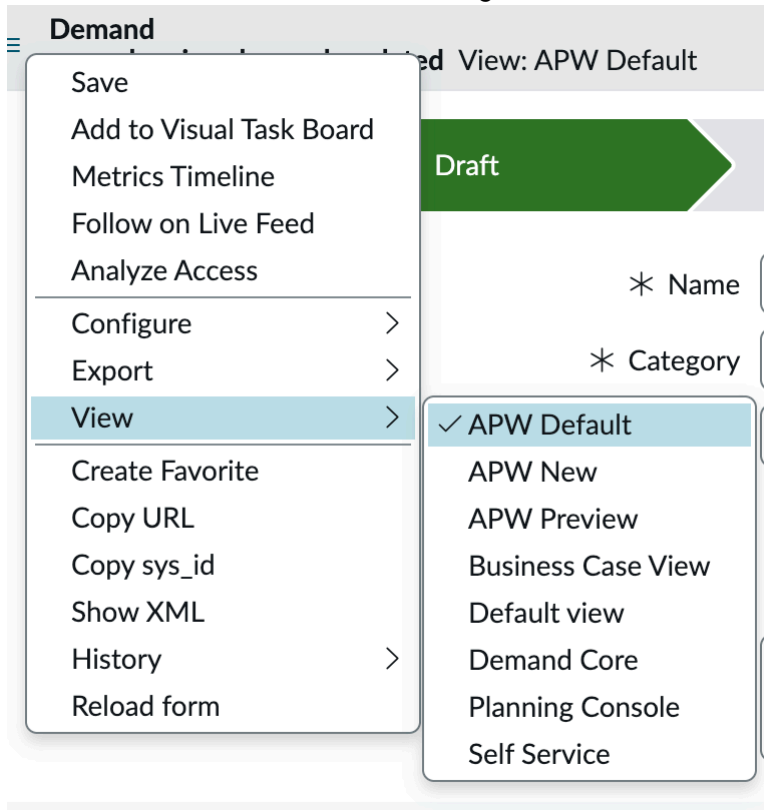

Enable the Investment Budget option to allocate budgeting for demands at a fiscal period level.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > Demands > Demand > All**.
2. Open the required demand.
3. Select the Additional actions and navigate to **View > APW Default**.

4. Select the Additional actions and navigate to **Configure > Related**

Lists.

5. Select **Investment Budget** from the Available column and add it to Selected column.

6. Select **Save**.

Manage lean budgeting for demand

Allocate budget for demands at each fiscal period instead of the entire fiscal year to reduce the overhead costs associated with traditional approach.

Before you begin

- Lean budgeting is enabled. For more information, see [Enable lean budgeting for demands](#).
- Role required: sn_invst_pln.sn_spm_funding_user

Any user role with this specific role attached can add or manage the investment budgets.

Procedure

1. Open a demand from the home page of Next Experience for Demand Management.
For more information, see [Access demands](#).
2. Select **Details** from the L-2 (level 2) navigation menu.
3. Select **Investment Budget**.

Note:

If the **Investment Budget** tab isn't visible, select **More** and then select **Investment Budget**.

4. Add or edit an investment budget record:

- To add an investment budget record, select **New**.
- To update the details of an investment budget record, select the record.

5. On the Create New Investment Budget form, fill in the fields.

Investment Budget form details

Field	Description
Amount	Investment budget amount.
Fiscal period	Fiscal period to allocate the budget.
Investment	Planning item to allocate this budget to. Note: The current demand is selected by default.
Expense type	Type of the expense. ○ Capex - Budget for capital expenses. ○ Opex - Budget for operational expenses.

6. Select **Save**.

Note:

To delete an investment budget record:

- Select a demand budget record from the **Investment Budget** tab and select **Delete**.
- Select **Delete** from the More Actions option in the investment budget record form.

After completing your work on the demand budget record, use the breadcrumb navigation to return to the **Investment Budget** tab.

Add or edit expense lines

Create an expense line to capture the cost associated with a specific source, such as a user or a fixed asset. Expense lines are part of demand cost plans.

Before you begin

Role required: it_demand_manager

About this task

Expense lines on a demand record track the costs incurred during the demand evaluation process. You can add multiple expense lines to a single demand, but they can only be used for evaluation costs and can't be linked to cost plans. Only processed expense lines are counted, and their total automatically rolls up to the **Demand actual costs** field on the demand record.

Note:

When a demand is converted to a project, the expense lines remain with the demand, while the cost plans and budget are moved over to the project.

Procedure

1. Open a demand from the home page of Next Experience for Demand Management.
For more information, see [Access demands](#).
2. Select **Details** from the L-2 (level 2) navigation menu.
3. Select **Expense Lines**.

Note:

If the **Expense Lines** tab isn't visible, select **More** and then select **Expense Lines**.

4. Add or edit an expense line:
 - To add an expense line, select **New**.
 - To update the details of an existing expense line, select the record.
5. On the Create New Expense Line form, fill in the fields.
For a description of the field names, see [Create expense line form](#).
6. Select **Save**.

Note:

To view the expense allocations associated with the expense line, select **Expense Allocations**.

After completing your work on an expense line, use the breadcrumb navigation to return to the **Expense Lines** tab.

Generate labor costs

Generate labor costs to view the expenses of resources using resource assignments and cost plans.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Definition > Scheduled Jobs**.
2. Open the **Generate labor costs for demands and projects** scheduled job.
3. Select **Active**.
4. On the Scheduled Script Execution form, fill the fields.
For a description of the field names, see [Scheduled Script Execution Form](#).
5. Select **Update**.

Tip:

Alternatively, as an admin, you can activate and define a scheduled job to generate labor costs at the required frequency. For more information, see [Activate a scheduled job to generate labor costs](#).

Docs for demands in Next Experience for Demand Management

Store and manage documentation for demands from a centralized location in Next Experience for Demand Management.

Docs overview

Demand managers can store information for demands using the Docs feature.

- Each demand can have a separate doc page to capture related information. For example, create a doc page for business objectives or technical requirements.
- Each demand can have multiple doc pages to help you effectively organize key artifacts.
- Predefined templates such as Project Brief, Product Requirements, Brainstorming Ideas, and Meeting Notes are available. Create doc pages using one of these templates or start with an empty page.

Features of Docs

The following are the key features of Docs:

- Auto-save content.
- See who is viewing or working on a doc page using the feature of live user presence.
- Create documents using pre-defined templates.
- Use rich text paragraph formatting, which includes headings, lists, alignment, and others.
- Move text blocks to change their placement using block-level editing.
- Tag team members inline or insert tables using the `/` command.
- Add reference to other ServiceNow AI Platform tables to connect work across teams.
- Insert images by uploading files or using web URLs.

Note:

The experience of inserting Google Images links might not work.

Real-time collaboration in Docs

With the feature of real-time collaboration, edit a doc page concurrently with multiple other editors. Colored cursors denote the current location of each editor on the page. You can choose to show or hide these live presence indicators based on your preference while working on or reviewing the content of the page.

Note:

A huge number of users editing the same block of content simultaneously might result in issues with application performance.

Dynamic data linking in Docs

Keep record information in your documentation always current and reduce manual effort with the Dynamic data linking feature in Docs. You can now reference any ServiceNow application record and Docs will automatically reflect the latest updates from those records.

For example, if you add a reference to a Project record, the reference shows the latest field information of the project in Docs without requiring manual edits. Selecting the project reference opens up the project form so that you can view the full details of the project and make any necessary changes.

A hover popover displays the details of the mentioned record, providing quick access to additional information without leaving the current context.

Dynamic linking also enables adding references to a particular field of a record, such as Assigned to of a Project record.

You can add references from any ServiceNow table you have access to, with no setup or configuration needed.

This feature reduces the need to switch between multiple ServiceNow applications within your instance and helps maintain a single, reliable source of truth for collaborative work, making it easier for teams to stay aligned and informed.

Images in Docs

Insert images into your Docs by uploading a file from your device or adding a web URL. Note that inserting Google Images links might not work.

Save images from your CWM documents directly to your device, making it easier to share or use them outside of the Docs environment. Click an image to access the download icon (📄), then click the icon to save it to your device. Alternatively, right-click the image and use your browser's built-in save option.

Create and manage pages and subpages for demands

Flexibly organize information for your planning items by creating, duplicating, and deleting pages and subpages in Next Experience for Demand Management.

Before you begin

Role required:

- Create and manage pages and subpages - it_demand_user, it_demand_manager, demand_approver
- Read pages and subpages - apw_read, ppm_read

Procedure

1. Open a demand from the home page of Next Experience for Demand Management. For more information, see [Access demands](#).
2. Select **Docs** from the L-2 (level 2) navigation menu.
3. Create or manage docs in any of the following ways.

Next Experience for Demand Management reference

Reference information to provide additional details about Next Experience for Demand Management such as the fields, user roles, tables, and multicurrency.

Actual cost and effort calculation for a demand and demand task

Actual cost and effort represent the realized cost and time spent working on demands and demand tasks during a specific time period. These values are calculated based on approved time cards and hourly rates for resources.

Overview of calculation

Working on demands and demand tasks involves cost and time that add to the overall expenditure of converting a demand to a product, feature, or enhancement. Demand managers must track the actual cost and effort incurred in assessment and planning activities.

- The actual cost is calculated by multiplying the hours reported in the time card by the hourly rate of the resource.
- The actual effort for a demand task is calculated based on the hours reported in the time card.
- The actual effort and cost for demand tasks roll up to calculate the actual effort and cost for the demand.

Hourly rate calculation

The hourly rate for calculating actual cost is derived in the following order:

1. If a rate model is associated with the demand, the actual cost is calculated based on the hourly rate defined in the rate model.
2. If a rate model is absent or if an hourly rate isn't found in the rate model, the hourly rate is derived from the default labor rate.
3. If an hourly rate isn't found in the default labor rate, the hourly rate is derived from the default system property.

Resource assignments and Time cards

Don't create resource assignments for allocating resources or groups to a demand task. Resource assignments created in the demand are used for resource estimation of the work entity created from the demand. These resource assignments automatically move to the resulting work entity when a demand is qualified and converted.

When you submit a time card for a demand, the actual effort and cost aren't reflected in the resource assignment. Resource assignments aren't associated with the demand by default. The actual cost and actual effort remain with the demand and aren't transferred to the created projects, even if you manually associate a resource assignment.

If a resource spends extra hours working on a demand that aren't associated with demand tasks, this time must also be recorded. The resource submits the time card for recording extra hours using the Time Sheet Portal. This extra cost and effort is added to the demand but isn't reflected in the actual cost and effort for the demand tasks.

Demand-level calculations

The actual cost and actual effort for the demand are calculated as follows:

- Demand Actual Cost = actual cost of all demand tasks + actual cost of extra activities
- Demand Actual Effort = actual effort of all demand tasks + actual effort of extra activities

If a demand has no task or assigned resource, you can capture the actual cost by submitting a time card against the demand. Once the time card is approved, an expense line is created on the demand. The expense line is processed and the actual cost of work for that time card rolls up to the demand in the Demand Actual Cost column.

This example demonstrates actual cost and effort calculation for demand tasks and rollup to the demand.

Scenario setup - For demand D1, the demand manager creates three demand tasks (DT1, DT2, and DT3) and assigns resources R1, R2, and R3 to each task respectively.

Hourly resource rates

Resource	Hourly rate in the rate model	Hourly rate in the default labor rate	Hourly rate in the system property
R1	\$200	\$150	\$50
R2	\$250	\$200	\$50
R3	\$150	\$100	\$50

Each resource spends eight hours on the assigned demand task and submits a time card.

Scenario 1: Rate derived from the rate model

Actuals	Demand task DT1	Demand task DT2	Demand task DT3
Actual effort	8 hours	8 hours	8 hours
Actual cost	$200 * 8 = \$1600$	$250 * 8 = \$2000$	$150 * 8 = \$1200$

Demand rollup:

- Demand Actual Cost = \$4,800
- Demand Actual Effort = 24 hours

Rate derived from default labor rate
(Rate model not associated with demand.)

Actuals	Demand task DT1	Demand task DT2	Demand task DT3
Actual effort	8 hours	8 hours	8 hours
Actual cost	$150 * 8 = \$1200$	$200 * 8 = \$1600$	$100 * 8 = \$800$

Demand rollup:

- Demand Actual Cost = \$3,600
- Demand Actual Effort = 24 hours

Rate derived from default system property
(Rate model not associated with demand and hourly rate not found in default labor rate.)

Actuals	Demand task DT1	Demand task DT2	Demand task DT3
Actual effort	8 hours	8 hours	8 hours
Actual cost	$50 * 8 = \$400$	$50 * 8 = \$400$	$50 * 8 = \$400$

Demand rollup:

- Demand Actual Cost = \$1,200
- Demand Actual Effort = 24 hours

Data migrated from demands to created entities

Data fields that are migrated from a demand to an entity when the selected entity is created from the demand.

Data migrated from a demand to a created project

Data fields are migrated from a demand to a project when the project is created from the demand.

Field type	Description
Demand	<p>The following demand fields are migrated to a project:</p> <ul style="list-style-type: none"> • Description • Business case • Investment Class • Investment Type • Risk of performing • Risk of not performing • Enablers • Barriers • In scope • Out of scope • Assumptions • Business Unit • Department • Impacted Business Units • Business Capabilities • Priority • Impact • Rate Model • Approved start date • Approved end date • Short description • Program • Domain • Goals • Strategies • Impacted Business Applications • Configuration item • Company • Urgency • Project Manager

Field type	Description
	<ul style="list-style-type: none"> • Project currency • Project calculation
Resource assignments	Resource assignments are migrated to a project by updating the task reference from the demand to project.
Requirements	Demand requirements.
Financial records	Financial records such as cost plans and breakdowns, benefit plans and breakdowns (monetary and non-monetary), and demand budgets are migrated to a project. This process updates the task reference from demand to project.
RIDAC	RIDAC entities are migrated to a project by updating the task reference from demand to project. The migrated entities include the risks, issues, decisions, project actions, request changes, and RIDAC_m2m records.
Assessment	<p>The following assessment data fields are migrated to a project:</p> <ul style="list-style-type: none"> • Risk • Value • Score • T-Shirt size
Stakeholders	Stakeholder records.
Project Currency Financial	If the multicurrency feature is active, the project financial fields are calculated according to the project currency and reference rate.

Data migrated from demands to Enterprise Agile Planning (EAP) entities

Data fields are migrated from a demand to an EAP entity when the entity is created from the demand.

Data fields migrated from demand to EAP entity

Field type	Description
Demand	<p>The following demand fields are migrated to the created entity:</p> <ul style="list-style-type: none"> • Business Capabilities • Product • Primary target • Team • Demand manager

Data fields migrated from demand to EAP entity (continued)

Field type	Description
	<ul style="list-style-type: none"> • Description • Department • Priority • Approved start date • Approved end date • Short description • Primary goal • Strategic program • Service offering • Business service • Business applications • Score • Requested by • Capital expense • Operating expense • Start date • Program • Total planned cost • Investment Class • Portfolio • Investment Type • ROI % • Rate Model • Model ID • Expense type • Financial benefit
Resource assignments	The resource assignments of a demand are migrated to the created entity.
Financial records	Cost plans and breakdowns, benefit plans and breakdowns (monetary and non-monetary), and investment budgets are migrated to the created entity.
Attachments	Demand attachments.
Goal/target relationships	Goal/target relationships of the demand.

Demands list view

The **All Demands** home page displays demands in a list view and contains specific UI components to create, edit, and export demands.

Actions

The actions available on the home page are listed in this

Number	Name	State	Demand manager	Score	Start date	Due date	Primary goal	Portfolio	Business Unit	Department
DMND0000800	AI-Powered Credit Risk Assessment Automation	Screening		0						
DMND0000810	HIPAA Compliance Audit Program Digitization	Qualified		4.63

All Demands UI

Feature	Description
Search	Option to search for demands by name.
Filter	Option to apply filters on the list. The filter preferences that you choose are retained in the filter criteria.
Sort by	Option to sort the demand list in ascending or descending order based on a selected field.
Group by	Option to group the demands by a selected field, such as state or stage, for better organization and visibility.
Refresh	Option to reload the list.
New	Option to create a demand.
Edit	Option to edit the selected demands.
Assign to me	Option to assign the selected demand to the logged-in user.
Export	Option to export the demand list to an external file format such as Excel or CSV.
More Actions	Option to see more features available in the All Demands list.
Personalize fields	Option to customize the columns displayed in the demand list to show only the fields relevant to you.

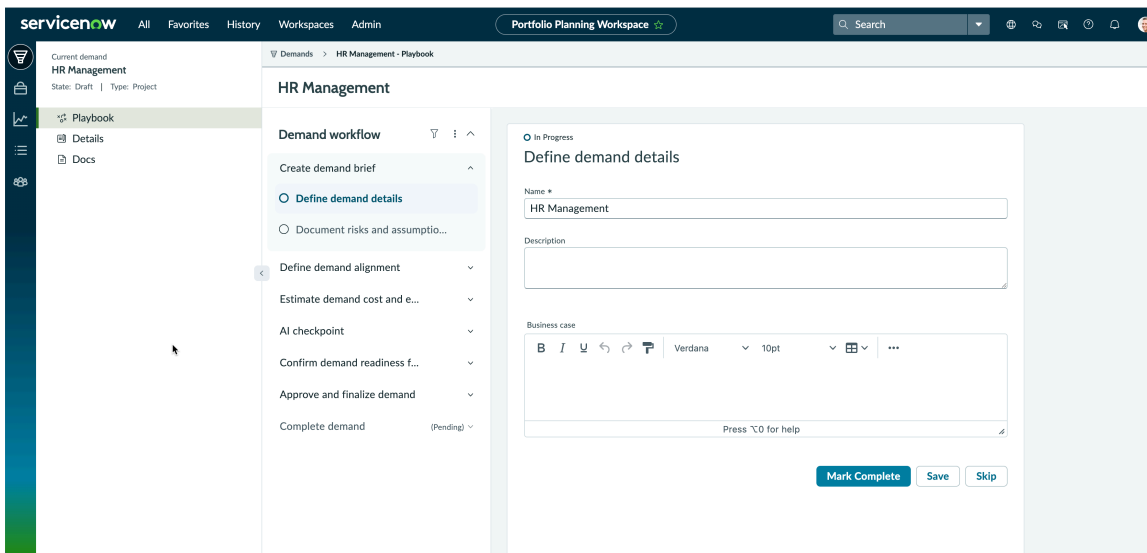

Data grid

The data grid shows the list of demands in rows, and the following options to perform actions on the rows.

Option	Description
Column actions	Group the demands by a column field using the action on the header. Point your mouse device to a column header to see the context menu icon ().
Rearrange columns	Enables the dragging of the columns to a position of your choice on the grid.
Select row ()	Choose to select multiple demand rows at once.
Cell actions	Show matching or filter out demands by selecting the cell context menu () or select and hold (or right-click) a cell.

Demand default playbook stages and activities

The default demand playbook includes certain predefined stages and activities. These activities guide you through the demand life-cycle, from capturing the initial brief to completing the demand.

Create demand brief

In this stage, capture the foundational information for the demand including the business justification, risks, and assumptions.

Create demand brief stage details

Activity	Type	Description
Define demand details	Form	Enter the demand name, description, and business case. For more information, see Demand form .
Document risks and assumptions	Form	Document the risk of not performing the demand and any assumptions. For more information, see Demand form .
The demand state will be moved to submitted	Automated	Completing the previous activities advances the demand to the next state in its life-cycle.

Define demand alignment

In this stage, align the demand with organizational goals, stakeholders, and team members.

Define demand alignment stage details

Activity	Type	Description
Define business alignment	Form	Define the business classification for the demand. For more information, see Demand form .
Define strategic alignment	Form	Define how the demand aligns with the organization's strategic objectives. For more information, see Demand form .
Add secondary goals	Related list	Associate secondary goals and targets with the demand. <ul style="list-style-type: none"> You can also add a goal or target relationship. You can view the details of an entry by selecting it from the list. For more information, see Demand form .
Update demand dates	Form	Specify or update the planned dates for the demand. For more information, see Demand form .
Add collaborators	Form	Add collaborators to the demand and indicate whether

Define demand alignment stage details (continued)

Activity	Type	Description
		an assessment is required. For more information, see Demand form .
Add stakeholders	Related list	Add stakeholders associated with the demand. You can view the details of an entry by selecting it from the list. For more information, see Create stakeholder form .
Add demand tasks	Related list	Create demand tasks to break down initial planning activities. For more information, see Create demand task form .
Update EAP details	Form	Update the Team field for the Enterprise Agile Planning (EAP) entity, to which the demand is converted. Note: This activity is available if the Type field is an EAP entity.
The demand state will be moved to screening	Automated	Completing the previous activities advances the demand to the next state in its life-cycle.

Estimate demand cost and effort

In this stage, evaluate the financial and resource requirements for the demand.

Estimate demand cost and effort stage details

Activity	Type	Description
Update assessment details	Form	Update the assessment information for the demand. For more information, see Demand form .
Estimate financial cost	Related list	View and manage cost plans associated with the demand. <ul style="list-style-type: none"> You can add a cost plan or delete an existing one. You can view the details of an entry by selecting it from the list.

Estimate demand cost and effort stage details (continued)

Activity	Type	Description
		For more information, see Create cost plan form .
Estimate resource requirements	Related list	View and manage resource assignments for the demand. You can view the details of an entry by selecting it from the list. For more information, see Create resource assignment form .
Define benefit estimates	Related list	View and manage benefit plans for the demand. <ul style="list-style-type: none"> You can add a benefit plan or delete an existing one. You can view the details of an entry by selecting it from the list. For more information, see Monetary benefit plan form and Non-monetary benefit plan form .
Cost estimates	Form	Review or update the cost estimate details for the demand.
The demand state will be moved to qualified	Automated	Completing the previous activities advances the demand to the next state in its life-cycle.

AI checkpoint

In this stage, associate AI systems with the demand to identify potential AI impacts.

Note:

If the AI Control Tower plugin is installed and the investment type of the demand is set to artificial intelligence, the AI checkpoint stage is available for playbooks.

AI checkpoint stage details

Activity	Type	Description
Associate AI systems	Form	Add AI systems to the demand by selecting from the existing systems. To link existing systems, use the Product and Impacted AI systems fields.

Confirm demand readiness for review

In this stage, verify that the demand is complete and ready for approval.

Confirm demand readiness for review stage details

Activity	Type	Description
Align demand and assign portfolio/program	Form	Review the demand details and confirm readiness for the approval process.
The demand state will be moved to approved	Automated	Completing the previous activities advances the demand to the next state in its life-cycle.

Approve and finalize demand

In this stage, confirm the demand details and convert the demand to a work entity.

Approve and finalize demand stage details

Activity	Type	Description
Confirm details and convert to selected entity	Form	Review the selected work entity type, such as project or enhancement, and the approved timeline.

Complete demand

This stage is the final stage of the demand workflow.

Complete demand stage details

Activity	Type	Description
Review the converted entity	Form	Review the work entity created from the demand to verify that the conversion is complete.

[Playbooks in Next Experience for Demand Management](#)

[Create and customize playbooks](#)

[Use Playbooks](#)

Demand tasks

A demand task is a unit of work created within a demand to break down initial planning activities before converting the demand into an entity.

Demand tasks overview

You can create a demand task from the **Demand Tasks** related list to delegate activities that help assess demand feasibility.

Demand tasks differ from project tasks in the following ways:

- Planned dates, actual dates, and original dates aren't supported in demand tasks.
- The due date indicates when the task is targeted for completion and doesn't affect the demand workflow. Project tasks affect project completion dates when planned dates and actual dates are changed.
- Nested demand tasks aren't supported.
- Task constraints such as Start ASAP and Start on a specific date aren't supported.
- Execution types such as Agile, Waterfall, or Hybrid aren't supported.

Resource assignment

Resources for a demand task can be assigned using the **Assigned to**, **Additional Assignee list**, and **Assignment Group** fields. Don't create resource assignments to allocate resources or groups to a demand task or submit time spent on the demand. If you associate a resource assignment with a demand task, the associated resource plan isn't transferred to the work entity created from that demand.

Resource assignments aren't associated with the demand by default. Don't use the resource assignments you created for the future work entity to submit time spent on a demand. When you submit a time card for a demand, the time and cost incurred aren't transferred to the work entity created from the demand. The time and cost remain within the demand as the demand cost and effort. Resources assigned to a demand task can submit the time spent on it using a time card.

Actual cost and effort

The actual effort for work performed on the demand task is derived from the time card. The actual cost is derived from the hourly resource rate defined in the rate model, default labor rate, or default system property. The actual cost and effort for a demand task roll up to derive the actual cost and effort for the associated demand. For more information, see [Actual cost and effort calculation for a demand and demand task](#).

Multicurrency in Next Experience for Demand Management reference

The multicurrency features in Next Experience for Demand Management enable you to manage and track demand financials in multiple currencies. This section provides field references and explains how cost and benefit plan updates recalculate values in demand currency.

Multicurrency fields in demand-related forms

When you enable the **Demand Currency** view in Demand, Cost Plan, and Cost Plan Breakdown forms, multicurrency fields appear in the Financials section of these forms.

Financials tab of the Demand form

Field	Description
Demand currency	<p>Currency for managing and tracking the demand. The available currency options depend on your selection in Preferences-Project under Project Administration. For more information, see Select demand currency preference.</p> <p>This field becomes read only once you create a cost plan, cost plan breakdown, benefit plan, or benefit plan breakdown.</p>

Financials tab of the Demand form (continued)

Field	Description
Project currency	Currency for implementing the project when this demand is converted to a project. This value carries over to the Project form in Project Management.
Capital expense in demand currency	Capital expenditure (Capex) for the demand.
Capital budget in demand currency	Total capital budget allocated to the demand across all fiscal years. Rolled up from the Capex budget of the demand.
Operating expense in demand currency	Operational expenditure (Opex) for the demand in the selected demand currency.
Operating budget in demand currency	Total operational budget allocated to the demand across all fiscal years in the selected demand currency. Rolled up from the Opex budget of the demand.
Total planned cost in demand currency	Estimated cost of the demand in demand currency.
Financial return in demand currency	Estimated revenue based on the Total planned costs in demand currency and Financial benefit in demand currency fields.
Financial benefit in demand currency	Estimated revenue if the demand is approved in the selected demand currency. Rolled up from the benefit breakdown of the demand.
Net present value in demand currency	Present value of future cash based on the given annual interest rate in the selected demand currency. A measure for comparing money spent today against future expected financial benefits, helping evaluate overall investment performance.
Actual cost in demand currency	Total cost incurred while working on a demand and demand tasks in the selected demand currency.

Multicurrency fields of the Demand Task form

Field	Description
Demand currency	Currency specified in the Demand currency field of the Demand form.
Actual cost in demand currency	Total cost incurred while working on the demand tasks in the selected demand currency. Actual cost populates after the assignee creates and submits a time card. When the time card is approved, the resource rate from the rate card, labor rate, or system properties populates this field.

Financials section of the Cost Plan form

Cost Plan form

Field	Description
Demand currency	Currency specified in the Demand currency Demand currency field of the Demand form.
Cost in demand currency	Value that is rolled up from the Entered cost field of all cost plan breakdowns.

Note:

Any change to the unit cost, quantity, or fiscal period of a cost plan recalculates the amounts in demand currency. See [Cost plan updates and cost recalculation in demand currency](#).

Multicurrency fields in the Cost Plan Breakdown form

Field	Description
Demand currency	Currency specified in the Demand currency field of the Demand form.
Cost in demand currency	Breakdown amount in demand currency.
Demand currency exchange rate	Rate in effect for the period corresponding to the cost plan breakdown in the demand currency.
Demand currency exchange rate date	Reference date on which the currency exchange rate is applied for conversion.

Financials section of the Benefit Plan form

Field	Description
Demand currency	Currency specified in the Demand currency field of the Demand form.
Benefit in demand currency	Benefit incurred from demand in demand currency.
Actual benefit in demand currency	Actual benefit value rolled up from the actual benefit in the benefit breakdown.

Multicurrency fields in the Benefit Plan Breakdown form

Field	Description
Demand currency	Currency specified in the Demand currency field of the Demand form.
Benefit in demand currency	Benefit incurred from demand in demand currency.

Multicurrency fields in the Benefit Plan Breakdown form (continued)

Field	Description
Demand currency exchange rate	Rate in effect for the period corresponding to the benefit plan breakdown in demand currency.
Demand currency exchange rate date	Reference date on which the currency exchange rate is applied for conversion.

Multicurrency fields in the Expense Line form

Field	Description
Demand currency	Currency specified in the Demand currency field of the Demand form.
Amount in demand currency	Expense cost in demand currency. Amount entered in the Amount field is converted to demand currency.

Multicurrency fields in the Demand Budget form

Field	Description
Capex budget in Demand Currency	Planned expense amount allocated for capital expenditure in the selected currency.
Opex budget in Demand Currency	Operating expense amount in the selected currency.
Total Budget in Demand Currency	Sum of Capex and Opex amounts in the selected currency.

Cost plan updates and cost recalculation in demand currency

Updating the unit cost, quantity, or fiscal period of a cost plan updates all related amount fields in the cost plan and its breakdowns. The amounts in the related demand fields are recalculated and reflected in the demand currency.

Unit cost, Quantity, and Recurring field changes

When you modify these fields in the Cost Plan form with multicurrency view enabled, the following values are recalculated:

- **Total planned cost** in demand currency.
- **Cost in demand currency** in the Cost Plan Breakdown.
- **Capital expense in demand currency, Operating expense in demand currency, and Total planned cost in demand currency** fields in the demand.

Fiscal period changes

When you change the fiscal period (start date or end date) in the Cost Plan form, the following values are recalculated:

- **Total planned cost** and **Cost in demand currency** of the cost plan. Cost Plan Breakdown records can be added or removed.
- If the **Recurring** check box isn't selected, the **Cost in demand currency** value of each Cost Plan Breakdown record is recalculated.
- **Capital expense in demand currency**, **Operating expense in demand currency**, and **Total planned cost in demand currency** fields in the demand.

Cost plan breakdown changes

When you change the entered cost in an individual Cost Plan Breakdown record or manually add cost plan breakdowns to a cost plan, the following values are recalculated:

- **Total planned cost** of the cost plan in demand currency.
- **Capital expense in demand currency**, **Operating expense in demand currency**, and **Total planned cost in demand currency** fields in the demand.

Benefit plan updates and recalculation in demand currency

Updating the entered currency, entered benefit, offset type, or fiscal period of a benefit plan updates all related amount fields in the benefit plan and its breakdowns. The amounts in the related demand fields are recalculated and reflected in demand currency.

Entered currency, Entered benefit, and Recurring field changes

When you modify these fields in the Benefit Plan form with multicurrency view enabled, the following values are recalculated:

- **Total planned cost** in demand currency.
- **Benefit in demand currency** in the Benefit Plan Breakdown.
- **Financial benefit in demand currency** field in the demand.

Offset type changes

When you change the offset type (start date or end date) and specify the offset period and duration in the Benefit Plan form, the following values are recalculated:

- **Total planned benefit** and **Benefit in demand currency** of the benefit plan. Benefit Plan Breakdown records can be added or removed.
- If the **Recurring** check box isn't selected, the **Benefit in demand currency** value of each Benefit Plan Breakdown record is recalculated.
- **Financial benefit in demand currency** field in the demand.

Fiscal period changes

When you change the fiscal period (start date or end date) in the Benefit Plan form, the following values are recalculated:

- **Benefit in demand currency** and **Total planned benefit** of the benefit plan. Benefit Plan Breakdown records can be added or removed.
- If the **Recurring** check box isn't selected, the **Benefit in demand currency** of each Benefit Plan Breakdown record is recalculated.
- **Financial benefit in demand currency** field in the demand.

Benefit plan breakdown changes

When you change the entered benefit in an individual Benefit Plan Breakdown record, the following values are recalculated:

- **Benefit in demand currency** of the benefit plan.
- **Financial benefit in demand currency** field in the demand.

Form field information

Field information for forms used in Next Experience for Demand Management.

Assessment instance form

The assessment instance form information is used to create and edit an assessment instance for a demand.

Assessment Instance

Field	Description
Number	Auto-generated unique identifier for the assessment instance.
State	Status of the assessment instance. Defaults to Ready to take .
Metric type	Type of metric used to define the evaluation criteria for the assessment.
Assessment group	Group responsible for completing the assessments.
Due date	Date by which the assessment must be completed.
Assigned to	Users responsible for completing the assessment instance.
Expiration date	Date after which the assessment instance is no longer valid.
Signature	Signature associated with the assessment instance on completion.
Preview	Indication of whether a preview of the assessment before it's submitted is available.
Signature result	Outcome or status of the signature collected for the assessment instance.

Create action form

The action form information is used to create an action for a demand.

Create New Action form

Field	Description
Number	System-generated number with a configurable prefix.

Create New Action form (continued)

Field	Description
State	<p>Current state of the action. All new action records are created with the state set to Open.</p> <p>The available states are:</p> <ul style="list-style-type: none"> • Pending • Open • Work in Progress • Closed Complete • Closed Incomplete • Closed Skipped
Priority	Urgency for implementing or approving the action based on impact.
Estimated Cost	Estimated cost generated by the action.
Impact	The impact on the outcome of the demand if you don't implement the action.
Approval	<p>Status of approval from the stakeholders for the action. The available options are:</p> <ul style="list-style-type: none"> • Not Yet Requested • Requested • Approved • Rejected
Assigned to	Primary resource assigned to implement the action.
Due date	Requested date on which the action must be approved or implemented.
Parent	The demand to which this action belongs.
Short description	Brief description of the action such as what the action involves, how to implement the action, who it affects, and the action outcome.
Description	Details of the action and its potential impact.
Work notes	Information about the action. Add work notes to communicate about the status of action approval, rejection, or implementation with other users.

Create assessment instance question form

The assessment instance question form information is used to create and edit an assessment questions for a demand.

Assessment Instance Question

Field	Description
Source table	Table from which the assessment instance question originates.
Category	Category used to classify the assessment instance question.
Source	Source record associated with the assessment instance question.
Domain	Domain to which the assessment instance question belongs. Defaults to global.
Metric	Assessment metric that defines the criteria being evaluated.
Instance	Assessment instance to which this question belongs. Auto-populated with the instance number.
Value	Numeric or scored value assigned to the assessment question response.
String value	Text-based response or value entered for the assessment question.
Reference id	Unique identifier of the referenced record associated with this question.
Additional information	Any supplementary details or context relevant to the assessment instance question.

Create cost plan breakdown form

The cost plan breakdown form information is used to create and edit a cost plan breakdown record for a cost plan of a demand.

Cost plan breakdown

Field	Description
Cost plan	Name of the cost plan to which the breakdown is associated.
Fiscal period	Fiscal period for the cost plan breakdown.
Entered currency	Currency to capture the unit cost value. If the selected currency is different from the default currency configured in the Financial Management application, the budget reference rate is used to calculate the cost of the demand.
Entered cost	Breakdown amount in entered currency.
Task	Task to which the cost plan breakdown belongs.

Cost plan breakdown (continued)

Field	Description
Functional cost	Functional cost obtained by multiplying exchange rate with entered cost.
Exchange rate	Rate in effect for the period corresponding to the cost plan breakdown. When the period corresponding to the cost plan break down has multiple rates, the rate in effect on the first date of that period is used. Exchange rate is used to convert entered cost into functional cost. It is obtained from the itfm_fx_rate [budget_reference_rates] table.
Exchange rate date	First date of the fiscal period corresponding to the cost plan breakdown.

Create cost plan form

The cost plan form information is used to create a cost plan for a demand.

Cost plan section

Field	Description
Name	Name of the cost plan.
Project/Demand	The demand to which this cost plan belongs.
Start fiscal period	Starting month in a fiscal period for the cost plan. When you change the start fiscal period, the associated cost breakdown values also change.
End fiscal period	Ending month in a fiscal period for the cost plan. When you change the end fiscal period, the associated cost breakdown values also change.

Financials section

Field	Description
Entered currency	Currency to capture the unit cost value. If the selected currency is different from the default currency configured in the Financial Management application, the budget reference rate is used to calculate the cost of the demand.

Financials section (continued)

Field	Description
Total planned cost	<p>Total planned cost value of the cost plan. If the cost is recurring, the calculation is Quantity x Unit cost x number of fiscal periods.</p> <p>If the cost is non-recurring, the calculation is Quantity x Unit cost.</p> <p>This value is rolled up from the cost breakdown.</p>
Unit cost	Cost of single unit of the resource.
Functional currency	The default currency configured in the Financial Management application and used for managing the demand.
Quantity	Quantity of cost plans.
Cost in functional currency	The total planned cost for the demand in functional currency. The value in this field changes if the entered currency is different from the functional currency.
Recurring	<p>Indicates if the cost is recurring for each fiscal period.</p> <p>Quantity x Unit cost value is incurred for every fiscal period.</p>
Total actual cost	Total actual costs of the cost plan. This value is rolled up from cost breakdown.
Cost type	Cost type of the plan.
Source	<p>Funding entity value from which you request fund.</p> <p>The field is available when you select a value in the Source type field.</p> <p>This field appears only if the legacy Investment Funding (com.snc.investment_funding) plugin is activated or the Investment Funding (sn_invst_pln) application is installed.</p>
Investment	<p>Name of the investment created for the project.</p> <p>This field appears only if the legacy Investment Funding (com.snc.investment_funding) plugin is activated or the Investment Funding (sn_invst_pln) application is installed.</p>

Financials section (continued)

Field	Description
Source type	<p>Funding entity type from which you request fund.</p> <p>This field appears only if the legacy Investment Funding (com.snc.investment_funding) plugin is activated or the Investment Funding (sn_invst_pln) application is installed.</p>

Create decision form

The decision form information is used to create a decision for a demand.

Decision form

Field	Description
Number	System-generated ID number with a configurable prefix.
State	<p>Current state of the decision. All new decision records are created with the Open state.</p> <p>The available states are:</p> <ul style="list-style-type: none"> • Pending • Open • Work in Progress • Closed Complete • Closed Incomplete • Closed Skipped
Priority	Urgency of approving or implementing the decision based on the possible impact.
Decision status	<p>Status of the decision. The available options are:</p> <ul style="list-style-type: none"> • Pending • Approved • Rejected
Impact	Impact on the outcome of the demand if you don't implement the decision.
Approval required	Option for determining whether approval of the decision is required.
Estimated Cost	Estimated cost of implementing the decision in the selected currency.
Due date	Requested date on which the decision must be approved or implemented.
Assigned to	Primary resource assigned to work on the decision. The default value is the name of the user creating the decision record.
Parent	Demand number to which this decision belongs.

Decision form (continued)

Field	Description
Short description	Brief description of the decision such as what the decision is about, who made it, what it affects, and the decision outcome.
Description	Details of the decision and its potential impact.
Work notes	Information to record and track the status of decision implementation or approvals.

Create demand task form

The demand task form information is used to create a demand task for the demand.

Demand Task form

Field	Description
Short description	A brief summary of the task, which helps quickly identify the purpose or nature of the work.
Assignment group	Team or group responsible for handling the task.
Number	System-generated ID number with a configurable prefix.
Assigned to	<p>Primary resource responsible for executing or progressing the task. The following conditions apply:</p> <ul style="list-style-type: none"> • If an assignment group is defined, users in the assignment group are listed. • If skills are defined, users with those skills are listed. • If no assignment groups or skills are defined, users with one of the Project Management application user roles are listed. • Users with the timecard_user role are also listed.
Priority	Indicates the urgency and importance of the task. Determines how quickly it should be addressed.
Additional assignee list	Users assigned to the demand task in addition to the single primary resource defined in the Assigned to field.
State	<p>Current state of the demand task. All new demand task records are created in the Open state.</p> <p>The states include:</p>

Demand Task form (continued)

Field	Description
	<ul style="list-style-type: none"> • Pending • Open • Work in Progress • Closed Complete • Closed Incomplete • Closed Skipped
Category	<p>Category of the demand task.</p> <p>The categories include:</p> <ul style="list-style-type: none"> • Initial review • Effort estimate • Cost estimate • Benefit estimate • Risk assessment
Due date	The expected completion date and time for the task.
Actual effort	<p>The actual time spent working on the demand task, which is derived from the approved time card for this demand task.</p> <p>You must add this field by personalizing the Create New Demand Task form as this field doesn't appear by default on the form.</p>
Actual cost	The actual cost of the demand task derived from the number of hours worked and hourly rate of the resource as defined in the rate card. In the absence of a rate card, the hourly rate is derived from the default labor rate card or default system property.
Description	Brief description of the demand task.
Work notes	Information about the demand task. Work notes are added throughout the demand management life cycle to communicate with other users associated with the demand.

Create expense line form

The expense line form information is used to create an expense line for your actual expenses.

Expense Line section

Field	Description
Number	Auto-generated number for the expense line.

Expense Line section (continued)

Field	Description
Amount	Expense cost in the selected currency.
Date	Date on which the expense was generated.
Process date	Date on which the expense line was processed.
Rate card	Name of the rate card.
Inherited	Indicates if the expense line is inherited from another expense line.
Parent	The parent expense line from which this expense line is inherited.
Rate type	Rate type for the expense line.
State	State of the expense line. Only processed expense lines are considered for an investment entity.
Source ID	Record that generated the associated cost.
Summary type	Business purpose of the expense line.
Cost plan	Associated cost plan name for recording the expense line.
Expense type	Defines the expense type, internal or external. By default, the expense type is considered from the cost type field entry.
Cost type	Cost type of the expense. By default, the cost type of the cost plan is selected.
Short description	Short description of the expense. Mention unique and specific details to identify the expense line.
Source	Sources of the expense line. These sources include: <ul style="list-style-type: none"> • Asset • Configuration item • Fixed asset • Task • Contract • Cost center • User

Create goal/target relationship form

The goal/target relationship form information is used to create a relationship between a goal and a demand.

Create New Goal/Target Relationship form

Field	Description
Goal	Name of the goal.
Demand	Demand with which a goal relationship is created with the goal.
Target	Name of the target.
Primary	Indicates that this goal is the primary goal associated with a demand. Although multiple goals can be linked to a demand, only one of them must be designated as the primary goal.
Parent goal	Name of the parent goal that this goal contributes to.
Status	Status of the goal. Status can be Red, Yellow, Green, or None.
State	State of the goal. The state can be Draft, In progress, Approved, Complete, Pending, Achieved, or Not Achieved.
End date	End date for the goal. By default, the end date of the current quarter is populated. For a subgoal, the end date of its parent goal is populated.
Start date	Start date for the goal. By default, the start date of the current quarter is populated. For a subgoal, start date of its parent goal is populated.
Progress	Percentage completion for the goal. If the goal has subgoals or/and targets, the progress value is calculated automatically. For more information on how the progress value is calculated, see Progress value calculation .
Category	Category of the goal. The available options are: <ul style="list-style-type: none"> • Total Applications • Total Cost • Opex • Capex • Cloud Applications • Homegrown Applications • Support Cost

Create New Goal/Target Relationship form (continued)

Field	Description
	<ul style="list-style-type: none"> • Labor Cost • Standards Compliance • Strategic • Operational • Tactical • Artificial Intelligence

Create issue form

The issue form information is used to create an issue for the demand.

Issue form

Field	Description
Number	System-generated ID number with a configurable prefix.
State	<p>Current state of the issue. All new issue records are created in the Open state.</p> <p>The available states are:</p> <ul style="list-style-type: none"> • Pending • Open • Work in Progress • Closed Complete • Closed Incomplete • Closed Skipped
Priority	Urgency of resolving or managing the issue based on possible impact.
Estimated cost	Estimated cost generated by the issue.
Impact	Impact on the outcome of the demand if the issue remains unresolved.
Due date	<p>Requested date for one of the following situations:</p> <ul style="list-style-type: none"> • If the issue has an assigned resource, then the due date is the date for resolving the issue. • If the issue isn't assigned to any resource, then the due date is the date when the issue must be closed or addressed.
Assigned to	Primary resource assigned to work on the issue resolution.
Parent	Demand to which this issue belongs.
Short description	Brief description of the issue and its potential impact on the success of the demand.

Issue form (continued)

Field	Description
Description	Details of the issue and its potential impact.
Work notes	Information to record and track the work accomplished for resolving the issue.

Create request change form

The request change form information is used to create a request change for a demand.

Request change form

Field	Description
Number	System-generated ID number with a configurable prefix.
State	Current state of the request change. All new request change records are created in the Open state. The available states are: <ul style="list-style-type: none"> • Pending • Open • Work in Progress • Closed Complete • Closed Incomplete • Closed Skipped
Priority	Urgency for approving the requested changes based on impact.
Estimated Cost	Estimated cost generated by the requested changes.
Impact	Impact on the outcome of the demand if you don't approve the requested changes.
Approval	Status of approval from the stakeholders for the requested changes.
Assigned to	Primary resource assigned to work on the request change.
Due date	Requested date to complete the request change.
Category	Entity for which you're creating the request change. The options are: <ul style="list-style-type: none"> • Resource • Scope • Cost • Schedule
Parent	Demand number to which this request change belongs.
Title	Title for the change request.
Description	Details of the request change and its potential impact.
Business Justification	Reason for requesting the proposed change in the demand. The change's impact on the business.

Request change form (continued)

Field	Description
Work notes	Additional information to indicate progress on the demand request change.

Create requirement form

The requirement form information is used to create a requirement for a demand.

Requirement form

Field	Description
Number	Unique identification number for the requirement. Automatically generated when a new requirement record is created.
Source	User requesting the requirement. This field automatically populates with the name of the person filling out the form, but the source can be a different person who identified the requirement.
Owner	User responsible for managing the requirement or ensuring that the requirement is met.
Estimated effort	Approximate amount of time to complete the requirement and any associated tasks.
Priority	Importance of the requirement as it applies to the overall demand.
State	Status of the requirement such as Pending, Approved, or Rejected. Note: The requirement state is independent of the demand state and the states of any planned tasks associated with the requirement. The demand can be closed without the requirement state being closed. Closing the demand doesn't change the state of the requirement.
Type	Type of requirement such as Business, Solution (Functional), Solution (Non-Functional), Quality, Stakeholder, or Transition.
Short description	Brief description of the requirement.
Description	Detailed description of the requirement and any associated tasks. For example, describe an expected outcome or result.

Create resource assignment form

The resource assignment form information is used to create a resource assignment record for a demand.

Resource assignment

Field	Description
Assignment type	Select an assignment type from the list.

Resource assignment (continued)

Field	Description
	<ul style="list-style-type: none"> • User - to create a resource assignment for a user. • Group - to create a resource assignment for a group.
Resource	<p>Name of the resource.</p> <p>This field is turned off for Group assignment.</p>
Group	<p>Name of the group to create resource assignment.</p> <p>If a resource is selected, the primary group name is populated by default.</p>
Role	<p>Primary role for the employee.</p> <ul style="list-style-type: none"> • If a resource is selected, the primary role is populated by default. • This field is turned off for Group assignment.
Skill	<p>Primary skill of the resource.</p> <ul style="list-style-type: none"> • If a resource is selected, the primary role is populated by default. • This field is turned off for Group assignment.
Effort type	<p>Select the effort type to request a resource.</p> <ul style="list-style-type: none"> • Hours - to request a resource or group by hourly basis. • FTE - to request a resource or group by FTE. <p>By default, one FTE is 8 hours.</p> <ul style="list-style-type: none"> • Person days - to request a resource or group by Person days.
Effort	<p>Enter the required effort count.</p>
Task	<p>Select the task from the list to associate the resource assignment.</p>
Start date	<p>Select the start date of the assignment using the calendar palette.</p>
End date	<p>Select the end date of the assignment using the calendar palette.</p>
Resource status	<p>Select the state of the resource assignment.</p> <ul style="list-style-type: none"> • Pending • Approved

Resource assignment (continued)

Field	Description
	<ul style="list-style-type: none"> • Unapproved • Unassigned
Rate override	Select this option to override the resource rate to match with your organization requirements.
Ready for review	<p>Select an option from the list so that the resource manager can review the request for allocation.</p> <ul style="list-style-type: none"> • Yes - if the resource assignment request is finalized and ready for resource manager's review for allocation. • No - if the resource assignment details are still being updated.
Notes	Enter details about the assignment to help resource manager or project manager with insights and additional information.

Create risk form

The risk form information is used to create a risk for the demand.

Risk form

Field	Description
Number	System-generated ID number with a configurable prefix.
State	<p>Current state of the risk. All new risks are created in the Pending state.</p> <p>The available states are:</p> <ul style="list-style-type: none"> • Pending • Open • Work in Progress • Closed Complete • Closed Incomplete • Closed Skipped
Risk status	<p>Status of the risk. All new risks are created in the Pending risk status. The available options are:</p> <ul style="list-style-type: none"> • Pending • Achieved • Not Achieved • Avoid • Mitigate

Risk form (continued)

Field	Description
	<ul style="list-style-type: none"> • Transfer • Accept
Probability	<p>The likelihood that the event described in the risk can occur. All new risks are created in the Low probability. The available options are:</p> <ul style="list-style-type: none"> • Absolute • High • Moderate • Low
Impact	Impact of the risk event on the outcome of the demand.
Estimated cost	Estimated cost generated by the risk event.
Risk rank	A value and color assigned to the risk. This value is calculated using risk probability and impact. You can configure the color and value using the Risk Value Lookup. For more information, see Configure a custom risk rank and risk value.
Risk owner	Primary resource who is responsible for monitoring and managing the risk.
Assigned to	Primary resource assigned to work on the risk.
Risk value	A value calculated from the Risk Value Lookup. For more information, see Configure a custom risk rank and risk value.
Due date	<p>Requested date for one of the following situations:</p> <ul style="list-style-type: none"> • If the risk has an assigned resource, then the due date is the date for resolving the risk. • If the risk isn't assigned to any resource, then the due date is the date when the risk must be closed or addressed.
Task	Demand to which this risk belongs.
Short description	Brief description of the event and its potential impact on the success of the demand.
Description	Details of the event and its potential impact.
Mitigation plan	Brief description of the efforts taken to mitigate the risk.
Work notes	Information to record and track the work accomplished for resolving the risk.

Create stakeholder form

The stakeholder form information is used to create a stakeholder record for the demand.

Stakeholder register form

Field	Description
Stakeholder	Name of the stakeholder being added to the demand.
Demand	Demand to which the stakeholder is assigned.
Level of Interest	Level of interest that the stakeholder has in pursuing the demand.
Assessment recipient	Indication of whether the stakeholder is authorized to receive assessment questionnaires for a demand.
Approver	Indication of whether the stakeholder has authority to approve demands.
Influence	Level of influence the stakeholder has over the group assessing the demand.
Engagement	Indication of the way the stakeholder is engaged with the demand.
Function	Function of the stakeholder in the demand process.

Create project funding form

The project funding form information is used to create a project funding budget for the demand.

Project Funding

Field	Description
Fiscal Year	The fiscal year for which you want to set the budget for the demand.
Capex target	Planned target amount allocated for capital expenditure.
Opex target	Planned target amount allocated for operating expenditure.
Target	Sum of capex and opex target amounts.
Demand/Project	Demand to which the budget belongs.
Capex budget	Planned expense amount allocated for capital expenditure.
Operating budget	Operating expense amount.
Budget	Sum of capex and opex amounts.
Selected for execution	Indication of whether the demand is planned for execution.

Demand form

The demand form information is used to create a demand.

Demand form fields

Field	Description
Name	Name of the demand.
Category	Category of the demand:

Demand form fields (continued)

Field	Description
	<ul style="list-style-type: none"> • Strategic: For demands for plans, such as projects or stories. • Operational: For demands for operational work, such as changes or defects.
Type	<p>The Category field selection determines the selections available in the Type field.</p> <ul style="list-style-type: none"> • The following demand types are available if the demand category is Strategic: <ul style="list-style-type: none"> ○ Enhancement ○ Project ○ Epic ○ Story ○ EAP Epic ○ EAP Feature ○ EAP Capability ○ No Conversion • The following demand types are available if the category is Operational: <ul style="list-style-type: none"> ○ Change ○ Defect ○ No Conversion <p>If the Agile Development 2.0 application is active, the Story, Epic, Enhancement, and Defect options are available.</p> <p>If the Strategic Planning application is active, the EAP Epic, EAP Feature, and EAP Capability options are available.</p> <p>The No Conversion option enables you to use your demand to fund a large project that includes one or more projects, epic, or programs.</p> <p>The selections in the Category and Type field also determine the fields that are displayed in the Assessment Data section.</p>
Project	<p>Name of the project created from this demand.</p> <p>This read-only field is visible only when you convert the demand into a project.</p>
Enhancement	<p>Number of the enhancement created from this demand.</p> <p>This read-only field is visible only when you convert the demand into an enhancement.</p>
Epic	<p>Name of the epic created from this demand.</p> <p>This read-only field is visible only when you convert the demand into an epic.</p>
Story	<p>Name of the story created from this demand.</p>

Demand form fields (continued)

Field	Description
	<p>This read-only field is visible only when you convert the demand into a story.</p>
Number	<p>Unique, auto-generated identification number for the demand.</p>
Approved start date	<p>The formal date approved by stakeholders for starting the demand. This date is set after prioritization and stakeholder approval and represents the committed and authorized timeline for execution. It's used for governance and traceability.</p> <p>For example, the approved date to start the database upgrade is 2026-01-10.</p> <p>This field is carried forward to the Approved start date field of the Project form if the demand is converted to a project and remains unchanged, even if the project starts later.</p> <p>This field is highlighted in red if the date is different than the value in the Start date field.</p> <p>i Note: If this field is empty while creating a demand, the date from the Start date field is inserted.</p>
Approved end date	<p>The formal date approved by stakeholders for completing the demand. This date is set after prioritization and stakeholder approval and defines the approved execution window and supports historical tracking.</p> <p>For example, the approved end date to complete the demand is 2026-02-15.</p> <p>This field is carried forward to the Approved end date field of the Project form if the demand is converted to a project and remains unchanged, even if the project ends later.</p> <p>This field is highlighted in red if the date in this field is different than the value in the Due date field.</p> <p>i Note: If this field is empty while creating a demand, the date from the Due date field is inserted.</p>
Start date	<p>The preliminary or estimated date when the work is initially planned to begin. This date helps outline the intended timing for early demand planning and prioritization. You can set this date during initial demand creation or anytime in the planning phase when a rough idea forms. This date can be updated until the demand is officially approved.</p> <p>For example, you're planning for a database upgrade to start on 2025-11-01.</p> <p>This date is changed to Planned start date when the demand is converted to a project.</p>

Demand form fields (continued)

Field	Description
	<p>i Note: When you change the planned start date of a demand or project, the associated cost plans and resource assignments also change. The Change Resource Plan and Cost Plan Start Date with Demand or Project Start Date Change property controls the behavior for a demand date change. This property isn't enabled by default. For more information, see Properties installed with Project Management.</p>
Due date	<p>The preliminary or estimated date when the planned work is expected to be completed. This date provides an expected completion window for planning and stakeholder communication. You can set this date anytime in the planning phase when a rough idea forms and can be updated until the demand is officially approved.</p> <p>For example, you're planning to complete the database upgrade by 2025-12-31.</p> <p>i Note: This date is changed to Planned end date when the demand is converted to a project.</p>
Description	Description of the demand.

Details section of the Demand form

Field	Description
Portfolio	Portfolio indicating the business focus of the demand.
Program	Name of the program to which the demand belongs.
Investment Class	<p>Type of investment class category assigned to the demand:</p> <ul style="list-style-type: none"> • Run: Investment made to sustain the existing business. • Change: Investment made to implement a change in the business.
Investment Type	<p>Investment type of the demand:</p> <ul style="list-style-type: none"> • Cost Reduction • End User Experience • Legal and Regulatory • Revenue Generating • Service Sustaining • Strategic Enabler • Artificial Intelligence

Details section of the Demand form (continued)

Field	Description
Demand manager	Name of the demand manager.
Collaborators	Users who can edit or contribute to the demand. A demand requester can select any user as a collaborator.
Expense type	The type of the expense, either capex (capital expense) or opex (operational expense).
Priority	The priority of the demand.
Department	<p>Department in a business unit to which the demand submitter belongs.</p> <p>Note: If you don't select a department, the default value is the name of the department to which the submitter belongs.</p>
Project Manager	Project manager that would be assigned to the project created from this demand. When a project is created, this field becomes read only. This field appears if the Category field is set to Strategic and the Type field is set to Project. If you delete the project created from this demand, this field becomes editable.
Business Unit	Business unit to which the demand submitter belongs.
Impacted Business Units	<p>Business units affected by the submitted demand. The selected units could experience operational impact, process changes, technology adoption, and so on.</p> <p>For example, if a demand is submitted by the procurement business unit, it can impact the finance, legal, and IT business units.</p>
Idea	Unique identification number of the idea from which the demand was created.
Business Capabilities	Business capabilities associated with the demand that links the demand to organizational goals and value. Business capabilities are defined in the Enterprise Architecture (formerly Application Portfolio Management) module.
Impacted Business Applications	If the demand is to change, enhance, or add one or more business applications, the applications associated with the demand. Business applications are defined in the Enterprise Architecture (formerly Application Portfolio Management) module.

Details section of the Demand form (continued)

Field	Description
	<p>For more information, see Exploring business applications.</p> <p>You can select any business application in your enterprise regardless of whether it's related to a capability selected in the Business Capabilities field.</p>
Business Applications	<p>If the demand is to change, enhance, or add one or more business applications, the applications associated with the demand. Business applications are defined in the Enterprise Architecture (formerly Application Portfolio Management) module. For more information, see Exploring business applications.</p> <p>You can select any business application in your enterprise regardless of whether it's related to a capability selected in the Business Capabilities field.</p>

Business Case section of the Demand form

Field	Description
Strategic priority	<p>Strategic objectives of the organization that the demand fulfills. A demand can fulfill multiple strategic objectives.</p> <p>If a business unit has been selected in the Details tab, the business strategies for the selected business unit along with other enterprise strategies are available for selection.</p>
Primary goal	<p>The primary goal associated with the strategy selected in the Strategic priority field.</p> <p>If a strategy hasn't been selected, all goals are available for selection.</p>
Business case	Business arguments that support the demand.
Risk of performing	Risks if the demand is approved and implemented.
Risk of not performing	Risks if the demand isn't approved, for example, risk of loss of opportunity.
Enablers	Key enablers for the demand that would aid the demand to be completed. For example, clearly defined resource and cost plans.

Business Case section of the Demand form (continued)

Field	Description
Barriers	Major barriers to the demand that would obstruct the demand's completion. For example, incomplete or unclear demand details.
In scope	Scope of the demand, which is the set of boundaries that define the extent of a demand.
Out of scope	Activities or deliverables not in the scope of the demand. Anything not defined in the scope is out of scope.
Assumptions	Assumptions made for the demand. Assumptions help to define the scope and risks, and fine-tune the estimates for time and cost.

Financials section of the Demand form

Field	Description
Rate Model	<p>Rate model assigned to the demand. This setting is used to derive hourly rates for the associated resource assignments and time cards. For more information, see Rate Models.</p> <p>Note: If the rate model assigned to the demand is changed or removed, the cost fields on the associated resource assignments aren't recalculated.</p>
Project Currency	<p>Currency used to execute the project once the project is created from this demand.</p> <p>You can select any active currency from the values listed in the Currency [fx_currency] table.</p> <p>After you create a project in the selected project currency, you can't change the project currency in the Project form if the demand contains a cost plan, a benefit plan, or a project budget. If the demand has no attached plan or budget, you can change the project currency in the Project form.</p>

Financials section of the Demand form (continued)

Field	Description
	<p>Note: The value of this field defaults to the Project currency field of the Financials tab in the project currency view of the Project form as well. This field is available only when the PPM Standard Multicurrency (com.snc.ppm_multicurrency) feature is activated and the Demand Currency view is enabled.</p>
Capital expense	Capital expenditure (capex) for the demand.
Operating expense	Operational expenditure (opex) for the demand.
Total planned cost	Result calculated based on the values in the Capital expense and Operating expense fields.
Financial return	Result calculated based on the values in the Total costs and Financial benefit fields.
Financial benefit	<p>Estimate of revenue if the demand is approved.</p> <p>This value is rolled up from the benefit breakdown of the demand.</p> <p>You can also enter the value manually by selecting a currency icon and entering a value.</p>
ROI %	<p>ROI calculated based on the values in the Total costs and Financial return fields.</p> <p>The value in this field is updated when a cost plan, benefit plan, or resource assignment is created or updated for the demand in the Qualified or Approved state.</p>
Capital budget	<p>Total capital budget allocated to the demand across all fiscal years.</p> <p>The value is rolled up from the capex budget of the demand.</p>
Operating budget	<p>Total operational budget allocated to the demand across all fiscal years.</p> <p>The value is rolled up from the opex budget of the demand.</p>
Discount Rate %	Demand discount rate, which is the interest rate to determine the present value of future cash flows.

Financials section of the Demand form (continued)

Field	Description
Net present value	<p>Present value of future cash based on the given annual interest rate, a measure for comparing money spent today against future expected financial benefits. This value is useful when evaluating the overall investment performance.</p> <p>For example, at a 12% discount rate, \$1.00 today is worth \$0.80 in two years. Therefore, receiving \$1.00 in two years is the same as receiving \$0.80 today.</p> <p>Net present value (NPV) is calculated from total costs according to year, financial benefit per year, and the discount rate for the demand.</p>
Internal rate of return %	<p>Annual interest rate required to achieve an NPV of zero.</p> <p>Internal rate of return (IRR) helps to determine which demands can deliver a higher rate of return in terms of revenue.</p>
Demand Actual Cost	<p>Total cost incurred while working on a demand and demand tasks. Demand actual cost is calculated after the assignee of the demand task creates and submits a time card. When the time card is approved, the resource rate, which is derived from the rate card, labor rate, or system properties, is used to populate this field.</p>
Demand Actual Effort	<p>Time accrued or spent by a resource while working on a demand or a demand task as derived from the submitted and approved time cards. This field isn't available on the Demand form by default.</p>

Note:

If you're creating a demand with the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin activated and the **Demand Currency** view enabled, then the fields in the **Financials** tab differ from the **Default** view. For more information about the fields that are available only in the Demand Currency view, see [Multicurrency fields in demand-related forms](#).

Assessment Data section of the Demand form

Field	Description
Impact	<p>Level of business impact created by the demand.</p>

Assessment Data section of the Demand form (continued)

Field	Description
Risk	Risk value calculated from the demand assessment.
Value	Business value of the demand calculated from the Impact and Financial return fields.
T-Shirt size	<p>Size of the demand.</p> <p>Before using this value as an indicator of demand size, consider creating and publishing definitions for each option outside the application. That process ensures that the values are interpreted correctly and consistently across the organization or department.</p>
Score	<p>The demand score is calculated based on the <i>risk</i>, <i>value</i>, and <i>size</i> attributes in the base system.</p> <p>The value of the <i>risk</i>, <i>value</i>, and <i>size</i> attributes are derived from the assessment metric category results. For more information, see View assessment results and assessment category results.</p> <ul style="list-style-type: none"> • When the <i>risk</i> and <i>size</i> values are high, the score of the demand is low. • When the <i>value</i> setting is high, the score of the demand is high.
Assessment Required	<p>Option for enabling the assessments for the demand. This option is active by default.</p> <p>Only a demand manager can update this value when the demand is in the Draft or Submitted state.</p> <p>Note: If this option isn't selected and you reset the demand to the Draft state, the option remains unselected.</p>

Note:

The values in the **Value** and **Score** fields are updated when a cost plan, benefit plan, or resource assignment is created or updated for the demand in the Qualified or Approved state. The values in the fields are updated only until an artifact such as project, enhancement, defect, or change is created from the demand.

Notes section of the Demand form

Field	Description
Watch list	The groups and users subscribed to the demand who can view the information in the Additional comments field.
Work notes list	The groups and users subscribed to the demand who can view the information in the Work notes field.
Work notes	Information about the demand. This information isn't visible to customers. Work notes are added throughout the demand management life cycle to communicate with other users associated with the demand.

Preferences section of the Demand form

Field	Description
Close Demand	<p>Determines when to close the demand automatically if it's converted to a project.</p> <ul style="list-style-type: none"> • None: Keeps the demand in the Open state after it's converted to a project. • On creation of project: Closes the demand when the demand is converted to a project. • On closure of project: Closes the demand when the project created from the demand is closed. <p>Note: The On creation of project and On closure of project options appear when the value for the Type field is set to Project. If the Type field is set to Enhancement, the default setting is None.</p>
Project calculation	<p>Determines the calculation to use for task dependencies for the project when the demand is converted to a project. The default value is Automatic.</p> <ul style="list-style-type: none"> • Manual: Task dates don't reflect any changes made to dependencies. • Automatic: Task dates are automatically updated to reflect any changes made to dependent or child tasks.

EAP Details section of the demand form

This section appears only if the selected type is an EAP entity.

Field	Description
Team	The planning team to which the created EAP entity is assigned. This field becomes read only once the EAP entity is created. This value is an optional value.
Converted to	The name of the created EAP entity. This field is read-only.

AI Associations section of the demand form

This section appears only if the AI Control Tower plugin is installed and the investment type of the demand is set to artificial intelligence.

Field	Description
Product	Product or system that the demand relates to.
Impacted AI systems	Impacted AI systems associated with the demand. You can select existing AI systems from the list or remove systems that are no longer relevant.

Monetary benefit breakdown form

The monetary benefit breakdown form information is used to create and edit a monetary benefit breakdown record for the demand.

Monetary Benefit Breakdown form

Field	Description
Task	Task to which the benefit plan breakdown belongs.
Portfolio	Portfolio to which the benefit plan breakdown belongs.
Entered currency	Currency specified in the benefit plan.
Exchange rate	Rate in effect for the period corresponding to the benefit plan breakdown. When the period corresponding to the benefit plan breakdown has multiple rates, the rate in effect on the first date of that period is used. Exchange rate is used to convert the entered benefit into the functional benefit. It's obtained from the itfm_fx_rate [budget_reference_rates] table.
Actual benefit	Actual benefit that is incurred from the project or demand.

Monetary Benefit Breakdown form (continued)

Field	Description
Benefit plan	Benefit plan to which the benefit plan breakdown belongs.
Fiscal period	Fiscals generated at the period level. For information on periods, see fiscal calendars .
Entered benefit	Benefit in entered currency.
Functional benefit	Functional benefit obtained by multiplying the exchange rate with the entered benefit.
Exchange rate date	First date of the fiscal period corresponding to the benefit plan breakdown.

Monetary benefit plan form

The benefit plan form information is used to create monetary and non-monetary benefit plans for a demand.

Create New Benefit Plan form

Field	Description
Name	Descriptive name of the benefit plan.
Work	Demand number to which the benefit plan belongs.
Sponsor	Sponsor for the demand.
Category	Type of benefit: <ul style="list-style-type: none"> • Hard: Benefits measured in terms of revenue. • Soft: Benefits measured in terms of value.
Sub category	Subcategories of hard and soft benefits. The selection in the Category field determines the available options in this field.
Benefit type	Type of the benefit: monetary or non-monetary.
Offset type	Indicates when the benefits start realizing. If the value in the selected offset type changes, the benefit plan start date shifts accordingly. For example, if the offset type is set to End Date and the demand due date changes, the benefit plan start date shifts to align with the new due date.
Start fiscal period	Starting fiscal period. Populated based on values in the Offset field relative to the selected Project or Demand start date or Project or Demand end date, and the Duration in period values. The field is editable if you select None in the Offset type field. When you change the start fiscal period, the associated benefit breakdown values also change.

Create New Benefit Plan form (continued)

Field	Description
End fiscal period	Ending fiscal period. When you change the end fiscal period, the associated benefit breakdown values also change.
Associated benefit	Benefits associated with this benefit plan.
Description	Description of the benefit plan.

Financials section

Field	Description
Entered benefit	Estimated amount of the potential benefit. Any change in the planned benefit on the benefit plan updates the associated benefit breakdown values for future fiscal periods.
Entered currency	Currency for the benefit plan. If the selected currency differs from the default currency configured in the Financial Management application, the budget reference rate is used to calculate the financial benefit of the demand. For more information, refer to budget reference rate .
Functional currency	Default currency configured in the Financial Management application and used for managing the demand or project.
Total planned benefit	Total benefit value rolled up from the benefit breakdown.
Benefit in functional currency	Benefit incurred from demand in functional currency. The value in this field changes if the Entered currency differs from the functional currency.
Actual benefit	Actual benefit value rolled up from the actual benefit in the benefit breakdown.
Recurring	Indicates if the benefit is recurring for each fiscal period in the benefit breakdown.

Non-monetary benefit plan breakdown form

The non-monetary benefit breakdown form information is used to create and edit a non-monetary benefit breakdown record for the demand.

Non-monetary Benefit Plan Breakdown form

Field	Description
Task	Task to which the benefit plan breakdown belongs.
Portfolio	Portfolio to which the benefit plan breakdown belongs.
Measure	Measure type specified in the benefit plan.
Actual benefit	Actual benefit that is incurred from the demand.
Benefit plan	Benefit plan to which the benefit plan breakdown belongs.
Fiscal period	Fiscals generated at the period level. For information on periods, see fiscal calendars  .
Entered benefit	Benefit in entered value.
Variance	The difference between the estimated and actual benefit.

Non-monetary benefit plan form

The benefit plan form information is used to create monetary and non-monetary benefit plans for a demand.

Create New Benefit Plan form

Field	Description
Name	Descriptive name of the benefit plan.
Work	Demand number to which the benefit plan belongs.
Sponsor	Sponsor for the demand.
Category	Type of benefit: <ul style="list-style-type: none"> • Hard: Benefits measured in terms of revenue. • Soft: Benefits measured in terms of value.
Sub category	Subcategories of hard and soft benefits. The selection in the Category field determines the available options in this field.
Benefit type	Type of the benefit: monetary or non-monetary.
Offset type	Indicates when the benefits start realizing. If the value in the selected offset type changes, the benefit plan start date shifts accordingly. For example, if the offset type is set to End Date and the demand due date changes, the benefit plan start date shifts to align with the new due date.
Start fiscal period	Starting fiscal period. Populated based on values in the Offset field relative to the selected Project or Demand start date or Project or Demand end date, and the Duration in period values.

Create New Benefit Plan form (continued)

Field	Description
	<p>The field is editable if you select None in the Offset type field.</p> <p>When you change the start fiscal period, the associated benefit breakdown values also change.</p>
End fiscal period	<p>Ending fiscal period.</p> <p>When you change the end fiscal period, the associated benefit breakdown values also change.</p>
Associated benefit	Benefits associated with this benefit plan.
Description	Description of the benefit plan.

Non-monetary Details section

Field	Description
Non-monetary entered benefit	<p>Estimated amount of the potential benefit.</p> <p>Any change in the planned benefit on the benefit plan updates the associated benefit breakdown values for future fiscal periods.</p>
Measure	<p>Type of measure for the non-monetary benefit plan. The measure types are Count, Percentage, Hours, Days, and Score.</p> <p>The Yes/No options are used to track the benefits that aren't quantifiable. When this option is selected, the only field available is Benefits achieved. You can select the Benefits achieved check box to indicate that the benefits have been achieved.</p>
Benefits achieved	Option to indicate if the benefit is achieved.
Non-monetary planned benefit	<p>Estimated value of the potential benefit.</p> <p>Any change in the planned benefit on the benefit plan updates the associated benefit breakdown values for future fiscal periods only.</p>
Breakdown type	<p>Type of breakdown creation when you save the benefit plan.</p> <ul style="list-style-type: none"> • None: No breakdowns are created. • Automatic: A non-monetary benefit plan breakdown record is created automatically with data. The breakdown is calculated linearly.

Non-monetary Details section (continued)

Field	Description
	<ul style="list-style-type: none"> Manual: A non-monetary benefit plan breakdown record is created automatically but without data in the entered benefit column.
Non-monetary actual benefit	Actual benefit value rolled up from the actual benefit in the benefit breakdown.
Aggregation mode	<p>Determines how the roll-up happens from breakdowns to the benefit plan and updates the values in the Non-monetary planned benefit and Non-monetary actual benefit fields.</p> <ul style="list-style-type: none"> Sum: Aggregates data from all breakdowns. Average: Average value from all breakdowns. Most recent: Recent breakdown value. Max: Maximum value among the breakdowns. Min: Minimum value among the breakdowns.

Risk value lookup form

The risk value lookup form information is used to rate the impact and probability of a risk.

Risk Value Matcher form

Field	Description
Impact	<p>Impact value of the risk.</p> <p>The default values are:</p> <ul style="list-style-type: none"> 1 = High 2 = Medium 3 = Low
Application	The application to which these risk values belong.
Risk Rank Color	<p>Color to indicate the severity of the risk.</p> <p> Tip: You can enter variations of a color to differentiate between risks with similar impact and probability values. For example, you could enter light green to indicate a low-severity risk.</p>

Risk Value Matcher form (continued)

Field	Description
Risk Value	<p>The value for the specified risk impact and probability combination.</p> <p>The options are: High, Medium, and Low.</p> <p>This value is displayed in the Risk value field of the Risk form.</p>
Probability	<p>Risk probability value is associated with the impact value of the risk. The options are: Absolute, High, Moderate, and Low.</p>
Probability Number	<p>Numerical value to indicate the probability. This value is multiplied by the value of the Impact field for calculating risk rank.</p> <p>The default values are:</p> <ul style="list-style-type: none"> • 1 = Absolute • 1 = High • 2 = Moderate • 3 = Low <p>The calculated risk rank and the risk rank color are displayed in the Risk rank field of the Risk form.</p>

Stakeholder register form

The stakeholder register form information is used to add users to the stakeholder registry.

Stakeholder register form

Field	Description
Number	Unique identification number for the stakeholder. This number is automatically generated when a new entry is created.
User	Name of user being added to the stakeholder registry.
Portfolio	Portfolio to which the user is assigned. A group of activities managed to align to business or operational objectives constitutes a portfolio. Typically, portfolios are named according to the business units of an organization.
Level of Interest	Level of interest that the stakeholder has in pursuing the demand.
Assessment recipient	Indication of whether the user is authorized to receive assessment questionnaires for a demand.
Approver	Indication of whether the user has authority to approve demands.
Influence	Level of influence the user has over the group assessing the demand.
Engagement	Indication of the way the user is engaged with the demand.

Stakeholder register form (continued)

Field	Description
Function	Function of the user in the demand process.

Next Experience for Demand Management key terms

Important terms in Next Experience for Demand Management are listed in the table.

Next Experience for Demand Management Key Terms

Term	Description
Portfolio	A collection of demands managed as a group to achieve strategic and operational objectives.
Assessable record	A demand record that you want to evaluate for metric type demand. You evaluate the assessable records with metric categories and metrics, which define traits and values to assess.
Metric	A trait or value used to evaluate assessable records. A metric can measure subjective values in an assessment questionnaire or gather objective values in a database query run by a script. Examples of metrics include perceived value of demands and return on investment for a demand.
Metric type	A characteristic that defines a set of records you want to evaluate. Demand management comes with the metric type demand, which uses records from the Demand [dmn_demand] table.
Metric category	A theme for evaluating assessable records. Categories contain one or more individual metrics, which define specific traits or values that comprise the theme. Examples of categories include return on investment and cost. Set filter conditions to control which assessable records to evaluate for the metrics in a category.
Stakeholder	A person affected by the demand or who has interest in the demand.
Scorecard	A visual breakdown on performance of an assessable record based on assessment results. Use scorecards to view various data summaries for one assessable record and to compare the ratings with other assessable records.
Requirement	An extra item that must be present or an extra action item that must be finished before a demand request closes.
Demand Task	A unit of work, created within a demand, to break down initial planning activities before converting the demand into a project. A demand task isn't a planned task like a project task.

Strategic Planning

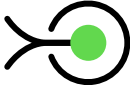

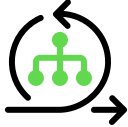

Strategic Planning Workspace (SPW) enables you to manage enterprise strategy and goals, product feedback, portfolio planning, and enterprise agile planning for your organization. Evaluate product performance, align work with strategy, and scale your Agile framework from a single workspace.

Strategic Planning is available for users with a Strategic Portfolio Management (SPM) Pro license.

Explore the generative AI features available in the Strategic Planning application, including the Multi-Feedback Summarization skill to generate summaries of one or more feedback items, the Planning Item Gen AI Docs skill to generate a summary of selected text in Docs, and the Target Generation skill to generate targets for goals.

[Installing Strategic Planning](#) also installs Strategy and Goals, Product Feedback, Demands, Portfolio Planning, and Enterprise Agile Planning features. Access to these features is based on the user roles assigned. Learn more about these features in the following sections.

Get started

Exploring Strategy and Goals in Strategic Planning Workspace

Use Strategy and Goals in Strategic Planning Workspace to create boards that organize your organization's strategic plans, strategic priorities, goals, and targets in a single, focused view.

Strategy and Goals key components

Understanding the key components of Strategy and Goals in Strategic Planning Workspace helps you structure your organization's strategic vision and track progress toward meaningful outcomes.

The key components for managing enterprise goals in Strategy and Goals are strategic plans, strategic priorities, goals, targets, and any work items associated with goals or targets.

A board is a collection of strategic plans, strategic priorities, goals, and targets based on your selected filter criteria—helping you stay focused and manage them effectively.

For an example of the structure of a strategy from the strategic plan level down to targets, see [Enterprise strategy example](#).

Board types

When you create a board, you can choose whether to base it on strategic plans, goals, or both.

- A strategy-based board lets you create and manage strategic plans and priorities, aligning high-level direction with the priorities your teams are executing against.
- A goals-based board lets you create goals and targets that align with your strategic priorities, with the ability to tailor the board by entity type and entity to focus on the goals that matter most.
- A combined strategy and goals board includes two pages—Strategy and Goals—supporting both strategic planning and goal execution within a single board.

For any board type, you can define what items appear using advanced filter conditions, giving you precise control over the scope and focus of each view. For details, see [Managing boards in Strategic Planning Workspace](#) and [Managing strategy and goals using boards](#).

Goals page within a strategy and goals-based board

Enterprise AI Transformation										2026
Goals and targets	Status	Progress	Owner	Start value	Final tar...	Actuals to ...	Team	Active	Plann	
1.1 Automate High-Volume Workflows	Red	48.61%	AM Adam...		80	20		true		
Achieve 80% straight-through processing rate for standard transactions by 2026	Green	25%	AM Adam...	0	80	20		true		
Deliver \$12M in annual operational cost savings from AI-driven automation	Yellow	20.83%	AM Adam...	0	12,000,000	2,500,000		true		
Reduce manual processing time by 50% across finance, HR, and procurement by 2026	Red	100%	AM Adam...	20	10	10		true		
1.2 Predictive Decision Support	Yellow	37.5%	AM Adam...					true

Achieve 70% self-service resolution rate via AI-powered knowledge assistants by Q4 2027	Green	28.57%	AM Adam...	0	70	20		true		
Index and make searchable 90% of enterprise knowledge repositories	Green	27.78%	AM Adam...	0	90	25		true		

Now Assist for Strategic Portfolio Management (SPM) capabilities for Strategy and Goals

If Now Assist for Strategic Portfolio Management (SPM) is installed, you can use the following capabilities to enhance your strategic planning and goal management:

- With the Goals insights skill, you can generate AI-powered insights for goals and review the results to identify at-risk goals, assess forecasted statuses, and act on recommendations before goals fall off track. For details, see [Generate insights for a goal](#).
- With the Target generation skill, you can generate measurable targets for your goals, reducing the effort required to define quantifiable success criteria. For details, see [Generate targets for a goal](#).

Reminders for target actuals check-in

The target check-in reminder feature lets you schedule automatic reminders that notify target owners and contributors to update actuals for their targets based on the defined check-in frequency and before the due date. This ensures that target actuals are updated on time.

To enable the feature, system properties must be configured. For details, see [Configure reminders for target actuals](#).

Goal owners, target owners, and contributors can also send reminders manually when needed. For details, see [Send a reminder for target actuals check in](#).

Comparing portfolio plan goals with enterprise goals (Strategy and Goals)

Creating goals for portfolio plans requires selecting a lens hierarchy and defining goals at the entity level based on the portfolio plan's hierarchy, which can limit flexibility and make it difficult to get started.

In Strategy and Goals, you can create boards and manage goals directly based on board filter criteria, without defining a lens hierarchy, providing a simpler and more flexible approach.

If you are already managing goals in portfolio plans, you can create corresponding boards based on your assigned entities or filter criteria to manage your goals and targets in one location without any additional configuration. For a portfolio plan created using the Goals lens, the goals

displayed in the portfolio plan match the goals displayed on a board when both are configured with the same filter criteria.

- **Portfolio plan goals:** Create goals for your portfolio plans, set targets for them, and evaluate the progress of the goals and targets in Strategic Planning Workspace to accomplish your organizational plans and drive business outcomes. For details, see [Managing portfolio plan goals in Strategic Planning Workspace](#).
- **Enterprise goals (Strategy and Goals):** Create boards to manage your organization's strategic plans (Mission, Vision, and values), strategic priorities, goals, and targets in a single, focused view. Create boards to manager org splans (missin, vision, values), sps, goals, and targets for your organization level. For details, see [Managing boards in Strategic Planning Workspace](#) and [Managing strategy and goals using boards](#).

Comparison of portfolio plan goals and strategic goals (Strategy and Goals) features

Feature	Portfolio plan goals	Enterprise goals (Strategy and Goals)
Create strategic plans	✗	✓
Create strategic priorities	✗	✓
Create goals	✓	✓
Add targets	✓	✓
Associate work with goals or targets	✓	✓
Send reminders to owners and contributors for target actuals check in	✗	✓
Generate goal insights with Now Assist for SPM	✓	✓
Generate targets for goals with Now Assist for SPM	✓	✓

Note:

Strategic plans and strategic priorities for portfolio plans can still be created using the list view within the Strategic Planning Workspace or the classic UI. The key difference is that in Strategy and Goals, you can create these directly within the workspace – whereas for portfolio plans, they must be created outside the workspace and then associated with goals inside it.

Enterprise strategy example

In Strategy and Goals, you start by creating a strategic plan that captures your organization's mission, vision, and values. You then define strategic priorities that align with your mission and vision of your organization, and create goals under each priority to establish what your organization wants to achieve. For each goal, you can set targets to track and measure progress toward achieving it.

The following illustration provides an example of a strategic plan, including its strategic priorities, goals, and targets.

Strategy map

Configuring Strategy and Goals

Strategy and Goals in Strategic Planning Workspace requires no mandatory configuration to get started.

Unlike portfolio plan goals, you can create and manage goals on a board without prerequisites or limitations. For example, portfolio plan goals do not display if they are not created at the lens entity level or if the assigned entity fields are empty. In Strategy and Goals, all goals that match the applied filter criteria or selected entity are visible on the board. For details, see [Managing boards in Strategic Planning Workspace](#) and [Managing strategy and goals using boards](#).

Optional configuration for Strategy and Goals

Although no mandatory configuration is required, you can perform the following administrative tasks based on your organization's needs.

Migrate legacy goals data

If your organization uses the legacy goal and strategy tables (Goal, Enterprise Strategy, Business Unit Strategy, and Strategic Objective), you can migrate the existing data to the new tables by running a scheduled job. After migration, you can create boards and manage your existing goals and strategic priorities. For details, see [Migrate existing goals data to Goal Framework tables](#).

Set display limit for goals

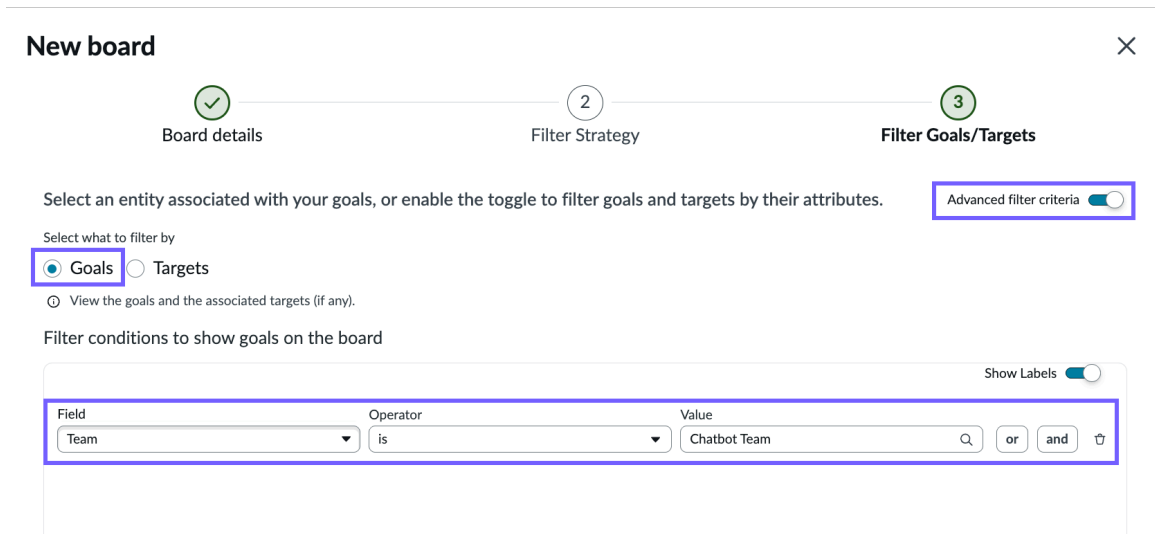

By default, 250 goals are displayed in the Goals page. To modify this limit, configure the value in the `sn_align_ws.goal_hierarchy.max_records` system property. For details, see [Set display limit for goals and targets in Strategic Planning](#).

Customize goal and target labels

You can customize the labels for the Goal [sn_gf_goal] and Target [sn_gf_goal_target] tables to match your organization's terminology. For example, you can rename Goal to Objective and Target to Key Result. For details, see [Customize label for Goal and Target tables](#).

Configure assigned entities

You can define goals at any level in your organization without assigning them to a specific entity. Using advanced filter criteria when creating a board, you can manage a specific set of goals based on any goal field value. For example, you can create a board to manage goals that belong to the Chatbot team.

You can also create boards for your goals based on assigned entities. The default assigned entities are Business Unit [business_unit], Department [cmn_department], Company [core_company], Product Model [cmdb_model], Value Stream [cmn_value_stream], Initiative [sn_align_core_initiative], and Strategic Program [sn_align_core_program].

To create boards based on assigned entities other than the defaults, create an entry in the assigned entity configuration. For details, see [Configure a table for an assigned entity](#).

Configure goal preferences

Configure goal preferences including the calendar type for goal setting, weighted average calculation for goal progress, and deletion settings for goals and targets. For details, see [Configure goal preferences](#).

Configure reminders for target actuals

Configure reminders to automatically notify target owners and contributors to update actuals for their targets before the due date, based on the check-in frequency defined for each target. For details, see [Configure reminders for target actuals](#).

Configure Goal insights generation

Activate the Goal insights generation scheduled job and configure the filter criteria to automatically generate AI-driven insights for a defined set of goals at a scheduled frequency. For details, see [Goal insights generation job](#).

Configure reminders for target actuals

Configure reminders to notify target owners and contributors to update actuals for their targets by a specified date.

Before you begin

Role required: sn_gf.goal_admin

About this task

The following two system properties must be configured to notify target owners and contributors to update the actuals for their targets:

- **target_checkin_due_date_reminder_feature_toggle**: Enables the reminder notifications feature for target actuals check-in.
- **target_checkin_due_date_reminder_config**: Defines the number of days before the due date to send the reminder. The following are the default values based on the check-in frequency:

Check-in frequency	Default number of days before due date
None	7
Weekly	2
Monthly	5
Quarterly	7
Yearly	10

Procedure

1. Navigate to **All > System Properties > All Properties**.

A list of all the properties in the System Properties [sys_properties] table appears.

2. Search for each of the following system properties, enter the required value in the **Value** field, and then select **Update**.

System property	Value
target_checkin_due_date_reminder_feature_toggle	Enter <code>true</code> to enable reminder notifications.
target_checkin_due_date_reminder_config	Enter the number of days before the due date to send the reminder automatically.

Result

Reminder notifications are enabled for target actuals check-in. Target owners and contributors are automatically notified to submit actuals for their targets based on the configured number of days before the due date and the check-in frequency defined for each target.

Goal insights generation job

The Goal insights generation scheduled job automatically generates AI-driven insights for a defined set of goals at a scheduled frequency.

Goal insights generation job configuration involves two components:

1. Configure the goals set for goal insights generation by editing the default filter criteria. This step is required only when the predefined filter criteria does not match the goals set you want to run the job against. For details, see [Configure the goals set for goal insights generation](#).
2. Activate the Goal insights generation scheduled job to automatically generate AI-driven insights for a predefined set of goals at a scheduled frequency. By default, the job is set to inactive. For details, see [Activate and configure the Goal insights generation job](#).

Configure the goals set for goal insights generation

Configure the filter criteria for the Goal insights generation scheduled job to define the set of goals for which insights are automatically generated.

Before you begin

Role required: sn_gf.goal_admin

About this task

By default, the Goal insights generation job runs on the predefined set of goals using the goals filter criteria (**Goal insights generation filter**) in the system. If the predefined filter criteria doesn't match goals set that you want to run the job, administrators must edit the predefined filter criteria to run the goal insights generation job on the specific set of goals as required.

Goal insights generation filter

The screenshot displays the 'Goal insights generation filter' configuration interface. At the top, there is a search bar with a 'Goals' label and a 'Name' dropdown. Below the search bar are several buttons: 'Run', 'Save Filters', 'AND', 'OR', 'Add Sort', and a refresh icon. The main area contains a list of filter conditions under the heading 'All of these conditions must be met'. The conditions are:

- Active is true (with AND, OR, and delete buttons)
- AI forecast last generated at or before Last 7 days (with a calendar icon, AND, OR, and delete buttons)
- or AI forecast last generated is empty (with a delete button)
- End date at or after Last 3 months (with a calendar icon, AND, OR, and delete buttons)

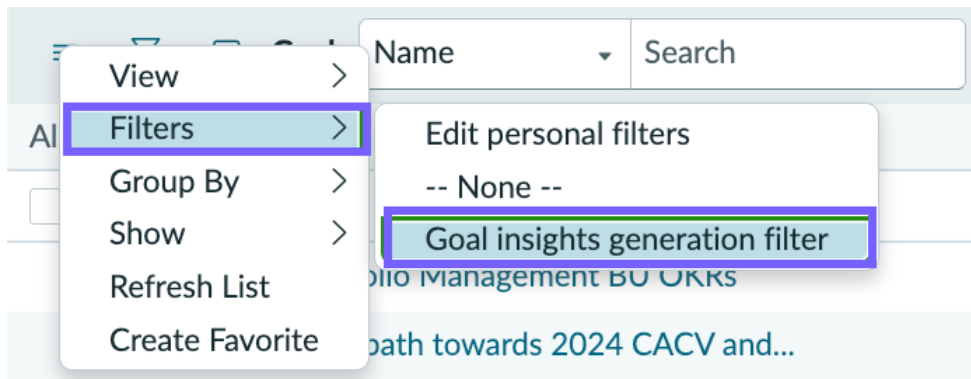

Tip:

Defining a precise goals set helps optimize AI resource usage and prevents excessive token consumption.

If a goal does not match the configured filter criteria, users can still generate insights for it manually by selecting the **Goal insights** button on the Goals page.

Procedure

1. Navigate to **All > Enterprise Goal Management > Goals**.
A list of all goals appears.
2. Select the predefined goals list view by navigating to **List controls > Filters > Goal insights generation filter**

3. Select the Show / hide filter icon ().
4. Add or edit the filter conditions as needed per your set of goals on which you want to the scheduled job.
5. Select **Save Filters** to save the filter criteria.

Result

The filter criteria is saved. The Goal insights generation job processes the goals that match the defined filter criteria and automatically generates insights for them at the configured frequency. Goals outside the filter criteria are not processed by the job.

What to do next

Activate the Goal insights generation scheduled job to automatically generate AI-driven insights for a predefined set of goals at a scheduled frequency. For details, see [Activate and configure the Goal insights generation job](#).

Activate and configure the Goal insights generation job

Activate the Goal insights generation scheduled job to automatically generate AI-driven insights for a predefined set of goals at a scheduled frequency.

Before you begin

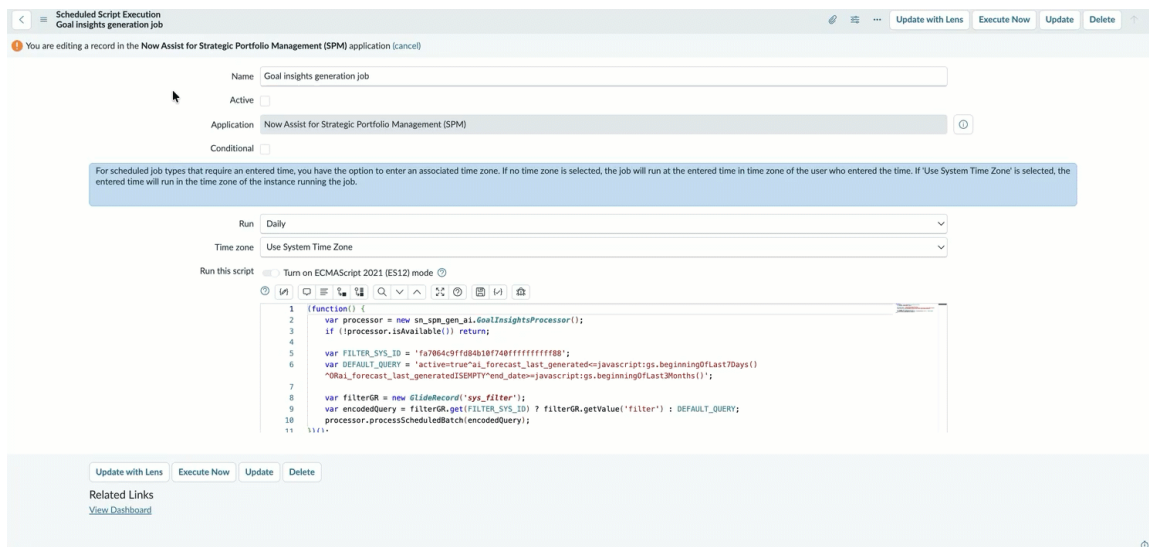

Role required: sn_gf.goal_admin

About this task

The Goal insights generation scheduled job is inactive by default. After activation, the job runs at the configured frequency and generates insights for all goals that match the admin-defined filter criteria. With this, goal users no need to generate insights individually for each goal.

Tip:

For better reviews and recommendations, use the Goal insights skill with the AWS Claude model.

Procedure

1. Navigate to **All > System Definition > Scheduled Jobs**.

A list of all scheduled jobs appears.

2. Search for and select the **Goal insights generation job** scheduled job.

3. Select the **Active** check box to run the job at a scheduled time.

4. In the **Run** field, select the frequency at which you want to run the scheduled job.

For example, you can select **Weekly** to run the job every week.

5. Select **Update** to save the configuration.

Important:

The job runs only on goals that match the defined filter criteria. Goals outside the filter criteria are not processed by the job. To optimize system resources and prevent excessive token consumption, define the filter criteria as specifically as possible. For details, see [Configure the goals set for goal insights generation](#).

6. **Optional:** To run the job immediately outside the scheduled frequency, select **Execute Now**.

Result

The Goal insights generation job is active and configured. The job automatically generates AI-driven insights for all goals that match the defined filter criteria at the configured frequency. The latest insights and their timestamps are displayed on the Goals page.

What to do next

To generate insights for goals outside the filter criteria, users can manually select **Goal insights** on the Goals page for the required goal. For details, see [Generate insights for a goal](#).

Managing boards in Strategic Planning Workspace

Using boards in Strategy and Goals within Strategic Planning Workspace, you can organize strategic plans, priorities, goals, and targets in a single, focused view.

Strategy and Goals within Strategic Planning Workspace lets you create and manage boards. A board is a collection of strategic plans, priorities, goals, and targets based on your selected filter criteria—helping you stay focused and manage them effectively.

Roles required for using and managing boards

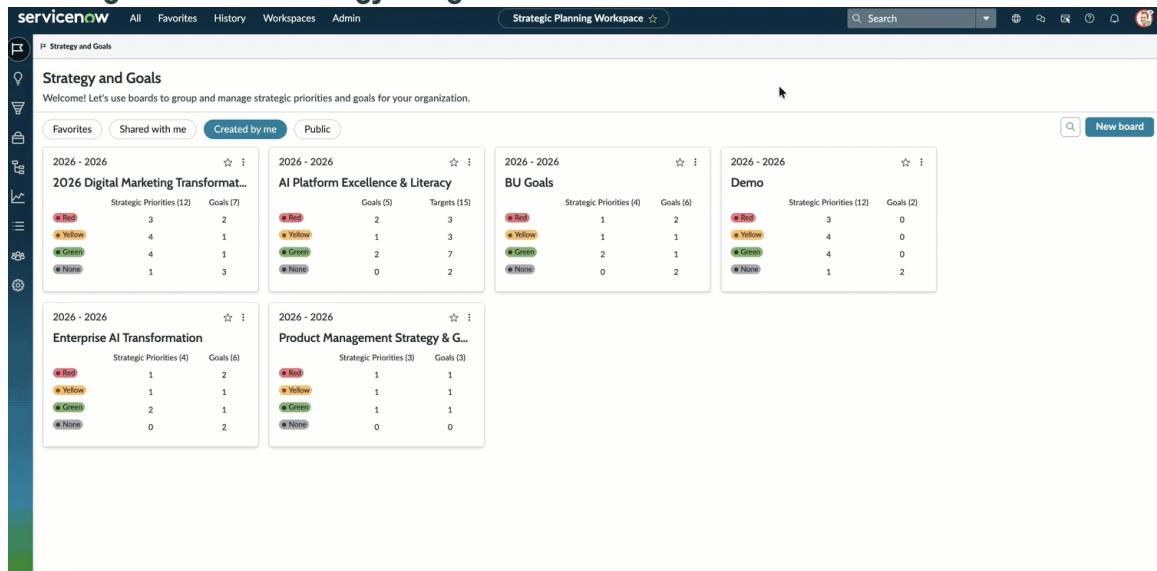

Access level	Required role
Read access to boards	sn_apw_advanced.spw_goal_user_read
Edit access to boards	sn_apw_advanced.spw_goal_user

Board types

When you create a board, you can choose whether to base it on strategic plans, strategic priorities, goals, or both.

- A strategy-based board lets you create and manage strategic plans and priorities, aligning high-level direction with the priorities your teams are executing against.
- A goals-based board lets you create goals and targets that align with your strategic priorities, with the ability to tailor the board by entity type and entity to focus on the goals that matter most.
- A combined strategy and goals board includes two pages—Strategy and Goals—supporting both strategic planning and goal execution within a single board.

Creating a combined strategy and goals-based board

What you can do with boards

Boards support the following capabilities to help you manage your organization's strategic priorities:

Filter and focus

Define what items appear on a board using advanced filter conditions. Build boards tailored to specific goals by entity type and entity, ensuring focus on the goals that matter most to your team or organization.

Share with stakeholders

Share boards with stakeholders to align efforts and drive shared outcomes. Shared boards give collaborators a consistent view of priorities and progress.

Add to favorites

Add boards to your favorites for faster navigation. Favorited boards appear in your quick-access list, reducing time spent searching for frequently used views.

Create a board

Create boards that bring strategic priorities, goals, and targets together in one focused view, helping your organization stay aligned and drive measurable business outcomes.

Before you begin

Role required: sn_apw_advanced.spw_goal_user

About this task

Boards can be configured in three ways:

- Strategy-based board: Tracks strategic plans or strategic priorities to align high-level direction with team execution.
- Goal or target-based board: Tracks goals, targets, or a combination, with filtering by entity type and entity to focus on the most relevant goals.
- A combined strategy and goals-based board: Tracks both strategy (strategic plans and strategic priorities) and goals or targets together.

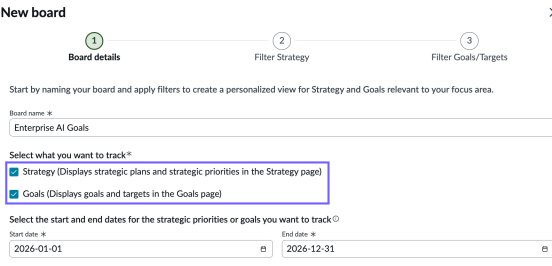

Note:

By default, only records with the Active field set to true are displayed.

Procedure

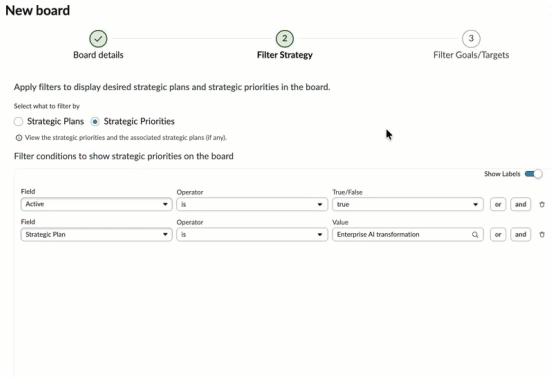

1. Navigate to **Workspaces > Strategic Planning Workspace > Strategy and Goals**.
2. On the Strategy and Goals page, select **New board**.
3. Make your selections by using the New board wizard.
 - a. On the **Board details** step, fill the details and then select **Next**.

Option	Description
Board name	Enter a name for the board.
Select what you want to track	<p>Select one or both options to determine what you want to track on the board:</p> <ul style="list-style-type: none"> ▪ Strategy: Enables you to filter strategic plans and strategic priorities that you want to view and track on the board. This option enables the Strategy page on the board after creation. ▪ Goals: Enables you to select entities to track goals for, or filter the goals and targets that you want to view and track on the board. This option enables the Goals page on the board after creation. <p>Selecting both Strategy and Goals options enables both Strategy and Goals pages on the board.</p>

Option	Description
	
<p>Select the start and end dates for the strategic priorities or goals you want to track</p>	<p>Fill the start and end dates for the board.</p> <p>Note: The start and end dates for your board act as a date range filter for all the items (strategic plans, strategic priorities, and goals) displayed in the board.</p>

b. On the **Filter Strategy** step, fill the details and then select **Next**.

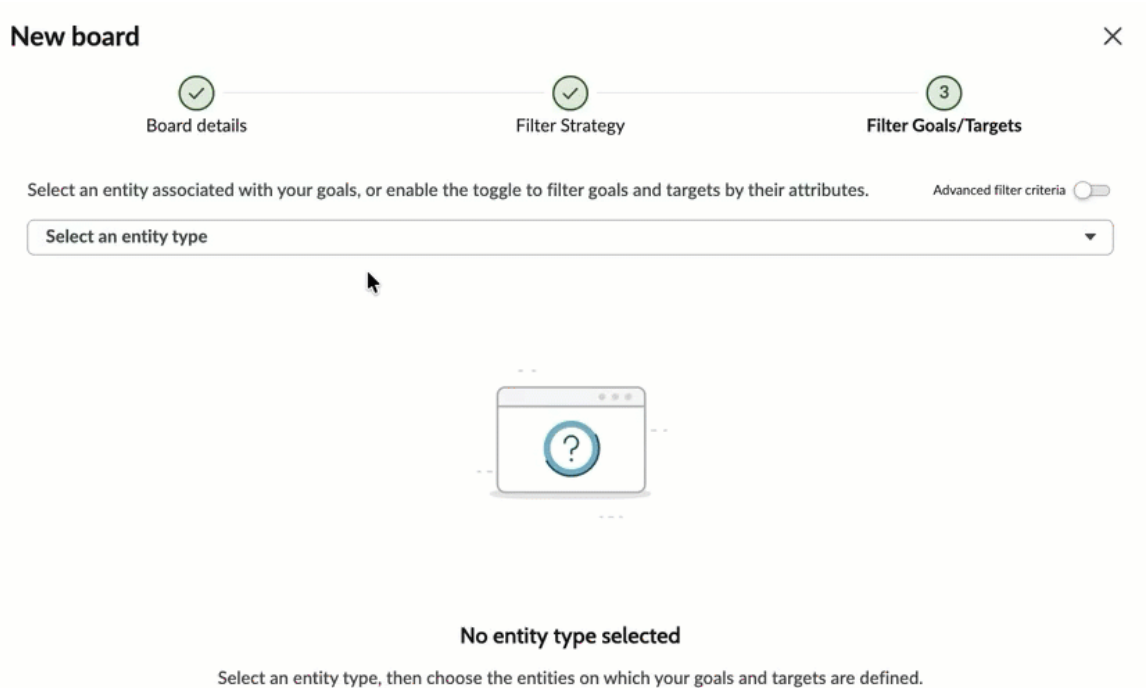

Option	Description
<p>Select what to filter by</p>	<p>Select Strategic plans or Strategic priorities option based on which you want to filter data create board.</p> <ul style="list-style-type: none"> ▪ Strategic Plans: Enables you to filter the strategic plans that you want to view on the board and their associated strategic priorities (if any). ▪ Strategic Priorities: Enables you to filter the strategic priorities that you want to view on the board and their associated strategic plans (if any). <p>For example, you can filter the strategic priorities that are part of the strategic plan, Enterprise AI transmission.</p> 

Option	Description
<p>Filter conditions to show strategic plans / strategic priorities on the board</p>	<p>Apply the filters to see the required records on the board.</p> <p>For example, you can further filter the strategic priorities that belong to the HR department.</p> 

c. On the **Filter Goals/Targets** step, select an entity type from the **Select an entity type** list, select the required entities, and then select **Create**.

Tip:

To narrow your focus, select **Advanced filter criteria** to apply additional filters on the goals or targets displayed on the board. For example, you can filter the goals associated with the Chatbot team.

You can use **Previous** and **Next** to navigate between the steps.

d. Select **Create**.

Result

The board is created and displays the Strategy page, Goals page, or both, depending on what you selected to track.

Modify a board

Update the details of a board, including its name, description, and configuration settings, to reflect changes in your strategic direction or organizational needs as they evolve.

Before you begin

Role required: sn_apw_advanced.spw_goal_user

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Strategy and Goals**.
2. From the Strategy and Goals page, select the board you want to edit.
3. From the board page, select the Board actions icon () and then select **Edit**.
4. Make your selections by using the Edit board wizard.
 - a. On the **Board details** step, fill or update the details and then select **Next**.

Option	Description
Board name	Update name of the board if necessary.
Select what you want to track	Update the options selection to determine what you want to track on the board: <ul style="list-style-type: none"> ▪ Strategy: Enables you to filter strategic plans and strategic priorities that you want to view and track on the board. ▪ Goals: Enables you to select entities to track goals for, or filter the goals and targets that you want to view and track on the board. Selecting both Strategy and Goals options enables both Strategy and Goals pages on the board.
Select the start and end dates for the strategic priorities or goals you want to track	Update the start and end dates for the board if necessary.

Option	Description
	<p>Note: The start and end dates for your board act as a date range filter for all the items (strategic plans, strategic priorities, and goals) displayed in the board.</p>

b. On the **Filter Strategy** step, fill or update the details and then select **Next**.

Option	Description
Select what to filter by	<p>Select Strategic plans or Strategic priorities option based on which you want to filter data create board.</p> <ul style="list-style-type: none"> ▪ Strategic Plans: Enables you to filter the strategic plans that you want to view on the board and their associated strategic priorities (if any). ▪ Strategic Priorities: Enables you to filter the strategic priorities that you want to view on the board and their associated strategic plans (if any).
Filter conditions to show strategic plans on the board	<p>Apply or update the filters to see the required records on the board.</p> <p>For example, if you want to see the strategic priorities that belong to HR Department, select the filter as shown after this.</p> <p>Department > is > HR</p>

c. On the **Filter Goals/Targets** step, select or update an entity type from the **Select an entity type** list, select the required entities, and then select **Create**.

Tip:

- If the **Goals** option was selected in the **Board details** step during board creation previously, the previously selected entity type is displayed instead of the **Select an entity type** option.
- To narrow your focus, select **Advanced filter criteria** to apply additional filters on the goals or targets displayed on the board.

You can use **Previous** and **Next** to navigate between the steps.

d. Select **Update**.

Result

The board is updated and displays the Strategy page, Goals page, or both, depending on what you selected to track.

Share a board

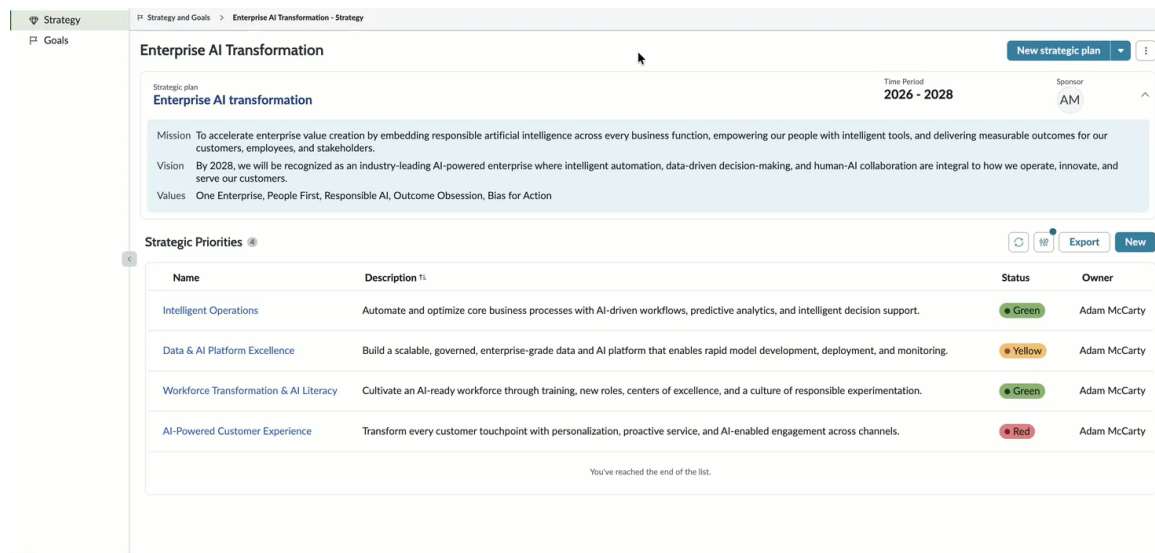

Share your board with stakeholders and planning managers to provide visibility into goal and target progress, and enable collaboration across your organization.

Before you begin

Role required: sn_apw_advanced.spw_goal_user

About this task

Users or groups that you want to share the board with must have the sn_apw_advanced.spw_goal_user_read or sn_apw_advanced.spw_goal_user role to get the read or edit access to the board respectively.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Strategy and Goals**.
2. From the Strategy and Goals page, select the board you want to share with stakeholders.
3. From the board page, select the Board actions icon () and then select **Share**.
4. On the Share board window, fill the board sharing access details to collaborate on the board.
 - a. In the **Board sharing and access** field, select **Restricted** or **Public**.
 - **Restricted:** Visible to users with whom the board will be shared.
 - **Public:** Visible to everyone within your organization.
 - b. In the **Members or Groups** field, enter the names of individual users or groups.

Note:

The **Members or Groups** field doesn't appear if the board sharing type is selected as **Public**.

c. Select **Share** or **Done**.

Alternatively, you can select **Copy link** for the Board actions icon and share it with your stakeholder to access the board.

Result

The selected individual and group users are notified of the board sharing through an email.

Managing strategy and goals using boards

After creating a board, you can create strategic plans, priorities, goals, and targets that align with your strategic priorities to drive business outcomes.

A strategy-based board supports the full strategic planning hierarchy, from organizational purpose to measurable outcomes. A goals-based board focuses on goal execution and outcome tracking. You can also create a combined strategy and goals board, which includes two pages—**Strategy** and **Goals**—to help you focus on both strategic planning and goal execution.

You can do the following in a board to manage your enterprise goals and drive business outcomes:

- Define the purpose and direction of your organization by creating strategic plans that serve as the foundation for your priorities and goals. For details, see [Create a strategic plan](#).
- Orient your strategic plan toward your goals by creating strategic priorities that reflect the most important areas of focus for your organization. For details, see [Create a strategic priority](#).
- Create goals that align with your organizational strategic priorities, translating high-level direction into specific, actionable outcomes. For details, see [Create a goal](#).
- Generate measurable targets for your goals using Now Assist for SPM. For details, see [Generate targets for a goal in Strategic Planning Workspace using Now Assist for SPM](#).
- Set targets for goals to track and measure progress toward achieving each goal within the defined time frame. For details, see [Add a target for goal](#).
- Align work or planning items with goals or targets to align your current or future work with your strategic priorities, helping your team achieve goals and targets efficiently. For details, see [Align work with a goal or target](#).
- Associate a goal or target as the primary for the work and planning items where the items contribute to achieving the goal or target. For details, see [Associate or update primary goal or target](#).
- Generate AI-powered insights for goals to identify at-risk goals, assess forecasted statuses, and act on recommendations before goals fall off track. For details, see [Generate insights for a goal](#).
- Send reminders to the target owner and contributors to ensure target check-ins are completed before the due date. For details, see [Send a reminder for target actuals check in](#).

Roles required for managing enterprise goals using boards

Create a strategic plan

Create and manage strategic plans to define your organization's purpose, strategic priorities, and associated goals.

Before you begin

Role required: sn_apw_advanced.spw_goal_user

About this task

You can create strategic plans only on boards that were created with the **Strategy** tracking option selected.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Strategy and Goals**.
2. On the Strategy and Goals page, select the strategy-based board for which you want to create a strategic plan.
The Strategy page opens.
3. Select **New strategic plan**.
4. On the form, fill in the **Name**, **Sponsor**, **Start date**, and **End date**, and other required fields.
For a description of the field values, see [Strategic Plan form](#).
5. Select **Submit**.

Related topics

[Create a goal](#)

Create a strategic priority

Create a strategic priority to define and focus your organization's strategic direction, and align it with the goals you want to achieve.

Before you begin

Role required: sn_apw_advanced.spw_goal_user

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Strategy and Goals**.
2. On the Strategy and Goals page, select the strategy-based board for which you want to create a strategic priority.
The Strategy page opens.
3. Select **New strategic priority** or **New** next to the Strategic Priorities heading.
4. On the form, fill in the **Name**, **Strategic Plan**, **Owner**, and other required fields.
For a description of the field values, see [Strategic Priority form](#).
5. Select **Submit**.

What to do next

Define goals and set targets for them to accomplish the strategic priorities.

Add a target for goal

Create SMART targets for goals to track and measure the progress of your goals.

Before you begin

Role required: sn_apw_advanced.spw_goal_user

About this task

If you're using Now Assist for SPM, you can use the Target generation skill to generate targets for a goal. The skill uses the goal's details and provided context to create a precise target for the goal. The more specific the input, the stronger the recommendations. For details, see [Generate targets for a goal in Strategic Planning Workspace using Now Assist for SPM](#).

Configuring a target source for your target updates the **Actuals to date** field on the Target form automatically. For more information on target automation, see [Target actuals automation in Strategic Planning](#).

A SMART target can be defined as S = Specific, M = Measurable, A = Attainable, R = Relevant, and T = Time-bound.

Note:

- Only the owner or contributors of the goal can create targets for the goal.
- You can also restrict the access for a target record to the specific users by enabling the **Confidential** field on the Target form if the ServiceNow® ESG Management application is installed.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Strategy and Goals**.
2. On the Strategy and Goals page, select the strategy-based board or goal-based board for which your goal belongs to.
The Strategy page opens if selected a strategy-based or combined strategy and goals-based board. The Goals page opens if selected a goals-based board.
3. Add a target for your goal using one of the following methods depending on your board type.
4. On the form, fill in the fields.
For a description of the field values, see [Target form](#).
5. Select **Save**.
If you are adding a target from the New target window on the Goals page, you can also select **Save and add a new target** and add more targets for the goal on the flow.

Result

The target progress records are automatically created when you save the target post populating the **Actuals to date** field. The target progress records specify the progress of each target for the goal.

Note:

When you delete a goal, its associated targets (if any) and their progress records are also deleted even though the **Allow the deletion of targets** property is set to **No**.

What to do next

[Update the progress of the target](#) manually if the target isn't enabled for target automation.

Update the progress of a manual target

Update the progress of a target when its status is changed.

Before you begin

Role required: sn_apw_advanced.spw_goal_user

About this task**Note:**

Only the owner or contributors of the goal can update a goal target.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Strategy and Goals**.
2. On the Strategy and Goals page, select the strategy-based board or goal-based board for which your target belongs to.
The Strategy page opens if selected a strategy-based or combined strategy and goals-based board. The Goals page opens if selected a goals-based board.
3. Update the target for your goal using one of the following methods depending on your board type.
4. On the form, update the **Actuals to date** or **Actual** field and add a business justification in the **Remark** field.

For a description of the field values, see [Target form](#).

5. Select either **Update** or **Save**.

Update the progress of an automated target

Update the progress of a target using the **Update Actual value** related link on the Target form.

Before you begin

Role required: sn_apw_advanced.spw_goal_user

About this task

Note:

Only the owner or contributors of the goal can update a goal target.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Strategy and Goals**.
2. On the Strategy and Goals page, select the strategy-based board or goal-based board for which your target belongs to.
The Strategy page opens if selected a strategy-based or combined strategy and goals-based board. The Goals page opens if selected a goals-based board.
3. Update the target for your goal using one of the following methods depending on your board type.
4. On the Target form, select the **Update Actual value** related link.
For a description of the field values, see [Target form](#).

Duplicate a goal or target

Create a copy of an existing goal or target to align goals with your organizational strategic priorities. If the goal or target you want to create is similar to an existing one, duplicating the existing record saves your time.

Before you begin

Role required: sn_apw_advanced.spw_goal_user

About this task

Goals are typically qualitative by nature. Goals should be ambitious and are expected to motivate and challenge your teams.

Note:

- Only the owner or contributors of the goal can edit the goal.
- Goals and targets can be duplicated only from the goal-based board. However, you can create goals and targets from the **Goals** tab on the Strategic Priority record page.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Strategy and Goals**.
2. On the Strategy and Goals page, select the goal-based board for which you want to duplicate a goal or target.
3. Select the Row context menu icon () of the goal or target that you want to duplicate and then select **Duplicate**.
 - For a goal, the New goal window opens with all details of the goal you copied from. You can update the details for the goal as needed and then select **Save** to save the goal or select **Save and add a target** to save the goal and add a target for the goal. For a description of the field values, see [Goal form](#).
 - For a target, the New target window opens with all details of the target you copied from. You can update the details for the target as needed and then select **Save** to save the target or select **Save and add a new target** to save the target and add another target for the goal. For a description of the field values, see [Target form](#).

By default, the name is *Copy of ABC* where ABC is the name of the target or target you copied from.

What to do next

Add more targets for the goals. For more information, see [Add a target for goal](#) or [Configuring target source for target automation](#).

Related topics

Target actuals automation

Automate the actual value for your targets using the target automation feature.

Use the following steps as guidelines to enable actuals automation and configure a target source for a target using the target automation feature.

You must perform the following steps on the [Target form](#) to enable target automation for the target.

1. Enter the Start value, Final target value, and Check-in frequency, and fill the other required fields for the target.
2. Select the **Automate actual value** field.

Target breakdowns

Breaking down a target into smaller periods (for example, Monthly) helps you set a target value for each month and focus on that specific monthly target. The target breakdowns are automatically created based on the Check-in frequency and Target value distribution set for the target.

The check-in frequency for a target can be set to Daily, Weekly, Monthly, Quarterly, or Yearly. Based on the Check-in frequency of the target, the corresponding target breakdowns are created. For example, if the Check-in frequency is set to Monthly for a target spanning for a year, 12 monthly target breakdowns are created. Planned target values are automatically set for each target breakdown based on the Target value distribution setting of the target.

Note:

The target breakdowns feature isn't supported for qualitative targets.

The following examples help you understand how the target progress is calculated for targets with different target distribution type.

Example 1: Acquire 1200 new customers in the calendar year 2026 (Track non-cumulatively)

In this example, you want to achieve a target of acquiring 1200 new customers in the calendar year 2026 and track the progress monthly (non-cumulatively), then you can set the target as the following:

- Set the start date and end dates to 2026-01-01 and 2026-12-31, respectively
- Set the start value and final target values to 0 and 1200, respectively
- Set the Check-in frequency for the target to Monthly
- Set the Target value distribution to Split equally across the time period (non-cumulative)

This Target value distribution means that the final target value is divided into 12 equal values (planned target value for each target breakdown) which aggregates to the final target value. You can edit the planned target value later from the respective target breakdown record as needed.

Goals and targets	Status	Progress	Owner	Start value	Final target value	Act
1.1 Automate High-Volume Workflows	Red	48.61%	AM Adam McCarty			
1.2 Predictive Decision Support	Yellow	37.5%	AM Adam McCarty			
1.3 Intelligent Knowledge Management	Green	28.18%	AM Adam McCarty			
2.0 Increase Sustainable Revenue Growth	Green	26.39%	SA System Administrator			
Achieve revenue of \$120K from petrochemicals	Green	29.17%	SA System Administrator	0	120,000	35,000
Acquire 1200 new customers in the calendar year 2026 (non-cumulative)	None	0%	MB Megan Burke (Portfolio...)	0	1,200	
Enter 4 new regional or export markets with established distribution partnerships	Green	50%	SA System Administrator	0	4	2
2.1 Hyper-Personalized Engagement	Red	2.78%	AM Adam McCarty			
Achieve 60% of customer interactions powered by AI-driven personalization	Yellow	8.33%	AM Adam McCarty	0	60	5
Achieve cross-sell/up-sell revenue to \$1M through AI-powered recommendations	Red	0%	AM Adam McCarty	0	1,000,000	0
Increase customer engagement scores (NPS/CSAT) by 20 points	Red	0%	AM Adam McCarty	40	60	40
2.2 Proactive & Predictive Service	None	0%	AM Adam McCarty			

In this case, the application creates 12 target breakdowns (January, February,, and December) for calendar year 2026 and sets the Planned target value for each target breakdown to 100 (Final target value divided by the number of target breakdowns).

Because the application sums up the actual value entered in each monthly target breakdown, you must enter the actual value that is achieved in the particular month for the target breakdown. For example, you acquired 100 customers in January, then enter 100 as the actual value in the January target breakdown. And, you acquired another 100 customers in February, then enter 100 as the actual value in the February target breakdown. Similarly, if you acquired another 100 in March and 100 in April, then enter 100 as the actual value in both the March and April target breakdowns.

The application sums up the actual values entered in each monthly target breakdown and rolls up the sum value to the actual value of the main target. Then, the progress of the target and its goal are auto-updated.

Example 2: Acquire 1200 new customers in the calendar year 2026 (Track cumulatively)

In this example, you want to achieve a target of acquiring 1200 new customers in the calendar year 2026 and track the progress monthly (cumulatively), then you can set the target as the following:

- Set the start date and end dates to 2026-01-01 and 2026-12-31, respectively
- Set the start value and final target values to 0 and 100, respectively
- Set the Check-in frequency for the target to Monthly
- Set the Target value distribution to Spread linearly across the time period (cumulative)

This Target value distribution means that the final target value is divided linearly into 12 planned target values (such a way that the value for the last monthly breakdown is equal to the final target value). You can edit the planned target value later from the respective target breakdown record as needed.

Goals and targets	Status	Progress	Owner	Start value	Final target value	Actual
1.1 Automate High-Volume Workflows	Red	48.61%	AM Adam McCarty			
1.2 Predictive Decision Support	Yellow	37.5%	AM Adam McCarty			
1.3 Intelligent Knowledge Management	Green	28.18%	AM Adam McCarty			
2.0 Increase Sustainable Revenue Growth	Green	26.39%	SA System Administrator			
Achieve revenue of \$120K from petrochemicals	Green	29.17%	SA System Administrator	0	120,000	35,000
Acquire 1200 new customers in the calendar year 2025 (non-cumulative)	Red	0%	MB Megan Burke (Portfolio...)	0	1,200	
Enter 4 new regional or export markets with established distribution partnerships	Green	50%	SA System Administrator	0	4	2
2.1 Hyper-Personalized Engagement	Red	2.78%	AM Adam McCarty			
Achieve 60% of customer interactions powered by AI-driven personalization	Yellow	8.33%	AM Adam McCarty	0	60	5
Achieve cross-sell/up-sell revenue to \$1M through AI-powered recommendations	Red	0%	AM Adam McCarty	0	1,000,000	0
Increase customer engagement scores (NPS/CSAT) by 20 points	Red	0%	AM Adam McCarty	40	60	40
2.2 Proactive & Predictive Service	Red	0%	AM Adam McCarty			

In this case, the application creates 12 target breakdowns (January, February,....., and December) for calendar year 2026 and sets the Planned target value for the January, February,....., and December breakdowns to 100, 200,....., and 1200 respectively.

Because the application considers only the actual value entered in the latest monthly target breakdown, you must enter the cumulative actual value in the latest monthly target breakdown. For example, you acquired 100 customers in January, then enter 100 as the actual value in the January target breakdown. And, you acquired another 100 customers in February, then enter 200 as the actual value in the February target breakdown. Similarly, if you acquired another 100 in March and 100 in April, then enter 300 and 400 as the actual value in the March and April target breakdowns, respectively.

The application considers the actual value entered in the latest monthly target breakdown and rolls up to the actual value of the main target. Then, the progress of the target and its goal are auto-updated.

Graphical visualisation of target progress

The **Overview** tab in the target’s record page provides graphical visualization for the trend of the target progress based on the planned target value and the actual value of the breakdowns. You can also edit the planned target and view the check-in history of the target actuals selecting the **Show check-in history** in the **Actuals check-in information** section.

The screenshot displays the 'Enterprise AI Goals' interface in ServiceNow. It features a table with columns for 'Goals and targets', 'Status', 'Progress', 'Owner', 'Start value', 'Final target value', and 'Actual'. The table lists several goals, including revenue growth, customer acquisition, and engagement metrics, each with its own progress bar and breakdowns.

Goals and targets	Status	Progress	Owner	Start value	Final target value	Actual
2.0 Increase Sustainable Revenue Growth	Green	19.79%	SA System Administrator			
Achieve revenue of \$120K from petrochemicals	Green	29.17%	SA System Administrator	0	120,000	35,000

Benefits of target breakdowns

The target breakdowns feature helps you when you want to set a target for a period but want to track the progress of the target in smaller periods such as daily, weekly, monthly, quarterly, and yearly. For example, you have set a target for a year with start value and final target values of 0 and 1200, respectively. Also, you want to set monthly targets of 100 for each quarter. In this case, you can break down the target into monthly targets and set a target value for each month so that you can focus on the specific monthly target and update your actuals against those monthly targets.

The target breakdowns feature has the following benefits:

- Break down the long-term targets into short-term intervals such as Daily, Weekly, Monthly, Quarterly, and Yearly for a better tracking or reporting of your progress
- Set or modify a planned target value for each target breakdown as needed
- Update the actual value for each target breakdown and track the progress of the main target
- Focus on the specific short-term target (target breakdown) rather than the whole target
- Track the progress of your short-term and long-term targets cumulatively or non-cumulatively
- Visualize the trend of the target's process wrt the planned target in the line or bar chart

How the actual value is calculated when the check-in frequency set to None

When the check-in frequency is set to None for a target, the actual value must be entered in the **Actuals to date** field in the main target record. The actual value entered must be cumulative irrespective of the time period of the target. Target breakdowns aren't created when the check-in frequency is set to None.

Target breakdowns in target automation

If you've enabled the target automation feature for a target and set the check-in frequency and Target value distribution, the target automation feature automatically updates the actual value in the respective target breakdown based on the check-in due date. After the actual value of a target breakdown is updated, the value is rolled up to rolls up to the actual value of the main target. Then, the progress of the target and its goal are auto-updated.

Update the actual value of a target breakdown

Update the actual value of a target breakdown when its status is changed.

Before you begin

Role required: sn_apw_advanced.spw_goal_user

About this task

Updating the actual value of a target breakdown automatically updates the actual value of its target. After the **Actual to date** field of the target is updated, the progress value for the target and its goal are auto-updated.

Note:

Only the owner or contributors of the goal can update the target breakdowns.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Strategy and Goals**.
2. On the Strategy and Goals page, select the strategy-based board or goal-based board for which your target belongs to.
The Strategy page opens if selected a strategy-based or combined strategy and goals-based board. The Goals page opens if selected a goals-based board.
3. Update the target for your goal using one of the following methods depending on your board type.
4. On the form, update the **Actual** field for the target breakdown and add a business justification in the **Remark** field.
For a description of the field values, see [Target Breakdown form](#).
5. Select **Save**.

Result

After the **Actual** field is updated, the progress value for the target and its goal are auto-updated. For information on how the progress value is calculated, see [progress value calculation](#). For information on how the actual value of the target breakdown is rolled up to its target, see [Target breakdowns](#).

Align work with a goal or target

Create a goal or target relationship with a planning item or any other item to identify and associate your current or future work and achieve your goals and targets.

Before you begin

Role required: sn_apw_advanced.spw_goal_user

About this task

You can associate a goal or target with planning items as well as with any ServiceNow AI Platform table record.

From the Align work window, you can associate a goal or target with multiple planning items at a time. From the Planning items tab of the goal or target, you can associate a goal or target with only one planning item at a time.

You can create goal or target relationships with a custom planning item from the Align work window only if the planning item table is added to the *planning_item_types_allow_list* property. For more information, see [Enable custom item types in Strategic Planning](#).

Note:

When a goal or target relationship is created with a planning item (Project, Demand, or Epic) or any other ServiceNow AI Platform table record, the record appears on the Aligned work tab on the goal record.

Enterprise AI Transformation Target breakdown perfi

Goals and targets		Status	Progress	Owner	Start value	Final tar...	Actuals to ...

+	Index and make searchable 90% of enterprise knowledge repositories	Green	27.78%	AM Adam...	0	90	25

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Strategy and Goals**.
2. On the Strategy and Goals page, select the goal-based board for which your goal or target belongs to.
3. Select the Row context menu icon () of the goal or target that you want to align work and then select **Align work**.
4. On the Align work window, select items that you want to align.
 - a. Select **Planning item** to align planning items or select **Other item** to align any ServiceNow AI Platform table records other than planning items.
 - b. From the list of items, select the items that you want to associate with the selected goal or target.

 **Tip:**

You can search for the required items by applying a filter on the Name or any other required column.

c. Select Confirm.

For a description of the field values, see [Goal/Target Relationship form](#).

Associate or update primary goal or target

Associate a primary goal or target for the planning items where the items contribute to achieving the goal or target.

Before you begin

Role required: sn_apw_advanced.spw_goal_user

About this task

You can associate a goal or target as primary with a planning item by populating the **Primary goal** and **Primary target** fields on the Planning item form respectively. When you populate the **Primary target** field, the **Primary goal** is automatically populated with the goal of the populated target. For more information, see [Planning item form](#).

After you associate planning items with goals or targets, you can check these relationships directly on the Planning items tab of the goal's form or on the Goal/Target Relationships tab of the planning item's form.

 **Note:**

- By default, the goal or target becomes the primary when you associate a goal or target with a planning item for the first time. Then after, association of any goal or target with the planning item becomes a secondary association unless the **Primary** field is selected while associating the goal or target.
- When a planning item already has a primary goal association and you want to make another goal as primary, the existing primary goal association becomes secondary and the fresh association becomes primary for the planning item.
- Associating the primary goal or target isn't supported for strategic items such as initiatives and strategic programs.
- To associate the primary goal or target with a custom planning item, ensure that the custom planning item is added to the `planning_item_types_allow_list` property.

Procedure

1. Open the required planning item form using one of the following options.
2. On the Item details side panel or **Details** tab, fill in or update the **Primary goal** and **Primary target** fields with the goal and target respectively that you want to associate or update.

Alternatively, you can select **Add** in the **Goal/Target Relationships** tab, populate the **Goal** and **Target** fields as needed, and then select **Primary**. The **Primary goal** and **Primary target** fields are then automatically populated on the planning item form.

For a description of the field values, see [Planning item form](#).

3. Select either **Update** or **Save**.

What to do next

If you want to remove the existing goal or target association, you can remove the association by selecting the association record and selecting the **Remove** option on the Goal/Target Relationships tab of the planning item record. If the planning item has the primary goal and secondary goal association, you can remove the primary association only after you make any other goal as primary for the planning item.

Generate insights for a goal

Review AI-generated insights to identify at-risk goals, assess forecasted statuses, and act on recommendations before goals fall off track.

Before you begin

Important:

This Now Assist skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see [Now Assist skills, agents, and agentic workflows on by default](#) .

Role required: sn_apw_advanced.spw_goal_user

About this task

The Goal insights skill analyzes the goal, its targets, subgoals, and aligned work, then delivers concise, data-driven insights—including AI forecasted status, confidence of achieving the goal, targets at risk, delayed or stalled aligned work and recommendations.

Note:

When you generate insights for a goal, insights are also generated individually for each of its targets.

The skill analyzes the real-time data — including check-in patterns, comments, and planned versus actual progress — to forecast goal status and surface proactive recommendations.

Tip:

For better reviews and recommendations, use the Goal insights skill with the AWS Claude model.

Note:

Only the owner or contributors of the goal can generate insights for the goal.

Goals and targets	St...	Progress	Owner	Start v...	Final target v...	Actuals to d
Achieve all NNACV targets for 2024	Yellow	0%	SA System Administrator			
Build a High-Quality Inbound Lead Pipeline	Yellow	0%	SA System Administrator			
Generate at least 100 product signups/month	Red	0%	SA System Administrator	0	1,200	
Maintain the MQL% above 70	Green	0%	SA System Administrator	40	75	
Improve Customer Retention	Green	0%	MB Megan Burke (Portfolio Manager)			
Increase CSAT score by 15% from baseline	None	0%	SA System Administrator	70	85	
Reduce customer churn rate by 10% from baseline	None	0%	SA System Administrator	25	22.5	
Optimize and Enhance website performance.	Green	78.89%	SA System Administrator			
Improve mobile performance score by 90	Green	75.56%	SA System Administrator	45	135	113
Maintain health score above 90%	Green	86.11%	SA System Administrator	60	96	91
Optimize page loading time from 6 sec to 2 sec	Green	75%	SA System Administrator	6	2	3

Note:

If the Goal insights generation job is enabled, it automatically generates insights for each goal based on the job's run frequency. Before manually regenerating, check the timestamp on the goal insights summary card to confirm when insights were last generated – regenerating unnecessarily increases token consumption. You can also view the last generated insights in the **AI rationale** column of the goal list. If goal or target data has changed since the last run, select the refresh icon on the goal insights summary card to regenerate the insights.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Strategy and Goals**.
2. Select **Favorites, Shared with me, Created by me, or Public**, depending on where the board is located.
3. Select the board that contains the goal for which you want to generate insights.
4. From the list of goals, select the Goal insights icon next to the goal.

Alternatively, you can select **Show insights** on the goal's full details page.

The Goal insights side pane appears to process the insights for the goal. After a while, the Insights by Now Assist pane shows the insights for the goal including AI forecasted status, confidence of achieving the goal, targets at risk, delayed or stalled aligned work and recommendations.

5. Review AI-generated insights to identify risk, assess forecasted statuses, and act on recommendations before goals fall off track.

This topic covers reference information specific to Strategy and Goals, including user roles, tables, and system properties. For common reference information about tables, roles, and system properties installed with Strategic Planning, see [Strategic Planning Workspace reference](#).

Tables installed with Strategic Planning Workspace

Table	Description
Strategic Plan [sn_gf_strategic_plan]	Stores the strategic plans defined for each planning organization hierarchy.
Strategic Priority [sn_gf_strategy]	Stores the strategic priorities defined for the organization.

System properties installed with Strategic Planning Workspace

Strategy and Goals system properties

Name	Description
target_checkin_due_date_reminder_feature_toggle	Option to enable the reminder notifications feature for target actuals check-in.
target_checkin_due_date_reminder_config	Option to define the number of days before the due date to send the reminder for target actuals check-in. The default values depend on the check-in frequency set for the target:

Strategy and Goals system properties (continued)

Name	Description
	<ul style="list-style-type: none"> • For the None check-in frequency, the default is 7 days. • For Weekly it's 2 days. • For Monthly, it's 5 days. • For Quarterly, it's 7 days. • For Yearly, it's 10 days.

Scheduled jobs installed with Strategic Planning Workspace

Scheduled job	Description
Goal insights generation job	Generates goal insights automatically for the set of goals that match the defined goal filter criteria.

Strategic Plan form

Use the Strategic Plan form to define the purpose of your organization, its strategic priorities, and the associated goals.

Strategic Plan form

Field	Description
Name	Name of the strategic plan.
Sponsor	Sponsor for the strategic plan.
Start date	Start date for the strategic plan.
End date	End date for the strategic plan.
Description	A detailed description of the strategic plan.
Vision	A brief description about where your organization’s business will be at some point in the future, based on its strategies and associated goals.
Mission	A brief description about what your organization’s objectives are and its approach to reach those objectives.

Strategic Priority form

Use the Strategic Priority form to orient your organization strategic plan toward your goal.

Strategic Priority form

Field	Description
Name	Name of the strategic priority.
Parent	Name of the parent strategic priority that this strategic priority contributes to.
Owner	Owner of the strategic priority. By default, the name of the user creating the strategy is populated.

Strategic Priority form (continued)

Field	Description
Start date	Start date for the strategic priority.
End date	End date for the strategic priority.
Type	Strategic priority type. The available options are: <ul style="list-style-type: none"> • Key Initiative • Shared Vision • Strategic Target • Operating Principle • Relationship Strategy • Environmental • Social • Governance • Artificial Intelligence
Status	Status of the strategic priority. Status can be Red, Yellow, Green, or None.
Strategic Plan	Name of the strategic plan for which this strategic priority is created.
Description	A detailed description of the strategic priority.

Feedback

Build a customer-centric feedback management system and optimize the process of creating and associating feedback and product ideas with Feedback application.

https://player.vimeo.com/video/1015698735?h=308bd4151e&badge=0&autoplay=0&player_id=0&app_id=58479

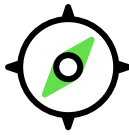

Feedback overview

The Feedback application is available for users with a Strategic Portfolio Management (SPM) Pro license.

The Feedback application simplifies the process of gathering and analyzing user feedback to make informed decisions on your product. The intuitive interface provides real-time feedback on your product features, usability, and performance and help users to share their thoughts. With Feedback application, you create feedback or product ideas and link them with a feedback or product idea or planning or non-planning items.

Leverage the multi-feedback summarization skill to quickly summarize one or multiple feedback and streamline feedback analysis. Create planning or non-planning items by copying the generated summary and save time on manual item creation. Use the Planning item Gen AI Docs skill to generate a summary from selected content in Docs.

Exploring Feedback application in Strategic Planning

Learn how to manage feedback and product ideas and make informed decisions in the Feedback application.

Feedback overview

The Feedback application is designed to collect, manage, and evaluate feedback and product ideas. Feedback is received from various sources such as emails, social media, chats, meetings, and the Idea portal. With Feedback, you can analyze feedback on your product, link feedback to a product idea. You can associate feedback or a product idea directly to a planning or non-planning item. This application aligns customer feedback with the product roadmap, identify trends and statistics, and track the progress of feedback implementation.

Feedback benefits

With Feedback, you can:

- Gather feedback from users and make data-driven decisions about product development, improvements, and future strategies.
- Create feedback or product ideas and link them with a feedback or product idea or planning or non-planning items.

- Import ideas from the Idea portal to Feedback application.
- Configure Microsoft Outlook add-ins to submit feedback directly from your Outlook account.
- Configure an email account in your instance so that sending emails to this configured email address creates a feedback record.

Configuring Feedback application in Strategic Planning

Configure Feedback application with other applications to submit your feedback.

Install the Strategic Planning application from ServiceNow Store and start configuring Feedback application. For more information on how to install Strategic Planning, see [Install Strategic Planning](#).

Related topics

- [Configuring Strategic Planning Workspace](#)

Install ServiceNow® Add-in for Microsoft Outlook

Configure user roles and download the office add-in manifest file to use the ServiceNow® add-in for Microsoft Outlook.

Before you begin

Role required: admin

Note:

Verify that you have a ServiceNow® add-in for Microsoft Outlook (com.sn_outlook_addin).

Procedure

1. Navigate to **All > ServiceNow Add-Ins for Office > Office Add-In-Manifests** from your ServiceNow instance.
2. Select **ServiceNow for Feedback**.
3. Select **Download Manifest**.
4. Open your email account in Microsoft Outlook.
5. From the more items menu, select **Get Add-ins > My add-ins > Add a custom add-in > Add from File**.
6. Select the manifest.xml file that you’ve downloaded from your ServiceNow® instance and select **Open**.
7. Select **Install**.
The ServiceNow for Feedback tile is added in the custom add-ins section.
8. From the more items menu, select **ServiceNow for Feedback**, and log in with your credentials. You can connect to your Microsoft Outlook account with your ServiceNow® instance.

Related topics[Create feedback from Microsoft Outlook](#)[Configure email for feedback submission](#)**Create feedback from Microsoft Outlook**

Create or submit feedback from Microsoft Outlook directly. By configuring feedback creation and submission within Microsoft Outlook, project managers can easily provide feedback without having to switch between different applications.

Before you begin

Role required: pf_user

About this task

Project managers can provide feedback while performing their daily tasks on Microsoft Outlook. For example, if a Product Manager receives feedback over an email, they can submit the email directly as feedback using an Microsoft Outlook add-in without disrupting the workflow.

Procedure

1. From your Microsoft Outlook account, select an email that you want to use as feedback.
2. Select the **ServiceNow for Feedback add-in**.

The subject of the email is copied as the name of the feedback, and the body of the mail is added as the description. The source is auto-populated as **Email**.

3. From the Type list, select the **Type** of feedback.
4. From the **Assigned to** list, select the user.
5. Add a **Tag** to the feedback and select **Save**.

Configure email for feedback submission

Configure email settings in your instance and send an email to this id to create feedback.

Before you begin

Role required: admin

About this task

Configure email settings in your instance use it to send an email directly. With the *sn_apw_advanced.feedback.idea_feedback_queue_address* system property, you can configure email settings within your instance and submit feedback directly from your email account.

Procedure

1. Navigate to your instance.
2. Navigate to **All > System Properties > Email Properties**.
3. **Optional:** Update the email properties.
 - a. Set **Email sending enabled & Email receiving enabled** to **Yes**.
 - b. Set **Automatically create users for incoming emails from trusted domains** to **Yes**.

(Optional) The default value for this field is **No**. You can select **Yes** to automatically create a user in the user table.

c. Select **Save**.

4. Update the system properties list.

a. Navigate to **All > System properties > All properties** and search for *sn_apw_advanced.feedback.idea_feedback_queue_address* property.

b. Open the *sn_apw_advanced.feedback.idea_feedback_queue_address* property and enter your instance email id in the **Value** field. Any configured email account can be used.

5. Select an existing email to forward as feedback or create feedback.

6. Select **Send**.

Integrate the Idea portal with Feedback application

Integrate the Idea portal with Feedback application to enable collaboration of product ideas with feedback.

Before you begin

Role required: sn_align_core.apw_admin

About this task

One-way synchronization is supported and mapping is done from the idea portal to Feedback. All the ideas are imported to Feedback. These ideas are created as feedback records in the Feedback and the number of votes received for each idea is also imported. You can assess feedback popularity with the number of votes received and prioritize them to make informed decisions.

Procedure

1. Go to your ServiceNow instance.
2. Navigate to **All > Strategic Planning > Integrations**.
3. View the alignment integrations for the internal applications by selecting **ServiceNow Internal**.
4. Create the table map between feedback and idea table by selecting **Generate Default Mapping Configurations**.
Mapping configurations consist of table, field, and choice maps for each record. For more information on creating custom mapping configurations between feedback and other tables, see [Create custom mapping configurations](#).

Configure non-planning items for feedback or product ideas records

Configure non-planning items to link your feedback or product idea records to navigate quickly between related items.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System properties > All properties**.
2. Open the `sn_apw_advanced.product_feedback_allowed_non_planning_items_for_link_item` property.
3. Edit the property by selecting **here**.
4. In the value field, enter the non-planning item table name and select **Update**.
You can add the table name of an incident, case, scrum task, agile story, or tables from any global or scoped application. You can enter one or multiple table names separated by comma in the value field.
5. Configure the non-planning items that you want to link.
 - a. Navigate to **All > System Definition > Tables**.
 - b. Search for feedback from the Label list.
 - c. Open the feedback record that has the `sn_align_core_feedback` table name and select the **Show List** related link.
 - d. Open any feedback record, select the additional actions **Configure > Related Lists**.
 - e. Select the **Edit this view** link.
 - f. Move Related Items from Available panel to Selected panel.
 - g. Select **Save**.
6. Configure a form view with view name `workspace_apw_new` for all the non-planning item tables added in step 4.

What to do next

[Associate a feedback or a product idea record with a non-planning item](#)

Configure the filters for feedback or product idea overview page

Configure the filters for the feedback or product idea overview page to display information based on the preferences of your users. Use filters to find and engage with feedback and product ideas that are the most relevant to their interests.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System properties > All properties**.
2. Open the `sn_apw_advanced.product_feedback_product_idea_filters` property.
3. Edit the property by selecting **here**.
4. In the value field, enter the field name in the query.
You can add field names in the JSON query. JSON has column objects for each filter. Each column object has two properties:
 - `fieldname`: The field name on the feedback or product idea table.
 - `encodedQuery`: The filter on the reference table.
 You can only add reference or choice type fields on the feedback or product idea tables as filters. You can either add a new filter or add a condition to the existing filter.
5. Select **Update**.

Managing Feedback application in Strategic Planning

Use Feedback application in Strategic Planning and create Feedback and product ideas to take data driven decisions during product development. Associate the feedback with a product idea or with a planning or non-planning item that can be tracked, prioritized, and implemented.

Use the following components to manage your Feedback within Strategic Planning.

- Feedback
- Product idea

Feedback

Feedback refers to a suggestion, issue, proposed solution, or problem statement provided by users or customers for a product. Strategic Planning enables you to collect feedback from multiple sources and review the incoming feedback to understand the critical issues or feature requests. You can create feedback filters from feedback homepage. For more information on feedback filters, see [Create feedback filters in Strategic Planning](#).

Feedback overview

Get insights of feedback, number of product ideas linked to feedback, top tags, and customers based on the feedback count on the overview page. View trends and statistics based on these filters:

- Top tags, which are majorly used to conclude on the focus areas
- Top customers who are most actively submitting feedback
- Feedback received in the last seven days
- Feedback that is not linked to any product idea
- Feedback based on the overall status
- Feedback that is assigned and unassigned to the user
- Identify the overall sentiment distribution across your feedback data.
- Analyze the sentiments of the feedback received over the past nine months.

The following figure shows a sample overview of customer feedback and indicates the different features on the overview tab. For example, know which customer has provided the maximum feedback by viewing the feedback count based on top customers. Use the filters at the top of the page to view feedback information on the Feedback application. For more information on filters, see [Configure the filters for feedback or product idea overview page](#).

Feedback List view

As a Product Manager, you can see a list of feedback submissions received from users or customers. You can navigate, sort, filter, group, or link the feedback and prioritize your actions based on their requirements.

You can also create a feedback record and link it with an idea or planning items on this page. For example, you can select multiple feedback records and associate them with an idea, epic, demand, or project.

Product idea

A product idea is a solution or improvement that is developed based on one or multiple feedback records, ensuring it benefits all the customers. Assess and prioritize the product idea or link it to another planning item (epic, demand, or project). Manage your product ideas and create a custom lens using the product ideas in Strategic Planning. Get an overview of product ideas, number of product ideas linked to the feedback, latest ideas, and planning state of the ideas. Use the filters at the top of the page to view the product ideas.

Product ideas List view

As a Product Manager, you can see a list of product idea submissions. You can sort ideas based on different attributes like planning state, MoSCoW, priority, and impact. Prioritize product ideas using the MoSCoW values in the list view. The list view displays linked feedback count and number of customers interested in a product idea. The number of customers is calculated or rolled up based on the linked feedback.

Create feedback filters in Strategic Planning

Create and organize feedback using feedback filters and reduce the need to manually apply filters each time to find specific feedback.

Before you begin

Role required: pf_user

About this task

Project managers can retain the feedback filters, share them with team members or groups, and collaborate on specific feedback filters.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace**.
2. Select **Feedback** and then select **New filter** to create a new filter.
3. On the form, fill in the **Feedback filter name**.
You can choose the filters or set up new filter condition if needed.
4. Select **Confirm**.

You can track your feedback filter, review statistics, and sentiments. You can also create new feedback directly from the filter page which is specific to this feedback filter.

Sort, pin, share, update, or delete the feedback filter card directly from feedback homepage. When sharing the feedback filter card, you can provide access to specific users or groups. You can also see who has access to the feedback filter card.

What to do next

- [Create Feedback in Strategic Planning](#)
- [Associate feedback with a product idea](#)
- [Associate a feedback or product idea with a planning item](#)

Update feedback filters in Strategic Planning

Edit the details of a feedback filters and make real-time updates on your feedback filter.

Before you begin

Role required: pf_user

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace** and select **Feedback**.
2. Create a feedback filter.
For more information, see [Create feedback filters in Strategic Planning](#).
3. From the feedback page, select the feedback filter card that you want to edit.
4. Update the record details or delete the feedback filter card.

Create Feedback in Strategic Planning

Create feedback using the Feedback application and make informed decisions on your product.

Before you begin

Role required: pf_user

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace**.
2. Select **Feedback**.
3. Select **Feedback** and then choose one of these options to create a feedback.
4. On the form, fill in the fields.
For more information on fields and description, see [Feedback form](#).
5. Select **Submit**.
You can now track your feedback. Go to the instance and search with the feedback number to open the feedback.

What to do next

- [Update Feedback or Product idea records from the list page](#)
- [Associate feedback with a product idea](#)
- [Associate a feedback or product idea with a planning item](#)

Update Feedback or Product idea records from the list page

Edit the details of a feedback or product idea record and make real-time updates using the list page of feedback or product ideas.

Before you begin

Role required: pf_user

About this task

Modify feedback or product idea records within the list view or side panel using inline editing. Edit the details inline from the list view or use the side panel. Enable quick updates for fields like short description, state, and others on the list page. You can use the full details page to add work notes, attachments, and view related lists of a feedback or product idea record.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace**.
2. From the feedback or product idea list, select the feedback or product idea record that you want to edit.

You can use the full details page to edit the feedback or product idea record. Select  to open the preview of the feedback or product idea record from the list view.
3. Update the record details, attach files, or delete the feedback or product idea record.
Information of certain columns that aren't editable in the full details page can't be edited inline either. For example, product ideas count and votes. If you group the feedback or product idea records by any attribute, you can't edit the short description of the items directly from the list view.

Associate feedback with a product idea

Link a feedback record with one or multiple product ideas that can be planned, prioritized, and executed.

Before you begin

Role required: pf_user

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace**.
2. Select **Feedback**.
3. Select **Feedback** and then [Create feedback](#).
4. Once the feedback is created, select **Link Product idea** to link the product idea.
5. **Optional:** From the Product idea list page, select one or multiple product idea records that you want to associate and select **Confirm**.
You can view associated product ideas from **Product ideas** tab.

Related topics

Associate a feedback or product idea with a planning item

Link a feedback or product idea record with a planning item. By doing this association, you can address customer concerns promptly in a central location and ensure that every input is considered when making decisions.

Before you begin

Role required: pf_user or apw_user

About this task

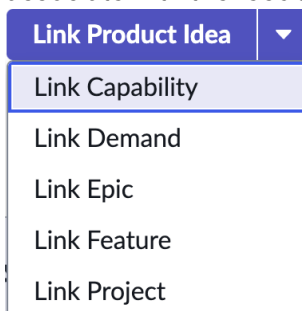

You can associate a feedback or product idea record with only one planning item at a time. You can link a feedback or product idea record with either a demand, epic, or project.

Note:

When a feedback or product idea record is associated with a planning item (project, demand, or epic), the record appears on the Planning items tab on the feedback or product idea record.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace**.
2. Select **Feedback**.
3. Select **Feedback** and then [Create feedback](#).
4. Once the feedback is created, from the link product idea list, select the planning item to associate with the feedback.

From the planning item list, select one or multiple records that you want to associate. You can follow similar steps for the product idea.

5. Select Confirm.

You can view associated Planning items from **Planning items** tab. Demands that are in the completed state cannot be associated with a product idea or feedback.

Create a product idea in Strategic Planning

Create a product idea using the Feedback application and prioritize which ideas are important to users. Incorporate product ideas into feedback to enhance your product.

Before you begin

Role required: pf_user

About this task

User-created product ideas help in identifying focus areas of a product. These product ideas facilitate continuous improvement in the product development life cycle.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace**.
2. Select **Feedback**.
3. Select **Product idea** and then select **New product idea**.
4. On the form, fill in the fields.

For more information on fields and description, see [Product idea form](#).

5. Select **Submit**.

What to do next

Associate a feedback or a product idea record with a non-planning item

Link a feedback record or product idea record with a non-planning item. By doing this association, you can address customer concerns promptly in a central location and ensure that every input is considered when making decisions.

Before you begin

Ensure to [Configure non-planning items for feedback or product ideas records](#).

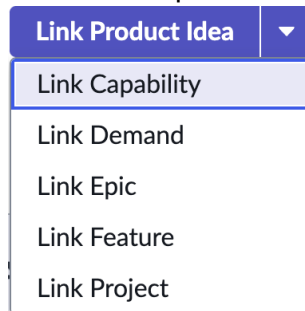

Role required: pf_user

About this task

You can associate single or multiple feedback records or product idea records with one or multiple non-planning items at a time. Non-planning items could be an incident, scrum task, agile story or item from any global or scoped application such as agile development, PPM standard or safe application.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace**.
2. Select **Feedback**.
3. From the feedback list, select one or multiple feedback records that you want to associate with the non-planning item.
You can follow similar steps for the product idea. From the product idea list, select one or multiple ideas that you want to associate with the non-planning item and follow steps from 2 through 4.
4. From the link product idea list, select the non-planning item.

The non-planning item is displayed in the link product idea list only if the item is configured. For example, if you have configured an incident, you can see the **Link incident** option in the list.

5. From the non-planning item list, select one or multiple records and select **Confirm**.
You can now track your feedback or product idea with Related items Tab.

Associate a product idea with a goal

Create a goal relationship by associating one or more product ideas with goals. Focus and target on product ideas by defining specific goals.

Before you begin

Role required: pf_user or apw_user or goal_user

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace**.
2. Select **Feedback**.
3. Select **Product idea** and then [Create product idea](#).
4. From the Product ideas List, select one or multiple ideas to associate.
5. Select **Add**.
6. From the Goal list, select a goal.
For more information on goals, see [Align a planning item with goals or targets](#).
7. If you want to set a goal as primary goal, then select the **Primary goal** check box.
The remaining fields are auto-populated from the goal record.
8. Select **Save**.
You can now track your goals from the Goal Relationship list.

Manage documentation in Feedback application

Capture documents, files, or resources associated with a product idea in the Doc tab.

Before you begin

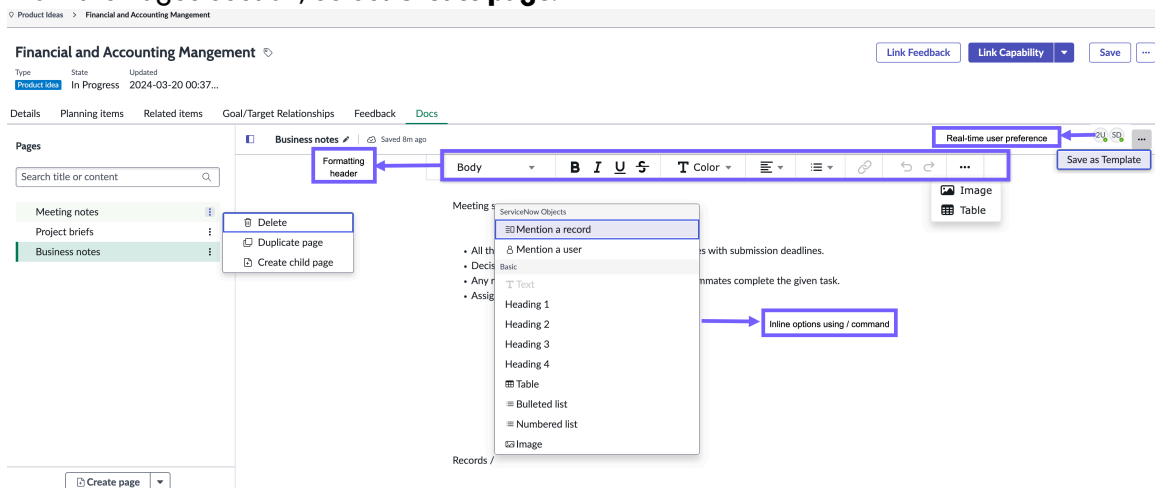

Role required: pf_user

Verify that you have a doc component plug-in (com.sn_docs) installed.

About this task

Procedure

1. Create a product idea in the Feedback application.
2. From the **Product idea list tab**, select the record to open.
3. From the side panel, open the details of the record by selecting the **Full Details** button.
4. Navigate to the **Docs** tab.
5. From the Pages section, select **Create page**.

You can perform these tasks under the **Doc** tab:

- Select the more actions menu to delete, duplicate, or create child pages in the pages section.
- Use the forward slash on the keyboard to open a list of actions, including **Mention a user** or **Mention a record** as required.
- Customize the appearance of your text using the formatting section.

6. Select **Save as Template** to save your worknotes.

Summarize the feedback by using Now Assist for Strategic Portfolio Management (SPM)

Generate a summary from the name and description of the feedback records so that you can analyze a large volume of feedback quickly without reading each feedback record manually. You can do this task by using the multi feedback summarization skill in the Now Assist for Strategic Portfolio Management (SPM) application.

https://player.vimeo.com/video/1016235687?h=c41764ac08&badge=0&autoplay=0&player_id=0&app_id=58479

Before you begin

i Important:

This Now Assist skill is now turned on by default. The skill will be automatically available to appropriate role users for the application. This change simply activates the skill and does not touch the roles that are needed to use the skill. The new default behavior works as follows:

New customers

When you install a Now Assist product, designated skills will turn on automatically.

Existing customers who are upgrading

Any previously unconfigured skill will turn on automatically (the skill was never turned on, then off again).

There is no change to Now Assist skills that are currently enabled and customized.

Previously configured skills that were turned on, then off, will remain inactive.

If you have users with custom roles that need access to this skill, you must update ACLs for those roles and also add those custom roles to the In product role.

Role required: pf_user

About this task

With the feedback or multi feedback summarization skill, you can get enough details about the feedback that you received on your product so that you can improve the product features, usability, and performance.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace** and select **Feedback**.
2. From the Feedback page, select any feedback filter card.
3. From the feedback list, select one or multiple feedback records.

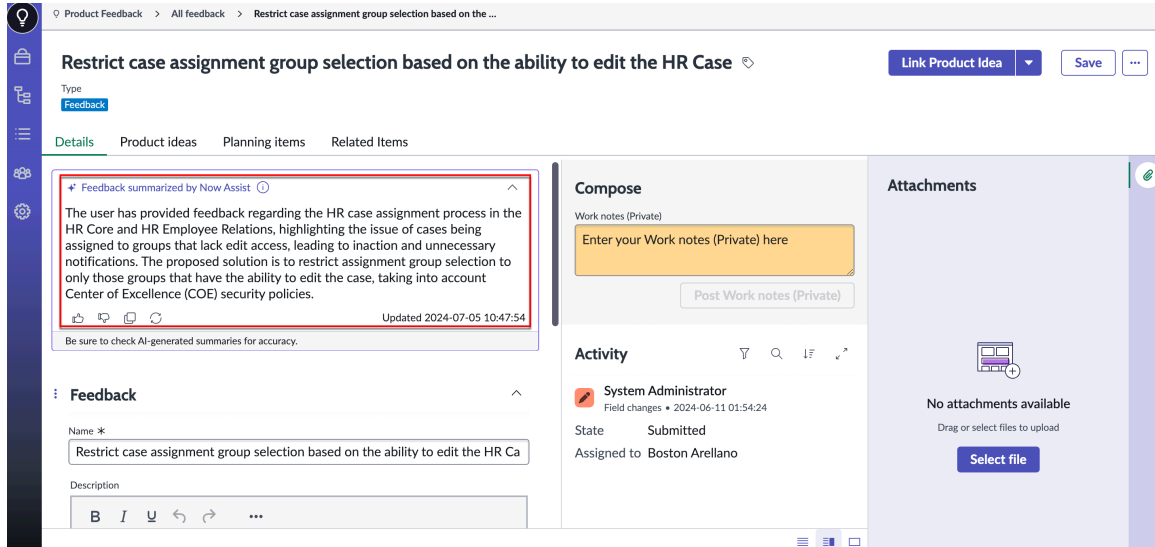

View a loader for the side panel while the summary content loads for a more engaging loading experience.

If you want to generate a summary for one feedback record, you can either generate it from the list level or at the record level. At the record level, the feedback summary is displayed in the Now Assist component. The component is collapsed by default and expands to display the summary.

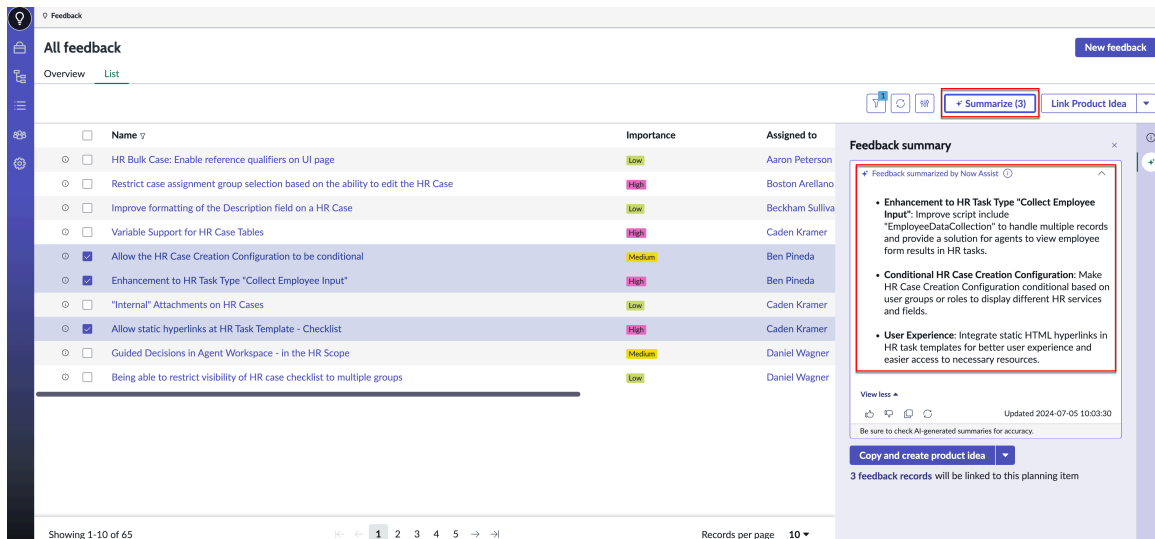

4. Select Summarize.

View an animation for the Now assist icon when you hover over it.

You can generate a summary of a single feedback record by using the feedback summarization skill. This image shows the AI-generated summary for a single feedback record.

You can use the multi feedback summarization skill to generate summaries of one or multiple feedback records. For example, you can analyze the high-priority feedback, filter them, summarize the records, and gain insights into the requirements.

Note:

Because the information in these fields is automatically generated, it's a good idea to review the text and make sure it's accurate.

The feedback or multi feedback summarization skill uses the name and description information of the feedback record to generate a paragraph or bullet-point summary from the feedback.

View the hover animation for the Now Assist icon on the Summarize button in the feedback list and Docs.

- 5. Optional:** When you're finished summarizing the feedback, you can expand or collapse the summary, provide feedback, copy it, or view information about it.

Note:

The feedback summarization or multi summarization skill checks the feedback records to determine if enough information is available to generate a summary. If there isn't enough feedback content to summarize, you can add more content and retry.

On the side panel, you can select the preview record icon (ⓘ) to view the additional details or select preview generated summary icon (✨) to view the summarization output.

- 6. Optional:** Select **Copy and create epic** to copy the generated summary and create a planning item.

(Optional) Save time and streamline your work flow by linking the feedback with planning items, which eliminates the need to copy summaries. You can quickly create work items in Feedback and view them in the roadmap.

Generate the summary for selected or complete content with Planning Item Doc Summarization skill

Quickly learn the details of the documents from the summary that is generated by Now Assist in Strategic Planning.

Before you begin

Important:

This Now Assist skill is now turned on by default. The skill will be automatically available to appropriate role users for the application. This change simply activates the skill and does not touch the roles that are needed to use the skill. The new default behavior works as follows:

New customers

When you install a Now Assist product, designated skills will turn on automatically.

Existing customers who are upgrading

Any previously unconfigured skill will turn on automatically (the skill was never turned on, then off again).

There is no change to Now Assist skills that are currently enabled and customized.

Previously configured skills that were turned on, then off, will remain inactive.

If you have users with custom roles that need access to this skill, you must update ACLs for those roles and also add those custom roles to the In product role.

Role required: sn_align_core.ap_read_only, sn_align_core.pf_read, sn_apw_advanced.eap_read_only, sn_apw_advanced.pf_user, sn_align_core.apw_user, or sn_align_core.ap_read_only

About this task

Minimize the time that you spend reading documents, meeting notes, project reports and so on by using a summary that is generated by Now Assist. You can also copy-and-paste the source materials that meet your learning needs in Docs and generate a quick summary.

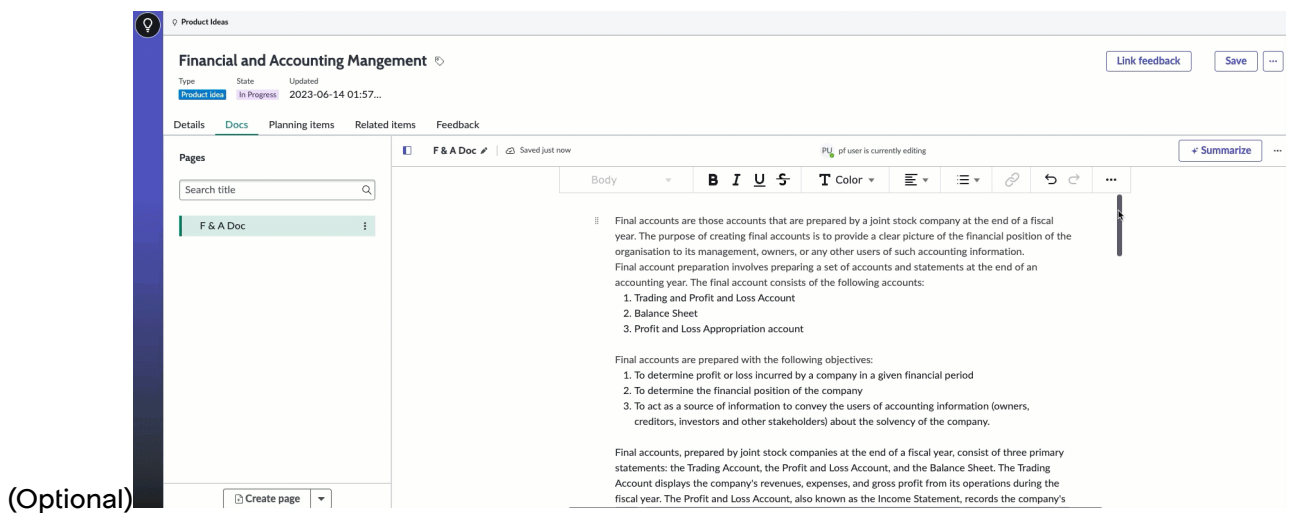

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace** and open any planning item records such as product idea from Feedback.
2. From the **Docs** tab, perform one of these actions according to your requirements.

Note:

Summarization of the entire content is also permitted for users with the read role.

3. **Optional:** When you're finished summarizing the content in Docs, you can provide feedback, copy, or view information about it.

(Optional)

Note:

Because the information in these fields is AI generated, it's a good idea to review the text and make sure it's accurate.

Only an administrator can activate the Now Assist skills. For more information, see [Configure Now Assist Admin features](#).

The Planning item doc summarization skill checks the doc content to determine if enough information is available to generate a summary. If there isn't enough content to summarize, you can add more content and retry.

Note:

The **Summarize** button is visible only if the Planning item doc summarization skill is active. If the selected text exceeds the token limit for Now Assist, the Planning item doc summarization skill can't be executed. If there is more content to summarize, you can remove some content and retry.

Feedback reference

Reference information to provide additional details about Feedback such as the fields, user roles, tables, and system properties information.

Components installed with Feedback application

Learn about several types of components installed with Feedback application in Strategic Planning such as user roles, tables, and, system properties.

Note:

The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see [Find components installed with an application](#).

Roles installed

Role title [name]	Description	Contains role
[sn_align_core.pf_read]	Can view the Feedback.	None
[sn_apw_advanced.pf_user]	Create, view, update, and delete the Feedback entities.	<ul style="list-style-type: none"> • pf_read • pf_basic
[sn_align_core.pf_basic]	Create, view, update, and delete the Feedback but cannot access the Feedback from Strategic Planning Workspace.	None

Tables installed

Table	Description
Feedback [sn_align_core_feedback]	Stores all the information about Feedback received from different sources.
Product idea [sn_align_core_product_idea]	Stores all the information about product ideas.
Feedback relationship [sn_align_core_m2m_feedback_rel]	Stores information about the feedback associated to an entity (planning or non-planning items).

System properties installed

Name	Description
sn_apw_advanced.feedback.idea_feedback_queue	Specifies the address for creating or submitting the feedback. With the <i>sn_apw_advanced.feedback.idea_feedback_queue</i> system property, you can configure email settings within your instance and submit feedback directly from your email account.

Name	Description
sn_apw_advanced.product_feedback_allowed	Specifies the items for link items that can be linked to feedback or product idea. With the <i>sn_apw_advanced.product_feedback_allowed</i> system property, you can link non-planning items such as incident, scrum tasks, agile stories, or items from safe application, agile development, PPM standard, or any global or scoped application tables to your feedback or product idea.
sn_apw_advanced.product_feedback_feedback_filters	Specifies filters to sort through feedback information. With the <i>sn_apw_advanced.product_feedback_feedback_filters</i> system property, you can configure to add and remove the filters on the feedback overview page.
sn_apw_advanced.product_feedback_product_idea_filters	Specifies filters to sort through product idea information. With the <i>sn_apw_advanced.product_feedback_product_idea_filters</i> system property, you can configure to add or remove the filters on the product idea overview page.
sn_apw_advanced.pf_docs_config	<p>With the <i>sn_apw_advanced.pf_docs_config</i>, you can customize the Doc component using different attributes.</p> <ul style="list-style-type: none"> • Type: string • Possible value: JSON with key-value pair with these attributes: <pre data-bbox="847 1192 1390 1986"> { "hideLeftPanel": true/false, "hideDocTitle": false, "hideFavorites": false, "collapseLeftPanel": false, "collapseRigthPanel": false, "allowExternalLink": false, "implicitSave": true, "recordMentionEnabled": true, "userMentionEnabled": true, "recordMentionConfig": [{ (Record mention configuration) "sourceTable": TABLE_NAME, "filterCondition": " ", "label": TABLE_LABEL,</pre>

Exploring Portfolio Planning in Strategic Planning Workspace

Learn about the features, functionality, and the business value that Strategic Planning provides.

Strategic Planning overview

Strategic Planning uses Lenses to help you plan work for your company in a delivery perspective of your choice. Personalized portfolio plans that are created using a lens help you cascade the plans from the enterprise level down through portfolios and products or align work with an

organizational goal or a value stream. Prioritize and roadmap relevant work, thus aligning the right execution teams to the right strategy.

After strategic plans are broken down into planning items such as projects or epics, you can schedule these items into your product or portfolio roadmaps. Using hybrid roadmaps, you can roll up both Waterfall and Agile work items to a shared initiative. You can also plan capacity and financials for each of these planning items all from a single workspace.

From the following table, learn about features of Strategic Planning in detail and how they enable managers to draw effective plans and drive agile transformation across the company.

Features and Benefits

Feature	Benefit
Lens	Choose a planning perspective to prioritize, fund, and align your work.
Lens configuration	Use six predefined lenses or create custom lenses.
Portfolio plans	Enable focused planning of work in the desired lens to align with strategy and drive shared outcomes.
High-level portfolio plans	Prioritize and roadmap work at a high-level by building portfolio plans for strategic items such as initiatives.
Planning items	Plan work in the form of projects, epics, demands, or a custom type to suit traditional, Agile, or hybrid approaches.
Prioritization	Facilitate smoother backlog grooming and prioritize the right work using List, Kanban, and Hierarchy views.
Portfolio roadmaps	Visualize the prioritized work into roadmaps and set milestones to track key outcomes.
Free-form roadmaps	Flexibly plan and track work across the company, without restricting to a planning organization or portfolio.
Scenario planning	Optimize your portfolio planning by comparing potential outcomes, assessing their alignment with strategic goals, and approving the best scenario as your live plan.
Scoring	Start scoring items in your portfolio plan to prioritize work based on a pre-defined or a custom score.
Goal management	Create goals for portfolio plans, set targets for them, and evaluate the progress of the goals

Feature	Benefit
	and targets to accomplish your organizational plans and drive business outcomes.
Diagnostics	Identify and fix errors in the configuration and other common settings.
Capacity Planning	Generate, view, and better plan the resource capacity for your prioritized planning items.
Financial planning	View the financial planning of your planning items using the comprehensive view in the new Financials screen.

Comparing Portfolio Planning Workspace with Strategic Planning Workspace

- Portfolio Planning Workspace: Prioritize, roadmap, and track work when using waterfall methodology. Enhance traditional portfolio planning for demand and project management. To learn more about Portfolio Planning, see [Portfolio Planning](#).
- Strategic Planning Workspace: Prioritize, roadmap, and track work when using traditional, agile, or hybrid methodologies. Align strategy to execution by defining and tracking goals across the organization.

Lenses in Strategic Planning

Lenses represent planning perspectives, which would be different for planning managers at different levels in an organization. Lenses enable you to create personalized portfolio plans through which you prioritize and align work with high-level initiatives and goals.

Lenses overview

Lenses in Strategic Planning indicate a perspective in which you can plan and fund work. By selecting a lens, you choose a planning perspective to prioritize and align your work in. For

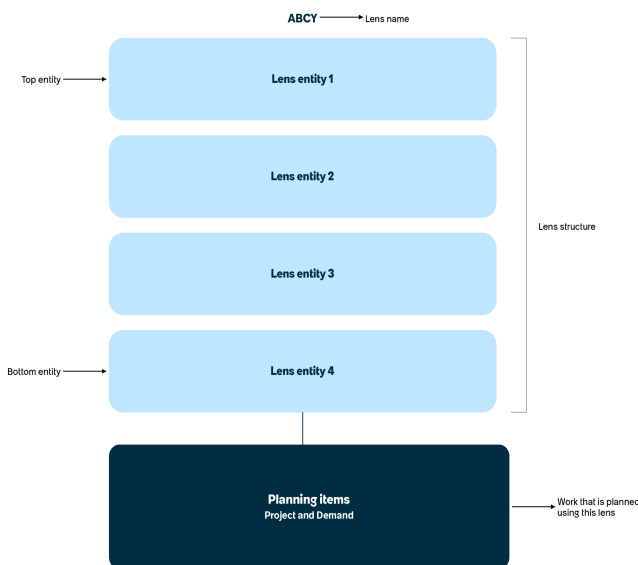

example, if you're a department leader, you can choose the Organization lens. If you're a product manager, you can choose the Product lens.

Lens structure

Each lens in Strategic Planning consists of a structure that is made up of entities. Lens entities represent different levels of planning for your company. You can build portfolio plans at one of these levels.

The planning item types associated with the bottom entity of a lens represent the type of work that can be planned using these portfolio plans.

Sample lens structure

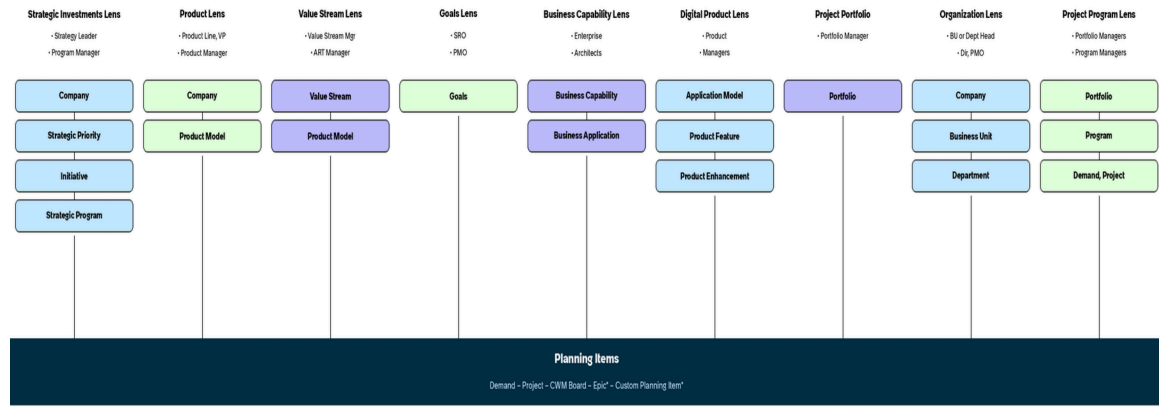

For example, the Organization lens has a Company, Business Unit, and Department as its entities. As the head of the Support department, you can create a portfolio plan at the department level. Then, you can prioritize the work that is assigned to the department and plan a roadmap for the prioritized work. This work can be in the form of epics, projects, demands, or any other custom type.

Get started with one of the pre-defined lenses, or build a custom lens structure, with up to six levels, to suit your planning needs.

Pre-defined lenses and their structure

Strategic Planning provides nine pre-defined lenses to get you started with building your portfolio plans - Project Portfolio, Project Program, Organization, Strategic Investments, Product, Digital Product, Value Stream, Goals, and Business Capability. Planning managers can use these lenses based on their role at the company.

Structure of pre-defined lenses

Lens	Planning levels (Lens entities)	Planning manager	Description
Organization	<ul style="list-style-type: none"> Company Business unit Department 	<ul style="list-style-type: none"> Department head Business unit head 	Plan and track the delivery of work in my organization and visualize how the work is aligned to various levels.
Product	<ul style="list-style-type: none"> Company Product models 	<ul style="list-style-type: none"> Product leader Product manager 	Plan, fund, and prioritize work from a product lens.
Digital Product	<ul style="list-style-type: none"> Application Model Product Feature Product Enhancement 	<ul style="list-style-type: none"> Product leader Product manager 	<p>Plan, prioritize, and roadmap work for digital products.</p> <p>If the ServiceNow[®] Digital Product Release Workspace is installed, the planning items associated with the product enhancement appear in the Planning items tab of the Release scope page in Digital Product Release Workspace. For details, see Scope of a release.</p>
Strategic Investments	<ul style="list-style-type: none"> Company Strategic priority 	<ul style="list-style-type: none"> Strategy leader EPMO 	Plan, manage, and provide oversight for strategic initiatives or programs regardless

Lens	Planning levels (Lens entities)	Planning manager	Description
	<ul style="list-style-type: none"> Initiative Strategic program 		of who is doing the work.
Goals	Goal	<ul style="list-style-type: none"> Portfolio manager Business unit head 	<ul style="list-style-type: none"> Create, share, and collaborate on a portfolio plan for defined goals. Set targets for the goals to track their progress. Align, prioritize, and roadmap the work you must do to achieve them.
Value stream	<ul style="list-style-type: none"> Product model Value Stream 	<ul style="list-style-type: none"> Value stream manager ART manager 	Plan, fund, and prioritize work for a value stream.
Project Portfolio	Portfolio	<ul style="list-style-type: none"> Product manager Portfolio manager 	Plan, fund, and prioritize work in your project portfolios.
Business Capability	<ul style="list-style-type: none"> Business capability Business application 	Enterprise architect	<p>Plan, prioritize, and roadmap the work based on your business capabilities or business applications.</p> <p>This lens can be used only if the ServiceNow® Enterprise Architecture Workspace is installed.</p>
Project Program	<ul style="list-style-type: none"> Portfolio Program 	<ul style="list-style-type: none"> Portfolio manager Program manager 	Plan, prioritize, and roadmap the work in your programs.

- If you're an admin, you can modify the structure for these pre-defined lenses or configure a new lens altogether based on your planning manager's requirements. For more information, see [Lens configuration in Strategic Planning](#).
- If you're a planning manager, learn about portfolio plans to start aligning your work with the business strategy. See [Portfolio plans in Strategic Planning](#).

Portfolio plans in Strategic Planning

Personalized portfolio plans help you align work with your company's objectives and roadmap the right work for the right time. Drive shared strategy using planning insights from portfolio plans and improve enterprise planning.

Portfolio plans overview

Portfolio plans are custom plans per planning manager that are built using a lens. They enable planning managers to define goals, set targets for these goals, and then roadmap the work to ensure alignment between goals and the planned work.

A strategy leader using the Strategic Investment lens plans in the perspective of initiatives, and a department head using the Organization lens plans in the perspective of a department.

As a planning manager, you can create multiple portfolio plans using different lenses. Visualize the plans and progress of work from different perspectives and share them with stakeholders.

Using portfolio plans, you can:

- Enable focused planning of work in the desired perspective (lens).
- Prioritize the right work and improve alignment with business strategy.
- Reduce the time spent on aligning execution teams to the right work.

High-level planning using portfolio plans

In Strategic Planning, you can roadmap work for your organization at a high level by building portfolio plans for strategic items such as initiatives. High-level planning items usually span across multiple business units, departments, or portfolios of a company. These strategic work items help you further breakdown a company's priorities.

- Initiative: Used to achieve long-term goals. Initiatives are designed to create a sustainable competitive advantage for the organization. They often involve large-scale effort that requires coordination and collaboration across multiple departments or business units.
- Strategic Program: Used to achieve specific milestones and outcomes of an Initiative.
- Program (pm_program): Used to achieve milestones and outcomes of a program.
- Product Enhancement: Used to plan and achieve feature enhancements for digital products.

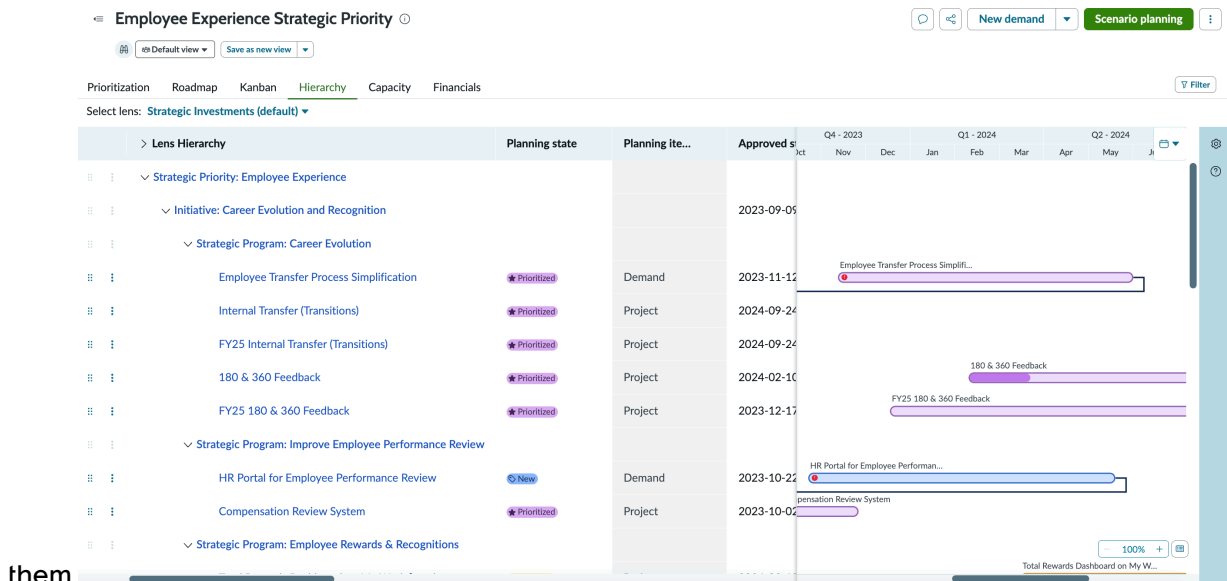

Using the Hierarchy view, review the work pipeline and drill down to the low level planning items that are associated to your strategic item.

For example, as an EPMO, you can view the epics associated to each initiative. Also, you can view and manage the goals that these initiatives are aligned to.

By default, you can use Initiatives or Strategic Programs from the Strategic Investments lens or Programs (pm_program) from the Project Program lens to create high-level portfolio plans. See [Create a high-level portfolio plan](#).

If you need high-level planning enabled for items other than Initiatives, Strategic Programs, Programs (pm_program), work with your ServiceNow admin to complete the additional configuration. See [High-level planning configuration in Strategic Planning](#).

Here's a sample portfolio plan that shows a few strategic programs of the company and the low-level work (projects and demands) that are aligned with

them.

Work with your administrator to ensure the required lens setup. See [Lens configuration in Strategic Planning](#).

Start creating portfolio plans to align work with strategy. See [Managing portfolio plans in Strategic Planning Workspace](#).

Scoring in Strategic Planning

Scoring enables you to prioritize items, such as epics, projects, demands, initiatives, strategic programs, and other planning items, based on a defined quantitative metric.

Before selecting a scoring framework for your portfolio plan, it's helpful to first learn about the pre-defined frameworks available for you to use. Later you can choose if you want to use one of the pre-defined scoring frameworks, or create a custom scoring framework, based on your preferred scoring parameters.

The following are the three pre-defined scoring frameworks available to use for your portfolio plan:

- RICE
- Value vs Effort
- WSJF

RICE

A framework to prioritize and evaluate items by scoring each criterion. It helps teams assess and compare items based on four key criteria: Reach, Impact, Confidence, and Effort.

Parameters:

- Reach- Indicates the number of people or users who will be affected by the project or feature. It's essential to estimate the potential audience that the item can reach. For example, if a new feature is likely to be used by a small subset of users, it might have a lower reach score compared to a feature that will be utilized by a large portion of the user base.

To populate this value, answer the question- How many existing/target users within a given period of time?

- **Impact-** Measures the potential impact or benefit that the item will bring to the users or the organization. This criterion focuses on the positive outcomes and value that the project can deliver.

To populate this value, answer the question- How much will this impact individual users?

- **Confidence-** Confidence gauges the level of certainty that the project will achieve its intended results. This criterion assesses how confident the team is in their estimates of reach and impact. Items with higher confidence are generally based on solid data, user feedback, or previous experiences, making it more likely for them to deliver the expected results.

To populate this value, answer the question- How confident are you about the impact and reach scores?

- **Effort-** Duration in person months, based on product, design, and development effort. This criterion helps teams understand the relative difficulty of executing. Items with higher effort scores may require more development time, financial investment, or significant changes to existing systems.

To populate this value, answer the question- How much time will this item require in person months?

The RICE score is calculated with this formula:

$$\text{RICE Score} = (\text{Reach} \times \text{Impact} \times \text{Confidence}) / \text{Effort}$$

Value vs Effort

A framework to prioritize planning items, based on the effort estimate and the value it brings to the users/customers. The Value vs. Effort method is the quickest way to prioritize your backlog items.

Parameters:

- **Value-** Significance of items based on the potential revenue, user benefit, business impact, and strategic goals.

To populate this value, answer the question- How does this contribute to your goal?

- **Effort-** Duration to build the product, including product, design, and development estimates.

To populate this value, answer the question- How difficult it is to deliver the task?

The Value vs. Effort score is calculated with this formula:

$$\text{Value vs. Effort Score} = \text{Value} / \text{Effort}$$

WSJF

A framework to sequence items for maximum benefit, particularly useful where frequent re-prioritization is a driver of economic value. This score is based on the relative cost of delay and relative job duration, business value, time criticality, risk reduction, and job size.

Parameters:

- **User Business value-** The relative importance to the users/customers and its potential impact on revenue.

To populate this value, answer the question- How important is this item to your business?

- **Time Criticality-** Identifies how the user business value will decay over time and denotes the urgency to release the item/feature.

To populate this value, answer the question- How does the item value decay over time?

- **Risk Reduction-** Identifies the items that can reduce technological and business risks and enable new opportunities.

To populate this value, answer the question- What else does the item do for your business?

- **Job Size-** Relative duration to complete the task.

To populate this value, answer the question- When will you complete the task?

The WSJF score is calculated with this formula:

$$\text{WSJF Score} = (\text{User Business value} + \text{Time criticality} + \text{Risk reduction}) / \text{Job Size}$$

To get started with Scoring your planning items in Strategic Planning, see [Scoring planning items in Strategic Planning Workspace](#).

Goals in Strategic Planning

Create goals for your portfolio plan, set targets for them, and evaluate the progress of these goals and targets to accomplish your organizational plans and drive business outcomes.

Goals key components:

- **Goals:** Objectives that you want to reach based on your strategic plans.
- **Targets:** Targets for goals to track and measure the progress of the goals.
- **Target source:** A configuration for a target to auto-update the actual value of the target.

Goals

Goals refer to objectives that an organization sets for itself to accomplish their organizational plans. Goals are typically qualitative by nature. Goals should be ambitious and are expected to motivate and challenge your teams. Some examples of goals are as follows:

- Using renewable energy by the end of the year 2022.
- Increase diversity in the workplace by 50 percent.

A goal can also have subgoals. You can associate work (planning items) to a goal so that you can track who is responsible for fulfilling the goal.

You can associate planning items - Demand, Project, and Epic, and strategic items - Program and Initiative - with a goal to capture the work being done to meet your goal.

Targets

Targets help you measure your goal. For example, to meet the goal of increasing diversity in the workplace by 50 percent, the target can be to hire a 30 percent diverse workforce by the first quarter of 2022.

Targets can be quantitative or qualitative, by defining the unit of measure for the target. Quantitative targets are numbers-based, countable, and measurable. Qualitative targets are interpretation-based, descriptive, and typically a yes or no type.

You can also break down a target into smaller periods (for example, Quarterly), which helps you set a target for each quarter and focus on the specific breakdown targets. The target breakdowns are automatically created based on the breakdown interval set for the target. For details on how the target breakdowns feature works, see [Target breakdowns in Strategic Planning](#).

Qualitative targets

Qualitative targets are typically non-measurable but can be tracked if the target has been achieved. The available unit of measure for qualitative targets is Yes/No. You can also define a custom unit of measure (for the available choice set) for qualitative targets according to your need and set qualitative targets for your goals.

For example, to achieve a target of conducting a hackathon in Q2-2023, the target can be set as conduct a hackathon in Q2-2023 with the unit of measure Yes/No. The base and target value of the target can be No and Yes, respectively. After the target is successful with the hackathon event, the target value can be updated to Yes.

Target sources

A target source is a configuration for a target to auto-update the actual value of the target, so that the progress of the target and its goal are auto-updated. Any table or a combination of tables (for example, benefit plans, cost plans, surveys, incidents, and PA indicators) present on the ServiceNow AI Platform[®] can be configured as a target source.

The following target source types are supported for automating the actual value of a target:

- PA Indicator: Updates the **Actual to date** field on the target form by fetching the required data from the PA Indicator.
- Assessment/Survey: Updates the **Actual to date** field on the target form by fetching the required data from the Assessment metric type and Assessment metric category records.
- Custom script: The Custom script fetches the required data from any ServiceNow AI Platform table that is configured. With the Custom script option, any table or a combination of tables present on the ServiceNow AI Platform can be configured as a target source.

[Predefined target automation script for benefit plans](#): The predefined, default script is a target source that updates the **Actual to date** field on the target form by fetching the value from the **Actual benefit** field or **Non-monetary actual benefit** field from the monetary or non-monetary benefit plans of relevant work items.

Context variable

The context variable is an additional configuration for the target source. The context variable provides information that can be used on the Target form to fetch the required data and update the **Actual to date** field on the Target form. The context variable is required for target source types Assessment/Survey and PA Indicator. If the Goal Framework for SPM scope is selected while creating a target source, the context variable is automatically created for the target source (of type Assessment/Survey and PA Indicator). For more information on context variables, see [Context variable in target source](#).

Example goals view

Business Development Portfolio										FY 23 - Q4		FY 24 - Q1	
Goals and targets	Assigned entity	Status	Start value	Final target value	Actuals to date	Progress	Check-in frequency	Target value distribution	Planned target	Actual	Status	Planned...	Actual
Acquire 10000 new customers	Department: Legal	Active				80%	Quarterly	Split equally across the time period (non-cumulative)	2,000	2,000	Active	2,000	2,000
Acquire 2000 new customer quarterly		Active	0	10,000	8,000	80%	Quarterly	Split equally across the time period (non-cumulative)	2,000	2,000	Active	2,000	2,000
Build dynamic, cost-effective, and business-centered systems	Department: IT	Active				0%							
Build intelligent and automated systems	Department: HR	Active				74.87%							
Employee wellbeing and growth	Department: HR	Active				0%							
Enroll at least 80% of team members in the employee wellness program		Active	40%	120%		0%	-- None --	Spread linearly across the time period (cumulative)					
Organize 4 mental health & wellbeing activities per quarter		Active	0	24		0%	-- None --	Spread linearly across the time period (cumulative)					

Goals workflow in Strategic Planning

Using the Goals view in the Strategic Planning Workspace, you can do the following activities:

- Create a goal for an entity such as company, business unit, department, and so on. For more information, see [Create a goal in Strategic Planning](#).
- Set targets and automate the actual value of the targets. For more information, see [Add targets for a goal in Strategic Planning](#).

Note:

- Automating the actual value of the targets is optional. If you don't want to automate the actual value of your targets, you can still update the actual value of the targets manually.
- You can also generate targets for your goals using the Target generation skill, if the Now Assist for SPM application is installed.
- Associate a planning item with goals. For more information, see [Align a planning item with goals or targets](#).
- Associate or update the primary goal for a planning item. For more information, see [Associate or update the primary goal or target for a planning item](#).

For more information on how to define and manage your goals in Strategic Planning see [Managing portfolio plan goals in Strategic Planning Workspace](#).

Prioritization in Strategic Planning

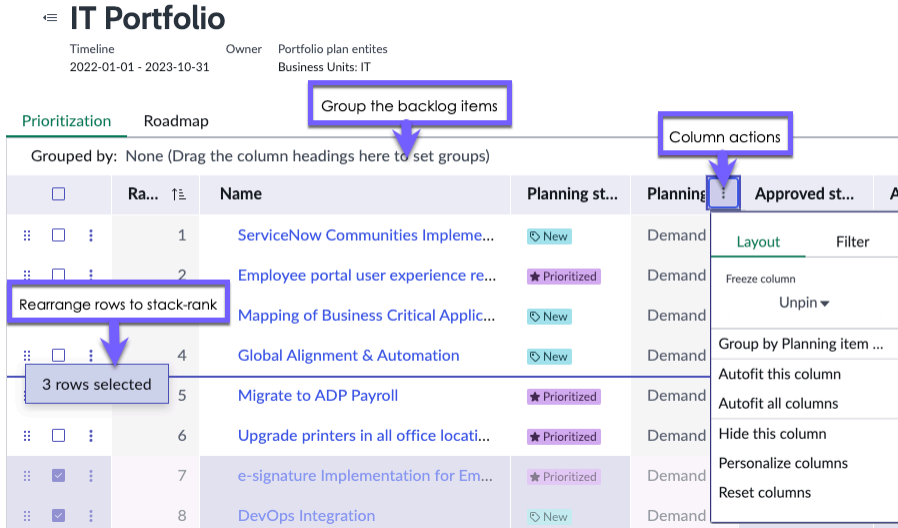

Prioritize work that is relevant for your portfolio using a centralized workspace in Strategic Planning. Review and determine the right work to invest in.

Before scheduling the roadmap for your portfolio plan, it's helpful to first know the existing and upcoming workload. Having all the work items listed at one place helps you understand the overall work pipeline. The consolidated view enables smoother backlog grooming so that you easily review and decide which items must be prioritized.

Using the Prioritization tab in the workspace, you can review all the new and existing work for your portfolio plan, representing its backlog. To help you review the workload efficiently, Prioritization provides information for each work item such as the associated goal, planned costs, and planned benefits. Using these data points, you can stack-rank the items and decide which items are to be prioritized over the others.

Prioritization tab

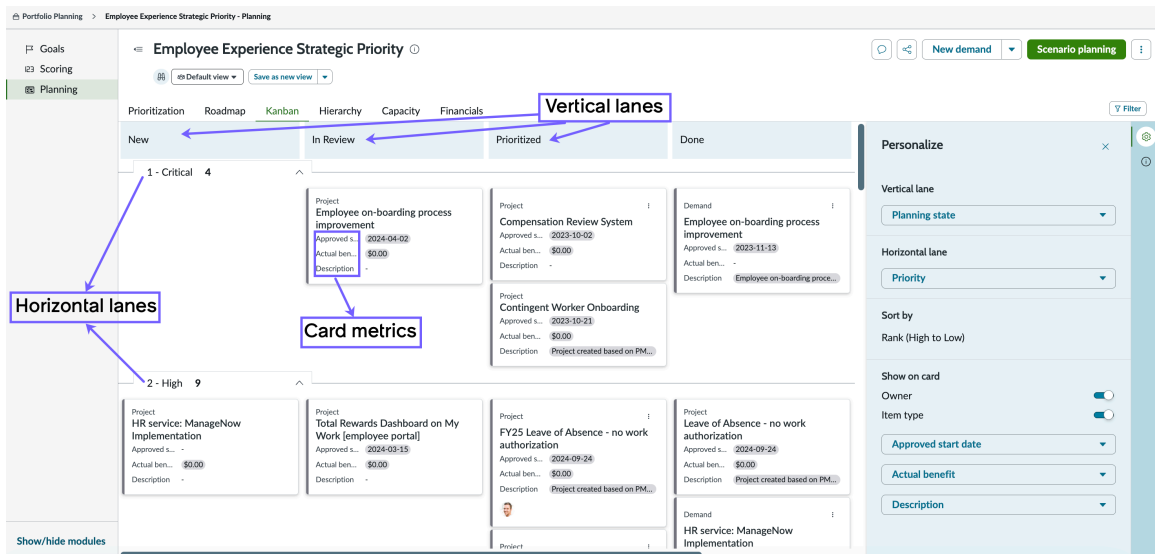

Planning items are listed in a grid format. You can stack-rank the items, group them by a desired attribute, and sort them based on their priority by using the drag functionality.

Alternatively, you can also use the Kanban or Hierarchy tab to review and manage your backlog.

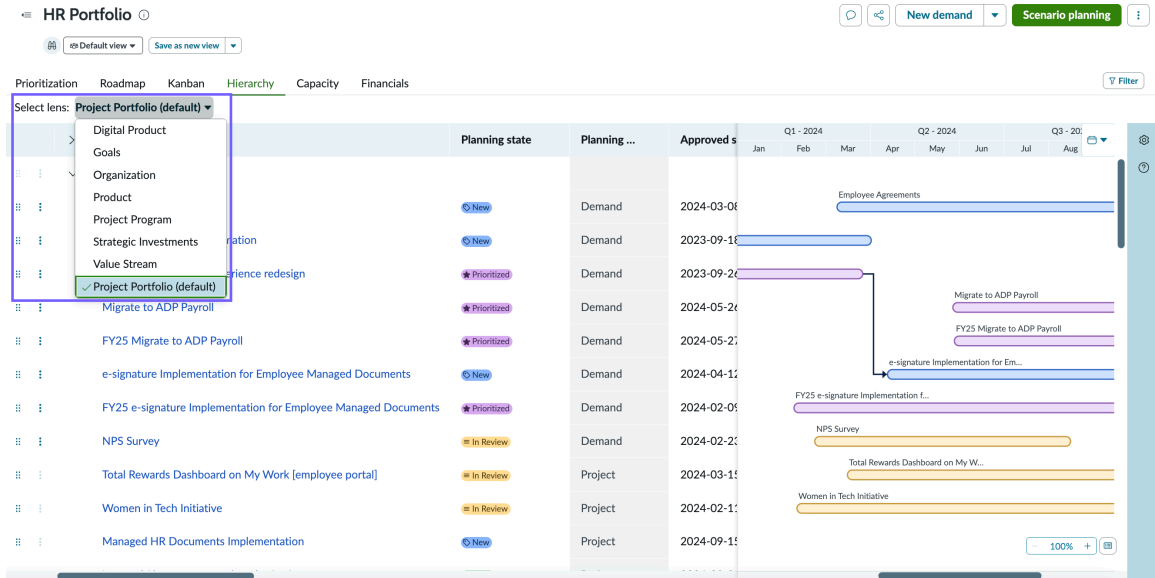

Kanban tab

Planning items are displayed in a Kanban board. Portfolio managers can visualize and adjust items in vertical lanes and horizontal lanes. Using the Personalize settings, you can choose to modify the attributes by which you want to view your vertical lanes and the horizontal lanes. For example, you can view the records grouped by planning state and priority, by simply changing the values of the vertical lanes and horizontal lanes. You can also choose not to have any horizontal lane value, by selecting **None** from the drop-down list. The data displayed on the cards can be modified using the side panel. With this feature, you will be able to prioritize more effectively and view just the required details on the cards. Also, click the card to open a side panel with details, to edit the planning item details on the same page.

Hierarchy tab

This tab displays how work in the current portfolio plan is aligned with respect to entities of other lenses. Using the lens switcher, you can change the perspective in which you view the alignment of the work. Using the timeline section of the view, prioritize work effectively by gaining visibility into the schedule and dependencies between the planning items.

To get started with managing your work pipeline in Strategic Planning, see [Prioritizing portfolio plan work in Strategic Planning Workspace](#).

Roadmaps in Strategic Planning

Strategically plan work for your company using visual roadmaps in Strategic Planning Workspace.

As your organization grows and priorities change, it's important to have the flexibility of changing existing plans and making new plans with ease. Using roadmaps, you can create a layout of current and upcoming plans while aligning them with your business objectives. Share these visual plans with other stakeholders across the organization, drive meaningful conversations, and validate common understandings.

Each roadmap is a high-level block of work, prioritized by different planning personas such as enterprise project managers, portfolio managers, project managers, or others. Roadmaps also provide insights to the stakeholders while guiding the delivery teams during development.

The following are the types of roadmaps that you can work with:

- Portfolio plan roadmaps
- Free-form roadmaps

The features available in these roadmaps are:

- Hybrid roadmaps
- Roadmap-level milestones
- Planning item-level milestones
- Planning item dependencies
- Tracking mode

i Note:

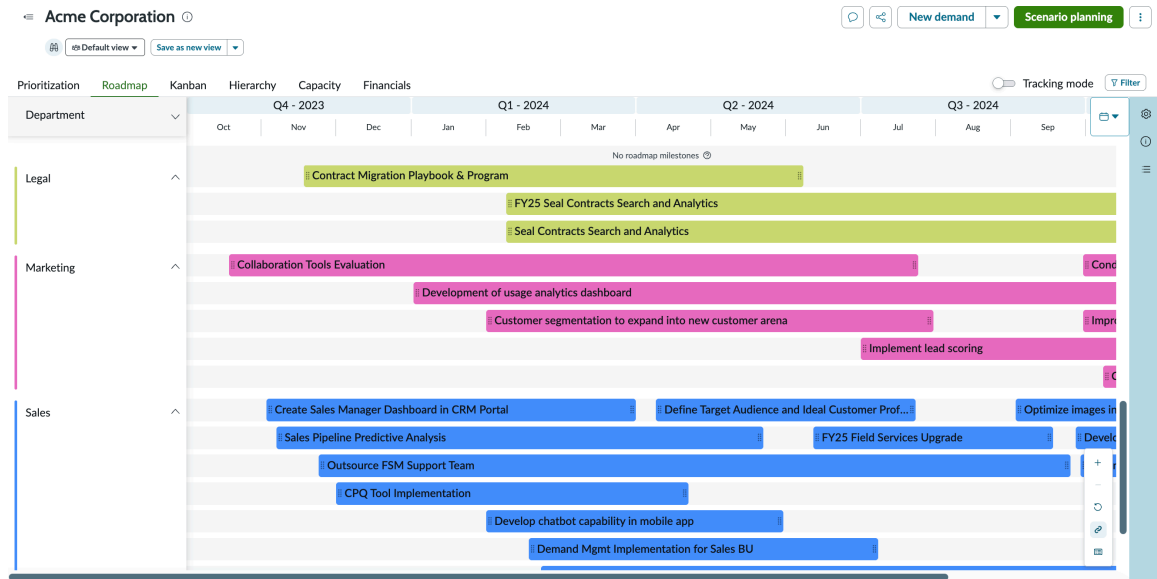

Roadmaps are available with Strategic Planning by default. Roadmap Planning (sn_roadmap_plng) is no longer available to install as a separate application.

Portfolio plan roadmaps

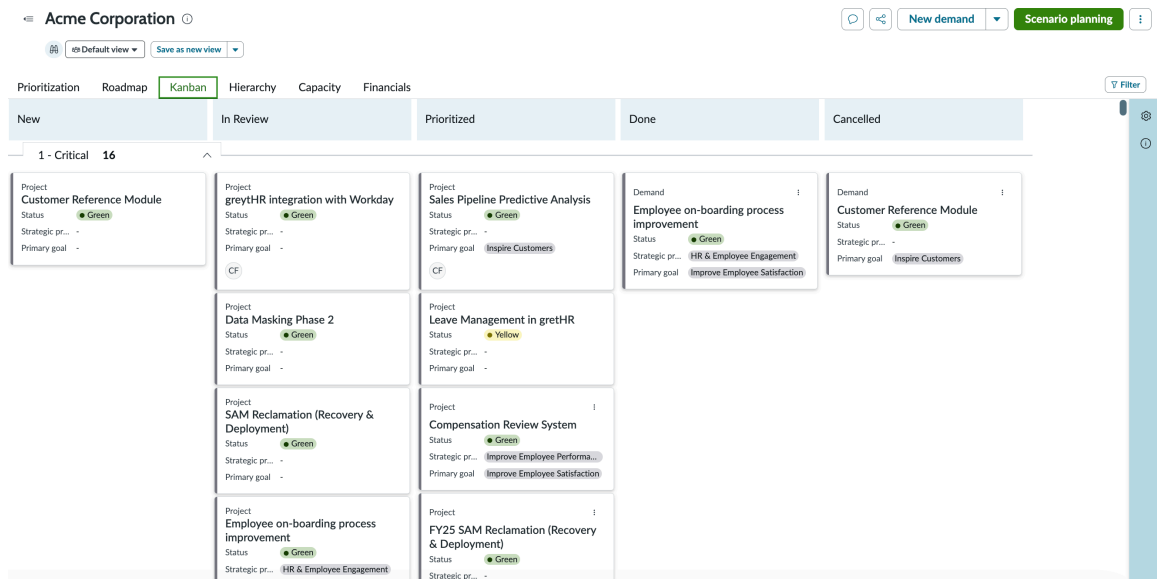

By creating a flexible portfolio plan using lenses, you can prioritize and roadmap work for your portfolio. Use these portfolio roadmaps to plan and track work in different perspectives of the organization separately, while connecting them to the high-level plans of the company.

Create a [portfolio plan](#) to get started. You can view and edit your roadmap in both Roadmap and Kanban tabs.

Roadmap tab

Kanban tab

Free-form roadmaps

Free-form roadmaps provide you the flexibility of planning and tracking work from different units of your company, such as work across multiple portfolios.

Using a filter condition, you can define what kind of work items you want on your roadmap. If you want to have a roadmap dedicated to just the projects of your department, define a roadmap for projects to start tracking the progress of current projects and create plans for new ones.

You can view and edit your free-form roadmap in both Timeline and Kanban views.

See [Create a free-form roadmap](#).

Hybrid roadmaps

In Strategic Planning, with both the portfolio roadmaps and free-form roadmaps, you can build hybrid roadmaps. For example, you can have a combination of projects, demands, and epics in a single view.

Milestones on the roadmap

You can create milestones for your roadmap, or for each planning item on the roadmap.

Roadmap-level or portfolio-level milestones

The milestones created at the roadmap level can help with tracking launch dates or key events during that roadmap's timeline. To learn how to create roadmap milestones, see [Add milestones for a roadmap](#).

Planning item milestones

Using the milestones created at the item level, you can focus better on strategic outcomes. These milestones help with tracking deadlines or other important dates. You can access milestones on all the planning items such as projects, demands, epics, and others.

From the roadmap, milestones can be created and updated for all types of planning items, except on projects. Project milestones are read-only on the roadmap because any changes to project milestones may impact the associated project plans. So, it is recommended to create or update project milestones using Project Workspace in Project Portfolio Management (PPM).

To learn how to create item-level milestones on a roadmap, see [Add milestones for roadmap items](#).

Planning item dependencies

While planning, it is essential to know how your planning items are connected with each other. Unless you know the dependency for each item, you might miss prioritizing time-critical projects or demands. This lack of information may also put you at risk of not scheduling the right work for the right time period.

Dependencies on the roadmap help you visualize these relationships between the planning items, so that you can adjust their scheduling accordingly.

In Strategic Planning, you can create simple or hybrid dependencies. For example, you can establish dependencies between two projects or between a project and an epic. Also, planning items can have dependency on items within the same portfolio plan or on items that aren't planned yet.

The dependency lines help you easily identify the items that may have to be prioritized together. Such easy identification of relationships between planning items provides better collaboration and facilitates enhanced decision making in the planning process.

To learn about creating and managing dependencies, see [Add dependencies for roadmap items](#).

Tracking mode in roadmaps

Track status, progress, and metrics for each item on the roadmap. Using the status indicators and the percentage complete score on the planning item bars, make informed decisions ahead of time and easily communicate your work progress to the stakeholders.

See [Track the progress of roadmap items](#).

Alignment of your work with business goals

Each planning item that you create and schedule into a roadmap can associate to high-level business goals. Strategic Planning enables you to visualize how your work is aligned to these business goals directly from the roadmap view.

On the roadmap, you can group your planning items by the **Strategic priority** and **Primary goal** fields so that you can map your work to their goals.

Better together with other ServiceNow® applications

Integrate ServiceNow® Digital Portfolio Management (DPM) with Strategic Planning to provide DPM managers the access to roadmap planning. With this integration, you can:

- Optimize portfolio performance by monitoring services and their performance levels in a comprehensive roadmap.
- Make informed budgetary decisions and deliver shared outcomes by prioritizing backlogs and managing roadmaps of business applications.

For more information, see [Exploring Digital Portfolio Management](#).

Scenario planning in Strategic Planning

Create and evaluate strategic scenarios to explore different planning approaches. Approve the optimal scenario that aligns with the organizational goals and strategic priorities.

Scenario planning overview

Scenario planning in Strategic Planning enables organizations to create, evaluate, and approve the best strategic scenario that aligns with their strategic goals and intended business outcomes. This process helps in visualizing different approaches, assessing their impacts, and making informed decisions before implementing the live plan. By using scenario planning, organizations can anticipate potential challenges. Scenario planning overview

What is a scenario

A scenario in Strategic Planning is a simulated version of a plan that enables you to explore a strategic approach without affecting the live plan. It provides a safe environment to prioritize items, adjust timelines, and evaluate the potential impacts of each approach.

As compared to a plan, a scenario additionally has the following:

Scenario: EarSta SIMULATION MODE Approve scenario

- In Plan toggle:** The **In Plan** toggle enables you to prioritize or de-prioritize the planning items in the scenario you're creating. By default, when you create a scenario, the **In Plan** toggle is turned on for planning items that have all of the following field values:
 - Planning state as Prioritized or Done
 - Start and end dates within the portfolio plan dates.
- Date fields:** The **Start date** and **End date** fields for the scenario are automatically populated based on either the planned or actual start and end dates of the planning items. You can update these dates during the scenario planning process. Once the scenario is approved, the updated dates are recorded as the approved dates for the planning items. If the updated dates fall outside the acceptable range, they're highlighted in yellow.

For more information on portfolio plans, see [Portfolio plans in Strategic Planning](#).

By comparing scenarios side by side, you can assess the differences in goal alignment and trade-offs between each scenario. This comparative analysis helps identify the scenario that best meets strategic objectives. For more information on comparing the scenarios, see [Compare scenarios](#).

Scenario planning workflow in Strategic Planning

Using the Scenario Planning feature in Strategic Planning, you can perform the following activities:

- Create a scenario to explore different strategic approaches and business outcomes. For more information, see [Create a scenario](#).
- Adjust and compare multiple scenarios side by side to evaluate differences in goal alignment, trade-offs, and financial benefits. For more information, see [Compare scenarios](#).
- Approve the best scenario that aligns with the organizational goals. For more information, see [Approve a scenario](#).
- Set a target portfolio budget for each of your planning cycle, which can be for fiscal period, quarter, yearly, or portfolio timeline.
- Evaluate the target vs proposed budget of In-plan items and review the monetary benefit from the prioritized items.

Scenario Planning workflow overview

The scenario planning workflow involves an execution owner and a portfolio owner. The following illustration illustrates how scenario plans are created based on the planned or actual dates of planning items and how the In-plan toggle is adjusted based on the states of these planning items.

User journey in Scenario planning

For more detailed guidance on using scenario planning to enhance your Strategic Planning process, see [Optimizing planning with scenario planning in Strategic Planning Workspace](#).

Capacity in Strategic Planning

The Capacity tab provides portfolio managers a comprehensive view of capacity, allocations, and utilization of resources.

Analyzing the Capacity screen, you can:

- View resource capacity for prioritized items in your portfolio.
- Understand the resource capacity needs and estimates across your organization by using key attributes such as group, role, and skill.
- Effectively forecast the supply of resources and the demand of work in your portfolio.
- Understand and get an overview of the resource capacity allocations by using the color indicators.
- Plan for resources with specific skills or roles for future assignments.
- View the resource allocation health instantly with the new intuitive user interface that gives you a detailed breakdown of portfolio duration by month having over allocations.
- Identify the risks in resource capacity for the prioritized planning items using the Rank field.
- Use the warning icons to easily identify the over utilized resources (⚠), planning items with actual dates (🕒), and the planning items or resource groups with no resource assignments (⊖).

Capacity screen

The top screen area displays:

- Resource capacity details depending on the defined resource criteria.
- Allocation details for the time period.
- Resources grouped by primary attributes.

The bottom screen area displays:

- Prioritized planning items.
- Interactive Gantt chart for the duration of planning items. Select a Gantt bar to see the capacity for that specific planning item only.

Note:

Move the Gantt bar of a planning item to adjust the planned dates depending on the available resource capacity. Planning items with actual dates, indicated with in-progress icon (🕒), cannot be adjusted for resource availability.

- Toggle option (🔍) to adjust the resource capacity view.
- Legend explaining the visual representation of the resource capacity and Gantt bar of planning items.

Legend

- Within Capacity
- Over Capacity / At risk
- No risk
- No resource assignment
- In progress (Locked in)

Financial planning for planning items

Plan, re-forecast, track the financials, and create baselines for all of your planning items.

You can work on financial planning supported on low level planning items like demands, projects, epics, features, capabilities, and so on.

The financials view provides a streamlined perspective, showcasing the actual and planned expenses for the entire fiscal period. You can view the latest estimated cost of completion by viewing the Actual costs for the past fiscal periods, planned costs for the current and future fiscal periods, and the total by quarter, year, or for the full scope of the item.

Note:

- Currently, Financials is not yet supported for high level entities like Initiatives, Strategic programs, Product ideas, and so on.
- Labor costs generation is not supported at planning item level.

Interface of the financials record page gives you the ability to create cost plans, expense lines, and baselines. As a financial user, you can:

- Enter high-level financial forecasts for planning items using the simple financials section in the Details tab.
- Work on high-level estimating for Planned opEx and Planned capEx.
- Create a detailed breakdown of the planned costs [using the financials tab](#).
- View the rollups of Planned costs, Actuals costs, and Planned benefits for all of your planning items in the Prioritization grid.
- [Add, edit, or delete cost plans](#) effortlessly from the Cost screen.
- Re-forecast your planned expenses using the in-line editing feature.
- View a streamlined perspective, showcasing your actual costs for the past and planned expenses for the future, for the entire time scope of the planning item.
- Get a better comprehensive solution by viewing the Forecast (previously EAC - Estimate at Completion), Remaining Estimates (previously ETC - Estimate to Completion), and Actuals of each cost plan for the total time scope and the yearly breakdowns.
- Re-forecast the planned cost for future fiscal periods by directly updating the quarterly and yearly totals using the in-line editing capability of the grid.
- [Generate labor costs](#) depending on the resource assignments for the entire scope of the planning item broken down by the financial attributes configured for your organization. For more information on the planning attributes for attribute-based mapping, see [Using the Planning attributes](#).
- [Add or edit expense lines](#) against the cost plans easily from the side panel with the associated cost plan details pre-populated.
- Record unplanned expenses using the New expense line side panel.
- Create and compare financial baseline to track the financials of your planning items.
- Compare the latest costs (actual expenses for past fiscal periods and planned costs for current and future fiscal periods) with the initial forecasted planned costs by creating financial baseline and using the compare baselines capability.
- Analyze the cause of variance in costs and when did this occur over time by capturing the financial baselines manually or automatically.
- Switch between different display modes to get a focused view of the financial records.

You can view the following information on the financials screen.

- Time scope: duration of the planning item or a cost plan, whichever has a larger fiscal period range.
- Functional currency: currency defined and used to calculate the financials.
- Customizable widgets showing different financial information such as allocated budget, Forecast (previously EAC - Estimate at Completion), Variance (the difference between budget and Forecast), breakdown of planned costs, and actuals by cost type.

Note:

Budget and Budget vs EAC Variance widgets are available for Demands and Projects only.

- Time scale: time period breakdowns to view the financials. Default value is set to Month/Period, depending on the fiscal calendar type.
- Display mode: list options to switch between different modes to get a focused view of financials.
- Generate labor costs: one-click solution to generate or refresh the planned labor costs for the planning item depending on resource assignments.

Note:

This option is enabled for the projects with resource assignments only.

- The left pane gives you a tabulated view of the cost plan attributes displaying the Name, Cost type, Expense type, Stat fiscal period, End fiscal period, Total planned cost, Employee type, and Role. You can customize these fields. For more information, see [Customize the left pane view for financials](#).
- In the right pane, you can view the total Actuals, Forecast, and Remaining Estimates for the selected Time scope duration. Actual expenses against a cost plan for the past fiscal periods, Actuals, Forecast, and Remaining Estimates for the current fiscal year, and planned costs for the current and future fiscal periods.

Note:

The header rows of actuals and planned are color-coded differently to help you easily identify and differentiate between the expense types.

- New cost plan: opens a simplified side-panel to create a new cost plan for the entity.
- Personalize option to customize the columns in the left pane of the table.
- Export option to download Cost or Baselines comparison as Microsoft Excel or CSV file.

Financial widgets in Strategic Planning

Financial widgets provide at-a-glance visibility into the portfolio's financial health. These widgets aggregate cost, budget, and benefit data to help you monitor spending, track variances, and measure return on investment.

Budget widget

The Budget widget displays the total approved budget for your planning item. This widget shows the funds allocated to the item against which all spending is measured. You can track how much money is allocated and compare latest forecast and actuals against the allocated budget.

The widget displays Total budget amount and the breakdown based on the Capex (capital expenditure) allocation or Opex (operational expenditure) allocation.

A project with a \$500,000 budget split into \$300,000 Capex and \$200,000 Opex helps you understand the nature of the investment—Capex for long-term assets, Opex for ongoing operations.

You can use this widget to ensure spending aligns with approved funding. A negative value indicates overspending against the budget.

EAC Cost widget

The EAC (Estimate at Completion) Cost widget shows the projected total cost when the project completes, based on current spending patterns. The widget forecasts final project cost by combining actuals with remaining estimates. This helps portfolio managers to anticipate whether you'll finish your work under, at, or over budget.

The widget displays Total projected cost at completion and the breakdown and Capex and Opex breakdown of the estimate.

If your budget is \$300,000 and EAC shows \$350,000, you know the project is trending \$50,000 over budget before completion.

You can review EAC widget regularly to catch cost overruns early. Use this data to justify budget adjustments or scope changes.

Budget vs EAC Variance widget

The Budget vs EAC Variance widget calculates the difference between your approved budget and the estimated cost at completion. This highlights the gap between what you planned to spend and what you expect to spend. Positive values indicate savings; negative values signal potential overruns.

The widget displays Variance amount (Budget minus EAC) and the Capex and Opex variance breakdown.

A variance of -\$50,000 means you're projecting to exceed budget by \$50,000. This might trigger discussions about cost control or additional funding.

You can use this widget to identify planning items that need intervention. A growing negative variance requires immediate attention.

Planned Cost widget

The Planned Cost widget displays the total cost you expect to incur based on approved cost plans. Widget shows how much you intend to spend across all cost categories before actuals are recorded. This serves as your spending roadmap.

The widget displays Total planned cost amount and the planned Capex and Opex amounts.

A \$1.50 M planned cost with \$1.00 M Capex and \$500.00 K Opex tells stakeholders exactly how the investment breaks down by expenditure type.

You can use this widget to compare planned costs against budget to validate feasibility. Compare against actuals to measure execution accuracy.

Actuals (Including current fiscal period) widget

The Actuals widget shows the actual money spent, including transactions from the current fiscal period. This provides the ground truth for financial tracking. While plans and forecasts are estimates, the processed actual expenses reflect real expenditures.

The widget displays Total actual spend and Capex and Opex breakdown of actual expenses.

If actuals show \$200,000 spent against a \$300,000 plan, you're 66% through your planned spending.

You can use this widget to monitor actual expenses against planned costs and budgets to track spending velocity and identify variances early.

Planned Benefits widget

The Planned Benefits widget displays the expected financial returns or savings from your portfolio. This quantifies the anticipated value your investment will deliver. This data supports business case validation and ROI calculations.

The widget displays Total planned benefit amount and the actual benefit captured via benefit plans.

A \$500,000 planned benefit against \$300,000 planned cost suggests a positive return, making the investment a good bet.

You can use this widget to compare planned benefits against actual benefits to validate the real-time benefits. Track throughout the project to ensure expected value remains achievable.

Total Return widget

The Total Return widget displays the absolute financial returns from your portfolio. This widget shows the net financial gain or loss in currency terms, making it easier to understand the actual dollar impact of your investment. The widget displays the Total return amount (Benefits minus Costs), ROI% and NPV. The ROI and NPV fields are only calculated on estimated benefits (planned benefits) and planned costs.

A \$200,000 total return means your planned estimate return \$200,000 more in benefits than it consumed in costs.

Use this widget to Report total return alongside ROI to give stakeholders both percentage and absolute value perspectives. Use the ROI widget to prioritize your work, justify investments, and report portfolio performance to stakeholders. The ROI calculates the financial return as a percentage of your investment. This provides a standardized metric to compare project performance and investment efficiency across your portfolio.

This widget displays ROI percentage calculated as: $(\text{Planned benefits} - \text{Planned costs}) / \text{Costs} \times 100$. An ROI of 67% means for every dollar spent, you received \$1.67 in value—a positive return on your investment.

The NPV widget calculates the present value of future cash flows, adjusted for the time value of money. NPV helps you compare planning items with different timelines and cash flow patterns. NPV can help you identify whether the portfolio is growing to be an asset (positive NPV) or liability (negative NPV). A positive NPV of \$150,000 means the project creates \$150,000 in value when future benefits are discounted to today's dollars. Use NPV for long-term planning items where cash flows span multiple years.

Best practices

- Review financial widgets weekly during active project phases.
- Investigate variances greater than 10% immediately.
- Create financial baselines at major milestones to track and compare changes over time.
- Use fiscal year breakdowns to identify seasonal spending patterns.
- Compare ROI and NPV together for comprehensive investment analysis.

Strategic Planning with PPM, Agile 2.0, and SAFe

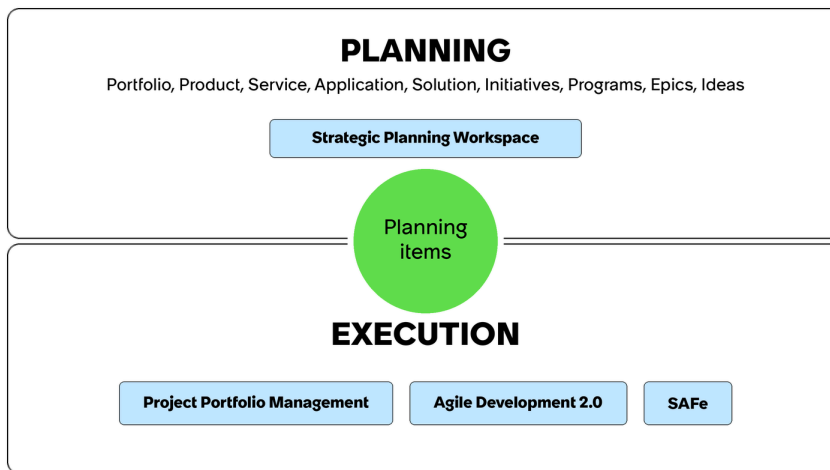

Facilitate execution of the work planned in Strategic Planning in ServiceNow applications such as Project Portfolio Management (PPM), Agile Development 2.0, or Scaled Agile Framework.

While planning personas like portfolio managers or product owners use Strategic Planning to align their plans with the business objectives, they can provide flexibility to the execution teams to decide how they deliver their work.

Teams can choose the methodology that would be the most effective for them, and decide on the execution system that would best fit their needs. They can use applications such as ServiceNow® Project Portfolio Management, Agile Development 2.0, or Scaled Agile Framework (SAFe) to execute the work planned by their managers.

With this flexible approach of delivering work, empower your teams to deliver more value, while being able to fund, manage, and monitor all work from a single workspace.

Strategic Planning integration with ServiceNow® applications

Key benefits of Strategic Planning with PPM, Agile 2.0, and SAFe

- View available PPM, Agile 2.0, and SAFe planning items in Strategic Planning.
- Import planning items from PPM, Agile 2.0, or SAFe to Strategic Planning.
- Export planning items from Strategic Planning to PPM, Agile 2.0, or SAFe.
- Synchronize updates for linked planning items of Strategic Planning with PPM, Agile 2.0, and SAFe.
- Track the progress of the linked planning items in Strategic Planning.

To get started on integrating Strategic Planning with PPM, Agile 2.0, and SAFe, see [Configuring Strategic Planning with PPM, Agile 2.0, and SAFe](#).

Frequently asked questions about execution integration

Can I use PPM Standard for project execution without Agile or SAFe?

Yes. If your teams follow waterfall or traditional Project Management methodology, use PPM Standard (Project Portfolio Management) as your execution system. Planning items created in Strategic Planning can be exported to PPM as projects. Changes in PPM (project status, costs, resources) sync back to Strategic Planning automatically.

Use case: Infrastructure team plans in Strategic Planning, executes data-center migration project in PPM Standard with Gantt charts, task dependencies, and resource management.

How do I decide between PPM, Agile 2.0, and SAFe for execution?

Base your decision on team methodology and org scale:

- PPM Standard: For waterfall projects, traditional PM teams, infrastructure work, conformance-driven initiatives.
- Agile 2.0: For single scrum teams, small agile projects, product development teams under 50 people.
- SAFe: For enterprise-scale agile, multiple Agile Release Trains (ARTs), large programs with 50+ team members, portfolio-level coordination.

Hybrid approach: Many organizations use multiple execution systems. Marketing team uses Agile 2.0 for campaigns, IT uses PPM for infrastructure, product

engineering uses SAFe for platform development—all visible in one Strategic Planning view.

Should I install all three execution systems to use Strategic Planning?

No. Install only the execution systems your teams actually use. Strategic Planning works standalone for planning and prioritization. Add PPM, Agile Development 2.0, or SAFe plug-ins when teams are ready to execute work in those systems.

What data syncs between Strategic Planning and execution systems?

Bi-directional sync includes:

- From Strategic Planning → execution: Planning item name, description, owner, goals, budget, priority, timeline.
- From execution → Strategic Planning: Status, progress %, actual costs, resource assignments, risks/issues.
- Real-time updates: Changes in either system appear in both within seconds.

Can a single planning item be executed in multiple systems?

No. Each planning item links to a single execution system. However, you can break down a large initiative into child planning items, each executed in different systems. For example, the Digital Transformation Initiative parent planning item contains: Mobile App Redesign (Agile 2.0), Legacy System Migration (PPM), and API Platform Modernization (SAFe).

Common execution scenarios

- Scenario 1: PPM only organization (waterfall projects)
 1. Portfolio managers create planning items in Strategic Planning.
 2. After prioritization, export planning items to PPM Standard as projects.
 3. Project managers build WBS, create tasks, assign resources, manage timeline in PPM.
 4. Strategic Planning shows project status, costs, risks automatically
- Scenario 2: SAFe only enterprise (Scaled Agile Framework)
 1. Product managers create epics in Strategic Planning.
 2. Export epics to SAFe for Program Increment (PI) planning.
 3. SAFe teams break epics into features and stories, execute in sprints.
 4. SAFe tracks epic progress across multiple ARTs.
- Scenario 3: Hybrid organization (multiple methodologies)
 1. Strategic Planning backlog contains projects (PPM), epics (Agile 2.0 and SAFe), and demands.
 2. Each team exports their planning items to their preferred execution system.
 3. Executives view unified progress, costs, and goals achievement in Strategic Planning regardless of the execution method.

Troubleshoot execution integration

- Issue: Planning item not appearing in PPM/Agile Development 2.0/SAFe
 - Verify the execution system plugin is installed and activated.
 - Check that planning item state is Prioritized (items in the Backlog state don't export).
 - Confirm user has required role in execution system (project_manager, scrum_admin, safe_admin).
- Issue: Changes in PPM not syncing back to Strategic Planning
 - Verify bi-directional sync is enabled in integration configuration.
 - Check that the planning item and PPM project/epic are properly linked (primary planning item field is populated).
 - Review transformation maps for any table, field, or choice mapping issues.

For detailed configuration steps, see [Configuring Strategic Planning with PPM, Agile 2.0, and SAFe](#).

Better together with other ServiceNow applications

The integration of Strategic Planning with other ServiceNow applications helps portfolio and product managers to optimize planning, collaboration, and release management for their products.

Strategic Planning with AI Control Tower workspace

The ServiceNow[®] AI Control Tower workspace enables you to track and monitor all your strategic priorities, goals, targets, planning items, and execution items—projects and demands categorized as Artificial Intelligence in the Strategic Planning Workspace.

Populate the **Type** field for strategic priorities, the **Category** field for goals, and the **Investment type** field for planning items with the **Artificial Intelligence** option to monitor their progress in the AI Control Tower workspace. For more information, see [Create a strategic priority](#), [Create a goal](#), and [Add a planning item](#).

When AI Control Tower is installed, the **AI strategy** tab appears in the AI Control Tower workspace, featuring different widgets for AI strategies, goals, targets, costs of planning items, prioritized work, and RIDAC details. For more information, see [AI strategy tab in AI Control Tower](#) .

Strategic Planning with Digital Product Release workspace

Using the Digital Product lens, product managers can plan, prioritize, and roadmap the work for digital products by aligning with the business strategy.

As part of planning when you associate planning items with the product enhancement in the Strategic Planning Workspace, those associated planning items appear in the **Planning items** tab of the Release scope page in ServiceNow Digital Product Release workspace. This tab helps product managers track the status of the planning items associated with the product enhancements in the Digital Product Release workspace itself to ease the release management for their products. For more information, see [Scope of a release](#) .

Strategic Planning with Collaborative Work Management

With the integration of ServiceNow Collaborative Work Management (CWM) with Strategic Planning, you can plan, roadmap, and associate goals to Boards in a portfolio plan. By adding

CWM Boards to a lens configuration, you can access them in the Prioritization, Roadmap, and Goals pages of a portfolio plan as planning items.

The lenses supported to configure the CWM Board as a planning item are Organization, Project Portfolio, and Strategic Investments.

For more information on integration of CWM with Strategic Planning, see [Connecting CWM with Strategic Planning or Portfolio Planning](#). To learn how to update the lens configuration, see [Create or modify a lens in Strategic Planning](#).

Strategic Planning with Enterprise Architecture Workspace

Using the Business Capability lens, enterprise architects can plan, prioritize, and roadmap the work based on business capabilities or business applications. For information on ServiceNow Enterprise Architecture Workspace, see [Enterprise Architecture Workspace](#).

Strategic Planning with Digital Portfolio Management

Integrate ServiceNow Digital Portfolio Management (DPM) with Strategic Planning to provide DPM managers the access to roadmap planning. With this integration, you can:

- Optimize portfolio performance by monitoring services and their performance levels in a comprehensive roadmap.
- Make informed budgetary decisions and deliver shared outcomes by prioritizing backlogs and managing roadmaps of business applications.

For more information, see [Exploring Digital Portfolio Management](#).

Configuring Strategic Planning Workspace

Learn about the process required to set up Strategic Planning to enable your product and portfolio managers start aligning their work with business goals and strategy.

Configuration workflow

Use the following steps as guidelines to set up Strategic Planning. Some of these steps require the admin role and some require the `sn_align_core.apw_admin` role.

1. [Install Strategic Planning](#).
2. Assign user roles.

See the Roles installed table in [Components installed with Strategic Planning Workspace](#).

Note:

If you are upgrading from an older version to Strategic Planning v2.1.0 or higher, a fix script is run to remove the `milestone_editor` role from the `roadmap_editor` role because the `roadmap_editor` role is no longer used. In this case, you may experience a longer time for the upgrade to complete if your ServiceNow instance has a large number of users with the `roadmap_editor` role. For more information, see [KB1443618](#).

3. Configure lenses to enable your planning managers to create portfolio plans.

See [Lens configuration in Strategic Planning](#).

4. Enable high-level planning for tables that are not enabled by default.

(Optional) See [High-level planning configuration in Strategic Planning](#).

5. Validate your configuration for lens, planning items, portfolio plans, high-level planning, and others.

See [Strategic Planning diagnostics](#).

6. Configure Prioritization and Roadmap display settings.

(Optional) See [Prioritization display settings in Strategic Planning](#).

7. Configure Feedback and manage your feedback and product ideas. See [Configuring Feedback application in Strategic Planning](#).

8. Integrate Strategic Planning with a ServiceNow® execution system of your choice. This integration enables you to plan in Strategic Planning and execute in your chosen app.

See [Configuring Strategic Planning with PPM, Agile 2.0, and SAFe](#) and [Configuring Feedback application in Strategic Planning](#).

9. Migrate your existing goals to Strategic Planning and configure goal preferences.

See [Configuring goals in Strategic Planning](#).

10. Configure Capacity Planning and generate resource capacity.

See [Capacity configuration in Strategic Planning](#).

11. Enable financial planning for epics and customise the Financials screen view.

See [Configure financials for planning items in Strategic Planning](#).

Guided Setup to configure Strategic Planning

Guided Setup provides a sequence of tasks to help you with the required configuration on your ServiceNow instances. After [installing Strategic Planning](#), navigate to **All > Strategic Planning > Guided Setup**.

When you're configuring a task from the Guided Setup, you can launch the in-app help for additional guidance by clicking the Show Help icon (.

Install Strategic Planning

Install the Strategic Planning application from ServiceNow Store if you have the admin role.

Before you begin

Ensure that the application and all of its associated store applications have valid ServiceNow entitlements. For more information, see [Get entitlement for a ServiceNow product or application](#) .

Role required: admin

Procedure

1. Navigate to **System Applications > All Available Applications > All**.
2. Find the Strategic Planning application using the filter criteria and search bar.

You can search for the application by its name or ID (sn_apw_advanced). If you cannot find an application, you may have to request it from ServiceNow store.

3. Click **Install**.

4. In the Application installation dialog box, review the application dependencies.

If your application requires other applications, install them first if they are not already installed. Installing your application also automatically installs the dependent applications or plugins if they are not installed already.

5. If you want to install demo data, click **Load demo data**.

Demo data includes sample records that describe application features for common use cases. Load demo data when you first install the application on a development or test instance.

6. Click **Install**.

Result

The following components are installed with installation of the Strategic Planning application:

- Roles
- Tables

See [Components installed with Strategic Planning Workspace](#) for more information.

Planning item configuration for lenses and portfolio plans

Learn about the types of default and custom planning items that planning managers can work with in Strategic Planning Workspace.

For every portfolio plan that you build using a lens, only those item types that are added to that lens are available for planning. For example, a lens XYZ has epics and projects added to it. Then, in any portfolio plan that you build using the XYZ lens, you can plan for work in the form of epics and projects only.

Default planning items

By default, you can use Projects, Demands, and Epics as planning items for your lens and build plans using them.

Pre-defined custom planning items

If you want to use a different item type, you can use up to five pre-defined custom planning item tables that are available in your ServiceNow instance.

1. Select one of the custom planning item type tables available. See [Components installed with Strategic Planning Workspace](#).

2. Modify the label of the table that you want to use.

For example, you want to plan for incidents, change the label of Custom planning item 1 to **Incident**.

3. Add this table to the `sn_align_core.planning_item_types_allow_list` property. See [Enable custom item types in Strategic Planning](#).

New custom planning items

If you've used up all these five pre-defined custom planning item tables and want a different item type to use for your portfolio plans, you can define new item types. See [Define a new planning item type in Strategic Planning](#).

Review existing planning item types in Strategic Planning

Before you create a portfolio plan using lenses, start with verifying that the default planning item types in Strategic Planning suit your company's planning needs.

Before you begin

Ensure you have the details of your company's planning needs.

Role required: admin

Procedure

1. Navigate to **All > System Definition > Tables**.
2. Filter the list of tables by using **sn_align_core** in the Name column.

Label	Name	Extends table
Capability	sn_align_core_capability	Enterprise agile planning item
Custom planning item 1	sn_align_core_custom_planning_item_1	Planning Item
Custom planning item 2	sn_align_core_custom_planning_item_2	Planning Item
Custom planning item 3	sn_align_core_custom_planning_item_3	Planning Item
Custom planning item 4	sn_align_core_custom_planning_item_4	Planning Item
Custom planning item 5	sn_align_core_custom_planning_item_5	Planning Item
Demand	sn_align_core_demand	Planning Item
Dependency	sn_align_core_dependency	(empty)
Enterprise agile planning item	sn_align_core_eap_planning_item	Planning Item
Feature	sn_align_core_feature	Enterprise agile planning item
Feedback	sn_align_core_feedback	(empty)
Initiative	sn_align_core_initiative	Planning Item
Lens	sn_align_core_lens	Application File
Lens structure	sn_align_core_lens_structure	Application File
Feedback Relation	sn_align_core_m2m_feedback_rel	(empty)
Planning Item	sn_align_core_planning_item	(empty)
Product idea	sn_align_core_product_idea	Planning Item
Strategic Program	sn_align_core_program	Planning Item
Project	sn_align_core_project	Planning Item

3. Review the tables that have **Planning Item** in the Extends table column. Confirm if those are all the tables that you would require to set up lens required for portfolio plans.

What to do next

If you need a planning item type other than those available, use one of the five pre-defined custom planning item tables or you can create your own.

- [Enable pre-defined custom planning item tables.](#)
- [Define a new planning item type in Strategic Planning](#)

Define a new planning item type in Strategic Planning

Create a custom planning item type in Strategic Planning to enable planning them on the portfolio plans.

Before you begin

Ensure the application scope in your instance is set to Portfolio Planning.

Role required: admin

Procedure

1. Navigate to **All > System Definition > Tables**.
2. Select **New**.
3. On the form, fill in the fields.

For field information, see [Planning item type form](#).

4. **Optional:** Deselect the **Create module** checkbox.
5. Save the form.
 - a. Select the Additional actions icon ()
 - b. Select **Save**.

What to do next

If you've created any planning item types, create relevant form views for it. For more information, see [Create form views for new planning item tables in Strategic Planning](#).

Create form views for new planning item tables in Strategic Planning

For every new planning item table that you create, you must create the necessary form views. You can also customize the views for existing planning items.

Before you begin

- [Define a new planning item type in Strategic Planning](#).
- Ensure that the application scope in your instance is set to Portfolio Planning.

Role required: admin

About this task

The following are the necessary form views:

- APW Preview: Supports the view that is used to display the planning item details on the roadmap side panel.
- APW Default: Supports the default view of the planning item form in Strategic Planning.
- APW New: Supports the form view that is used while creating a planning item of this type from the roadmap.

Procedure

1. Navigate to **All > System Definition > Tables**.
2. Filter the list of tables by using **Planning Item** in the Extends table column.
3. Select a planning item type that you created.
4. Select the **Layout Form** related link.
5. From the **View name** field, select **New**.
6. In the **Create New View** window, enter one of the following names in the **View name** field:
 - To create the APW Preview view, enter **Workspace APW Preview**
 - To create the APW Default view, enter **Workspace APW Default**
 - To create the APW New view, enter **Workspace APW New**

If you're creating a view other than these, ensure that your view name does not contain any special characters. For example, if you want to create a view with the name SAFe-Portfolio, replace the hyphen (-) with a space and enter the name as SAFe Portfolio.

7. Select **OK**

8. Using the Available and Selected lists of fields, select the fields to be visible on the form.

You can also rearrange them in the order of your choice. To keep the form views of new tables consistent with that of the default settings, ensure you do the following changes:

- For Preview and APW Default views, select the **Strategic priority** and the **Primary goal** fields to be visible on the form.
- For all three views, select the field for the bottom entity of your lens to be visible on the form.
- For all three views, add the Milestones related list. See [Add a related list to a form](#) .

9. Select **Save**.

A new form view is created for this planning item type.

10. Repeat the steps 4 through 8 to complete creating the other two form views.

What to do next

[Create list views for new planning item tables in Strategic Planning.](#)

Create list views for new planning item tables in Strategic Planning

For every new planning item table that you create, you must create the necessary list views. You can also customize the views for existing planning items.

Before you begin

- [Define a new planning item type in Strategic Planning.](#)
- Ensure that the application scope in your instance is set to Portfolio Planning.

Role required: admin

About this task

Create the APW Default and APW Prioritization list views for the planning item table that you created.

Procedure

1. Navigate to **All > System Definition > Tables**.
2. Filter the list of tables by using **Planning Item** in the Extends table column.
3. Select a planning item type that you created.
4. Select the **Layout List** related link.
5. From the **View name** field in the List view section, select **New**.
6. In the **View name** field, enter **APW Default**.
7. Select **OK**
8. Using the Available and Selected lists of fields, select the fields to be visible for the list view of this planning item.
You can also rearrange them in the order of your choice.
9. Select **Save**.
A new list view is created for this planning item type.
10. Repeat steps 4 to 9 to create a list view for **APW Prioritization**

What to do next

[Create related list views for new planning item types in Strategic Planning](#)

Create related list views for new planning item types in Strategic Planning

For every new planning item table that you create, you must create the necessary related list views. You can also customize the related list views for existing planning items.

Before you begin

- [Define a new planning item type in Strategic Planning.](#)
- Ensure that the application scope in your instance is set to Portfolio Planning.

Role required: admin

About this task

Every Related list that you add to your planning item tables must be in the APW Default view.

Procedure

1. Navigate to **All > System Definition > Tables.**
2. Filter the list of tables by using **Planning Item** in the Extends table column.
3. Select a planning item type that you created.
4. Select the **Show Form** related link.
5. From the form header, select the Additional actions menu () and select **Configure > Related Lists.**
6. From the **View name** field in the List view section, select **New.**
7. In the **View name** field, enter **APW Default.**
8. Select **OK**
9. Using the Available and Selected lists of related lists, select the ones that you want on your planning item form.
You can also rearrange them in the order of your choice.
10. Select **Save.**

What to do next

[Create workspace view rules for new planning item forms in Strategic Planning.](#)

Create workspace view rules for new planning item forms in Strategic Planning

Define workspace view rules for the form views of new planning item types in Strategic Planning.

Before you begin

- [Create form views for new planning item tables in Strategic Planning](#)
- Ensure the application scope in your instance is set to Portfolio Planning

Role required: admin

Procedure

1. Navigate to **All > Workspace Experience > Forms > Workspace View Rules.**
2. Select **New.**
3. On the form, fill in the fields.

For field information, see [View rule form](#).

4. In the Conditions section, select **Add Filter Condition** and add the following condition:
 - For APW Default view: **Created is not empty**
 - For Default view: **Created is empty**
5. Select **Submit**.
6. Repeat this process until you have completed creating both workspace view rules.

What to do next

[Enable custom item types in Strategic Planning](#).

Enable custom item types in Strategic Planning

Enable the usage of a custom planning item type in Strategic Planning so that your planning managers can start adding them to their free-form roadmaps or portfolio plans.

Before you begin

Role required: sn_align_core.apw_admin

About this task

Add the table that you want to allow for planning in Portfolio plans and free-form roadmaps to a system property.

Procedure

1. Navigate to **All > System Properties > All Properties**.
2. Open one of the following system properties.
 - For portfolio plans: *sn_align_core.planning_item_types_allow_list*
 - For free-form roadmaps: *sn_align_ws.freeform_planning_items_creation_list*
3. In the **Value** field, add your custom table.

For example, add **sn_align_core_custom_planning_item_1**.

4. Select **Update**.

What to do next

- For portfolio plans: Add your custom planning item type to the lens that your planning managers want to use. See [Lens form](#).
- For free-form roadmaps: [Create planning items from the roadmap view](#).

Lens configuration in Strategic Planning

Learn how to configure settings for planning items and add additional configuration for a lens in Strategic Planning so that you can set up lenses for your planning manager.

Your planning manager can use one of the nine pre-defined lenses - Project Portfolio, Project Program, Organization, Strategic Investments, Product, Digital Product, Value Stream, Goals, and Business Capability - to create portfolio plans, or you can set up a custom lens structure for them.

Pre-defined lens	Custom lens
<ol style="list-style-type: none"> 1. Navigate to the Lenses list and add Epic as a planning item for each of the pre-defined lenses. See Lens form. 2. (Optional) Change the structure for these lenses per your requirements. See Add or modify lens structure in Strategic Planning. 3. For the planning items types included in the Product or Strategic Investment lenses, ensure that all necessary form and list views have a field for the bottom entity of the lens. 4. For Product or Strategic Investment lenses, update roadmap configuration to include the bottom entity and its parent entity in Group by fields and Color by fields. See Customize the planning item display preferences for Prioritization and Roadmap. 5. Configure integration with a ServiceNow execution application of your choice. See Configuring Strategic Planning with PPM, Agile 2.0, and SAFe. 	<ol style="list-style-type: none"> 1. Create or modify a lens in Strategic Planning. 2. Add or modify lens structure in Strategic Planning. 3. Associate planning items to the bottom entity of the lens. See Lens structure form. 4. Ensure that all APW form views of all planning item types include a field for the bottom entity of the lens. 5. Update roadmap configuration to include the bottom entity and its parent entity in Group by fields and Color by fields. See Customize the planning item display preferences for Prioritization and Roadmap. 6. Validate and activate your lens. See Activate a lens in Strategic Planning. 7. Configure integration with a ServiceNow execution application of your choice. See Configuring Strategic Planning with PPM, Agile 2.0, and SAFe.

Create or modify a lens in Strategic Planning

Start defining your company's planning perspectives in Strategic Planning by creating a lens.

Before you begin

Role required: admin

About this task

Create a lens record and add the type of items (Project, Demand, and others) that can be planned using this lens. The type of planning items that you associate with the lens are the only type of work that the planning managers can use, in their portfolio plans.

Procedure

1. Navigate to **All > Strategic Planning > Lenses**.
2. Select **New**.
3. On the form, fill in the fields.
For field information, see [Lens form](#).
4. Select **Submit**.

What to do next

[Add or modify lens structure in Strategic Planning](#).

Related topics

[Lenses in Strategic Planning](#)

Add or modify lens structure in Strategic Planning

Add entities to your lens and build its structure so that your planning managers can start creating their portfolio plans in Strategic Planning.

Before you begin

Ensure that your application scope is set to **Portfolio Planning Core**.

Role required: admin

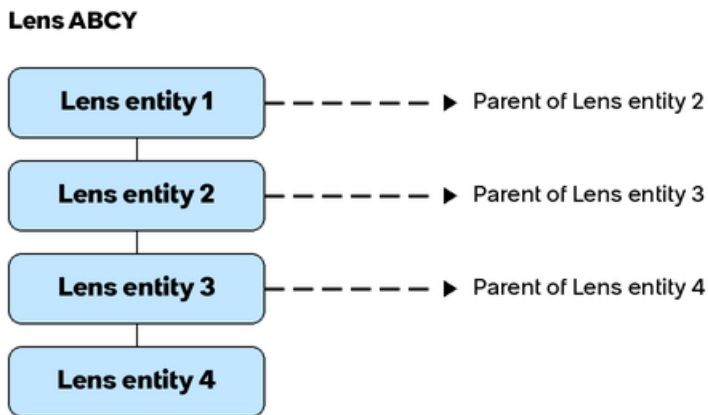

About this task

For a lens, add entities to build a new lens structure or to modify the existing structure. You can add up to six entities in a lens structure. For more information on lens and its structure, see [Lens configuration in Strategic Planning](#).

Procedure

1. Navigate to **All > Strategic Planning > Lenses**.
2. From the Lenses list, select a lens for which you want to add or update the lens structure.
3. Add an entity to the lens structure.
 - a. From the Lens structure related list, select **New**.
 - b. On the form, fill in the fields.
For field information, see [Lens structure form](#).
 - c. Select **Submit**.
4. Repeat step 3 to complete adding all your lens entities.
 - Add the entities in a top-down manner:
Add the top-level entity first, followed by the second-level entity, followed by the third, and so on.
 - Ensure that every entity, except the top-level, has a parent entity reference.

For example, the second-level entity must refer to the top-level entity as its parent.

What to do next

1. Verify that the Planning item table [sn_align_core_planning_item] has a field that references the bottom entity of this lens.
2. Ensure that the following form views for all the planning item types that are associated in your lens contains a field for the bottom entity of your lens structure.
 - APW Preview
 - APW New
 - APW Default
3. Update the roadmap configuration for the tables all planning item types that you associate with this lens:

Add the bottom entity of this lens structure and its parent to **Group by fields** and **Color by fields**. These fields are used as the default group by and color by settings for the portfolio roadmap. See [Customize the planning item display preferences for Prioritization and Roadmap](#).

4. Validate your lens configuration and activate it. See [Activate a lens in Strategic Planning](#).

Activate a lens in Strategic Planning

Validate your lens configuration and activate it so that your planning managers can start creating portfolio plans using this lens.

Before you begin

Role required: admin

About this task

If you've changed the structure of an existing lens or created a custom lens, validate its configuration and set its state to Active.

Planning managers can create portfolio plans using only lenses that are active. For a lens to be available in the workspace for a planning manager, its configuration must be valid and must be in the Active state.

Procedure

1. Navigate to **All > Strategic Planning > Lenses**.
2. From the Lenses list, select a lens.
3. On the lens form, click the **Validate Lens** related link.
 - If the lens configuration is valid, a success message prompts you that you can now activate it.
 - If the lens configuration isn't valid, use the error messages to understand the issues and fix the configuration.

Try validating the lens using the related link again.
4. Select the **Active** field and save the form.

Related topics

[Add or modify lens structure in Strategic Planning](#)

High-level planning configuration in Strategic Planning

If your planning managers need high-level planning enabled for items other than the default ones, you need to update the configuration for lens entities and portfolio plans.

By default, Strategic Programs, Programs (pm_program), and Initiatives are the items that are enabled for high-level planning. Also by default, the Product Enhancement entity with the Digital Product lens is enabled for high-level planning. To enable other planning item types, complete the following configuration tasks.

Note:

High-level planning is enabled for Strategic Planning v2.1.0 and higher.

For items that extend the Planning Item table

For example, you added Custom planning item 1 [sn_align_core_custom_planning_item_1] to your lens structure and you want to use it for high-level portfolio plans. In the Lens structure related list for your lens, set the **Planning enabled** field to **true** for the Custom planning item 1 entity. For detailed information, see [Enable high-level planning for a lens entity](#).

For items that do not extend the Planning Item table

Consider the example of enabling high-level planning for the Strategic Priority [sn_gf_strategy] planning item type.

1. Create a global rank column in the Strategic Priority [sn_gf_strategy] table. See [Create global rank column for high-level planning](#).
2. Create rank configuration for the new global rank column. See [Create rank configuration for high-level planning](#).
3. Create portfolio plan configuration for the Strategic Priority [sn_gf_strategy] table. See [Create portfolio plan configuration for high-level planning](#).
4. Enable high-level planning for the Strategic Priority [sn_gf_strategy] entity in the lens structure record. See [Enable high-level planning for a lens entity](#).

5. Run diagnostics and fix script to populate global rank for all existing Strategic Priority records. See [Populate global rank for high-level planning items](#).
6. Create a business rule for the Strategic Priority [sn_gf_strategy] table to enable setting a global rank for any future records created. See [Create a business rule for high-level planning](#).

 **Tip:**

While choosing a table as your high-level planning entity, ensure that it has fields such as start date and end date, owner or assigned to, name or short description, so that this can be used as a planning item. For example, you cannot use the Organization or Product tables as your high-level planning entities. On the other hand, the Strategic Priority tables meets the requirements of a planning item and can be configured for high-level planning.

Once all these tasks are complete, your planning manager can create a high-level portfolio plan for the desired entity - for this example, portfolio plans can be created to prioritize and roadmap the strategic priorities of the company, and to view how the work across the company is aligned to these strategic priorities.

Create global rank column for high-level planning

Create a global rank column for planning item types that do not extend the Planning Item [sn_align_planning_item] table so that you can enable high-level planning for these items in Strategic Planning Workspace.

Before you begin

Upgrade to Strategic Planning v2.1.0.

Role required: admin

About this task

Create a **Global rank** column on the planning item table for which you want to enable high-level planning. This column allows populating a global rank for all existing and new records of this table in your ServiceNow instance.

Procedure

1. Navigate to **All > System Definition > Tables**.
2. Search for and open your planning item table.

For example, search for and open the Strategic Priority [sn_gf_strategy] table.

3. From the Columns related list, select **New**.
4. On the form, fill in the following fields.

Dictionary Entry form fields

Field	Description
Table	Table for which you are creating this column. This field is automatically set to the table you've selected in Step 2.
Type	Value type of the column that you're creating. Select Long .

Field	Description
Column label	Label for the rank column. Enter Global rank .
Column name	Auto-generated unique name for the column.
Application	Application scope of the table. This field is populated automatically based on the table that you selected.

For complete details of the Dictionary Entry form fields, see [Dictionary entry form](#).

5. Save the form.

What to do next

Create a rank configuration for the global rank field you created. See [Create rank configuration for high-level planning](#).

Create rank configuration for high-level planning

To enable high-level planning on a table that is not a planning item in Strategic Planning Workspace, create a rank configuration for the global rank column of the table.

Before you begin

[Create global rank column for high-level planning](#).

Role required: admin

About this task

Create a configuration for the global_rank column for the table that you want to enable for high-level planning. Completing this task would allow you assigning a global rank value to the records of this table.

In this task, consider the example of creating a rank configuration for the Strategic Priority [sn_gf_strategy] table.

Procedure

1. Navigate to **All > rank_configuration.list**.
A list of tables that have a configuration for their Global rank field is shown.
2. Select **New**.
3. On the form, fill in the fields.

Rank Configuration form

Field	Description
Table	Table that you want to enable high-level planning. For example, Strategic Priority [sn_gf_strategy]

Field	Description
Column	Global rank column of your table.

4. Select **Submit.**

What to do next

Create a portfolio plan configuration for your high-level planning table. See [Create portfolio plan configuration for high-level planning](#).

Create portfolio plan configuration for high-level planning

To enable high-level planning on a table that is not a planning item in Strategic Planning Workspace, create portfolio plan configuration for the table.

Before you begin

[Create rank configuration for high-level planning](#)

Role required: admin

About this task

After creating a global rank column and a rank configuration for that column, create a portfolio plan configuration for the table that you chose for high-level planning. Following this task, configure the Prioritization and Roadmap page settings for a portfolio plan that your planning managers would create for this table.

In this task, consider the example of Strategic Priority [sn_gf_strategy] table.

Procedure

1. Navigate to **All > sn_align_ws_roadmap_configuration.list**.
A list of existing portfolio plan configuration records for the Strategic Planning tables is shown.
2. Select **New** to create a portfolio plan configuration for your table.
3. On the form, fill the fields.

Portfolio plan configuration

Field	Description
Source table	Table that you want to enable high-level planning for. For example, Strategic Priority [sn_gf_strategy] .

Rank configuration

Field	Description
Rank configuration	Table that is used to create the portfolio plan. The value for this field is the table selected in the Source table field.

For complete details of the fields on this form, see [Portfolio plan configuration form](#).

4. Save the form.

What to do next

Populate global rank value for all existing records of your high-level planning table.

Enable high-level planning for a lens entity

To enable high-level planning on for an entity in Strategic Planning Workspace, update the lens entity configuration.

Before you begin

[Create portfolio plan configuration for high-level planning.](#)

Role required: admin

About this task

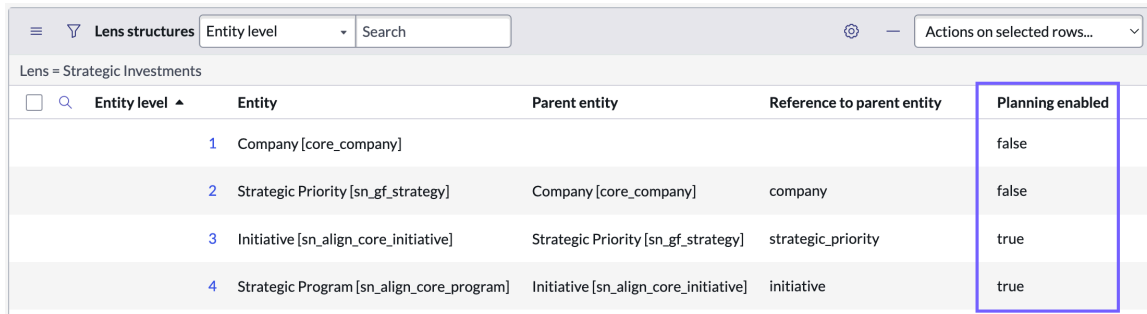

For the table that you want to enable high-level planning, set the **Planning enabled** field to **Yes** in the Lens form. Completing this task would enable your planning managers to create portfolio plans using this table as a planning item, in Strategic Planning Workspace.

For this task, consider the example of Strategic Investments as the lens and the Strategic Priority [sn_gf_strategy] table as the high-level planning entity.

Procedure

1. Navigate to **All > Strategic Planning > Lenses**.
2. Select and open the lens that you want to use for high-level planning.
For example, select **Strategic Investments**.
3. In the Lens structures related list of the Lens form, set the **Planning enabled** field of your high-level entity to **true**.
For example, set the Planning enabled field of Strategic Priority entity to **true**.

If your high-level entity is not a part of your lens structure, you can add it. See [Add or modify lens structure in Strategic Planning](#).

Entity level	Entity	Parent entity	Reference to parent entity	Planning enabled
1	Company [core_company]			false
2	Strategic Priority [sn_gf_strategy]	Company [core_company]	company	false
3	Initiative [sn_align_core_initiative]	Strategic Priority [sn_gf_strategy]	strategic_priority	true
4	Strategic Program [sn_align_core_program]	Initiative [sn_align_core_initiative]	initiative	true

4. Save the Lens form.

Result

Your planning managers can now create portfolio plans on the Strategic Investment lens and use Strategic Priority as their planning item.

Important:

Once a portfolio plan is creating based on this entity, you can neither disable high-level planning for it nor delete the entity record from the lens structure.

What to do next

[Populate global rank for high-level planning items.](#)

Populate global rank for high-level planning items

To enable high-level planning on a table that is not a planning item in Strategic Planning Workspace, populate global rank for existing records of this table.

Before you begin

[Enable high-level planning for a lens entity.](#)

Role required: admin

About this task

Use the Strategic Planning diagnostics module to populate global rank for all existing records of the table that your planning managers chose for high-level planning. Completing this task would generate a value for the Global rank field of your table.

For this task, consider the example of generating a rank value for all existing records of the Strategic Priority [sn_gf_strategy] table.

Procedure

1. Navigate to **All > Strategic Planning > Diagnostics**.
2. Run the Identify the high-level entities enabled for planning, without a global rank diagnostic script by selecting **Run Diagnosis**.
The diagnosis would fail and show you the type and the total number of records that are missing a global rank.
3. Select **Run fix script** to populate global rank value for all the flagged records.
You can verify that the rank is populated by running the diagnostic script again. You would see that the diagnosis is a success.

What to do next

Create a business rule to populate global rank on any future records create on your high-level planning table. See [Create a business rule for high-level planning](#).

Create a business rule for high-level planning

To enable high-level planning on a table that is not a planning item in Strategic Planning Workspace, create a business rule to allow assigning a rank value for all future records of this table.

Before you begin

[Populate global rank for high-level planning items.](#)

Role required: admin

About this task

All future records of your high-level planning entity must have a global rank so that when your planning managers reorder and prioritize items of this type in their portfolio plan, their rank is automatically updated. To enable this auto assigning of rank value to any new records, create a business rule.

For this task, consider the example of creating a business rule on the Strategic Priority [sn_gf_strategy], to enable auto-assignment of rank value for all its future records.

Procedure

1. Navigate to **All > System Definition > Tables**.
2. Search for and open your planning item table.

For example, search for and open the Strategic Priority [sn_gf_strategy] table.

3. Right-click the form header and select **Configure > Business Rule**.
4. Select **New**.
5. On the form, fill in the fields.

Business Rule form

Field	Description
Name	Name to identify the rule. For example, Strategic Priority rank insert rule .
Table	Table on which this business rule is applied. For this example, select Strategic Priority [sn_gf_strategy] .
Advanced	Option to enable advanced settings for this business rule.

6. In the Advanced related list, enter the following code in the **Script** field.

```
(function executeRule(current, previous /*null when async*/)
{
    var spwRankingHelper = new
    sn_align_core.SPWRankingHelper();
    var rankConfig =
    spwRankingHelper.getRankConfiguration(current.getTable());
    if (rankConfig.isValidRecord())
    {
        var sequencer = new
        sn_align_core.AlignmentPlanningRankProcessor(rankConfig.getValue("table"), rankConfig.getValue("column"));
        sequencer.generateNewIndex(current);
    }
})
(current, previous);
```

7. In the When to run related list, enable the **Insert** option.
8. Save the form.

Result

This task is the end of the series of tasks to enable high-level planning on a table that does not extend the Planning Item [sn_align_planning_item] table. After this task is complete, you can notify your planning managers that they can start creating portfolio plans for the configured entity type.

See [Managing portfolio plans in Strategic Planning Workspace](#).

Custom scoring frameworks in Strategic Planning

Learn how to create a custom scoring framework and associate it with a portfolio plan, so you can prioritize your planning items based on a defined score.

You may use one of the three pre-defined scoring frameworks - RICE, Value vs Effort, or WSJF, or you can create a custom scoring framework and associate it with your portfolio plan.

Note:

The pre-defined scoring frameworks aren't editable. Administrators can enable or disable the base system scoring frameworks by setting the Active field on the Scoring Framework form.

Create a custom scoring framework

Start scoring your planning items based on your preferences by creating a custom scoring framework.

Before you begin

Role required: sn_align_core_apw_admin

About this task

Creating a custom scoring framework.

Procedure

1. Navigate to **All > Strategic Planning > Scoring Frameworks**.
2. Select **New**.
3. Enter a name of your scoring framework in the **Name** field.
4. Enter the details of your scoring framework in the **Description** field.
5. Select **Submit**.

What to do next

[Create your scoring framework attributes](#)

Create your scoring framework attributes

Add attributes within your scoring framework, so that you can build a formula and start scoring your planning items within your portfolio plan.

Before you begin

Role required: sn_align_core.apw_admin

About this task

Create Scoring Framework attribute.

Procedure

1. Navigate to **All > Strategic Planning > Scoring Frameworks**.
2. From the Scoring Frameworks list, select a framework for which you want to add the Scoring Framework Attributes.
3. Select **New**, from the Scoring Framework Attributes related list.
4. On the form, fill in the fields.

Scoring Framework Attribute form

Field	Description
Label	Name that defines your scoring Framework.

Field	Description
Type	Type of the label, such as integer, choice, star, and so on.
Description	Details of the Scoring Framework.

 **Tip:**

If you want to add a choice type scoring attribute, ensure to have Decimal or Integer in the **Type** field, and Choice in the **Display type** field.

5. Select **Submit**.

6. Repeat step 3 to add all your Scoring Framework Attributes.

What to do next

[Create a final score attribute](#)

Create a final score attribute

Learn how to create an attribute to calculate the final score of your Scoring Framework.

Before you begin

Role required: sn_align_core_apw_admin

About this task

Create an attribute to calculate the final score of a Scoring Framework.

Procedure

1. Navigate to **All > Strategic Planning > Scoring Frameworks**.
2. From the Scoring Frameworks list, select a framework for which you want to add the final score attribute.
3. Select **New**, from the Scoring Framework Attributes related list.
4. On the form, fill in the fields.

Scoring Framework Attribute form

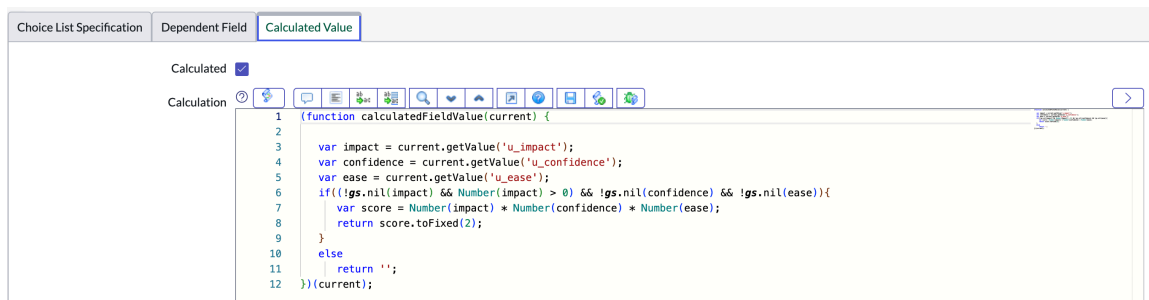

Field	Description
Label	Name that defines your Scoring Framework's final score.
Type	Type of the label, such as choice, decimal, integer, or string.
Description	Details of the Scoring Framework attribute.

5. Select the **Final score** option to mark this attribute as the final score attribute of your Scoring Framework.

6. Select the **Calculated Value** tab and add a formula to derive the value of the final score attribute

This formula should be based only on the scoring attributes of your scoring framework. In the this example, the ICE custom framework has the formula:

```
ICE score = Impact * Confidence * Ease
```

7. Select Update.

Configuring goals in Strategic Planning

To define and manage goals in Strategic Planning, you must perform some initial administrative tasks for the workspace to be fully functional. The data displayed in the goals view in Strategic Planning is stored in the Goal Framework tables.

- With the admin role, you can migrate the existing goals data to the Goal Framework tables.
- With the sn_gf.goal_admin role, you can set the goal preferences.

Post migration of your existing goals (if any) and configuring the goal preferences, use the Goals view in Strategic Planning to define your goals. For more information, see [Managing portfolio plan goals in Strategic Planning Workspace](#).

Import goals and targets data from a spreadsheet

With the admin role, you can import your existing goals and targets data from a spreadsheet to the Goal Framework tables.

Before you begin

Role required: sn_gf.goal_admin

- On a successful job run, the goals data from your spreadsheet is imported to the Goal [sn_gf_goal] table.
- On a successful job run, the targets data from your spreadsheet is imported to the Target [sn_gf_goal_target] table.

Note:

Because the targets are associated to a goal, you should import the goals first and then the targets.

Important:

Goals and targets data in the spreadsheet must be in the supported format. For details on the supported data format to import goals and targets data from a spreadsheet, see [Import goals and targets data \[KB1191233\]](#).

Procedure

1. Navigate to **All > System Import Sets > Load Data**.
2. From the Import set table drop-down list, select **Goal Import Set [imp_sn_gf_goal]** or **Target Import Set [imp_sn_gf_goal_target]**.
3. From the **Source of the import** option, select **File**.
4. In the **File** option, click **Choose** and select your spreadsheet to import the data.

i Important:

- Goals and targets data in the spreadsheet must be in a specific format. For details on the supported data format, see [Import goals and targets data \[KB1191233\]](#) .
- Don't modify the names in the header row of the spreadsheet because the data is imported to the respective fields in the goal and target tables based on the header title of each column.

5. Click **Submit**.

6. On the Progress page, click **Run Transform**.

7. On the Specify Import set and Transform map page, click **Transform**.

8. Click **Transform history** and verify that the State column is set to **Complete** in the Import Set Runs related list.

Depending on the option that you selected from the Import set table drop-down list, your goals or targets data is imported to the Goal [sn_gf_goal] or Target [sn_gf_goal_target] tables.

If the job is failed, click **Transform history** and refer to the details.

i Note:

The Import operation can be used for inserting new data or updating the existing data in the tables. By default, the Name and Owner values are the primary keys used for updating the existing records. You can also add additional fields as primary key for inserting new data or updating the existing data. For details on how to add additional fields as primary key, see [Import goals and targets data \[KB1191233\]](#) .

Migrate existing goals data to Goal Framework tables

With the admin role, you can migrate the existing goals data to the Goal Framework tables by running the scheduled job.

Before you begin

Role required: admin

About this task**i Note:**

Migrating data to the Goal Framework tables is a one-time job, and not meant to be on a schedule.

Procedure

1. Navigate to **All > System Definition > Scheduled Jobs**.

2. Search for and click the **Migrate Goal, Strategy, and Work item data to the Goal Framework and related Planning item tables** scheduled job.

3. On the Scheduled Script Execution form:

a. Ensure that the frequency is selected as **On Demand** in the **Run** field.

b. Set the value to **true** for the required parameters in the **Run this script** field.

For parameters information, see [Migrate Goal, Strategy, and Work item data to the Goal Framework and related Planning item tables](#).

4. Click **Execute Now**.

Configure goal preferences

Configure goal preferences to manage goals such as the calendar type used for goal setting, weighted average calculation for goal progress, and deletion of goals and targets.

Before you begin

Role required: sn_gf.goal_admin

Procedure

1. Navigate to **All > Enterprise Goal Management > Preferences**.
2. On the Goal Preferences form, configure the properties.
For properties information, see [Goal Preferences form](#).
3. Click **Save**.

Customize label for Goal and Target tables

Customize the label for Goal [sn_gf_goal] and Target [sn_gf_goal_target] tables according to your organization's requirement.

Before you begin

Role required: admin

About this task

When you rename the label for the Goal [sn_gf_goal] and Target [sn_gf_goal_target] tables, the changes apply to these labels across the Heisenberg UI and the Workspace UI. Also, the **Goals** and **Targets** modules under **Enterprise Goal Management** in the navigation pane will be renamed.

Procedure

1. Navigate to **All > System Definition > Tables**.
2. Customize the label name for the tables according to your requirement.

Configure a table for an assigned entity

Configure a table for an assigned entity type, so that the goal user can associate goals with the required assigned entity.

Before you begin

Role required: sn_gf.goal_admin

About this task

- By default, with the installation of Strategic Planning, the assigned entities, Business Unit [business_unit], Department [cmn_department], and Company [core_company], Product Model [cmdb_model], Value Stream [cmn_value_stream], Initiative [sn_align_core_initiative], and Strategic Program [sn_align_core_program] are installed.
- With the activation of PPM Standard (Project Portfolio Management), the Portfolio [pm_portfolio] assigned entity is installed.

About this task

An assigned entity is an organizational unit or structure that a goal can be associated with, such as a business unit or department. Assigned entities provide context for goals by linking them to the relevant part of your organization, making it easier to track and manage goals at any level.

Procedure

1. Navigate to **All > Enterprise Goal Management > Assigned Entities**.
2. Click **New**.
3. On the form, fill in the fields.
For field information, see [Goal Assigned Entity Configuration form](#).
4. Click **Submit**.

Create goals demo data with target breakdowns

Run the **Create Goals Demo Data with Target Breakdowns** schedule job to create goals demo data with target breakdowns, so that you can view the target breakdowns section on the Goals page.

About this task

You must run the job to be able to see the target breakdowns section in the Goals and targets tab on the Goals page.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Definition > Scheduled Jobs**.
2. Search for and select the **Create Goals Demo Data with Target Breakdowns** scheduled job.
3. On the Scheduled Script Execution form, ensure that the frequency is selected as **On Demand** in the **Run** field.
4. Select **Execute Now**.

Result

A goals demo data with target breakdowns is created. You can now view the target breakdowns for your goals in the Goals and targets tab on the Goals page.

Update a schedule job to automate Actual value of the targets

Use the Goal Framework for SPM application to modify the run time for the scheduled job according to your preference to auto-update the actual value of the targets for which a target source has been configured.

Before you begin

Role required: sn_gf.goal_admin

About this task

By default, the scheduled job runs daily at 00:00:00 AM (System Time Zone).

Procedure

1. Navigate to **All > System Definition > Scheduled Jobs**.
2. Search for and click the **Update Actual value of the targets using Goal Framework for SPM** scheduled job.
3. Ensure that the **Active** check box is selected to run the job at a scheduled time.
4. Edit the details of the **Run** and **Time** fields according to your preference.
5. Click **Update**.
To learn more about scheduled jobs, see [Scheduled jobs](#) .

Set display limit for goals and targets in Strategic Planning

Update system property value to set the display limit for goals on the Goals page in Strategic Planning.

Before you begin

Role required: sn_gf.goal_admin

About this task

The default display limit for goals on the Goals page is 250.

Important:

If the value of a system property exceeds its default value, the UI performance can degrade.

Procedure

1. Navigate to **All > System Properties > All Properties**.

A list of all the properties in the System Properties [sys_properties] table appears.

2. Search for the *sn_align_ws.goal_hierarchy.max_records* system property and open it.

3. In the **Value** field, enter the desired number of goals to display in the Goals view.

4. Select **Update**.

Migrate target breakdowns

After upgrading to Strategic Planning v4.3.2 or later, run the **Migrate BreakdownInterval To Checkinfrequency** scheduled job to migrate the existing values from the **Review frequency** field to the **Check-in frequency** field in the target records.

About this task

After running the job, the value in the **Check-in frequency** field for a target is populated based on the existing value in the **Review frequency** field of the target. If the existing value in the **Review frequency** field was set to any option other than **None**, then target breakdowns will be created for such targets based on the value in the existing check-in frequency of the target. For more information on how these values are migrated for targets with different values, see [Target breakdowns migration](#).

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Definition > Scheduled Jobs**.

2. Search for and select the **Migrate BreakdownInterval To Checkinfrequency** scheduled job.

3. On the Scheduled Script Execution form, ensure that the frequency is selected as **On Demand** in the **Run** field.

4. Select **Execute Now**.

Target breakdowns migration

As an administrator, when you run the **Migrate BreakdownInterval To Checkinfrequency** scheduled job, the existing values in the **Review frequency** and **Breakdown interval** fields are migrated to the **Check-in frequency** field in the target records.

The value in the **Actuals to date** field for the target and values in the **Planned target value** and **Actual** fields for the target breakdowns are populated based on the current actual value of the target and values in the existing target breakdowns.

Target breakdowns migration for targets with breakdown interval set to None

After running the job, the value in the **Check-in frequency** field for a target is populated based on the existing value in the **Review frequency** field of the target. If the existing value in the **Review frequency** field was set to any option other than **None**, then target breakdowns will be created for such targets based on the existing review frequency of the target. Even though **Breakdown interval** was set to **None** for a target, target breakdowns will be created for the target based on the existing review frequency of the target.

The following table describes how the check-in frequency value is populated for targets with different values in the **Review frequency** and **Breakdown interval** fields.

Target breakdowns migration with breakdown interval set to None

Review frequency (Before upgrade)	Breakdown interval (Before upgrade)	Check-in frequency (After upgrading and running the job)
Yearly	None	Yearly
Quarterly	None	Quarterly
Monthly	None	Monthly
Fortnightly	None	Fortnightly The Fortnightly option is retained and no target breakdowns will be created because the Fortnightly option is no longer supported. After the owner or a contributor of the target updates the check-in frequency for the target, the target breakdowns will be created accordingly.
Weekly	None	Weekly
Daily	None	Daily
None	None	None In this case, no target breakdowns will be created.

For example, consider a scenario where details of a target are as follows before upgrade:

- The base value and target value of the target is 0 and 100, respectively
- The review frequency is set to **Monthly** and Breakdown interval was set to **None**
- The start date and end date of the target are 2024-01-01 and 2024-12-31, respectively
- The current actual value of the target is 60 and the current month is August

In this case, after running the scheduled job 12 monthly target breakdowns are created for the target and the current actual value as 60 is populated in the August monthly breakdown. Also, the planned target value is populated for each breakdown.

Target breakdowns migration for targets with breakdown interval set to Quarterly or Yearly

After running the job, the value in the **Check-in frequency** field for a target is populated based on the existing value in the **Review frequency** field of the target. Then, target breakdowns are created for the targets based on the existing review frequency of the target.

The following table describes how the check-in frequency value is populated for targets with different values in the **Review frequency** and **Breakdown interval** fields.

Target breakdowns migration with breakdown interval set to Quarterly or Yearly

Review frequency (Before upgrade)	Breakdown interval (Before upgrade)	Check-in frequency (After upgrading and running the job)
Quarterly	Quarterly	Quarterly
Quarterly	Yearly	Quarterly

Note:

For targets with breakdowns interval set to Yearly, irrespective of the target is of type cumulative or non-cumulative, after running the scheduled job quarterly target breakdowns will be created and the Target value distribution is set to **Spread linearly across the time period (cumulative)** for the target.

For example, consider a scenario where details of a target are as follows before upgrade:

- The base value and target value of the target is 0 and 80, respectively
- The review frequency is set to **Quarterly** and Breakdown interval was set to **Yearly**
- The start date and end date of the target are 2023-01-01 and 2024-12-31, respectively
- The target is of type non-cumulative
- The actual value achieved in each quarter is 10 starting from Q1-2023 till Q2-2024
- The current total actual value of the target is 60 and the current quarter is Q2-2024

In this case, after running the scheduled job 8 quarterly breakdowns are created and the Target value distribution is set to **Spread linearly across the time period (cumulative)** for the target. The current actual value for Q1-2023, Q2-2023, Q3-2023, Q4-2023, Q1-2024, and Q2-2024 quarterly target breakdowns are populated as 10, 20, 30, 40, 50, and 60, respectively. Also, the planned target value is populated for each breakdown.

Migrate goal relationships for assigned entities

Migrate the existing goal relationship data from the Goal Relationship [sn_gf_goal_m2m_relationship] table by running the scheduled job.

Before you begin

Role required: admin

About this task

- If you've upgraded from Alignment Planner Workspace v4.1.1 or v5.0.1 to Strategic Planning v2.0.1 and have created m2m relationship with lens entities other than **Company, Business Unit, Department, and Portfolio**, you can migrate those lens entities from the Goal Relationship [sn_gf_goal_m2m_relationship] table to the Goals table to access and manage the goals for those lens entities in the respective portfolio plans.

- Migrating goal relationships data for assigned entities is a one-time job, and not meant to be on a schedule.
- Running the job populates the **Assigned entity type** and **Assigned entity** fields on the [Goal form](#) based on the data in the Goal Relationship [sn_gf_goal_m2m_relationship] table if you have any customized lenses other than the lens entity types, **Company**, **Business Unit**, **Department**, and **Portfolio**.

Procedure

1. Navigate to **All > System Definition > Scheduled Jobs**.
2. Search for and click the *Migrate goal relationships for assigned entities* scheduled job.
3. On the Scheduled Script Execution form:
 - a. Ensure that the frequency is selected as **On Demand** in the **Run** field.
 - b. In the **Run this script** field, list the entities configured in the Goal Assigned Entity Configuration [sn_gf_assigned_entity_config] table that you want to migrate the goal relationship data for.
For parameters information, see [Scheduled Script Execution form](#).
4. Click **Execute Now**.

Configuring target source for target automation

Configure target sources for target automation so that the goal user can define a target source when setting a target for the goal. Defining a target source for a target updates the actual value of the target automatically.

Use the following steps as guidelines for configuring target sources.

1. Create a target source for a target to configure it as a source to update the actual value of the target. For more information, see [Create a target source](#).

The context variable is required for target source types Assessment/Survey and PA Indicator. The mandatory context variables are automatically created while creating a target source with the type selected as Assessment/Surveys or PA Indicator. For more information on when the mandatory context variables are created, see [Context variable in target source](#).

2. If required, create context variables for the target source so that the required data is fetched from the context variables to update the actual value of the target. For more information, see [Create context variables for a target source](#).

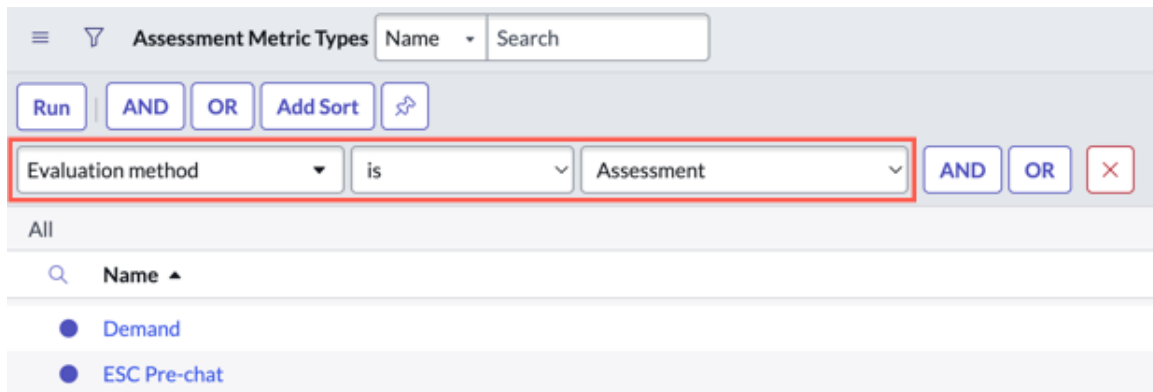

Context variable in target source

The context variable is an additional configuration for the target source that can be used on the Target form to fetch the required data and auto-update the **Actual value** field on the Target form. A context variable is required for target source types Assessment/Survey and PA Indicator.

The context variable is automatically created (with the **Mandatory** field set to **true** on the context variable form) for the target source (of type Assessment/Survey and PA Indicator) when the Goal Framework for SPM scope is selected before creating a target source. The context variables created automatically are also known as mandatory context variables.

The mandatory context variables are created when you've selected the Goal Framework for SPM scope and you've met one of the following conditions:

- (For target source type, Assessment/Survey) On the Target Source form, the **Type** field is set to **Assessment/Survey** and the **Assessment Metric Types** field is populated with a metric type of **Evaluation method = Assessment**.

- (For target source type, PA Indicator) On the Target Source form, the **Type** field is set to **PA Indicator** and the value populated in the **Breakdown** field isn't of Choice list type.

To create a context variable for the target source type, PA Indicator, where the Breakdown field is of Choice list type, see [Create a context variable for the target source type PA Indicator](#).

Note:

Mandatory context variables can't be deleted.

You can also create context variables manually for a target source and use them to configure for fetching the required data and auto-updating the **Actual value** field on the Target form. For more information on how to create a context variable manually, see [Create a context variable for a target source](#).

Create a target source for automating the Actual value of the targets

Create a target source so that the goal user can configure it for the targets to automate the Actual value of the targets.

Before you begin

Select the Goal Framework for SPM scope for the application.

Role required: sn_gf.goal_admin

About this task

The context variable is required for target source types Assessment/Survey and PA Indicator. The mandatory context variables are automatically created while creating a target source with the type selected as Assessment/Surveys or PA Indicator. For more information on when the mandatory context variables are created, see [Context variable in target source](#).

Procedure

1. Navigate to **All > Enterprise Goal Management > Target Sources**.
2. Click **New**.
3. On the form, fill in the fields.
For a description of the field values, see [Target Source form](#).
4. Click **Submit**.

Create a context variable for a target source

Create a context variable manually if you want to configure more context variables for a target source.

Before you begin

Select the Goal Framework for SPM scope for the application.

Role required: sn_gf.goal_admin

About this task

The Context variable provides information that can be used to fetch the required data and auto-update the Actual value on the target form. After a context variable is created for the target source, the goal user can configure the Actual Value Source Configuration section on the Target form so that the Actual value gets auto-updated.

Creating a context variable is similar to creating a column on a table.

To create a context variable for the target source type PA Indicator and the breakdown is of Choice list type, see [Create a context variable for the target source type PA Indicator](#).

Procedure

1. Navigate to **All > Enterprise Goal Management > Target Sources**.
2. Open the required target source that you want to create a context variable for.
3. In the Context Variables related list, click **New**.
4. On the form, fill in the fields.
For a description of the field values, see [Context Variable form](#).
5. Click **Submit**.

Create a context variable for the target source type PA Indicator

Create a context variable manually for the target source type PA Indicator if the breakdown is of Choice list type.

Before you begin

Select the Goal Framework for SPM scope for the application.

Role required: sn_gf.goal_admin

About this task

The context variable provides information that can be used to fetch the required data and auto-update the Actual value on the Target form. After a context variable is created for the target source, the goal user can configure the Actual Value Source Configuration section on the Target form for the Actual value to get auto-updated.

Creating a context variable is similar to creating a column on a table.

Procedure

1. Navigate to **All > Enterprise Goal Management > Target Sources**.
2. Open the required target source that you want to create a context variable for.
3. In the Context Variables related list, click **New**.
4. On the form, fill in the **Type** field as Choice and the other fields as needed.
For a description of the field values, see [Context Variable form](#).
5. Click **Submit**.

A context variable of choice type is created.

6. In the Choices related list of the context variable you created, click **New**.

Note:

If you don't see the Choices related list on the Context Variable form, add it by navigating to **Configure > Related Lists** on the form.

7. On the form, fill in the fields.

Choice form

Field	Description
Table	Name of the context variable for which the choice is created.
Element	Column name in the context variable form for which the choice is created.
Label	Name of the choice.
Value	Sys_id of the choice value for which the context variable is created. You can copy the sys_id from the Choices related list of the Dictionary Entry [sys_dictionary] table.

8. Click **Submit**.

9. **Optional:** Repeat the steps 6 through 8 to create more choices for the context variable.

What to do next

The goal user can configure these choices as context variables on the Target form for which the target source is configured.

Defining a custom unit of measure

Defining a custom unit of measure helps the goal users to set the unit of measure for targets as per their choice. Unit of measures are two types, quantitative and qualitative.

By default, the available unit of measures for quantitative targets are **#, \$, %, Days**. By default, the available unit of measure for qualitative targets is **Yes/No**.

As an administrator, you must create custom unit of measures so that the goal user can use them for setting a unit of measure for their targets:

- For quantitative targets, you can define a custom unit of measures from the Unit [sn_gf_unit] table.
- For qualitative targets, you must first create a choice set and then create a choice list for the choice set.

Prioritization display settings in Strategic Planning

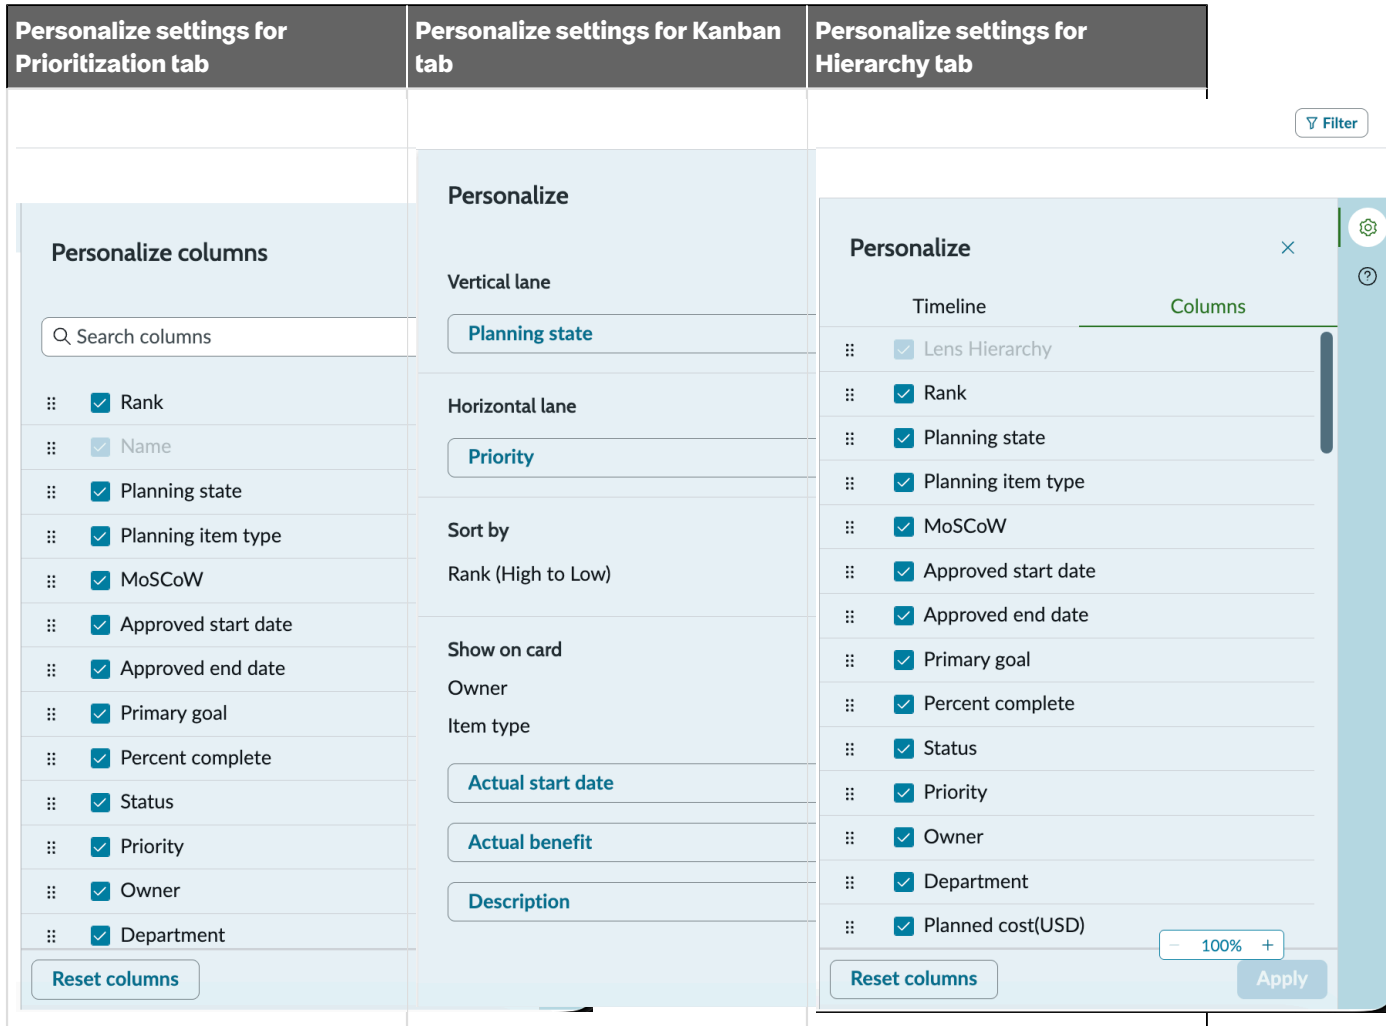

Configure the way data is shown on the Prioritization tab of the workspace so that your planning managers view the information that is relevant for them.

Configuring additional columns for Prioritization in Strategic Planning

Customize the default column configuration for the Prioritization page of your portfolio plan so that your planning managers can select the appropriate data points they need.

Portfolio managers or product owners can show or hide the data for their planning items by using the Personalize side panel in the Prioritization tab of their workspace. By default, this side

panel of Prioritization tab provides all the default fields available for that planning item. If your planning managers want to see additional columns, for example, there could be a requirement of information from a dot-walked field. In such cases or to remove any existing choices, you can configure them using the admin role.

Add extra columns as choices to this side panel or remove any of the default column choices by updating the list layout configuration for the planning item types associated to the portfolio plan.

- If the portfolio plan has multiple item types associated to it, update the view configuration of the Planning Item [sn_align_core_planning_item] table.
- If the portfolio plan has a single item type associated to it, update the view configuration of the relevant table.

From the form view of the identified table, change the view to **APW Prioritization**, and update the list layout. For the detailed procedure of updating the layout configuration for a list, see [Configure the list layout](#).

Note:

List v3 is no longer available for new deployments. If you are already using list v3, you may continue to do so, but in this case some of the functionalities might not be available.

Customizing highlighted fields on Prioritization page of Strategic Planning Workspace

Customize the fields to be highlighted on the Prioritization page of a portfolio plan according to your planning manager's needs.

By default, the Prioritization and Hierarchy tabs of a portfolio plan highlight the **Planning state** and **Status** fields of a planning item with colors. Based on your planning manager's requirements, you can configure fields that are of Choice type, such as Owner or Priority to also be the highlighted columns on the page. This customization requires:

- Modifying the Prioritization view Script Includes (APWBacklogConfigImpl for List view and APWGanttConfigImpl for Hierarchy view).
- Configuring a new record for the required field in the sys_highlighted_value table.

Modify Script Includes for Prioritization page in Strategic Planning

Modify the Script Includes for List and Hierarchy views of the Prioritization page to change the columns to be highlighted in these views in the workspace.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Definition > Script Includes**.
2. From the list, select one of the following:
 - For List view, select APWBacklogConfigImpl
 - For Hierarchy view, select APWGanttConfigImpl
3. Update the column name in the **Script** field of the Script Include.

In the *getColumnsForHighlightedValues* function, update the return value to the desired column.

For example, if you want to highlight the Priority column, update the return value to ("planning_state", "state", "priority").

4. Select **Update**.

What to do next

[Create new highlighted values for Prioritization columns in Strategic Planning](#)

Create new highlighted values for Prioritization columns in Strategic Planning

Customize the fields to be highlighted on the Prioritization page of a portfolio plan according to your planning manager's needs.

Before you begin

[Modify Script Includes for Prioritization page in Strategic Planning](#).

Role required: admin

Procedure

1. Navigate to **Workspace Experience > Administration > Highlighted Values**.
2. Select **New**.
3. On the form, fill in the fields.
For field information, see [Highlighted Value form](#).
4. Save the form.
5. In the Highlighted Value Conditions related list, create records to configure the color, order, and icon for each of the field values that you want to be highlighted in the workspace.

- a. Select **New**
 - b. On the form, fill in the fields.
For field, information, see [Highlighted Value Condition form](#).
 - c. Select **Submit**.
6. Repeat step 5 to complete this configuration for all the field values.
For example, if you are configuring for status column, you must create three records in the Highlighted Value Conditions related list for each of the choices Red, Green, and Yellow.
 7. Select **Update**.

Modify Script Includes for milestone icons in Strategic Planning

Modify the Script Includes for milestone icons in the roadmap and portfolio plan to customize the icons displayed in the Roadmap tab in the workspace.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Definition > Script Includes**.
2. From the list, select `RoadmapMilestoneAPIImpl`.
3. Update the milestone icon type in the **Script** field of the Script Include.
In the `getMilestoneMetadata` method, update the return value to the required icon.

For example, if you want to display the Circle exclamation icon (ⓘ) for key event milestone, update the return value to `'circle-exclamation-outline'` for the `key_event` milestone.

The default icons are as follows:

- `key_event: 'flag-fill'`
- `launch_date: 'rocketship-fill'`
- `important_date: 'calendar-clock-fill'`
- `key_milestone: 'diamond-fill'`
- `deadline: 'star-fill'`

```

168 getMilestoneMetadata: function() {
169
170     return {
171         type: {
172             key_event: {
173                 icon: 'flag-fill'
174             },
175             launch_date: {
176                 icon: 'rocketship-fill'
177             },
178             important_date: {
179                 icon: 'calendar-clock-fill'
180             },
181             key_milestone: {
182                 icon: 'diamond-fill'
183             },
184             deadline: {
185                 icon: 'star-fill'
186             }
187         }
188     };
189 },
190 type: 'RoadmapMilestoneAPIImpl'
191 };

```

4. Select **Update**.

Update the display limit of items on Prioritization and Roadmap

Create a system property to update the display limit of the items shown in Prioritization and Roadmap views in Strategic Planning Workspace.

Before you begin

Ensure the application scope in your instance is set to Global.

Role required: admin

About this task

The default display limit for Prioritization and Roadmap pages are:

- Planning items shown in the Prioritization tab = 250
- Roadmap items shown in the Roadmap tab = 250
- Goals shown in the Hierarchy tab = 250
- Item-level milestones in the Roadmap view = 100
- Items shown in the Kanban tab = 250
- Lanes shown in the Kanban tab = 30

If the total number exceeds these default limits, the additional number of planning items, milestone indicators, and vertical lanes are not visible in the workspace. To overwrite this default setting, create a system property and set its value to a desired limit of display.

i Important:

If the value of a system property exceeds its default value, the UI performance can degrade.

Procedure

1. Navigate to **All > System Properties > All Properties**.

A list of all the properties in the System Properties [sys_properties] table appears.

2. Click **New**.

3. On the form, fill in the fields.

For information on the other form fields, see the field description table in [Add a system property](#) .

4. Select **Submit**.

Configure additional source tables for a free-form roadmap

Add new tables to roadmap preferences and configure their details so that these tables can be used as source tables while creating a free-form roadmap in Strategic Planning.

Before you begin

[Install Strategic Planning](#).

Role required: sn_align_core.apw_admin

Procedure

1. Navigate to **All > Strategic Planning > Portfolio Plan Configuration**.

2. Select **New**.

3. On the form, fill in the fields.

For field information, see [Portfolio plan configuration form](#).

4. Select **Submit**.

Customize the planning item display preferences for Prioritization and Roadmap

Update the default display configuration of planning item attributes in Prioritization, portfolio plan Roadmap, and Free-form roadmap pages so that data relevant to you is displayed in Strategic Planning Workspace.

Before you begin

[Install Strategic Planning](#).

Role required: sn_align_core.apw_admin

About this task

Update default settings for the display of planning items such as Group by fields, Color by fields, Metrics fields, and Kanban preferences, such as default vertical lane and horizontal lane, metrics on the Kanban cards and others, on the following pages:

- Portfolio plans:
 - Prioritization view
 - Kanban view
 - Roadmap view
- Free-form roadmaps:
 - Timeline view
 - Kanban view

The options in these configurations are as follows:

Table Configurations

Configuration table	Fields
Prioritization and Roadmap configuration	<ul style="list-style-type: none"> • Group by fields • Color by fields • Metrics fields • Status field • Percent complete field
Kanban configuration	Prioritization, roadmap, and free-form roadmap tabs: <ul style="list-style-type: none"> • Horizontal lane • Vertical lane • Metrics on Kanban card
Rank configuration	Rank configuration

Procedure

1. Navigate to **All > Strategic Planning > Portfolio Plan Configuration**.
2. Open a table for which you want to edit the configuration.
3. Edit the required fields.
For field information, see [Portfolio plan configuration form](#).
4. Select **Update**.

Hierarchy tab display configuration in Strategic Planning

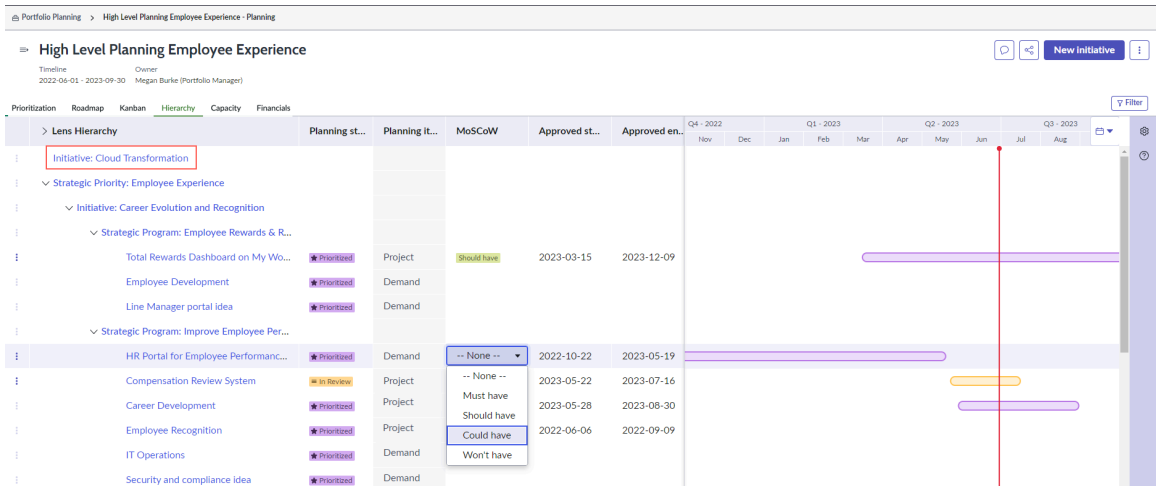

Show or hide parent records of planning items shown in the Hierarchy tab for high-level and regular portfolio plans by configuring system properties.

Display empty parent entities in the Hierarchy tab

In the Hierarchy tab, the parent records are displayed only if they have any associated planning items.

For example, a portfolio plan built from the Organization lens (Company > Business Unit > Department) is used to manage and track plans for Demands and Projects. So, when you switch to the Hierarchy tab, only those departments that have at least one Demand or Project associated with it are shown in the view.

If you want to see other departments that are included in this portfolio plan but have no planning items associated to them, work with your administrator to create the system property `sn_align_ws.gantt_hide_empty_entities` and set it to **false**.

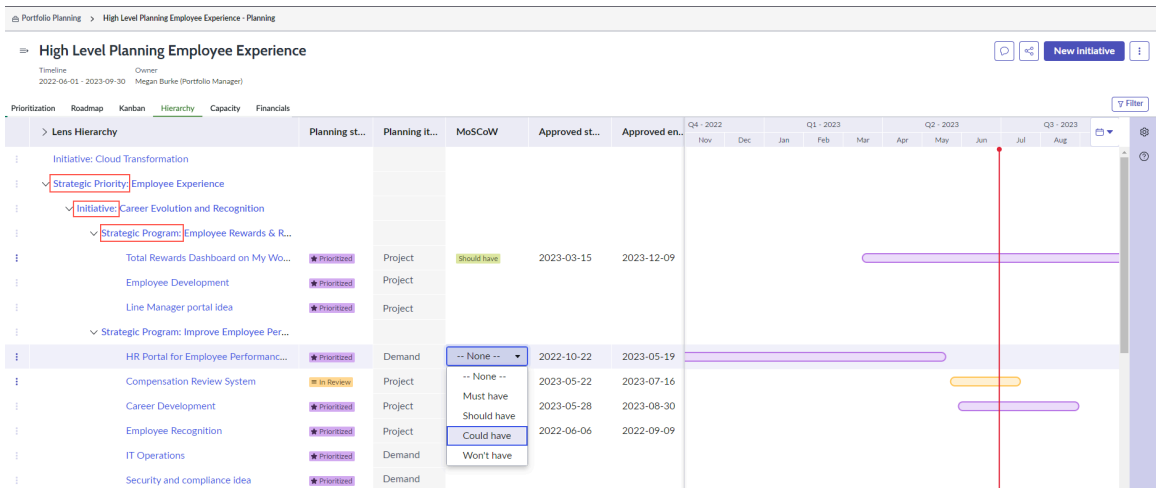

Display complete hierarchy for high-level portfolio plans

For high-level portfolio plans, the Hierarchy tab by default shows only the hierarchy up to the parent level.

For example, a portfolio plan built from the Strategic Investment lens (Company > Strategic priority > Initiative > Strategic program) is used to manage and track plans for strategic programs. So, when you switch to the Hierarchy tab, only Strategic Priority > Initiative levels are shown by default.

If you want to see the whole hierarchy of Strategic priority > Initiative > Strategic program > planning items, work with your administrator to create the system property **true**.

Configuring roadmap in Strategic Planning

Create custom themes to configure roadmap bar colors, ensuring they align with your organization's standards.

Use the following steps as guidelines for configuring custom themes for your roadmap bar colors:

1. Create a custom theme for roadmap bar colors. For details, see [Create a custom theme for roadmap](#).
2. Publish your custom theme so that you can apply it to your roadmap. For details, see [Publish a custom roadmap theme](#).
3. Apply a custom theme for your roadmap. For details, see [Apply a custom theme to roadmap](#).
4. Verify that the custom theme is applied for your roadmap.

Create a custom theme for roadmap

Customize roadmap bar colors to align with your organization’s branding guidelines and maintain visual consistency.

Before you begin

Role required: admin

About this task

The roadmap applies the colors defined in the UI theme’s **Alert** and **Grouped** options.

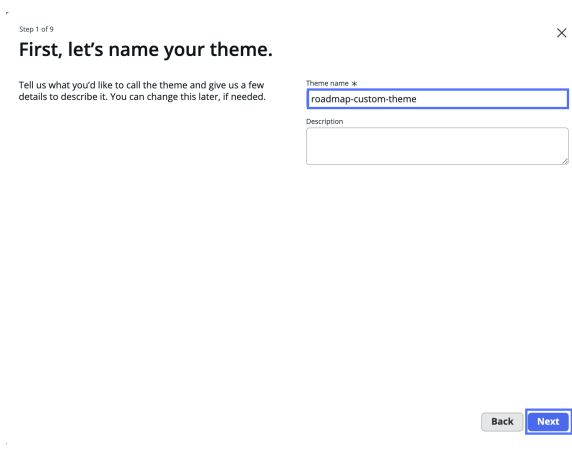

Procedure

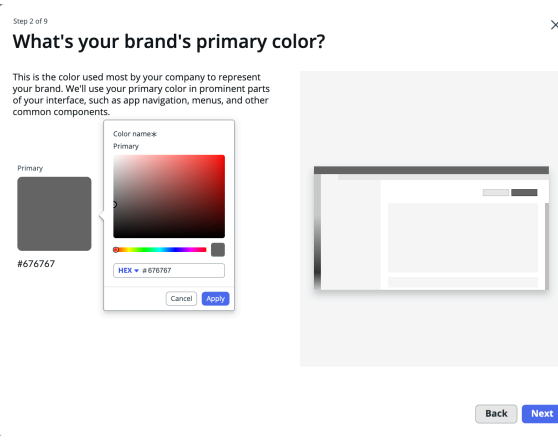

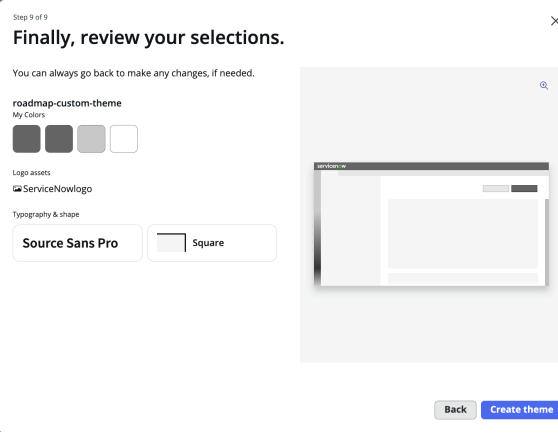

1. Navigate to **All > Now Experience Framework > Theme Management > Theme Builder**.
2. From the Theme Builder Home page or Editor page, select **Create a theme**.
The theme creation wizard opens.
3. On the Before we get started window, select **Continue**.

Complete the following steps for each screen in the wizard.

Note:

- Only the step 1 (Naming your theme) is required to create a theme.
- Configuring items in steps 2–8 (such as primary, secondary, and neutral colors, company logo, additional colors, fonts, and corner shapes) doesn’t affect roadmap bar colors.

On this wizard screen...	Perform these steps...
<p>Step 1 of 9</p> <p>First, let’s name your theme</p>	<p>a. Enter a name for your theme in the Theme name field.</p> <p>b. (Optional) Enter a brief description for your theme in the Description field.</p> <p>c. Select Next to continue.</p> 
<p>Step 2–8 of 9</p>	<p>a. (Optional) Choose the primary color, secondary color, neutral color, add any extra colors, company logo, font style,</p>

On this wizard screen...	Perform these steps...
<ul style="list-style-type: none"> ○ Step 2: What's your brand's primary color ○ Step 3: Do you want to add a secondary color ○ Step 4: Now, choose a neutral brand color ○ Step 5: Do you want to add any additional colors ○ Step 6: Next, let's add your company logo ○ Step 7: Which font would you like to use ○ Step 8: Almost done. Choose the corner shape you prefer. 	<p>user interface corner shapes for your organization on the respective screens.</p> <p>b. Select Next to continue until you reach step 9.</p> 
<p>Finally, review your selections.</p>	<p>a. Review all configured items (colors, logo, font, and shape).</p> <p>b. Select Create theme to finalize.</p> 

4. On the Theme Builder page under **Global styles, select Color icon (🎨) to configure colors for your roadmap bars.**

What to do next

Publish your custom theme so that you can apply it to your roadmap. For details, see [Publish a custom roadmap theme](#).

Publish a custom roadmap theme

Publish a custom roadmap theme so that you can apply it to your roadmap.

Before you begin

You have created a custom theme to apply to the roadmap.

Role required: admin

Procedure

1. Navigate to **All > Now Experience Framework > Theme Management > Theme Builder**.
2. On the Theme Builder page, select **Manager** from the **Page** drop-down.
3. In the Unpublished section, find your theme in the list, select the More actions icon (), and then select **Publish**.

4. On the Publish the theme window, select **Publish**.

Manage your themes

Choose the theme you want to publish or select a theme to view and edit its details.

Published

Unpublished

Result

Your custom theme is now published.

What to do next

Apply your custom theme to update the colors displayed in the roadmap. For details, see [Apply a custom theme to roadmap](#).

Apply a custom theme to roadmap

Apply your custom theme to ensure roadmap bar colors align with your organization’s style.

Before you begin

- You have created and published a custom theme to apply to the roadmap.
- Ensure the application scope in your instance is set to **Portfolio Planning**.

Role required: admin

About this task

To update the color theme for your roadmap bars, you must copy the sys_id of your custom theme, and then create a system property and set its value to the copied sys_id.

The colors configured in the custom theme will be applied to the roadmap bars. However, these colors won’t affect the colors of roadmap milestones or planning item milestones.

Procedure

1. Copy the sys_id of the custom theme.
 - a. Navigate to **Now Experience Framework > Theme Management > Themes**.
 - b. Search for the custom theme that you want to apply to the roadmap.
 - c. Right-click the name of your custom theme and select **Copy sys_id**.
The sys_id of your custom theme is copied.
2. Create a system property and enter the copied sys_id in the form.
 - a. Navigate to **All > System properties > All properties**.
 - b. Select **New**.
 - c. On the form, fill in the fields.

System Property

Field	Description
Name	Name of the system property. Enter the name as <code>sn_align_ws.spw_custom_theme</code>
Application	Application scope for the system property. Ensure the scope is set to Portfolio Planning .
Type	System property type. Set the type to string .
Value	Sys_id of the custom theme you created for roadmap bar colors.

Field	Description
	Enter the copied sys_id.

d. Select Submit.

The system property is created and updated to include the custom theme information.

Result

The roadmap bars now display the colors configured in the custom theme.

Configuring scenario planning in Strategic Planning

Configure scenario planning in strategic planning to create and compare multiple scenarios.

1. Enable or disable scenario planning.

For more information, see [Enable or disable scenario planning in Strategic Planning](#).

2. Manage financial widgets in compare scenarios page.

For more information on how to add and manage widgets to the comparison view, see [Configure financial widgets in compare scenario](#).

Enable or disable scenario planning in Strategic Planning

Enable or disable scenario planning in Strategic Planning.

Before you begin

Role required: sn_align_core.apw_admin

About this task

Scenario planning is enabled by default. Use the following steps to disable or enable scenario planning, as required.

Procedure

1. Navigate to All > System properties > All properties.

2. Search for the property

sn_align_ws.is_scenario_planning_disabled.

3. Verify the value of the property.

- To enable scenario planning, verify that the property is set to **False**.
- To disable scenario planning, verify that the property is set to **True**.

What to do next

[Create a scenario](#)

Configure financial widgets in compare scenario

Add or manage existing widgets to view financial insights while comparing scenarios. Define your own attribute from the cost types to view it's details in the Compare scenario page.

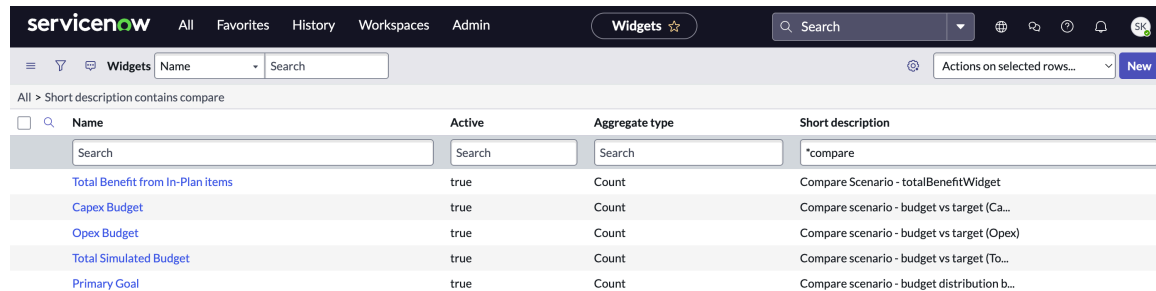

Before you begin

Role required: admin

Procedure

1. Navigate to **All > Project Administration > Widgets**.
2. In the Widgets list, filter the Short description with **Compare scenario** to view the existing list.

By default, there are five financial widgets enabled to compare the financial performance of scenarios.

Name	Active	Aggregate type	Short description
Total Benefit from In-Plan items	true	Count	Compare Scenario - totalBenefitWidget
Capex Budget	true	Count	Compare scenario - budget vs target (Ca...
Opex Budget	true	Count	Compare scenario - budget vs target (Opex)
Total Simulated Budget	true	Count	Compare scenario - budget vs target (To...
Primary Goal	true	Count	Compare scenario - budget distribution b...

3. Edit an existing widget or create a widget to use it in scenario planning.
4. Select **Submit**.

Capacity configuration in Strategic Planning

Generate employee profiles for resources and map them with primary attributes to start capacity planning.

- Enable the planning attributes for capacity to map resources to a unique attribute. For more information, see [Enable planning attributes for Capacity in Strategic Planning](#).
- Create resource assignments and generate employee profiles. For more information, see [Generate employee profiles for resources to work with Capacity](#).
- Map resources to a unique group, role, and skill to generate employee profiles. For more information, see [Map primary attributes to resources](#).

Enable planning attributes for Capacity in Strategic Planning

Enable the planning attributes Group, Skill, and Role so that your planning managers can view the resource capacity details.

Before you begin

Role required: admin

i Note:

This activation is a one-time task to enable planning attributes to plan and work on resource capacity.

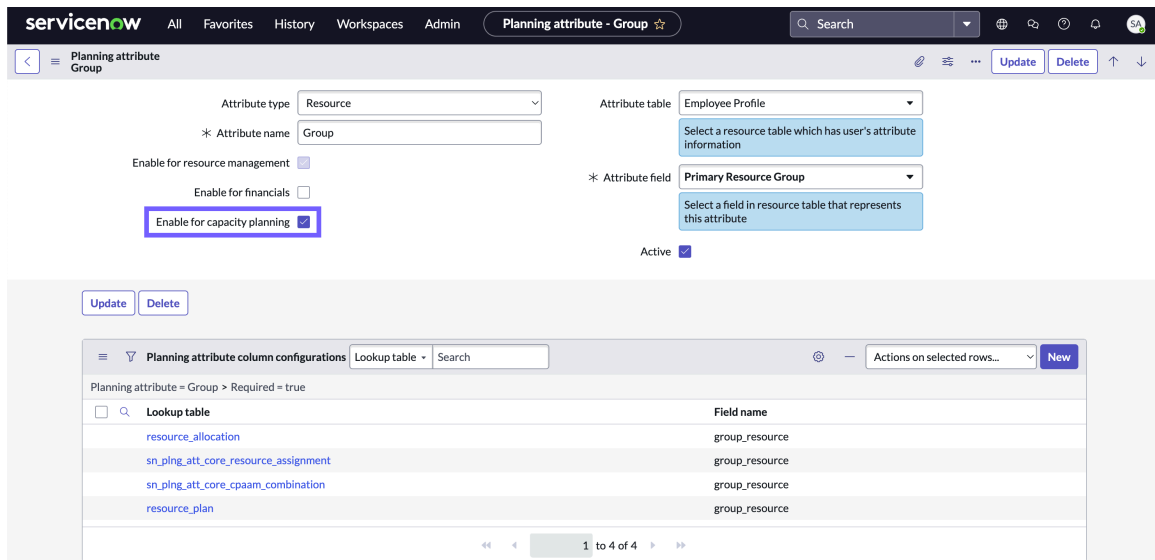

Procedure

1. Navigate to **All > Strategic Planning > Planning Attributes**.
2. Filter the Attribute name to locate and open the **Group** attribute.
3. Select the **Enable for capacity planning** option.

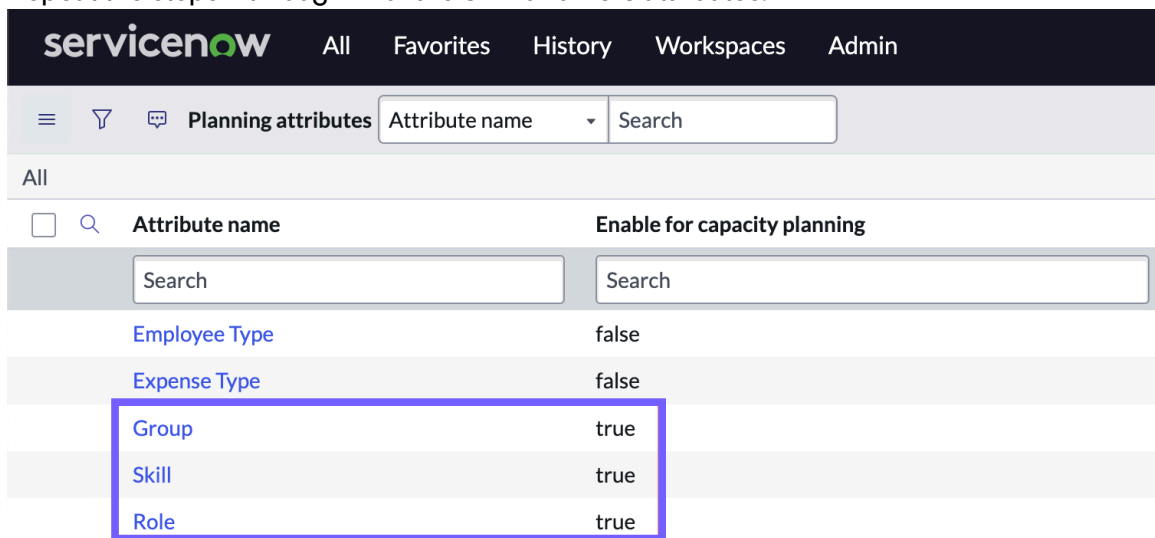

4. Select **Update**.

Note:

If an attribute is enabled for capacity planning, it is enabled for resource management by default.

5. Repeat the steps 2 through 4 for the **Skill** and **Role** attributes.

You can create custom attributes and map them to resources. For more information, see [Create or edit planning attributes](#).

6. Set the value of the Enable for capacity planning column for Group, Role, and Skill field to **true**.

What to do next

1. Configure attribute values: Navigate to **All > Strategic Planning > Planning Attributes** to view and manage attribute values. You can add, edit, or import attribute entries for Group, Skill, and Role.
2. Map attributes to resources: Assign the enabled planning attributes to your resources so they appear in capacity views. For custom attributes, see [Create or edit planning attributes](#).
3. Start capacity planning: Navigate to the Capacity tab in your *Strategic Planning Workspace* to view resource capacity based on the enabled attributes.

Generate employee profiles for resources to work with Capacity

Generate employee profiles for the resources to map against primary attributes.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > Employee Profile > Employee Definition**.
2. Filter the name to locate and open the **sys_user** table.
3. In the Employee Definition page, select **User** from the Table list.
4. Use the condition builder to filter the required resources and then select the update count icon ()
5. Select **Generate Employee Profiles** ()
6. In the Generate Employee Profiles window, select **Proceed**.

Result

Employee profiles for the selected resources are generated.

What to do next

Populate a primary group, primary role, and primary skill for the resources with employee profiles. For more information, see [Map primary attributes to resources](#).

Map primary attributes to resources

Locate and map the primary group, primary role, and primary skill for the resources associated with existing employee profile tables.

Before you begin

[Generate employee profiles for resources to work with Capacity](#).

Role required: admin

Procedure

1. Navigate to **All > Employee Profile > Employee Profiles**.
2. Filter the User column to locate and open the resources with employee profiles.
3. Select the **Populate primary resource attributes** related link to auto-populate the attributes.
 - If an employee is assigned to a single group, role, and skill, the primary attributes are populated.
 - If an employee is assigned to multiple groups, skills, or roles, select the **Primary Resource Group, Primary Resource Role, and Primary Resource Skill**, using the lookup icon.
4. Select **Update**.

Activate a scheduled job to automatically generate resource capacity

Activate the scheduled job to auto-generate the resource capacity at required cadence.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Definition > Scheduled Jobs**.
2. Filter the name field to locate and open **Generate Resource Capacity**.
3. Select **Active** option to activate the schedule job.
4. Edit the fields on the Scheduled Script Execution form to customize the job and meet your requirements.
For more information about the field description and scripts, see [Automatically run a script of your choosing](#).
5. Select **Execute Now** to execute the scheduled job or select **Update** to save your changes.

Configure financials for planning items in Strategic Planning

Configure the ServiceNow Internal integrations to view the financials for planning items in Strategic Planning.

Before you begin

Role required: admin

Procedure

1. Configure the attributes to generate labor costs in financials based on the resource assignments on the work items.
For more information, see [Using the Planning attributes](#) and [Create or edit planning attributes](#).
2. Generate default mapping configurations to create table maps.
For more information, see [Generate default mapping configurations](#).
3. Enable financials for epics to work on financial planning.
For more information, see [Enable financials for planning items in Strategic Planning](#).
4. Enable budget allocation and define a budget attribute, cost type or expense type, to allocate budget for your planning items.
For more information see [Enable financial budget allocation for planning items in Strategic Planning](#) and [Configure budget attribute at instance-level to allocate budget](#)
5. Enable financial benefit planning for planning items in workspace view.
For more information, see [Enable monetary benefit plans for planning items](#)
6. Add the monetary and non-monetary benefit plans related lists for your planning items in workspace view.
For more information, see [Add monetary and non-monetary benefit plans related lists](#).
7. Create new widgets to view the rolled up financial data at planning item level.
For more information, see [Configure a widget and associate it with project](#).
8. **Optional:** Customize the left pane in the financials screen to match the requirements of your organization.
For more information, see [Customize the left pane view for financials](#).
9. **Optional:** Customize the Create cost plan form fields to match the requirements of your organization.
For more information, see [Customise cost plan form](#).
10. Customize the default expense types to manage cost plans for your planning items.
For more information, see [Change the default expense type for your planning items](#)
11. Define a custom prefix for your baseline name.
For more information, see [Create a custom prefix for baseline](#).
12. Activate and define scheduled job to automatically migrate budget for your planning items.
For more information, see [Activate a scheduled job to migrate budget of your planning items](#).

13. Activate and define a scheduled job to migrate financial baselines for your planning items. For more information, see [Migrate financial baselines to Next Experience](#).
14. Activate and define scheduled job to automatically create financial baselines for your planning items at a defined cadence. For more information, see [Activate scheduled job to create financial baselines for planning items](#).
15. Activate and define scheduled jobs to automatically generate labor costs for your planning items based on the attribute-based resource assignments at a defined cadence. For more information, see [Activate scheduled job to generate labor costs for your planning items](#).

Enable financials for planning items in Strategic Planning

Enable financials for all the planning items to work on the financial estimates.

Before you begin

Role required: sn_invst_pln_v2.investment_admin

Procedure

1. Navigate to **All > Investment Funding > Setup > Investment Entities**.
2. Filter the Table field to locate and open the required planning item. For example, select **sn_align_core_scrum_epic** for epics, select **pm_project** for projects, **dmn_demand** for demands, **sn_align_core_capability** for capabilities, or **sn_align_core_feature** for features.
3. In the Entity form, build the required condition to get the required planning items.

Note:

If you want to work on the financial records for completed or closed planning items, remove the **Active is true** condition.

4. Select **Update**.

Enable financial budget allocation for planning items in Strategic Planning

Enable allocation property after migrating to Next Experience to work on budget allocation for your planning items using Strategic Planning.

Before you begin

- For new customers accessing financials in Next Experience, this property is enabled by default.
- Role required: admin

Procedure

1. Navigate to **All > System Properties > Properties**.
2. Filter the Name column to locate and open **sn_invst_pln.enable_budget_allocation_v2** property.
3. Update the Value field to **True** and select **Update**.

What to do next

Configure budget attributes to work on managing budget of your planning items. For more information, see [Configure budget attribute at instance-level to allocate budget](#).

Configure budget attribute at instance-level to allocate budget

Configure the budget attribute by expense type or cost type as an instance-level to work on budget allocations for your planning items using Strategic Planning.

Before you begin

- Enable the budget allocation property to work on budgeting for planning items. For more information, see [Enable financial budget allocation for planning items in Strategic Planning](#).
- Role required: admin

Important:

Existing customers can't change the budget attribute to `cost_type`.

Procedure

1. Navigate to **All > System Properties > Properties**.
2. Filter the Name column to locate and open **sn_invst_pln.budget_allocation_attribute** property.
3. Update the Value field to one of the following.
 - **cost_type** - view financials by cost types such as Hardware Opex, External labor Capex, Software Capex, Software Opex.

Note:

It's suggested to limit the number of cost types to four.

- **expense_type** - view financials by expense types such as Capex and Opex.
4. Select **Update**.

Enable monetary benefit plans for planning items

Enable the benefit plans property to create and manage benefit plans for planning items.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Properties > Properties**.
2. Filter the Name column to locate and open the **sn_invst_pln.enable_benefit_plan_in_new_financials** system property.
3. In the **Value** field, enter **true**.
4. Select **Update**.

Add monetary and non-monetary benefit plans related lists

Enable the monetary benefit plans and non-monetary benefit plans related lists for your planning item types such as Epics, Features, and Capabilities.

Before you begin

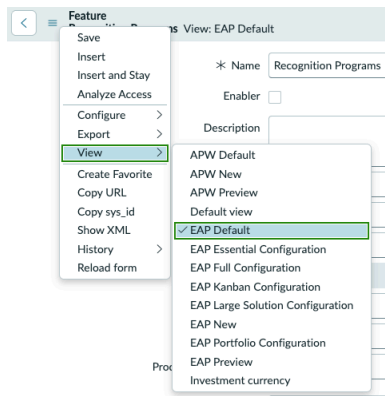

- This is a one time activity to enable and view the monetary benefit plans and non-monetary benefit plans related list for all the planning items.
- Role required: admin

Procedure

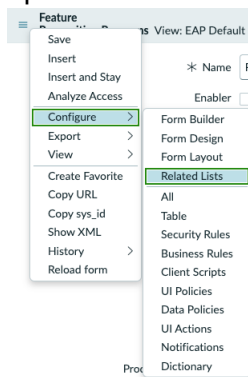

1. Navigate to **All > System Definition > Tables**.
2. Filter the Label field to locate a planning item type.
 - If you want to enable the benefit plans for Feature, filter the Label field to locate and open **Feature** [sn_align_core_feature] table.
 - If you want to enable the benefit plans for Capability, filter the Label field to locate and open **Capability** [sn_align_core_capability] table.
3. Select the **Show List** related link.
4. Open a record from the list of Features or Capabilities.
5. Change the scope of the application if you don't see the editable form of the record page.
6. Change the record page view to **EAP Default**.

To change the view, select **Additional actions** menu (), select **View**, and select the **EAP Default** view.

7. Select **Additional actions** menu (), select **Configure**, and select the **Related Lists** option.

8. Select **Monetary Benefit Plans** and **Non-monetary Benefit Plans** from the Available list and add them to Selected list.
9. Select **Save**.
10. Select **Update** on the planning item record page.

What to do next

Create and manage monetary and non-monetary benefits plans for your planning items.

- [Create monetary benefit plans for your planning items in Strategic Planning](#)
- [Manage non-monetary benefit plans for your planning items in Strategic Planning](#)

Configure a widget and associate it with project

Enable and associate a widget to view financial summary of work items at a high-level.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > Project Administration > Widgets**.
2. Select **New**.
3. On the Widget New Record form, fill the fields.
For a description of the field names, see [Widget New Record form](#).
4. Select the **Additional actions menu** and select **Save**
5. In the Widget associations related list, select **New**.
6. On the Widget association New Record form, fill the fields.
For a description of the field names, see [Widget association form](#).
7. Select **Submit**.

Customize the left pane view for financials

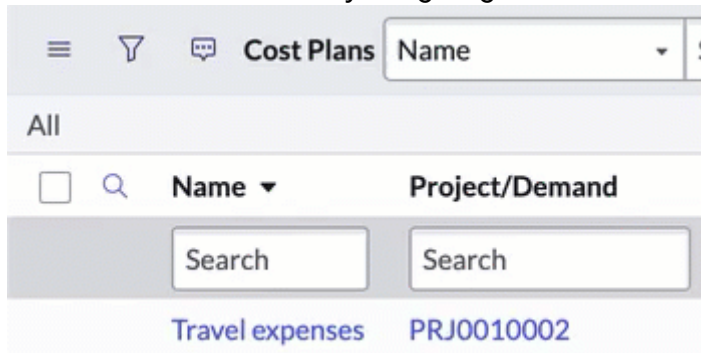

Customize the left pane for financials to view custom field information.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Definition > Tables**.
2. Filter the Label field to locate and open the **Cost Plan** table.
3. Select the **Show List** related link.
4. Select the financials view by navigating to **List controls > View > Financials View**.

The selected view (Financials View) is displayed on the header.

5. Select the header options to configure list layout.

Cost Plans		View: Financials View	Name	Search
All				
<input type="checkbox"/>	<input type="checkbox"/>	Name	Cost type	
		Travel costs	Other Opex	
		Travel costs	Other Opex	
		Support vendors	External labor Opex	
		Servicenow Subscription	Software Capex	
		Servicenow Subscription	Software Capex	
		SAP Subscription	Software Opex	
		Resource_Internal_DEV_Opex	Labor Opex	
		QE team	Labor Opex	
		Oracle SDK	Software Capex	
<input type="checkbox"/>	<input type="checkbox"/>	Office supplies	Other Capex	
		Office supplies	Other Capex	
		Monitor Rentals	Hardware Capex	

6. Add or remove the fields in the Selected column to customize the left pane view in financials view.

7. Select **Save**.

Result

Cost plans table with customized fields for Financials View is displayed.

Customise cost plan form

Manage the fields required on the new cost plan form as per your organization needs.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Definition > Tables**.
2. Filter the Label field to locate and open the **Cost Plan** table.
3. Select the **Design Form** related link.
4. On the header row, select **Cost Plan [cost_plan]** from the table list and **Financials View** from the view list.
5. On the form, you can:
 - o Drag and drop the required fields from the Fields column.
 - o Remove the existing fields using the Remove field icon.
6. Select **Save**.

Change the default expense type for your planning items

Configure the default expense type to create or edit cost plans for your planning items.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Properties > All properties**.
2. Filter the name to locate and open **sn_plng_att_core.default.expense_type**.
3. Change the Value field to the required expense type and select **Save**.
Opex is the default value.

Create a custom prefix for baseline

Modify the prefix to customize the name of the baselines for your planning items.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Properties > All Properties**.
2. Filter the name field to locate and open **sn_invst_pln.baseline_prefix**.
3. Modify the **Value** field to create a custom prefix for your baselines.

If you're working on a sales portfolio, you may change the **Value** field to `Sales baseline on`.

4. Select **Update**.

Example:

Assume you are creating a baseline for a sales project using the above prefix on December 04, 2023. Name of the new baseline will be **Sales baseline on 2023-12-04**.

Create custom labor costs and map them to sys_id

Create and map custom labor costs to sys_id to generate labor costs based on the relevant expenses.

Before you begin

Role required: admin

About this task

Consider you removed the out-of-box cost types and created the following two labor cost types:

- Internal Workforce Capital Expenditure (to replace Labor Capex)
- Contractor Operational Expense (to replace External Labor Opex)

Once these new cost types are created, the system automatically assigns them unique sys_ids. These sys_ids are not same as the deleted defaults.

To ensure the system continues to recognize these new cost types for workflows, reporting, or calculations, you must manually updated in the `sn_plng_att_core.labor_costtype_sysid_mapping` system property with the new sys_ids.

Omitting this update may result in system errors or incomplete data processing in cost-related operations.

Procedure

1. Create custom labor costs.

- a. Navigate to **All > System Definition > Tables**.
- b. Filter the Label field to locate the open **Cost Type Definition**.
- c. From the Related Links, select **Show List**.

List of OOB labor costs is displayed.

- d. Select **New**.
- e. On the Cost Type Definition form, fill the fields.
 - **Name** - enter the name of the labor cost plan.

Tip:

Adding the cost type, either capex or opex, as a suffix to the name helps you to easily identify while creating cost plans.

- **Expense type** - select Capex or Opex from the list to define expense.

For example, you can create Software Capex labor cost to capture software purchasing expenses. Hardware Opex labor cost to capture your hardware purchasing expenses.

- f. Click **Submit**.

The new cost plan is displayed on the list.

- g. Right-click on the cost plan row and select **Copy sys_id**.

2. Map the custom labor costs with sys_id.

- a. Navigate to **All > System Properties > All properties**.
- b. Filter the name field to locate and open the **sn_pmg_att_core.labor_costtype_sysid_mapping** property.
- c. In the Value field, enter the labor cost type name and its sys_id in the same format as the OOB labor costs mapping format.
- d. Select **Update**.

Example: Mappings of default out of box labor costs with their sys_id

```
{
  "labor_capex": "3d16eaf79330120064f572edb67ffb04",
  "labor_opex": "5b26eaf79330120064f572edb67ffb39",
  "external_labor_capex": "ed36eaf79330120064f572edb67ffb41",
  "external_labor_opex": "7b36eaf79330120064f572edb67ffb58"
}
```

Activate a scheduled job to migrate budget of your planning items

Activate the **Migrate budget for active demands and projects** scheduled job to migrate budget of active planning items from Classic UI to Next Experience.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Definition > Scheduled Jobs**.
2. Filter the name field to locate and open **Migrate budget for active demands and projects**.
3. Select **Active** option to activate the schedule job.
4. Edit the fields on the Scheduled Script Execution form to customize the job and meet your requirements.
For more information about the field description and scripts, see [Automatically run a script of your choosing](#) .
5. Select **Execute Now** to execute the scheduled job or select **Update** to save your changes.

Activate scheduled job to create financial baselines for planning items

Activate and define a scheduled job to automatically create financial baselines for your planning items at a required cadence.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Definition > Scheduled Jobs**.
2. Filter the name field to locate and open **Create Financial Baseline For Planning Items**.
3. Select **Active** option to activate the schedule job.
4. Edit the fields on the Scheduled Script Execution form to customize the job and meet your requirements.
For more information about the field description and scripts, see [Automatically run a script of your choosing](#) .
5. Select **Execute Now** to execute the scheduled job or select **Update** to save your changes.

Activate scheduled job to generate labor costs for your planning items

Activate scheduled jobs to automatically generate labor costs for attribute-based resource assignments.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Definition > Scheduled Jobs**.
2. Filter the Name field to locate and open **Generate Labor Costs For Epic and other planning items**.
3. Select **Active** and on the Scheduled Script Execution form, fill the fields.

For a description of the field names, see [Scheduled Script Execution form to generate labor costs for planning items](#).

Note:

You can generate the labor costs for inactive planning items. Remove `true` in the following code line.

```
fundingEntityGr.addQuery('active', true);
```

4. Select **Update** to save your changes or **Execute Now** to run the scheduled job.

Activate scheduled job to populate to multicurrency fields

Activate and execute the scheduled job to map your costs and work with multicurrency.

Before you begin

- After upgrading from classic experience to the latest version, run this job once to populate the new investment currency fields for all existing projects. The job copies values from the corresponding demand currency or project currency fields. This ensures that financial data aligns with the updated multicurrency model.
- Role required: admin

Procedure

1. Navigate to **All > System Definition > Scheduled Jobs**.
2. Filter the Name field to locate and open **Update multi-currency fields to investment currency for existing demands and projects**.
3. Select **Active** and on the Scheduled Script Execution form, fill in the details.

For a description of the field names, see [Scheduled Script Execution form to generate labor costs for planning items](#).

4. Select **Update** to save your changes and execute the job as scheduled, or select **Execute Now** to run the scheduled job.

What to do next

When the job completes, review your project records to confirm that the investment currency fields are accurately populated.

Configure portfolio financials in Strategic Planning

Configuration details for properties and scheduled jobs to view and manage portfolio financials in Strategic Planning

Before you begin

Role required: admin

Procedure

1. Enable integration for an internal planning item type.
For more information, see [Generate default mapping configurations](#).
2. Activate the investment entities for Demands, Projects, and Epics.
For more information, see [Activate investment entities for planning items](#).
3. Enable the roll up system property to true to view financials.
For more information, see [Activate rollup property for projects to view portfolio financials](#).

4. Activate the data generation scheduled job to view portfolio financials.
For more information, see [Activate a scheduled job to generate data to view portfolio financials](#).

Activate investment entities for planning items

Activate the investment entitied for Demands, Projects, and Epics to view portfolio financials.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Definition > Tables**.
2. Filter the name field to locate and open the **Investment Entity** [sn_invst_pln_invst_funding_entity] table.
3. Select the **Show List** Related Link.
4. Set the Active field to **true** for Demand, Epic, and Project fields.

Name	Table	Owner field	Owner filter	Active	Fundable entities
Demand	Demand [dmn_demand]	demand_manager	Active = true	true	
Epic	Epic [sn_allgn_core_scrum_epic]	owner	Active = true	false	
Generic Bucket			Active = true	true	
Portfolio	Portfolio [pm_portfolio]	portfolio_manager	Active = true	false	
Program	Program [pm_program]	program_manager	Active = true	false	
Project	Project [pm_project]	project_manager	Active = true	true	
Project Task	Project Task [pm_project_task]	assigned_to	Active = true	true	

Activate rollup property for projects to view portfolio financials

Activate project cost rollup property to view the rolled up costs of top projects in portfolio financials.

About this task

Financial fields such as planned costs, forecasts, actual costs are rolled up from sub-projects to top projects upon setting this property to true.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Properties > All Properties**.
2. Filter the name field and select the **com.snc.project.rollup.cost** property.
3. Enter **true** in the Value field and select **Update**.

Activate a scheduled job to generate data to view portfolio financials

Activate and define **Data generation for financials in SPW/PPW** scheduled job to migrate budget from old data model to new data model and view portfolio financials.

About this task

It's a one-time activity to define and run this scheduled job to view portfolio financials.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Definition > Scheduled Jobs**.
2. Filter the name field to locate and open **Data generation for financials in SPW/PPW**.
3. Select the Active option to activate and schedule the job.
4. Edit the fields on the Scheduled Script Execution form to customize the job and meet your requirements.

For more information about the field description and scripts, see [Automatically run a script of your choosing](#).

5. **Optional:** Remove the condition 'active=true' to generate the financial data and work on costs for inactive planning items.
6. Select **Update** to save your changes and execute the job as scheduled, or select **Execute Now** to run the scheduled job.

Result

All the required mappings to view the portfolio financials for Epics, Demands, and Projects are mapped.

To validate if the data generation job is successful, navigate to **All > System Definition > Tables** and check the mappings for **Investment** record in the **Project** [sn_align_core_project] table.

Customizing Lists in Strategic Planning

You can add custom tables to the Lists menu in Strategic Planning Workspace and manage access to the newly created categories and lists.

Perform the following tasks to customize Lists and manage access to the newly created categories and lists in the Lists page of Strategic Planning Workspace:

- Add the **New** button to the APW List Menu Configuration page. For more information, see [Enable adding custom tables to the Lists menu](#).
- Add custom tables to the Lists menu. For more information, see [Customize Lists in Strategic Planning Workspace](#).
- Manage who can view the newly created categories and lists in the Lists page. For more information, see [Define audience for new lists in Strategic Planning](#).

Enable adding custom tables to the Lists menu

Add the **New** action button to the APW List Menu Configuration page, so that you can add custom tables to the Lists menu in Strategic Planning Workspace.

Before you begin

Role required: admin

Procedure

1. Navigate to **Workspace Experience > Actions & Components > List Actions**.
2. From the Action Assignments page, select **New** to create the action button.
3. On the form, fill in the fields.
For a description of the field values, see [Action Assignment form](#).
4. Select **Submit**.

Result

The **New** action button is added to the APW List Menu Configuration page.

What to do next

[Customize Lists in Strategic Planning Workspace.](#)

Customize Lists in Strategic Planning Workspace

Add custom tables to the Lists menu in Strategic Planning Workspace.

Before you begin

- Ensure that your application scope is set to **Portfolio Planning**.
- [Enable adding custom tables to the Lists menu.](#)

Role required: admin

About this task

Lists menu in the Workspace homepage helps planning managers quickly find a record that they need. By default, this view shows the list of entities of all the planning items and lens available for this ServiceNow instance. If your planning managers need more categories or lists, you can add them.

For more information of configuring lists in a workspace, see [Lists](#) .

Procedure

1. Navigate to **sys_ux_list_menu_config.list**.
2. From the UX List Menu Configurations list, select **APW List Menu Configuration**.
3. Select a new category or a new list.

 **Tip:**

Create a category first and then create a list.

4. On the form, fill in the fields.
 - [UX List Category form](#).
 - [UX List form](#).
5. Select **Submit**.
Repeat this procedure until you've created all the custom categories and lists.

What to do next

[Define audience for new lists in Strategic Planning.](#)

Define audience for new lists in Strategic Planning

Manage who can view the newly created categories and lists in the Lists page of Strategic Planning Workspace.

Before you begin

[Customize Lists in Strategic Planning Workspace.](#)

Role required: admin

Procedure

1. Navigate to **sys_ux_applicability_m2m_list.list**.
2. Select **New**.
3. On the form, fill in the fields.
For field information, see [List Applicability form](#).
4. Select **Submit**.

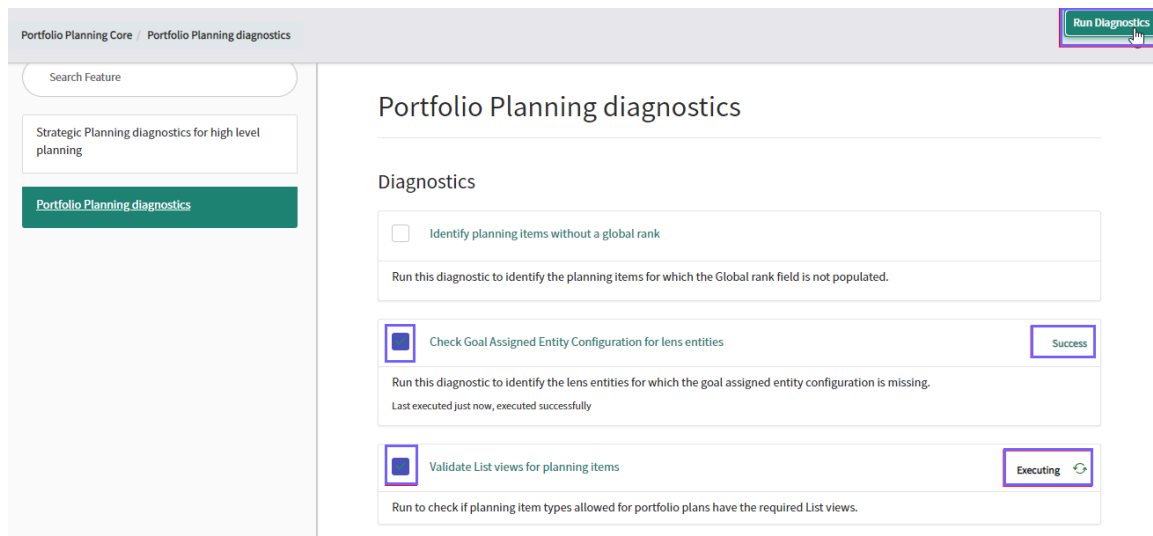

Strategic Planning diagnostics

Run diagnostic scans to identify and fix errors in the configuration and other common settings for Strategic Planning before your planning managers prioritize and roadmap work for their portfolio plans.

Strategic Planning diagnostic scans help you find discrepancies by validating the configuration for the following:

- Lens and lens structure
- Form views, list views, related list views, and workspace view rules for planning items
- Global ranking for planning items
- Portfolio plans
- Goals data
- high-level planning entities

The following are the default diagnostic scans available for Strategic Planning.

Strategic Planning diagnostics for high-level planning

Field	Description
Validate Rank configuration for the high-level planning entities	Verifies that entities enabled for high-level planning have a Rank configuration. If this test fails, see Create rank configuration for high-level planning to fix failure.

Field	Description
<p>Validate Form section views for high-level planning entities</p>	<p>Verifies that all the lens entities that are enabled for high-level planning have the required Form section views.</p> <p>If this scan fails, the result displays the Form section views that are missing for certain entities that are enabled for high-level planning.</p> <p>To learn how to fix these, see Create form views for new planning item tables in Strategic Planning.</p>
<p>Validate Related list views for high-level planning entities</p>	<p>Verifies that all the lens entities that are enabled for high-level planning have the required Related list views.</p> <p>If this scan fails, the result displays the Related List views that are missing for certain entities that are enabled for high-level planning.</p> <p>To learn how to fix these, see Create related list views for new planning item types in Strategic Planning.</p>
<p>Validate List views for high-level planning entities</p>	<p>Verifies that all the lens entities that are enabled for high-level planning have the required List views.</p> <p>If this scan fails, the result displays the List views that are missing for certain planning item tables.</p> <p>To learn how to fix these, see Create list views for new planning item tables in Strategic Planning.</p>
<p>Identify high-level planning entities enabled for planning, without a global rank</p>	<p>Identifies the number of high-level planning entities that do not have a global rank.</p> <p>If this scan fails, the result shows the planning items that do not have a global rank. Click Run Fix Script to populate a global rank to items for which this field is empty.</p>

Portfolio Planning diagnostics

The following are the diagnostic scans available to validate common configuration errors for planning items, goals, and portfolio plans:

Name of the scan	Description
Identify planning items without a global rank	<p>Identifies the number of planning items on the Prioritization List page, for which the global rank is not populated.</p> <p>If this scan fails, the result shows the planning items that do not have a global rank. Click Run Fix Script to populate a global rank to items for which this field is empty.</p>
Check Goal Assigned Entity Configuration for lens entities	<p>Identifies the lens entities for which the goal assigned entity configuration is missing.</p> <p>If this scan fails, the result shows the lens entities that don't have Assigned Entity Configuration.</p>
Validate List views for planning items	<p>Verifies that all the planning items that can be added to portfolio plans have the APW Prioritization and APW Default List views.</p> <p>If this scan fails, the result displays the List views that are missing for certain planning item tables.</p> <p>To learn how to fix these, see Create list views for new planning item tables in Strategic Planning.</p>
Validate Form section views for planning items	<p>Verifies that all the planning items that can be added to portfolio plans have the APW Prioritization, APW Default, and APW New form views.</p> <p>If this scan fails, the result displays the Form section views that are missing for certain planning item tables.</p> <p>To learn how to fix these, see Create form views for new planning item tables in Strategic Planning.</p>
Validate Related list views for planning items	<p>Verifies that all the planning items that are allowed on portfolio plans have the APW Default Related list view.</p> <p>If this scan fails, the result displays the Related list views that are missing for certain planning item tables.</p>

Name of the scan	Description
	<p>To learn how to fix these, see Create related list views for new planning item types in Strategic Planning.</p>
<p>Validate Workspace view rule for Default view of planning items</p>	<p>Verifies that all the planning items that are allowed on portfolio plans have the Default view's workspace view rule.</p> <p>If this scan fails, the result displays the Default view rule is missing for certain planning item tables.</p> <p>To learn how to fix these, see Create workspace view rules for new planning item forms in Strategic Planning.</p>
<p>Validate the goal relationships for assigned entities</p>	<p>Identifies if there are any m2m goal relationships defined for assigned entities.</p> <p>If this scan fails, the result displays the goals that do have m2m goal relationships any assigned entity table. You can run the <i>Migrate goal relationships for assigned entities</i> scheduled job to migrate the existing goal relationship data from the Goal Relationship [sn_gf_goal_m2m_relationship] table to the Goals table. For more information, see Migrate goal relationships for assigned entities.</p>
<p>Validate Workspace view rule for APW Default view of planning items</p>	<p>Verifies that all the planning items that are allowed on portfolio plans have the APW Default view's workspace view rule.</p> <p>If this scan fails, the result displays the APW Default view rule is missing for certain planning item tables.</p> <p>To learn how to fix these, see Create workspace view rules for new planning item forms in Strategic Planning.</p>
<p>Validate invalid fields in the Portfolio Plan configuration</p>	<p>Finds any invalid fields in the portfolio plan configuration records for all existing portfolio plans.</p> <p>If this scan fails, click Run Fix Script to remove the identified invalid fields.</p>
<p>Validate Portfolio Plan Configuration for all the portfolio plans</p>	<p>Verifies if each existing portfolio plan created in your instance has a valid portfolio plan configuration.</p>

Configuring Strategic Planning with PPM, Agile 2.0, and SAFe

Understand the process required to set up Strategic Planning to work with Agile Development 2.0, Scaled Agile Framework, Next Experience for Demand Management, and Project Portfolio Management.

Configuration workflow

Use the following steps as guidelines for your Strategic Planning with PPM, Agile 2.0, Next Experience for Demand Management, and SAFe setup process. Some of these steps require the admin role (sn_align_core.apw_admin) and some require the user role (sn_align_core.apw_user).

1. [Create an alignment integration](#)
2. [Generate default mapping configurations](#)
3. [Create custom mapping configurations](#) (Optional)

Guided Setup

After installing Strategic Planning, you can use the guided setup to help you with the required configuration. To open the guided setup, navigate to **Strategic Planning > Guided Setup**.

Create an alignment integration

Once you have Strategic Planning installed, the **ServiceNow Internal** Alignment integration is created by default. In case the alignment integration is not available, you can create your alignment integration type.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > Strategic Planning > Integrations**.
2. Verify if the **ServiceNow Internal** alignment integration exists.
3. If not, click **New** to create an alignment integration.
4. In the **Name** field, enter the name of the alignment integration.
Alternatively, you can also click **Create ServiceNow Internal Integration** from the related links to create an internal alignment integration.
5. Click **Submit**.

Generate default mapping configurations

Generate default mapping configurations to create table maps for the available applications.

Before you begin

Role required: sn_align_core_apw.admin

Procedure

1. Navigate to **All > Strategic Planning > Integrations**.
2. Click **ServiceNow Internal** to view the alignment integrations for the internal applications.
3. Click **Generate Default Mapping Configurations** to create the table maps for the available applications.
Table mapping for the planning item types such as Epic, Demand, Project, and project task are generated and the alignment mappings are displayed in the Table Maps related list. See

the following table for details on the list of table maps that are created for the respective applications.

Application installed	Table maps created
Project Portfolio Management	Projects, project tasks (for milestones), demands, and idea
Agile Development 2.0	Epics
SAFe	SAFe epic

Note:

Mapping configurations consist of table, field, and choice maps for each record.

Default mapping configurations

Execution table	Alignment table	Active
dmn_demand	Demand [sn_align_core_demand]	true
pm_project	Project [sn_align_core_project]	true
im_idea_core	Feedback [sn_align_core_feedback]	true
pm_project_task	Milestone [sn_milestones_milestone]	true
rm_epic	Epic [sn_align_core_scrum_epic]	true

Create custom mapping configurations

Create mapping configurations for planning items that are not created by default such as features, stories, etc.

As an admin, you can choose to create table maps, field maps, and choice maps for the planning items that are not created by default. For more information, see:

1. [Create a table map](#)
2. [Create a field map](#)
3. [Create a choice map](#)

Create a table map

Create a table map to define the mapping between tables in Strategic Planning with the tables in Agile Development 2.0, SAFe, and PPM.

Before you begin

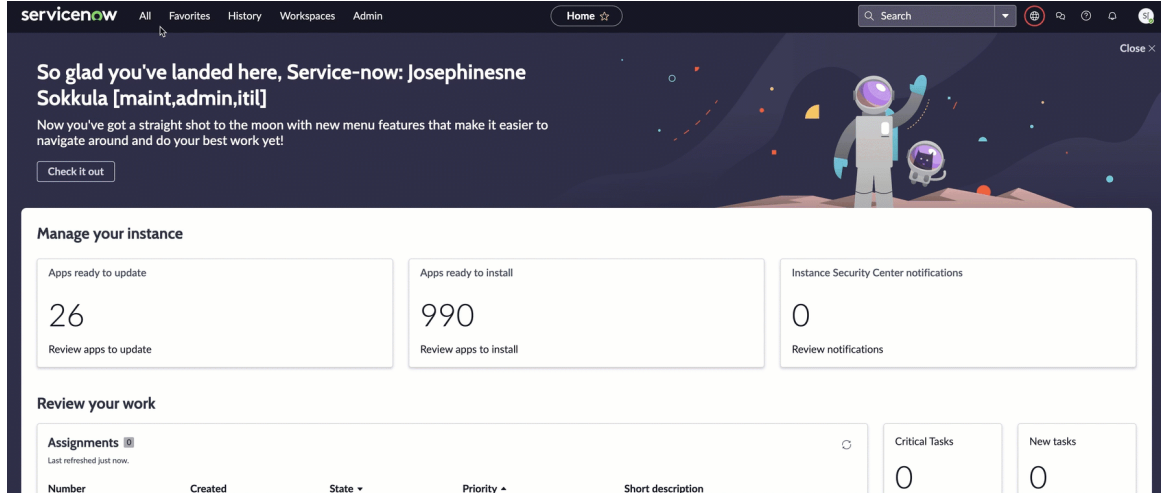

Role required: sn_align_core.apw_admin

Procedure

1. Navigate to **All > Strategic Planning > Integrations**.
2. Select **ServiceNow Internal**.
3. Create a new table map by selecting **New** in the **Table maps** tab.
4. In the [Table map form](#), fill in the fields.

5. Select **Submit**.

Create a new table map

Result

A new table map is created with your alignment and execution table configurations.

Note:

To create or update a table map for a planning item type other than demand or project, the SPM Pro license is required. Contact your administrator for more details.

What to do next

Create a business rule to support export of this new table map configuration to Agile Development 2.0, SAFe, or PPM. For more information, see [Create a business rule to apply a custom table map configuration](#).

Create a business rule to apply a custom table map configuration

Create a business rule to enable import for your new custom table map configuration from Agile Development 2.0, SAFe, and PPM applications.

Before you begin

Role required: sn_align_core_apw.admin

About this task

After you create a custom table map in Strategic Planning integrations, create a business rule similar to 'Sync Data from Execution to Alignment' business rule in the rm_epic or dmn_demand tables.

Note:

Ensure that the business rule is created in the execution application, such as Agile Development 2.0, SAFe, or PPM.

Procedure

1. Navigate to **All > System Definition > Business Rules**.
2. From the list of available business rules, locate and open the Sync Data from Execution to Alignment rule.
3. From the context menu (☰), perform an Insert and Stay operation on this business rule. If you have not enabled the **Insert and Stay** action in your ServiceNow instance, see [Allow insert options on records](#).
4. On the business rule form, edit the following fields.

Business rule form

Field	Description
Name	<p>Unique name for the business rule.</p> <p>For example, if your new table map is to map demands, name this rule as Sync Demands with Strategic Planning.</p>
Table	<p>Select the table for which you've created the custom map.</p> <p>For example, Feature [sn_safe_feature].</p>

5. Click Update.**Create a field map**

Map the fields for each table map from Strategic Planning to Agile Development 2.0, SAFe, Project Portfolio Management and vice-versa.

Before you begin

Ensure that you have created a table map for an alignment integration record. For more information, see [Create a table map](#).

 Note:

If the execution field type is 'Reference' and the alignment field type is 'String', then the sync will not work.

Role required: sn_align_core.apw_admin

Procedure

1. Navigate to **All > Strategic Planning > Integrations**.
2. Select **ServiceNow Internal**.
3. In the **Table Maps** related list, select the table map for which you want to create a field map.
4. Create a new field map by selecting **New** in the Field Maps tab.
5. In the [Field map form](#), fill in the fields.
6. Click **Submit**.

Create a choice map

Map the choice list for each field map for fields with a list of values from Strategic Planning to Agile Development 2.0, SAFe, Project Portfolio Management and vice-versa.

Before you begin

Ensure that you have created a field map and it contains choice fields with a list of values. For more information, see [Create a field map](#).

Role required: sn_align_core.apw_admin

Procedure

1. Navigate to **All > Strategic Planning > Integrations**.
2. Select **ServiceNow Internal**.
3. In the **Table Maps** related list, select the table map which has the fields for which you want to create a choice map.
4. In the **Field Maps** related list, select a relevant field map for which you want to create a choice map.
5. Create a new choice map by selecting **New** in the Choice Maps tab.
6. In the [Choice map form](#), fill in the fields.
7. Click **Submit**.

Configure bulk import

This system property enables you to update the bulk import functionality in Strategic Planning with PPM, Agile 2.0, and SAFe.

Before you begin

Role required: `sn_align_core.apw_admin`

Procedure

1. Enter `sys_properties.list` in the navigation filter.
2. Search for `com.sn_align_cmn_int.bulk_import`.
3. Set the property value to either of the following options.
When the records are imported from PPM, Agile Development 2.0, or SAFe to Strategic Planning, only the last comment will be imported.

Working with Teamspaces

Strategic Planning can be integrated with Project Portfolio Management's Teamspaces to access and manage relevant projects and demands with the corresponding planning item records.

You must activate a teamspace plugin to use the teamspace feature. The following teamspace plugins are available:

- Project Management TeamSpace 1 (`com.snc.ppm_teamspace_1`)
- Project Management TeamSpace 2 (`com.snc.ppm_teamspace_2`)
- Project Management TeamSpace 3 (`com.snc.ppm_teamspace_3`)
- Project Management TeamSpace 4 (`com.snc.ppm_teamspace_4`)
- Project Management TeamSpace 5 (`com.snc.ppm_teamspace_5`)

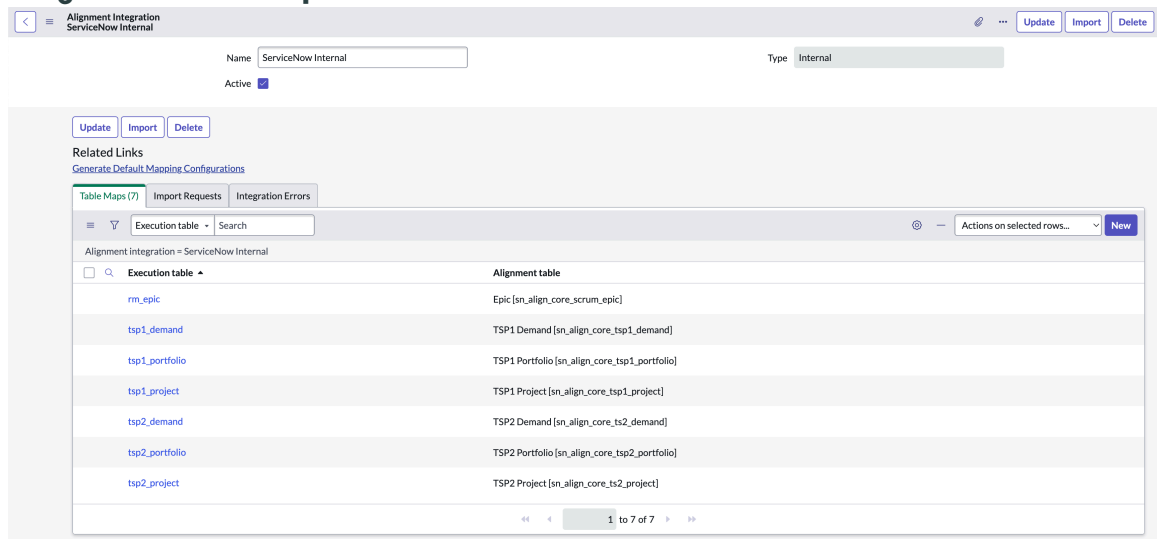

The teamspaces installed with these plugins contain the same components, but the components have different prefixes. For example, teamspace 1 includes a project table named **TeamSpace_1 Project [tsp1_project]** and teamspace 5 includes a project table named **TeamSpace_5 Project [tsp5_project]**.

Also, the corresponding teamspace role must be added to the Strategic Planning admin (`sn_align_core.apw_admin`) role. For example, `tsp1_portfolio_manager` for teamspace1, `tsp2_portfolio_manager` for teamspace2 and so on.

To integrate teamspaces with Strategic Planning records:

1. Create one alignment integration for all the teamspace. On the alignment side, create extended tables to store individual teamspace table data (like TSP1 Portfolio [sn_align_core_tsp1_portfolio], TSP1 Demand [sn_align_core_tsp1_demand], TSP2 Project [sn_align_core_tsp2_project], and so on).
2. In the alignment integration, map the extended tables you have created in Step 1, to the respective teamspace tables (like tsp1_portfolio, tsp1_demand, tsp2_project, and so on).

Integration with Teamspace

Managing portfolio plans in Strategic Planning Workspace

Create personalized portfolio plans in Strategic Planning Workspace and enable focused planning of work in the desired perspective (lens) to drive alignment.

The following sections guide you on creating, updating, sharing, and collaborating with portfolio plans in Strategic Planning Workspace.

Create a high-level portfolio plan

Build a portfolio plan for high-level strategic items in the Strategic Planning Workspace so that you can prioritize, roadmap, and manage work aligned to these strategic items.

Before you begin

Role required: sn_align_core.apw_user or business_stakeholder

About this task

By default, you can select the Strategic Investments lens and use Initiatives or Strategic Programs, or select the Project Program lens and use Programs as your high-level planning items. You can also select the Digital Product lens and use the Product Enhancement entity for high-level planning. If you want to plan using a different item, work with your admin to enable those items in your ServiceNow instance. For more information on the configuration, see [High-level planning configuration in Strategic Planning](#).

In this task, select a lens, add conditions to filter the planning item data that you need, and enter additional details to build a portfolio plan.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Portfolio Planning**.
2. From the Portfolio Plans page, select **New**.
If there are no existing portfolio plans, select **Create your first portfolio plan**.
3. Select a lens for your high-level planning.

By default, the Strategic Investments and Project Program lenses are enabled for high-level planning.

Note:

Don't select Goals lens because the Goal [sn_gf_goal] table doesn't support high-level planning.

The Create portfolio plan wizard is shown.

4. Make your selections by using the Create portfolio plan wizard.

- a. For the selected lens, choose the type of work that you want to plan.

For example, you want to manage work for initiatives in your company. Select Initiatives as your high-level planning item. This enables you to plan for initiatives and review the work aligned to these initiatives.

What are you planning in Strategic Investments?

Your lens structure: **Company** → **Strategic Priority** → **Initiative** → **Strategic Program** → **Work items**

Select the item you want to see on your planning board. You can only choose one type.

- Initiative
- Strategic Program
- I manage work items: Demand, Project

- b. Add conditions to further filter the data of your planning items.

For example, you're responsible for the initiatives of the Customer Support department. You can set a condition to filter initiatives of only the Customer Support department from the Initiative table.

You can also add multiple conditions to help you set a complex filter and add the right information to your portfolio plan.

- c. Fill in the details of the portfolio plan.

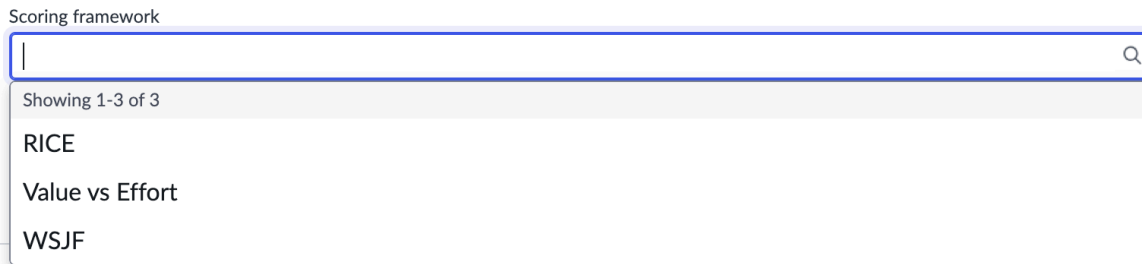

Provide the information of the portfolio plan's name, owner, start and end dates, and description.

d. Select a scoring framework using the drop-down values or from the Scoring framework window.

To create a custom scoring framework for your portfolio plan, select **Explore scoring**

Scoring

Select a framework to score items, that helps in ranking and prioritizing them. [Explore scoring frameworks](#)

frameworks.

Use the **Previous** and **Next** buttons to navigate between the steps.

5. Select **Create**.

Result

The portfolio plan is created and the page is refreshed to show the Goals, Scoring, and Planning pages. You can view the list of all portfolio plans that you own or shared with you from the Home page.

What to do next

- Define goals for your portfolio plan and align work to them. See [Managing portfolio plan goals in Strategic Planning Workspace](#).
- Analyze the backlog and prioritize work for your portfolio plan. See [Prioritizing portfolio plan work in Strategic Planning Workspace](#).
- Show or hide features for your portfolio plan according to your requirement while sharing a portfolio plan with your stakeholders. See, [Show or hide the features for a portfolio plan](#).

Create a portfolio plan

Use lens and build a personalized portfolio plan in Strategic Planning Workspace so that you can start to prioritize and align work.

Before you begin

Role required: sn_align_core.apw_user or business_stakeholder

About this task

Use a four-step wizard to select a lens, add conditions to filter the planning items that you need, and enter additional details to create a portfolio plan.

(For Enterprise Architecture Workspace users only) You must install Enterprise Architecture Workspace to create a portfolio plan using the Business Capability lens. You must have the sn_apm.apm_user role to create a portfolio plan using the Business Capability lens.

This task guides you on creating a regular work item-level portfolio plan. To create high-level portfolio plans, see [Create a high-level portfolio plan](#).

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Portfolio Planning**.
2. From the Portfolio Plans page, select **New**.

If there are no existing plans, select **Create your first portfolio plan**.

3. Make your selections by using the Create Portfolio plan wizard.

a. Select a lens.

b. For the selected lens, choose an entity type and the desired entities of that type.

The entity type represents the level that you plan your work in.

For example, to plan work for the HR department, select the **Organization** as lens, **Department** as your entity type, and **HR** from the list of departments. This selection ensures that only the work associated with the HR department is added to your portfolio plan.

c. Select the type of planning items that you want to include in your portfolio plan.

You can further filter the planning item data with additional conditions.

For example, to plan and track progress for all HR projects created this year, select **Project** as your planning item and add a condition to filter all the HR projects created this year.

You can also add multiple conditions to set a complex filter and add the right planning items to your portfolio plan.

Add filters

Select the relevant planning item types.

Demand

Project

Apply filters to narrow the results for all selected planning item types.

Created ▼ at or after ▼ This year ▼ or and ×

+ New condition set

d. Fill in the details of the portfolio plan.

Provide the portfolio plan's name, owner, start and end dates, and description.

Important: The start and end dates for your portfolio plan act as a date range filter for all the planning items that get added to the plan.

For example, if your portfolio plan spans from March 1, 2023, to July 6, 2024, then the projects approved with start and end dates in Feb 2023 won't appear in the plan, despite meeting the "created in 2023" criteria.

- e. Select a scoring framework using the drop-down values or from the Scoring framework window.

To create a custom scoring framework for your portfolio plan, select **Explore scoring**

Scoring

Select a framework to score items, that helps in ranking and prioritizing them. [Explore scoring frameworks](#)

Scoring framework

Showing 1-3 of 3

- RICE
- Value vs Effort
- WSJF

frameworks.

You can use **Previous** and **Next** to navigate between the steps.

4. Select **Create**.

Result

The portfolio plan is created and the page is refreshed to show the Goals, Scoring, and Planning pages for this new portfolio plan. You can view the list of all portfolio plans that you own or are shared with you from the Home page.

Planning items that meet the following criteria appear in the portfolio plan:

- Planning items that belong to one of the entity types selected in Step 3(b)
- Planning items that match the planning item types selected in Step 3(c)
- Planning items with an approved start date or an end date that falls within the portfolio plan timeline
- Planning items that don't have both Approved start and Approved end dates

i Note:

If any demands were converted into projects in Project Portfolio Management, only the resulting project planning items (converted from demands) appear in the portfolio plan.

What to do next

- Define goals for your portfolio plan and align your work to them. See [Managing portfolio plan goals in Strategic Planning Workspace](#).
- Analyze the backlog and prioritize work for your portfolio plan. See [Prioritizing portfolio plan work in Strategic Planning Workspace](#).
- Show or hide features for your portfolio plan according to your requirement while sharing a portfolio plan with your stakeholders. See, [Show or hide the features for a portfolio plan](#).

Duplicate a portfolio plan

Create a portfolio plan with the data of an existing portfolio plan. If the portfolio plan you want to create is similar to an existing portfolio plan, duplicating the existing portfolio plan saves your

time. You can also duplicate portfolio plans that were shared with you either with view or edit access.

Before you begin

Role required: sn_align_core.apw_user or business_stakeholder

About this task

The **Duplicate portfolio plan** option copies the selected portfolio plan with its all data (Goals, Prioritization, and Roadmap) into the portfolio plan. It also preserves all dependencies and relationships among the copied items and their child items.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Portfolio Planning**.
2. From the list of portfolio plans, select one.
3. From the portfolio plan header, select the More actions icon () and then select **Duplicate portfolio plan**.
4. On the Duplicate portfolio plan window, fill the details.
 - a. Enter a name for the portfolio plan in the **Portfolio plan name** field.
By default, the name is *ABC (Copy)* where ABC is the name of the portfolio plan you copied from.
 - b. **Optional:** Select **Share with same users and groups** option to grant access to the users of the portfolio plan you copied from.
The action grants the same read and edit access as is the users had for the portfolio plan you copied from.
 - c. Select **Confirm**.

Result

The new portfolio plan is created and a link is generated on the screen to access the new portfolio plan.

What to do next

- View or update the goals for your portfolio plan according to the new portfolio plan. See [Managing portfolio plan goals in Strategic Planning Workspace](#).
- Analyze the backlog and prioritize work for your portfolio plan. See [Prioritizing portfolio plan work in Strategic Planning Workspace](#).
- Show or hide features for your portfolio plan according to your requirement while sharing a portfolio plan with your stakeholders. See, [Show or hide the features for a portfolio plan](#).

Modify a portfolio plan

Update the details of a portfolio plan in Strategic Planning Workspace or delete it, to reflect the changes in your planning priorities.

Before you begin

[Create a portfolio plan](#).

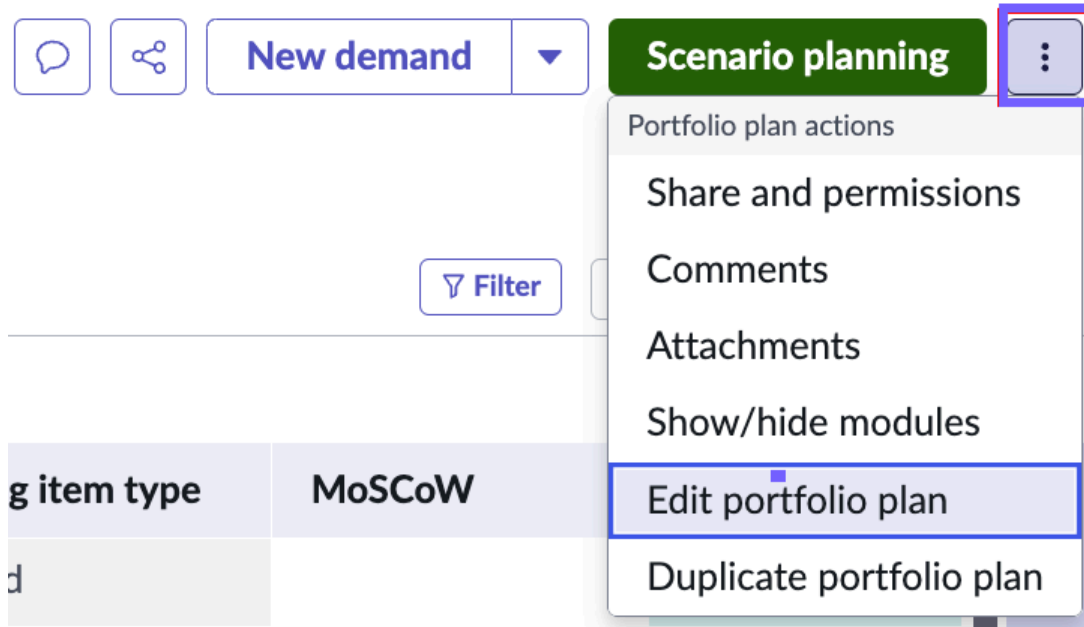

Role required: sn_align_core.apw_user or business_stakeholder

About this task**Note:**

Only the owner or editors of a portfolio plan can modify it.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Portfolio Planning**.
2. From the list of portfolio plans, select one.
3. From the portfolio plan header, select the More actions icon (⋮).

4. Update the details of the portfolio plan or delete it.

Related topics

- [Show or hide the features for a portfolio plan](#)

Show or hide the features for a portfolio plan

As a portfolio manager, show or hide the features (for example, Goals, Scoring, Prioritization, Roadmap, and so on) for your portfolio plan as needed so that you can share only the required data with your stakeholders.

About this task

Hiding features for your portfolio plan helps you share only the data that matters to your stakeholders and restrict access to the other data in your portfolio plan.

Note:

When you [share a portfolio plan with your stake holder](#) providing view access and hiding a feature (for example, Scoring), the viewer can only view the enabled features and can't see the hidden feature (Scoring) in the shared portfolio plan. However, when you share a portfolio plan providing edit access, the editor can enable or hide the features as required and can view and edit any data in the shared portfolio plan.

Before you begin

[Create a portfolio plan.](#)

Role required: sn_align_core.apw_user or business_stakeholder

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Portfolio Planning.**
2. From the list of portfolio plans, select the portfolio plan for which you want to show or hide the features.
3. From the left pane of the portfolio plan, select **Show/hide modules.**
4. On the Show/hide modules window, select the modules and features that you want to show and deselect the modules and features that you want to hide.

[Share a portfolio plan with stakeholders](#)

Share a portfolio plan with stakeholders

Share your portfolio plan with stakeholders and other planning managers so that they have visibility into the plan's progress and start collaborating.

Before you begin

- [Create a portfolio plan.](#)
- Users or groups that you want to share the portfolio plan with must have the sn_align_core.ap_read_only or sn_align_core.apw_user role to get the read or edit access to the portfolio plan respectively.

Role required: sn_align_core.apw_user or business_stakeholder

About this task

Select individual users or groups to share the portfolio with.

When you share a portfolio plan with an individual user or a group, they can access the following data of the portfolio plan:

- Planning page
 - Prioritization, Roadmap, Kanban, Hierarchy tabs by default
 - Capacity tab if the user has the sn_align_ws.spw_capacity_user or sn_align_ws.spw_capacity_read role
 - Financials tab if the user has sn_align_ws.spw_financial_user role
- Goals page if the user has the sn_apw_advanced.spw_goal_user role
- Scoring page if the user has the sn_align_core.apw_user role

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Portfolio Planning**.
2. From the list of portfolio plans, select one.
3. From the portfolio plan header in the Planning page, select the **Share portfolio plan** icon ().

Note:

Alternatively, you can select Share actions icon () and then select **Copy link** to copy a direct link to the portfolio plan that you can share with other users. The link provides access only to users who already have the required permissions.

4. On the Share portfolio plan form, select users to share the portfolio plan with and set their access appropriately.
 - a. In the **Members or Groups** field, enter the names of individual users or groups.
 - b. From the **Access** field, select the access level as **Viewer** or **Editor** for the selected names.
 - An editor can view and change the portfolio plan's settings and data.
 - A viewer can comment and add attachments to the portfolio plan, but cannot modify the portfolio plan's settings or data.

Note:

Even if a user has the sn_align_core.apw_user role, they cannot edit planning item data from the portfolio plan grid view or side panel when granted view-only access. However, users with the sn_align_core.apw_user role can edit planning items and related tables from the record page.

5. Select **Send invite**.

Result

The selected individual and group users are notified of the portfolio plan sharing through an email.

What to do next

[Collaborate on a portfolio plan.](#)

Change the access level or remove access for a user or a group.

1. From the portfolio plan header, select Share actions icon () and then select **Manage access**.
2. From the user or group card, select the Action Menu icon ()
3. Select the right access level or select **Remove**.

Related topics

Scoring planning items in Strategic Planning Workspace

Evaluate the work in your portfolio plans using scoring frameworks in Strategic Planning Workspace. Determine the priority and feasibility of planning items using the scores assigned to them so that you can make informed decisions about resource and finance allocations.

The following sections guide you on scoring and ranking the items in your portfolio plan in Strategic Planning Workspace.

Score items in a portfolio plan

Score your items using the Scoring framework attributes that generate a score, that helps in prioritizing and ranking the items in your portfolio plan.

Before you begin

Role required: sn_align_core.apw_user

Procedure

1. Navigate to **All > Strategic Planning > Strategic Planning Workspace**.
2. Select to open the portfolio plan for which you want to start scoring.
If you don't have a scoring framework assigned to your portfolio plan:
 - a. Select the more actions icon ().
 - b. Select **Edit portfolio plan**.
 - c. Navigate to the **Add Details** step.
 - d. Select a framework for your portfolio plan.

Note:

The scoring framework selection is available only for planning items.

3. Select **Scoring**.
4. Enter values for each of the scoring framework attributes.

Reach ⓘ	Impact ⓘ	Confidence ⓘ	Effort ⓘ	RICE score ⓘ	Scoring framework
<input type="text" value="I"/>	☆☆☆☆☆				RICE
	☆☆☆☆☆				RICE
	☆☆☆☆☆				RICE

To learn about the scoring framework attributes and the scoring formula, select the information icon (ⓘ) for each of the fields.

Result

The score for each item is populated based on the scoring attribute values and calculation formula.

Note:

To generate a final score for a pre-defined scoring framework, all the attributes of a scoring framework need to have values.

Related topics

Rank items in a portfolio plan

Assign ranks to the items based on the planning item attributes and scoring framework attributes such as Planned Cost, Moscow, Priority, Score, and so on.

Before you begin

Role required: sn_align_core.apw_user

Procedure

1. Navigate to **All > Strategic Planning > Strategic Planning Workspace**.
2. Select to open the portfolio plan for which you want to start ranking of items.

3. Select **Planning**.
4. Select **Rank items** in the Prioritization view.
5. Select an attribute using the drop-down list.
For example, if you want to rank your items based on confidence, select **Confidence** as an attribute. You can rank on choice and number type attributes of a planning item.
6. Choose the order in which you want the items to be ranked.
7. Select **Apply**.

Result

The items in your portfolio plan are ranked based on your ranked attribute.

Export planning items data from Scoring to Excel or CSV

Export the data of portfolio plan items from your portfolio plan into a Microsoft Excel or CSV file. You can share this data and collaborate with your business stakeholders.

Before you begin

Role required: sn_align_core.apw_user

Procedure

1. Navigate to **All > Strategic Planning > Strategic Planning Workspace > Portfolio Planning**.
2. From the list of portfolio plans, select one and then select **Scoring**.
3. Verify that the columns you want to export are personalized.

Note:

If the filters are applied on the view, the filtered data is exported.

4. Use the personalized side panel to export the data of your portfolio plan items.

a. Select Export icon ().

b. From the **File type** drop-down on the Export window, select **Excel** or **CSV** to export the data to a Microsoft Excel or CSV file respectively.

A file with the selected format is exported. By default, the name of the file is *ABC_Scoring_List* where ABC is the name of the portfolio plan you exported the data from.

Managing portfolio plan goals in Strategic Planning Workspace

Create goals for your portfolio plans, set targets for them, and evaluate the progress of the goals and targets in Strategic Planning Workspace to accomplish your organizational plans and drive business outcomes.

[https://player.vimeo.com/video/1089949088?](https://player.vimeo.com/video/1089949088?h=313cb311d3&badge=0&autoplay=0&player_id=0&app_id=58479)

[h=313cb311d3&badge=0&autoplay=0&player_id=0&app_id=58479](https://player.vimeo.com/video/1089949088?h=313cb311d3&badge=0&autoplay=0&player_id=0&app_id=58479)

The Goals view in the Strategic Planning Workspace gives you an overview of your goals and their targets with the Dashboard, List, and Hierarchy tabs. The Dashboard tab (formerly known as the Overview tab) provides a summary of all your goals in a particular portfolio plan. The List tab helps you view, create, and manage your goals and targets of the particular portfolio level. The Hierarchy tab helps you view the goals and targets of the portfolio plan entities in a hierarchical manner. This tab also helps you view the goals of the parent entities (of the portfolio plan entities) along with the goals and targets of the current portfolio plan.

Roles required for managing goals

Access level	Required roles
Read access to Goals	<ul style="list-style-type: none"> • sn_align_core.apw_user • sn_apw_advanced.spw_goal_user_read
Edit access to Goals	<ul style="list-style-type: none"> • sn_align_core.apw_user • sn_apw_advanced.spw_goal_user

Portfolio plan details section in the Goals view

The portfolio plan details section in the Goals view provides the portfolio plan details along with options to manage the portfolio plan and create goals. The header section is the same for all tabs in the Goals view.

From the Portfolio plan details section, you can:

- [Create goals](#) for your portfolio plan.
- [Share your portfolio plan](#) with stakeholders and other planning managers so that they have visibility into the progress of the plan and can start collaborating.
- [Collaborate with stakeholders](#) and drive shared outcomes by adding comments and attachments to your portfolio plan so that users can review and share their feedback.
- Customize the widgets and cards that you want to view on the Dashboard tab using the Settings icon (⚙️). This setting is available only when the Dashboard tab is selected.

i Note:

Only users with access to edit the portfolio plan can customize the widgets and cards.

Example Header section in the Goals view

Dashboard tab in the Goals view

The Dashboard tab has multiple widgets that help you drill down in the goals and targets, see their details, and manage them. The following figure shows a sample goals list and indicates the different features for goals in Strategic Planning Workspace on the Dashboard tab.

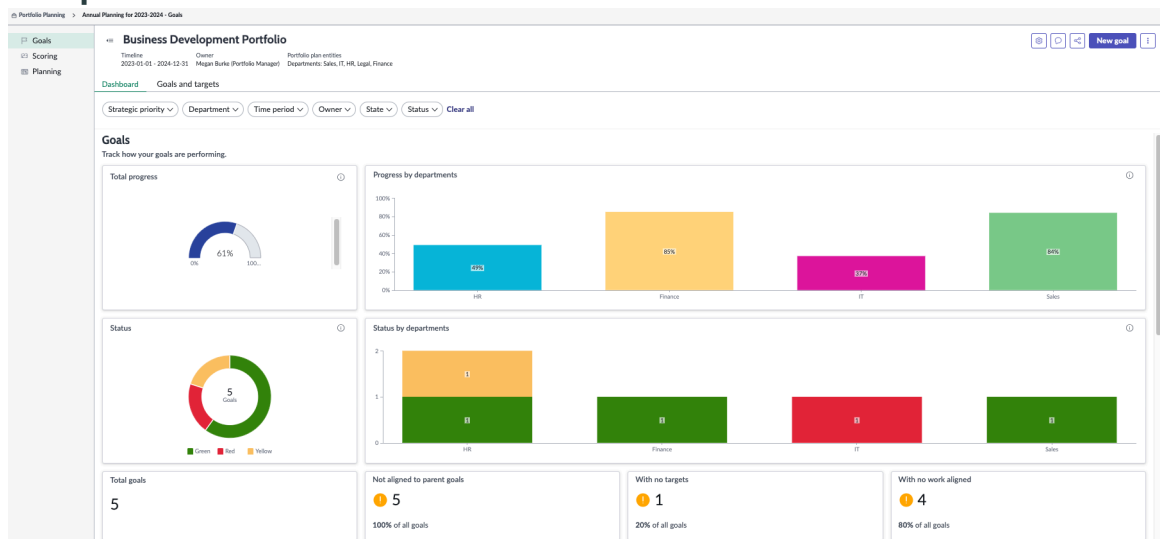

- **Goals:** A section with multiple widgets that help you view and manage your goals and targets defined for the portfolio plan.
 - **Total progress:** Displays the average progress of all the goals from all the entities of the portfolio plan.
 - **Progress by <entity type of the portfolio plan>:** Displays the average progress (in percentage) of total goals by each entity type of the portfolio plan. For example, if the portfolio plan is of entity type department, the widget shows the average progress of total goals in each department.

- Status: Displays your goals based on their status (example, Red, Green, and Yellow).
- Status by <entity type of the portfolio plan>: Displays your goals status by each entity type of the portfolio plan. For example, if the portfolio plan is of entity type department, the widget shows the goals status in each department.
- Total goals: Displays the number of total goals defined for the portfolio plan.
- Not aligned to parent goals: Displays the goals that aren't directly associated with its parent goal or any of the entities of the portfolio plan. Associate such goals with the parent goal or the entities so that the effort is visible.

Note: Associating a goal with the parent goal is optional.

- With no targets: Displays the goals that don't have targets set for them. Set targets for such goals to achieve them.
 - With no work aligned: Displays the goals that aren't associated with work. You can associate work items (Project, Demand, and Epic) with goals so that the work being done to accomplish goals and meet targets is easily visible.
- The "Not aligned to parent goals," "With no targets," and "With no work aligned" cards help you review and define the goals in the system properly from the alignment perspective. After goals are defined and aligned, you can choose to hide these cards.

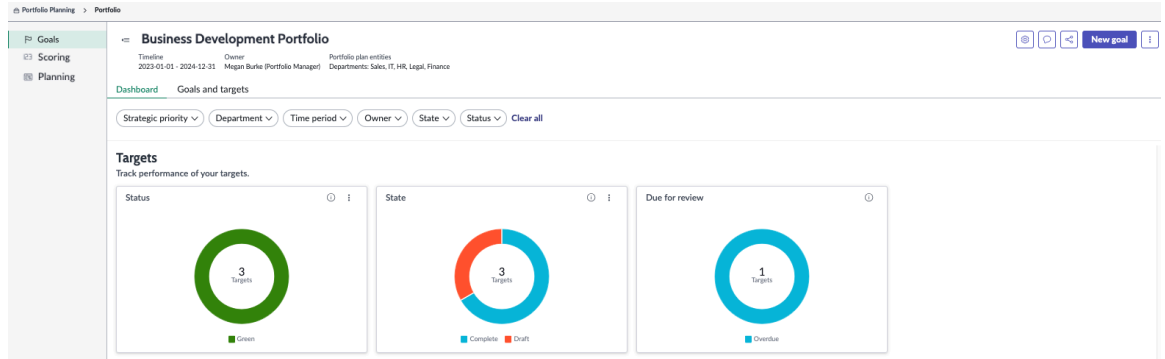

Example Goals section on the Dashboard tab

- **Targets:** A section with multiple widgets that help you view and manage your targets set for the portfolio plan.
- Status: Displays your targets based on their status. The status indicates whether the target is likely to be completed by the planned end date.
- State: Displays the state of the targets from all the entities of the portfolio plan.

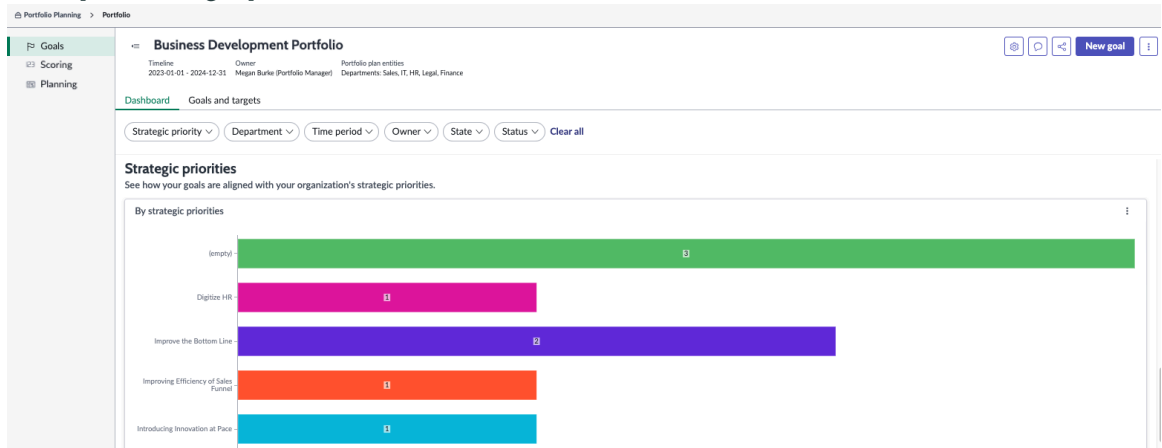

- Due for review: Displays the targets that are due in a week or already overdue from their respective review due date perspective. The **Check-in due date** field on the target form helps you to update your targets periodically based on their check-in frequency.

Example Targets section on the Dashboard tab

- Strategic priorities: A section with the By strategic priorities widget that helps you view how your goals are aligned with your organization's long-term strategies and manage them.

Example Strategic priorities section on the Dashboard tab

Filtering data of the portfolio plan

Use the filtering options on the Dashboard tab to filter the data of the goals and targets by their Strategic priority, entity type of the portfolio plan, Time period, Owner, State, and Status, so that you can focus on the particular

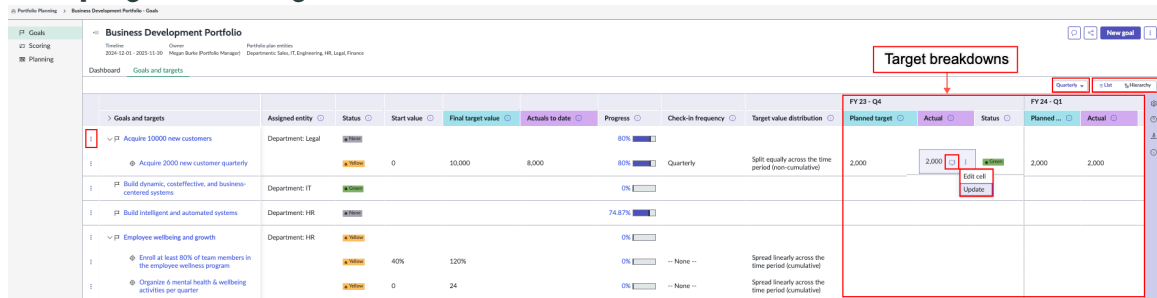

information.

List view in the Goals and targets tab

The List view helps you view, create, and manage your goals and targets of the particular portfolio plan. The List tab hides the downstream and upstream goals, enabling you to focus on only the goals and targets of the current portfolio plan. The List tab helps you update the actual values for your target breakdowns directly. However, you can view the downstream and upstream goals and targets from the Hierarchy tab. The following figure shows a sample goals list and indicates the different features for goals in Strategic Planning Workspace on the List tab.

- The row context menu icon (⋮) gives you options for managing a goal such as create subgoal, set target, and align work for the selected goal.
- Assigned entity: Name of the entity to which the goal belongs.
- Personalize: Helps you customize the columns that you want to view on the List tab. Select the settings icon (⚙️) to enable the columns that you want to view on the List tab.
- Check-in frequency: Specifies the breakdown interval for the target. Breaking down the target into smaller periods (example, Quarterly) helps you set targets for each quarter and focus on the specific breakdown targets.
- Add remarks icon (🗨️): Specifies the remarks that were entered by the user for business justification when updating the breakdown actuals. Selecting the Remark icon opens the breakdown side panel with Details and Comments tabs.
- Target breakdowns: Helps you view the details of target breakdowns in yearly or quarterly intervals. You can also enter or update the actual values in this window.
- Quarterly / Yearly: Helps to customize the view of target breakdowns quarterly or yearly.

Example goals and targets view on the List tab

Hierarchy view in the Goals and targets tab

The Hierarchy view helps you view the goals and targets of the portfolio plan entities in a hierarchical manner. Also, the tab helps you view the goals of the parent entities (of the portfolio plan entities) along with the goals and targets of the current portfolio plan. For example, in the following figure, the departments are the portfolio plan entities and business units are their parent entities. Enabling the **Parent entities goals** option shows the goals of the parent entities (of the portfolio plan entities) along with the goals and targets of the current portfolio plan. Enabling the **Parent entities goals** option helps you plan and align your portfolio goals with the goals of the parent entities.

- Parent entities goals: Displays the goals of the parent entities (of the portfolio plan entities) that helps you plan and align your portfolio goals with the goals of the parent entities.
- Personalize: Helps you customize the columns that you want to view on the Hierarchy tab. Select the settings icon (⚙️) to enable the columns that you want to view on the Hierarchy tab.
- The row context menu icon (⋮) gives you options for managing a goal such as create subgoal, set target, and align work for the selected goal.
- Unaligned goals - Not directly associated with parent entities: Lists the goals that aren't directly associated with the parent goals. You can open these goal records from the side panel and fill in the **Parent goal** field that is based on the goal of the parent entities that your goal belongs to.

Example goals view on the Hierarchy tab

Goals examples and recommendations

Business goals are an important part of establishing up priorities and setting a company for success. Understanding how to set achievable goals can greatly increase the ability to stay on track both in the short term and the long term for a company.

The following are the examples for strategic priorities along with their goals and targets.

Examples for strategic priorities along with their goals and targets

Strategic Priority	Goal	Target
Enhance customer experience	Improve customer satisfaction	Achieve a customer satisfaction score of 90% or higher by Q4 2024
		Reduce customer complaints by 20% by the end of 2024
	Increase customer engagement	Increase active users on the platform by 15% within 12 months
		Increase customer retention rate by 10% by Q4 2024
Drive innovation and product development	Accelerate time to market for new products	Launch 3 new products or features per year starting from 2024
		Reduce the product development cycle from 12 months to 8 months by 2025
	Foster a culture of innovation	Allocate 15% of the annual budget to research and development
		Increase the number of innovation projects submitted by employees by 25% within 18 months
Expand market reach	Increase market share in key regions	Achieve 5% market share growth in the Asia-Pacific region by 2025
		Expand into 3 new international markets by 2026

Examples for strategic priorities along with their goals and targets (continued)

Strategic Priority	Goal	Target
	Build strategic partnerships	Establish 5 new strategic partnerships with local distributors or resellers by 2024
		Increase revenue from partnerships by 20% by the end of 2025
Strengthen operational efficiency	Optimize internal processes	Implement an enterprise resource planning (ERP) system by Q3 2024
		Reduce operational costs by 10% by 2025 through automation
	Improve employee productivity	Increase employee satisfaction score to 85% by the end of 2024
		Reduce employee turnover by 15% by 2025

Recommendations to setup goals and targets

The following are the recommendations on how to setup goals and targets for an organization business growth.

Goal: Increase overall revenue and market share in 2024

Target 1: Expand market share by 10% in target regions

The following is the recommended setup for defining the target using the [Target form](#) in the workspace:

- Start date: 1/1/24
- End date: 31/12/24
- Type: Maximize
- Unit of measure: Percentage
- Start value: 40% (considering market share is already 40% by the end of 2023)
- Final target value: 50%
- Check-in frequency: Monthly or Quarterly
- Target value distribution: Spread linearly across the time period (cumulative)

Target 2: Launch four new products or services by the end of Q4

The following is the recommended setup for defining the target using the [Target form](#) in the workspace:

- Start date: 1/1/24
- End date: 31/12/24

- Type: Maximize
- Unit of measure: Count
- Start value: 0
- Final target value: 4
- Check-in frequency: Quarterly
- Target value distribution: Split equally across the time period (non-cumulative)

Target 3: Acquire 1,000 new enterprise customers

The following is the recommended setup for defining the target using the [Target form](#) in the workspace:

- Start date: 1/1/24
- End date: 31/12/24
- Type: Maximize
- Unit of measure: Count
- Start value: 0
- Final target value: 1000
- Check-in frequency: Monthly or Quarterly
- Target value distribution: Split equally across the time period (non-cumulative) or Spread linearly across the time period (cumulative)

Goal: Improve customer satisfaction and retention

Target 1: Increase Net Promoter Score (NPS) from 70 to 85

The following is the recommended setup for defining the target using the [Target form](#) in the workspace:

- Start date: 1/1/24
- End date: 31/12/24
- Type: Maximize
- Unit of measure: Count
- Start value: 70
- Final target value: 85
- Check-in frequency: Monthly or Quarterly
- Target value distribution: Spread linearly across the time period (cumulative)

Target 2: Decrease customer churn rate from 12% to 8%

The following is the recommended setup for defining the target using the [Target form](#) in the workspace:

- Start date: 1/1/24
- End date: 31/12/24
- Type: Minimize
- Unit of measure: Percentage
- Start value: 12%

- Final target value: 8%
- Check-in frequency: Monthly or Quarterly
- Target value distribution: Spread linearly across the time period (cumulative)

Target 3: Conduct quarterly customer feedback surveys with a 60% response rate

The following is the recommended setup for defining the target using the [Target form](#) in the workspace:

- Start date: 1/1/24
- End date: 31/12/24
- Type: Maximize
- Unit of measure: Percentage
- Start value: 0
- Final target value: 60%
- Check-in frequency: Quarterly
- Target value distribution: Spread linearly across the time period (cumulative)

Goal: Build strategic partnership channels

Target 1: Establish partnership with five new consulting firms

The following is the recommended setup for defining the target using the [Target form](#) in the workspace:

- Start date: 1/1/24
- End date: 31/12/24
- Type: Maximize
- Unit of measure: Count
- Start value: 0
- Final target value: 5
- Check-in frequency: Monthly or Quarterly
- Target value distribution: Spread linearly across the time period (cumulative)

Target 2: Generate \$100K revenue through partners

The following is the recommended setup for defining the target using the [Target form](#) in the workspace:

- Start date: 1/1/24
- End date: 31/12/24
- Type: Maximize
- Unit of measure: Currency
- Start value: 0
- Final target value: 100K
- Check-in frequency: Monthly or Quarterly

- Target value distribution: Spread linearly across the time period (cumulative) or Split equally across the time period (non-cumulative). Set this option depending on whether you want to track the target progress individually for each month or quarter, or at an aggregated level.

Create a goal in Strategic Planning

Create goals for your portfolio plans and set targets to measure overall goal progress and align goals with your organizational strategic priorities.

Before you begin

Role required: sn_apw_advanced.spw_goal_user and (sn_align_core.apw_user or sn_gf.goal_admin)

About this task

Goals are typically qualitative by nature. Goals should be ambitious and are expected to motivate and challenge your teams.

Only the owner or contributors of the goal can edit the goal.

i Note:

If you have created goals but don't see them appearing in the portfolio plan, populate the Assigned entity type and Assigned entity fields on the Goal form to display those goals in the portfolio plan.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Portfolio Planning**.
2. From the list of portfolio plans, select a portfolio plan that you want to create a goal for.
3. From the Goals page, select **New goal**.
4. On the form, fill in the fields.
For a description of the field values, see [Goal form](#).
5. Select **Save**.
You can also select **Save and add target** and add a target for the goal on the flow. For a description of the field values for a target, see [Target form](#).

What to do next

Set targets for the goals. For more information, see [Add targets for a goal in Strategic Planning](#) or [Configuring target source for target automation](#).

Add targets for a goal in Strategic Planning

Create SMART targets for goals to track and measure the progress of your goals.

Before you begin

Role required: sn_apw_advanced.spw_goal_user and (sn_align_core.apw_user or sn_gf.goal_admin)

About this task

If you're using Now Assist for SPM, you can use the Target generation skill to generate targets for a goal. The skill uses the goal's details and provided context to create a precise target for the goal. The more specific the input, the stronger the recommendations. For details, see [Generate targets for a goal in Strategic Planning Workspace using Now Assist for SPM](#).

Configuring a target source for your target updates the **Actuals to date** field on the Target form automatically. For more information on target automation, see [Target actuals automation in Strategic Planning](#).

A SMART target can be defined as S = Specific, M = Measurable, A = Attainable, R = Relevant, and T = Time-bound.

Note:

- Only the owner or contributors of the goal can create targets for the goal.
- You can also restrict the access for a target record to the specific users by enabling the **Confidential** field on the Target form if the ServiceNow® ESG Management application is installed.

Procedure

1. Create a target for a goal using one of the following options.
2. On the form, fill in the fields.
For a description of the field values, see [Target form](#).
3. Select **Save**.
You can also select **Save and add new target** and add more targets for the goal on the flow.

Result

The target progress records are automatically created when you save the target post populating the **Actuals to date** field. The target progress records specify the progress of each target for the goal.

Note:

When you delete a goal, its associated targets (if any) and their progress records are also deleted even though the **Allow the deletion of targets** property is set to **No**.

What to do next

[Update the progress of the target](#) manually if the target is not enabled for target automation.

Update the progress of a manual target

Update the progress of a target when its status is changed.

Before you begin

Role required: sn_apw_advanced.spw_goal_user and sn_align_core.apw_user

About this task

Note:

Only the owner or contributors of the goal can update a goal target.

Procedure

1. Open the target record of the goal using one of the following options.
2. On the form, update the **Actuals to date** or **Actual** field and add a business justification in the **Remark** field.

For a description of the field values, see [Target form](#).
3. Select either **Update** or **Save**.

Result

After the **Actuals to date** field is updated, the progress value for the target and its goal is auto-updated. For information on how the progress value is calculated, see [progress value calculation](#). For information on how the progress value is calculated for a target that has target breakdowns, see [Target breakdowns in Strategic Planning](#).

Update the progress of an automated target

Update the progress of a target using the **Update Actual value** related link on the Target form.

Before you begin

Role required: sn_apw_advanced.spw_goal_user and sn_align_core.apw_user

About this task**Note:**

Only the owner or contributors of the goal can update a goal target.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Portfolio Planning**.
2. From the list of portfolio plans, select the required portfolio plan that the target belongs to.
3. In the Goals view, select the **Goals and targets** tab.
4. Select the target that you want to update the progress for.
The Target side panel opens with the **Details** tab.

If the target has breakdowns, selecting the target opens the Target side panel with the **Progress** tab. Select the **Details** tab on the Target side panel.

5. From the side panel, select **Full Details** to open the target form.
6. On the Target form, select the **Update Actual value** related link.
For a description of the field values, see [Target form](#).

Result

After the **Actuals to date** field is updated, the progress value for the target and its goal is auto-updated. For information on how the progress value is calculated, see [progress value calculation](#). For information on how the progress value is calculated for a target that has target breakdowns, see [Target breakdowns in Strategic Planning](#).

[Update the progress of a manual target](#)

[Update the actual value of a target breakdown](#)

Duplicate a goal or target

Create a copy of an existing goal or target to align goals with your organizational strategic priorities. If the goal or target you want to create is similar to an existing one, duplicating the existing record saves your time.

Before you begin

Role required: sn_apw_advanced.spw_goal_user and sn_align_core.apw_user

About this task

Goals are typically qualitative by nature. Goals should be ambitious and are expected to motivate and challenge your teams.

Only the owner or contributors of the goal can edit the goal.

Note:

If you have created goals but don't see them appearing in the portfolio plan, populate the Assigned entity type and Assigned entity fields on the Goal form to display those goals in the portfolio plan.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Portfolio Planning**.
2. From the list of portfolio plans, select a portfolio plan that you want to create a goal for.
3. From the Goals page, select **Goals and targets** and then select **List** or **Hierarchy** view.
4. Select the Row context menu icon () of the goal or target that you want to copy and then select **Duplicate**.
 - For a goal, the Goal modal opens with all details of the goal you copied from. You can update the details for the goal as needed and then select **Save** to save the goal or select **Save and add a target** to save the goal and add a target for the goal. For a description of the field values, see [Goal form](#).
 - For a target, the New target window opens with all details of the target you copied from. You can update the details for the target as needed and then select **Save** to save the target or select **Save and add a new target** to save the target and add another target for the goal. For a description of the field values, see [Target form](#).

By default, the name is *Copy of ABC* where ABC is the name of the goal or target you copied from.

What to do next

Set more targets for the goals. For more information, see [Add targets for a goal in Strategic Planning](#) or [Configuring target source for target automation](#).

Target actuals automation in Strategic Planning

Automate the actual value for your targets using the target automation feature.

https://player.vimeo.com/video/1077953139?h=93de7e6865&badge=0&autoplay=0&player_id=0&app_id=58479%0Ahttps://youtu.be/pd0dWCbHRkA

Use the following steps as guidelines to enable actuals automation and configure a target source for a target using the target automation feature.

You must perform the following steps on the [Target form](#) to enable target automation for the target.

1. Enter the Start value, Final target value, and Check-in frequency, and fill the other required fields for the target.
2. Select the **Automate actual value** field.

Achieve 100 new customers in this year

Target Automation

Automate actual value

Actual value source *
Benefit Plans  

 Please save the form to view additional actual value source configuration.

You can select either the Benefit Plans option or a custom target source as a target source for the target. After selecting a target source, save the target record to view additional actual value source configuration.

- Benefit Plans target source - A target source that is created using a custom script where the actual benefit value of benefit plans of the planning items associated with the goal or target fetches the target actuals. Then the application updates the actual value of the target based on the actual benefit value.

When you select Benefit Plans target source ([predefined target automation script for benefit plans](#)) as the Actual value source for the target, the **benefit_plan** field appears in the Variables section, from which you can select the required benefit plans for fetching the value and automating the actual value of the target.

Note:

Only benefit plans of the planning items associated with the goal or target will be available to select in the **benefit_plan** field as a source for target automation.

Achieve 100 new customers in this year

[Details](#) [Planning items \(58\)](#) [Other items](#) [Target Breakdowns \(209\)](#)

Target Automation 

Automate actual value

Actual value source *

Benefit Plans  

Type

Custom script

Description

Actual value for the target is populated based on the Actual benefit value of the selected benefit plans (of the planning items aligned to the goal or target). For this Actual value source to work effectively, it is recommended to use either Monthly, Quarterly, or Yearly check-in frequency for the target.

Variables 

benefit_plan *

- Custom target source - Create a custom target source and configure it as a source to update the actual value of the target. For instructions on how to create a target source, see [Create a target source](#).

For instructions on creating targets for a goal, see [Add targets for a goal in Strategic Planning](#).

Target breakdowns in Strategic Planning

Breaking down a target into smaller periods (for example, Monthly) helps you set a target value for each month and focus on that specific monthly target. The target breakdowns are automatically created based on the Check-in frequency and Target value distribution set for the target.

The check-in frequency for a target can be set to Daily, Weekly, Monthly, Quarterly, or Yearly. Based on the Check-in frequency of the target, the corresponding target breakdowns are created. For example, if the Check-in frequency is set to Monthly for a target spanning for a year, 12 monthly target breakdowns are created. Planned target values are automatically set for each target breakdown based on the Target value distribution setting of the target.

Note:

The target breakdowns feature isn't supported for qualitative targets.

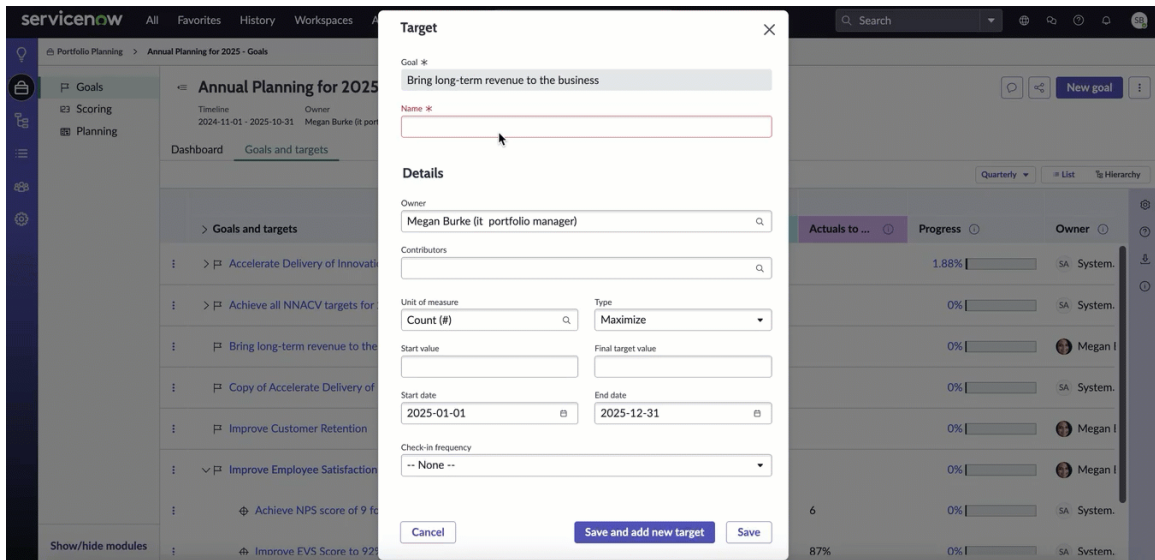

The following examples help you understand how the target progress is calculated for targets with different target distribution type.

Example 1: Acquire 1200 new customers in the calender year 2025 (Track non-cumulatively)

In this example, you want to achieve a target of acquiring 1200 new customers in the calender year 2025 and track the progress monthly (non-cumulatively), then you can set the target as the following:

- Set the start date and end dates to 2025-01-01 and 2025-12-31, respectively
- Set the start value and final target values to 0 and 1200, respectively
- Set the Check-in frequency for the target to Monthly
- Set the Targeting value distribution to Split equally across the time period (non-cumulatively)

This Target value distribution means that the final target value is divided into 12 equal values (planned target value for each target breakdown) which aggregates to the final target value. You can edit the planned target value later from the respective target breakdown record as needed.

In this case, the application creates 12 target breakdowns (January, February,, and December) for calender year 2025 and sets the Planned target value for each target breakdown to 100 (Final target value divided by the number of target breakdowns).

Because the application sums up the actual value entered in each monthly target breakdown, you must enter the actual value that is achieved in the particular month for the target breakdown. For example, you acquired 100 customers in January, then enter 100 as the actual value in the January target breakdown. And, you acquired another 100 customers in February, then enter 100 as the actual value in the February target breakdown. Similarly, if you acquired another 100 in March and 100 in April, then enter 100 as the actual value in both the March and April target breakdowns.

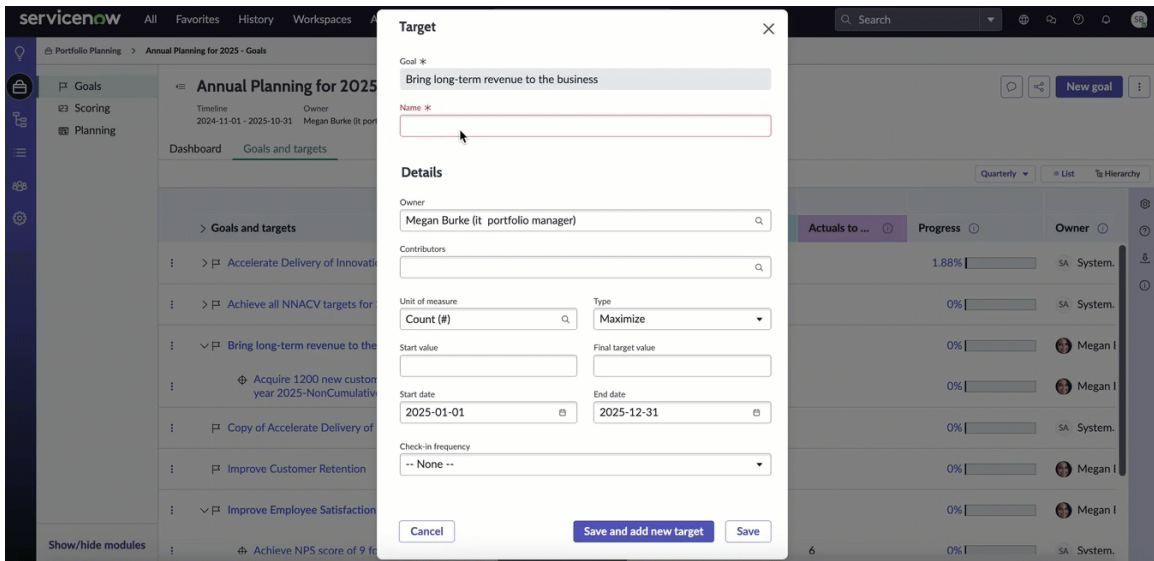

The application sums up the actual values entered in each monthly target breakdown and rolls up the sum value to the actual value of the main target. Then, the progress of the target and its goal are auto-updated.

Example 2: Acquire 1200 new customers in the calender year 2025 (Track cumulatively)

In this example, you want to achieve a target of acquiring 1200 new customers in the calendar year 2025 and track the progress monthly (cumulatively), then you can set the target as the following:

- Set the start date and end dates to 2025-01-01 and 2025-12-31, respectively
- Set the start value and final target values to 0 and 100, respectively
- Set the Check-in frequency for the target to Monthly
- Set the Target value distribution to Spread linearly across the time period (cumulative)

This Target value distribution means that the final target value is divided linearly into 12 planned target values (such a way that the value for the last monthly breakdown is equal to the final target value). You can edit the planned target value later from the respective target breakdown record as needed.

In this case, the application creates 12 target breakdowns (January, February,....., and December) for calendar year 2025 and sets the Planned target value for the January, February,....., and December breakdowns to 100, 200,....., and 1200 respectively.

Because the application considers only the actual value entered in the latest monthly target breakdown, you must enter the cumulative actual value in the latest monthly target breakdown. For example, you acquired 100 customers in January, then enter 100 as the actual value in the January target breakdown. And, you acquired another 100 customers in February, then enter 200 as the actual value in the February target breakdown. Similarly, if you acquired another 100 in March and 100 in April, then enter 300 and 400 as the actual value in the March and April target breakdowns, respectively.

The application considers the actual value entered in the latest monthly target breakdown and rolls up to the actual value of the main target. Then, the progress of the target and its goal are auto-updated.

Graphical visualisation of target progress

The **Progress** tab in the target’s side panel provides graphical visualization for the trend of the target progress based on the planned target value and the actual value of the breakdowns. You can also edit the planned target and view the check-in history of the target actuals from the **Progress** tab.

Goals and targets	Assigned entity	Status	Start value	Final target value	Actuals to date	Progress	Check-in frequency
Acquire 10000 new customers	Department: Legal	None				91.67%	
Acquire 100 new customers monthly		Yellow	0	1,200	1,100	91.67%	Monthly
Build dynamic, costeffective, and business-centered systems	Department: IT	Green				0%	
Build intelligent and automated systems	Department: HR	None				74.87%	
Employee wellbeing and growth	Department: HR	Yellow				0%	
Enroll at least 80% of team members in the employee wellness program		Yellow	40%	120%		0%	-- None --
Organize 6 mental health & wellbeing activities per quarter		Yellow	0	24		0%	-- None --
Improve the business revenue	Department: Legal	Red				60%	
Achieve \$1.2M revenue from web applications (Track monthly) Achieve \$1.2M revenue from...		None	\$500,000	\$1,000,000	\$800,000	60%	Weekly

Benefits of target breakdowns

The target breakdowns feature helps you when you want to set a target for a period but want to track the progress of the target in smaller periods such as daily, weekly, monthly, quarterly, and yearly. For example, you have set a target for a year with start value and final target values of 0 and 1200, respectively. Also, you want to set monthly targets of 100 for each quarter. In this case, you can break down the target into monthly targets and set a target value for each month so that you can focus on the specific monthly target and update your actuals against those monthly targets.

The target breakdowns feature has the following benefits:

- Break down the long-term targets into short-term intervals such as Daily, Weekly, Monthly, Quarterly, and Yearly for a better tracking or reporting of your progress
- Set or modify a planned target value for each target breakdown as needed
- Update the actual value for each target breakdown and track the progress of the main target
- Focus on the specific short-term target (target breakdown) rather than the whole target
- Track the progress of your short-term and long-term targets cumulatively or non-cumulatively
- Visualize the trend of the target's process wrt the planned target in the line or bar chart

How the actual value is calculated when the check-in frequency set to None

When the check-in frequency is set to None for a target, the actual value must be entered in the **Actuals to date** field in the main target record. The actual value entered must be cumulative irrespective of the time period of the target. Target breakdowns aren't created when the check-in frequency is set to None.

Target breakdowns in target automation

If you've enabled the target automation feature for a target and set the check-in frequency and Target value distribution, the target automation feature automatically updates the actual value in the respective target breakdown based on the check-in due date. After the actual value of a target breakdown is updated, the value is rolled up to rolls up to the actual value of the main target. Then, the progress of the target and its goal are auto-updated.

Update the actual value of a target breakdown

Update the actual value of a target breakdown when its status is changed.

Before you begin

Role required: sn_apw_advanced.spw_goal_user and (sn_align_core.apw_user or sn_gf.goal_admin)

About this task

Updating the actual value of a target breakdown automatically updates the actual value of its target. After the **Actual to date** field of the target is updated, the progress value for the target and its goal are auto-updated.

Note:

Only the owner or contributors of the goal can update the target breakdowns.

Procedure

1. Open the target record of the goal using one of the following options.
2. On the form, update the **Actual** field for the target breakdown and add a business justification in the **Remark** field.
For a description of the field values, see [Target Breakdown form](#).
3. Select **Save**.

Result

After the **Actual** field is updated, the progress value for the target and its goal are auto-updated. For information on how the progress value is calculated, see [progress value calculation](#). For information on how the actual value of the target breakdown is rolled up to its target, see [Target breakdowns in Strategic Planning](#).

Align a planning item with goals or targets

Create a goal or target relationship with a planning item or any other item to identify and associate your current or future work and achieve your goals and targets.

Before you begin

Role required: sn_apw_advanced.spw_goal_user and sn_align_core.apw_user

About this task

You can associate a goal or target with the planning items - Project, Demand, and Epic.

From the Align work window, you can associate a goal or target with multiple planning items at a time. From the Planning items tab of the goal or target, you can associate a goal or target with only one planning item at a time.

You can create goal or target relationships with a custom planning item from the Align work window only if the planning item table is added to the *planning_item_types_allow_list* property. For more information, see [Enable custom item types in Strategic Planning](#).

Note:

When a goal or target relationship is created with a planning item (Project, Demand, or Epic), the record appears on the Planning items tab on the goal record. When a goal or target relationship is created with any other item, the record appears on the Other items tab on the respective goal or target record.

Procedure

1. Open the Goal/Target Relationship form using one of the following options.
2. Select either **Done** or **Save**.

Associate or update the primary goal or target for a planning item

Associate a primary goal or target for the planning items where the items contribute to achieving the goal or target.

Before you begin

Role required: sn_apw_advanced.spw_goal_user and sn_align_core.apw_user

About this task

You can associate a goal or target as primary with a planning item by populating the **Primary goal** and **Primary target** fields on the Planning item form respectively. When you populate the **Primary target** field, the **Primary goal** is automatically populated with the goal of the populated target. For more information, see [Planning item form](#).

After you associate planning items with goals or targets, you can check these relationships directly on the Planning items tab of the goal's form or on the Goal/Target Relationships tab of the planning item's form.

Note:

- By default, the goal or target becomes the primary when you associate a goal or target with a planning item for the first time. Then after, association of any goal or target with the planning item becomes a secondary association unless the **Primary** field is selected while associating the goal or target.
- When a planning item already has a primary goal association and you want to make another goal as primary, the existing primary goal association becomes secondary and the fresh association becomes primary for the planning item.
- Associating the primary goal or target isn't supported for strategic items such as initiatives and strategic programs.
- To associate the primary goal or target with a custom planning item, ensure that the custom planning item is added to the *planning_item_types_allow_list* property.

Procedure

1. Open the required planning item form using one of the following options.
2. On the Item details side panel or **Details** tab, fill in or update the **Primary goal** and **Primary target** fields with the goal and target respectively that you want to associate or update.

Alternatively, you can select **Add** in the **Goal/Target Relationships** tab, populate the **Goal** and **Target** fields as needed, and then select **Primary**. The **Primary goal** and **Primary target** fields are then automatically populated on the planning item form.

For a description of the field values, see [Planning item form](#).

3. Select either **Update** or **Save**.

What to do next

If you want to remove the existing goal or target association, you can remove the association by selecting the association record and selecting the **Remove** option on the Goal/Target Relationships tab of the planning item record. If the planning item has the primary goal and secondary goal association, you can remove the primary association only after you make any other goal as primary for the planning item.

Generate insights for a goal in Strategic Planning Workspace using Now Assist for SPM

Review AI-generated insights to identify at-risk goals, assess forecasted statuses, and act on recommendations before goals fall off track.

Before you begin

i Important:

This Now Assist skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see [Now Assist skills, agents, and agentic workflows on by default](#).

Role required: sn_apw_advanced.spw_goal_user and (sn_align_core.apw_user or sn_gf.goal_admin)

About this task

The Goal insights skill analyzes the goal, its targets, subgoals, and aligned work, then delivers concise, data-driven insights—including AI forecasted status, confidence of achieving the goal, targets at risk, delayed or stalled aligned work and recommendations.

The skill analyzes the real-time data – including check-in patterns, comments, and planned versus actual progress – to forecast goal status and surface proactive recommendations.

i Note:

Only the owner or contributors of the goal can generate insights for the goal.

The screenshot displays the ServiceNow interface for a goal record. At the top, the breadcrumb navigation shows 'Portfolio Planning > Enterprise Goals - Goals > 1. Accelerate path towards 2024 CACV and NNACV targets'. The goal record header shows '1. Accelerate path towards 2024 CACV and NNACV targets' with a 'Save' button. Below the header, there are tabs for 'Details', 'Quantitative Targets (9)', 'Qualitative Targets', 'Sub-goals', and 'Aligned work'. A 'Now Assist' button is visible, along with a 'Show Insights' button. The goal details section shows the goal name, state (Draft), status (None), and progress (65.12%). The description field contains the text: '001. Accelerate path towards \$500M CACV in 2025, and deliver on all NNACV targets, every quarter'. The parent information section shows the strategic priority.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Portfolio Planning**.
2. From the list of portfolio plans, select a portfolio plan for your the goal belongs to.
3. From the Goals page, select **Goals and targets**.
4. From the list of goals, select the name of the goal for which you want to generate insights.

The goal side pane opens with the **Details** tab.

- From the side pane, select **Full Details** to open the goal form.
The goal's full details page opens.

- Select **Show insights**.

The Goal insights side pane appears processing the insights for the goal. After a while, the Insights by Now Assist pane shows the insights for the goal including AI forecasted status, confidence of achieving the goal, targets at risk, delayed or stalled aligned work and recommendations.

- Review AI-generated insights to identify risk, assess forecasted statuses, and act on recommendations before goals fall off track.

Export goals and targets data to Excel or CSV

Export the data of goals and targets from your portfolio plan into a Microsoft Excel or CSV file. You can share this data and collaborate with your business stakeholders.

Before you begin

Role required: sn_apw_advanced.spw_goal_user and sn_align_core.apw_user

Procedure

- Navigate to **Workspaces > Strategic Planning Workspace > Portfolio Planning**.
- From the list of portfolio plans, select one and then select **Goals**.
- From the Goals page, select **List** view.
- Verify that the columns you want to export are personalized.

Note:

If the filters are applied on the view, the filtered data is exported. Also, to differentiate between goal and target record in the exported file, select **Record type** in the personalized side panel.

- Use the Personalize side panel to export the data of your goals and targets.

- Select Export icon ().

- From the **File type** drop-down on the Export window, select **Excel** or **CSV** to export the data to a Microsoft Excel or CSV file respectively.

The data is exported into the selected file format. By default, the name of the file is *ABC_goals_and_targets_list* where ABC is the name of the portfolio plan you exported the data from.

Prioritizing portfolio plan work in Strategic Planning Workspace

Review the work pipeline for your portfolio in Strategic Planning Workspace. Add, update, and rank planning items so that you can prioritize the right work for the right time.

Views for prioritizing planning items

The Prioritization tab on the Planning page in Strategic Planning represents your backlog, displaying the items in your work pipeline. The Kanban and Hierarchy tabs also represent your

backlog, each providing a different view of the same items. For an overview of these views, see [Prioritization in Strategic Planning](#).

Note:

The Prioritization feature is available only for portfolio plans.

Planning items in the Prioritization tab

By default, portfolio plans show only the records that are created within the Planning Item [sn_align_core_planning_item] table and its child tables. Any records stored in other ServiceNow AI Platform tables aren't shown unless an integration is established.

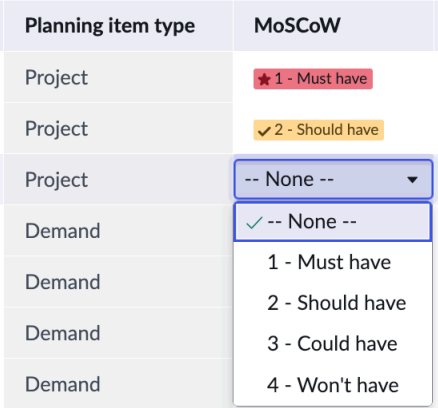

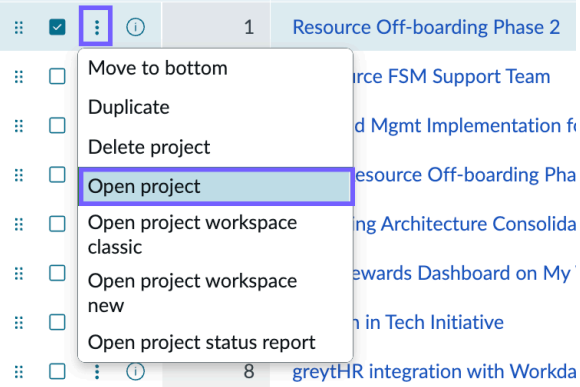

Consider that you want to manage projects through a portfolio plan. Project records that are only stored in the Planning Item Project [sn_align_project] table are displayed in the Prioritization, Kanban, and Hierarchy tabs. But any projects created using the PPM Standard aren't shown by default because these project records are stored in the PPM Project [pm_project] table. To enable their display in Strategic Planning Workspace, set up integration with PPM so that the tables of Strategic Planning are mapped to the tables of PPM.

The same is the case with Epics created using Agile Development 2.0 and SAFe applications. See [Configuring Strategic Planning with PPM, Agile 2.0, and SAFe](#).

Prioritization features

In the Prioritization and Hierarchy tabs, you can perform the following actions:

Feature	Description	Example UI
Add new planning items	<p>Add new items to your backlog directly from the Prioritization page.</p> <p>The type of planning items that you can create here depends on your portfolio plan configuration.</p>	
Update planning item details	<p>Edit details of the planning items, add attachments, and collaborate on them with the stakeholders directly from the Prioritization page to facilitate smoother real-time backlog grooming.</p>	

Feature	Description	Example UI
<p>MoSCoW values</p>	<p>Categorize planning items using the Must have, Could have, Should have, or Won't have (MoSCoW) values in the List and Hierarchy views. This categorization creates a baseline of priority that you can later use when you're grooming and prioritizing work for your portfolio.</p>	 <p>The screenshot shows a table with 'Planning item type' and 'MoSCoW' columns. The 'MoSCoW' column has a dropdown menu open, showing options: '1 - Must have', '2 - Should have', '-- None --', and '4 - Won't have'. The '-- None --' option is selected and highlighted.</p>
<p>Rank planning items</p>	<p>Decide on the order of priority for the planning items by using the drag functionality to rearrange them.</p>	
<p>Prioritize items to roadmap</p>	<p>Set the planning state of an item to Prioritized to add them to the portfolio's roadmap.</p>	
<p>Open the planning item in the Execution app</p>	<p>If you're using ServiceNow PPM, Agile Development 2.0, or SAFe applications to execute the planned work, you can open the planning items in their own application.</p> <p>For example, if your planning item is an epic, you can navigate to the epic form directly from the Prioritization page.</p>	 <p>The screenshot shows a list of planning items. A context menu is open over one item, with the 'Open project' option highlighted. Other options include 'Move to bottom', 'Duplicate', 'Delete project', 'Open project workspace classic', 'Open project workspace new', and 'Open project status report'.</p>
<p>Personalize the Prioritization page views</p>	<p>Change the way that the Prioritization page is displayed so that you can view the information in the format that you need.</p> <p>All settings, such as row and column personalization, grouping, and sorting, are saved as the portfolio plan preferences. So, these settings are applied to all the users or user groups that the portfolio plan is shared with.</p>	

Feature	Description	Example UI
Apply filters for Prioritization	Apply filters to all the views of Prioritization, Roadmap, Hierarchy, or Scoring so that you can view a consistent data set for your portfolio plan.	
Reorder the columns by dragging them horizontally	Reorder the position of the columns in the Prioritization tab by dragging them horizontally.	

Add planning items to Prioritization

Add new planning items to your portfolio plan's work backlog in Strategic Planning Workspace and ensure that the work pipeline is current.

Before you begin

[Create a portfolio plan](#)

Role required: sn_align_core.apw_user

About this task

Use the Prioritization tab of your portfolio plan to add new planning items or import them from other ServiceNow execution system such as PPM, Agile Development 2.0, or SAFe.

You can use the Prioritization, Kanban, or the Hierarchy tabs while you perform this task.

Procedure

1. Navigate to **All > Strategic Planning > Strategic Planning Workspace > Portfolio Planning**.
2. From the list of portfolio plans, select one and then select **Planning**.
3. From the Prioritization tab, add a new planning item for your portfolio plan.

Use the More options drop-down to select the planning item that you want to create.

4. On the form, fill in the short description and approved dates.
For full information, see [Planning item form](#).

You can refine planning item descriptions—for item types such as Demand, Epic, Project, Capability, Feature, and Story—using the Write planning item skill, if the Now Assist for SPM application is installed.

5. Select **Submit.**

6. Optional: If you're using PPM, Agile Development 2.0, or SAFe to execute the planned work, you can also import your work items from these applications.

For more information, see [Executing Strategic Planning work in PPM, Agile 2.0, and SAFe](#).

Result

The new item is created with its **Planning state** field is set to **New** and the position of the item is based on the view that you are in.

- Prioritization tab: Added to the bottom of the list.
- Kanban tab: Added to the **4-Low priority** horizontal lane.
- Hierarchy tab: Added to the appropriate grouping.

For example, your selected lens is Organization. Then, the new item is added to the grouping of its department.

What to do next

- [Rank planning items](#).
- [Update planning item details from Prioritization tab](#).
- Learn about [Personalizing views for prioritization](#)

Duplicate a planning item

Create a copy of an existing planning item to add it to your portfolio plan's work backlog in Strategic Planning Workspace and ensure that the work pipeline is current. If the planning item you want to create is similar to an existing planning item, duplicating the existing planning item saves your time.

Before you begin

[Create a portfolio plan](#)

Role required: sn_align_core.apw_user

About this task

Use the Prioritization tab of your portfolio plan to add new planning items or import them from other ServiceNow execution system such as PPM, Agile Development 2.0, or SAFe.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Portfolio Planning**.
2. From the list of portfolio plans, select one and then select **Planning**.
3. From the Planning page, select **Prioritization** tab.
4. Select the More actions icon () of the planning item that you want to copy and then select **Duplicate**.

The new planning item is created and the item appears right below the planning item you copied from. Also, the rank is updated for the new planning item automatically based on the rank of the planning item you copied from.

By default, the name is *Copy of ABC* where ABC is the name of the planning item you copied from.

- 5. Optional:** If you're using PPM, Agile Development 2.0, or SAFe to execute the planned work, you can also import your work items from these applications.
For more information, see [Executing Strategic Planning work in PPM, Agile 2.0, and SAFe](#).

What to do next

- [Rank planning items](#).
- [Update planning item details from Prioritization tab](#).
- Learn about [Personalizing views for prioritization](#)

Update planning item details from Prioritization tab

Update the details of your planning items or delete them so that your Strategic Planning Prioritization tab reflects the latest work pipeline.

Before you begin

Role required: sn_align_core.apw_user

About this task

Update the details of a planning item using the Prioritization, Kanban, and Hierarchy tabs in the Planning page. Edit the details inline from the grid view or use the side panel. You can edit details such as short description, MoSCoW, approved dates and others to facilitate smoother real-time backlog grooming. Use the full details page of the planning item to add attachments and collaborate on them with the stakeholders.

Procedure

1. Navigate to **All > Strategic Planning > Strategic Planning Workspace > Portfolio Planning**.
2. From the list of portfolio plans, select one and then select **Planning**.
3. Update item details, attach files to the item, or delete the item.

Information of certain columns that aren't editable in the full details page, can't be edited inline too. For example, planned cost and planned benefit. These cells are visually differentiated using grey color as their background.

If you group the Prioritization items list by any attribute, you can't edit the short description of the items directly from the grid view.

Rank planning items

Rank the planning items that are added to the pipeline of your portfolio plan to decide on their priority so that you can start prioritizing work for your portfolio.

Before you begin

- [Create a portfolio plan](#).
- Ensure that the planning items in the Prioritization tab are sorted by the Rank column in ascending order.

Role required: sn_align_core.apw_user

About this task

Important:

Use the List view to stack-rank the planning items of your portfolio plan.

Within the ServiceNow system, all the planning items are assigned a global rank. Reorder the items in the Prioritization tab to change their rank and update their planning state. If you decide to include a planning item into your roadmap schedule, mark its Planning State as **Prioritized** to add it to the roadmap directly from the Prioritization tab.

The Rank column helps you quickly identify the rank of an item relative to the other items in the backlog. This information is useful to determine the top-ranked items from a long list of planning items. When there's no custom grouping or sorting, the planning items are sorted by their rank, and you can reorder the rows.

Note:

Reordering of rows is not allowed if the planning items are already grouped or sorted by any other attribute. Remove the grouping or sorting to reorder rows.

Procedure

1. Navigate to **All > Strategic Planning > Strategic Planning Workspace > Portfolio Planning**.
2. From the list of portfolio plans, select one and then select **Planning**.
3. From the Prioritization tab, rank the planning items according to your priority by rearranging their order.

Repeat this step until the ranking of the planning items align with your business priorities. To get better visibility of data that you need:

- Sort or group the list by the required columns. See [Personalize the Prioritization view](#)
- Filter the planning items by applying filters.

Tip:

Using the Row context menu (), you can also assign the highest and lowest ranks to the planning items using the **Move to top** and **Move to bottom** options respectively.

What to do next

[Prioritize work](#)

Prioritize work

Review and prioritize the items of your portfolio plan pipeline to add them to the plan's roadmap so that your teams can start working on them.

Before you begin

- [Create a portfolio plan](#).
- Ensure that the planning items in the Prioritization tab are sorted by the Rank column in ascending order.

Role required: sn_align_core.apw_user

About this task

Review and prioritize the items in the Prioritization, Kanban, or Hierarchy tab during your grooming sessions. You can use the MoSCoW values assigned to an item to help you decide the priority of work.

Procedure

1. Navigate to **All > Strategic Planning > Strategic Planning Workspace > Portfolio Planning**.
2. From the list of portfolio plans, select one and then select **Planning**.
3. From the Prioritization tab or any other tab, mark a planning item as In Review or Prioritized.

After you mark a planning item as **Prioritized**, it's automatically added to your portfolio roadmap, based on the values in the **Approved start date** and **Approved end date** fields. Your roadmap shows only those items that have their Planning state set to **Prioritized**.

- If the dates fall within the portfolio planning period, then the item is displayed on the roadmap.
- If either of the date fields is empty, then the item is added to the **Unscheduled items** list of the roadmap.

If you've marked an item as **Done** or **Cancelled**, that item isn't displayed on the Prioritization page by default. You can update the filter on the Planning state column to show the items that are completed or canceled.

4. **Optional:** From the Prioritization tab, you can update the planning state of multiple items at once.
 - a. Select the **Planning state** cell of one of the rows that you want to update.
 - b. Press and hold the **Ctrl** key (for Windows OS) or **command** key (for Mac OS), and select the **Planning state** cells of the other rows that you want to update.
 - c. Double-click one of the selected cells and choose a state.

Short description	Planning state

(Optional)

Categorize work items using tags

Categorize your planning items based on your requirement by adding tags.

Before you begin

[Create a portfolio plan](#)

Role required: sn_align_core.apw_user

About this task

Tags enable you to categorize planning items. You create the tag name, which should name the reason for the tag. You can make the tags visible to everyone, some people, or just yourself. The visibility setting specifies who can use the tags to search for planning items.

Any tagging additions or removals made to a planning item are automatically synced across all views in the Planning page and in the Scoring page. After tagging planning items, you can use the tags to search for planning items using the **Filter** option () in the List view of Prioritization and in the Scoring page.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Portfolio Planning**.
2. From the list of portfolio plans, select one and then select **Planning**.
3. From the Prioritization or Scoring, add a tag for a planning item using one of the following options.

Note:

The tag visibility setting defaults to private, which means the tag is only visible to the user who created the tag. So, only the user who created the tag can use the tag to search for planning items labeled with that tag.

4. To change the visibility setting of the tag, on the Details page of the planning item, select the tag and change the **Viewable by** setting.

Edit Tag ×

Tag name

test tag

Viewable by

✓ Me

Groups and Users

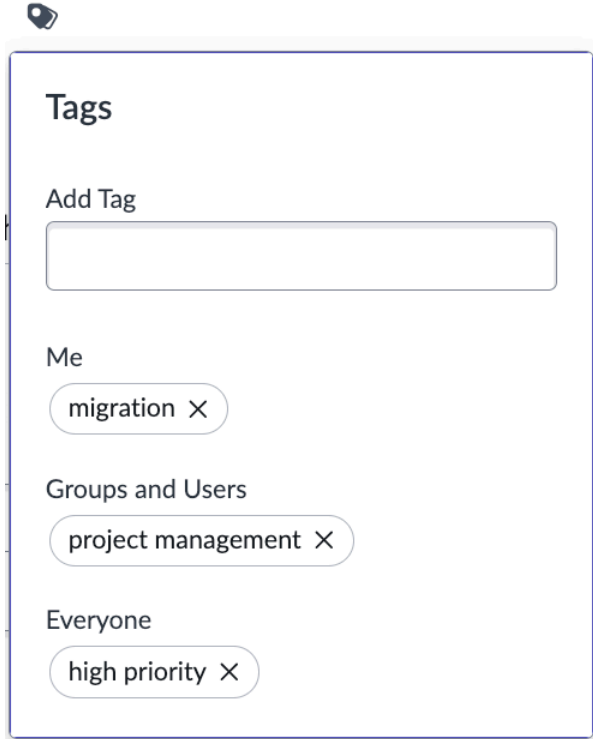

Everyone

Cancel
Save

Option	Description
Me	Tag is visible only to the person who created the tag. Only the user who created the tag can use the tag to search for planning items labeled with that tag. This setting is the default.
Groups and Users	Tag is visible to specific groups or users. You can specify the groups and users who can view this tag.
Everyone	Tag is visible to everyone.

Option	Description
	<p>Note: This visibility setting is only available to an admin or tags_admin role.</p>

A planning item can have multiple tags and each can have a different visibility setting.

- To remove a tag from a planning item, double-click the cell in the Tag column on the List view or select the filled tag icon () on the Details page of the planning item to open the list of tags, then select the **X** next to the tag you want to remove.

Personalizing views for prioritization

Personalize how the Prioritization, Kanban, and Hierarchy tabs on the Planning page are displayed so that you can view the planning item information that is most relevant to you and your stakeholders.

Personalize the Prioritization view

Personalize the List view in the Prioritization page by grouping, sorting, and hiding columns so that you can view the information that is most relevant for planning.

Before you begin

[Create a portfolio plan.](#)

Role required: sn_align_core.apw_user

About this task

This task provides guidance on different options to personalize the view of Prioritization tab in the Planning page.

Personalization preferences are saved as the portfolio plan's settings in Strategic Planning. So, these settings are applied to all the users or user groups that the portfolio plan is shared with.

Procedure

1. Navigate to **All > Strategic Planning > Strategic Planning Workspace > Portfolio Planning**.
2. From the list of portfolio plans, select one and then select **Planning**.
3. Use the Personalize side panel to update the display of rows and columns on the page.

a. Select the Personalize icon ()

b. From the Columns section, select the columns that you want to see or hide the data of.

You can reorder the columns here to change their display order on the backlog.

If you want additional columns to be available in this page, your admin can configure them. See [Configuring additional columns for Prioritization in Strategic Planning](#).

c. From the Rows section, choose how the rows are displayed, using the **Shade alternate rows** toggle.

4. Group your items by one or multiple columns that are on display in the Prioritization tab.

You can group the planning items by an attribute of the type choice or reference. Some examples to group by are Planning state, Planning item type, Owner, and Primary goal.

Use one of the following ways to group the planning items. Repeat the action to group the list by multiple attributes.

Grouping remains unaffected even when you switch to Kanban or Hierarchy tabs. The same setting is retained when you come back to the Prioritization tab. This preference is saved per session for a portfolio plan.

5. Sort the planning items by any column, by clicking the column name. For example, you can sort the items by **Approved start date**.

6. Pin columns to the left or right of the list.

a. For the column that you want to pin, select the Column actions icon ()

b. From the Pin column section, select **Pin to left** or **Pin to right**. The default selection is **Unpin**.

7. Adjust the width of the columns as per choice or set the width to autofit.

Hold and drag the column border to adjust its width. You can set the column width to autofit using the **Autofit this column** or **Autofit all columns** options from the Column actions ()

8. Reset columns to default settings by selecting **Reset columns** from the Personalize menu ()

Selecting this option reverts the column personalization, grouping, and sorting to default settings.

Personalization settings that you've made so far on the Prioritization tab would be cleared. Any personalization that you make after this point is set as the new preference for the portfolio.

9. Apply filters to the data shown in Prioritization.

Personalize Kanban view

Personalize the Kanban tab view in your portfolio plan's Planning page as displayed in Strategic Planning, so you can view information that is most relevant to you and your stakeholders.

Before you begin

[Create a portfolio plan.](#)

Role required: sn_align_core.apw_user

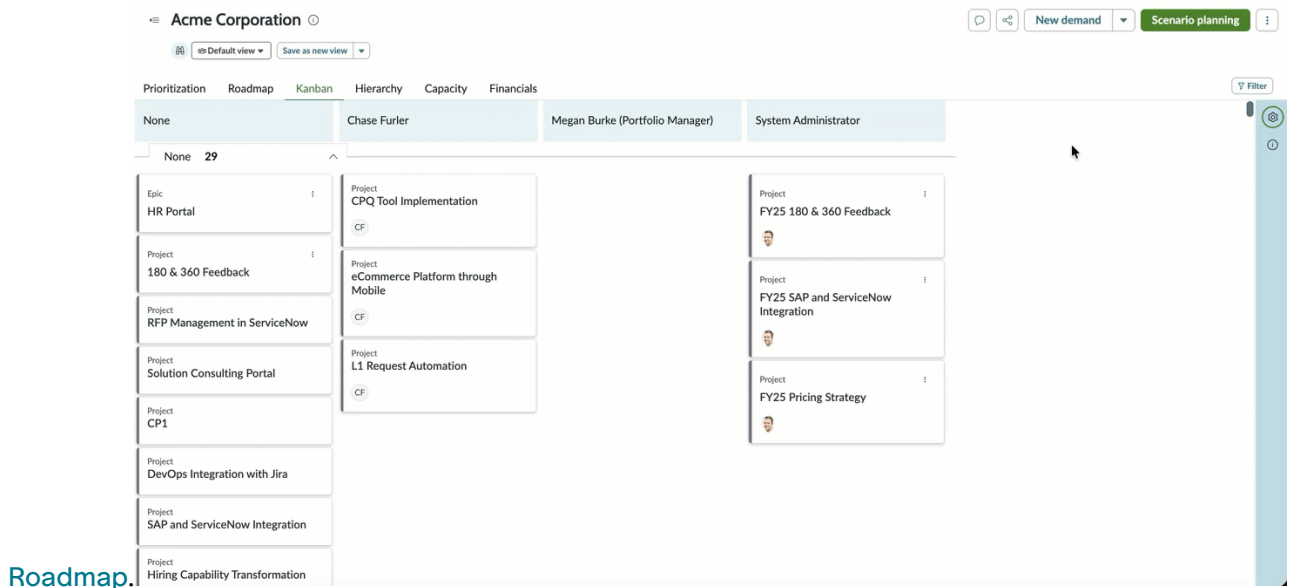

About this task

This task Provides guidance on different options to personalize the view of the Kanban tab in the Planning page.

Kanban preferences are saved in the portfolio plan level. So, these settings are applied to all the users or user groups that the portfolio plan is shared with.

Procedure

1. Navigate to **All > Strategic Planning > Strategic Planning Workspace > Portfolio Planning.**
2. From the list of portfolio plans, select one and then select **Planning.**
3. Select Kanban tab.
4. Select the Personalize icon (⚙️) to update the view, based on your preferences. See [Customize the planning item display preferences for Prioritization and](#)

Important: The default display limit of vertical lanes and horizontal lanes shown on a Kanban board is 30 and 30 respectively. These lanes support only reference and choice fields. As you user, you will not be able to change the field metrics on a Kanban card.

Personalize Hierarchy view

Personalize the Hierarchy tab view in the Planning page of Strategic Planning Workspace so that you can view the information that is most relevant to you and your stakeholders.

Before you begin

[Create a portfolio plan.](#)

Role required: sn_align_core.apw_user

About this task

Sort the planning items by an attribute of your choice and use the Personalize side panel to customize the display of the columns.

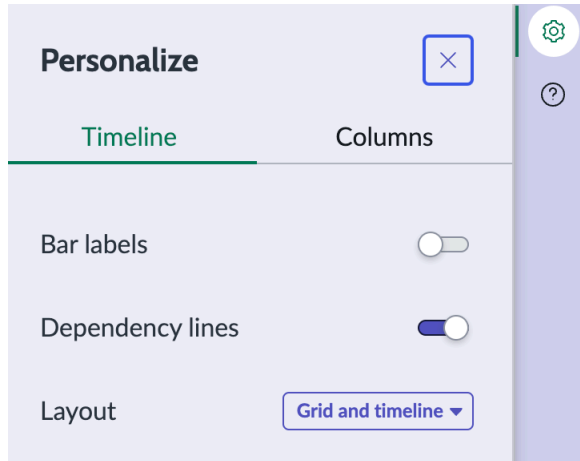

Personalization preferences are saved as the portfolio plan's settings in Strategic Planning. So, these settings are applied to all the users or user groups that the portfolio plan is shared with.

Procedure

1. Navigate to **All > Strategic Planning > Strategic Planning Workspace > Portfolio Planning**.
2. From the list of portfolio plans, select one and then select **Planning**.
3. Personalize the timeline view and the columns on the grid view using the Personalize side panel.

- a. Select the Personalize icon ().

The personalize side panel opens.

- b. From the Timeline section, toggle the display of item names and dependency lines. You can also choose to update the layout. Select Grid and timeline view, Grid view, or just the Timeline view.
 - c. From the Columns section, update the planning item fields that are displayed in the grid view. Select the necessary columns and click **Apply**.
4. Sort the planning items by any column, by clicking the column name. For example, you can sort the items by **Approved start date**.
 5. Apply filters to the data shown in Prioritization.

Export data of portfolio plan items from Prioritization to Excel or CSV

Export the data of portfolio plan items from your portfolio plan into a Microsoft Excel or CSV file. You can share this data and collaborate with your business stakeholders.

Before you begin

Role required: sn_align_core.apw_user

Procedure

1. Navigate to **All > Strategic Planning > Strategic Planning Workspace > Portfolio Planning**.
2. From the list of portfolio plans, select one and then select **Planning**.
3. On the Planning page, select **Prioritization** tab.
4. Verify that the columns you want to export are personalized.

Note:

If the filters are applied on the view, the filtered data is exported.

5. Use the personalized side panel to export the data of your portfolio plan items.

a. Select Export icon ().

b. From the **File type** drop-down on the Export window, select **Excel** or **CSV** to export the data to a Microsoft Excel or CSV file respectively.
A file with the selected format is exported. By default, the name of the file is *ABC_Prioritization_List* where ABC is the name of the portfolio plan you exported the data from.

Planning roadmaps in Strategic Planning Workspace

Create a layout of the plans for upcoming projects or initiatives while aligning them with your business objectives using roadmaps in Strategic Planning Workspace. Facilitate collaboration among stakeholders and adjust plans on the go.

Roadmaps in Strategic Planning Workspace are of two types: Portfolio plan roadmaps and free-form roadmaps.

For portfolio plans, only those planning items that are prioritized from the Prioritization tab are shown on the roadmap. For more information, see [managing backlog items](#) and [prioritizing those items](#) for the roadmap.

You can create roadmaps for a specific period, which could be the period that your organization focuses on meeting its goals. From a centralized view, you can do the following using the Roadmap capabilities in the Strategic Planning Workspace:

- Build simple roadmaps using a single type of planning item or hybrid roadmaps using multiple types of planning item at once.
- Visualize how your work aligns to the strategic priorities or goals of your business.
- Create and use direct and indirect dependencies between work items to understand how cross-organizational work aligns with the enterprise strategy.
- Use conversations and share files to enable collaboration among stakeholders.
- Focus on strategic outcomes using milestones for all the work items.
- Decide on necessary corrective actions ahead of time by tracking the progress and status of the work.

Related topics

[Roadmaps in Strategic Planning](#)

Create a free-form roadmap

Create a standalone visual roadmap to start high-level planning of work from different units of the company.

Before you begin

Role required: sn_align_core.apw_user

About this task

Create a standalone roadmap to plan work across multiple units of your organization, such as projects of all departments. To learn more about free-form roadmaps, see [Roadmaps in Strategic Planning](#).

Select a source table as a starting point to base your roadmap on. Select one of project, epic, program, demand, SAFe epic, and SAFe feature tables for a simple roadmap or Planning Item table for a hybrid roadmap.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Portfolio Planning > Free-form Roadmaps**

2. Select **New**.

If this is the first free-form roadmap in your ServiceNow® instance, select **Create your first free-form roadmap**.

3. Use the Create free-form roadmap wizard to fill out the details of your roadmap.

a. Select a source table to base your roadmap on.

Your admin can configure other tables to be visible in this list. For more information, see [Portfolio plan configuration form](#).

b. Add conditions to filter the data from the source table.

For example, if your source table is **Project**, the related filter condition can be **Business Unit is Finance AND Active is true**.

c. Enter details of the name and planned dates for the roadmap.

Note:

The start and end dates for your roadmap act as a date range filter for all the items displayed in the roadmap.

4. Select **Create**.

Result

- A new roadmap is created and displayed.
- This roadmap is listed in the **Free-form roadmaps** tab of the Home page of Strategic Planning Workspace.

What to do next

- Update, personalize, and collaborate with your roadmap.
- Add milestones or create dependencies for the items planned on your roadmap.

Related topics

- [Update details of a free-form roadmap](#)
- [Create planning items from the roadmap view](#)
- [Plan unscheduled items into a roadmap](#)

- [Share a free-form roadmap with stakeholders](#)

Update details of a free-form roadmap

Update the details of a free-form roadmap to reflect the changes in priorities or the timeline of the roadmap.

Before you begin

[Create a free-form roadmap.](#)

Role required: sn_align_core.apw_user

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Portfolio Planning > Free-form Roadmaps**
2. Select a roadmap to open it.
3. From the roadmap header, select the More actions icon ().
4. Use the Update free-form roadmap wizard to edit out the details of your roadmap. For field information, see [Create a free-form roadmap.](#)
5. Select **Update.**

Result

The roadmap is updated and the roadmap items are displayed according to the latest changes.

Related topics

- [Create planning items from the roadmap view](#)
- [Plan unscheduled items into a roadmap](#)
- [Add dependencies for roadmap items](#)

Share a free-form roadmap with stakeholders

Add people from your organization who are the stakeholders for the work involved in your roadmap plan so that they have visibility into the roadmap's progress.

Before you begin

- [Create a free-form roadmap.](#)
- Ensure that the users that you add as stakeholders have the appropriate role to access the roadmap. For more details on user roles, see [Components installed with Strategic Planning Workspace.](#)

Role required: sn_align_core.apw_user

About this task

Grant access for the free-form roadmap to other users and stakeholders in your organization.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Portfolio Planning > Free-form Roadmaps**
2. Select a roadmap to open it.
3. From the roadmap header, select the **Share roadmap** icon ()
4. On the Share roadmap form, select users to share the roadmap with and set their access appropriately.
 - a. In the **Members or Groups** field, enter the names of individual users or groups.
 - b. From the **Access** field, select the access level as **Viewer** or **Editor** for the users selected.

For a business stakeholder user, even if you grant the Editor access, they can only add comments on the roadmap.

5. Select **Send invite**.

What to do next

Change the access level or remove access for a user or a group.

1. On the Share roadmap form, select **Manage access**.
2. From the user or group card, select the action menu icon ()
3. Select the right access level or select **Remove**.

Collaborate on a free-form roadmap with stakeholders

Add comments and attachments to a free-form roadmap for other users of your organization can review and share their feedback. Collaborate and ensure that your roadmap aligns with your company's priorities.

Before you begin

Role required: sn_align_core.apw_user or sn_roadmap_plng.roadmap_editor

About this task

Using the Comments side panel, add attachments or notes at the roadmap-level or the planning item-level.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Portfolio Planning > Free-form Roadmaps**
2. Select a roadmap to collaborate on.
3. Select the appropriate tab at the roadmap-level or planning item-level.
4. Add attachments or worknotes.

Managing free-form roadmap views

Portfolio managers can create customized views for their free-form roadmap by applying personalization settings such as grouping, milestones selection, dependencies selection, and tracking mode. Portfolio owners or editors can share these personalized views with stakeholders to enable easier collaboration on the free-form roadmaps.

Benefits of free-form roadmap views

Portfolio managers can create personalized views as needed by applying settings such as grouping, milestones selection, dependencies selection, and tracking mode.

- Views can be created as private or public.
- Can create up to three private views and up to 10 shared (public) views.
- Free-form roadmap views can be shared with stakeholders to enable collaboration on the free-form roadmap.
- Switch between shared and private views as needed.

Create a free-form roadmap view

Create a customized free-form roadmap view based on your requirements, so you can access it when you log in again and share it with stakeholders for collaboration.

Before you begin

Role required: sn_align_core.ap_read_only

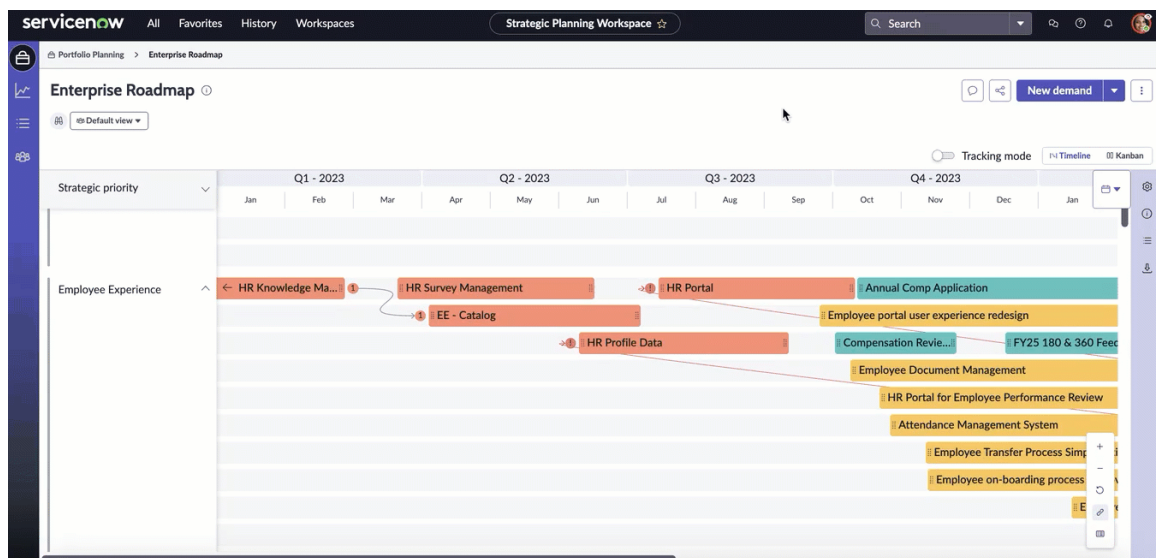

About this task

You can create up to three private views and up to 10 shared (public) views per free-form roadmap.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Portfolio Planning > Free-form Roadmaps**
2. Select a free-form roadmap to open it.
3. Make any changes to the view as needed.
For example, enable **Tracking mode** toggle.

The **Save as new view** option appears on the free-form roadmap header.

4. From the free-form roadmap header, select **Save as new view**.
5. On the Save as new view window, fill the details.
 - a. Enter a name for the view in the **View name** field.
 - b. **Optional:** Select the **Shared view** toggle to make this view public.
Selecting the **Shared view** toggle makes the view visible to all stakeholders with whom this free-form roadmap is shared.
 - c. Select **Save**.

Result

The shared view for the free-form roadmap is created and will be visible to all stakeholders with whom this free-form roadmap is shared.

What to do next

- Share the free-form roadmap with your stakeholders to start collaborating on the free-form roadmap. See [Share a free-form roadmap with stakeholders](#).
- Edit a free-form roadmap view to make any changes to the existing view. See [Edit a free-form roadmap view](#).

Edit a free-form roadmap view

Edit a customized free-form roadmap view based on your requirements, so you can access it when you log in again and share it with stakeholders for collaboration.

Before you begin

Role required: sn_align_core.ap_read_only

About this task

- Only the owner of a free-form roadmap view can edit a shared (public) view.
- You can have up to three private views and up to ten shared (public) views per free-form roadmap.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Portfolio Planning > Free-form Roadmaps**
2. Select a free-form roadmap to open it.
3. From the free-form roadmap header, select the view you want to edit or override with your personalization settings from the list of available free-form roadmap views.
The selected view appears.
4. Make changes to the view as needed.
For example, enable **Tracking mode** toggle.

After you make any change to the view, the Save view option appears in the free-form roadmap header.

5. Select **Save view**.
The view is updated to reflect the changes made.

6. Optional: To edit name of the view, select the Free-form roadmap drop-down from the free-form roadmap header and then select Edit view icon (✎) next to the view you want to edit the name for. On the Edit view window, fill the details.

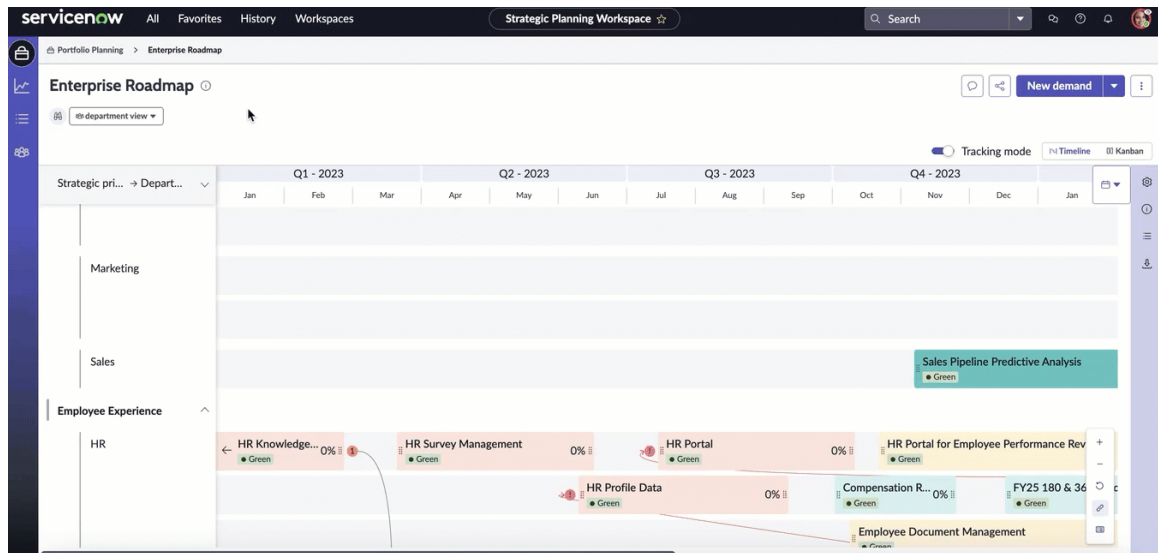

a. Update the name for the view in the **View name** field as required.

Note: Only the owner of the free-form roadmap view can rename the view.

b. **Optional:** Select the **Shared view** toggle to make this view public or disable the **Shared view** toggle to make the view private.

Important: Changing a shared view to a private view removes access for existing stakeholders.

c. **Select Save.**

What to do next

Share the free-form roadmap with your stakeholders to start collaborating on the free-form roadmap. See [Share a free-form roadmap with stakeholders](#).

Related topics

[Create a free-form roadmap view](#)

[Delete a free-form roadmap view](#)

Delete a free-form roadmap view

Delete a customized free-form roadmap view if it is no longer needed or if the maximum limit of ten shared or three private views has been reached.

Before you begin

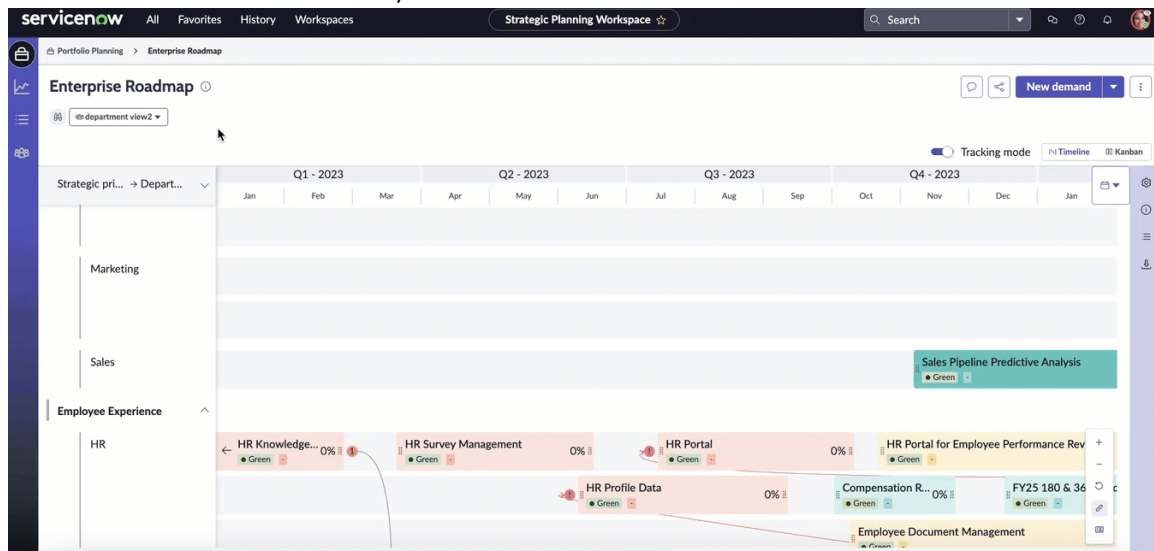

Role required: sn_align_core.ap_read_only

About this task

- Only the owner of the free-form roadmap view or an editor of the free-form roadmap can delete the view.
- Deleting a free-form roadmap deletes the view, including any changes made to the view. However, this action keeps the items (projects, demands, epics) intact in the free-form roadmap.
- You can have up to three private views and up to ten shared (public) views per free-form roadmap.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Portfolio Planning > Free-form Roadmaps**
2. Select a free-form roadmap to open it.
3. Select the Free-form roadmap view drop-down from the free-form roadmap header and then select Delete view icon (🗑️) next to the view you want to delete. The Delete this view window appears.
4. On the Delete this view window, select **Delete**.

Related topics

[Create a free-form roadmap view](#)

[Edit a free-form roadmap view](#)

Duplicate a free-form roadmap

Create a roadmap with the data of an existing roadmap. If the roadmap you want to create is similar to an existing roadmap, duplicating the existing roadmap saves your time.

Before you begin

Role required: sn_align_core.apw_user

About this task

Create a standalone roadmap to plan work across multiple units of your organization, such as projects of all departments. To learn more about free-form roadmaps, see [Roadmaps in Strategic Planning](#).

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Portfolio Planning > Free-form Roadmaps**
2. Select a roadmap that you want to create a copy from.
3. From the roadmap header, select the More actions icon () and then select **Duplicate roadmap**.
4. On the Duplicate roadmap window, fill the details.
 - a. Enter a name for the roadmap in the **Roadmap name** field.
By default, the name is *ABC (Copy)* where ABC is the name of the roadmap you copied from.
 - b. **Optional:** Select **Share with same users and groups** option to grant access to the users of the roadmap you copied from.
The action grants same read and edit access as is the users had for the roadmap you copied from.
 - c. Select **Confirm**.

Result

- A new roadmap is created and a link is generated on the screen to access the new roadmap.
- This roadmap is listed in the **Free-form roadmaps** tab of the Home page of Strategic Planning Workspace.

What to do next

- Update, personalize, and collaborate with your roadmap.
- Add milestones or create dependencies for the items planned on your roadmap.

Create planning items from the roadmap view

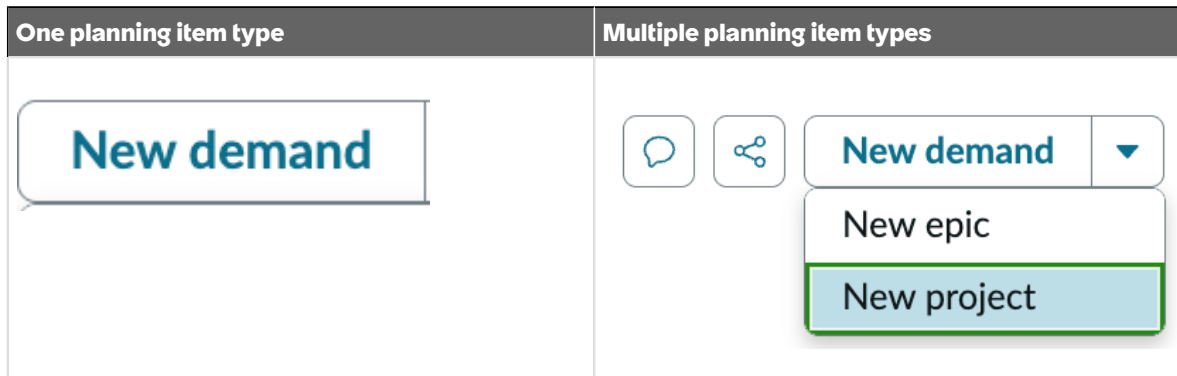

Create and add new planning items to your portfolio roadmap or free-form roadmap directly from the roadmap view.

Before you begin

Role required: sn_align_core.apw_user

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Portfolio Planning** and open your roadmap.
2. From the roadmap view, select the **New <item type>** option.
 - For a free-form roadmap, the option depends on the roadmap's source table.
 - For a portfolio plan roadmap, the option depends on the portfolio plan configuration.

For a free-form roadmap, if the source table is Planning Item [sn_align_core_planning_item] table, then the options depend on the values configured for the *freeform_planning_items_creation_list* property. By default, project and demand are available. Work with your admin to configure these options. See [Enable custom item types in Strategic Planning](#).

3. On the form, fill in the required field information.
For full field information, see [Planning item form](#).

You can refine planning item descriptions—for item types such as Demand, Epic, Project, Capability, Feature, and Story—using the Write planning item skill, if the Now Assist for SPM application is installed.

4. Select **Submit**.

Result

The new item appears on the roadmap, at a place based on its approved start and end dates.

If you don't fill both the approved start and end date fields, the item that you created would be moved to the list of unscheduled items. You can add them to your roadmap plan later. For more information, see [Plan unscheduled items into a roadmap](#).

Modify planning items from the roadmap view

Update the details of planning items or delete them from a portfolio plan or free-form roadmap so that your roadmap reflects the latest plans.

Before you begin

Role required: sn_align_core.apw_user

About this task

Edit the details of planning items from a side panel view, or the full details view in the roadmap.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Portfolio Planning** and open your roadmap.
2. From the roadmap view, click a planning item that you want to update or delete.

The side panel opens with the Details tab.

Further, you can click **Full details** and open the item's record page. On the full details page, you can also view related lists such as Milestones, Dependencies, and others. For field information, see [Planning item form](#).

You can refine planning item descriptions—for item types such as Demand, Epic, Project, Capability, Feature, and Story—using the Write planning item skill, if the Now Assist for SPM application is installed.

Note:

If your free-form roadmap was built on one of the PPM tables, such as project [pm_project] or demand [dmn_demand], you can only make updates from the full details page.

3. Update the details or delete the item.

- To update, edit the field details and click **Update**.

If you're on the full details page, click **Save**.

- To delete, do the following:

a. On the full details page, click the More Actions icon () and select **Delete**.

b. Click **OK** to confirm.

[Add milestones for roadmap items](#)

[Add dependencies for roadmap items](#)

Plan unscheduled items into a roadmap

Add items without start or end dates yet to your portfolio plan or free-form roadmap.

Before you begin

Role required: sn_align_core.apw_user

About this task

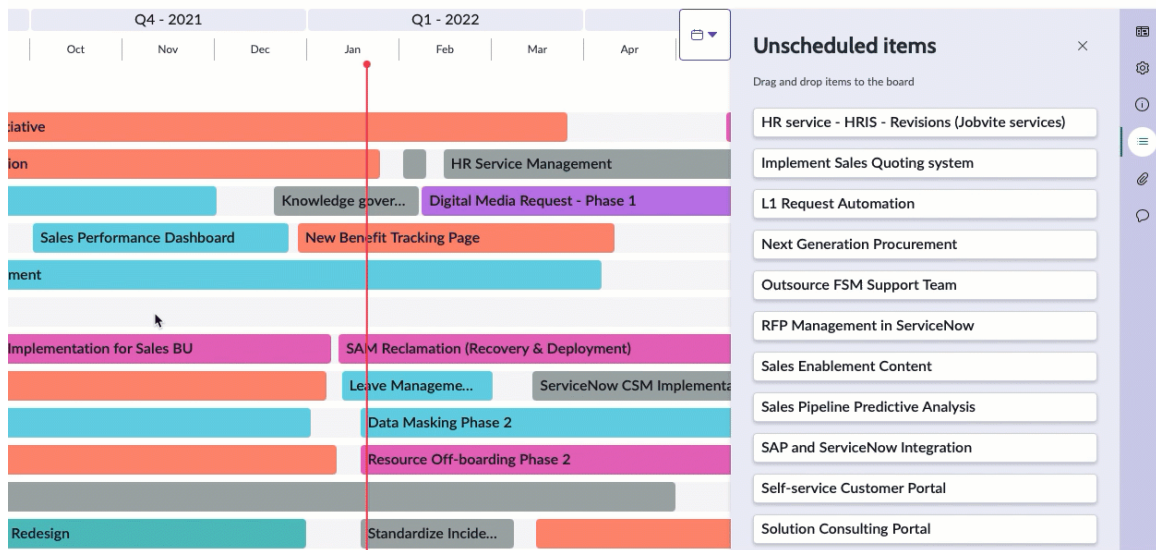

Planning items that meet the criteria of your portfolio plan or free-form roadmap, but don't have either the start or end dates are categorized as unscheduled items. As you progress in your planning, use the unscheduled items list to schedule these items into your roadmap timeline.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Portfolio Planning** and open your roadmap.

2. From the sidebar, select **Unscheduled items** ().

- From the list of unscheduled items in the side panel, drag and drop a planning item at a place of your choice on the roadmap.

Related topics

[Reschedule roadmap items](#)

Reschedule roadmap items

Update the planned dates of your roadmap items to account for any changes in your scheduling priorities.

Before you begin

Role required: sn_align_core.apw_user

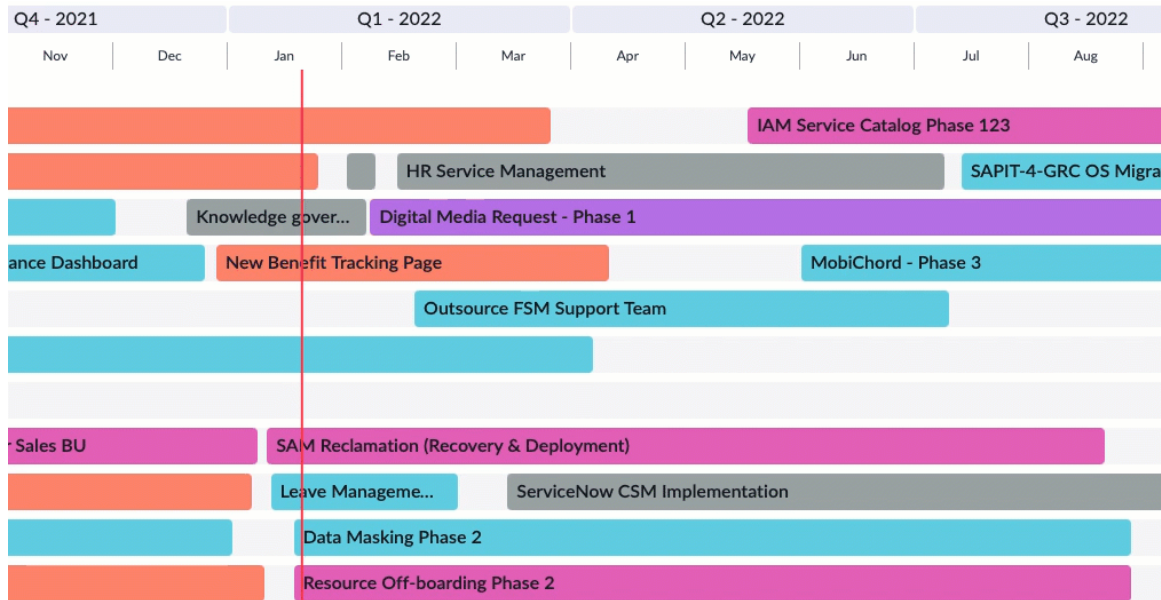

Procedure

- Navigate to **Workspaces > Strategic Planning Workspace > Portfolio Planning** and open your roadmap.
- To change the dates planned for a roadmap item, resize the roadmap item bar.

Note:

- When the start date of a demand is changed along the roadmap, the start date of the demand record in the Demand [dmn_demand] table and the timeline of the associated cost plan are automatically updated to match the new date.
- When the dates of a project are changed along the roadmap, the changes are updated in the project record in the Project [pm_project] table.

3. To reschedule the roadmap item, drag and drop the item to a timeline area of your choice.

Related topics

- [Add milestones for a roadmap](#)
- [Add milestones for roadmap items](#)

Add milestones for a roadmap

Track key dates of your plan's timeline by creating milestones and displaying them on the roadmap.

Before you begin

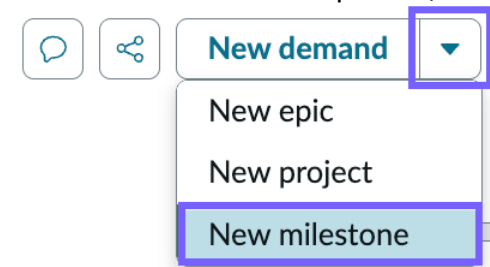

Role required: sn_align_core.apw_user

About this task

For the timeline of your portfolio plan or free-form roadmap, create milestones such as launch dates, deadlines, or other key events directly from the roadmap view.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Portfolio Planning** and open your roadmap.
2. From the More actions drop-down, select **New milestone**.

3. On the form, fill in the fields.

For field information, see [Roadmap milestone form](#).

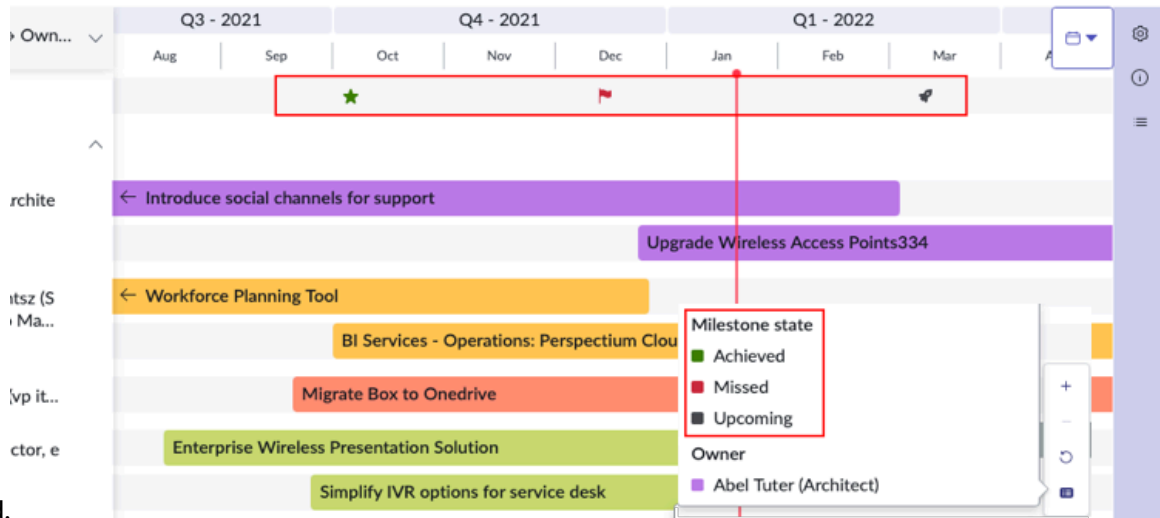

4. Select **Submit**.

5. **Optional:** Repeat steps 2 through 4 to add more milestones to your roadmap.

Result

Milestones that you created are visible on the roadmap.

Here is an image of a sample roadmap with the milestone bar showing different milestones for the planning

period.

The color of the milestone, shown on the legend, indicates the status of the milestone.

- Red: Missed milestone.
- Green: Achieved milestone.
- Grey: Upcoming milestone.

If multiple milestones are scheduled close to each other, they might appear grouped in the milestone bar. In this case, you can expand and collapse the milestone bar to view all the milestones of that period.

Related topics

Update a roadmap milestone

Update or delete the milestones that you added to your portfolio plan or free-form roadmap so that they reflect any change of plans.

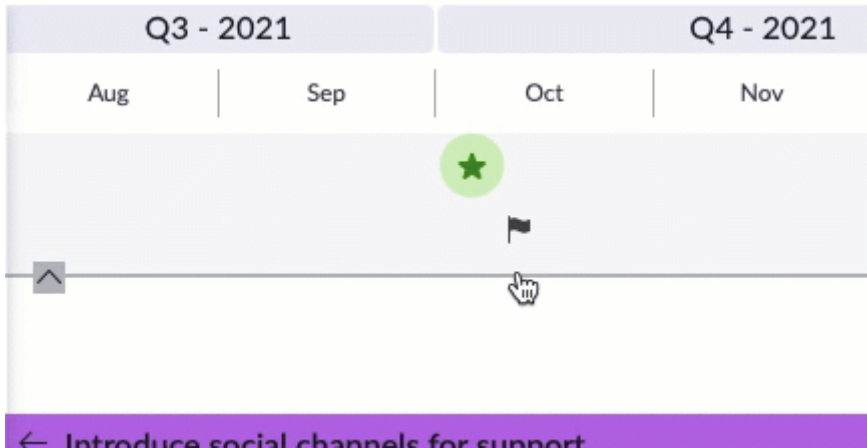

Before you begin

Add milestones for a roadmap.

Role required: sn_align_core.apw_user

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Portfolio Planning** and open your roadmap.
2. To reschedule a milestone, you can drag and drop it at a timeline area of your choice.

If you want to update other details or delete the milestone, proceed with the following steps.

3. From the roadmap view, click the milestone that you want to update. The side panel opens showing the milestone details.
4. Update or delete the milestone.
 - To update, edit the field details and click **Save**.
For information on the form fields, see [Roadmap configuration form](#).
 - To delete the milestone, click **Delete**.
Select **OK** to confirm.

Related topics

[Customizing milestones display on roadmap in Strategic Planning Workspace](#)

Add milestones for roadmap items

Track key outcomes of your planning items (such as demands, epics, or programs) by creating milestones for them, directly from the roadmap view.

Before you begin

Role required: sn_align_core.apw_user

About this task

Select a roadmap item and create a milestone for it. Use the roadmap side panel to fill in the details and submit.

For free-form roadmaps, milestones are supported only if the source table is Planning Item [sn_align_core_planning_item] or one of its extensions.

Important:

You can't add a project milestone from the roadmap view. Creating or updating project milestones may impact the associated project plans. So, it's recommended to create or update project milestones using Project Workspace in Project Portfolio Management (PPM).

However, any existing milestones of the project are visible on the roadmap if you've [integrated Strategic Planning with PPM](#).

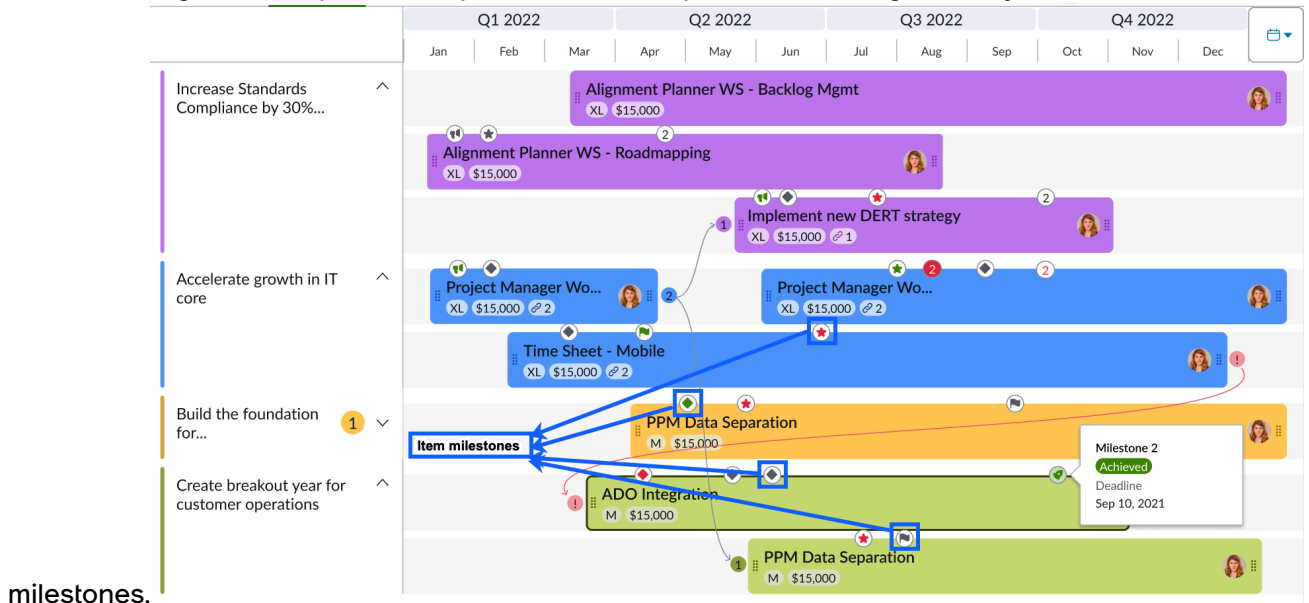

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Portfolio Planning** and open your roadmap.
2. From the roadmap view, click a planning item to which you want to add the milestone. The side panel opens showing the item details.
3. Select the Milestones tab. Alternatively, you can click **Full details** and select the Milestones tab from the full details page.
4. Select the Add milestone icon (+). If the item doesn't have any milestones, select **New milestone**.
5. On the form, fill in the fields. For field information, see [Planning item milestone form](#).
6. Select **Save**. When you go back to the Milestones tab, you can see the milestone listed there.
7. **Optional:** Repeat steps 2 through 6 to add more milestones to your items.

Result

- Milestones that you created are indicated on the roadmap item bars.

Here's an image of a sample roadmap with the roadmap items indicating that they have

milestones.

- Pointing your cursor over these milestone indicators shows the details such as the milestone name, type, and due date.
- Clicking one of these indicators opens the Milestones tab of the Item details side panel. Here, you can see a list of all the milestones for this planning item.

What to do next

Update roadmap item milestones

Update or delete the milestones that you added to your planning items (such as demands, epics, or programs) so that they reflect any change of plans.

Before you begin

Role required: sn_align_core.apw_user

About this task

From the portfolio roadmap or free-form roadmap, select a planning milestone to update its details. Use the roadmap side panel to edit the details and submit.

For free-form roadmaps, milestones are supported only if the source table is Planning Item [sn_align_core_planning_item] or one of its extensions.

Important:

You can't add a project milestone from the roadmap view. Creating or updating project milestones may impact the associated project plans. So, it's recommended to create or update project milestones using Project Workspace in Project Portfolio Management (PPM).

However, any existing milestones of the project are visible on the roadmap if you've [integrated Strategic Planning with PPM](#).

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Portfolio Planning** and open your roadmap.

2. From the roadmap view, click a planning item and select the Milestones tab.

The side panel shows the list of all the milestones associated with this planning item.

Alternatively, you can click **Full details** and open the item's record page and then select the Milestones tab.

3. Click the milestone that you want to update.

4. From the milestone form, update the details or delete the milestone.

- To update, edit the field details and click **Save**.

For information on the form fields, see [Planning item milestone form](#).

- To delete the milestone, click **Delete**.

Select **OK** to confirm.

Related topics

Add dependencies for roadmap items

Create dependencies and visualize relationships between planning items of your portfolio or free-form roadmap, so that you can adjust their scheduling.

Before you begin

Role required: sn_align_core.apw_user

About this task

From the portfolio roadmap or the free-form roadmap, use the item details side panel to create dependencies between two planning items. Dependencies are supported for projects, epics, demands, initiatives, programs, or any custom planning item types that you may have created.

The dependency for a planning item on your roadmap can be on an item from the same roadmap, a different roadmap, or the item might not be planned yet. [Learn more about dependencies in the roadmap.](#)

Note:

Dependencies for free-form roadmaps are available only if the roadmap's source table is Planning Item [sn_align_core_planning_item] or one of its extensions.

Procedure

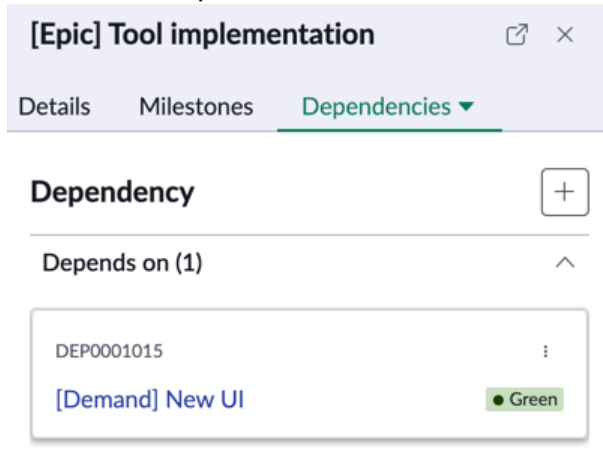

1. Navigate to **Workspaces > Strategic Planning Workspace > Portfolio Planning** and open your roadmap.
2. From the roadmap view, click a planning item for which you want to add the dependency. The side panel opens showing the item details.
3. Select **More > Dependencies**.
4. From the Dependencies tab, select the Add dependency icon ().
5. On the form, fill in the fields.

For form field information, see [Dependency form](#).

6. Select **Save**.

Result

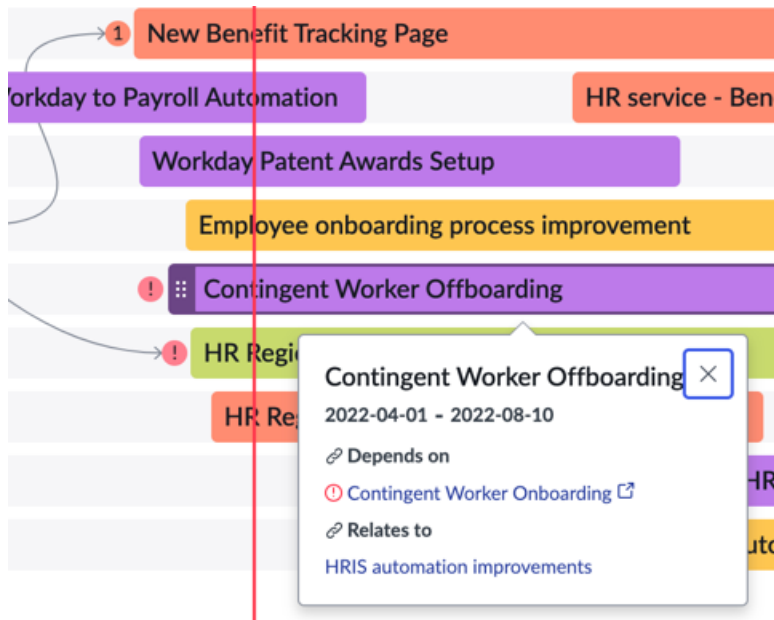

The dependency is created between the selected planning items and is listed in the Dependencies tab of the Item details side

panel.

On the roadmap, you can see the dependency details from the roadmap item card or the dependency lines. [Learn about display settings available for dependencies on the roadmap.](#)

If one of the dependency items is not on the roadmap, then the dependency details are shown on the roadmap item card, with a redirect link to the external planning item. In this case, the items could belong to the same roadmap or not.

What to do next

- [Learn how to resolve roadmap item dependency errors.](#)
- Update the dependency details or delete it. See [Update roadmap item dependencies.](#)

Update roadmap item dependencies

Update or delete the dependencies for the planning items on your roadmap so that they reflect any change of plans.

Before you begin

Role required: sn_align_core.apw_user

About this task

Use the roadmap side panel to change the details of a dependency or delete it.

Dependencies for free-form roadmaps are available only if the roadmap's source table is Planning Item [sn_align_core_planning_item] or one of its extensions.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Portfolio Planning** and open your roadmap.

2. From the roadmap view, click a planning item whose dependencies you want to update or delete.

The side panel opens showing the item details.

3. Select **More > Dependencies**.

Dependencies for this planning item are listed in the form of cards.

4. From the side panel, locate your dependency and use the More actions icon () to edit or delete.

Personalize roadmap Timeline view

Customize the way that your roadmap is displayed in the Timeline view. Group the roadmap items, color them by a category, add numerical data points, and display milestones and dependencies to analyze your roadmap efficiently and take informed decisions.

Before you begin

Role required: sn_align_core.apw_user

About this task

This task provides guidance on different options to personalize the Timeline view of your roadmap. Choose the options that you want to apply.

Any settings that you apply here are saved as preferences per roadmap. All users who can access the roadmap would see the same settings.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Portfolio Planning** and open your roadmap.

2. Modify the scale of the timeline of your roadmap.

Select the time scale icon () and choose **Month**, **Quarter**, or **Year**.

Note:

The timescale view that you choose is saved in the roadmap preferences.

3. Use the side panel to personalize how your roadmap looks like.

a. From the side bar, select the Personalize icon ().

b. Group and color your roadmap items by the available attributes.

You can group the roadmap items by up to two attributes and color-code them by one attribute.

You can work with your admin to add other attributes for the Group by, Color by, and Metrics fields. See [Customize the planning item display preferences for Prioritization and Roadmap](#).

Important: Don't group your roadmap items by the name attribute because the application renames the roadmap item when you move the item bar from one group to another.

- c. Enable visibility of owners of the roadmap items by using the **Owner** toggle.
- d. Display data points such as planned cost on the roadmap item bars by adding fields in the **Metrics** section.

You can add up to three metrics.

- e. If your roadmap items (such as projects, epics, or demands) have milestones, adjust how they're displayed using the toggles in the Milestones section. For more information, see [Customizing milestones display on roadmap in Strategic Planning Workspace](#).
- f. If your roadmap items have dependencies, adjust how they're displayed using the toggles in the Dependencies section. For more information, see [Customizing the dependencies display on the roadmap in Strategic Planning Workspace](#).
- g. Identify the current date on your timeline using the current date indicator. Enable the **Current date line** toggle from the Other settings section.

4. Quickly enable or disable the display of dependency lines between the roadmap items using the Display dependency lines icon ().

5. Zoom in, zoom out, and reset the zoom of your roadmap view by using the zoom options.

Note: The zoom level that you choose isn't saved as the roadmap preferences.

6. Apply filters to the data shown on the roadmap.

Personalize roadmap Kanban view

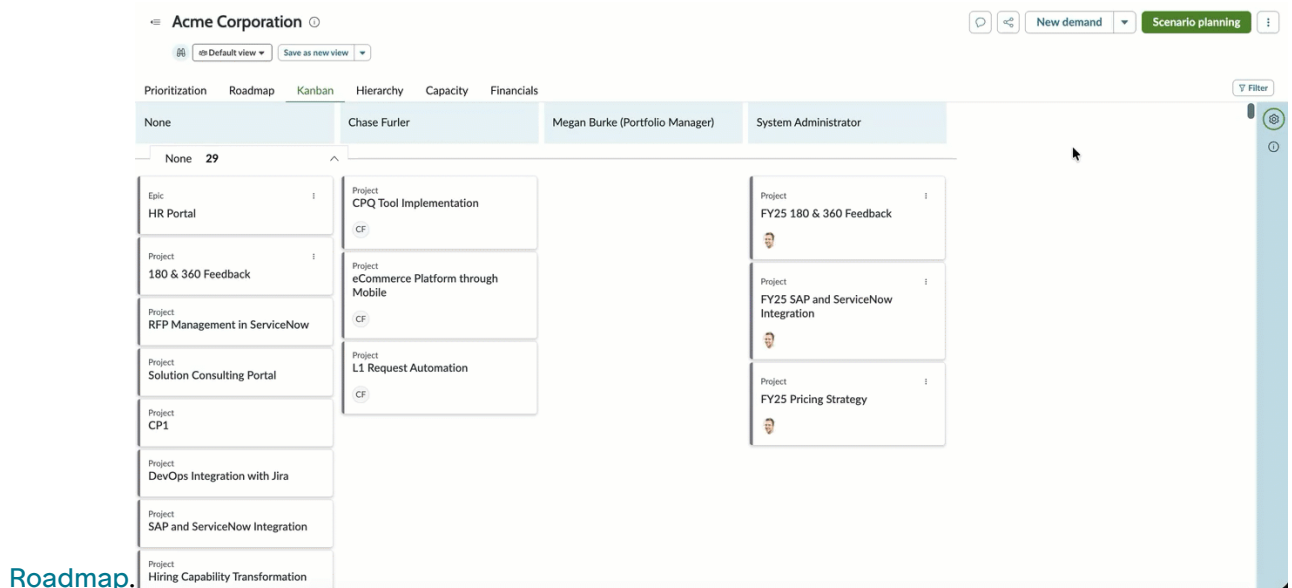

Customize the way that your roadmap Kanban is displayed. Modify the lane values to change the way your cards are sorted, or customize the card metrics to view only the fields you want to see on the cards.

Before you begin

Role required: sn_align_core.apw_user

Procedure

1. Navigate to **All > Strategic Planning > Strategic Planning Workspace > Portfolio Planning**.
2. From the list of portfolio plans, select one and then select **Planning**.
3. Select Kanban tab.
4. Select the Personalize icon (⚙️) to update the view, based on your preferences.
See [Customize the planning item display preferences for Prioritization and](#)

Roadmap.

i Important:

The default display limit of vertical lanes and horizontal lanes shown on a Kanban board is 30 and 30 respectively. These lanes support only reference and choice fields. As you user, you will not be able to change the field metrics on a Kanban card.

Track the progress of roadmap items

Visually track the completion of a work item on your portfolio plan roadmap or free-form roadmap using the tracking mode.

Before you begin

Role required: sn_align_core.apw_user

About this task

Use a toggle to switch your roadmap view from planning mode to tracking mode. The roadmap item cards turn into progress bars to indicate the status and progress.

i Note:

While in Tracking mode, you cannot create, update, or reschedule roadmap items and milestones. This view is a read-only mode.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Portfolio Planning** and open your roadmap.

2. Select the Tracking mode option to turn on the tracking view of the roadmap.

3. **Optional:** Personalize the roadmap view in tracking mode.

Note:

The group by and color by personalization that you've done in the planning mode of your roadmap gets carried over to the tracking mode but the metrics are not carried over.

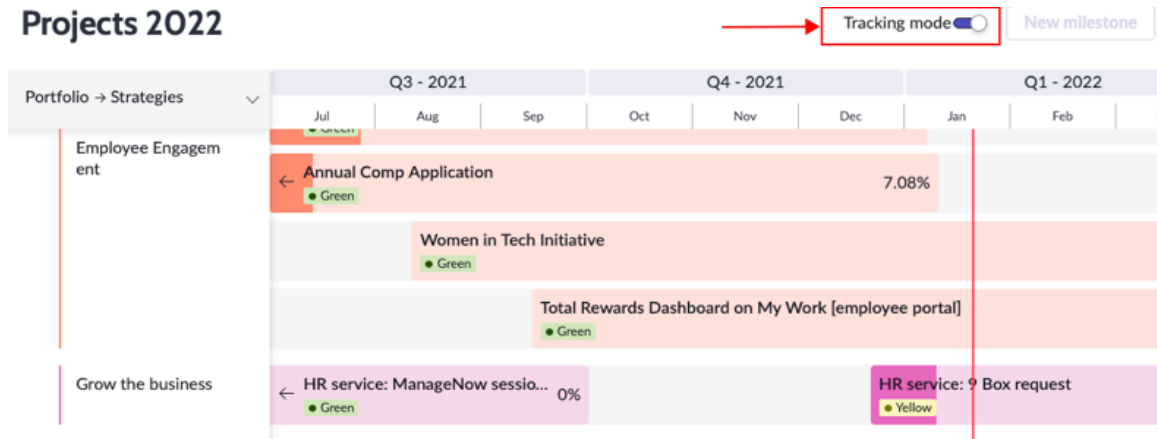

- a. Enable or disable the visibility of the roadmap item status and percentage complete using the **Status** and **% Complete** toggles respectively.
- b. Display data points such as planned cost on the roadmap item bars by adding fields in the **Metrics** section.
You can add up to two metrics in tracking mode.
- c. Personalize the display of milestones.
You can choose to display the milestone with just its icon or along with its label.

Milestone indicator with label			Milestone indicator

Result

The tracking view of your roadmap is displayed according to your personalization settings. A sample view of roadmap tracking is shown in the following image.

Projects 2022

Optimizing planning with scenario planning in Strategic Planning Workspace

As a portfolio manager, optimize your portfolio planning by comparing potential outcomes, assessing their alignment with strategic goals, and approving the best scenario as your live plan.

Scenario planning items in the Prioritization tab

The **Prioritization** tab of the Scenario page enables you to add and remove planning items to/from a scenario and adjust their dates.

Scenario: EarSta

Timeline: 2024-08-01 - 2025-07-31

Portfolio plan entities: Departments: Facilities, Developme...

Created by

Scenario planning items in Financials tab

The **Financials** tab of the Scenario page enables you to set custom targets, budget, and compare the allocated budget against target using the outcomes panel.

Portfolio Manager can simulate multiple scenarios with different budget combinations and compare their outcomes to arrive at an informed decision to balance the resources and strategic objectives. Using the financials view in Scenario planning, you can get a simulation mode for the financial information. Using this view, the strategic planning users such as Portfolio managers, Program managers, or Portfolio user working on the portfolios, can set a portfolio budget target for a particular planning cycle, which could be a monthly, quarterly, yearly, or beyond a year up to 5 years. Using this defined budget, portfolio users can prioritize the planning items within the portfolio to analyze if the prioritized items can be executed within their portfolio budget, while reviewing the monetary benefit from the prioritized items.

i Important:

Enable the budget allocation property to allocate budget to your planning items at portfolio-level and configure the budget attributes to allocate budget by expense type or cost type.

Create multiple scenarios to compare them, and work with your stakeholders to approve an ideal plan with better monetary benefit returns. Once approved, the approved Scenario will become your new portfolio plan for the defined planning cycle. For more information to know about the changes happening in a portfolio after scenario approval, see [Approve a scenario](#).

You can perform financial scenario planning throughout your planning or execution cycle depending on your organization needs such as at your regular planning cycles, quarterly reviews, or financial review cycles. Financials in scenario planning helps you to arrive at an informed decision and customize the portfolio planning to match with your organization needs.

i Note:

- Financials in scenario planning is supported only for Epics, Projects, and Demands type of planning items.
- Customers using the Legacy Investment Funding should migrate to new experience to work on the financial scenario planning.

Personalize your scenario planning financials view using the Time scale and Range filters. Manage the budget of your planning items by monthly, quarterly, or yearly cadence depending on the planning cycle of your organization.

Outcomes panel in Scenario planning

The outcomes panel in the simulation indicates the financial information of the portfolio such as target and budget amounts for Capex and Opex, set budget target for this simulation, utilized and remaining budget from the target, benefit from the In-plan items, and the actual costs accounting from the out of plan items. The aggregated data is fetched based on the portfolio timeline range including the target and budget data.

Representations in outcomes panel for the identification.

Outcomes panel representation

Indication	Definition
Red text for amount without progress bar indication for Total Simulated Budget	No defined or set target amount for this scenario.
Red text for amount and red progress bar for Total Simulated Budget	Total allocated budget for planning items exceeds the scenario's set target amount.
Red text amount for Capex Budget	Capex Budget allocations exceed the scenario's Capex target.
Red text amount for Opex Budget	Opex Budget allocations exceed the scenario's Opex target.
Green text for budget amounts and green progress bar	Budget allocation for each expense types and total budget is within the scenario's set target.

Scenario planning features

In scenario planning, you can perform the following actions:

Feature	Description
Create a scenario	Create a scenario from the current plan, or another scenario, in a simulated environment to compare the scenario with the live plan and other scenarios.
Compare scenarios	Compare scenarios and the live plan side by side to review tradeoffs and items added or removed from the plans.
Approve a scenario	Approve the best scenario.
Manage scenarios	View list of scenarios, rename scenarios, and delete scenarios.

Scenario planning use cases

The following are high-level use cases for scenario planning.

- **Fiscal year planning:** Megan Burke, Portfolio Manager at ACME Inc, is planning for the next fiscal year and is required to prioritize planning items and align them with the organizational strategic goals. Megan creates a scenario for the portfolio plan and then uses the Prioritization tab to align items with goals. Megan holds discussions with program managers and with the financial team, creates multiple scenarios, and compares them. Megan approves the optimal scenario as a well-aligned strategic portfolio plan for the next fiscal year.
- **Mid-cycle reprioritization;** Changed priorities emerging mid-year require adjustments to the current portfolio plan. John Doe, the product manager at ACME Inc, creates a scenario and incorporates the changed priorities. John adjusts the plan based on the program manager's and financial team's feedback and finalizes the plan.

Create a scenario

Create a scenario from a live plan or another scenario in a simulated environment to compare the scenario with the live plan and other scenarios.

Before you begin

Role required:

- sn_align_core.apw_user
- sn_align_ws.spw_financial_user - to view and edit financial details.

About this task

Creating a scenario enables you to visualize and anticipate potential outcomes. You can create a scenario based on the live plan or on another existing scenario. Once you have created one or more scenarios, you can compare them side by side with the live plan and approve the most desirable scenario. The scenario you approve becomes the live plan.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace**.
2. From the list of portfolio plans, select one and then select **Planning**.
3. Select **Create scenario**.

i Note:

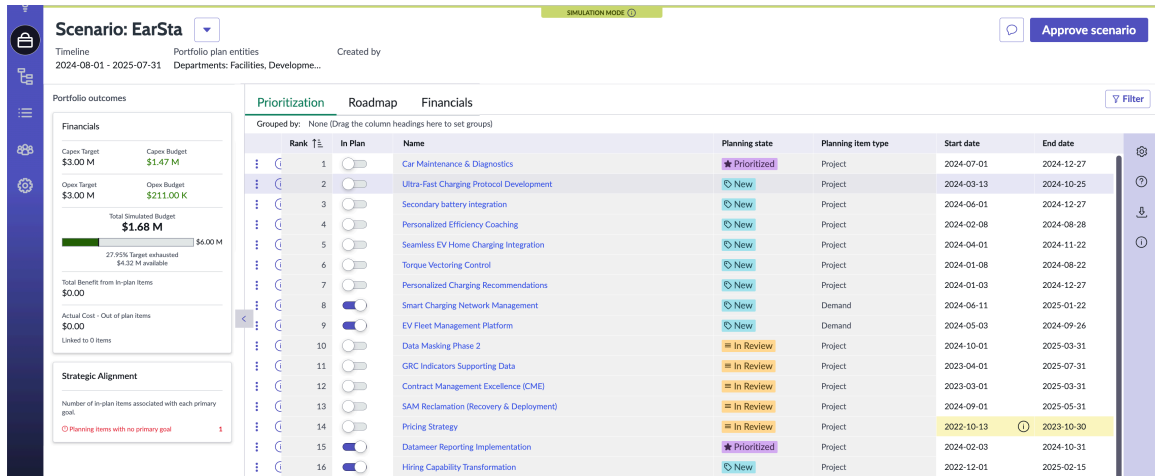

Before you have created your first scenario, you see the **Scenario planning** button on the Scenario page. In such a case, select **Scenario planning** and then you see the **Create scenario** button.

- a. Enter a name for your scenario in the **Scenario name** field.
- b. **Optional:** In the **Description** field, enter the details of your scenario.
- c. In the **Copy From** field, select the *Current Plan* or the name of an existing scenario based on which you want to create the scenario.
- d. Select **Create**.

The Scenario planning- [Scenario Name] page appears with the Prioritization tab open. The Prioritization tab lists all the planning items that you have in the live plan, or in the existing scenario that you copied the scenario from. The planning item start and end dates are determined based on the dates specified in the live plan or the actual execution dates.

- **In Plan** toggle: By default, the **In Plan** toggle is switched on for planning items that have the planning state as Prioritized or Done and have their start dates within the portfolio plan timeline. The **In Plan** toggle is turned off for items that have the status New, In Review, or Canceled.
- Yellow highlights for out of range dates: The planning item dates that are out of range of the portfolio plan timeline are highlighted with a yellow background. For such items, the **In Plan** toggle is turned off.

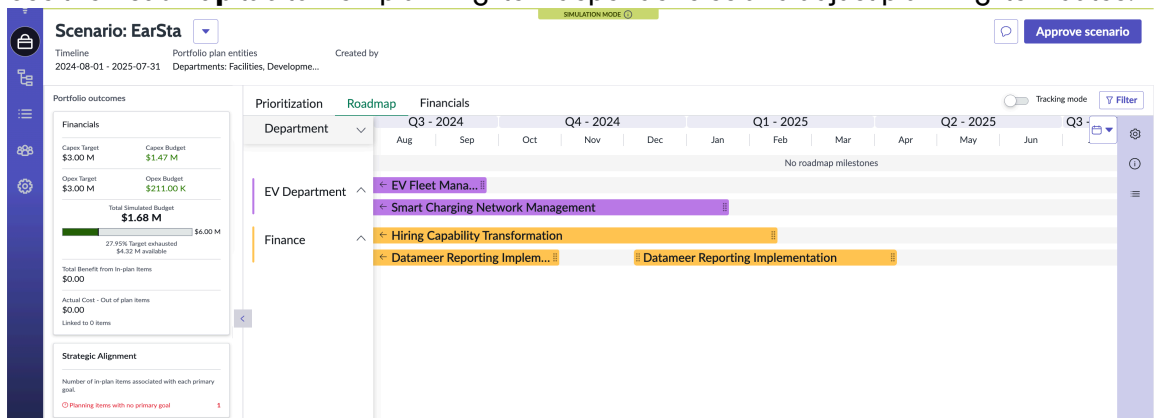

4. Use the Prioritization tab to include or exclude additional planning items in the scenario.

- a. **Optional:** To exclude a planning item from the scenario, turn off the **In Plan** toggle.
- b. **Optional:** To include a planning item in the scenario, edit the start and end dates of the item to fall within the portfolio plan timeline, and then turn on the **In Plan** toggle.

If you include out-of-timeline items in a scenario, these items remain in the scenario during the planning and prioritization process. When the scenario is approved, the dates of these items are updated to align with the scenario dates. However, because these updated dates fall outside the original portfolio plan timeline, the items are moved out of the live portfolio plan.

5. Use the **Roadmap** tab to view planning item dependencies and adjust planning item dates:

- a. Drag the start or end of the planning item bars to change their start or end dates.
- b. Drag the planning item bars to shift them in the plan timeline.
- c. View the dependencies and milestones of the various planning items.

6. Use the **Financials** tab view the prioritize, invest, and execute the right items to provide best returns on investments for your organization.

In Plan	Rank	Name	FY25 Capex		FY25 Opex		FY25 Total	
			Budget	Forecast	Budget	Forecast	Budget	Forecast
		Target	3,000,000		3,000,000		6,000,000	
		Target balance	1,354,000		2,627,000		3,981,000	
<input checked="" type="checkbox"/>	1	Automating IT operations for streamlined efficiency	360,000	360,000	15,000	15,000	375,000	375,000
<input checked="" type="checkbox"/>	2	Automation of cloud infrastructure management and deployment	45,000	45,000	54,000	54,000	99,000	99,000
<input type="checkbox"/>	3	Automated software deployment and version control	0	0	0	0	0	0
<input checked="" type="checkbox"/>	4	Security automation for continuous vulnerability scanning and patching	50,000	35,000	60,000	42,000	110,000	77,000
<input checked="" type="checkbox"/>	5	Robotic process automation (RPA) for task management and IT support	156,000	117,000	40,000	30,000	196,000	147,000
<input checked="" type="checkbox"/>	6	Infrastructure provisioning and scaling through automation	90,000	90,000	54,000	54,000	144,000	144,000
<input type="checkbox"/>	7	Automated patch management across IT systems	0	0	0	0	0	0
<input type="checkbox"/>	8	Network configuration and monitoring automation	720,000	540,000	30,000	22,500	750,000	562,500
<input type="checkbox"/>	9	Automating data integration, transformation, and backup processes	180,000	135,000	66,000	49,500	246,000	184,500
<input checked="" type="checkbox"/>	10	Continuous integration/continuous delivery (CI/CD) automation	45,000	45,000	54,000	54,000	99,000	99,000

a. Set target for your portfolio budget.

i. Select the **Set Targets** () button.

ii. In the Set Targets window, set budget for an expense type or a cost type using the inline edit feature.

 **Tip:**

You can change the **Time scale** and **Range** to set targets for each fiscal period at monthly, quarterly, or yearly cadence to meet your organization's planning cycle. The target set for a higher timescale, it is equally split it between the fiscal periods.

Once the target is set for a scenario, the **Target** row displays the defined target amount by fiscal period and budget allocation choices.

b. Include or exclude planning items in scenario using the **In-plan** toggle.

c. Add or reduce budget for individual planning items using the inline editing feature.

Changes made to the budget using while creating a scenario are marked with  icon.

What to do next

- Create more scenarios, if necessary.
- **Compare scenarios.** You can directly compare scenarios from simulation mode by selecting **Compare scenarios** from the Scenario actions list.
- **Approve a scenario**

Compare scenarios

Compare scenarios side by side to confirm alignment with primary goals, evaluate comprehensive planning, optimize resource usage, confirm feasibility, and financial information.

Before you begin

Verify that you have created one or more planning scenarios and selected planning items for execution. For more information, see **Create a scenario.**

Role required:

- sn_align_core.apw_user
- sn_align_ws.spw_financial_user - to view the financial widgets and details.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace**.
2. From the list of portfolio plans, select one and then select **Planning**.
3. From the Create scenario menu, select **Compare scenarios**.
The Compare scenarios page appears.
4. Select **Add Scenario To Compare** and select or deselect scenarios to be included in the comparison.
You can add up to five scenarios to the comparison.
5. Select **Compare**.
You can also view the Compare Scenario page by selecting **Compare Scenarios** from the Scenario Actions menu in the Scenario page. The Compare Scenario page appears with the scenario open in the Scenario page included in the comparison with the current plan.
The selected scenarios appear side by side on the Compare Scenario page.
6. Compare different aspects of the scenarios such as Budget vs Target, Benefit, Budget distribution, trade offs, and alignment with primary goals.

Portfolio Planning > Portfolio FY25 > Scenario Planning - Benefits optimization > Compare scenarios

Visual cues in scenario comparison

Criteria	Description
Planning items with no primary goal	The planning items with no primary goals are indicated in red font.
Removed from this plan	Items that are removed from the plan when the scenario is approved, are marked with a red X.

Criteria	Description
Added to this plan	Items that are added to the plan, when the scenario is approved, are marked with a green checkmark.

The following are some indications of the suitability of a scenario for approval:

- All planning items align with primary goals, with no items unassociated, providing a focused strategy that supports the organization's objectives effectively.
- The trade-off section includes relevant items, demonstrating comprehensive and inclusive planning that addresses various aspects of the project or initiative.
- The scenario is realistic and achievable, considering current constraints and capabilities, confirming that planned actions can be executed within the given timeframe and budget.
- Better benefit from financial planning using the widgets, Budget vs Target to validate the allocated budget against the set targets, Benefit to identify scenario with better monetary benefit, and Budget Distribution to see the amount of budget allocated to the top four goals.

7. Optional: Select the **Approve Scenario** button relevant to a scenario to approve it. For more information about approving existing scenarios in the Strategic Planning Workspace, see [Approve a scenario](#).

What to do next

[Approve a scenario](#)

Approve a scenario

Approve a scenario that aligns with your organizational goals and offers the best business outcomes to make the scenario your current plan.

Before you begin

Ensure that you have compared the scenarios and selected the one you want to approve. For more information, see [Compare scenarios](#).

Role required:

- sn_align_ws.scenario_approver
- sn_align_ws.spw_funding_user - to view and approve the financial changes.

About this task

When you approve a scenario:

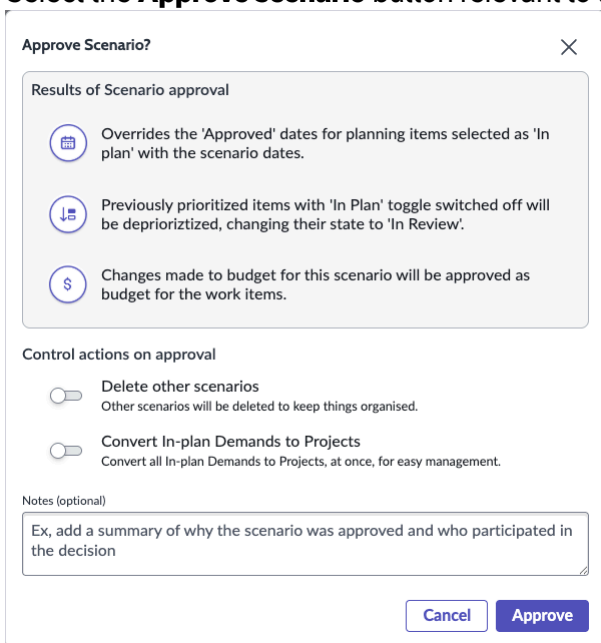

- Planning items with the In Plan state are updated to the Prioritized state.
- Planning items that you moved out of the plan are changed to the In Review state.
- The approved dates are revised accordingly.
- Changes made to the budget of a planning item is will be approved as the budget.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace**.
2. From the list of portfolio plans, select one and then select **Planning**.
3. From the Create scenario menu, select **Compare scenarios**.

The **Approve scenario** button is also available on the Scenario page. As soon as you have created a scenario, you can directly approve a scenario without comparing it with the other scenarios.

4. Select the **Approve scenario button relevant to the scenario that you want to approve.**

While approving a scenario, you can:

- Convert the prioritized demands to projects to automatically build a portfolio plan by selecting the **Convert In-plan Demands to Projects** toggle.
- Delete the remaining scenarios by selecting the **Delete other scenarios** toggle.
- Enter a reason for approving the scenario in the Notes field.

5. Select **Approve.**

Manage scenarios

Use the **Manage scenarios** option to view a list of all scenarios, rename scenarios, or delete scenarios.

Before you begin

Role required:sn_align_core.apw_user

Procedure

- 1. Navigate to **Workspaces > Strategic Planning Workspace**.**
- 2. From the list of portfolio plans, select one and then select **Planning**.**
- 3. Navigate to **Create Scenario > Manage Scenarios**.**
You can also select **Manage Scenarios** in the Recent Scenarios menu in the Scenario page.
The Manage scenarios dialog appears with the list of scenarios relevant to the current plan.
- 4. Do any of the following actions.**

Planning user capacity in Strategic Planning Workspace

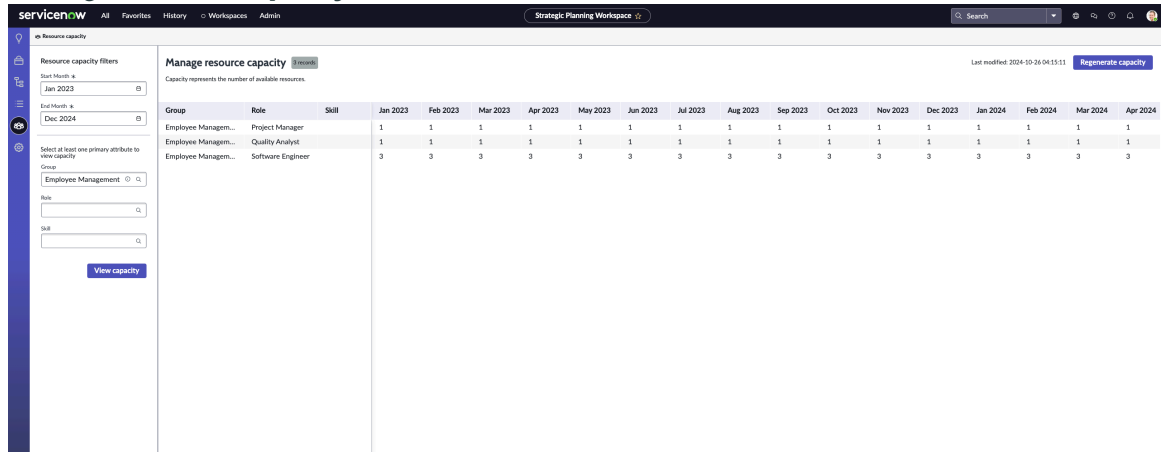

Assess the resource capacity and review existing allocations, which help you to make informed decisions while working on assigning resources in Strategic Planning.

Use the [manage resource capacity](#) screen to generate resource capacity details.

Use the [Capacity screen](#) to view detailed information about the resource capacity mapping to a portfolio.

Manage resource capacity

Manage resource capacity screen

Using Manage resource capacity, select a time frame and primary attributes to view number of available resources. Generated resource capacity details are saved. You can regenerate capacity to view latest changes in the resource availability.

Resource capacity screen helps you to view the following data.

- Resource availability for generated capacity.
- Total number of available resources in a monthly breakdown view.
- Latest date of generating the capacity details.
- Option to regenerate and fetch the latest capacity details from the employee profile mappings.

On the Manage resource capacity screen, you can:

- Filter resources with specific capacity attributes for a required date range to view the number of available resources.
- Regenerate capacity details to view the latest details from the resource employee profile mapping.

Select resource criteria

- Select a primary attribute to automatically view the available groups, roles, or skills from the resource assignments of the prioritized planning items.
- Switch between **Auto-select** and **Manual-select** option to view the allocated resource efforts for all planning items or to view a custom data, respectively.
- Define resource criteria to view the available groups, roles, or skills from the resource assignments of the prioritized planning items.

Capacity

Capacity screen displays the resource efforts from the prioritized planning items.

- Comprehensive overview of resource capacity and allocations.
- Current resource capacity allocation.
- Interactive Gantt chart to view prioritized planning items in the bottom tray to analyze and plan work.

Understanding the Capacity screen.

Capacity legend

Color	Description
Yellow (Gantt bar)	Planning item with no resource assignments.
Blue (Gantt bar)	Resource estimates for Planning items are within the resource capacity.
Red (Cells and Gantt bar)	Overallocation in resource estimates.
Green (Cells)	Resource estimates within the resource capacity.

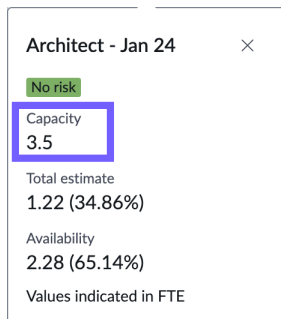

Using Capacity, you can:

- View the capacity allocations of prioritized planning items for your current portfolio and better forecast your future resource requirements.
- Use the filter option () to view planning items by their type, state, priority or any by any required attributes to create capacity plans.

Note:

Default filter is set to display prioritized planning items only.

- View the updated resource capacity based on the assigned operational resource assignments.
- View the total resource capacity in the heatmap view.

- View total resource capacity and total estimates.
- View the efforts for operational work and efforts for estimates outside of portfolio in the **Additional items** list.
- Redefine the workforce criteria by selecting **Resource criteria** ()

Example: Calculation of Operational Resource Assignment in Capacity

As a Resource Manager, you can [create operation resource assignments](#) or [migrate existing operational resource plans](#) of your employees to handle the required meetings, trainings, time off and so on to meet your work requirements.

Consider a group with capacity of 2 FTE and resource manager creates a Group type operation resource assignment for 10% of the capacity for training. This operational assignment can be viewed in the **Operational work** line item in the top-tray of the Capacity screen. The value of the **Operational work** line item will be 0.2, which is 10% of total capacity of the group.

When a resource manager creates a Group type operation resource assignment for time off, this doesn't update the **Operational work** line item but reduces the total available capacity.

Consider the same group for which resource manager creates an operation resource assignment for 25% of the capacity for time off, for a quarter from April to June. The total available capacity of the group for the quarter April to June will be 1.5 FTE, which is 75% of the total capacity after reducing the 25% time off.

0.5 FTE, which is 25% of total capacity of the group will be reduced.

Note:
The **Operational work** line item is highlighted in gray color.

Group, Role, Skill & Planning Item	Rank	Type	Row type	Q1 - 2024			Q2 - 2024			Q3 - 2024			Q4 - 2024

Generate resource capacity

Generate and view the total capacity of the resources with primary attributes. Capacity details helps Portfolio Managers to plan and manage planning items depending on the resource availability.

Before you begin

1. Enable planning attributes for capacity planning. For more information, see [Enable planning attributes for capacity planning](#).
2. Generate employee profiles for resources. For more information, see [Generate employee profiles for resources to work with Capacity](#).

Role required: sn_align_ws.spw_capacity_user

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace**.
2. Select the **Resource capacity** option (⚙️).

Note:
If planning attributes aren't enabled for capacity planning, you see an empty state screen with an option to configure. Contact your admin to enable planning attributes for capacity planning. For more information, see [enable planning attributes for capacity planning](#).

3. Use one of the following options to view and regenerate the capacity details.

What to do next

Use [Capacity Planning](#) to view the resource capacity, resource-to-work mapping and re-prioritize resource allocations to effectively execute your prioritized planning items.

Using Capacity in Strategic Planning Workspace

View and analyze the resource capacity for your portfolio to plan and re-forecast the resource assignments.

Before you begin

Generate resource capacity using [manage resource capacity](#).

Role required: sn_align_ws.spw_capacity_user

Procedure

1. Navigate to **Workspaces** > *Strategic Planning Workspace*.
2. Select a plan from Portfolio Plans.
3. Select **Planning** > **Capacity**.
4. Define a resource criteria by selecting a primary attribute from the list.
If you select Group, all the available groups from the resource assignments of the prioritized planning items are automatically displayed in the Auto-select option. You can add or remove the suggestions to view the resource capacity using the Manual-select option.

Tip:

You can always redefine and change the resource criteria to view custom results using the **Resource criteria** (—) button.

Let's set this up!

The body of work in current Portfolio is related to:

Portfolio lens
Goals

Choose resources for capacity review:

Resource based on: Group ▾

Method ⓘ

Auto-select Manual-select

Payroll Team ×
Core HR Team ×
HR Process Team ×
IT HR Solutions ×
Employee Management Team ×

5. Select Submit.

Result

The Capacity screen for resource capacity allocation for the selected workforce criteria is displayed. Based on the workforce criteria selection, the resource capacity is nested by Group, Skill, and Role.

Managing financials for planning items in Strategic Planning Workspace

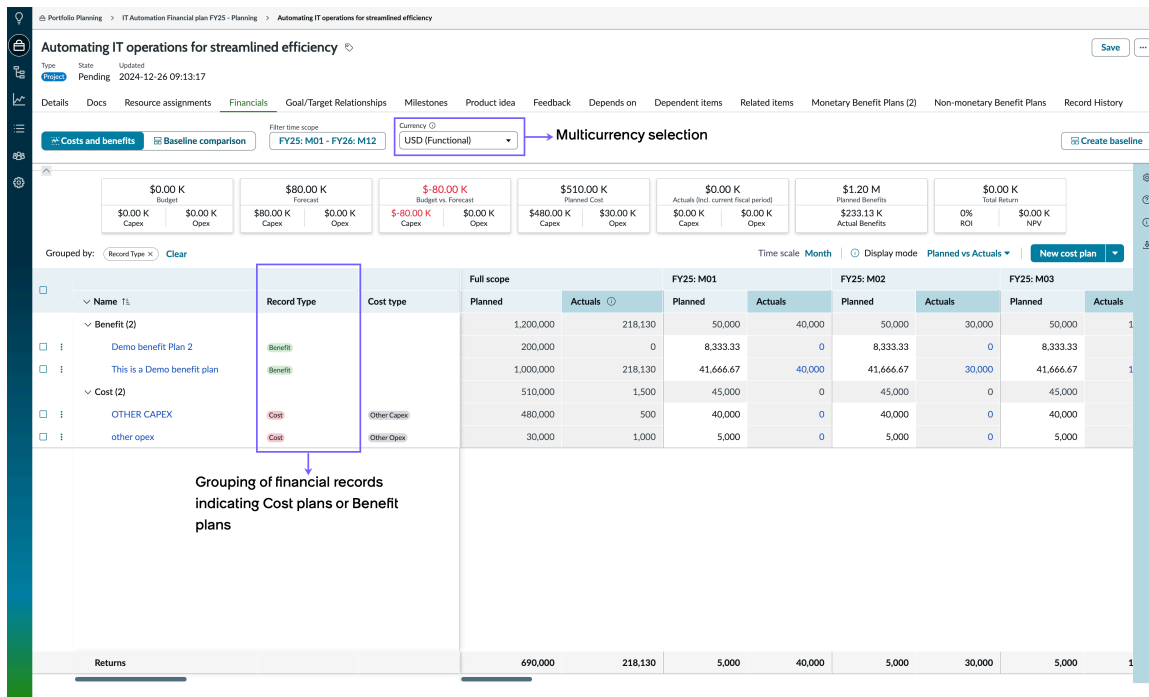

Manage budget, cost plans as forecasts, actual expenses as expense lines, generate labor costs, create financial baselines, and view, analyze, and compare the financial performance of your planning items at required cadence in Strategic Planning Workspace.

The comprehensive financials view helps you to understand planned and actual costs, Forecast (previously EAC - Estimate At Completion), Remaining Estimates (previously ETC - Estimate To Completion), Actual (previously Actuals to date), and so on, for the selected item. You can manage cost plans and associate the expense lines and process them to reflect the actuals for a planning item.

Export the financials data from Costs and benefits or Baseline comparison view as Microsoft Excel or a CSV file and share it with your stakeholders to review the financial performance of your planning items and portfolio.

Cost view

Forecast your planned costs, create, and manage cost plans and expense lines to track the financial performance of your planning items, review the latest costs and actuals.

In the Cost screen, you can:

- As a Project Manager, you have the enhanced visibility and ability to manage the financial data across multiple project levels. Cost view of financials shows cost plans and expense lines from sub-projects, allowing you to track the finances.
- The parent project widgets display the consolidated values of forecasted costs and expenses.
- Identify and manage costs using the **Project/Demand** column for any sub-project or demand directly from Cost view of the parent planning item.
- Reforecast all the cost plan values for future fiscal periods by double-clicking to edit the value in the least time scale view, either by month or by period.
- Manage cost plans for your planning items. For more information, see [Add, edit, or delete cost plans](#).
- Add or edit expense lines for your planning items to record any planned or unplanned expenses. For more information, see [Add or edit expense lines](#).
- Generate labor costs based on the resource assignments. For more information, see [Generate labor costs](#).
- Create and compare baselines to capture the financial snapshot of your planning items. For more information, see [Create and compare financial baselines for your planning items](#).
- [Configure widgets](#) to get a high-level overview of the financial data for your planning item.
- All financial details from sub-projects will be aggregated and displayed in the parent project's cost plans and widgets.

Tip:

Cost view gives you enhanced user experience to customize the left pane columns by using the personalize icon (⚙️) and by saving user preferences to retain the customizations made to hide, view, or adjust columns, time scope viewing, and so on.

Multicurrency

The multicurrency feature enables you to manage the financials of your planning items in two different currencies, Functional currency and Investment currency. Functional currency is typically defined by the admin based as the primary currency that is used for planning, budgeting, and tracking the financials of your planning items.

Financial users can now perform the following financial activities in Investment currency.

- Ability to select the Investment currency.
- Track the planned and actual expenses.
- Allocate and manage the budget.
- View simple financials data.

i Important:

New customers should install the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin to enable multicurrency feature and [Activate scheduled job to populate to multicurrency fields.](#)

Using this feature, you can work on financial reporting at a global level and see the real-time currency conversions of your financial records.

Organizations operation at a global or multinational level, the work is planned and financed at one location and executed at a different location. Each might use a different currency from what was used in the planning phase, multicurrency makes it easy to manage and track your planning items using any currency.

You can monitor and track the financials in one currency, and capture the costs in a different currency.

Using multicurrency, you can see all the costs in the currency you choose for the planning item, instead of restricting to use Functional currency defined in your locale. For more information on how to choose investment currency of your planning items, see [Configure multicurrency for planning items.](#)

Financial records and widgets will display the costs based on the currency selection.

i Note:

Once a cost plan, benefit plan or expense line or an investment budget gets created, you won't be able to change investment currency. You can change the investment currency as long as there are no financial records captured against the planning item.

Display modes

On the financials page for a planning item in Strategic Planning Workspace, you have Display Mode drop-down switch between different modes to view different formats of financial information of your planning items. These views provide the relevant and focused information that helps project managers and funding users to work on the financial planning.

- Forecast
- Budget vs forecast
- Planned vs actual
- Planned

Users with financial funding role [sn_align_ws.spw.funding_user] will see the Budget allocation option instead of the Budget vs forecast.

Display modes value

Mode	Value
Forecast	<p>View Actuals, Remaining estimates, and Forecast for the entire scope of the planning items.</p> <p>Use the time scale to view the actuals for the past fiscal periods and planned costs for the current and future fiscal periods.</p>
Budget vs forecast	<p>View the Budget, Actuals, and Variance for the fiscal periods and Forecast values for the entire scope of the planning items.</p> <p>Using this mode, you can:</p> <ul style="list-style-type: none"> • Compare the latest forecasts with the approved budget at different time scales. • View the budget vs actual for past fiscal periods and budget vs planned for current and future fiscal periods at fiscal period level.
Budget allocation (funding role)	<p>View the Budget, Actuals, and Variance for the fiscal periods and Forecast values for the entire scope of the planning items.</p> <p>Using this mode, funding users can:</p> <ul style="list-style-type: none"> • View the latest forecast and enter the budget that can they be approved to the work item. • Analyze the variance for the past fiscal periods and work on budget allocation for future fiscal periods. • Compare latest forecast with approved budget and revise the budget, if necessary.
Planned vs actual	<p>Compare the planned costs with actual expense for the past and current fiscal periods, and view planned costs for the future fiscal periods.</p>
Planned	<p>View only planned costs for the full range and manage the planned costs using the inline editing feature.</p>

Note:

- If you don't see the Budget allocation or Budget vs forecast display options, [enable the budget allocation property](#) and [configure the budget attribute](#) at instance level.
- To work on budget allocation using the Next Experience, [Activate a scheduled job to migrate budget of your planning items](#).

The last selected view is saved as user preferences.

Default display mode and access level for financial users

User role	Default mode	Role-level access
sn_align_ws.spw_funding_user	Budget Allocation	Allocate and approve budget, manage cost plans and expenses lines.
sn_align_ws.spw_financial_user	Forecast	Manage cost plans and expense lines.
business_stakeholder	Forecast	View financial data.

Baseline view

Create a financial to capture a snapshot of the financial changes for your planning items. You can create on-demand baselines manually or automatically at a required cadence using a scheduler job. For more information, see [Create a baseline](#)

Note:

Baselines created on the parent project include cost plans and expense lines from all of the child projects to calculate and give you a better breakdown of the financial performance of the projects and sub-projects.

[Compare baselines](#) to compare the difference in costs between latest status against a baseline or between any two baselines.

Note:

Each baseline is tagged with a number based on the order that they're created. The Current Financials baseline captures the financials details in real-time and is always represented with a flag icon ().

Financial baselines now capture the investment currency for customers using multicurrency.

A planning item baseline includes the following financial metrics in investment currency.

- Investment currency
- Total planned cost
- Planned benefit
- Planned return
- Budget cost

At the investment baseline level, a corresponding investment baseline is automatically created. This baseline captures:

- Planned cost
- Actual cost
- Planned benefit
- Actual benefit
- Total budget
- Capex, Opex, and breakdown of these fields, and so on

All values are populated along with their respective investment currency.

Cost plan baselines now store actual cost values in investment currency, along with the investment currency field. Benefit plan baselines capture benefit values in the investment currency, along with the associated currency. At the breakdown level (for example, fiscal period or monthly breakdowns), actual cost and actual benefit values are populated in investment currency where actuals exist.

Note:

Comparison of financial baselines using multicurrency is not yet supported.

You can view the planning item and investment baseline using the list view.

Access the `pm_project_baseline` list to view project baselines, and `sn_invst_pln_invst_investment_baseline` to view the investment baselines.

The baselines comparison view helps you to understand the variances between the two baselines.

Name	Cost type	Full scope - EAC			FY23: M04			FY23: M05		
		EAC	EAC	Variance	Actuals	Actuals	Variance	Actuals	Actuals	Variance
Software costs	Software Capex	30,000	30,500	(500)	2,500	2,500	0	2,500	2,500	0
Labor costs	Labor Capex	96,000	99,200	(3,200)	8,000	8,000	0	8,000	8,000	0
Product Documen...	Other Opex	17,000	20,000	(3,000)	7,000	7,000	0	0	0	0
Travel costs	Other Opex	6,000	7,000	(1,000)	500	500	0	500	500	0
Hardware costs	Hardware Capex	64,500	64,500	0	5,500	5,500	0	5,500	5,500	0
Professional services	Other Opex	71,500	71,500	0	8,000	8,000	0	4,000	4,000	0
Total		285,000	292,700	-7,700	31,500	31,500	0	20,500	20,500	0

Use the widgets when you compare baselines to view:

- Two dedicated widgets for each baseline displaying the EAC.
- The third widget displays the total variance between the EAC values of the selected baselines.
- The fourth widget displays the top three variances contributing to the overall variance by cost type.

The widgets and the header rows are color-coded to help you identify the selected baselines.

Tip:

Switch between different baselines from the comparison view by selecting the name of a baseline from one of the widgets.

When you compare baselines, you get the list of cost plans with their associated costs types, EAC at full scope, and a breakdown view of actual expenses and planned costs.

By default, the time scale of the breakdown view is set to Month.

- Use the **Time scale** option to view the comparison breakdown view at monthly, quarter, and yearly levels.
- Select **Time scope** to filter fiscal periods, data in the widgets, and the comparison table.

The widgets and the header rows are color-coded to help you identify the selected baselines.

Tip: Select the name of a baseline from the first or second widget to compare different baselines.

Let's take an example of the comparison view of two baselines: 2023-10-01, Baseline A, and Current Financials, Baseline B.

Example: How actuals, planned, and EAC are compared between two baselines captured at different timestamps

For a selected baseline, based on the creation date, the table shows Actuals values for the past fiscal periods from the created date and Planned values for the current and future fiscal periods.

Consider a planning item scoped from July 2023 to June 2024. Baseline A is created on 2023-10-01. If you compare the Current Financials baseline in December 2023 to the baseline captured in October 2023:

1. The baseline comparison view show Actuals vs Actuals columns from July 2023 to September 2023.

Name	Cost type	FY23: M07			FY23: M08			FY23: M09		
		Actuals	Actuals	Variance	Actuals	Actuals	Variance	Actuals	Actuals	Variance
Professional services	External labor Capex	3,500	3,500	0	3,500	3,500	0	4,700	4,700	0
Travel costs	Other Opex	800	800	0	450	450	0	0	6,000	(6,000)
Labor costs	Labor Capex	9,800	9,800	0	9,800	9,800	0	9,800	9,800	0
Software costs	Software Capex	0	0	0	3,000	3,000	0	3,000	3,000	0
Hardware costs	Hardware Capex	4,000	4,000	0	4,000	4,000	0	4,000	4,000	0
other costs	Other Capex									
Server costs	Hardware Capex									
Total		18,100	18,100	0	20,750	20,750	0	21,500	27,500	-6,000

2. Planned vs Actuals for October 2023 and November 2023.

Name	Cost type	FY23: M10			FY23: M11		
		Planned	Actuals	Variance	Planned	Actuals	Variance
Professional servi...	External labor Capex	3,000	3,000	0	3,000	4,000	(1,000)
Travel costs	Other Opex	450	500	(50)	450	600	(150)
Labor costs	Labor Capex	9,800	9,800	0	9,800	9,800	0
Software costs	Software Capex	3,000	3,500	(500)	3,000	3,000	0
Hardware costs	Hardware Capex	4,000	4,000	0	4,000	4,000	0
other costs	Other Capex		0	0		0	0
Server costs	Hardware Capex					1,200	(1,200)
Total		20,250	20,800	-550	20,250	22,600	-2,350

3. Planned vs Planned from December 2023 to June 2024.

Name	Cost type	FY23: M12			FY24: M01			FY24: M02			FY24: M03		
		Planned	Planned	Variance	Planned	Planned	Variance	Planned	Planned	Variance	Planned	Planned	Variance
Professional servi...	External labor Capex	3,000	3,000	0	3,000	3,000	0	3,000	3,000	0	3,000	3,000	0
Travel costs	Other Opex	450	450	0	450	450	0	450	450	0	450	450	0
Labor costs	Labor Capex	9,800	9,800	0	9,800	9,800	0	9,800	9,800	0	9,800	9,800	0
Software costs	Software Capex	3,000	3,000	0	3,000	4,000	(1,000)	3,000	4,000	(1,000)	3,000	4,000	(1,000)
Hardware costs	Hardware Capex	4,000	4,000	0	4,000	5,000	(1,000)	4,000	5,000	(1,000)	4,000	5,000	(1,000)
other costs	Other Capex	1,000	(1,000)										
Server costs	Hardware Capex	1,000	(1,000)										
Total		20,250	22,250	-2,000	20,250	22,250	-2,000	20,250	22,250	-2,000	20,250	22,250	-2,000

Note:

The columns are defined to calculate EAC, which is the sum of Actual costs until the last fiscal period and Planned costs from current to future fiscal periods.

Budget allocation

Portfolio managers can manage and approve the budget for planning items. The approved budget helps project managers to plan and meet the expenses to execute work.

Plan and approve the budget for a shorter planning cycle at monthly, quarterly, or yearly level using the lean budgeting and funding feasibility. Lean budgeting helps Portfolio managers to track the value in return for the approved budget and to better plan the budget for future fiscal periods.

Note:

If the budget is allocated monthly, the total budget is rolled up to quarterly and yearly level. Similarly, if the budget is allocated at a quarterly or yearly level, the equal breakdown happens until monthly level.

For more information on how to allocate, approve, and handle budget for planning items, see, [Manage budget of your planning items in Strategic Planning](#).

Tip:

In the budget allocation view, Portfolio managers review the EAC to understand the financial projections made by Project managers and use the **Copy cost as budget** option to allocate the entire planned cost as budget.

Choose the cost type as the attribute to allocate and approve the budget for individual cost types such as labor, non-labor.

Project managers can view the approved budget at the required time scale using the Budget vs forecast option from the display modes. As the work progresses and the actuals are captured, you can compare the budget and actual costs using the Budget vs forecast mode and reforecast the planned costs where the actuals are exceeding the budget using the inline edit feature at the required time scale.

Product managers can compare the latest cost with the approved budget by Capex or Opex, cost types, and for the required time scale at monthly, quarterly, or yearly level. The comparison view provides insights to Product managers to locate any variance at expense type or cost type, and at which fiscal period. Product manager can leverage this information to request for additional budget from the Portfolio manager.

You can migrate the budget of existing active projects and demands items from the Classic UI to Next Experience. Financials in the Next Experience has new budget data model that facilitates to store the budget at a detailed level by monthly breakdowns and cost types. You can migrate the budget for active projects and demands individually or by bulk using the scheduled job.

- Migrate budget of active projects from Classic UI to Next Experience. For more information, see [Migrate budget of active projects to Next Experience](#).
- Migrate budget of active demands from Classic UI to Next Experience. For more information, see [Migrate budget of active demands to Next Experience](#).

Note:

The migrated budget is captured in the `sn_invst_pln_invst_budget` table to enable the lean budgeting for required time scope.

Budget distribution logic

The budget allocation approach introduces data-aware budget distribution, prioritizing actuals for completed periods and planned costs for future periods. The system uses different distribution strategies depending on whether actuals or Estimate at Completion (EAC) values are available, and whether the fiscal period falls in the past, present, or future.

Budget allocation logic is divided into three focus areas: past fiscal periods, current fiscal periods, and future fiscal periods.

1. Past fiscal periods that have already ended.

- If actuals exist, the budget is distributed proportionally to actual spending. If the total budget amount equals the total actuals, the distribution exactly matches the actual values.
- If there are no actuals, the budget is distributed evenly across the past fiscal periods.

2. The current fiscal year is like a mid-year scenario where both past and future fiscal periods are available.

- For past or completed fiscal periods, the system distributes the budget proportionally matching the actual expenses. If there are no actual expenses, budget is allocated as zero (0).
- If planned costs exists for the current and future fiscal periods the remaining budget is distributed proportionally based on the planned costs.
- If planned costs doesn't exists for the current and future fiscal periods, budget is distributed evenly across the fiscal periods.

3. Future fiscal periods

- If planned costs exists, the remaining budget is distributed proportionally based on planned costs.
- If planned costs doesn't exists, the remaining budget is distributed evenly across the remaining fiscal periods.

Budget distribution based on financial records

Fiscal periods	Available financial data	Distribution method
Past fiscal	Actual expenses	Proportional to actuals
Past fiscal	No financial records	No budget allocation
Current year – past fiscals	Actual expenses	Allocate budget proportionate to actual values
Current year – remaining months	Planned costs exists	Allocate budget proportionate to planned costs
Current year – remaining months	No planned costs	Even distribution
Future fiscal periods	Planned costs exists	Allocate budget proportionate to planned costs
Future fiscal periods	No financial records	Even distribution

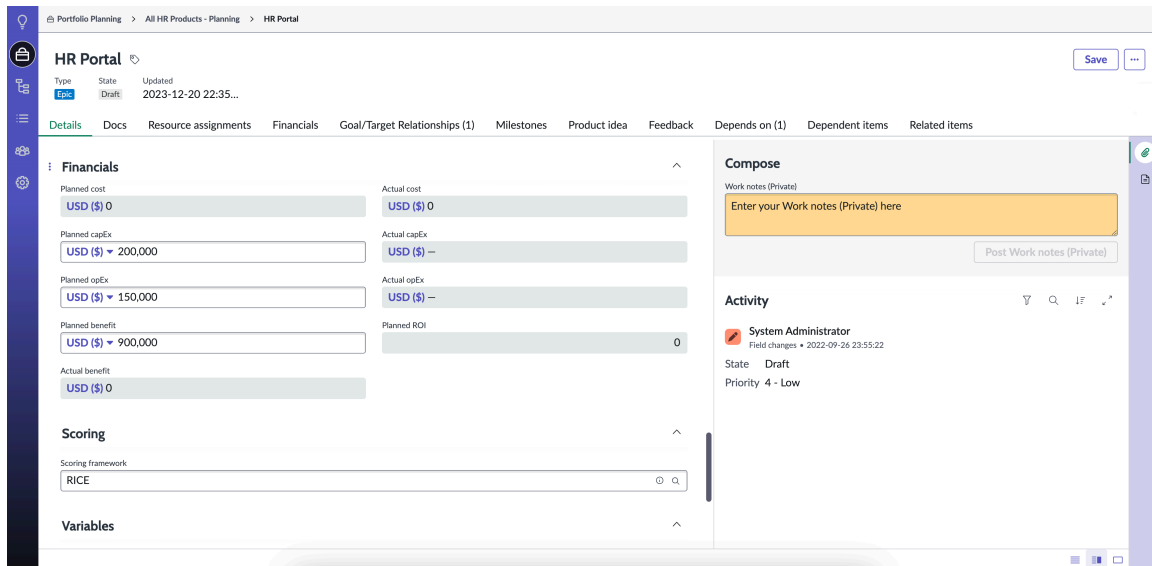

Benefit plans

Monetary benefit plans capture potential benefits accrued while executing a planning item. Non-monetary benefit plans capture the potential non-financial benefits accrued while executing a planning item. You can create and manage [monetary benefit plans](#) and [non-monetary benefit plans](#) to capture the potential benefits of your planning items.

Instead of switching to and fro from the financials record page to benefit plan tabs, you now have a seamless experience to manage all the cost plans and benefit plans from the Cost and benefits view and can leverage the new financials experience with the side panel and grids for quick forecasting and tracking of monetary benefit plans.

Simple financials

Simple financials gives you the ability to enter the preliminary high-level planned capex, opex, benefit, and so on from the Details page without capturing the costs plans from the Cost view. You can update the simple financials values as required until you have the planned and actual costs captured.

Using the baseline feature, you can capture these simple financial values in a baseline and compare them against any existing baseline. You can:

- Reforecast simple financials and compare the by selecting the Current Financials from the list of baselines.
- Capture the planned and actual expenses as the project progresses and compare any financial baseline with a simple financials baseline to track the financial performance of the planning item.

Configure multicurrency for planning items

Select investment currency as an additional currency, which can be different from your functional currency, to manage financial records of your planning items.

Before you begin

- You can define investment currency for planning items which do not have any financials records, such as cost plans, expense lines, benefit plans, and actual benefits. To define a investment currency for existing work, you should delete all the financial records and configure the investment currency.
- [Enable monetary benefit plans for planning items](#)
- Role required: admin

About this task

Following are the current limitations for multicurrency.

- Multicurrency for cost plans that are bundled with project tasks. This feature is scheduled to be available starting with the January patch update.
- Financial baselines do not capture investment currency fields. This feature will be available with the March store release.

Procedure

1. Navigate to **Workspaces** > *Strategic Planning Workspace* and select portfolio plan.
2. Select a planning item from the Planning module.
3. Select the **Financials** tab.
In the **Currency** field, the current system currency is displayed. For example, if your Functional currency is in USD, the field is displayed as **USD (Functional)**.
4. Select **Confirm** to save the investment currency selection.

Add, edit, or delete cost plans

Create a cost plan for a required duration to track your planned and actual expenses. Edit cost plans to adjust your planned expenses and delete any de-scoped forecasts.

Before you begin

Role required: sn_align_ws.spw_financial_user

Procedure

1. Navigate to **Workspaces** > *Strategic Planning Workspace* and select portfolio plan.
2. Select a planning item from the Planning module.
3. Select the **Financials** tab.

Tip:

Create a [financial baseline](#) immediately after capturing the initial planned costs to have a snapshot of your planned costs. Use this baseline to compare it against the baselines from later dates, as the work progresses, to identify the variance between initial planned costs and actual expenses.

This helps you to plan for the future expenses and re-forecast the planned costs.

Generate labor costs

Generate labor costs in the Financials view for attribute-based resource assignments based on the financial attributes configured in the planning attributes page.

Before you begin

Role required: sn_align_ws.spw_financial_user

Procedure

1. Navigate to **Workspaces** > *Strategic Planning Workspace* and select portfolio plan.
2. Select a planning item from the Planning module.
3. Select the **Financials** tab.

4. Select **Generate labor costs** ().

5. Select **Generate** on the Generate labor costs confirmation window.

Note:

Alternatively, you can [activate a scheduled job](#) to automatically create baselines at the required cadence.

Manage budget of your planning items in Strategic Planning

Allocate, manage, and approve budget for your planning items. Lean budgeting enables you to allocate budget for short planning cycles for different fiscal periods such as monthly, quarterly, or yearly breakdown level rather than allocating the budget to the complete duration of the planning item.

Before you begin

- As an Admin, enable the property to work on budgeting. For more information, see [Enable financial budget allocation for planning items in Strategic Planning](#).
- As an Admin, configure the attribute to allocate and approve budget by cost type or expense type. For more information, see [Configure budget attribute at instance-level to allocate budget](#).
- Role required: it_portfolio_manager

Procedure

1. Navigate to **Workspaces** > *Strategic Planning Workspace* and select portfolio plan.
2. Select a planning item from the Planning module.
3. Select the **Financials** tab.
4. Enable the **Budget allocation** toggle ().
5. You can manage the budget by one of the following ways for the selected time scale at monthly, quarterly, or yearly level.
 - Double-click each cell in the Budget column to manually enter the value.
 - Select **Copy cost as budget** from the Budget column options to copy the EAC as budget. You can always reforecast the budget for each cost type using the in-grid editing feature even if the EAC is copied as budget.

Note:

Unapproved budget values are indicated with  icon.

6. Select **Approve budget** ().

Approve budget confirmation window is displayed. The **Create a financial baseline for this budget approval** option is enabled by default which captures the latest budget and financial estimates.

Tip:

The financial baseline created while approving the budget can be compared with the future baselines once the actual expenses are captured to track financial performance.

7. On the confirmation window, select **Approve** ().

Result

Budget widget is updated to reflect the latest approved budget. Project Manager can view the approved budget and compare it with the planned costs using the **budget vs cost** view by cost type.

Add or edit expense lines

Create or edit expense lines to capture the actuals costs. You can associate the expense lines with a cost plan or create standalone expense lines to record unplanned expenses.

Before you begin

Role required: sn_align_ws.spw_financial_user

About this task

An expense line is part of the project cost plans that can be associated with a specific source. You can create multiple expense lines for a cost plan. Only the expense lines that are in the processed state are considered for roll ups on the work item.

For unplanned expense lines which are not associated to any cost plan, system automatically creates a cost plan or associates to an existing system generated cost plan of the same expense type.

Procedure

1. Navigate to **Workspaces** > *Strategic Planning Workspace* and select portfolio plan.
2. Select a planning item from the Planning module.
3. Select the **Financials** tab.
4. Use one of the following options to add an expense line.
5. On the Create expense line form, fill the fields.
For a description of the field names, see [Create expense line form](#).
6. Select **Save**.

Note:

The expense lines created for sub projects can be viewed in the Cost screen of the parent project.

7. To edit a cost plan from the financials record page, select the actuals value from the cost plan to ex[open the Expense line side panel.
8. Select the expense you want to edit.
9. Update the expense values as needed and select **Save**.

Create and compare financial baselines for your planning items

Create and compare financial baselines to get a snapshot of the project expenses and compare the planned costs against the actual expenses.

Before you begin

Role required: sn_align_ws.spw_financial_user

Procedure

1. Navigate to **Workspaces** > *Strategic Planning Workspace* and select portfolio plan.
2. Select a planning item from the Planning module.
3. Select the **Financials** tab.

4. Create or compare baselines.

Tip:

You can migrate existing financials baselines of your projects or demands from Classic UI to Financials in Next Experience.

For more information on how to migrate financial baselines of demands, see [Migrate financial baselines of demands to Next Experience](#).

For more information on how to migrate financial baselines of projects, see [Migrate financial baselines of projects to Next Experience](#).

Create monetary benefit plans for your planning items in Strategic Planning

Create and manage monetary benefit plans to capture the potential benefits while executing your planning items.

Before you begin

- [Enable monetary benefit plans for planning items](#)
- [Add monetary and non-monetary benefit plans related lists](#)
- Role required: sn_align_ws.spw_financial_user

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Portfolio Planning**.
2. From the list of portfolio plans, select a portfolio plan.
3. From the Prioritization or Roadmap tab, select the planning item to create a monetary benefit plan.
The full details page of the planning item is displayed.
4. Create a monetary benefit plan using one of the following options.
5. On the Benefit Plan form, fill the fields.
For a description of the field names, see [Benefit Plan form](#).
6. Select **Save**.

Result

The newly created monetary benefit plan appears in the financials record page and in the monetary benefit plans related list.

What to do next

- [Edit monetary benefit plans](#).
- [Capture actual monetary benefits](#).

Edit monetary benefit plan

Edit a planned monetary benefit plan to revise the benefits, dates, offset, and so on, to maintain the updated financial records as your work progresses.

Before you begin

- [Create monetary benefit plans for your planning items in Strategic Planning](#)
- Role required: sn_align_ws.spw_financial_user

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Portfolio Planning**.
2. From the list of portfolio plans, select a portfolio plan.
3. From the Prioritization or Roadmap tab, select the planning item for which you want to edit a monetary benefit plan.
The full details page of the planning item is displayed.
4. Update a monetary benefit plan using one of the following options.

Capture actual monetary benefits

Capture the actual benefit from the planned benefits to measure revenue and calculate the profits.

Before you begin

- [Create monetary benefit plans for your planning items in Strategic Planning](#)
- Role required: sn_align_ws.spw_financial_user

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Portfolio Planning**.
2. From the list of portfolio plans, select a portfolio plan.
3. From the Prioritization or Roadmap tab, select the planning item for which you want to capture actual monetary benefits.
The full details page of the planning item is displayed.
4. Capture actual monetary benefits using one of the options.
5. **Optional:** You can change the previously captured planned benefit from the **Entered benefit** field.
6. Enter the actuals benefits resulted from the work execution in the **Actual benefit** field and select **Save**.

Manage non-monetary benefit plans for your planning items in Strategic Planning

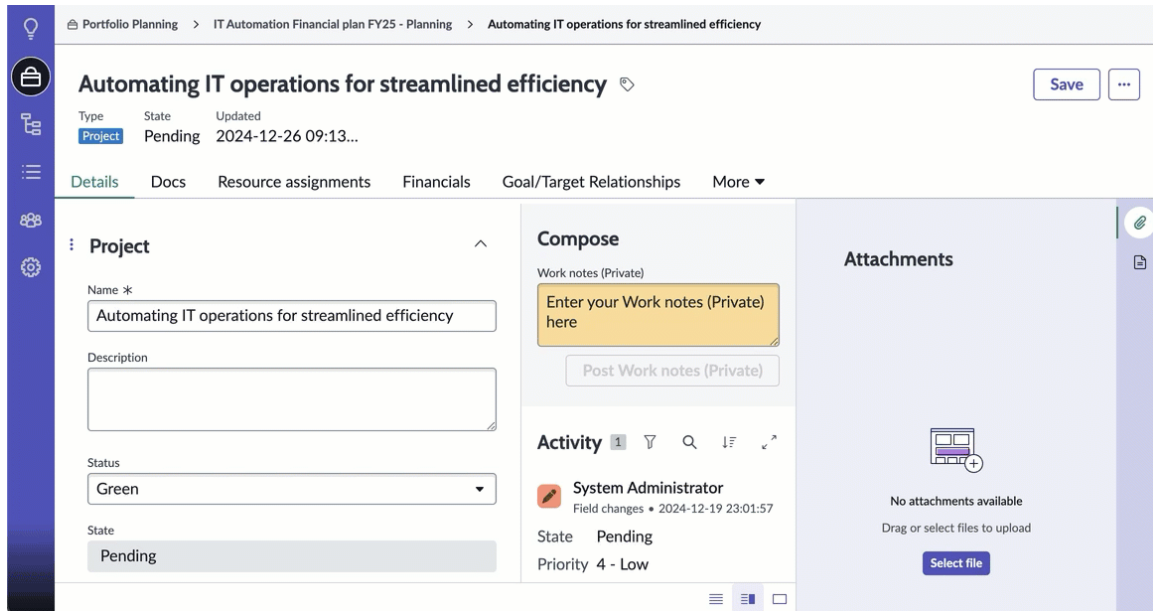

Create and manage monetary benefit plans to capture the potential benefits while executing your planning items.

Before you begin

- [Enable monetary benefit plans for planning items](#)
- [Add monetary and non-monetary benefit plans related lists](#)
- Role required: sn_align_ws.spw_financial_user

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace** and select portfolio plan.
2. Select a planning item from the Planning module.
3. Select the **Non-monetary Benefit Plans** related list.

4. On the Benefit Plan form, fill the fields.
For a description of the field names, see [Non-monetary benefit plans form](#).
5. Select **Save**.

Export financials as Excel or CSV file

Export the costs or baseline comparison data of your planning items to easily share them with your stakeholders.

Before you begin

Role required: sn_align_ws.spw_financial_user

Procedure

1. Navigate to **Workspaces** > *Strategic Planning Workspace* and select portfolio plan.
2. Select a planning item from the Planning module.
3. Select the **Financials** tab.
4. Select the Export option ().
5. In the Export side panel, select **Excel** or **CSV** from the File type list and select the **Export**

button ().

The financials data is download as an Excel or CSV file with name_ **fin**_mmddy naming convention. The breakdown of the naming convention:

- a. name - fetches the first 10 characters from the name of the planning item.
- b. fin - denotes that the file has financial data.
- c. mmddy - system date format when you're exporting this data.

For example, if you're downloading financials data for a planning item named Documentation on January 26, 2024, then the file name reads `documentat_fin_012624`.

Note:

You can export financials data from Cost view and Baselines comparison view.

Managing portfolio financials in Strategic Planning Workspace

View the financial breakdown of estimates, approved costs, benefits, and actuals and so on for portfolio financials.

As a portfolio user, you can view the rolled up financial values of top-level demands, projects, and epics.

You can view the costs by expense type or cost type. Using the Financials view at portfolio level, you can view different financial fields such as Budget (approved budget for planning items), Forecast, Variance (difference between the approved budget and latest forecast), Actuals, and the Remaining Estimates for Capex, Opex, Total, and Benefits for each planning item. This information can be used to track the financials status of the planning items and take an informed decision on which planning items to consider while working on the next planning cycle and track the to avoid overspending.

Using the portfolio financials, portfolio managers can:

- Track the financial performance and status of planning items.
- Arrive at an informed decision by analyzing the estimated cost and benefits of a planning item while planning and prioritizing for the next Portfolio cycle.
- View the financials based on the expense type or cost type depending on the [budget attribute configuration](#).
- Avoid overspending on planning items by comparing the approved budget with the latest forecast and actuals.

Important:

New and existing customers need to configure the portfolio financials to view the financials of your planning items at portfolio level. For more information, see [Configure portfolio financials in Strategic Planning](#).

The portfolio financials view supports Demands, Epics, and Projects with Fiscal Calendar type configuration only.

Note:

Group header row displays the rolled up values for Budget, Forecast, Variance, Actuals, and Remaining estimate of all the planning items in the group.

The default view of portfolio financials is set to display the planning items grouped by their budget approval status. Budget approved grouping lists the planning items which have the budget allocated and approved. Approval pending grouping lists the planning items which do not have any budget or if the requested budget is not approved.

Note:

Portfolio financials view is not yet compatible with Investment Funding. This view may not show the right budget values allocated to planning items from Investment Funding application. This will be add as a future enhancement.

In the left-grid, planning item details such as name, rank, planning state, planning item type, approved start date, total planned cost, total actual costs, total planned benefits and ROI for the full planning item duration.

In the right-grid, financial attributes of the planning items such as, Budget, Forecast, Variance, Actuals, and Remaining Estimates for Capex, Opex, Total, and Benefits portfolio for the portfolio timeline or breakdowns by year, quarter, month, or period.

Tip:

You can select the name of a planning item from the left-grid to directly access the financials record page of that planning item.

You can export the portfolio financials details to Excel or CSV using the **Export** option ().

Customize your financials view

Customize the portfolio financials to view and access the required parameters helping you in better planning your portfolio and planning items.

- You can get a more detailed and granular view of the financials at monthly, quarterly, and yearly view by defining Timescale and Range. Use time scale to select a fiscal period and filter the range within the time scale to view the financials for any specific months, quarters, or years.

Time scale & range ✕

Select time scale & range to personalize your financials view.

Time scale

Fiscal Month

i Select up to 5 years.

Cancel
Save

Time scale and range parameters

Time scale	Description and range
Fiscal Month	Portfolio financials view by monthly breakdown. You can select up to 12 months.
Fiscal Quarter	Portfolio financials view by quarterly breakdown. You can select up to 4 quarters.
Fiscal Year	Portfolio financials view by yearly breakdown. You can select up to 5 years period.

Time scale	Description and range
Plan Timeline	Portfolio financial breakdown for the entire portfolio timeline.

- Personalize grouping and columns in the grids.

Configure the columns and groupings in the right-grid using Personalize option () to build a custom view.

For example, if you want to compare budget and actuals breakdowns, select only these two options and apply your preferences. You can also customize the left-grid by selecting the required columns from the **Left Grid** list from the personalize settings.

- Group the planning items.

By default, the financials view is grouped by the Budget status column. You can remove Budget status grouping from the Grouped by row and drag-drop the required header to change this view.

Docs for planning items in Strategic Planning

Store and manage all kinds of documentation for planning items from a centralized location of Strategic Planning Workspace.

Docs overview

Product and portfolio managers can store information for planning items using the Docs feature.

- Each planning item can have a separate doc page to capture the information related to it.

For example, for an Epic planning item, you create a doc page for high level business objectives or technical product requirements.

- Each planning item can have multiple doc pages associated to it to help you effectively organize key artifacts.
- Predefined templates such as Project Brief, Product Requirements, Brainstorming Ideas, and Meeting notes are available. Create doc pages for your planning items using one of these templates or start with a blank page.

Features of Docs

The following are the key features of Docs:

- Auto-save content.
- See who is viewing or working on a doc page using the feature of live user presence.
- Create documents using pre-defined templates.
- Use rich text paragraph formatting, which includes headings, lists, alignment, and others.
- Move text blocks to change their placement using block-level editing.
- Tag team members inline or insert tables using the / command.
- Add reference to other ServiceNow AI Platform tables to connect work across teams.
- Insert images by uploading files or using web URLs.

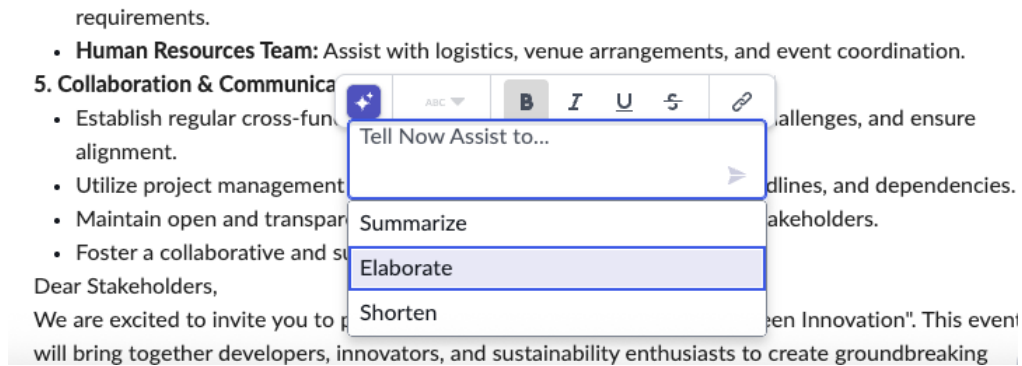

Note:

The experience of inserting Google Images links might not work.

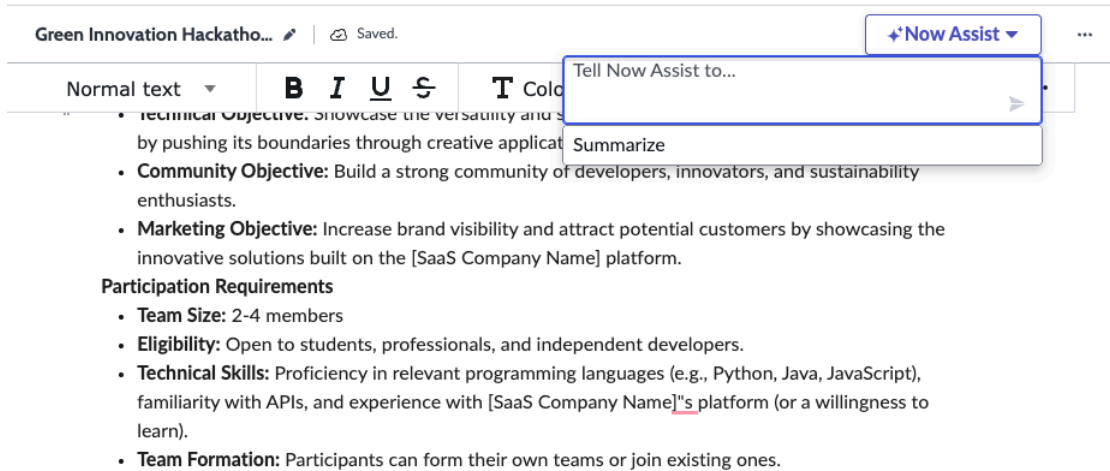

Summarize Docs content using Now Assist for SPM

Use Now Assist capabilities to elaborate, shorten, and summarize selected content in Docs, or to get a summary of the whole document.

- Summarize, elaborate, or shorten selected text.

- Summarize the entire content on the page.

Note:

- Now Assist for Docs requires an SPM Pro + license. For more information, see [Configure Now Assist Admin features](#).
- If there is more content to summarize, you can remove some content and retry.
- Because the information in these fields is AI generated, it's a good idea to review the text and make sure it's accurate.

Real-time collaboration within planning item Docs

With the feature of real-time collaboration, edit a doc page concurrently with multiple other editors. Colored cursors denote the current location of each editor on the page. You can choose to show or hide these live presence indicators based on your preference while working on or reviewing the content of the page.

Note:

Huge number of users editing the same block of content simultaneously might result in issues with application performance.

Dynamic data linking in Docs

Keep record information in your documentation always current and reduce manual effort with the Dynamic data linking feature in Docs. You can now reference any ServiceNow application record and Docs will automatically reflect the latest updates from those records.

For example, if you add a reference to a Project record, the reference shows the latest field information of the project in Docs without requiring manual edits. Selecting the project reference opens up the project form so that you can view the full details of the project and make any necessary changes.

A hover popover displays the details of the mentioned record, providing quick access to additional information without leaving the current context.

Dynamic linking also enables adding references to a particular field of a record, such as Assigned to of a Project record.

You can add references from any ServiceNow table you have access to, with no setup or configuration needed.

This feature reduces the need to switch between multiple ServiceNow applications within your instance and helps maintain a single, reliable source of truth for collaborative work, making it easier for teams to stay aligned and informed.

Create and manage pages and subpages for planning items

Flexibly organize information for your planning items by creating, duplicating, and deleting pages and subpages in Strategic Planning Workspace.

Before you begin

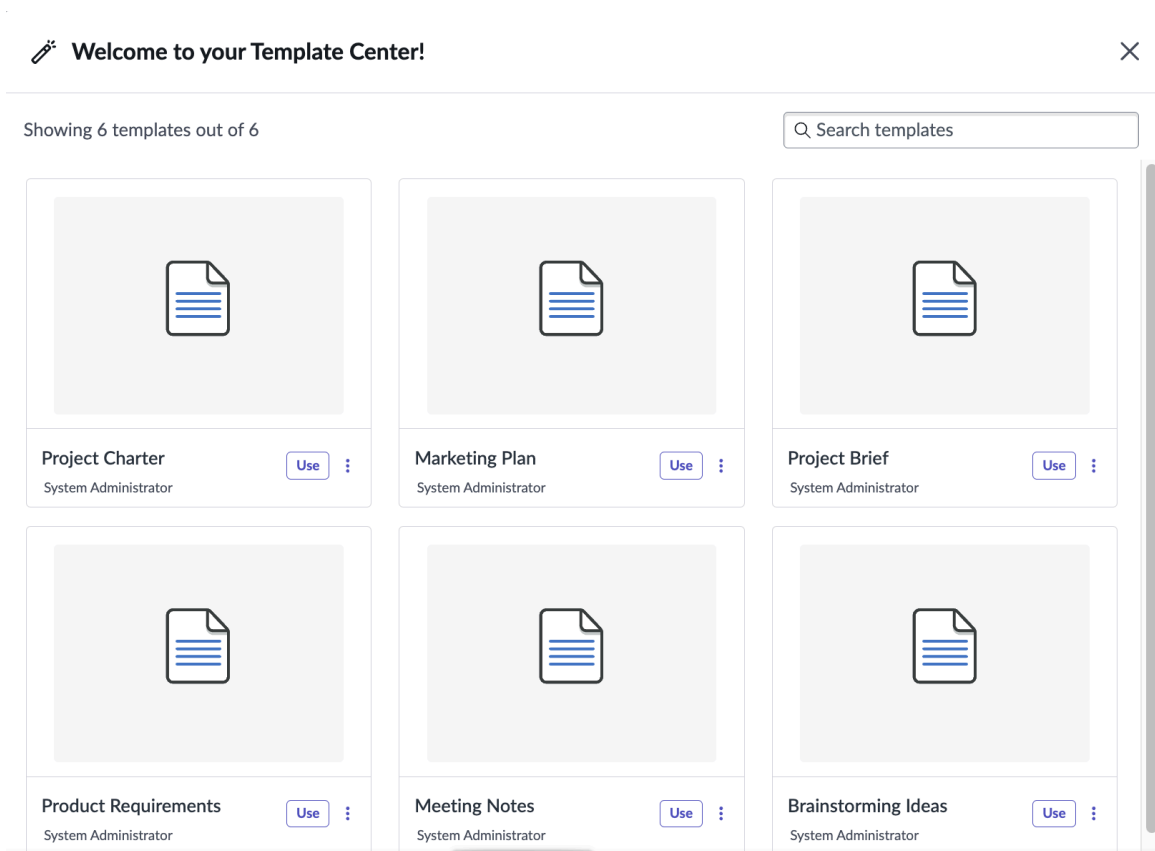

Role required: sn_align_core.apw_user

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Portfolio Planning**.
2. From the list of portfolio plans, select one and then select **Planning**.
3. From the Prioritization or Roadmap page, select a planning item that you would like to create a doc page for.
If you have selected a planning item from the Roadmap page, select **Full details** from the **Details** tab of the item's side panel.
4. From the planning item's record page, select **Docs**.
5. To create a page, you can create a blank page or start with a predefined template.
 - For a blank page, select **Create page**.
 - To create from templates:
 - a. Select **Create Page from template**.

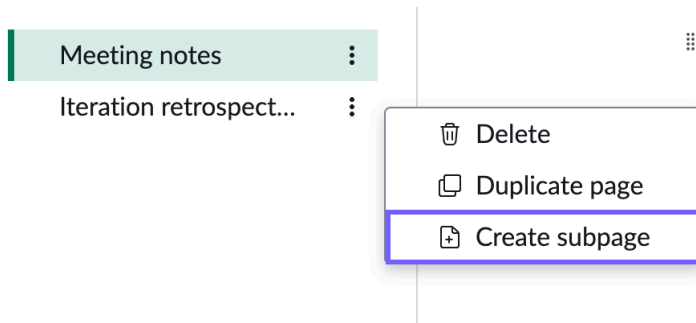

- b. Select a template from the Template Center and select **Create page**.

The new page is created and added to your Doc with the name **Untitled**, which you can rename.

6. To create a subpage, select the **Page Actions** menu () and select **Create subpage**.

7. To delete a page or a subpage, select the **Page Actions** menu () and select **Delete**.

Managing portfolio plan views in Strategic Planning Workspace

Portfolio managers can create customized views for their portfolio plans by applying personalization settings such as column selection, grouping, and filtering. Portfolio owners or editors can share these personalized views with stakeholders to enable easier collaboration on the portfolio plans.

Benefits of portfolio plan views

Portfolio managers can create personalized views as needed by applying settings such as column selection, grouping, and filtering.

- Views can be created as private or public.
- Can create up to three private views and up to 10 shared (public) views.
- Portfolio plan views can be shared with stakeholders to enable collaboration on the portfolio plan.
- Switch between shared and private views as needed.
- Each view saves your display preferences across the Prioritization, Roadmap, Capacity, and Financials tabs.

Note:

Views are available only for the Planning module and are supported in live mode, but not in scenario mode.

Create a portfolio plan view

Create a customized portfolio plan view based on your requirements, so you can access it when you log in again and share it with stakeholders for collaboration.

Before you begin

Role required: sn_align_core.ap_read_only

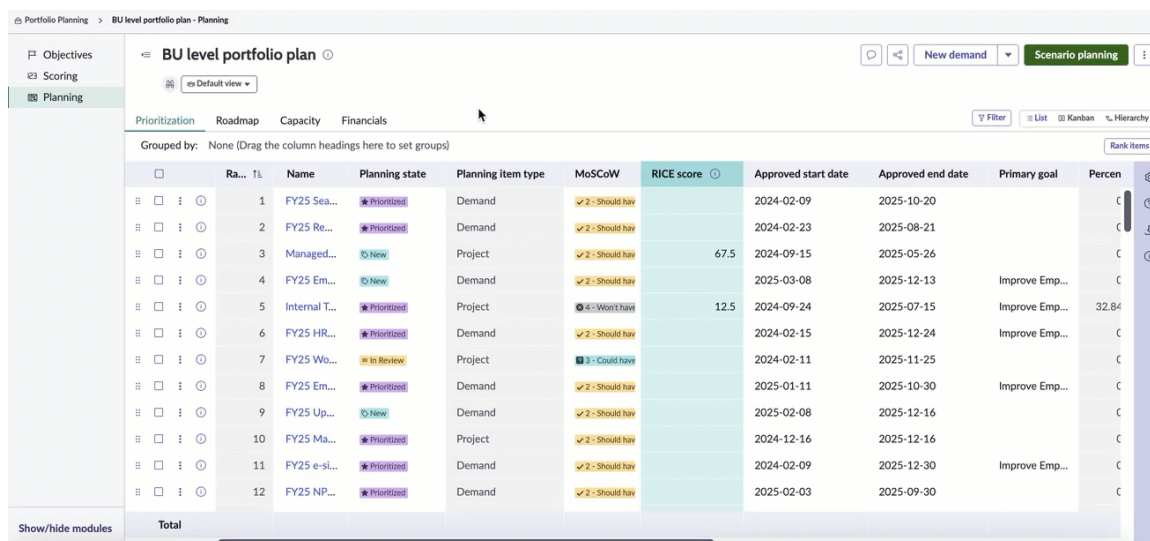

About this task

You can create up to three private views and up to ten shared (public) views per portfolio plan.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Portfolio Planning**.
2. From the list of portfolio plans, select one.
3. Make any changes to the view as needed.
For example, apply filter with the **Department** attribute and the value as **Finance**.

The **Save as new view** option appears on the portfolio plan header.

4. From the portfolio plan header, select **Save as new view**.

5. On the Save as new view window, fill the details.

a. Enter a name for the view in the **View name** field.

b. **Optional:** Select the **Shared view** toggle to make this view public.

Selecting the **Shared view** toggle makes the view visible to all stakeholders with whom this portfolio plan is shared.

c. Select **Save**.

Result

The shared view for the portfolio plan is created and will be visible to all stakeholders with whom this portfolio plan is shared.

What to do next

- Share the portfolio plan with your stakeholders to start collaborating on the portfolio plan. See [Share a portfolio plan with stakeholders](#).
- Edit a portfolio plan view to make any changes to the existing view. See [Edit a portfolio plan view](#).

Edit a portfolio plan view

Edit a customized portfolio plan view based on your requirements, so you can access it when you log in again and share it with stakeholders for collaboration.

Before you begin

Role required: sn_align_core.ap_read_only

About this task

- Only the owner of a portfolio plan view can edit a shared (public) view.
- You can have up to three private views and up to ten shared (public) views per portfolio plan.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Portfolio Planning**.
2. From the list of portfolio plans, select one.
3. From the portfolio plan header, select the view you want to edit or override with your personalization settings from the list of available portfolio plan views. The selected view appears.
4. Make changes to the view as needed. For example, apply filter with the **Department** attribute and the value as **Finance**.

After you make any change to the view, the Save view option appears in the portfolio plan header.

5. Select **Save view**. The view is updated to reflect the changes made.
6. **Optional:** To edit name of the view, select the Portfolio plan view drop-down from the portfolio plan header and then select Edit view icon (🔗) next to the view you want to edit the name for. On the Edit view window, fill the details.

- a. Update the name for the view in the **View name** field as required.

Note:

Only the owner of the portfolio plan view can rename the view.

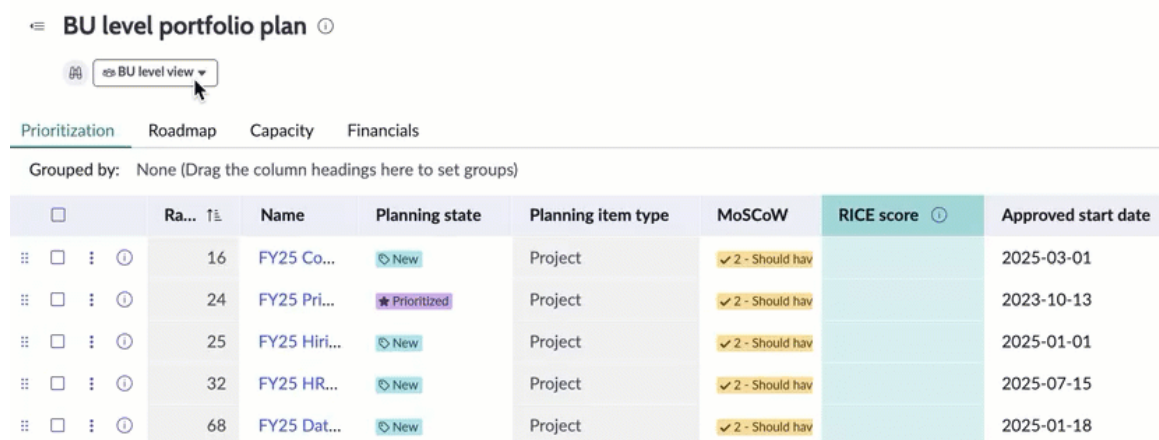

- b. **Optional:** Select the **Shared view** toggle to make this view public or disable the **Shared view** toggle to make the view private.

Important:

Changing a shared view to a private view removes access for existing stakeholders.

- c. Select **Save**.

(Optional) The name of the view is updated.

Share the portfolio plan with your stakeholders to start collaborating on the portfolio plan. See [Share a portfolio plan with stakeholders](#).

Related topics

- [Create a portfolio plan view](#)
- [Delete a portfolio plan view](#)

Delete a portfolio plan view

Delete a customized portfolio plan view if it is no longer needed or if the maximum limit of ten shared or three private views has been reached.

Before you begin

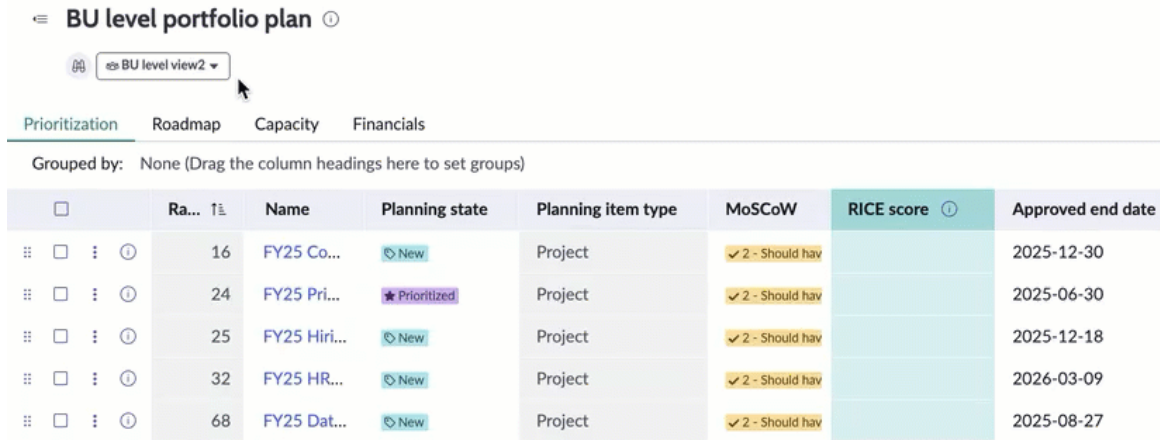

Role required: sn_align_core.ap_read_only

About this task

- Only the owner of the portfolio plan view or an editor of the portfolio plan can delete the view.
- Deleting a portfolio plan deletes the view, including any changes made to the view. However, this action keeps the items (projects, demands, epics) intact in the portfolio plan.
- You can have up to three private views and up to ten shared (public) views per portfolio plan.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Portfolio Planning**.
2. From the list of portfolio plans, select one.
3. Select the Portfolio plan view drop-down from the portfolio plan header and then select Delete view icon (🗑️) next to the view you want to delete. The Delete this view window appears.
4. On the Delete this view window, select **Delete**.

Executing Strategic Planning work in PPM, Agile 2.0, and SAFe

Facilitate execution of the work planned in Strategic Planning in ServiceNow applications such as Project Portfolio Management (PPM), Agile Development 2.0, or Scaled Agile Framework (SAFe).

Import, export, and manage your planning items between Strategic Planning and PPM, Agile 2.0, and SAFe.

Integrating planning and execution systems

Import records to Strategic Planning Workspace

Import records from Agile Development 2.0, after the relevant table maps, fields maps, and choice maps are configured.

Before you begin

Role required: sn_align_core.apw_admin

Procedure

1. Navigate to **All > Strategic Planning > Integrations**.
2. Select **ServiceNow Internal** Alignment Integration type.
3. Click **Import**.
4. On the Create Import Request form, fill in the date range for importing the records.

Create Import Request

Create Import Request
✕

Select the From and To dates below and click OK to import the records from respective Execution tables to Alignment tables.

* From Date

* To Date

Cancel OK

5. Select **OK**.

Note:

Records that have been created within the specified dates will be imported.

Result

An import request is created and a link is shared to track the progress of the request.

Note:

If you want to import records for a specific table map, click the **Import** button that is available for the respective table map.

View error logs

View error logs to understand the cause of any issues that might have occurred during the integration process.

Before you begin

Role required: sn_align_core.apw_admin

Procedure

1. Navigate to **All > Strategic Planning > Integrations**.
2. To view the error logs, select the **Integrations Errors** tab.

Export the portfolio plan status or roadmap to Microsoft PowerPoint

Export the status of goals, work items, roadmap, and key metrics of your portfolio plan and free-form roadmap into a Microsoft PowerPoint file so that you can keep your business stakeholders updated on the progress. Save time by avoiding copying data into reports and drive shared outcomes by enabling collaboration even with stakeholders who can't access your ServiceNow instance.

Before you begin

[Install Export to PowerPoint for Strategic Portfolio Management.](#)

Important:

Export to PowerPoint is currently unavailable for customers in the FedRAMP, NSC DOD IL5, or Australia IRAP-Protected data centers, self-hosted customers, or in other restricted environments. Please check for availability updates in future releases.

Role required: admin

About this task

https://player.vimeo.com/video/1004219064?h=242c60b94c&badge=0&autoplay=0&player_id=0&app_id=58479

The following three PowerPoint templates are provided by default to generate a status report for your portfolio plan:

- **Portfolio plan status:** Contains individual detailed slides for the top five items prioritized by rank.
- **Portfolio plan & goals status:** Contains slides for Goals and targets for this portfolio, achieved goals, goals at risk, and individual detailed slides for the top five items prioritized by rank.
- **Roadmap Template - default:** Contains slides for Roadmap for this portfolio. You can export roadmap data for maximum period of a year at a time.

You can customize the type of the data to be shown in the generated report by updating a predefined template or by creating your own branded template. See [Create a Microsoft PowerPoint template](#).

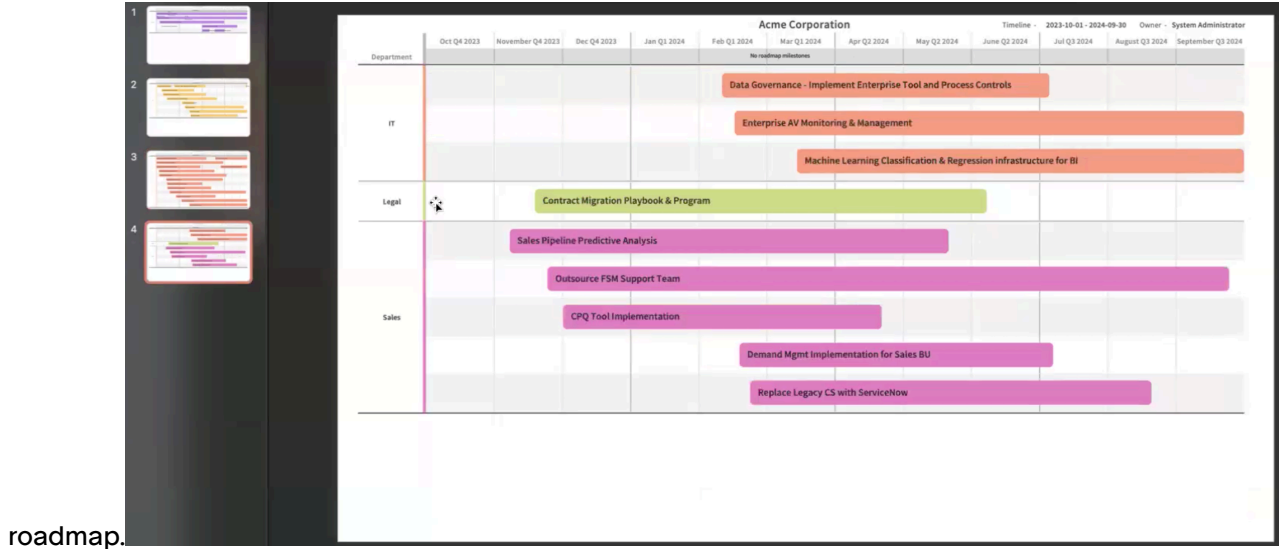

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Portfolio Planning**.
2. Export the status of goals, work items, roadmap, and key metrics of your portfolio plan and free-form roadmap into a Microsoft PowerPoint file.

Result

A PowerPoint file is generated with the relevant data.

The following image shows the example for an exported

roadmap.

Strategic Planning Workspace reference

Reference information to provide additional details about Strategic Planning such as the fields, user roles, tables, guidelines, and domain separation information.

Customizing milestones display on roadmap in Strategic Planning Workspace

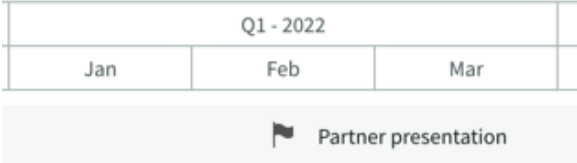

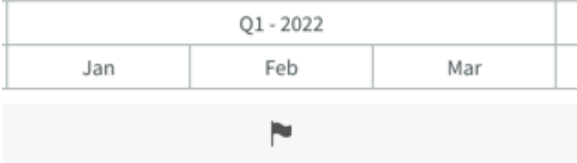

Easily track the milestones of your roadmap timeline or its planning items by choosing how the milestones are displayed on the roadmap view.

The Personalize (⚙️) side panel on the roadmap provides different toggles to personalize the display of milestones on your roadmap.

- For portfolio plan roadmaps, these toggles are always available.
- For free-form roadmaps, these toggles are available only if the roadmap's source table is the Planning Item table [sn_align_core_planning_item] or one of its extensions.

Milestones toggle	Roadmap view
<p>Roadmap milestones</p> <p>Shows the milestones of the roadmap timeline.</p>	
<p>Item milestones</p> <p>Shows the milestones of the planning items.</p>	
<p>Only milestones</p> <p>Shows just the milestones on the roadmap by hiding all the planning item bars.</p> <p>When you select this toggle, the group by and color by fields are changed and made inactive. Your previous personalization settings are available when you turn off this toggle.</p> <p>You can also see that the milestone indicators are colored in this view.</p> <ul style="list-style-type: none"> • Red: Missed • Green: Achieved • Black/Dark gray: Upcoming <p>Note: If the total number of item-level milestones, including the milestones for unscheduled items, exceeds 100, the item milestone indicators aren't visible on the roadmap. You can work with your admin to change this number to a value of your preference. For more information, see Update the display limit of items on Prioritization and Roadmap.</p>	

Milestones toggle	Roadmap view
<p>Milestone label</p> <p>Shows the milestone labels.</p>	<p>Milestone indicator with label</p>  <p>Milestone indicator without label</p> 

Customizing the dependencies display on the roadmap in Strategic Planning Workspace

Improve the efficiency of identifying the relationships between your planning items by choosing how the dependencies are displayed on the roadmap view.

The Personalize (⚙️) side panel on the roadmap provides different toggles to personalize the display of dependencies on your roadmap.

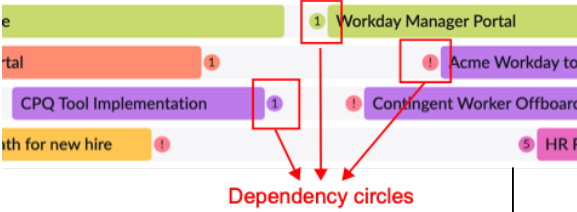

- For portfolio plan roadmaps, these toggles are always available.
- For free-form roadmaps, these toggles are available only if the roadmap's source table is the Planning Item table [sn_align_core_planning_item] or one of its extensions.

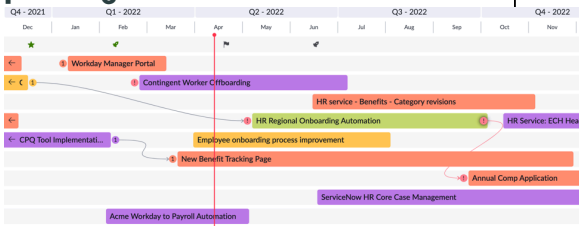

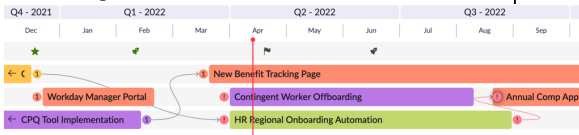

Dependencies Show/Hide

View dependencies

Dependency lines

Only items with dependencies

Dependencies Toggle	Roadmap view
<p>View dependencies</p> <p>Indicates dependencies in the form of circles on either side of the planning item bars.</p> <p>These circles either contain a number inside them (1), indicating the number of dependencies that item shares, or is colored red (!) indicating a conflicting dependency.</p>	<p>Dependency circles on the roadmap</p> 

Dependencies Toggle	Roadmap view
<p>Note: This toggle must be enabled to use the other two toggles in the Dependencies section.</p>	
<p>Dependency lines</p> <p>Indicates dependencies using lines between the planning items.</p> <p>These lines are shown only if:</p> <ul style="list-style-type: none"> Both planning items of the dependency are within the same roadmap Dependency is of the Depends on type 	<p>Dependency lines between the planning items</p>

Tables installed with Strategic Planning Workspace

Table	Description
Custom planning item 1 [sn_align_core_custom_planning_item_1]	Stores information for a additional planning item type.
Custom planning item 2 [sn_align_core_custom_planning_item_2]	Stores information for a additional planning item type.
Custom planning item 3 [sn_align_core_custom_planning_item_3]	Stores information for a additional planning item type.
Custom planning item 3 [sn_align_core_custom_planning_item_3]	Stores information for a additional planning item type.
Custom planning item 4 [sn_align_core_custom_planning_item_4]	Stores information for a additional planning item type.
Custom planning item 5 [sn_align_core_custom_planning_item_5]	Stores information for a additional planning item type.
Demand [sn_align_core_demand]	Stores records created with Demand planning item type.
Epic [sn_align_core_scrum_epic]	Stores records created with Epic planning item type. These records could be Scrum or SAFe epics.
Initiative	Stores records created with Initiative item.

Table	Description
[sn_align_core_initiative]	
Lens [sn_align_core_lens]	Stores data of the lens configuration.
Lens structure [sn_align_core_lens_structure]	Stores data of lens entities and the relationship between them for different lenses.
Milestone [sn_milestones_milestone]	Stores data of milestones.
Planning Item [sn_align_core_planning_item]	Stores the data of all planning item types.
Portfolio plan [sn_align_ws_portfolio_plan]	Stores data of portfolio plans.
Project [sn_align_core_project]	Stores records created with Project planning item type.
Roadmap configuration [sn_align_ws_roadmap_configuration]	Stores the configuration data for tables that are used to create portfolio roadmaps and free-form roadmaps.
Strategic Program [sn_align_core_program]	Stores records created with Strategic Program item.

Goals tables

Table	Description
Context Variable [sn_gfa_context_variable]	Stores the context variable details for the target source.
Goal [sn_gf_goal]	Stores the goal details.
Goal Assigned Entity Configuration [sn_gf_assigned_entity_config]	Store the assigned entity configuration for a table for an assigned entity type, so that the goal user can associate the goal with the required assigned entity.
Goal Core [sn_gf_core_goal]	Stores the core (basic) details for the goal. The Goal [sn_gf_goal] table extends the Goal Core [sn_gf_core_goal] table.
Goal Relationship	Defines the relationship between a goal and items (Project, Demand, Program, Scrum Epic,

Goals tables (continued)

Table	Description
[sn_gf_goal_m2m_relationship]	Scrum Feature, SAFe Epic, SAFe Feature, and Planning item).
Strategic Plan [sn_gf_strategic_plan]	Stores the strategic plans defined for each planning organization hierarchy.
Strategic Priority [sn_gf_strategy]	Stores the strategic priorities defined for the organization.
Strategy Value [sn_gf_strategy_value]	Stores the strategic values for strategic plans.
Target [sn_gf_goal_target]	Stores the target details for the goal.
Target Breakdown [sn_gfa_target_breakdown]	Stores the target breakdown details for the target that were created based on the breakdown intervals specified for the target.
Target Progress [sn_gf_goal_target_progress]	Stores the target progress details for the goal.
Target Source [sn_gfa_target_source]	Stores the target source configuration details for automating the actual value of the targets.
Units [sn_gf_units]	Stores the available units for measuring the progress of targets.

Strategic Planning with PPM, Agile 2.0, and SAFe tables

Table	Description
Field Map [sn_align_cmn_int_field_map]	Field mappings for work items between Strategic Planning and the execution applications.
Alignment Integration [sn_align_cmn_int_integrations_setup]	Integration setup information for your instance.
Table Map [sn_align_cmn_int_table_map]	Table maps for work items between Strategic Planning and the execution applications.

Strategic Planning with PPM, Agile 2.0, and SAFe tables (continued)

Table	Description
Integration Mapping [sn_align_cmn_int_integration_mapping]	Integration mappings for work items between Strategic Planning and the execution applications.
Import Request [sn_align_cmn_int_import_request]	Stores the information for import requests created to import records from PPM, Agile Development 2.0, or SAFe to Strategic Planning.
Instance Mapping [sn_align_cmn_int_instance_mapping]	Stores instance mapping information between Strategic Planning and the execution applications.
Integration Error [sn_align_cmn_int_integration_error]	List of the integration errors.
Choice Map [sn_align_cmn_int_choice_map]	Workflow choice mappings for work items between Strategic Planning and the execution applications.

Financials tables

Table	Description
Investment Baselines [sn_invst_pln_invst_investment_baseline]	Stores the information about the financial baselines.
Investment Baseline Headers [sn_invst_pln_invst_investment_baseline_header]	Stores all the information about financial baselines and the investment tables.
Investment Budget [sn_invst_pln_invst_budget]	Stores the migrated budget information to work on lean budgeting at required time scope.

Scoring tables

Table	Description
Scoring Framework [sn_apw_advanced_scoring_framework]	Stores the records of scoring frameworks such as RICE, WSJF, Value vs Effort, or any new custom framework.
Scoring Framework Attribute [sn_apw_advanced_scoring_attributes]	Stores the attributes of each of the scoring frameworks such as Reach, Impact, Confidence, Effort, Value, Job Size, Time

Scoring tables (continued)

Table	Description
	Criticality, and so on. These attributes are of Glide var type fields.

Digital Product Release Data Model tables

Table	Description
Product Enhancement [sn_dpr_model_product_enhancement]	Stores the information about the product enhancement of a product feature.
Product Feature [sn_dpr_model_product_feature]	Stores the information about the function or capability that adds value to a product for the customer.

Scheduled jobs installed with Strategic Planning Workspace

Goals scheduled jobs

Scheduled job	Description
Migrate Goal, Strategy, and Work item data to the Goal Framework and related Planning item tables	Migrates the existing goals data to the Goal Framework tables. For information on what data is migrated and how the data can be migrated, see goal data migration .
Migrate goal relationships for assigned entities	Populates the fields, Assigned entity type and Assigned entity on the Goal form based on the data in the Goal Relationship [sn_gf_goal_m2m_relationship] table if you have created m2m relationship with lens entities other than Company , Business Unit , Department , and Portfolio .
Clear the Planning item value in the Goal Relationship for strategic items	Clears the planning item value in the existing Goal Relationship records for strategic items - Program and Initiative.
Update Actual value of the targets using Goal Framework for SPM	Updates the actual value of the targets by collecting the data from the respective target sources, so that the progress of the targets is updated and then the targets' progress is rolled up to the goals.
Create Goals Demo Data with Target Breakdowns	Creates a target breakdowns demo data for the targets.

Financials scheduled jobs

Scheduled job	Description
Create Financial Baseline For Planning Items	Automatically create financial baselines for your planning items at a defined cadence.

Financials scheduled jobs (continued)

Scheduled job	Description
Migrate budget for active demands and projects	Migrate the budget of your planning items as a bulk action.
Generate Labor Costs	Activate scheduled jobs to automatically generate labor costs for attribute-based resource assignments for Projects and Demands.
Generate Labor Costs For Epic	Activate scheduled jobs to automatically generate labor costs for attribute-based resource assignments for Epics.

Custom scripts installed with Strategic Planning Workspace

Goals custom scripts

Name	Description
Benefit Plans A target source with predefined script.	<p>Predefined script that updates the Actual value field on the target form by fetching the required value from the Actual benefit field or Non-monetary actual benefit field from the monetary or non-monetary benefit plan records. For script template, see Predefined target automation script for benefit plans.</p> <p>Note: You can use the Benefit Plans custom script only when PPM Standard (Project Portfolio Management) is installed.</p>

System properties installed with Strategic Planning Workspace

Portfolio Planning and Portfolio Planning Core system properties

Name	Description
sn_align_ws.portfolio_plan_items_limit	<p>Option to define the number of planning items to be loaded on the planning page.</p> <p>Note: If the value in the system property is more than 250, the performance of the UI may degrade. The default value is 250.</p>
sn_align_ws.item_milestone_limit	Option to define the number of milestone items to be loaded in the Roadmap tab. The default value is 50.
sn_align_ws.is_scenario_planning_disabled	Option to enable the scenario_planning feature.
sn_align_core.planning_item_types_allow_list	Option to define the planning item types to be allowed for configured for a portfolio plan.

Goals system properties

Name	Description
glide.ui.sn_gf_goal_target_activity.fields	Option to enable activity stream for fields of the targets.
glide.ui.sn_gf_goal_activity.fields	Option to enable activity stream for fields of the goals.
sn_align_ws.goal_hierarchy.max_records	Specifies the number of goals to be loaded on the Hierarchy tab on the Goals view. Note: If the value in the system property is more than 500, the performance of the Goals UI may degrade. The default value is 500.
sn_gf.allow_goal_deletion	Option to enable deletion of goals. The default value is true.
sn_gf.allow_target_deletion	Option to enable deletion of targets. The default value is true.
sn_gf.goal_calendar_type	Option to set calendar type for setting goals. The available calendar types are Gregorian Calendar and Fiscal Period. The default value is Gregorian Calendar.
sn_gf.weighted_average_enabled	Option to enable the weighted average logic to calculate the progress of goals from their subgoals and targets.
sn_gfa.disable_target_breakdown	Option to enable the target breakdowns feature at the instance level. The default value is false.
sn_gfa.target_breakdown_decimals	Option to define the number of decimals to show for target values while generating the target breakdowns. The default value is 2.
sn_gfa.weeklyCheckInDayToMapMonth	Option to define end day of the week for weekly target breakdowns mapping to month. The default value is Friday.

Strategic Planning with PPM system properties

Name	Description
com.sn_align_cmh_int.bulk_import	<ul style="list-style-type: none"> • Type: Choice list • Default value: INSERT • Other possible values: <ul style="list-style-type: none"> ○ INSERT ○ <Value 2 name>

Strategic Planning with PPM system properties (continued)

Name	Description
	<ul style="list-style-type: none"> • Location: System Property [sys_properties] table • Learn more: Configure bulk import

Domain separation and Strategic Planning

Domain separation is supported for Strategic Planning. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see [Application support for domain separation](#) .

Overview of domain separation in Strategic Planning

You can create lens, portfolio plans, planning items, and roadmaps in different domains.

How domain separation works in Strategic Planning

After you enable domain separation on your ServiceNow instance, the data of Strategic Planning is automatically domain separated. So, the data of lens, portfolio plans, planning items, and roadmap configuration for different domains is visible to only those users who have access to these domains.

Domain separated tables in Strategic Planning

All the tables installed with Strategic Planning support domain separation. For a complete list of tables, see [Components installed with Strategic Planning Workspace](#).

Planning item reorder errors in Strategic Planning Workspace

Review the scenarios when the reordering of items can fail in the List view of Prioritization in Strategic Planning Workspace.

To update the rank of the planning items in the work pipeline of your portfolio plan, you can reorder the items from the List view of the Prioritization page. While doing so, the reorder can

fail due to an error in the ranking configuration. Following are the scenarios where reordering of planning items can fail:

Scenario 1: Global ranking plugin is not active

Check if the Global Ranking Application plugin (com.snc.sdlc.ranking) is active in your ServiceNow instance. If not, contact your admin to activate it.

Scenario 2: Planning item doesn't have a rank configuration

Check if all the planning items that you are reordering have a rank configuration. If not, contact your admin to update rank configuration for these planning item types.

Scenario 3: Target row doesn't have a global rank

Check if the planning item before or after your target position to reorder has a global rank. If not, contact your system admin to generate a global rank for them.

[Rank planning items](#)

Item milestone errors in Strategic Planning Workspace

Learn about the scenarios when the planning item milestones on the portfolio plan roadmap or free-form roadmap can be in an error state in Strategic Planning Workspace.

An item milestone can fall out of the approved start or end dates of the item when you reschedule the existing planning item.

When you reschedule a planning item on the roadmap, the due dates of its milestones don't change. So, if the due date of a milestone is falls outside the item's date range, the indicator for that out-of-range milestone is hidden and moved to an error state. Indicators for milestones that are still within the item's date range are

visible.

The milestones that are out of sync with the item's schedule can be viewed from the Milestones tab on the side panel. From the side panel, you can edit and adjust the

due date of the milestone to reflect the change of plans. See [Update roadmap item](#)

milestones.

Note:

You can't update a project milestone from the roadmap view. Updating project milestones may impact the associated cost and resource plans of the project. So, it's recommended to update project milestones using Project Workspace in Project Portfolio Management (PPM).

Item dependency errors in Strategic Planning Workspace

Learn about the scenarios when the planning item dependencies on the portfolio plan roadmap or free-form roadmap in Strategic Planning and Portfolio Planning can be in an error state.

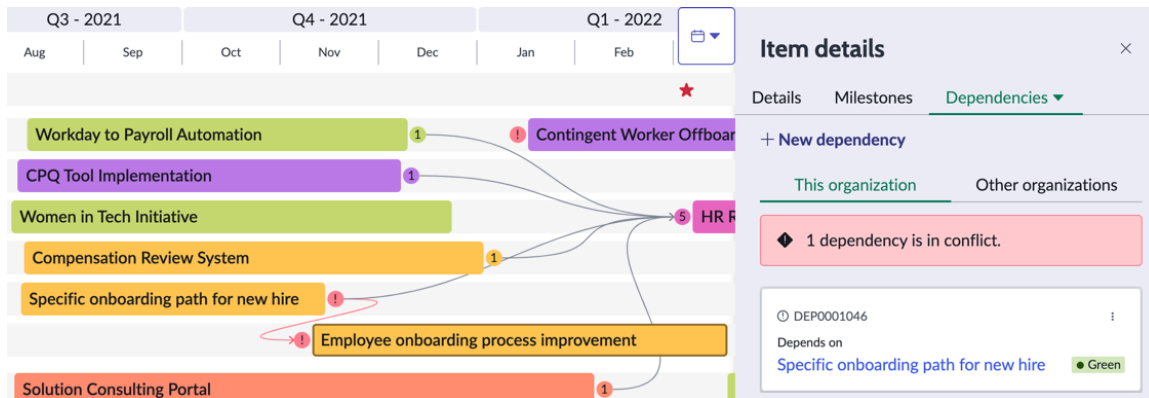

A dependency between two planning items can be in an error state when a scheduling conflict exists between the items. In a linear (Depends on) dependency, the items are scheduled in a way that starting the work on one item requires completing the work on another item.

Note:

Error states are displayed for only if the planning items have a **Depends on** type of relationship.

In the sample roadmap shown here, starting work on **Employee onboarding process improvement** is dependent on the completion of **Specific onboarding path for new hire**. This relation is considered a linear dependency. Here, **Employee onboarding process improvement** is scheduled to start before the end date of **Specific onboarding path for new hire**. This conflict is indicated on the roadmap with an error icon (), and is also mentioned in the Dependencies tab of the Item details side panel.

To resolve such errors, review the scope of the planning items and update the start or end dates to adjust their scheduling accordingly.

[Update roadmap item dependencies](#)

Managing Strategic Planning with Project Portfolio Management, Agile Development 2.0, and SAFe

Ensure that Strategic Planning is integrated properly with PPM, Agile Development 2.0, and SAFe with these guidelines.

- Do not change the filter condition of a table map after the records are interfaced. The already interfaced records might not match with the new filter condition and any change in the filter condition can result in data inconsistency. If you need to change the filter condition, ensure that the relevant attributes on the interfaced records are updated manually to avoid data inconsistency issues.
- Whenever a table map is created, ensure that the relevant field maps and choice maps are also configured.
- When an import job for a table map is running (processing), do not modify the table map or its field maps.
- Using the **Converted to** field on the planning item form, you can identify the original record from which it was converted.
- Ensure that the **Lookup field** and **Lookup column** values are added whenever the execution and alignment tables are referencing two different tables, while creating a field map for field type of reference or glide list.
- If there is a data synchronization failure, check if:
 - The **Integration error logs** related list within that Alignment integration record.
 - The **Alignment table filter** (for import) and **Execution table filter** (for export) conditions are met.
 - The **Active** flag in both the alignment integration and the table map is checked.
 - The appropriate fields and choices are configured for each table map.
- If you want to view the **Execution URL** field, configure the alignment planning item record to view it.
- If the Execution URL field in your synced planning item(s) is blank, navigate to **All > Strategic Planning > Integrations** and select the required alignment integration. If any of the execution URL is missing, select the **Fix execution URL(s) for planning items** related link. This runs a job and updates the execution URL field.

Note:

The **Fix execution URL(s) for planning items** related link is only available when the execution URL is missing for any of the planning item.

- A **Primary goal** field is introduced to the projects, demands, and epics table maps to support the integration of the **Goal** field between alignment and execution tables.
- When you are trying to import or export a project, ensure that the demands (that are a part of that project) are synced.
- You can create a table map for any execution table. If a table map is not created from one of the delivered tables (pm_portfolio, rm_epic, dmn_demand, pm_project) or does not extend from them, you are required to create a business rule to support the interfacing of the table map records. For more information on creating a business rule, see [Create a business rule to apply a custom table map configuration](#).

Form field information for Strategic Planning

Field information for forms used in the Strategic Planning application.

Action Assignment form

Learn about the fields of the Action Assignment form. Use this form to add the **New** action button to the APW List Menu Configuration page.

Goal form

Field	Description
Action Label	Name of the action label. Enter New.
Action name	Name of the action. Enter create-new-uxf.
Implemented as	Implementation for the action. Select UXF Client Action .
Table	Name of the table the action is created for. Select sys_ux_list_menu_config .
Specify client Action	Client action. Look up and select Create New Record .
View	View of the form on which the action button is displayed.

Choice map form

Understand the fields of the choice map form. This form is used to create choice maps.

Choice map form

Field	Description
Execution table column	Field column of the selected execution table that needs to be mapped. The value in this field is automatically added based on the selection made in the field map configuration.
Execution choice	Select the choice field value of the selected execution table column field.
Alignment table column	Field column of the selected alignment table that needs to be mapped. The value in this

Choice map form (continued)

Field	Description
	field is automatically added based on the selection made in the field map configuration.
Alignment choice	Select the choice field value of the selected alignment table column field.

Context Variable form

Use the Context Variable form to create a context variable for a target source for calculating the actual value of the target based on the configured input values.

Context Variable form

Field	Description
Type	Context variable type. For information about the different field types, see Field types .
Application	Name of the application scope.
Label	Name of the label that the context variable type is created for.
Column name	ID of the context variable for which the context variable type is created.
Choice List Specification	Option to display the context variables on the Target form in the Actual Value Source Configuration section.
Default value	Default value to consider for updating the actual value of the target.

Create cost plan form

Use this form to create cost plans for your planning items.

Create cost plan form

Field	Description
Name	Name of the cost plan.
Entered currency	Currency to capture the unit cost value.
Unit cost	Planned cost for the cost plan.
Quantity	Quantity of cost plans.
Total planned cost	Total planned costs value of the cost plan.
Start fiscal period	Starting month in a fiscal period for the cost plan.
End fiscal period	Ending month in a fiscal period for the cost plan.
Cost distribution	Allocate planned cost by fiscal period or duration. Select a value from the list.

Create cost plan form (continued)

Field	Description
	<ul style="list-style-type: none"> • Split equally across fiscal periods - Distributes the cost equally among all the fiscal periods across the duration. • Recurring per fiscal period - Recurs the cost for each fiscal period across the duration.
Cost type	<p>Cost type of the cost plan.</p> <p>Select a cost type from the list.</p> <p>Note: Based on the selected cost type, the Role and Product model fields appear.</p>
Employee type	<p>Read-only field.</p> <ul style="list-style-type: none"> • External if Cost type is External labor Capex or External labor Opex. • Internal if Cost type is Labor Capex or Labor Opex.
Role	Name of the role to expense the cost plan.
Product model	<p>Available if the Cost type is Software, Hardware, or Other Capex or Opex.</p> <p>Select a model from the list to expense the cost plan.</p> <p>Model name of a hardware expenditure to expense the cost plan.</p>

Create expense line form

Use this form to create expense lines for your actual expense.

Create expense line form

Field	Description
Number	Auto-generated number for the expense line.
Amount	Expense incurred.
Short description	<p>Short description of the expense.</p> <p>Mention unique and specific details to identify the expense line.</p>
Date	Date of the expense.
Process date	Processed date of the expense.
Cost plan	Associated cost plan name for recording the expense line.

Create expense line form (continued)

Field	Description
Cost type	Cost type of the expense. by default, the cost type of the cost plan is selected.
State	State of the expense line. Only processed expense lines are considered for an investment entity.
Expense type	Defines the expense type, internal or external. By default, the expense type is considered from the Cost type field entry.
Rate card	Name of the rate card.
Summary type	Business purpose of the expense line.

Dependency form

Learn about the fields of the dependency form. Use this form to add and establish dependencies between planning items on the roadmap in Strategic Planning workspace.

Dependency form

Field	Description
Planning item	Planning item that you selected from the roadmap, to create the dependency. Consider this as the successor item. This field is automatically filled based on your selection.
Relationship type	Choose one of the following: <ul style="list-style-type: none"> • Depends on: Starting the work on one item depends on finishing the work of the other item. This dependency is considered a linear relationship. • Relates to: Work of the two items is related to each other but doesn't have a strict dependency on each other's completion. This dependency is considered a non-linear relationship.
Planning item	Planning item that is required. Consider this as the predecessor item.
Number	System-generated unique identification number for the dependency.

Field map form

Understand the fields of the field map form. This form is used to create mappings for a corresponding table map.

Field map form

Field	Description
Execution table	Table in Agile Development 2.0, SAFe, or PPM that needs to be mapped with a table in Strategic Planning. The value in this field is automatically added based on the selection made in the table map configuration.
Execution table column	Field column of the selected execution table that needs to be mapped.
Alignment table	Table in Strategic Planning that needs to be mapped with a table in Agile Development 2.0, SAFe, or PPM. The value in this field is automatically added based on the selection made in the table map configuration.
Alignment table column	Field column of the selected alignment table that needs to be mapped.
Flow type	Specifies whether the mapping is done from alignment to execution, execution to alignment, or both. Here, alignment implies Strategic Planning, and execution implies PPM, Agile Development 2.0, and SAFe applications.

You can also create custom fields and map them to the required source fields as needed. For example, if you want to display the execution project number, you can create a custom field called 'Project number' in the Project planning item [sn_align_core_project] table within the Portfolio Planning Core application scope. Then, map this field to the 'Number' field of the Project table (pm_project) using the project field map.

Goal Assigned Entity Configuration form

Use the Goal Assigned Entity Configuration form to configure a table for an assigned entity type so that the goal user can associate goals with the required assigned entity.

Goal Assigned Entity Configuration form

Field	Description
Assigned entity table	Entity table that a goal is assigned to.
Application	Name of the application scope.
Assigned entity field	Reference field on the goal form.

Goal form

Use the Goal form to create goals for your organizational strategic priorities.

Note:

For Operational Sustainability Workspace and Strategic Planning users, to view the other fields (that are not added to the default or your custom form view) on the form in the workspace, configure the default/custom form layout. For information on how to configure the form layout, see [Configuring the form layout](#).

Goal form

Field	Description
Name	Name of the goal.
State	State of the goal. The state can be Draft, In progress, Approved, Complete, Pending, Achieved, Not Achieved, or Cancelled.
Category	Category of the goal. The available options are: <ul style="list-style-type: none"> • Total Applications • Total Cost • Opex • Capex • Cloud Applications • Homegrown Applications • Support Cost • Labor Cost • Standards Compliance • Strategic • Operational • Tactical • Artificial Intelligence
Status	Status of the goal. Status can be Red, Yellow, Green, or None.
Progress	Percentage complete for the goal. The progress value is calculated automatically if the goal has sub-goals or/and targets. For more information on how the progress value is calculated, see Progress value calculation .
Description	Brief description of the goal. You can refine goal description using the Refine records skill, if the Now Assist for SPM application is installed.

Parent information section of the Goal form

Field	Description
Strategic priority	Name of the strategic priority that this goal is created for.
Parent goal	Name of the parent goal that this goal contributes to.
Impact on parent goal	<p>A numerical value that represents the importance of this goal relative to sibling goals or other goals under its parent goal. By default, the value is (1) Neutral.</p> <p>The available options are:</p> <ul style="list-style-type: none"> • (0) No impact • (1) Neutral • (2) Moderate • (3) High • (4) Very high • (5) Maximum <p>i Note: This field is available only when the sn_gf.weighted_average_enabled system property is set to Yes.</p>

Owners & Contributors section of the Goal form

Field	Description
Assigned entity type	Entity type to which the goal is assigned. For example, Business Unit, Department, Company, or Portfolio.
Assigned entity	<p>Entity to which the goal is assigned. For example, if the portfolio plan is created with Business Units, HR and IT, populate the Assigned entity type as Business Unit and Assigned entity type as HR or IT.</p> <p>i Note: Populating the Assigned entity type and Assigned entity fields are required to display the goals in the portfolio plan.</p>
Owner	Owner of the goal. By default, the name of the user creating the goal is populated.
Contributors	Users who contribute to the achievement of the goal.

Duration section of the Goal form

Field	Description
Start date	Start date for the goal. By default, the start date of the current quarter is populated. For a sub-goal, start date of its parent goal is populated.
End date	End date for the goal. By default, the end date of the current quarter is populated. For a sub-goal, the end date of its parent goal is populated.

Other section of the Goal form

Field	Description
Comments	Detailed comments for the goal to facilitate collaboration.
Team	Assignment group responsible for different activities in achieving the goal.
Classification	Goal classification type. The available options are Environmental , Social , and Governance . This field is applicable only for the Operational Sustainability Workspace users.

Goal Preferences form

Use the Goal Preferences form to manage goals such as the calendar type used for goal setting, weighted average calculation for goal progress, and deletion of goals and targets.

Goal Preferences form

Property	Description
Enable the weighted average logic to calculate the progress of goals from their sub-goals and targets.	<p>When enabled, the fields, Impact on parent goal and Impact on goal appear in the Goal [sn_gf_goal] and Target [sn_gf_goal_target] tables respectively. The progress value of the parent goal is calculated by applying the Weighted Average logic.</p> <p>The default value is Yes.</p> <p>The progress value of a parent goal is calculated based on the progress value and the value defined in the Impact on parent goal and Impact on goal fields for sub-goals and targets respectively.</p> <p>For more information on how the progress value is calculated, see progress value calculation.</p>
Allow deletion of goals.	<p>Can delete the goals.</p> <p>The default value is Yes.</p>

Goal Preferences form (continued)

Property	Description
Allow deletion of targets.	<p>Can delete the targets.</p> <p>The default value is Yes.</p> <p>Note: When you delete a goal, its associated targets (if any) are also deleted even though the Allow the deletion of targets property is set to No.</p>
Calendar type used for setting goals.	<p>Calendar type that is used for setting goals. The available calendar types are Gregorian calendar and Fiscal period.</p> <p>The default value is Gregorian calendar.</p>
Disable target breakdowns at the instance level.	<p>Can disable the target breakdowns feature. When the feature is enabled, target breakdowns are automatically created based on the breakdown interval set for the target.</p> <p>The default value is false.</p>

Goal/Target Relationship form

Use the Goal/Target Relationship form to create a relationship between a goal and planning item, strategic item, or any other item.

Goal/Target Relationship form fields for Planning and Strategic item

Field	Description
Goal	Name of the goal you want to associate the planning item with.
Target	Name of the target you want to associate the planning item with.
Primary	<p>Option to make the goal/target relationship as primary.</p> <p>Selecting this field automatically populates the Primary goal and Primary target fields on the planning item form.</p>
Planning item type	Type of planning item.
Planning item	Planning item with which a goal relationship is created with the goal.

Goal/Target Relationship form fields for an item(that is of entity type, Product Model)

Field	Description
Table	Name of the reference table.
Document ID	Document ID of the column from the selected reference table.

**Goal/Target Relationship form fields for an item(that is of entity type, Product Model)
(continued)**

Field	Description
	The suggested values in this field depend on the reference table selected in the Table field.

Highlighted Value form

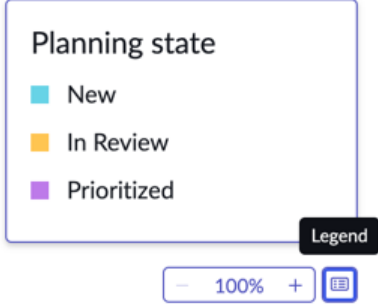

Learn about the fields of the Highlighted Value form. Use this form to customize the fields to be highlighted on the Prioritization page of a portfolio plan in Strategic Planning workspace.

Field	Description
Table	Table which contains the highlighted columns. Enter sn_align_core_planning_item .
Application	Scope of yourServiceNow instance. By default, this field is set to Portfolio Planning .
Field	Column of the table that is highlighted in the workspace.

Highlighted Value Condition form

Learn about the fields of the Highlighted Value Conditions form. Use this form to configure the display of highlighted fields in Strategic Planning workspace.

Field	Description
Condition	Condition for the field value. For example, Status is Green.
Color	Color for the field value that meets the condition specified.
Application	Scope of yourServiceNow instance. By default, this field is set to Portfolio Planning .
Order	Order in which this color appears on the legend in the Hierarchy view of the Prioritization page. For example, for the Planning Status column, the value New is given the order 1.

Field	Description
	
Hide Label	Option to hide the label for the highlighted value condition. When selected, the Label field is not available.
Label	Name of the label displayed for the highlighted value condition. This field is not available when Hide Label is selected.
Show Icon	Option to show icon beside the field value.
Icon	Icon that is displayed beside the field value. This field is shown only if the Show Icon field is selected.
Variant	Option to define color variant. The available options are primary , secondary , and tertiary .
Value Override	Custom display text that replaces the actual field value in the view. When specified, the override text appears instead of the stored value.

Initiative form

Learn about the fields of the initiative form. Use this form to create or edit the details of an Initiative in Strategic Planning.

These fields are displayed on the full details page of the initiative.

Initiative form

Field	Description
Name	Brief description of the initiative.
Description	Detailed information of the initiative. You can refine initiative description using the Refine records skill, if the Now Assist for SPM application is installed.
State	Current working state of the initiative.
Owner	User assigned to this initiative.
Planning state	State of the initiative in the Strategic Planning workspace.

Initiative form (continued)

Field	Description
Percent complete	Percentage of work completed for this initiative.
MoSCoW	Priority of this initiative based on its importance. The available options are: <ul style="list-style-type: none"> • 1 - Must have • 2 - Should have • 3 - Could have • 4 - Won't have
Work notes	Notes to capture the updates and discussions on the initiative as the work progresses.
Strategic priority	Strategic priority that this initiative is associated to.

Details section of the Initiative form

Field	Description
Approved start date	Approved start date for this initiative.
Approved end date	Approved end date for this initiative.
Actual start date	Actual date on which the work for this initiative has started.
Actual end date	Actual date on which the work for this initiative is complete.
Priority	Priority of this initiative.
Business capabilities	Business capabilities of this initiative.
Business application	Business application that this initiative is related to.
Other impacted business applications	Business applications that this initiative has an impact on.

Business case section of the Initiative form

Field	Description
Overview	Business case overview of this initiative.
Background	Background for this initiative.
Limitations	Applicable limits to this initiative.
Approach	Planned approach to work on this initiative.
Benefit	Business benefit from this initiative.

Financials section of the Initiative form

In this section, capture financial details for this initiative such as cost, CapEx, OpEx, benefit, ROI, and other estimates.

Field	Description
Planned cost	Planned cost to take up this initiative.
Planned capEx	Planned capital expenditure for this initiative.
Planned opEx	Planned operational expenditure for this initiative.
Planned benefit	Planned benefit from this initiative.
Actual benefit	Actual benefit achieved from this initiative,
Actual cost	Actual cost on this initiative.
Actual capEx	Actual value of capital expenditure for this initiative.
Actual opEx	Actual value of operational expenditure for this initiative.
Planned ROI	Planned return of investment for this initiative.

Lens form

Learn about the fields of the Lens form. Use this form to create a lens in Strategic Planning.

Lens form

Field	Description
Name	Name of the lens.
Active	Indicates if the lens is active.
Description	Brief description of the lens. You can indicate the business purpose of this lens and the planning managers that would use this lens.
Planning items	Type of work that can be planned using this lens. Move the desired planning item types from the Available list to the Selected list.

If you want additional planning items types, you can create them. See [Define a new planning item type in Strategic Planning](#).

List Applicability form

Learn the field information for the List Applicability form. Use this information to define audience for the newly created lists for Strategic Planning workspace.

Field	Description
List	Name of the list that you want to define audience for.
Application	This field is set to Portfolio Planning by default.
Applicability	Audience for this list. Set this field to Alignment Workspace Home Audience .
Active	Option to enable this applicability to the list.

Planning item type form

Learn about the fields of the new table form that are required to add a new planning item type in Strategic Planning.

New table form

Field	Description
Label	Unique label for the table.
Name	This field is auto generated from your input in the Label field .
Application	This field is automatically set to Portfolio Planning based on your scope. If this field shows a different value, then ensure that your ServiceNow instance is in Portfolio Planning scope.
Extends table	If this new table is a type of planning item, select Planning Item .

Controls section of the new planning item type form

Field	Description
User role	Set this field to sn_align_core.apw_user so that you grant access to the Strategic Planning user to this table.

Application Access section of the new planning item type form

Application Access
Enable the Can read , Can create , Can update , and Can delete fields.

Epic planning item form

Learn about the fields of the epic form. Use this form to create or edit the details of a planning item of the type Epic in Strategic Planning.

These fields are displayed on the full details page of the planning item.

Epic planning item form

Field	Description
Name	Brief description of the planning item.
Description	Detailed information of the planning item. You can refine epic description using the Refine records skill, if the Now Assist for SPM application is installed.
State	Current working state of the planning item.
Owner	User assigned to this planning item.
Planning state	State of the planning item in the Strategic Planning Backlog.
Percent complete	Percentage of work completed for this planning item.
Methodology	Agile methodology used.
Enabler	Option to indicate if this epic is an enabler.

Epic planning item form (continued)

Field	Description
MoSCoW	Priority of this planning item based on its importance. The available options are: <ul style="list-style-type: none"> • 1 - Must have • 2 - Should have • 3 - Could have • 4 - Won't have
Portfolio	Portfolio that this planning item is associated to.
Product	Product that this planning item is associated to.
Strategic program	Strategic program that this planning item is associated to.
Product enhancement	Product enhancement that this planning item is associated to.
Primary goal	Goal that is associated with this planning item as the primary goal.
Primary target	Target that is associated with this planning item as the primary target.
Work notes	Notes to capture the updates and discussions on the planning item as the work progresses.
Strategic priority	Strategic priority that this planning item is related to.

Dates section of the Epic planning item form

Field	Description
Approved start date	Approved start date for this planning item.
Approved end date	Approved end date for this planning item.
Actual start date	Actual date on which the work for this planning item has started.
Actual end date	Actual date on which the work for this planning item is complete.
Planned start date	Planned start date for this planning item.
Planned end date	Planned end date for this planning item.

Details section of the Epic planning item form

In this section, capture additional details for this planning item such as Investment type, Execution type, impacted business application, and more.

Field	Description
Priority	Priority of this planning item.
Phase	Phase of this planning item. This field is available only if the planning item is of the type Project.
Business capabilities	Business capabilities of this planning item.
Business application	Business application that this planning item is related to.
Other impacted business applications	Business applications that this planning item has an impact on.
Missing estimate	Number of stories in the epic that are missing estimates.
Percent complete by count	Percentage of completed work in the epic. Story count is used to calculate this value.
Completed count	Number of completed stories in the epic.
Completed estimate	Sum of the estimates of all the completed stories in the epic.
T-Shirt size	Size of the demand.
Total count	Number of stories in the epic.
Total estimate	Sum of the estimates of all stories in the epic.
Percent complete by estimate	Percentage of completed work in the epic. Story estimate is used to calculate this value.

WSJF score section of the Epic planning item form

*Use this section if your epic is a **SAFe** epic.*

Field	Description
WSJF score	Weighted Shortest Job First (WSJF) score is used to prioritize and sequence jobs to result in optimum business value. An epic with the highest WSJF score gets the highest priority for implementation. This field is automatically filled using other field values in this section.
User-business Value	Business value of the job based on parameters like impact on revenue or other solutions in the market offering similar capabilities.

WSJF score section of the Epic planning item form

*Use this section if your epic is a **SAFE** epic.*

(continued)

Field	Description
Job size	Estimated duration for completion of the job.
Time criticality	Impact on the business when deadlines are missed. For example, how projected revenue gains are reduced over time when deadlines are shifted.
Risk reduction	Analyze how much risk that this epic can help you avoid by answering questions such as: <ul style="list-style-type: none"> • Does the job add value to the business in other ways? • Does the job bring in new business opportunities? • Does the job reduce the risk for a future delivery?

Financials section of the Epic planning item form

In this section, capture financial details for this planning item such as cost, CapEx, OpEx, benefit, ROI, and other estimates.

Field	Description
Planned cost	Planned cost to take up this planning item.
Planned capEx	Planned capital expenditure for this planning item.
Planned opEx	Planned operational expenditure for this planning item.
Planned benefit	Planned benefit from this planning item.
Actual benefit	Actual benefit achieved from this planning item,
Actual cost	Actual cost on this planning item.
Actual capEx	Actual value of capital expenditure for this planning item.
Actual opEx	Actual value of operational expenditure for this planning item.
Planned ROI	Planned return of investment for this planning item.

These fields are displayed on the full details page of the planning item.

Demand planning item form

Field	Description
Name	Brief description of the planning item.
Description	Detailed information of the planning item. You can refine demand description using the Write planning item skill, if the Now Assist for SPM application is installed.
State	Current working state of the planning item.
Owner	User assigned to this planning item.
Planning state	State of the planning item in the Strategic Planning Backlog.
Category	Category of this planning item. Choose from Strategic or Operational .
Execution URL	Link to the demand's execution record in Next Experience for Demand Management.
MoSCoW	Priority of this planning item based on its importance. The available options are: <ul style="list-style-type: none"> • 1 - Must have • 2 - Should have • 3 - Could have • 4 - Won't have
Portfolio	Portfolio that this planning item is associated to.
Program	Program that this planning item is associated to.
Product	Product that this planning item is associated to.
Strategic program	Strategic program that this planning item is associated to.
Primary goal	Goal that is associated with this planning item as the primary goal.
Product enhancement	Product enhancement that this planning item is associated to.
Primary target	Target that is associated with this planning item as the primary target.

Demand planning item form (continued)

Field	Description
Work notes	Notes to capture the updates and discussions on the planning item as the work progresses.
Strategic priority	Strategic priority that this planning item is associated to.

Dates section of the Demand planning item form

Field	Description
Approved start date	Approved start date for this planning item.
Approved end date	Approved end date for this planning item.
Planned start date	Date on which the work for this planning item is planned to start. This value is copied from the Approved start date field.
Planned end date	Date on which the work for this planning item is planned to be complete. This value is copied from the Approved end date field.

Details section of the Demand planning item form

In this section, capture additional details for this planning item such as Investment type, Execution type, impacted business application, and more.

Field	Description
Investment class	Choose from Run and Change
Investment type	Type of investment this planning item comes under. For example, if completing work on this item improves the user experience for your product, select End User Experience .
Priority	Priority of this planning item.
Business application	Business application that this planning item is related to.
Other impacted business applications	Business applications that this planning item has an impact on.
Business capabilities	Business capabilities of this planning item.

Business case section of the Demand planning item form

In this section, capture business details for this planning item such as risks, scope, blockers for this planning item.

Field	Description
Business case	Business case to invest in this planning item.

Business case section of the Demand planning item form

In this section, capture business details for this planning item such as risks, scope, blockers for this planning item.

(continued)

Field	Description
Risk of performing	Risks to the business if work on this planning item is completed.
Risk of not performing	Risks to the business if work on this planning item isn't completed.
Enablers	Enablers for this demand.
Barriers	Blockers, if any, for this planning item.
In scope	Defined criteria for this planning item.
Out of scope	Clearly defined criteria that is not necessary for this planning item.
Assumptions	Assumptions, if any, to work on this planning item.

Financials section of the Demand planning item form

In this section, capture financial details for this planning item such as cost, CapEx, OpEx, benefit, ROI, and other estimates.

Field	Description
Planned cost	Planned cost to take up this planning item.
Planned capEx	Planned capital expenditure for this planning item.
Planned opEx	Planned operational expenditure for this planning item.
Planned ROI	Planned return of investment for this planning item.
Financial return	Financial return on this planning item.
Planned benefit	Planned benefit from this planning item.

Assessment data section of the Demand planning item form

Field	Description
Impact	Impact that this planning item has on the business.
Risk	Numerical value for the risk associated with this planning item.
Value	Numerical value for the value obtained with this planning item.
Score	Score of the planning item.

Portfolio plan configuration form

Learn about the fields of the Portfolio plan form. Use this form to create or update display settings of the planning items for a portfolio plan in Strategic Planning Workspace.

Portfolio plan configuration form

Field	Description
Source table	Table that you want to configure portfolio plan for. For example, Strategic Priority [sn_gf_strategy] .
Start date field	Field to retrieve the start date value from.
End date field	Field to retrieve the end date value from.
Item name field	Field to retrieve the name of the item from.

Portfolio plan configuration form (continued)

Field	Description
Item owner field	Field to retrieve the item owner name from.

Roadmap timeline configuration section of the Portfolio plan configuration form

Field	Description
Group by fields	<p>List of fields with which the roadmap items can be categorized into groups.</p> <p>For example, the State attribute can be used to categorize the items into groups of states such as Draft, Ready, Work in progress, and others.</p>
Color by fields	<p>List of fields with which the roadmap items can be categorized by color.</p> <p>For example, the Planning item type attribute can be used to assign a unique color to each group of items belonging to a specific type.</p>
Metrics fields	<p>List of fields used as the metrics for the roadmap items.</p> <p>For example, Planned benefit or Actual cost.</p> <p>These values are displayed when you point the mouse cursor on the roadmap item.</p>
Status field	Field that is used for the status of the roadmap item.
Percent complete field	<p>Field that is used to track the completion of the roadmap item.</p> <p>This field value is used to visualize the progress of the roadmap item in the tracking mode.</p>

Kanban configuration section of the Portfolio plan configuration form

Field	Description
Swim lane	Field to use for the swim lane on the board in the Prioritization Kanban view.
Vertical lane	Field to use for the vertical lane on the board the Prioritization Kanban view.

Kanban configuration section of the Portfolio plan configuration form (continued)

Field	Description
Metrics on Kanban card	Default metrics that your planning managers want to view on a planning item card in the Prioritization Kanban view.
Swim lane	Field to use for the swim lane on the board in the roadmap view.
Vertical lane	Field to use for the vertical lane on the board in the roadmap view.
Metrics on Kanban card	Default metrics that your planning managers want to view on a planning item card on the Kanban board in the roadmap view.

Rank configuration section of the Portfolio plan configuration form

Field	Description
Rank Configuration	Table that is used to create the portfolio plan. The value for this field is the table selected in the Source table field.

Product Enhancement form

Learn about the fields of the product enhancement form. Use this form to create or edit the details of a product enhancement in Strategic Planning.

These fields are displayed on the full details page of the product enhancement.

Product Enhancement form

Field	Description
Product	Name of the product that this product enhancement is created for.
Product feature	Product feature that this product enhancement is associated to.
Version	Version of the product enhancement.
Name	Name of the product enhancement.
State	State of the product enhancement.
Assignment group	User group that is assigned to the product enhancement.
Assigned to	User who is assigned to the product enhancement.
Description	Brief description of the product enhancement.

Product Enhancement form (continued)

Field	Description
Start date	Start date for the product enhancement.
End date	End date for the product enhancement.

Progress value calculation

The progress or percentage complete value of goals is auto-calculated using different formulas. The formula depends on whether the goal has only targets, a combination of sub-goals and targets, and if it has weighted average calculation enabled.

Scenario	Formula used to calculate the progress value of the goal
<ul style="list-style-type: none"> The goal has targets. The goal doesn't have sub-goals. The Impact on goal field is defined for targets. 	$\text{Progress value of the goal} = \frac{\text{Sum of progress values of its associated targets}}{\text{number of targets}}$
<ul style="list-style-type: none"> The goal has sub-goals and targets. The Impact on parent goal and Impact on goal fields are defined for sub-goals and targets respectively. 	$\text{Progress value of the goal} = \frac{\text{Sum of progress values of its sub-goals and associated targets}}{\text{number of sub-goals and targets}}$
<ul style="list-style-type: none"> The goal has two targets (target 1 and target 2). The goal doesn't have sub-goals. The Impact on goal field is defined for targets and the sn_gf.weighted_average_enabled system property is set to Yes. 	$\text{Progress value of the goal} = \frac{[(\text{Progress of target 1} * \text{Weight scale of target 1}) + (\text{Progress of target 2} * \text{Weight scale of target 2})]}{(\text{Weight scale of target 1} + \text{Weight scale of target 2})}$
<ul style="list-style-type: none"> The goal has two targets (target 1 and target 2). The goal has two sub-goals (sub-goal 1 and sub-goal 2). The Impact on parent goal and Impact on goal fields are defined for sub-goals and targets respectively and the sn_gf.weighted_average_enabled system property is set to Yes. 	$\text{Progress value of the goal} = \frac{[(\text{Progress of sub-goal 1} * \text{Weight scale of sub-goal 1}) + (\text{Progress of sub-goal 2} * \text{Weight scale of sub-goal 2}) + (\text{Progress of target 1} * \text{Weight scale of target 1}) + (\text{Progress of target 2} * \text{Weight scale of target 2})]}{(\text{Weight scale of sub-goal 1} + \text{Weight scale of sub-goal 2} + \text{Weight scale of target 1} + \text{Weight scale of target 2})}$

Consider a scenario where a goal (G1) has two targets (T1 and T2) and the **Impact on goal** field for T1 and T2 is set to 2 and 3 respectively. The current Progress values of T1 and T2 are 40% and 20% respectively. In this case, the progress value for G1 is calculated as follows:

- Contribution of T1 towards G1 progress = $2/(2+3)*40 = 16\%$
- Contribution of T2 towards G1 progress = $3/(2+3)*20 = 12\%$
- Therefore, Progress of G1 = $16\% + 12\% = 28\%$

Roadmap milestone form

Learn about the fields of the roadmap milestone form. Use this form to create a milestone for the timeline of your roadmap in Strategic Planning workspace.

Field	Description
Name	Preferred name for your milestone.
Type	Milestone type. Select from one of the following: <ul style="list-style-type: none"> • Key Event • Launch Date • Important Date • Deadline • Key Milestone
Due date	The date of the milestone.
Assigned to	User who is assigned to the milestone.

Roadmap configuration form

Learn about the fields of the roadmap configuration form. Use this form to add new tables to roadmap preferences and configure their details in Strategic Planning.

Roadmap configuration form

Field	Description
Source table	Table that is used to build your roadmap.
Start date field	Field that is used for the start date of the roadmap item. For example, Planned start date .
End date field	Field that is used for the end date of the roadmap item. For example, Planned end date .

Roadmap configuration form (continued)

Field	Description
Item name field	Field that is used for the name of the roadmap item. For example, Short description .
Item owner field	Field that is used for the owner of the roadmap item. For example, Assigned to .
Status	Field that is used for the status of the roadmap item.
Percent Complete	Field that is used to track the completion of the roadmap item. This field value is used to visualize the progress of the roadmap item in the tracking mode.
Group by fields	List of fields with which the roadmap items can be categorized into groups. For example, the State attribute can be used to categorize the items into groups of states such as Draft, Ready, Work in progress, and others.
Color by fields	List of fields with which the roadmap items can be categorized by color. For example, the Planning item type attribute can be used to assign a unique color to each group of items belonging to a specific type.
Metric fields	List of fields used as the metrics for the roadmap items. For example, Planned benefit or Actual cost . These values are displayed when you point the mouse cursor on the roadmap item.

Scheduled Script Execution form

Scheduled Jobs are automated pieces of work that can be performed at a specific time or on a recurring schedule.

Migrate Goal, Strategy, and Work item data to the Goal Framework and related Planning item tables

Use the **Migrate Goal, Strategy, and Work item data to the Goal Framework and related Planning item tables** job to migrate the existing goals data to the Goal Framework tables.

Scheduled Script Execution form

Parameter	Description
migrateGoalData	<ul style="list-style-type: none"> Migrates all existing goal records from the Goal [goal] table to the Goal [sn_gf_goal] table. The sys_id remains the same. The corresponding target records will be created in the Target [sn_gf_goal_target] table. Creates the existing relationship between the goal and work items (Project, Demand, Program) in the Goal Relationship [sn_gf_goal_m2m_relationship] table with the first goal (from the order in the glide list) as the primary goal.
migrateStrategyData	Migrates all existing strategy records from the Enterprise Strategy [enterprise_strategy], Business Unit Strategy [business_unit_strategy], and Strategic Objective [strategic_objective] tables to the Strategic Priority [sn_gf_strategy] table. The sys_id remains the same.
migratingGoalStrategyM2Mdata	<p>In Goal Framework, a goal can be mapped to only one strategy. If an existing goal has two strategies mapped to it, a clone of the goal will be created (one as a generic goal and another as a sub-goal) with the same strategy populated for both. And, for the sub-goal, the first goal will be set as the parent goal.</p> <p>For example, consider a scenario where an existing goal (G1) is mapped to five strategies (S1, S2, S3, S4, and S5). Then, four clones of G1 will be created as sub-goals (G2, G3, G4, and G5) and the parent goal is populated as G1. For the parent goal (G1) and the sub-goals (G2, G3, G4, and G5), the Strategy field is populated respectively (S1, S2, S3, S4, and S5).</p> <p>i Note: The name of the cloned sub-goal will be prefixed with <code>Cloned SubGoal1 :</code>, followed by the parent goal name.</p>
migrateStrategyWorkItemRelData	<ul style="list-style-type: none"> Migrates the existing relationship of strategy and work items (Project, Demand, Program) to the Goal Relationship [sn_gf_goal_m2m_relationship] table. If a goal doesn't have an association between the strategy (as current strategy) and the work item in the Goal Relationship [sn_gf_goal_m2m_relationship] table, a dummy goal will be created with a strategy value of current strategy. And, a goal relationship is created

Scheduled Script Execution form (continued)

Parameter	Description
	<p>with the dummy goal and the work item in the Goal Relationship [sn_gf_goal_m2m_relationship] table.</p> <p>Note: The name of the dummy goal will be prefixed with Goal :, followed by the strategy name.</p>

Migrate goal relationships for assigned entities

Use the **Migrate goal relationships for assigned entities** job to populate the fields, **Assigned entity type** and **Assigned entity** on the **Goal form** based on the existing values in the legacy fields, **Business Unit**, **Department**, **Company**, **Portfolio**, and any customized entity field.

Scheduled Script Execution form

Parameter	Description
Migrate goal relationships for assigned entities	<p>(For Strategic Planning users) Populates the fields, Assigned entity type and Assigned entity on the Goal form based on the data in the Goal Relationship [sn_gf_goal_m2m_relationship] table if you've created an m2m relationship with lens entities other than Company, Business Unit, Department, and Portfolio.</p> <p>If users had already created m2m relationship, they may use this script to move those relationships from the m2m table to the goals table to access and manage those goals in the respective portfolio plans.</p> <p>If the goal has only one relationship with an assign entity table type, the Assign entity type and Assign entity fields are populated on the Goal [sn_gf_goal] table based on the Goal Relationship [sn_gf_goal_m2m_relationship] table.</p> <p>If the goal has multiple relationships with an assign entity table type, number of relationships (n) cloned sub-goals will be created and the Assign entity type and Assign entity fields are populated on the Goal [sn_gf_goal] table based on the data in the Goal Relationship [sn_gf_goal_m2m_relationship] table for each cloned sub-goal.</p>

Scheduled Script Execution form to generate labor costs for planning items

Use the Scheduled Script Execution form to enable Generate Labor Costs and Generate Labor Costs For Epic scheduler jobs for your planning items.

Schedule Item form

Field	Description
Name	Name that identifies this scheduled job.
Active	Option that indicates that scheduled job is active and should be executed at the specified date and time.
Run	Time interval to use for running the scheduled job:

Schedule Item form (continued)

Field	Description
	<ul style="list-style-type: none"> • Daily: Runs daily, at a designated time. • Weekly: Runs on a weekly basis, at a designated time and day of the week. • Monthly: Runs on a monthly basis, at a designated time and day of the month. • Periodically: Runs on a designated repeating interval. • Once: Runs for a single occurrence only. • On Demand: Runs immediately on demand. • Business Calendar: Entry Start: Runs on the starting entry dates for the business calendar that you select in the Business Calendar field. A scheduled job runs for the starting date of each of the business entries that you defined for the business calendar. For example, if the business calendar represents a fiscal year, and the starting date of each entry is a fiscal month, the scheduled job runs on the first day of each month. • Business Calendar: Entry End: Runs for the ending date for the business calendar that you select in the Business Calendar field. This selection runs in the same manner as Business Calendar: Entry Start, but for the end dates of the associated business calendar entries. <p>Note: When you select Business Calendar: Entry Start or Business Calendar: Entry End, you can apply an offset factor to schedule the job to run before or after the time span of the selected business calendar. To learn more, see the Offset type and Offset fields.</p> <p>To learn more about creating and using business calendars and defining business calendar entries, see Creating business calendars and Define business calendar entries.</p>
Time zone	<p>Time zone to use with the Time field entry when you specify the time at which the scheduled job should run. Select a time zone entry:</p> <ul style="list-style-type: none"> • -None-: Use the default time zone for the logged-in user who is creating the scheduled job. For example, the scheduled job runs at 04:45 p.m. US/Pacific time if it is the user's assigned time zone, and you enter 16 : 45 into the Time field. • Use System Time Zone: Use the default system time zone that is specified for the instance in which it runs. For example, the scheduled job runs at 10:15 p.m. London time if Europe/London is the default system time zone for the instance, and you enter 22 : 15 in the Time field. • Actual time zone. For example, the scheduled job runs at 1:30 p.m. in the US Eastern time zone if you select US/Eastern, and enter 13 : 30 in the Time field.

Schedule Item form (continued)

Field	Description
Day	<p>Day on which the scheduled job should run.</p> <ul style="list-style-type: none"> • If Run is set to Weekly, select the day of the week. For example, select Wednesday. • If Run is set to Monthly, select the day of the month. For example, select 25 for the 25th day of the month. <p>This field appears only if you select Monthly or Weekly in the Run field.</p>
Repeat Interval	<p>Duration of the repeat interval for each scheduled job execution. Enter the duration in the number of days, hours, or minutes. For example:</p> <ul style="list-style-type: none"> • To run the scheduled job every four days, enter 04 in the Days field. • To run it every 26 hours, enter 26 in the Hours field. • If it should repeat at an interval of 13:30:25, enter 13 in the Hours field, and then enter 30 and 25 in the two unlabeled fields after it. <p>These fields appear only if you select Periodically in the Run field.</p> <p>Note: This setting does not account for Daylight Saving Time changes. For example, if you select a period of one day, the calculation adds 24 hours to the starting time of the job. If the start time is in a Daylight Saving Time (DST) period, the job runs with a one-hour offset when that time zone is not in DST.</p>
Business Calendar	<p>Business calendar entry that you are using to determine the business calendar start or end date for the scheduled job. This field appears only if you select Business Entry: Start Date or Business Entry: End Date in the Time field.</p>
Offset Type	<p>Type of time offset, if any, to apply to the business calendar that you selected for scheduling this job:</p> <ul style="list-style-type: none"> • Past: Apply an offset factor to schedule the job to run before the start of the time span of the selected business calendar. • Future: Apply an offset factor to schedule the job to run after the end of the time span of the selected business calendar. • --None--: Do not apply a time offset when scheduling this job. <p>Adding an offset factor enables you to schedule the job to run before, or after, the formal time span that is defined in the business calendar for the following use cases:</p> <ul style="list-style-type: none"> • Schedule a job at a certain time, outside of the time span for the selected business calendar. • Arrange multiple jobs to run in sequence, around the time span of the selected business calendar.

Schedule Item form (continued)

Field	Description
	The Offset type and Offset fields appear only if you select Business Calendar: Entry Start or Business Calendar: Entry End in the Run field.
Offset	<p>Amount of time offset, expressed in days, hours, minutes, and seconds, to apply to the business calendar that you selected for scheduling this job. For example, if you want to schedule the job to start three days, 14 hours, 10 minutes, and 45 seconds before the business calendar start date, do the following actions:</p> <ul style="list-style-type: none"> • Select Past in the Offset type field. • Enter 3 in the Days field. • Enter 14, 10, and 45 in the Hours field. <p>The Offset Days and Hours fields appear only if you select Business Calendar: Entry Start or Business Calendar: Entry End in the Run field, and Past or Future in the Offset type field.</p>
Time	<p>Time of day at which the scheduled job should run, expressed in hours, minutes, and seconds on a 24-hour clock. The selection that you make in the Time zone field determines the time zone for this entry.</p> <p>Note: Time values are always saved in the ServiceNow AI Platform[®] in UTC time and then translated into the proper time. This translation depends on the selected Time zone and the entry in the Time field.</p> <p>This field appears only if you select Daily, Weekly, or Monthly in the Run field.</p>
Starting	Date and time of the first scheduled job generation. Select the calendar date and time. This field appears only if you select Periodically in the Run field.
Priority	<p>Numerical priority for the scheduled job:</p> <ul style="list-style-type: none"> • Set essential jobs to a priority value below 100. • Set nonessential jobs to a priority above 100. • If 70 percent or more of all scheduled jobs are Overdue, any jobs that are marked with a value above 100 do not run.
Run as	Name of the user who is creating and running the scheduled job. To assign the scheduled job to the system instead of the person creating the scheduled job, create a system or dummy user and add it to this field.
Conditional	Option for enabling the running of the scheduled job if certain conditions are met in the associated script.
Condition	Conditional script that determines if a scheduled job should run. The last expression of the script should evaluate to a Boolean (true/false) value. This text box appears only if you select Use conditions .
Starting	Date and time of the first scheduled job generation. Select the calendar date and time. This field appears only if you select Periodically in the Run field.

Strategic program form

Learn about the fields of the Strategic program form. Use this form to create or edit the details of a Strategic Program in Strategic Planning.

These fields are displayed on the full details page of the strategic program.

Strategic program form

Field	Description
Name	Brief description of the strategic program.
Description	Detailed information of the strategic program. You can refine strategic program description using the Refine records skill, if the Now Assist for SPM application is installed.
State	Current working state of the strategic program.
Initiative	Initiative that this strategic program is associated to.
Owner	User assigned to this strategic program.
Percent complete	Percentage of work completed for this strategic program.
MoSCoW	Priority of this strategic program based on its importance. The available options are: <ul style="list-style-type: none"> • 1 - Must have • 2 - Should have • 3 - Could have • 4 - Won't have
Work notes	Notes to capture the updates and discussions on the strategic program as the work progresses.

Details section of the Strategic program form

Field	Description
Approved start date	Approved start date for this strategic program.
Approved end date	Approved end date for this strategic program.
Actual start date	Actual date on which the work for this strategic program has started.
Actual end date	Actual date on which the work for this strategic program is complete.
Priority	Priority of this strategic program.
Business capabilities	Business capabilities of this strategic program.
Business application	Business application that this strategic program is related to.

Details section of the Strategic program form (continued)

Field	Description
Other impacted business applications	Business applications that this strategic program has an impact on.

Business case section of the Strategic program form

Field	Description
Overview	Business case overview of this strategic program.
Background	Background for this strategic program.
Limitations	Applicable limitations to this strategic program.
Approach	Planned approach to work on this strategic program.
Benefits	Business benefit from this strategic program.

Financials section of the Strategic program form

In this section, capture financial details for this item such as cost, CapEx, OpEx, benefit, ROI, and other estimates.

Field	Description
Planned cost	Planned cost to take up this strategic program.
Planned capEx	Planned capital expenditure for this strategic program.
Planned opEx	Planned operational expenditure for this strategic program.
Planned benefit	Planned benefit from this strategic program.
Actual benefit	Actual benefit achieved from this strategic program.
Actual cost	Actual cost on this strategic program.
Actual capEx	Actual value of capital expenditure for this strategic program.
Actual opEx	Actual value of operational expenditure for this strategic program.
Planned ROI	Planned return of investment for this strategic program.

Table map form

Understand the fields of the table map form. This form is used to create a new custom table map for any record to integrate with Agile Development 2.0, SAFe, and PPM.

table map form

Field	Description
Alignment Integration	Specifies the Alignment integration type. The value is ServiceNow Internal by default.
Execution table	Table in Agile Development 2.0, SAFe, or PPM that needs to be mapped with a table in Strategic Planning. For example, Defect [rm_defect].
Alignment table	Table in Strategic Planning that needs to be mapped with a table in Agile Development 2.0, SAFe, or PPM. For example, Milestone [sn_milestones_milestone].
Milestone table map	This field is relevant only for Project [pm_project] table map. It is a reference to the new Milestone table map (sn_milestones_milestone) for integrating project milestones from Project Portfolio Management workspace to Strategic Planning. For all the other table maps, the milestone table map field is not available.
Execution table filter	Filter condition to retrieve the relevant records from PPM, Agile Development 2.0, or SAFe. For example, Portfolio is HR or Active is True.
Alignment table filter	Filter condition to retrieve the relevant records from Strategic Planning.
Active flag	Ensures that the table map sync is active. This field is checked by default.
Sync attachments	Ensures that the attachments are synced between the applications. This field is checked by default.

Target automation script for benefit plans

Use the predefined Benefit Plans script as a target source to automate the actual value of your targets from the benefit plans of relevant work items.

Use the following predefined benefit plans script to configure the target source for your targets. The script fetches the required data for monetary or non-monetary benefit plans and updates the actual value for the target. You can use this script as is or you can also modify it according to your requirement. You can also create context variables and configure them for this target source (Benefit Plans).

```
result = '';
var benefitPlans = new
  GlideRecord(sn_gfa.GFAdvancedConstants.BENEFIT_PLAN_TABLE);
benefitPlans.addQuery('sys_id', 'IN', benefit_plan);
benefitPlans.query();
```

```

var nonMonetaryBenefitSum = 0;
var monetaryBenefitSum = 0;
var hasMonetary = false;
var hasNonMonetary = false;
while (benefitPlans.next() && !(hasMonetary && hasNonMonetary))
{
    if (!gs.nil(benefitPlans.getValue('currency'))) {
        monetaryBenefitSum +=
        parseInt(benefitPlans.getValue('actual_benefit'));
        hasMonetary = true;
    } else {
        nonMonetaryBenefitSum +=
        parseInt(benefitPlans.getValue('nm_actual_benefit'));
        hasNonMonetary = true;
    }
}

if (hasMonetary && hasNonMonetary)
    gs.addErrorMessage(gs.getMessage('The Benefit Plan list can
    contain either monetary or non-monetary benefit plans.));
else
    result = hasMonetary ? monetaryBenefitSum :
    nonMonetaryBenefitSum;

```

Target Breakdown form

Use the Target Breakdown form to track and measure the progress of the target breakdown and its goal.

Target Breakdown form

Field	Description
Breakdown period	Period of the target breakdown.
Parent breakdown	Year of the target breakdown.
Target	Parent target of the target breakdown.
Status	Status of the target breakdown. The status indicates whether the target breakdown is likely to be completed by the planned end date.
Breakdown	Breakdown interval specified in the parent target.
Planned target	Target value for the target breakdown.
Actual	Actual value for the target breakdown.
Remark	Remark entered for business justification when updating the actuals.

Target form

Use the Target form to track and measure the progress of the goals.

Note:

For Operational Sustainability Workspace and Strategic Planning users, to view the other fields that aren't added to the default view or your custom form view on the form in the workspace, configure the default or custom form layout. For information on how to configure the form layout, see [Configuring the form layout](#).

Target form

Field	Description
Name	Name of the target.
Goal	Name of the associated goal. This field is auto-populated when creating a target from the Targets related list on the Goal form.
Description	Brief description of the target. You can refine target description using the Refine records skill, if the Now Assist for SPM application is installed.
State	State of the target. The state can be Draft, In progress, Approved, Complete, Pending, Achieved, Not Achieved, or Cancelled.
Status	Status of the target. The status indicates whether the target breakdown is likely to be completed by the planned end date.
Progress	Percentage of the target execution that is complete. The value is calculated automatically. If the Type field is set to Maximize , the progress value is calculated using the following formula: $\text{Progress} = (\text{Actual value} - \text{Base value}) / (\text{Target value} - \text{Base value}) \times 100$ If the Type field is set to Minimize , the progress value is calculated using the following formula: $\text{Progress} = (\text{Base value} - \text{Actual value}) / (\text{Base value} - \text{Target value}) \times 100$ For more information on how the progress value is calculated when the weight scale is defined, see Progress value calculation .
Impact on goal	A numerical value that represents the importance of the target relative to the other targets of the goal. If there are any subgoals present, they are also considered for relative weights and consequent progress calculation. By default, the value is (1) Neutral . The available options are: <ul style="list-style-type: none"> • (0) No impact • (1) Neutral • (2) Moderate • (3) High • (4) Very high • (5) Maximum

Target form (continued)

Field	Description
	<p>Note: This field is available only when the sn_gf.weighted_average_enabled system property is set to Yes.</p>
Assigned entity type	Entity type to which the target is assigned. For example, Business Unit, Department, Company, or Portfolio.
Assigned entity	Entity to which the target is assigned.
Owner	Owner of the target. By default, the name of the user creating the target is populated.
Contributors	Users who contributes to the achievement of the target. By default, the contributors of the associated goal are populated.

Duration section of the Target form

Field	Description
Start date	Start date for the target. By default, the start date of the associated goal is populated.
End date	End date for the target. By default, the end date of the associated goal is populated.

Metrics section of the Target form

Field	Description
Unit of measure	Measure type for the specified value. Usage of the measure such as cost, time, and rate. The available measure types are stored in the Units [sn_gf_units] table. Unit of measure defines the type of the target as qualitative or quantitative. The available unit of measures for the quantitative target are # , \$, % , and Days . The available unit of measure for the qualitative target is Yes/No .
Type	<p>Target type that signifies the direction of achievement.</p> <ul style="list-style-type: none"> • Maximize: The direction of the progress is toward the target value from the base value where the base value must be less than the target value. • Minimize: The direction of the progress is toward the target value from the base value where the target value must be less than the base value. • Milestone: Fixed type. Only the qualitative target values are allowed (that are set in the Unit of measure field for the target)

Metrics section of the Target form (continued)

Field	Description
	<p>to capture the achievement of the target. The Milestone option is applicable only for qualitative targets.</p> <p>The Type field becomes read-only with the value populated as Milestone for qualitative targets (when the Unit of measure field is set to a qualitative target value).</p>
Start value	<p>Start value of the target. The start value can also be considered as the present or current value.</p> <p>This field becomes read-only when a value is entered in the Actual value field. Clear the Actual value field to update a value in the Base value field.</p> <p>This field is available when the Type field is set to Maximize or Minimize.</p>
Final target value	<p>Final target value of the target. The target value should be aspirational and should challenge the teams.</p> <p>This field is available when the Type field is set to Maximize or Minimize.</p>
Baseline reference	<p>Past achievement of the target to provide reference for future performance. This value is only for reference purpose and not considered for target progress calculation.</p>
Actuals to date	<p>Actual value of the target at a given time.</p> <p>This field is available when the Type field is set to Maximize or Minimize.</p>
Check-in frequency	<p>Option to specify breakdown intervals for the target and how frequently the owner or contributor should update the actual value of the target. Breaking down the target into smaller periods helps you set a target for smaller periods and focus on the specific breakdown targets. The available options are Daily, Weekly, Monthly, Quarterly, and Yearly. Target breakdowns are automatically created when you set this field to any of the available options other than None. For more details on target breakdowns, see Target breakdowns in Strategic Planning.</p>

Metrics section of the Target form (continued)

Field	Description
	<p>Note: The target breakdowns feature isn't supported for qualitative targets.</p>
Target value distribution	<p>Option to specify the target to be calculated cumulatively or non-cumulatively. The available options are Split equally across the time period (non-cumulative) and Spread linearly across the time period (cumulative).</p> <p>This field is available only when the Check-in frequency field is set to any of the available options other than None.</p>
Remark	Remark entered by the user for business justification when updating the actuals.
Check-in due date	Due date that the owner or contributor of the target must update the actual value of the target to.
Confidential	<p>Option to restrict the access for this target record to the specific users populated in the Allowed groups and Allowed users fields.</p> <p>This field is available when the ESG Management application is installed and the <i>sn_grc.enable_record_confidentiality</i> property is enabled. This field is applicable only when the Classification field in the goal form of the target is populated as Environmental, Social, or Governance. The required role to configure this field is <code>sn_esg.reader</code>.</p> <p>Note: Irrespective of the target record set to confidential or not, the target progress value rolls up to its goal for calculating the progress value of the goal.</p>
Allowed groups	<p>User groups who can access the target record. This field is applicable only for the Operational Sustainability Workspace users.</p> <p>Even though a user group is populated in this field, the users can access the confidential record only if the user group has the <code>sn_esg.reader</code> role.</p> <p>This field is available when the Confidential field is set to true.</p>

Metrics section of the Target form (continued)

Field	Description
Allowed users	<p>Users who can access the target record. This field is applicable only for the Operational Sustainability Workspace users.</p> <p>Even though a user name is populated in this field, the user can access the confidential record only if the user has the sn_esg.reader role.</p> <p>This field is available when the Confidential field is set to true.</p>

Target Automation section of the Target form

Field	Description
Comments	Detailed comments for the target to facilitate collaboration.

Activity section of the Target form

Field	Description
Automate actual value	Option to enable the target automation feature for the target.
Actual value source	<p>Target source table that the data is fetched from to auto-update the actual value of the target on the target's review due date.</p> <p>This field is available when the Automate actual value field is set to true.</p>

Variables section of the Target form

This section appears based on the context variables available in the target source that is selected in the **Actual value source** field.

When you select Actual value source as Benefit Plans ([predefined target automation script for benefit plans](#)), the **Benefit Plan** field appears in this section, from which you can select the required benefit plans for automating the actual value of the target.

Note:

You can use the Benefit Plans custom script only when PPM Standard (Project Portfolio Management) is installed. If you can't find the benefit plan that you want to select, you can find and select the same from Heisenberg UI by navigate to **Enterprise Goal Management > Targets** and opening the Target form.

Target Source form

Use the Target Source form to create and configure a source for your targets so that the actual value of the target is auto-updated.

Target Source form

Field	Description
Name	Name of the target source.
Active	Option to activate this target source for use.
Type	Type of target source. Available options: <ul style="list-style-type: none"> • Assessment/Survey • PA Indicator • Custom script
Advanced	Enables the Custom script option for the target source type Assessment/Survey with the pre-defined script. This field is available when the Type field is set to Assessment/Survey .
Assessment metric type	Assessment metric type for the target source.  Tip: A context variable is automatically created for the target source if the field is populated with a metric type of Evaluation method = Assessment. This field is available when the Type field is set to Assessment/Survey .
Assessment metric category	Assessment metric category for the assessment metric type. This field is available when the Type field is set to Assessment/Survey .
Description	Brief description of the target source.
PA Indicator	PA Indicator for the target source. This field is available when the Type field is set to PA Indicator .
Breakdown	Breakdown for the PA Indicator. This field is available when the Type field is set to PA Indicator .
Custom script	Custom script to fetch the required data from any ServiceNow AI Platform table for the target source. This field is available when the Type field is set to Custom . Or, when the Type field is set to Assessment/Survey and the Advanced field is set to true .

UX List Category form

Learn about the fields of the UX List Category form. Use this form to create additional categories for lists in the Lists menu of Strategic Planning workspaces.

Field	Description
Title	Display name of the category in the workspace.

Field	Description
Application	Application scope. Ensure that this is set to Portfolio Planning .
Order	Order in which this category is displayed in the workspace.
Active	Option to enable the display of this category in the workspace.
Description	Brief description of the category.
Configuration	Configuration that the category is referencing. By default, this field is set to APW List Menu Configuration .

Related topics

UX List form

Learn about the fields of the UX List form. Use this form to create additional lists in the Lists menu of Strategic Planning workspaces.

Field	Description
Title	Display name of the category in the workspace.
Application	Application scope. Ensure that this is set to Portfolio Planning .
Order	Order in which this category is displayed in the workspace.
Category	Category that this list would be displayed under, in the workspace.
Active	Option to enable the display of this category in the workspace.
Table	Source table for the list.
Configuration	Configuration that the category is referencing. By default, this field is set to APW List Menu Configuration .
Conditions	Conditions to filter the records of the source table.
Fixed query	Current fixed query conditions applied to the list.
Columns	Columns of the table that must be displayed in the list in the workspace.

Field	Description
Group by column	Attribute that would be used to group the list of records by.
View	View to determine which columns are displayed in the list in the workspace. If you select a view, the Columns field is disabled.

Related topics

Widget association form

Use these form fields to associate a widget with project table and view it on financials.

Widget association form

Field	Description
Association ID	Record to associate to the widget. Use the lookup icon to identify and select tables.

Widget association form (continued)

Field	Description
	To access the relevant records, select Table [sys_db_objects] from the Table name list and Investment from the Document list.
Association table	Table to associate to the widget. You must select Table [sys_db_objects] from the list.
Widget	Unique name of the widget.
Order	Position of the widget in relation to other widgets in the Financials tab of the Project Workspace. Widgets appear in numeric order with the smallest number listed first.
Display on card	Option to display the widget in the Financials tab.
Include by default	Option to show the widget by default in the Financials tab.

Widget New Record form

Use these form fields to create a new widget for your project administration.

Widget form

Field	Description
Name	Unique name for the widget.
Scripted	Option for indicating the value on the widget is from a code script. By default, this option is selected and is read-only.
Show Label	Option for displaying either the label or the color indicator. If you clear the check box, the Color field appears and you can set the color.
Active	Option for indicating the status of the widget. Only active widgets can be shown on the Financials tab of the Project Workspace.
Parent widget	Widget that is the parent of the current widget. The current widget displays in the Child widgets related list of the selected widget. You can add a maximum of three child widgets for a parent widget.
Formatter required	Option for specifying whether a currency formatter is required for the widget.
Script	Code script that returns a requested metric value that is displayed on the widget. In the script, use the context and filter objects. The context object contains all of the project financial fields, such as capex_costs, opex_costs, and budget_cost.

Widget form (continued)

Field	Description
	<p>The following sample script returns the Estimate At Completion metric value of a project to appear on the widget.</p> <pre> var context = JSON.parse(context); var filter = context.filters; var now_GR = new GlideRecord('pm_project'); gr.addEncodedQuery(filter['pm_project']); gr.query(); if(gr.next()) gr.getValue('forecast_cost'); Collapse </pre>
Short description	Description of the widget.

Enterprise Agile Planning in Strategic Planning

ServiceNow® Enterprise Agile Planning helps streamline communication and collaboration between teams, and drive coordination with diverse teams. Using an intuitive workspace, scale your Agile framework across the organization with flexible work and team structure configurations.

https://player.vimeo.com/video/1059081473?h=9af475911c&badge=0&autoplay=0&player_id=0&app_id=58479

Enterprise Agile Planning (EAP) is available when you install the Strategic Planning application from ServiceNow Store using the SPM Pro license.

Exploring Enterprise Agile Planning

Learn more about Enterprise Agile Planning (EAP) and review the benefits it can provide for your organization.

Enterprise Agile Planning benefits

Scrum leaders, product owners, portfolio managers, solution train engineers, and Agile release train engineers can enhance their Agile framework using the following EAP features:

Benefit	Feature
Manage backlog and prioritize work.	Backlog
Create and plan activities such as creating PIs and Sprints, assigning work to teams, and scheduling this work into team-level iterations.	Backlog
Manage dependencies across teams and Agile release trains (ARTs).	Planning Board
Track activities and visualize progress.	Backlog
Collaborate real-time and asynchronously to discuss resolutions for blockers.	Backlog
Manage work and track progress efficiently for Kanban teams that don't operate in a regular cadence.	Backlog and Planning Board for Kanban-type teams
Get a unified, end-to-end view of your entire work item hierarchy from strategic epics down to individual stories. This way, every team member can instantly see how their work connects to broader organizational work, without navigating multiple screens or running reports.	Work item hierarchy for EAP teams
Flexibly configure team and work hierarchies.	Agile configurations in EAP

Benefit	Feature
Store and manage all kinds of documentation for Agile teams and their work items from a centralized location.	Collaborate using Docs in EAP
Gain insights into the page content by summarizing it or improve content quality by refining it using Now Assist.	Summarize and refine Docs content in EAP using Now Assist for SPM
Save time and reduce manual effort by automatically generate stories for work items using Now Assist.	Generate stories for epics and features using Now Assist for SPM
Define goals at the iteration level or the team level iterations so that teams are aligned with the business value and have greater visibility into the work they contribute toward organizational objectives.	Iteration goals and work item goals in EAP
Analyze team progress, performance, and keep track of key metrics using preconfigured dashboards with data visualizations.	EAP Dashboards

Configuring Enterprise Agile Planning

Activate a configuration, add teams to your Agile structure, and define your planning calendars so that your team can get started with Backlog management and PI planning in EAP.

Agile configurations in EAP

Learn about the different SAFe configurations available in Enterprise Agile Planning (EAP) so that you can work with your admin to update the configuration according to your team's needs.

Default EAP configurations

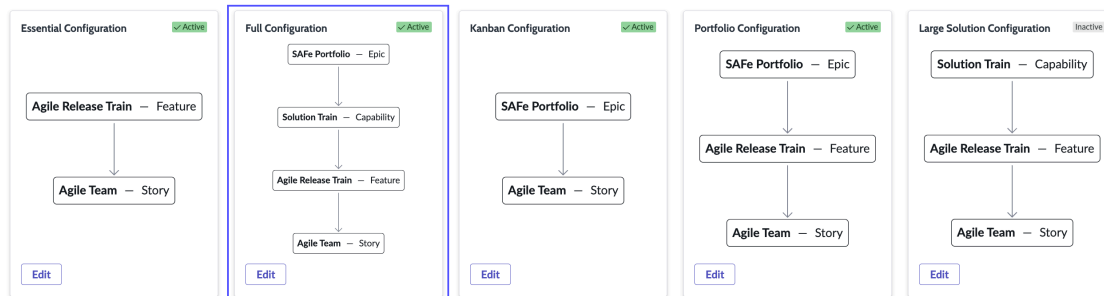

A configuration includes the team level structure and work item types. The following Agile configurations, with the relevant team level, work item type, and planning calendar mapping, are available by default:

- Full Configuration
- Essential Configuration
- Large Solution Configuration
- Portfolio Configuration
- Kanban Configuration

Configurations

Choose a configuration that works for you or add a new configuration for customized team levels and work item types. Activate a configuration and add teams to it. [Learn more.](#)

New configuration

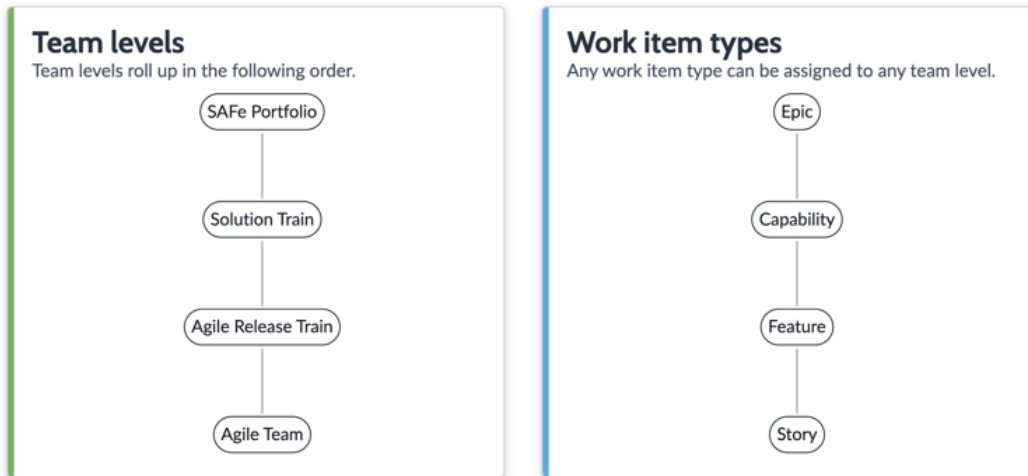

If you installed the Strategic Planning demo data, **Full Configuration** is activated for you. You can choose to activate a different configuration or define a new configuration.

For more information, see [Activate an EAP configuration](#) or [Create or update a configuration in EAP](#).

Default team level and work item hierarchy

Instance global hierarchy

View available team levels, work item types, and how they roll up on the instance level. [Learn more.](#)

- The EAP teams follow the hierarchy of Portfolio > Solution Train > Agile Release Train > Agile Team.
- The work item types follow the hierarchy of Epic > Capability > Feature > Story.

However, while setting up a new configuration or editing an existing configuration, you can assign any work item type to any team level. For example, a Feature can be mapped to the Solution Train level or a Story can be mapped to the ART level. Based on how teams in your organization choose to operate, you can flexibly define or update the EAP configurations.

- All work items types used in EAP extend from the EAP Planning item [sn_align_core_eap_planning_item] table, which in turn extends from the Planning Item [sn_align_core_planning_item] table of Strategic Planning.
- The Story records are saved in the Story [rm_story] table.

You can also create a custom work item type. See [Create a custom work item type in EAP.](#)

Create or update a configuration in EAP

Define your own Agile configuration or update an existing configuration in Enterprise Agile Planning (EAP).

Before you begin

[Install Strategic Planning.](#)

Set the Application Scope of your ServiceNow instance to Strategic Planning.

Role required: sn_apw_advanced.eap_admin

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace.**
2. From the **Settings** menu, select **Enterprise Agile Planning > Configuration.**
3. Choose to create a configuration or update an existing one.

- To create, select **New configuration**.
- To update, select **Edit** from one of the available configurations.

Configurations New configuration

Choose a configuration that works for you or add a new configuration for customized team levels and work item types. Activate a configuration and add teams to it. [Learn more.](#)

4. On the form, fill in or update the fields.

New configuration form

Field	Description
Configuration name	Name to identify the configuration.
State	<p>State of the configuration. The default value for this field is Inactive.</p> <p>Change it to Active to make it available to use for your Agile teams in Enterprise Agile Planning.</p>
Sync with Agile Development	<p>Select this option to sync iterations such as Planning Intervals and Sprints with Agile Development 2.0. For more information, see Integration between EAP and Agile Development 2.0.</p> <p>If your team is of the Kanban type, you can leave this option unselected.</p>

5. Select the work item types to be available within this configuration.
 Only the work item types that you enable here are available for your Agile teams in the Backlog and Planning board.

Work item structure

Level	Work item level	Enabled
1	Epic	<input checked="" type="checkbox"/>
2	Capability	<input checked="" type="checkbox"/>
3	Feature	<input checked="" type="checkbox"/>
4	Story	<input checked="" type="checkbox"/>

6. Select the team levels that you want to have in your configuration.

Based on the team levels that you enable here, you can add only those entities to your Agile structure. For example, if you didn't enable **Solution Train** team level in the configuration, you can't add any solution trains to your Agile structure and you can't plan work for any solution trains from the Backlog or Planning board.

7. Select the default work item type to be available at each team level and its planning calendar.

Scrum teams with a regular cadence

Planning calendars can be set only for Agile Release Trains (ARTs) and Agile Teams and the planning calendar types available by default are **Planning Interval** and **Sprint**. If you want a different calendar, create one. See [Create a planning calendar in EAP](#).

Team level structure

Level	Team level	Enabled	Default work item type	Planning calendar
1	SAFe Portfolio	<input checked="" type="checkbox"/>	Epic	
2	Solution Train	<input type="checkbox"/>		
3	Agile Release Train	<input checked="" type="checkbox"/>	Feature	Planning Interval
4	Agile Team	<input checked="" type="checkbox"/>	Story	Sprint

Kanban teams

If your team operates in a Kanban style, which is a continuous workflow structure without any regular planning interval schedule, you can set the **Planning calendar** fields to **None**.

Team level structure

Level	Team level	Enabled	Default work item type	Planning calendar
1	SAFe Portfolio	<input checked="" type="checkbox"/>	Epic	
2	Solution Train	<input type="checkbox"/>		
3	Agile Release Train	<input checked="" type="checkbox"/>	Feature	None
4	Agile Team	<input checked="" type="checkbox"/>	Story	None

8. Select **Save**.

What to do next

- If you have updated the planning calendar selection for any active configuration that has teams associated with it, update the relevant dashboard configuration too. This action ensures that the metrics displayed for those teams are accurate. See [Updating dashboards for planning calendar changes in EAP](#).
- [Activate an EAP configuration](#)

Define agile structure in EAP

Add organizational entities and teams to an Enterprise Agile Planning (EAP) configuration so that users can plan work for them in the EAP Backlog and Planning Board.

Before you begin

[Activate an EAP configuration.](#)

Ensure that **Application Scope** of your ServiceNow instance is set to **Strategic Planning**.

Role required: sn_apw_advanced.eap_admin

About this task

[https://player.vimeo.com/video/1067467329?](https://player.vimeo.com/video/1067467329?h=d09d828790&badge=0&autoplay=0&player_id=0&app_id=58479)

[h=d09d828790&badge=0&autoplay=0&player_id=0&app_id=58479](https://player.vimeo.com/video/1067467329?h=d09d828790&badge=0&autoplay=0&player_id=0&app_id=58479)

Based on your configuration, add entities such as Portfolios, Solutions Trains, ARTs, and Agile Teams to different team levels of the configuration.

Note:

This task is explained using **Full Configuration** as an example. Use these steps as guidance to add entities and teams to any other configuration in EAP.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace**.
2. From the **Settings** menu, select **Enterprise Agile Planning > Agile structure**.
3. Add a Portfolio by selecting the + icon () next to the configuration name.
 - a. On the SAFe Portfolio form, fill in details such as name, description and parent portfolio.
 - b. Select **Submit**.
 - c. Repeat the action to add as many portfolios as you need.
4. Repeat this action to add other entities to a Portfolio.
 - To a portfolio, add Solution Trains.
 - To a Solution Train, add Agile Release Trains (ART).
 - To an ART, add Agile Teams.

The teams that you add as Agile Teams must be of the type **Agile**. If you need new teams or cannot find any existing teams, contact your admin. For more information, see [Assignment groups in Agile Development 2.0](#).

Activate an EAP configuration

Activate a new or existing configuration in Enterprise Agile Planning (EAP) so that your users can start planning work for their teams.

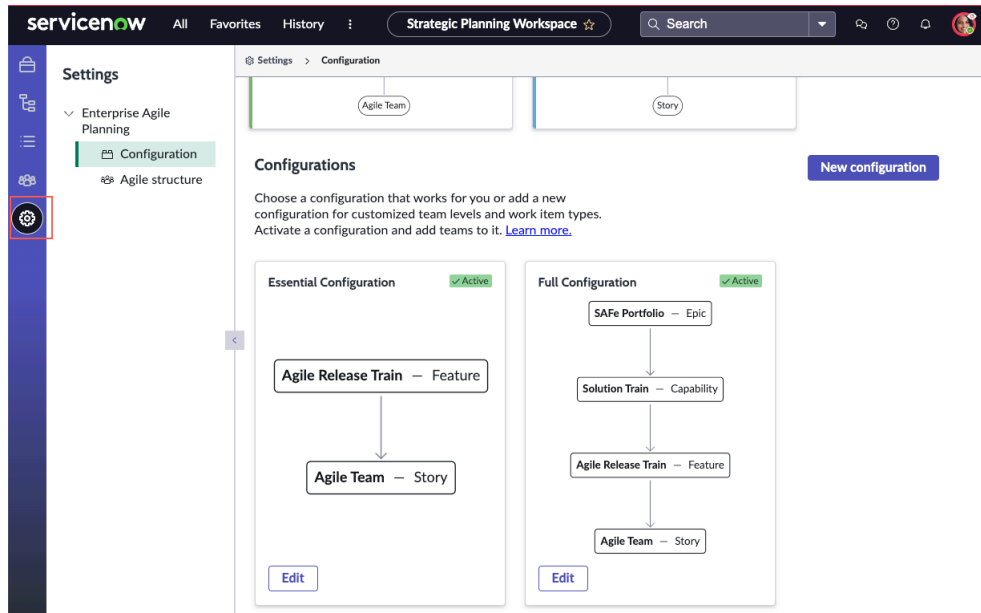

Before you begin

Set the Application Scope of your ServiceNow instance to Strategic Planning.

Role required: sn_apw_advanced.eap_admin

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace**.
2. From the **Settings** menu, select **Enterprise Agile Planning > Configuration**.

3. Select **Edit** from one of the available configurations.
4. On the configuration form, set the **State** field to **Active**.
5. Select **Save**.

What to do next

Add teams to your configuration. See [Define agile structure in EAP](#).

Update epic methodology for an EAP configuration

Change the epic methodology of your Enterprise Agile Planning configuration to SAFe or Scrum based on your Agile workflow.

Before you begin

Set the Application Scope of your ServiceNow instance to Strategic Planning.

Role required: sn_apw_advanced.eap_admin

About this task

By default, the epic methodology for an EAP configuration is set to **SAFe** and all epics created for this configuration are SAFe epics. Based on how your Agile teams prefer to work, you can change the epic methodology to Scrum or retain it as SAFe.

i Note:

The epic methodology for an EAP configuration can be updated only if there are no work items associated with it.

Procedure

1. Navigate to **All > Strategic Planning > Enterprise Agile Planning > EAP Configurations**.
2. From the list of Enterprise agile configurations, locate the one you want to change the methodology for.
3. Double-click the Epic methodology cell to change and update the value.

Name	Active	Work types allowed	Work item view	Epic methodology
Essential Configuration	true	sn_align_core_scrum_epic,sn_align_core_f...	EAP Essential Configuration	SAFe
Full Configuration	true	sn_align_core_capability,sn_align_core_s...	EAP Full Configuration	Scrum
Large Solution Configuration	false	sn_align_core_scrum_epic,sn_align_core_f...	EAP Large Solution Configuration	Scrum
Portfolio Configuration	true	sn_align_core_scrum_epic,sn_align_core_f...	EAP Portfolio Configuration	SAFe

If the Epic methodology column is not displayed in your ServiceNow instance, personalize the column settings using the Update Personalized List icon (⚙️) from the list header.

Configure display of other work item types in EAP Backlog and Planning board

Enable viewing different work item types in the Backlog and Planning board pages for EAP teams such as Portfolio, Solution Train, Agile Release Train, or Agile Team.

Before you begin

Ensure that you set the **Application Scope** in your instance to **Strategic Planning**.

Role required: sn_apw_advanced.eap_admin

About this task

The Planning board for an EAP team shows only those work items that are enabled in its default configuration. For example, for a Solution Train with Full Configuration, the Backlog and Planning board show only Capabilities by default. If your product managers or team members want to switch between viewing other work item types such as Features, Epics, or Stories, you can enable it by updating the team-level configuration details.

This task provides guidance on updating the **Planning work types** or **Backlog work types** fields for your Agile teams in the Enterprise agile configuration details table [sn_apw_advanced_eap_configuration_detail].

Procedure

1. Navigate to **All > Enterprise Agile Planning > EAP Configurations**.
2. Select a configuration that you need to update the work item type selections for.

Name	Active	Work types allowed	Work item view
Essential Configuration	true	sn_align_core_scrum_epic,sn_align_core_f...	EAP Essential Configuration
Full Configuration	true	sn_align_core_capability,sn_align_core_s...	EAP Full Configuration
Kanban Configuration	false	sn_align_core_scrum_epic,rm_story	EAP Kanban Configuration
Large Solution Configuration	false	sn_align_core_scrum_epic,sn_align_core_f...	EAP Large Solution Configuration
Portfolio Configuration	true	sn_align_core_scrum_epic,sn_align_core_f...	EAP Portfolio Configuration

s

3. In the Enterprise agile configuration details related list, select the team level that you want to update.

Configure the display limit of iterations in EAP Backlog

Create a system property to modify the limit on the number of iterations displayed for an EAP Team in its Backlog in Enterprise Agile Planning (EAP).

Before you begin

Ensure the application scope in your instance is set to **Strategic Planning**.

Role required: sn_apw_advanced.eap_admin

About this task

By default, the number of iterations shown in the Backlog page for an EAP Team is 6. If your organization's processes require more iterations to be displayed in the Backlog, create a system property *sn_apw_advanced.eap_backlog_iterations_limit* and update the display limit.

Procedure

1. Navigate to **sys_properties.list**.
2. Select **New**.
3. On the form, fill in the fields.

System property form

Field	Description
Suffix	<i>sn_apw_advanced.eap_backlog_iterations_lim</i>
Type	Integer
Value	Desired maximum number of iterations in the Backlog

For information on the other form fields, see the field description table in [Add a system property](#).

4. Select **Submit**.

Enable Hierarchy tab in EAP

Run a fix script to enable the Hierarchy tab in the Enterprise Agile Planning (EAP) workspace.

Before you begin

Ensure that **Application Scope** of your ServiceNow instance is set to **Strategic Planning**.

Role required: sn_apw_advanced.eap_admin

About this task

By default, the Hierarchy tab is not enabled for use in the EAP workspace.

Running the fix script *Populate parent level data for work item* creates a system property *sn_apw_advanced.enable_hierarchy_view* the value of the property is set to **true**. This action activates the Hierarchy tab and makes it available to all team members alongside the Backlog and Planning board tabs in the workspace.

Procedure

1. Navigate to **System Definition > Fix Scripts**.
2. Search for *Populate parent level data for work item* and open the record.
3. Select **Run Fix Script**.
4. From the Run Fix Script window, select **Proceed**.
The fix script creates the *sn_apw_advanced.enable_hierarchy_view* if it's not already present in your instance and sets its value to **true**.

What to do next

Verify that the value of the *sn_apw_advanced.enable_hierarchy_view* property is set to true.

1. Navigate to **sys_properties.list**
2. Search for *sn_apw_advanced.enable_hierarchy_view* and open the record.
3. Verify if the Value field is set to **true**.

Related topics

[Work item hierarchy for EAP teams](#)

[Modify display limit in Hierarchy tab of EAP](#)

Modify display limit in Hierarchy tab of EAP

Configure an initial load limit system property to control how many work items the Hierarchy tab displays at each portfolio level in the Enterprise Agile Planning (EAP) workspace.

Before you begin

Ensure that **Application Scope** of your ServiceNow instance is set to **Strategic Planning**.

Role required: admin

About this task

By default, the Hierarchy tab loads the top 100 work items at each portfolio level, ordered by global rank. This limit applies across all levels such as Portfolio, Solution Train, Agile Release Train, and Agile Team. When a portfolio contains more than 100 top-level items, team members may not see all relevant work without manually applying filters.

Creating the *sn_apw_advanced.eap_hierarchy_items_limit* system property overrides this default and lets you set a display limit that better matches your organization's portfolio size and performance requirements.

Procedure

1. Navigate to **sys_properties.list**.
2. Select **New**.
3. On the form, fill in the fields.

System property form

Field	Description
Name	sn_apw_advanced.eap_hierarchy_items_limit
Application	Strategic Planning. This value is automatically filed based on your instance's application scope.
Description	A clear description on the purpose and functionality of the property.
Type	Integer
Value	Number of work items to be displayed in the Hierarchy tab of Enterprise Agile Planning.
Read roles	User roles who can view this property.
Write roles	User roles who can edit this property.

4. Select **Submit**.

Create a planning calendar in EAP

Create any additional planning calendars that you use in your organization, such as Release, so that you can plan and track work in the calendar of your choice.

Before you begin

Role required: sn_apw_advanced.eap_admin

About this task

Sprint and Planning Interval are the two planning calendars available by default. To create a different planning calendar, create one from the EAP Settings menu.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace**.
2. From the **Settings** menu, select **Enterprise Agile Planning > Planning calendars**.
3. Select **New**.
4. On the form, fill in the fields.

Enterprise agile calendar form

Field	Description
Name	Unique name for the calendar.
Label	Label of how this calendar shows up in the EAP application.
Plural label	plural form of this calendar's label.
Iteration type	Type that this calendar belongs to. Select one from Planning Interval and Sprint .
Parent	Parent calendar for this calendar.

Field	Description
	For example, Planning Interval is the parent for Sprint.
Description	A brief description of the calendar, its use case, and other details.

5. Select **Save**.

What to do next

Create entries for the newly created calendar. See [Create calendar entries for iterations in EAP](#).

Override planning calendar in EAP

Flexibly change the planning calendar for your Agile Release Train (ART) or Agile Team by overriding the default calendar that is set during configuration of Enterprise Agile Planning.

Before you begin

Set the Application Scope of your ServiceNow instance to Strategic Planning.

Role required: sn_apw_advanced.eap_admin

About this task

The override calendar option EAP settings helps you change the planning calendar that your teams use in EAP. This way, teams can choose their own planning calendars.

The new calendar takes effect after end date of the current calendar. If you want the calendar to take effect sooner or later, you must add or remove iterations to the current calendar.

The new calendar is automatically applied to child teams. For example, if an ART's planning calendar is changed, all child EAP teams associated with this ART must follow the new planning calendar.

This change is applied to only those ARTs that you update.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace**.
2. From the **Settings** menu, select **Agile structure** and navigate to your ART.
3. From the Details tab of your ART, select a value for the **Override planning calendar** field. The planning calendar that you select here must have calendar entries so that iterations can be created for this team and its child teams.

4. Select **Save**.

The page shows the date from which the new calendar will override the existing calendar.

For example, in the screenshot shown here, the new calendar **Planning Interval** is set to override an existing calendar on 2024-07-30. If you choose to go back to using your old calendar:

- Before 2024-07-30, clear the **Override planning calendar** field.
- After 2024-07-30, set your old calendar as the value for the **Override planning calendar** field.

Once the new calendar comes into effect, the child teams will inherit it for all their future iterations. For Agile Teams, the **Override planning calendar** field is read-only and can't be changed independently of its parent ART.

Create calendar entries for iterations in EAP

Define timelines for planning calendars so that the teams can create their own iterations in the Backlog and Planning Board of Enterprise Agile Planning.

Before you begin

Role required: sn_apw_advanced.eap_admin

About this task

This task is explained using Planning Interval (PI) and Sprint as an example. These are the calendars available by default in the workspace and PI is set as the parent for Sprint.

By the end of this task, you define the timeline for a PI and its child Sprints. The EAP teams can then create their own team-specific PIs and Sprints, within this defined timeline, in a naming convention of their choice.

Note:

You can create PIs in a naming convention of your choice, but the Sprint names are predefined. After creating Sprints for the PI, you can manually update their names per your preference.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace**.
2. From the **Settings** menu, select **Enterprise Agile Planning > Planning calendars**.
3. Select **Planning Interval** to create entries for it.
4. Select **New calendar entry**.
5. On the form, fill in the name of the entry, and the start and end dates for the planning interval. For example, you're creating a PI for 01 January 2024 to 31 March 2024.
6. Create calendar entries for the Sprint calendar based on the PI start and end dates.
 - a. Select **Create child entries on Sprint**.
 - b. In the **Number of child entries (Sprint)** field, enter the number of sprints you want to create for this PI.
 - c. In the **Sprint length (days)** field, enter the number of days your Sprint is made of. For the PI that spans from 01 January 2024 to 31 March 2024, you can create 6 Sprints with a length of 14 days each.

Planning Interval 🔍 New calendar entry

New calendar entry ✕

Name *

Start date *
2024-01-01 📅

End date *
2024-03-31 📅

Create child entries on Sprint

Number of child entries (Sprint) Sprint length (days)

Cancel Create

7. Select **Create**.

Result

A PI and its child sprints are created with the timelines that you defined. The EAP teams can create their own PI and Sprint iterations with their own naming convention.

Example:

PI 1 is created for 2024-01-01 to 2024-03-31. Within this PI, child six Sprints are created, each with a length of 14 days.

PI 1

Sprint 6	2024-03-11	2024-03-22	2023-11-24 01:31:48

Under the Digital Banking portfolio, the teams create their own ARTs and Sprints as follows:

- Payment Analytics ART creates two PIs: **Digi bank ST2 ART1 PI1** and **Digi bank ST2 ART1 PI2**.
- The Agile Teams PAT Team 1 and PAT Team 2 create sprints within these PIs:
 - PAT Team 1 creates **PAT 1 Sprint 1, PAT 1 Sprint 2**, and so on.
 - PAT Team 2 creates **PAT 2 Sprint 1, PAT 2 Sprint 2**, and so on.

The teams can use these PIs and Sprints to schedule their work.

Short description

Create a custom team type in EAP

Create a custom team type to include in the Agile configurations for Enterprise Agile Planning.

Before you begin

Set the application scope in your instance to Portfolio Planning Core.

Role required: sn_apw_advanced.eap_admin

Procedure

1. Navigate to **All > System Definition > Tables**.
2. Select **New**.
3. On the form, fill in the fields.

For field information, see [Team type form](#).

4. **Optional:** Deselect the **Create module** check box.
5. Select **Submit**.

Create a custom work item type in EAP

Create a custom work item type to include in the Agile configurations for Enterprise Agile Planning.

Before you begin

Set the application scope in your instance to Portfolio Planning Core.

Role required: sn_apw_advanced.eap_admin

Procedure

1. Navigate to **All > System Definition > Tables**.
2. Select **New**.
3. On the form, fill in the fields.

For field information, see [Work item type form](#).

4. **Optional:** Deselect the **Create module** check box.
5. Select **Submit**.

What to do next

For any new work item type tables, create relevant form views and list views. See [Create or update form views for EAP work items](#) and [Create or update list view for EAP work items](#).

Create or update form views for EAP work items

Create or update form views for work item types so that the fields displayed in the Backlog and Planning board pages of Enterprise Agile Planning suit your team requirements.

Before you begin

Set the application scope in your instance to Portfolio Planning Core.

Role required: sn_apw_advanced.eap_admin

About this task

Configuration for form views of work item tables determines the fields that are displayed in the workspace. For a work item type in EAP, the following are the necessary form views:

- EAP Default: Determines the fields to be displayed in the Full details page.
- EAP Preview: Determines the fields to be displayed in the side panel of the Backlog or Planning board.
- EAP New: Determines the fields to be displayed when creating a work item from the Backlog or Planning board.

Procedure

1. Navigate to **All > System Definition > Tables**.
2. Filter the list of tables by using **EAP planning item** in the Extends table column.
3. Select a work item type that you created.
4. Select the **Layout Form** related link.
5. Create form views or update them.
6. Select **Save**.

What to do next

[Create or update list view for EAP work items](#).

Create or update list view for EAP work items

Create or update EAP List View for work item types so that the columns displayed in the Backlog page of Enterprise Agile Planning suit your team requirements.

Before you begin

Set the application scope in your instance to Portfolio Planning Core.

Role required: sn_apw_advanced.eap_admin

About this task

Configuration for EAP List View determines the columns that are displayed for a work item on the Backlog page of the workspace.

Procedure

1. Navigate to **All > System Definition > Tables**.
2. Filter the list of tables by using **EAP planning item** in the Extends table column.
3. Select a work item type that you created.
4. Select the **Layout List** related link.
5. Create the EAP List View or update its configuration.
6. Select **Save**.

Configuring custom dashboards in EAP

Associate a custom dashboard to your Enterprise Agile Planning configurations to track and measure key metrics for your teams.

Dashboard configuration overview

Get visibility into metrics of your Agile teams such as progress, blockers, team performance trends, and others using dashboards. You can associate any of the default dashboards or create a dashboard with custom queries to view and track specific metrics for your Agile team.

EAP provides the following dashboards for different default configurations:

Default dashboards for EAP configurations

Team level	Full Configuration	Essential Configuration	Large Solution Configuration	Portfolio Configuration	Kanban Configuration
Portfolio	Portfolio Inline Dashboard	NA	NA	Portfolio Inline Dashboard	Kanban Portfolio Dashboard
Solution Train	Solution Train Inline Dashboard	NA	Solution Train Inline Dashboard	NA	NA
Agile Release Train	ART Inline Dashboard	ART Inline Dashboard	NA	NA	NA
Agile Team	<ul style="list-style-type: none"> • Agile Team Inline Dashboard • Agile Team Technical Dashboard 	<ul style="list-style-type: none"> • Agile Team Inline Dashboard • Agile Team Technical Dashboard 	<ul style="list-style-type: none"> • Agile Team Inline Dashboard • Agile Team Technical Dashboard 	<ul style="list-style-type: none"> • Agile Team Inline Dashboard • Agile Team Technical Dashboard 	Kanban Team Dashboard

Default dashboards for EAP configurations (continued)

Team level	Full Configuration	Essential Configuration	Large Solution Configuration	Portfolio Configuration	Kanban Configuration
	<ul style="list-style-type: none"> Agile Team Velocity Inline Dashboard 	<ul style="list-style-type: none"> Agile Team Velocity Inline Dashboard 	<ul style="list-style-type: none"> Agile Team Velocity Inline Dashboard 	<ul style="list-style-type: none"> Agile Team Velocity Inline Dashboard 	

For more information about availability of these default dashboards with different configurations, see [EAP reports and dashboards](#).

i Important:

You can only copy and customize an Inline dashboard.

The following tasks require the admin or EAP admin (sn_apw_advanced.eap_admin) role.

1. [Create or update a configuration in EAP](#).
2. [Create a dashboard in EAP](#).
3. [Add a tag to the EAP dashboard](#).
4. [Associate the EAP read-only role to the dashboard](#).
5. [Add EAP dashboards to an Agile configuration](#).
6. (Optional) [Create implementation of a Scripted Extension Point in EAP](#).

Create a dashboard in EAP

Create a dashboard to track key metrics for your custom Agile configuration by creating a dashboard or duplicating and editing a default EAP dashboard.

Before you begin

[Create or update a configuration in EAP](#)

Role required: sn_apw_advanced.eap_admin

Procedure

1. Navigate to **All > Platform Analytics > Dashboards**.
2. Create a dashboard or modify one of the default dashboards for your Agile configuration.
 - o To create a dashboard, select **Create new dashboard**. For more information, see [Create a dashboard with the in-line editor](#) .
 - o To modify an existing dashboard, create a copy of it so that you can the widgets that you need. For more information, see [Duplicate a Platform Analytics dashboard](#) .

i Note:

The **Duplicate** option is available only for an Inline dashboard.

3. Add visualizations and widgets.

For more information, see step 6 through 10 in [Create a dashboard with the in-line editor](#) .

For information about the default indicators, see [Enterprise Agile Planning Indicators](#).

4. Select Save.

What to do next

[Add a tag to the EAP dashboard.](#)

Add a tag to the EAP dashboard

Add the EAP dashboards tag to identify your dashboard. The dashboards with tag appear in the reference qualified definition list, which helps you to add the dashboard to your configuration detail.

Before you begin

[Create a dashboard in EAP.](#)

Role required: sn_apw_advanced.eap_admin

Procedure

1. Navigate to **par_dashboard.list**.
2. Add the Tags column to your view using the **Update Personalized List** option.
3. For the dashboard you want to add a tag to, enter **EAP Dashboards** in the Tags column. The tag is added to the dashboard.

Name	Active	Certified	Tags
Agile Team Inline Dashboard	true	false	EAP Dashboards X ...
Agile Team Inline Dashboard - Custom	true	false	EAP Dashboards X ...
Agile Team Technical Dashboard	true	false	EAP Dashboards X ...
Agile Team Velocity Inline Dashboard	true	false	EAP Dashboards X ...
Application Services Dashboard	true	false	Add tag...
ART Inline Dashboard	true	false	EAP Dashboards X ...
Essential Configuration - ART Inline Das...	true	false	EAP Dashboards X ...
Full Config - Portfolio Inline Dashboard	true	false	EAP Dashboards X ...
Full Config - Solution Train Inline Dash...	true	false	EAP Dashboards X ...
Gen AI Actions Dashboard	true	false	Add tag...
Hardware and software	true	false	Add tag...

What to do next

[Associate the EAP read-only role to the dashboard.](#)

Associate the EAP read-only role to the dashboard

Associate the EAP read-only (sn_apw_advanced.eap_read_only) role to the dashboard. The users with this role can view and edit the dashboard for the teams in their Agile configuration.

Before you begin

- [Add a tag to the EAP dashboard.](#)
- Set the Application Scope of your ServiceNow instance to Strategic Planning.

Role required: sn_apw_advanced.eap_admin

Procedure

1. Navigate to the PAR Dashboard Permissions [par_dashboard_permission] table.
2. Locate the dashboard that you created.
3. Double-click a cell in the Role column and then enter **sn_apw_advanced.eap_read_only**.
4. Select **Save**.
The role is associated with the dashboard.

What to do next

[Add EAP dashboards to an Agile configuration.](#)

Add EAP dashboards to an Agile configuration

Add dashboards to your Agile configuration so that product managers or scrum team members can access them from the Home tab of their Agile teams in Enterprise Agile Planning workspace.

Before you begin

- [Associate the EAP read-only role to the dashboard.](#)
- Set the Application Scope of your ServiceNow instance to Strategic Planning.

Role required: sn_apw_advanced.eap_admin

About this task

You can add single or multiple dashboards to your Agile configuration. If you are using a default configuration, a default dashboard is automatically associated with your Agile configuration. However, when you create a custom configuration, you must associate a dashboard with the configuration to view the metrics from selected data sources.

Procedure

1. Navigate to **sn_apw_advanced_eap_configuration_detail.list**.
2. Using the column options, group the records by Enterprise agile configuration.
3. For your Agile configuration, select an Agile Team to view its details.
4. From the **Home dashboards** field, add the dashboards that your team needs.
5. Select **Update**.
The selected dashboard or dashboards are added to the **Home** tab of the selected configuration.

Create implementation of a Scripted Extension Point in EAP

Update the default Scripted Extension Point or create a scripted extension point using the default one as a template to filter the data displayed on the EAP dashboard.

Before you begin

[Associate the EAP read-only role to the dashboard.](#)

Role required: sn_apw_advanced.eap_admin

About this task

The **Scripted Extension Points** enable you to create a custom query to filter the information from different data sources. By default, each EAP configuration is associated with an extension point. Each extension point handles all the team types associated with it. You must create an implementation of the scripted extension point every time you create a new EAP configuration.

Important:

Perform this task only for a custom configuration or if you want to customize a default dashboard. This task is not required if you are using any of the default configurations.

Procedure

1. Navigate to **All > Scripted Extension Points**.
2. Search for and open the *EAPDashboardsEncodedQueryProvider* (*sn_apw_advanced.EAPDashboardsEncodedQueryProvider*) scripted extension point.
3. Select the **Create implementation** related link to create an implementation of this scripted extension point.
The new implementation record form is shown.
4. Update the **Name** field of the newly created Implementation to a custom name of your choice. Ensure that you don't include any spaces in the name. For example, rename the implementation to **MyConfigEAPDashboardsEncodedQueryProvider**.
5. Select **Update**.
6. Open the *EAPDashboardsEncodedQueryProvider* (*sn_apw_advanced.EAPDashboardsEncodedQueryProvider*) scripted extension point.
7. From the Implementations related list, click the Class of your newly created implementation record to open it.
8. Update the **Script** field to include the following.
 - In the `getConfigId` function, enter the `sys_id` of your EAP configuration.
 - In the `fetchEncodedQueries` function, enter queries to filter the information for each level of your EAP configuration such as iteration ID, team type, and team ID.

The following is an example script for the default Large Solution Configuration.

```
fetchEncodedQueries: function(teamType, teamId, iterationId)
{
    switch (teamType) {
        case "sn_apw_advanced_agile_team":
            return {
                rm_story: `iteration=${iterationId}`,
                sn_apw_advanced_eap_iteration:
                `sys_id=${iterationId}`,
                sn_gf_goal_m2m_relationship:
                `table_name=sn_apw_advanced_eap_iteration^entity_id=${iterationId}`,
                sn_apw_advanced_eap_iteration_db_view:
                `iter_eap_team=${teamId}`
            };
        case "sn_apw_advanced_agile_release_train":
            return {
```

```

        sn_align_core_feature:
`iteration=${iterationId}`,
        sn_apw_advanced_eap_iteration:
`sys_id=${iterationId}`,
        sn_gf_goal_m2m_relationship:
`table_name=sn_apw_advanced_eap_iteration^entity_id=${iterationId}`,
        sn_apw_advanced_eap_iteration_db_view:
`iter_parent=${iterationId}`
    };
    case "sn_apw_advanced_solution_train":
    return {
        sn_apw_advanced_eap_iteration:
`eap_team.parent=${teamId}`,
        sn_align_core_capability:
`eap_team=${teamId}^OReap_team.parent=${teamId}`
    };
    default:
    return {
        sn_align_core_eap_planning_item:
`iteration=${iterationId}`,
    };
    }
},

getConfigId: function() {
    return "e4e11e0977243110740fefc0aa5a99f9";
},

```

9. Update.

Result

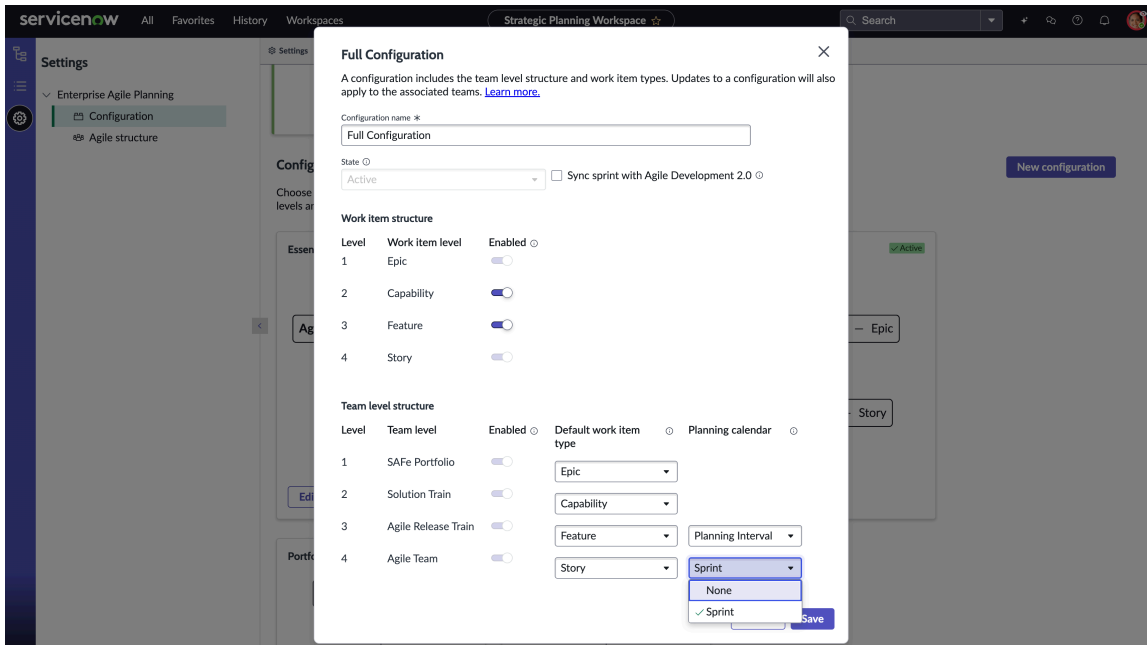

The next time you reload the Home tab for your EAP teams, the dashboard shows the filtered data according to the updates you made to the implementation.

Updating dashboards for planning calendar changes in EAP

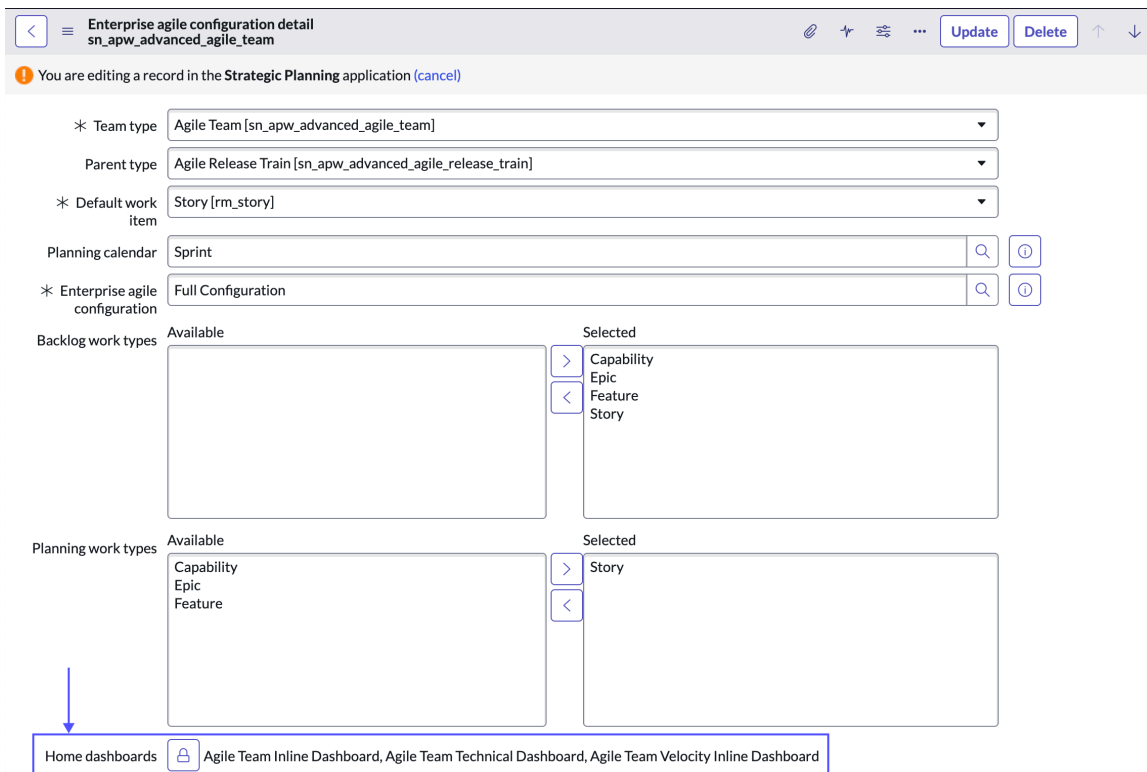

Update the EAP dashboard configuration whenever there are changes to the planning calendar for any currently active configurations in Enterprise Agile Planning.

When your product managers update the planning calendars for an EAP configuration with active teams and work items, the reports on the Home tab for those teams are affected. As an admin, you must update the corresponding dashboards for this EAP configuration. This action ensures that the reports and metrics your teams see are accurate.

For example, the Agile Team's Planning Calendar value is updated from **Sprint** to **None** for a Full Configuration. Then, the Home tab should no longer display sprint-related reports such as Burnup or Burndown charts, Sprint velocity, and others.

To ensure this change, you must configure new dashboards according to the latest planning calendar and replace the existing Agile Team dashboards of the Full Configuration with the new ones.

This procedure involves a series of tasks as listed here:

1. For the latest planning calendar, create a dashboard or duplicate the existing dashboard and add the reports that your teams want to have. See [Create a dashboard in EAP](#).
2. Add a tag to the EAP dashboard.
3. Associate the EAP read-only role to the dashboard.

4. Add the newly created dashboard to the EAP configuration that has the planning calendar change. See [Add EAP dashboards to an Agile configuration](#).
5. (Optional) [Create implementation of a Scripted Extension Point in EAP](#).

Migrating from SAFe to EAP

Learn about the process required For a successful migration of data from Scaled Agile Framework applications to Enterprise Agile Planning.

<https://vimeo.com/showcase/11420435/embed>

Guided Setup to migrate data from SAFe to EAP

Guided Setup provides a sequence of tasks to help you complete the required tasks on your ServiceNow instances. Navigate to **All > Strategic Planning > Enterprise Agile Planning > SAFe Migration Guided Setup**.

The following tasks are included in the guided setup.

SAFe to EAP migration tasks

1. [Verify EAP configuration for migration from SAFe](#).

Based on your existing SAFe configuration, verify that the right EAP configuration is activated in your instance and ensure that the right work types (Epic, Feature, and Story) are allowed for this configuration.

For example, if you are a user of ServiceNow Essential SAFe application, you must activate the Essential Configuration in EAP and ensure that EAP Epic and Feature are allowed as work types.

2. [Verify table, field, and choice mapping between SAFe and EAP](#).

Verify that the tables, columns, choice fields, and custom tables of your SAFe application are correctly mapped to those in EAP.

i Note:

By default, all columns of SAFe Story [sn_safe_story] and SAFe Scrum Task [sn_safe_scrum_task] tables are migrated to the Story [rm_story] and Scrum Task [rm_scrum_task] tables. To include or exclude any columns, see [Modify columns to migrate from SAFe story and SAFe Scrum task tables to EAP](#).

3. [Start migration of SAFe data to EAP](#).

4. Add **Agile Team** as the type for existing SAFe groups. See [Add Agile Team type to SAFe groups for EAP migration](#).

5. Assign the EAP roles sn_apw_advanced.eap_read_only, sn_apw_advanced.eap_user, and sn_apw_advanced.eap_admin to your SAFe groups or to individual users in your teams.

See [Assign a role to a group](#)  or [Assign a role to a user](#) .

Verify EAP configuration for migration from SAFe

Ensure that the right EAP configuration which suits your current SAFe configuration is active and that the required work types are selected.

Before you begin

Check the SAFe application (Essential SAFe or Portfolio SAFe) that is currently in use in your ServiceNow instance.

Role required: sn_apw_advanced.eap_admin

About this task

[https://player.vimeo.com/video/1049452534?](https://player.vimeo.com/video/1049452534?h=ee0299eb63&badge=0&autoplay=0&player_id=0&app_id=58479)

[h=ee0299eb63&badge=0&autoplay=0&player_id=0&app_id=58479](https://player.vimeo.com/video/1049452534?h=ee0299eb63&badge=0&autoplay=0&player_id=0&app_id=58479)

Procedure

1. Navigate to **All > Strategic Planning > Enterprise Agile Planning > EAP Configurations**.
2. Activate the EAP configuration that you need and verify that the required work types are allowed.
 - a. Open the EAP configuration record.
 - b. Enable the **Active** field.
 - For Essential SAFe: Activate Essential Configuration.
 - For Portfolio SAFe: Activate Portfolio Configuration.
 - c. In the **Work types allowed** field, ensure that **Epic**, **Feature**, and **Story** are added to the Selected list.
3. Save the form.

What to do next

[Verify table, field, and choice mapping between SAFe and EAP.](#)

Verify table, field, and choice mapping between SAFe and EAP

Before starting the migration from SAFe, verify that the default mapping of tables, fields, and column choices between Scaled Agile Framework applications and Enterprise Agile Planning is according to your requirements.

Before you begin

[Verify EAP configuration for migration from SAFe.](#)

Role required: sn_apw_advanced.eap_admin

About this task

[https://player.vimeo.com/video/1023012765?](https://player.vimeo.com/video/1023012765?h=9fdc807e46&badge=0&autoplay=0&player_id=0&app_id=58479)

[h=9fdc807e46&badge=0&autoplay=0&player_id=0&app_id=58479](https://player.vimeo.com/video/1023012765?h=9fdc807e46&badge=0&autoplay=0&player_id=0&app_id=58479)

Procedure

1. Navigate to **sn_apw_advanced_safe_eap_mig_setup.list**.
2. Select the **SAFe to EAP migration** record.
3. From the Table Maps related list, verify the table mapping between SAFe and EAP.
4. Open each table mapping record to verify its field mapping.

For example, open the **sn_safe_epic** record to see how the fields of SAFe epic are mapped to EAP epic.

If you need to change a field mapping, open its record and update the fields.

- From the Field Maps related list, open a choice column record to verify the choice mapping of the fields between SAFe and EAP.

For example, in the **sn_safe_epic** table map, open the **status** field map record to see how the choices for the **Status** field are mapped between SAFe and EAP.

If you need to change a field mapping, open its record and update the fields.

What to do next

- For SAFe Story [sn_safe_story] and SAFe Scrum Task [sn_safe_scrum_task] tables, all default columns are migrated to the Story [rm_story] and Scrum Task [rm_scrum_task] tables. To include or exclude any columns, update the *sn_apw_advanced.SAFEEAPStoryTaskMigrationAPI* script include. See [Modify columns to migrate from SAFe story and SAFe Scrum task tables to EAP](#).
- [Start migration of SAFe data to EAP](#).

Modify columns to migrate from SAFe story and SAFe Scrum task tables to EAP

For the SAFe Story and SAFe Scrum task tables, ensure that only the data from the necessary columns is migrated to Enterprise Agile Planning. By updating a Script Include, include or exclude any columns according to your requirements.

Before you begin

[Verify table, field, and choice mapping between SAFe and EAP](#).

Role required: sn_apw_advanced.eap_admin

About this task

https://player.vimeo.com/video/1020716174?h=3cf2011632&badge=0&autoplay=0&player_id=0&app_id=58479

Procedure

- Navigate to **All > System Definition > Script Includes**.
- Search for and open the **sn_apw_advanced.SAFEEAPStoryTaskMigrationAPI** script include.
- Follow the comments in the **Script** field to include or exclude any columns of the SAFe Story and SAFe Scrum Task tables.
- Save the form.

What to do next

[Start migration of SAFe data to EAP](#).

Start migration of SAFe data to EAP

Submit a SAFe-EAP migration request and start the migration of data between the tables of Scaled Agile Framework and Enterprise Agile Planning.

Before you begin

Role required: sn_apw_advanced.eap_admin

About this task

https://player.vimeo.com/video/1049439810?h=256249f11c&badge=0&autoplay=0&player_id=0&app_id=58479

Procedure

1. Navigate to **All > Strategic Planning > Enterprise Agile Planning > SAFe Migration requests**.
2. Select **New**.
3. On the form, fill in the fields.

For field information, see [SAFe-EAP migration request form](#).

Note:

- Planning intervals, formerly known as program increments, can only be migrated one time per team. Planning intervals falling before the selected date in the migration request and those created after the migration is complete, cannot be migrated through the automated migration (Guided Setup).

For example, submit migration requests in the sequence of PI 1 > PI 2 > PI 3 and so on.

- If the composition of a SAFe ART has been changed any time after it is created, it is suggested to migrate only those PIs that have the current composition of the ART.
- For a Portfolio SAFe migration, if a SAFe Epic is associated with SAFe Features but is not linked to any Portfolio, then this Epic will not be migrated by the automated migration.
- Migration can be run multiple times for the same criteria. In such case, any newly created records will be migrated to EAP.
- If changes are made to already migrated SAFe records, these changes will not be synched with the EAP records.

4. Select **Submit**.

Important:

Submitting the request does not trigger the migration. Open the submitted record from the SAFe Migration requests list and select **Start migration**.

Result

Monitor the progress of data migration:

- If the migration is successful, the Import Requests related list shows the details of the data migration such as failed count, insert count, and total count of records moved from SAFe to EAP.
- If the migration encounters any error, the Migration Errors related list shows the details of records that failed to migrate from SAFe to EAP.

What to do next

[Add Agile Team type to SAFe groups for EAP migration](#).

Add Agile Team type to SAFe groups for EAP migration

Add **Agile Team** in the **Type** field of existing SAFe groups so that these teams are visible for your EAP users in the workspace.

Before you begin

Role required: sn_apw_advanced.eap_admin

About this task

https://player.vimeo.com/video/1062964725?h=f69cc5c0e8&badge=0&autoplay=0&player_id=0&app_id=58479

Procedure

1. Navigate to **All > Scaled Agile Framework > SAFe Teams**.
2. Open a SAFe team record.
3. From the Additional actions menu, change the form view to Default view.
4. If the **Type** field is not visible, configure the form layout of the Default view to include it. For information on configuring the form layout, see [Show or hide fields on a form](#).
5. Add the value of **Agile Team** to the **Type** field.

The screenshot shows the ServiceNow interface for editing a SAFe Team record. The breadcrumb trail is 'Group - Employee Portal Features Team'. The form fields are: Name (Employee Portal Features Team), Manager (empty), Hourly rate (\$ 0.00), Description (empty), and Type (SAFe Team, Agile Team). The Type field is expanded to show the selected value 'Agile Team'. There are also fields for Group email and Parent.

6. Repeat steps 3 through 6 for all SAFe teams that are to be migrated to EAP.

Using Enterprise Agile Planning

Manage your team backlog, plan for sprints and iterations, add dependencies, and collaborate using team-level and work item level Docs using Enterprise Agile Planning in the Strategic Planning Workspace.

Use the following areas of Enterprise Agile Planning to plan, track, and collaborate on work across your agile structure.

Manage team backlog

Create, update, and prioritize work items from the Backlog page. Schedule work into Planning Intervals (PIs) or Sprints, make inline edits, and track progress at every level of your agile structure, from Agile Teams up through ARTs, Solution Trains, and Portfolios.

Perform PI planning

Plan work across multiple teams and iterations using the Planning board. Visualize and create dependencies between work items, track capacity, and reschedule work to respond to changing priorities during Big Room Planning events.

View work item hierarchy

Get a unified view of your entire work item hierarchy from high-level epics down to individual stories using the Hierarchy tab. Understand how team-level work contributes to broader organizational objectives without switching between multiple views or reports.

Collaborate using Docs

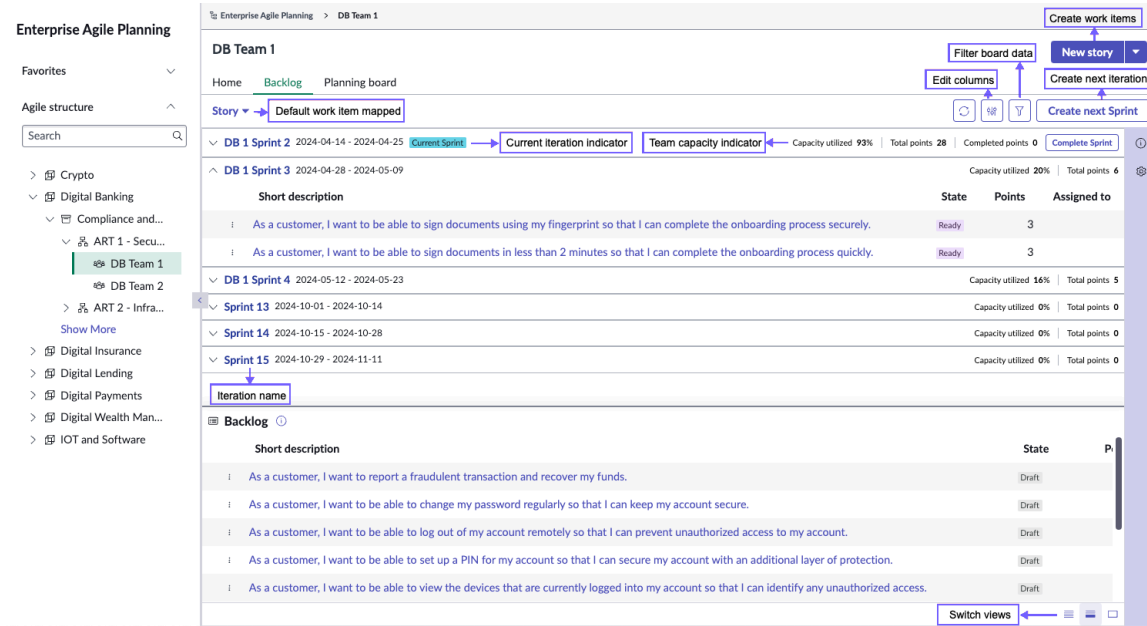

Store and manage documentation for Agile teams and planning items such as Epics, Capabilities, and Features from a centralized location. Use rich-text authoring, real-time collaboration, and Now Assist to draft, refine, and share team knowledge alongside your work.

Track iteration and work item goals

Define functional goals for PIs or sprints to keep teams aligned on what they plan to accomplish. Connect work items to portfolio-level or enterprise goals and OKRs to give teams greater visibility into the value their work delivers.

Manage team backlog in EAP

Using the Backlog page of Enterprise Agile Planning, create, update, and prioritize work items. Additionally, schedule work items into iterations such as Planning Intervals (PI) or Sprints.

The following sections provide a brief overview of EAP Backlog and the actions that you can perform in it.

Layout and default grouping

The layout of Backlog across different team levels such as Agile Team, Agile Release Train (ART), Solution Train, or Portfolio, remains the same. The change is in the way that the work items are grouped. As you go bottom to top in an Agile structure, the work assigned to the teams is grouped as follows:

i Important:

The team hierarchy and the iterations within teams are based on your EAP configuration. The following information applies to the default Full Configuration.

- Agile Team: Grouped by Sprints.
- ART: Grouped by Planning Intervals.
- Solution Train: Grouped by child ARTs.
- Portfolio: Grouped by child Solution Trains.

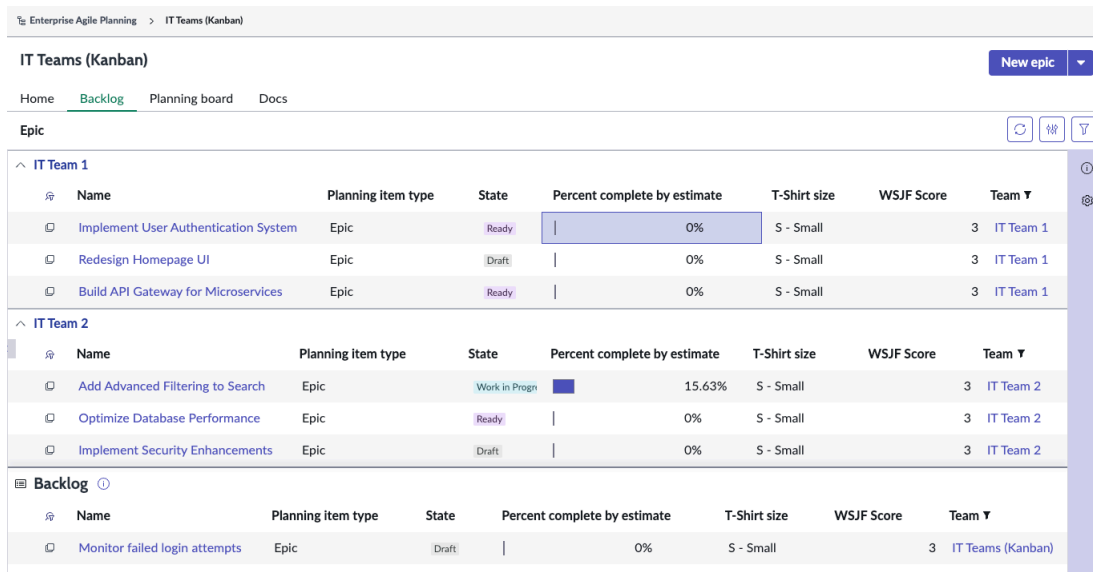

Any work item that doesn't fall into any of these groups is displayed in the Backlog section.

By default, the number of iterations that the Backlog page displays is set to 6. You can work with your admin to modify this number using a system property. For more information, see [Configure the display limit of iterations in EAP Backlog](#).

Layout and default grouping for Kanban teams

The Backlog for teams using the Kanban configuration is grouped as follows:

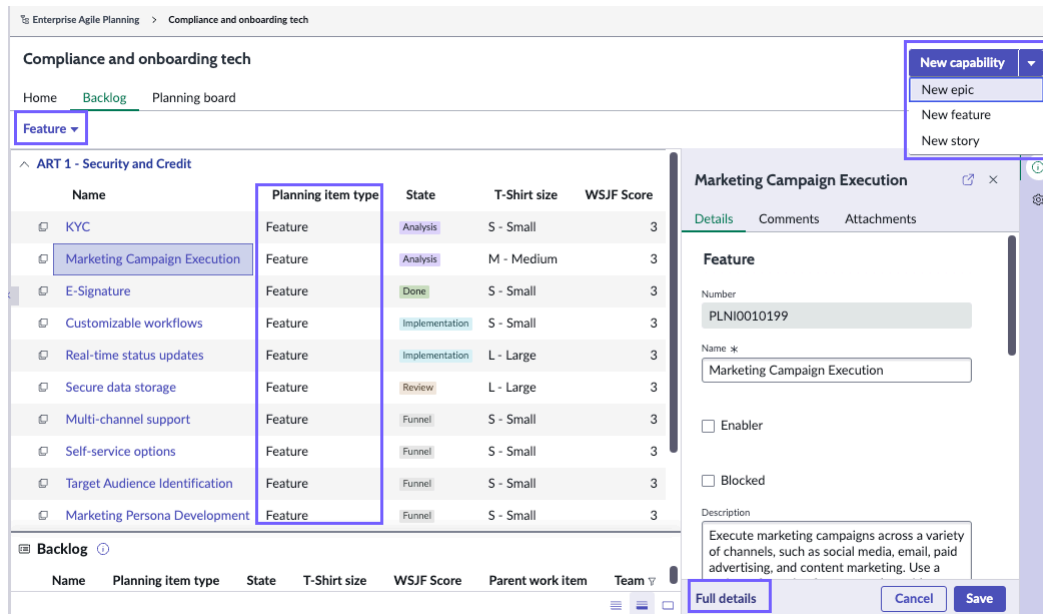

- **Portfolio:** Assigned work items are grouped by child teams. Any work item that is not assigned to the child teams is displayed in the Backlog section.

- **Team:** Assigned work is displayed in a list.

Default work items

The work items shown in Backlog are of the Type that is mapped for this team in the configuration. As you move up in your Agile structure, the level of the work assigned also increases. At an Agile Team level, you see information of stories. As you move up through ARTs and Portfolios, you see information of Features, Capabilities, and Epics. However, at any level, you can change the type of the work items displayed.

For example, in the screenshot, **Capability** is the default item type mapped to **Compliance and onboarding tech** Solution Train based on its configuration. You can change this selection to see work of other types assigned to this team. When this selection is changed to **Feature**, you

can see all the features assigned to this ART. Similarly, you can choose to create and assign a different type of work item for this Solution Train, even though its default item type is **Capability**.

View the details of any work item in the side panel by selecting its primary column. To access all the fields and related lists of the work item, select **Full details** from the side panel.

Note:

The Backlog page for an EAP team shows only those work items that are enabled in its default configuration. For example, for an ART with Full Configuration, the Backlog might show only Features by default. If you want to view other work item types such as Capabilities, Epics, or Stories, work with your admin to update the required EAP configuration details. For more information, see [Configure display of other work item types in EAP Backlog and Planning board](#).

Column-level filtering of data

Quickly find the work items that you need by using column-level filters for the data on your EAP Backlog. Using the Column filtering option (🔍), you can filter data on any column displayed on the **Backlog** tab, which is of the type choice, string, or reference.

The screenshot shows the 'DB Team 1' backlog page. At the top, there are navigation tabs for 'Home', 'Backlog', 'Planning board', and 'Docs'. Below the team name, there are icons for refresh, sort, and filter, along with a 'Create next Sprint' button. The main table displays work items for 'DB 1 Sprint 1' (2024-11-01 - 2024-11-12, Current Sprint). Summary statistics show 'Capacity utilized 60%', 'Total points 18', and 'Completed points 3'. The table columns are: Short description (with a filter 'report'), State, Percent complete, Points, and Assigned to. The first item is 'As a user I want to be able to create and edit reports' (Complete, 100%, 3 points, assigned to Milan Diaz). Other items include 'As a fraud analyst, I want to see a report that shows me the number of fraudulent claims d' (Work in progress, 0%, 5 points, assigned to Violet Monroe), 'As a compliance officer, I want to see a report that shows me the number of policies that a' (Work in progress, 0%, 3 points, assigned to Milan Diaz), 'As a risk analyst, I want to see a report that shows me the number of policies that are high' (Ready, 0%, 5 points, assigned to Arlo Gardner), 'As a finance manager, I want to see a report that shows me the revenue generated, the ex' (Ready, 0%, 2 points, assigned to Legend Torres), and 'As a data scientist, I want to see a report that shows me the correlation between different' (Ready, 0%, assigned to Carmelo Mora).

Actions within the Backlog

Within the Backlog, you can perform the following actions:

- Create iterations such as PIs or Sprints for your teams.
- Add work to the team's Backlog.
- Schedule work from Backlog into different iterations.
- Make in-line edits to update information of work such as Status, Assigned to, or Story points.
- Reorder planning items (in a section) to prioritize them.

However, reordering is not possible when the planning items are grouped. For example you grouped the items in the Backlog section by State, you won't be able to reorder the items unless the grouping is removed.

- Start and complete those iterations.
- Move incomplete work to the Backlog.
- Filter the data that's displayed.
- Choose the columns to be displayed.
- Open a work item in a new tab.

Use the following tasks to start creating and scheduling work for teams in EAP.

Create next PI and Sprint from EAP Backlog

Create iterations of Planning Intervals (PI) and Sprints so that teams can start prioritizing and scheduling their work from the Backlog in Enterprise Agile Planning (EAP).

Before you begin

Role required: sn_apw_advanced.eap_user

About this task

From the Backlog, create the next iteration for Agile Release Trains (ARTs) and Teams. Based on your EAP configuration of teams and planning calendars, you can create PIs, Sprints, or the iteration of any other calendar that you created.

This task is explained using the default Full Configuration as an example, where ARTs are mapped to Planning Intervals and Agile Teams are mapped to Sprints.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Enterprise Agile Planning**.
2. From the Agile structure section of the left navigation panel, choose your ART.
3. Create Planning Intervals for ART.
 - a. From the Backlog tab of a selected ART, select **Create next Planning Interval**.
 - b. In the confirmation dialog box, select **Create**.

A PI is created for the selected ART. The start and end dates are based on the next available business calendar span that was created by your system admin.

The default name for the PI is **<calendar name> <n+1>** where:

- **calendar name** is the name of the business calendar entries that your system admin has created.
- **n** is the number of the last created PI.

For example, if the name of your business calendar entry is set as **Greenbacks PI** and Greenbacks PI 1 and Greenbacks PI 2 exist already, then the new PI is named **Greenbacks PI 3**.

After the PI is created, you can edit this name according to your naming convention. See [Update iteration details in EAP](#).

For more information on how a system admin can define the calendar entries and their dates, see [Create calendar entries for iterations in EAP](#).

i Note:

If you have Agile Teams added to this ART, Sprints are automatically created for them too. The number of Sprints created for the teams are based on the child calendar spans that match with the PI dates. If you add Agile Teams to this ART later, Sprints aren't added to them automatically. In that case, proceed to step 4.

4. Create Sprints for Agile Teams.
 - a. From the left navigation panel, select an Agile Team.
 - b. From the Backlog tab of this team, select **Create next Sprint**.
 - c. Confirm by selecting **Create**.

The default name and dates for this Sprint are according to the business calendar entry defined by the system admin.

After the Sprint is created, you can edit this name according to your naming convention. See [Update iteration details in EAP](#).

What to do next

- [Update iteration details in EAP](#).
- [Schedule work items into iterations in EAP Backlog](#).

Update iteration details in EAP

Edit details of a PI or a Sprint to update details such as name, team capacity, committed points.

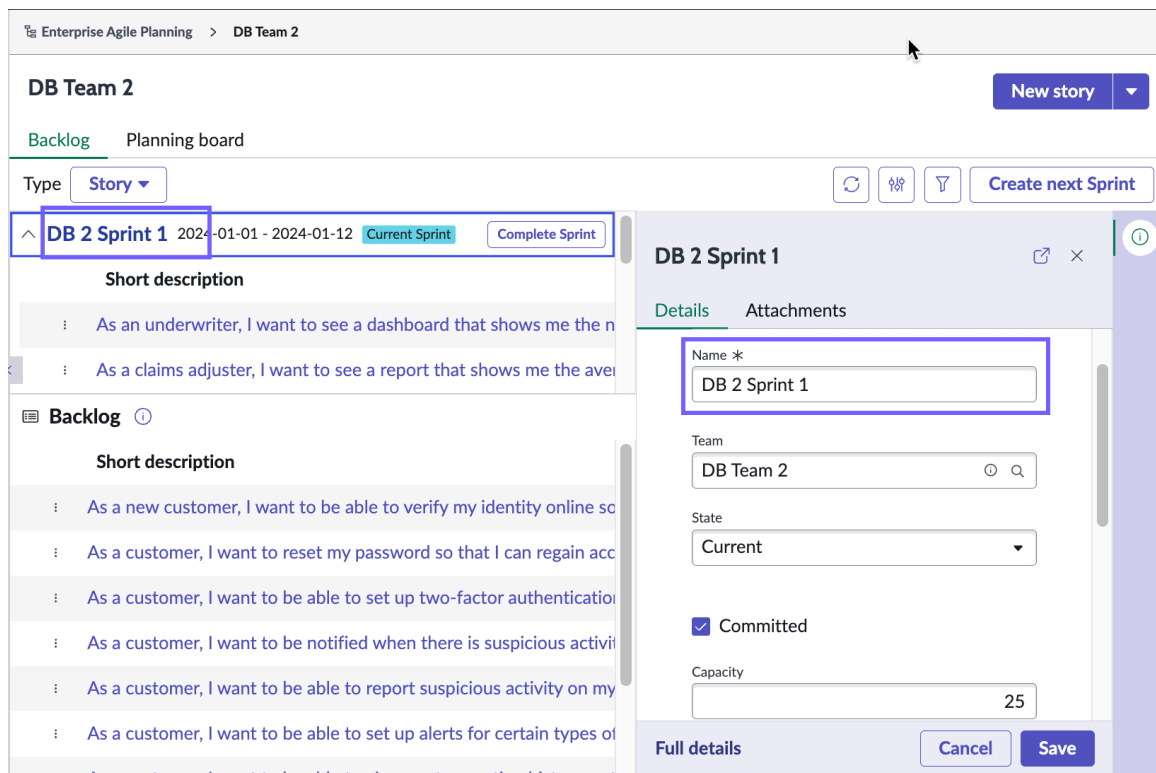

Before you begin

[Create next PI and Sprint from EAP Backlog](#).

Role required: sn_apw_advanced.eap_user

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Enterprise Agile Planning**.
2. From the Agile structure section of the left navigation panel, choose your EAP team.
3. From the Backlog tab of an ART or an Agile Team, select the name of the iteration to open its details in the side panel.
4. From the side panel, edit details such as Name, Capacity, Committed points and others.

5. Save changes by selecting **Save**.

Related topics

[Schedule work items into iterations in EAP Backlog](#)

Create work items for teams in EAP Backlog

Create stories, features, epics, or capabilities for teams to add work to their backlog in Enterprise Agile Planning.

Before you begin

Role required: sn_apw_advanced.eap_user

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Enterprise Agile Planning**.
2. From the Agile structure section of the left navigation panel, choose your EAP team.
3. From the page header, select **New <work item type>**.

The item type that you see on the screen depends on the configuration for your EAP team. Alternatively, you can choose a different item type from the More options menu.

4. On the form, fill in the fields.

The fields that you see on the form vary based on the type of work item that you selected.

5. Select **Submit**.

Result

The new work item is added to one of the sections of the page, based on the values that you fill in on the form.

You can open the work item from the success message to add more information.

What to do next

- Refine the description with Now Assist. See [Improve efficiency and quality using refine records skill with Now Assist Context Menu](#).

This feature requires activating the Write planning item skill of Now Assist for SPM. For more information, see .

- [Schedule work items into iterations in EAP Backlog](#).

Breakdown work from parent work item into child items in EAP

Streamline breaking down work by creating child work items directly from the parent record page in Enterprise Agile Planning workspace.

Before you begin

Role required: sn_apw_advanced.eap_user

About this task

https://player.vimeo.com/video/1079893987?h=7eb7c4b082&badge=0&autoplay=0&player_id=0&app_id=58479

From the full details page of a work item, you can create all types of associated child work items. For example, based on the EAP configuration, the full details page of an Epic shows separate tabs for its child work items (Capabilities, Features, or Stories) and the full details page of a Capability shows separate tabs for Features and Stories.

Use the **New** button in each of these related tabs to breakdown work from the parent work item record.

Note:

Views for all default EAP configurations include child item-specific related lists to enable work breakdown. For any new or custom configuration, work with your EAP admin to include these related lists in the EAP views for your configuration.

This task provides guidance to create child items directly from the parent work item record page, taking the example of creating a Capability record as the child item for an Epic.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Enterprise Agile Planning**.
2. From the Agile structure section of the left navigation panel, choose your EAP team.
3. From the Backlog or Planning board, open the work item that you want to create the child items for and select **Full details**.
4. Select the related tab in which you want to create a child item.
Any child items that are already associated are shown in the tabs. The Digital Onboarding Epic already has 6 Capabilities, 1 Feature, and 2 Stories associated to it.
5. Select **New** to create a child item.
For example, to add a new Capability to the Digital Onboarding Epic, select **New** from the Capabilities tab.
An empty form to fill out the details of the child item opens. The Parent work item field is automatically set to the parent record, which is in this case **Digital Onboarding**.
6. Fill in the details for the child work item and select **Save**.
The full details page of the newly created child work item is opened.
7. Navigate back to the parent work item record page using the breadcrumb navigation.

What to do next

- Refine the description with Now Assist. See [Improve efficiency and quality using refine records skill with Now Assist Context Menu](#).

This feature requires activating the Write planning item skill of Now Assist for SPM. For more information, see .

- [Schedule work items into iterations in EAP Backlog](#).

Create stories for work items in EAP

Create stories directly from a work item's form. Create them manually or save time by generating them using Now Assist in the Enterprise Agile Planning (EAP) workspace.

Before you begin

Role required: sn_apw_advanced.eap_user

About this task

This task details the procedure of creating stories for work items such as Epic, Capability, and Feature and uses the example of creating stories for an Epic. To create other child work items, see [Breakdown work from parent work item into child items in EAP](#).

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Enterprise Agile Planning**.
2. From the Agile structure section of the navigation panel, choose your EAP team.

3. From the Backlog or Planning board pages, select a work item for which you want to create stories.
In this example, an epic is selected and its details are displayed in the side panel.
4. From the side panel, select **Full details**.
5. From the work item details page, create stories manually or with Now Assist.
The newly created stories are listed in the Stories tab of the work item details page.

6. You can open a story to update further details or delete them.
From the full details page of a story, you can perform the following actions:
 - Refine the description with Now Assist. See [Improve efficiency and quality using refine records skill with Now Assist Context Menu](#).

This feature requires activating the Write planning item skill of Now Assist for SPM. For more information, see .

 - Update other fields of the story.
 - Add dependencies or scrum tasks to the story.

- Add any files as attachments to the story.
- Delete the story by selecting **Delete** from the More Actions menu on the header.

Generate acceptance criteria for stories using Now Assist for Strategic Portfolio Management (SPM)

Create clear, comprehensive, and testable acceptance criteria for user stories without writing them manually in Enterprise Agile Planning (EAP). Review and refine suggested options to ensure they meet your requirements.

Before you begin

i Important:

This Now Assist skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see [Now Assist skills, agents, and agentic workflows on by default](#).

For more information, see [Configure Now Assist Admin features](#).

Role required: sn_apw_advanced.eap_user

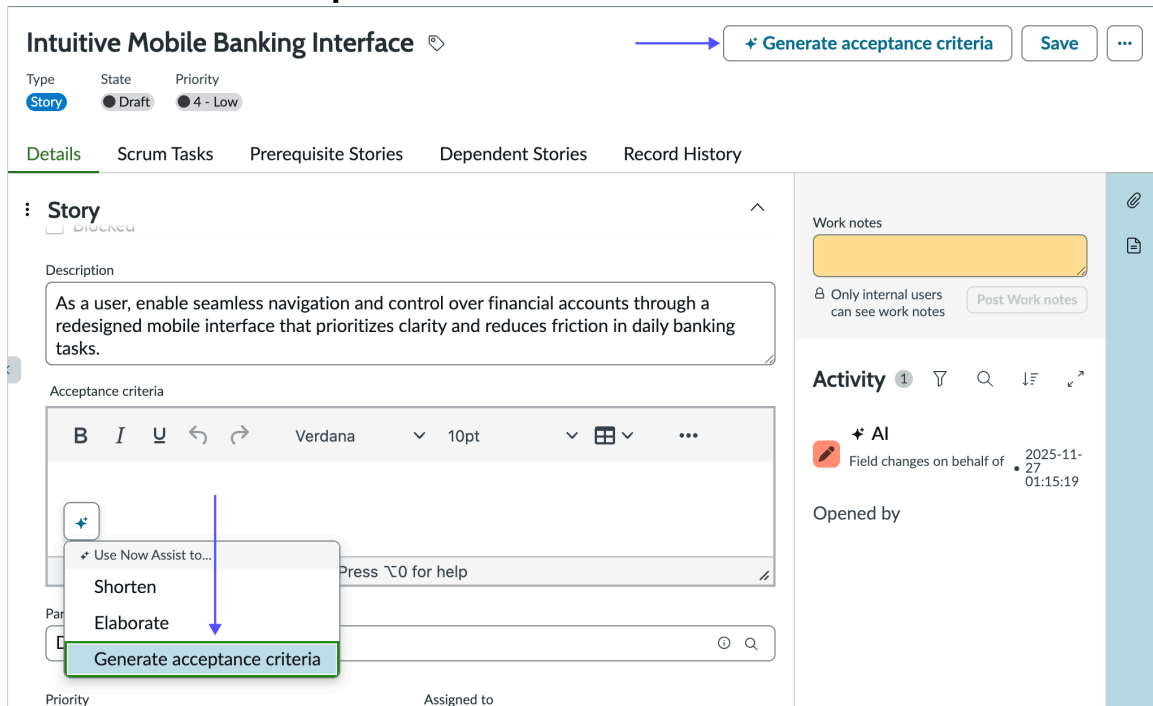

About this task

For an EAP story, you can generate acceptance criteria by selecting **Generate acceptance criteria** from the story header or using the Now Assist context menu in the Acceptance criteria field.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace**.
2. Navigate to your story using one of the following options from the left navigation menu:
 - **Enterprise Agile Planning:** Select a team from the Agile structure and navigate to your story.
 - **Lists:** Select **Planning items > Stories** and navigate to your story.

3. Ensure that the story record is open in the Full details page.
4. Generate acceptance criteria for the story using one of the following options:
 - o From the story form header: Select **Generate acceptance criteria**.
 - o From the Acceptance criteria field:
 - a. Place your mouse cursor in the field.
 - b. Select the **Refine with Now Assist** menu (👉).
 - c. Select **Generate acceptance criteria**.

5. Review the generated acceptance criteria.
6. You can choose to further refine the generated content using the Now Assist context menu (👉) or generate a new criteria.
7. Save the Story form.

Create a copy of work items in EAP Backlog

For creating work items with details similar to an existing item, save time and effort by creating a copy of the existing item.

Before you begin

[Create work items for teams in EAP Backlog.](#)

Role required: sn_apw_advanced.eap_user

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Enterprise Agile Planning**.
2. From the Agile structure section of the left navigation panel, choose your EAP team.
3. From the Backlog page, locate the item that you want to create a copy of.

4. Select the more icon () and select **Create copy**.

Alternatively, you can right-click the work item to view the options.

Result

A copy of the selected work item is created, with the information in the required fields copied over. This new work item is added to the same section as the original. For example, if you created a copy of a Story from the Backlog section, then the copied story is added to the Backlog section.

What to do next

From the full details page of the work item, you can refine the description with Now Assist. See [Improve efficiency and quality using refine records skill with Now Assist Context Menu](#). This feature requires activating the Write planning item skill of Now Assist for SPM. For more information, see [Configure Now Assist Admin features](#).

[Manage team backlog in EAP](#)

[Schedule work items into iterations in EAP Backlog](#)

Schedule work items into iterations in EAP Backlog

Perform backlog grooming and schedule work from the team's backlog for the upcoming iteration Enterprise Agile Planning.

Before you begin

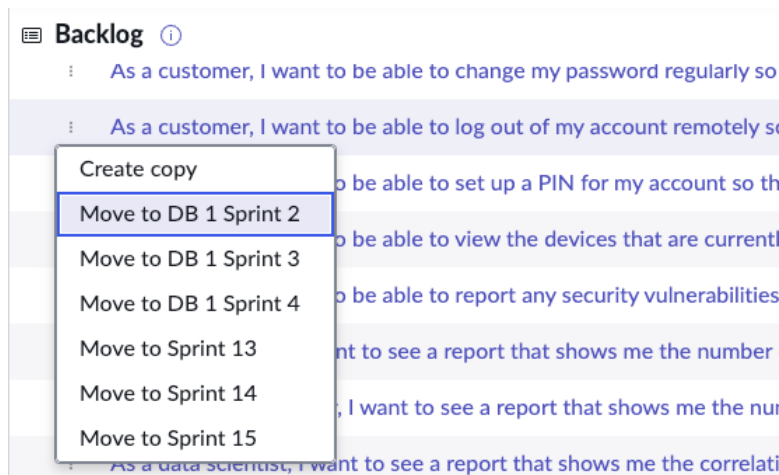

- [Create next PI and Sprint from EAP Backlog](#).
- [Create work items for teams in EAP Backlog](#).

Role required: sn_apw_advanced.eap_user

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Enterprise Agile Planning**.
2. From the Agile structure section of the left navigation panel, choose your EAP team.
3. Move an item from the Backlog section to an iteration.
 - a. From the Backlog section, locate the item that you want to schedule into an iteration. During backlog grooming sessions, you can estimate story points and add them in-line to this work item.
 - b. Select the more icon () and choose to move the story to any existing iteration.

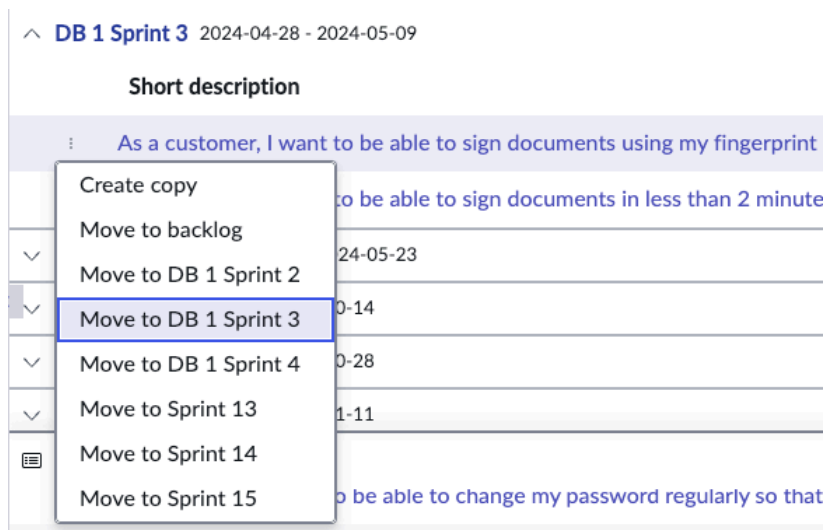

Alternatively, you can right-click the work item to view these options.

4. Move an item across iterations.

- a. From the iterations, locate the item that you want to reschedule.
- b. Select the more icon (⋮) and choose the iteration that you want to reschedule into or move the item to the backlog.

Alternatively, you can right-click the work item to view these options.

5. Repeat the process to complete scheduling work for the next iteration for the team.

What to do next

- [Plan work for an ART in EAP.](#)
- [Start or complete iterations in EAP.](#)
- [Analyze team performance and progress using dashboards.](#)

Start or complete iterations in EAP

Start an iteration of a Sprint or PI so that your team can start working and tracking progress of work, and after your team finishes the assigned work, mark this iteration as complete, directly from the Backlog in Enterprise Agile Planning.

Before you begin

Role required: sn_cwm.cwm_user

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Enterprise Agile Planning**.
2. From the Agile structure section of the left navigation panel, choose your EAP team.
3. Complete an iteration.
 - a. From the Backlog page, locate the iteration that you want to complete and select **Complete <iteration>**.
 - For a Sprint, the option is displayed as **Complete Sprint**.
 - For a PI, the option is displayed as **Complete Planning Interval**.

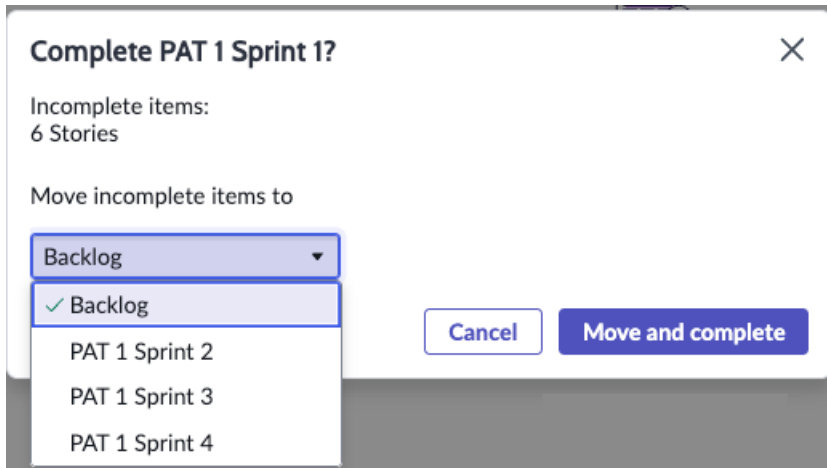

Note:

Before marking a Planning Interval as Complete, all its associated child Sprints must be complete.

The screenshot shows the ServiceNow Backlog interface. At the top, there are tabs for 'Backlog' and 'Planning board'. Below the tabs, there is a 'Type' dropdown menu set to 'Story'. To the right of the dropdown are three icons: a refresh icon, a filter icon, and a funnel icon. Further right is a button labeled 'Create next Sprint'. Below this is a header for the current iteration: 'PAT 1 Sprint 1' with dates '2024-01-01 - 2024-01-12' and a 'Current Sprint' label. A red box highlights a button labeled 'Complete Sprint' next to the iteration header. Below the iteration header is a 'Short description' section containing three items, each with a vertical ellipsis icon on the left and a blue text description: 'Copy of As a customer, I want to be able to change my password regularly so that I can keep my', 'Copy of As a customer, I want to be able to close my account if I no longer need it.', and 'As a customer, I want to be able to view the devices that are currently logged into my account s'.

- b. Depending on the amount of work that's left incomplete for the current iteration, confirm its completion.

- If there are incomplete work items in the current iteration, you're asked to move the incomplete items to the Backlog or any future iteration.

- If all assigned work is complete, then the iteration is automatically marked complete without any confirmation from you.

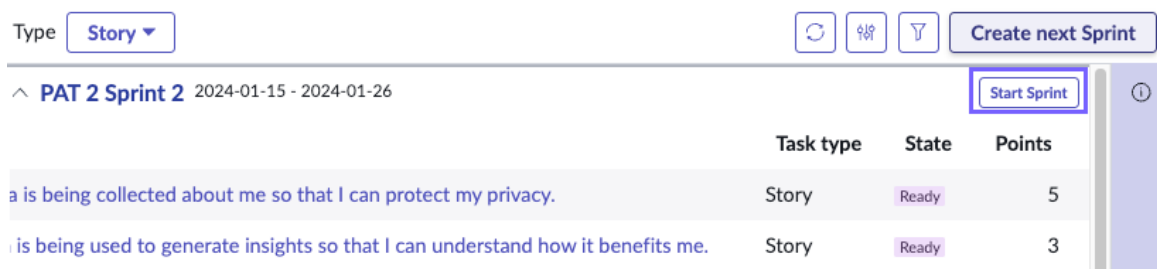

Note:

When you complete any iteration, it is no longer displayed in the Backlog page, and all the work items which are completed in that iteration are no longer available to view from the Backlog page either.

4. Start an iteration.

a. From the Backlog page, locate the iteration that you want to start and select **Start <iteration>**.

- For a Sprint, the option is displayed as **Start Sprint**.
- For a PI, the option is displayed as **Start Planning Interval**.

Add or remove teams from Favorites in EAP

Add the EAP teams that you frequently work with to Favorites so that you can save time navigating to them in the workspace without searching for them.

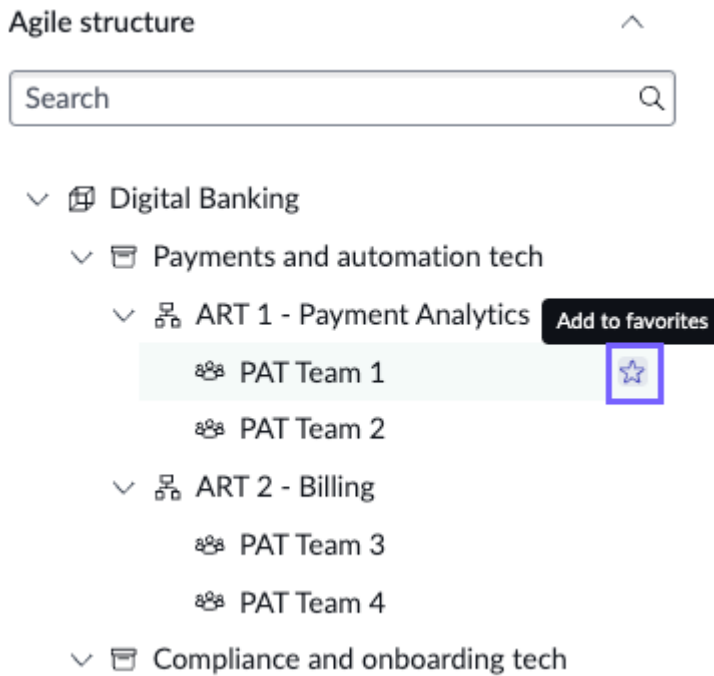

Before you begin

[Define agile structure in EAP.](#)

Role required: sn_apw_advanced.eap_user

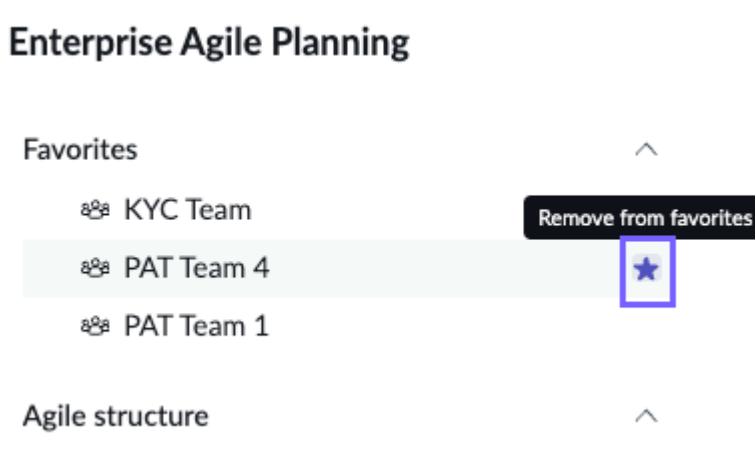

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Enterprise Agile Planning.**
2. Add a team to Favorites.
 - a. From the left navigation panel, locate the team that you want to favorite.
 - b. Select the Add to favorites icon (☆) next to the team name.

The team is added to the Favorites section of the navigation panel.

3. Remove a team from Favorites.
 - a. From the Favorites section, locate the team that you want to remove.
 - b. Select the Remove from favorites icon (★) next to the team name.

The team is removed from the Favorites section.

Personalize and filter data in EAP Backlog

View the information that is most relevant to you and your team on the Backlog tab by choosing the columns to be displayed and applying filters to narrow down the data on the page.

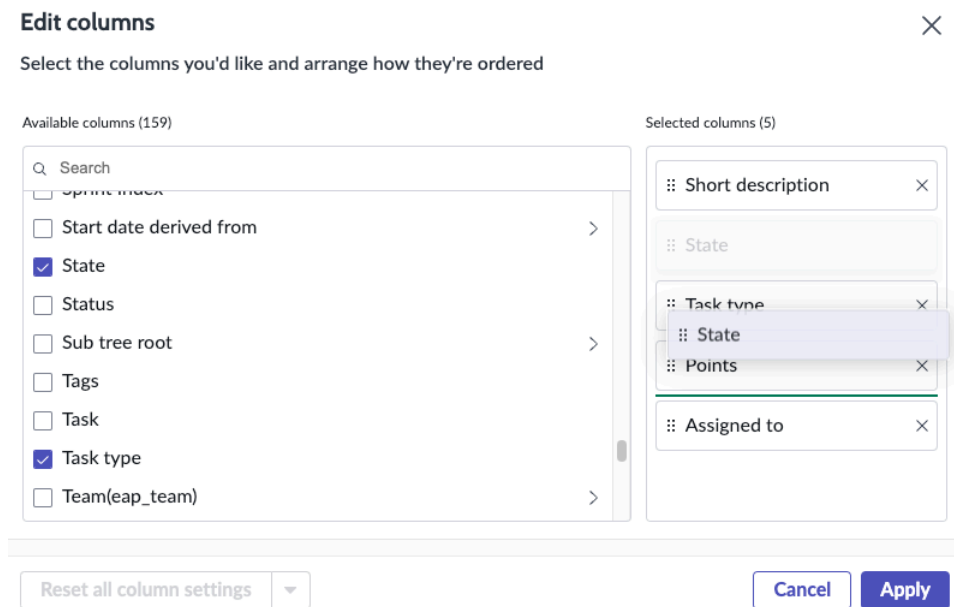

Before you begin

Role required: sn_apw_advanced.eap_user

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Enterprise Agile Planning**.
2. From the Agile structure section of the left navigation panel, choose your EAP team.
3. Add or remove columns and change their order of display on the Backlog page.

- a. Select **Edit columns** ().
- b. From the Available columns section, select the columns that you want to be displayed on the Backlog.
- c. From the Selected columns section, Remove the columns that you don't want on the Backlog.
- d. From the selected columns section, rearrange the columns to change the order of their display on the Backlog.
- e. Select **Apply**.

4. Apply filters to work items to narrow down the data that's displayed on the Backlog.

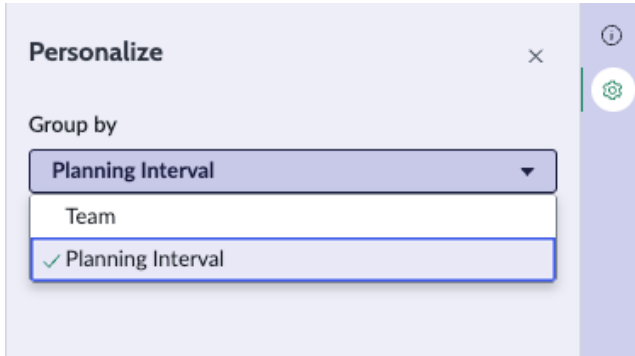

- a. Select **Filter** ().
- b. Add conditions to filter the work items.

You can add multiple conditions. These conditions apply to the **Type** of work item that is displayed in the Backlog page.

c. Optional: Select **Save filter** so that you need not recreate the same conditions to apply them to a different set of data.

d. Select Apply.

5. For an ART, you can personalize the grouping of the work items by Planning Interval or Team.

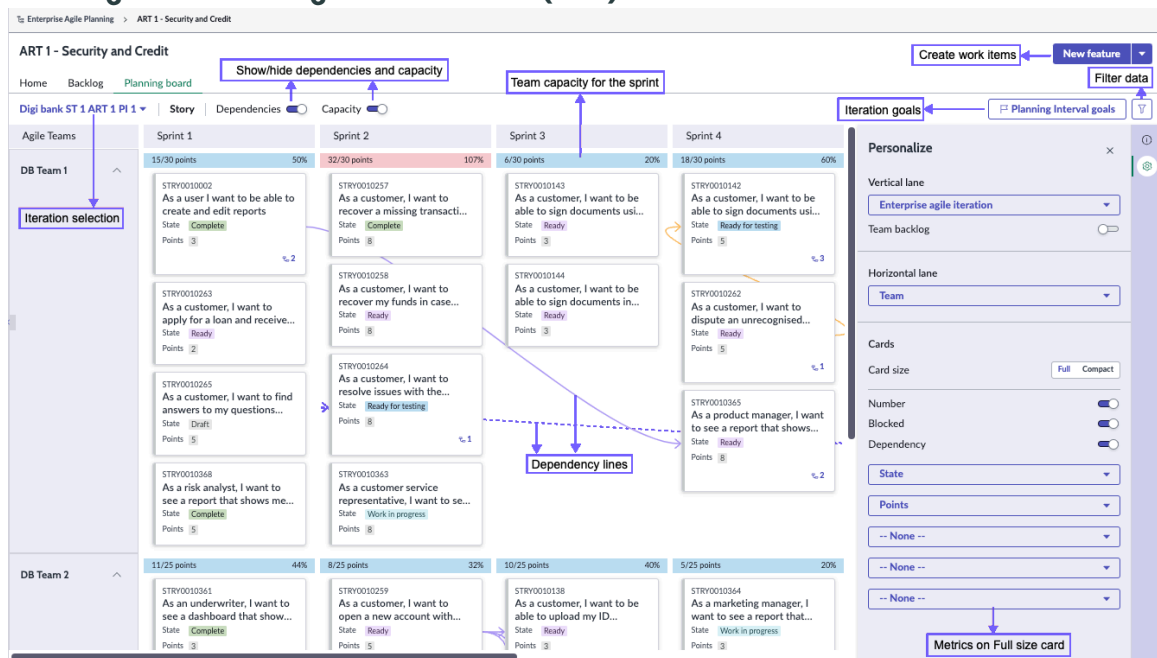

Perform PI planning in EAP

Using the Planning board of Enterprise Agile Planning, plan work for multiple teams across iterations (for example, Big Room Planning). Track the progress of work, create and visualize dependencies between work items, and reschedule work to react quickly to changes while confirming alignment with business priorities.

Layout of Planning board

Planning Board for an Agile Release Train (ART)

Based on the EAP configuration, the layout of the Planning board across different team levels such as Agile Team, ART, Solution Train, or Portfolio is:

- ART, Solution Train, and Portfolio: Two-dimensional Kanban board layout with differences in the horizontal and vertical lanes.
- Agile Team: Simple Kanban board with work item States as the vertical lanes.

The work items are represented as cards. You can choose to display cards in the compact or full size. Full size cards have data points on them such as item Number, State, and indicators for enabler, dependencies, or blocked whereas compact cards display just the short description.

Default grouping of work items

As you go bottom to top in an Agile structure, the cards are grouped as follows for each team:

i Important:

The team hierarchy and the iterations within teams are based on your EAP configuration. The following information applies to the default Full Configuration.

- Agile Team: For an iteration, vertical lanes represent the State of the story.

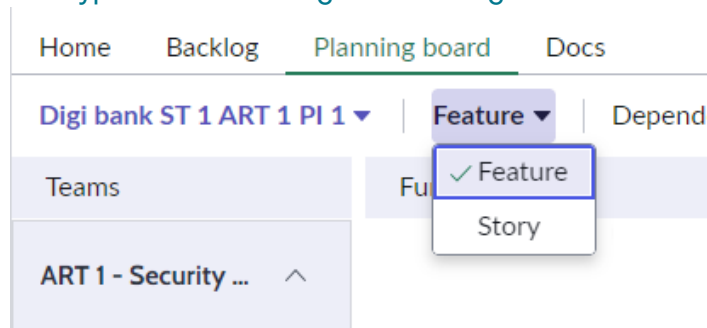

For example, if Sprint is the planning calendar configured for an Agile Team, the cards on the Planning Board represent the work assigned for the selected Sprint. For an Agile Team, you can see Stories on the planning board.

- ART: For an iteration, the Story cards are horizontally grouped by child teams and vertical lanes represent the iterations of the child teams.

If Planning Interval (PI) is the planning calendar configured for ART, the vertical lanes represent the Sprints within the selected PI.

- Solution Train: Horizontally grouped by child ARTs and vertical lanes represent the state of the item.
- Portfolio: Horizontally grouped by child Solution Trains and vertical lanes represent the state of the item.
- If the **Dependency** toggle is enabled, you can visualize the dependencies between work items.
- If the **Capacity** toggle is enabled, you can visualize the work load of the teams.

The Planning board for an EAP team shows only those work items that are enabled in its default configuration. For example, for an ART with Full Configuration, the Planning board shows only Features by default. If your product managers or team members want to switch to viewing other work item types such as Capabilities, Epics, or Stories, work with your admin to update the required EAP configuration details. For more information, see [Configure display of other work item types in EAP Backlog and Planning board](#).

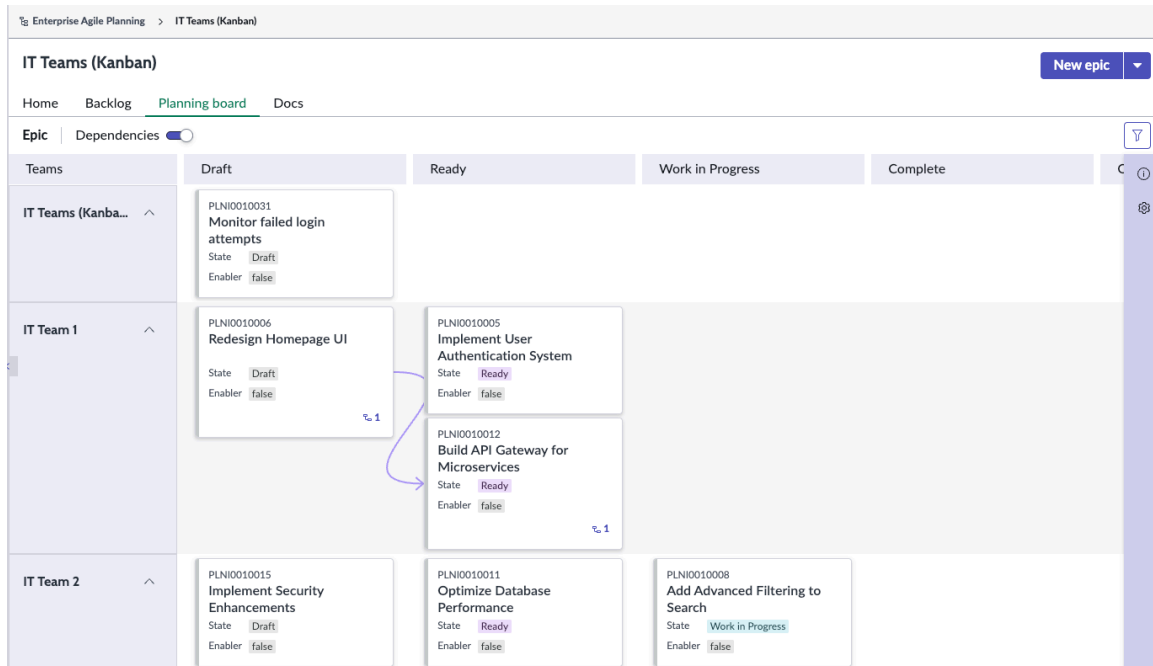

Tip:

For an ART, if you switch from viewing Story to another work item type on the planning board for the first time after updating this configuration, you might not have your work item cards displayed. To resolve this, ensure that the Vertical lane selection in the Planning board personalization is not set to Enterprise agile iteration.

Layout and default grouping for Kanban teams

The Planning board for Kanban teams is grouped as follows:

- **Portfolio:** Assigned work items are displayed in a two-dimensional Kanban board, with the teams as the horizontal lanes and state of the assigned work as the vertical lanes. Any work item that is not assigned to the child teams is displayed in the Portfolio section.

- **Team:** Assigned work is displayed in one-dimensional Kanban board.

As with Backlog, you can change the **Type** of work items displayed and create work items of multiple types from the Planning board.

Use the following tasks to get started with PI Planning within Enterprise Agile Planning.

Plan work for an ART in EAP

Plan work across all teams in an ART for multiple Planning Intervals, coordinate with different teams to manage dependencies and resolve blockers in real-time using the Planning board in Enterprise Agile Planning.

Before you begin

Role required: sn_apw_advanced.eap_user

About this task

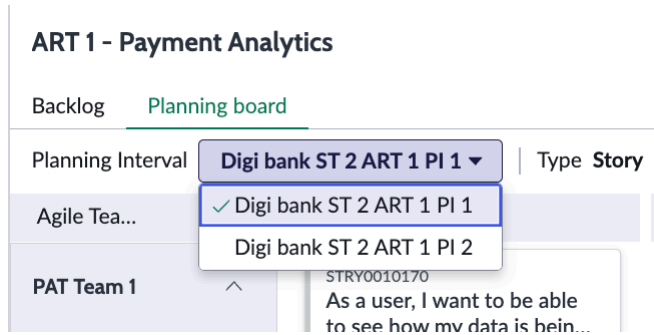

This task is explained using an Agile Release Train (ART) that has a Planning Interval (PI) as its calendar. This ART has child teams associated with it, which have Sprints defined for them.

On the board, move the story cards into different lanes or add new stories for the teams during planning meetings. Enable the **Dependencies** toggle to view dependencies and blockers across work for the teams.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Enterprise Agile Planning**.
2. From the Agile structure section of the left navigation panel, choose an ART and select **Planning Board**.

- The planning board shows the current iteration for the ART by default. You can select a different iteration.

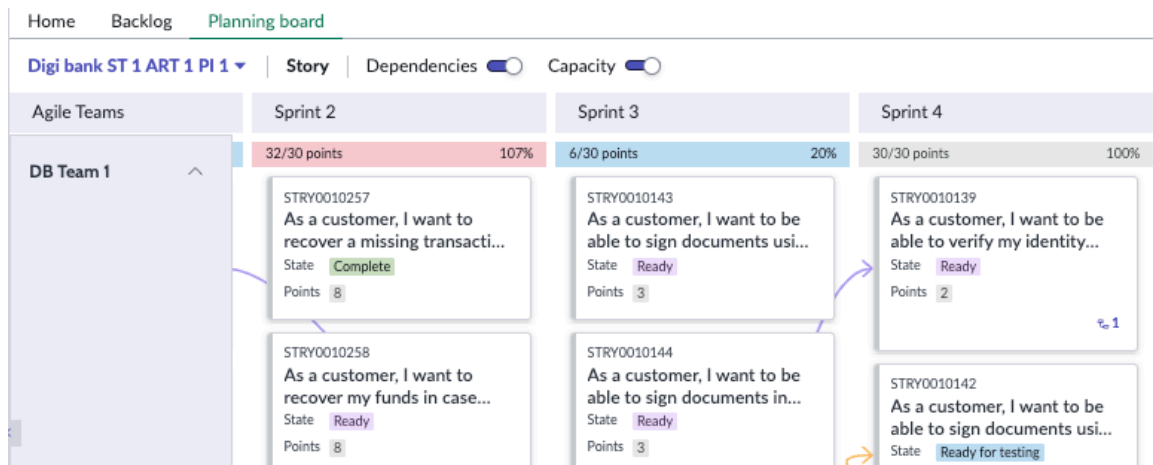

- Based on the scheduling of work done in the Backlog page, story cards are displayed in the Sprint lanes.

3. Enable the **Dependencies** toggle to view dependencies between stories. Based on how dependencies are created, the stories sometimes need rescheduling. For more information on story dependencies, see [Create and manage dependencies between work items in EAP](#).

4. Enable the **Capacity** toggle to view the workload of the teams for each Sprint.

The color of the capacity bar acts as a visual indicator of the workload:

- Red: Team is overloaded.
- Grey: Team is at 100% capacity.
- Blue: Team is at less that 100% capacity.

5. Collaborate with the teams on stories by clicking a card open in the side panel. During the planning meetings, collaborate with multiple teams and update story information such as priority, story points, or blocked reason.

You can also upload files in the Attachments tab and add notes and @-mention team members in the Comments tab of the side panel.

If you want to access additional information of the story such as scrum tasks, select **Full details** from the side panel.

6. Reschedule a story into a different Sprint or reassign it to a different team by dragging the cards into the respective lanes.

What to do next

For the work that you assigned and scheduled, track the progress at different levels of your Agile structure using EAP dashboards. See [EAP reports and dashboards](#).

Work item dependencies in EAP

Learn about work item dependencies and how they're shown on the Planning board for a team in Enterprise Agile Planning.

Dependencies overview

While planning, it's essential to know how your work items are connected with each other. Knowing dependencies between work items enables identification of challenges, coordination for resolution, and an overall improvement in collaboration between teams. Unless you know the dependency for each item, you could be at risk of not scheduling the right work for the right iteration. To get started with dependencies in EAP, see [Create and manage dependencies between work items in EAP](#).

Dependency line colors

On the Planning board in EAP, enable the **Dependencies** toggle to view dependencies lines across teams. The color of the dependency line indicates how the stories are scheduled.

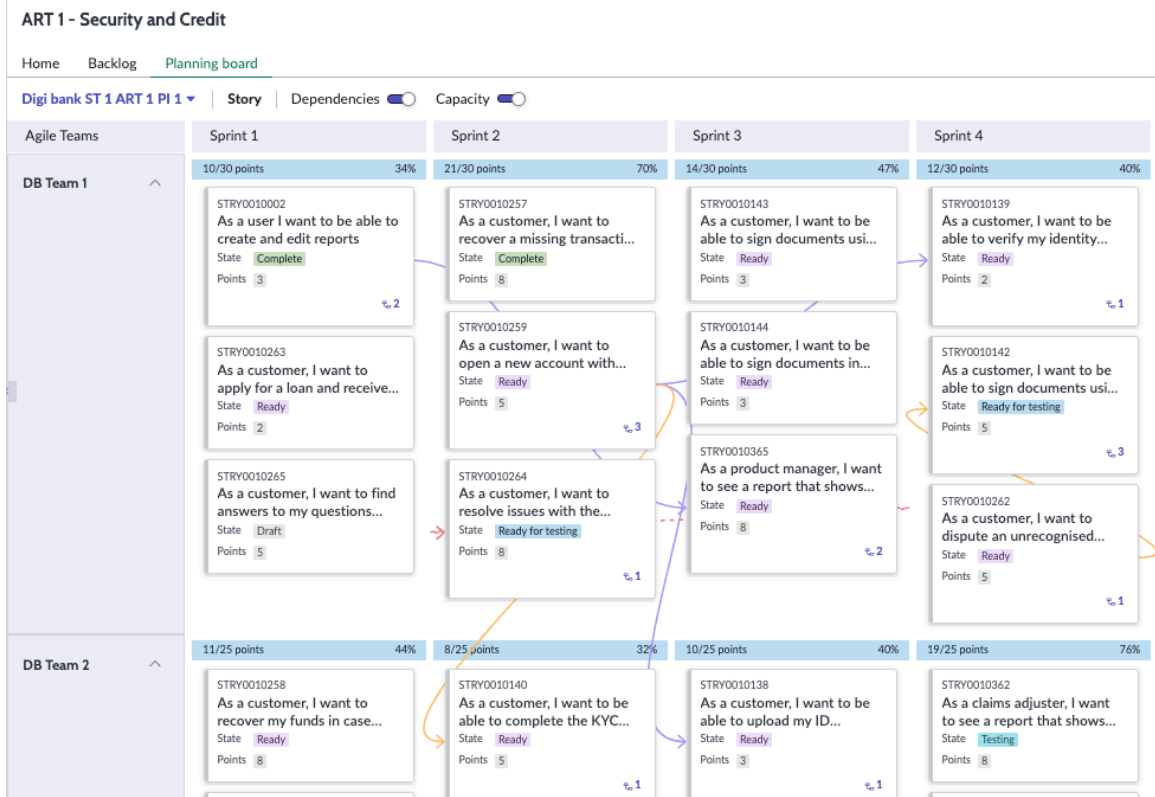

- Purple: The prerequisite story is scheduled in an earlier sprint than the dependent story. This dependency doesn't require any changes.
- Yellow: The prerequisite story is scheduled in the same sprint as the dependent story. In this case, rescheduling the stories might or might not be necessary.
- Red: The prerequisite story is scheduled in a later sprint than the dependent story. In this case, rescheduling stories is necessary.

Note:

These colors are applicable to the Planning board of ARTs and Agile Teams because they typically involve a planning calendar.

- Dependencies on the Planning board of a Solution Train or Portfolio appear in purple and don't indicate any scheduling conflicts.
- Dependencies on the Planning board of an Agile Team appear in Yellow because they're scheduled for the same Sprint.

Dependency lines for an ART

Dependencies related lists for work items

Dependencies added to a work item are displayed in its Full details page. The dependent and prerequisite items are listed in the related lists of this work item. You can also add new dependencies from these related lists.

The name of these related lists varies between Epic, Capability, Feature, and Story. Based on the type of item that you're viewing, the lists could be named as Dependent items, Depends on, Prerequisite stories, and Dependent stories.

The following screenshot shows the dependencies related lists for a Story.

The screenshot shows the details of a story: 'As a user, I want to be able to see how my data is being used to improve t...'. The 'Prerequisite Stories (1)' list is highlighted with a red box and contains one entry:

Prerequisite Story	Sys class name	Created by	Created
As a user, I want to be able to see how my data is being used to improve the accuracy of insurance quotes so that I can get better rates.	Story Dependencies	[Redacted]	[Redacted]

[Create and manage dependencies between work items in EAP](#)

Create and manage dependencies between work items in EAP

Draw work item dependencies in real-time across teams and iterations and visually analyze them while you collaborate using the Planning board in Enterprise Agile Planning.

Before you begin

Role required: sn_apw_advanced.eap_user

About this task

This task is explained using stories in an Agile Release Train (ART) as an example, which has Planning Interval (PI) as its calendar. The same guidance applies to creating, updating, and deleting dependencies for work items of an Agile Team, Solution Train, or Portfolio.

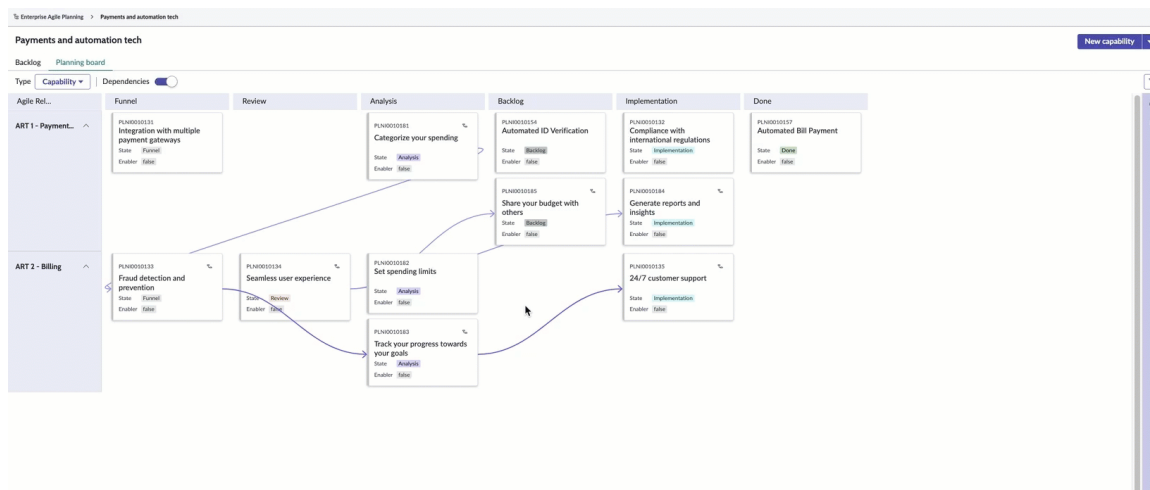

- A story that has a dependency on it by another story is called a prerequisite story.
- A story that is dependent on another story is called the dependent story.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Enterprise Agile Planning**.
2. From the Agile structure section of the left navigation panel, choose your EAP team.
3. Identify stories that have dependencies, and use the interactive functionality of the Planning board to draw dependency lines between them.

a. On the dependent story card, click the Add dependency line icon ().
A dotted dependency line appears.

b. Select the prerequisite story card to finish drawing the dependency line.

The dependencies are added to the work items on the board.

4. If the dependency line color is Yellow or Red, review it and reschedule stories as required.
5. Delete a dependency, to account for any change in the requirements.

a. Navigate to the full details page of a work item card that has a dependency to it.

b. From the Prerequisite Stories or the Dependent Stories related lists, locate the dependency that you want to remove.

Note:

The names of these related lists are different for Epic and Solution Train.

c. From the Sys class name column, select **Story Dependencies**.

As a customer, I want to open a new account with ease so that... Save ...

Priority State
4 - Low Ready

Details Scrum Tasks Prerequisite Stories Dependent Stories (3)

Dependent Stories 3 Refresh Settings Filter New Share

Last refreshed just now

Dependent Story	Sys class name
As a customer, I want to be able to upload my ID documents online so that I can complete the KYC process quickly.	Story Dependencies
As a customer, I want to be able to verify my identity using facial recognition technology so that I can complete the KYC process without any hassle.	Story Dependencies
As a customer, I want to be able to complete the KYC process in less than 5 minutes so that I can start using the digital banking services.	Story Dependencies

d. From the dependency item header, select the More Actions icon (...) and select **Delete**.

e. Select **OK** to confirm deleting the dependency.

Personalize the EAP Planning board

Choose metrics and indicators to be shown on cards so that key information is available at a glance on the Planning board in Enterprise Agile Planning workspace.

Before you begin

Role required: sn_apw_advanced.eap_user

Procedure

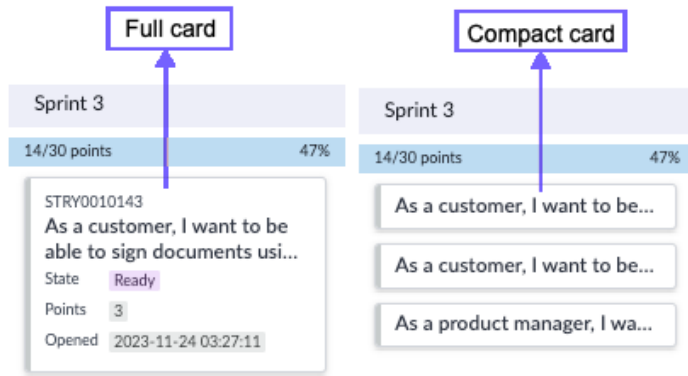

1. Navigate to **Workspaces > Strategic Planning Workspace > Enterprise Agile Planning**.
2. From the Agile structure section of the left navigation panel, select your EAP Team.
3. From the Planning board, select the Planning board personalize panel icon ().
4. From the Personalize side panel, update one or more of the following:

- o Selections of vertical lane and horizontal lane grouping.

Note:

When **State** is selected as the vertical lane, the columns displayed on the Planning board are based on the Agile methodology (Scrum or SAFe) for the selected EAP team.

- o Card size: Compact or Full.

- Indicators and data points that you want displayed on the cards. The selections are automatically applied to the cards. The following screenshot shows an ART planning board and its personalization options.

5. After making all the required selections, close the side panel.

Work item hierarchy for EAP teams

View and manage the complete work item hierarchy across your portfolio configurations directly from the Hierarchy tab in the Enterprise Agile Planning (EAP) workspace.

Agile teams may often struggle to understand how their day-to-day work rolls up to larger organizational work. A story that is assigned to a developer might support a feature that belongs to a capability, which ultimately delivers on a strategic epic. However, tracing that hierarchy typically requires navigating multiple screens or running reports.

The Hierarchy tab in Enterprise Agile Planning (EAP) provides a unified view of work items across all levels of your portfolio structure, from high-level epics down to individual stories. This hierarchical display of work updates dynamically based on your selected portfolio configuration, giving team members immediate visibility into how their work contributes to broader objectives.

When to use

The Hierarchy tab is valuable when you need to know the complete context of work items rather than viewing them in isolation. Consider using it in the following cases:

- Planning work and need to see what stories already exist under a feature before creating new ones.
- Reviewing progress at the portfolio level and to drill down into execution details.
- Onboarding team members who need to understand how their assigned work fits the bigger picture.

If you only need to track work items at a single level (for example, just stories for your sprint), the Backlog or Planning board views may be more efficient.

Benefits

For product owners

Quickly assess whether epics are broken down adequately, identify gaps in backlog refinement, and trace how customer requirements flow down through the hierarchy without switching between multiple views.

For scrum masters

Understand cross-team dependencies at a glance, facilitate conversations about work that spans multiple agile teams, and help team members see how their sprint commitments connect to release-level objectives.

For agile team members

Gain context for assigned work by seeing the parent feature and epic, get visibility into the business value behind technical tasks, and identify related stories that might affect their implementation approach.

Key capabilities

Multi-level hierarchy display

View work items across four portfolio levels: Portfolio, Solution Train, Agile Release Train (ART), and Agile Team, with each level displaying its default work item type such as Epics, Capabilities, Features, and Stories based on the configuration.

Context-sensitive navigation

The hierarchy automatically adjusts based on your selected portfolio configuration. Selecting a Solution Train displays only the epics, capabilities, features, and stories relevant to that configuration.

On-demand expansion

Child work items load only when you expand a parent item. This approach keeps the interface responsive, as you only retrieve the data you need.

Interactive filters

Filter the hierarchy by work item type using the Filters option. Filtering enables you to focus on the work items that you need and are relevant for you.

i Note:

Your filter selections do not persist across sessions; you must reapply filters each time you access the hierarchy.

Personalized column display

Customize which columns appear in the hierarchy grid and adjust column widths to match your workflow. Your preferences persist across sessions, so you see your configured view each time you return. For more information, see [Personalize column layout of Hierarchy in EAP](#).

Direct record access

Open any work item in a new browser tab using the context menu or by clicking the Name field hyperlink. This allows you to view or edit full record details without losing your place in the hierarchy.

Use cases

Release planning and dependency mapping

During Program Increment (PI) planning, release train engineers and product managers need to know how work flows across multiple agile teams. A common scenario: your organization is planning a major platform upgrade that requires coordinated changes across three agile teams.

Using the Hierarchy tab, the release manager can expand the epic to see all capabilities, then drill down to features assigned to each team. This visual mapping reveals which teams have dependencies on shared components, where hand-offs need to occur, and whether any critical path work lacks adequate story breakdown, all without leaving a single view or assembling data from multiple reports.

Impact assessment for scope changes

When stakeholders request changes to a feature mid-sprint, product owners need to quickly assess the downstream impact. For example, a customer escalation requires adding new acceptance criteria to a feature that is already in progress.

The product owner uses the Hierarchy tab to expand the affected feature and review all associated stories. They can immediately see which stories are in progress, which are complete, and which teams are involved. This visibility enables an informed conversation with stakeholders about the true cost of the change,

whether it affects one story or ripples across multiple teams, before committing to revised scope.

Considerations

Initial load limits

For optimal performance, the hierarchy initially loads only the top 100 work items at each level, ordered by global rank. If your portfolio contains more than 100 top-level work items, use filters to narrow your view to the relevant subset.

If you want to change this default number, work with your admin to create a `sn_apw_advanced.eap_hierarchy_items_limit` system property. For more information, see [Modify display limit in Hierarchy tab of EAP](#).

Enabling the Hierarchy view

The Hierarchy tab requires your admin to enable it through the `sn_apw_advanced.enable_hierarchy_views` system property. See [Enable Hierarchy tab in EAP](#).

Getting started

To access the Hierarchy tab, navigate to the EAP workspace and select your Agile team. The Hierarchy tab is available alongside the Backlog and Planning board tabs.

Personalize column layout of Hierarchy in EAP

Customize the column layout of the Hierarchy grid in the Enterprise Agile Planning (EAP) workspace by selecting which columns to display, reordering them, or adjusting their widths.

Before you begin

Role required: `sn_apw_advanced.eap_user`

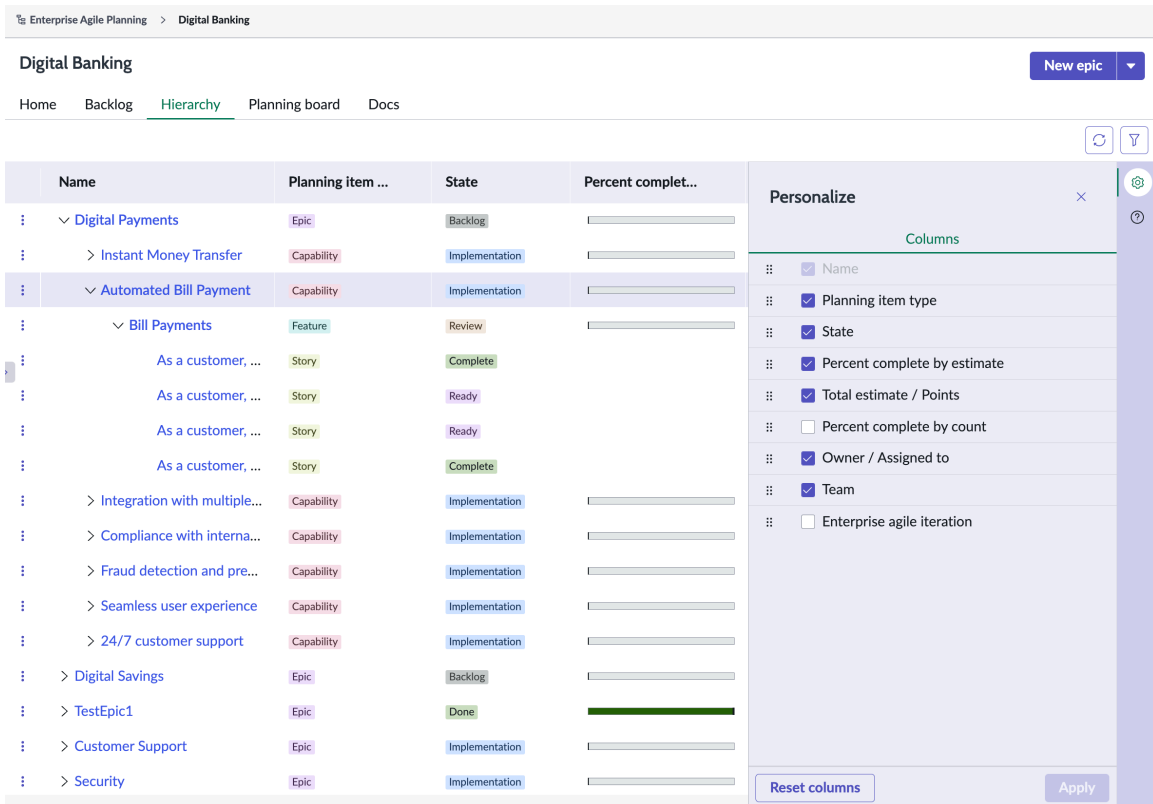

About this task

By default, the Hierarchy grid displays a standard set of columns that may not reflect the information most relevant to your role or workflow.

Column visibility, order, and width preferences are saved to your user profile and applied automatically each time you open the Hierarchy tab.

Procedure

1. Navigate to **Workspaces** > *Strategic Planning Workspace* > **EEnterprise Agile Planning**.
2. From the Agile structure section of the left navigation panel, choose your team and open the **Hierarchy** tab.
3. Select the Personalize icon ().

4. Choose the columns to be displayed in the Hierarchy tab and rearrange their order per your preference.
5. Select **Apply**.

[Work item hierarchy for EAP teams](#)

Collaborate using Docs in EAP

Store and manage all kinds of documentation for Agile teams and their planning items (Epics, Capabilities, and Features) from a centralized location of Enterprise Agile Planning workspace.

https://player.vimeo.com/video/1029774226?h=8e0cab6b63&badge=0&autoplay=0&player_id=0&app_id=58479

Docs overview

Product managers, team leads, and team members associated with EAP teams can store and manage information at the Agile Structure level and work level (Epic, Capabilities, and Features).

- Each planning item or team in EAP can have a separate doc to capture the information related to it.

For example, for an Epic, you create Docs for high-level business objectives or technical product requirements. Similarly at the team level, you can use Docs to capture the information related to team details, Scrum calls, iteration summaries, and so on.

- Each planning item or Agile Structure level can have multiple Docs associated with it and each Doc can have multiple pages to help you effectively organize key artifacts. Also, the Agile Structure can organize these pages into multiple documents.
- Predefined templates such as Iteration Retrospective, Marketing Plan, Meeting notes are available. Create pages for your Doc using one of these templates or start with an empty page. You can also create or modify the templates according to your requirements.

Features of Docs

The following are the key features of Docs:

- Auto-save content.
- See who is viewing or working on a Doc using the feature of live user presence.
- Create documents using pre-defined templates. You can edit the templates to suit your team's requirements.
- Use rich text paragraph formatting, which includes headings, lists, alignment, and others.
- Move text blocks to change their placement using block-level editing.
- Tag team members inline or insert tables using the / command.
- Add reference to other ServiceNow AI Platform tables to connect work across teams.
- Insert images by uploading files or using web URLs.

Note:

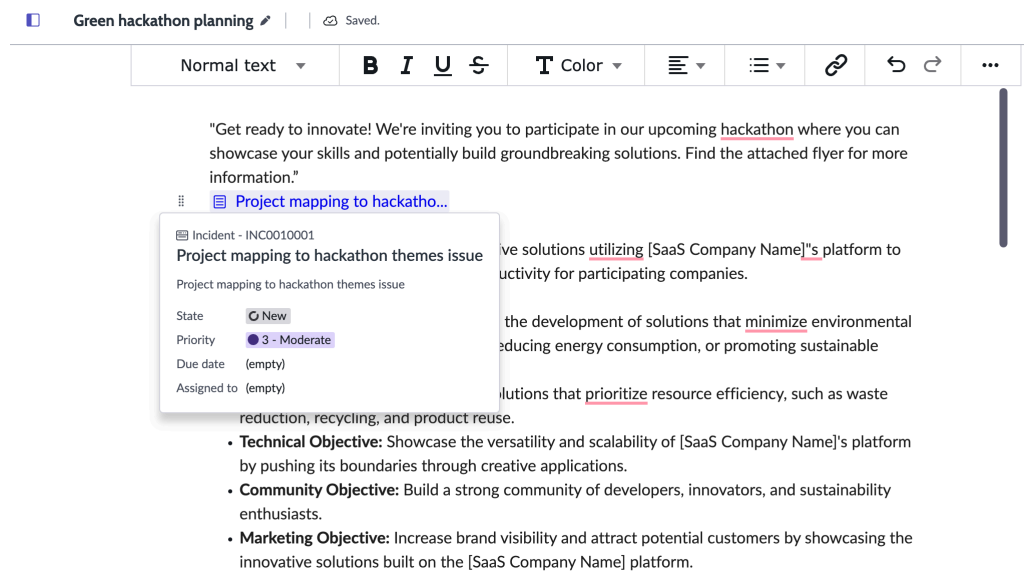

The experience of inserting Google Images links might not work.

Dynamic data linking in Docs

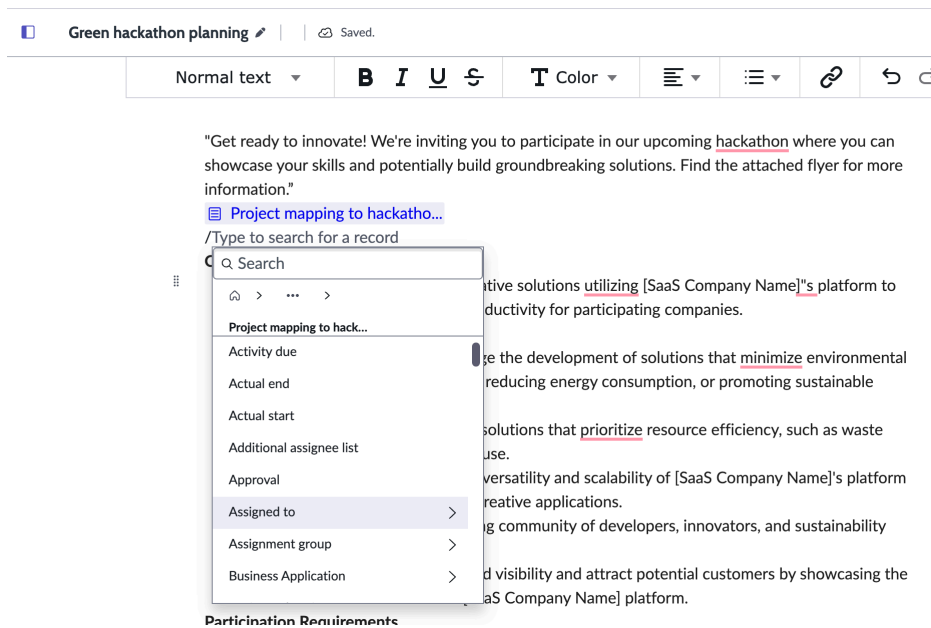

Keep record information in your documentation always current and reduce manual effort with the Dynamic data linking feature in Docs. You can now reference any ServiceNow application record and Docs will automatically reflect the latest updates from those records.

For example, if you add a reference to an Incident record, the reference will show the latest field information of the incident in Docs without requiring manual edits. Clicking the incident reference opens up the incident form so that you can view the full details of the incident and make any necessary changes.

A hover popover displays the details of the mentioned record, providing quick access to additional information without leaving the current context.

Dynamic linking also enables adding references to a particular field of a record, such as Assigned to of an Incident record.

You can add references from any ServiceNow table you have access to, with no setup or configuration needed.

This feature reduces the need to switch between multiple ServiceNow applications within your instance and helps maintain a single, reliable source of truth for collaborative work, making it easier for teams to stay aligned and informed.

Draft content using Now Assist for SPM

Generate content with Now Assist for SPM directly in your Docs using custom prompts. In addition, summarize existing sections, elaborate where needed, and refine drafts to help improve your productivity.

You can interact with Now Assist directly in your Doc to create new content, add context, or improve existing sections. This helps you draft faster, refine ideas, and keep your work relevant without leaving the page.

Work with content of the whole page

Some examples are:

- For Marketing teams: **Create a compelling product launch announcement highlighting the key benefits and emotional appeal for our target audience.**
- For Legal teams: **Write a plain-language summary of the privacy policy in this doc, that customers can easily understand.**
- For product teams: **Analyze the customer feedback comments in this Doc, group into top 5 themes, and suggest top 3 enhancements for highest impact.**

Now Assist uses the context from your Doc page to generate a response.

Refine, elaborate, or improve the existing content within the page

Some examples are:

- If you have a list of stakeholders, you can ask **Elaborate on the scope of these roles.**
- **Rewrite this in a casual tone.**

Key Stakeholders:

- **Product Team:** Provide access to the platform, API documentation, and technical support.
- **Marketing & Communications Team:** Develop promotional materials, manage social media campaigns, and coordinate media outreach.
- **Business Development Team:** Identify potential sponsors and explore partnership opportunities.
- **Customer Success Team:** Provide guidance and mentorship to participating teams.
- **Legal & Compliance Team:** Ensure compliance with all relevant regulations and data privacy requirements.
- **Human Resources Team:** Assist with logistics, venue arrangements, and event coordination.

Collaboration & Communication:

- Establish regular cross-team meetings to discuss challenges, and ensure alignment.
- Utilize project management tools to track progress, deadlines, and dependencies.
- Maintain open and transparent communication channels between all stakeholders.
- Foster a collaborative and supportive environment for all participants.

Take assistance on a blank page

Some examples are:

- 1. Generate 5 icebreaker questions for a virtual team-building session.**
- 2. Write a 3-paragraph blog post explaining why [industry trend] is changing how businesses operate.**
- 3. Generate an outline for the Instagram campaign tasks for a Hackathon initiative.**

Answer questions in the context of this Doc

Whether the content in the Doc is added manually or generated using Now Assist, you can ask questions to find anything in the page's context.

For example, if you have a project charter document, you can try asking **What is the total budget of this project and which part is the most expensive?**

or Mobile app + Now Assist

Normal text **B** *I* U ~~S~~ **T** Color what is the total budget of this project and which part is the most expensive?

Type something here or type / for commands.

Project Charter – Mobile Application for Games Apparel

1. Project Overview

The project aims to design, develop, and launch a **mobile application** (iOS & Android) for purchasing gaming-related apparel (t-shirts, hoodies, caps, jerseys, accessories). The app will target **18–35-year-old gamers** worldwide, with an emphasis on **North America, Europe, and Asia-Pacific** markets.

Projected launch: **Q4 2025**
 Initial budget: **\$1.5M**
 Expected user base in Year 1: **150,000 active users**
 Projected revenue in Year 1: **\$3.2M**
 ROI target in Year 2: **42%**

2. Objectives

- Launch an app with **90% crash-free sessions** and **app store rating ≥4.5**.
- Achieve **50,000 downloads** within the first 3 months post-launch.
- Onboard at least **50 gaming brands** and **200 SKUs (Stock Keeping Units)** at launch.
- Enable **average cart value (ACV) of \$32** by end of Year 1.
- Maintain **customer retention rate ≥35%** after 6 months.

3. Scope

In Scope:

Real-time collaboration within EAP Docs

With the feature of real-time collaboration, edit a Doc page concurrently with multiple other editors. Colored cursors denote the current location of each editor on the page. You can choose to show or hide these live presence indicators based on your preference while working on or reviewing the content of the

Note: Application performance may degrade with a large number of concurrent editors.

Create a Doc in EAP

Store information related to your work, iterations, and teams, and collaborate in real-time using Docs in Enterprise Agile Planning workspace.

Before you begin

Role required: `sn_apw_advanced.eap_user`

About this task

Create a Doc at the team-level or planning item level.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Enterprise Agile Planning**.
2. Navigate to a team or planning item that you would like to create a Doc for.
3. Select **New** to create a new document for the team or planning item.
4. Provide the title for your document and select **Create**.

The Doc is created and an untitled blank page is opened for you to start capturing information. You can create multiple pages within the Doc.

What to do next

[Manage pages and subpages within a Doc in EAP.](#)

Summarize and refine Docs content in EAP using Now Assist for SPM

Use Now Assist capabilities to elaborate, shorten, and summarize selected content in Docs, or to get a summary of the whole document in Enterprise Agile Planning (EAP).

Before you begin***i* Important:**

This Now Assist skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see [Now Assist skills, agents, and agentic workflows on by default](#) .

- [Create a Doc in EAP.](#)
- Activate the EAP doc summarization Now Assist skill. See .

Role required: sn_apw_advanced.eap_user

If you have custom roles that require access to this skill, update the ACLs for those roles that require access. For more information, see [Implement access control in Now Assist AI agents](#) .

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Enterprise Agile Planning**.
2. Navigate to your Doc.
3. From your Doc, open the page you want to summarize or refine.
4. Choose to summarize the selected text on the page or the whole page.
 - To refine the selected text:
 - a. Select a single block or multiple blocks of content on the page.
 - b. Select **Now Assist** and choose an option.

- i. **Summarize** to summarize the selected text.
- ii. **Elaborate** to lengthen the selected text based on the existing context.
- iii. **Shorten** to make the selected text concise.

- o To summarize the entire content on the page, select **Now Assist** from the Doc header and select **Summarize**.

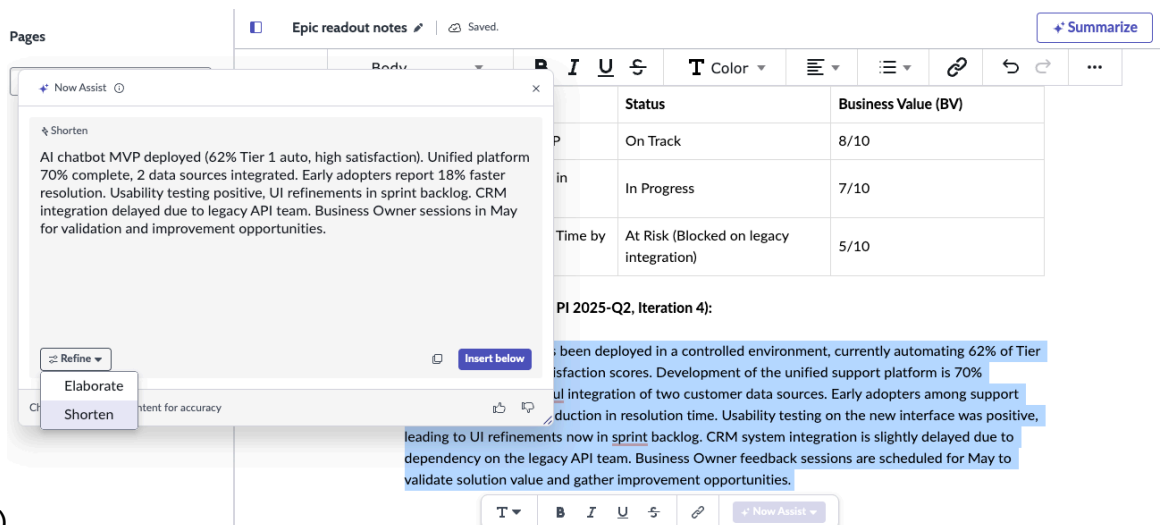

Tip:

If there's more content to summarize, you can remove some text and retry.

Now Assist analyzes the text and generates an output in a separate pop-up.

- 5. **Optional:** Based on the output generated, you can further refine the result or insert the generated content into the Doc.

(Optional)

- Optional:** Copy the generated output by selecting the Copy to clipboard icon (📄) to use it for purposes such as sending an email, saving to notes, and others.

Important: Because the output is AI-generated, review it to ensure accuracy.

Manage pages and subpages within a Doc in EAP

Flexibly organize information for your teams and work items by creating, duplicating, and deleting pages and subpages within a Doc in Enterprise Agile Planning workspace.

Before you begin

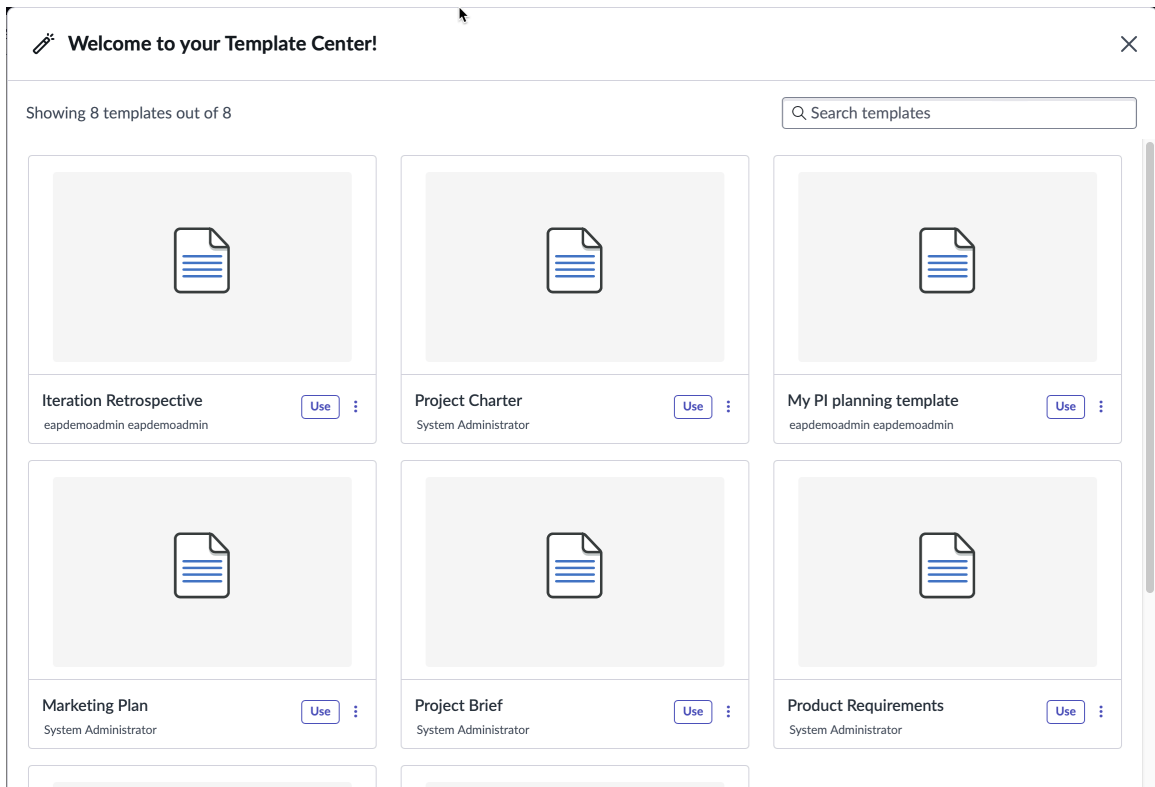

Role required: sn_apw_advanced.eap_user

Procedure

- Navigate to **Workspaces > Strategic Planning Workspace > Enterprise Agile Planning**.
- Navigate to your Doc.
- To create a page, you can create a blank page or start with a predefined template.
 - For a blank page, select **Create page**.
 - To create from templates:
 - Select **Create Page from template**.

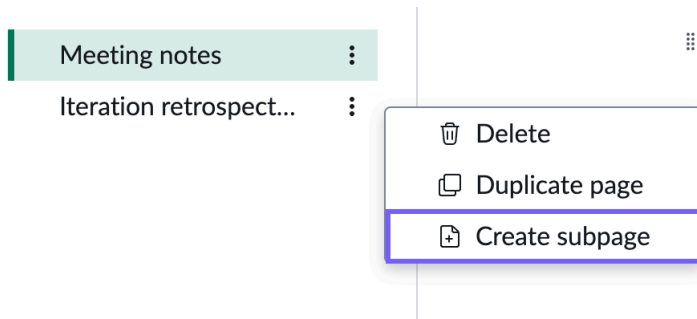

- Select a template from the Template Center and select **Create page**.

The new page is created and added to your Doc with the name **Untitled**, which you can rename.

4. To create a subpage, select the **Page Actions** menu () and select **Create Subpage**.

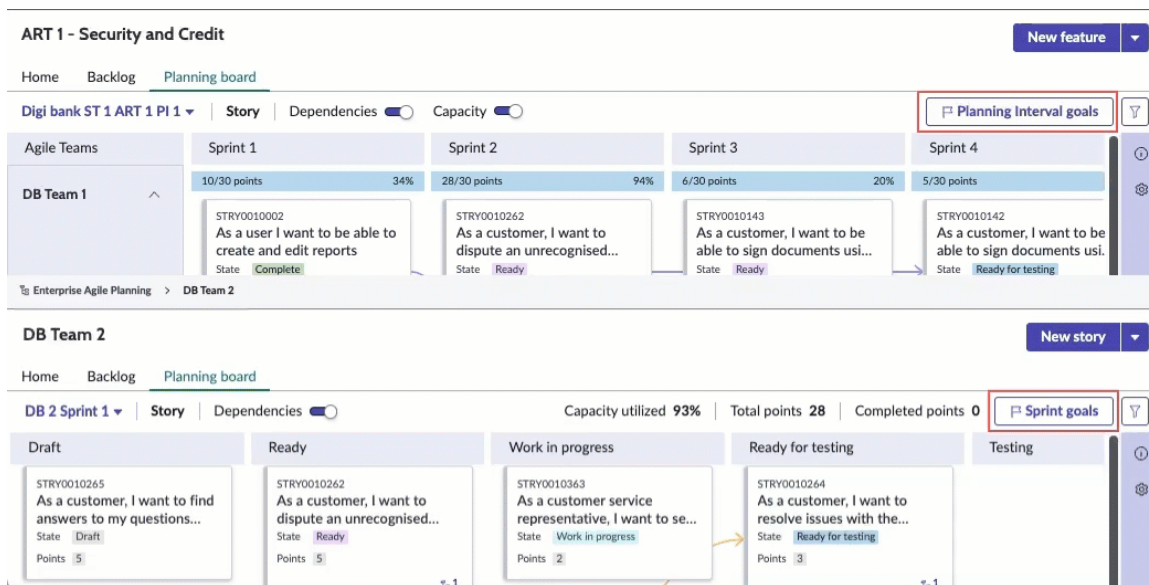

5. To delete a page or a subpage, select the **Page Actions** menu () and select **Delete**.

Iteration goals and work item goals in EAP

Within Enterprise Agile Planning, define PI-level or sprint level objectives or associate work items with enterprise goals.

Iteration goals

During planning interval (PI) or sprint planning, create functional goals for your team detailing what you plan to accomplish for the current iteration. Depending on your EAP configuration and team structure, you can create goals at the planning interval level or sprint level from the Planning board tab of a team.

To learn how to create iteration goals in EAP, see [Create iteration goals for a PI or sprint in EAP](#).

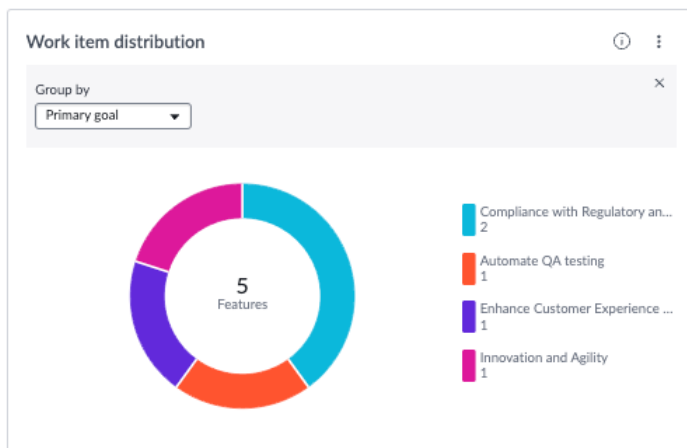

Work item goals

Establish a relationship between work items (Epic, Capability, Feature, or Story) with the portfolio-level or enterprise-level goals and OKRs. When goals are added to work items, the teams working on these items have greater visibility into the value that their work would contribute to.

Using the **Primary goal** field of the work item details, goals can be added to work items individually.

The screenshot shows a ServiceNow interface. On the left, a table lists work items with columns for Name, Planning item type, State, T-Shirt size, and WSJF Score. The 'Marketing Campaign Execution' item is highlighted. On the right, a detailed view for this item is shown, including fields for Owner, Team, Enterprise agile iteration, and a 'Primary goal' field containing 'Innovation and Agility'. A 'Save' button is visible at the bottom right of the details panel.

Product managers, team leads, or team members can also view their work distribution with respect to goals associated in the **Work item distribution** report of the dashboards.

Create iteration goals for a PI or sprint in EAP

Create iteration goals for your Agile teams to highlight the overall objectives to be accomplished for a planning interval or sprint.

Before you begin

Role required: sn_apw_advanced.eap_user

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Enterprise Agile Planning**.
2. From the Agile structure section of the left navigation panel, choose an ART or an Agile team and select **Planning Board**.
 - The Planning board shows the current iteration for the ART by default. You can select a different iteration.
 - The Planning board shows the current sprint for the Agile team by default. You can select a different sprint.
3. Depending on the Agile team level that you are at, select **Planning Interval goals** or **Sprint goals**.

The **Goals** tab displays existing goals for the PI or sprint.

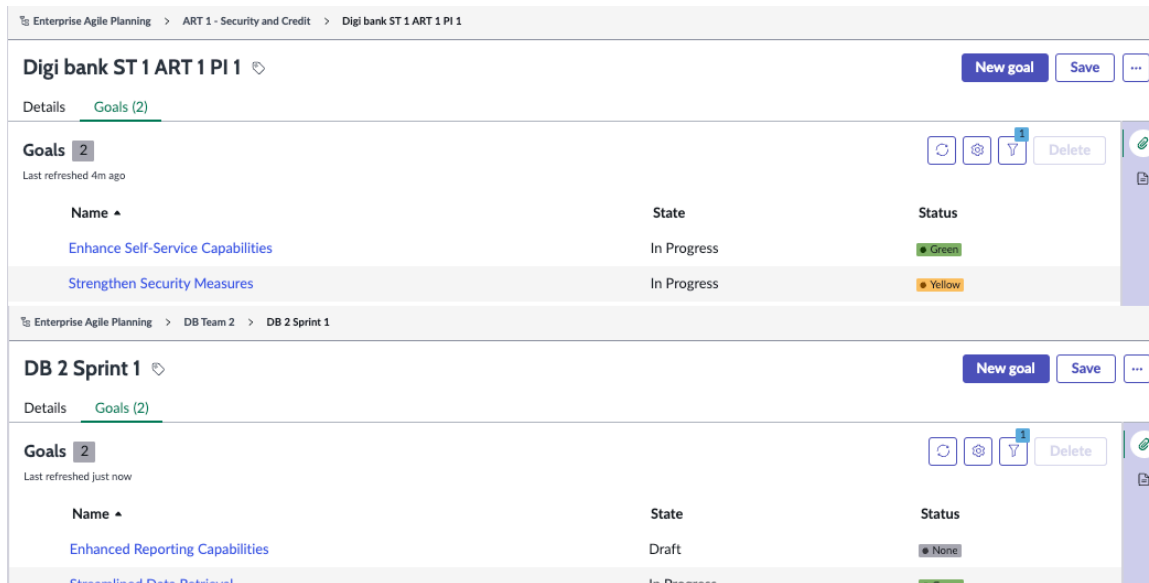

4. Select New goal.

5. In the New iteration goal dialog box, enter the name and a description for the goal.

6. Select Save.

Result

The goal is created for the PI or sprint and is displayed in the **Goals** tab.

What to do next

You can add details to your goal or add sub-goals to it by updating its fields. For information on the form fields for a goal, see [Goal form](#).

Connecting EAP with Collaborative Work Management

Enhance visibility and streamline planning for your Agile teams by connecting Enterprise Agile Planning (EAP) with Collaborative Work Management (CWM).

Overview of EAP-CWM connection

The EAP-CWM integration enables organizations to connect strategic program planning with team-level execution in a single system, eliminating silos and improving delivery predictability.

Using EAP, program managers and release train engineers can define Program Increment (PI) objectives, align Epics, Features, and Stories, create sprints for teams, and manage cross-team dependencies. After completing a PI, they can conduct PI retrospectives and update roadmaps for the next cycle. These capabilities ensure that enterprise priorities are clearly structured and traceable across all levels.

By linking EAP to CWM, product owners and team members can plan and execute sprints, manage agile stories alongside operational tasks such as incidents, track progress, and hold team-level retrospectives, all within the same workspace.

This connection between the applications reduces context switching and ensures that both planned and unplanned work is accounted for, without losing alignment to strategic goals. The result is end-to-end transparency where leadership can track progress against PI goals through EAP, while teams maintain flexibility to adapt to changing priorities.

Workflow of EAP-CWM integration

1. EAP admin connects an EAP team to CWM. See [Connect an EAP team with CWM](#).
2. A new Space and Board are created for this EAP team in the CWM workspace.
3. Existing work items assigned to this EAP team are brought over to the newly created CWM Board through Connected Work filters.
4. Sprint planning view is enabled for this CWM Board where the existing work items and sprints are automatically shown.
5. Check team's access to CWM and provide the CWM user [sn_cwm.cwm_user] to all team members.
6. EAP team can start creating more work, manage current work, and update progress directly from the CWM Board. See [Sprint planning in CWM](#).
7. The team's progress and work status is reflected back on the Team dashboard in the EAP workspace. See [EAP Agile Team dashboard](#)

Creating or managing sprints for EAP teams in CWM

For EAP teams integrated with CWM, existing sprints and their scheduled work automatically sync to CWM. These details are displayed in the Sprint Planning view on the CWM Board.

As the team progresses through assigned work, they can update the work status directly in the Sprints section. The sprint can be marked **Complete** from this view and any incomplete work items can be moved either to the backlog or the next sprint, if it exists.

New sprints for the team must be created in EAP. After creating new sprints in EAP, they will sync to CWM, allowing the team to schedule work into these sprints from CWM.

Note:

Sprints for EAP teams are not created directly at the Agile team level. Sprints are created automatically when a Planning Interval (PI) is defined for the parent Agile Release Train (ART) in EAP and sync to CWM automatically.

The screenshot shows the 'DB Team 1 Board' in 'Sprint planning' view. The interface includes a left sidebar with navigation options like '+ Create', 'My Work', and 'Spaces'. The main area is divided into a 'Backlog' and two active sprints. The 'Backlog' contains several 'Story' items with descriptions like 'As a customer, I want to be able to view th...'. The first sprint, 'DB 1 Sprint 1', has a capacity of 86% and 22/26 points completed. It lists tasks with assigned team members and their states (Complete, Ready, Work in progress). The second sprint, 'DB 1 Sprint 2', also shows tasks and their states.

Connected work in CWM

Sprint planning in CWM

EAP Agile Team dashboard

Connect an EAP team with CWM

Establish a connection to CWM by setting your EAP team's Agile tool to Collaborative Work Management.

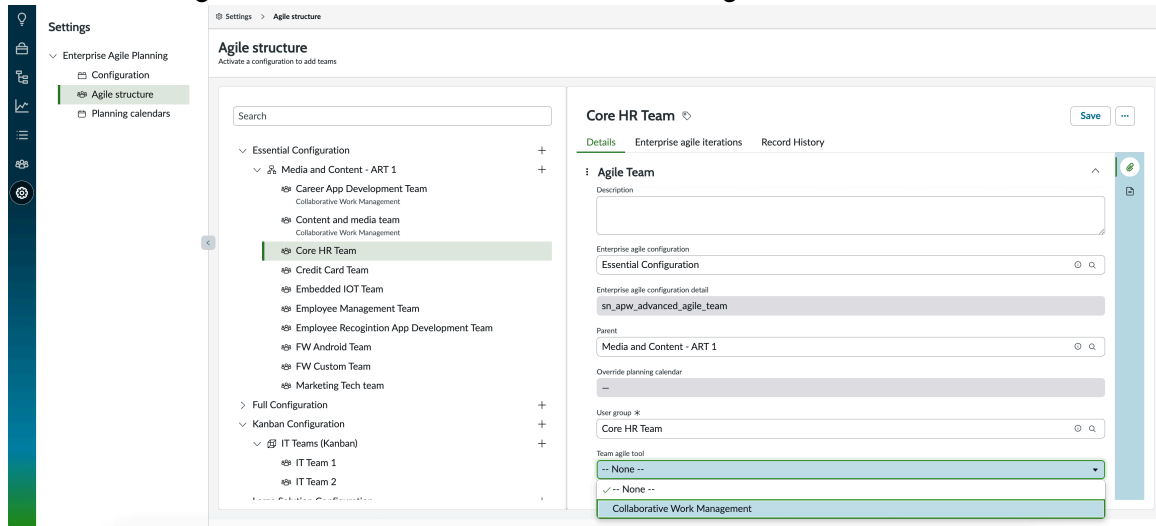

Before you begin

Ensure that **Application Scope** of your ServiceNow instance is set to **Strategic Planning**.

Role required: sn_apw_advanced.eap_admin

Procedure

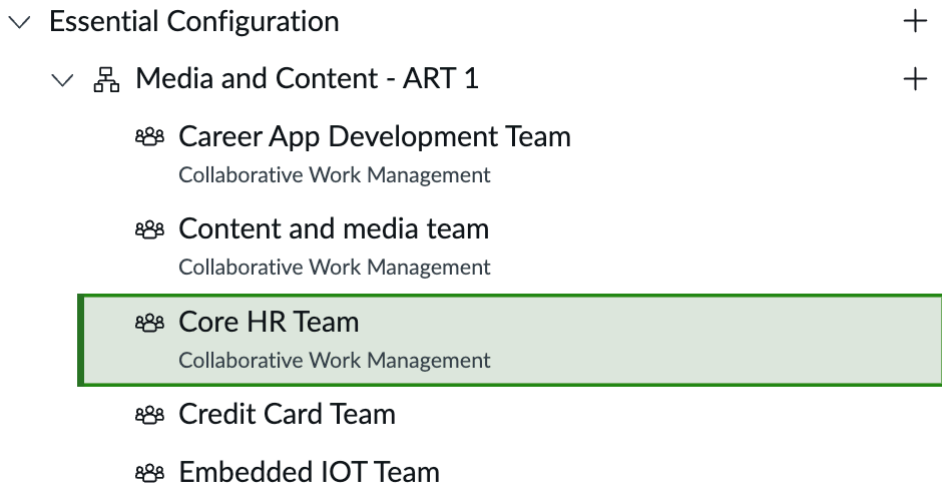

1. Navigate to **Workspaces > Strategic Planning Workspace**.
2. From the **Settings** menu, select **Enterprise Agile Planning > Agile structure**.
3. Select an EAP team that you want to connect with CWM.
4. Set the **Team agile tool** field to **Collaborative Work Management**.

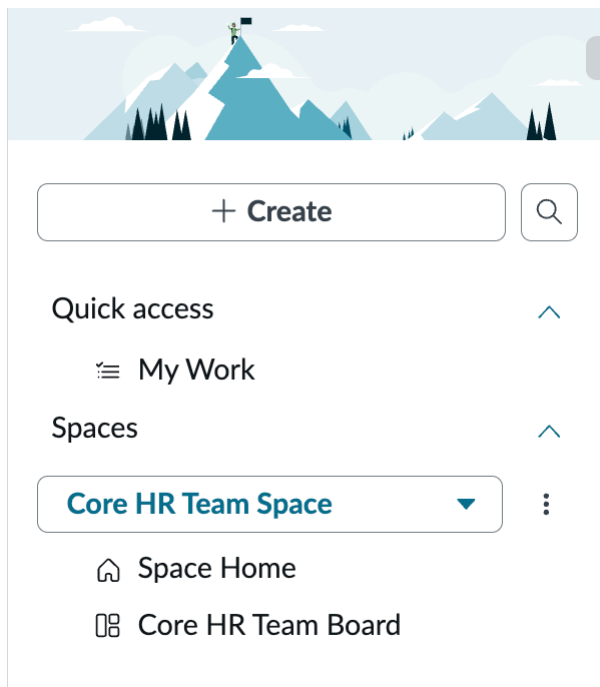

5. Select **Save**.

Result

- Collaborative Work Management is displayed underneath this team in EAP.

- A Space and Board are created for this team in Collaborative Work Management.

What to do next

Navigate to **Workspaces > Collaborative Work Management** to start managing this team's work. To learn more, see [Managing work using Boards in CWM](#) and [Sprint planning in CWM](#).

EAP reports and dashboards

Use the EAP dashboards to visualize metrics, identify blockers, and analyze performance trends for your Agile teams.

As a portfolio manager, product manager, team lead, or a team member, get insights into the team performance using the EAP dashboard. EAP dashboards are available at each level of the Agile structure such as Portfolio, Solution Train, ART, or Team.

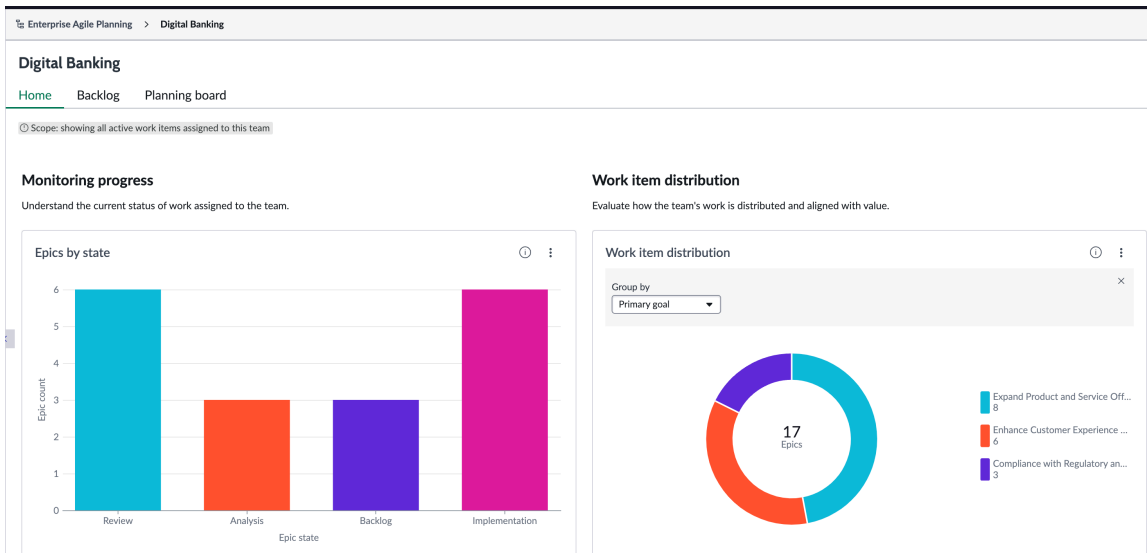

You can use a default dashboard or you can configure a custom dashboard and associate it with your Agile configuration. For more information, see [Configuring custom dashboards in EAP](#).

EAP provides the following default Inline and Technical dashboards for different hierarchy levels based on your configuration.

Dashboard	Available with
EAP Portfolio dashboard	<ul style="list-style-type: none"> • Full Configuration • Portfolio Configuration
EAP Solution Train dashboard	<ul style="list-style-type: none"> • Full Configuration • Large Solution Configuration

EAP Portfolio dashboard

The Portfolio dashboard provides a high-level view of all the active work items in your portfolio.

You can use a default dashboard or you can configure a custom dashboard and associate it with your Agile configuration. For more information, see [Configuring custom dashboards in EAP](#).

Required EAP roles

The EAP read-only (sn_apw_advanced.eap_read_only) role is required to view the dashboard.

Access the Portfolio dashboard

1. Navigate to **Workspaces > Strategic Planning Workspace > Enterprise Agile Planning**.
2. From the Agile structure section of the navigation panel, choose your EAP Portfolio.
3. Select the **Home** tab.

Use cases

User	Dashboard use
<ul style="list-style-type: none"> • Portfolio manager • Product manager • Team lead • Team member 	View the active work items assigned to the teams in your portfolio and distribution of work items.

Reports

Title	Type	Source table	Description

Enterprise Agile Planning reference

Reference topics provide additional information about the lists, forms, roles, tables, and other components that you use to configure and use Enterprise Agile Planning (EAP).

Components installed with Enterprise Agile Planning

Several types of components are installed with Enterprise Agile Planning when you install the Strategic Planning applications, including tables and user roles.

Roles installed

Role title [name]	Description	Contains roles
EAP admin [sn_apw_advanced.eap_admin]	Can add teams to EAP configurations or remove them.	sn_apw_advanced.eap_user
EAP user [sn_apw_advanced.eap_user]	<ul style="list-style-type: none"> • Can create, update, and delete work items • Can create and modify iterations like Planning Intervals and Sprints • Can access the team's Backlog and Planning Board 	<ul style="list-style-type: none"> • scrum_master • sn_apw_advanced.eap_read_only • now_assist_panel_user <p>This role is available only with the Now Assist for SPM plugin.</p>
EAP read-only role [sn_apw_advanced.eap_read_only]	Can view the EAP team's Backlog and Planning Board	<ul style="list-style-type: none"> • scrum_user • workspace_user • canvas_user

Tables installed

Table	Description
Agile Release Train [sn_apw_advanced_agile_release_train]	Stores information of all Agile Release Trains created for the Agile structure of an EAP configuration.

Table	Description
	This table extends the Enterprise agile team [sn_apw_advanced_eap_team] table.
Agile Team [sn_apw_advanced_agile_team]	Stores information of all Agile Teams created for the Agile structure of an EAP configuration. This table extends the Enterprise agile team [sn_apw_advanced_eap_team] table.
Capability [sn_align_core_capability]	Stores information of all Capability type of work items created in EAP. This table extends the EAP planning item [sn_align_core_eap_planning_item] table.
EAP planning item [sn_align_core_eap_planning_item]	Base table for all EAP work item types. This table extends the Planning Item Entry [sn_align_core_planning_item] table.
Enterprise agile calendar [sn_apw_advanced_eap_calendar]	Stores information of iteration types such as Planning Intervals and Sprints. This table extends the Business Calendar [business_calendar] table.
Enterprise agile calendar entry [sn_apw_advanced_eap_calendar_span]	Stores information of the timeline defined or date span for calendar entries of a business calendar span. For example, for a Sprint calendar type, six calendar entries spanning over three months can be created. This table stores the date spans for each of these Sprint calendar entries. This table extends the Business Calendar Entry [business_calendar_span] table.
Enterprise agile configuration (sn_apw_advanced_eap_configuration)	Stores information of agile configurations such as Full configuration, Portfolio configuration, and other default and custom configurations.
Enterprise agile configuration detail [sn_apw_advanced_eap_configuration_detail]	Stores the details of the default work item type and planning calendar associated with a team type for a configuration. It also stores: <ul style="list-style-type: none"> • Team hierarchy in the Agile structure for a configuration. • Work item type available on the Backlog and Planning board pages.
Enterprise agile iteration	Stores the details of team-level iterations details such as capacity, total points, State, and others.

Table	Description
[sn_apw_advanced_eap_iteration]	
Enterprise agile iteration type [sn_apw_advanced_eap_iteration_type]	Stores the information about planning calendar types such as Planning Intervals or Sprints.
Enterprise agile team [sn_apw_advanced_eap_team]	Base table for all EAP teams such as ART, Solution Trains, Agile Release Trains, and Portfolios created in the Agile structure for a configuration.
Enterprise agile team structure [sn_apw_advanced_eap_team_structure]	Contains information of team hierarchy.
Enterprise agile work structure [sn_apw_advanced_eap_work_structure]	Contains information of work item type hierarchy.
Epic [sn_align_core_scrum_epic]	Stores information of all Epic work items created in EAP. This table extends the EAP planning item [sn_align_core_eap_planning_item] table.
Feature [sn_align_core_feature]	Stores information of all Feature work items created in EAP. This table extends the EAP planning item [sn_align_core_eap_planning_item] table.
Solution Train [sn_apw_advanced_solution_train]	Stores information of all Solution Trains created for the Agile structure of an EAP configuration. This table extends the Enterprise agile team [sn_apw_advanced_eap_team] table.
SAFe Portfolio [sn_apw_advanced_eap_portfolio]	Stores information of all Portfolios created for the Agile structure of an EAP configuration. This table extends the Enterprise agile team [sn_apw_advanced_eap_team] table.
Story [rm_story]	Stores information of all stories created.

Scheduled jobs installed

Scheduled jobs installed with Enterprise Agile Planning

Scheduled job	Description
Populate parent level data for work item and stories	Populates the details of the parent work item up to seven levels.
Populate parent level data for work item and stories (Bulk)	Populates the details of the parent work item up to seven levels. Run this scheduled jobs when you have multiple stories that needs update to parent work item details at once.

Properties installed with Enterprise Agile Planning

System properties that you can configure to modify the way your product manager or scrum team members view their work in the Enterprise Agile Planning (EAP) workspace.

These properties are available for Enterprise Agile Planning.

Note:

To open the System Properties [sys_properties] table, enter `sys_properties.list` in the navigation filter.

Integration between EAP and Agile Development 2.0

While setting up a configuration in Enterprise Agile Planning, you can establish an integration with Agile Development 2.0. Learn more about the tables connected and the way you access the information.

Portfolio Configuration ✕

A configuration includes the team level structure and work item types. Updates to a configuration will also apply to the associated teams. [Learn more.](#)

Configuration name *

State ⓘ

Active ▼

Sync with Agile Development ⓘ

In the EAP configuration form, when you enable the **Sync with Agile Development** option, information of the following tables is synced between the two apps.

EAP tables	Agile Development 2.0 tables
Enterprise agile iteration [sn_apw_advanced_eap_iteration]	Sprint [rm_sprint]

When this sync is established for a configuration, the following are the functionality changes:

Sprint creation and updates

- Creating a Sprint is suggested to be done from EAP.
- Creating a Sprint in EAP creates a related Sprint in Agile Development 2.0.

If the dates of the Sprint in EAP overlap with a record in the `rm_sprint` table, then a new Sprint isn't created for Agile Development 2.0. You can either choose to create sprints for non-overlapping dates or delete the existing sprint from the `rm_sprint` table.

- Fields of planned start and end dates for Sprints in Agile Development 2.0 become read-only, and are derived from the business calendar spans mapped to the iterations in EAP.
- Updating Sprint details in EAP updates the corresponding Sprint details in Agile Development 2.0.

- Deleting Sprints from EAP deletes the corresponding record from the Sprint [rm_sprint] table.
- On the Sprint [rm_sprint] table, reference fields are created for parent of the EAP iteration and the EAP team this iteration belongs to.

Story creation and updates

- All Stories scheduled for any Sprints in this configuration can be accessed in Sprints of Agile Development 2.0.

You can track the progress of this Sprint from the Agile board.

- Any changes made to the story details or its progress are visible in both the applications.
- On the Story [rm_story] table, reference fields are created for EAP team, iteration, configuration, and parent work item in the EAP fields related list.
- If a story is rescheduled to a different sprint or moved to the Backlog on the Agile board, it's updated in EAP and vice versa.

i Note:

The Story records for EAP are by default saved in the Story [rm_story] table, which is installed with the Agile Development 2.0 plugin.

Team type form

Learn about the fields of the new table form that are required to add a new team type in Enterprise Agile Planning.

New table form

Field	Description
Label	Unique label for the table.
Name	This field is auto-generated from your input in the Label field .

Enterprise Agile Planning Indicators

Indicators included in the EAP dashboard.

Indicator	Description	Version added
EAP: Sum of story points of completed stories in current iteration	Sum of story points of completed stories in current	Washington DC

Indicator	Description	Version added
	iteration is measured daily as unit.	
EAP: Sum of story points of all stories in the current iteration	Sum of story points of all stories in the current iteration is measured daily as unit.	Washington DC
EAP: Sum of story points of active stories in the current iteration	Sum of story points of active stories in the current iteration is measured daily as unit.	Washington DC

For information about the metrics you can view on the EAP dashboard through these indicators, see [EAP reports and dashboards](#).

Work item reorder errors in EAP Backlog

Review the scenarios when the reordering of work items can fail in the Backlog of Enterprise Agile Planning workspace.

While reordering work items in different sections of the EAP Backlog, the reorder can fail due to an error in the ranking configuration. Following are the scenarios where reordering of work items can fail:

Scenario 1: Global ranking plugin is not active

Check if the Global Ranking Application plugin (com.snc.sdlc.ranking) is active in your ServiceNow instance. If not, contact your admin to activate it.

Scenario 2: Work item doesn't have a rank configuration

Check if all the work items that you are reordering have a rank configuration. If not, contact your admin to update rank configuration for these work item types.

Scenario 3: Target row doesn't have a global rank

Check if the work item before or after your target position to reorder has a global rank. If not, contact your system admin to generate a global rank for them.

SPW Jira Integrations

Improve visibility from strategy to execution with Jira Integration. This integration enables bi-directional syncing of Epics, Features, Capabilities, and Stories. While sprints are created in Enterprise Agile Planning (EAP) and synced to Jira, sprint status updates flow back from Jira to EAP.

SPW Jira integration overview

As a portfolio manager, you may rely on Strategic Planning Workspace (SPW) for roadmap planning, prioritization, and aligning work with strategic goals. However, your delivery teams could prefer using tools like Jira for the actual execution of work such as creating and managing stories and epics. This disconnect could create a visibility gap for portfolio managers, making it difficult to track progress and ensure alignment between strategy and execution.

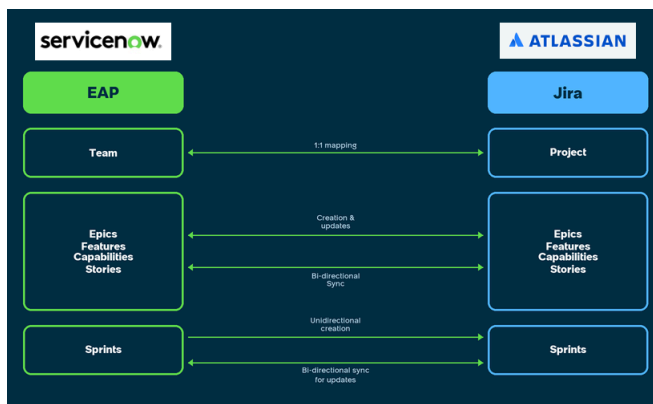

The SPW-Jira integration helps solve this problem by providing seamless, bi-directional synchronization of key work items, including Epics, Features, Capabilities, and Stories. This synchronization ensures that updates made in either system are reflected in the other, giving portfolio managers real-time insight into execution without leaving SPW.

Sprints are created in EAP and sync to Jira, while status updates flow back from Jira to maintain visibility. This approach enables comprehensive end-to-end planning in SPW with the ability to plan dependencies and capacities across teams and sprints in EAP.

By bridging the gap between strategic planning and operational execution, this integration provides end-to-end visibility, enabling better decision-making, improved collaboration, and stronger alignment across teams.

SPW Jira Integrations workflow

The following infographic shows how the integration between SPW and Jira work in both the applications.

- One-to-One Mapping: Each Jira Project is directly mapped to an EAP Team.
- Bidirectional Sync of Work Items:
 - Epics, Features, Capabilities, and Stories are synced both ways between SPW and Jira.
 - Sync applies to creation and updates.

Example: A product owner creates an Epic in EAP and it appears in Jira. Team members update the Epic in Jira and the changes sync back to EAP.

Note:

If your Jira instance has state transition rules, the export sync from EAP to Jira might fail. For example, if a transition rule in Jira restricts a story or work item from moving directly to a **Complete** state without first passing through an **In Progress** state, and the story is marked **Complete** without that intermediate step, the sync fails.

- Sprint Management:
 - Sprints can only be created in EAP, then synced to Jira.
 - Updates to sprints can be made in either application and are synced bidirectionally.

What to explore next

To learn more about configuring and using SPW Jira Integrations, see:

- [Configuring SPW Jira Integrations](#)
- [SPW Jira Integrations reference](#)

Configuring SPW Jira Integrations

Configure the set up and implementation of SPW Jira Integrations. You can either follow the tasks listed in the configuration or use Guided Setup.

Configuration overview

1. [Install SPW Jira Integrations.](#)
2. Assign the Jira integration admin role. See [Components installed with SPW Jira Integrations.](#)
3. [Set up a Jira instance.](#)
4. [Connect SPW to Jira.](#)
5. [Import Jira projects to SPW.](#)
6. Configure Jira Project settings.
 - a. [Associate Jira projects with EAP teams.](#)
 - b. [Review default mapping configuration for Jira projects in SPW.](#)
 - c. (Optional) [Create custom mapping configuration.](#)
 - d. [Enable bidirectional sync between SPW and Jira.](#)
7. [Import issues from Jira to SPW.](#)
8. Repeat steps 6 and 7 for all imported Jira projects.
9. [Activate Jira configuration in Enterprise Agile Planning.](#)
10. [Define team structure in Enterprise Agile Planning.](#)

Using guided setup to implement SPW Jira Integrations

Guided setup provides a sequence of tasks that help you configure SPW Jira Integrations on your ServiceNow instance. To open guided setup for SPW Jira Integrations, navigate to **All > Strategic Planning > Jira integration > Guided Setup.**

Install SPW Jira Integrations

You can install the SPW Jira Integrations application (sn_spw_jira_int) if you have the admin role. The application installs related ServiceNow® Store applications and plugins if they are not already installed.

Before you begin

- Confirm that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see [Get entitlement for a ServiceNow product or application](#).
- Review the SPW Jira Integrations application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Role required: admin

About this task

The following items are installed with SPW Jira Integrations:

- Store applications
- Roles
- Scheduled jobs
- Tables

For more information, see [Components installed with SPW Jira Integrations](#).

Procedure

1. Navigate to **All > System Applications > All Available Applications > All**.
2. Find the SPW Jira Integrations application (sn_spw_jira_int) using the filter criteria and search bar.

You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

A list of the versions available to you are displayed.

3. Select a version from the list and select **Install**.

In the Review Installation Details dialog box, any dependencies installed with your application are listed.

4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
Demo data are the sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.

6. Select **Install**.

Setting up a Jira instance for SPW Jira Integrations

Establish a connection between Strategic Planning Workspace (SPW) and Jira using a Jira instance record.

Before connecting SPW and Jira, you need a Jira instance record and Jira connection alias in your ServiceNow instance.

Based on the type of your Jira instance, perform the following steps:

- For Jira Cloud:
 1. [Create a child alias for the Jira Spoke alias.](#)
 2. Integrate your ServiceNow instance with your Jira account using OAuth. See [Option 1: Using OAuth authentication \(Authorization Code grant type\)](#) .

 **Note:**

To create credential record and connection record in this task, use the child alias that you created earlier and not the parent Jira Spoke.

- 3.
 - 4.
 5. [Create a Jira instance record in ServiceNow AI Platform.](#)
- For Jira Server or Data center:
 1. [Create a child alias for the Jira Spoke alias.](#)
 2. Set up a MID server. See [Tips to set up your MID Server](#) .
 3. [Create Personal Access Token \(PAT\) in Jira.](#)
 4. [Using the PAT, set up connection & credentials for the child alias.](#)
 5. [Create a Jira instance record in ServiceNow AI Platform.](#)

After successfully setting up the Jira instance record, proceed to connect Strategic Planning Workspace and Jira. For more information, see [Connect SPW to Jira](#).

Create a child alias for Jira Spoke alias for SPW Jira Integrations

Create a child connection & credential alias that will be used to connect to Jira later, to enable integration between Strategic Planning and Jira.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > Connection & Credentials > Connection & Credential Aliases**.
2. From the list of aliases, open the alias based on your Jira instance type.
 - For Jira Cloud, open **sn_jira_spoke.Jira**.
 - For Jira Server/Data Center, open **sn_jira_int.Jira**.
3. Create a child alias.
 - a. From the Child Aliases related list, select **New**.
 - b. Enter a name.
For example, **Jira instance – GenAI team**.
 - c. Select **Submit**.

What to do next

- For Jira Cloud: .
- For For Jira Server/Data Center: [Create PAT for Jira Server](#).

Create Personal Access Token in Jira Server/Data Center for SPW Jira Integrations

Create a Personal Access Token (PAT) for your Jira Server/Data Center instance, which is later used to create a connection between Strategic Planning and Jira.

Before you begin

- [Create a child alias for Jira Spoke alias for SPW Jira Integrations.](#)
- Set up a MID server. See [Tips to set up your MID Server](#) .

Role required: NA

About this task

This task is performed outside the ServiceNow instance.

Important:

A Jira Server account is used to create the PAT. After establishing the integration, any updates that are made in Strategic Planning Workspace will show up in Jira as done by this logged-in user. So, it is recommended that this account that is used to generate the PAT is either an admin or a placeholder user profile that is not used to make any updates in Jira once the integration is complete. If this user makes any updates in Jira, it may result in cyclic changes.

Procedure

1. Log into your Jira Server instance.
2. Navigate to your profile.
3. From your profile details, select **Personal Access Tokens** from the left navigation menu.
4. Select **Create token**.
5. Enter the details of name and expiry period.
6. Select **Create**.
7. Copy the created token and store it securely to retrieve it for later steps.

What to do next

Use this PAT as password while creating connection and credential for your Jira alias. See [Create connection and credentials for SPW Jira Integrations](#).

Create connection and credentials for SPW Jira Integrations

Using your Jira instance details, create a connection and credential for the child alias, which is used to enable the two-way sync of work item updates between Strategic Planning Workspace and Jira.

Before you begin

1. [Create a child alias for Jira Spoke alias for SPW Jira Integrations.](#)
2. or [Create Personal Access Token in Jira Server/Data Center for SPW Jira Integrations.](#)

Role required: admin or sn_jira_int.admin

About this task

This task is performed for Jira Server/Data Center type instances only. For Jira Cloud, follow the steps of OAuth authentication. For more information, see [Option 1: Using OAuth authentication \(Authorization Code grant type\)](#) .

Procedure

1. Navigate to **All > Connection & Credentials > Connection & Credential Aliases**.
2. From the list of aliases, open **sn_jira_int.Jira**
3. From the Child Aliases related list, open the child alias record that you created earlier.
4. From the Connection & Credential Aliases form, select **Create New Connection & Credential** related link.
5. On the form, fill in the fields.
For field information, see [Create Connection & Credential form](#).
6. Select **Create**.

What to do next

[Create Jira instance for SPW Jira Integrations](#).

Create Jira instance for SPW Jira Integrations

Create a Jira instance record which is later used to connect Strategic Planning Workspace and Jira.

Before you begin

[Create connection and credentials for SPW Jira Integrations](#).

Role required: sn_jira_int.admin

Procedure

1. Navigate to **All > Strategic Planning > Jira Integration > Jira Instances**.
2. Select **New**.
3. On the form, fill in the fields.
For field information, see [Jira Instance form](#).
4. Select **Submit**.

What to do next

[Connect SPW to Jira](#).

Connect SPW to Jira

Connect Strategic Planning Workspace to Jira to enable the integration between the applications.

Before you begin

Role required: sn_jira_int.user

Procedure

1. Navigate to **All > Strategic Planning > Jira Integration > Jira Instances**.
2. Select your Jira instance.
3. Click **Get Webhook Callback URL**.
4. Set up a webhook using this URL in Jira Administration.
This action is done outside your ServiceNow instance.

[Registering a webhook via the Jira administration console](#) 

5. On the Jira instance form, select **Connect**.

Result

If the connection is successful, the **State** field on your Jira instance record shows **Connected**. A webhook is now registered in Jira to receive update events.

What to do next

[Import Jira projects to SPW.](#)

Import Jira projects to SPW

Discover and import all available Jira projects and boards into Strategic Planning Workspace to start using the integration between the two applications.

Before you begin

[Connect SPW to Jira.](#)

Role required: sn_jira_int.user

Procedure

1. Navigate to **All > Strategic Planning > Jira Integration > Jira Instances**.
2. Open your Jira instance record.
3. Select **Discover Projects**.

This action creates requests to import Jira projects and boards, and to create mapping configuration for all these projects. You can view all the import requests in the Jira Import Requests related list and the initial state of all the requests would be **Requested**

Result

Once the status of each import request changes to **Complete**, you can see that the related lists of this Jira instance are populated as follows:

- Jira Projects: All available projects from Jira
- Jira Boards: All available boards from Jira
- Project Style Mappings: Mapping configuration for all the imported Jira projects.

What to do next

[Configure integration settings for a Jira project.](#)

Configuring Jira project settings in SPW

Configure integration settings for each Jira project before importing issues to ensure accurate and consistent visibility of work in both Strategic Planning Workspace and Jira. These settings such as team association and data mappings define how work items sync between both applications.

For each Jira project, perform the following tasks:

1. [Associate the Jira project with an EAP team.](#)

Each Jira project must be associated with an EAP team so that work items brought in from Jira map to the right team in SPW.

2. [Review default data mapping configurations.](#)

Predefined data mapping configurations for Epics, Sprints, and Stories between the two applications are available but if these default mappings don't fit your team's requirements, you can edit them or create new ones. See [Create custom mapping configurations](#).

3. Enable bidirectional data sync.

This step ensures updates done in either application are reflected in the other so that data is consistent across.

These steps must be completed for every Jira project that you plan to integrate. Doing so ensures that imported issues sync correctly and enables portfolio managers with real-time visibility into execution.

Associate Jira projects with EAP teams

Ensure work items from Jira are mapped to the right teams in Enterprise Agile Planning (EAP) by associating Jira projects with EAP teams.

Before you begin

[Import Jira projects to SPW](#)

Role required: sn_jira_int.user

Procedure

1. Navigate to **All > Strategic Planning > Jira Integration > Jira Projects**.
2. Open your Jira project record.
3. From the Team Integration Settings related list, select **New**.
4. On the Team Integration Settings form, fill in the fields,
For field information, see [Team Integration Settings form](#).
5. Select **Submit**.

What to do next

[Review default mapping configuration for Jira projects in SPW](#).

Review default mapping configuration for Jira projects in SPW

Verify that the default mapping configuration between work items in Strategic Planning Workspace (SPW) and Jira aligns with your team's processes.

Before you begin

[Import Jira projects to SPW](#)

Role required: sn_jira_int.user

About this task

Review the predefined table, field, and choice mapping configuration for a Jira Project. For more information on the default configuration for Epics, Stories, and Sprints, see [Default mapping configuration for SPW Jira Integrations](#).

Procedure

1. Navigate to **All > Strategic Planning > Jira Integration > Jira Projects**.
2. Open your Jira project record.
3. From the Table Maps related list, review the list of mappings available between tables of Jira and SPW for this project.
4. Review the field mapping for each table map.

- a. Select a table mapping record to open it.
 - b. From the Field Maps related list, review the mapping configuration of the fields between the tables.
5. Review the choice mapping for a field such as the State field.
- a. Select a field mapping record to open it.
 - b. From the Choice Maps related list, review the mapping configuration of choices of the fields.
6. Repeat steps 3, 4, and 5 for all table maps of the Project.

What to do next

If the available mapping configuration doesn't fit your team's requirements or processes, you can create custom mappings between entities of Jira and SPW. For more information, see [Custom mapping configuration for SPW Jira Integrations](#).

Custom mapping configuration for SPW Jira Integrations

Learn about creating custom mapping configurations to map Jira issue types, fields, and choices with SPW entities, to match your team's processes.

Custom mapping configurations allow you to control how Jira issue types, fields, and values align with SPW planning items. While default mappings cover common use cases, they may not fit your team's processes or reporting needs. By creating custom mappings, you can:

- Ensure accurate synchronization of work items between Jira and SPW.
- Align data mapping to reflect your team's terminology and workflows.
- Support consistent reporting and visibility across strategy and execution.

This flexibility helps provides a tailored integration experience, so that portfolio managers and delivery teams work with information that matches their context.

Create custom table mapping for SPW Jira integrations

Create a custom mapping configuration between tables of Strategic Planning Workspace (SPW) and Jira.

Before you begin

[Review default mapping configuration for Jira projects in SPW.](#)

Role required: sn_jira_int.user

About this task

Choose one table from Jira and one from SPW to create a mapping between them.

For example, if your team uses an issue type like Feature that isn't mapped by default, you can create a new mapping between the Feature issue type in Jira and the Feature [sn_align_core_feature] table in SPW.

Procedure

1. Navigate to **All > Strategic Planning > Jira Integration > Jira Projects**.
2. Open your Jira project record.
3. From the Table Maps related list, select **New**.
4. On the Table Map form, fill in the fields.
For field information, see [Table Map form](#).
5. Select **Submit**.

What to do next

1. Validate your new table map configuration by clicking **Validate and fix mapping** from the Jira project form.
2. For this table map, create field mappings. See [Create custom field mapping for SPW Jira integrations](#).

Create custom field mapping for SPW Jira integrations

Create a custom mapping configuration between fields of Strategic Planning Workspace (SPW) and Jira.

Before you begin

Role required: sn_jira_int.user

About this task

Select a Jira field and map it to a corresponding SPW field in the Table Map record.

For example, a table mapping between the Story entity in Jira and the Story [rm_story] table in SPW is available by default. If you need to map additional fields, such as story points, create a custom Field Map record using the steps below.

Procedure

1. Navigate to **All > Strategic Planning > Jira Integration > Jira Projects**.
2. Open your Jira project record.
3. From the Table Maps related list, open a table map record for which you want to create field maps.
4. From the Field Map related list, select **New**.
5. On the form, fill in the fields.
For field information, see [Field Map form](#).
6. Select **Submit**.

What to do next

1. Validate your new mapping configuration by clicking **Validate and fix mapping** from the Jira project form.
2. (Optional) If your new field is of the type Choice, create custom choice mapping for it. See [Create custom choice mapping for SPW Jira integrations](#).

Create custom choice mapping for SPW Jira integrations

Create a custom mapping configuration for field choices between Strategic Planning Workspace (SPW) and Jira.

Before you begin

Role required: sn_jira_int.user

About this task

Select a choice value from a Jira entity and map it to a corresponding choice value in an SPW table.

For example, Jira Stories include default states such as To Do, In Progress, and Done. If your team adds a custom state like Testing, you can create a choice mapping to link **Testing** in Jira to the **Ready for Testing** state in the Story [rm_story] table in SPW.

Procedure

1. Navigate to **All > Strategic Planning > Jira Integration > Jira Projects**.
2. Open your Jira project record.
3. From the Table Maps related list, open your table map record.
4. From the Field Maps related list, open a field map record for which you want to create choice maps.
5. From the Choice Map related list, select **New**.
6. On the form, fill in the fields.
For field information, see [Choice Map form](#).
7. Select **Submit**.

What to do next

1. Validate your new mapping configuration by clicking **Validate and fix mapping** from the Jira project form.
2. [Enable bidirectional sync of work items between Jira projects and SPW](#).
3. [Import issues from Jira to SPW](#).

Enable bidirectional sync between SPW and Jira

Enable import and export for a Jira project to ensure data is consistent across for all stakeholders using Strategic Planning Workspace and Jira.

Before you begin

Role required: sn_jira_int.user

Procedure

1. Navigate to **All > Strategic Planning > Jira Integration > Jira Projects**.
2. Open your Jira project record.
3. Select both the **Enable Import** and **Enable Export** options.
4. Select **Update**.

What to do next

[Import issues from Jira to SPW](#).

Import issues from Jira to SPW

Import work items such as epics, features, capabilities, and stories from Jira to Strategic Planning Workspace (SPW) to enable end-to-end visibility in SPW.

Before you begin

[Enable bidirectional sync between SPW and Jira](#)

Role required: sn_jira_int.user

Procedure

1. Navigate to **All > Strategic Planning > Jira Integration > Jira Projects**.
2. Open your Jira project record.
3. Select **Import issues**.
4. Select a date range to import issues from your Jira project.

5. On the Import Request form, select **Submit.**

An Import request is created and is shown in the Jira Import Requests related list of the Jira project.

Result

After the State of the import request changes to Complete, all the work items from Jira would have been imported into Strategic Planning Workspace tables, based on the mapping configuration defined for the project.

What to do next

1. [Activate Jira configuration in Enterprise Agile Planning.](#)
2. [Define Agile structure in EAP for Jira Configuration](#)

Activate Jira configuration in Enterprise Agile Planning

Activate the Jira configuration so that EAP teams integrated with Jira projects can be shown in the Enterprise Agile Planning workspace.

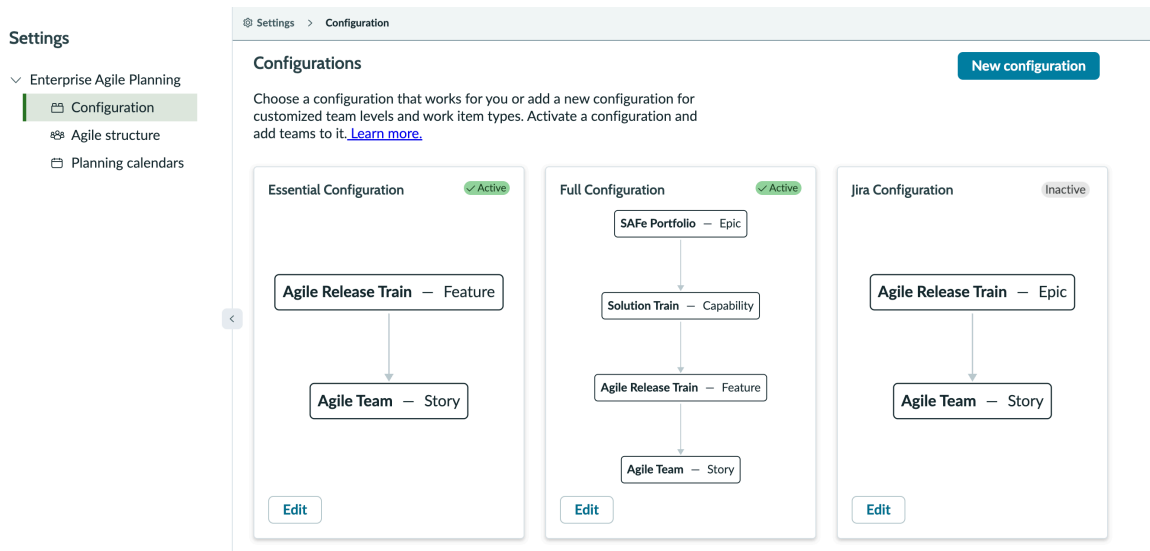

Before you begin

Ensure that **Application Scope** of your ServiceNow instance is set to **Strategic Planning**.

Role required: sn_apw_advanced.eap_admin

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace**.
2. From the **Settings** menu, select **Enterprise Agile Planning > Configuration**.

3. On the Jira configuration card, select **Edit.**

4. On the configuration form, set the **State field to **Active**.**

5. Select **Save.**

What to do next

[Define Agile structure in EAP for Jira Configuration.](#)

Define Agile structure in EAP for Jira Configuration

Set up Agile team structures in Enterprise Agile Planning (EAP) for teams associated with Jira projects so that imported work items and updates from Jira display correctly in EAP.

Before you begin

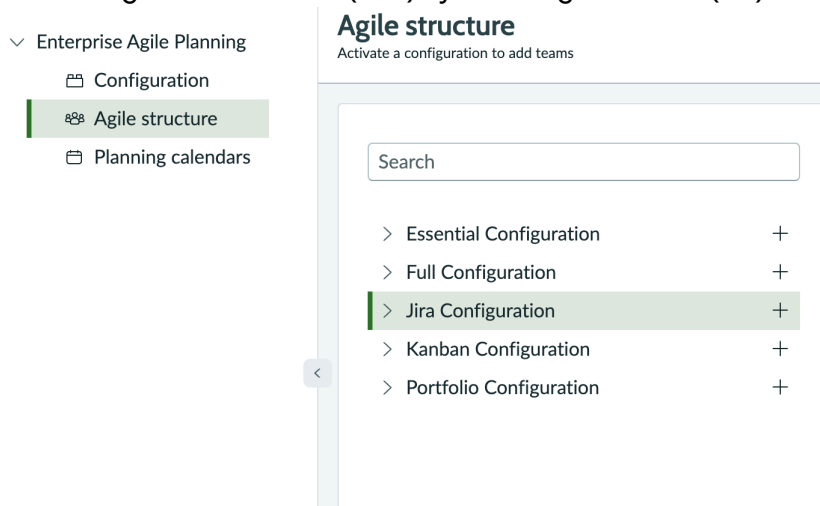

Activate Jira configuration in Enterprise Agile Planning.

Ensure that **Application Scope** of your ServiceNow instance is set to **Strategic Planning**.

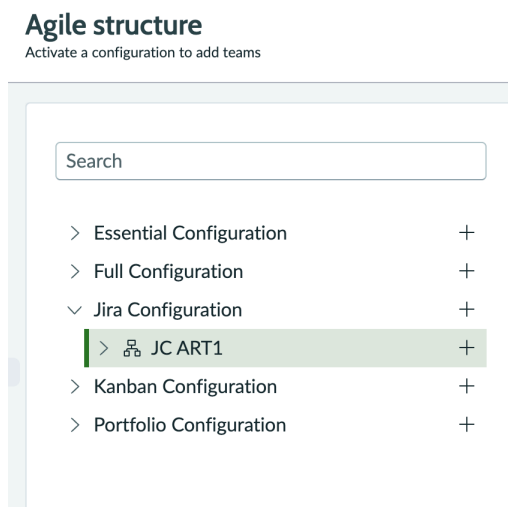

Role required: sn_apw_advanced.eap_admin

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace**.
2. From the **Settings** menu, select **Enterprise Agile Planning > Agile structure**.
3. Add an Agile Release Train (ART) by selecting the + icon (+) next to Jira Configuration.

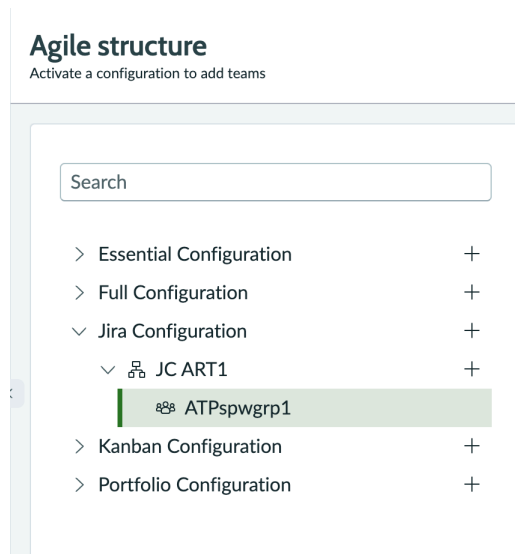

- a. On the Agile Release Train form, fill in details such as name and description.
 - b. Select **Submit**.
 - c. Repeat the action to add as many ARTs as you need.
4. For each ART, add Agile Teams by selecting the + icon (+) next to the ART's name. If you cannot find your teams, contact your admin.

Result

An Agile structure is defined for Jira Configuration in EAP.

**What to do next**

[Start using SPW and EAP with Jira integration.](#)

eap-config-hierarchy

TBD TBD.

Before you begin

Role required: admin

Procedure

Navigate to **All** > > .

Using EAP with SPW Jira Integrations

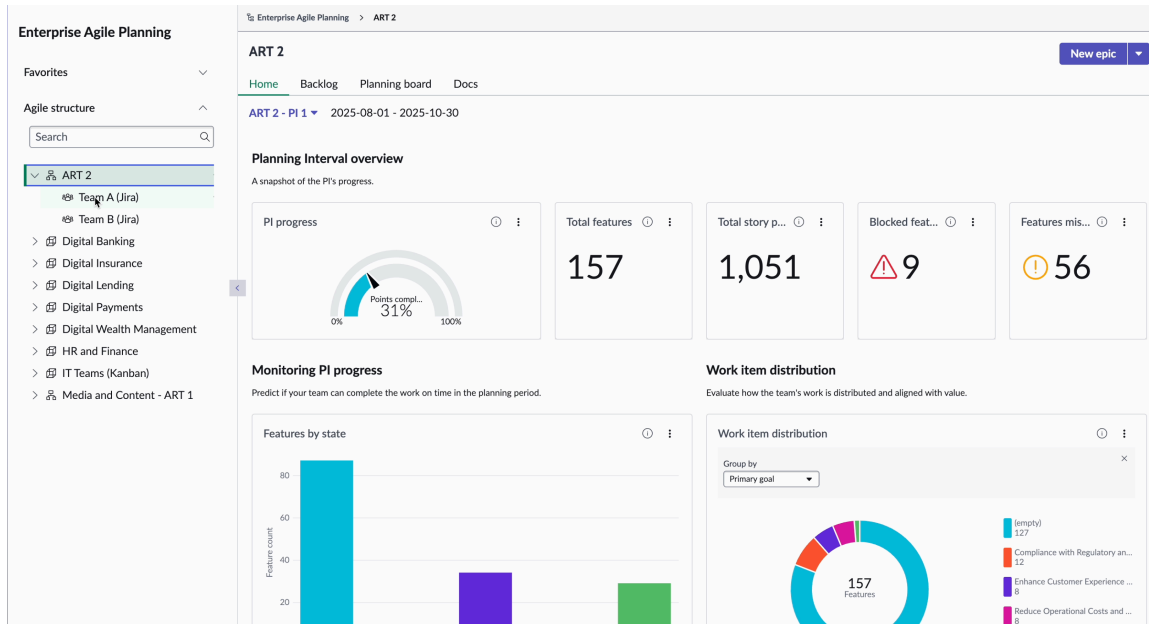

After configuration is complete for SPW Jira Integrations, use Enterprise Agile Planning (EAP) to bridge strategy and execution. Plan and schedule work in EAP, let teams deliver in Jira, and see progress and performance flow back to EAP for accurate, real-time visibility.

Strategic planners such as portfolio managers and product owners can use EAP to define planning intervals and sprints, create and prioritize epics and stories, and assign them to teams. These plans sync to Jira, where delivery teams execute and update work.

Changes made in Jira such as sprint updates, status changes, or newly scheduled work flow back into EAP, maintaining end-to-end visibility without switching tools.

From the EAP team's Home tab, you can view reports to track current-sprint status, overall execution health, and team performance.

This workflow enables you to plan in EAP, execute in Jira, and monitor outcomes in one place.

For more information on managing backlog and sprints using EAP, see [Manage team backlog in EAP](#) and [Perform PI planning in EAP](#).

SPW Jira Integrations reference

Reference topics provide additional information about the lists and forms that you use to configure SPW Jira Integrations.

Components installed with SPW Jira Integrations

Learn about the roles and tables installed with the SPW Jira Integrations application.

Roles installed

Role title [name]	Description	Contains roles
Jira integration admin [sn_jira_int.admin]	Has complete access to the SPW Jira Integrations application	<ul style="list-style-type: none"> sn_int_common.admin sn_jira_int.user
Jira integration user [sn_jira_int.user]	<ul style="list-style-type: none"> Sets up integration between Jira and Strategic Planning Can create new or update the existing map configurations between Jira and Strategic Planning 	<ul style="list-style-type: none"> connection_admin sn_int_common.user credential_admin

Tables installed

Table	Description
Choice Map [sn_int_common_choice_map]	Stores the list of workflow state mapping for Jira projects.

Table	Description
Event Type [sn_int_common_input_event_type]	Stores information of the type of webhook events such as create, update, or delete of a work item.
External Identifiers [sn_int_common_external_identifiers]	Stores the list of all Jira reference identifiers such as External ID, External Key, External Project, External URL, and so on.
External Project [sn_int_common_project]	Stores information of the Jira project such as project ID, the Jira instance of this project, project name, and so on.
External system [sn_int_common_external_system]	Stores information of Jira application used for the integration.
External System Version [sn_int_common_external_system_version]	Stores version information of Jira application used for the integration.
Field Map [sn_int_common_field_map]	Stores the list of field mapping of different issue types for Jira projects.
Jira Board [sn_jira_int_board]	Stores the list of imported boards from Jira.
Jira Import Request [sn_jira_int_import_request]	Stores the list of all import requests created to import projects, boards, and project style mappings from Jira.
Jira Instance [sn_jira_int_instance]	Stores the list of all Jira instances.
Jira Project [sn_jira_int_project]	Stores the list of all imported projects from Jira.
Team Integration Settings [sn_agile_jira_int_import_settings]	Stores the list of one-to-one relation between a Jira project, board, and an EAP Team.
Project Style Mapping [sn_jira_int_prj_style_mapping]	Store the list of map configuration templates per Jira project style.
Table Map [sn_int_common_table_map]	Stores the list of table maps for Jira projects.

Default mapping configuration for SPW Jira Integrations

Learn about the default mapping configuration of Epic, Story, and Sprint work types between Strategic Planning and Jira.

Epic mapping configuration

Epic [sn_align_core_scrum_epic] in Strategic Planning is mapped to Epic in Jira. The field mapping between these two tables is as follows.

Epic Table Map

Field in Strategic Planning	Field in Jira
approved_start_date	Start date
state	Status
short_description	Summary
approved_end_date	Due date

Story mapping configuration

Story [rm_story] in Strategic Planning is mapped to Story in Jira. The field mapping between these two tables is as follows.

Story Table Map

Field in Strategic Planning	Field in Jira
assigned_to	Assignee
description	Description
iteration	Sprint
parent_work_item	Parent
priority	Priority
short_description	Summary
state	Status

Sprint mapping configuration

Enterprise agile iteration [sn_apw_advanced_eap_iteration] in Strategic Planning is mapped to Sprint in Jira. The field mapping between these two tables is as follows.

Sprint Table Map

Field in Strategic Planning	Field in Jira
state	state
start_date	startDate
name	name
end_date	endDate

Exploring Dashboards in Strategic Planning Workspace

As a product and portfolio manager, use dashboards in Strategic Planning Workspace to monitor performance, track progress, and make informed decisions related to ideas, feedback, strategy, planning, and execution. These dashboards leverage Platform Analytics to provide a trend of historical data and regular reports.

The following are four out-of-the-box dashboards available in the Strategic Planning Workspace:

- Product Idea Dashboard
- Feedback Dashboard
- Strategy Execution Dashboard
- Execution Dashboard

You can use the default dashboards or create your own dashboards to monitor performance and take informed decisions.

Benefits of dashboards

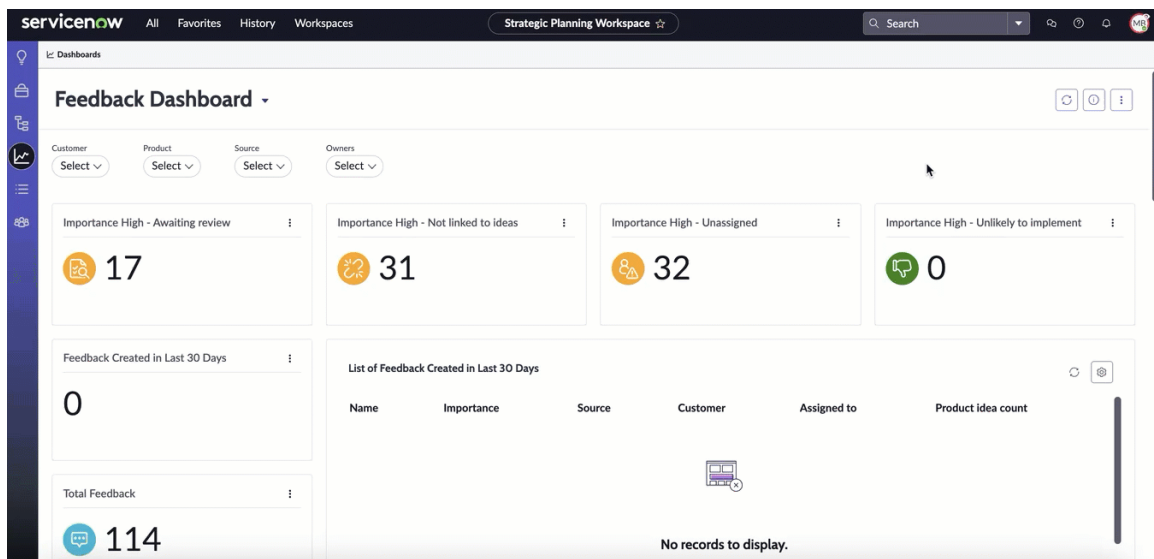

- Create data visualizations and add them to the dashboards using the Platform Analytics experience.
- Monitor performance, track progress, and make informed decisions related to ideas, feedback, strategy, planning, and execution.
- Duplicate existing dashboards and customize them as needed, without modifying the out-of-the-box dashboards.
- Use the out-of-the-box dashboards or configure your own dashboards as needed.

- Share dashboards with stakeholders to enable collaboration.
- View relevant data by applying filters directly within a dashboard.
- Any filters applied are saved as part of user personalization and are available the next time you log in.

For guidance on using and managing dashboards in the Strategic Planning Workspace, see [Using Dashboards in Strategic Planning Workspace](#).

Feedback Dashboard in Strategic Planning Workspace

The Feedback Dashboard helps product managers track feedback volume and stakeholder trends to surface recurring pain points, inform prioritization decisions, and demonstrate responsiveness.

Feedback Dashboard

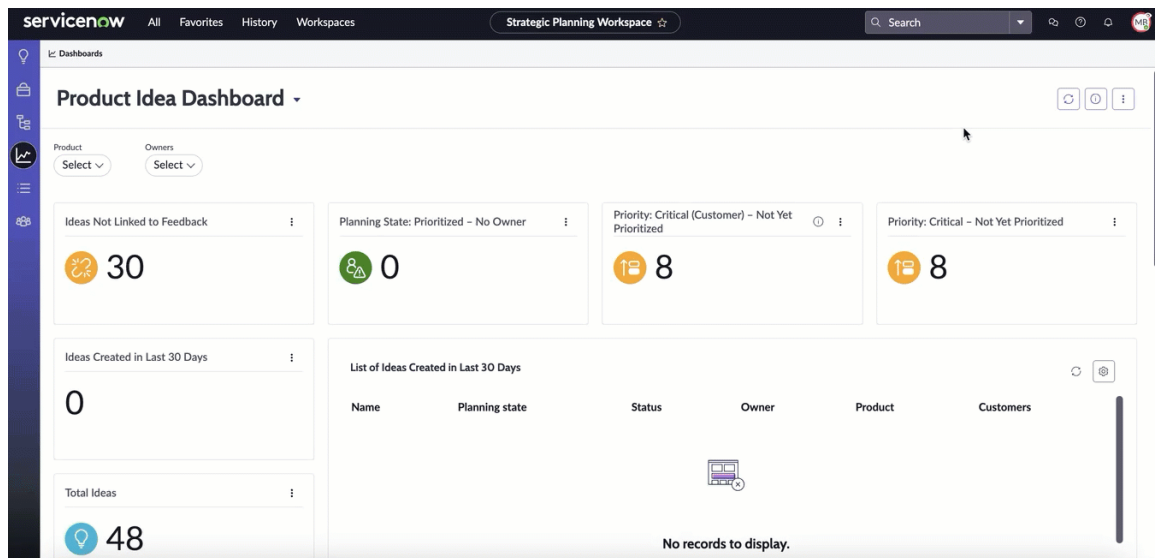

Widget/Visualization	Description
Importance High - Awaiting review	Count of feedback items with high importance (1-High) and a state of either Submitted or Need More Information.
Importance High - Not linked to ideas	Count of feedback items with high importance (1-High) that aren't linked to any ideas.
Importance High - Unassigned	Count of feedback items with high importance (1-High) that aren't assigned to anyone.
Importance High - Unlikely to implement	Count of feedback items with high importance (1-High) and a state of Unlikely to Implement.
Feedback Created in Last 30 Days	Count of feedback items created within the last 30 days.
List of Feedback Created in Last 30 Days	List of feedback items created within the last 30 days, including details such as Name, Importance, Source, Customer, Assigned to, and Product idea count.
Total Feedback	Total number of feedback items received to date.

Feedback Dashboard (continued)

Widget/Visualization	Description
Feedback Distribution	Visualization of feedback items with grouped by Importance and stacked by Customer.
Overall Feedback Distribution	Visualization of feedback items with grouped by Importance.
Feedback Linked to Ideas in the Last 30 Days	Visualization of feedback items linked to ideas within the last 30 days and grouped by Importance.
Feedback Count by Location	Count of feedback items by location.

Product Idea Dashboard in Strategic Planning Workspace

The Product Idea Dashboard helps product managers understand the health, flow, and maturity of submitted ideas, helping innovations progress and helping prevent backlog bottlenecks.

Product Idea Dashboard

Widget/Visualization	Description
Ideas Not Linked to Feedback	Count of ideas that aren't linked to any feedback.
Planning State: Prioritized – No Owner	Count of ideas whose planning state is Prioritized but that have no assigned owner.
Priority: Critical (Customer) – Not Yet Prioritized	Count of ideas whose: <ul style="list-style-type: none"> • Planning state isn't Prioritized or Done • Priority is 1-Critical, and • Customers field is populated
Priority: Critical – Not Yet Prioritized	Count of ideas whose:

Product Idea Dashboard (continued)

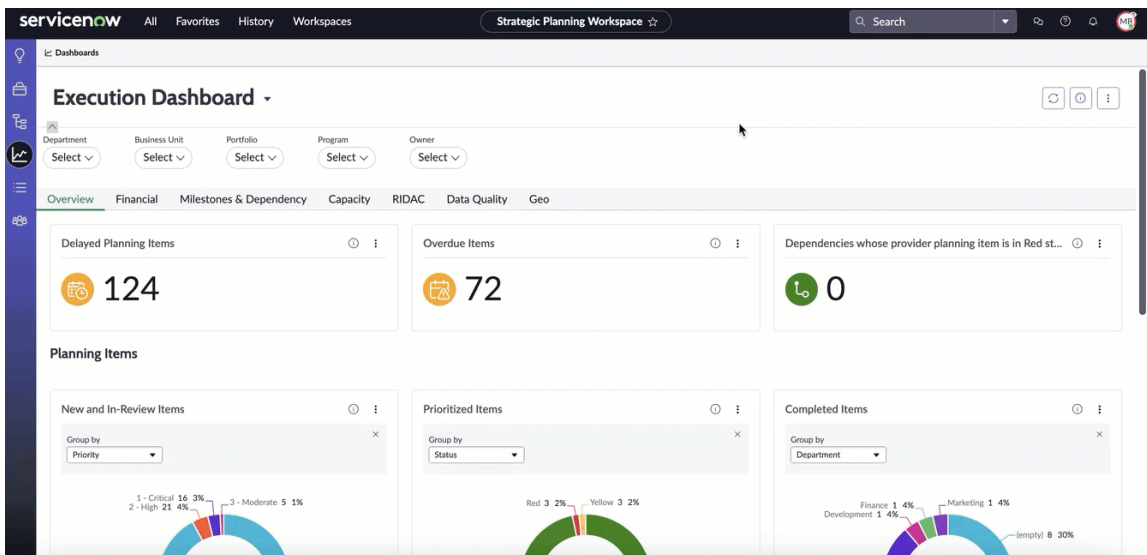

Widget/Visualization	Description
	<ul style="list-style-type: none"> • Planning state isn't Prioritized or Done, and • Priority is 1-Critical
Ideas Created in Last 30 Days	Count of ideas created within the last 30 days.
List of Ideas Created in Last 30 Days	List of ideas created within the last 30 days, including details such as Name, Planning state, Status, Owner, Product, and Customers.
Total Ideas	Total number of ideas received to date.
Breakdown of All Ideas	Visualization of all ideas with grouped by Planning state.
Breakdown: Ideas Not Linked to Feedback	Visualization of ideas not linked to feedback within the last 30 days and grouped by Planning state.
Idea Analyzer	Visualization of ideas with grouped by Impact and stacked by Priority.

Execution Dashboard in Strategic Planning Workspace

The Execution Dashboard helps portfolio and product managers gain real-time visibility into delivery progress across work items, enabling portfolio leads to detect delays, course-correct early, and keep the strategy on track.

The Execution Dashboard provides various analytics across different tabs, including Overview, Financial, Milestones & Dependency, Capacity, RIDAC, Data Quality, and Geo.

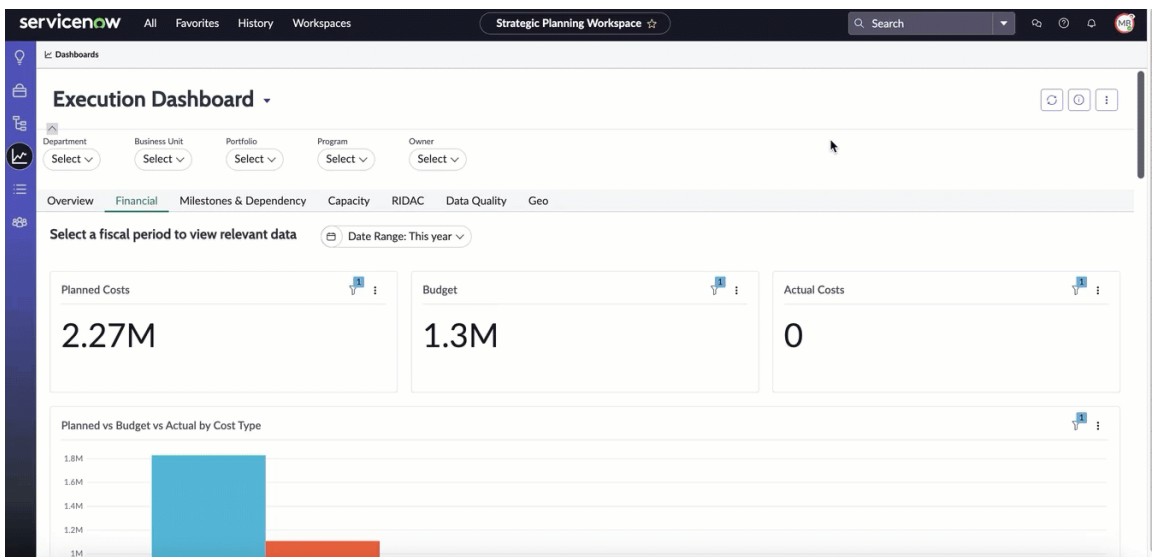

Overview tab in the Execution Dashboard

Widget/Visualization	Description
Delayed Planning Items	Planning items that were prioritized but haven't started yet (no recorded actual start

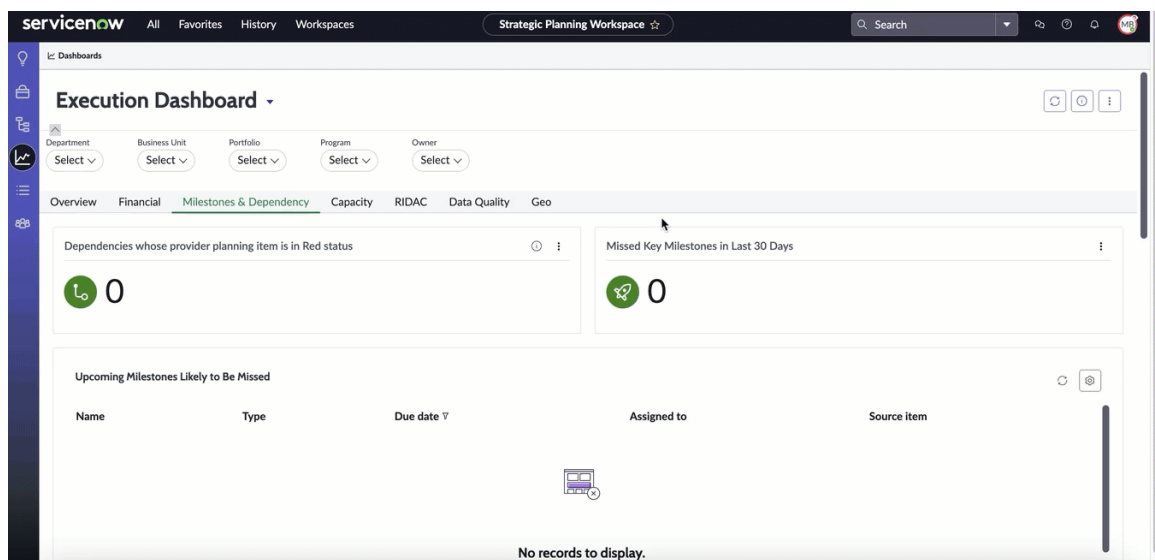

Widget/Visualization	Description
	date), despite having an approved start date in the past.
Overdue Items	Prioritized planning items that remain incomplete (no recorded actual end date), despite having an approved end date in the past.
Dependencies whose provider planning item is in Red status	Dependencies that have a provider planning item in red status, affecting all dependent planning items.
Planning Items	
New and In-Review Items	Visualization of new and in-review planning items grouped by Priority. You can also group the items using other available options.
Prioritized Items	Visualization of prioritized planning items grouped by Status. You can also group the items using other available options.
Completed Items	Visualization of planning items whose state is Done. You can also group the items using other available options.
Execution Items	
Projects	Visualization of projects count grouped by State. You can also group the items using other available options.
Demands	Visualization of demands count grouped by State. You can also group the items using other available options.

Financial tab in the Execution Dashboard

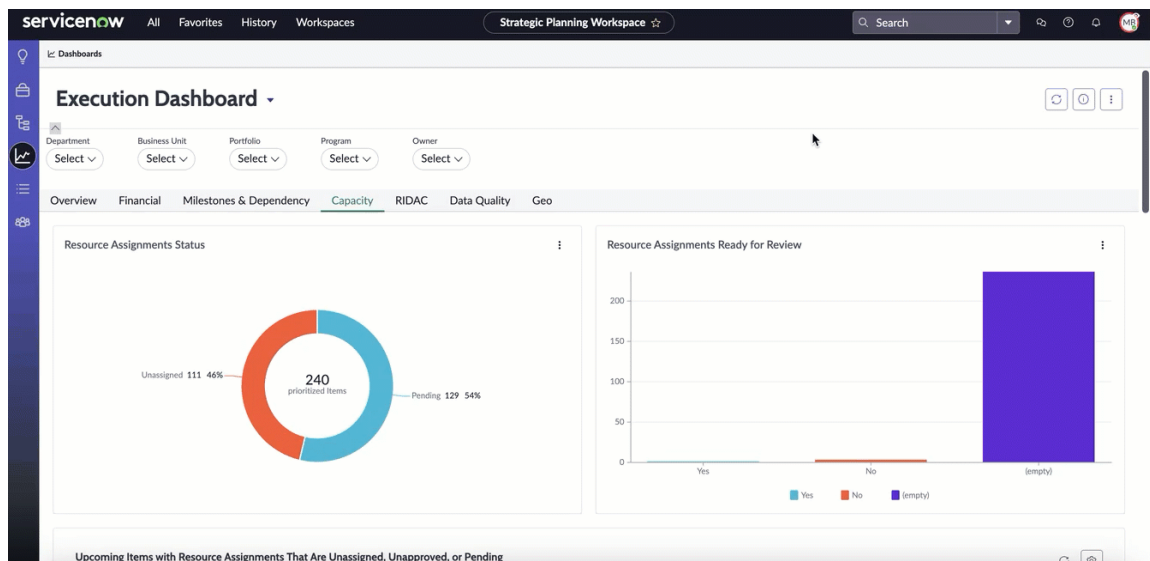

Widget/Visualization	Description
Select a fiscal period to view relevant data	Option to select date range as This year or Last year to filter and display the data accordingly. Clearing the date range displays the data considering from the start date of the portfolio plan.
Planned Costs	Estimated cost for executing the plan.
Budget	Estimated budget for executing the plan.
Actual Costs	Actual cost incurred during plan execution.
Planned vs Budget vs Actual by Cost Type	Visualization of Planned vs Budget vs Actuals by Cost Type.
Planned vs Budget vs Actual	Visualization of cost by Planned vs Budget vs Actual.
Budget by Investment Type	Visualization of budget by Investment type.
Benefits	
Planned Monetary Benefits	Monetary benefits that have been planned.
Actual Monetary Benefits.	Monetary benefits that have been achieved.
Pending Monetary Benefits.	Monetary benefits that are in pending state.
Benefits by Category	Benefits by category such as Revenue, Cost savings, and Customer satisfaction score.
Monetary Benefits	Visualization of monetary benefits with respect to planned and actual benefits.

Milestones & Dependency tab in the Execution Dashboard

Widget/Visualization	Description
Dependencies whose provider planning item is in Red status	Count of dependencies that have a provider planning item in red status, affecting all dependent planning items.
Missed Key Milestones in Last 30 Days	Count of planning items whose key milestones were missed within the last 30 days.
Upcoming Milestones Likely to Be Missed	List of planning items whose key milestones about to be missed soon with details including Name, Type, Due date, Assigned to, Source item.
Missed Milestones in Last 30 Days	List of planning items whose key milestones were missed within the last 30 days with details including details, Name, Type, Due date, Assigned to, and Source item.
Achieved Milestones in Last 30 Days	List of planning items whose key milestones were achieved within the last 30 days with details including details, Name, Type, Due date, Assigned to, and Source item.
Milestones Analyzer	Visualization of key milestones grouped by state and stacked by Type. You can also group and stack the items using other available options.

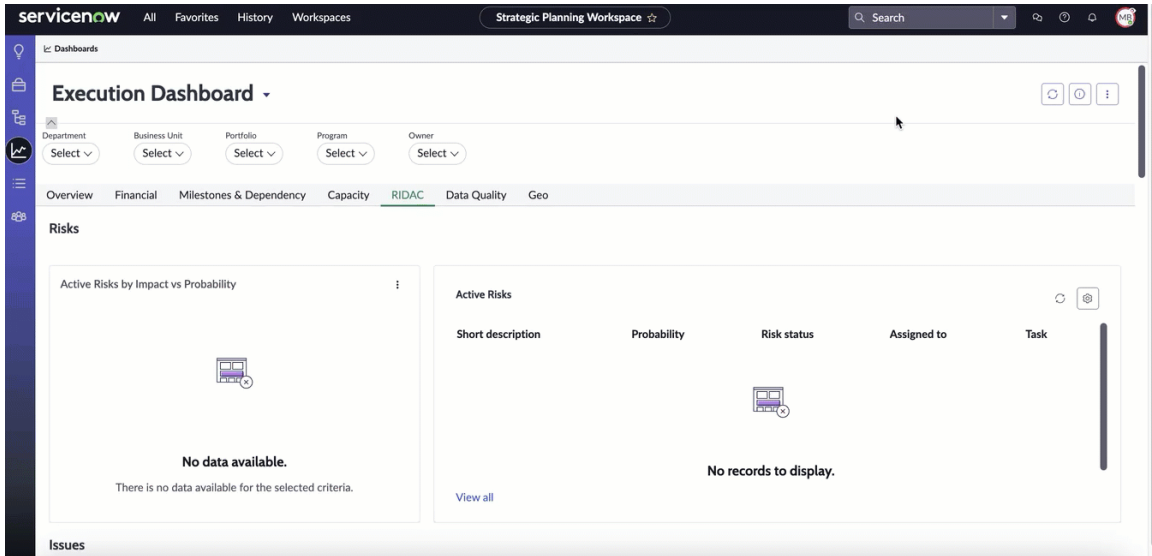

Capacity tab in the Execution Dashboard

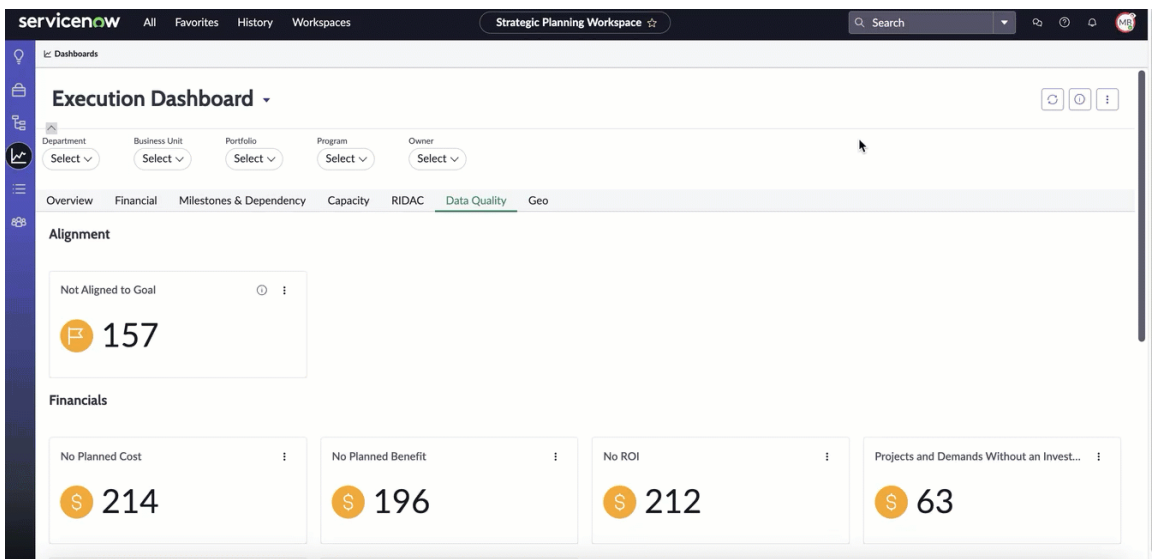

Widget/Visualization	Description
Resource Assignments Status	Visualization of resource assignments status.
Resource Assignments Ready for Review	Visualization of resource assignments count that is ready for review.

Widget/Visualization	Description
Upcoming Items with Resource Assignments That Are Unassigned, Unapproved, or Pending	List of upcoming planning items whose resource assignments status is Unassigned, Unapproved, or Pending.
Resource Assignments by Group, Role & Skill	Visualization of resource assignments count by their group, role, and skill.

RIDAC tab in the Execution Dashboard

Data Quality tab in the Execution Dashboard

Widget/Visualization	Description
Alignment	
Not Aligned to Goal	Count of work items that aren't associated with any goal.
Financials	

Widget/Visualization	Description
No Planned Cost	Count of work items for which cost estimation is done yet for execution.
No Planned Benefit	Count of work items for which benefit estimation is done yet.
No ROI	Count of work items for which ROI isn't estimated yet.
Projects and Demands Without an Investment Type	Count of projects and demands for which Investment type isn't defined yet.
Monetary Benefit Plans Without a Planned Benefit	Count of monetary benefit plans for which benefit isn't defined yet.
Monetary Benefit Plans Without a Sponsor	Count of monetary benefit plans for which a sponsor hasn't been assigned yet.
Planning Items with Other Attributes	
No Resource Assignments	Count of planning items without resource assignments.
Unscheduled Items	Count of planning items not scheduled yet.
No Portfolio	Count of planning items with no portfolio defined.
No Program	Count of planning items with no program defined.
No Department	Count of planning items with no department populated.
No Business Unit	Count of planning items with no business unit populated.
No Owner	Count of planning items with no owner assigned.

Geo tab in the Execution Dashboard

Widget/Visualization	Description
Planned cost by location	Estimated cost by location for executing the plan.

Strategy Execution Dashboard in Strategic Planning Workspace

The Strategy Execution Dashboard helps portfolio managers monitor the alignment between strategy and business outcomes, and quickly assess goal progress to ensure high-impact delivery.

The Strategy Execution Dashboard provides various analytics through the tabs and Execution Hub.

Strategic Overview tab in the Strategy Execution Dashboard

Strategic Overview tab of Strategy Execution Dashboard

Widget/Visualization	Description
Goal Status	Goals that are In Progress or Approved, or have a status of Green, Yellow, or Red.
Goal Analyzer	Visualization of goals with grouped by Owner and stacked by Strategic priority.
Target Status	Visualization of targets count with their status as Red, Green, Yellow, and None.
Targets by Goal	Visualization of targets count with their goals.
Goals and Targets	List of goals and targets, including details such as Name, Status, and Progress.

Execution tab in the Strategy Execution Dashboard

Widget/Visualization	Description
Select a fiscal period to view relevant data	Option to select date range as This year or Last year to filter and display the data accordingly. Clearing the date range displays the data considering from the start date of the portfolio plan.
Planned Costs	Estimated cost for executing the plan.
Budget Costs	Estimated budget for executing the plan.
Actual Costs	Actual cost incurred during plan execution.
Planned Monetary Benefits	Monetary benefits that have been planned.
Actual Monetary Benefits	Monetary benefits that have been achieved.
Planned vs Budget vs Actual by Cost Type	Visualization of Planned vs Budget vs Actuals by Cost Type.
Budget by Investment type	Visualization of budget by Investment type.
Supplementary Data	
New and In-Review Items	Visualization of new and in-review planning items with grouped by Priority.
Prioritized Items	Visualization of prioritized planning items with grouped by Status.
Completed Items	Visualization of planning items whose state is Done.
Delayed Planning Items	Planning items that were prioritized but haven't started yet (no recorded actual start date), despite having an approved start date in the past.
Items Overdue	Prioritized planning items that remain incomplete (no recorded actual end date), despite having an approved end date in the past.
Dependencies whose provider planning item is in Red status	Dependencies that have a provider planning item in red status, affecting all dependent planning items.
Missed Key Milestones in Last 30 Days	Count of planning items whose key milestones were missed within the last 30 days.
Upcoming Milestones Likely to Be Missed	List of planning items whose key milestones about to be missed soon with details including Name, Type, Due date, Assigned to, Source item.
Resource Assignments Status	Visualization of resource assignments status.
Resource Assignments Ready for Review	Visualization of resource assignments count that is ready for review.
Upcoming Items with Resource Assignments That Are Unassigned, Unapproved, or Pending	List of upcoming planning items whose resource assignments status is Unassigned, Unapproved, or Pending.

Using Dashboards in Strategic Planning Workspace

Using the Platform Analytics dashboards in Strategic Planning Workspace, you can monitor performance, track progress, and make informed decisions related to ideas, feedback, strategy, planning, and execution.

Roles required for managing dashboards

Required roles to access out-of-the-box dashboards

Access level	Required roles
Read, duplicate, or share the Strategy Execution Dashboard and Execution Dashboard	sn_align_core.ap_read_only Note: To view data in financial-related and capacity-planning-related widgets, users must have the appropriate roles.
Read, duplicate, or share the Product Idea Dashboard and Product Feedback Dashboard	pf_read
Edit the Strategy Execution Dashboard and Execution Dashboard	admin
Edit the Product Idea Dashboard and Product Feedback Dashboard	admin

Required roles to create or edit dashboards (excluding out-of-the-box dashboards)

Access level	Required roles
Create dashboards	sn_align_core.apw_user
Edit dashboards	sn_align_core.apw_user Note: You can edit dashboards that you own or those you've been granted permission to edit.

Note:

You can create widgets in dashboards by configuring any available data source table in the ServiceNow AI Platform. However, you must have read access to the source tables to view key data, metrics, or visualizations.

For example, if you create a widget in a dashboard configuring the Cost Plan Breakdown table to display budget data, the budget summary is visible on the dashboard only if you have read access to the Cost Plan Breakdown table. Similarly, when you share this dashboard with a stakeholder, the stakeholder must also have read access to the Cost Plan Breakdown table to view the budget summary.

For more information on the required roles to manage Platform Analytics dashboards, see [Platform Analytics dashboard roles](#).

View a dashboard

View key data and metrics on a dashboard to monitor performance, track progress, and make informed decisions related to ideas, feedback, strategy, planning, and execution.

Before you begin

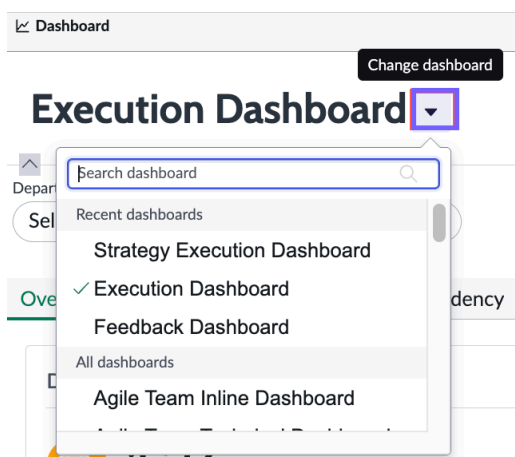

Role required: sn_align_core.ap_read_only

About this task

Dashboards consolidate data from multiple sources into a single, easily digestible format. Each widget within a dashboard displays key data and metrics and may include visualizations.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Dashboards**.
By default, the Execution Dashboard appears on the Dashboards page.
2. From the Change dashboard drop-down, select the dashboard you want to view.

The selected dashboard appears.

3. **Optional:** Select a required tab that you want to view the key data and metrics for.
Each widget within a dashboard displays key data and metrics and may include visualizations.
4. **Optional:** Select a widget to see more details of the data in list view.
If you have edit access, you can update the details of an individual record directly from the list view when necessary.

Related topics

- [Add a Platform Analytics dashboard](#)

Create a dashboard

In the Platform Analytics experience, you can create shareable dashboards with data visualizations, filters, and other elements. You can use the available elements in the inline editor to create different types of widgets as needed.

Before you begin

Role required: sn_align_core.apw_user

About this task

Dashboards consolidate data from multiple sources into a single, easily digestible format. Each widget within a dashboard displays key data and metrics and may include visualizations.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Dashboards**.
By default, the Execution Dashboard appears on the Dashboards page.
2. From the dashboard header, select the More actions icon () and then select **Create new**.
3. On the New dashboard window, fill the details.
 - a. Enter a name for the dashboard in the **Name** field.
 - b. **Optional:** Enter a brief description for the dashboard in the **Description** field.
 - c. Select **Create new dashboard**.

Result

The dashboard has been created.

What to do next

Edit a dashboard as needed by adding sections, filters, images, lists, process mining maps, and rich text. For more information, see [Edit a dashboard](#).

Related topics

[View a dashboard](#)

[Duplicate a dashboard](#)

[Share a dashboard](#)

[Add a Platform Analytics dashboard](#)

Edit a dashboard

Customize or edit a dashboard as needed by adding sections, filters, images, lists, process mining maps, and rich text. If the dashboard has been shared, any changes you make are applied globally.

Before you begin

Role required: sn_align_core.apw_user

About this task

Note:

- You can edit dashboards that you own or those you've been granted permission to edit.
- Only an administrator can edit the out-of-the-box dashboards, including the Product Idea Dashboard, Feedback Dashboard, Strategy Execution Dashboard, and Execution Dashboard. However, you can [duplicate an out-of-the-box dashboard](#) and customize it as needed.

You can use the following elements to create or edit your dashboard.

Dashboard elements in Strategic Planning

Element	Description
Data visualization	Enables you to present a visual representation of current instance data or temporary data that

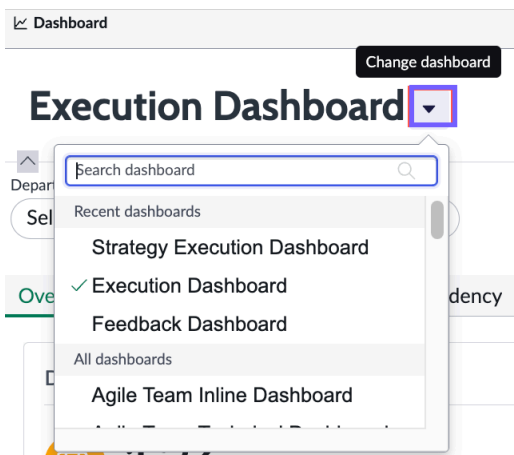

Dashboard elements in Strategic Planning (continued)

Element	Description
	you've imported. Data visualizations include visualizations that you create in the dashboard designer and data visualizations from the library.
Filter	Enables you to filter the visualizations on a dashboard based on specified criteria. You can put filters either on the individual tabs or above the tabs so that the filter applies to elements every tab. Filters include both data filters and domain filters. You can create filters in the dashboard designer or select them from the library.
Heading	Provides a place for text at the top of a dashboard or section of a dashboard. Formatting for headings is limited to six heading levels.
Image	Holds static or animated images on the dashboard.
List - Simple	Shows table data that you can customize for the dashboard audience.
Process Mining - Map	Maps the different states that are part of your process and the transitions between those states. See which states the objects of the process are in and the speed with which they change state. Requires an existing Process Mining project.
Rich text	Holds text that you can format either as text or as html, including font selection, text size, highlighting, and hyperlinks. To edit HTML markup, open the HTML editor from the Configuration panel and select the Code tags < > icon.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Dashboards**.
By default, the Execution Dashboard appears on the Dashboards page.
2. From the Change dashboard drop-down, select the dashboard you want to edit.

The selected dashboard appears.

3. From the dashboard header, select **Edit**.
4. Drag to move the widget or resize it as required.
5. From the dashboard header, select **Save**.
6. From the dashboard header, select **Exit editing mode**.

Result

The dashboard is updated with the latest changes.

What to do next

- Add more elements and customize your dashboard as required.
- For detailed instructions on editing a dashboard using the Platform Analytics experience in Strategic Planning, see [Edit Platform Analytics dashboards](#) .

Related topics

[View a dashboard](#)

[Create a dashboard](#)

[Duplicate a dashboard](#)

[Share a dashboard](#)

[Add a Platform Analytics dashboard](#)

Duplicate a dashboard

If the dashboard you want to create is similar to an existing one, duplicating the existing dashboard saves your time. After duplicating the dashboard, you can customize the tabs and widgets as required.

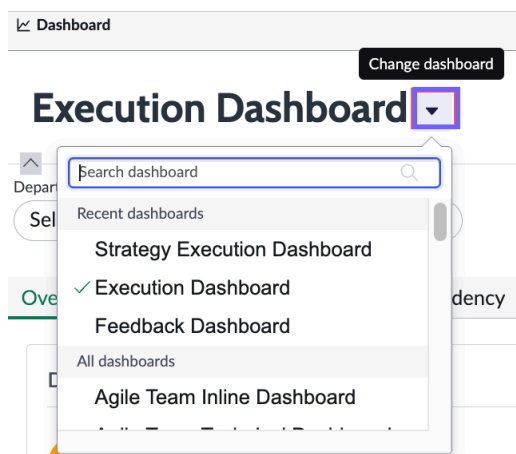

Before you begin

- Users or groups that you want to share the dashboard with must have the `sn_align_core.ap_read_only` or `sn_align_core.apw_user` role to get the read or edit access to the portfolio plan respectively.
- When you duplicate a dashboard, you copy all settings and details of the original. Content that exists locally on the original dashboard is duplicated onto the new dashboard. If the original dashboard contains references to content in a library, such as a shared visualization, the references are duplicated. The role requirements for editing an element in a library apply to the latter.

Role required: `sn_align_core.ap_read_only`

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Dashboards**.
By default, the Execution Dashboard appears on the Dashboards page.
2. From the Change dashboard drop-down, select the dashboard that you want to duplicate.

The selected dashboard appears.

3. From the dashboard header, select the More actions icon () and then select **Duplicate**.
4. On the Duplicating dashboard window, fill the details.

- a. Enter a name for the portfolio plan in the **New name** field.
By default, the name is *ABC (Copy)* where ABC is the name of the dashboard you duplicated from.
- b. **Optional:** Enter a brief description of the goal in the **Description** field.
- c. Select **Duplicate**.

Duplicating the dashboard may take some time. Select **Continue in background** to keep using the application in the meantime.

Result

The dashboard is copied with the new name. The appearance of the dashboard is identical to the original.

What to do next

Edit a dashboard as needed by adding sections, filters, images, lists, process mining maps, and rich text. For more information, see [Edit a dashboard](#).

Related topics

Share a dashboard

Share a dashboard with stakeholders, planning managers, portfolio managers, or product managers to provide visibility into work progress and foster collaboration. You can grant either view-only rights or both view and edit rights to a shared dashboard.

Before you begin

Role required: sn_align_core.ap_read_only

About this task

Users or groups you want to share the dashboard with must have the appropriate roles assigned to access shared dashboards:

Required roles to access dashboards

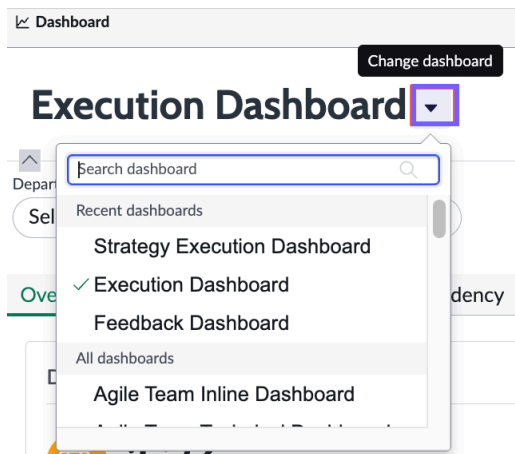

Dashboard	Role required
<ul style="list-style-type: none"> • Strategy Execution Dashboard • Execution Dashboard 	<p>sn_align_core.ap_read_only</p> <p>Note: To view data in financial-related and capacity-planning-related widgets, users must have the appropriate roles.</p>

Required roles to access dashboards (continued)

Dashboard	Role required
<ul style="list-style-type: none"> • Product Idea Dashboard • Product Feedback Dashboard 	pf_read

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Dashboards**.
By default, the Execution Dashboard appears on the Dashboards page.
2. From the Change dashboard drop-down, select the dashboard you want to share.

The selected dashboard appears.

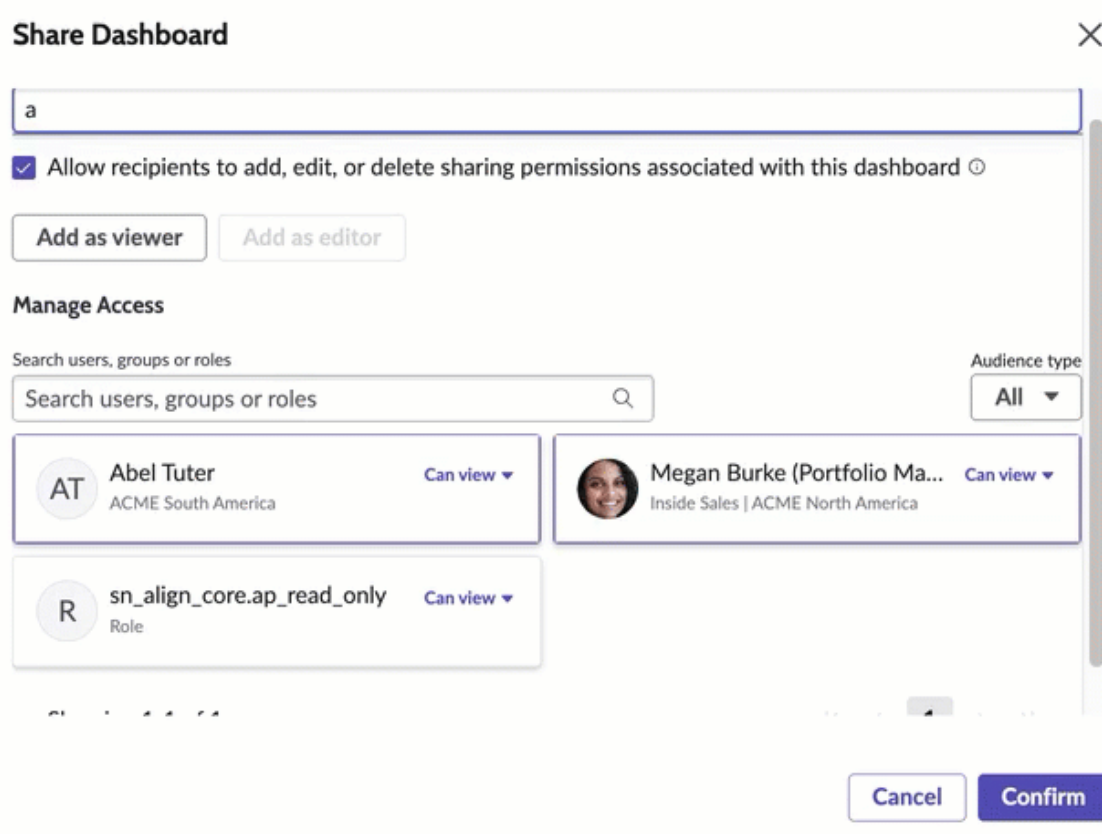

3. From the dashboard header, select the More actions icon () and then select **Share**.
4. On the Share Dashboard window, fill the details.
 - a. Enter a user name or group name in the **Grant access to** field to provide access to individual users or user groups, respectively.
You can also select a role to grant dashboard access to all users assigned that role.
 - b. **Optional:** Select **Allow recipients to add, edit, or delete sharing permissions associated with this dashboard** to enable users to grant access to new users and modify or remove existing permissions.
 - c. Select **Add as viewer** or **Add as editor** as required.

Note: You can select **Add as editor** only if you have the sn_align_core.apw_user role assigned to you.

The selected users, groups, and roles appear under **Manage Access**.

You can also manage sharing permissions by selecting a user, group, or role and enabling the **Can share** option.

d. Select Confirm.

Result

The roles, groups, and users you have shared the dashboard with appear when you reopen the dialog, along with the rights you have given them.

What to do next

You can change the rights of whom you have shared the dashboard with in the Share Dashboard dialog, under the Can view/Can share list for each user, group, or role.

- [Duplicate a dashboard](#)
- [Add a Platform Analytics dashboard](#)

Add a Platform Analytics dashboard

If you have existing dashboards created using Platform Analytics, you can add them to the Strategic Planning Workspace to access them directly from a single location.

Before you begin

Role required: sn_align_core.apw_user

About this task

You can add any Platform Analytics dashboard to Strategic Planning Workspace.

Procedure

1. Navigate to All > Platform Analytics > Analytics Center.

The Dashboards section appears on the page.

2. Select a bookmarked or certified dashboard from the **Bookmarked or **Certified** tabs, respectively.**

If the dashboard you want to add is not bookmarked or certified, select **View all** from the Dashboards section, and then select the dashboard from the Dashboards page.

The selected dashboard appears.

3. From the dashboard header, select **Edit.**

4. From the dashboard header, select the View dashboard details icon ().

a. In the Details side panel, fill in the **Dashboard visibility** field with Strategic Planning Workspace.

5. From the dashboard header, select **Save.**

6. From the dashboard header, select **Exit editing mode.**

Result

The dashboard appears in the Strategic Planning Workspace.

Next Experience for Demand Management in Strategic Planning

Create, evaluate, and prioritize demands throughout the demand life-cycle using Next Experience for Demand Management.

Next Experience for Demand Management gives organizations and teams a structured way to capture, assess, and prioritize different types of work before committing to execution. Using Next Experience for Demand Management, demand managers can review incoming requests, assess business cases and capacity, estimate costs, evaluate risks, and decide which demands are worth moving forward. Playbooks allow teams to define different governance processes as well.

Next Experience for Demand Management comes with the Playbook, Details, and Docs pages and is available for users with the Strategic Portfolio Management (SPM) Pro license.

Key benefits of Next Experience for Demand Management:

- Consistent demand intake and evaluation process - Next Experience for Demand Management enables a structured workflow where each demand progresses through defined evaluation stages such as intake, capacity and assessment, financial assessment, and approval.
- Centralized visibility into demand information - Next Experience for Demand Management provides a single interface to view all demands and their associated details such as business cases, capacity, and financials. This feature eliminates the need to cross-reference multiple forms, modules, or applications to compile a complete picture of a demand.

- **Playbook-guided demand life-cycle** - Playbooks define the sequence of stages and activities that a demand must go through such as creation, planning, assessment, and approval. Each stage contains a set of prescribed activities that must be completed before the demand transitions to the next stages. Using playbooks, you can define your own processes according to your requirements.
- **Consolidated data for demand prioritization** - Next Experience for Demand Management provides demand details, capacity and risk assessment outputs, financial summaries, and progress indicators in a unified view. This feature helps demand managers to compare, rank, and prioritize demands based on any defined criteria of an organization.
- **AI system integration through playbook activities** - The AI playbook enables the association of AI systems to a demand through a playbook activity. This feature enables demand managers to associate a demand with an AI system from directly within the demand workflow.
- **AI-assisted record refinement and summarization** - Using the Now Assist for Strategic Portfolio Management (SPM) skills, you can expand or condense text content in text fields and summarize the demand.

Exploring Next Experience for Demand Management

Next Experience for Demand Management helps you to create, evaluate, and prioritize demands, throughout the demand life-cycle.

Next Experience for Demand Management overview

Next Experience for Demand Management is a centralized workspace experience that streamlines how organizations capture, evaluate, and progress demands through their life-cycle. It brings together all demand-related activities, such as intake, qualification, and task management, into a single interface. By consolidating access to demands, tasks, resources, financials, and supporting records, the workspace eliminates the need to navigate across multiple modules.

Next Experience for Demand Management gives product owners, portfolio managers, and demand managers a comprehensive overview of all active and incoming demands. It enhances planning accuracy by providing structured ways to define demand scope, assess capacity, estimate effort, and evaluate financial and strategic impact. With guided governance through Playbooks, the Next Experience for Demand Management helps teams prioritize work effectively, improve decision-making, and ensure consistent progression of demands from intake to completion.

Next Experience for Demand Management benefits

Benefit	Feature
Capture a new business need and kick off structured governance from intake.	Create a demand and start the intake flow. For more information, see Create a demand .
Use advanced filtering options to find specific demands based on criteria such as status, start and end dates, and project type.	Filter and sort demands. For more information, see Demands list view .
Define different governance processes for demands.	Use playbooks (default and custom) for demand governance processes with low code/no code changes. For more information, see Use Playbooks .

Next Experience for Demand Management benefits (continued)

Benefit	Feature
Add and manage work needed to progress a demand to approval or delivery readiness.	Create and manage demand tasks (including time card submission). For more information, see Create and manage demand tasks .
Collaborate on specifications, notes, and decisions within the demand record.	Use Docs to co-author content directly from the demand. For more information, see Docs for demands in Next Experience for Demand Management .
Track risks, issues, and decisions to maintain traceability and control.	Add or associate RIDAC records with the demand. For more information, see Add and manage RIDAC records .
Plan and control financials associated with a demand.	Create cost plans, generate labor costs, and manage expense lines. For more information, see Managing financials for demands .
Create financial baselines to track variance over time.	Create demand baselines to track the demand finances. For more information, see Create financial baselines .
Quantify expected value for business cases.	Create and manage monetary and non-monetary benefit plans for your demand and associate them to each other. For more information, see Create and manage benefit plans .
Align work capacity with demand scope and timelines.	Create and manage capacity for a demand. For more information, see Create and manage resource assignments .
Progress qualified demands into downstream delivery entities.	Create entities from a demand such as projects, enhancements, and changes. For more information, see Create an entity from a demand .
Summarize demands and refine them using Now Assist.	Summarize a demand record from its details and refine the text field values of a demand. For more information, see Now Assist skills in Next Experience for Demand Management .
Link AI systems to a demand directly from Next Experience for Demand Management.	Associate AI systems with your demand as and when necessary. For more information, see Create AI systems .

Demand workflow

The demand workflow defines the life-cycle of a request, from initial intake through assessment and approval to downstream execution. This structured approach ensures that each request is evaluated consistently, aligned with business objectives, and supported by the right processes before any resources are committed.

Workflow overview

The end-to-end life-cycle for managing demands is described in the following table. This workflow confirms that the demands are progressively refined, validated, and aligned with business and strategic objectives.

Note:

The demand workflow overview table describes the traditional demand management process. You can customize the states and activities according to the requirements of your organization by defining your custom playbook.

Demand workflow overview

Task	Description	Demand states involved	Roles involved
Create a demand	<p>Demands enter the system via Service Catalog, Idea Portal, or directly by demand managers:</p> <ul style="list-style-type: none"> • Business users can submit an idea via the Service Catalog or Idea Portal. These ideas are evaluated by demand managers and promoted to a demand, if necessary. • Business users can bypass the ideation process and submit a demand directly from the Service Catalog. • Demand managers or demand users can directly submit demands from the Next Experience for Demand Management. 	Draft	Business user, demand manager, demand user
Complete demand details	<p>The demand manager or demand user reviews and adds required details. Demand managers can create and assign demand tasks to gather more information, if necessary.</p> <p>The demand is moved from the draft to the submitted state once the basic demand details are added.</p>	Draft → Submitted	Demand manager, demand user
Refine and finalize demand	The demand manager completes all required information (size, impact, business case, timeline, resources, costs/benefits, stakeholder registry, strategy alignment). They can assign tasks or request SME (subject matter expert) support, whenever required.	Submitted	Demand manager
Move demand to screening	The demand manager moves the demand to screening.	Submitted → Screening	Demand manager

Demand workflow overview (continued)

Task	Description	Demand states involved	Roles involved
	The assessments are sent to the stakeholders to score the demand once it is in the screening state.		
Complete assessments	Stakeholders complete and submit assessments for scoring.	Screening	Stakeholder
Move demand to qualified	<p>The demand moves to the qualified state once the required assessments are submitted.</p> <ul style="list-style-type: none"> • Next Experience for Demand Management updates the state automatically. • Demand manager manually sets the demand to qualified while it is in screening. For example, when assessments are delayed or not required. 	Screening → Qualified	Demand manager, Next Experience for Demand Management
Review demand	Stakeholders review the demand for approval or deferral.	Qualified	Stakeholder
Approve/Defer a demand	The demand manager sets demand as approved (moves forward for execution) or deferred (moves to Deferred state).	Qualified → Approved/Deferred	Demand manager, demand approver
Convert demand to strategic/operational entity	<p>Once the Demand is approved, the demand manager creates the selected entity such as project, enhancement, or Enterprise Agile Planning (EAP) entities.</p> <p>The created entity is based on the values in the Category and Type fields of the Demand record.</p> <p>Depending on the type of record created, the demand data is migrated to the created entity.</p>	Approved	Demand manager
Complete demands	Based on the selection in the Close Demand field, a demand is completed automatically when converted entity is completed, or manually by the demand manager at any state.	Approved → Completed	Demand manager, Next Experience for Demand Management

Playbooks in Next Experience for Demand Management

Playbooks in Next Experience for Demand Management provide a guided, structured approach to managing a demand from initiation to completion. Playbooks focus specifically on helping demand teams follow the standard demand life-cycle, confirming every demand progresses consistently and no critical steps are missed. You can define your playbooks according to your requirements.

Purpose of Playbooks in Demand Management

Playbooks provide a structured way to manage work by guiding teams through predefined steps. It shows what to do, when to do it, and where to find the tools or information required to complete each task. You can apply a playbook to processes such as managing a demand, resolving an issue, launching a product, onboarding new employees, or define key steps of a process. For more information on playbooks and how to create them, see [Workflow studio playbooks](#) .

In Next Experience for Demand Management, playbooks help demand managers and reviewers:

- Understand exactly which activities must be completed at each demand stage.
- Track required inputs, approvals, and validations for demand progression.
- Confirm that demand evaluation, prioritization, and planning follow the organization's standard governance.
- Provide built-in process guidance within the demand record, reducing the need to rely on informal or undocumented knowledge.
- Maintain process consistency across all demands, regardless of the requester or manager.
- Enable you to define multiple standardized governance processes across the organization.

How Playbooks work for demands

When a playbook is applied to a demand:

- Demand life-cycle stages such as ideation, assessment, prioritization, and planning are outlined.
- Each stage contains activities and tasks tailored to demand requirements, such as defining scope, estimating effort, documenting benefits, or securing stakeholder approval.
- Playbooks guide demand managers through dependencies before the demand can move forward.
- Demand records automatically capture progress and trigger actions such as assessments and approvals as the tasks are completed.

For example, a demand about a Customer Self-Service Portal enhancement uses a playbook to guide its progress as follows:

- The ideation stage prompts the demand manager to capture objectives and benefits.
- The assessment stage guides effort, cost, and risk evaluation.
- Prioritization helps validate scoring and funding.
- Planning finalizes the scope and links the demand to a potential work entity.

As each stage is completed, the playbook ensures that the demand follows the standard life-cycle without missing any required steps.

Playbook benefits

Playbooks add value to demand management by:

- Standardizing demand intake: Ensuring required information is captured early.
- Providing step-by-step instructions: Useful for new demand managers or occasional users.
- Supporting governance: Ensuring stage gating for evaluation and approval.
- Improving visibility: Showing exactly where a demand sits in the life-cycle and what is blocking its progress.
- Integrating workflows: Using Flow Designer to set up different business logic for each playbook flow.

Types of Playbooks

- Demand default playbook - The default demand playbook is a stage-gate playbook. In a stage-gate playbook, the stages and tasks must be completed in a linear order. Each stage must be finished before moving to the next one. The stages are visible only when all activities in the previous stage are completed or skipped. After completing a stage, demand managers can still return to previous stages if needed.
- AI playbook - The AI playbook is available for a demand when the AI Control Tower plugin is installed and the investment type of the demand is set to artificial intelligence. This playbook has an additional AI checkpoint stage where you can associate new or existing AI systems to your demand.

Note:

- You can use the demand default playbook and customize it according to your organization's requirements. For more information about the stages and activities of this playbook, see [Demand default playbook stages and activities](#).
- You can also create a demand playbook according to your requirements. For more information, see [Create and configure playbooks](#) .

Now Assist skills in Next Experience for Demand Management

Now Assist for Strategic Portfolio Management (SPM) provides AI-powered skills for demand records that help you quickly understand demand details and refine records. These skills improve planning efficiency and support informed decision-making.

Demand summarization

The demand summarization skill reviews the fields and related lists of a demand record and helps generate a clear summary. Use this skill to quickly understand the key details of a demand without reviewing individual fields, comments, and work notes.

The generated summary is displayed in a summary card on the demand record. You can copy the summary for further use.

For more information, see [Summarize demands with demand summarization skill](#).

Refine records

The refine record skill improves demand quality by enabling AI-assisted text refinement directly within the text fields of demand records. Using the skill, you can elaborate on a brief description or shorten lengthy content without losing key information. This feature ensures demands are clear, complete, and actionable from the start.

The skill considers other fields in the demand form to generate contextually relevant content. It reduces rework caused by missing or unclear information and helps demand managers create well-structured records more efficiently. For more information, see [Improve efficiency and quality using refine records skill with Now Assist Context Menu](#).

Configuring Next Experience for Demand Management

Configure your Next Experience for Demand Management to assess and promote demands to projects, enhancements, changes, defects, or Enterprise Agile Planning (EAP) entities.

Next Experience for Demand Management planning

Use the following table to identify what you must define before setting up the Next Experience for Demand Management.

Item name	Description
Roles	Define who can access and work in the Next Experience for Demand Management. Includes identifying workspace administrators, demand managers, approvers, and reviewers who participate in the demand process.
Stakeholders	Identify individuals or groups who review or need visibility into demand items. Stakeholders provide domain insight during evaluation. For more information, see Populate the stakeholder registry for demands .
Integrations	Set up Strategic Planning to work with Demands. For more information on how to define this integration, see Configuring Strategic Planning with PPM, Agile 2.0, and SAFe .
Information model	Specify the fields and attributes required to capture demand data. Includes form layouts, required fields, and custom data elements.
Evaluation criteria	Define the metrics used to assess and compare demand items. Common criteria include business value, complexity, cost estimates, and alignment to strategy. For more

Next Experience for Demand Management planning

Use the following table to identify what you must define before setting up the Next Experience for Demand Management.

(continued)

Item name	Description
	information, see View an assessment metric category .
Resource considerations	Determine what resource#related information must be associated with demand items, such as estimated effort or team availability.
Workflow expectations	Describes the life-cycle stages for a demand item, from creation to review, approval, or conversion through Playbooks.
Playbooks	Define or verify that the demand playbooks are in accordance with the processes of your organization. For more information, see Create and customize playbooks .
Dependencies with other applications	Identify related workspaces or applications are required with Next Experience for Demand Management, such as Project Workspace or Resource Management Workspace. Ensures consistent data across applications.

Populate the stakeholder registry for demands

Add users to the stakeholder registry so that Next Experience for Demand Management can automatically populate the stakeholder list when demand users create a demand.

Before you begin

Role required: pps_admin

Procedure

1. Access the Stakeholder Register record form in one of the following ways.
 - Navigate to **All > Project Administration > Settings > Stakeholders**.
 - Navigate to a demand playbook or the **Stakeholders** tab in **Details** page, and select **New**. For more information, see [Access demands](#).
2. On the Stakeholder Register record form, fill in the fields. For a description of the field values, see [Stakeholder register form](#).
3. Select **Submit**.

i Note:

When adding a user to the stakeholder registry, the combination of the user and the assigned portfolio must be unique. However, there can be multiple records for the same user but with different portfolios.

Configure a custom risk rank and risk value

Configure custom risk ranks and value scores to rate the impact and probability factors for a risk.

Before you begin

Role required: pps_admin

About this task

Use the Risk Value Lookup module to set up the risk rank and risk value for a specific combination of risk impact and probability. The system uses these values to determine the degree of risk (Absolute, High, Medium, and Low) based on the impact and probability factors of a risk.

The value in the **Probability** field is multiplied by the value of the **Impact** field to generate the values for the **Risk rank** and corresponding **Risk value** in the Create New Risk form.

By default, you can use the following impact, value, and probability scores for a risk to create a risk rank and risk value score:

- Absolute
- Low
- Medium or Moderate
- High

For example, a risk might have high probability and medium impact but you might want to consider it as an overall low risk for the demand. In that case, you would configure the Risk Value Matcher form with the following values:

- Impact = 2 Medium
- Risk Rank Color = Green
- Probability = High
- Probability Number = 1
- Risk Value = 3 Low

In this case, the calculated risk rank and value are as follows:

- Calculated risk rank = 2
- Calculated risk value = 2

The following image illustrates a Risk

The image shows a form with the following fields and values:

Number	RSK0001002
Probability	Low
Impact	3 - Low
Risk rank	9
Risk value	3 - Low

form.

Procedure

1. Navigate to **All > Project Administration > Settings > Risk Value Lookup**.
2. Select **New**.
3. On the risk value lookup form, fill in the fields.
For a description of the field names, see [Risk value lookup form](#).
4. Select **Submit**.

View an assessment metric category

View assessment metric categories that are used with assessment metric types and assessment metrics.

Before you begin

Role required: pps_admin

About this task

Demands come with an assessment metric type named **Demand**, five default assessment metric categories, and assessment metrics.

Procedure

1. Navigate to **All > Project Administration > Settings > Assessments Metric Categories**.

2. Open an assessment metric category to review it.

The following default assessment metric categories are available with demands.

Demand assessment metric categories

Assessment metric category	Data source	Description
Size	T-Shirt size field on the demand form.	Assesses demand size relative to the size of other demands.
Strategic Alignment	View an assessment category result field in the assessment category result for the Strategic Alignment metric category. For more information, see View an assessment category result 	Assesses how closely the demand aligns with strategic goals of the organization compared to other demands.
Risk	Rating field in the assessment category result for the Risk metric category.	Assesses demand risks compared to other demands.
ROI	Impact and Financial return fields on the Demand form.	Assesses demand return on investment compared to other demands.
Cost	Labor costs , Capital expense , and Operating expense fields on the Demand form.	Assesses demand cost compared to other demands.

Multicurrency in Next Experience for Demand Management

Manage and track demand financials in your corporate currency, regional currency, or project currency using the multicurrency feature.

Overview of multicurrency

In global organizations, demands are often managed at one location and executed at another. Each location might use different currencies for budget spending, making it difficult to monitor and track financials.

The multicurrency feature in Next Experience for Demand Management lets you manage and track demands from any geographic location in any currency. You can monitor demand financials in one currency while spending the budget in a different currency, such as your functional currency or regional currency. You can also manage your demands in one currency and specify a different currency for managing your future projects.

Activation information

To enable multicurrency features in Next Experience for Demand Management, activate the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin. This activation:

- Enables the demand currency view in demand, cost plan, and benefit plan forms.
- Enables you to manage simple demand financials, cost plans, benefit plans, and budgets in the demand currency
- Automatically activates the PPM Standard (com.snc.financial_planning_pmo) plugin, giving you the option to switch between the default view and demand currency view

Currency preferences

After activating the plugin, specify your currency preference for managing demand financials. You can select your functional currency, a regional currency, or a local currency. For more information, see [Select demand currency preference](#).

Demand currency view

The Demand Currency view displays multicurrency fields in addition to the standard demand form fields. Enable this view from the form context menu.

You can designate a currency other than the functional currency as the processing demand currency. The **Demand currency** field appears on the Financials section of the Demand form, where you can select any active currency from the Currencies [fx_currency] table.

Note:

The Demand currency field becomes read only once you create a cost plan, cost plan breakdown, benefit plan, or benefit plan breakdown for the demand.

Multicurrency in demand tasks

Track expenses for demand tasks in demand currency. When a time card for a demand task is submitted and processed, the actual cost is calculated based on the rate model, default labor rate, or system property rate. View this actual cost in the Demand Task form in the **Demand currency** and **Actual cost in demand currency** fields.

Multicurrency in demand baselines

Compare financial baselines to track demand performance over time. Baseline comparison helps you identify and review financial changes made to the demand at various life-cycle stages. With the multicurrency feature, you can view financial information in demand currency when comparing baselines. You can also configure the baseline view to add fields and view details in demand currency. For more information, see [Create financial baselines](#).

Select demand currency preference

Set your currency preference for managing and tracking demand financials from the functional currency, regional currency, or local currency.

Before you begin

Activate the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin.

Role required: admin

Procedure

1. Navigate to **All > Project Administration > Settings > Preferences-Project**.
2. Select a currency option from the Demand currency setup list.
3. Select **Save**.

What to do next

Enable the multicurrency view in the demand form and other demand-related forms. For more information, see [Enable demand currency view](#).

Enable demand currency view

Switch to the demand currency view to track the planned costs of a demand in the selected currency.

Before you begin

Activate the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin.

Role required: admin or it_demand_manager

About this task

To manage demands in a currency different from the functional currency, demand currency fields are added to the demand tables such as dmn_demand and dmn_demand_task.

Tables with demand currency fields

Table	Description
Demand [dmn_demand]	Demands can be tracked in a different currency. When you create a demand, select another currency by navigating to the Financials tab and selecting a currency in the Demand Currency field.
Demand Task [dmn_demand_task]	Demand tasks delegate cost, effort, risk, and benefit assessment activities.
Cost Plans [cost_plan]	Cost plans capture the costs of demands.
Cost Plan Breakdown [cost_plan_breakdown]	Cost plan breakdowns specify the estimated cost and actual cost at a granular level for a fiscal period.
Benefit Plan [benefit_plan]	When you open the demand form in Demand Currency view, fields related to the demand currency appear in the Benefit Plans related list by default.
Benefit Plan Breakdowns [benefit_plan_breakdown]	Benefit plans capture the potential benefits accrued when the demand is executed.
Expense Line [fm_expense_line]	Expense lines are part of demand cost plans and store costs associated with a specific resource.
Project Funding [project_funding]	Stores the demand target and budget expense values for both capital and operating expenses for a single fiscal period.

Procedure

1. Navigate to the form in which you want to enable the demand currency view.
2. Right-click the form header or select the additional actions icon to open the context menu.
3. Select **View**.
4. Select **Demand Currency** from the list.

What to do next

Review the form fields exclusive to the **Demand Currency** view. All other form tabs and fields remain the same in both default view and demand currency view. Continue entering values as you would in the default view. For more information, see [Multicurrency fields in demand-related forms](#).

Quick start tests for multicurrency in Next Experience for Demand Management

Validate that multicurrency in Next Experience for Demand Management works correctly after making configuration changes such as applying an upgrade or developing an application. Copy and customize these quick start tests to pass when using your instance-specific data.

⚠ Danger:
 By default, the system property that is used to run automated tests is disabled to prevent you from accidentally running these tests on a production system. To avoid data corruption or an outage, run tests only on development, test, and other non-production instances. See [Enable or disable executing Automated Test Framework tests](#).

Activate the PPM Standard Multicurrency – ATF Tests plugin (com.snc.ppm_multicurrency.atf) to use demand currency quick start tests.

Demand currency test suites tests

Test	Description
Verify cost in demand currency on cost plan	Validates the calculation of cost plan breakdown with budget reference rate and verifies the roll up to cost plan in demand currency.
Verify benefit in demand currency on benefit plan	Validates the calculation of benefit plan breakdown with budget reference rate and verifies the roll up to benefit plan in demand currency.

Upgrade existing demands

Execute scheduled jobs to upgrade your existing active and inactive demands after activating the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin.

Before you begin

Activate the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin.

Role required: admin

About this task

Run these scheduled jobs on demand to upgrade your existing active and inactive demands in demand currency only when necessary.

Note:

The jobs can impact performance depending on the number of demands and cost plans. Run the jobs only when necessary.

Procedure

1. Navigate to **All > System Definition > Scheduled Jobs**.
2. Execute the appropriate scheduled job for your demands.

Create and customize playbooks

Configure playbooks to customize demand workflows or create playbooks for your organization.

Before you begin

Role required: admin

About this task

Next Experience for Demand Management includes two predefined playbooks available in Workflow Studio:

- Demand default
- AI playbook

Note:

The AI playbook is available only when the AI Control Tower plugin is installed and the investment type of the demand is set to artificial intelligence.

These playbooks are ready to use without any additional configuration. Configure playbooks only when you must customize an existing playbook or create one for your organization's specific demand workflows.

In Next Experience for Demand Management, playbooks are triggered by record creation. A playbook is associated with demand records, and the Playbook page appears in the L-2 (level 2) menu when a demand meets the trigger condition.

For more information on how to create or customize playbooks, see [Configuring playbooks](#) .

Procedure

1. Navigate to **Workflow Studio > Playbooks**.
2. To customize an existing playbook or create one, create and configure the playbook according to your requirement.
 - To activate a predefined playbook, select the required playbook and define an appropriate trigger condition. For more information, see [Activate playbooks](#)  and [Triggers](#) .
 - To create a playbook, select **New**. For more information, see [Create and configure playbooks](#) .
 - Multiple playbooks can be enabled at a time. Define trigger conditions so that each demand maps to only one playbook type. For more information, see [Create and configure playbooks](#) .

Access demands

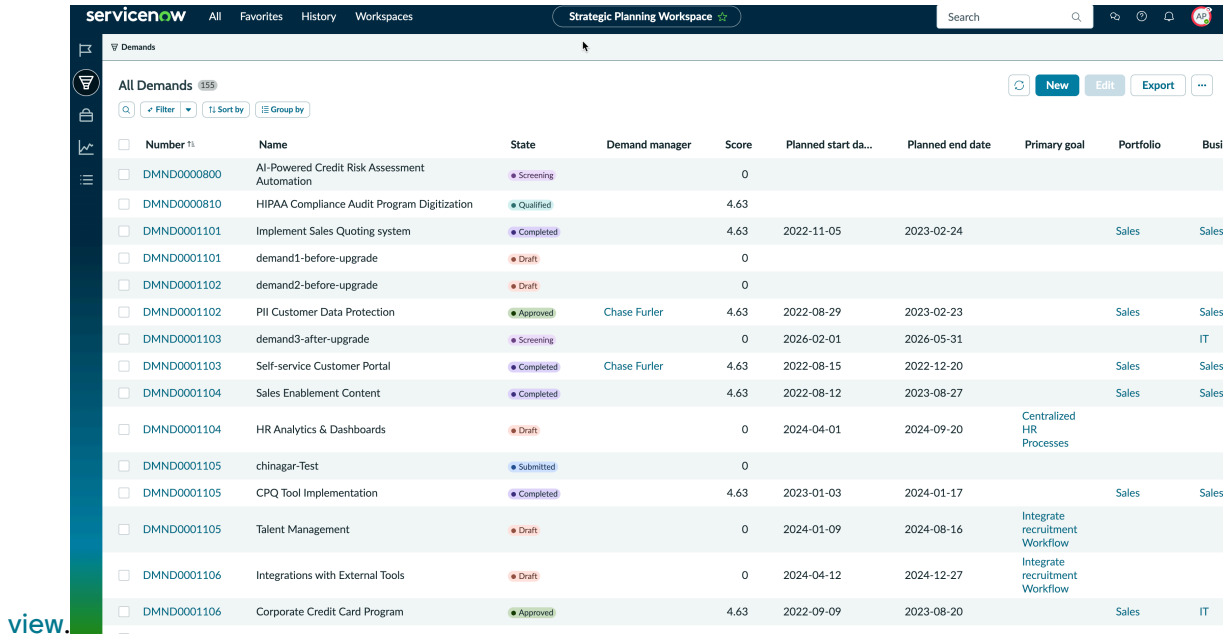

Learn how to navigate to the Next Experience for Demand Management and open a demand from the **All Demands** page.

Before you begin

Role required: it_demand_user, it_demand_manager, sn_ppm_read, demand_approver, apw_read

Procedure

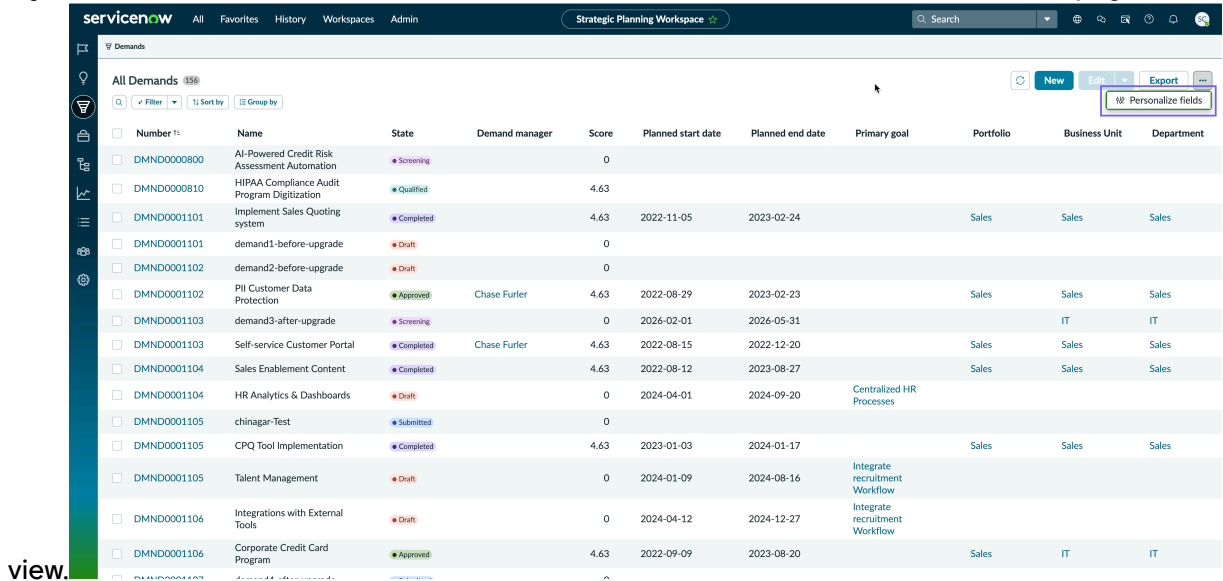

1. Navigate to **Workspaces > Strategic Planning Workspace > Demands**. Demands on the **All Demands** home page are displayed in a list view. For more information, see [Demands list](#)

2. Select a demand to open it.

- If a playbook is available for the demand, the **Playbook** page is displayed.
 - If there are no playbooks associated with the demand, the **Details** page is displayed.
- If you select the short description of a demand, it opens the demand details in a side panel, enabling you to edit them. For more information, see [Update the demand details](#).

3. **Optional:** Select **Personalize fields** from More Actions to customize the **All Demands** page

4. **Optional:** Select **Apply**.

Note:

You can also increase or reduce the area occupied by the columns in the data grid by dragging the line that separates them.

Related topics

Create a demand

Create demands to capture your strategic and operational requirements and centralize information for stakeholder assessment and prioritization.

Before you begin

Role required: it_demand_manager, it_demand_user

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Demands >**

Demand

Name *

Planned start date

Planned end date

Cancel

Create

New

2. On the Demand form, fill in the fields.

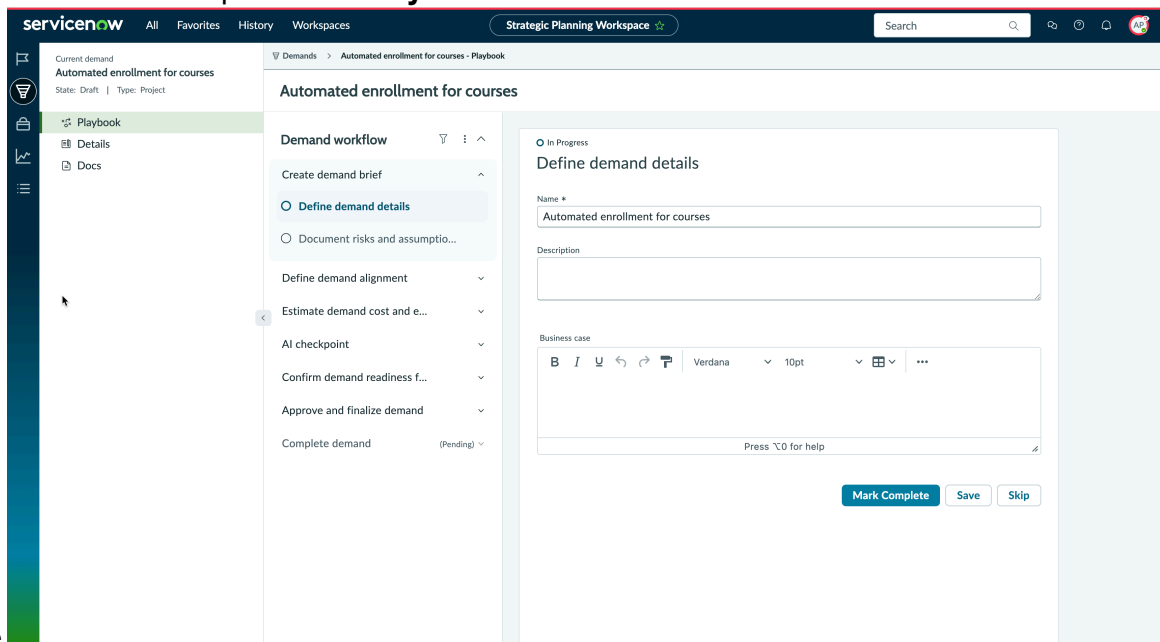

Demand form

Field	Description
Name	Name of the demand.
Start date	<p>The preliminary or estimated date when the work is initially planned to begin. This date helps outline the intended timing for early demand planning and prioritization. You can set this date during initial demand creation or anytime in the planning phase when a rough idea forms. This date can be updated until the demand is officially approved.</p> <p>For example, you're planning for a database upgrade to start on 2025-11-01.</p> <p>This date is changed to Planned start date when the demand is converted to a project.</p>

Field	Description
	<p>Note: When you change the planned start date of a demand or project, the associated cost plans and resource assignments also change. The Change Resource Plan and Cost Plan Start Date with Demand or Project Start Date Change property controls the behavior for a demand date change. This property isn't enabled by default. For more information, see Properties installed with Project Management.</p>
Due date	<p>The preliminary or estimated date when the planned work is expected to be completed. This date provides an expected completion window for planning and stakeholder communication. You can set this date anytime in the planning phase when a rough idea forms and can be updated until the demand is officially approved.</p> <p>For example, you're planning to complete the database upgrade by 2025-12-31.</p> <p>Note: This date is changed to Planned end date when the demand is converted to a project.</p>

3. Select **Create**.

The created demand opens in the **Playbook**

page.

What to do next

- Review and refine the demand details and progress the demand using the playbook stages. For more information, see [Use Playbooks](#).
- Review and refine the demand details using the forms and tabs in the **Details** page. For more details, see [Update the demand details](#).

Related topics

[Update the demand details](#)

Customize the demand new record form

You can customize the fields displayed on the demand new record form in Next Experience for Demand Management by modifying the APW New view.

Before you begin

Role required: admin

About this task

By default, the demand new record form in Next Experience for Demand Management displays a predefined set of fields. Modifying the APW New view allows you to add, remove, or reorder fields to meet your organization's requirements.

Procedure

1. Navigate to **All > Demands > Demand > All > New**.
2. Select **Additional actions** and navigate to **Configure > Form**

Layout.

3. In the **View name** field, select **APW New**.
4. Add, remove, or reorder fields as needed.
5. Select **Save**.

Result

The updated field layout is applied to the demand new record form for all users.

Use Playbooks

Use a playbook to guide a demand through each stage of its life-cycle, from creating the initial brief to final approval and completion. Playbooks provide step-by-step activities within each stage, ensuring that all required information is captured and governance processes are followed.

Before you begin

- Role required: it_demand_user, it_demand_manager
- As an administrator, ensure that either the default or custom playbooks are activated.

About this task

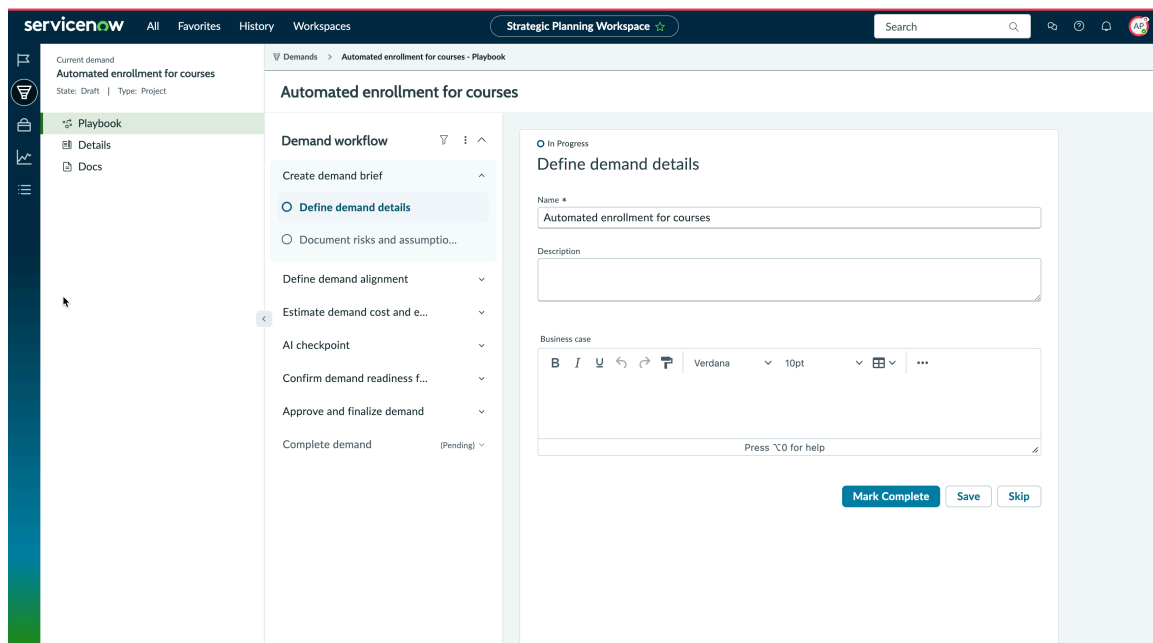

A playbook defines the standard stages of a demand (for example, Initiation, Planning, Execution, Monitoring, and Closure) and includes activities or action items to complete at each stage.

i Note:

The playbook presents demand information in a guided, stage-based workflow. The same fields and lists are also available in the **Details** page of the demand record. You can update demand information from either location, and changes made in one are reflected in the other.

This task topic follows the demand AI playbook. It's a standard playbook comprising the following seven stages:

- Create demand brief
- Define demand alignment
- Estimate demand cost and effort
- AI checkpoint
- Confirm demand readiness for review
- Approve and finalize demand
- Complete demand

i Note:

The AI checkpoint stage is available if the AI Control Tower plugin is installed and the investment type of the demand is set to artificial intelligence.

Each stage consists of activities, action items, or steps that guide the demand manager in successfully completing the demand. You can view the **Playbook** menu only if the demand matches the trigger condition defined for that playbook.

i Note:

A demand created in Next Experience for Demand Management opens in the playbook page.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Demands**.

2. Open an existing demand or create a demand.

For more information on creating demands, refer to [Create a demand](#).

3. Use the default playbook or create or customize one.

○ To use the default playbook:

a. Select **Playbooks** from the L-2 (level 2) navigation menu.

b. Select a stage to view its activities. Each activity displays its status (In Progress, Pending, or Complete) and the fields or lists to update.

i Note:

The default playbook is a stage-gate playbook, that is, a stage is unlocked only when its prior stages are marked as completed or skipped.

c. Complete the activities within each stage. For more information, see [Demand default playbook stages and activities](#).

d. For each activity, perform one of the following actions:

- Select **Mark Complete** to mark the activity as done and move to the next activity.
- Select **Save** to save your progress without completing the activity.
- Select **Skip** to bypass the activity and move to the next one.

i Note:

- An activity becomes read-only when you select **Mark Complete** or **Skip**.
- A stage is marked as completed once all activities within it are either completed or skipped.
- Use the **Restart** option (available at both the activity and stage levels) to revisit or edit completed or skipped activities.
- Some stages include an automated task that advances the demand state when all activities in the stage are completed. These automated tasks don't require manual action.

○ To create a playbook, define the trigger condition in Workflow Studio. For more information, see [Triggers](#) [↗](#).

For more information on how to create and use playbooks, see [Building playbooks](#) [↗](#) and [Designing playbooks](#) [↗](#).

Update the demand details

Update the details of a demand record in Next Experience for Demand Management to reflect any changes in scope, priority, or capacity.

Before you begin

Role required: it_demand_user, it_demand_manager

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Demands**.
2. Update the demand record details in any of the following ways.
For a description of the field values, see [Demand form](#).

Related topics

- [Use Playbooks](#)
- [Demand form](#)
- [Demand default playbook stages and activities](#)

Create and manage demand tasks

Create tasks for a demand to delegate cost, effort, risk, and benefit assessment activities. Assign a resource or group to the demand task to track the actual time and effort spent on performing the specified activities.

Before you begin

Role required: it_demand_manager

About this task

You create demand tasks to plan the work for demands rather than for the target work entity such as a project, change, defect, or enhancement. The resources assigned to a demand task can submit the time spent on it using a time card.

 Note:

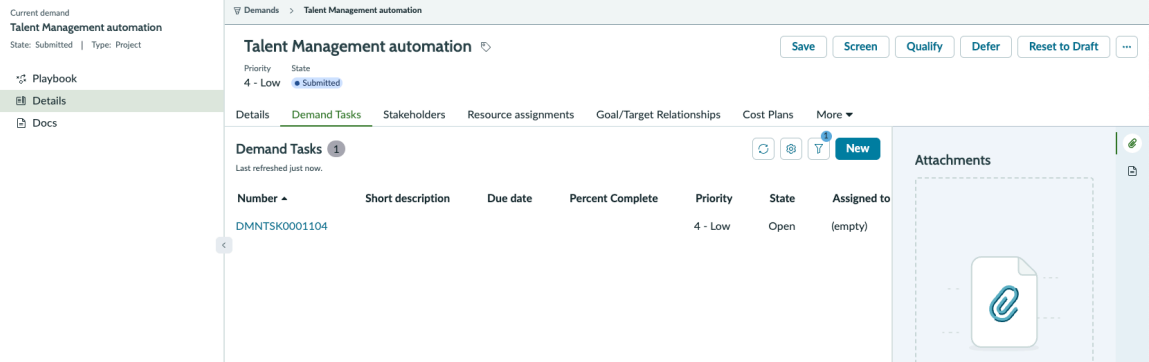

If you're creating a demand task with the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin activated and Demand Currency view enabled, additional fields are available. For more information about the fields that are available only in the Demand Currency view, see [Multicurrency in Next Experience for Demand Management reference](#).

For more information about demand tasks, see [Demand tasks](#).

Procedure

1. Open a demand from the home page of Next Experience for Demand Management.
For more information, see [Access demands](#).
2. Select **Details** from the L-2 (level 2) navigation menu.

3. Select Demand

Tasks.

Note: If the **Demand Tasks** tab isn't visible, select **More** and then select **Demand Tasks**.

4. Add or edit a demand task from the **Demand Tasks** tab:

- To add a demand task, select **New**.
- To update the details of an existing demand task, select the record.

5. On the Create New Demand Task form, fill in the fields.

For a description of the field names, see [Create demand task form](#).

6. Select **Save**.

- Note:**
- To delete a demand task, select the record and select **Delete** from the More Actions option.
 - Alternatively, you can create, edit, or delete demand tasks using the **Add demand tasks** playbook activity. For more information, see [Use Playbooks](#).

After completing your work on the demand task, use the breadcrumb navigation to return to the **Demand Tasks** tab.

Note: Team members can access demand tasks assigned to them from Collaborative Work Management. For more information, see [Managing SPM work in Collaborative Work Management](#).

Submit a time card for a demand task

The resources assigned to a demand task create and submit a time card or time sheet to record the time spent on a demand task. The reported hours are used to calculate the actual cost and effort for a demand task.

Before you begin

Role required: timecard_user

About this task

The resource submits the time card or time sheet to record and track the work performed on a demand task. An appropriate approver then has to approve the submitted time card or time sheet.

Procedure

1. Navigate to **All > Time Sheets > Time Sheet Portal**.
2. Create a time card.
3. Fill in the hours for each day spent working on the demand task.
4. Select **Submit**.

Add and manage stakeholders

Add and manage stakeholders for a demand to delegate assignments and progress the demand in its life cycle.

Before you begin

Role required: it_demand_manager

About this task

When a demand is submitted, the demand stakeholder list is populated automatically from the associated portfolio. You can also add stakeholders.

A demand can have multiple stakeholders and a stakeholder can be associated with multiple demands.

Procedure

1. Open a demand from the home page of Next Experience for Demand Management.
For more information, see [Access demands](#).
2. Select **Details** from the L-2 (level 2) navigation menu.
3. Select **Stakeholders**.

Note:

If the **Stakeholders** tab isn't visible, select **More** and then select **Stakeholders**.

4. Add or edit a stakeholder record:
 - To add a stakeholder, select **New**.
 - To update the details of an existing stakeholder, select the record.
5. On the Create New Demand Stakeholder form, fill in the fields.
For a description of the field names, see [Create stakeholder form](#) form.
6. Select **Save**.

Note:

- To delete a stakeholder record, select the record and select **Delete** from the More Actions option.
- Alternatively, you can create, edit, or delete stakeholder records using the **Add stakeholders** playbook activity. For more information, see [Use Playbooks](#).

After completing your work on the stakeholder record, use the breadcrumb navigation to return to the **Stakeholders** tab.

Related topics

- [Use Playbooks](#)

Add and manage goal/target relationships

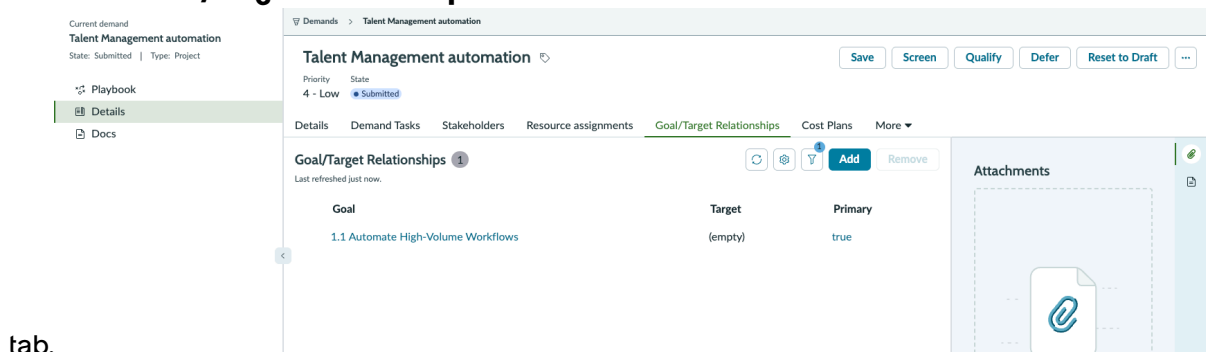

Track and manage the relationship between demands and organizational goals or targets directly from the Next Experience for Demand Management. Linking demands to goals or targets helps ensure alignment with strategic priorities and provides visibility into how each demand contributes to broader organizational objectives.

Before you begin

Role required: it_demand_manager

Procedure

1. Open a demand from the home page of Next Experience for Demand Management. For more information, see [Access demands](#).
2. Select **Details** from the L-2 (level 2) navigation menu.
3. Select the **Goal/Target Relationships**

tab.

Note:

If the required **Goal/Target Relationships** tab isn't visible, select **More** and then select the required **Goal/Target Relationships** tab.

4. Add or edit a goal/target relationship record:
 - To add a goal/target relationship record, select **New**.
 - To update the details of an existing goal/target relationship record, select the record.
5. On the form, fill in the fields. For field information, see [Create goal/target relationship form](#).
6. Select **Save**.

Note:

- To remove a goal/target relationship record:
 - Select a record from the **Goal/Target Relationships** tab and select **Remove**.
 - Select **Remove** from the More Actions option in the goal/target relationship form.
- Alternatively, you can add, edit, or remove goal/target relationship records using the **Add secondary goals** playbook activity. For more information, see [Use Playbooks](#).

After completing your work on the goal/target relationship record, use the breadcrumb navigation to return to the **Goal/Target Relationships** tab.

Related topics

- [Use Playbooks](#)

Add and manage requirements

Define and manage requirements for a demand to capture the functional and technical specifications needed for its fulfillment. Keeping requirements up to date within the demand record ensures clarity for stakeholders and reduces ambiguity during the demand evaluation and approval process.

Before you begin

Role required: it_demand_user, it_demand_manager

About this task

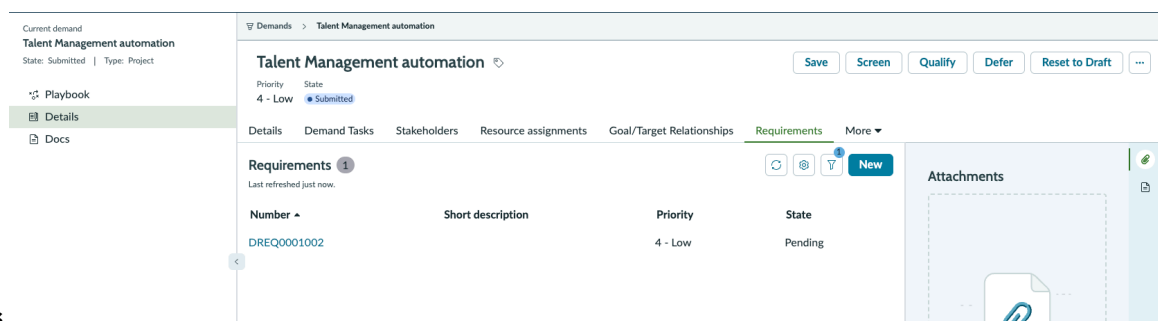

Typically, the stakeholders associated with a demand request have insights into what the requirements are for a demand request to be completed. The demand manager can create requirements from their inputs.

Demand managers use the Requirement form to describe the requirement and assign an owner who is responsible for making sure that the requirement is met. When a requirement is complex, demand managers can associate planned tasks, such as project tasks, with the requirement. The demand manager assigns and tracks the tasks until they're complete.

Procedure

1. Open a demand from the home page of Next Experience for Demand Management. For more information, see [Access demands](#).
2. Select **Details** from the L-2 (level 2) navigation menu.
3. Select

Requirements.

Note:

If the **Requirements** tab isn't visible, select **More** and then select **Requirements**.

4. Add or edit a requirement record from the **Requirements** tab:

- To add a requirement, select **New**.
- To update the details of an existing requirement record, select the record.

5. On the Create New Requirement form, fill in the fields.

For a description of the field names, see [Create requirement form](#) form.

6. Select **Save**.**Note:**

To delete a requirement record, select the record and select **Delete** from the More Actions option.

After completing your work on the requirement record, use the breadcrumb navigation to return to the **Requirements** tab.

Add and manage RIDAC records

Add a Risk, Issue, Decision, Action, or Request Change (RIDAC) record to your demand in the Next Experience for Demand Management. Adding RIDAC records enables you to keep a track of risks or issues during the demand life cycle and help in analyzing the outcome of a demand.

Before you begin

Role required: it_demand_user, it_demand_manager

About this task

You can select the type of record you want to create, fill in the required details, and associate it to your demand. You can use the RIDAC page in Next Experience for Demand Management to view, add, manage, and evaluate all the RIDAC records.

For information about RIDAC records for demand management, see [RIDAC \(Risk, Issue, Decision, Action, and Request Changes\) records for a demand](#).

Procedure**1.** Open a demand from the home page of Next Experience for Demand Management.

For more information, see [Access demands](#).

2. Select **Details** from the L-2 (level 2) navigation menu.**3.** Select the required RIDAC tab.**Note:**

If the required RIDAC tab isn't visible, select **More** and then select the required RIDAC tab.

4. Add or edit a RIDAC record from the required RIDAC tab:

- To add a RIDAC record, select **New**.
- To update the details of an existing RIDAC record, select the record.

5. On the form, fill in the fields.

For field information, see:

- Create risk form
- Create issue form
- Create action form
- Create decision form
- Create request change form

6. Select Save.

Note:

To delete a RIDAC record, select **Delete** from the More Actions option in the RIDAC record form.

After completing your work on the RIDAC record, use the breadcrumb navigation to return to the required RIDAC tab.

Submit a demand

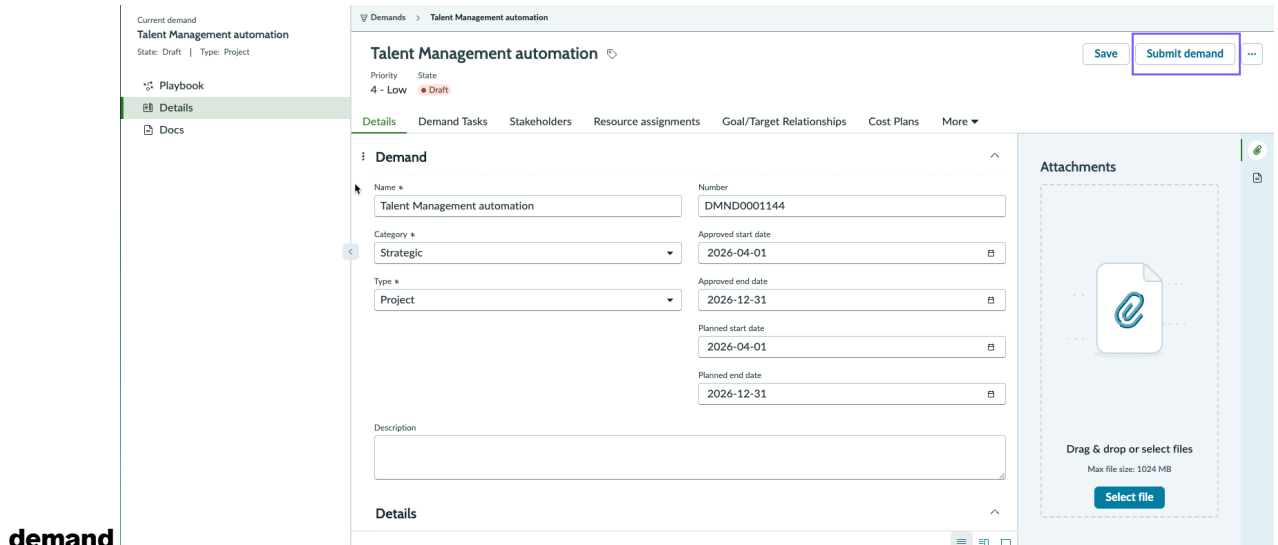

Submit the demand record once the necessary details are provided for a demand.

Before you begin

Role required: it_demand_manager, it_demand_user

Procedure

1. Open a demand from the home page of Next Experience for Demand Management. For more information, see [Access demands](#).
2. Select **Details** from the L-2 (level 2) navigation menu.
3. Select **Submit**

demand.

Note:

The submit option is available only when the demand is in the Draft state.

The demand moves to the Submitted state.

Manage assessment instances and questions

Add and manage assessment instances and questions for a demand to evaluate its feasibility and gather structured feedback from relevant stakeholders.

Before you begin

Role required: admin

Procedure

1. Open a demand from the home page of Next Experience for Demand Management.
For more information, see [Access demands](#).
2. Select **Details** from the L-2 (level 2) navigation menu.
3. Select **Assessment**

Instances.

Note:

If the **Assessment Instances** tab isn't visible, select **More** and then select **Assessment Instances**.

4. Add or edit an assessment instance record:
 - To add an assessment instance record, select **New**.
 - To update the details of an assessment instance record, select the record.
5. On the assessment instance form, fill in the fields.
For a description of the field names, see [Assessment instance form](#) form.
6. Select **Save**.
7. Select **Assessment Instance Questions**.
8. To add a question, select **New**.
9. On the Create New Assessment Instance Question form, fill in the fields.
For a description of the field names, see [Create assessment instance question form](#) form.
10. Select **Save**.

Note:

To delete an assessment instance record, select the record and select **Delete** from the More Actions option.

After completing your work on the assessment instance question and record, use the breadcrumb navigation to return to the **Assessment Instances** tab.

Create and manage resource assignments

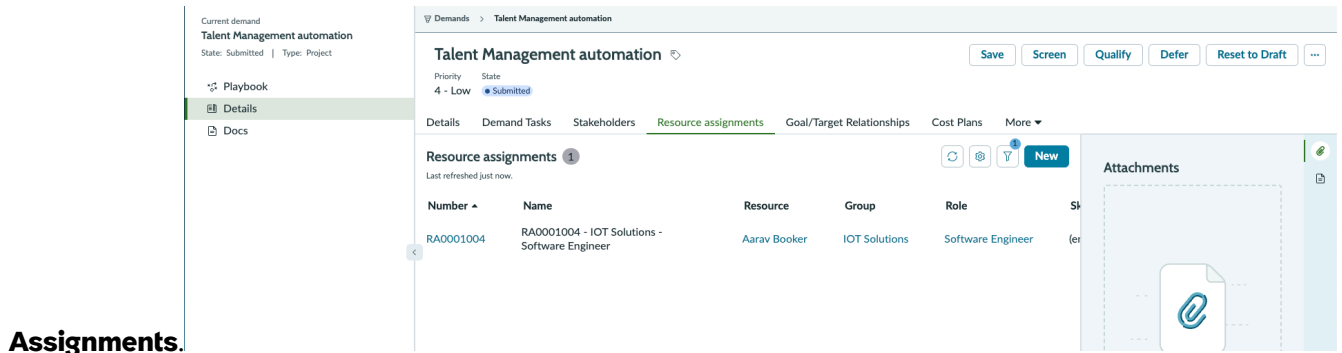

Create and manage resource assignments for a demand to find the availability of the resources and allocate them to the demand tasks. Effective resource assignment ensures that demands are adequately staffed and helps demand managers track resource availability and utilization.

Before you begin

Role required: it_demand_manager

Procedure

1. Open a demand from the home page of Next Experience for Demand Management.
For more information, see [Access demands](#).
2. Select **Details** from the L-2 (level 2) navigation menu.
3. Select **Resource**

Assignments.

- Note:**
If the **Resource Assignments** tab isn't visible, select **More** and then select **Resource Assignments**.

4. Add or edit a resource assignment record:
 - To add a resource assignment record, select **New**.
 - To update the details of an existing resource assignment record, select the record.
5. On the Create New Resource assignment form, fill in the fields.
For a description of the field names, see [Create resource assignment form](#) form.
6. Select **Save**.

- Note:**
 - To delete a resource assignment record, select the record and select **Delete** from the More Actions option.
 - Alternatively, you can create, edit, or delete resource assignment records using the **Estimate resource requirements** playbook activity. For more information, see [Use Playbooks](#).

After completing your work on the resource assignment record, use the breadcrumb navigation to return to the **Resource Assignments** tab.

Related topics

Recalculate costs of resource assignments of a demand

Recalculate the costs of all active resource assignments of a demand whenever the hourly rates change in the associated rate model. This feature helps keep the plan costs are up to date.

Before you begin

- The demand must be active.
- The demand must have an active rate model assigned.

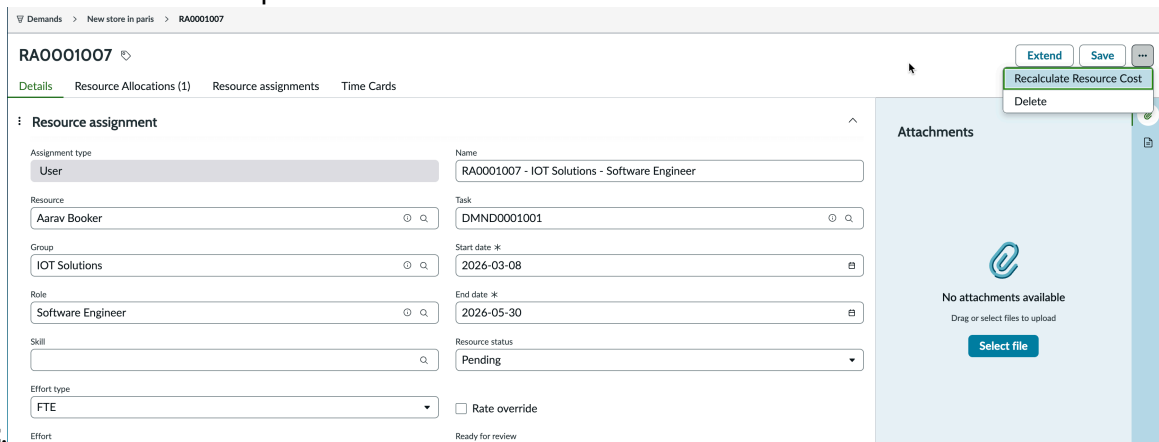

Role required: it_demand_manager

Procedure

1. Open a demand from the home page of Next Experience for Demand Management. For more information, see [Access demands](#).
2. Select **Details** from the L-2 (level 2) navigation menu.
3. Select the **Resource assignments** tab.

Note: If the required **Resource assignments** tab isn't visible, select **More** and then select the required **Resource assignments** tab.

4. Select the resource assignment record that you want to recalculate the costs for.
5. Select the More Actions option and select **Recalculate Resource**

Cost.

6. On the Recalculate Resource Cost form, fill in the fields.

Field	Description
Start date	Start date of the time period for which the costs are recalculated. By default, the field shows the current date.
End date	End date of the time period for which the costs are recalculated. By default, the field shows the due date of the demand. If the due date isn't specified for the demand, the field is empty.

7. Select **OK**.

Note: Alternatively, you can recalculate the resource costs using the **Estimate resource requirements** playbook activity. For more information, see [Use Playbooks](#).

Result

- Recalculates the selected resource costs of all the applicable resource assignments in the demand based on the latest hourly rates. The hourly rates are derived from the rate model associated with the demand.
- Updates the recalculated resource costs on the respective cost fields on the resource assignment form and the **Resource assignments** tab.
- Reflects the revised values in the respective cost fields of the demand.

Realign resource assignments for demands

Planning and execution of your roadmap involves change in priority or timelines of your work. In such cases, you can adjust the resource assignment dates to match with the latest dates of your demands.

Before you begin

[Migrate resource plans to resource assignments](#)

Role required: it_demand_manager

Procedure

1. Open a demand from the home page of Next Experience for Demand Management.
For more information, see [Access demands](#).
2. Select **Details** from the L-2 (level 2) navigation menu.
3. Change the **Approved start date** and **Planned start date** to meet your organizational priorities.
4. Select **Save**.
5. Select the More Actions option and select **Realign assignments to demand**.

Result

In the Resource assignments tab, you can see the Start date of the resource assignments aligned with the demand start dates.

View assessment results

View assessment results for a demand to evaluate its feasibility, priority, and alignment with organizational objectives. Assessment results provide demand managers with the insights needed to make informed decisions on whether to approve, defer, or reject a demand.

Before you begin

Role required: it_demand_manager

Procedure

1. Open a demand from the home page of Next Experience for Demand Management.
For more information, see [Access demands](#).
2. Select **Details** from the L-2 (level 2) navigation menu.
3. Select **Assessment Results**.

Note: If the **Assessment Results** tab isn't visible, select **More** and then select **Assessment Results**.

4. Select an assessment result record to view the details.

Approve demands

Review and approve demands in Next Experience for Demand Management to move them forward in the demand life cycle.

Before you begin

Role required: demand_approver, it_demand_manager

Procedure

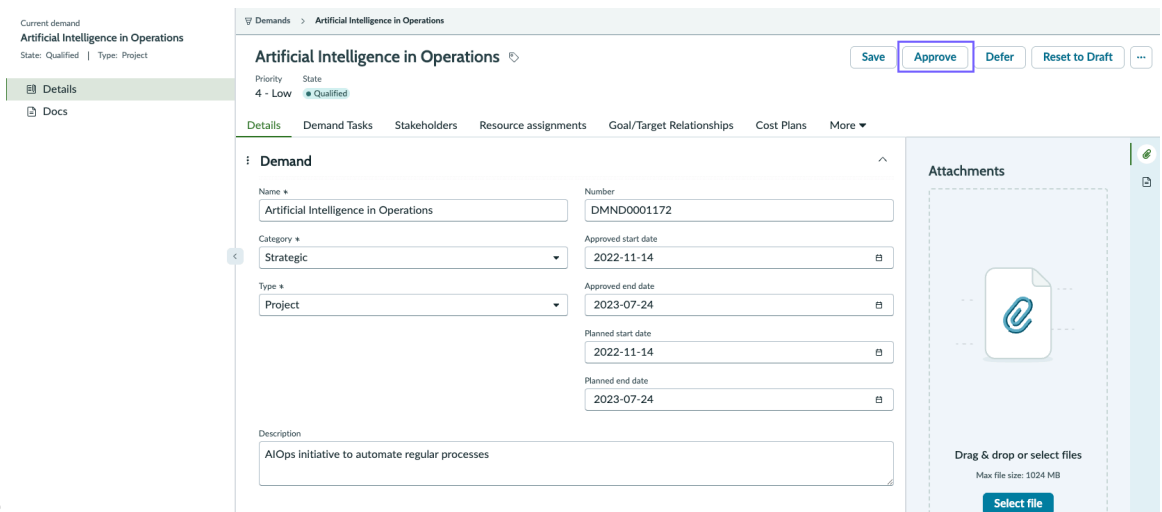

1. Open a demand from the home page of Next Experience for Demand Management.

Note: Users with the demand_approver role only see demands that are in the Qualified state.

For more information, see [Access demands](#).

2. Select **Details** from the L-2 (level 2) navigation menu.

3. Select

Approve.

Note: The **Approve** option is available only when a demand is in the Qualified state.

Create an entity from a demand

Create an entity, such as a work item, from a demand so that you can track work on the demand.

Before you begin

A demand must have been created. For more information, see [Create a demand](#).

The category and type of a demand and the applications you have installed determine the entity you can create from it. The available entity types and the applications you must have installed to be able to create them are listed in the following table.

Entity	Required application
Enhancement, change, or defect	Project Portfolio Suite
Agile Development entities (story or epic)	Agile Development 2.0
Enterprise Agile Planning (EAP) entities (epic, feature, or capability)	Strategic Planning

Role required: it_demand_manager

Note:

The sn_apw_advanced.eap_user role is required to convert a demand to EAP entities.

Procedure

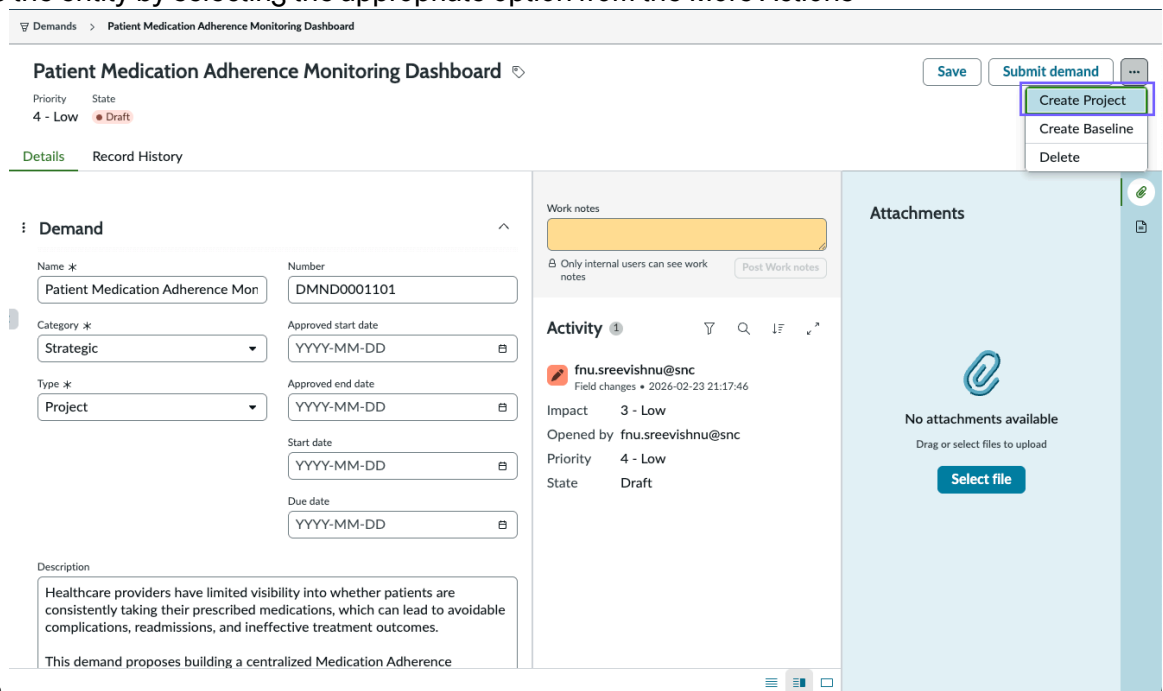

1. Open a demand from the home page of Next Experience for Demand Management. For more information, see [Access demands](#).
2. Verify that the values in the **Category** and **Type** fields are appropriate for the entity you want to create. The options in the Type list change according to the category that you select. For more information, see [Demand form](#).

Note:

The **Category** and **Type** fields are set to read only when an entity is created from a demand. If you delete the created entity, these fields become editable again.

3. Select **Save**.

4. Create the entity by selecting the appropriate option from the More Actions

option.

Depending on the category and type of the demand, options related to the entity you can create become available.

Related topics

[Use Playbooks](#)

[Demand default playbook stages and activities](#)

Reset a demand to draft state

Move a demand back to the Draft state, if necessary.

Before you begin

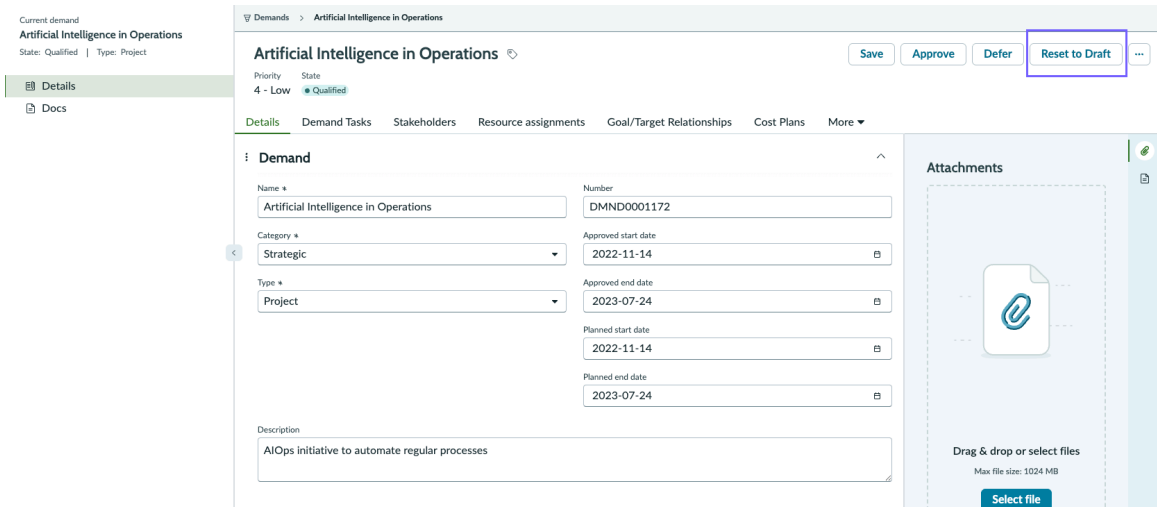

Role required: it_demand_manager

About this task

A demand can be reset to Draft from the Completed, Approved, Screening, or Submitted states, or until an entity such as a project is created from it. The **Reset to Draft** option is unavailable if the demand is in the Qualified state.

Procedure

1. Open a demand from the home page of Next Experience for Demand Management.
For more information, see [Access demands](#).
2. Select **Details** from the L-2 (level 2) navigation menu.
3. Select **Reset to**

Draft.

A confirmation message appears, if there are:

- Active assessments pending with stakeholders, or
- Resource assignments are created for the demand

4. Select the check box to replan the allocated resource plans that have no actual hours reported.
5. Select **OK**.

Result

- The demand is moved to the Draft state.
- All the score values in **Assessment Data** tab are reset to default.
- All active assessments for the demand are canceled. New assessments are triggered when the demand moves to the Screening state and if the **Assessment Required** field on the demand form is set to true.

Defer demands

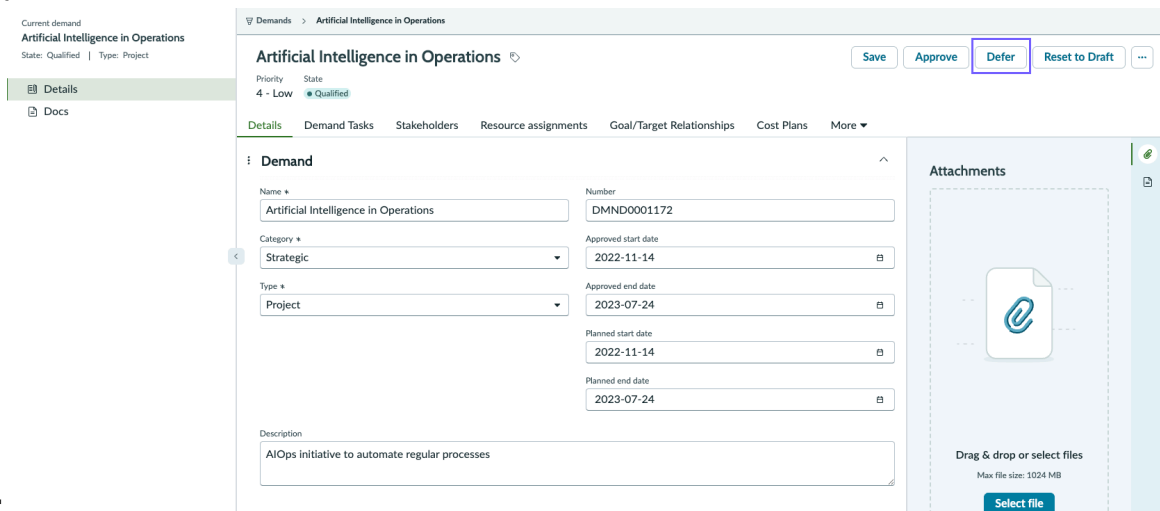

Defer demands in Next Experience for Demand Management to move them to the backlog. You can review them and move them back to any other demand state.

Before you begin

Role required: it_demand_manager

Procedure

1. Open a demand from the home page of Next Experience for Demand Management. For more information, see [Access demands](#).
2. Select **Details** from the L-2 (level 2) navigation menu.
3. Select

Defer.

Note:

You can defer the demands that are not in the Draft or Completed states.

Delete demands

Delete demands to remove them from Next Experience for Demand Management. Demands can be deleted only while in the Pending state.

Before you begin

Role required: it_demand_manager, it_demand_user

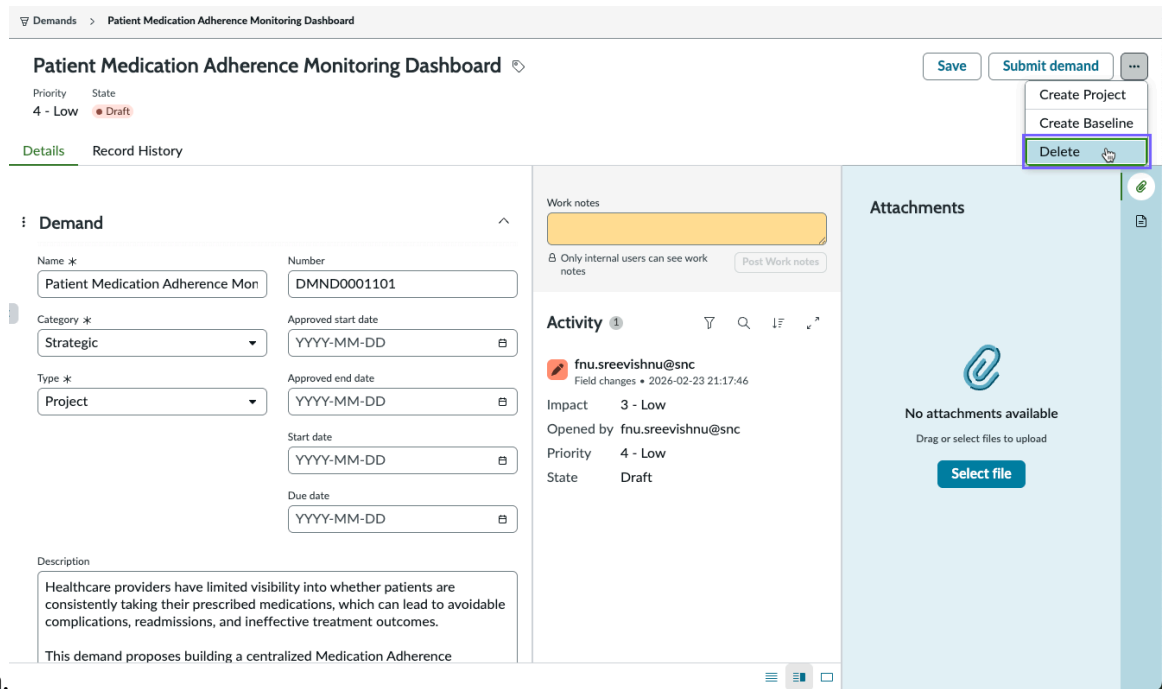

About this task

When you delete a demand, all data related to the demand, such as risks, demand tasks, requirements, and decisions are deleted. However, the stakeholders aren't deleted from the Stakeholder Register [dmn_stakeholders_register] table.

If a project is already created from a demand, its reference is removed from the project along with the data related to the demand. However, the project isn't deleted from the database.

Procedure

1. Open a demand from the home page of Next Experience for Demand Management.
For more information, see [Access demands](#).
2. Select **Details** from the L-2 (level 2) navigation menu.
3. Select **Delete** from the More Actions

4. Select **OK** to delete the demand.

Export demands

Export demand records from the Next Experience for Demand Management to share data with stakeholders or perform further analysis outside the platform.

Before you begin

Role required: it_demand_manager

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Demands**.
2. Select the demands that you want to export.
You can export all demands on the record page by selecting the check box in the column header.
3. Select **Export**.
4. Select the **File Type** as Excel, CSV, JSON, or PDF.
The export file is created in the selected format.

5. Select the **Delivery Type** as Download or

Export ✕

Email *

abel.tutor@example.com

Cancel
Export

Email

6. Provide your preferred email address if you selected Email as the delivery type.

7. Select **Export**.

The export file is downloaded on your system or mailed to your provided email address.

Create AI systems

Create AI systems from directly within the demand workflow and associate them with your demands.

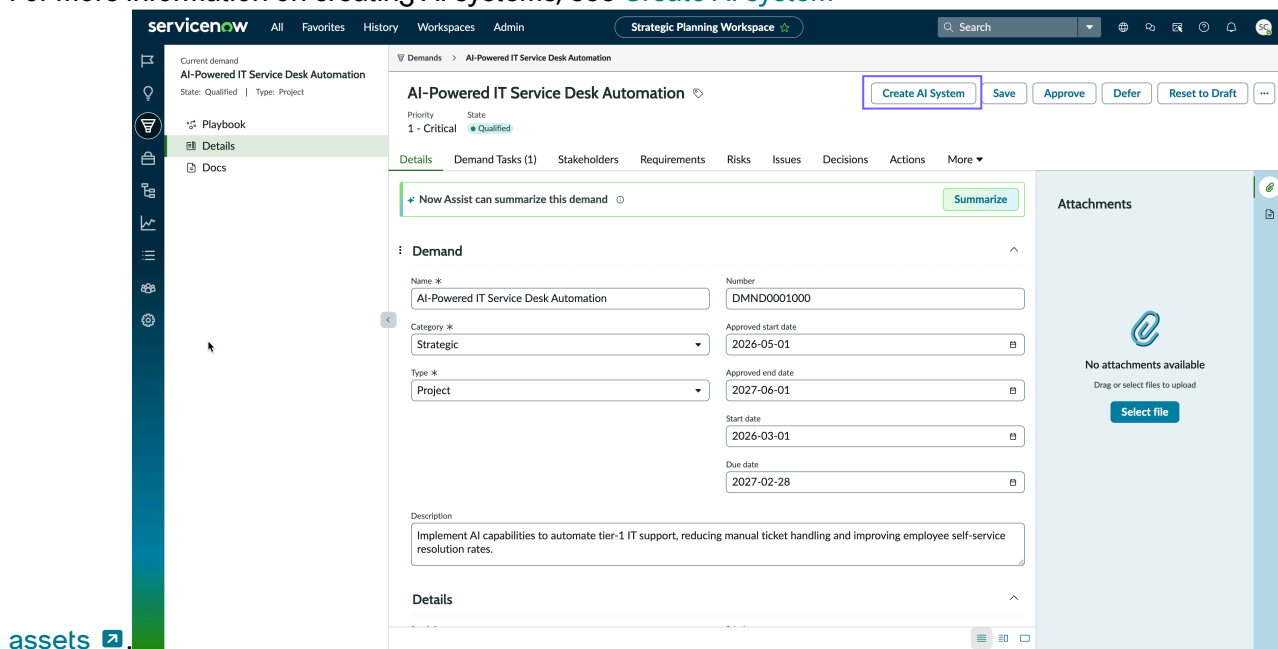

Before you begin

- The AI Control Tower plugin must be installed. For more information, see [Activation and installation of AI Control Tower](#).
- The investment type of the demand is set to artificial intelligence.
- Role required: sn_ai_steward

Procedure

1. Open a demand from the home page of Next Experience for Demand Management.
For more information, see [Access demands](#).
2. Select a demand record from the **All Demands** list.
3. Select **Details** from the L-2 (level 2) navigation menu.

4. Select the **Create AI System** button to create an AI system in the AI Control Tower workspace. For more information on creating AI systems, see [Create AI system](#)

What to do next

Associate your demands with the created AI systems:

- Using the AI checkpoint stage in your demand playbook. For more information, see [Use Playbooks](#).
- Using the **AI Associations** section in the **Details** tab.

Summarize demands with demand summarization skill

Summarize demand records using the demand summarization skill. The skill reviews the demand fields and related lists and helps create a clear summary of the demand.

https://player.vimeo.com/video/1174987769?h=cc74855ef5&badge=0&autoplay=0&player_id=0&%E2%80%A6

Before you begin

i Important:

This Now Assist skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see [Now Assist skills, agents, and agentic workflows on by default](#).

Role required: it_demand_user, it_demand_manager, sn_ppm_read

If you have custom roles that require access to this skill, update the ACLs (access control lists) for those roles that require access. For more information, see [Implement access control in Now Assist AI agents](#).

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Demands**.
2. Select a demand from the **All Demands** list.
3. Navigate to the **Details** tab.
4. Select the **Summarize** button to generate a summary of the demand.

Result

The summary generated by Now Assist is displayed in the summary card.

The screenshot shows the ServiceNow interface for a 'new demand' card. The card is titled 'new demand' and has a priority of '4 - Low' and a state of 'Draft'. The 'Summary by Now Assist' section is highlighted with a green border and contains the following information:

- Business Requirement:** A new demand classified as a Project with low business impact (level 3) and low operational effect (level 3), requiring no capitalized funding or operational spending. The effort is categorized as Small (S) with an effort estimate of 5.
- Key Risks of Performing:** Low calculated overall risk rating (5) indicates minimal risk associated with implementation.
- Effort:** Effort estimate indicator: S - Small; effort estimate value: 5.
- Non-Monetary Benefit:** Expected business value delivered: 5 (quantified as a score).
- ROI:** No monetary benefits, costs, or financial gains reported; overall expected cost and financial gain are \$0.00.

At the bottom of the summary card, there is a note: 'Check AI-generated summaries for accuracy'. To the right of the summary card is an 'Attachments' section with a 'Select file' button.

i Note:

Select the copy icon to copy the generated summary for further use.

Managing financials for demands

Manage budget, cost plans as forecasts, actual expenses as expense lines, generate labor costs, and create financial baselines at a required cadence in Next Experience for Demand Management.

The following features help you to manage your financials.

- Manage cost plans for your demands. For more information, see [Add, edit, or delete demand cost plans](#).
- Add or edit expense lines for your demands to record any planned or unplanned expenses. For more information, see [Add or edit expense lines](#).
- Generate labor costs for the fiscal period. For more information, see [Generate labor costs](#).
- Create baselines to capture the financial snapshot of your demands. For more information, see [Create financial baselines](#).

Multicurrency

The multicurrency feature enables you to manage the financials of your demands in two different currencies, Functional currency and Demand currency. Functional currency is typically defined by the admin based as the primary currency, which is used for planning, budgeting, and tracking the financials of your planning items.

You can perform the following financial activities in Demand currency.

- Select the Demand currency.
- Track the planned and actual expenses.
- Allocate and manage the budget.
- View simple financials data.

Using this feature, you can work on financial reporting at a global level and see the real-time currency conversions of your financial records.

Organizations operate at a global or multinational level, the work is planned and financed at one location and executed at a different location. Each might use a different currency from what was used in the planning phase. Multicurrency makes it easy to manage and track your planning items using any currency.

You can monitor and track the financials in one currency, and capture the costs in a different currency. For more information, see [Multicurrency in Next Experience for Demand Management](#).

Note:

Once a cost plan, benefit plan or expense line or an investment budget gets created, you can't change the Demand currency. You can change the Demand currency as long as there are no financial records captured against the demand.

Baselines

Create a baseline to capture a snapshot of the financial changes for your demands. You can create on-demand baselines or at a cadence using a scheduler job. For more information, see [Create a baseline](#).

Budget allocation

Portfolio managers can manage and approve the budget for demands. The approved budget helps demand managers to plan and meet the expenses to execute work. For more information, see [Allocate budget to a demand](#).

Benefit plans

Monetary benefit plans capture potential benefits accrued while executing a demand. Non-monetary benefit plans capture the potential non-financial benefits accrued while executing a demand. You can create and manage monetary and non-monetary benefit plans and to capture the potential benefits of your planning items. For more information, see [Create and manage benefit plans](#).

Add, edit, or delete demand cost plans

Create a cost plan for a required duration to track your planned and actual expenses. Edit cost plans to adjust your planned expenses and delete any descope forecasts.

Before you begin

Role required: it_demand_manager

About this task

The application automatically creates cost plan breakdown records when you save the cost plan. The cost plan breakdowns are records that specify the estimated and actual costs and the budget at a granular level for specific fiscal periods, such as FY16: M04 and FY16: M05. The demand cost plans are added to the parent program and portfolio.

If you want to use multiple currencies, create a cost plan for another currency.

If you're creating a cost plan for a demand with the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin activated and Demand Currency view enabled, the fields in the **Financials** section differ from the Default view. For more information about the fields that are available only in the Demand Currency view, see [Multicurrency in Next Experience for Demand Management reference](#).

Note:

For projects, the cost plan breakdowns specify the estimated cost and actual cost at a granular level for a fiscal period of the demand cost plan. These breakdowns are recalculated in the project currency. Similarly, the estimated breakdown amounts of the planned benefit and actual benefit of the demand benefit plans are recalculated in the project currency. The project currency amounts are then rolled up to the cost plan, benefit plan, and the project records.

Procedure

1. Open a demand from the home page of Next Experience for Demand Management. For more information, see [Access demands](#).
2. Select **Details** from the L-2 (level 2) navigation menu.
3. Select **Cost Plans**.

Note:

If the **Cost Plans** tab isn't visible, select **More** and then select **Cost Plans**.

Tip:

[Create financial baselines](#) immediately after capturing the initial planned costs to have a snapshot of your planned costs. Use this baseline to compare it against the baselines from later dates, as the work progresses, to identify the variance between initial planned costs and actual expenses.

This step helps you to plan for the future expenses and re-forecast the planned costs.

Alternatively, you can create, edit, or delete cost plans and cost plan breakdowns using the **Estimate financial cost** playbook activity. For more information, see [Use Playbooks](#).

Create and manage benefit plans

Create a monetary or non-monetary benefit plan to specify the estimated monetary or non-monetary benefit in a category for a fiscal period. Demand benefit plans capture the potential benefits accrued by the demand when the demand is executed.

Before you begin

Role required: it_demand_manager

About this task

The monetary benefit plan breakdown records are automatically created when you save the benefit plan. The monetary benefit plan breakdown records specify the estimated and actual benefits at a granular level for specific fiscal periods, such as FY16: M04 and FY16: M05. The **Monetary Benefit Plan Breakdowns** tab shows the aggregated benefits for estimated and actual benefits for each fiscal period for the demand.

The non-monetary benefit plan breakdown records are automatically created when you save the benefit plan by selecting **Automatic** or **Manual** in the **Breakdown Type** field. The non-monetary benefit plan breakdown records specify the estimated and actual non-financial benefits at a granular level for specific fiscal periods, such as FY16: M04 and FY16: M05. The **Non-monetary**

Benefit Plan Breakdowns tab shows the aggregated benefits for estimated and actual non-financial benefits for each fiscal period of the demand.

Note:

Converting a demand to a project or EAP entity transfers the benefit plan from the demand to the target project or EAP entity.

Procedure

1. Open a demand from the home page of Next Experience for Demand Management.
For more information, see [Access demands](#).
2. Add, edit, or delete a benefit plan.

Note:

When you move the demand dates, the associated benefit plans also change accordingly based on whether the benefit plan is tied to the demand start date, or end date. The [project property Change Resource Plan, Cost Plan and Benefit Plan Start Date with Demand or Project Start Date Change](#) controls the behavior for demand date changes.

Associate monetary and non-monetary benefit plans

Associate monetary and non-monetary benefit plans, so that you can capture the potential benefits (financial and non-financial) accrued by the demand.

Before you begin

Role required: it_demand_manager

About this task

You can associate a monetary benefit plan with a non-monetary benefit plan and vice versa.

Note:

When you delete a benefit plan, its relationship with the associated benefit plan (if any) is also removed.

Procedure

1. Open a demand from the home page of Next Experience for Demand Management.
For more information, see [Access demands](#).
2. Select **Details** from the L-2 (level 2) navigation menu.
3. Select the **Monetary Benefit Plans** or **Non-monetary Benefit Plans** tab.

Note:

If the **Monetary Benefit Plans** or **Non-monetary Benefit Plans** tabs aren't visible, select **More** and then select the **Monetary Benefit Plans** or **Non-monetary Benefit Plans** tab.

4. Select the benefit plan that you want to associate.
5. On the Benefit Plan form, fill in the **Associated benefit** field with the benefit plan that you want to associate.
6. Select **Save**.
The selected benefit plan is associated with this benefit plan.

Note:

Alternatively, you can associate benefit plans with each other from the **Benefit estimate** playbook activity. For more information, see [Use Playbooks](#).

Create financial baselines

Create a financial baseline of a demand, which captures benefit and financial metric information (snapshot of cost plan, benefit plan, and demand-level financial metrics) at a particular moment in time.

Before you begin

Role required: it_demand_manager

About this task

You can create as many financial baselines as necessary and review the financials changes that have been made to the demand since the previous baseline. Any financial baseline doesn't capture the actual cost component of the demand.

Procedure

1. Open a demand from the home page of Next Experience for Demand Management.
For more information, see [Access demands](#).
2. Select **Details** from the L-2 (level 2) navigation menu.
3. To create a financial baseline of a demand, use either of the options.
4. On the Create New Demand Baseline form, fill in the fields.

Demand form

Field	Description
Name	Name of the demand baseline.
Demand	Demand to which the baseline belongs.

Field	Description
Description	Description of the demand baseline.

5. Select **Save**.

Note:

To delete a demand baseline, select the record and select **Delete** from the More Actions option.

After completing your work on the demand baseline, use the breadcrumb navigation to return to the **Demand Baselines** tab.

Allocate budget to a demand

Set the capital expense (Capex) and operating expense (Opex) budgets in demand or functional currency according to the fiscal years. The sum of the Capex and Opex budgets is calculated as the total budget in demand currency.

Before you begin

Role required: portfolio_manager

Procedure

1. Open a demand from the home page of Next Experience for Demand Management.
For more information, see [Access demands](#).
2. Select **Details** from the L-2 (level 2) navigation menu.
3. Select **Demand Budget**.

Note:

If the **Demand Budget** tab isn't visible, select **More** and then select **Demand Budget**.

4. Add or edit a demand budget record:
 - To add a demand budget record, select **New**.
 - To update the details of a demand budget record, select the record.
5. On the Create New Project Funding form, fill in the fields.

Tip:

You can work on allocating lean budgets at the fiscal period level using the Investment Budget. For more information, see [Enable lean budgeting for demands](#).

For a description of the field names, see [Create project funding form](#).

6. Select **Save**.

Note:

- To delete a demand budget record:
 - Select a demand budget record from the **Demand Budget** tab and select **Delete**.
 - Select **Delete** from the More Actions option in the project funding record form.
- If the demand doesn't have a cost plan, start date, and due date, then demand budget is distributed from the current month until the end of the demand budget fiscal year.
- If the demand doesn't have a cost plan, start date, and due date, then demand budget is distributed from the current month until the end of the demand budget fiscal year.
- If the demand doesn't have a cost plan and a due date but has a start date, then the demand budget is distributed from either:
 - Start date (if the start date falls in the given budget fiscal year) until the end of the demand budget fiscal year.
 - Start of the demand budget fiscal year until the end of the demand budget fiscal year.
- If the demand doesn't have a cost plan and a start date but has a due date, then the demand budget is distributed from either:
 - Current month until due date (if the due date falls in the given budget fiscal year).
 - Current month until the end of demand budget fiscal year.
- If the demand has a cost plan associated, then demand budget is distributed by honoring the cost plan fiscal periods.

After completing your work on the demand budget record, use the breadcrumb navigation to return to the **Demand Budget** tab.

Result

The demand budget for the selected year appears in the **Demand Budget** tab. You can select the amounts in the list to revise them.

Enable lean budgeting for demands

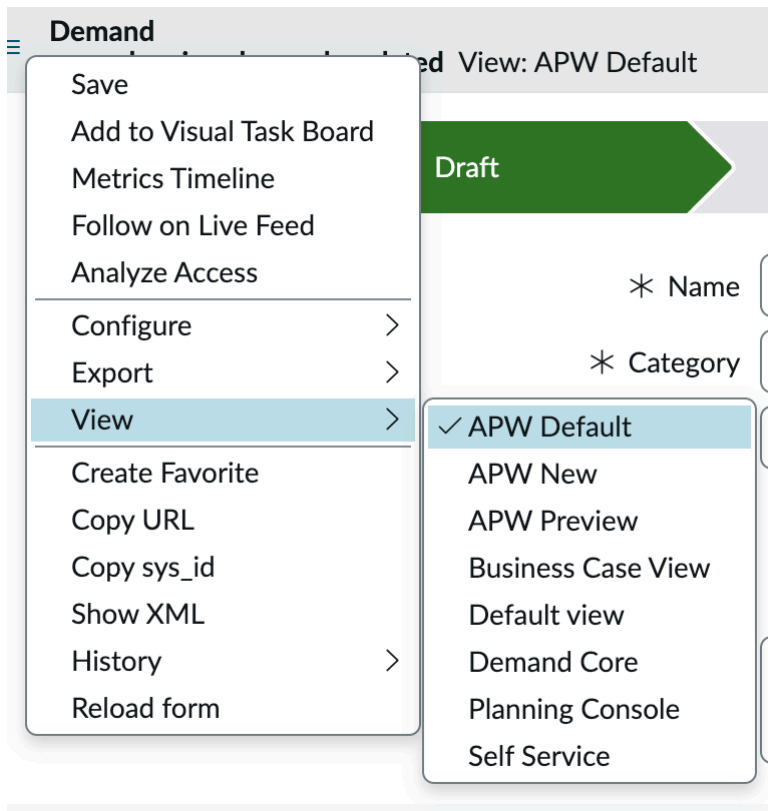

Enable the Investment Budget option to allocate budgeting for demands at a fiscal period level.

Before you begin

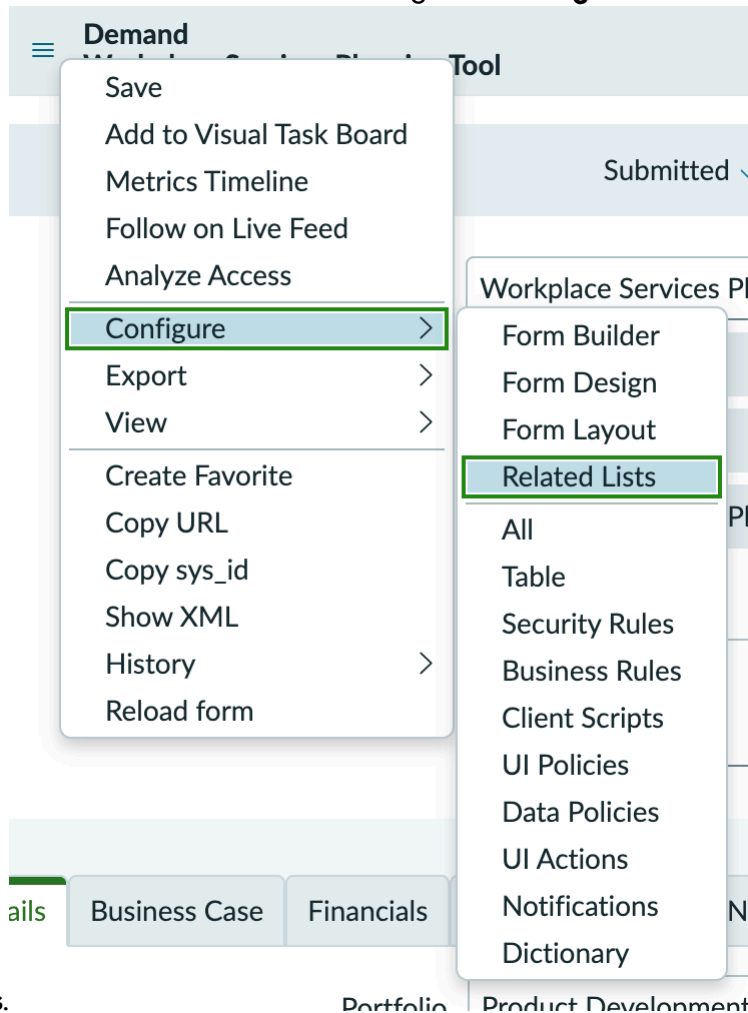

Role required: admin

Procedure

1. Navigate to **All > Demands > Demand > All**.
2. Open the required demand.
3. Select the Additional actions and navigate to **View > APW Default**.

4. Select the Additional actions and navigate to **Configure > Related**

Lists.

5. Select **Investment Budget** from the Available column and add it to Selected column.

6. Select **Save**.

Manage lean budgeting for demand

Allocate budget for demands at each fiscal period instead of the entire fiscal year to reduce the overhead costs associated with traditional approach.

Before you begin

- Lean budgeting is enabled. For more information, see [Enable lean budgeting for demands](#).
- Role required: sn_invst_pln.sn_spm_funding_user

Any user role with this specific role attached can add or manage the investment budgets.

Procedure

1. Open a demand from the home page of Next Experience for Demand Management.

For more information, see [Access demands](#).

2. Select **Details** from the L-2 (level 2) navigation menu.

3. Select **Investment Budget**.

i Note:

If the **Investment Budget** tab isn't visible, select **More** and then select **Investment Budget**.

4. Add or edit an investment budget record:

- To add an investment budget record, select **New**.
- To update the details of an investment budget record, select the record.

5. On the Create New Investment Budget form, fill in the fields.

Investment Budget form details

Field	Description
Amount	Investment budget amount.
Fiscal period	Fiscal period to allocate the budget.
Investment	Planning item to allocate this budget to. i Note: The current demand is selected by default.
Expense type	Type of the expense. <ul style="list-style-type: none"> ○ Capex - Budget for capital expenses. ○ <i>Opex</i> - Budget for operational expenses.

6. Select **Save**.

Note:

To delete an investment budget record:

- Select a demand budget record from the **Investment Budget** tab and select **Delete**.
- Select **Delete** from the More Actions option in the investment budget record form.

After completing your work on the demand budget record, use the breadcrumb navigation to return to the **Investment Budget** tab.

Add or edit expense lines

Create an expense line to capture the cost associated with a specific source, such as a user or a fixed asset. Expense lines are part of demand cost plans.

Before you begin

Role required: it_demand_manager

About this task

Expense lines on a demand record track the costs incurred during the demand evaluation process. You can add multiple expense lines to a single demand, but they can only be used for evaluation costs and can't be linked to cost plans. Only processed expense lines are counted, and their total automatically rolls up to the **Demand actual costs** field on the demand record.

Note:

When a demand is converted to a project, the expense lines remain with the demand, while the cost plans and budget are moved over to the project.

Procedure

1. Open a demand from the home page of Next Experience for Demand Management.
For more information, see [Access demands](#).
2. Select **Details** from the L-2 (level 2) navigation menu.
3. Select **Expense Lines**.

Note:

If the **Expense Lines** tab isn't visible, select **More** and then select **Expense Lines**.

4. Add or edit an expense line:
 - To add an expense line, select **New**.
 - To update the details of an existing expense line, select the record.
5. On the Create New Expense Line form, fill in the fields.
For a description of the field names, see [Create expense line form](#).
6. Select **Save**.

Note:

To view the expense allocations associated with the expense line, select **Expense Allocations**.

After completing your work on an expense line, use the breadcrumb navigation to return to the **Expense Lines** tab.

Generate labor costs

Generate labor costs to view the expenses of resources using resource assignments and cost plans.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > System Definition > Scheduled Jobs**.
2. Open the **Generate labor costs for demands and projects** scheduled job.
3. Select **Active**.
4. On the Scheduled Script Execution form, fill the fields.
For a description of the field names, see [Scheduled Script Execution Form](#).
5. Select **Update**.

Tip:

Alternatively, as an admin, you can activate and define a scheduled job to generate labor costs at the required frequency. For more information, see [Activate a scheduled job to generate labor costs](#).

Docs for demands in Next Experience for Demand Management

Store and manage documentation for demands from a centralized location in Next Experience for Demand Management.

Docs overview

Demand managers can store information for demands using the Docs feature.

- Each demand can have a separate doc page to capture related information. For example, create a doc page for business objectives or technical requirements.
- Each demand can have multiple doc pages to help you effectively organize key artifacts.
- Predefined templates such as Project Brief, Product Requirements, Brainstorming Ideas, and Meeting Notes are available. Create doc pages using one of these templates or start with an empty page.

Features of Docs

The following are the key features of Docs:

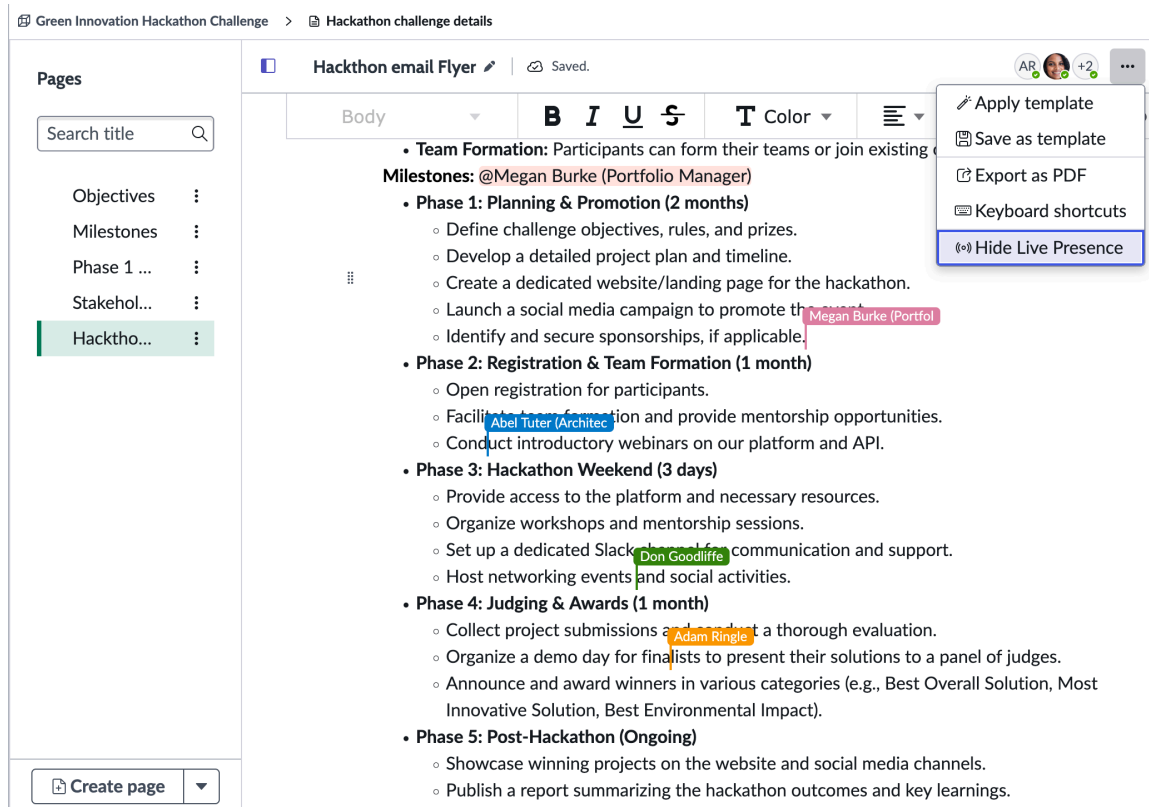

- Auto-save content.
- See who is viewing or working on a doc page using the feature of live user presence.
- Create documents using pre-defined templates.
- Use rich text paragraph formatting, which includes headings, lists, alignment, and others.
- Move text blocks to change their placement using block-level editing.
- Tag team members inline or insert tables using the `/` command.
- Add reference to other ServiceNow AI Platform tables to connect work across teams.
- Insert images by uploading files or using web URLs.

Note:

The experience of inserting Google Images links might not work.

Real-time collaboration in Docs

With the feature of real-time collaboration, edit a doc page concurrently with multiple other editors. Colored cursors denote the current location of each editor on the page. You can choose to show or hide these live presence indicators based on your preference while working on or reviewing the content of the page.

Note:

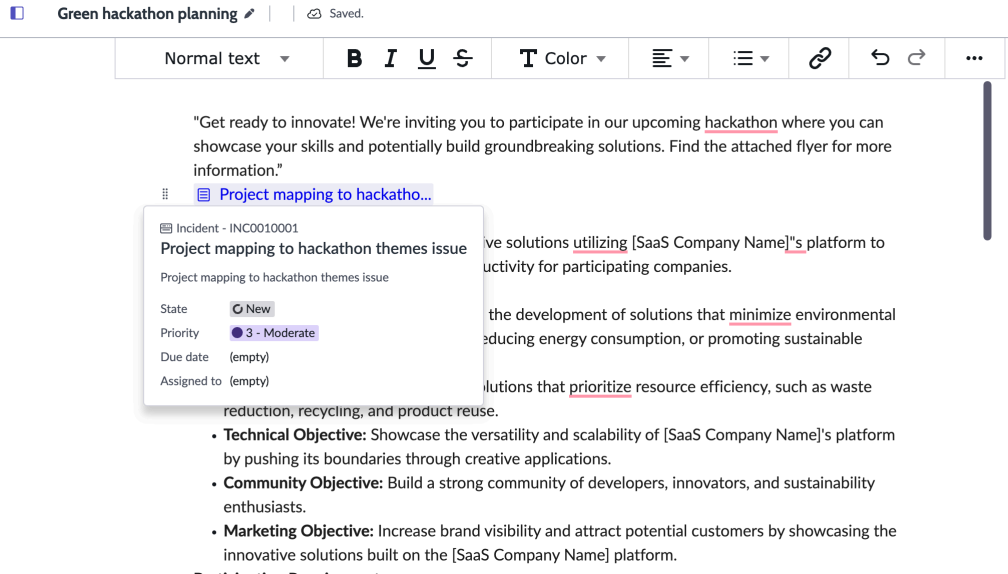

A huge number of users editing the same block of content simultaneously might result in issues with application performance.

Dynamic data linking in Docs

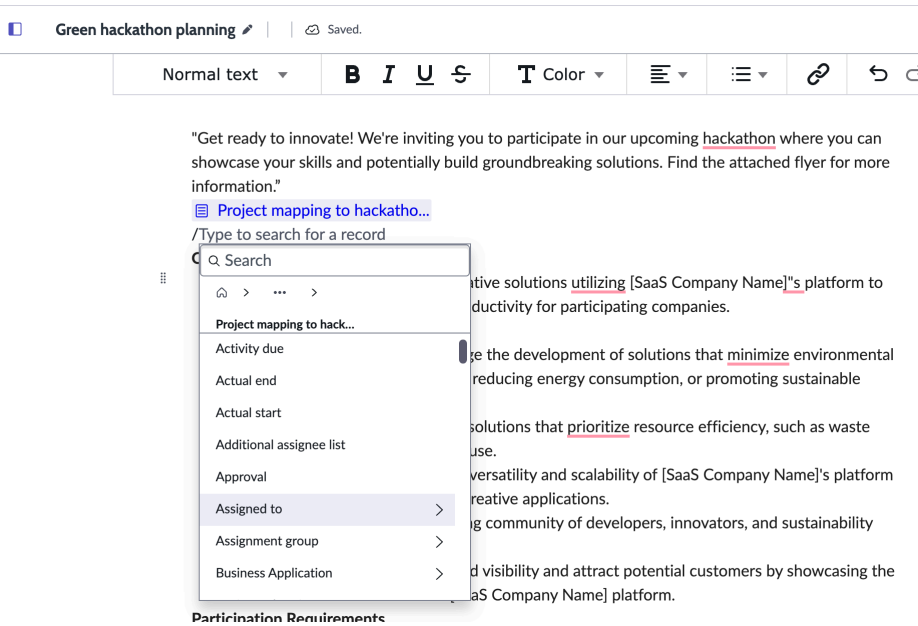

Keep record information in your documentation always current and reduce manual effort with the Dynamic data linking feature in Docs. You can now reference any ServiceNow application record and Docs will automatically reflect the latest updates from those records.

For example, if you add a reference to a Project record, the reference shows the latest field information of the project in Docs without requiring manual edits. Selecting the project reference opens up the project form so that you can view the full details of the project and make any necessary changes.

A hover popover displays the details of the mentioned record, providing quick access to additional information without leaving the current context.

Dynamic linking also enables adding references to a particular field of a record, such as Assigned to of a Project record.

You can add references from any ServiceNow table you have access to, with no setup or configuration needed.

This feature reduces the need to switch between multiple ServiceNow applications within your instance and helps maintain a single, reliable source of truth for collaborative work, making it easier for teams to stay aligned and informed.

Images in Docs

Insert images into your Docs by uploading a file from your device or adding a web URL. Note that inserting Google Images links might not work.

Save images from your CWM documents directly to your device, making it easier to share or use them outside of the Docs environment. Click an image to access the download icon (📄), then click the icon to save it to your device. Alternatively, right-click the image and use your browser's built-in save option.

Create and manage pages and subpages for demands

Flexibly organize information for your planning items by creating, duplicating, and deleting pages and subpages in Next Experience for Demand Management.

Before you begin

Role required:

- Create and manage pages and subpages - it_demand_user, it_demand_manager, demand_approver
- Read pages and subpages - apw_read, ppm_read

Procedure

1. Open a demand from the home page of Next Experience for Demand Management. For more information, see [Access demands](#).
2. Select **Docs** from the L-2 (level 2) navigation menu.
3. Create or manage docs in any of the following ways.

Next Experience for Demand Management reference

Reference information to provide additional details about Next Experience for Demand Management such as the fields, user roles, tables, and multicurrency.

Actual cost and effort calculation for a demand and demand task

Actual cost and effort represent the realized cost and time spent working on demands and demand tasks during a specific time period. These values are calculated based on approved time cards and hourly rates for resources.

Overview of calculation

Working on demands and demand tasks involves cost and time that add to the overall expenditure of converting a demand to a product, feature, or enhancement. Demand managers must track the actual cost and effort incurred in assessment and planning activities.

- The actual cost is calculated by multiplying the hours reported in the time card by the hourly rate of the resource.
- The actual effort for a demand task is calculated based on the hours reported in the time card.
- The actual effort and cost for demand tasks roll up to calculate the actual effort and cost for the demand.

Hourly rate calculation

The hourly rate for calculating actual cost is derived in the following order:

1. If a rate model is associated with the demand, the actual cost is calculated based on the hourly rate defined in the rate model.
2. If a rate model is absent or if an hourly rate isn't found in the rate model, the hourly rate is derived from the default labor rate.
3. If an hourly rate isn't found in the default labor rate, the hourly rate is derived from the default system property.

Resource assignments and Time cards

Don't create resource assignments for allocating resources or groups to a demand task. Resource assignments created in the demand are used for resource estimation of the work entity created from the demand. These resource assignments automatically move to the resulting work entity when a demand is qualified and converted.

When you submit a time card for a demand, the actual effort and cost aren't reflected in the resource assignment. Resource assignments aren't associated with the demand by default. The actual cost and actual effort remain with the demand and aren't transferred to the created projects, even if you manually associate a resource assignment.

If a resource spends extra hours working on a demand that aren't associated with demand tasks, this time must also be recorded. The resource submits the time card for recording extra hours using the Time Sheet Portal. This extra cost and effort is added to the demand but isn't reflected in the actual cost and effort for the demand tasks.

Demand-level calculations

The actual cost and actual effort for the demand are calculated as follows:

- Demand Actual Cost = actual cost of all demand tasks + actual cost of extra activities
- Demand Actual Effort = actual effort of all demand tasks + actual effort of extra activities

If a demand has no task or assigned resource, you can capture the actual cost by submitting a time card against the demand. Once the time card is approved, an expense line is created on the demand. The expense line is processed and the actual cost of work for that time card rolls up to the demand in the Demand Actual Cost column.

This example demonstrates actual cost and effort calculation for demand tasks and rollup to the demand.

Scenario setup - For demand D1, the demand manager creates three demand tasks (DT1, DT2, and DT3) and assigns resources R1, R2, and R3 to each task respectively.

Hourly resource rates

Resource	Hourly rate in the rate model	Hourly rate in the default labor rate	Hourly rate in the system property
R1	\$200	\$150	\$50
R2	\$250	\$200	\$50
R3	\$150	\$100	\$50

Each resource spends eight hours on the assigned demand task and submits a time card.

Scenario 1: Rate derived from the rate model

Actuals	Demand task DT1	Demand task DT2	Demand task DT3
Actual effort	8 hours	8 hours	8 hours
Actual cost	$200 * 8 = \$1600$	$250 * 8 = \$2000$	$150 * 8 = \$1200$

Demand rollup:

- Demand Actual Cost = \$4,800
- Demand Actual Effort = 24 hours

Rate derived from default labor rate
(Rate model not associated with demand.)

Actuals	Demand task DT1	Demand task DT2	Demand task DT3
Actual effort	8 hours	8 hours	8 hours
Actual cost	$150 * 8 = \$1200$	$200 * 8 = \$1600$	$100 * 8 = \$800$

Demand rollup:

- Demand Actual Cost = \$3,600
- Demand Actual Effort = 24 hours

Rate derived from default system property
(Rate model not associated with demand and hourly rate not found in default labor rate.)

Actuals	Demand task DT1	Demand task DT2	Demand task DT3
Actual effort	8 hours	8 hours	8 hours
Actual cost	$50 * 8 = \$400$	$50 * 8 = \$400$	$50 * 8 = \$400$

Demand rollup:

- Demand Actual Cost = \$1,200
- Demand Actual Effort = 24 hours

Data migrated from demands to created entities

Data fields that are migrated from a demand to an entity when the selected entity is created from the demand.

Data migrated from a demand to a created project

Data fields are migrated from a demand to a project when the project is created from the demand.

Field type	Description
Demand	<p>The following demand fields are migrated to a project:</p> <ul style="list-style-type: none"> • Description • Business case • Investment Class • Investment Type • Risk of performing • Risk of not performing • Enablers • Barriers • In scope • Out of scope • Assumptions • Business Unit • Department • Impacted Business Units • Business Capabilities • Priority • Impact • Rate Model • Approved start date • Approved end date • Short description • Program • Domain • Goals • Strategies • Impacted Business Applications • Configuration item • Company • Urgency • Project Manager

Field type	Description
	<ul style="list-style-type: none"> • Project currency • Project calculation
Resource assignments	Resource assignments are migrated to a project by updating the task reference from the demand to project.
Requirements	Demand requirements.
Financial records	Financial records such as cost plans and breakdowns, benefit plans and breakdowns (monetary and non-monetary), and demand budgets are migrated to a project. This process updates the task reference from demand to project.
RIDAC	RIDAC entities are migrated to a project by updating the task reference from demand to project. The migrated entities include the risks, issues, decisions, project actions, request changes, and RIDAC_m2m records.
Assessment	<p>The following assessment data fields are migrated to a project:</p> <ul style="list-style-type: none"> • Risk • Value • Score • T-Shirt size
Stakeholders	Stakeholder records.
Project Currency Financial	If the multicurrency feature is active, the project financial fields are calculated according to the project currency and reference rate.

Data migrated from demands to Enterprise Agile Planning (EAP) entities

Data fields are migrated from a demand to an EAP entity when the entity is created from the demand.

Data fields migrated from demand to EAP entity

Field type	Description
Demand	<p>The following demand fields are migrated to the created entity:</p> <ul style="list-style-type: none"> • Business Capabilities • Product • Primary target • Team • Demand manager

Data fields migrated from demand to EAP entity (continued)

Field type	Description

All Demands UI

Feature	Description
Search	Option to search for demands by name.
Filter	Option to apply filters on the list. The filter preferences that you choose are retained in the filter criteria.
Sort by	Option to sort the demand list in ascending or descending order based on a selected field.
Group by	Option to group the demands by a selected field, such as state or stage, for better organization and visibility.
Refresh	Option to reload the list.
New	Option to create a demand.
Edit	Option to edit the selected demands.
Assign to me	Option to assign the selected demand to the logged-in user.
Export	Option to export the demand list to an external file format such as Excel or CSV.
More Actions	Option to see more features available in the All Demands list.
Personalize fields	Option to customize the columns displayed in the demand list to show only the fields relevant to you.

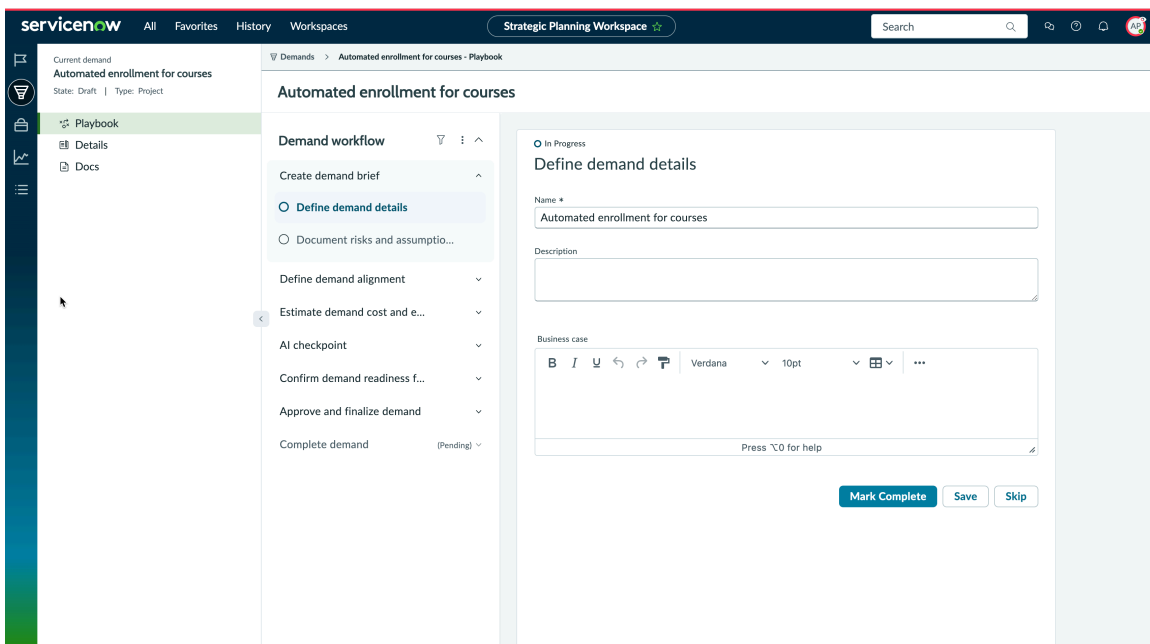

Data grid

The data grid shows the list of demands in rows, and the following options to perform actions on the rows.

Option	Description
Column actions	Group the demands by a column field using the action on the header. Point your mouse device to a column header to see the context menu icon ().
Rearrange columns	Enables the dragging of the columns to a position of your choice on the grid.
Select row ()	Choose to select multiple demand rows at once.
Cell actions	Show matching or filter out demands by selecting the cell context menu () or select and hold (or right-click) a cell.

Demand default playbook stages and activities

The default demand playbook includes certain predefined stages and activities. These activities guide you through the demand life-cycle, from capturing the initial brief to completing the demand.

Create demand brief

In this stage, capture the foundational information for the demand including the business justification, risks, and assumptions.

Create demand brief stage details

Activity	Type	Description
Define demand details	Form	Enter the demand name, description, and business case. For more information, see Demand form .
Document risks and assumptions	Form	Document the risk of not performing the demand and any assumptions. For more information, see Demand form .
The demand state will be moved to submitted	Automated	Completing the previous activities advances the demand to the next state in its life-cycle.

Define demand alignment

In this stage, align the demand with organizational goals, stakeholders, and team members.

Define demand alignment stage details

Activity	Type	Description
Define business alignment	Form	Define the business classification for the demand. For more information, see Demand form .
Define strategic alignment	Form	Define how the demand aligns with the organization's strategic objectives. For more information, see Demand form .
Add secondary goals	Related list	Associate secondary goals and targets with the demand. <ul style="list-style-type: none"> You can also add a goal or target relationship. You can view the details of an entry by selecting it from the list. For more information, see Demand form .
Update demand dates	Form	Specify or update the planned dates for the demand.

Define demand alignment stage details (continued)

Activity	Type	Description
		For more information, see Demand form .
Add collaborators	Form	Add collaborators to the demand and indicate whether an assessment is required. For more information, see Demand form .
Add stakeholders	Related list	Add stakeholders associated with the demand. You can view the details of an entry by selecting it from the list. For more information, see Create stakeholder form .
Add demand tasks	Related list	Create demand tasks to break down initial planning activities. For more information, see Create demand task form .
Update EAP details	Form	Update the Team field for the Enterprise Agile Planning (EAP) entity, to which the demand is converted. Note: This activity is available if the Type field is an EAP entity.
The demand state will be moved to screening	Automated	Completing the previous activities advances the demand to the next state in its life-cycle.

Estimate demand cost and effort

In this stage, evaluate the financial and resource requirements for the demand.

Estimate demand cost and effort stage details

Activity	Type	Description
Update assessment details	Form	Update the assessment information for the demand. For more information, see Demand form .
Estimate financial cost	Related list	View and manage cost plans associated with the demand.

Estimate demand cost and effort stage details (continued)

Activity	Type	Description
		<ul style="list-style-type: none"> You can add a cost plan or delete an existing one. You can view the details of an entry by selecting it from the list. <p>For more information, see Create cost plan form.</p>
Estimate resource requirements	Related list	<p>View and manage resource assignments for the demand.</p> <p>You can view the details of an entry by selecting it from the list.</p> <p>For more information, see Create resource assignment form.</p>
Define benefit estimates	Related list	<p>View and manage benefit plans for the demand.</p> <ul style="list-style-type: none"> You can add a benefit plan or delete an existing one. You can view the details of an entry by selecting it from the list. <p>For more information, see Monetary benefit plan form and Non-monetary benefit plan form.</p>
Cost estimates	Form	<p>Review or update the cost estimate details for the demand.</p>
The demand state will be moved to qualified	Automated	<p>Completing the previous activities advances the demand to the next state in its life-cycle.</p>

AI checkpoint

In this stage, associate AI systems with the demand to identify potential AI impacts.

Note:

If the AI Control Tower plugin is installed and the investment type of the demand is set to artificial intelligence, the AI checkpoint stage is available for playbooks.

AI checkpoint stage details

Activity	Type	Description
Associate AI systems	Form	<p>Add AI systems to the demand by creating one or selecting from the existing systems.</p> <ul style="list-style-type: none"> To create an AI system, select the Create new AI system link. To link existing systems, use the Product and Impacted AI systems fields.

For more information on creating AI systems, see [Create AI system assets](#) .

Confirm demand readiness for review

In this stage, verify that the demand is complete and ready for approval.

Confirm demand readiness for review stage details

Activity	Type	Description
Align demand and assign portfolio/program	Form	Review the demand details and confirm readiness for the approval process.
The demand state will be moved to approved	Automated	Completing the previous activities advances the demand to the next state in its life-cycle.

Approve and finalize demand

In this stage, confirm the demand details and convert the demand to a work entity.

Approve and finalize demand stage details

Activity	Type	Description
Confirm details and convert to selected entity	Form	Review the selected work entity type, such as project or enhancement, and the approved timeline.

Complete demand

This stage is the final stage of the demand workflow.

Complete demand stage details

Activity	Type	Description
Review the converted entity	Form	Review the work entity created from the demand to verify that the conversion is complete.

Demand tasks

A demand task is a unit of work created within a demand to break down initial planning activities before converting the demand into an entity.

Demand tasks overview

You can create a demand task from the **Demand Tasks** related list to delegate activities that help assess demand feasibility.

Demand tasks differ from project tasks in the following ways:

- Planned dates, actual dates, and original dates aren't supported in demand tasks.
- The due date indicates when the task is targeted for completion and doesn't affect the demand workflow. Project tasks affect project completion dates when planned dates and actual dates are changed.
- Nested demand tasks aren't supported.
- Task constraints such as Start ASAP and Start on a specific date aren't supported.
- Execution types such as Agile, Waterfall, or Hybrid aren't supported.

Resource assignment

Resources for a demand task can be assigned using the **Assigned to**, **Additional Assignee list**, and **Assignment Group** fields. Don't create resource assignments to allocate resources or groups to a demand task or submit time spent on the demand. If you associate a resource assignment with a demand task, the associated resource plan isn't transferred to the work entity created from that demand.

Resource assignments aren't associated with the demand by default. Don't use the resource assignments you created for the future work entity to submit time spent on a demand. When you submit a time card for a demand, the time and cost incurred aren't transferred to the work entity created from the demand. The time and cost remain within the demand as the demand cost and effort. Resources assigned to a demand task can submit the time spent on it using a time card.

Actual cost and effort

The actual effort for work performed on the demand task is derived from the time card. The actual cost is derived from the hourly resource rate defined in the rate model, default labor rate, or default system property. The actual cost and effort for a demand task roll up to derive the actual cost and effort for the associated demand. For more information, see [Actual cost and effort calculation for a demand and demand task](#).

Multicurrency in Next Experience for Demand Management reference

The multicurrency features in Next Experience for Demand Management enable you to manage and track demand financials in multiple currencies. This section provides field references and explains how cost and benefit plan updates recalculate values in demand currency.

Multicurrency fields in demand-related forms

When you enable the **Demand Currency** view in Demand, Cost Plan, and Cost Plan Breakdown forms, multicurrency fields appear in the Financials section of these forms.

Financials tab of the Demand form

Field	Description
Demand currency	<p>Currency for managing and tracking the demand. The available currency options depend on your selection in Preferences-Project under Project Administration. For more information, see Select demand currency preference.</p> <p>This field becomes read only once you create a cost plan, cost plan breakdown, benefit plan, or benefit plan breakdown.</p>
Project currency	Currency for implementing the project when this demand is converted to a project. This value carries over to the Project form in Project Management.
Capital expense in demand currency	Capital expenditure (Capex) for the demand.
Capital budget in demand currency	Total capital budget allocated to the demand across all fiscal years. Rolled up from the Capex budget of the demand.
Operating expense in demand currency	Operational expenditure (Opex) for the demand in the selected demand currency.
Operating budget in demand currency	Total operational budget allocated to the demand across all fiscal years in the selected demand currency. Rolled up from the Opex budget of the demand.
Total planned cost in demand currency	Estimated cost of the demand in demand currency.
Financial return in demand currency	Estimated revenue based on the Total planned costs in demand currency and Financial benefit in demand currency fields.
Financial benefit in demand currency	Estimated revenue if the demand is approved in the selected demand currency. Rolled up from the benefit breakdown of the demand.
Net present value in demand currency	Present value of future cash based on the given annual interest rate in the selected demand currency. A measure for comparing money spent today against future expected

Financials tab of the Demand form (continued)

Field	Description
	financial benefits, helping evaluate overall investment performance.
Actual cost in demand currency	Total cost incurred while working on a demand and demand tasks in the selected demand currency.

Multicurrency fields of the Demand Task form

Field	Description
Demand currency	Currency specified in the Demand currency field of the Demand form.
Actual cost in demand currency	Total cost incurred while working on the demand tasks in the selected demand currency. Actual cost populates after the assignee creates and submits a time card. When the time card is approved, the resource rate from the rate card, labor rate, or system properties populates this field.

Financials section of the Cost Plan form

Cost Plan form

Field	Description
Demand currency	Currency specified in the Demand currency Demand currency field of the Demand form.
Cost in demand currency	Value that is rolled up from the Entered cost field of all cost plan breakdowns.

Note:

Any change to the unit cost, quantity, or fiscal period of a cost plan recalculates the amounts in demand currency. See [Cost plan updates and cost recalculation in demand currency](#).

Multicurrency fields in the Cost Plan Breakdown form

Field	Description
Demand currency	Currency specified in the Demand currency field of the Demand form.
Cost in demand currency	Breakdown amount in demand currency.
Demand currency exchange rate	Rate in effect for the period corresponding to the cost plan breakdown in the demand currency.

Multicurrency fields in the Cost Plan Breakdown form (continued)

Field	Description
Demand currency exchange rate date	Reference date on which the currency exchange rate is applied for conversion.

Financials section of the Benefit Plan form

Field	Description
Demand currency	Currency specified in the Demand currency field of the Demand form.
Benefit in demand currency	Benefit incurred from demand in demand currency.
Actual benefit in demand currency	Actual benefit value rolled up from the actual benefit in the benefit breakdown.

Multicurrency fields in the Benefit Plan Breakdown form

Field	Description
Demand currency	Currency specified in the Demand currency field of the Demand form.
Benefit in demand currency	Benefit incurred from demand in demand currency.
Demand currency exchange rate	Rate in effect for the period corresponding to the benefit plan breakdown in demand currency.
Demand currency exchange rate date	Reference date on which the currency exchange rate is applied for conversion.

Multicurrency fields in the Expense Line form

Field	Description
Demand currency	Currency specified in the Demand currency field of the Demand form.
Amount in demand currency	Expense cost in demand currency. Amount entered in the Amount field is converted to demand currency.

Multicurrency fields in the Demand Budget form

Field	Description
Capex budget in Demand Currency	Planned expense amount allocated for capital expenditure in the selected currency.
Opex budget in Demand Currency	Operating expense amount in the selected currency.

Multicurrency fields in the Demand Budget form (continued)

Field	Description
Total Budget in Demand Currency	Sum of Capex and Opex amounts in the selected currency.

Cost plan updates and cost recalculation in demand currency

Updating the unit cost, quantity, or fiscal period of a cost plan updates all related amount fields in the cost plan and its breakdowns. The amounts in the related demand fields are recalculated and reflected in the demand currency.

Unit cost, Quantity, and Recurring field changes

When you modify these fields in the Cost Plan form with multicurrency view enabled, the following values are recalculated:

- **Total planned cost** in demand currency.
- **Cost in demand currency** in the Cost Plan Breakdown.
- **Capital expense in demand currency, Operating expense in demand currency, and Total planned cost in demand currency** fields in the demand.

Fiscal period changes

When you change the fiscal period (start date or end date) in the Cost Plan form, the following values are recalculated:

- **Total planned cost** and **Cost in demand currency** of the cost plan. Cost Plan Breakdown records can be added or removed.
- If the **Recurring** check box isn't selected, the **Cost in demand currency** value of each Cost Plan Breakdown record is recalculated.
- **Capital expense in demand currency, Operating expense in demand currency, and Total planned cost in demand currency** fields in the demand.

Cost plan breakdown changes

When you change the entered cost in an individual Cost Plan Breakdown record or manually add cost plan breakdowns to a cost plan, the following values are recalculated:

- **Total planned cost** of the cost plan in demand currency.
- **Capital expense in demand currency, Operating expense in demand currency, and Total planned cost in demand currency** fields in the demand.

Benefit plan updates and recalculation in demand currency

Updating the entered currency, entered benefit, offset type, or fiscal period of a benefit plan updates all related amount fields in the benefit plan and its breakdowns. The amounts in the related demand fields are recalculated and reflected in demand currency.

Entered currency, Entered benefit, and Recurring field changes

When you modify these fields in the Benefit Plan form with multicurrency view enabled, the following values are recalculated:

- **Total planned cost** in demand currency.
- **Benefit in demand currency** in the Benefit Plan Breakdown.
- **Financial benefit in demand currency** field in the demand.

Offset type changes

When you change the offset type (start date or end date) and specify the offset period and duration in the Benefit Plan form, the following values are recalculated:

- **Total planned benefit** and **Benefit in demand currency** of the benefit plan. Benefit Plan Breakdown records can be added or removed.
- If the **Recurring** check box isn't selected, the **Benefit in demand currency** value of each Benefit Plan Breakdown record is recalculated.
- **Financial benefit in demand currency** field in the demand.

Fiscal period changes

When you change the fiscal period (start date or end date) in the Benefit Plan form, the following values are recalculated:

- **Benefit in demand currency** and **Total planned benefit** of the benefit plan. Benefit Plan Breakdown records can be added or removed.
- If the **Recurring** check box isn't selected, the **Benefit in demand currency** of each Benefit Plan Breakdown record is recalculated.
- **Financial benefit in demand currency** field in the demand.

Benefit plan breakdown changes

When you change the entered benefit in an individual Benefit Plan Breakdown record, the following values are recalculated:

- **Benefit in demand currency** of the benefit plan.
- **Financial benefit in demand currency** field in the demand.

Form field information

Field information for forms used in Next Experience for Demand Management.

Assessment instance form

The assessment instance form information is used to create and edit an assessment instance for a demand.

Assessment Instance

Field	Description
Number	Auto-generated unique identifier for the assessment instance.
State	Status of the assessment instance. Defaults to Ready to take .
Metric type	Type of metric used to define the evaluation criteria for the assessment.

Assessment Instance (continued)

Field	Description
Assessment group	Group responsible for completing the assessments.
Due date	Date by which the assessment must be completed.
Assigned to	Users responsible for completing the assessment instance.
Expiration date	Date after which the assessment instance is no longer valid.
Signature	Signature associated with the assessment instance on completion.
Preview	Indication of whether a preview of the assessment before it's submitted is available.
Signature result	Outcome or status of the signature collected for the assessment instance.

Create action form

The action form information is used to create an action for a demand.

Create New Action form

Field	Description
Number	System-generated number with a configurable prefix.
State	Current state of the action. All new action records are created with the state set to Open. The available states are: <ul style="list-style-type: none"> • Pending • Open • Work in Progress • Closed Complete • Closed Incomplete • Closed Skipped
Priority	Urgency for implementing or approving the action based on impact.
Estimated Cost	Estimated cost generated by the action.
Impact	The impact on the outcome of the demand if you don't implement the action.
Approval	Status of approval from the stakeholders for the action. The available options are:

Create New Action form (continued)

Field	Description
	<ul style="list-style-type: none"> • Not Yet Requested • Requested • Approved • Rejected
Assigned to	Primary resource assigned to implement the action.
Due date	Requested date on which the action must be approved or implemented.
Parent	The demand to which this action belongs.
Short description	Brief description of the action such as what the action involves, how to implement the action, who it affects, and the action outcome.
Description	Details of the action and its potential impact.
Work notes	Information about the action. Add work notes to communicate about the status of action approval, rejection, or implementation with other users.

Create assessment instance question form

The assessment instance question form information is used to create and edit an assessment questions for a demand.

Assessment Instance Question

Field	Description
Source table	Table from which the assessment instance question originates.
Category	Category used to classify the assessment instance question.
Source	Source record associated with the assessment instance question.
Domain	Domain to which the assessment instance question belongs. Defaults to global.
Metric	Assessment metric that defines the criteria being evaluated.
Instance	Assessment instance to which this question belongs. Auto-populated with the instance number.
Value	Numeric or scored value assigned to the assessment question response.

Assessment Instance Question (continued)

Field	Description
String value	Text-based response or value entered for the assessment question.
Reference id	Unique identifier of the referenced record associated with this question.
Additional information	Any supplementary details or context relevant to the assessment instance question.

Create cost plan breakdown form

The cost plan breakdown form information is used to create and edit a cost plan breakdown record for a cost plan of a demand.

Cost plan breakdown

Field	Description
Cost plan	Name of the cost plan to which the breakdown is associated.
Fiscal period	Fiscal period for the cost plan breakdown.
Entered currency	Currency to capture the unit cost value. If the selected currency is different from the default currency configured in the Financial Management application, the budget reference rate is used to calculate the cost of the demand.
Entered cost	Breakdown amount in entered currency.
Task	Task to which the cost plan breakdown belongs.
Functional cost	Functional cost obtained by multiplying exchange rate with entered cost.
Exchange rate	Rate in effect for the period corresponding to the cost plan breakdown. When the period corresponding to the cost plan break down has multiple rates, the rate in effect on the first date of that period is used. Exchange rate is used to convert entered cost into functional cost. It is obtained from the itfm_fx_rate [budget_reference_rates] table.
Exchange rate date	First date of the fiscal period corresponding to the cost plan breakdown.

Create cost plan form

The cost plan form information is used to create a cost plan for a demand.

Cost plan section

Field	Description
Name	Name of the cost plan.
Project/Demand	The demand to which this cost plan belongs.
Start fiscal period	Starting month in a fiscal period for the cost plan. When you change the start fiscal period, the associated cost breakdown values also change.
End fiscal period	Ending month in a fiscal period for the cost plan. When you change the end fiscal period, the associated cost breakdown values also change.

Financials section

Field	Description
Entered currency	Currency to capture the unit cost value. If the selected currency is different from the default currency configured in the Financial Management application, the budget reference rate is used to calculate the cost of the demand.
Total planned cost	Total planned cost value of the cost plan. If the cost is recurring, the calculation is Quantity x Unit cost x number of fiscal periods. If the cost is non-recurring, the calculation is Quantity x Unit cost. This value is rolled up from the cost breakdown.
Unit cost	Cost of single unit of the resource.
Functional currency	The default currency configured in the Financial Management application and used for managing the demand.
Quantity	Quantity of cost plans.
Cost in functional currency	The total planned cost for the demand in functional currency. The value in this field changes if the entered currency is different from the functional currency.
Recurring	Indicates if the cost is recurring for each fiscal period.

Financials section (continued)

Field	Description
	Quantity x Unit cost value is incurred for every fiscal period.
Total actual cost	Total actual costs of the cost plan. This value is rolled up from cost breakdown.
Cost type	Cost type of the plan.
Source	<p>Funding entity value from which you request fund.</p> <p>The field is available when you select a value in the Source type field.</p> <p>This field appears only if the legacy Investment Funding (com.snc.investment_funding) plugin is activated or the Investment Funding (sn_invst_pln) application is installed.</p>
Investment	<p>Name of the investment created for the project.</p> <p>This field appears only if the legacy Investment Funding (com.snc.investment_funding) plugin is activated or the Investment Funding (sn_invst_pln) application is installed.</p>
Source type	<p>Funding entity type from which you request fund.</p> <p>This field appears only if the legacy Investment Funding (com.snc.investment_funding) plugin is activated or the Investment Funding (sn_invst_pln) application is installed.</p>

Create decision form

The decision form information is used to create a decision for a demand.

Decision form

Field	Description
Number	System-generated ID number with a configurable prefix.
State	<p>Current state of the decision. All new decision records are created with the Open state.</p> <p>The available states are:</p> <ul style="list-style-type: none"> • Pending • Open

Decision form (continued)

Field	Description
	<ul style="list-style-type: none"> • Work in Progress • Closed Complete • Closed Incomplete • Closed Skipped
Priority	Urgency of approving or implementing the decision based on the possible impact.
Decision status	Status of the decision. The available options are: <ul style="list-style-type: none"> • Pending • Approved • Rejected
Impact	Impact on the outcome of the demand if you don't implement the decision.
Approval required	Option for determining whether approval of the decision is required.
Estimated Cost	Estimated cost of implementing the decision in the selected currency.
Due date	Requested date on which the decision must be approved or implemented.
Assigned to	Primary resource assigned to work on the decision. The default value is the name of the user creating the decision record.
Parent	Demand number to which this decision belongs.
Short description	Brief description of the decision such as what the decision is about, who made it, what it affects, and the decision outcome.
Description	Details of the decision and its potential impact.
Work notes	Information to record and track the status of decision implementation or approvals.

Create demand task form

The demand task form information is used to create a demand task for the demand.

Demand Task form

Field	Description
Short description	A brief summary of the task, which helps quickly identify the purpose or nature of the work.
Assignment group	Team or group responsible for handling the task.
Number	System-generated ID number with a configurable prefix.

Demand Task form (continued)

Field	Description
Assigned to	<p>Primary resource responsible for executing or progressing the task. The following conditions apply:</p> <ul style="list-style-type: none"> • If an assignment group is defined, users in the assignment group are listed. • If skills are defined, users with those skills are listed. • If no assignment groups or skills are defined, users with one of the Project Management application user roles are listed. • Users with the timecard_user role are also listed.
Priority	<p>Indicates the urgency and importance of the task. Determines how quickly it should be addressed.</p>
Additional assignee list	<p>Users assigned to the demand task in addition to the single primary resource defined in the Assigned to field.</p>
State	<p>Current state of the demand task. All new demand task records are created in the Open state.</p> <p>The states include:</p> <ul style="list-style-type: none"> • Pending • Open • Work in Progress • Closed Complete • Closed Incomplete • Closed Skipped
Category	<p>Category of the demand task.</p> <p>The categories include:</p> <ul style="list-style-type: none"> • Initial review • Effort estimate • Cost estimate • Benefit estimate • Risk assessment
Due date	<p>The expected completion date and time for the task.</p>

Demand Task form (continued)

Field	Description
Actual effort	The actual time spent working on the demand task, which is derived from the approved time card for this demand task. You must add this field by personalizing the Create New Demand Task form as this field doesn't appear by default on the form.
Actual cost	The actual cost of the demand task derived from the number of hours worked and hourly rate of the resource as defined in the rate card. In the absence of a rate card, the hourly rate is derived from the default labor rate card or default system property.
Description	Brief description of the demand task.
Work notes	Information about the demand task. Work notes are added throughout the demand management life cycle to communicate with other users associated with the demand.

Create expense line form

The expense line form information is used to create an expense line for your actual expenses.

Expense Line section

Field	Description
Number	Auto-generated number for the expense line.
Amount	Expense cost in the selected currency.
Date	Date on which the expense was generated.
Process date	Date on which the expense line was processed.
Rate card	Name of the rate card.
Inherited	Indicates if the expense line is inherited from another expense line.
Parent	The parent expense line from which this expense line is inherited.
Rate type	Rate type for the expense line.
State	State of the expense line. Only processed expense lines are considered for an investment entity.
Source ID	Record that generated the associated cost.
Summary type	Business purpose of the expense line.
Cost plan	Associated cost plan name for recording the expense line.

Expense Line section (continued)

Field	Description
Expense type	Defines the expense type, internal or external. By default, the expense type is considered from the cost type field entry.
Cost type	Cost type of the expense. By default, the cost type of the cost plan is selected.
Short description	Short description of the expense. Mention unique and specific details to identify the expense line.
Source	Sources of the expense line. These sources include: <ul style="list-style-type: none"> • Asset • Configuration item • Fixed asset • Task • Contract • Cost center • User

Create goal/target relationship form

The goal/target relationship form information is used to create a relationship between a goal and a demand.

Create New Goal/Target Relationship form

Field	Description
Goal	Name of the goal.
Demand	Demand with which a goal relationship is created with the goal.
Target	Name of the target.
Primary	Indicates that this goal is the primary goal associated with a demand. Although multiple goals can be linked to a demand, only one of them must be designated as the primary goal.
Parent goal	Name of the parent goal that this goal contributes to.
Status	Status of the goal. Status can be Red, Yellow, Green, or None.

Create New Goal/Target Relationship form (continued)

Field	Description
State	State of the goal. The state can be Draft, In progress, Approved, Complete, Pending, Achieved, or Not Achieved.
End date	End date for the goal. By default, the end date of the current quarter is populated. For a subgoal, the end date of its parent goal is populated.
Start date	Start date for the goal. By default, the start date of the current quarter is populated. For a subgoal, start date of its parent goal is populated.
Progress	<p>Percentage completion for the goal. If the goal has subgoals or/and targets, the progress value is calculated automatically.</p> <p>For more information on how the progress value is calculated, see Progress value calculation.</p>
Category	<p>Category of the goal. The available options are:</p> <ul style="list-style-type: none"> • Total Applications • Total Cost • Opex • Capex • Cloud Applications • Homegrown Applications • Support Cost • Labor Cost • Standards Compliance • Strategic • Operational • Tactical • Artificial Intelligence

Create issue form

The issue form information is used to create an issue for the demand.

Issue form

Field	Description
Number	System-generated ID number with a configurable prefix.

Issue form (continued)

Field	Description
State	<p>Current state of the issue. All new issue records are created in the Open state.</p> <p>The available states are:</p> <ul style="list-style-type: none"> • Pending • Open • Work in Progress • Closed Complete • Closed Incomplete • Closed Skipped
Priority	Urgency of resolving or managing the issue based on possible impact.
Estimated cost	Estimated cost generated by the issue.
Impact	Impact on the outcome of the demand if the issue remains unresolved.
Due date	<p>Requested date for one of the following situations:</p> <ul style="list-style-type: none"> • If the issue has an assigned resource, then the due date is the date for resolving the issue. • If the issue isn't assigned to any resource, then the due date is the date when the issue must be closed or addressed.
Assigned to	Primary resource assigned to work on the issue resolution.
Parent	Demand to which this issue belongs.
Short description	Brief description of the issue and its potential impact on the success of the demand.
Description	Details of the issue and its potential impact.
Work notes	Information to record and track the work accomplished for resolving the issue.

Create request change form

The request change form information is used to create a request change for a demand.

Request change form

Field	Description
Number	System-generated ID number with a configurable prefix.
State	<p>Current state of the request change. All new request change records are created in the Open state.</p> <p>The available states are:</p> <ul style="list-style-type: none"> • Pending • Open

Request change form (continued)

Field	Description
	<ul style="list-style-type: none"> • Work in Progress • Closed Complete • Closed Incomplete • Closed Skipped
Priority	Urgency for approving the requested changes based on impact.
Estimated Cost	Estimated cost generated by the requested changes.
Impact	Impact on the outcome of the demand if you don't approve the requested changes.
Approval	Status of approval from the stakeholders for the requested changes.
Assigned to	Primary resource assigned to work on the request change.
Due date	Requested date to complete the request change.
Category	Entity for which you're creating the request change. The options are: <ul style="list-style-type: none"> • Resource • Scope • Cost • Schedule
Parent	Demand number to which this request change belongs.
Title	Title for the change request.
Description	Details of the request change and its potential impact.
Business Justification	Reason for requesting the proposed change in the demand. The change's impact on the business.
Work notes	Additional information to indicate progress on the demand request change.

Create requirement form

The requirement form information is used to create a requirement for a demand.

Requirement form

Field	Description
Number	Unique identification number for the requirement. Automatically generated when a new requirement record is created.
Source	User requesting the requirement. This field automatically populates with the name of the person filling out the form, but the source can be a different person who identified the requirement.
Owner	User responsible for managing the requirement or ensuring that the requirement is met.
Estimated effort	Approximate amount of time to complete the requirement and any associated tasks.

Requirement form (continued)

Field	Description
Priority	Importance of the requirement as it applies to the overall demand.
State	Status of the requirement such as Pending, Approved, or Rejected. Note: The requirement state is independent of the demand state and the states of any planned tasks associated with the requirement. The demand can be closed without the requirement state being closed. Closing the demand doesn't change the state of the requirement.
Type	Type of requirement such as Business, Solution (Functional), Solution (Non-Functional), Quality, Stakeholder, or Transition.
Short description	Brief description of the requirement.
Description	Detailed description of the requirement and any associated tasks. For example, describe an expected outcome or result.

Create resource assignment form

The resource assignment form information is used to create a resource assignment record for a demand.

Resource assignment

Field	Description
Assignment type	Select an assignment type from the list. <ul style="list-style-type: none"> • User - to create a resource assignment for a user. • Group - to create a resource assignment for a group.
Resource	Name of the resource. This field is turned off for Group assignment.
Group	Name of the group to create resource assignment. If a resource is selected, the primary group name is populated by default.
Role	Primary role for the employee. <ul style="list-style-type: none"> • If a resource is selected, the primary role is populated by default. • This field is turned off for Group assignment.
Skill	Primary skill of the resource.

Resource assignment (continued)

Field	Description
	<ul style="list-style-type: none"> • If a resource is selected, the primary role is populated by default. • This field is turned off for Group assignment.
Effort type	<p>Select the effort type to request a resource.</p> <ul style="list-style-type: none"> • Hours - to request a resource or group by hourly basis. • FTE - to request a resource or group by FTE. <p>By default, one FTE is 8 hours.</p> <ul style="list-style-type: none"> • Person days - to request a resource or group by Person days.
Effort	Enter the required effort count.
Task	Select the task from the list to associate the resource assignment.
Start date	Select the start date of the assignment using the calendar palette.
End date	Select the end date of the assignment using the calendar palette.
Resource status	<p>Select the state of the resource assignment.</p> <ul style="list-style-type: none"> • Pending • Approved • Unapproved • Unassigned
Rate override	Select this option to override the resource rate to match with your organization requirements.
Ready for review	<p>Select an option from the list so that the resource manager can review the request for allocation.</p> <ul style="list-style-type: none"> • Yes - if the resource assignment request is finalized and ready for resource manager's review for allocation. • No - if the resource assignment details are still being updated.
Notes	Enter details about the assignment to help resource manager or project manager with insights and additional information.

Create risk form

The risk form information is used to create a risk for the demand.

Risk form

Field	Description
Number	System-generated ID number with a configurable prefix.
State	<p>Current state of the risk. All new risks are created in the Pending state.</p> <p>The available states are:</p> <ul style="list-style-type: none"> • Pending • Open • Work in Progress • Closed Complete • Closed Incomplete • Closed Skipped
Risk status	<p>Status of the risk. All new risks are created in the Pending risk status. The available options are:</p> <ul style="list-style-type: none"> • Pending • Achieved • Not Achieved • Avoid • Mitigate • Transfer • Accept
Probability	<p>The likelihood that the event described in the risk can occur. All new risks are created in the Low probability. The available options are:</p> <ul style="list-style-type: none"> • Absolute • High • Moderate • Low
Impact	Impact of the risk event on the outcome of the demand.
Estimated cost	Estimated cost generated by the risk event.
Risk rank	A value and color assigned to the risk. This value is calculated using risk probability and impact. You can configure the color and value using the Risk Value Lookup. For more information, see Configure a custom risk rank and risk value.
Risk owner	Primary resource who is responsible for monitoring and managing the risk.
Assigned to	Primary resource assigned to work on the risk.

Risk form (continued)

Field	Description
Risk value	A value calculated from the Risk Value Lookup. For more information, see Configure a custom risk rank and risk value.
Due date	Requested date for one of the following situations: <ul style="list-style-type: none"> • If the risk has an assigned resource, then the due date is the date for resolving the risk. • If the risk isn't assigned to any resource, then the due date is the date when the risk must be closed or addressed.
Task	Demand to which this risk belongs.
Short description	Brief description of the event and its potential impact on the success of the demand.
Description	Details of the event and its potential impact.
Mitigation plan	Brief description of the efforts taken to mitigate the risk.
Work notes	Information to record and track the work accomplished for resolving the risk.

Create stakeholder form

The stakeholder form information is used to create a stakeholder record for the demand.

Stakeholder register form

Field	Description
Stakeholder	Name of the stakeholder being added to the demand.
Demand	Demand to which the stakeholder is assigned.
Level of Interest	Level of interest that the stakeholder has in pursuing the demand.
Assessment recipient	Indication of whether the stakeholder is authorized to receive assessment questionnaires for a demand.
Approver	Indication of whether the stakeholder has authority to approve demands.
Influence	Level of influence the stakeholder has over the group assessing the demand.
Engagement	Indication of the way the stakeholder is engaged with the demand.
Function	Function of the stakeholder in the demand process.

Create project funding form

The project funding form information is used to create a project funding budget for the demand.

Project Funding

Field	Description
Fiscal Year	The fiscal year for which you want to set the budget for the demand.

Project Funding (continued)

Field	Description
Capex target	Planned target amount allocated for capital expenditure.
Opex target	Planned target amount allocated for operating expenditure.
Target	Sum of capex and opex target amounts.
Demand/Project	Demand to which the budget belongs.
Capex budget	Planned expense amount allocated for capital expenditure.
Operating budget	Operating expense amount.
Budget	Sum of capex and opex amounts.
Selected for execution	Indication of whether the demand is planned for execution.

Demand form

The demand form information is used to create a demand.

Demand form fields

Field	Description
Name	Name of the demand.
Category	Category of the demand: <ul style="list-style-type: none"> • Strategic: For demands for plans, such as projects or stories. • Operational: For demands for operational work, such as changes or defects.
Type	The Category field selection determines the selections available in the Type field. <ul style="list-style-type: none"> • The following demand types are available if the demand category is Strategic: <ul style="list-style-type: none"> ○ Enhancement ○ Project ○ Epic ○ Story ○ EAP Epic ○ EAP Feature ○ EAP Capability ○ No Conversion • The following demand types are available if the category is Operational: <ul style="list-style-type: none"> ○ Change ○ Defect ○ No Conversion

Demand form fields (continued)

Field	Description
	<p>If the Agile Development 2.0 application is active, the Story, Epic, Enhancement, and Defect options are available.</p> <p>If the Strategic Planning application is active, the EAP Epic, EAP Feature, and EAP Capability options are available.</p> <p>The No Conversion option enables you to use your demand to fund a large project that includes one or more projects, epic, or programs.</p> <p>The selections in the Category and Type field also determine the fields that are displayed in the Assessment Data section.</p>
Project	<p>Name of the project created from this demand.</p> <p>This read-only field is visible only when you convert the demand into a project.</p>
Enhancement	<p>Number of the enhancement created from this demand.</p> <p>This read-only field is visible only when you convert the demand into an enhancement.</p>
Epic	<p>Name of the epic created from this demand.</p> <p>This read-only field is visible only when you convert the demand into an epic.</p>
Story	<p>Name of the story created from this demand.</p> <p>This read-only field is visible only when you convert the demand into a story.</p>
Number	<p>Unique, auto-generated identification number for the demand.</p>
Approved start date	<p>The formal date approved by stakeholders for starting the demand. This date is set after prioritization and stakeholder approval and represents the committed and authorized timeline for execution. It's used for governance and traceability.</p> <p>For example, the approved date to start the database upgrade is 2026-01-10.</p> <p>This field is carried forward to the Approved start date field of the Project form if the demand is converted to a project and remains unchanged, even if the project starts later.</p> <p>This field is highlighted in red if the date is different than the value in the Start date field.</p> <p>i Note: If this field is empty while creating a demand, the date from the Start date field is inserted.</p>
Approved end date	<p>The formal date approved by stakeholders for completing the demand. This date is set after prioritization and stakeholder approval and defines the approved execution window and supports historical tracking.</p> <p>For example, the approved end date to complete the demand is 2026-02-15.</p>

Demand form fields (continued)

Field	Description
	<p>This field is carried forward to the Approved end date field of the Project form if the demand is converted to a project and remains unchanged, even if the project ends later.</p> <p>This field is highlighted in red if the date in this field is different than the value in the Due date field.</p> <p>i Note: If this field is empty while creating a demand, the date from the Due date field is inserted.</p>
Start date	<p>The preliminary or estimated date when the work is initially planned to begin. This date helps outline the intended timing for early demand planning and prioritization. You can set this date during initial demand creation or anytime in the planning phase when a rough idea forms. This date can be updated until the demand is officially approved.</p> <p>For example, you're planning for a database upgrade to start on 2025-11-01. This date is changed to Planned start date when the demand is converted to a project.</p> <p>i Note: When you change the planned start date of a demand or project, the associated cost plans and resource assignments also change. The Change Resource Plan and Cost Plan Start Date with Demand or Project Start Date Change property controls the behavior for a demand date change. This property isn't enabled by default. For more information, see Properties installed with Project Management.</p>
Due date	<p>The preliminary or estimated date when the planned work is expected to be completed. This date provides an expected completion window for planning and stakeholder communication. You can set this date anytime in the planning phase when a rough idea forms and can be updated until the demand is officially approved.</p> <p>For example, you're planning to complete the database upgrade by 2025-12-31.</p> <p>i Note: This date is changed to Planned end date when the demand is converted to a project.</p>
Description	Description of the demand.

Details section of the Demand form

Field	Description
Portfolio	Portfolio indicating the business focus of the demand.
Program	Name of the program to which the demand belongs.

Details section of the Demand form (continued)

Field	Description
Investment Class	Type of investment class category assigned to the demand: <ul style="list-style-type: none"> • Run: Investment made to sustain the existing business. • Change: Investment made to implement a change in the business.
Investment Type	Investment type of the demand: <ul style="list-style-type: none"> • Cost Reduction • End User Experience • Legal and Regulatory • Revenue Generating • Service Sustaining • Strategic Enabler • Artificial Intelligence
Demand manager	Name of the demand manager.
Collaborators	Users who can edit or contribute to the demand. A demand requester can select any user as a collaborator.
Expense type	The type of the expense, either capex (capital expense) or opex (operational expense).
Priority	The priority of the demand.
Department	Department in a business unit to which the demand submitter belongs. <p>Note: If you don't select a department, the default value is the name of the department to which the submitter belongs.</p>
Project Manager	Project manager that would be assigned to the project created from this demand. When a project is created, this field becomes read only. This field appears if the Category field is set to Strategic and the Type field is set to Project. If you delete the project created from this demand, this field becomes editable.
Business Unit	Business unit to which the demand submitter belongs.
Impacted Business Units	Business units affected by the submitted demand. The selected units could experience

Details section of the Demand form (continued)

Field	Description
	<p>operational impact, process changes, technology adoption, and so on.</p> <p>For example, if a demand is submitted by the procurement business unit, it can impact the finance, legal, and IT business units.</p>
Idea	<p>Unique identification number of the idea from which the demand was created.</p>
Business Capabilities	<p>Business capabilities associated with the demand that links the demand to organizational goals and value. Business capabilities are defined in the Enterprise Architecture (formerly Application Portfolio Management) module.</p>
Impacted Business Applications	<p>If the demand is to change, enhance, or add one or more business applications, the applications associated with the demand. Business applications are defined in the Enterprise Architecture (formerly Application Portfolio Management) module. For more information, see Exploring business applications.</p> <p>You can select any business application in your enterprise regardless of whether it's related to a capability selected in the Business Capabilities field.</p>
Business Applications	<p>If the demand is to change, enhance, or add one or more business applications, the applications associated with the demand. Business applications are defined in the Enterprise Architecture (formerly Application Portfolio Management) module. For more information, see Exploring business applications.</p> <p>You can select any business application in your enterprise regardless of whether it's related to a capability selected in the Business Capabilities field.</p>

Business Case section of the Demand form

Field	Description
Strategic priority	<p>Strategic objectives of the organization that the demand fulfills. A demand can fulfill multiple strategic objectives.</p>

Business Case section of the Demand form (continued)

Field	Description
	If a business unit has been selected in the Details tab, the business strategies for the selected business unit along with other enterprise strategies are available for selection.
Primary goal	The primary goal associated with the strategy selected in the Strategic priority field. If a strategy hasn't been selected, all goals are available for selection.
Business case	Business arguments that support the demand.
Risk of performing	Risks if the demand is approved and implemented.
Risk of not performing	Risks if the demand isn't approved, for example, risk of loss of opportunity.
Enablers	Key enablers for the demand that would aid the demand to be completed. For example, clearly defined resource and cost plans.
Barriers	Major barriers to the demand that would obstruct the demand's completion. For example, incomplete or unclear demand details.
In scope	Scope of the demand, which is the set of boundaries that define the extent of a demand.
Out of scope	Activities or deliverables not in the scope of the demand. Anything not defined in the scope is out of scope.
Assumptions	Assumptions made for the demand. Assumptions help to define the scope and risks, and fine-tune the estimates for time and cost.

Financials section of the Demand form

Field	Description
Rate Model	Rate model assigned to the demand. This setting is used to derive hourly rates for the associated resource assignments and time cards. For more information, see Rate Models .

Financials section of the Demand form (continued)

Field	Description
	<p>Note: If the rate model assigned to the demand is changed or removed, the cost fields on the associated resource assignments aren't recalculated.</p>
Project Currency	<p>Currency used to execute the project once the project is created from this demand.</p> <p>You can select any active currency from the values listed in the Currency [fx_currency] table.</p> <p>After you create a project in the selected project currency, you can't change the project currency in the Project form if the demand contains a cost plan, a benefit plan, or a project budget. If the demand has no attached plan or budget, you can change the project currency in the Project form.</p> <p>Note: The value of this field defaults to the Project currency field of the Financials tab in the project currency view of the Project form as well. This field is available only when the PPM Standard Multicurrency (com.snc.ppm_multicurrency) feature is activated and the Demand Currency view is enabled.</p>
Capital expense	Capital expenditure (capex) for the demand.
Operating expense	Operational expenditure (opex) for the demand.
Total planned cost	Result calculated based on the values in the Capital expense and Operating expense fields.
Financial return	Result calculated based on the values in the Total costs and Financial benefit fields.
Financial benefit	<p>Estimate of revenue if the demand is approved.</p> <p>This value is rolled up from the benefit breakdown of the demand.</p> <p>You can also enter the value manually by selecting a currency icon and entering a value.</p>
ROI %	ROI calculated based on the values in the Total costs and Financial return fields.

Financials section of the Demand form (continued)

Field	Description
	<p>The value in this field is updated when a cost plan, benefit plan, or resource assignment is created or updated for the demand in the Qualified or Approved state.</p>
<p>Capital budget</p>	<p>Total capital budget allocated to the demand across all fiscal years.</p> <p>The value is rolled up from the capex budget of the demand.</p>
<p>Operating budget</p>	<p>Total operational budget allocated to the demand across all fiscal years.</p> <p>The value is rolled up from the opex budget of the demand.</p>
<p>Discount Rate %</p>	<p>Demand discount rate, which is the interest rate to determine the present value of future cash flows.</p>
<p>Net present value</p>	<p>Present value of future cash based on the given annual interest rate, a measure for comparing money spent today against future expected financial benefits. This value is useful when evaluating the overall investment performance.</p> <p>For example, at a 12% discount rate, \$1.00 today is worth \$0.80 in two years. Therefore, receiving \$1.00 in two years is the same as receiving \$0.80 today.</p> <p>Net present value (NPV) is calculated from total costs according to year, financial benefit per year, and the discount rate for the demand.</p>
<p>Internal rate of return %</p>	<p>Annual interest rate required to achieve an NPV of zero.</p> <p>Internal rate of return (IRR) helps to determine which demands can deliver a higher rate of return in terms of revenue.</p>
<p>Demand Actual Cost</p>	<p>Total cost incurred while working on a demand and demand tasks. Demand actual cost is calculated after the assignee of the demand task creates and submits a time card. When the time card is approved, the resource rate, which is derived from the rate card, labor rate, or system properties, is used to populate this field.</p>

Financials section of the Demand form (continued)

Field	Description
Demand Actual Effort	Time accrued or spent by a resource while working on a demand or a demand task as derived from the submitted and approved time cards. This field isn't available on the Demand form by default.

Note:

If you're creating a demand with the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin activated and the **Demand Currency** view enabled, then the fields in the **Financials** tab differ from the **Default** view. For more information about the fields that are available only in the Demand Currency view, see [Multicurrency fields in demand-related forms](#).

Assessment Data section of the Demand form

Field	Description
Impact	Level of business impact created by the demand.
Risk	Risk value calculated from the demand assessment.
Value	Business value of the demand calculated from the Impact and Financial return fields.
T-Shirt size	Size of the demand. Before using this value as an indicator of demand size, consider creating and publishing definitions for each option outside the application. That process ensures that the values are interpreted correctly and consistently across the organization or department.
Score	The demand score is calculated based on the <i>risk</i> , <i>value</i> , and <i>size</i> attributes in the base system. The value of the <i>risk</i> , <i>value</i> , and <i>size</i> attributes are derived from the assessment metric category results. For more information, see assessment categories and assessment category results ↗ . <ul style="list-style-type: none"> • When the <i>risk</i> and <i>size</i> values are high, the score of the demand is low. • When the <i>value</i> setting is high, the score of the demand is high.
Assessment Required	Option for enabling the assessments for the demand. This option is active by default.

Assessment Data section of the Demand form (continued)

Field	Description
	<p>Only a demand manager can update this value when the demand is in the Draft or Submitted state.</p> <p>i Note: If this option isn't selected and you reset the demand to the Draft state, the option remains unselected.</p>

i Note:

The values in the **Value** and **Score** fields are updated when a cost plan, benefit plan, or resource assignment is created or updated for the demand in the Qualified or Approved state. The values in the fields are updated only until an artifact such as project, enhancement, defect, or change is created from the demand.

Notes section of the Demand form

Field	Description
Watch list	The groups and users subscribed to the demand who can view the information in the Additional comments field.
Work notes list	The groups and users subscribed to the demand who can view the information in the Work notes field.
Work notes	Information about the demand. This information isn't visible to customers. Work notes are added throughout the demand management life cycle to communicate with other users associated with the demand.

Preferences section of the Demand form

Field	Description
Close Demand	<p>Determines when to close the demand automatically if it's converted to a project.</p> <ul style="list-style-type: none"> • None: Keeps the demand in the Open state after it's converted to a project. • On creation of project: Closes the demand when the demand is converted to a project. • On closure of project: Closes the demand when the project created from the demand is closed.

Preferences section of the Demand form (continued)

Field	Description
	<p>Note: The On creation of project and On closure of project options appear when the value for the Type field is set to Project. If the Type field is set to Enhancement, the default setting is None.</p>
Project calculation	<p>Determines the calculation to use for task dependencies for the project when the demand is converted to a project. The default value is Automatic.</p> <ul style="list-style-type: none"> • Manual: Task dates don't reflect any changes made to dependencies. • Automatic: Task dates are automatically updated to reflect any changes made to dependent or child tasks.

EAP Details section of the demand form

This section appears only if the selected type is an EAP entity.

Field	Description
Team	The planning team to which the created EAP entity is assigned. This field becomes read only once the EAP entity is created. This value is an optional value.
Converted to	The name of the created EAP entity. This field is read-only.

AI Associations section of the demand form

This section appears only if the AI Control Tower plugin is installed and the investment type of the demand is set to artificial intelligence.

Field	Description
Product	Product or system that the demand relates to.
Impacted AI systems	Impacted AI systems associated with the demand. You can select existing AI systems from the list or remove systems that are no longer relevant.

Monetary benefit breakdown form

The monetary benefit breakdown form information is used to create and edit a monetary benefit breakdown record for the demand.

Monetary Benefit Breakdown form

Field	Description
Task	Task to which the benefit plan breakdown belongs.
Portfolio	Portfolio to which the benefit plan breakdown belongs.
Entered currency	Currency specified in the benefit plan.
Exchange rate	Rate in effect for the period corresponding to the benefit plan breakdown. When the period corresponding to the benefit plan breakdown has multiple rates, the rate in effect on the first date of that period is used. Exchange rate is used to convert the entered benefit into the functional benefit. It's obtained from the itfm_fx_rate [budget_reference_rates] table.
Actual benefit	Actual benefit that is incurred from the project or demand.
Benefit plan	Benefit plan to which the benefit plan breakdown belongs.
Fiscal period	Fiscals generated at the period level. For information on periods, see fiscal calendars .
Entered benefit	Benefit in entered currency.
Functional benefit	Functional benefit obtained by multiplying the exchange rate with the entered benefit.
Exchange rate date	First date of the fiscal period corresponding to the benefit plan breakdown.

Monetary benefit plan form

The benefit plan form information is used to create monetary and non-monetary benefit plans for a demand.

Create New Benefit Plan form

Field	Description
Name	Descriptive name of the benefit plan.
Work	Demand number to which the benefit plan belongs.
Sponsor	Sponsor for the demand.
Category	Type of benefit: <ul style="list-style-type: none"> • Hard: Benefits measured in terms of revenue. • Soft: Benefits measured in terms of value.
Sub category	Subcategories of hard and soft benefits.

Create New Benefit Plan form (continued)

Field	Description
	The selection in the Category field determines the available options in this field.
Benefit type	Type of the benefit: monetary or non-monetary.
Offset type	Indicates when the benefits start realizing. If the value in the selected offset type changes, the benefit plan start date shifts accordingly. For example, if the offset type is set to End Date and the demand due date changes, the benefit plan start date shifts to align with the new due date.
Start fiscal period	Starting fiscal period. Populated based on values in the Offset field relative to the selected Project or Demand start date or Project or Demand end date, and the Duration in period values. The field is editable if you select None in the Offset type field. When you change the start fiscal period, the associated benefit breakdown values also change.
End fiscal period	Ending fiscal period. When you change the end fiscal period, the associated benefit breakdown values also change.
Associated benefit	Benefits associated with this benefit plan.
Description	Description of the benefit plan.

Financials section

Field	Description
Entered benefit	Estimated amount of the potential benefit. Any change in the planned benefit on the benefit plan updates the associated benefit breakdown values for future fiscal periods.
Entered currency	Currency for the benefit plan. If the selected currency differs from the default currency configured in the Financial Management application, the budget reference rate is used to calculate the financial benefit of the demand. For more information, refer to budget reference rate .
Functional currency	Default currency configured in the Financial Management application and used for managing the demand or project.
Total planned benefit	Total benefit value rolled up from the benefit breakdown.

Financials section (continued)

Field	Description
Benefit in functional currency	Benefit incurred from demand in functional currency. The value in this field changes if the Entered currency differs from the functional currency.
Actual benefit	Actual benefit value rolled up from the actual benefit in the benefit breakdown.
Recurring	Indicates if the benefit is recurring for each fiscal period in the benefit breakdown.

Non-monetary benefit plan breakdown form

The non-monetary benefit breakdown form information is used to create and edit a non-monetary benefit breakdown record for the demand.

Non-monetary Benefit Plan Breakdown form

Field	Description
Task	Task to which the benefit plan breakdown belongs.
Portfolio	Portfolio to which the benefit plan breakdown belongs.
Measure	Measure type specified in the benefit plan.
Actual benefit	Actual benefit that is incurred from the demand.
Benefit plan	Benefit plan to which the benefit plan breakdown belongs.
Fiscal period	Fiscals generated at the period level. For information on periods, see fiscal calendars  .
Entered benefit	Benefit in entered value.
Variance	The difference between the estimated and actual benefit.

Non-monetary benefit plan form

The benefit plan form information is used to create monetary and non-monetary benefit plans for a demand.

Create New Benefit Plan form

Field	Description
Name	Descriptive name of the benefit plan.
Work	Demand number to which the benefit plan belongs.
Sponsor	Sponsor for the demand.
Category	Type of benefit:

Create New Benefit Plan form (continued)

Field	Description
	<ul style="list-style-type: none"> • Hard: Benefits measured in terms of revenue. • Soft: Benefits measured in terms of value.
Sub category	<p>Subcategories of hard and soft benefits.</p> <p>The selection in the Category field determines the available options in this field.</p>
Benefit type	Type of the benefit: monetary or non-monetary.
Offset type	<p>Indicates when the benefits start realizing. If the value in the selected offset type changes, the benefit plan start date shifts accordingly.</p> <p>For example, if the offset type is set to End Date and the demand due date changes, the benefit plan start date shifts to align with the new due date.</p>
Start fiscal period	<p>Starting fiscal period. Populated based on values in the Offset field relative to the selected Project or Demand start date or Project or Demand end date, and the Duration in period values.</p> <p>The field is editable if you select None in the Offset type field.</p> <p>When you change the start fiscal period, the associated benefit breakdown values also change.</p>
End fiscal period	<p>Ending fiscal period.</p> <p>When you change the end fiscal period, the associated benefit breakdown values also change.</p>
Associated benefit	Benefits associated with this benefit plan.
Description	Description of the benefit plan.

Non-monetary Details section

Field	Description
Non-monetary entered benefit	<p>Estimated amount of the potential benefit.</p> <p>Any change in the planned benefit on the benefit plan updates the associated benefit breakdown values for future fiscal periods.</p>
Measure	<p>Type of measure for the non-monetary benefit plan. The measure types are Count, Percentage, Hours, Days, and Score.</p> <p>The Yes/No options are used to track the benefits that aren't quantifiable. When this option is selected, the only field available is Benefits achieved. You can select the</p>

Non-monetary Details section (continued)

Field	Description
	Benefits achieved check box to indicate that the benefits have been achieved.
Benefits achieved	Option to indicate if the benefit is achieved.
Non-monetary planned benefit	<p>Estimated value of the potential benefit.</p> <p>Any change in the planned benefit on the benefit plan updates the associated benefit breakdown values for future fiscal periods only.</p>
Breakdown type	<p>Type of breakdown creation when you save the benefit plan.</p> <ul style="list-style-type: none"> • None: No breakdowns are created. • Automatic: A non-monetary benefit plan breakdown record is created automatically with data. The breakdown is calculated linearly. • Manual: A non-monetary benefit plan breakdown record is created automatically but without data in the entered benefit column.
Non-monetary actual benefit	Actual benefit value rolled up from the actual benefit in the benefit breakdown.
Aggregation mode	<p>Determines how the roll-up happens from breakdowns to the benefit plan and updates the values in the Non-monetary planned benefit and Non-monetary actual benefit fields.</p> <ul style="list-style-type: none"> • Sum: Aggregates data from all breakdowns. • Average: Average value from all breakdowns. • Most recent: Recent breakdown value. • Max: Maximum value among the breakdowns. • Min: Minimum value among the breakdowns.

Risk value lookup form

The risk value lookup form information is used to rate the impact and probability of a risk.

Risk Value Matcher form

Field	Description
Impact	<p>Impact value of the risk.</p> <p>The default values are:</p> <ul style="list-style-type: none"> • 1 = High • 2 = Medium • 3 = Low
Application	The application to which these risk values belong.
Risk Rank Color	<p>Color to indicate the severity of the risk.</p> <p> Tip: You can enter variations of a color to differentiate between risks with similar impact and probability values. For example, you could enter light green to indicate a low-severity risk.</p>
Risk Value	<p>The value for the specified risk impact and probability combination.</p> <p>The options are: High, Medium, and Low.</p> <p>This value is displayed in the Risk value field of the Risk form.</p>
Probability	Risk probability value is associated with the impact value of the risk. The options are: Absolute, High, Moderate, and Low.
Probability Number	<p>Numerical value to indicate the probability. This value is multiplied by the value of the Impact field for calculating risk rank.</p> <p>The default values are:</p> <ul style="list-style-type: none"> • 1 = Absolute • 1 = High • 2 = Moderate • 3 = Low <p>The calculated risk rank and the risk rank color are displayed in the Risk rank field of the Risk form.</p>

Stakeholder register form

The stakeholder register form information is used to add users to the stakeholder registry.

Stakeholder register form

Field	Description
Number	Unique identification number for the stakeholder. This number is automatically generated when a new entry is created.
User	Name of user being added to the stakeholder registry.
Portfolio	Portfolio to which the user is assigned. A group of activities managed to align to business or operational objectives constitutes a portfolio. Typically, portfolios are named according to the business units of an organization.
Level of Interest	Level of interest that the stakeholder has in pursuing the demand.
Assessment recipient	Indication of whether the user is authorized to receive assessment questionnaires for a demand.
Approver	Indication of whether the user has authority to approve demands.
Influence	Level of influence the user has over the group assessing the demand.
Engagement	Indication of the way the user is engaged with the demand.
Function	Function of the user in the demand process.

Next Experience for Demand Management key terms

Important terms in Next Experience for Demand Management are listed in the table.

Next Experience for Demand Management Key Terms

Term	Description
Portfolio	A collection of demands managed as a group to achieve strategic and operational objectives.
Assessable record	A demand record that you want to evaluate for metric type demand. You evaluate the assessable records with metric categories and metrics, which define traits and values to assess.
Metric	A trait or value used to evaluate assessable records. A metric can measure subjective values in an assessment questionnaire or gather objective values in a database query run by a script. Examples of metrics include perceived value of demands and return on investment for a demand.
Metric type	A characteristic that defines a set of records you want to evaluate. Demand management comes with the metric type demand, which uses records from the Demand [dmn_demand] table.
Metric category	A theme for evaluating assessable records. Categories contain one or more individual metrics, which define specific traits or values that comprise the theme.

Next Experience for Demand Management Key Terms (continued)

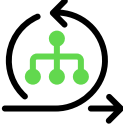

Term	Description
	Examples of categories include return on investment and cost. Set filter conditions to control which assessable records to evaluate for the metrics in a category.
Stakeholder	A person affected by the demand or who has interest in the demand.
Scorecard	<p>A visual breakdown on performance of an assessable record based on assessment results.</p> <p>Use scorecards to view various data summaries for one assessable record and to compare the ratings with other assessable records.</p>
Requirement	An extra item that must be present or an extra action item that must be finished before a demand request closes.
Demand Task	A unit of work, created within a demand, to break down initial planning activities before converting the demand into a project. A demand task isn't a planned task like a project task.

Now Assist for Strategic Portfolio Management (SPM)

Use the ServiceNow[®] Now Assist for Strategic Portfolio Management (SPM) application to summarize feedback in Strategic Planning or text in Docs, create a demand with a conversational experience, generate insights for projects, and generate stories from epics. Product, project, and demand managers can use the Now Assist skills and AI agents to streamline their projects and workflows.

Get started

<p>Explore</p>  <p>Learn more about Now Assist for SPM</p>	<p>Configure</p>  <p>Configure the application to get started with Now Assist for SPM</p>	<p>Use AI agents</p>  <p>Use the generative AI agents of Now Assist for SPM</p>

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by [ServiceNow's AI Acceptable Use Policy](#), which may be updated by ServiceNow.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our [CORE Compliance Portal](#).

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. In addition, this application will collect task data (for Case Assist) and chat transcripts (for Chat Assist). Customers can opt out of future data collection at any time, as described in the [Now Assist Opt-Out page](#).

For more information, see the [Now Assist documentation](#).

Exploring Now Assist for Strategic Portfolio Management (SPM)

Use ServiceNow® Now Assist skills and AI agents in multiple SPM workspaces to transform Strategic Portfolio Management (SPM) into a continuous value engine-embedding intelligence across every stage and to provide optimize resources and smarter investments resulting in delivering continuous value.

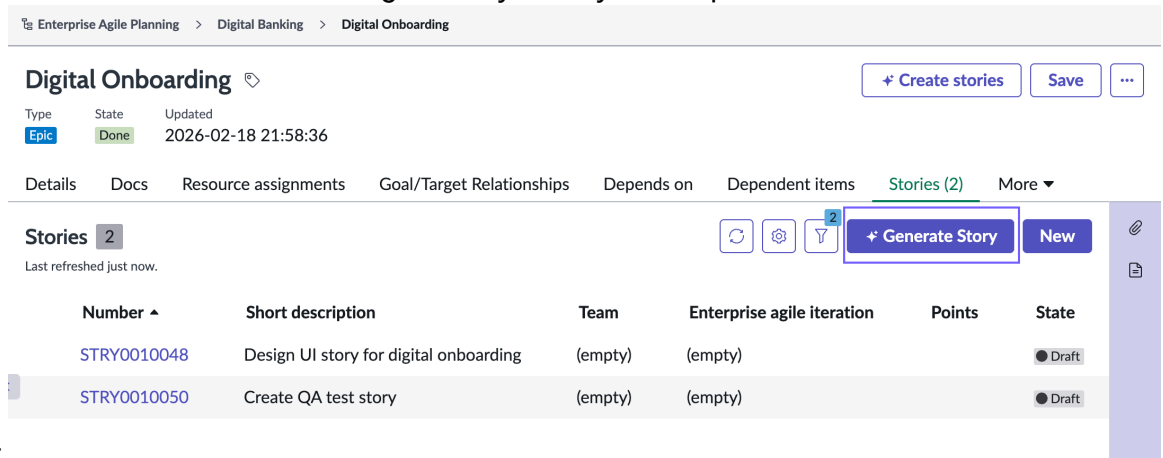

Skills

The Now Assist for SPM application includes the generative AI skills and features that enable your product, project, portfolio, and demand managers to leverage Now Assist skills so that they can streamline their processes and workflows.

Quick story generation

As a product manager or agile team member, generate complete user stories directly from an epic using the Quick story generation skill, without lengthy conversations or manual authoring. Available in both Agile Development 2.0 and EAP applications, this Now Assist feature removes the friction of story creation so your team can focus on delivery.

To generate a story, open an epic and select **Generate Story** from the Stories related list. Enter one or two lines of context to guide Now Assist, then select **Generate**. Now Assist generates a story title, description, and acceptance criteria based on the epic and your input. Review and refine all fields inline before saving the story directly to the epic's related

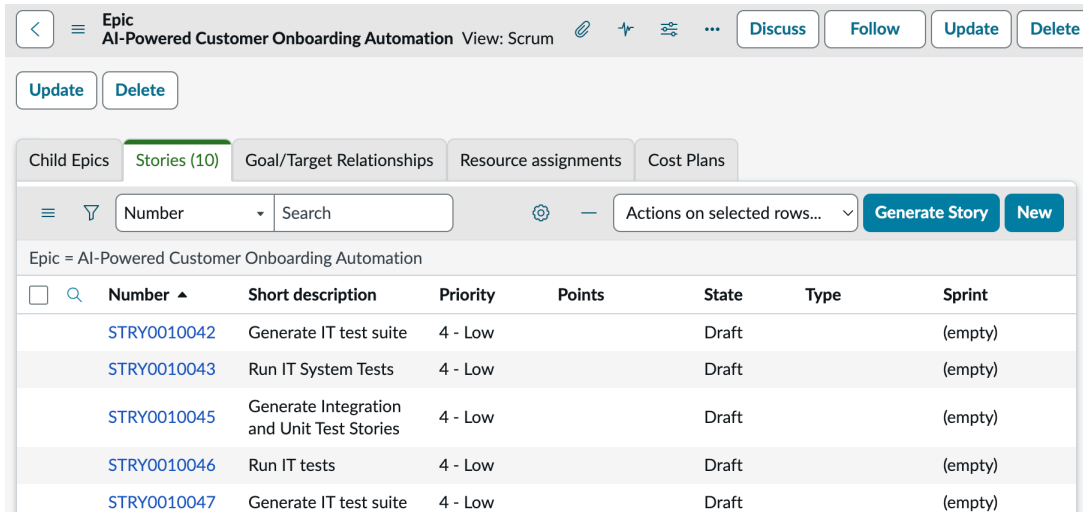

list.

By using the Quick story generation skill, you can:

- Create well-structured stories instantly, reducing the time and effort spent on manual story authoring.
- Generate complete stories including title, description, and acceptance criteria, ensuring consistency across your backlog.

- Maintain full control with inline editing of all AI-generated fields before saving, preserving human oversight throughout the process.
- Use a fast, non-conversational option in both Agile Development 2.0 and EAP. In EAP, you also have access to the conversational Agile story generation agent for creating multiple stories for an epic.

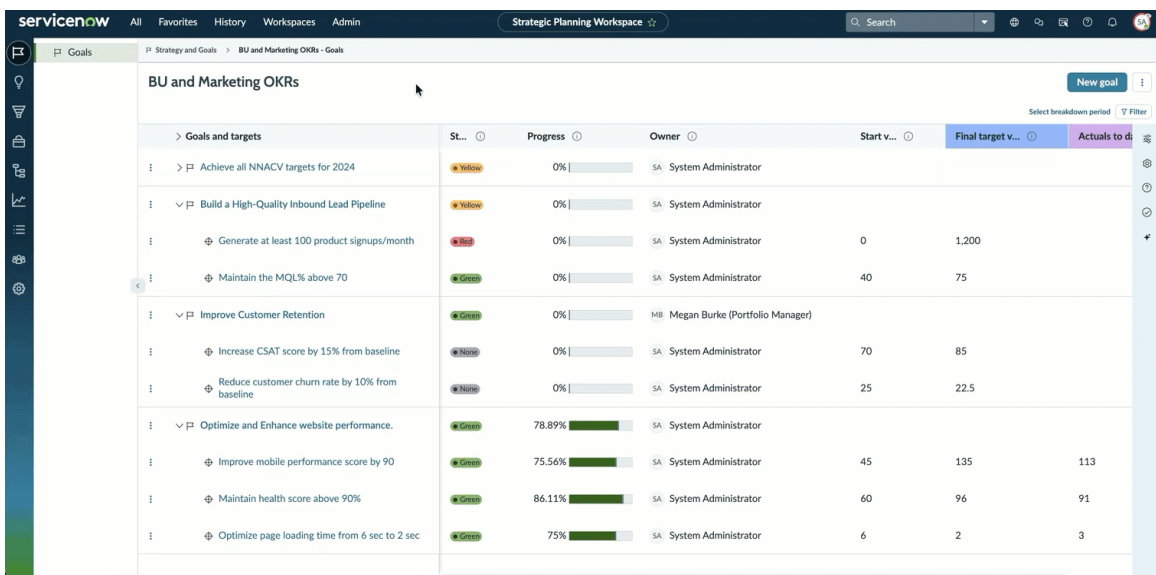

Goal insights skill

Generate insights for goals to gain predictive, actionable visibility into goal health using the Goal insights skill. The skill analyzes the goal, its targets, subgoals, and aligned work, then delivers concise, data-driven insights—including AI forecasted status, confidence of achieving the goal, targets at risk, delayed or stalled aligned work and recommendations—helping goal owners and contributors proactively manage risks and improve goal outcomes. You can trigger the skill by selecting the **Goal insights** or **Show insights** on the grid view or goals' full details page respectively.

Note:

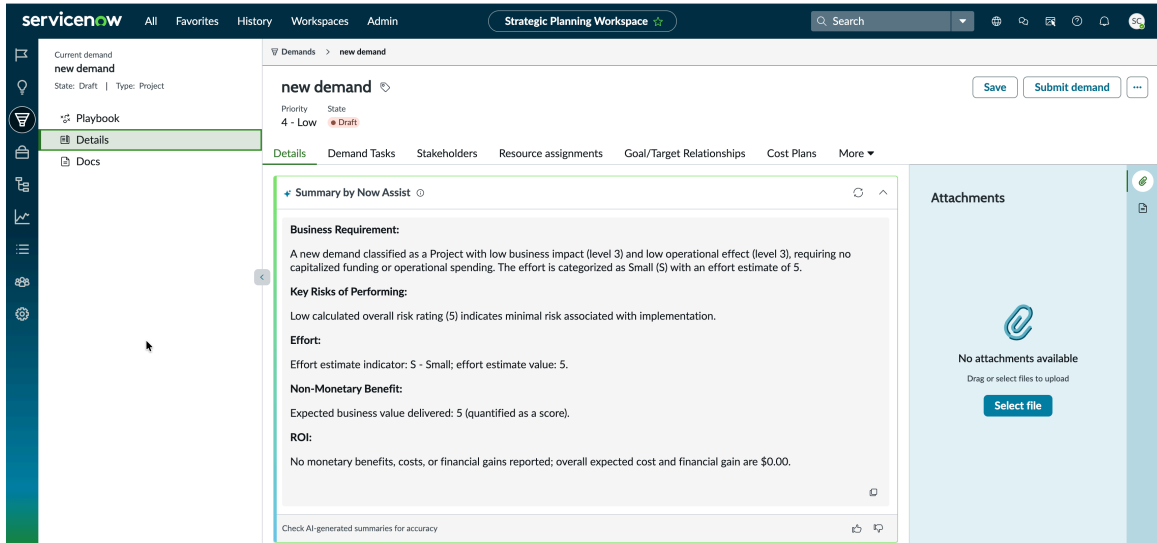

When you generate insights for a goal, insights are also generated individually for each of its targets.

Summarize demands with the demand summarization skill

Generate a concise, structured summary of any demand using the demand summarization Now Assist skill. The skill reviews the demand fields and related lists and helps create a clear summary of the demand. You can trigger the skill by selecting the **Summarize** button on the demand form.

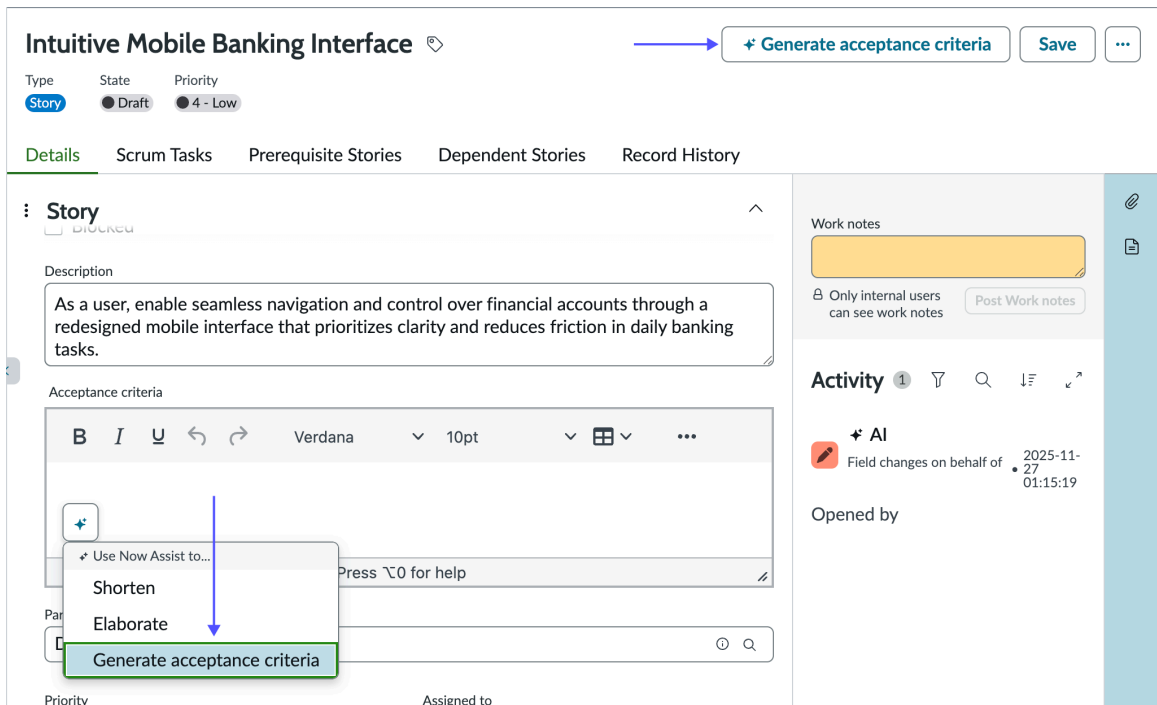

The generated summary is displayed in a summary card in the demand form.

Generate acceptance criteria skill

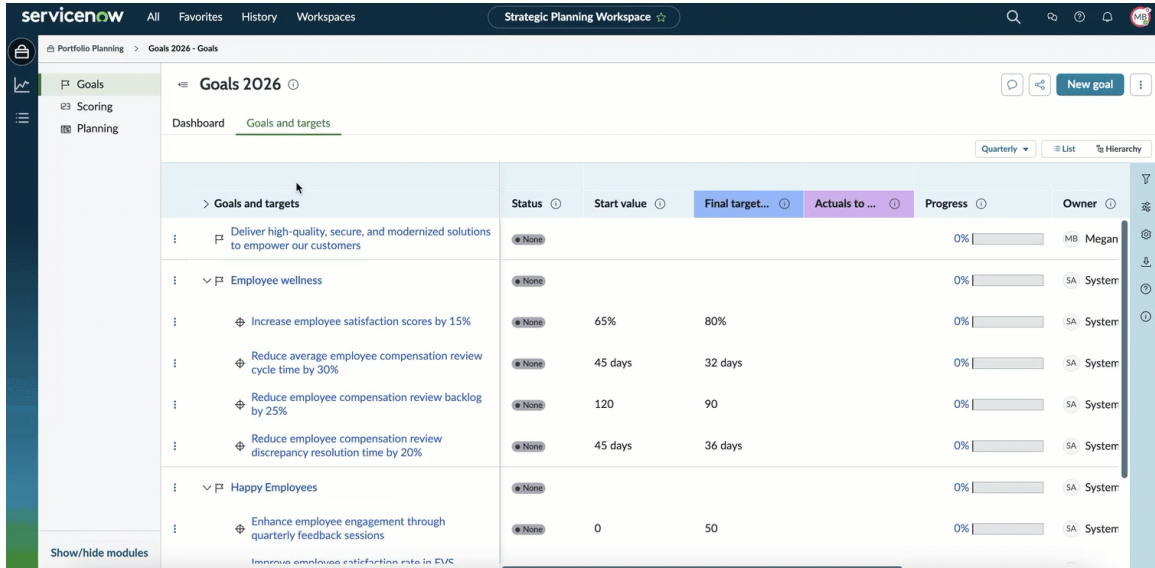

As a product manager, generate clear, comprehensive, and testable acceptance criteria for your user stories, instead of spending hours writing and refining them manually.

You can review and refine the suggested options to ensure they meet your story requirements without slowing down planning. By helping you streamline generating acceptance criteria as a process, this skill helps save time, improve quality, and speed up delivery with cleaner backlogs and better collaboration.

Target generation skill

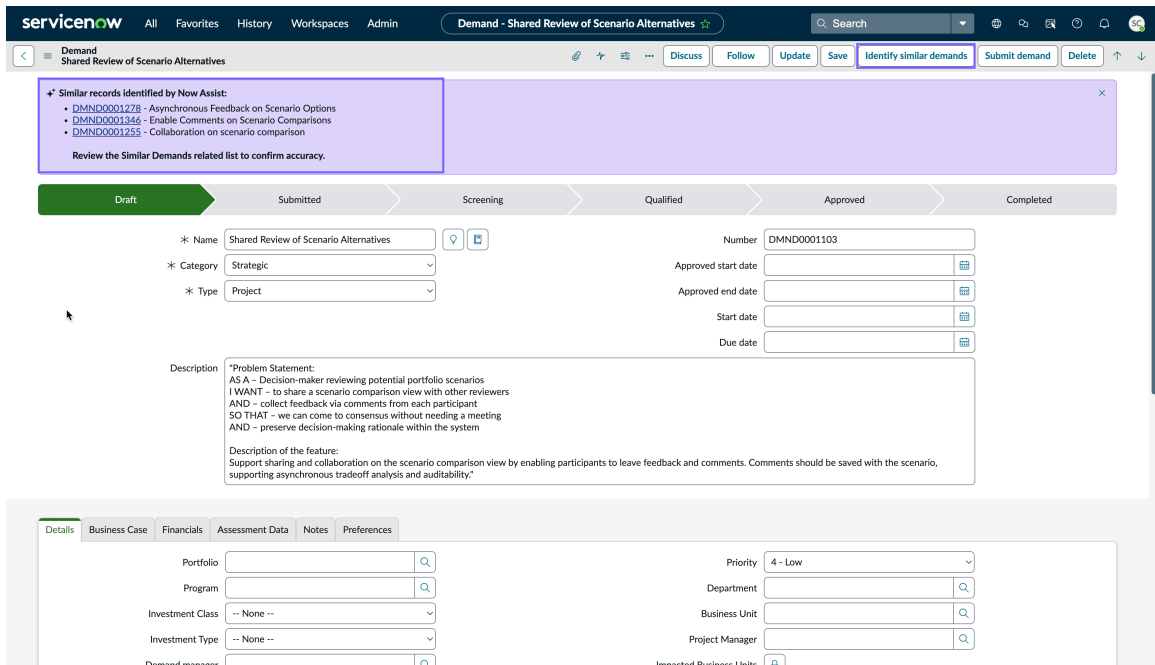

Generate measurable targets from goal's information and optional context with the Target generation skill in Strategic Planning Workspace. The skill automatically populates key fields in the target creation form, ensuring precision and alignment to the goal. This enables teams to define clear and measurable outcomes and accelerate the target creation process.

Identify similar records skill

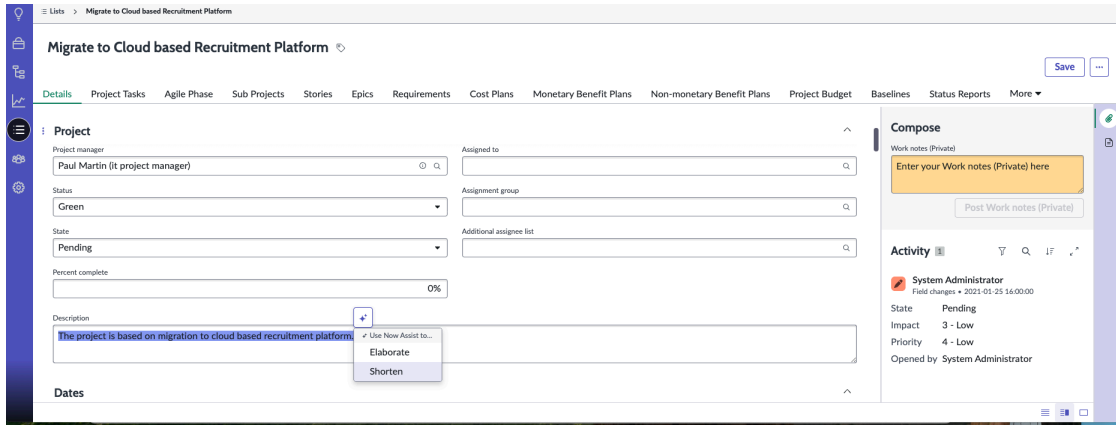

Detect similar demand records using the identify similar records Now Assist skill. The skill identifies similar demand records based on contextual similarity in the name, description, and business case content, with a minimum 85% similarity threshold. It also excludes the outdated and irrelevant records. You can trigger the skill by selecting the **Identify similar demands** button on the demand record page.

The similar demand records identified by Now Assist are displayed in the Similar Demands related list as well as in a message banner at the top of the record page.

Refine records

Improve record quality by enabling AI assistance in the rich and long fields of Product idea, Demands, Epic, Projects, Capability, Features, Stories, Project tasks, Risks, Strategic priorities, Goals, Targets, Initiatives, Feedback, Milestones, and Story forms. You can enable text refinement with the **Elaborate** and **Shorten** options on the records to support portfolio, project, product, demand managers and agile team members in creating and editing records content more effectively.

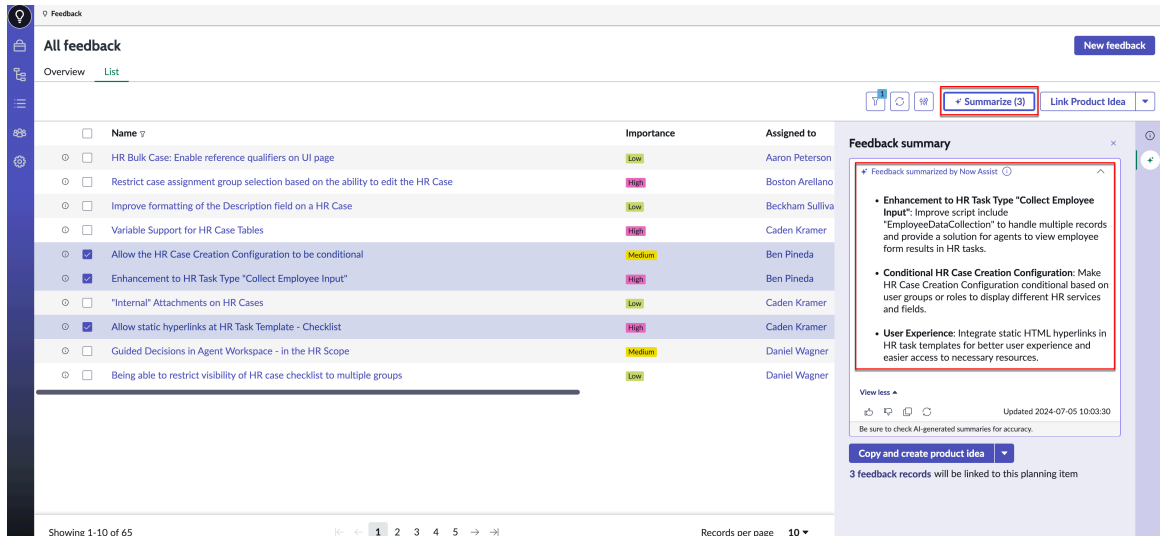

Multi feedback summarization or Feedback summarization

Provides your product managers with a concise and informative summary of the lengthy customer feedback comments. The product managers can generate a summary from the name and description of one or multiple feedback records so that they can quickly understand the feedback context. The generated summary can be directly converted to an execution item. Now Assist can generate a summary from the feedback only if the feedback has at least 60 words in the fields that are used for the input data. The 60-word minimum optimizes the experience by verifying that there's enough information to make a summary.

The following example shows a summarization of multiple feedback records by using the multi feedback summarization skill.

Multi feedback summarization skill

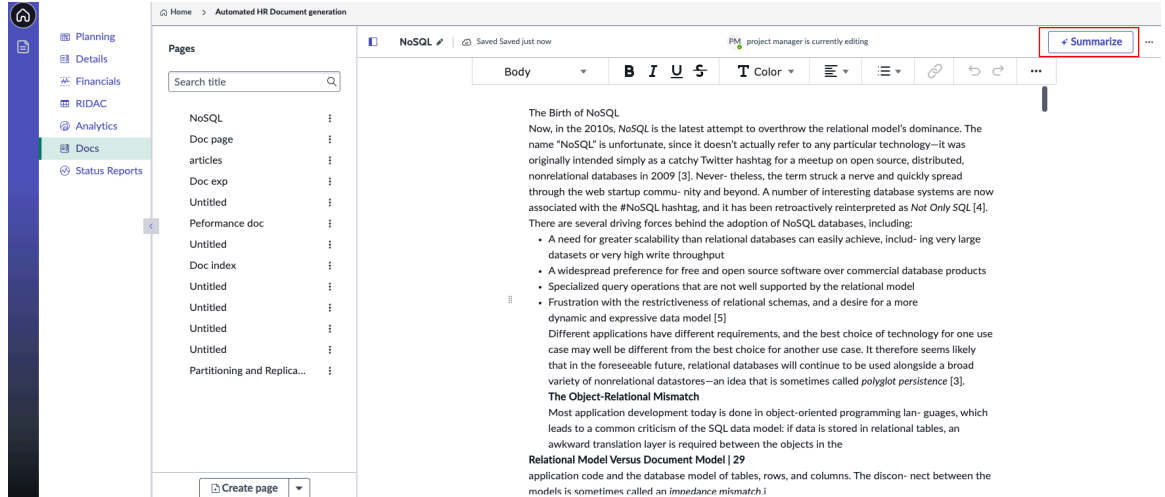

Project doc summarization, Planning Item doc summarization, or EAP doc summarization

Provides your product managers with a concise and informative summary of the selected or complete text by using Now Assist in Docs. Your product managers can summarize, elaborate, or shorten the selected or complete content on Docs

to quickly understand the key information by using the Project doc summarization (Project Workspace), Planning item doc summarization (Strategic Planning), or EAP doc summarization (Enterprise Agile Planning) skill.

Now Assist in Docs

Project insights generation

Monitor the progress and changes in each project through the Project insights generation skill. With minimal effort, your project managers can schedule a cadence for generating project insights and receive it via email. They can track key elements such as the project, project task, milestone, resource assignment, ridac, and financial. They can also prioritize key elements to focus on. They can also decide the cadence of receiving project insight emails.

Now Assist Project insights generation skill

AI generated this project summary using project details and history. Be sure to check it for accuracy and make edits before sharing.

Please find your project summary for PRJ0010004 - Migrate to Cloud based Recruitment Platform by Now Assist

This summary provides an overview from the 2024-10-17 through the 2024-10-17.

Overall Project Insights

- The project has transitioned from 'Work in Progress' to 'Pending' state, indicating a potential delay in the project start date. The start date has been shifted from August 2023 to October 2024, and the end date has been adjusted accordingly. No changes in budget or forecast costs have been observed.

Top Insights Needing Attention

- The project has experienced a significant delay of over a year, which requires immediate attention.
- Resource task (PRJTASK0011981) is in 'Red' status with a close due date (October 7, 2024), indicating a potential risk or issue.
- Two new milestones (PRJTASK0011982 and PRJTASK0011980) and one new project task (PRJTASK0011979) have been introduced, which could have a significant impact on the project.
- Resource allocation (PRJTASK0011978) has a 'Yellow' status, indicating a potential risk or issue.

Milestone Insights

- Task analysis (PRJTASK0011982) has a close due date (October 25, 2024), which requires attention.
- Resource task (PRJTASK0011981) is in 'Red' status with a close due date (October 7, 2024), indicating a potential risk or issue.
- Resource planning (PRJTASK0011980) has been newly introduced, which could have a significant impact on the project.

Resource Assignment Insights

- Adam Q1 has two pending resource assignments (RA0001307 and RA0001309), which could impact the project schedule.
- Barbara D1's resource assignment (RA0001309) has been approved, indicating a potential resource availability for the project.

Project Task Insights

- Resource allocations (PRJTASK0011979) has a 'Yellow' status, indicating a potential risk or issue.
- Cloud management (PRJTASK0011985) has been newly introduced, which could have a significant impact on the project.

[PRJ0010004 - Migrate to Cloud based Recruitment Platform](#)

Conversational experiences for demand creation

Simplify the process of creating a Demand within the Employee Service Management (ESC) portal by using the Now Assist conversational catalog creation capability.

- Avoid searching through the list of catalog items to find the right item for demand creation.
- Answer contextual questions in the chat to auto-populate the relevant fields in the Demand form.

If Microsoft Teams and Mobile are enabled as a display location for Now Assist in Virtual Agent, users can use the conversational experience to create a demand in those applications too.

Note:

This skill is available within the Platform category of the Now Assist Admin console.

Project status generation

Generate an AI-assisted project status report using project status generation skill.

With project status generation skill, Now Assist predicts overall and dimension-level project health (such as schedule, cost, resources, and scope), generates an executive summary using weekly project data, and provides a rationale for each prediction. Project Managers can generate a status report where AI pre-populates key fields:

- Overall project health
- Health by dimensions (schedule/cost/resources/scope)
- Executive summary
- Rationale/analysis for each predicted health value

This skill streamlines the process of status report creation in Project Workspace.

Now Assist Admin console

An administrator can use the Now Assist Admin console in Strategic Planning Workspace to activate and manage Now Assist features and skills in Workspace. For more information about the Now Assist Admin console, see [Overview tab in Now Assist Admin](#).

AI agents

The ServiceNow AI agents use LLMs (Large Language Models) to process tasks, from basic responses to complex problem-solving and optimize the live agent workflows. For more information on Now Assist AI agents, see [Using AI agent or agentic workflows in Now Assist for Strategic Portfolio Management \(SPM\)](#).

Supporting information for Now Assist for Strategic Portfolio Management (SPM)

Get a quick overview of the important information that is related to the Now Assist for Strategic Portfolio Management (SPM) application.

Supported versions

The Now Assist for SPM application is supported starting with the Xanadu patch 3 release.

Supported user interfaces

The Now Assist for SPM application is supported for the Strategic Planning Workspace, Project Workspace, Demand Management, and Enterprise Agile Planning.

Licensing requirements

The Now Assist for SPM application requires an SPM Pro plus license.

Application information

Activate the latest Now Assist for SPM (sn_spm_gen_ai) store app to use the Now Assist skills.

This store app has the following dependencies:

- Now Assist for Platform (sn_genai_platform)
- Strategic Planning
- Project Workspace
- Enterprise Agile Planning
- Demand workbench

For more information, see [Configure Now Assist Admin features](#).

Related topics

Configure Now Assist Admin features

Use the Now Assist Admin console to activate the various Now Assist applications and skills that you're entitled to.

Configuration overview

Install and activate the plugins, turn on the Now Assist panel, and view the account settings. You must install at least one Now Assist application before you can configure any skills.

The following example shows the Settings page with available plugins to install, including Now Assist for Strategic Portfolio Management (SPM).

Now Assist Admin settings page

To enable the Agile story generation skill and project insights generation skill, verify that Now assist panel is enabled. For more information, see [Activate the Now Assist panel standard chat](#). For Agile story generation skill, verify AI Search is activated and ready to use by navigating to **All > AI Search > AI Search Status**

Important:

The Acceptance criteria generation skill also requires activating Refine Records skill.

Related topics

[Using Now Assist for Strategic Portfolio Management \(SPM\)](#)

[Overview tab in Now Assist Admin](#)

[Configuring Now Assist Admin features](#)

Install Now Assist plugins

Install Now Assist plugins to enable generative AI on your instance.

Before you begin

Role required: admin

Follow these instructions to get started with Now Assist Admin:

1. To get started with Now Assist, you must install at least one Now Assist application on your instance.
2. Activate any Now Assist plugin from the ServiceNow Store to access Now Assist Admin.
3. Install additional plugins, from the Now Assist Admin console.
4. The Now Assist Admin console guides your implementation, starting with installation.
5. Check out the [Now Assist Journey Checklist for more information](#).

Procedure

1. Navigate to **All > Now Assist Admin > Settings**.

If you're already in Now Assist Admin, select the **Settings** tab.

2. On the **Settings** page, select **Plugins**.

Plugins appear as cards. Review all Now Assist plugins on the **Available for you** tab. Plugins that you have already installed appear on the **Installed** tab.

3. Select **Get plugins** on the card for the plugin that you want to install.
4. In the confirmation window, select **Install Plugin** to open the ServiceNow Store page for the plugin in a new browser tab.
5. Install the plugin from the ServiceNow Store page.

Some applications may require you to request the app from the ServiceNow[®] Store first. After you've requested the application from the ServiceNow[®] Store page, navigate to **All > System Applications > All Available Applications > All** to finish the installation.

6. Return to the Now Assist Admin console.
7. In the dialog box, select **Refresh**.
8. Either close the dialog box to review all of your plugins or select **View all (Plugin) Assists and Skills** to review the features of your new plugin.

Result

Your plugin is successfully installed.

If you encounter issues installing or updating applications, see this [knowledge article](#) for steps that may address your issue. Otherwise, you can make a Support case.

Skill inputs for Now Assist for Strategic Portfolio Management (SPM)

Learn about the inputs of each skill for the Now Assist for Strategic Portfolio Management (SPM) application. By configuring the inputs for a skill, you can determine how and when a skill is used.

Now Assist for Strategic Portfolio Management (SPM) Overview

Depending on the selected skill, you can configure inputs. These settings determine how a skill is used. An input identifies the data that is used for a skill, such as the table and fields that are used to generate a feedback summary. If you have the admin role and any input fields are editable, you can modify the input data for a skill.

Demand summarization skill inputs

The demand summarization skill includes the inputs that identify the table along with the fields and related lists that are used to generate the demand summary. The following table provides more details on the input data.

Input data for the demand summarization skill

Input	Description
Table	Demand [dmn_demand]
Fields	<ul style="list-style-type: none"> • Short description • Category • Type • Description • Investment Class • Investment Type • Submitted by • Demand manager • Expense type • Priority • Department • Business Unit • Business Capabilities • Impacted Business Applications • Risk of performing • Risk of not performing • Enablers • Barriers • In scope • Out of scope • Assumptions • Capital expense • Operating expense • Total planned cost • Financial return • Financial benefit • Capital budget • Operating budget • Impact • Risk • T-Shirt size • Value • Size • Score • Start date

Input data for the demand summarization skill (continued)

Input	Description
	<ul style="list-style-type: none"> • Due date • Approved start date • Approved end date • Business case
Related lists	<ul style="list-style-type: none"> • Work notes • Demand tasks • Cost plans • Monetary benefit plans • Non-monetary benefit plans • Resource assignments

Feedback summarization skill inputs

The feedback summarization skill includes the inputs that identify the table and fields that are used when a feedback summary is generated. The data source contains the tables and fields that the skill relies on. The following table lists the inputs for the feedback summarization skill.

Inputs for the feedback summarization skill

Input	Description
Table	Feedback [sn_align_core_feedback]
Fields	<ul style="list-style-type: none"> • Name • Description

Acceptance criteria generation skill inputs

The Acceptance criteria generation skill includes the inputs that identify the fields that are used as context to generate acceptance criteria for a story. The following table provides more details on the input data.

These inputs are available to configure for both Enterprise Agile Planning and Agile Development 2.0 applications.

Story input data for Generate acceptance criteria skill

Input	Description
Table	Story [rm_story] This value can't be changed.
Fields	Short description, Description

Story input data for Generate acceptance criteria skill (continued)

Input	Description
	You can choose to add more fields to serve as context to generate acceptance criteria.
Acceptance criteria template	A default template is provided. You can choose to modify the existing template or define a new template based on your team's requirements.
Reference stories	Tag a story as a reference when it contains ideal acceptance criteria. These tagged stories serve as examples for Now Assist, giving it additional context to generate well-structured acceptance criteria for new stories.

Refine records skill inputs

Input data for the writing planning item skill

Input	Description
Planning item fields	Description
Story fields	<ul style="list-style-type: none"> • Description • Acceptance criteria
Table	Product idea [sn_align_core_product_idea] Demand [sn_align_core_demand] Capability [sn_align_core_capability] Epic [sn_align_core_scrum_epic] Project [sn_align_core_project] Feature [sn_align_core_feature] Story [rm_story]

Enable conversational demand creation using Now Assist in Virtual Agent

Activate the required skills and learn about required configuration to enable creating a demand through Agent assist in Virtual Agent using the conversational experience.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > Now Assist Admin > Skills**.
2. Select the **Platform** category.
3. On the Now Assist Multi-Turn Catalog Ordering skill card, select **Turn on**.

What to do next

- Ensure that AI Search is installed and provisioned for your instance. Navigate to **All > AI Search > AI Search Status**
- Set up Now Assist in Virtual Agent. See [Configuring assistants overview](#) .
- You can add or modify the question prompts to be asked by Agent assist in Virtual Agent while creating a demand for the user. See [Configure the questions for demand creation in Now Assist for Strategic Portfolio Management \(SPM\)](#).

Configure the questions for demand creation in Now Assist for Strategic Portfolio Management (SPM)

Add a new or modify an existing question for Now Assist in Virtual Agent while creating a demand in the Now Assist for Strategic Portfolio Management (SPM) application.

Before you begin

Ensure that the following plugins are installed:

- Now Assist for Platform (v4.0.2)
- Now Assist for IT Service Management (ITSM)
- Now Assist in Conversational Catalog Request

Note:

Installing Now Assist in Conversational Catalog Request automatically installs all the other dependent plugins.

- Activate the Conversational experience skill.
- Configure Now Assist in Virtual Agent. For more information, see [Configure Now Assist in Virtual Agent](#) .

Note:

If Microsoft Teams and Mobile are enabled as a display location for Now Assist in Virtual Agent, your end user can use the conversational experience to create a demand in those applications too.

Role required: admin or catalog_admin

Procedure

1. Navigate to **All > Service Catalog > Catalog Administration > Conversational catalog overview**.
2. Select the **Create a New Demand** catalog item.
3. Identify any unsupported conversational catalog item question types and suggestions to make them conversational by selecting **Now Assist for Virtual Agent**.
For information on unsupported fields, see [Configure Now Assist in Conversational Catalog Request](#) .
4. Review the existing questions in the Variables related list and add or modify questions by selecting **Edit in advanced view**.

Update the project summary header and footer of your email using script include

Use the script include to modifying the email template for project summary.

Before you begin

Ensure the Now Assist for SPM is installed and email project summary skill is active.

Role required: admin

Procedure

1. Navigate to **All > System UI > Script Includes**.
2. Open the *ProjectInsightsEmailTemplateCustomConstants* script include and update the *ProjectInsightsEmailTemplateCustomConstants.EMAIL_HEADER_HTML* constant for email's header.

This example demonstrates the script include for email's header as follows:

```
ProjectInsightsEmailTemplateCustomConstants.EMAIL_HEADER_HTML
= `

<span style="color: white;"><a
href="https://www.servicenow.com/" target="_blank"
rel="noopener noreferrer nofollow"><span style="color:
white; text-decoration: none;"><span style="color:
blue;"></span></span></a></span></p>`;

```

3. Update the *ProjectInsightsEmailTemplateCustomConstants.EMAIL_FOOTER_HTML* constant for email's footer.

This example demonstrates the script include for email's footer as follows:

```
ProjectInsightsEmailTemplateCustomConstants.EMAIL_FOOTER_HTML
= `
```

```

target="_blank" rel="noopener noreferrer nofollow"
style="text-decoration: none;">                                </a>                </span>                </div>
    <!-- Address and Footer Information -->                <div
style="font-family: 'Century Gothic', CenturyGothic,
Helvetica, sans-serif; font-size: 12px; line-height:
0.8; color: #293e40; margin-top: 5px;">                <p
style="margin-bottom: 0; padding: 0; line-height: 0.8;
font-size: 10px;">                <span>2225 Lawson Lane, Santa
Clara, CA 95054, United States</span>                </p>
<p style="margin-bottom: 0; padding: 0; line-height: 0.8;
font-size: 10px; color: #293e40;">                <span>&copy; 2024
ServiceNow. All rights reserved</span>                </p>                </div>
</div>`;

```

On completion, the project summary email template is customized with the header and footer.

Configure the Monitor project tasks AI agent in AI Agent Studio

Monitor project tasks autonomously by configuring the AI agent in the AI Agent Studio.

Before you begin

Role required: admin or it_project_manager

Procedure

1. Navigate to **All > AI Agent Studio > Create and manage**.
2. From the Agentic workflows list, select Monitor project tasks AI agent.
From the Monitor project tasks agentic workflow, each AI agent is shipped as active by default.

Note:

Only users with the Now Assist panel (NAP) role can access agents, even if the current agentic workflow doesn't require that role.

3. Enable the Monitor project tasks AI agent:
 - a. From Define key requirements screen, select **Continue**.
 - b. From Define user access screen, select **Continue**.
 - c. From Define data access screen, select **Continue**.
 - d. From Add triggers screen, select the Project task update monitoring and turn on the Trigger. Select **Save** and select **Continue**.
 - e. From the Select channels and status screen, select **Save and test**.

The agentic workflow trigger defines the events that invoke AI agents for this agentic workflow. The trigger ensures that the AI agents can only start working upon specific key updates to project tasks.

4. Navigate to **Workspaces > Project Workspace** and select the project.

The admin must enable the project insights generation skill for a specific project and set up a cadence for the project insights email. For more information on how to set up an email cadence, see the [Schedule the project insights email](#).

5. Enable the AI agent for a specific project:

- a. [Schedule the project insights email.](#)
- b. From the planning page, select the more actions icon () and then select **Enable critical task alerts.**

Note:

Enable critical task alerts option is only available when the email is scheduled. To

disable the AI agent, select the more actions icon () and then select **Disable critical task alerts.**

The Monitor project tasks agents are enabled for the selected project.

Configure Create stories agentic workflow with Now Assist for SPM

Using the AI Agent Studio, you can review and edit the configuration of the Create stories agentic workflow to modify the workflow description, steps, and agents included.

Before you begin

Ensure that the Application scope of your ServiceNow instance is set to Now Assist for Strategic Portfolio Management (SPM).

Role required: admin

Procedure

1. Navigate to **All > AI Agent Studio > Create and manage.**
2. From the list of Agentic workflows, select **Create stories.**
Each AI agent included in this workflow is active by default.

Note:

Only users with the Now Assist panel (NAP) role can access agents, even if the current agentic workflow doesn't require that role.

3. Review and modify the Create stories AI workflow using the following sections:
 - a. From the Define key requirements section, review the workflow description, steps involved, and AI agents added.
 - b. From the Define user access section, select which user roles can access this agentic workflow
 - c. From the Define data access section, select the type of user who can access this agentic workflow.
 - d. From the Add triggers section, add triggers if you like this agentic workflow to be launched according to predefined triggers.
 - e. From the Select channels and status section, choose the ways in which your users can access this agentic workflow. The default selection for Create stories workflow is the Now Assist panel.

4. Select **Save and test**.

The Create stories agentic workflow can only be tested in the Enterprise Agile Planning (EAP) workspace, from an epic or a feature record. To access EAP, navigate to **Workspaces > Strategic Planning Workspace > Enterprise Agile Planning**. For more information on how to use this agentic workflow in EAP, see [Generate stories for work items in EAP using Now Assist for SPM](#).

After testing the workflow, you can come back to AI Agent Studio to make any further changes.

Related topics

Update severity scoring configuration for portfolio insights

Configure the severity thresholds and scoring factors that determine how planning items are classified as critical, medium, or low risk, so that Portfolio insights generates recommendations based on your organization's risk criteria.

Before you begin

Role required: sn_align_core.apw_admin

Note:

Default severity thresholds and scoring factors are preconfigured for portfolio insights. Update these settings only if your organization's risk criteria differ from the defaults.

For example, the following default values apply to the Delayed planning items category:

- Default severityThresholds configuration: `{ "severityThresholds": { "critical": { "minScore": 10 }, "medium": { "minScore": 5 }, "low": { "minScore": 1 } } }`
- Default scoringFactors configuration: `"scoringFactors": { "scheduleDelay": { "enabled": true, "pointsPerDay": 0.5, "maxPoints": 10 }, "priority": { "enabled": true, "weights": { "High": 3, "Medium": 1, "Low": 0 } }, "dependencyImpact": { "enabled": true, "pointsPerDownstreamDependency": 1, "maxPoints": 6 }, "financialRisk": { "enabled": true, "benefitThreshold": 100000, "pointsIfAboveThreshold": 3, "maxPoints": 3 } } }`

About this task

Severity scoring determines how the Portfolio insights skill classifies planning items and surfaces root causes and recommended actions. Each planning item receives an overall risk score based on weighted scoring factors – scheduled delay, priority, dependency impacts, and financial risk. The score is then evaluated against configurable thresholds to assign a severity level.

Severity levels are color-coded for quick identification: red for critical, yellow for medium, and green for low. The color assignments are fixed and cannot be changed.

Configuration is managed in the Insight topic configuration table using records with type set to **Portfolio**.

The insights are generated for the following categories for a portfolio plan:

- Delayed planning items - Planning items delayed beyond planned end date
- Date misalignment - Planned vs Approved date misalignment
- Delayed start - Planning items with delayed starts

Note:

- For Delayed planning items insights, root causes and recommendations are generated from the top 15 delayed planning items, ranked by severity score.
- For Delayed start insights, only planning items whose planned start date falls within the last 30 days are included.

Important:

This topic covers severity scoring configuration for the Delayed planning items category. The same steps apply to the Delayed start and Date misalignment categories.

Procedure

1. Navigate to **All > sn_spm_gen_ai_insight_topic.list**.

A list of Insight topic table records appear.

2. In the **Type** column, right-click **Portfolio** and select **Show Matching** to show only records with the type set to **Portfolio**.

Topic information	Topic id	Type
Planning items that started later than t...	delayed_start_planning_items	Portfolio
	tasks_with_no_progress	t
	dependency_issues	t
Planned end date do not align with appro...	date_misaligned_planning_items	Portfolio
Analyzes portfolio planning items that h...	delayed_planning_items	Portfolio

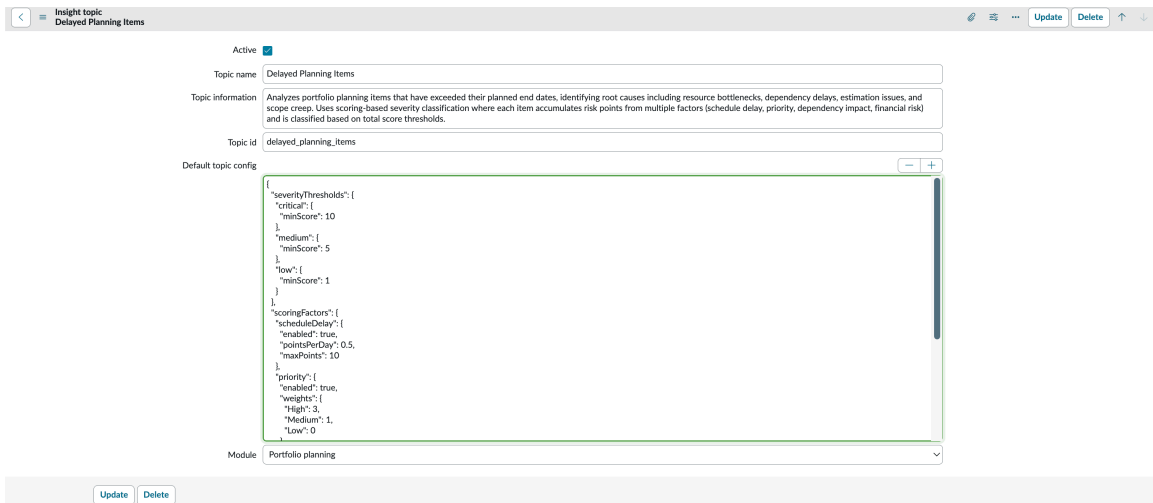

After applying the filter, the following three insight topic table records appear.

Active	Default topic config	Module	Topic name	Topic information	Topic id	Type
true	{ "severityThresholds": ["critica..."	Portfolio planning	Delayed Start Planning Items	Planning items that started later than L...	delayed_start_planning_items	Portfolio
true	{ "severityThresholds": ["criti..."	Portfolio planning	Date misaligned Planning Items	Planned end date do not align with appro...	date_misaligned_planning_items	Portfolio
true	{ "severityThresholds": ["critica..."	Portfolio planning	Delayed Planning Items	Analyzes portfolio planning items that h...	delayed_planning_items	Portfolio

3. Next to an Insight topic record, select preview icon to open the record.

For example, select Preview Delayed Planning Item record icon to view the Delayed Planning Items record.

4. In the **severityThresholds** section of the **Default topic config** field, set the score range for each severity level according to your organization's risk criteria.

Severity levels

Severity level	Description
Critical	Planning items whose risk score meets or exceeds the critical threshold. Displayed in red.
Medium	Planning items whose risk score falls between the critical and low thresholds. Displayed in yellow.
Low	Planning items whose risk score falls below the medium threshold. Displayed in green.

Default severityThresholds configuration: { "severityThresholds": { "critical": { "minScore": 10 }, "medium": { "minScore": 5 }, "low": { "minScore": 1 } } }

- In the **scoringFactors** section of the **Default topic config** field, set the weight for each factor that contributes to the overall risk score according to your organization's risk criteria.

Scoring factors

Scoring factor	Description
Scheduled delay	Contributes to the risk score based on the number of days a planning item is delayed beyond its planned end date. The score is calculated as 0.5 points per day delayed, up to a maximum of 10 points.
Priority	Contributes to the risk score based on the priority assigned to the planning item: High (3 points), Medium (1 point), or Low (0 points).
Dependency impacts	Contributes to the risk score based on the number of downstream dependent planning items affected by the delay, up to a maximum of 6 points.
Financial risk	Contributes to the risk score based on the financial exposure associated with the planning item. Planning items with a benefit above the threshold receive additional points, up to a maximum of 3 points.

```
Default scoringFactors configuration: "scoringFactors":
{ "scheduleDelay": { "enabled": true, "pointsPerDay": 0.5,
"maxPoints": 10 }, "priority": { "enabled": true, "weights":
{ "High": 3, "Medium": 1, "Low": 0 } }, "dependencyImpact":
{ "enabled": true, "pointsPerDownstreamDependency": 1,
"maxPoints": 6 }, "financialRisk": { "enabled": true,
"benefitThreshold": 100000, "pointsIfAboveThreshold": 3,
"maxPoints": 3 } } }
```

6. Save the configuration record.

The updated severity thresholds and scoring factor weights are applied when Portfolio insights next generates insights for planning items in the portfolio plan.

What to do next

To verify that the configuration is working as expected, open a portfolio plan that contains planning items with known delays and confirm that the severity classifications reflect the thresholds you set. For details, see [View portfolio insights for a portfolio plan in Strategic Planning Workspace](#) or [Portfolio Planning Workspace using Now Assist for SPM](#).

Use Now Assist Admin

Use Now Assist Admin to explore the various Now Assist plugins, skills and associated Generative AI application features you are entitled to.

Activate a Now Assist skill

Configure the triggers, settings, and display locations for Now Assist skills to enable generative AI capabilities.

Before you begin

Role required: sn_generative_ai.nsa_admin

About this task

Activate the skills that are most relevant to your use cases and business needs. For a full list of available skills, see [Now Assist skills](#) . After the skills have been activated, they're accessible across the ServiceNow AI Platform based on the availability and display settings you choose.

Procedure

1. Navigate to **All > Now Assist Admin Console > Features**.

If you're already in the Now Assist Admin console, select the **Now Assist Features** tab.

2. On the navigation panel, select a workflow, such as **Technology**.

Each workflow contains feature sets.

3. On the feature card that is associated with the skill you'd like to activate, select **View details**.

4. In the All available skills section, select **Activate Skill**.

5. In the first step of the skill configuration, determine which inputs or triggers that you want to associate with the skill.

Each skill configuration has steps that are shown in the guided setup. The exact steps vary from skill to skill. A symbol next to each step indicates whether the step is completed, partially completed, or not completed. After configuring a step, select **Save and continue** to go to the next step. Return to a previous step by selecting **Back**.

Note:

Some configuration options are read only.

6. After you've configured the current step, select **Save and continue** to go to the next step.

7. **Optional:** For some skills, the next step is to define the availability.

(Optional) You can select **Skill is always available** if you do not want to place any restrictions on when the skill is available for use. If you want to add conditions, select **Customize skill availability**. Selecting this option opens up a condition builder for you to select fields and values that determines whether someone can use the skill.

8. In the next step of the skill configuration, select where you'd like to display the skill.

Options vary from skill to skill. Some options are only available for certain skills.

- **In-product desktop:** When selected, Now Assist skills are displayed on forms and workspaces.
- **Now Assist panel:** When selected, Now Assist skills are available in the Now Assist panel. If you don't see this option, you must activate the Now Assist panel. For more information, see [Activate the Now Assist panel standard chat](#).
- **Core UI:** When selected, the Now Assist skill will display as a UI action in the Core UI. Select the down arrow next to the Display toggle to select the roles that can use the skill. Roles can be added by entering the name of the role in the User roles field. Existing roles can be removed by selecting the X icon in the role bubble. You must have at least one role specified, but you can add as many as you like.

9. Review your choices and select **Activate** to complete the configuration.

What to do next

Use the Now Assist applications and skills that you've activated.

Configure project insights generation skill in the Now Assist Admin console

Define the triggers, inputs, and display location for project insights generation skill.

Before you begin

Role required: admin

Important:

This Now Assist skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see [Now Assist skills, agents, and agentic workflows on by default](#).

Procedure

1. Navigate to **All > Now Assist Admin > Features**.

If you're already in the Now Assist Admin console, select the **Now Assist Features** tab.

2. On the navigation panel, select **Technology** and select **SPM**.

Each workflow contains feature sets.

3. On the Project insights generation feature card, select **Turn on**.

Edit access for Project insights generation

Edit access for Project insights generation in SPM. You can specify who has access to this skill and add further restrictions to prevent unauthorized data access.

Add user access ^

Specify the individuals or groups that can utilize this skill. Access control lists (ACLs) are implemented to identify the users permitted to access this skill.

Decision type	Roles
Allow if	<div style="border: 1px solid #ccc; border-radius: 5px; padding: 2px 5px; display: inline-block;">project_manager</div> ✎

Role restrictions to skill ⊙

Cancel
Save

4. In Add users access section, specify the user or roles.

5. Review the role restrictions to skill and select **Turn on** to activate the skill.

New topics in project insights framework to support reuse across portfolio insights, project insights, and status report contextual data:

- Project delays
- Task dependency
- Budget fluctuations

Result

The skill is active on the instance.

What to do next

Analyze your skill performance and usage on the Now Assist Admin console to help determine the success of the skill. Learn more about tracking your Now Assist usage at [Monitoring Now Assist usage in Subscription Management](#) ↗.

Configure project status generation skill in the Now Assist Admin console

Configure the project status generation Now Assist skill to enable.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > Now Assist Admin > Now Assist Features**.

If you're already in the Now Assist Admin console, select the **Now Assist Features** tab.

2. On the navigation panel, select a workflow, such as **Technology**.

3. On the project status generation card that is associated with the skill you'd like to activate, select **Activate skill**.

Admin configurations: On Status report generation skill card, select **Edit** to review settings. Review the dimension level configurations and update the skill. Select **Save and continue** to apply changes. Review and update the executive summary template according to your guidelines and select **Save and continue** to proceed with next screens. This is one time admin configuration.

4. From Overall health screen, review health criteria for each project dimension and select **Save and continue**.

Switch scope

5. Review the executive summary screen and select **Save and continue**.

Switch scope

6. From Define access screen, select **Save and continue**.

Roles can be added by entering the name of the role in the User roles field. Existing roles can be removed by selecting the X icon in the role bubble. You must have at least one role specified, but you can add as many as you like. In the next step of the skill configuration, select where you'd like to display the skill.

7. You can select in-product if you'd like to display the skill on forms and workspaces.

8. Review your choices and select **Activate** to complete the configuration.

Using AI agent or agentic workflows in Now Assist for Strategic Portfolio Management (SPM)

Use the AI agents for SPM to monitor project tasks autonomously.

Available AI agents for SPM

Agentic workflow name	Description	Available AI agents
Monitor project tasks	<p>Autonomously monitor project tasks on the critical path of a project. Detect key updates, such as a delay to planned end dates, status updates to red, or state updates to incomplete or skipped.</p> <p>When these changes occur, the AI Agent autonomously triggers a project summary email to the project manager, highlighting the specific updates that triggered the alert.</p>	<ul style="list-style-type: none"> • Project summarizer • Project eligibility analyzer
Create stories	<p>Convert epics into actionable user stories quickly. Powered by an agentic workflow, Now Assist analyzes epic details to recommend the optimal number of stories, enables adjustments, refines story content based on your feedback, and helps create relevant and accurate story records.</p>	<p>Validate the work item and generate stories</p>

Looking for an AI agent?

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see [Find AI agents](#).
- To find agents that might not be installed on your instance, visit the [AI Agent Marketplace](#) on the ServiceNow Store.

i Important:

All agentic workflows and AI agent records are read-only by default.

To run the AI agents autonomously, you must do the following steps:

- Activate the agentic workflow.
- All AI agents in a agentic workflow are active by default.

Strategic Portfolio Management AI agents for the monitor project tasks agentic workflow

Use the Monitor project tasks agentic workflow to autonomously generate a project insights email by using AI agents. AI agents help project managers to manage risks, resolve issues, or take actionable decision on the projects.

i Important:

This agentic workflow is turned on by default. For more information, see [Now Assist skills, agents, and agentic workflows on by default](#) .

Monitor project tasks overview

The Monitor project tasks agentic workflow can help to trigger a project insights email and provide real-time visibility into key project updates. Use the project insights generation skill to generate a project summary and send it as an email to the project managers.

This proactive monitoring and alert system saves time and effort for project managers, ensuring that they can respond promptly to keep project schedules on track. By leveraging these AI agents, project managers can optimize their operations and enhance the overall project efficiency.

The email summary includes the following sections:

- Overall project insights
- Top insights needing attention
- Milestone insights
- Resource insights
- Project task insights

If you want to change this agentic workflow, you can [duplicate it](#) , adjust the settings to suit your specific needs, and activate the duplicated version of the agentic workflow instead.

Monitor project tasks agentic workflow

Autonomously generate a project insights email using AI agents. To use Monitor project tasks, make sure that the project insights generation skill is active. For more information on how to activate the skill, see [Configure Now Assist Admin features](#).

To access the Monitor project tasks agentic workflow:

1. Navigate to **All > AI Agent Studio > Create and manage**.

2. Select **Monitor project tasks**.

To configure the Monitor project tasks agentic workflow and associated AI agents, see [Configure the Monitor project tasks AI agent in AI Agent Studio](#).

AI agents used in the Monitor project tasks agentic workflow

The following AI agents are used for the Monitor project tasks agentic workflow:

- Project summarizer
- Project eligibility analyzer

Other agentic workflow

For more information on other agentic workflow that are associated with the Platform workflow, see [Platform agentic workflows](#).

Related topics

[AI Agent Studio](#)

Create stories agentic workflow using Now Assist for Strategic Portfolio Management (SPM)

Use the Create stories agent to generate high-quality stories for planning items in Enterprise Agile Planning (EAP).

i Important:

This agentic workflow is turned on by default. For more information, see [Now Assist skills, agents, and agentic workflows on by default](#).

Create stories overview

Product managers often spend excessive time manually converting epics into user stories. This process is not only time-consuming but also prone to gaps in detail, leading to confusion, rework, and delays in planning and delivery. Missed or unclear requirements can compromise the quality of the final product.

Create stories AI agentic workflow addresses these challenges by automating story generation from epics and features through an intelligent, conversational process:

- **Analyze and generate:** The agent reviews the epic description and creates relevant, detailed user stories.
- **Interactive refinement:** The agent engages in a free-flow conversation with you, presenting story recommendations, accepting feedback, and iterating based on your input.
- **Decision and action:** The agent manages successful flows such as saving validated stories and feedback loops such as removing unwanted stories and learning from corrections to ensure that accurate, high-quality stories are finalized.

The key benefits of this workflow are:

- Time savings: Automatically generates stories from epics and features, reducing manual effort.
- Improved quality: Produces clear, validated stories aligned with requirements.
- Faster execution: Creates cleaner backlogs and better alignment for planning.

Unlike rigid AI templates, this workflow emphasizes flexibility and collaboration, enabling dynamic input and refinement to deliver precise, actionable user stories.

If you want to change this agentic workflow, you can [duplicate it](#) , adjust the settings to suit your specific needs, and activate the duplicated version of the agentic workflow instead.

Create stories agentic workflow

To access the Create stories agentic workflow:

1. Navigate to **All > AI Agent Studio > Create and manage**.
2. Select **Create stories**.

To configure the Create stories agentic workflow and associated AI agents, see [Configure the Monitor project tasks AI agent in AI Agent Studio](#).

AI agents used in the Create stories agentic workflow

Validate the work item and generate stories: Responsible for the end-to-end process of transforming Enterprise Agile Planning work items (epics and features) into a set of well-formed, actionable user stories.

Using the Create stories agentic workflow

See [Generate stories for work items in EAP using Now Assist for SPM](#).

Using Now Assist for Strategic Portfolio Management (SPM)

With the Now Assist for Strategic Portfolio Management (SPM) application, you can summarize feedback, create demands, generate document summaries, and refine planning item descriptions for clarity and alignment. You can also quickly produce and share project insights via email and use the AI agents to monitor project tasks autonomously.

Related topics

[Using AI agent or agentic workflows in Now Assist for Strategic Portfolio Management \(SPM\)](#)

Summarize the feedback by using Now Assist for Strategic Portfolio Management (SPM)

Generate a summary from the name and description of the feedback records so that you can analyze a large volume of feedback quickly without reading each feedback record manually. You can do this task by using the multi feedback summarization skill in the Now Assist for Strategic Portfolio Management (SPM) application.

https://player.vimeo.com/video/1016235687?h=c41764ac08&badge=0&autoplay=0&player_id=0&app_id=58479

Before you begin

i Important:

This Now Assist skill is now turned on by default. The skill will be automatically available to appropriate role users for the application. This change simply activates the skill and does not touch the roles that are needed to use the skill. The new default behavior works as follows:

New customers

When you install a Now Assist product, designated skills will turn on automatically.

Existing customers who are upgrading

Any previously unconfigured skill will turn on automatically (the skill was never turned on, then off again).

There is no change to Now Assist skills that are currently enabled and customized.

Previously configured skills that were turned on, then off, will remain inactive.

If you have users with custom roles that need access to this skill, you must update ACLs for those roles and also add those custom roles to the In product role.

Role required: pf_user

About this task

With the feedback or multi feedback summarization skill, you can get enough details about the feedback that you received on your product so that you can improve the product features, usability, and performance.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace** and select **Feedback**.
2. From the Feedback page, select any feedback filter card.
3. From the feedback list, select one or multiple feedback records.

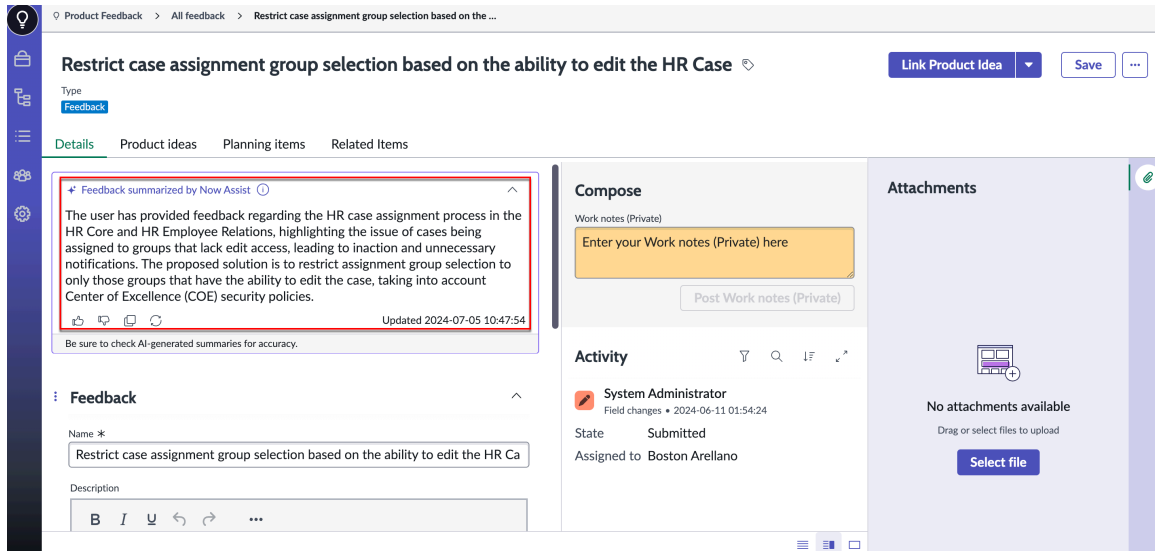

View a loader for the side panel while the summary content loads for a more engaging loading experience.

If you want to generate a summary for one feedback record, you can either generate it from the list level or at the record level. At the record level, the feedback summary is displayed in the Now Assist component. The component is collapsed by default and expands to display the summary.

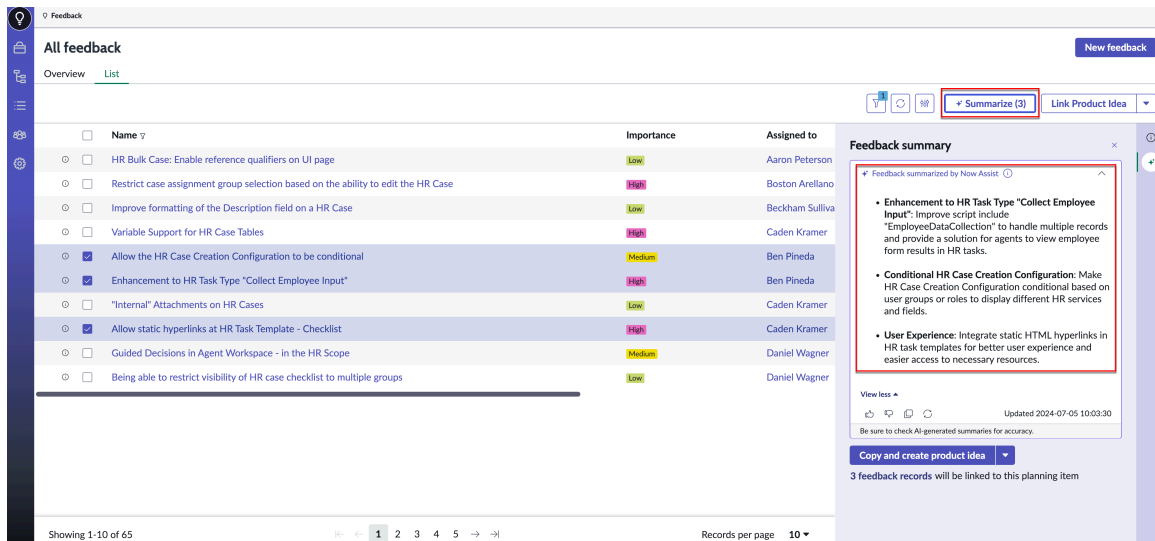

4. Select **Summarize**.

View an animation for the Now assist icon when you hover over it.

You can generate a summary of a single feedback record by using the feedback summarization skill. This image shows the AI-generated summary for a single feedback record.

You can use the multi feedback summarization skill to generate summaries of one or multiple feedback records. For example, you can analyze the high-priority feedback, filter them, summarize the records, and gain insights into the requirements.

Note:

Because the information in these fields is automatically generated, it's a good idea to review the text and make sure it's accurate.

The feedback or multi feedback summarization skill uses the name and description information of the feedback record to generate a paragraph or bullet-point summary from the feedback.

View the hover animation for the Now Assist icon on the Summarize button in the feedback list and Docs.

5. Optional: When you're finished summarizing the feedback, you can expand or collapse the summary, provide feedback, copy it, or view information about it.

Note:

The feedback summarization or multi summarization skill checks the feedback records to determine if enough information is available to generate a summary. If there isn't enough feedback content to summarize, you can add more content and retry.

On the side panel, you can select the preview record icon () to view the additional details or select preview generated summary icon () to view the summarization output.

6. Optional: Select **Copy and create epic** to copy the generated summary and create a planning item.

(Optional) Save time and streamline your work flow by linking the feedback with planning items, which eliminates the need to copy summaries. You can quickly create work items in Feedback and view them in the roadmap.

Create demands by using the conversational experience

Use the conversational experience of Now Assist in Virtual Agent to create a demand from any application that supports Virtual Agent.

Before you begin

Ensure that the following tasks are completed:

- Install an application that supports Virtual Agent.
- Complete configuring the conversational experiences for demand creation. For more information, see [Configure Now Assist Admin features](#).

Role required: none

About this task

https://player.vimeo.com/video/986004158?h=d45fb142d9&badge=0&autoplay=0&player_id=0&app_id=58479

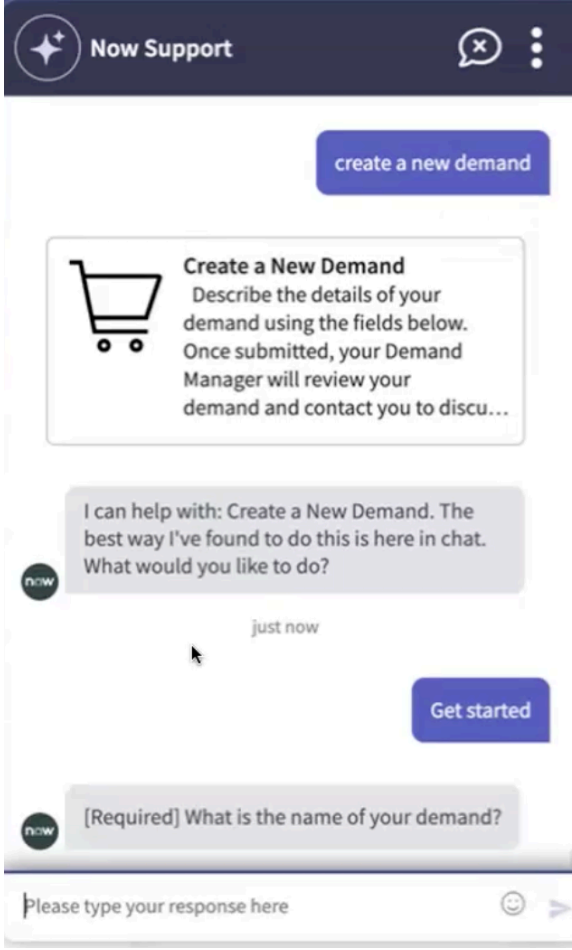

In the application that supports Virtual Agent, for example Employee Service Center, start with a prompt to create a demand in the chat. Through a series of questions, Virtual Agent prompts you to provide information for the questions that you configured for a catalog item. Now Assist in Virtual Agent understands the context and maps the information that you provide in response to a question to an appropriate catalog item, in this case, a demand.

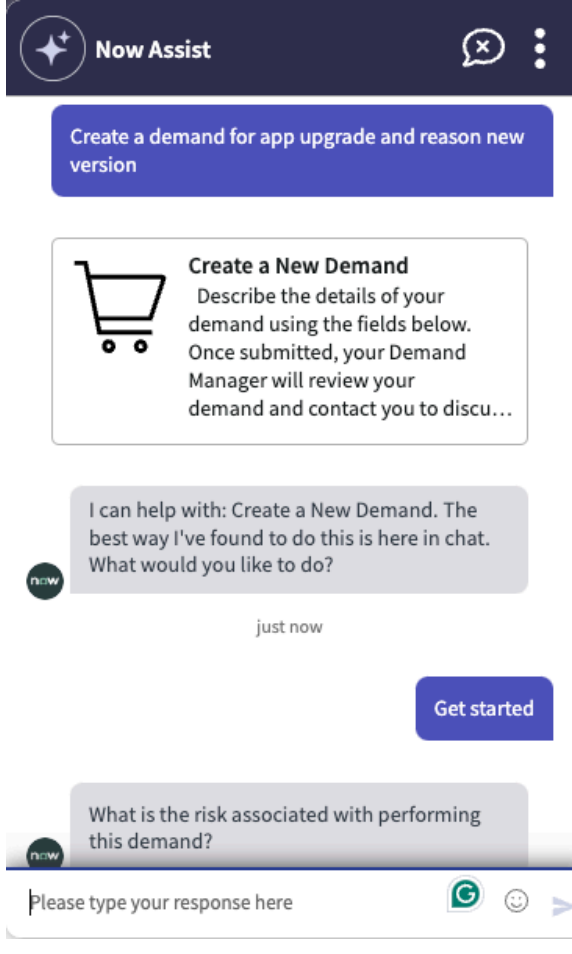

Procedure

1. Navigate to **All > Self-Service > Employee Center**.
2. Select **Open chat window**.
3. Enter an instruction to start the conversation with Virtual Agent.

You can start with a basic instruction such as **Create demand** or an elaborate instruction that includes the demand's information. The following examples show how each instruction is handled in the chat.

Instruction	Description
Short: Create demand	Virtual Agent starts a conversation to ask more information from you about the demand through a series of questions:

Instruction	Description
	<ul style="list-style-type: none"> ○ What is the name of your demand? ○ What is the reason for this demand? ○ What are the risks associated with performing this demand? <p>The information you provide is used to fill in the fields of the Demand form. You can skip answering a question that is related to non-required fields by entering skip.</p>  <p>The screenshot shows a chat window with a dark header containing 'Now Support' and a 'create a new demand' button. Below the header is a card titled 'Create a New Demand' with a shopping cart icon and instructions to describe the demand. A chat message from 'now' says: 'I can help with: Create a New Demand. The best way I've found to do this is here in chat. What would you like to do?'. Below the message is a 'Get started' button and a required question: '[Required] What is the name of your demand?'. At the bottom is a text input field with the placeholder 'Please type your response here'.</p>
<p>Elaborate: Create a demand with the name Upgrade MyApp and business justification as upgrade and risk of not performing as milestones will be missed.</p>	<p>Using the context that you provided, Virtual Agent automatically matches it to the relevant field on the Demand form.</p> <p>It then instructs you to enter information of only those fields that you haven't provided, such as the risk associated with performing the demand, assumption, and others.</p> <p>You can skip answering a question that is related to non-required fields by entering skip.</p>

Instruction	Description
	

4. Review the information that Virtual Agent filled in for the Demand form fields. You can choose to make changes or submit.

5. Optional: Add attachments for the demand. The information that you provided is submitted to create a demand. Virtual Agent creates a demand and provides the information such as its number, short description, and state.

The conversation is now complete.

[Using Now Assist in Virtual Agent](#)

Identify similar records using Now Assist for Strategic Portfolio Management (SPM)

Detect similar demand records using the identify similar records Now Assist skill. The skill detects similar demand records based on contextual similarity in the name, description, and business case content.

Before you begin

i Important:

This Now Assist skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see [Now Assist skills, agents, and agentic workflows on by default](#).

If you have custom roles that require access to this skill, update the ACLs (access control lists) for those roles that require access. For more information, see [Implement access control in Now Assist AI agents](#).

Role required: it_demand_user

Procedure

1. Navigate to **All > Demand > Demands > Create New**.
Alternatively, you can create a demand from **Self-Service > Demands > Create New**.
2. On the Demand form, fill in the **Name**, **Description**, and **Business case** fields.
For a description of the field names, see [Demand form](#).
3. Save **Save**.
4. Select the **Identify similar demands** button to detect similar demand records.

Result

The similar demands identified by Now Assist are displayed in the top banner and the Similar Demands related list.

The screenshot shows the ServiceNow interface for creating a demand. At the top, there is a navigation bar with 'servicenow' and various tabs like 'All', 'Favorites', 'History', 'Workspaces', and 'Admin'. The current page is 'Demand - Shared Review of Scenario Alternatives'. A search bar is visible on the right. Below the navigation, there are buttons for 'Discuss', 'Follow', 'Update', 'Save', 'Identify similar demands', 'Submit demand', and 'Delete'. A notification banner at the top left, titled 'Similar records identified by Now Assist', lists three related demand records: DMND0001278, DMND0001346, and DMND0001255. Below the banner is a progress bar with stages: Draft, Submitted, Screening, Qualified, Approved, and Completed. The 'Draft' stage is currently active. The form fields include:

- Name: Shared Review of Scenario Alternatives
- Category: Strategic
- Type: Project
- Number: DMND0001103
- Approved start date, Approved end date, Start date, and Due date (all empty)
- Description: "Problem Statement: AS A - Decision-maker reviewing potential portfolio scenarios I WANT - to share a scenario comparison view with other reviewers AND - collect feedback via comments from each participant SO THAT - we can come to consensus without needing a meeting AND - preserve decision-making rationale within the system. Description of the feature: Support sharing and collaboration on the scenario comparison view by enabling participants to leave feedback and comments. Comments should be saved with the scenario, supporting asynchronous tradeoff analysis and auditability."
- Priority: 4 - Low
- Department, Business Unit, Project Manager, and Impacted Business Units (all empty)

i Note:

- If any similar records are present on the demand record, the related list is updated to display the list of identified similar records.
- If there are no identified similar records for a demand, a message is displayed to convey the same and the related list remains empty.

What to do next

View the full details of the identified similar demand records by selecting the demand number link from the Similar Demands related list.

Summarize demands with the demand summarization skill

Summarize demand records using the demand summarization skill. The skill reviews the demand fields and related lists and helps create a clear summary of the demand.

https://player.vimeo.com/video/1174987769?h=cc74855ef5&badge=0&autoplay=0&player_id=0&%E2%80%A6

Before you begin

i Important:

This Now Assist skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see [Now Assist skills, agents, and agentic workflows on by default](#).

Role required: it_demand_user, it_demand_manager

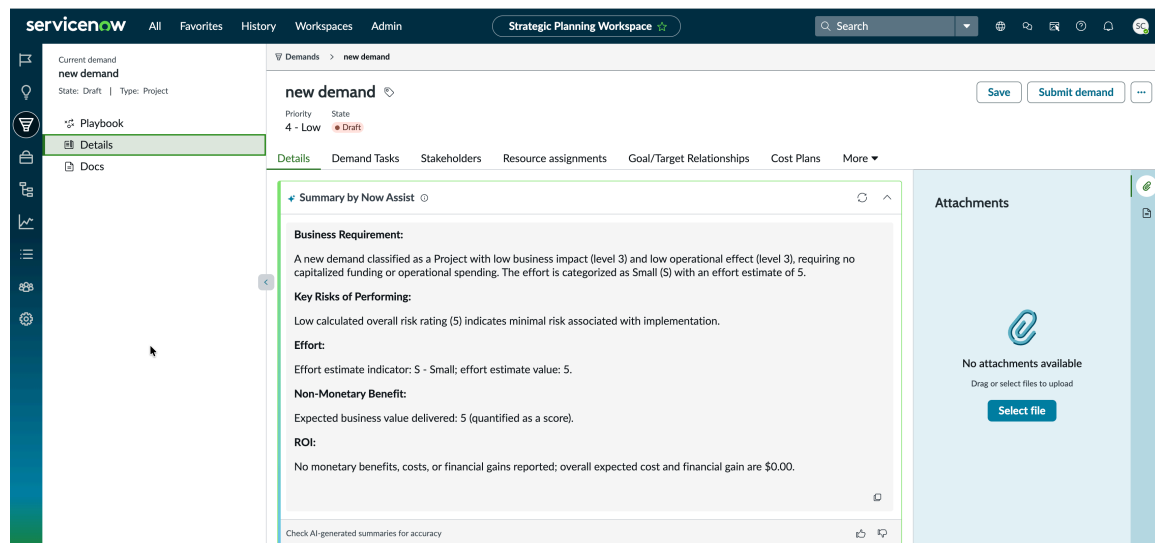

If you have custom roles that require access to this skill, update the ACLs (access control lists) for those roles that require access. For more information, see [Implement access control in Now Assist AI agents](#).

Procedure

1. Access a demand record in one of the following ways.
2. Select the **Summarize** button to generate a summary of the demand.

Result

The summary generated by Now Assist is displayed in the summary card.

i Note:

Select the copy icon to copy the generated summary for further use.

Generate targets for a goal in Strategic Planning Workspace using Now Assist for SPM

Generate measurable targets for your goals in Strategic Planning Workspace using Now Assist for SPM.

Before you begin

i Important:

This Now Assist skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see [Now Assist skills, agents, and agentic workflows on by default](#).

Role required: sn_apw_advanced.spw_goal_user and (sn_align_core.apw_user or sn_gf.goal_admin)

About this task

The Target generation skill leverages the goal’s details and provided context to create a precise target for the goal. The more specific the input, the stronger the recommendations.

The skill automatically populates key fields in the Target form, ensuring accuracy and alignment with the goal. This helps teams define clear, measurable outcomes and speeds up the target-setting process.

i Note:

Only the owner or contributors of the goal can create targets for the goal.

The screenshot shows the 'Goals 2026' view in the Strategic Planning Workspace. The table lists various goals with their status, start values, final targets, actuals, and progress bars. The 'Goals and targets' tab is selected, and the table is filtered to show 'Quarterly' data.

Goals and targets	Status	Start value	Final target...	Actuals to ...	Progress	Owner
Deliver high-quality, secure, and modernized solutions to empower our customers	None				0%	MB Megan
Employee wellness	None				0%	SA System
Increase employee satisfaction scores by 15%	None	65%	80%		0%	SA System
Reduce average employee compensation review cycle time by 30%	None	45 days	32 days		0%	SA System
Reduce employee compensation review backlog by 25%	None	120	90		0%	SA System
Reduce employee compensation review discrepancy resolution time by 20%	None	45 days	36 days		0%	SA System
Happy Employees	None				0%	SA System
Enhance employee engagement through quarterly feedback sessions	None	0	50		0%	SA System

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Portfolio Planning**.
2. From the list of portfolio plans, select the required portfolio plan that the goal belongs to.
3. In the Goals view, select the **Goals and targets** tab.
4. Next to the goal that you want to create a target for, select the row context menu icon (⋮) and select **Generate target**.
5. On the Provide context to generate a target window, enter a context to generate a desired target and then select **Generate**.

Tip:

The more specific the input, the stronger the recommendations.

6. On the form, verify the filed values and update them as needed.
For a description of the field values, see [Target form](#).

7. Select **Save**.

Result

A target is created based on the goal's details and any context that you provide.

The target progress records are automatically created when you save the target post populating the **Actuals to date** field. The target progress records specify the progress of each target for the goal.

Note:

When you delete a goal, its associated targets (if any) and their progress records are also deleted even though the **Allow the deletion of targets** property is set to **No**.

What to do next

[Update the progress of the target](#) manually if the target isn't enabled for target automation.

Related topics

[Add targets for a goal in Strategic Planning](#)

Generate insights for a goal in Strategic Planning Workspace using Now Assist for SPM

Review AI-generated insights to identify at-risk goals, assess forecasted statuses, and act on recommendations before goals fall off track.

Before you begin**Important:**

This Now Assist skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see [Now Assist skills, agents, and agentic workflows on by default](#) .

Role required: sn_apw_advanced.spw_goal_user and (sn_align_core.apw_user or sn_gf.goal_admin)

About this task

The Goal insights skill analyzes the goal, its targets, subgoals, and aligned work, then delivers concise, data-driven insights—including AI forecasted status, confidence of achieving the goal, targets at risk, delayed or stalled aligned work and recommendations.

Note:

When you generate insights for a goal, insights are also generated individually for each of its targets.

The skill analyzes the real-time data — including check-in patterns, comments, and planned versus actual progress — to forecast goal status and surface proactive recommendations.

Tip:

For better reviews and recommendations, use the Goal insights skill with the AWS Claude model.

Note:

Only the owner or contributors of the goal can generate insights for the goal.

Goals and targets	St...	Progress	Owner	Start v...	Final target v...	Actuals to d...
Achieve all NNACV targets for 2024	Yellow	0%	SA System Administrator			
Build a High-Quality Inbound Lead Pipeline	Yellow	0%	SA System Administrator			
Generate at least 100 product signups/month	Red	0%	SA System Administrator	0	1,200	
Maintain the MQL% above 70	Green	0%	SA System Administrator	40	75	
Improve Customer Retention	Green	0%	MB Megan Burke (Portfolio Manager)			
Increase CSAT score by 15% from baseline	None	0%	SA System Administrator	70	85	
Reduce customer churn rate by 10% from baseline	None	0%	SA System Administrator	25	22.5	
Optimize and Enhance website performance.	Green	78.89%	SA System Administrator			
Improve mobile performance score by 90	Green	75.56%	SA System Administrator	45	135	113
Maintain health score above 90%	Green	86.11%	SA System Administrator	60	96	91
Optimize page loading time from 6 sec to 2 sec	Green	75%	SA System Administrator	6	2	3

Note:

If the Goal insights generation job is enabled, it automatically generates insights for each goal based on the job's run frequency. Before manually regenerating, check the timestamp on the goal insights summary card to confirm when insights were last generated – regenerating unnecessarily increases token consumption. You can also view the last generated insights in the **AI rationale** column of the goal list. If goal or target data has changed since the last run, select the refresh icon on the goal insights summary card to regenerate the insights.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Strategy and Goals**.
2. Select **Favorites, Shared with me, Created by me, or Public**, depending on where the board is located.
3. Select the board that contains the goal for which you want to generate insights.
4. From the list of goals, select Goal insights icon next to the goal.

Alternatively, you can select **Show insights** on the goal's full details page.

The Goal insights side pane appears processing the insights for the goal. After a while, the Insights by Now Assist pane shows the insights for the goal including AI forecasted status, confidence of achieving the goal, targets at risk, delayed or stalled aligned work and recommendations.

5. Review AI-generated insights to identify risk, assess forecasted statuses, and act on recommendations before goals fall off track.

Role required: sn_align_core.apw_user

About this task

Use Portfolio Insights to identify prioritized planning items that are at risk of schedule delays. The insights are categorized by impact severity and include root cause analyses and AI-generated recommended actions to help you address identified risks.

The insights are generated for the following categories for a portfolio plan:

- Delayed planning items – Planning items delayed beyond the planned end date
- Date misalignment – Planned versus approved date misalignment
- Delayed start – Planning items with delayed starts

Grouped by:	None (Drag the column headings here to set groups)									
	Ra...	ts	Name	Planning state	Planning item type	MoSCoW	Approved start date	Approved end date	Owner	
	1		Project 118	Prioritized	Sn Align Core Project	2 - Should have	2026-03-03	2026-04-06	AT: Abel Tut	
	2		CRM Account data deprecation	Prioritized	Sn Align Core Project	2 - Should have	2026-02-28	2026-04-26	AT: Abel Tut

	Total									

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Portfolio Planning**.
2. From the list of portfolio plans, select the portfolio plan to view insights.
3. From the portfolio plan header, select **Portfolio insights**.
Portfolio Insights displays risk signals across the following areas: delayed planning items, projects at risk of schedule delay, start delays, and approved versus planned misalignments.
4. On the Portfolio insights modal, review the insight categories displayed.
Insights are grouped by impact severity – critical, medium, and low – to help you prioritize which items require immediate attention.

5. Select an insight to view the root cause analysis.
The system displays detailed root cause information, including compounding risks such as resource overallocation across multiple planning items.
6. Review the AI-generated recommended actions for each root cause.
Recommended actions provide specific steps to mitigate delays and resolve misalignments within the portfolio plan.
7. Take corrective action based on the recommendations, as needed.

Result

Portfolio Insights identifies prioritized planning items at risk, along with root cause analyses and recommended actions to help you maintain portfolio health.

Generate stories for work items in EAP using Now Assist for SPM

Breakdown epics and features into stories using the Now Assist panel in the Enterprise Agile Planning (EAP) workspace. Based on the work item details, Now Assist generates stories.

Before you begin

Important:

This Now Assist skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see [Now Assist skills, agents, and agentic workflows on by default](#) .

Role required: `sn_apw_advanced.eap_user` or `sn_apw_advanced.eap_read_only`, with `now_assist_panel_user`

If you have custom roles that require access to this skill, update the ACLs for those roles that require access. For more information, see [Implement access control in Now Assist AI agents](#) .

About this task

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Enterprise Agile Planning**.
2. From the Agile structure section of the navigation panel, choose your EAP team that has an epic or feature as its work item type.
3. From the Backlog or Planning board pages, select an epic or a feature for which you want to create stories.
The work item details are displayed in the side panel.
4. From the side panel, select **Full details**.
5. From the work item header, select **Create stories** to open the Now Assist panel and trigger the Create stories agentic workflow.
The AI agent generates story recommendations based on the context available within the epic or feature.
6. Go through the story recommendations and choose to confirm, combine, split, remove any of the stories, suggest modifications, or create more stories.

Tip:

While Now Assist is working on the story recommendations for the current work item, you can start a new chat to create stories for another epic or feature. Select **New chat**  from the Now Assist panel header. You can switch between chats by selecting **All chats**

7. You can iterate on any of these actions and when you're satisfied with the recommendations, enter **Save**.

Now Assist creates stories with the confirmed recommendations. The newly created stories are displayed in the Stories tab of the epic or feature details page.

Generate a story from an epic using Now Assist for SPM in EAP

Generate a complete user story directly from an epic using Quick story generation feature in EAP. Provide brief context, and Now Assist generates a story title, description, and acceptance criteria that you can review and edit before saving.

Before you begin

Important:

This Now Assist skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see [Now Assist skills, agents, and agentic workflows on by default](#) .

Important:

Quick story generation is only available if the following two skills are active:

- Agile story generation
- Generate acceptance criteria

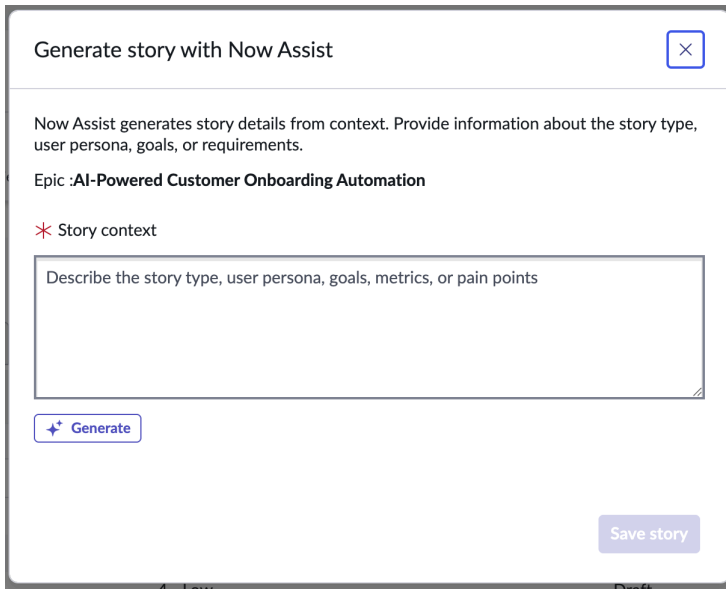

Role required: sn_apw_advanced.eap_user

Procedure

1. Navigate to **Workspaces** > *Strategic Planning Workspace* > *Enterprise Agile Planning*.
2. From the Agile structure section of the navigation panel, choose your EAP team that has an epic as its work item type.
3. From the Backlog, Hierarchy, or Planning board tabs, open your epic in its full details page.
4. Navigate to the Stories related list.
5. Select **Generate Story**.
6. In the context field, enter one or two lines describing the focus of the story.

For example, enter context such as "progress tracking for onboarding steps to help users visualize their journey and reduce abandonment rates" to direct Now Assist toward a specific area of the epic.

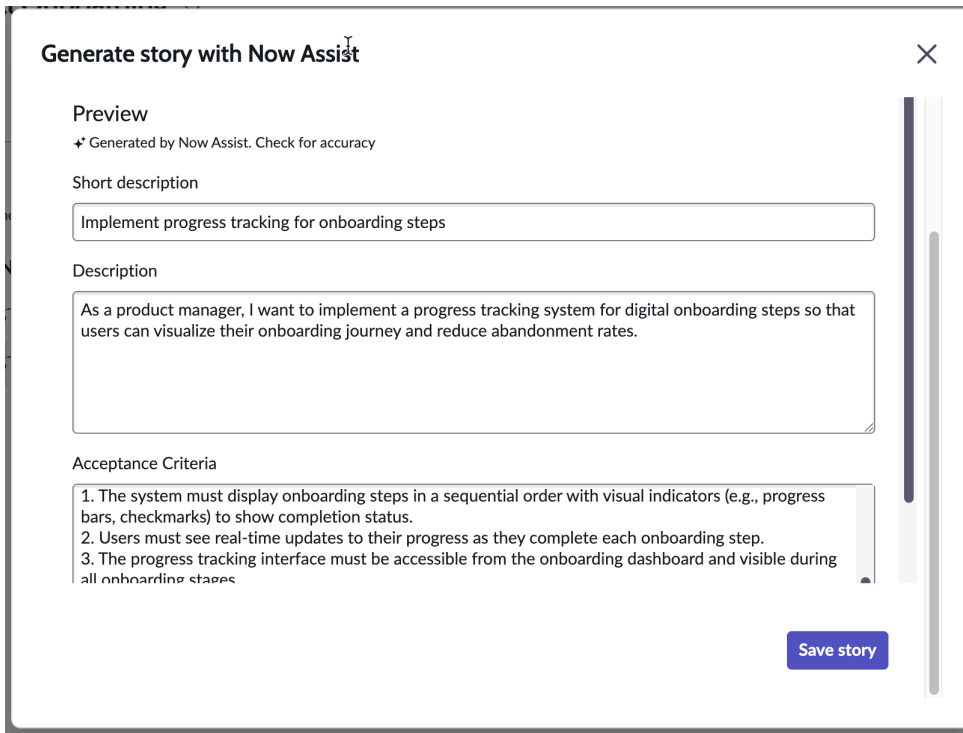

7. Select **Generate**.

Now Assist generates a story title, description, and acceptance criteria based on the epic context and the input you provided.

8. Review and edit any of the generated fields inline to refine the story before saving.

All fields are editable. You can modify, add to, or remove generated content in the title, description, and acceptance criteria fields.

9. Select **Save story.**

The new story is added to the Stories list of the epic.

What to do next

To further refine the story after saving, open the story record and select **Generate acceptance criteria** to regenerate or update the acceptance criteria using Now Assist. For more information, see [Generate acceptance criteria for EAP stories using Now Assist for Strategic Portfolio Management \(SPM\)](#).

+ Generated by Now Assist. Check for accuracy

Short description

Implement progress tracking for onboarding steps

Description

As a product manager, I want to implement a progress tracking system for digital onboarding steps so that users can visualize their onboarding journey and reduce abandonment rates.

Acceptance Criteria

1. The system must display onboarding steps in a sequential order with visual indicators (e.g., progress bars, checkmarks) to show completion status.
2. Users must see real-time updates to their progress as they complete each onboarding step.
3. The progress tracking interface must be accessible from the onboarding dashboard and visible during all onboarding stages.

Save story

8. Select **Save story**.

The new story is added to the Stories list of the epic.

What to do next

To further refine the story after saving, open the story record and select **Generate acceptance criteria** to regenerate or update the acceptance criteria using Now Assist. For more information, see [Generate acceptance criteria for stories in Agile Development 2.0](#).

Generate acceptance criteria for EAP stories using Now Assist for Strategic Portfolio Management (SPM)

Create clear, comprehensive, and testable acceptance criteria for user stories without writing them manually in Enterprise Agile Planning (EAP). Review and refine suggested options to ensure they meet your requirements.

Before you begin

Important:

This Now Assist skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see [Now Assist skills, agents, and agentic workflows on by default](#) .

Ensure that Now Assist for SPM is installed in your instance and that the following two skills are active:

- Acceptance criteria generation
- Refine records

For more information, see [Configure Now Assist Admin features](#).

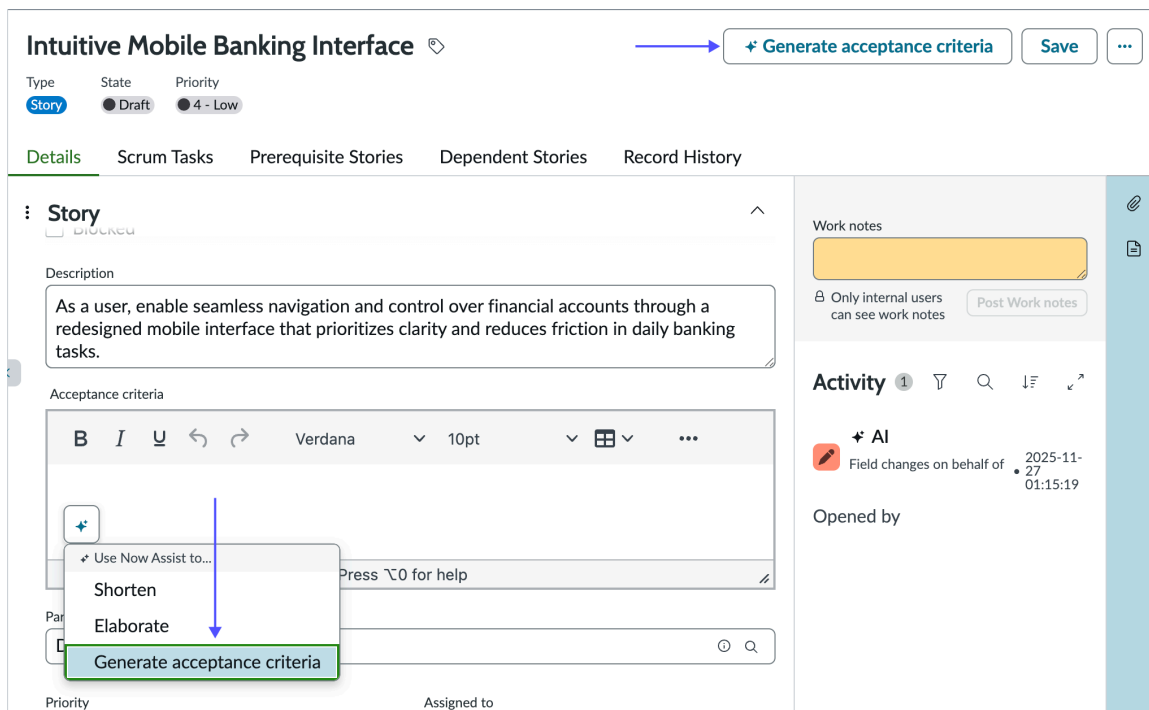

Role required: sn_apw_advanced.eap_user

About this task

For an EAP story, you can generate acceptance criteria by selecting **Generate acceptance criteria** from the story header or using the Now Assist context menu in the Acceptance criteria field.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace**.
2. Navigate to your story using one of the following options from the left navigation menu:
 - **Enterprise Agile Planning**: Select a team from the Agile structure and navigate to your story.
 - **Lists**: Select **Planning items > Stories** and navigate to your story.
3. Ensure that the story record is open in the Full details page.
4. Generate acceptance criteria for the story using one of the following options:
 - From the story form header: Select **Generate acceptance criteria**.
 - From the Acceptance criteria field:
 - a. Place your mouse cursor in the field.
 - b. Select the **Refine with Now Assist** menu (.
 - c. Select **Generate acceptance criteria**.

5. Review the generated acceptance criteria.
6. You can choose to further refine the generated content using the Now Assist context menu () or generate a new criteria.
7. Save the Story form.

Generate acceptance criteria for stories in Agile Development 2.0

Create clear, comprehensive, and testable acceptance criteria for user stories without writing them manually in Agile Development 2.0. Review and refine suggested options to ensure they meet your requirements.

Before you begin

Important:

This Now Assist skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see [Now Assist skills, agents, and agentic workflows on by default](#).

Ensure that Now Assist for SPM is installed in your instance and that the following two skills are active:

- Acceptance criteria generation
- Refine records

For more information, see [Configure Now Assist Admin features](#).

Role required: `scrum_story_editor`

About this task

For an Agile 2.0 story, you can generate acceptance criteria by selecting **Generate acceptance criteria** from the story header or using the Now Assist context menu in the Acceptance criteria field.

Procedure

1. Navigate to **All > Agile Development > Stories**.
2. Open your story record.
3. Generate acceptance criteria for the story using one of the following options:
 - From the story form header: Select **Generate acceptance criteria**.
 - From the Acceptance criteria field:
 - a. Place your mouse cursor in the field.
 - b. Select **Refine with Now Assist** menu ().
 - c. Select **Generate acceptance criteria**.

4. Review the generated acceptance criteria.
5. You can choose to further refine the generated content using the Now Assist context menu () or generate a new criteria.
6. Save the Story form.

Generate and improve Docs content with Now Assist for Strategic Portfolio Management (SPM)

Generate content with Now Assist for SPM directly in your Docs using custom prompts. In addition, summarize existing sections, elaborate where needed, and refine drafts to help improve your productivity.

Before you begin

Role required: sn_align_core.ap_read_only, sn_align_core.pf_read, sn_apw_advanced.eap_read_only, sn_apw_advanced.pf_user, sn_align_core.apw_user, or sn_align_core.ap_read_only

About this task

You can interact with Now Assist directly in your Doc to create new content, add context, or improve existing sections. This helps you draft faster, refine ideas, and keep your work relevant without leaving the page.

The Generate and Improve Content feature is available in Strategic Planning Workspace, Portfolio Planning Workspace, and Project Workspace.

This task will be explained using Project Workspace as the example.

Procedure

1. Navigate to **Workspaces > Project Workspace** and open the required project.
2. From your Doc, open the page you want to work with and use Now Assist for any of your use cases.
Now Assist analyzes the text and generates an output in a separate pop-up.
3. **Optional:** Based on the output generated, you can further refine the result.
4. **Optional:** Copy the generated output by selecting the copy to clipboard icon () to use it for purposes such as sending an email, saving to notes, and others.

Important:

Because the output is AI-generated, review it to ensure accuracy.

Summarize and refine Docs content in EAP using Now Assist for SPM

Use Now Assist capabilities to elaborate, shorten, and summarize selected content in Docs, or to get a summary of the whole document in Enterprise Agile Planning (EAP).

Before you begin

Important:

This Now Assist skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see [Now Assist skills, agents, and agentic workflows on by default](#) .

- [Create a Doc in EAP](#).
- Activate the EAP doc summarization Now Assist skill. See .

Role required: sn_apw_advanced.eap_user

If you have custom roles that require access to this skill, update the ACLs for those roles that require access. For more information, see [Implement access control in Now Assist AI agents](#) .

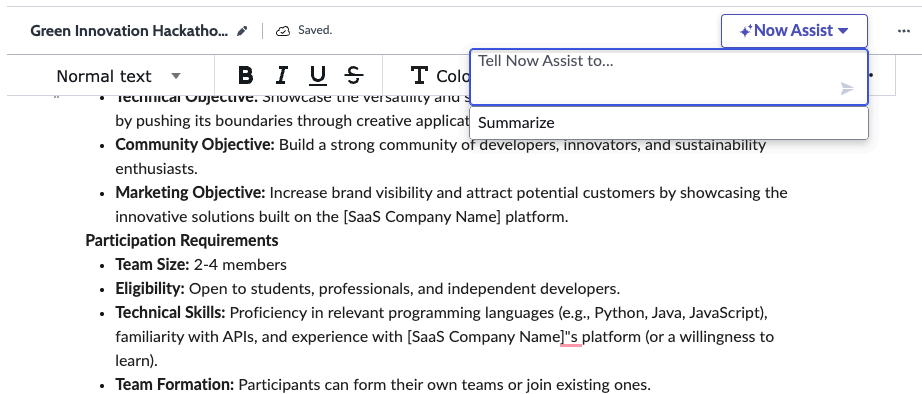

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace > Enterprise Agile Planning**.
2. Navigate to your Doc.
3. From your Doc, open the page you want to summarize or refine.
4. Choose to summarize the selected text on the page or the whole page.
 - To refine the selected text:
 - a. Select a single block or multiple blocks of content on the page.
 - b. Select **Now Assist** and choose an option.

- i. **Summarize** to summarize the selected text.
- ii. **Elaborate** to lengthen the selected text based on the existing context.
- iii. **Shorten** to make the selected text concise.

- o To summarize the entire content on the page, select **Now Assist** from the Doc header and select **Summarize**.

Tip:

If there's more content to summarize, you can remove some text and retry.

Now Assist analyzes the text and generates an output in a separate pop-up.

- 5. **Optional:** Based on the output generated, you can further refine the result or insert the generated content into the Doc.

(Optional)

- 6. Optional:** Copy the generated output by selecting the Copy to clipboard icon () to use it for purposes such as sending an email, saving to notes, and others.

i Important:

Because the output is AI-generated, review it to ensure accuracy.

Generate the summary for selected or complete content with Planning item doc summarization skill in Strategic Planning

Quickly learn the details of the documents from the summary that is generated by Now Assist in Strategic Planning.

Before you begin

i Important:

This Now Assist skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see [Now Assist skills, agents, and agentic workflows on by default](#) .

If you have users with custom roles that need access to this skill, you must update ACLs for those roles and also add those custom roles to the In product role.

Role required: sn_align_core.ap_read_only, sn_align_core.pf_read, sn_apw_advanced.eap_read_only, sn_apw_advanced.pf_user, sn_align_core.apw_user, or sn_align_core.ap_read_only

About this task

Minimize the time that you spend reading documents, meeting notes, project reports and so on by using a summary that is generated by Now Assist. You can also copy-and-paste the source materials that meet your learning needs in Docs and generate a quick summary.

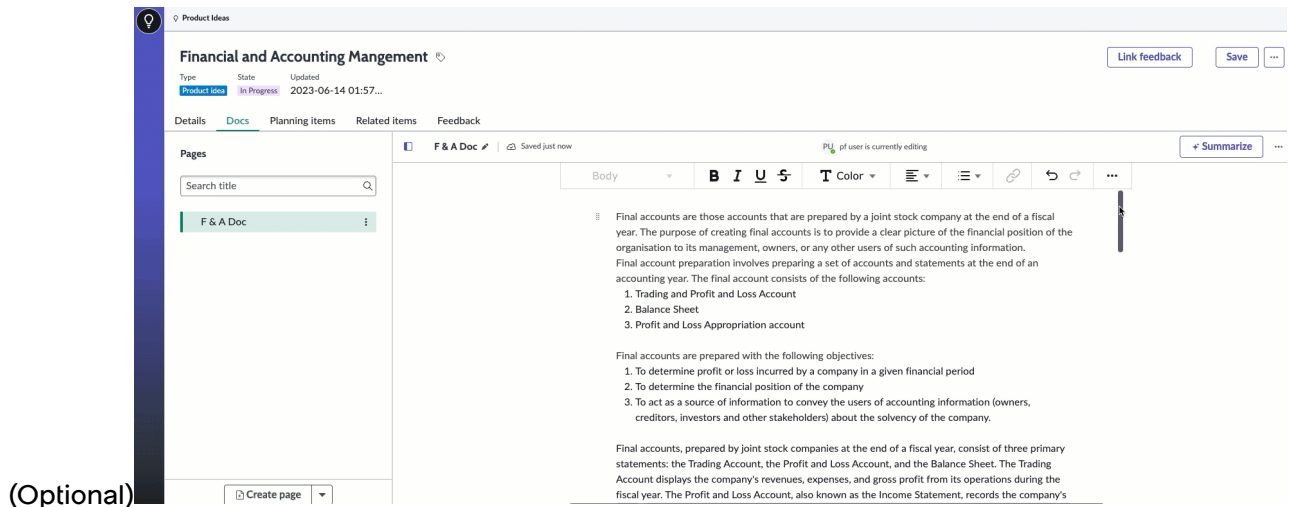

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace** and open any planning item records such as product idea from Feedback.
2. From the **Docs** tab, perform one of these actions according to your requirements.

i Note:

Summarization of the entire content is also permitted for users with the read role.

3. **Optional:** When you're finished summarizing the content in Docs, you can provide feedback, copy, or view information about it.

(Optional)

Note:

Because the information in these fields is AI generated, it's a good idea to review the text and make sure it's accurate.

Only an administrator can activate the Now Assist skills. For more information, see [Configure Now Assist Admin features](#).

The Planning item doc summarization skill checks the doc content to determine if enough information is available to generate a summary. If there isn't enough content to summarize, you can add more content and retry.

Note:

The **Summarize** button is visible only if the Planning item doc summarization skill is active. If the selected text exceeds the token limit for Now Assist, the Planning item doc summarization skill can't be executed. If there is more content to summarize, you can remove some content and retry.

Generate the summary for selected or complete content with Project doc summarization skill in Project Workspace

Quickly learn the details of the documents from the summary that is generated by in Project Workspace.

https://player.vimeo.com/video/1038147968?h=9451c75819&badge=0&autoplay=0&player_id=0&app_id=58479

Before you begin

Important:

This Now Assist skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see [Now Assist skills, agents, and agentic workflows on by default](#).

If you have users with custom roles that need access to this skill, you must update ACLs for those roles.

Role required: project_manager, it_project_user

Procedure

1. Navigate to **Workspaces > Project Workspace** and open the required project.
2. From the Docs, perform one of these action according to your requirements.

Note:

Summarization of the entire content is also permitted for users with the read role.

3. **Optional:** When you're finished summarizing the page in Docs, you can provide feedback, copy, or view information about it.

Note:

Because the information in these fields is AI generated, it's a good idea to review the text and make sure it's accurate.

Only an administrator can activate the Now Assist skills. For more information, see [Activate a Now Assist skill](#).

The Project doc summarization skill checks the doc content to determine if enough information is available to generate a summary. If there isn't enough content to summarize, you can add more content and retry.

Note:

The **Summarize** button is visible only if the Project doc summarization skill is active. If the selected text exceeds the token limit for Now Assist, the Project doc summarization skill can't be executed. If there is more content to summarize, you can remove some content and retry.

Schedule the project insights email

Schedule the project insights email to prioritize and track the most important changes in the project in Project Workspace.

https://player.vimeo.com/video/1156994852?h=fc02bd8ee8&badge=0&autoplay=0&player_id=0&app_id=58479%22

Before you begin

Important:

This Now Assist skill is now turned on by default. The skill will be automatically available to appropriate role users for the application. This change simply activates the skill and does not touch the roles that are needed to use the skill. The new default behavior works as follows:

New customers

When you install a Now Assist product, designated skills will turn on automatically.

Existing customers who are upgrading

Any previously unconfigured skill will turn on automatically (the skill was never turned on, then off again).

There is no change to Now Assist skills that are currently enabled and customized.

Previously configured skills that were turned on, then off, will remain inactive.

Role required: it_project_manager

About this task

By using the Project insights generation skill, you can generate a concise project insights. The project insights are shared through email. Project managers can monitor key elements such as project, project task, milestone, resource assignment, ridac, and financial. They can also prioritize their projects and decide the cadence of receiving these project insights email.

When a project is created in the work in progress state, the project insight generation skill is automatically enabled. This ensures that projects begin generating insights early in the execution phase without requiring manual setup. In addition, all existing projects in the work in progress state are automatically enabled for email-based project insights.

Procedure

1. Navigate to **Workspaces > Project Workspace** and open any project.
2. From the planning page, select the more actions icon () and then select **Configure project insights**.

From Project insights generation skill card, select **Edit** to modify the email conditions. From project insights configuration screen, select **Switch scope** and then select **Edit conditions**. Administrators can control insight generation through admin-level configuration. For more information on configurations, see [Configure Now Assist Admin features](#). From Email condition modal, admins can define which projects should generate insights and trigger email notifications, providing flexibility over when and for which projects insights are sent.

3. From the Configure project insights modal, in Choose topics step, select **Next**.
You can select or deselect the project, project task, milestone, resource assignment, ridac, and financial card to customize what information is displayed in the Project insights email.
4. In Personalize content step, add your requirements and select **Next**.
You can define your tone, writing style, and priority entities. For example, identify risks of this project. Please provide a formal summary in bullet points.
5. In Set frequency step, select the **Cadence** as Weekly, Bi-weekly, or Monthly according to your requirement.
6. Select **On this day**, as days for weekly or bi-weekly or dates for monthly cadence.
7. Select **Users** from the list.
 - The project manager is automatically set as the default email recipient for the project.
 - You can select one or multiple users. Only users with sn_ppm_read role or have read or view access to project information appear for selection in the users list.
 - When an email is sent to recipients, the project manager is placed in the To list, while all other recipients are included in the Cc list.
 - For confidential projects, recipients are required to be included in the list of users authorized to view the project.
8. **Optional:** Select **Send preview** to generate and send a preview of the insights email instantly. When you select Send preview, you receive a project insights instantly and also receive insights based on the selected cadence. The email would go to the recipients selected along with the Project Manager.
9. Select **Schedule** to schedule insights email for the project.

Note:

Because the information in these fields is AI generated, it's a good idea to review the text and make sure it's accurate.

This skill automatically generates and sends project insight emails based on project data and activity. These emails provide a consolidated view of project health, including schedule variance, RIDAC (risks, issues, decisions, actions, and change requests), resources, milestones, projects, project tasks, and financial insights. Project items are automatically grouped into RIDAC categories and classified by impact level: high, medium, or low, while financial insights highlight potential risks and variances. This automated insight delivery helps stakeholders stay informed about project health, risks, and financial status without manual reporting effort.

This skill generates insights and emails them to the project manager and other stakeholders based on the cadence. For instance, when a resource is over allocated, the project manager receives an alert without having to review it manually. When scheduling the email, managers can pick or unpick the topics they want, customize the insights with their own prompt instructions, add more stakeholders, and choose whether to schedule the email or instantly send a preview.

You can pause email by selecting **Pause cadence** check box.

Example: Schedule a project insight email

Let's assume that you have selected a weekly cadence and chosen Monday (which falls on 2025-07-07). After adding recipients:

- If you select **Schedule**, the project insights are emailed to you and the recipients weekly on Mondays, starting from 2025-07-07 and continues until the project is inactive.
- If you select **Send preview**, you will receive an initial insights email immediately and will also receive insights according to the selected cadence and day.

Generate a project status report with Now Assist

Generate an AI-assisted project status report with predicted health indicators. Now assist pre-populates project health, an executive summary, and supporting rationale based on weekly project data.

Before you begin

Ensure project status generation skill is active.

Role required: it_project_manager

About this task

When the Project status generation skill is enabled, project managers can generate a status report pre-populated by Now Assist. Now Assist predicts overall and dimension-level project health (such as schedule, cost, resources, and scope), generates an executive summary using weekly project data, and provides a rationale for each prediction.

After generation, project managers can review:

- Predicted overall health
- Predicted dimension statuses
- Explanation/rationale text for each prediction in analysis sections
- Executive summary text generated from the project's recent data

After submission, the same information appears in the report view, including rationale text (for example, a rationale/status explanation column).

Procedure

1. Open a project from the planning page of Project Workspace.
For information on how to navigate to the planning page, see [Access the new Project Workspace](#).
2. Open the Status reports page of the project by selecting **Status Reports** from the list.
3. From the Pages section, select **Generate status report**.
The system invokes LLM to pre-populate the form with predicted fields and an executive summary.
4. Review the AI-generated fields:

Create

All sections were generated by Now Assist. Please review the content for accuracy.

Status report for Automation project 2026-03-05

Status: Draft Overall health: Red

Overall Status

AI Overall Health Analysis

The project has a red schedule health status due to a 6000% delay (60-day variance) and an overdue milestone without an assigned owner. While resource, cost, and scope health are green, the presence of a red sub-indicator (schedule) triggers an overall red status per evaluation criteria.

Unsupported formats: Video embeds, code blocks, and non-standard images (GIFs, embedded docs files). These may not be retained in Docs.

Executive summary

As of this reporting period, PRJ0010001 is Work in Progress. Key achievements this period include Security & Authentication Ready. Looking ahead, the team is tracking toward UAT Sign-off & Go-Live, targeted for 2026-03-09 00:55:23. Attention is required on 4 high-priority overdue tasks, including 'Train customer support team on new portal features' (PRJTASK0010015) and 'Conduct comprehensive security penetration testing' (PRJTASK0010011), with immediate focus on resolving overdue high-priority items to keep the project on track.

Unsupported formats: Video embeds, code blocks, and non-standard images (GIFs, embedded docs files). These may not be retained in Docs.

Comments

Empty comment box with rich text editor toolbar.

Unsupported formats: Video embeds, code blocks, and non-standard images (GIFs, embedded docs files). These may not be retained in Docs.

Last Week's Achievements

Empty text box with rich text editor toolbar.

Unsupported formats: Video embeds, code blocks, and non-standard images (GIFs, embedded docs files). These may not be retained in Docs.

Key activities planned

Empty text box with rich text editor toolbar.

Schedule

Schedule

Red

AI Schedule Health Analysis

Schedule health is red. The project is 6000% behind schedule, with a 60-day delay from the original baseline end date (2026-02-09) to the current forecasted completion date (2026-04-11). Additionally, 1 active milestone ('Security & Authentication Ready') is overdue and lacks an assigned owner, requiring immediate attention. The combination of extreme variance and critical milestone risks indicates significant delays requiring urgent management intervention.

Unsupported formats: Video embeds, code blocks, and non-standard images (GIFs, embedded docs files). These may not be retained in Docs.

Comments on schedule

Empty comment box with rich text editor toolbar.

Cost

Green

AI Cost Health Analysis

Cost health is green. No budget or cost overrun issues have been reported. Project spending remains within acceptable tolerance limits with no variance exceeding 10% of planned costs.

- Overall health (predicted)
- Dimension health such as schedule/cost/resources/scope (predicted)
- Executive summary (generated from project data for the reporting period)
- Rationale/analysis sections explaining each prediction (for example, schedule health analysis, cost health analysis).

5. Edit any fields as needed.

6. Select **Submit**.

7. **Optional:** Verify the submitted report.

8. **Optional:** Select **Now Assist** to ask more questions on the generated status report or select **Summarize** to generate a short summary of generated report.

(Optional) You can export and edit the AI-generated status report. You cannot duplicate an AI-generated status report.

Result

An AI-assisted status report is generated with predicted health values, an executive summary, and rationale text.

Improve efficiency and quality using refine records skill with Now Assist Context Menu

Improve record quality by enabling AI-assisted text refinement in the text fields of Product idea, Demands, Epic, Projects, Capability, Features, Stories, Project tasks, Risks, Strategic priorities, Goals, Targets, Initiatives, Feedback, Milestones, and Story forms.

Before you begin

Important:

This Now Assist skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see [Now Assist skills, agents, and agentic workflows on by default](#)

If you have users with custom roles that need access to this skill, you must update ACLs for those roles and also add those custom roles to the In product role.

Role required: You only need the roles required for the record type you want to refine.

About this task

Use the refine records skill and Now Assist Context Menu to simplify record creation and updates, reduce effort, and improve record quality. Within the rich or long text field of these records, you can use the now assist context menu to shorten or elaborate the text. For example, you can type a short sentence in the rich or long text field or select the existing text and then expand or shorten it. The skill considers other fields in the form to generate meaningful content that improves the record quality. You can also enter a long paragraph in the text field and shorten it without losing key information.

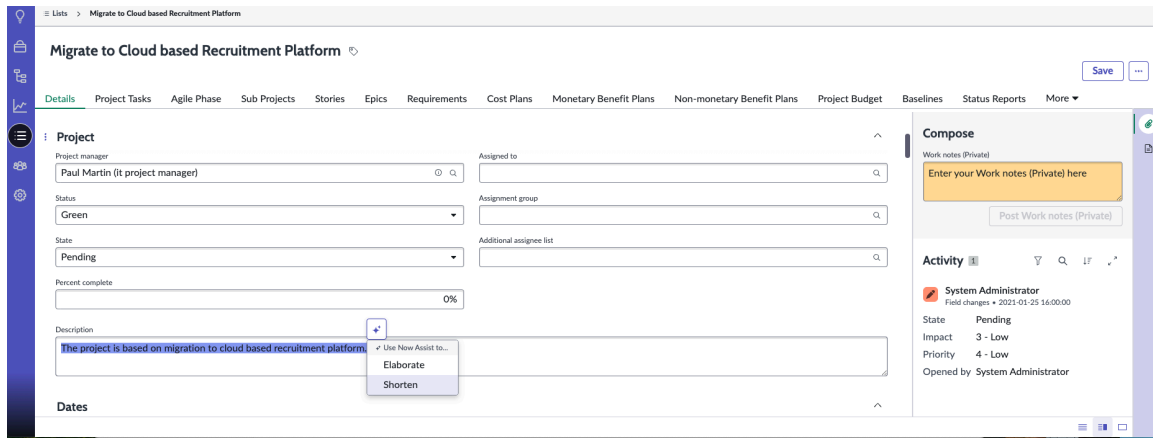

Enable portfolio, project, product, demand managers and agile team members to refine record content efficiently using the Elaborate and Shorten options and create records with sufficient information. The refine records skill helps in improving clarity and completeness of your records and reduces the rework due to missing or unclear information.

The refine records skill and Now Assist Context Menu is available in Strategic Planning Workspace, Portfolio Planning Workspace, Demand Workbench, Agile Development 2.0 and Project Workspace.

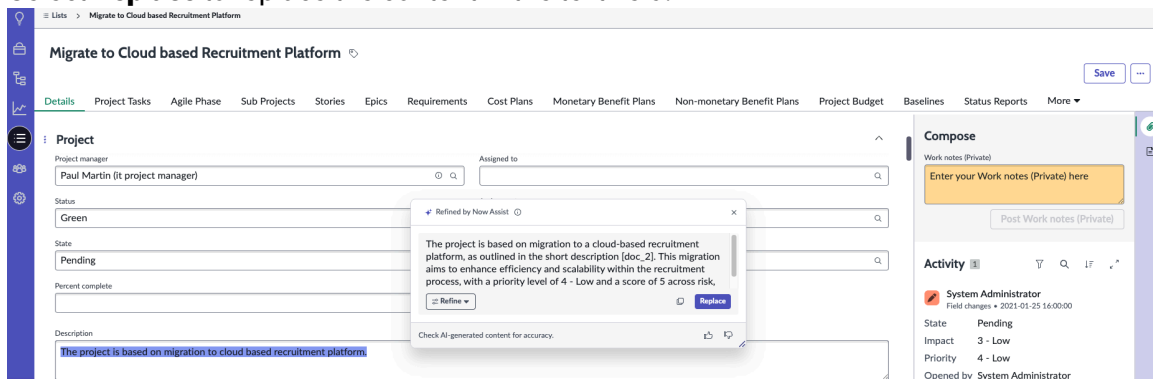

This task is explained using Strategic Planning Workspace as the example.

Procedure

1. Navigate to **Workspaces > Strategic Planning Workspace**.
2. From Strategic Planning Workspace, open any record that you want to refine.
3. Select the text to refine in the text field of your record.
For example, you can select **Description** text for Feedback record text. You can refer to context menu configuration table to view the forms and text fields which includes Now Assist context menu.
4. Select the **Refine with Now assist** menu and then select **Shorten** or **Elaborate** based on your requirement.

5. Select **Replace** to replace the content in the text field.

6. **Optional:** From the Refined by Now Assist window, select **Refine** and then select **Shorten** or **Elaborate** to improve the generated text.
7. When you're finished refining the content, you can replace the existing content with generated content, provide feedback, or copy it.

Note:

The refine records skill and Now Assist context menu is available in the text fields of Product idea, Demands, Epic, Projects, Capability, Features, Stories, Project tasks, Risks, Strategic priorities, Goals, Targets, Initiatives, Feedback, Milestones, and Story forms.

You can configure the Now Assist context menu for these forms and long text fields.

Context Menu Configuration

Generate and track project details from AI insights page

Generate and monitor project insights directly from AI insights page in Project Workspace.

Before you begin

Ensure that the Project insights generation skill is active.

Role required: it_project_manager

Procedure

1. Open a project from the planning page of Project Workspace.
For information on how to navigate to the planning page, see [Access the new Project Workspace](#).
2. Open AI insights page by selecting **AI insights** from the list.
3. Select **Generate insights** to generate AI insights of your project.

Project insights are generated using the same Project insights generation skill used for email insights. Insights are displayed directly in the in-app AI insights experience.

4. Review the generation project insights.

Result

The project insights are generated from the AI insights page with access to current project insights in a single in-app view.

What to do next

- View and reuse stored insights:
 - Generated insights are stored and reused based on a defined date threshold.
 - When you revisit the AI Insights page, previously generated insights are displayed if they are still within the threshold.
- Regenerate project insights:
 - From the AI insights page, select **Regenerate** icon.
 - Now Assist generates updated project insights.

Generate a project plan using project plan generation skill

Use Project plan generation skill to generate a project plan from natural language input, uploaded files, or both.

Before you begin

Role required: it_project_manager

- Install Now Assist for Strategic Portfolio Management (SPM) plugin.
- To use attachments to generate a project, activate the document intelligence skill. The default LLM is Azure OpenAI. Switching to a different model may affect accuracy.
- The project plan generation skill is activated by default. For more information on how to activate the skill if it isn't automatically activated or if you want to change the skill configuration, see [Configure Now Assist Admin features](#).

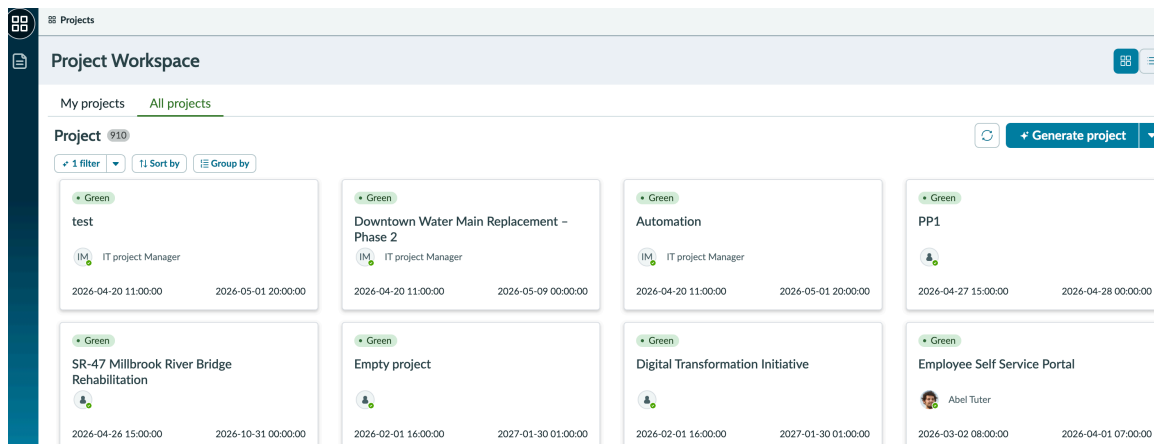

About this task

Now Assist scans your project and task details to generate content. Review and edit the output before creating the project. Supported file types are word, pdf, excel, and powerpoint, with a 5 MB file size limit. Only the first five attachments are processed.

For project and task supported column configurations, see [Supported columns for project and task generation](#).

Procedure

1. Navigate to **Workspaces > Project Workspace**.
2. Select **Generate project** to use Now Assist to generate a project.

To create a project without using Now Assist, use **New project from template** or **New project** options.

3. Provide your project input using one or more of these methods.
 - In the text field, describe your project using natural language. If you provide only natural language input, the document intelligence skill is not required.
 - Select Attach files and upload a word, pdf, excel, or powerpoint document. To use file attachments, activate the document intelligence skill. For more information, see [Activate a Now Assist in Document Intelligence skill](#).

Note:

Attach a file or enter context as free-form text before proceeding. No input returns an error. Insufficient context may also trigger an error.

4. Select **Next** to generate the project.

5. Select **Create project**.

6. Review the pre-populated project name, approved start date, approved end date, or business case.

WBS	Short description	Planned sta...	Planned en...	Planned dur...	Time constr...
1	Security Review	2026-04-29	2026-04-30	2 Days	Start no earl...

3	Requirements Gathering	2026-04-29	2026-04-30	2 Days	Start no earl...
4	Backend Development	2026-04-29	2026-04-30	2 Days	Start no earl...
5	Deployment Planning	2026-04-29	2026-04-30	2 Days	Start no earl...
6	QA Testing	2026-04-29	2026-04-30	2 Days	Start no earl...
7	System Architecture Desi...	2026-04-29	2026-04-30	2 Days	Start no earl...
8	Frontend Development	2026-04-29	2026-04-30	2 Days	Start no earl...

Edit the fields as needed and add a description.

Note:

Because the information in these fields is automatically generated, it's a good idea to review the text and make sure it's accurate.

Result

The project is created with the generated tasks, including task hierarchy and dates derived from your input.

Example: Generate a project plan from an Excel file

Input: An excel file with two sheets:

- Sheet 1: Project details such as project name, start and end dates, budget, and key objectives.
- Sheet 2: 18 tasks with task name, phase, start date, end date, and duration.

Output AI reads the file and creates the following:

- Project record with: Name, description, start and end dates, and business case derived from the key objectives.
- 18 task records with: Task name, description, start and end dates, duration, and state. Fields not present in the file, such as key milestone and time constraint, are auto-populated with default values.

Generate tasks for a project using project plan generation skill

Use project plan generation skill to populate an empty project with tasks by providing text input, uploading files, or both.

Before you begin

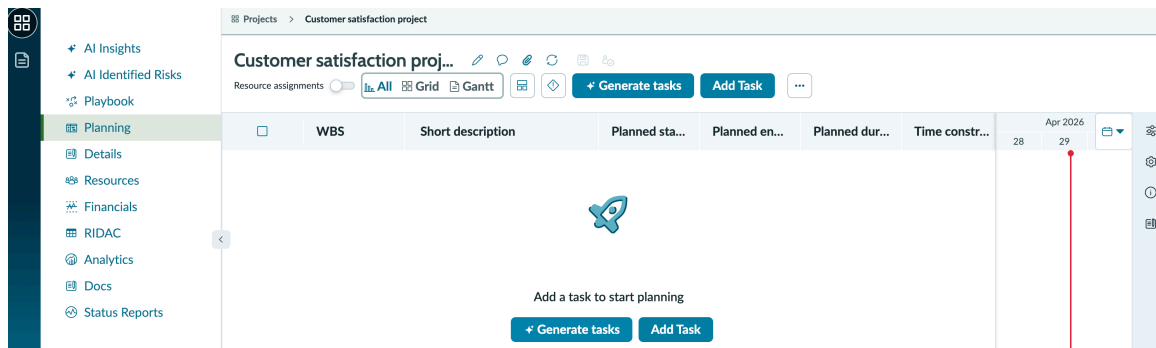

Role required: it_project_manager

- Install Now Assist for Strategic Portfolio Management (SPM) plugin.
- To use attachments to generate a project, activate the document intelligence skill. The default LLM is Azure OpenAI. Switching to a different model may affect accuracy.
- The project plan generation skill is activated by default. For more information on how to activate the skill if it isn't automatically activated or if you want to change the skill configuration, see [Configure Now Assist Admin features](#).

Procedure

1. Navigate to **Workspaces > Project Workspace**.
2. Create a project or open any project without tasks.
3. Select **Generate tasks** to use Now Assist to generate tasks.

To create a project task without using Now Assist, use **Add Task** option.

4. Provide your project task input using one or more of these methods.
 - In the text field, describe your project tasks using natural language. If you provide only natural language input, the document intelligence skill is not required.
 - Select Attach files and upload a word, pdf, excel, or powerpoint document. A preview of the attachment appears before you proceed. To use file attachments, activate the document intelligence skill. For more information, see [Activate a Now Assist in Document Intelligence skill](#).

Note:

Attach a file or enter context as free-form text before proceeding. No input returns an error. Insufficient context may also trigger an error.

5. Select **Submit** to generate the project.
6. Review the task details for a project on the planning page.

Note:

Because the information in these fields is automatically generated, it's a good idea to review the text and make sure it's accurate.

Result

The project is created with the generated tasks, including task hierarchy and dates derived from your input.

Example: Generate tasks for an empty project

Input: A project manager types the following in the text input: Create tasks for a website redesign project starting May 1, 2026 and ending July 31, 2026. Tasks include requirements gathering, UI design, and user acceptance testing.

Output AI creates three task records: Requirements gathering, UI design, and user acceptance testing. Each task is populated with a name, description, start and end dates, and duration. Fields not present in the input are auto-populated with default values.

Generate, accept, and reject risks using risk generation skill

Use generative AI to identify, generate, and manage potential risks in your project based on insights, resources, financials, and milestones.

Before you begin

Role required: it_project_manager

- Install Now Assist for Strategic Portfolio Management (SPM) plugin.
- Verify risk generation skill is active.
- The risk generation skill is activated by default. For more information on how to activate the skill if it isn't automatically activated or if you want to change the skill configuration, see [Configure Now Assist Admin features](#).

About this task

AI analyzes project data to identify potential risks and presents them for project manager review. AI-suggested risks are generated as part of the project insights cadence and appear in the AI Risks menu for project managers to accept or reject. AI generates risks by analyzing data from project insights, resources, financials, and milestones.

The AI Identified Risks menu is visible only to project managers when the risk generation skill is active. If no risks are identified during generation or regeneration, the AI Identified Risks page displays an empty state where you can generate risks again.

Procedure

1. Navigate to **Workspaces > Project Workspace**.
2. From Project Workspace, [Create a project](#) or open an existing project.
3. Select **AI Identified Risks** from the navigation menu.
4. Review the AI-suggested risks in the list and perform one of these actions:
 - Regenerate: When you select regenerate option, the risk is generated again and added to the AI identified risks list. AI-generated risks appear in AI draft state.
 - Accept: When you accept a risk, the approved risk appear in the RIDAC list and its state moves from AI Draft to Pending.
 - Reject: When you reject a risk, the rejected risk is removed or hided from the AI identified risks list and its state moves to Closed skipped. The rejected risks are retained so that AI does not generate the same risk again.

If no risks are identified during generation or regeneration, the AI identified risks page displays an empty state. In this case, you cannot regenerate risks immediately and are advised to revisit the page later as the project evolves.

5. Optional: Select **Generate AI Risks** if no risks are identified for the project.

The screenshot displays the 'AI Identified Risks' page for a project named 'Digital Transformation Initiative'. The page title is 'AI Identified Risks' with a count of 2. There are buttons for '+ Regenerate', 'Reject', and 'Accept'. Below the title, it says 'Risks generated by AI. Check for accuracy.' There are filter and sort options: '2 filters', '1 Sort by', and 'Group by'. A message states: 'AI-generated risks start in AI Draft state. Accept to move them to Pending state and surface them in the RIDAC grid, or reject to Close Skipped state and hide them.' The table below has the following data:

Number	Short description	Description	Impact	Probability	AI rationale	Mitigation plan
<input checked="" type="checkbox"/> RSK0001001	Critical delay in Data Migration Planning task	The Data Migration Planning task (PRJTASK0010007) is 12 days overdue, with a planned end date o...	1 - High	High	<ul style="list-style-type: none"> The task "Data Migration Planning" is currently 12 days overdue, as noted in the Project Task Issues Data. Showing 1-2 of 2 records. Records per page: 20.

Assign a resource using AI resource finder

Use AI resource finder to identify and assign a resource to an unassigned resource assignment.

Before you begin

Role required: `it_project_manager` or `resource_manager`

To use AI rationale, verify that resource fit analysis skill is active.

About this task

The AI resource finder uses generative AI to calculate AI rationale for available resources. Review the fit scores and availability before assigning a resource. Selecting a resource opens the existing assign resources modal where you can review allocations and distributions before confirming the assignment.

AI resource finder helps resource and project managers identify the best-fit resources for unassigned resource assignments in a project. The fit score indicates how well a resource matches a task based on the availability, past experience, similar kind of work and working on same projects. Resource managers review the AI-generated fit scores and rationale and decide which resource to assign to an unassigned assignment. The resource finder modal displays the following information for each resource:

- Fit score: Percentage match of a resource for the task. The Fit score is deterministic and is not generated using AI.
- Rationale: AI-generated explanation for the fit score.
- Availability: The availability of the resource for a task.

Procedure

1. Navigate to **Workspaces > Project Workspace** and open a project.
2. View the resource assignment pane by enabling the Resource assignments toggle button. If the `sn_pw.enable_resource_planning` property is set to true, then the Resource assignment toggle button and resource assignment pane are displayed in Project Workspace. The default value is false. You must have the `pps_admin` role to enable this property.
3. Create a unassigned resource assignment by selecting **Add resource** and selecting an attribute.
4. From unassigned tasks pane, select the context menu row () for any task and select **Resource finder**.

Resource finder ✕

Task	Parent Item	Total effort	Assignment start date	Assignment end date

Additional information on Project insights generation skill

View the additional information about project insights generation skill such as column restrictions, date criteria, and so on.

Column restrictions

The columns that are considered for generating the project insights for each table are listed in the following table.

Column restrictions for tables

Tables	Columns
Milestone	<ul style="list-style-type: none"> • Short description • State • Status • Planned start date • Planned end date • Actual end date • Milestone • Assigned to

Column restrictions for tables (continued)

Tables	Columns
	<ul style="list-style-type: none"> • Resource assignees • Additional assignees list • Assignment group
Project task	<ul style="list-style-type: none"> • Short description • State • Status • Planned start date • Planned end date • Percent complete • Assigned to • Resource assignees • Additional assignees list • Assignment group • Priority
Resource assignments	<ul style="list-style-type: none"> • Resource • Start date • End date • Resource status • Group • Role • Skill • Employment type • Resource allocation (Weekly/Monthly) • Project Workspace planning columns

Supported columns for project and task generation

Now Assist extracts project and project task details from uploaded documents (e.g., excel workbooks). Recognized data is mapped to pm_project and pm_project_task columns. Columns not present in the document are initialized with valid defaults internally.

Supported Project Columns (Auto-extracted)

Column	Description
short_description	Project name/title
description	Detailed project description

Supported Project Columns (Auto-extracted) (continued)

Column	Description
approved_start_date	Project start date
approved_end_date	Project end date
business_case	Business case/objectives

Supported Project Task Columns (Auto-extracted)

Column	Extracted from/Default behavior
short_description	Task name: mandatory, extracted from document
description	Task details/deliverables. If only a name exists, a brief description is generated from context.
start_date	Task start date
end_date	Task end date
duration	Task duration (derived or explicit)
work_start	Work start date/time
work_end	Work end date/time
work_duration	Actual work duration
state	Task state (defaults internally if absent)
milestone	Whether the task is a milestone
key_milestone	Whether it is a key milestone
constraint_date	Date constraint for scheduling
time_constraint	Type of time constraint applied
<p>Note:</p> <p>If a column value is not present in the excel document, it is handled internally and initialized with a valid default.</p>	

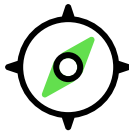

Collaborative Work Management

ServiceNow® Collaborative Work Management (CWM) provides a central hub to plan, visualize, manage, and collaborate on work with your teams. Save time and improve the efficiency of your team by avoiding switching between multiple tools to manage the progress of work and goals.

https://player.vimeo.com/video/1172272081?h=dd564e11a2&badge=0&autoplay=0&player_id=0&app_id=58479

CWM enables planning tasks in detail, organizing unplanned work and its resources, and collaborating with cross-functional teams.

Exploring Collaborative Work Management

Collaborative Work Management (CWM) is a work management tool that centralizes tasks, documentation, and planning in a single workspace, helping knowledge workers, project managers, and agile teams manage work without switching between applications.

Collaborative Work Management overview

Teams managing work across disconnected tools often lose context, duplicate effort, and struggle to maintain a clear picture of progress. Tasks live in one tool, documentation in another, and sprint planning in a third, with dependencies tracked in spreadsheets and status updates shared over email or chat.

CWM solves this by bringing tasks, documentation, and planning into a single workspace organized around Spaces. Each Space contains Boards for task and project management and Docs for documentation, so everything related to a team's work stays connected and accessible from one place.

Teams can choose how they work within CWM. Use a custom workflow for general task management, or run sprints end-to-end using the built-in Agile capabilities, including sprint planning, scrum tasks, and cross-team dependencies. Boards are highly configurable without

admin involvement, and generative AI features help reduce manual overhead on task creation and content generation.

CWM integrates with the broader ServiceNow AI Platform, connecting to other ServiceNow applications, records, and the Strategic Planning workspace so that team-level execution stays aligned with organizational goals.

Collaborative Work Management users

Users

User	Description
Knowledge worker/Team member	Creates and manages tasks on Boards, collaborates on Docs, and tracks personal work in My Space. Uses Now Assist for Collaborative Work Management (CWM) to reduce manual overhead in task creation and content generation.
Project manager	Organizes work into Spaces and Boards, tracks progress across teams, and connects work to business goals and the Strategic Planning workspace.
Agile practitioner	Plans and runs sprints, manages backlogs, generates scrum tasks from user stories, and tracks cross-team dependencies.
SPM team member	Views and updates project and demand tasks from Project Workspace and Next Experience for Demand Management directly in CWM using the team member read or team member read-write role.

Collaborative Work Management benefits

Benefit	Feature	Users
<p>Keep all team work in one place by organizing Boards and Docs into shared Spaces. Your team gets a single location to find tasks, documentation, and status without switching between tools.</p> <p>Use My Space as a personal space to manage any work assigned to you.</p>	Spaces	All users
<p>Get started without admin involvement by configuring your own workflow and organizing work the way your team needs it.</p> <ul style="list-style-type: none"> • Create custom fields for task records. • Switch between List, Gantt, and Kanban views. • Create custom work item types. • Add a list of additional assignees to a task. 	Boards	All users
Create and collaborate on meeting notes, technical specifications, or feature	Docs	Knowledge worker/ Team member

Benefit	Feature	Users
<p>requirements directly within your workspace, keeping documentation connected to the work it supports.</p> <ul style="list-style-type: none"> • Create rich text docs and add action items to users from within and outside the team. • Collaborate on docs in real-time with multiple concurrent editors. • Use AI to summarize page content for quick insights, generate and refine content using custom prompts, or generate tasks directly from the information in your Doc and add them to Boards. 		
<p>Reduce repetitive setup and ensure consistency across your team by starting from predefined templates for Spaces, Boards, and Docs.</p>	<p>Templates for Spaces, Boards, and Docs</p>	<p>All users</p>
<p>Run sprints end-to-end in CWM without switching to a separate Agile tool. Plan work into sprints, manage backlogs, track progress through the sprint lifecycle, and conduct retrospectives, all within your Board.</p>	<p>Sprint planning in CWM</p>	<p>Agile practitioner</p>
<p>Break user stories into granular scrum tasks to improve sprint execution and estimation. Assign tasks to team members and track daily progress through a sprint.</p> <p>Using Now Assist to accelerate sprint preparation, you can generate acceptance criteria for your stories from the story description, then generate an initial set of scrum tasks based on that description and criteria. Review and refine both before adding them to your sprint, or create scrum tasks manually from the story form.</p>	<p>Scrum tasks</p>	<p>Agile practitioner</p>
<p>Link work items as prerequisites, dependents, or related to surface dependencies directly in CWM without tracking them in spreadsheets or notes. Blocked items are visible at a glance on the Kanban board to help teams spot bottlenecks and plan work in the right sequence.</p>	<p>Task dependencies and relationships</p>	<p>Agile practitioner</p>
<p>Switch between List, Gantt, and Kanban view modes to visualize work in the format that fits your team's workflow. Save personalized views</p>	<p>Board views</p>	<p>All users</p>

Benefit	Feature	Users
or create shared views to give the whole team a consistent starting point.		
Reduce manual overhead by automating repetitive processes such as sending notifications, reassigning tasks, or updating task priority when conditions are met, without involving an admin.	Automations	Project manager
Bring work from across your ServiceNow AI Platform applications onto a single CWM Board, giving your team one place to plan and manage cross-functional work without switching between applications.	Connected work in CWM	Project manager, SPM team member
Access and update project and demand tasks directly in CWM without requiring access to Project Workspace or Next Experience for Demand Management. View assigned work in My Work or pull tasks into a Board using Connected Work .	Team member roles for project work	SPM team member
Connect team execution to organizational strategy by surfacing CWM Boards in Strategic Planning portfolio plans, where work can be prioritized and roadmapped alongside other investments.	Connecting CWM with Strategic Planning or Portfolio Planning	Project manager
Reference live ServiceNow AI Platform records such as Incidents, Risks, or Issues directly in CWM Docs. References update automatically to reflect the latest record data, keeping documentation accurate without manual updates.	Enable ServiceNow AI Platform records in CWM Docs	Knowledge worker/ Team member
Share Board data with stakeholders outside CWM or prepare for offline analysis and presentations by exporting to CSV or Microsoft Excel.	Export Board as CSV or Excel	Project manager
Share Doc content with stakeholders who don't have access to CWM by exporting pages to PDF.	Export Doc as PDF	Knowledge worker

- [Configuring Collaborative Work Management](#)
- [Using Collaborative Work Management](#)
- [Collaborative Work Management reference](#)

Configuring Collaborative Work Management

Plan and configure how your team can implement Collaborative Work Management.

Configuration overview

Use the following steps as guidelines to set up Collaborative Work Management. Steps 3–5 are optional and provide additional configuration options to make your CWM experience more connected with the ServiceNow AI Platform.

1. [Install Collaborative Work Management](#).
2. Assign CWM roles to the relevant users. See [Components installed with Collaborative Work Management](#).
3. Configure Strategic Planning to include CWM Boards for Prioritization, Roadmap, and Goals. See [Connecting CWM with Strategic Planning or Portfolio Planning](#).
4. Add other ServiceNow AI Platform tables that can be referenced in the Docs.

See [Enable ServiceNow AI Platform records in CWM Docs](#).
5. Enable the **Request access** button for non-CWM users to request access to the CWM workspace.

See [Properties installed with Collaborative Work Management](#).

Install Collaborative Work Management

You can install the Collaborative Work Management (CWM) application (sn_cwm) if you have the admin role. The application includes demo data and installs related ServiceNow[®] Store applications and plugins if they are not already installed.

Before you begin

- Confirm that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see [Get entitlement for a ServiceNow product or application](#) .
- Review the [Collaborative Work Management](#)  application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Role required: admin

About this task

The following items are installed with Collaborative Work Management:

- Roles
- Tables
- System properties

For more information, see [Components installed with Collaborative Work Management](#) and [Properties installed with Collaborative Work Management](#).

Procedure

1. Navigate to **All > System Applications > All Available Applications > All**.
2. Find the Collaborative Work Management application (sn_cwm) using the filter criteria and search bar.

You can search for the application by its name or ID (sn_cwm). If you cannot find the application, you might have to request it from the ServiceNow Store.

In the list next to the **Install** button, the versions that are available to you are displayed.

3. Select a version from the list and select **Install**.

In the Review Installation Details dialog box, any dependencies installed with your application are listed.

4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
Demo data are the sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.
6. Select **Install**.

Connecting CWM with Strategic Planning or Portfolio Planning

Configure Strategic Planning or Portfolio Planning to include CWM Boards so that you can plan, roadmap, and associate goals to Boards in a portfolio plan.

By adding CWM Boards to a lens configuration, you can access them in the Prioritization, Roadmap, and Goals pages of a portfolio plan as planning items.

Note:

This functionality requires installing the Strategic Planning or Portfolio Planning application from ServiceNow Store.

To successfully enable planning with CWM Boards in Strategic Planning or Portfolio Planning, complete the following tasks.

Add CWM Boards to lens configuration

For the lens that you want to use to build portfolio plans, update the configuration to include CWM Board as a planning item in Strategic Planning or Portfolio Planning.

Before you begin

Role required: admin

Ensure that the Application scope of your instance is set to **Portfolio Planning Core**.

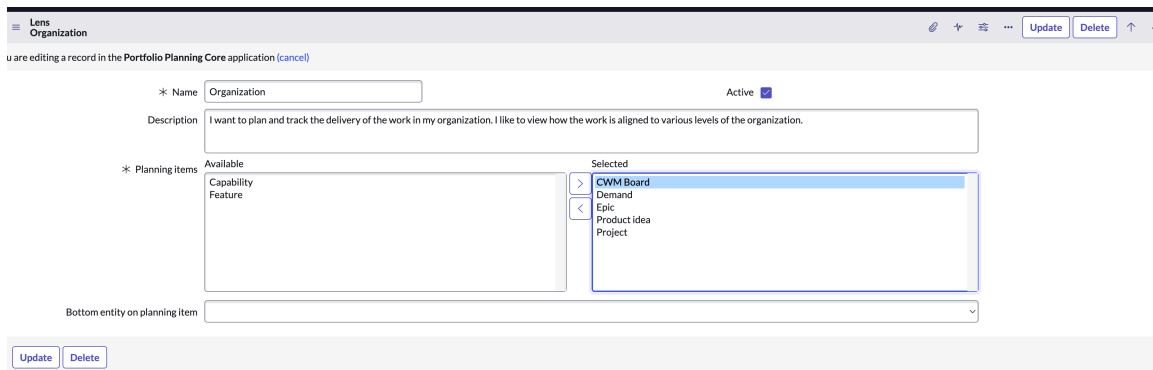

About this task

All default lenses support CWM Board as a planning item. For example, if you are building portfolio plans using Organization lens, then you can add CWM Board as a planning item in the Organization lens configuration.

Procedure

1. Navigate to **All > Strategic Planning > Lenses**.
2. Select a lens.

3. From the Available list of planning items, move **CWM Board** to the Selected list.

Note:

If you don't see CWM Board in the Available list, update the system property `sn_align_core.planning_item_types_allow_list` to allow it.

4. Select **Update**.

What to do next

[Configure CWM Board form layout.](#)

Configure CWM Board form layout

Add the lens entity field to the CWM Board form so users can link Boards and have them appear in the right portfolio plan in Strategic Planning or Portfolio Planning workspaces.

Before you begin

Role required: admin

Ensure that the Application scope of your instance is set to **Collaborative Work Management**.

About this task

Include the field for your lens entity in the CWM Board form. This allows CWM users to link their Boards to the lens entity so that the Boards appear in the corresponding portfolio plan. For example, using the project Portfolio lens, you could create a portfolio plan for the Technology portfolio. When CWM users associate their Boards with the Technology portfolio, those Boards will automatically show up in the Technology portfolio's portfolio plan.

Similarly, you can associate Boards to goals or portfolios. To ensure that your CWM users can perform this association, configure the Board form to include these fields.

Procedure

1. Navigate to **System Definition > Tables**.
2. From the list of tables, search for and select **sn_cwm_board**.
3. From the Related Links section, select **Layout Form**.
4. From the list of fields in the Available section, move your desired field to the Selected section. For example, move the **Portfolio** field to the Selected section.

Create new field

Name

Type String

Field length Small (40)

Add

5. Repeat this step for other fields that you want to add to the CWM Board form.

6. Select **Save**.

Result

The CWM Board form now shows the new fields added to its layout.

Your CWM users can add details of their departments, portfolios, or primary goals depending on the portfolio plans they want these Boards to show up in.

What to do next

[Associate Boards with portfolio plan entities.](#)

Associate Boards with portfolio plan entities

Link CWM Boards to a lens entity so that these Boards appear in the corresponding portfolio plans in Strategic Planning or Portfolio Planning workspaces.

Before you begin

Role required: sn_cwm.cwm_user

Procedure

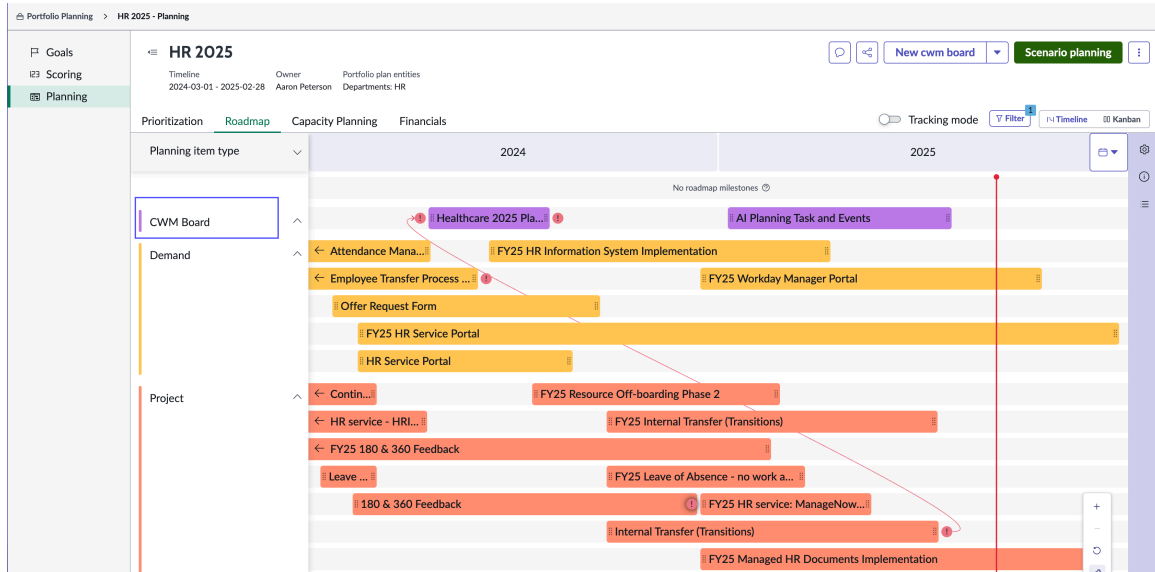

1. Navigate to **Workspaces > Collaborative Work Management**.
2. From a Space, select a Board.
3. From the Board header, select the Edit icon ().
4. In the Board form, select a department, primary goal, strategic program, or portfolio to associate with this Board.

5. Select **Update**.

Result

- If a primary goal is added, this Board will show up in the aligned work for the selected goal in Strategic Planning workspace.

- If you add a department, and the Board's dates align with that department's portfolio plan, the Board will automatically appear as a planning item on the roadmap.

- If a portfolio is added, and the Board’s dates align with the portfolio plan, the Board will appear as a planning item in that portfolio plan’s roadmap.

If there are no dates added to your CWM Board, you can check for **Unscheduled items** on the Roadmap side panel and add the Board to your

Enable ServiceNow AI Platform records in CWM Docs

Facilitate connecting work across ServiceNow AI Platform by enabling CWM users to add a reference to records of any ServiceNow table in CWM Docs.

Before you begin

Verify that **Application Scope** of your instance is set to **Collaborative Work Management**.

Role required: admin

About this task

By default, the `sn_cwm.record_mention_config` property is configured to include only CWM task records. To include any other ServiceNow AI Platform record, update the **Value** field of this property.

Watch this video for information about enabling ServiceNow AI Platform records.

Video explaining how to enable Now platform records in CWM. Approximately one minute and 4 seconds long.

Procedure

1. Navigate to **sys_properties.list**.
2. From the Name column, search for and open the **sn_cwm.record_mention_config** property.
3. Update the **Value** field of the property.
Include the table name, its label, and the fields that you want displayed for its record in a CWM Doc. For example, you want to include Incident table details. The updated contents of the **Value** field would be:

```
[{"sourceTable": "sn_cwm_task", "label": "CWM Task", "fields": ["short_description", "number"]}, {"sourceTable": "incident", "label": "Incident", "fields": ["short_description", "number"]}]]
```

4. Repeat step 3 to include other ServiceNow tables.
5. Select **Update** to save your changes to the property.

Result

Tables included in the property can now be referenced in CWM Docs of any space.

Using Collaborative Work Management

Use the different features of Collaborative Work Management (CWM) to collaborative with teams across your organizations and manage work in the way your teams want.

Collaborating with Spaces in CWM

Create collaborative Spaces for teams to work together on projects, goals, or assignments.

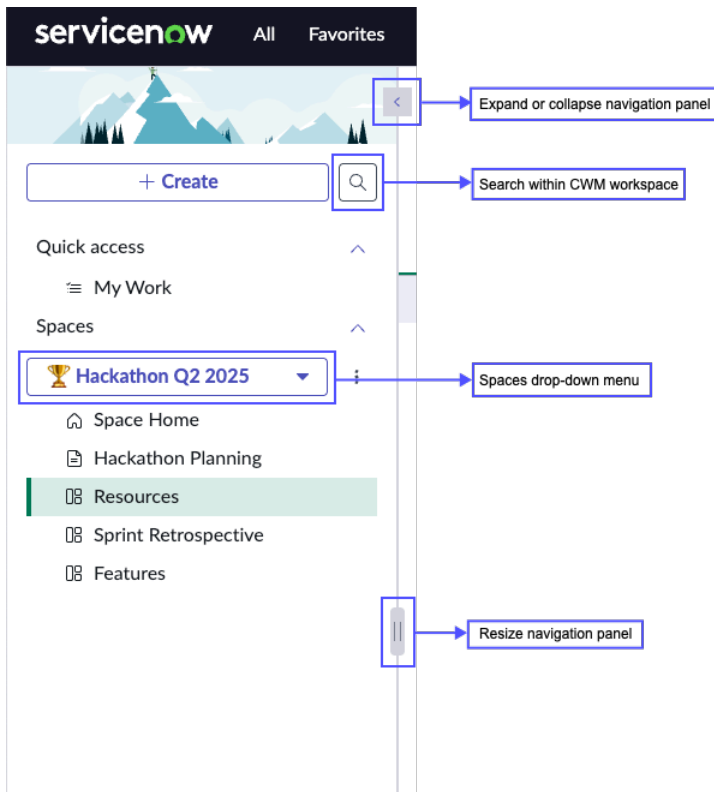

CWM provides two kinds of Spaces: A personal Space that can be accessed only by you and shared Spaces to collaborate with other users in your organization.

Navigation within the CWM workspace

Navigation panel

The CWM navigation panel provides a simpler and cleaner user interface. At a given time, the navigation panel shows the contents of just one Space to provide a distraction-free experience while you work.

Use the Spaces menu to choose a different Space. The Spaces you are part of are sorted by alpha in the Spaces dropdown menu. Additionally, you can also choose to resize the navigation panel or collapse it altogether to increase the working area for your Boards or Docs.

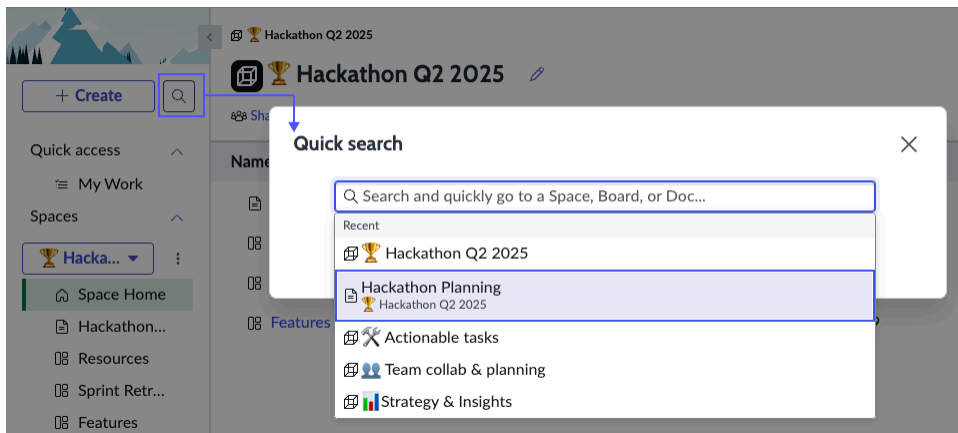

When you expand or collapse the Spaces menu, it's saved as your user preference and will remain so until you change it.

Search

Use the Search option to quickly find and open any Space, Board or Doc.

Also, the Search bar displays all the recent Spaces, Boards, and Docs that you've navigated to within the CWM workspace so that you can quickly select from the recent items without having to search for them again.

Keyboard shortcuts

Use the following keyboard shortcuts to quickly perform actions within the workspace.

Keyboard shortcuts for CWM

Action	macOS shortcut	Windows OS shortcut
Search for a Space, Board, or Doc	Option + F	Alt + F
Create Space	Option + S	Alt + S
Create Board	Option + B	Alt + B
Create Doc	Option + D	Alt + D
Navigate to My Work	Option + M	Alt + M

My Space

By default, a Space and a sample Board are created for you so that you can get familiar with the features and options in the workspace. From your personal Space, you can browse through the **Intro to Docs** and **Welcome to CWM** documents for a high-level overview of what you can do with CWM.

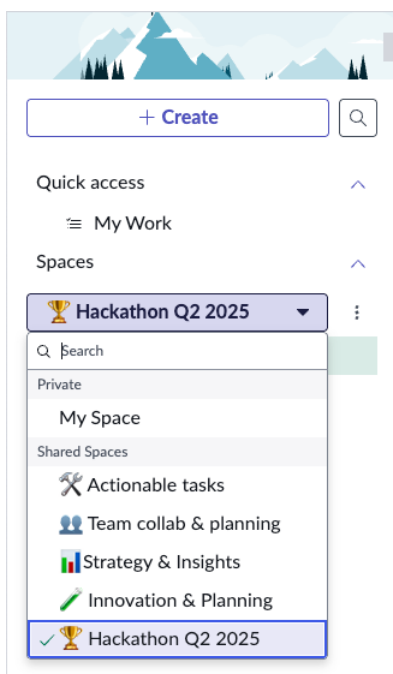

Create more task Boards, docs, and organize them into folders to manage the work assigned to you.

Shared Spaces

Collaborating with Spaces

Shared spaces act as a central location for cross-functional teams to come together and collaborate toward common goals. Plan for the next big release, prepare for a presentation, organize a conference, and do much more using task Boards and collaborative Docs.

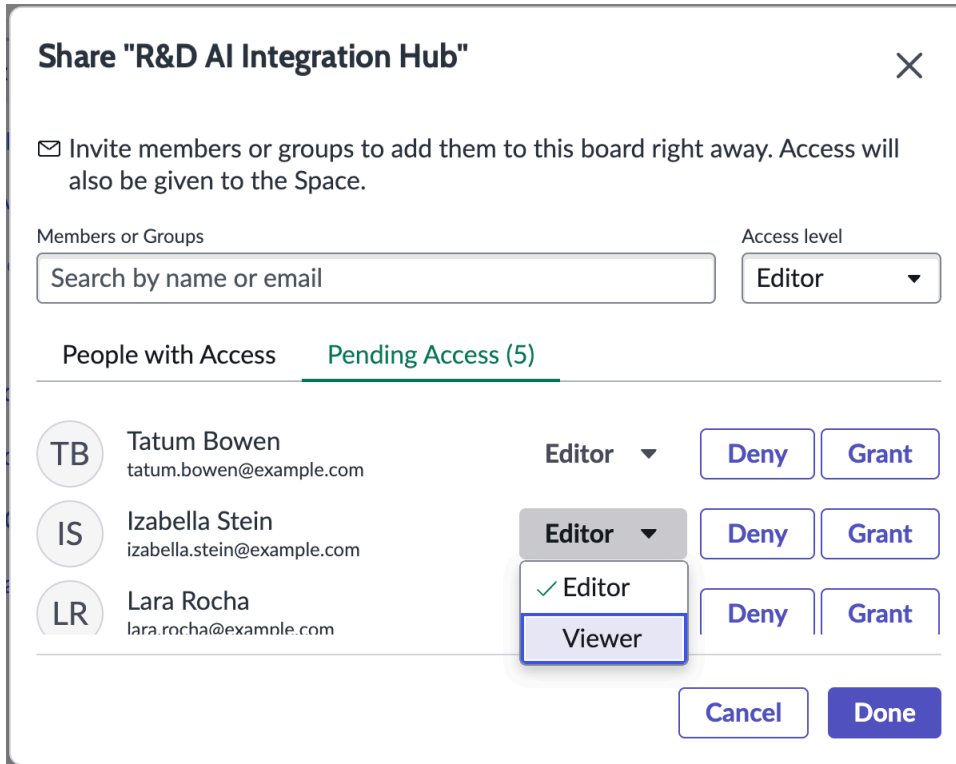

With the capability to connect to any record across the ServiceNow AI Platform, avoid the risk of having information scattered across multiple apps and missing unplanned tasks.

Managing access in the Share permissions modal

As a Space owner or editor, you can manage access for existing users of your Space and review access requests from other users using the Share permissions modal.

- People with Access section: Manage the access level of existing collaborators to Editor, Viewer, or Owner, or remove them from the Space.
- Pending Access section: Review requests from users and choose to grant or deny them access to your Space.

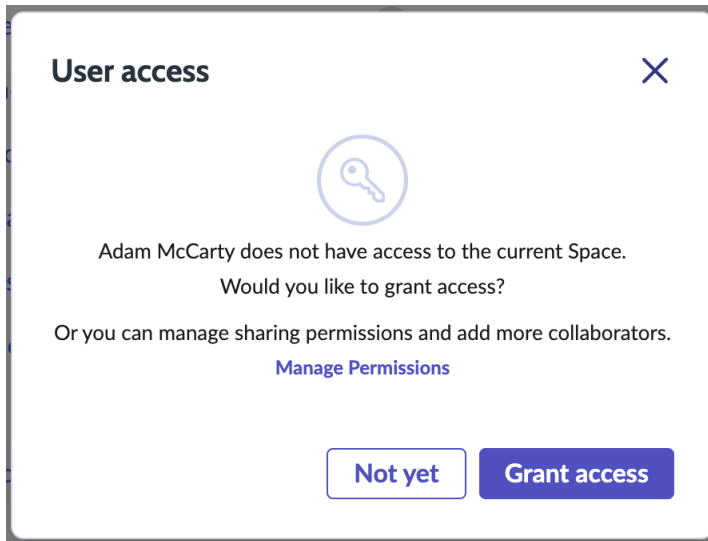

Managing Space permissions for task assignees and other users

As a Space owner or editor, while assigning tasks to your team members, you can identify users who don't have access to the workspace through a lock icon next to the user name. This icon is visible in the List view of the Board in the columns of type People such as **Assigned to**, **Additional Assignee**, and **Assignment group**.

List		Gantt		Kanban	
	Task type	Short description	Assigned to	State	
☐	Task	Approve requests from email	🔒 Adam Mc...	Open	
☐	Task	Revamped space modal.	Tatum Bo...	Open	
☐	Task	Deep linking to docs, boards, and tasks.	KP Kadence P...	Open	

You can either use the workspace prompt to grant assignees Viewer access or choose to manage their access level later from the Share permissions modal. For more information on managing sharing permissions, see [Share a Space in CWM and manage sharing permissions](#).

Requesting to elevate user access role to Editor

The Viewing mode indicator in the Board header indicates that you have only the Viewer role to the Space that you're in. As a Space viewer, you can send a request to Space owners and editors to request elevating your role to Editor by selecting the indicator.

Space owners and editors receive an email request from which they can choose to grant or deny access to the user.

Using the following sections, get started with shared Spaces in the workspace.

Create a Space in CWM

Create Spaces in Collaborative Work Management to enable cross-functional teams to come together and manage work tasks and documentation.

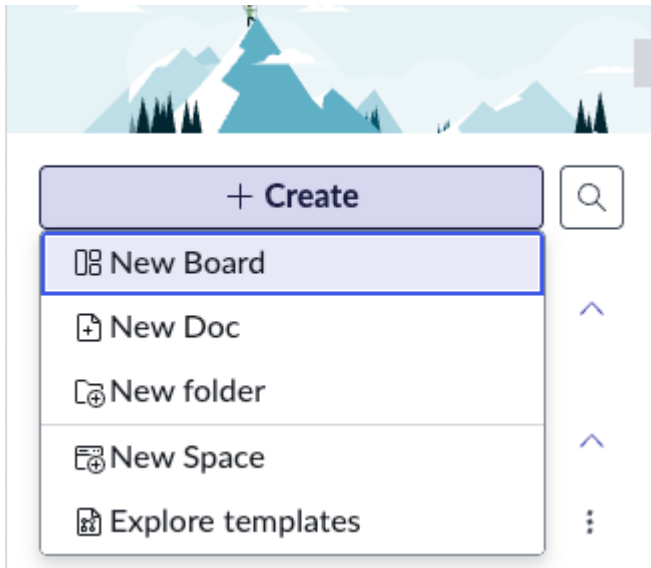

Before you begin

[Install Collaborative Work Management.](#)

Role required: sn_cwm.cwm_user

Procedure

1. Navigate to **Workspaces > Collaborative Work Management.**
2. From the left side panel, select **+ Create > New Space.**

3. In the **Space name** field, enter a name for the Space.

4. Select **Create**.

Result

A new Space is created and added right below the **My Space** section. You can add as many Spaces as you need for each of your projects, teams, or other assignments.

What to do next

- Create a Board to organize and manage work for your team or projects. See [Create a Board in CWM](#).
- Share the Space with others on your team. See [Share a Space in CWM and manage sharing permissions](#).

Share a Space in CWM and manage sharing permissions

Invite cross-team members to Collaborative Work Management Spaces to collaborate on tasks or projects. You can also manage permissions for users with existing access to your Space.

Before you begin

[Create a Space in CWM](#).

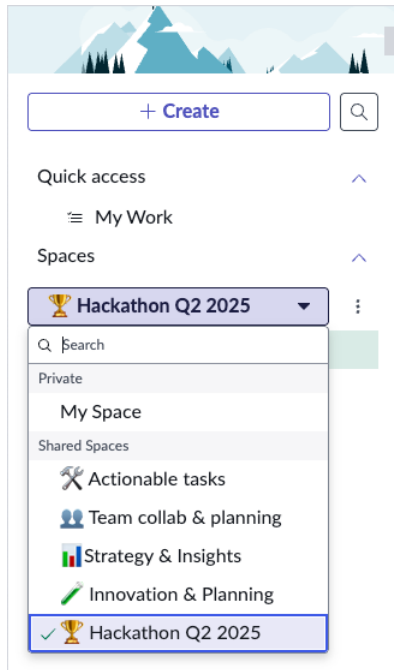

Role required: sn_cwm.cwm_user

About this task

Sharing a Space with a user results in them gaining access to all Boards, Docs, and folders within that Space. Use the Share permissions modal from the Space or Board header to manage sharing permissions and access levels to your Space for your team.

Procedure

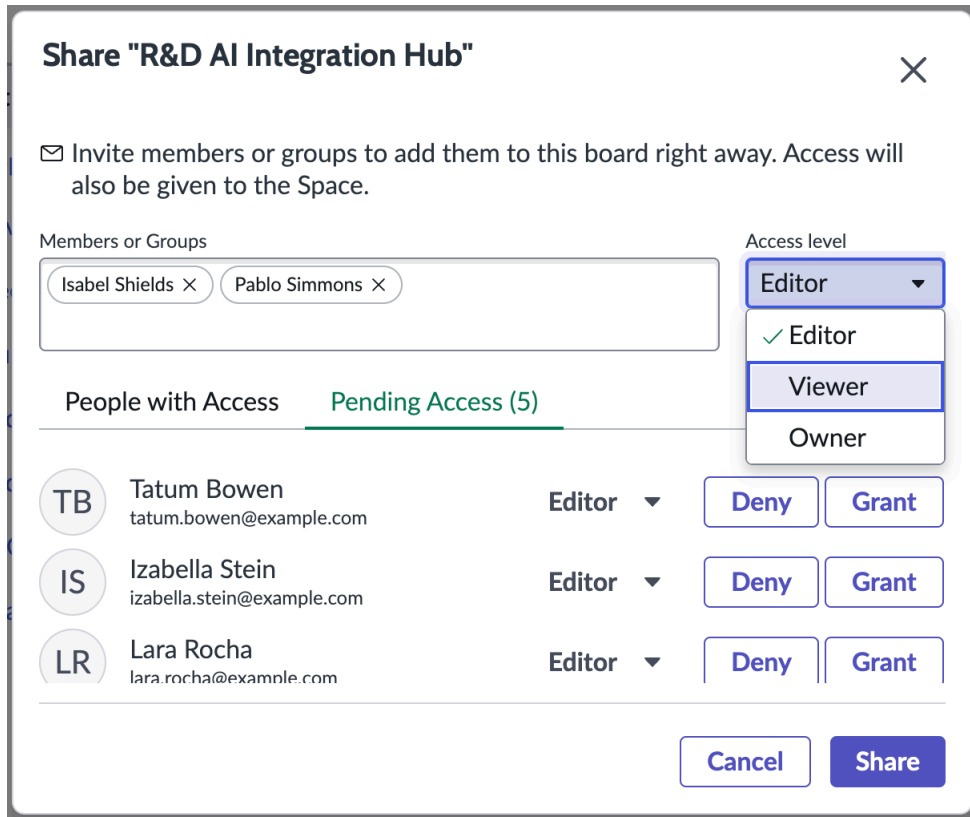

1. Navigate to **Workspaces > Collaborative Work Management**.
2. From the left side panel, select a Space.

3. From the header of the Space, select **Share**.
My Space is personal to you cannot be shared.
4. Add new users to the Space.

- a. In the **Members or Groups** field, enter the names of individual users or groups.

You can search for users and groups by email along with their name so that you choose the right collaborator.

b. From the **Access level** field, set the access required for these users.

Type of access levels for a CWM Space

Access level	Description
Owner	This role is typically assigned to the creator of the space. They have the create, read, update, and delete access to Boards, Tasks, Columns, and Docs in the Space.
Editor	They have the create, read, update, and delete access to tasks in the Board and Docs in the Space. They can share the Board but can't delete it.
Viewer	They can view the data in the Space but can't update or delete it.

c. Select **Share**.

5. From the **People with Access** tab, manage permissions for existing users by changing their access level or removing a user from the Space.
As the Owner or Editor of a Space, you can remove access for existing users of the Space or yourself at anytime. As a viewer, you can only remove access for yourself.

Share "R&D AI Integration Hub" ✕

Invite members or groups to add them to this board right away. Access will also be given to the Space.

Done

Result

An email invite is sent to the users that you shared this Space with.

What to do next

Start working on tasks for your team using Boards. See [Managing work using Boards in CWM](#).

Create a folder in CWM

Organize Boards and Docs of a Space into folders in Collaborative Work Management Workspace.

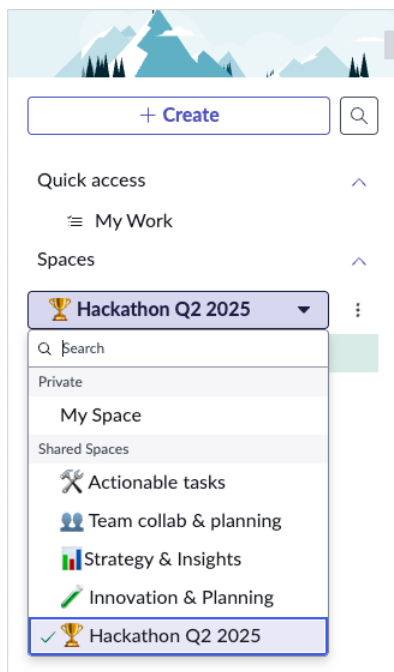

Before you begin

[Create a Space in CWM](#).

Role required: sn_cwm.cwm_user

Procedure

1. Navigate to **Workspaces > Collaborative Work Management**.
2. Open a Space that you want to create a folder in.

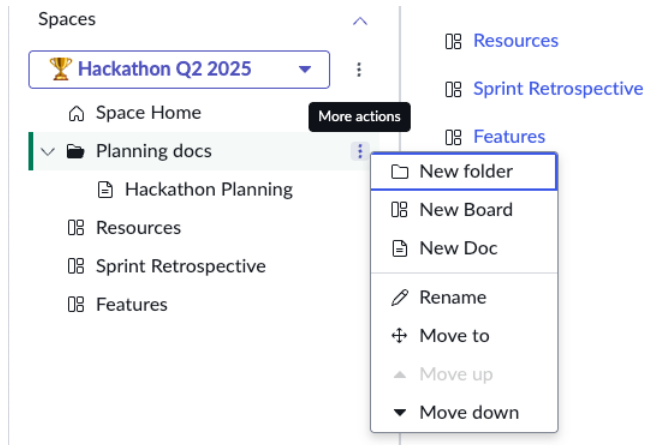

3. From the More options menu of the Space (⋮), select **New folder**.
4. In the **Folder name** field, enter a name for the folder.
5. Select **Create**.

Result

A new folder is created in the Space that you selected.

What to do next

- Create subfolders, Boards, and Docs in this new folder.
- Move any existing Boards, Docs, or folders into this new folder.

Managing work using Boards in CWM

Use Boards in Collaborative Work Management to define and organize tasks. With views such as List, Kanban, and Gantt, configure your workspace based on the way you and your team work.

[https://player.vimeo.com/video/1049444492?](https://player.vimeo.com/video/1049444492?h=672bbda3a0&badge=0&autoplay=0&player_id=0&app_id=58479)

[h=672bbda3a0&badge=0&autoplay=0&player_id=0&app_id=58479](https://player.vimeo.com/video/1049444492?h=672bbda3a0&badge=0&autoplay=0&player_id=0&app_id=58479)

Using the following sections, get started with Boards in the CWM workspace.

Create a Board in CWM

Manage work assigned to your team as tasks and track them to completion using customizable Boards for your shared Spaces in Collaborative Work Management.

Before you begin

[Create a Space in CWM.](#)

Role required: sn_cwm.cwm_user

Procedure

1. Navigate to **Workspaces > Collaborative Work Management.**
2. From the Spaces menu, open a Space that you want to add a Board to.

3. From the More options menu of the Space (⋮), select **New Board**

4. In the **Board name** field, enter a name for the Board.

5. Select **Create**.

Result

A Board is created within the Space that you selected and an empty Board is shown in the workspace. You can add unlimited Boards to a Space, based on how you choose to manage your workflows.

What to do next

- Add tasks to the Board. See [Add tasks to a CWM Board](#).
- Rename or edit other details of the Board using the Edit icon (✎) on the Board header.

Duplicate a Board in CWM

Save time by duplicating an existing Board to copy all the task and collaborator details without having to copy the information manually in the Collaborative Work Management workspace.

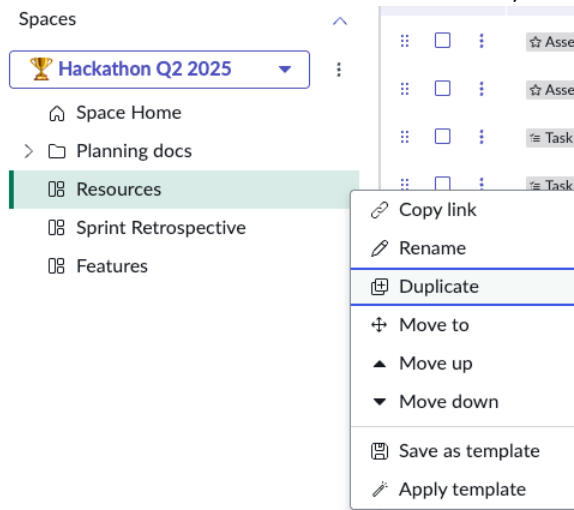

Before you begin

[Create a Board in CWM](#).

Role required: sn_cwm.cwm_user

Procedure

1. Navigate to **Workspaces > Collaborative Work Management**.
2. Navigate to the Space that your Board is in.
3. From the **More actions** menu of the Board, select **Duplicate**.

4. Provide a name for the new Board in the **Board name** field.
The default name given is in the format of **(Copy) <Original Board name>**.
5. Select **Duplicate**.

Result

- The new Board is added to the same Space as the original Board.
- If your original Board was in a folder, the new Board is added to the same folder.
- If necessary, you can move it to a different Space or a different position in the same Space.
- The states of all the copied tasks are reset to the default (open) state in the new Board.
- All the assigned tasks are reset to unassigned.
- The start date for the tasks shift to the current date.
- Any custom columns in the original Board are copied to the new Board.

Add tasks to a CWM Board

Start planning work on your Board by adding tasks and assigning them to team members in Collaborative Work Management workspace.

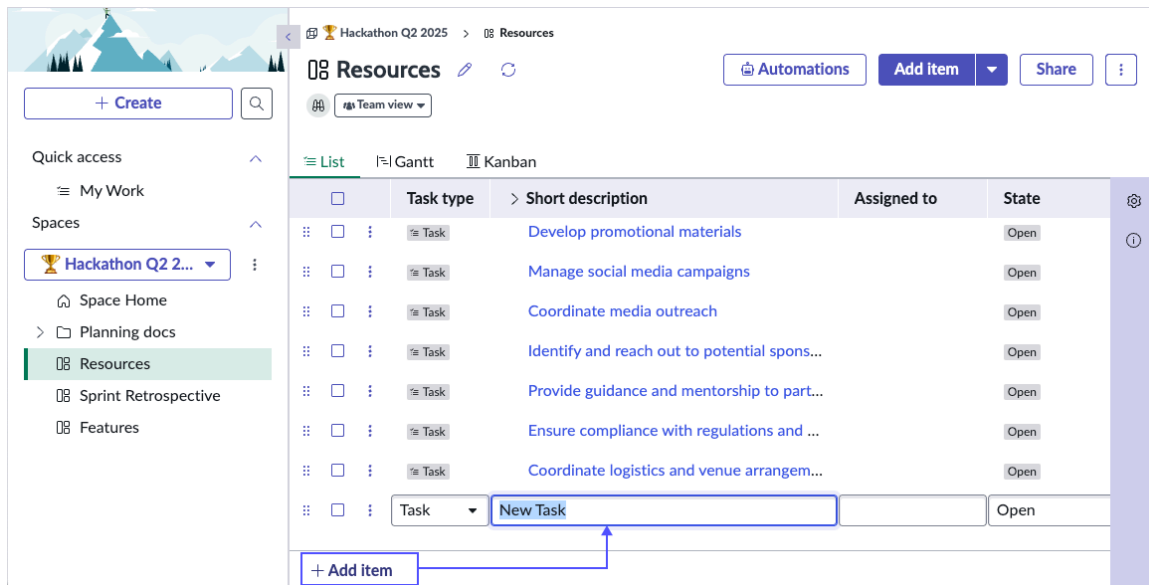

Before you begin

[Create a Board in CWM.](#)

Role required: sn_cwm.cwm_user

Procedure

1. Navigate to **Workspaces > Collaborative Work Management**.
2. From a Space, select a Board that you want to add tasks to.
3. From the Board footer, select **+ Add item**.

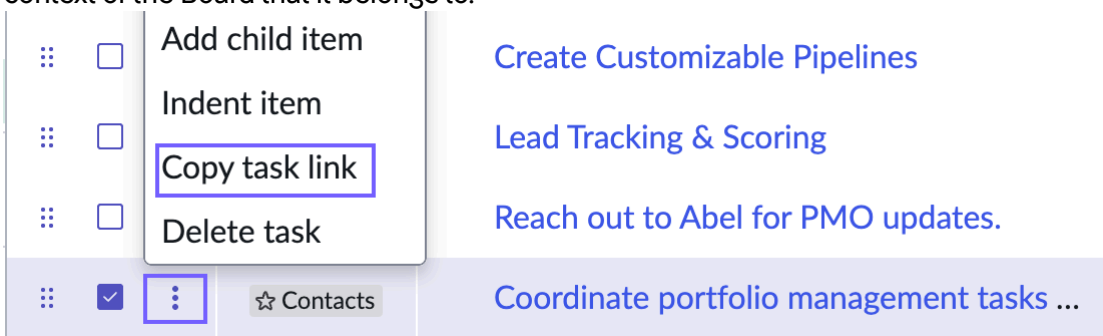

4. Fill in details such as the Type, Short description, Assigned to, dates, and others.

The default work item types available in CWM are Task and Defect. If you want to create other work items such as Milestones or Events, you can create your own task type. See [Create and manage custom work item types in CWM](#).

What to do next

- Add more tasks to the Board and assign them to yourself or members of your team.
- Edit the information of your task from the side panel by clicking the short description to open it or directly from the grid through inline editing by double-clicking a cell.
- Rearrange your tasks on the Board by using the drag-and-drop feature.
- Share tasks by their URL using the **Copy task link** option from the row context menu of the task. This way, when a user clicks the shared URL, the task opens in the side panel in the context of the Board that it belongs to.

Additionally, to enhance the planning and management of tasks, you can:

- Create additional columns for a task to add other details. See [Add custom columns for tasks in a CWM Board](#)
- Choose the columns to be displayed for the tasks on the Board. See [Personalize List, Gantt and Kanban display for CWM Boards](#).

Create and manage custom work item types in CWM

Create custom item types for Boards in Collaborative Work Management, so that you can organize and manage multiple types of tasks from a single location, regardless of the workflow.

Before you begin

[Create a Board in CWM.](#)

Role required: sn_cwm.cwm_user

About this task

Watch this video for information about creating a work item type.

Create custom work item type in CWM video. Approximately forty nine seconds long.

Procedure

1. Navigate to **Workspaces > Collaborative Work Management.**
2. Navigate to the Board that you want to add custom tasks to.
3. From the Board header, select the More actions icon () and select **Manage item types.**
4. From the Default item types section, enable or disable Task or Defect to be available for your Boards.
5. From the Custom work item types section, add a new item type.
 - a. Select **Add new item type.**
 - b. In the Item type name field, enter a name for the work item type.
 - c. Select an icon to represent the item type.
 - d. Select the check box to make this item type available for use in the Board.
 - e. Select **+ Add new item type** to repeat adding another item type.
6. After adding all required work item types, select **Save.**

What to do next

Add tasks of the new item type to your Board using the More actions menu () on the Board header.

Add custom columns for tasks in a CWM Board

Create custom fields in a Board so that you can organize all details of tasks at a single location, thereby improving task management and saving time by reducing dependency on system admin.

Before you begin

[Create a Board in CWM.](#)

Role required: sn_cwm.cwm_user

You need to have either Editor or Owner access to the Space to add a custom column.

About this task

Watch this video for guidance on adding custom columns for tasks in a CWM Board.

Video for add custom columns for tasks in a CWM board. Approximately one minute and twelve seconds long.

Procedure

1. Navigate to **Workspaces > Collaborative Work Management.**
2. From a Space, select a Board that you want to add tasks to.
3. In the List view of the Board, select **Add column** from the column header and select a data type.

4. In the **Field name** field, enter the name for this new column and other details, if asked.
 - If you select the type as **Label** or **Dropdown**, you're prompted to enter the options for this field.
 - If you select **People**, you're prompted to select the type of users available for this field. Also, choose to allow input of single or multiple users in this field.
 - If you select **Reference**, you're prompted to select a table that you want to add as reference to the tasks.
5. Select **Add column**.

Result

The new column is added to the task and you can start entering the values for this column.

Note:

Custom columns added for a task are local to the Board that they're created in and are not applicable to other Boards and Spaces in the workspace.

If you have the Owner access for this Space, you can delete any custom columns based on your changing requirements.

Add a goal to CWM Board

Associate a goal to your Board so that you can plan and track all the tasks and activities that contribute to this goal directly from the Collaborative Work Management workspace.

Before you begin

[Create a Board in CWM.](#)

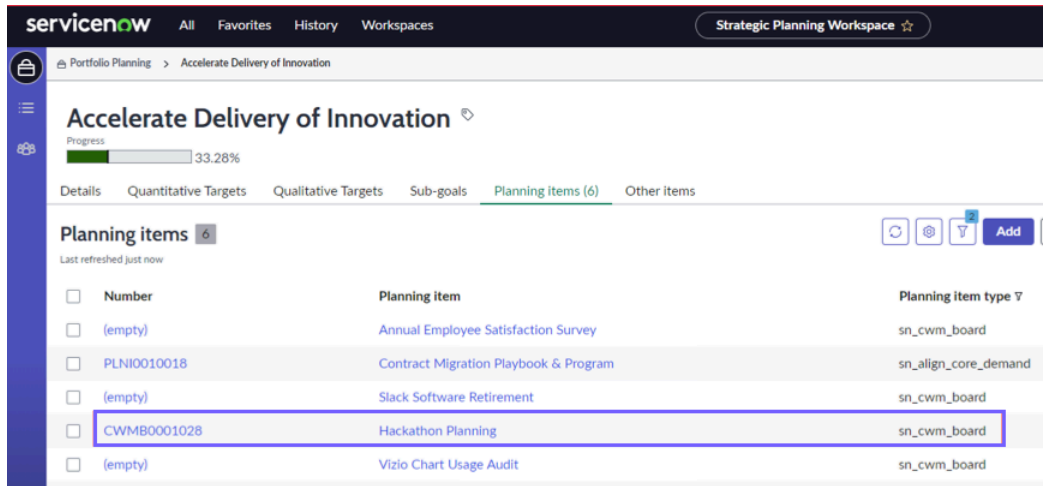

Role required: sn_cwm.cwm_user

Procedure

1. Navigate to **Workspaces > Collaborative Work Management**.
2. From a Space, select a Board that you want to add a goal to.
3. Edit the Board by selecting the Edit icon () from the Board header.
4. In the Board form on the side panel, select a goal from the **Primary goal** field.
5. Select **Update**.

Result

- Within CWM workspace: The current Board is associated with the selected goal, and is shown in the Board details page.
- Within Strategic Planning workspace: If the goal that you selected is part of a portfolio plan within Strategic Planning Workspace, you can see that this CWM Board is added to the goal as a planning item.

Note: CWM Board must be configured as a planning item for the lens that is used to create the portfolio plan. For more information, see [Connecting CWM with Strategic Planning or Portfolio Planning](#).

Board views in CWM

Create, customize, and switch seamlessly between Board display preferences such as column display, sorting, and filtering based on the audience and purpose in Collaborative Work Management (CWM).

https://player.vimeo.com/video/1036476020?h=6a4e66d756&badge=0&autoplay=0&player_id=0&app_id=58479

With Board views, you can save your preferred data views or create shared views to ensure a consistent experience across sessions and for the entire team. Saved preferences include column display, column order, sorting, filters, view mode display, Kanban vertical lane selection.

You can create multiple views for Board display personalization and come back to the view of your choice, without having to rearrange columns on the Board every time. The following are some more advantages of Board views:

- Save Board display preferences as personal or shared views.
- Create shared views for the team so that all the team members consuming the data have the same experience.
- Create multiple views for the same Board so that you can display data in a way that is fit for your audience.
- Quickly switch between views to avoid manually updating display preferences each time the audience is changed.
- Update the view preferences anytime to adapt to changing processes.

Board views in CWM can be classified as personal and shared:

My views

The Board display settings that are personal to you and are only available for you to access are grouped into **My views**. You can create multiple personal views and switch between them depending on your workflow patterns.

Any display personalization settings that you have already applied to your Boards before upgrading to CWM version 4.0.1 are saved as your personal view, with the name **<Your name>'s view**.

Shared views

Shared views are available to all members that have access to the Board or Space. You can create multiple shared views for a Board so that each type of audience has a view that is customized for them.

Note:

Shared views cannot be created in **My Space** because it's your personal Space.

When you save a Board with shared views as a template, the shared views are also saved as part of the template. For more information on templates, see [Templates in CWM for Boards and Docs](#).

The view that you last visited for a Board is saved as your user preference and is selected the next time you reload the Board.

Use the following sections to learn more on how to make the most out of Board views and their customizations for your team.

List, Gantt, and Kanban views in CWM

Switch between List, Gantt, and Kanban views to manage and visualize work on a CWM Board in the way that best fits your team's workflow.

Each CWM Board supports three views: List, Gantt, and Kanban. You can switch between views at any time without losing data, and each view can be personalized to show the columns and attributes most relevant to your team. For more information, see [Personalize List, Gantt and Kanban display for CWM Boards](#).

List view

The List view displays all work items on a Board in a grid format. Use this view to review the status of work items at a glance, update fields inline, or assign items to team members quickly. The List view displays up to 1,000 work items by default.

HACKATHON!							

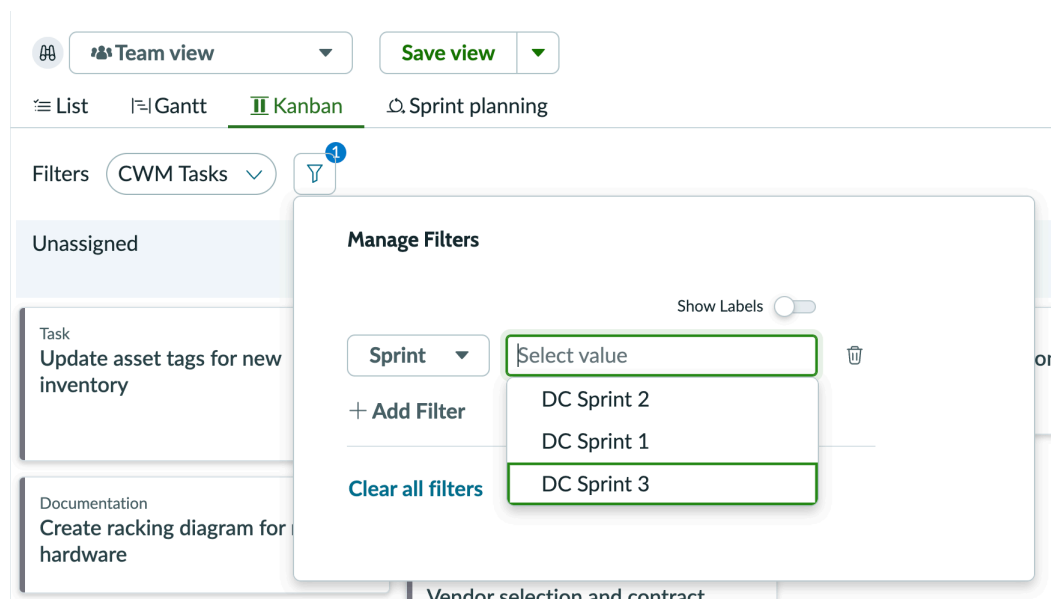

Kanban view

The Kanban view organizes work items into columns and rows based on attributes you choose, such as **State** and **Assigned to**. Vertical lanes represent one attribute and horizontal swimlanes represent another, giving teams a visual overview of work distribution and status. Each axis supports up to 50 lanes by default.

Quick filters

Use quick filters to focus the Kanban board on a specific sprint, state, or other column attribute. Multiple filters can be active at the same time, and a counter at the top of the board shows the number of active filters. For example, use quick filters for sprint-specific information during daily standups or sprint reviews.

You can save these filters to a Board view of your choice and when you save this Board as a template, these filters get saved in the template.

Work item indicators on Kanban cards

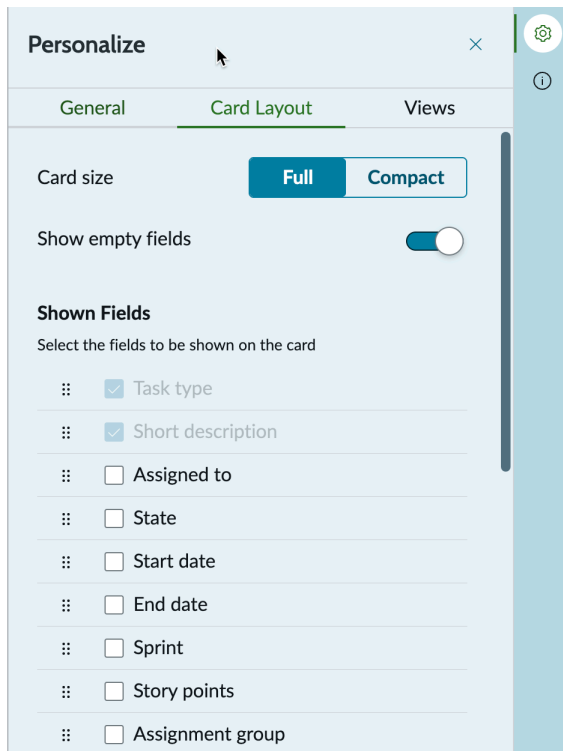

Kanban cards display indicators that give teams at-a-glance visibility into scrum tasks and relationships associated with a work item, without opening the item.

- **Scrum task indicator:** Appears on a story card when the story has one or more scrum tasks. Selecting the indicator opens the right side panel showing the scrum tasks for that story. For more information, see [Scrum tasks for stories in CWM](#).
- **Relationship indicator:** Appears on a work item card when the item has one or more linked relationships, such as a prerequisite, dependent, or related-to item.

Selecting the indicator opens the right side panel showing the related work items and their relationship types. For more information, see [Task dependencies and relationships in CWM](#).

Kanban card layout options

Personalize Kanban cards to surface the information most relevant to your team using card layout settings. Select up to five fields to display on each card. Use the Compact layout to show only the work item name for a focused view, or the Full layout to show all selected fields for more context directly on the card.

Kanban view with Connected work

If the Board includes Connected work items, you can use vertical and horizontal lane combinations to group and filter them. For example:

- Set the vertical lane to **State** and the horizontal lane to **Task type** to view all epics grouped by state, then filter to show only epics.
- Set the vertical lane to **Sprint** and the horizontal lane to **Task type** to view connected stories grouped by sprint.

Related topics

[Task dependencies and relationships in CWM](#)

Personalize List, Gantt and Kanban display for CWM Boards

Show, hide, or rearrange columns and apply sorting or filters to personalize the way data is displayed in Collaborative Work Management Boards based on your workflow.

Before you begin

[Create a Board in CWM](#).

Role required: sn_cwm.cwm_user

Procedure

1. Navigate to **Workspaces > Collaborative Work Management**.
2. From a Space, select a Board that you want to personalize.
3. Select List, Gantt, or Kanban for the Board and select the Personalize icon (⚙️).
4. Update the display of the view on the Board or hide views.
5. For List and Gantt, use column actions (⋮) such as pinning a column to the left of the grid, filtering the data from a column, and resetting the column size to default.

What to do next

After changing the way data is displayed on your Board, you have the option of saving it as a personal view for your reference or a shared view for your team or stakeholders. For more information, see [Board views in CWM](#).

Create a custom view for CWM Boards

Modify Board display preferences and save them as custom personal or shared views that suit the working preferences for you and your team members in Collaborative Work Management (CWM).

Before you begin

[Create a Board in CWM](#).

Role required: sn_cwm.cwm_user

About this task

Use the personalization settings to change how the data is presented on a CWM Board and save the changes as a new view. You can create a different custom view for each of the List, Gantt, and Kanban view modes or save them all into a single view.

Procedure

1. Navigate to **Workspaces > Collaborative Work Management**.
2. From a Space, select a Board that you want to create a view for.
3. Modify the display preferences of the Board data using the personalization settings, sorting, filtering, and adding custom columns.
For more information, see [Personalize List, Gantt and Kanban display for CWM Boards](#).
4. Select the More actions icon (▼) of the Save view menu and choose **Save as new view**.

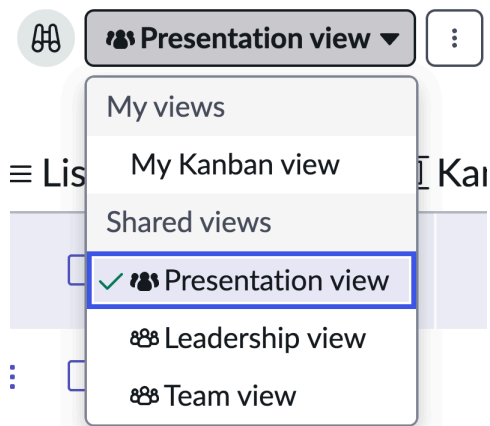

5. Enter a name for this view and choose to make it a shared view or keep it a personal view. Shared views are available for all members who have access to this Board. Not selecting this option saves this view as a new personal view that's only available to you.

6. Select **Create**.

Result

The new view is available in the view switcher.

Update a CWM Board view

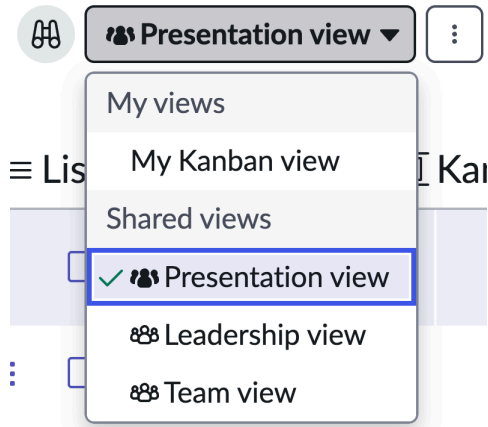

Modify the display preferences of your Collaborative Work Management (CWM) Boards and update the existing personal or shared views.

Before you begin

Role required: sn_cwm.cwm_user

Procedure

1. Navigate to **Workspaces > Collaborative Work Management**.
2. From a Space, select a Board for which you want to update a view.
3. From the view switcher, select a view that you want to modify.

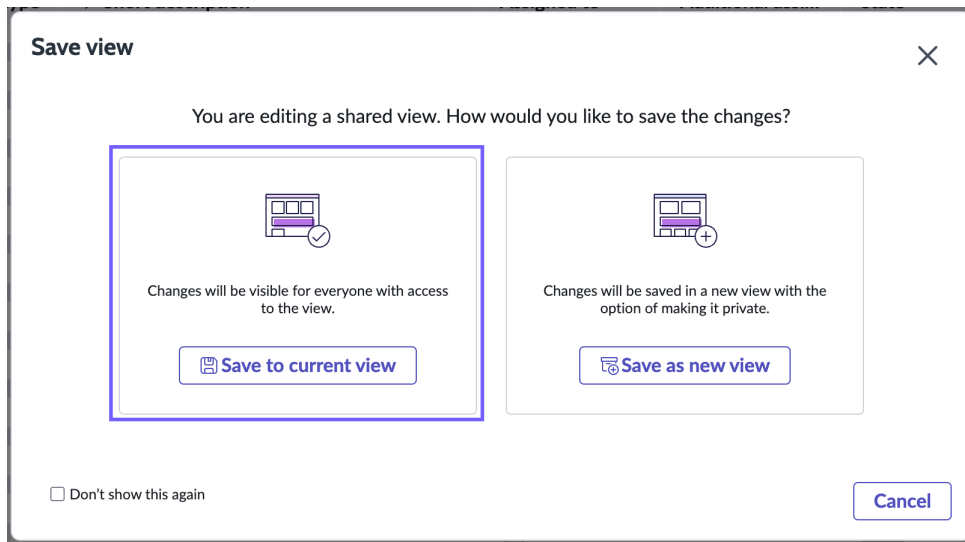

4. Modify the display preferences of the Board data using the personalization settings, sorting, filtering, and adding custom columns.

For more information, see [Personalize List, Gantt and Kanban display for CWM Boards](#).

5. Select **Save view**.

6. Select **Save to current view**.

Note:

If you select the **Don't show this again** checkbox, this dialog box doesn't appear the next time.

Result

The current view is updated with the changes that you made.

Delete a custom CWM Board view

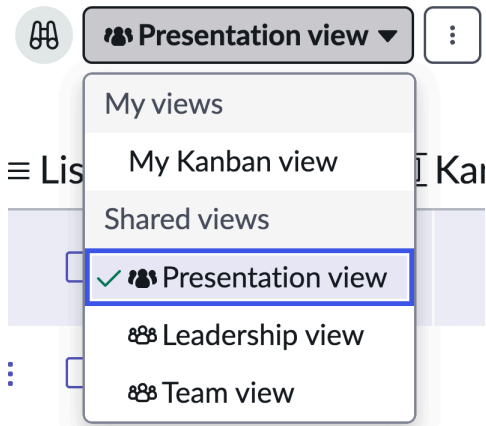

Delete the custom personal or shared views for your CWM Boards and keep your Board views current for your workflow.

Before you begin

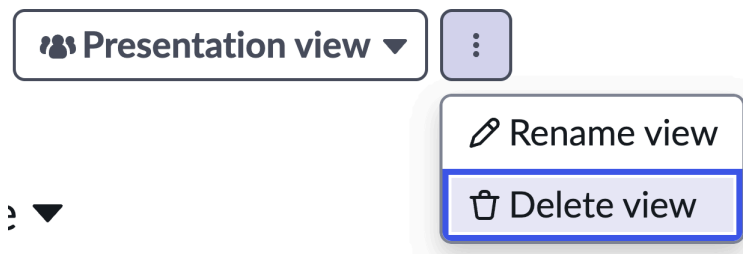

Role required: sn_cwm.cwm_user

Procedure

1. Navigate to **Workspaces > Collaborative Work Management**.
2. From a Space, select a Board for which you want to delete a view.
3. From the view switcher, select a view that you want to delete.

4. From the More view options menu (⋮), select **Delete view**.

5. Select **Delete** to confirm.

Result

The view is deleted and no longer available in the view switcher for this Board.

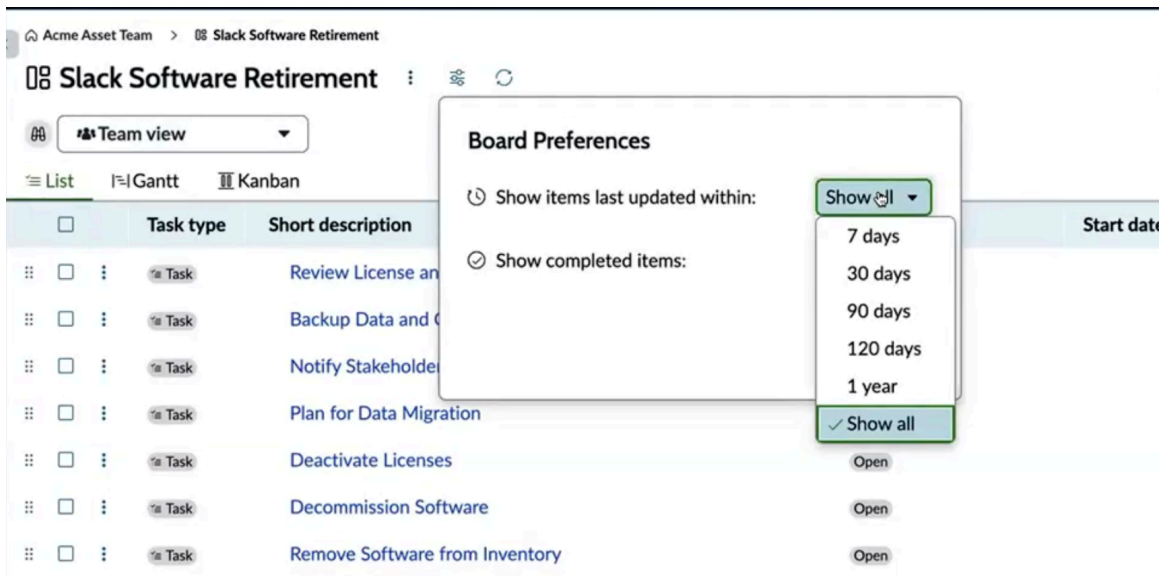

CWM Board preferences

Reduce cognitive load and focus on the most relevant and actionable tasks by filtering work items on Boards in Collaborative Work Management (CWM).

Use the **Board Preferences** menu on the Board header to show items that are your current focus.

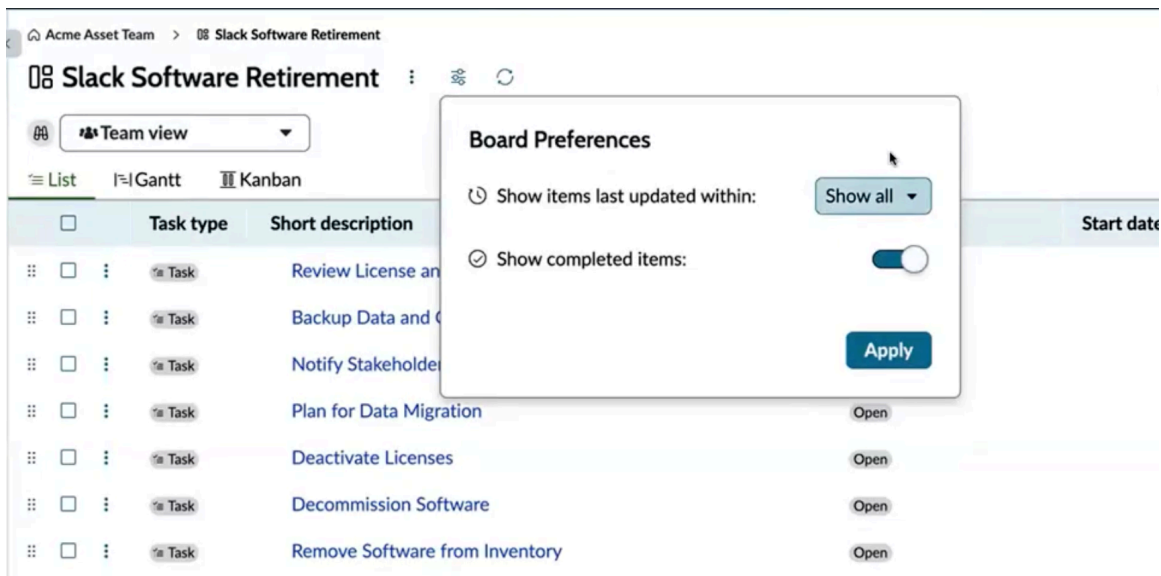

Show items based on their last updated date

Filter work items based on their last updated date. You can choose to show items last updated within 7 days, 30 days, 90 days, 120 days, or 1 year.

Show or hide completed items

Choose to show or hide the work items that are marked as Closed complete.

The Board preferences that you set are applied across the List, Gantt, and Kanban views.

Export a CWM Board to CSV or Microsoft Excel

Export the list view of Collaborative Work Management (CWM) Boards to CSV or Microsoft Excel so that you can use the data to obtain insights, share with stakeholders, and prepare for analysis or presentations.

Before you begin

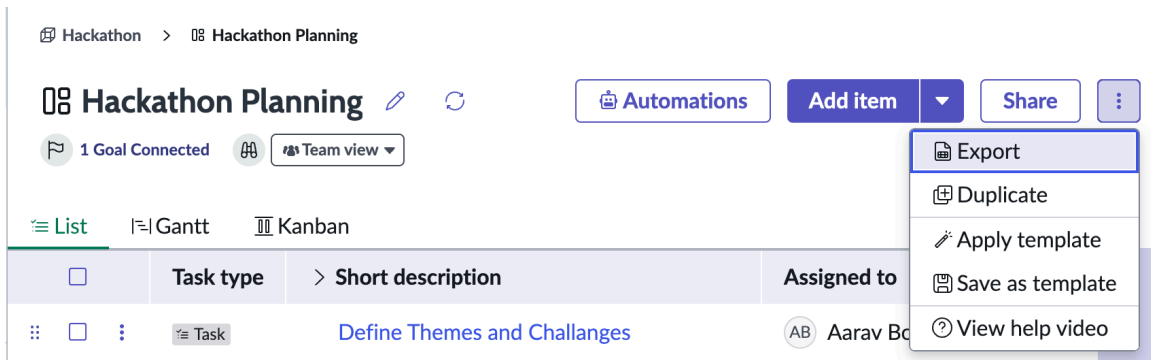

[Create a Board in CWM](#)

Role required: sn_cwm.cwm_user

Procedure

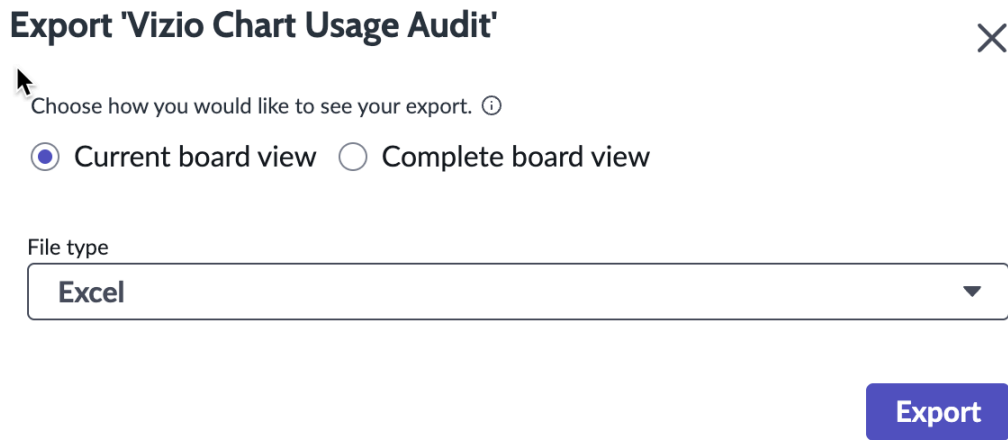

1. Navigate to **Workspaces** > *Collaborative Work Management*.
2. From a Space, select the Board that you want to export.

3. From the Board header, select the More options icon (⋮), and then select **Export**.

4. In the Export dialog, select the Board view that you want to export and the file type.

5. Select **Export**.

Note: The exported file doesn't retain the hierarchy of the tasks from the Board and all links, including URLs, references to records and assigned users, are converted to plain text.

Result

The file is downloaded and saved in your local system.

Work item automations in CWM

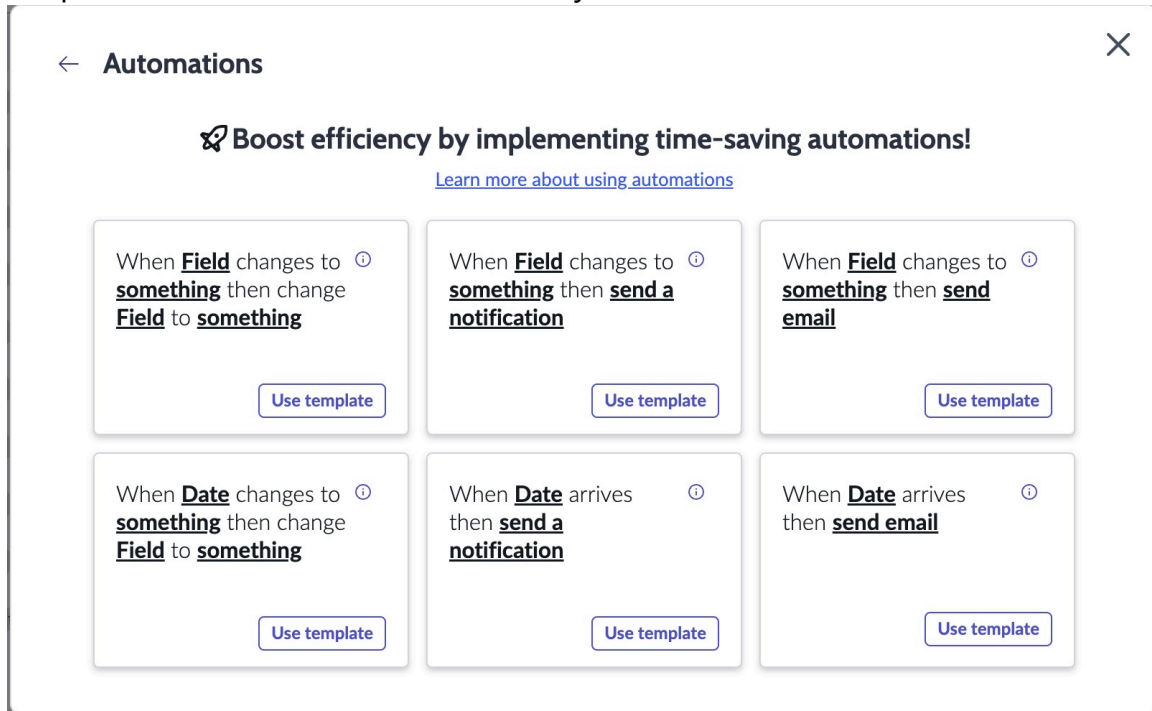

Boost team efficiency by automating monotonous actions such as sending notifications and emails, monitoring key dates, or reassigning tasks based on the conditions that suit the team's workflow.

When teams work together, they often spend much time and manual effort on workflow activities. To address this issue and help improve the overall team efficiency, team members can create automations for tasks in CWM Boards.

Automations in CWM are actions that are triggered when certain conditions are met. Once created, these automations are applicable to all work items in the Board that they're created in. Some examples of automated actions are:

- Sending an email when a task assignment is changed.
- Updating task priority when the due date is moved.
- Reassigning tasks when the priority is changed.
- Sending a notification when a task is complete.
- Notifying a task assignee dynamically when the priority is changed.

Six predefined templates are provided in the application to help you build multiple simple or complex conditions and automate actions for your work items.

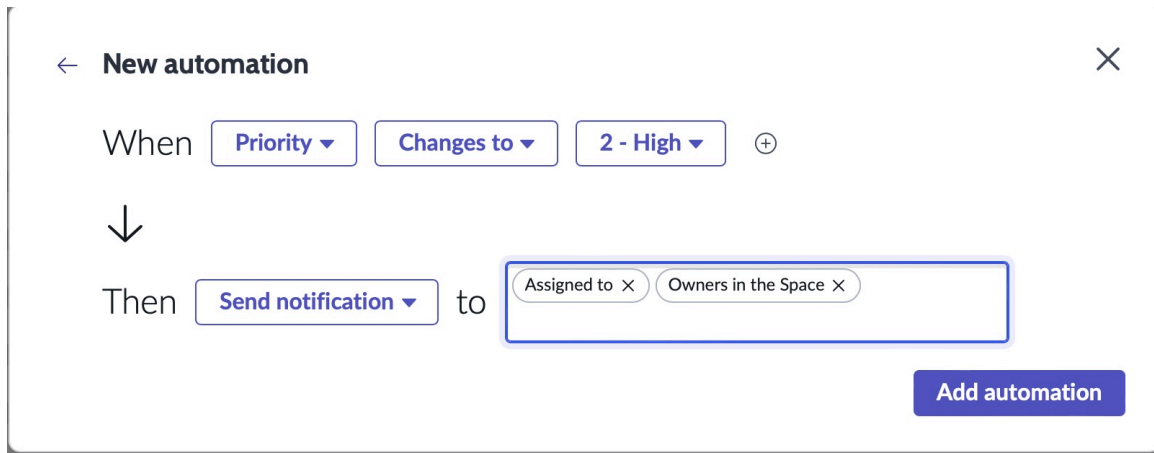

Based on the changing conditions of your team's workflow, you can edit, disable, or delete automations anytime later. For a Board, a maximum of 10 automations can be created, which includes all the active and inactive ones.

In this example automation, when the **Priority** of a task on this Board changes to **High**, the people in the **Assigned to** column of the task and the owners of this Space are notified of it.

Going forward, when the priority of any item of this Board changes to High, a notification is sent to the user assigned to that task and the Space owners. Thus this automation saves the time that it takes to perform this action manually instead.

Note:

You can also send notifications to any user if you've added a custom people column in addition to the default Assigned to or Additional Assignee.

Get started with automations in CWM. See [Create automations in CWM](#).

Create automations in CWM

Add conditions to build task automations for CWM Boards and help your team save time from manual task updates.

Before you begin

[Create a Board in CWM](#).

Role required: sn_cwm.cwm_user

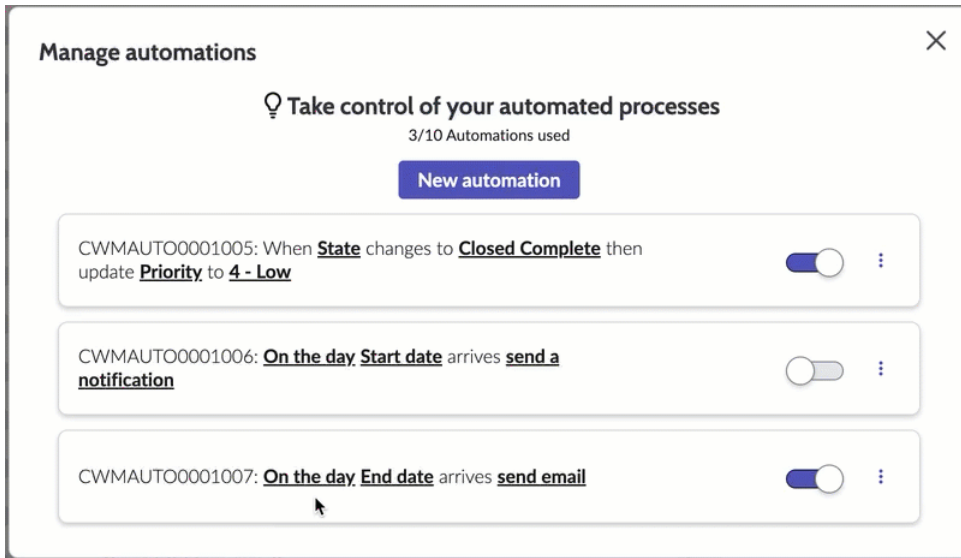

Procedure

1. Navigate to **Workspaces > Collaborative Work Management**.
2. From a Space, select a Board that you want to create automations for.
3. From the Board header, select **Automations**.

4. Choose a predefined template.

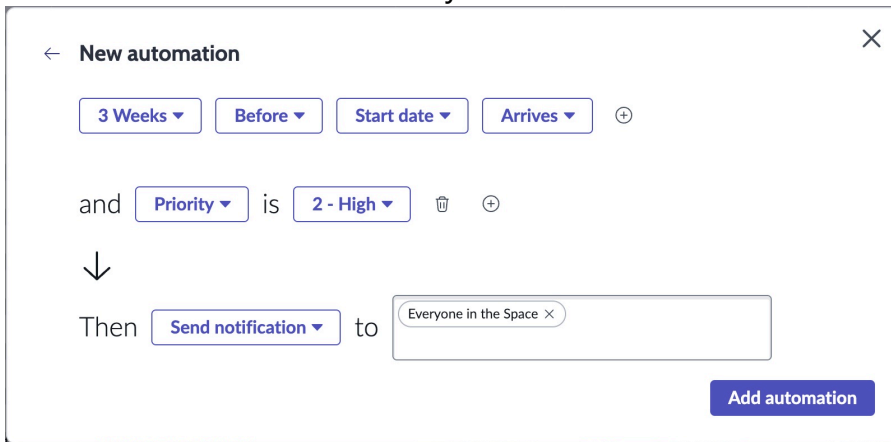

- If it's your first automation, choose a template to get started.
- If automations exist already, select **New automation** and then choose a template.

5. Add conditions for automating the activities of updating a field, sending an email, or sending notifications.

You can add multiple conditions to act as triggers to an automation. For example, an automation can be created to send a notification to everyone in the Space when it meets the following conditions:

- Task priority is high.
- The start date is three weeks away.

6. Select **Add automation**.

7. Repeat the steps to add more automations.

Note:

You can create up to 10 automations for a Board and the automations are applied only to CWM tasks and not any connected work items on the Board.

What to do next

[Manage or delete automations in CWM.](#)

Manage or delete automations in CWM

Edit, disable, or delete automations for your Boards in Collaborative Work Management based on the changing conditions of your team's workflow.

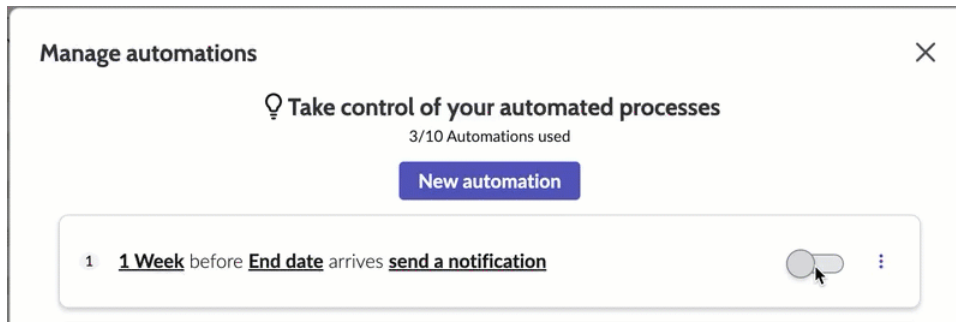

Before you begin

Create automations in CWM.

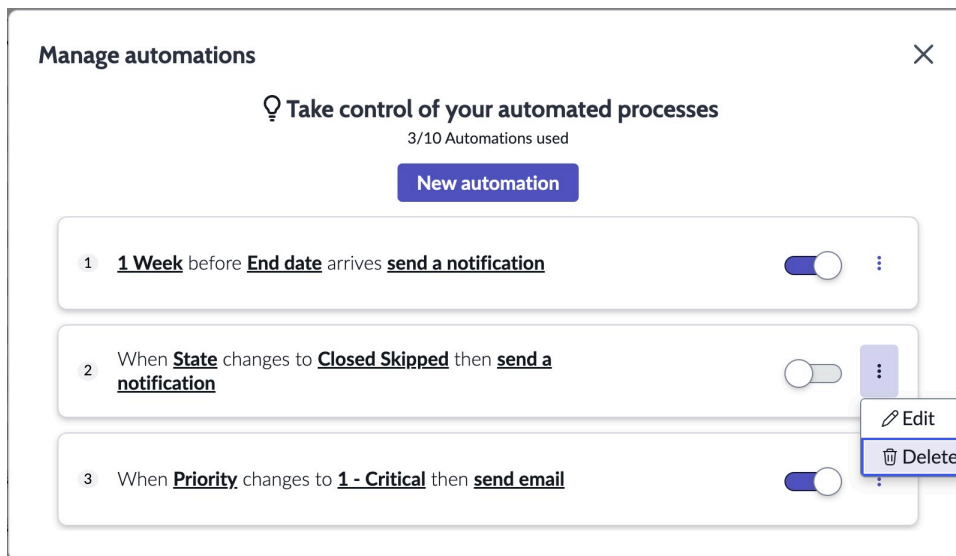

Role required: sn_cwm.cwm_user

Procedure

1. Navigate to **Workspaces > Collaborative Work Management**.
2. From a Space, select a Board that you want to edit the automations for.
3. From the Board header, select **Automations**.
4. Choose to enable, disable, edit, or delete an automation.
 - To disable an active automation, switch the toggle off.
 - To enable a disabled automation, switch the toggle on.

- To edit an automation:
 - a. Select **More actions** and select **Edit**.
 - b. Update the conditions.
 - c. Select **Save automation**.
- To delete an automation:
 - a. Select **More actions** and select **Delete**.
 - b. Confirm by selecting **Delete**.

Connected work in CWM

Streamline task management for teams by bringing in various work items from across ServiceNow applications into Boards in Collaborative Work Management.

<https://vimeo.com/1142605644/a4e1a19040?share=copy&fl=sv&fe=ci>

The Connected work feature in CWM enables bringing in all types of work items from applications across the ServiceNow AI Platform, thereby helping streamline collaboration, planning, and execution for all teams. Here's how it works:

Centralized view

Teams can connect various types of work from different ServiceNow applications to a single CWM board. By defining conditions for the work items, the teams can bring in only those work items that they need. This consolidation ensures that all relevant work is visible in one place, reducing the need to switch between multiple workspaces. For more information, see [Connect work from other ServiceNow apps to CWM Boards](#).

Only those tables that you have access to and from the applications that are already installed and active in your ServiceNow instance are available for you.

Flexible planning

Once the work is connected, teams can plan and manage it efficiently. They can plan them into sprints for agile execution, or follow a free-flow methodology, ensuring that tasks are prioritized and tracked in the way that the teams choose to.

For sprint planning, the connected work items are automatically displayed in the Backlog pane of the Board's Sprint planning view. From here, the team can schedule work into sprints and proceed with execution. For more information, see [Plan work items into sprints in CWM](#).

Real-time updates

Teams can update the status and other details of connected work items directly from the side panel within the CWM board. This real-time updating capability enhances transparency and keeps everyone involved on the same page. For more information, see [Update details of connected work items in CWM Boards](#).

Deleting a connected work item record only removes it from the Board in CWM but doesn't delete the original record.

Improved efficiency

By centralizing work and providing a unified environment, Connected work helps teams stay focused and reduces the time spent navigating between different workspaces. This can help lead to increased productivity and collaboration.

Connect work from other ServiceNow apps to CWM Boards

Enable a consolidated view of all relevant work by connecting work items from different ServiceNow applications to a Board in Collaborative Work Management.

Before you begin

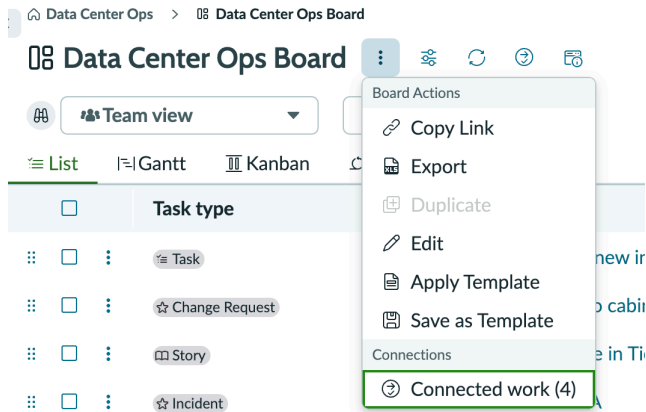

Role required: sn_cwm.cwm_user

Procedure

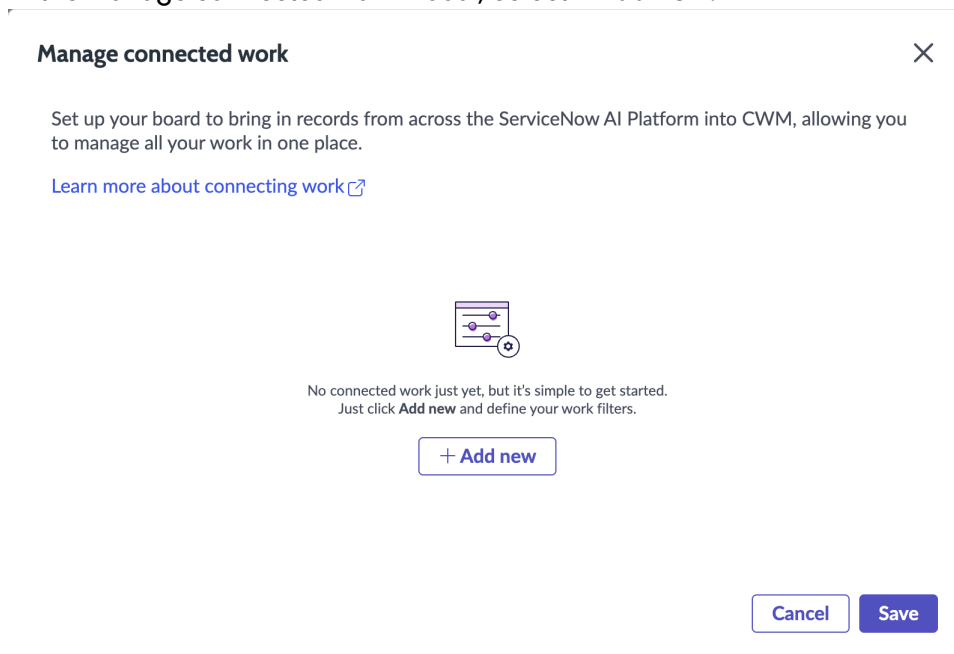

1. Navigate to **Workspaces > Collaborative Work Management**.
2. From a Space, select a Board that you want to connect work for.

3. From the Board header, select the Board more options icon (⋮) and select **Connect work**.

If you already have connected any work items, then this label is displayed as **Connected work**.

4. In the Manage connected work modal, select **+ Add new**.

5. Choose a table and define the conditions to filter the records from the selected table.

a. From the **Table** field, select a table.

For example, to bring in all the incidents, select the Incident [incident] table.

Note:

Only those tables that you have access to and from the applications that are already installed and active in your ServiceNow instance are available for you.

b. Change the value in the **Name** field according to your requirement.

c. Use the condition builder to add conditions and filter the records from the table you selected.

For example, you'd like to bring in incidents that are active and belong to certain categories. Then, your condition set would be similar to the following:

Active is true and **Category is Inquiry / Help** or **Category is Software**.

- d. Select the Update count icon (🔄) to check the number of records that exist which match the filter criteria that you defined.

Note:

Ensure that the number of records available for your filter criteria are not more than 100. You can change this number by default to 500 by working with your admin to update the system property `sn_cwm.connect_work_import_limit`.

6. Select **Save**.

7. Repeat steps 4 through 6 to connect work items of other types.

You can connect up to 10 work item types to a Board and you can add only one connected work configuration per table.

8. Select **Save**.

Result

- The Board is refreshed to load and display all the connected work items.
- Any existing information such as Assigned to, State, and Start and End dates is also shown on the Board.
- With the Sprint planning view enabled, you can see all these connected work items in the Backlog list. For more information about performing sprint planning, see [Sprint planning in CWM](#).

Manage connected work item types in CWM

Enable, disable, refresh data, or delete the connected work item types on your CWM Board to keep the work items up to date based on changing requirements.

Before you begin

Role required: sn_cwm.cwm_user

Procedure

- Navigate to **Workspaces > Collaborative Work Management**.
- From a Space, select the Board that you want to manage the connected work item types for.
- From the Board header, select **Connected work**.

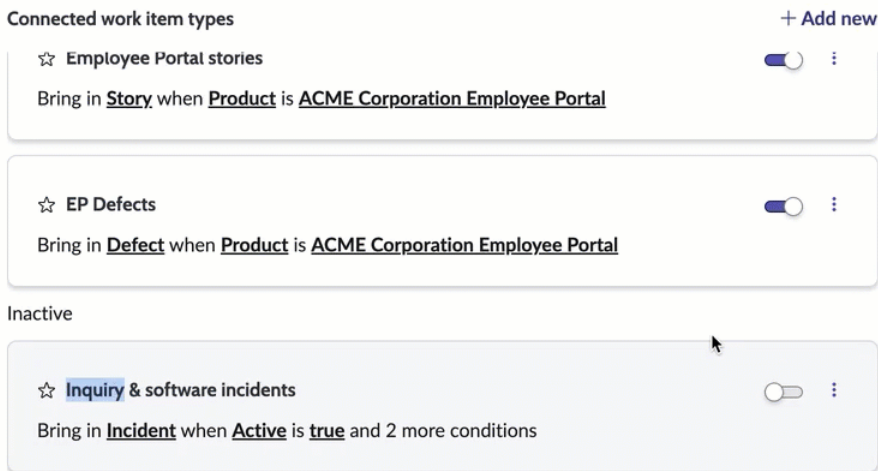

Q3 Employee portal enhancements ✎ 🔄

Connected work: 3 🔍 Team view

List | Gantt | Kanban | Sprint planning

<input type="checkbox"/>	Task type	Short description	
--------------------------	-----------	-------------------	--

- From the Manage connected work modal, disable or enable any existing work item type.

5. Update the filter conditions for a work item type by selecting **Edit** from the More actions menu ().

For more information, see [Update filter conditions for connected work in CWM](#).

6. Select **Refresh data** from the More actions menu () to fetch any latest records for the work item type that you defined.

7. If the work item type is no longer necessary, you can delete it.

- a. From the More actions menu () of a work item type configuration, select **Delete**.
- b. From the Delete configuration modal, select **Confirm**.

8. After you have done all the required changes, select **Save**.

Result

The Board is refreshed to load the work items based on your changes.

Update filter conditions for connected work in CWM

Update the filter conditions for connected work item types in Collaborative Work Management Boards so that the work items displayed in the Board reflect your team's current workload.

Before you begin

Role required: sn_cwm.cwm_user

Procedure

1. Navigate to **Workspaces > Collaborative Work Management**.
2. From a Space, select the Board that you want to manage the connected work item types for.
3. From the Board header, select **Connected work**.

Q3 Employee portal enhancements

Connected work: 3 Team view

Employee Portal stories
Bring in Story when Product is ACME Corporation Employee Portal

EP Defects
Bring in Defect when Product is ACME Corporation Employee Portal

5. Use the condition builder to edit the defined conditions.

6. Select the Update count icon (↻) to check the number of records that exist which match the filter criteria that you updated.

Note: Ensure that the number of records available for your filter criteria are not more than 100.

Define work type conditions

Table * Incident Name * Inquiry & software incidents

Number of results matching criteria: 26

Active is true or Category is Inquiry / Help or Category is Software

+ New condition set

Cancel Save

7. Select **Save**.

8. Repeat steps 4 through 7 to update conditions of any other connected work item type.

9. After all required changes are made, select **Save** in the Manage connected work modal.

Result

The Board is refreshed to load the work items based on your changes.

Update details of connected work items in CWM Boards

Learn how to update the status, assigned to, and other details for the work items that are brought into your Collaborative Work Management Board through Connected work.

Before you begin

Role required: sn_cwm.cwm_user

About this task

The details of connected work items can be updated only from the side panel and not through in-line editing in the grid. However, deleting the connected work items from the Board will only remove them from the Board but won't delete the original record.

Procedure

1. Navigate to **Workspaces > Collaborative Work Management**.
2. From a Space, select the Board with connected work items that you want to update.
3. From the List, Gantt, Kanban, or Sprint planning view, open the item details in the side panel.
4. Update the required details.
You can also choose to open the original record form and update the details from there using the Detailed form view icon (🔗).

The screenshot displays the ServiceNow CWM interface. At the top, there's a header for 'Q3 Employee portal enhancements' with options for Automations, Add item, Share, and a menu icon. Below this, there are view options: List (selected), Gantt, Kanban, and Sprint planning. A table lists various tasks with columns for Task type, Short description, and State. The task 'Integrate training and recognition portals' is selected. To the right, a side panel titled 'Profile creation for employee' is open, showing details for this task. The side panel includes tabs for Details, Attachments, and Activity. Under the Details tab, there are fields for State (set to 'Work in progress'), Percent complete (40%), Points (8), Assigned to (Remy Wilson), Team, and Work notes. At the bottom of the side panel are 'Cancel' and 'Update' buttons.

5. If you've edited the details in CWM, select **Update** or **Save**.

Result

The updated information is available on the work item both in CWM and in its parent application.

Agile work management in CWM

Run your agile workflow in Collaborative Work Management (CWM), from building and refining a backlog to planning sprints, executing work as stories and scrum tasks, and collaborating with your team.

CWM is a unified workspace where agile teams can manage their delivery cycle. Teams transitioning to CWM can continue to run the Scrum workflow they're familiar with, which includes managing a backlog, planning and executing sprints, and tracking daily progress, while also benefiting from CWM's flexible work item model, AI assistance, and broader collaboration features.

Agile workflow in CWM

The following end-to-end workflow shows how agile teams use CWM to plan and execute work.

Set up your workspace

Create a Space and a Board for your team. The Space is where all your work lives. CWM provides Stories, Scrum tasks, and CWM Tasks as default work item types. You can also define custom work item types to reflect your team's terminology, for example, Bugs. For more information, see [Create a Board in CWM](#) and [Create and manage custom work item types in CWM](#).

Build and maintain your backlog

Add work items to your Board through the Sprint Planning view. All unscheduled work appears in the Backlog pane, giving your team a single place to groom, prioritize, and reorder items before pulling them into a sprint. For more information, see [Add work items to Sprint planning Backlog in CWM](#).

Plan sprints

Create sprints by setting a duration, start and end dates, and story point capacity. Drag items from the Backlog into a sprint, or add them directly. Capacity indicators in each sprint section help teams avoid over-committing. For more information, see [Create a sprint in CWM](#) and [Plan work items into sprints in CWM](#).

Execute and track work

Start the sprint and use the Kanban board to track work in progress. Team members move story cards across state lanes to update status. Use quick filters to focus the board on a specific sprint, state, or other columns to stay on top of what matters during the current sprint. For more information, see [Start or complete a sprint in CWM](#).

Break stories into scrum tasks

For more granular daily execution, break user stories into scrum tasks. Scrum tasks are subtasks linked to a story, which help teams estimate effort, distribute work, and track daily progress. Create them manually from the story's Scrum tasks tab, or use Now Assist to generate them automatically based on the story context. When a story has scrum tasks, an indicator appears on the Kanban card so teams can quickly see stories that have been decomposed. For more information, see [Scrum tasks for stories in CWM](#).

Track dependencies

Link work items to show how they relate to each other using three relationship types: prerequisite, dependent, and related to. These are informational relationships and don't block task progress. You can link work items across boards and spaces, enabling visibility into cross-team dependencies without needing to be on the same board. For more information, see [Task dependencies and relationships in CWM](#).

Hold retrospectives

At the end of each sprint, create a retrospective board to capture what went well and what to improve for the next sprint. For more information, see [Create a retrospective board for a sprint in CWM](#).

Bringing in work from other ServiceNow applications

Agile teams often work on more than just stories. Incidents must be resolved, defects must be fixed, and enhancement requests must be delivered. The Connected work feature in CWM lets you bring records from any ServiceNow application into your Board by defining filter conditions. Once connected, you can plan those records into sprints and manage them alongside your stories from a single backlog.

Teams who previously used the Unified Backlog and triage boards in Agile Development 2.0 to manage defects, incidents, and other work records can use Connected work to achieve a similar centralized view in CWM. For more information, see [Connected work in CWM](#).

Comparing CWM to Agile Development 2.0

CWM covers the core Scrum workflow, but approaches some functional areas differently. The following describes how key Agile Development 2.0 concepts map to CWM.

Functional area	In Agile Development 2.0	In CWM
Work item hierarchy	Fixed hierarchy of Products, Epics, Stories, and Scrum Tasks.	<p>Create custom work item types to build a hierarchy that fits your team. There are no built-in Products, Releases, or Themes.</p> <p>You can use Spaces to separate product areas and Goals to connect work to business objectives.</p>
Unified backlog and triage	Triage boards filtered records from other apps and automatically created stories for triaged items.	The Connected work feature brings source records directly into the board backlog. So, no separate triage step required. Teams can plan them into sprints and update their status directly from the CWM Board. See Connected work in CWM .
Multi-team and program planning	Scrum Programs enabled coordination across multiple teams.	CWM is optimized for team-level execution. For program-level planning such as PI planning, use EAP. EAP teams can connect to

Functional area	In Agile Development 2.0	In CWM
		CWM so teams execute sprint work in CWM while program-level visibility remains in EAP. See Connecting EAP with Collaborative Work Management .

- [Connecting EAP with Collaborative Work Management](#)

Sprint planning in CWM

Plan, track, and manage work for your teams in the Agile methodology using Sprint planning in Collaborative Work Management.

Within the Sprint Planning view of your CWM Board, you can manage your team's backlog, create sprints, plan work into sprints, and execute them seamlessly. All existing work items on your CWM Board are automatically added to the Backlog pane in the Sprint Planning view. This means that whether the work items are old or new, they will all be visible in the Backlog. From this pane, you can easily schedule these items into sprints for execution.

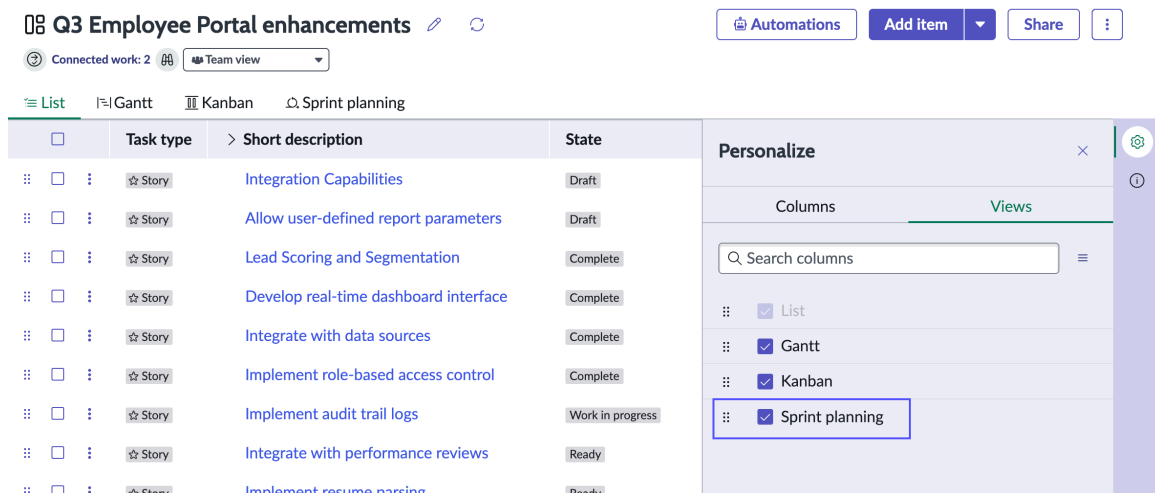

You have the flexibility to create work items of various types, such as Stories, or use any other default and custom work types that are available on your CWM Board. This flexibility ensures that you can tailor your sprint planning to fit the specific needs of your team and projects.

Enabling Sprint planning view

From the Views section of the Personalize (⚙️) side panel, select Sprint planning to enable the display of Sprint planning view on your CWM Board.

Note:

Save your Board view to ensure that the Sprint planning view is always displayed on your Board.

Backlog

The Backlog pane displays all unplanned work items, including both newly added and older incomplete tasks. Completed work items are not shown, keeping your focus on what needs to be done. You can add work items directly to the Backlog from this view and use the personalize side panel to show or hide columns within the Backlog pane, customizing the display to suit your needs.

Within the Backlog pane, you can do the following:

- Move work items to the top or bottom of the backlog based on the priority.
- Move items to the currently ongoing sprint.
- Move work items within the list by rearranging rows.
- Delete work items.
- Apply filters on any column. However, filters can't be applied on custom columns within Backlog.
- Change the number of items displayed per page.
- Duplicate work items by using **Copy row**.

i Note:

You can duplicate only CWM tasks and Stories but not other connected work records.

- Drag and drop a single or multiple work items from Backlog to one of the sprints.

The screenshot shows the ServiceNow Backlog interface. At the top, there's a header for 'Q3 Employee Portal enhancements' with options for 'Automations', 'Add Item', and 'Share'. Below the header, there are navigation tabs for 'List', 'Gantt', 'Kanban', and 'Sprint planning'. The main area is a table with columns: Task type, Short description, State, Story points, Assigned to, Priority, and Start date. A context menu is open over the first row, showing options like 'Copy row', 'Paste row above', 'Paste row below', 'Move to bottom', 'Move to current sprint', 'Move to top', and 'Delete task'. The table shows several items in 'Draft' state with various story points and priorities. At the bottom, it indicates 'Showing 1-10 of 84' records and 'Records per page 10'.

Sprints

The Sprints section in your CWM Board displays the list of active sprints. If you haven't created any sprints yet, this section will show a form to help you get started. You can create a sprint by selecting the sprint duration, start and end dates, and story points capacity. To create additional sprints with the same settings, use the **Add another Sprint** option. For sprints with different durations or capacities, select **Create Sprint**. For more information, see [Create a sprint in CWM](#).

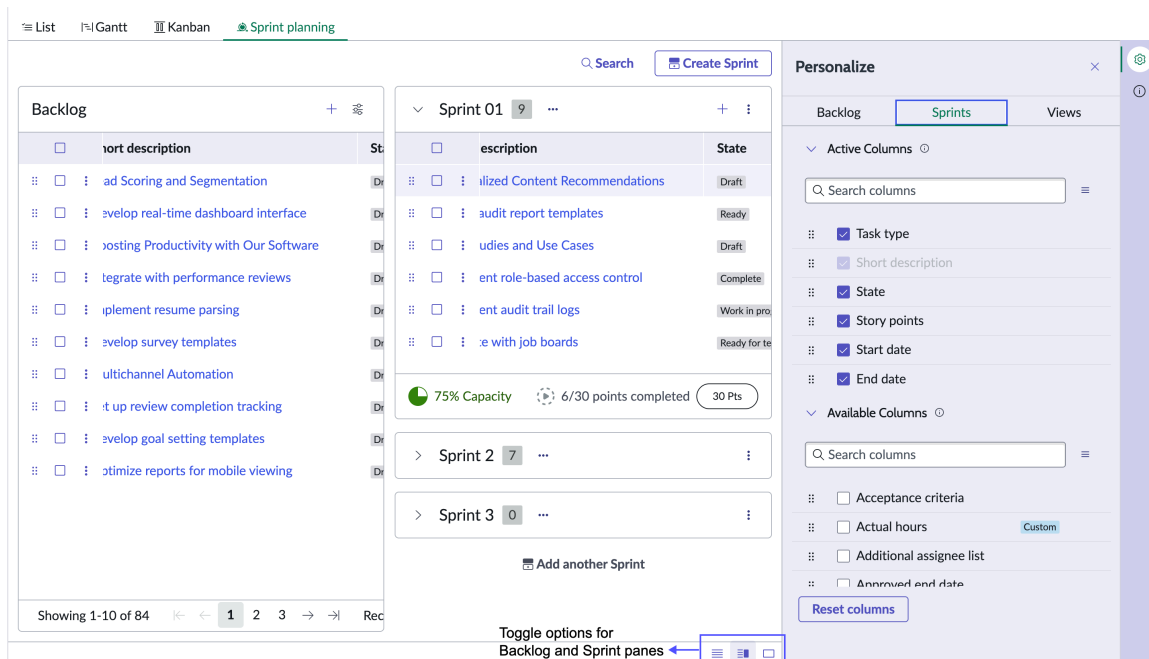

Each sprint is a collapsible section where you can add work items directly and customize the view using the personalize side panel. Each sprint section also shows the percentage of utilized capacity and the remaining story points, helping you manage your team's workload effectively.

The screenshot displays the 'Sprint planning' view in ServiceNow. At the top, navigation options include 'List', 'Gantt', 'Kanban', and 'Sprint planning'. A search bar and a 'View Completed Sprints' link are also visible. The main content area shows a 'Backlog' for 'DC Sprint 1' with 13 items. A context menu is open over the task 'Implement multi-factor authentication', offering options like 'Copy row', 'Paste row above', 'Paste row below', 'Delete task', 'Add scrum task', and 'Move to next sprint'. The task list includes columns for 'Short description', 'Story points', 'Assignee', and 'Priority'. Below the list, a progress indicator shows '0 of 25 points completed'. A second sprint section is partially visible below, showing tasks like 'Audit camera coverage in Tie...' and 'Conduct internal audit of dat...'. At the bottom, a capacity indicator shows '76% Capacity' and '6 of 25 points remain'.

Personalizing Sprint Planning view

You can customize the columns displayed in the Backlog and Sprint panes using the Personalize (⚙️) side panel, allowing you to see the most relevant information. Any changes you make can be saved to the current Board view or as a new view, depending on your needs.

If you require more working area for the Backlog or Sprints within the Sprint planning view, you can toggle between the **Backlog**, **Sprints**, and **Backlog and Sprints** options.

Add work items to Sprint planning Backlog in CWM

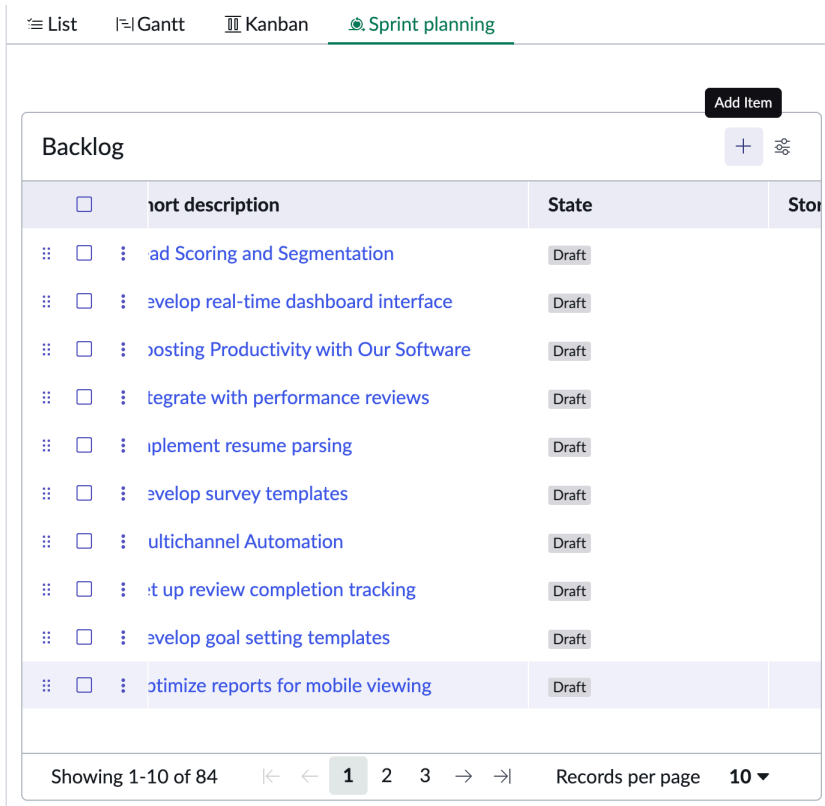

Create and add new work items to the Backlog directly from the Sprint planning view of Collaborative Work Management.

Before you begin

Role required: sn_cwm.cwm_user

Procedure

1. Navigate to **Workspaces > Collaborative Work Management**.
2. From a Space, select a Board that you're performing sprint planning for.
3. Select the **Sprint planning** tab.
4. From the Backlog pane, select the Add item (+) icon.

5. Select the work item type from the **Item type** drop-down list.
The default work item type available is Task. You can enable other types such as Story or create a custom type. See [Create and manage custom work item types in CWM](#).
6. On the form, fill in the details for the item such as short description, start and end dates, story points, and others.
7. Select **Submit**.

Result

The newly created work item is added to the Backlog.

What to do next

You can plan this item into one of the active sprints by dragging and dropping it into the Sprint section. See [Plan work items into sprints in CWM](#).

Create a sprint in CWM

Create a sprint with custom duration and capacity to enable your team to plan and execute their work in an Agile methodology in Collaborative Work Management.

Before you begin

Role required: sn_cwm.cwm_user

Procedure

1. Navigate to **Workspaces > Collaborative Work Management**.
2. From a Space, select a Board that you're performing sprint planning for.
3. Select the Sprint planning tab.
4. If there are no sprints in your CWM Board, you can use the **Plan a Sprint** form in the Sprints section.

5. If there are existing sprints, choose an option to create a new sprint.

What to do next

[Plan work items into sprints in CWM.](#)

Update sprint details in CWM

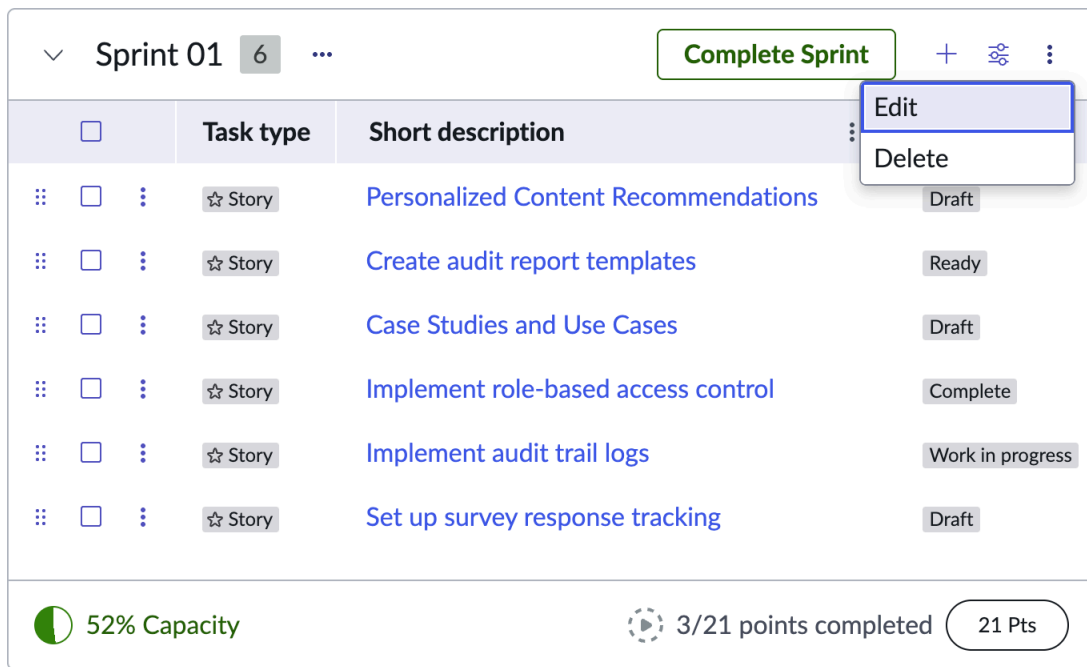

Modify the duration, capacity, and dates for a sprint in Collaborative Work Management.

Before you begin

Role required: sn_cwm.cwm_user

Procedure

1. Navigate to **Workspaces > Collaborative Work Management**.
2. From a Space, select a Board that you're performing sprint planning for.
3. Select the Sprint planning tab.
4. From the sprint header, select the More options icon (⋮) and select **Edit**.

5. Make the necessary edits to the sprint details.

6. Select **Save**.

[Delete a sprint in CWM](#)

Delete a sprint in CWM

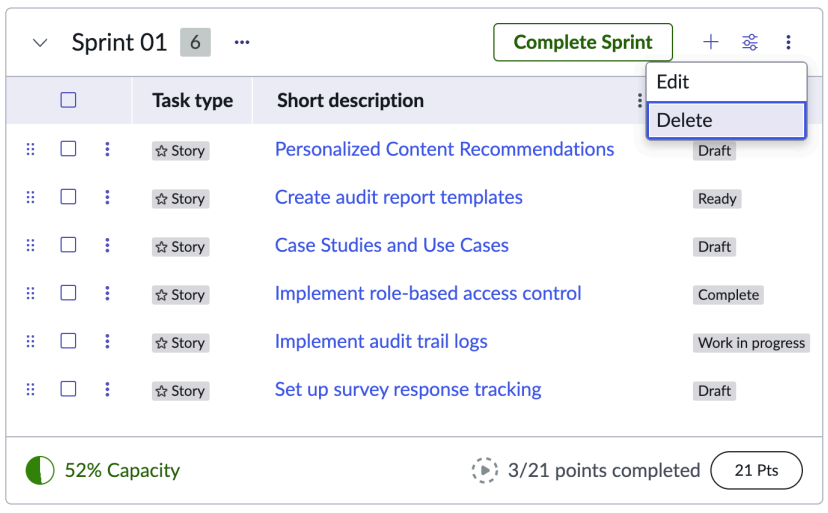

Delete individual sprints from Sprint planning in Collaborative Work Management so that your Board reflects the changes in your planning priorities.

Before you begin

Role required: sn_cwm.cwm_user

Procedure

1. Navigate to **Workspaces > Collaborative Work Management**.
2. From a Space, select a Board that you're performing sprint planning for.
3. Select the Sprint planning tab.
4. From the sprint header, select the More options icon () and select **Delete**.

5. In the Delete Sprint confirmation modal, select **Delete**.

Result

The sprint is deleted and any active incomplete work items that were scheduled into this sprint are moved to the backlog.

Create work items for sprints in CWM

Create and add new work items to a sprint directly from the Sprint planning view of Collaborative Work Management.

Before you begin

Role required: sn_cwm.cwm_user

Procedure

1. Navigate to **Workspaces > Collaborative Work Management**.
2. From a Space, select a Board that you're performing sprint planning for.
3. Select the Sprint planning tab.
4. From the sprint header, select the Add item () icon.

Search Create Sprint

The default work item type available is Task. You can enable other types such as Story or create a custom type. See [Create and manage custom work item types in CWM](#).

6. On the form, fill in the details for the item such as short description, start and end dates, story points, and others.

7. Select **Submit**.

Plan work items into sprints in CWM

Schedule stories and other CWM tasks from the backlog into sprints or move work across sprints in Collaborative Work Management.

Before you begin

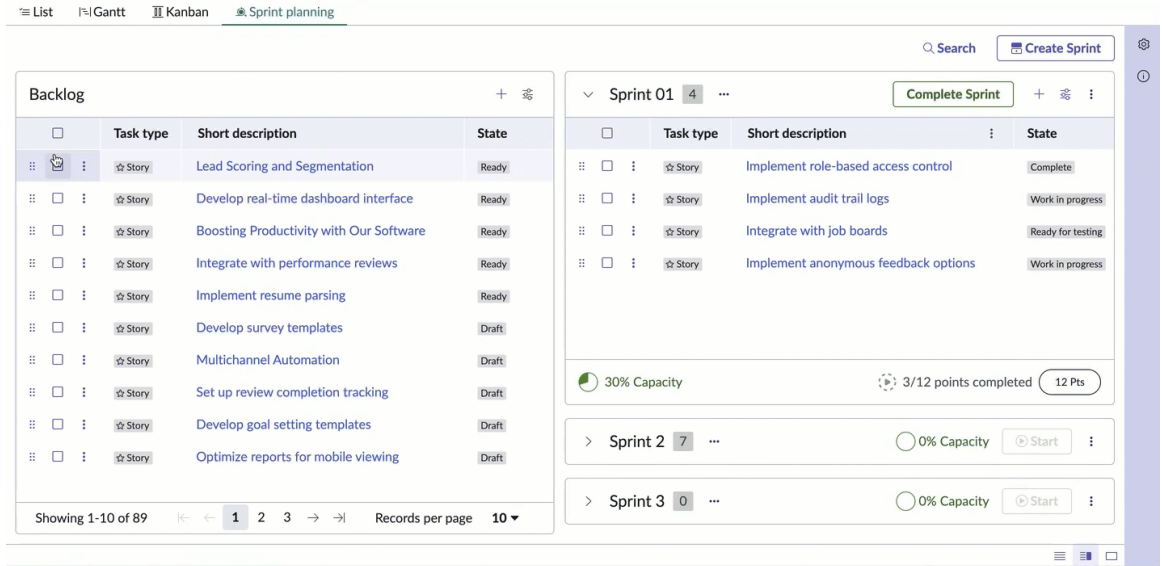

Role required: admin

Procedure

1. Navigate to **Workspaces > Collaborative Work Management**.
2. From a Space, select a Board that you're performing sprint planning for.
3. Select the Sprint planning tab.
4. From the Backlog, select the work items that you'd like to schedule into a sprint.

5. Drag and drop them into the sprint of your choice.
You can drag and drop the work items into sprints even when the sprint sections are collapsed.
6. To move the work items from one sprint to another, select them and drop them in the sprint of your choice.

Here's a gif showing the drag and drop action between the backlog and sprint sections, and across

sprints.

Start or complete a sprint in CWM

Start a sprint so that your team can start work on the planned items. After your team finishes the assigned work, you can mark this sprint complete, all directly from the Sprint planning view in Collaborative Work Management.

Before you begin

Role required: sn_cwm.cwm_user

Procedure

1. Navigate to **Workspaces > Collaborative Work Management**.
2. From a Space, select a Board that you're performing sprint planning for.
3. Select the Sprint planning tab.
4. To start a sprint, select **Start** from the sprint header.

<input type="checkbox"/>	Task type	Short description	:	State
⋮ <input type="checkbox"/> ⋮	Task	Release Notes	:	Open
⋮ <input type="checkbox"/> ⋮	Story	Integration Capabilities	:	Draft
⋮ <input type="checkbox"/> ⋮	Story	Allow user-defined report parameters	:	Draft
⋮ <input type="checkbox"/> ⋮	Story	Develop review templates	:	Draft
⋮ <input type="checkbox"/> ⋮	Story	Simplifying Complex Processes	:	Draft
⋮ <input type="checkbox"/> ⋮	Story	Integrate with data sources	:	Draft

55% Capacity 18/40 points remain 22 Pts

5. Complete a sprint.

a. From the sprint header, select **Complete Sprint.**

<input type="checkbox"/>	k type	Short description	:	State
⋮ <input type="checkbox"/> ⋮	ask	Release Notes	:	Closed Complete
⋮ <input type="checkbox"/> ⋮	tory	Integration Capabilities	:	Draft
⋮ <input type="checkbox"/> ⋮	tory	Allow user-defined report parameters	:	Draft
⋮ <input type="checkbox"/> ⋮	tory	Develop review templates	:	Complete
⋮ <input type="checkbox"/> ⋮	tory	Simplifying Complex Processes	:	Complete
⋮ <input type="checkbox"/> ⋮	tory	Integrate with data sources	:	Complete

55% Capacity 13/22 points completed 22 Pts

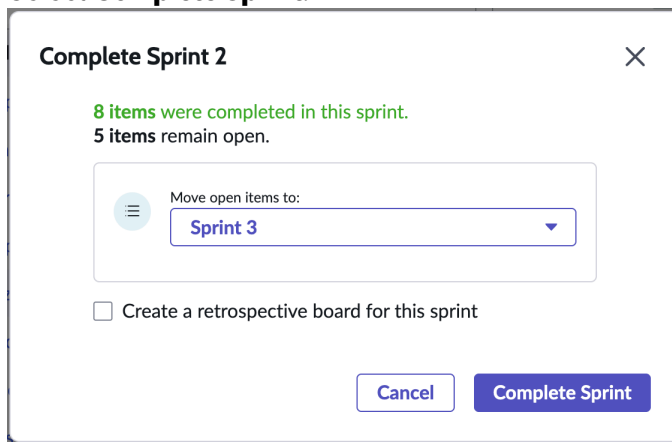

b. Review the details of completed and open items for this sprint.

c. Move the incomplete items to the next sprint or the backlog.

d. Choose to create a retrospective Board for this sprint to perform a sprint retrospective with your team.

For more info, see [Create a retrospective board for a sprint in CWM](#).

e. Select Complete Sprint.

The sprint is marked as complete and is no longer displayed on the Sprint planning view anymore. All the open items are moved into the next sprint or to the backlog based on your selection.

Create a retrospective board for a sprint in CWM

When marking a sprint complete, choose to create a sprint retrospective board for your team to collaborate and reflect on the recent sprint in Collaborative Work Management.

Before you begin

Role required: sn_cwm.cwm_user

Procedure

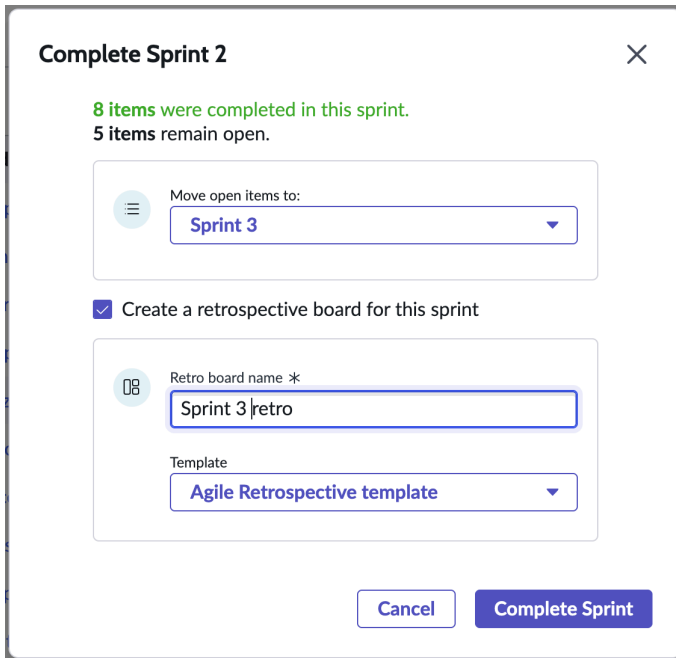

1. Navigate to **Workspaces > Collaborative Work Management**.
2. From a Space, select a Board that you're performing sprint planning for.
3. Select the Sprint planning tab.
4. From the sprint header, select **Complete Sprint**.

5. Review the details of completed and open items for this sprint.
6. Move the incomplete items to the next sprint or the backlog.
7. Select the option create a retrospective Board for this sprint.
8. Provide a name for your Board.

9. Select a template to apply to this Board.

By default, the Agile Retrospective template is applied. If you want to create a different template depending on your requirements, see [Templates in CWM for Boards and Docs](#).

10. Select **Complete Sprint**.

Result

A new retrospective Board is created for the sprint that is just marked complete within the same Space. You can navigate to the new board from the success message or from the left navigation

panel.

Scrum tasks for stories in CWM

Extend your agile workflow in CWM by breaking user stories into scrum tasks, giving your team the granularity needed to estimate effort, distribute work, and track daily progress through a sprint.

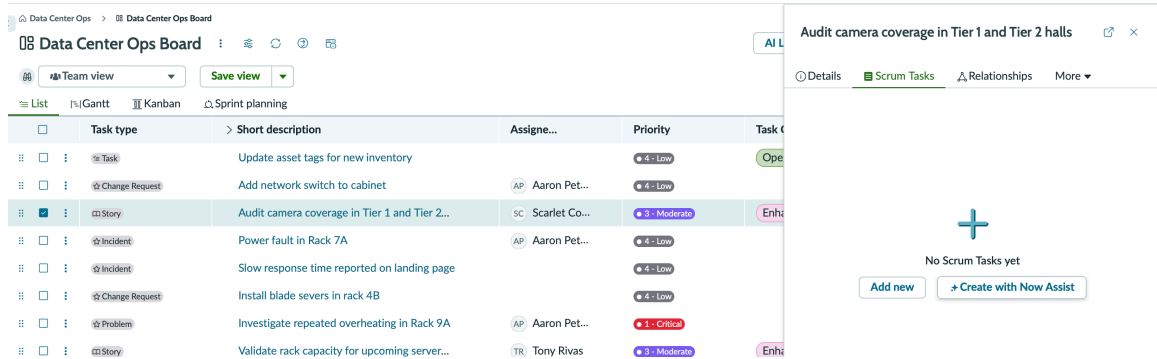

In CWM, scrum tasks represent the individual units of work that make up a user story. While stories capture a feature or requirement from the user's perspective, scrum tasks break that story into steps that team members can pick up and complete independently during a sprint. Scrum tasks are always associated with a parent story and aren't a standalone work items on the board.

Creating scrum tasks

You can create scrum tasks manually or use Now Assist to generate them based on the story content.

Manual creation

After a story is saved, a Scrum Tasks tab is available on the story form. From this tab, you can add tasks by entering a title and any relevant details directly on the story. You can also create scrum tasks for stories inline from the List and Sprint planning views. For more information, see [Add scrum tasks to a story in CWM](#).

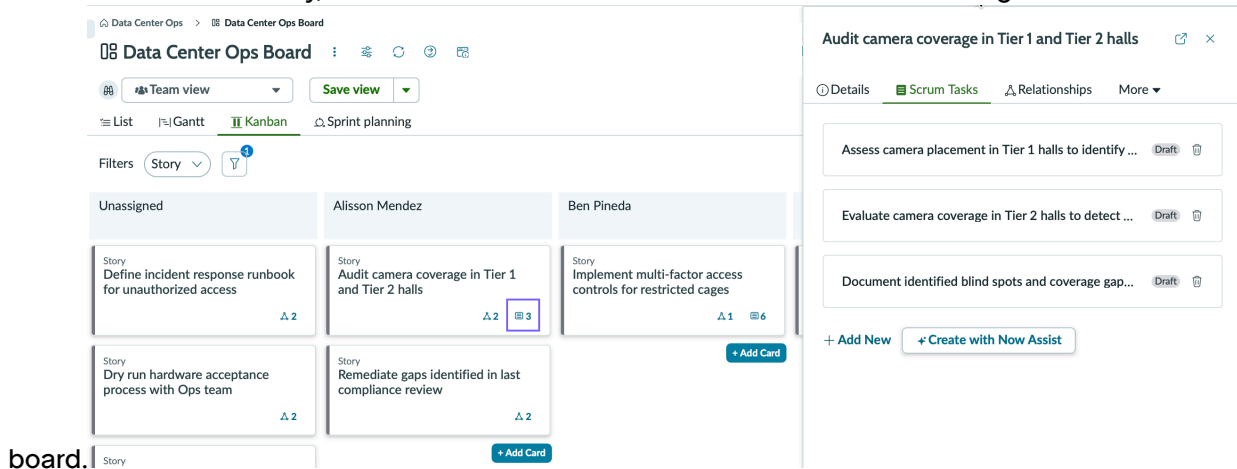

AI-generated scrum tasks

Now Assist can analyze the story description and context to suggest a set of scrum tasks. The **Create with Now Assist** button on the story form and the inline sparkle button on the **Scrum tasks** tab both trigger generation. You can review the suggestions, regenerate if the results don't fit the story, and then insert the tasks. AI-generated tasks serve as a starting point and can be edited after they're created. For more information, see [Generate scrum tasks for a story with Now Assist for CWM](#).

Scrum tasks on the Kanban board

When a story has one or more scrum tasks, a scrum task indicator icon appears on the story's Kanban card. Selecting the icon opens a side panel that shows the scrum tasks for that story, so team members can view task details without leaving the

board. Quick filters on the Kanban board let teams focus on specific sprints, states, or other columns. Multiple filters can be active at the same time, and a counter at the top of the board shows how many filters are currently applied. This makes it easier to track sprint-specific work during daily stand-ups and sprint execution.

Scrum task considerations and limitations

- Scrum tasks belong to a parent story and can't exist independently as standalone work items on the board.
 - When a story is moved from one sprint to another, the child scrum tasks also move to the new sprint.
 - You can reorder scrum tasks only within its parent story.
 - Scrum tasks can't be moved (drag and drop) or copied outside its parent story.
- Percent complete isn't rolled up from scrum tasks to the parent story. Percent complete is tracked only for CWM tasks.
- When a story is imported through Connected work, its associated scrum tasks are brought in automatically along with it. Scrum tasks can't be imported directly through Connected work.
- Scrum tasks can't be assigned to a sprint independently. They inherit the sprint of their parent story. When you change the sprint for a story, all associated scrum tasks move to the new sprint automatically.
- Scrum tasks aren't displayed in the Backlog section of the Sprint planning view. They're shown only in the sprint section.
- Sprint information can't be edited on a scrum task record.
- Deleting a scrum task in CWM doesn't delete the underlying record. It's only removed from viewing in CWM.
- You can't add scrum tasks if the scrum task work type is disabled in your ServiceNow instance.
- You can't add scrum tasks if you have just the Viewer access to the CWM Board.
- If scrum tasks were previously imported through Connected work before upgrading to v9.0.0, and stories are then imported through Connected work after the upgrade, duplicate scrum tasks may appear on the board. To resolve this, remove the existing configuration for scrum tasks in Connected work for your Board.

[Task dependencies and relationships in CWM](#)

Add scrum tasks to a story in CWM

Break down a user story into scrum tasks in Collaborative Work Management (CWM) to distribute work across team members and track daily progress during a sprint.

Before you begin

Role required: sn_cwm.cwm_user

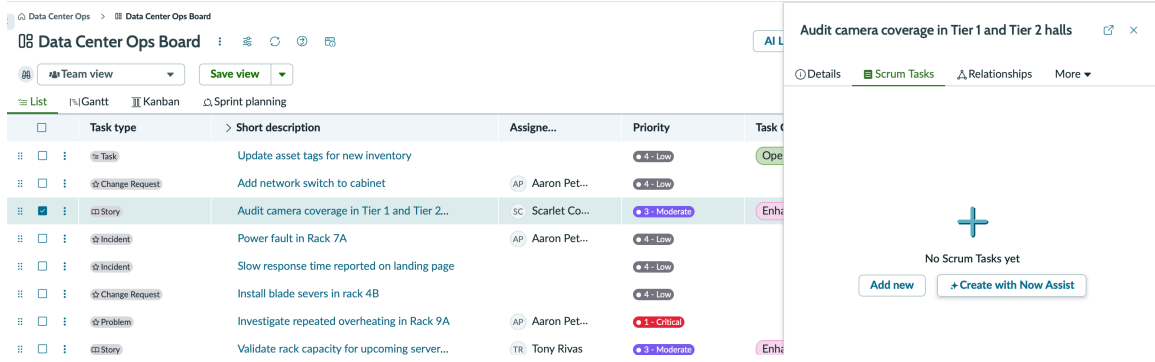

About this task

Scrum tasks are added one at a time from the **Scrum tasks** tab on a story form. To generate multiple scrum tasks at once based on the story description using Now Assist, see [Generate scrum tasks for a story with Now Assist for CWM](#).

Procedure

1. Navigate to **Workspaces** > *Collaborative Work Management*.
2. From a Space, select a Board.
3. Open a story by selecting it from one of the views (List, Gantt, Kanban, or Sprint planning).

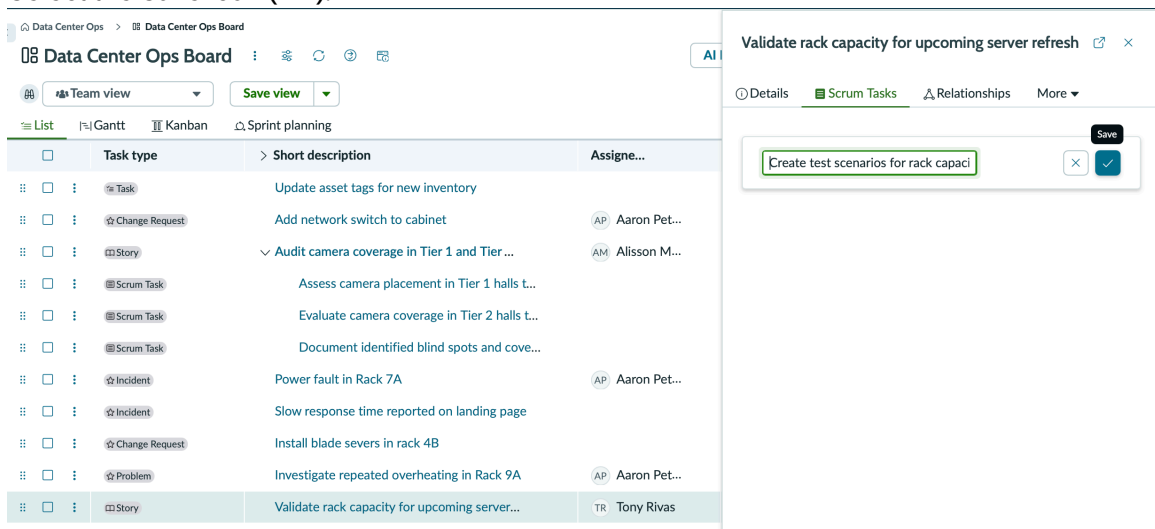

4. Select the **Scrum Tasks** tab on the story form.

5. Select **Add new**.

6. Enter a name for the scrum task.

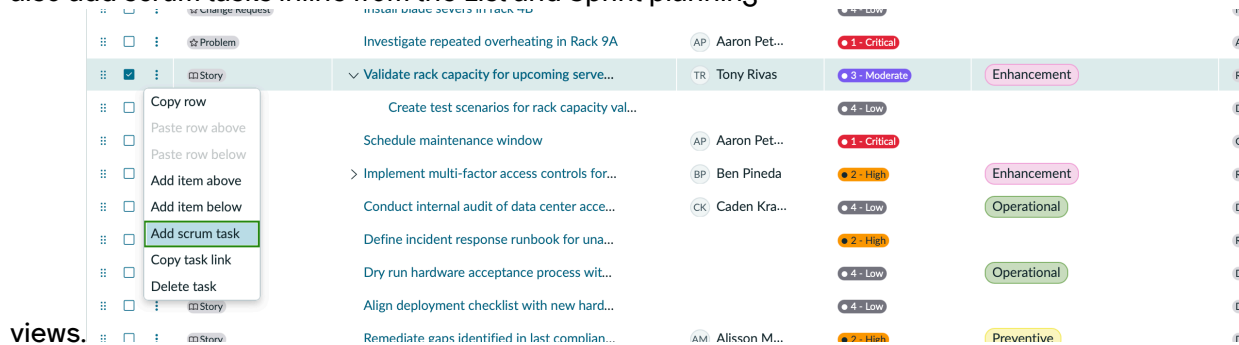

7. Select the Save icon (✓).

8. Select **+ Add new** to add more scrum tasks.

What to do next

To add more scrum tasks, repeat the previous steps. You can also add scrum tasks inline from the List and Sprint planning

To generate scrum tasks automatically based on the story content without manual work, see [Generate scrum tasks for a story with Now Assist for CWM](#).

Task dependencies and relationships in CWM

Increase visibility into how work is connected by linking work items directly in Collaborative Work Management (CWM), eliminating the need to track dependencies in spreadsheets or notes fields.

In CWM, you can link any task-type work item to another to show how pieces of work relate to each other. Relationships are informational and team members can progress on a work item regardless of the state of its linked items. Relationships can be created across Boards and Spaces, giving teams visibility into cross-team dependencies for their work.

Relationship types

Work items in CWM support three relationship types.

Prerequisite

Indicates that another work item must be completed before this item can begin. Use this relationship to communicate sequencing and upstream dependencies to your team. Only task-type work items extending the Task [task] table and CWM tasks can be added as prerequisites. Planning items such as Epics aren't supported.

Dependent

Indicates that this work item must be completed before work on another item can begin. This is the inverse of a prerequisite relationship and communicates downstream impact to your team.

Related

Indicates a general connection between two work items without implying a specific order of execution. Use this relationship when items share context, overlap in scope, or are otherwise connected without one blocking the other.

The screenshot displays the ServiceNow CWM interface. On the left, a Kanban board titled 'Data Center Ops Board' is shown in 'Team view'. It has filters for '2 task types' and is divided into columns for 'Unassigned', 'Aaron Peterson', and 'Adam McCarty'. Tasks are represented as cards with status indicators (e.g., '1', '2').

On the right, a detailed view of a task is shown: 'Remediate gaps identified in last compliance review...'. The 'Relationships' tab is active, showing three categories:

- Pre-requisite (1):** Tasks that must be completed before this task. One story is listed: 'Define incident response runbook for unauthorized access'.
- Dependent (1):** Tasks that depend on the completion of this task. One demand is listed: 'Automated Project Orchestration Platform'.
- Related (0):** Tasks that are linked to this task without dependency. No items are listed.

Linking work items across boards and spaces

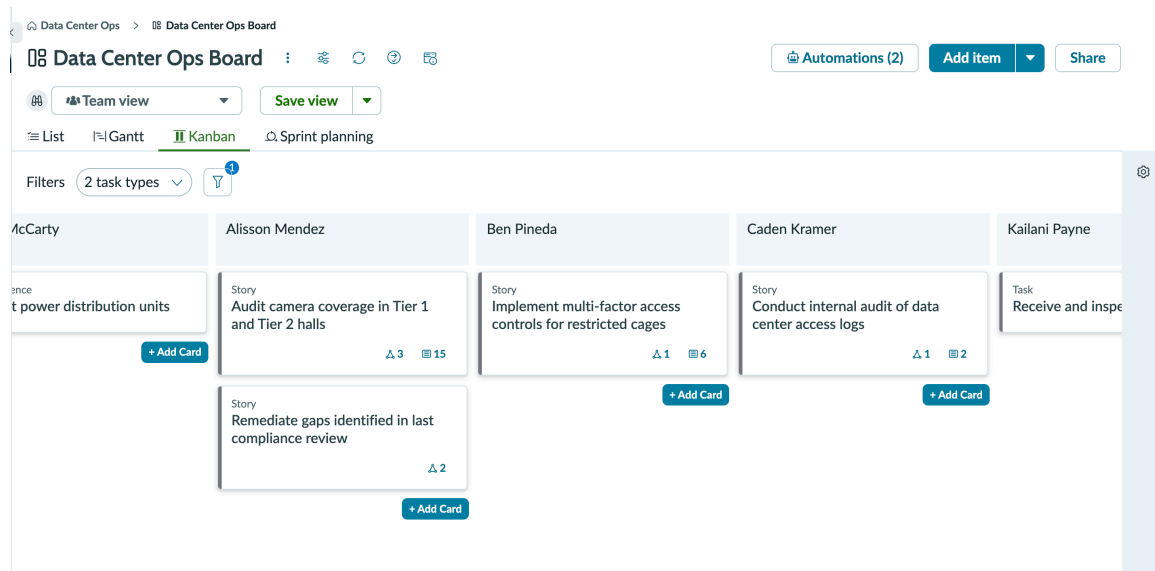

You can link any task-type work item to another across the ServiceNow AI Platform, regardless of which Board or Space it belongs to. To create a relationship, search for the work item by name and attach it. The search covers all task type work items that you have permission to view.

Note:

Work items brought onto a Board through the Connected work feature don't display relationships on their original source record unless the relationship is added directly on that record.

Relationships on the Kanban board

When a work item has one or more relationships, a relationships indicator icon appears on its Kanban card. Selecting the icon opens the right side panel showing the related work items and their relationship types, so team members can view dependency details without leaving the board.

Task dependency considerations and limitations

- Planning items such as Epics can't be added as prerequisites because they aren't derived from the Task [task] table.
- You can add a work item as a dependency on if you have permission to view that item.
- Relationships have no effect on percent complete calculations for CWM Tasks or Boards in Strategic Planning Workspace.
- If a story in the Story [rm_story] table already has prerequisite and dependent stories associated to it, those details are shown in CWM.
- Adding a story-type work item as a relationship to another story syncs with the prerequisite and dependent fields in the Story [rm_story] table.
- Adding a non-story-type work item as a relationship to a story does not sync with the Story [rm_story] table.

Add a dependency to a work item in CWM

Link a work item to another in Collaborative Work Management (CWM) to show how they relate, whether one is a prerequisite for another or they are generally connected.

Before you begin

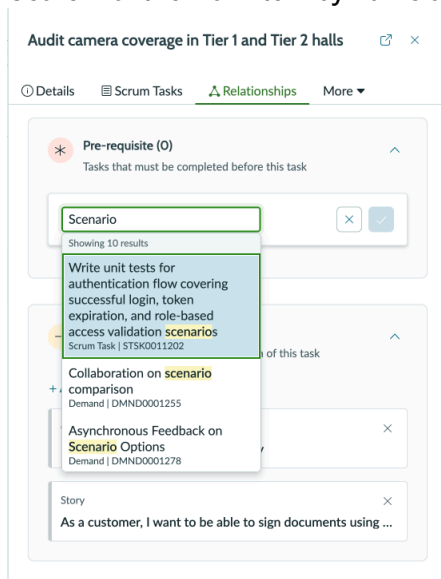

Role required: sn_cwm.cwm_user

About this task

Relationships are added from the **Relationships** tab on the work item form in the side panel. You can link work items across Boards and Spaces, and a single work item can have multiple relationships. For an overview of the available relationship types, see [Task dependencies and relationships in CWM](#).

Procedure

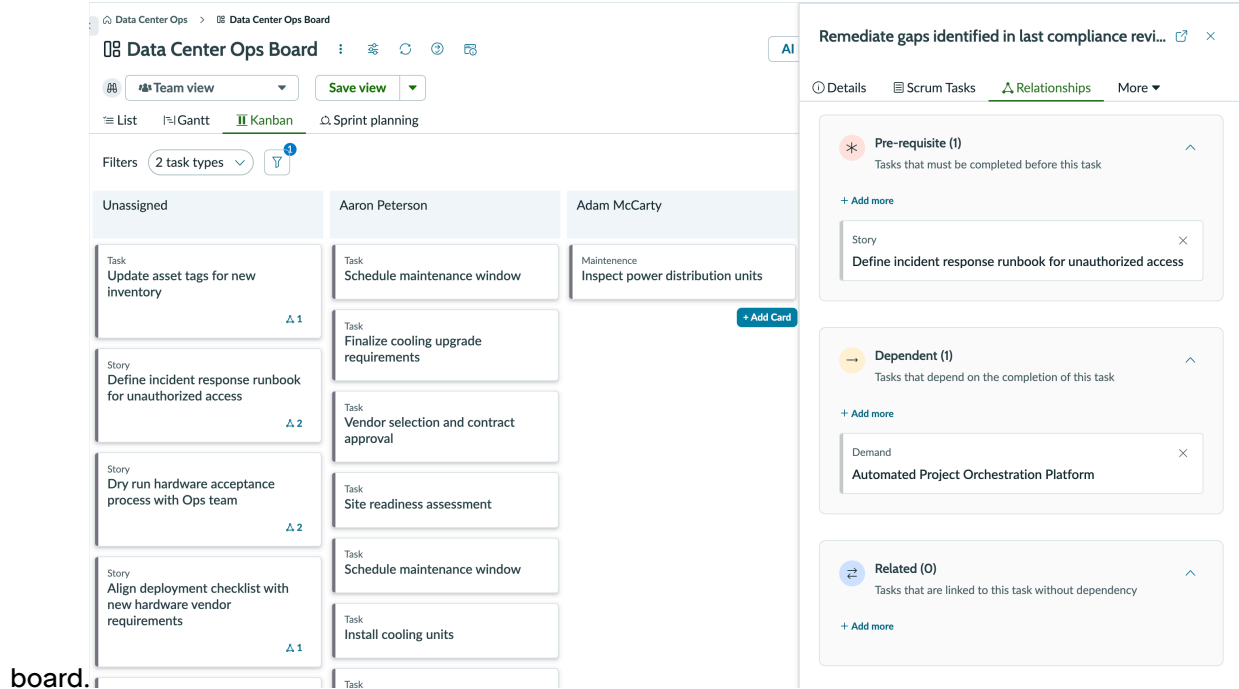

1. Navigate to **Workspaces** > *Collaborative Work Management*.
2. From a Space, select a Board.
3. Select a work item to open it in the side panel.
4. Select the **Relationships** tab.
5. From the **Prerequisite**, **Dependent**, or **Related to** section, select **Add more**.
6. Search for the work item by name and select it.

7. Select the Save icon () to save the relationship.

What to do next

After adding a relationship, a relationships indicator icon appears on the work item's Kanban card. Select the icon to view all relationships for that work item from the

If a relationship doesn't apply to your task anymore, you can remove it. For more information, see [Remove a dependency from a work item in CWM](#).

Related topics

[Task dependencies and relationships in CWM](#)

[Remove a dependency from a work item in CWM](#)

Remove a dependency from a work item in CWM

Unlink a relationship between work items in Collaborative Work Management (CWM) when it is no longer relevant or was added incorrectly.

Before you begin

Role required: sn_cwm.cwm_user

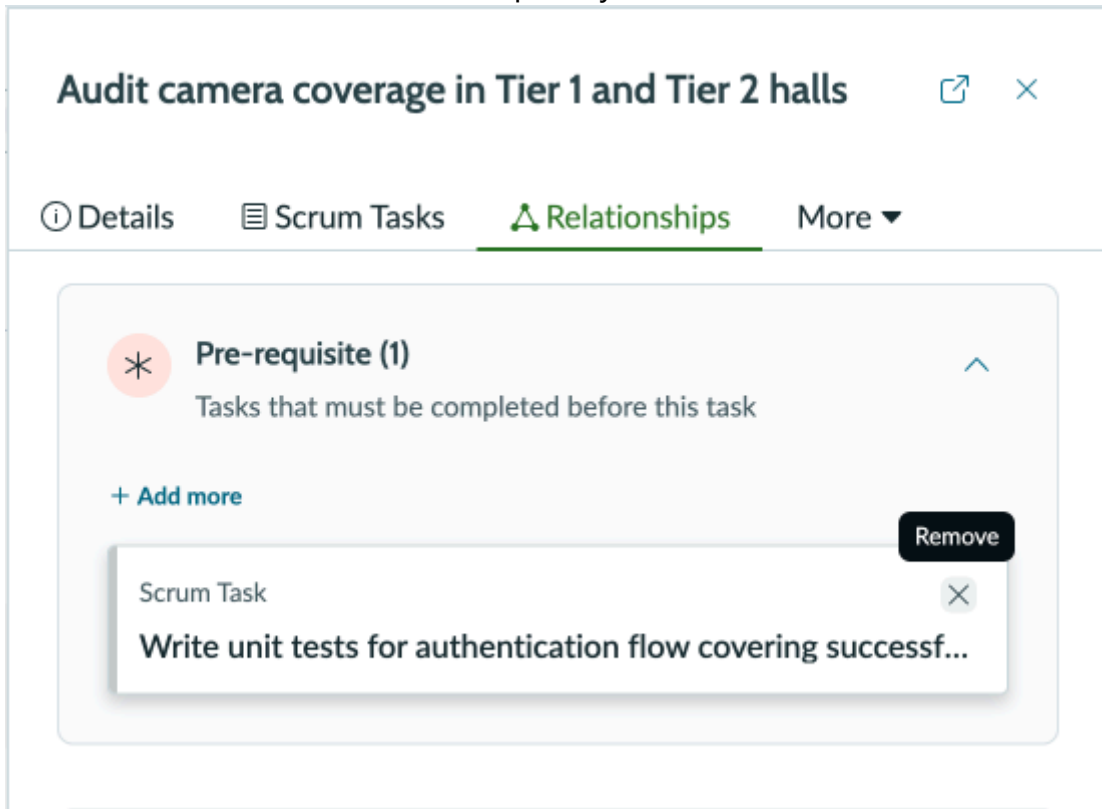

About this task

Relationships are removed from the **Relationships** tab on the work item form. Removing a relationship does not affect the work items themselves or their progress, it only removes the link between them.

Procedure

1. Navigate to **Workspaces** > *Collaborative Work Management*.
2. From a Space, select a Board.
3. Select a work item to open it in the side panel.
4. Select the **Relationships** tab.

5. Select the remove icon on the relationship card you want to remove.

Result

The relationship is removed from both work items.

What to do next

To add a new relationship, see [Add a dependency to a work item in CWM](#).

[Task dependencies and relationships in CWM](#)

[Add a dependency to a work item in CWM](#)

Connecting EAP with Collaborative Work Management

Enhance visibility and streamline planning for your Agile teams by connecting Enterprise Agile Planning (EAP) with Collaborative Work Management (CWM).

Overview of EAP-CWM connection

The EAP-CWM integration enables organizations to connect strategic program planning with team-level execution in a single system, eliminating silos and improving delivery predictability.

Using EAP, program managers and release train engineers can define Program Increment (PI) objectives, align Epics, Features, and Stories, create sprints for teams, and manage cross-team dependencies. After completing a PI, they can conduct PI retrospectives and update roadmaps for the next cycle. These capabilities ensure that enterprise priorities are clearly structured and traceable across all levels.

By linking EAP to CWM, product owners and team members can plan and execute sprints, manage agile stories alongside operational tasks such as incidents, track progress, and hold team-level retrospectives, all within the same workspace.

This connection between the applications reduces context switching and ensures that both planned and unplanned work is accounted for, without losing alignment to strategic goals. The result is end-to-end transparency where leadership can track progress against PI goals through EAP, while teams maintain flexibility to adapt to changing priorities.

Workflow of EAP-CWM integration

1. EAP admin connects an EAP team to CWM. See [Connect an EAP team with CWM](#).
2. A new Space and Board are created for this EAP team in the CWM workspace.
3. Existing work items assigned to this EAP team are brought over to the newly created CWM Board through Connected Work filters.
4. Sprint planning view is enabled for this CWM Board where the existing work items and sprints are automatically shown.
5. Check team's access to CWM and provide the CWM user [sn_cwm.cwm_user] to all team members.
6. EAP team can start creating more work, manage current work, and update progress directly from the CWM Board. See [Sprint planning in CWM](#).
7. The team's progress and work status is reflected back on the Team dashboard in the EAP workspace. See [EAP Agile Team dashboard](#)

Creating or managing sprints for EAP teams in CWM

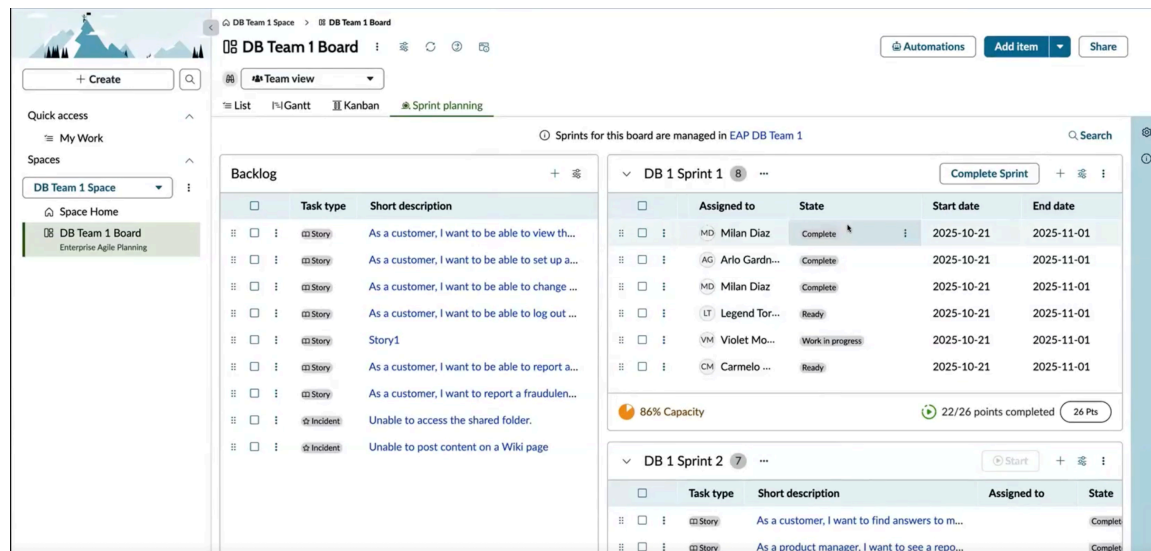

For EAP teams integrated with CWM, existing sprints and their scheduled work automatically sync to CWM. These details are displayed in the Sprint Planning view on the CWM Board.

As the team progresses through assigned work, they can update the work status directly in the Sprints section. The sprint can be marked **Complete** from this view and any incomplete work items can be moved either to the backlog or the next sprint, if it exists.

New sprints for the team must be created in EAP. After creating new sprints in EAP, they will sync to CWM, allowing the team to schedule work into these sprints from CWM.

Note:

Sprints for EAP teams are not created directly at the Agile team level. Sprints are created automatically when a Planning Interval (PI) is defined for the parent Agile Release Train (ART) in EAP and sync to CWM automatically.

My Work in CWM

Manage your work from all ServiceNow applications from a centralized view in the Collaborative Work Management workspace.

My Work provides a centralized view of all your assigned tasks, including project tasks, problems, and incidents. It also offers visualizations that group items by state, priority, and status, such as open or overdue.

Work items from all ServiceNow applications assigned to you're displayed in My Work. If you receive a work item on the CWM Board via Connected Work, those items appear here as well. This ensures you have a single source for all assigned work without the need to switch between applications.

i Note:

- Any task record created in a table that doesn't extend the Task [task] table, such as VTask, won't show up in My Work.
- If you're added as **Additional assignee** to a task, work with your admin to enable the display of such tasks in My Work. See [Properties installed with CWM](#).

Overview tab of My Work

The following are the filters available on My Work:

- Task type filter displays a list of all task types that are assigned to you currently.
- Date filter lets you select predefined or custom date ranges.
- You can choose to include open items that don't have start or end dates.

My Work page has two views, Overview and List.

- Overview tab shows multiple widgets that provide information related to the progress of your work. It also enables you to apply filters on the type of tasks that you want to view.
- List tab shows all open work items assigned to you in a list or grid format, where you can apply the group by and filter options on the columns.

List view also provides a link back to the source of the work item. For example, if your work item is a Risk, the Source column in the List view provides a navigation to the RIDAC page of the Project Workspace application.

The List view shows all open work items assigned to you. Select the **Short description** of a work item to view its details in a modal pop-up. Select the **Source** of a work item to open the work item in a new tab.

Note:

- The list view displays all the tasks with start or end dates that fall within the range of the date filter.
- Any closed task that doesn't have dates populated isn't shown in My Work.
- You can't perform bulk editing of state, priority, or date values of the tasks through My Work.

Managing SPM work in Collaborative Work Management

Team members can view and update project tasks and demand tasks directly in Collaborative Work Management (CWM) using team member roles, without requiring access to Project Workspace or Next Experience for Demand Management.

Collaborative Work Management application provides roles that give team members access to project tasks and demand tasks within CWM. Using these roles, team members can manage their assigned work through CWM features such as My Work and Connected Work and submit time card against the project tasks and demand tasks.

Team member roles

The following roles are available for team members:

Team member read [sn_stm.team_member_read]

Allows users to view project tasks and demand tasks, and leave comments on them.

Team member read-write [sn_stm.team_member_read_write]

Allows users to view and edit project tasks and demand tasks.

For the full list of access permissions for each role, see [Team member role access permissions in CWM](#).

Note:

Assigning one of these team member roles automatically grants the CWM user role [sn_cwm.cwm_user] and Time card user role [timecard_user].

Accessing project and demand tasks in CWM

After a team member role is assigned, users can view and manage project and demand tasks in CWM through the following features:

- **My Work:** View all project and demand tasks assigned to you in one place. For more information, see [My Work in CWM](#).
- **Connected Work:** Pull project and demand tasks into CWM Boards using flexible filters, such as tasks assigned to you, your assignment group, or other criteria. You can edit and update tasks directly from the board.

For more information, see [Connected work in CWM](#)

By default, team member roles provide broad access to the tasks assigned to them. Administrators can configure additional ACLs to restrict access to specific tasks.

Accessing My Calendar

Users assigned these team member roles can access My Calendar and perform the following actions:

- View My calendar
- Edit My calendar
- Create Events on calendar
- Delete their own events

Note:

Users can see only events that they created.

Considerations

The following limitations apply to team member roles in this release:

- Team member roles don't grant access to Project Workspace or Next Experience for Demand Management.
- The SPM applications such as Project Workspace and Next Experience for Demand Management must be present in your ServiceNow AI Platform instance for team members to be able to access those work items from CWM.
- The Timecard Management application must be installed to for team members to create timecards against their project tasks or demand tasks.

[Managing SPM work in Collaborative Work Management](#)

Collaborative documentation using CWM

Manage all kinds of documentation for work such as meeting notes, project requirements, or technical specifications using rich text Docs with real-time collaboration.

Overview of collaboration within Docs for CWM workspace. Approximately two minutes long.

Docs can be created within a Space, and organized into folders. Within a Space, you can create multiple Docs and within each Doc, you can create unlimited pages to help you effectively organize your information.

Key features of Docs

- Auto-save content.
- Live user presence: See who is viewing or editing the document in real time.
- @-mention notifications: Get notified when someone @-mentions you in a Doc.
- Templates: Create and apply document templates.
- Rich text formatting: Headings, lists, alignment, and other paragraph styles.
- Block-level editing: Move text blocks to change placement.
- Cross-references: Add references to other ServiceNow AI Platform tables to connect work across teams.
- Slash command (/) for more options:
 - Insert tables quickly
 - Mention a record. See [Dynamic data linking](#).
 - Insert a list.
 - Choose formatting options.
- Copy and paste within Docs: Transfer text, images, lists, and tables between Docs pages.
- Table features:
 - Resize column width
 - Add color to single or multiple cells
 - Select multiple cells using mouse or **Shift + arrow** keys

- Delete content from multiple cells using **Backspace** or **Delete** keys.
- Copy and paste cell content:
 - Copy from one cell and paste into multiple cells
 - Copy from n number of cells and paste into another set of n number of cells
 - Copy multiple cells and paste as a new table in an empty block

Images in Docs

Insert images into your Docs by uploading a file from your device or adding a web URL. Note that inserting Google Images links might not work.

Save images from your CWM documents directly to your device, making it easier to share or use them outside of the Docs environment. Click an image to access the download icon (📄), then click the icon to save it to your device. Alternatively, right-click the image and use your browser's built-in save option.

Inline comments

Add comments to specific text in documents to collaborate with other users, provide feedback, or track discussions without modifying the document content.

Visual indication

Commented text displays with a yellow highlight and underline. Clicking the text darkens the highlight and opens a popover showing the comment thread.

Add a comment

Select text and click **Comment** from the selection toolbar. You can include hyperlinks by typing or pasting URLs directly into your comment and these links are automatically converted to a clickable format when you post the comment.

Mention users

Type @ followed by a name to mention someone in your comment. Select the user from the lookup that appears. Mentions are highlighted in the posted comment, and the system can trigger notifications to alert mentioned users.

Edit your comments

If you're the owner of the comment, you can modify your comment text. Edited comments display an **Edited** indicator to show they have been updated.

Comments on dynamic data

Add comments to dynamic data elements such as references and links. Click once to open the comment popover, or click again while the popover is open to navigate to the referenced content.

Comment restrictions

Overlapping comments on the same text are not supported—reply to existing threads instead. Comments cannot be added to non-text elements such as images and table cells.

Show or hide highlights

Toggle comment highlights on or off to switch between a marked-up view and a clean reading view.

Export behavior

Comments and highlights are excluded when you export a document to PDF or duplicate it.

Read-only access

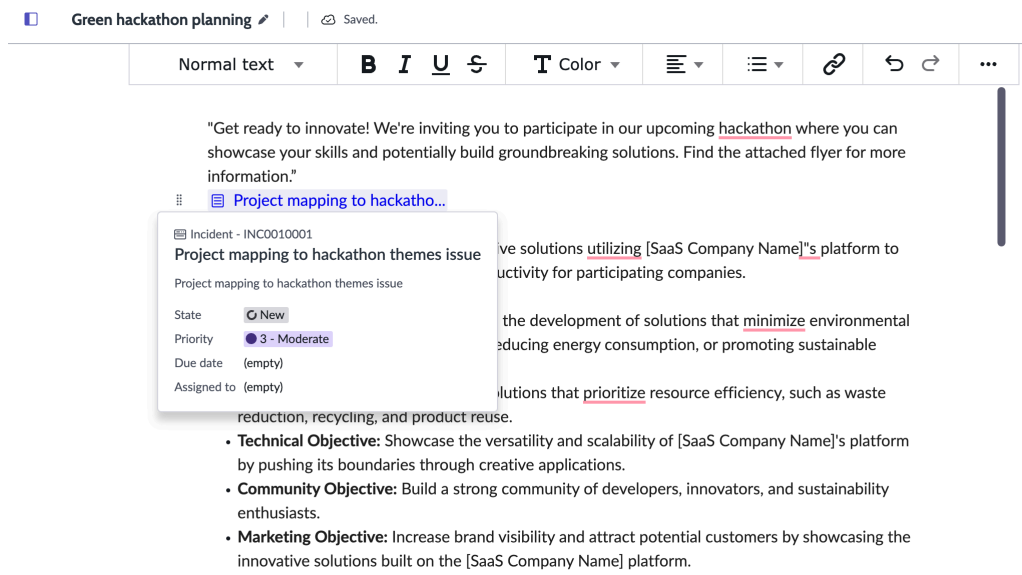

Users with read-only document access can still add and view comments.

Dynamic data linking in Docs

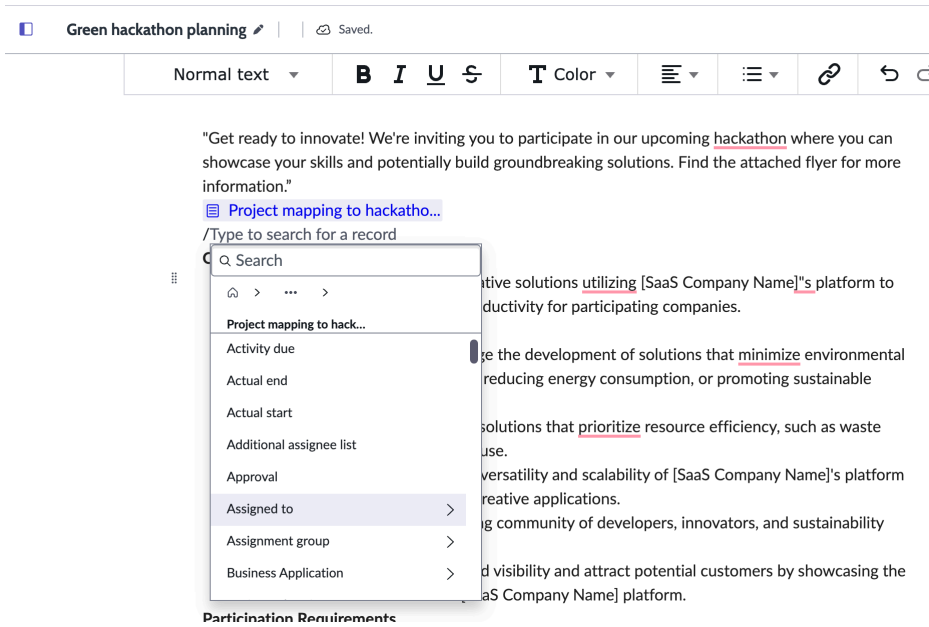

Keep record information in your documentation always current and reduce manual effort with the Dynamic data linking feature in Docs. You can now reference any ServiceNow application record and Docs will automatically reflect the latest updates from those records.

For example, if you add a reference to an Incident record, the reference shows the latest field information of the incident in Docs without requiring manual edits. Selecting the incident reference opens up the incident form so that you can view the full details of the incident and make any necessary changes.

A hover popover displays the details of the mentioned record, providing quick access to additional information without leaving the current context.

Dynamic linking also enables adding references to a particular field of a record, such as Assigned to of an Incident record.

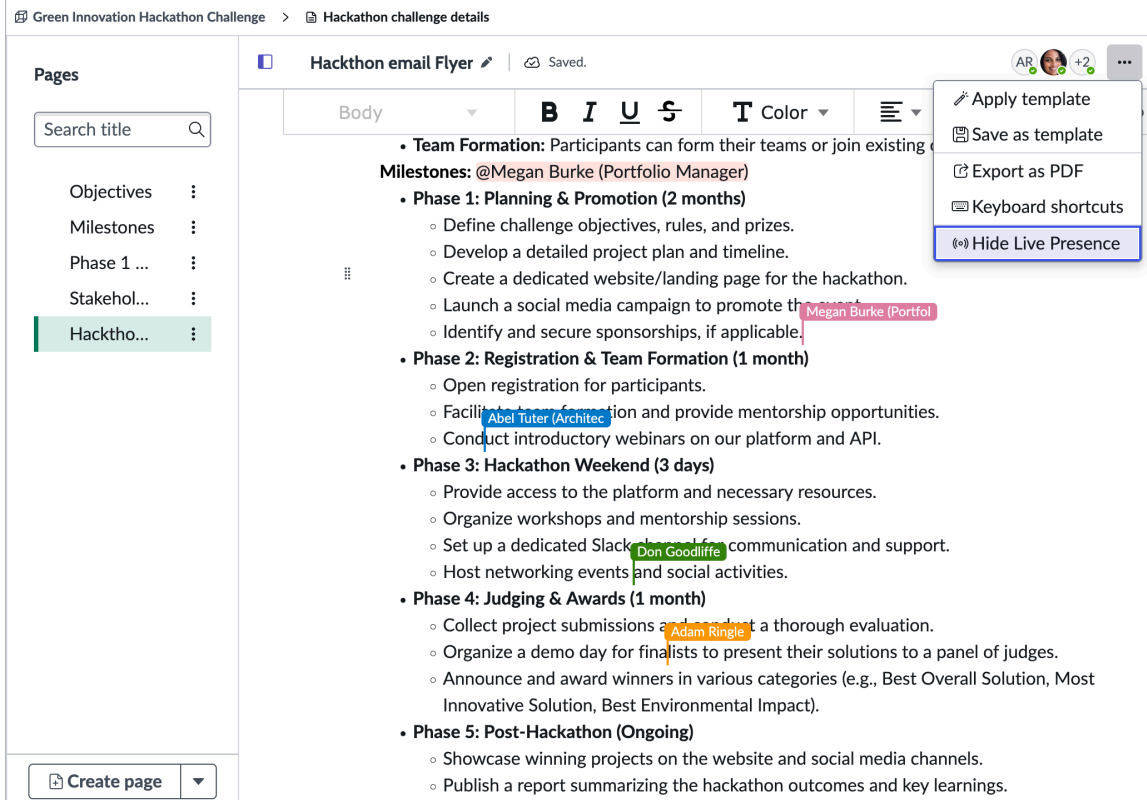

You can add references from any ServiceNow table you have access to, with no setup or configuration needed.

This feature reduces the need to switch between multiple ServiceNow applications within your instance and helps maintain a single, reliable source of truth for collaborative work, making it easier for teams to stay aligned and informed.

Real-time collaboration within CWM Docs

With the feature of real-time collaboration, edit a Doc page concurrently with multiple other editors. Colored cursors denote the current location of each editor on the page. You can choose to show or hide these live presence indicators based on your preference while working on or reviewing the content of the page.

Note:

Application performance may degrade with a large number of concurrent editors.

Draft content using Now Assist for CWM

Generate content with Now Assist for CWM directly in your Docs using custom prompts. In addition, summarize existing sections, elaborate where needed, and refine drafts to help improve your productivity.

You can interact with Now Assist directly in your Doc to create content, add context, or improve existing sections. This helps you draft faster, refine ideas, and keep your work relevant without leaving the page.

Work with the content of the whole page

Some examples are:

- For Marketing teams: **Create a compelling product launch announcement highlighting the key benefits and emotional appeal for our target audience.**
- For Legal teams: **Write a plain-language summary of the privacy policy in this doc, that customers can easily understand.**
- For product teams: **Analyze the customer feedback comments in this Doc, group into top 5 themes, and suggest top 3 enhancements for highest impact.**

Now Assist uses the context from your Doc page to generate a response.

Refine, elaborate, or improve the existing content within the page

Some examples are:

- If you have a list of stakeholders, you can ask **Elaborate on the scope of these roles.**
- **Rewrite this in a casual tone.**

Key Stakeholders:

- **Product Team:** Provide access to the platform, API documentation, and technical support.
- **Marketing & Communications Team:** Develop promotional materials, manage social media campaigns, and coordinate media outreach.
- **Business Development Team:** Identify potential sponsors and explore partnership opportunities.
- **Customer Success Team:** Provide guidance and mentorship to participating teams.
- **Legal & Compliance Team:** Ensure compliance with all relevant regulations and data privacy requirements.
- **Human Resources Team:** Assist with logistics, venue arrangements, and event coordination.

Collaboration & Communication:

- Establish regular cross-team meetings to discuss challenges, and ensure alignment.
- Utilize project management tools to track progress, deadlines, and dependencies.
- Maintain open and transparent communication channels between all stakeholders.
- Foster a collaborative and supportive environment for all participants.

**Take assistance on a empty page**

Some examples are:

1. **Generate 5 icebreaker questions for a virtual team-building session.**
2. **Write a 3-paragraph blog post explaining why [industry trend] is changing how businesses operate.**

3. Generate an outline for the Instagram campaign tasks for a Hackathon initiative.

Answer questions in the context of this Doc

Whether the content in the Doc is added manually or generated using Now Assist, you can ask questions to find anything in the page's context.

For example, if you have a project charter document, you can try asking **What is the total budget of this project and which part is the most expensive?**

Type something here or type / for commands.

Project Charter – Mobile Application for Games

Apparel

1. Project Overview

The project aims to design, develop, and launch a **mobile application (iOS & Android)** for purchasing gaming-related apparel (t-shirts, hoodies, caps, jerseys, accessories). The app will target **18-35-year-old gamers** worldwide, with an emphasis on **North America, Europe, and Asia-Pacific** markets.

Projected launch: **Q4 2025**

Initial budget: **\$1.5M**

Expected user base in Year 1: **150,000 active users**

Projected revenue in Year 1: **\$3.2M**

ROI target in Year 2: **42%**

2. Objectives

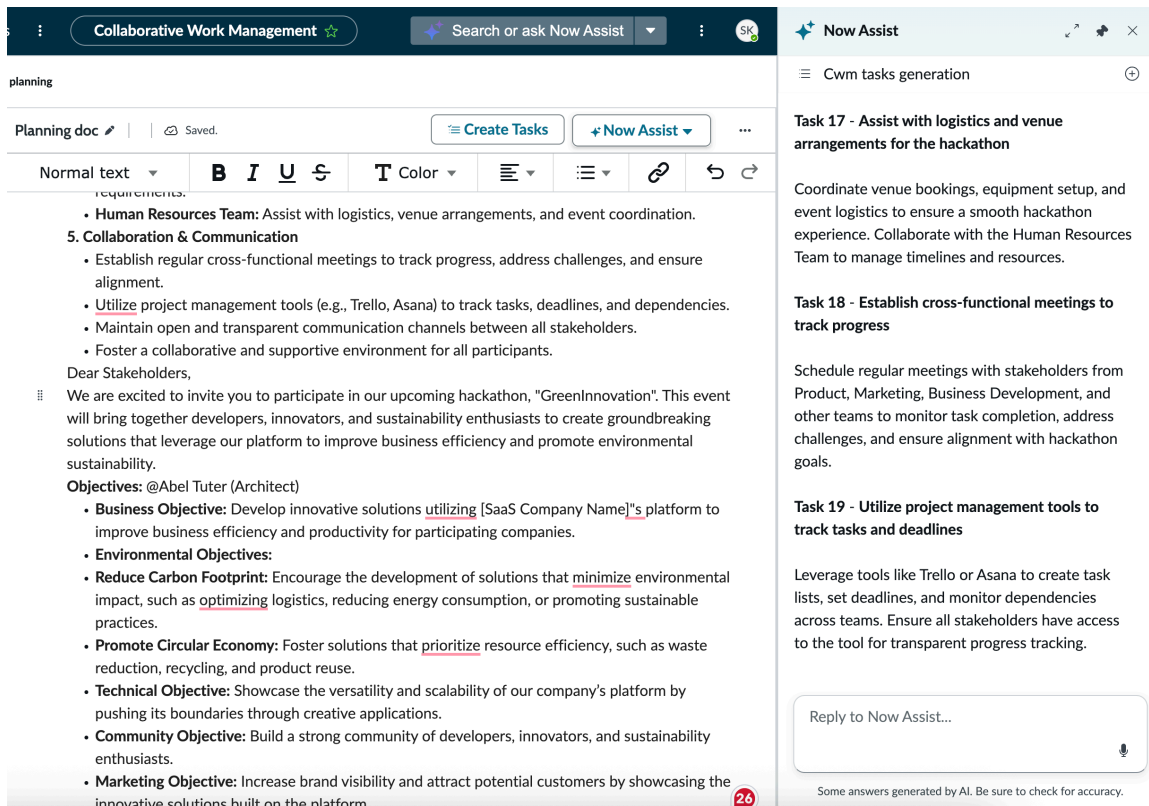

- Launch an app with **90% crash-free sessions** and **app store rating ≥4.5**.
- Achieve **50,000 downloads** within the first 3 months post-launch.
- Onboard at least **50 gaming brands** and **200 SKUs (Stock Keeping Units)** at launch.
- Enable **average cart value (ACV) of \$32** by end of Year 1.
- Maintain **customer retention rate ≥35%** after 6 months.

3. Scope

In Scope:

Generate tasks from Docs and add them to Board using Now Assist for CWM

Use the generative AI capabilities of Now Assist to create tasks from the context of your Docs. From the Doc header, select **Create Tasks** and Now Assist generates task recommendations for you and walks you through to add them to the required Board in CWM workspace.

Create a Doc in CWM

Store information related to your tasks, reference users and task records, and collaborate in real-time using Docs in Collaborative Work Management workspace.

Before you begin

[Create a Space in CWM.](#)

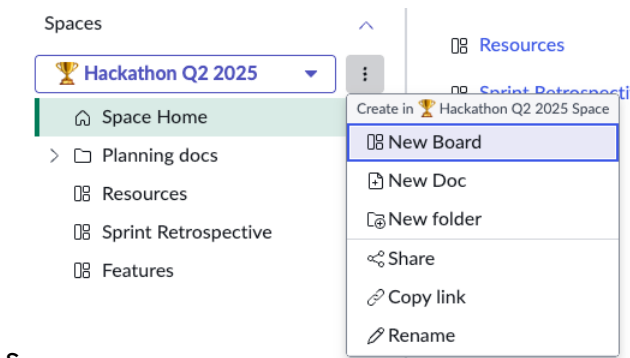

Role required: sn_cwm.cwm_user

Procedure

1. Navigate to **Workspaces > Collaborative Work Management.**
2. Open a Space that you want to create a document in.
3. From the Spaces menu, open a Space that you want to add a Board to.

4. From the More options menu of the Space (⋮), select **New Doc**

5. In the **Doc name** field, enter the name for the document.
For example, **Meeting notes**.

6. Select **Create**.

Result

A new Doc is created for the current Space, and an untitled page is opened for you to start drafting your content.

What to do next

Utilize the rich-text formatting options of the Doc to draft information relevant for your team or type / to explore other options.

Note:

To reference ServiceNow AI Platform records other than CWM tasks, work with your admin to update the `sn_cwm.record_mention_config` system property. For more information, see [Enable ServiceNow AI Platform records in CWM Docs](#).

Add comments to Docs in CWM

Streamline collaboration by turning your documents into living conversations. Highlight any passage, add a comment, and watch the discussion through threads, all without leaving the page or switching applications.

Before you begin

Role required: admin

Procedure

Navigate to **All** > > .

Manage pages and subpages in CWM Docs

Flexibly organize information for your teams and work items by creating, duplicating, and deleting pages and subpages within a Doc in Collaborative Work Management (CWM) workspace.

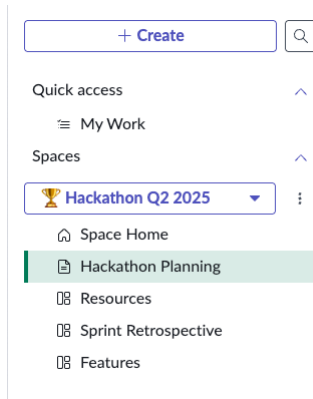

Before you begin

[Create a Doc in CWM](#)

Role required: sn_cwm.cwm_user

Procedure

1. Navigate to **Workspaces > Collaborative Work Management**.
2. From the Spaces menu, navigate to the Space where your Doc is located and open it.

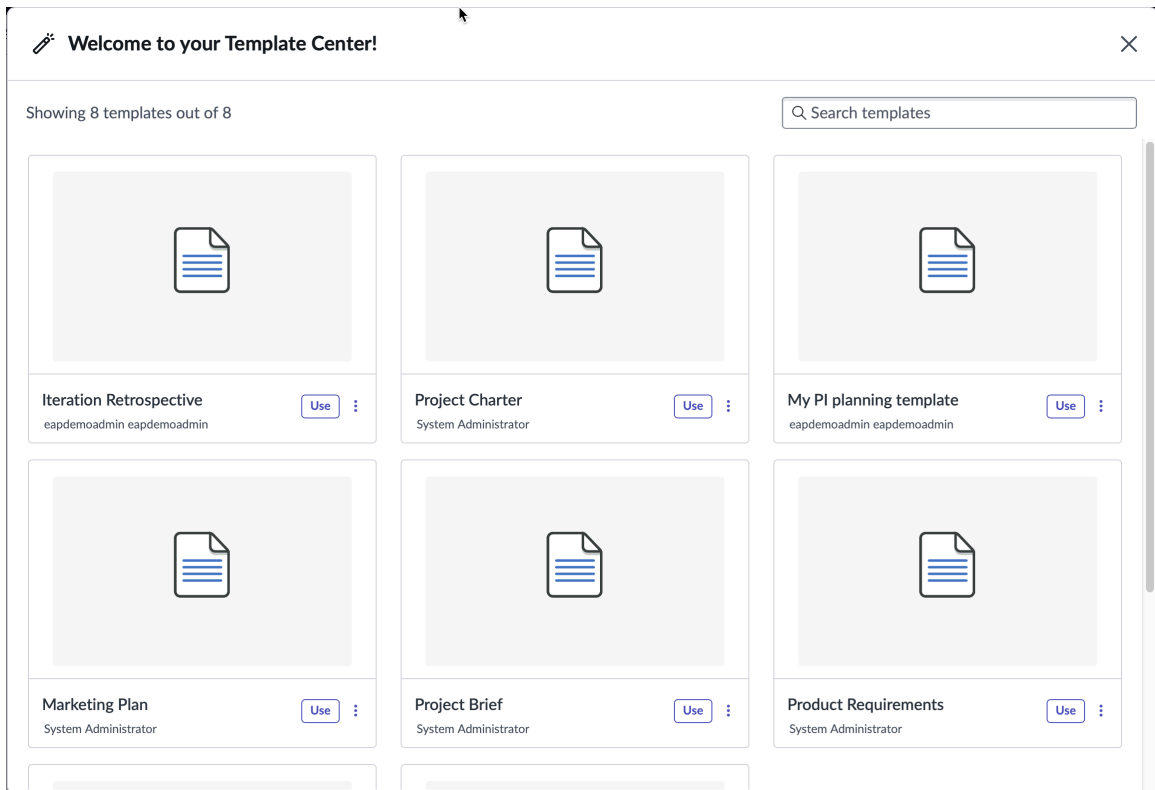

3. To create a page, you can create a blank page or start with a predefined template.

- For a blank page, select **Create page**.
- To create from templates:
 - a. Select **Create Page from template**.

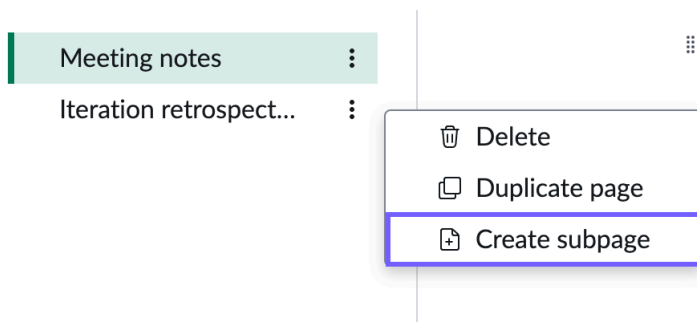

b. From a template card that you want to use, select **Use**.

The new page is created and added to your Doc.

4. To create a subpage, select the **Page Actions** menu () and select **Create Subpage**.

5. To delete a page or a subpage, select the **Page Actions** menu () and select **Delete**.

Only a user with Editor or Owner access to the Space can delete Doc pages. If there's only one page left in the Doc, it can't be deleted by any user.

Duplicate a Doc in CWM

Save time by duplicate an existing Doc to copy all its pages and content without having to copy the information manually in the Collaborative Work Management workspace.

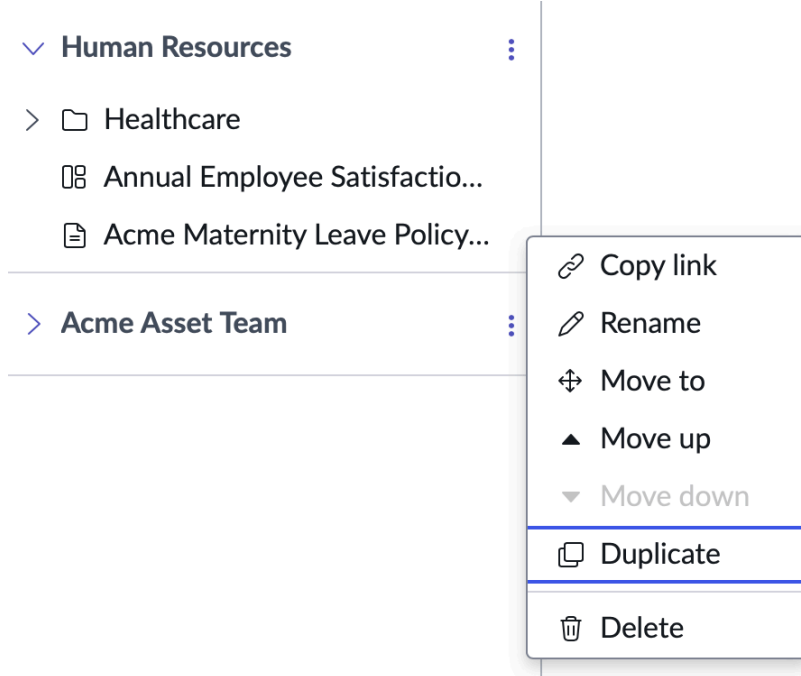

Before you begin

[Create a Doc in CWM.](#)

Role required: sn_cwm.cwm_user

Procedure

1. Navigate to **Workspaces > Collaborative Work Management**.
2. Navigate to the Space that your Doc is in.
3. From the **More actions** menu of the Doc, select **Duplicate**.

4. Provide a name for the new Doc in the **Doc name** field.
The default name given is in the format of **(Copy) <Original Doc name>**.
5. Select **Duplicate**.

Result

The new Doc is added to the same Space as the original Doc. If necessary, you can move it to a different Space or a different position in the same Space.

Export a Doc in CWM to a PDF file

Use the Docs offline, and share with teams or stakeholders outside Collaborative Work Management (CWM) by exporting Docs as PDF.

Before you begin

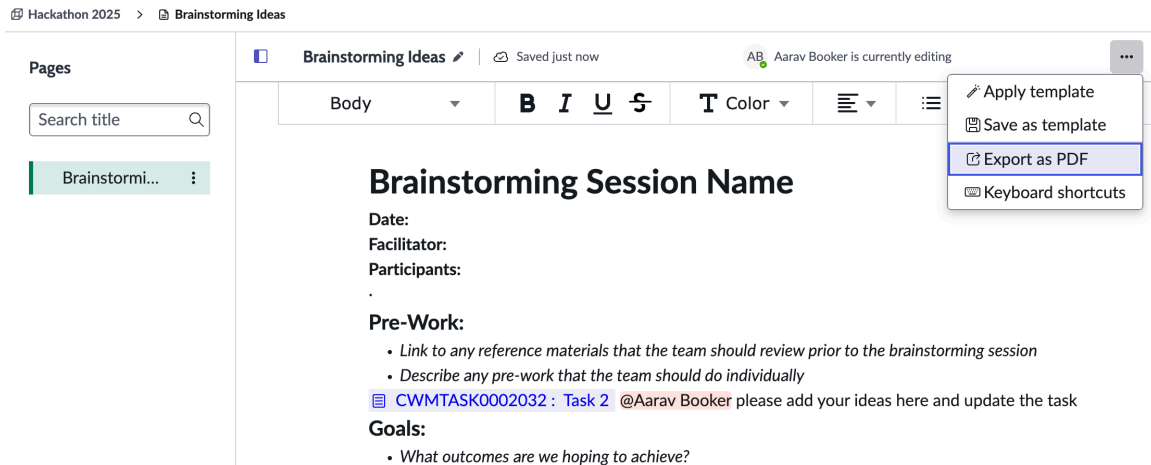

[Create a Doc in CWM](#)

Role required: sn_cwm.cwm_user

Procedure

1. Navigate to **Workspaces > Collaborative Work Management**.
2. From a Space, select the Doc that you want to export.

3. From the Doc header, select the More actions icon (...), and then select **Export as PDF**.

Result

The Doc is exported and saved in your local system as a PDF file.

Templates in CWM for Boards and Docs

By enabling creation of Boards and Docs from predefined or custom templates, Collaborative Work Management (CWM) helps improve efficiency, save time, and reduce inconsistencies in format.

https://player.vimeo.com/video/1054556151?h=84dc648b21&badge=0&autoplay=0&player_id=0&app_id=58479

Creating Boards and Docs from scratch across similar processes often consumes time and effort, and could also lead to differences in their structure. With templates in CWM, you get a predefined format for Boards and Docs, which you can use as-is or customize to suit your workflow. You can use templates for new Boards and Docs or apply them to existing ones. You can also save an existing Board or Doc in its current format as templates.

Template Center provides a centralized space where you can manage all templates for Boards and Docs. From the Template Center, you can:

- Explore predefined templates for Boards and Docs.
- Filter for available templates by Owner or Type.
- Search for templates using its title.
- View details for all available templates where you can see a preview of the Board or Doc format.
- Delete templates that you own.

Templates for Boards

When you use a template for a Board, any template tasks, custom columns, and shared columns that the template contains are applied to the Board. The Board data is displayed with all the custom columns available as part of the template.

Templates for Docs

When you use a template for a Doc, any template pages and content formatting is applied to the Doc.

To access templates, you can choose one of the following ways:

- For creating a Board or Doc from template, use these options:
 - **Explore templates** from the main Create menu.
 - **Use templates** from the New Board or New Doc modal.
 - **Apply template** from the More actions menu or in the header of the Board or Doc.
- For saving a Board or Doc as a template: Use the **Save as template** option from the More actions menu or in the header of the Board or Doc.

The following sections help you get started with templates in CWM.

Create a Board or Doc from a template in CWM

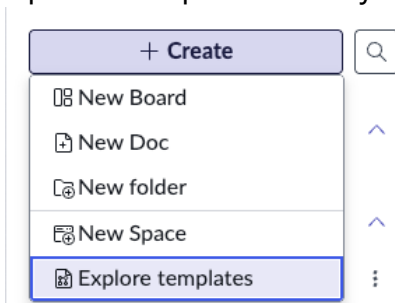

Create Boards or Docs using predefined or custom templates from the Template Center.

Before you begin

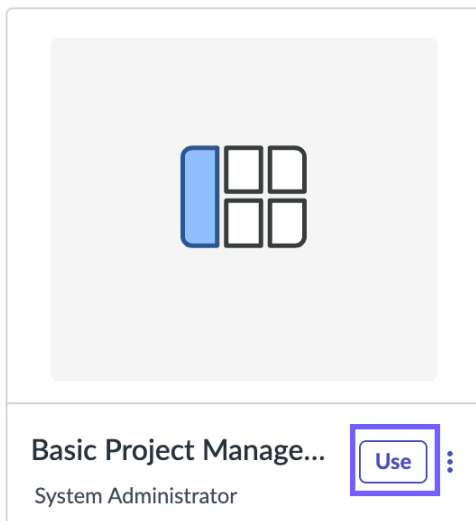

Role required: sn_cwm.cwm_user

Procedure

1. Navigate to **Workspaces > Collaborative Work Management**.
2. Select **+Create**.
3. Open the Template Center by selecting **Explore templates**.

4. Locate the template that you want to use.
 - Filter the available templates by Owner or Type
 - Search for the template using its title or keyword.
5. From the template card that you want to apply, select **Use**.

6. Enter the Board or Doc name.

7. Select the Space that you want to create this Board or Doc in.

8. Select **Save**.

Result

The Board or Doc is created in the Space that you selected.

- For a Board, any template tasks and custom columns that the template contains are applied to the Board. To learn more about Board views, see [Board views in CWM](#).
- For a Doc, any template pages and content formatting is applied to the Doc.

Apply a template to existing Board or Doc in CWM

Apply predefined or custom templates to existing Boards or Docs in Collaborative Work Management workspace so that you can avoid inconsistencies in structure and format across your processes.

Before you begin

- [Create a Board in CWM](#)
- [Create a Doc in CWM](#)

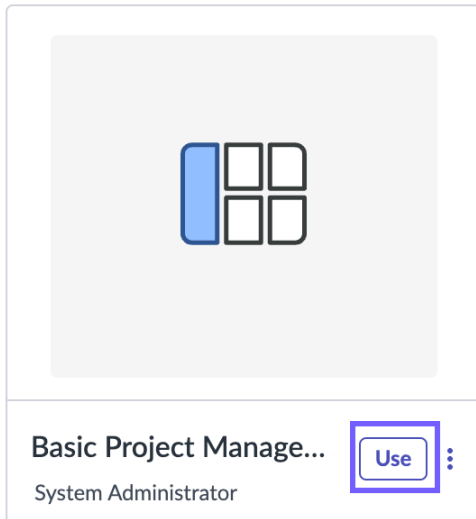

Role required: sn_cwm.cwm_user

Procedure

1. Navigate to **Workspaces > Collaborative Work Management**.
2. Open the Board or Doc that you want to apply a template to.
3. You can apply template to a Board, Doc, or a single page in a Doc.
4. Locate the template that you want to use.
 - Filter the available templates by Owner. The Type filter is automatically set based on your choice in the earlier steps.
 - Search for the template using its title.
5. **Optional:** Check the details of the template by selecting **View details** from the Template actions menu ().
For a Board template, you can view the details of the number of Board views and custom task types that you get if you apply this template. You can also review the information on which of the List, Gantt, Kanban, and Sprint planning views are enabled in this template.

(Optional) Only those custom columns that are part of these views are brought over when you apply this template.

6. From the template card that you want to apply, select **Use**.

Result

The selected template is applied to your Board, Doc, or page and the data is displayed according to the template.

Save a CWM Board or Doc as a template

Save a Board or Doc, which you created or personalized, as a template so that you can reuse the same structure and format for other Boards and Docs in the future.

Before you begin

- [Create a Board in CWM](#)
- [Create a Doc in CWM](#)

Role required: sn_cwm.cwm_user

Procedure

1. Navigate to **Workspaces > Collaborative Work Management**.
2. Open the Board or Doc that you want to save as a template.
3. You can save a Board, a Doc, or a single Doc page as a template.
4. Enter a name and description for the template.
5. From the Share with selection, select the access level for the template.
6. From the Board Views to Save selection, choose to include all shared views or just the current view of the Board.
7. Review the number of Board views and custom task types that will be included into this template.
8. Select **Save**.

Result

The saved template is added to the Template Center.

Update a template in CWM

Update sharing permissions for a Board template or edit the format of a Doc template using the Template Center in Collaborative Work Management (CWM).

Before you begin

Role required: sn_cwm.cwm_user

You must be the owner of the template to update its details.

About this task

Updating Board templates

You can only modify the sharing permissions, template name, and the description of a Board template. The tasks, column order, sorting, custom columns, or any other preferences within the template can't be updated.

Updating Doc templates

You can modify sharing permissions along with the format, structure, and pages for a Doc template.

Procedure

1. Navigate to **Workspaces > Collaborative Work Management**.
2. Select **+Create**.
3. Open the Template Center by selecting **Explore templates**.

4. Locate the template that you want to edit.
 - Filter the available templates by Owner or Type
 - Search for the template using its title or keyword.
5. From the template card, select the Template actions menu (⋮) and select **View details**.

6. Modify the template title, the **Share with** access, or the description.

Marketing Plan

Executive Summary
Briefly overview the marketing plan, summarizing key goals and strategies.

Business Overview

Company Name	
Mission Statement	
Product/Service Overview	
Target Audience	

Marketing Goals
Outline specific, measurable, and time-bound goals for the marketing campaign.

SWOT Analysis
Conduct a brief analysis of the company's strengths, weaknesses, opportunities, and threats.

Target Audience

- After making your changes, select **Done** to close the template editor.
The changes are automatically saved to the template and they are applied to any Docs that you create from this template in the future.

Delete a Board or Doc template in CWM

Delete any custom templates that are no longer necessary for your workflows using the Template Center in Collaborative Work Management (CWM).

Before you begin

Role required: sn_cwm.cwm_user

You must be the owner of the template to delete it.

Procedure

- Navigate to **Workspaces > Collaborative Work Management**.
- Select **+Create**.
- Open the Template Center by selecting **Explore templates**.

- Locate the template that you want to use.
 - Filter the available templates by Owner or Type
 - Search for the template using its title or keyword.
- From the template card, select the Template actions () menu and select **Delete**.

- Select **Delete** to confirm.

Result

The template is deleted and is no longer available for you or your team to use.

Collaborative Work Management reference

Reference topics provide details on the roles, tables, and properties installed with Collaborative Work Management (CWM).

Components installed with Collaborative Work Management

Several types of components are installed with activation of the Collaborative Work Management application, including tables and user roles.

Roles installed

Role title [name]	Description	Contains roles
CWM user [sn_cwm.cwm_user]	The basic role required to access the CWM workspace.	spm_agile_common_user
CWM admin [sn_cwm.cwm_admin]	Admin role to modify and update any system properties for functionality across CWM.	sn_cwm.cwm_user
Docs admin [sn_docs.docs_admin]	Admin role to modify and update any system properties for functionality in Docs.	None
Team member read [sn_stm.team_member_read]	Allows users to view project tasks and demand tasks, and add comments to them.	<ul style="list-style-type: none"> sn_cwm.cwm_user timecard_user
Team member read-write [sn_stm.team_member_read_write]	Allows users to view and edit project tasks and demand tasks.	sn_stm.team_member_read

Tables installed

Table	Description
CWM Automation [sn_cwm_automation]	Stores data of automation conditions for Boards.
CWM Board [sn_cwm_board]	Contains all tasks, views, and column configuration.
CWM Column Choice [sn_cwm_col_choice]	Stores data for choices and labels created for custom columns.
CWM Column Usage [sn_cwm_columns_usage]	Stores usage of custom columns and its type.
CWM Content Tree Preference	Stores user preference of left navigation menu in the expanded or collapsed state.

Table	Description
[sn_cwm_content_tree_preference]	
CWM Document [sn_cwm_doc]	Stores the information of all Docs created within CWM.
CWM Document page [sn_cwm_doc_page]	Stores the information of pages and subpages created for a Doc within CWM.
CWM Document relationship [sn_cwm_doc_m2m]	Stores relation between Docs and Doc pages
CWM Import Configuration [sn_cwm_import_config]	Stores the configuration of tasks imported into My Work.
CWM Menu Item [sn_cwm_menu_item]	Stores the content hierarchy for Boards, Docs, and folders within a Space.
CWM Notification Digest [sn_cwm_notification_digest]	Stores information of notifications sent to CWM users.
CWM Permission [sn_cwm_permission]	Stores different level of permissions for the users and groups for the Spaces.
CWM Space [sn_cwm_space]	Stores information of all CWM Spaces.
CWM Space Access Request [sn_cwm_space_access_request]	Stores the list of users who requested access to the Space.
CWM Sprint [sn_cwm_sprint]	Stores information of sprints created in CWM.
CWM Task [sn_cwm_task]	Stores tasks data.
CWM Task Relationship [sn_cwm_m2m]	Stores information of the relationships for the CWM tasks such as prerequisites, dependencies, and related tasks.
CWM Template	Stores information of Board and Doc templates within CWM workspace.

Table	Description
[sn_cwm_template]	
CWM Template Board Metadata [sn_cwm_template_board_metadata]	Stores metadata of CWM Board templates such as work types, automations, and others.
CWM Template Board Views [sn_cwm_template_board_view]	Stores information of views within Board templates.
CWM Template Column Choice [sn_cwm_template_column_choice]	Stores information of column choices within Board templates.
CWM Template Custom Column Label [sn_cwm_template_custom_column_label]	Stores information of custom column labels within Board templates.
CWM Template Document Page [sn_cwm_template_doc_page]	Stores information of pages within Doc templates.
CWM Template Task [sn_cwm_template_task]	Stores information of tasks within Board templates.
CWM User Preference sn_cwm_user_preference	Stores user preferences such as last selected Board, Agile preferences, and others.
CWM View Preferences [sn_cwm_view_preference]	Stores information of view preferences for Boards.
CWM Views sn_cwm_view	Stores information of all Board views within CWM.
CWM Work Type [sn_cwm_work_type]	Stores work types for task allowed within a Space.
MyWork Table Mapping [sn_cwm_mywork_table_mapping]	Stores information of tasks shown in My Work such as dates, states, and assigned users.

Properties installed with Collaborative Work Management

System properties that you can configure to include other ServiceNow AI Platform records in CWM Docs and modify the way non-CWM users request access to the workspace.

These properties are available for Collaborative Work Management.

Note:

To open the System Properties [sys_properties] table, enter `sys_properties.list` in the navigation filter.

Properties for Collaborative Work Management

Property	Description
sn_cwm.request_role_access	<p>Property to show or hide the Request Access button for non-CWM users in the workspace.</p> <p>By default, the button is hidden. When this property is set to true, an event <code>sn_cwm.REQUEST_ROLE_ACCESS</code> is raised. Admins can configure this event to trigger one of the following workflows, allowing the non-CWM user to request access to the workspace.</p> <ul style="list-style-type: none"> • Raising a Service Catalog request. • Sending an email. • Type: true false • Default value: false • Location: System Property [sys_properties] table • Role needed: sn_cwm.cwm_admin
sn_cwm.record_mention_config	<p>Property to configure mentioning any ServiceNow AI Platform record within Docs pages of CWM workspace.</p> <ul style="list-style-type: none"> • Type: string • Default value: <pre>[{"sourceTable": "sn_cwm_task", "label": "CWM Task", "fields": ["short_description", "number"]}]</pre> <p>By default, this property is configured to include CWM task records.</p> <ul style="list-style-type: none"> • Location: System Property [sys_properties] table • Role needed: sn_cwm.cwm_admin <p>To include any other ServiceNow AI Platform record, update the property.</p> <p>For example, to reference the Incident records in the Docs pages, update the Value field of this property to include the Incident table.</p>

Grouping of tasks in status reports of CWM My Work

Learn how various tasks assigned to you are grouped based on their State and Priority in My Work reports of Collaborative Work Management (CWM).

State buckets

State buckets represent the lifecycle stage of different tasks. Existing state values from different task types are automatically mapped into these buckets based on meaning and also internal value of any task type. In My Work, all states are automatically grouped into three standard State Buckets.

- Open: Represents tasks not yet started. For example, states of Draft, Pending, and Ready.
- Work in Progress: Represents tasks currently being worked on. For example, states of In Progress, Implement, and Testing.
- Closed: Represents tasks that are finished or no longer active. For example, states of are Complete, Cancelled, and Closed Skipped.

Priority buckets

Priority buckets provide a unified way to understand the urgency of tasks. Priority buckets are created by mapping existing priority values from the Task table. All tasks are automatically grouped into five Priority Buckets.

- Planning: Not yet prioritized.
- Low: Minimal urgency.
- Moderate: Medium priority tasks.
- High: Important tasks that require attention soon.
- Critical: Most urgent tasks.

Custom State and Priority values

Your ServiceNow instance may have some extended task types that have custom state or priority values. These custom values may not align with the default values of the Task table. These work items with these non-default State or Priority values appear as **Others** in the bar graphs in My Work. This method ensures reporting accuracy instead of forcing a state/priority into the wrong bucket.

i Important:

- Not all model providers are available for customers with in-country SKUs, and some Now Assist products/features are currently unavailable for in-country customers. For more information, see the [KB1584492](#) article in the Now Support Knowledge Base. Be sure to check for model provider availability updates in future releases.
- Some Now Assist products/features are currently unavailable for customers in the FedRAMP, NSC DOD IL5, or Australia IRAP-Protected data centers, self-hosted customers, or in other restricted environments. For more information, see the [KB0743854](#) article in the Now Support Knowledge Base. Be sure to check for availability updates in future releases.
- Some Now Assist products/features are currently available only for customers in some regions. Be sure to check for availability updates in future releases.
- Some AI products and skills are not available in Regulated Markets. For more information, see [KB2593939: Regulated Markets AI Products/Skills Not Available](#). Be sure to check for availability updates in future releases.

You can use Now LLM Service, Now LLM Long Term Stable models (LTS), Azure OpenAI, Google Gemini or Anthropic Claude on AWS as the AI model provider for all Now Assist skills and AI agents. Use the Configuration Controls in [AI Control Tower](#) to define which options are available, then set the skill-level preferences in the [Now Assist Admin console](#). For more information, see [Large language models on the ServiceNow AI Platform](#).

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by [ServiceNow's AI Acceptable Use Policy](#), which may be updated by ServiceNow.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our [CORE Compliance Portal](#).

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. In addition, this application will collect task data (for Case Assist) and chat transcripts (for Chat Assist). Customers can opt out of future data collection at any time, as described in the [Now Assist Opt-Out page](#).

For more information, see the [Now Assist documentation](#).

Exploring Now Assist for Collaborative Work Management (CWM)

Learn more about the generative AI capabilities of Now Assist for CWM and how they can help you save time and improve efficiency for the actions your team performs within the CWM workspace.

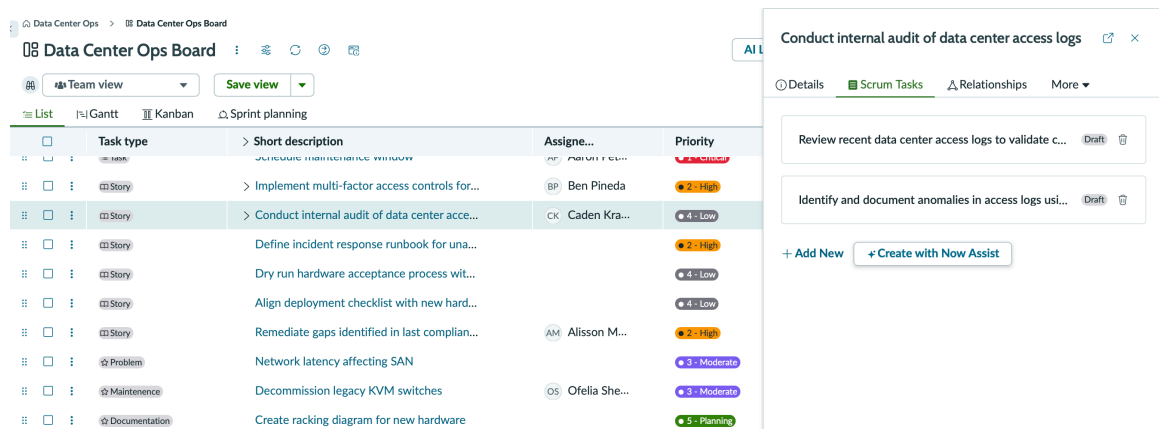

Skills**Generate scrum tasks for stories**

Accelerate your sprint planning by using Now Assist to generate scrum tasks based on user story descriptions and acceptance criteria. Instead of manually creating

each task, you receive a relevant set of scrum tasks as a starting point for further refinement.

Generate scrum tasks from the story form or create them inline from the List or Sprint planning views. Now Assist analyzes the user story description and acceptance criteria to propose tasks that align with the required work. For stories that already have scrum tasks, Now Assist considers existing tasks when generating new ones to avoid duplication and maintain continuity.

You can review and edit AI-generated tasks before adding them to your story. There is no limit on the number of tasks generated, giving you flexibility to capture all necessary work breakdown items. This capability reduces the time spent on repetitive task creation and helps teams establish a consistent starting point for sprint execution.

Generate formulas from natural language

Create formula columns faster by describing your calculation in natural language and letting Now Assist generate the formula for you.

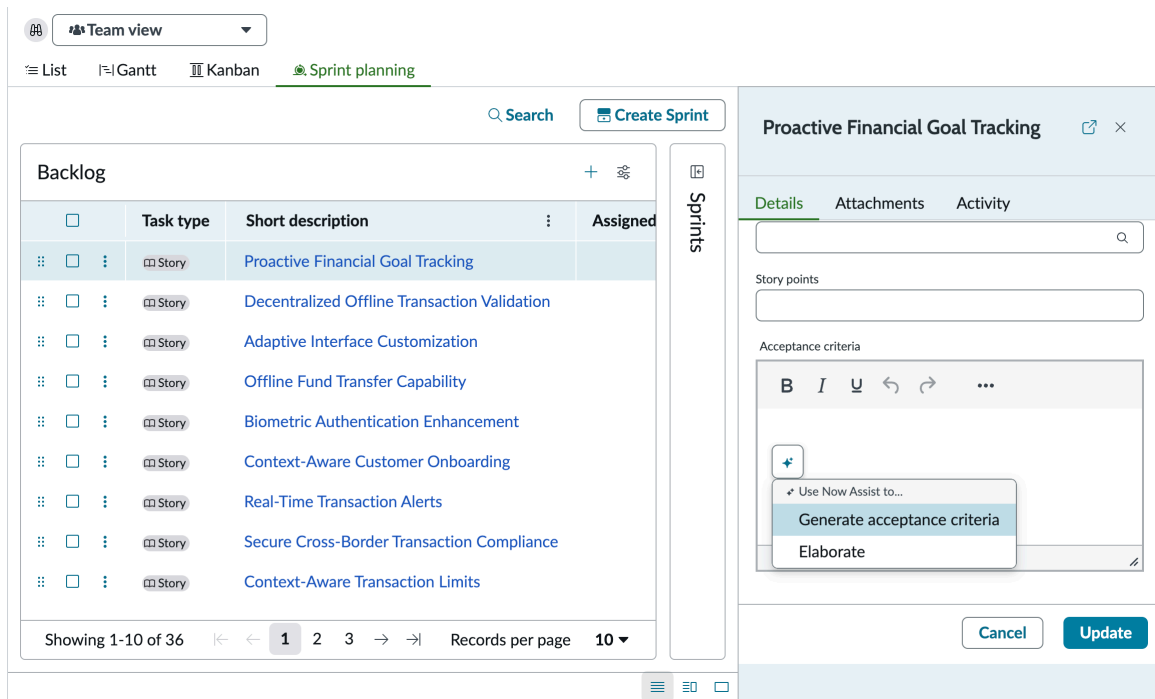

Instead of manually building complex formulas, type what you want to calculate in the Formula Builder panel. For example, enter descriptions like `days between start date and end date` or `total estimated hours for all subtasks`. Now Assist analyzes your description and generates a valid formula using the available columns in your List view.

Review the generated formula to verify that it matches your intent. Insert the formula into the editor with a single click, then make any adjustments if needed. This capability removes the need to memorize formula syntax, making calculated columns accessible to team members of all technical skill levels.

Generate acceptance criteria for stories

As a product manager, generate clear, comprehensive, and testable acceptance criteria for your user stories, instead of spending hours writing and refining them manually.

You can review and refine the suggested options to ensure they meet your story requirements without slowing down planning. By helping you streamline generating acceptance criteria as a process, this skill helps save time, improve quality, and speed up delivery with cleaner backlogs and better collaboration.

CWM Doc generation and insights

Generate content with Now Assist for CWM directly in your Docs using custom prompts. In addition, summarize existing sections, elaborate where needed, and refine drafts to help improve your productivity.

You can interact with Now Assist directly in your Doc to create new content, add context, or improve existing sections. This helps you draft faster, refine ideas, and keep your work relevant without leaving the page.

Work with content of the whole page

Some examples are:

- For Marketing teams: Create a compelling product launch announcement highlighting the key benefits and emotional appeal for our target audience.
- For Legal teams: Write a plain-language summary of the privacy policy in this doc, that customers can easily understand.
- For product teams: Analyze the customer feedback comments in this Doc, group into top 5 themes, and suggest top 3 enhancements for highest impact.

Now Assist uses the context from your Doc page to generate a response.

Refine, elaborate, or improve the existing content within the page

Some examples are:

- If you have a list of stakeholders, you can ask Elaborate on the scope of these roles.
- Rewrite this in a casual tone.

Key Stakeholders:

- **Product Team:** Provide access to the platform, API documentation, and technical support.
- **Marketing & Communications Team:** Develop promotional materials, manage social media campaigns, and coordinate media outreach.
- **Business Development Team:** Identify potential sponsors and explore partnership opportunities.
- **Customer Success Team:** Provide guidance and mentorship to participating teams.
- **Legal & Compliance Team:** Ensure compliance with all relevant regulations and data privacy requirements.
- **Human Resources Team:** Assist with logistics, venue arrangements, and event coordination.

Collaboration & Communication:

- Establish regular cross-team meetings to discuss challenges, and ensure alignment.
- Utilize project management tools to track progress, deadlines, and dependencies.
- Maintain open and transparent communication channels between all stakeholders.
- Foster a collaborative and supportive environment for all participants.

Take assistance on a blank page

Some examples are:

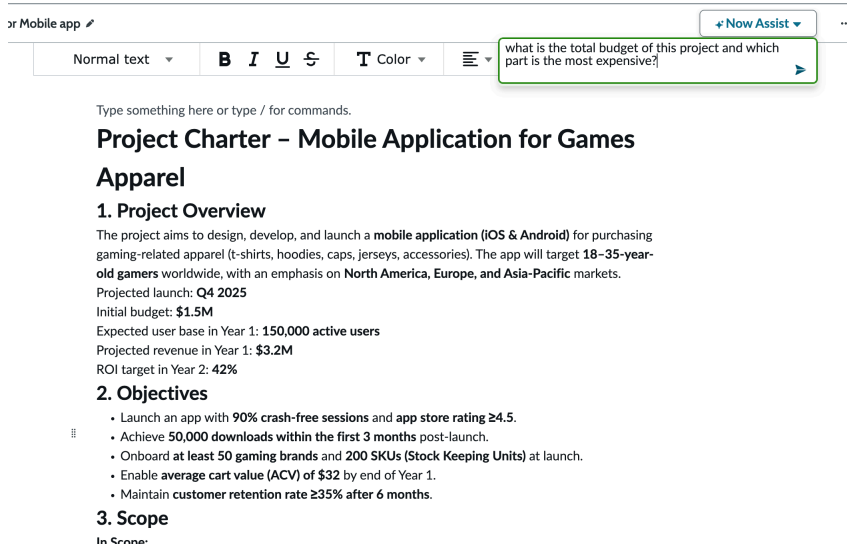

1. Generate 5 icebreaker questions for a virtual team-building session.
2. Write a 3-paragraph blog post explaining why [industry trend] is changing how businesses operate.
3. Generate an outline for the Instagram campaign tasks for a Hackathon initiative.

Answer questions in the context of this Doc

Whether the content in the Doc is added manually or generated using Now Assist, you can ask questions to find anything in the page's context.

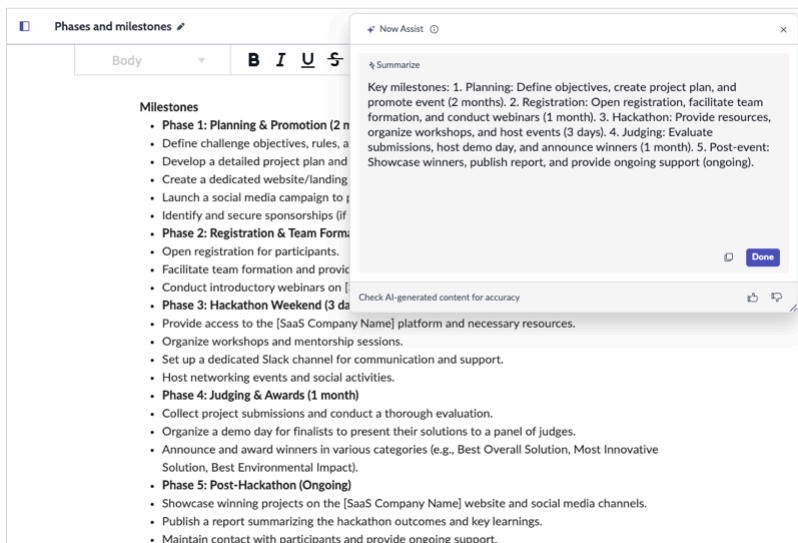

For example, if you have a project charter document, you can try asking **What is the total budget of this project and which part is the most expensive?**

Doc summarization

Gain insights into the contents of the page by summarizing it in CWM Docs. Whether you're reviewing long documents or preparing for meetings, Doc summarization skill helps you stay informed and efficient.

With the Doc summarization skill, you can also elaborate and shorten content, resulting in improved content quality in the CWM Doc pages. Quickly shorten lengthy paragraphs, paraphrase bullet points, or expand on key points ensuring that your content is tailored to specific needs.

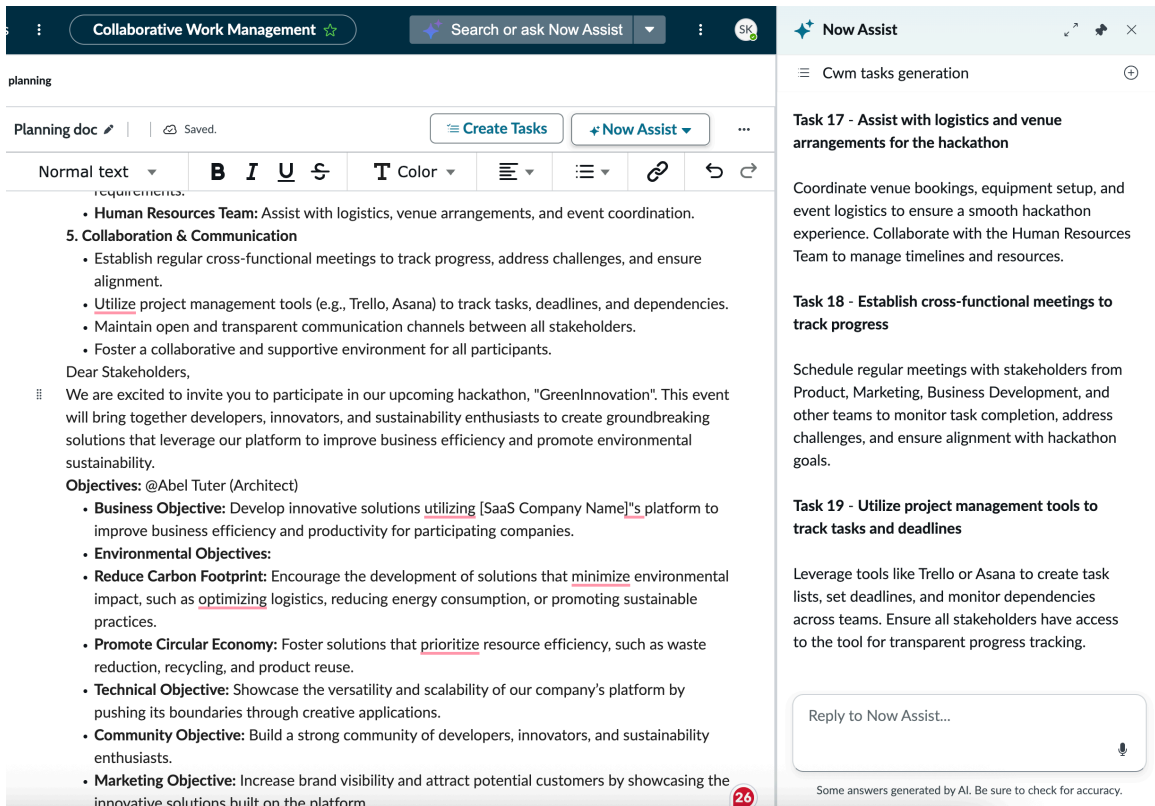

Generate CWM Tasks from Docs

Creating tasks with detailed descriptions for your CWM Board requires significant time and manual effort. If the tasks aren't detailed enough, it can lead to confusion and misalignment within the team, affecting their understanding of the expected outcomes. To avoid this manual effort and improve time to value, Now Assist can generate tasks for your Board using the information in your Docs. This way, you can ensure clear and comprehensive task descriptions, allowing you to focus more on execution and less on the administrative work.

Based on the recommendations, you can ask Now Assist to perform one of the following:

- Generate task according to its original recommendations.
- Split a task recommendation into multiple tasks.
- Combine multiple task recommendations into one task.
- Remove any task recommendation.

Thus, by using the Task generation skill within CWM, you can:

- Remove initial roadblocks to create tasks for a CWM Board.
- Save time and increase productivity by automating the task creation process.

You can use Now LLM Service, Now LLM Long Term Stable models (LTS), Azure OpenAI, Google Gemini or Anthropic Claude on AWS as the AI model provider for all Now Assist skills and AI agents. Use the Configuration Controls in [AI Control Tower](#) to define which options are available, then set the skill-level preferences in the [Now Assist Admin console](#). For more information, see [Large language models on the ServiceNow AI Platform](#).

Now Assist Admin console

An administrator can activate and manage Now Assist features and skills for the CWM workspace using the Now Assist Admin console. For more information, see [Overview tab in Now Assist Admin](#).

Now Assist panel in CWM workspace

A knowledge worker can use the Now Assist panel in CWM workspace. This conversational interface enables the user to generate CWM tasks from the context of a Doc page. For more information about the Now Assist panel, see [Now Assist panel](#).

What to explore next

To learn more about configuring and using Now Assist for CWM, see:

- [Configure Now Assist for Collaborative Work Management \(CWM\)](#)

- [Now Assist for Collaborative Work Management \(CWM\) reference](#)

Supporting information for Now Assist for Collaborative Work Management (CWM)

Learn about supported versions, user interfaces, and application dependencies of Now Assist for CWM.

Compatible versions

The Now Assist for CWM application is compatible with Yokohama Patch 3 release and later.

Supported user interfaces

The Now Assist for CWM application is supported for Collaborative Work Management version 6.0.0 and later.

Application information

Installing the latest Now Assist for Collaborative Work Management (CWM) store app (sn_cwm_ai) also installs Now Assist for Platform (sn_genai_platform).

Related topics

[Configure Now Assist for Collaborative Work Management \(CWM\)](#)

Configure Now Assist for Collaborative Work Management (CWM)

If you have the admin role, you can configure the implementation for the Now Assist for CWM application so that your team members can utilize generative AI skills in the CWM workspace.

Before you begin

- The minimum version of CWM application that is required to support Now Assist for CWM features is v6.0.0 and later. If you're on earlier versions, upgrade your app through Application Manager. See [Update an application or plugin](#) .
- Install the Now Assist for Collaborative Work Management (CWM) plugin (sn_cwm_ai). See [Install Now Assist plugins](#) .
- [Activate the Now Assist panel standard chat](#) .

Role required: admin

About this task

Use the Now Assist Admin console to configure Now Assist for SPM. All Now Assist for SPM skills are activated by default. If a skill isn't automatically activated or you want to update its configuration, follow the steps below.

Use the Now Assist Admin console to activate the following skills of Now Assist for CWM.

- CWM Doc generation and insights
- Acceptance criteria generation

- Tasks generation
- CWM Scrum tasks generation

Note:

Now LLM Service is the default provider for this Now Assist application's skills.

Procedure

1. Navigate to All > Now Assist Admin > Skills.

The **Now Assist Skills** tab of the Now Assist Admin console is displayed.

2. From the Technology grouping, select CWM.

The skills for CWM are displayed as tiles.

3. For the skill that you want to activate, select Activate skill.

4. Review the skill configuration settings from the following sections.

To edit the inputs, switch your application scope to **Now Assist for Collaborative Work Management (CWM)**. For more information on these inputs, see [Skill inputs for Now Assist for Collaborative Work Management \(CWM\)](#).

Note:

The display options are available based on the skill.

- a. Choose inputs:** These are the skill settings for summarizing and refining selected content within a CWM Doc page.

This section is not available for the Tasks generation skill.

- b. Select Save and continue.**

- c. Define access:** Review who has access to skills.

- Configure ACLs or role-based permissions to ensure who can view or edit the skills.
- Review role restrictions to skill.

- d. Page inputs:** These are the skill settings for summarizing the whole content of a CWM Doc page.

- e. Select Save and continue.**

- f. Select display:**

- In-product desktop: Enabling this option shows the skill within the CWM workspace.
- Now Assist panel: Enabling this option shows the skill within the Now Assist panel.
- Now Assist context menu: Enabling this option shows the skill within a form field in the CWM workspace.

- g. Select Save and continue.**

- h. Review and activate:** Review your selections for the skill.

5. Select Activate.

Result

The skill is successfully activated.

What to do next

Return to the CWM skill grouping and repeat the process to activate any remaining skills.

If you have custom roles that require access to a skill, update the ACLs for those roles that require access. For more information, see [Implement access control in Now Assist AI agents](#).

Skill inputs for Now Assist for Collaborative Work Management (CWM)

Learn about the inputs of each skill of Now Assist for CWM. By configuring inputs for a skill, you can determine how and when a skill is used within the CWM workspace.

Acceptance criteria generation skill inputs

The Acceptance criteria generation skill includes the inputs that identify the fields that are used as context to generate acceptance criteria for a story. The following table provides more details on the input data.

Story input data for Generate acceptance criteria skill

Input	Description
Table	Story [rm_story] This value can't be changed.
Fields	Short description, Description You can choose to add more fields to serve as context to generate acceptance criteria.
Acceptance criteria template	A default template is provided. You can choose to modify the existing template or define a new template based on your team's requirements.
Reference stories	Tag a story as a reference when it contains ideal acceptance criteria. These tagged stories serve as examples for Now Assist, giving it additional context to generate well-structured acceptance criteria for new stories.

Using Now Assist for Collaborative Work Management (CWM)

Save time, reduce manual effort, and improve overall efficiency by using the generative AI capabilities of Now Assist for CWM.

The following tasks provide guidance on using Now Assist skills within the CWM workspace. Navigate to the task that suits your use case.

- Summarize and refine content of a Doc page in Collaborative Work Management (CWM).
- Generate and improve Docs content with Now Assist for Collaborative Work Management (CWM).
- Generate tasks from Docs in Collaborative Work Management (CWM).
- Generate acceptance criteria for stories in CWM.

Summarize and refine content of a Doc page in Collaborative Work Management (CWM)

Gain insights into the page content by summarizing it or improve content quality by refining it in CWM Docs.

Before you begin

Create a Doc in CWM.

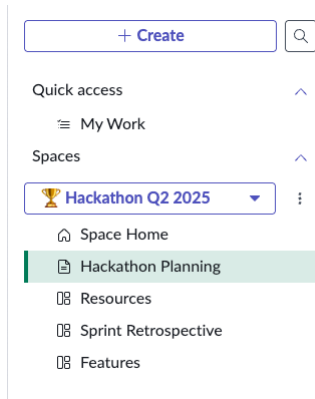

i Important:

This Now Assist skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see [Now Assist skills, agents, and agentic workflows on by default](#).

Role required: sn_cwm_ai.cwm_ai_user

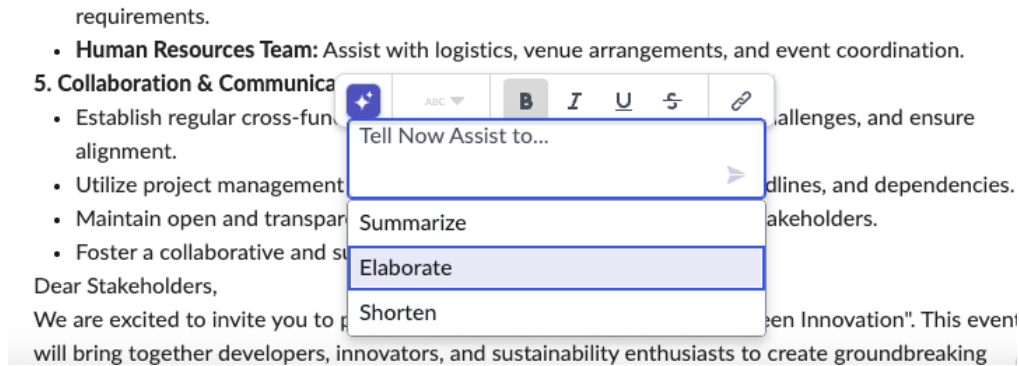

Procedure

1. Navigate to **Workspaces > Collaborative Work Management**.
2. From the Spaces menu, navigate to the Space where your Doc is located and open it.

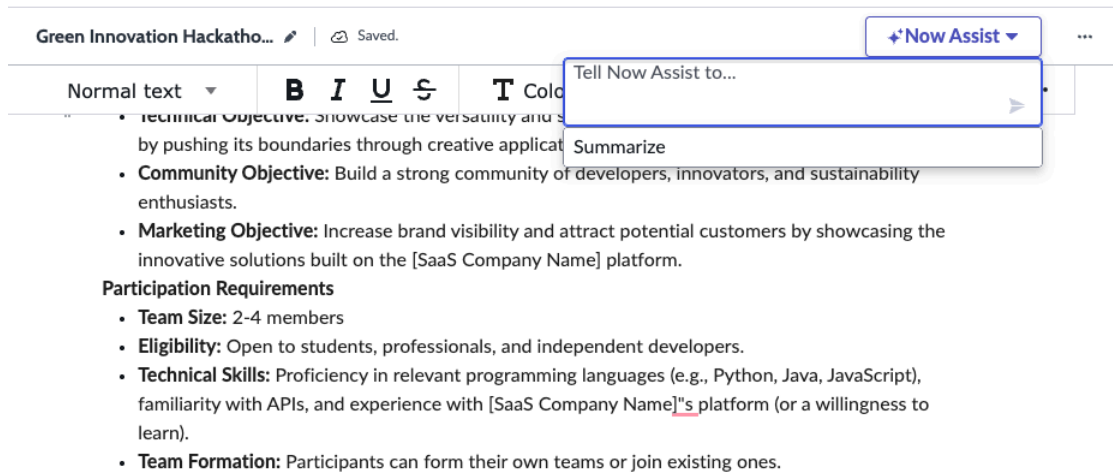

3. From your Doc, open the page you want to summarize or refine.
4. Choose to summarize the selected text on the page or the whole page.
 - To refine the selected text:
 - a. Select a single block or multiple blocks of content on the page.
 - b. Select **Now Assist** and choose an option.

- **Summarize** to summarize the selected text.
- **Elaborate** to lengthen the selected text based on the existing context.
- **Shorten** to make the selected text concise.

- To summarize the entire content on the page, select **Now Assist** from the Doc header and select **Summarize**.

Tip:

If there's more content to summarize, you can remove some text and retry.

Now Assist analyzes the text and generates an output in a separate pop-up.

5. Optional: Based on the output generated, you can further refine the result.

6. Optional: Copy the generated output by selecting the copy to clipboard icon (📄) to use it for purposes such as sending an email, saving to notes, and others.

Important:

Because the output is AI-generated, review it to ensure accuracy.

Generate and improve Docs content with Now Assist for Collaborative Work Management (CWM)

Generate content with Now Assist for CWM directly in your Docs using custom prompts. In addition, summarize existing sections, elaborate where needed, and refine drafts to help improve your productivity.

Before you begin

i Important:

This Now Assist skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see [Now Assist skills, agents, and agentic workflows on by default](#) .

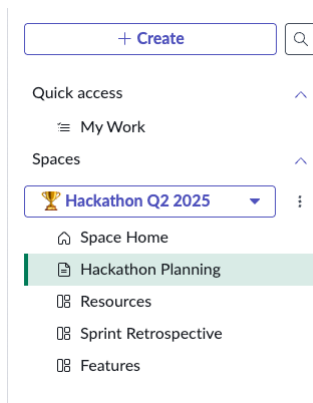

Role required: sn_cwm_ai.cwm_ai_user

About this task

You can interact with Now Assist directly in your Doc to create new content, add context, or improve existing sections. This helps you draft faster, refine ideas, and keep your work relevant without leaving the page.

Procedure

1. Navigate to **Workspaces > Collaborative Work Management**.
2. From the Spaces menu, navigate to the Space where your Doc is located and open it.

3. From your Doc, open the page you want to work with and use Now Assist for any of your use cases.
Now Assist analyzes the text and generates an output in a separate pop-up.
4. **Optional:** Based on the output generated, you can further refine the result.
5. **Optional:** Copy the generated output by selecting the copy to clipboard icon () to use it for purposes such as sending an email, saving to notes, and others.

i Important:

Because the output is AI-generated, review it to ensure accuracy.

Generate tasks from Docs in Collaborative Work Management (CWM)

Use the generative AI capabilities of Now Assist to create tasks from the content of your Docs and help you add them to the required Board in CWM workspace.

Before you begin

i Important:

This Now Assist skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see [Now Assist skills, agents, and agentic workflows on by default](#) .

Create a Doc in CWM

Role required: sn_cwm_ai.cwm_ai_user

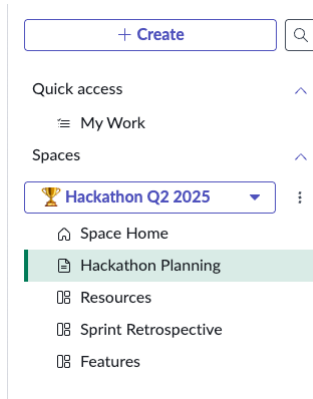

About this task

[https://player.vimeo.com/video/1079861522?](https://player.vimeo.com/video/1079861522?h=a6bccdb612&badge=0&autoplay=0&player_id=0&app_id=58479)

[h=a6bccdb612&badge=0&autoplay=0&player_id=0&app_id=58479](https://player.vimeo.com/video/1079861522?h=a6bccdb612&badge=0&autoplay=0&player_id=0&app_id=58479)

Procedure

1. Navigate to **Workspaces** > *Collaborative Work Management*.
2. From the Spaces menu, navigate to the Space where your Doc is located and open it.

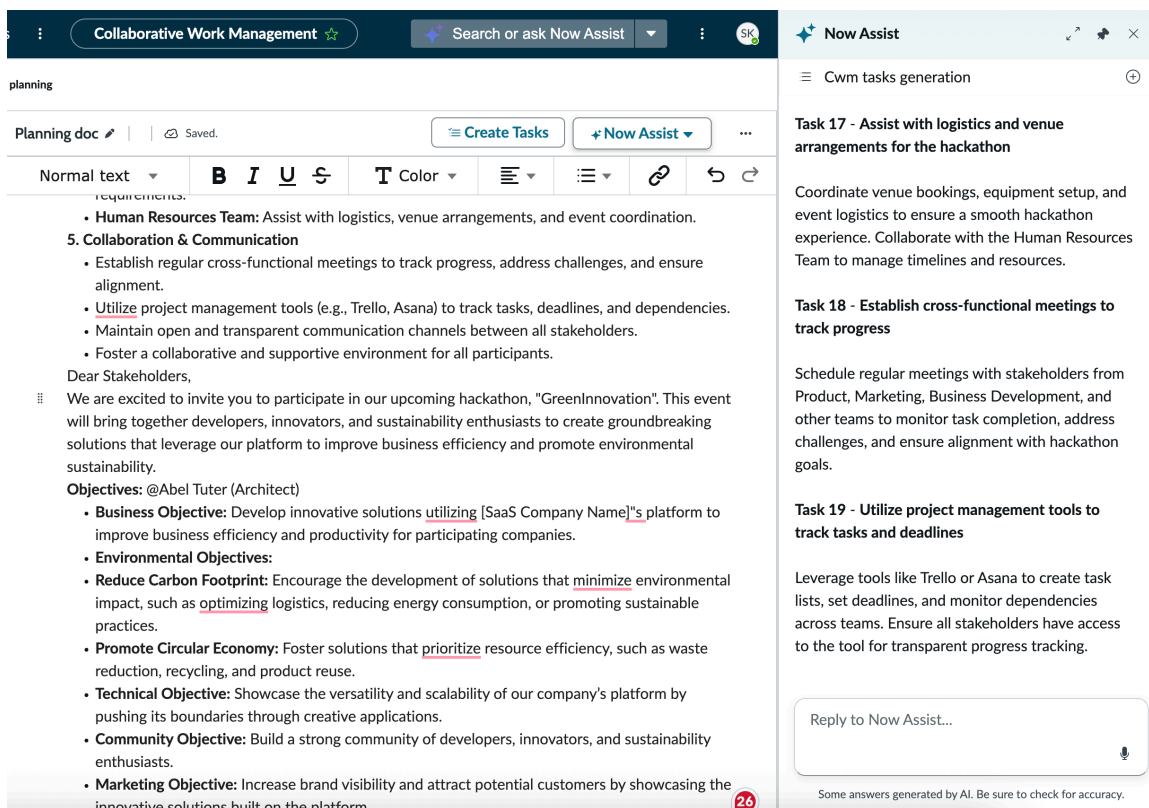

3. From the header of the Doc, select **Create Tasks**.
The Now Assist panel opens up. Now Assist generates recommendations for tasks based on the information on your Doc page. So, to experience an easier interaction within the panel, you can pin it.
4. **Optional:** Go through the task recommendations and choose to refine or modify any task recommendation.
5. You can iterate on refining or modifying the tasks and when you're satisfied with the recommendations, select **Add to Board**.
6. Select the Space of the CWM Board to which you want to add these tasks to.
7. Select the Board to add these tasks to.

Now Assist adds all the generated task recommendations to the selected Board. You can navigate to the Board through the link provided in the Now Assist message to review them.

Note:

If the Space you selected in Step 6 has just one Board, then you won't be asked to select a Board. The tasks are added to the Board directly.

Generate acceptance criteria for stories in CWM

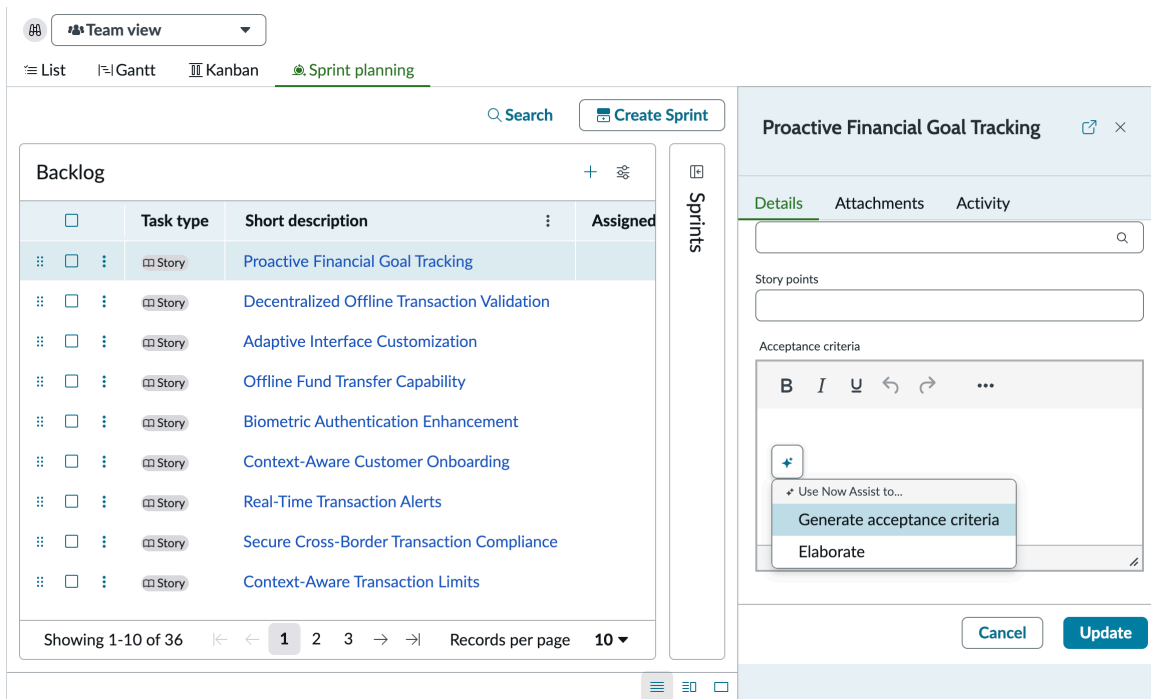

Create clear, comprehensive, and testable acceptance criteria for user stories without writing them manually in Collaborative Work Management (CWM). Review and refine suggested options to ensure they meet your requirements.

Before you begin

Role required: sn_cwm_ai.cwm_ai_user

Procedure

1. Navigate to **Workspaces > Collaborative Work Management**.
2. From the Spaces menu, navigate to the Board containing your story.
3. Select the story to open its details in the side panel.
4. From the Acceptance criteria field in the side panel, select the **Use Now Assist to...** menu (.
5. Select **Generate acceptance criteria**.

6. Review the generated acceptance criteria.
7. You can choose to further refine the generated content using the Now Assist context menu (👉) or generate a new criteria.
8. Select **Update** to save the acceptance criteria in the Story form.

Generate scrum tasks for a story with Now Assist for CWM

Use Now Assist to automatically generate scrum tasks for a story in Collaborative Work Management (CWM) based on the story's description and context, saving time on manual task breakdown.

Before you begin

Role required: sn_cwm_ai.cwm_ai_user

About this task

https://player.vimeo.com/video/1173343785?h=1ff2048afb&badge=0&autoplay=0&player_id=0&app_id=58479

Now Assist generates scrum tasks by analyzing the story's description and context. You can generate scrum tasks in two ways: with review, where you evaluate and approve the suggestions before they are added to the story, or without review, where suggestions are generated and added to the story immediately using the inline Now Assist icon from the Board.

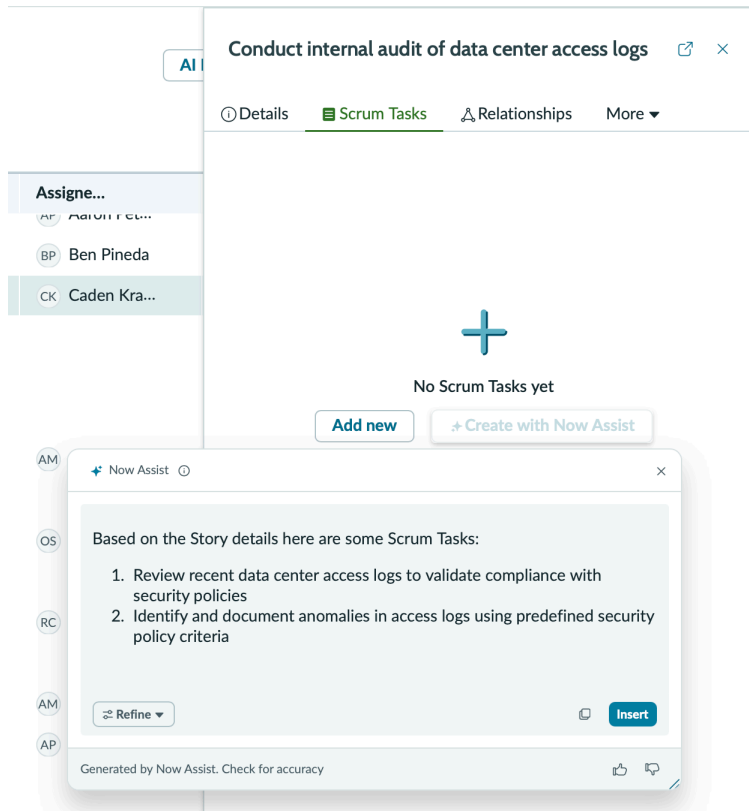

Procedure

1. Navigate to **Workspaces** > *Collaborative Work Management*.
2. From a Space, select a Board.
3. Open the story you want to generate scrum tasks for.

You can open a story from any board view: List, Gantt, Kanban, or Sprint planning.

4. On the story form, select the **Scrum Tasks** tab.
5. Select **Create with Now Assist**.

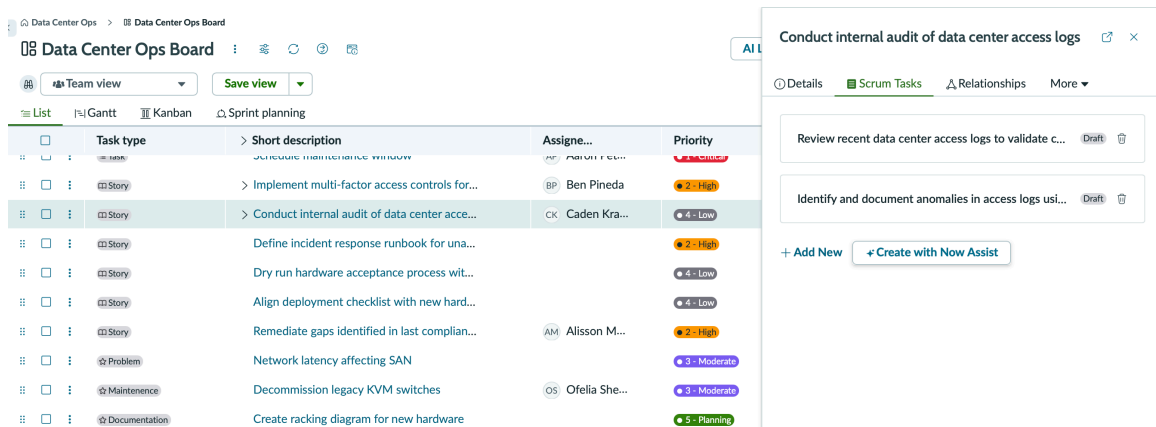

Now Assist analyzes the story description and context and generates scrum task recommendations.

6. Review the generated recommendations.

If the suggestions don't match the story, select **Refine** > **Regenerate** to produce a new set of recommendations.

7. Select **Insert** to add the scrum tasks to the story.

Result

The generated scrum tasks are added to the story and appear in the **Scrum Tasks** tab. You can edit any of the generated tasks after they're added.

What to do next

💡 Tip:

For a quicker path that skips the review step, hover your cursor over the story's short description in the List, Gantt, or Sprint planning views to reveal the Now Assist scrum tasks icon () and select it. The scrum tasks are generated and added to the story immediately without a review step.

To add scrum tasks manually instead, see [Add scrum tasks to a story in CWM](#).

Goal Framework and Goal Framework for SPM

Create goals, set targets for them, and evaluate the progress of the goals and targets to accomplish your organizational plans and drive business outcomes using ServiceNow® Goal Framework.

The ServiceNow® Goal Framework for Strategic Portfolio Management (SPM) application (formerly known as Advanced Goal Framework) enables you to automate the actual value of your targets. The Goal Framework for SPM application is an extension to the Goal Framework application. When you install the Goal Framework for SPM application, you get all the features of Goal Framework as well as the target automation feature.

Using Goal Framework, you can define strategic priorities and associated goals for your organization as part of strategic plans. After goals are created, you can then associate work, planning items, and strategic items such as demand, project, epic, program, and initiative.

The ServiceNow® Strategic Planning users can define personalized portfolio plans using lenses for your organization and use them to align your goals according to your organization's portfolio plans. For information on how a portfolio plan is defined using a lens, see [Lens and portfolio plans](#). You can also create strategic plans, capturing the vision, mission, and values for your organization.

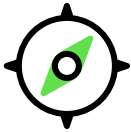

Key benefits of Goal Framework:

- Helps ensure that the entire organization focuses efforts on the same strategic priorities.
- Makes goals that align and focus effort visible.
- Enables the association of work or planning items with goals so that the work being done to accomplish goals and meet targets is easily visible.
- Provides real-time checkpoints for goals over weekly, monthly, and quarterly durations.
- Provides an end-to-end view of goal performance to users with the sn_gf.epmo_strategy_planner role.

Key benefits of Goal Framework for SPM:

- Enables you to automate the actual value of your targets by collecting the actuals from different target sources such as benefit plans, cost plans, assessments/surveys, and PA Indicators.
- Enables you to configure any table or combination of tables that are present on the ServiceNow AI Platform[®] as a target source.

Exploring Goal Framework and Goal Framework for SPM

The Goal Framework application helps you create goals, set targets for them, and evaluate the progress of the goals and targets to accomplish your organizational plans and drive business outcomes.

The Goal Framework for Strategic Portfolio Management (SPM) application enables you to automate the actual value of your targets by collecting the actuals from different target sources such as benefit plans, cost plans, assessments/surveys, and PA Indicators.

Goal Framework key components:

- **Strategic priorities:** Actions of a strategic plan that help to orient your organizational strategic plan toward your goal.
- **Goals:** Objectives that you want to reach based on your strategic plans.
- **Targets:** Targets for goals to track and measure the progress of the goals.

Goal Framework for SPM key component:

Target source is the key component of Goal Framework for SPM. Target source is a configuration for a target that is used to auto-update the actual value of the target, so that the progress of the target and its goal is auto-updated.

Strategic priorities

Strategic priorities are the objectives of your organizational plans. Strategic priorities help you to achieve your goals over a designated time period. The strategic priorities are also known as focus areas or long-term strategies. Defining strategic priorities helps to orient your organizational strategic plans toward your goals.

Goals

Goals refer to objectives that an organization sets for itself to accomplish their organizational plans. Goals are typically qualitative in nature. Goals should be ambitious and are expected to motivate and challenge your teams. Some examples of goals are as follows:

- Using renewable energy by the end of the year 2022.
- Increase diversity in the workplace by 50 percent.

A goal can also have sub-goals. You can also associate work and planning items to a goal so that you can track who is responsible for fulfilling the goal.

If you use Goal Framework with other products, you can also do the following:

- If you're a ServiceNow[®] Project Portfolio Management user, you can associate demands, projects, and programs with a goal to capture the work being done to meet your goal.
- If you're a ServiceNow[®] Agile Development 2.0 user, you can associate scrum epics with a goal to capture the work being done to meet your goal.
- If you're a ServiceNow[®] Scaled Agile Framework (SAFe) user, you can associate SAFe epics and SAFe features with a goal to capture the work being done to meet your goal.
- If you're a Strategic Planning user, you can associate planning items - Demand, Project, and Epic, and strategic items - Program and Initiative - with a goal to capture the work being done to meet your goal.

Targets

Targets help you to measure your goal. For example, to meet the goal of increasing diversity in the workplace by 50 percent, the target can be to hire a 30 percent-diverse workforce by the first quarter of 2022.

Targets can be set as a quantitative or qualitative by defining the unit of measure for the target. Quantitative targets are numbers-based, countable, and measurable. Qualitative targets are interpretation-based, descriptive, typically yes or no type.

You can also breakdown a target into smaller periods (example, Quarterly) which helps you set a target for each quarter and focus on the specific breakdown targets. The target breakdowns are automatically created based on the breakdown interval set for the target. For details on how the target breakdowns feature works, see [Target breakdowns](#).

Qualitative targets

Qualitative targets are typically non-measurable but can be tracked whether the target has been achieved. The available unit of measure for qualitative targets is Yes/No. You can also define a custom unit of measure (for the available choice set) for qualitative targets as per your need and set qualitative targets for your goals.

For example, to achieve a target of conducting hackathon in Q2-2023, the target can be set as conduct hackathon in Q2-2023 with the unit of measure Yes/No. Base and target value of the target can be No and Yes respectively. After the target is successful with the hackathon event, the target value can be updated to Yes.

Target sources

Target source is a configuration for a target that is used to auto-update the actual value of the target, so that the progress of the target and its goal is auto-updated. Any table or a combination of tables (for example, benefit plans, cost plans, surveys, incidents, and PA indicators) present on the ServiceNow AI Platform[®] can be configured as a target source.

The following target source types are supported for automating the actual value of a target.

- PA Indicator: Updates the **Actual value** field on the target form by fetching the required data from the PA Indicator.
- Assessment/Survey: Updates the **Actual value** field on the target form by fetching the required data from the Assessment metric type and Assessment metric category records.
- Custom script: The Custom script fetches the required data from any ServiceNow AI Platform table that is configured. With the Custom script option, any table or a combination of tables present on the ServiceNow AI Platform can be configured as a target source.

Predefined target automation script for benefit plans: The predefined, default script is a target source that updates the **Actual value** field on the target form by fetching the value from the **Actual benefit** field or **Non-monetary actual benefit** field from the monetary or non-monetary benefit plans of relevant work items.

Context variable

The context variable is an additional configuration for the target source. The context variable provides information that can be used on the target form to fetch the required data and update the **Actual value** field on the Target form. The context variable is required for target source types Assessment/Survey and PA Indicator. If the Goal Framework for SPM scope is selected while creating a target source, the context variable is automatically created for the target source (of type Assessment/Survey and PA Indicator). For more information on context variables, see [Context variable in target source](#).

Benefits and workflow

Use the Goal Framework or Goal Framework for SPM application to do the following activities:

- Create a strategic plan for your organization (If Strategic Planning is installed). For more information, see [Create a strategic plan](#).
- Create a strategic priority to orient your organization strategic plan toward your goal. For more information, see [Create a strategic priority for a strategic plan](#).
- Create a goal. For more information, see [Create a goal](#).
- (For Goal Framework users) Set targets for a goal to track and measure the progress of the goal. For more information, see [Set targets for a goal](#).
- (For Goal Framework for SPM users) Set targets and automate the actual value of the targets. For more information, see [Configuring target source for target automation using Goal Framework for SPM](#).
- Create a goal relationship with a work, planning, strategic, or any other item to identify and associate your current or future work and achieve your goals. For more information, see [Associate a work or planning item with goals or targets](#).
- Associate the primary goal for a work and planning item. For more information, see [Associate the primary goal for work and planning items](#).

For an example of the structure of a strategy from the strategic plan level down to targets, see [Enterprise strategy example](#).

Comparing Goal Framework with Goal Framework for SPM

- Goal Framework: Create goals, set targets for them, and evaluate the progress of the goals and targets to accomplish the organizational plans and drive business outcomes.
- Goal Framework for SPM: Automate the actual value of your targets by collecting the actuals from different target sources such as benefit plans, cost plans, assessments/surveys, and PA Indicators.

Comparison of Goal Framework and Goal Framework for SPM features

Comparison of Goal Framework and Goal Framework for SPM features (continued)

Feature	Goal Framework	Goal Framework for SPM
Create strategic priorities	✓	✓
Create goals	✓	✓
Set targets	✓	✓
Set target breakdowns	✗	✓
Associate work with goals	✓	✓
Automate actual value of targets	✗	✓
Monitor goals and strategies in ServiceNow AI Control Tower	✓	✓

Note:

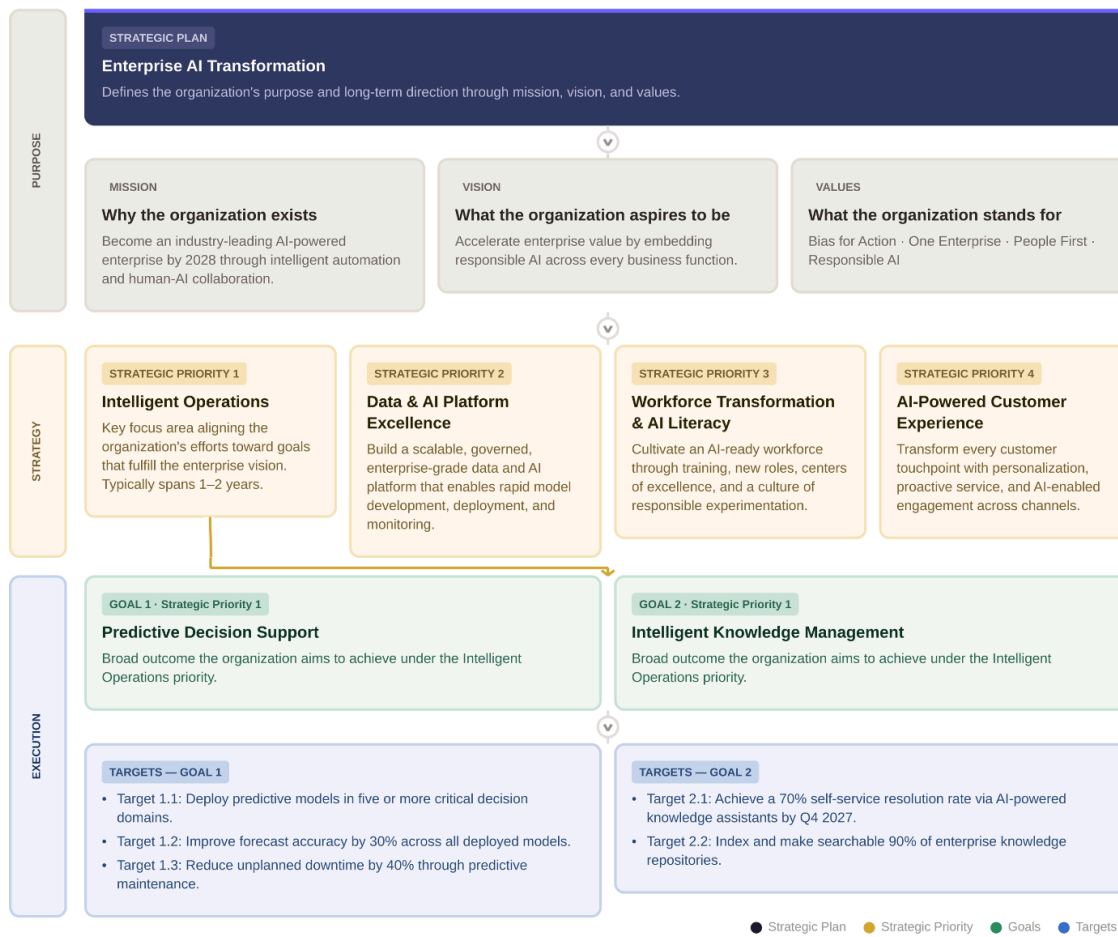

The Goal Framework for SPM application is an extension to the Goal Framework application. When you install the Goal Framework for SPM application, you get all the features of Goal Framework as well as the target automation feature.

Enterprise strategy example

For defining an enterprise strategy, you can start by creating a strategic plan that captures your organization's mission, vision, and values. You then define strategic priorities that align with your mission and vision of your organization, and create goals under each priority to establish what your organization wants to achieve. For each goal, you can set targets to track and measure progress toward achieving it.

The following illustration provides an example of a strategic plan, including its strategic priorities, goals, and targets.

Strategy map

Better together with other ServiceNow applications

The integration of Goal Framework or Goal Framework for SPM with other ServiceNow applications helps portfolio, product, and program managers to optimize planning and track goals for their products.

Goal Framework with AI Control Tower workspace

The ServiceNow[®] AI Control Tower workspace enables you to track and monitor all your strategic priorities, goals, and targets categorized as Artificial Intelligence in Goal Framework.

Populate the **Type** field for strategic priorities and the **Category** field for goals with the **Artificial Intelligence** option to monitor their progress in the AI Control Tower workspace. For more information, see [Create a strategic priority](#) and [Create a goal](#).

When AI Control Tower is installed, the **AI strategy** tab appears in the AI Control Tower workspace, featuring different widgets for AI strategies, goals, and targets details. For more information, see [AI strategy tab in AI Control Tower](#).

Goal Framework with Operational Sustainability Workspace

With the integration of ServiceNow Operational Sustainability Workspace with Goal Framework, you can create environmental, social, and governance (ESG) goals to track your progress toward your chosen material topics. You can also create an environmental, social, and social (ESG) target to help track the progress toward your ESG goal. For more information, see [Create an](#)

Operational Sustainability Management (formerly ESG Management) goal [🔗](#) and Create an Operational Sustainability Management (formerly ESG Management) target [🔗](#).

Goal Framework for SPM with Strategic Planning

Use the ServiceNow Strategic Planning Workspace to visualize the progress of your targets graphically and update the target actuals with ease.

You can create a goal or target relationship with a planning item or any other item to identify and associate your current or future work and achieve your goals and targets. You can also associate a primary goal or target for the planning items where the items contribute to achieving the goal or target. For more information, see [Managing portfolio plan goals in Strategic Planning Workspace](#).

Note:

When you install Strategic Planning, you get all the features of the Goal Framework and Goal Framework for SPM applications.

Configuring Goal Framework and Goal Framework for SPM

As an administrator, use this section to set up the Goal Framework and Goal Framework for SPM applications.

Install Goal Framework and Goal Framework for SPM

You can install the Goal Framework (sn_gf) and Goal Framework for SPM (sn_gfa) applications if you have the admin role.

Before you begin

Ensure that the applications and all associated store applications have valid ServiceNow entitlements. For more information, see [Get entitlement for a ServiceNow product or application](#) [🔗](#).

When you install the Goal Framework for SPM application, you get all the features of Goal Framework as well as the target automation feature.

Role required: admin

Important:

You can install the Goal Framework for SPM application only when you own the Strategic Portfolio Management (SPM) Pro license.

Procedure

1. Navigate to **System Applications > All Available Applications > All**.
2. Find the Goal Framework or Goal Framework for SPM application using the filter criteria and search bar.
You can search for the application by its name or ID (sn_gf or sn_gfa). If you can't find an application, you may have to request it from ServiceNow store. Visit the [ServiceNow Store](#) [🔗](#) website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the [ServiceNow Store version history release notes](#) [🔗](#).
3. Click **Install**.
4. In the Application installation dialog box, review the application dependencies.

If your application requires other applications, install them first if they aren't already installed.

Installing your application also automatically installs the dependent applications or plugins if they aren't installed already.

5. Click **Install**.

Result

The following components are installed with installation of the Goal Framework or Goal Framework for SPM application:

- Roles
- Tables
- Scheduled jobs
- Target automation script for benefit plans (installed with Goal Framework for SPM)

As part of Goal Framework for SPM installation, components of both Goal Framework and Goal Framework for SPM are installed. See [Components installed with Goal Framework and Goal Framework for SPM](#) for more information.

Migrate existing goals data to Goal Framework tables

With the admin role, you can migrate the existing goals data to the Goal Framework tables by running the scheduled job.

Before you begin

Role required: admin

About this task

Note:

Migrating data to the Goal Framework tables is a one-time job, and not meant to be on a schedule.

Procedure

1. Navigate to **All > System Definition > Scheduled Jobs**.
2. Search for and click the **Migrate Goal, Strategy, and Work item data to the Goal Framework and related Planning item tables** scheduled job.
3. On the Scheduled Script Execution form:
 - a. Ensure that the frequency is selected as **On Demand** in the **Run** field.
 - b. Set the value to **true** for the required parameters in the **Run this script** field.
For parameters information, see [Migrate Goal, Strategy, and Work item data to the Goal Framework and related Planning item tables](#).
4. Click **Execute Now**.

Configure goal preferences

Configure goal preferences to manage goals such as the calendar type used for goal setting, weighted average calculation for goal progress, and deletion of goals and targets.

Before you begin

Role required: sn_gf.goal_admin

Procedure

1. Navigate to **All > Enterprise Goal Management > Preferences.**
2. On the Goal Preferences form, configure the properties.
For properties information, see [Goal Preferences form](#).
3. Click **Save**.

Configure a table for an assigned entity

Configure a table for an assigned entity type so that the goal user can associate goals with the required assigned entity.

Before you begin

- By default, with the installation of Goal Framework, the assigned entities, Business Unit [business_unit], Department [cmn_department], and Company [core_company] are installed.
- With the activation of PPM Standard (Project Portfolio Management), the Portfolio [pm_portfolio] assigned entity is installed.
- With the installation of Strategic Planning, the assigned entities, Product Model [cmdb_model], Value Stream [cmn_value_stream], Initiative [sn_align_core_initiative], and Strategic Program [sn_align_core_program] are installed.

Role required: sn_gf.goal_admin

About this task

An assigned entity is an organizational unit or structure that a goal can be associated with, such as a business unit or department. Assigned entities provide context for goals by linking them to the relevant part of your organization, making it easier to track and manage goals at any level.

Procedure

1. Navigate to **All > Enterprise Goal Management > Assigned Entities.**
2. Click **New**.
3. On the form, fill in the fields.
For a description of the field values, see [Goal Assigned Entity Configuration form](#).
4. Click **Submit**.

Import goals and targets data from a spreadsheet

With the admin role, you can import your existing goals and targets data from a spreadsheet to the Goal Framework tables.

Before you begin

- On a successful job run, the goals data from your spreadsheet is imported to the Goal [sn_gf_goal] table.
- On a successful job run, the targets data from your spreadsheet is imported to the Target [sn_gf_goal_target] table.

Note:

Because the targets are associated to a goal, you should import the goals first and then the targets.

i Important:

Goals and targets data in the spreadsheet must be in the supported format. For details on the supported data format to import goals and targets data from a spreadsheet, see [Import goals and targets data \[KB1191233\]](#) .

Role required: admin

Procedure

1. Navigate to **All > System Import Sets > Load Data**.
2. From the Import set table drop-down list, select **Goal Import Set [imp_sn_gf_goal]** or **Target Import Set [imp_sn_gf_goal_target]**.
3. From the **Source of the import** option, select **File**.
4. In the **File** option, click **Choose** and select your spreadsheet to import the data.

i Important:

- Goals and targets data in the spreadsheet must be in a specific format. For details on the supported data format, see [Import goals and targets data \[KB1191233\]](#) .
- Don't modify the names in the header row of the spreadsheet because the data is imported to the respective fields in the goal and target tables based on the header title of each column.

5. Click **Submit**.
6. On the Progress page, click **Run Transform**.
7. On the Specify Import set and Transform map page, click **Transform**.
8. Click **Transform history** and verify that the State column is set to **Complete** in the Import Set Runs related list.
Depending on the option that you selected from the Import set table drop-down list, your goals or targets data is imported to the Goal [sn_gf_goal] or Target [sn_gf_goal_target] tables.

If the job is failed, click **Transform history** and refer to the details.

i Note:

The Import operation can be used for inserting new data or updating the existing data in the tables. By default, the Name and Owner values are the primary keys used for updating the existing records. You can also add additional fields as primary key for inserting new data or updating the existing data. For details on how to add additional fields as primary key, see [Import goals and targets data \[KB1191233\]](#) .

Update a scheduled job to automate the Actual value of the targets

Use the Goal Framework for SPM application to modify the run time for the scheduled job according to your preference to auto-update the actual value of the targets for which a target source has been configured.

Before you begin

Role required: admin

About this task

By default, the scheduled job runs daily at 00:00:00 AM (System Time Zone).

Procedure

1. Navigate to **All > System Definition > Scheduled Jobs**.
2. Search for and click the **Update Actual value of the targets using Goal Framework for SPM** scheduled job.
3. Ensure that the **Active** check box is selected to run the job at a scheduled time.
4. Edit the details of the **Run** and **Time** fields according to your preference.
5. Click **Update**.
To learn more about scheduled jobs, see [Scheduled jobs](#) .

Configuring target source for target automation using Goal Framework for SPM

Configure target sources for target automation so that the goal user can define a target source when setting a target for the goal. Defining a target source for a target updates the actual value of the target automatically.

Use the following steps as guidelines for setting targets and automating the actual value of the targets using Goal Framework for SPM. Some of these steps require the `sn_gf.goal_user` role and some require the `sn_gf.goal_admin` role.

1. Create a target source for a target to configure it as a source to update the actual value of the target. For more information, see [Create a target source](#).

The context variable is required for target source types Assessment/Survey and PA Indicator. The mandatory context variables are automatically created while creating a target source with the type selected as Assessment/Surveys or PA Indicator. For more information on when the mandatory context variables are created, see [Context variable in target source](#).

2. If required, create context variables for the target source so that the required data is fetched from the context variables to update the actual value of the target. For more information, see [Create context variables for a target source](#).

Context variable in target source

The context variable is an additional configuration for the target source that can be used on the Target form to fetch the required data and auto-update the **Actual value** field on the Target form. A context variable is required for target source types Assessment/Survey and PA Indicator.

The context variable is automatically created (with the **Mandatory** field set to **true** on the context variable form) for the target source (of type Assessment/Survey and PA Indicator) when the Goal Framework for SPM scope is selected before creating a target source. The context variables created automatically are also known as mandatory context variables.

The mandatory context variables are created when you've selected the Goal Framework for SPM scope and you've met one of the following conditions:

- (For target source type, Assessment/Survey) On the Target Source form, the **Type** field is set to **Assessment/Survey** and the **Assessment Metric Types** field is populated with a metric type of **Evaluation method = Assessment**.

- (For target source type, PA Indicator) On the Target Source form, the **Type** field is set to **PA Indicator** and the value populated in the **Breakdown** field isn't of Choice list type.

To create a context variable for the target source type, PA Indicator, where the Breakdown field is of Choice list type, see [Create a context variable for the target source type PA Indicator](#).

Note:

Mandatory context variables can't be deleted.

You can also create context variables manually for a target source and use them to configure for fetching the required data and auto-updating the **Actual value** field on the Target form. For more information on how to create a context variable manually, see [Create context variable for a target source](#).
